\*This document corresponds to `bodeplot` v1.1.0, dated July 20, 2022.

# 1 Introduction

Generate Bode, Nyquist, and Nichols plots for transfer functions in the canonical (TF) form

$$G(s) = e^{-Ts} \frac{b_m s^m + \cdots + b_1 s + b_0}{a_n s^n + \cdots + a_1 s + a_0} \quad (1)$$

and the zero-pole-gain (ZPK) form

$$G(s) = K e^{-Ts} \frac{(s - z_1)(s - z_2) \cdots (s - z_m)}{(s - p_1)(s - p_2) \cdots (s - p_n)}. \quad (2)$$

In the equations above,  $b_m, \dots, b_0$  and  $a_n, \dots, a_0$  are real coefficients,  $T \geq 0$  is the loop delay,  $z_1, \dots, z_m$  and  $p_1, \dots, p_n$  are complex zeros and poles of the transfer function, respectively, and  $K \in \mathbb{R}$  is the loop gain. For transfer functions in the ZPK format in (2) with zero delay, this package also supports linear and asymptotic approximation of Bode plots. By default, all phase plots use degrees as units. Use the `rad` package option to generate plots in radians.

## 1.1 External Dependencies

By default, the package uses `gnuplot` to do all the computations. If `gnuplot` is not available, the `pgf` package option can be used to do the calculations using the native `pgf` math engine. Compilation using the `pgf` math engine is typically slower, but the end result should be the identical (other than phase wrapping in the TF format, see limitations below).

## 1.2 Directory Structure

Since version 1.0.8, the `bodeplot` package places all `gnuplot` temporary files in the working directory. The package option `declutter` restores the original behavior where the temporary files are placed in a folder called `gnuplot`.

## 1.3 Limitations

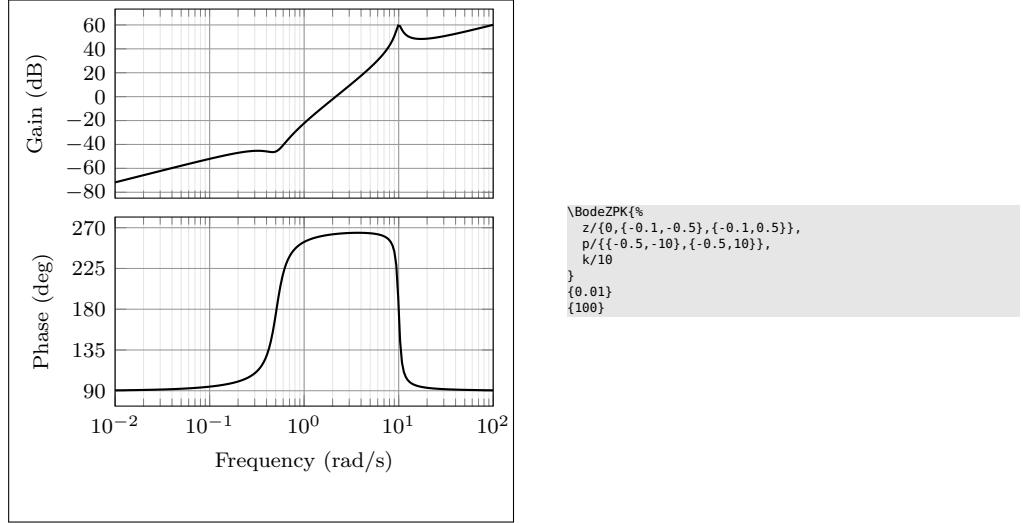

- When plotting Nichols charts in TF form, the phase angles are wrapped between 0 and 360°. As such, the Nichols charts will have phase wrapping discontinuities. Phase wrapping in Bode plots was fixed in v1.1.0 using `gnuplot`. In `pgf` mode, Bode phase plots, plotted using the TF form, will also show phase wrapping discontinuities.
- Use of the `declutter` option with other directory management tools such as a `tikzexternalize` prefix is not recommended.

## 2 TL;DR

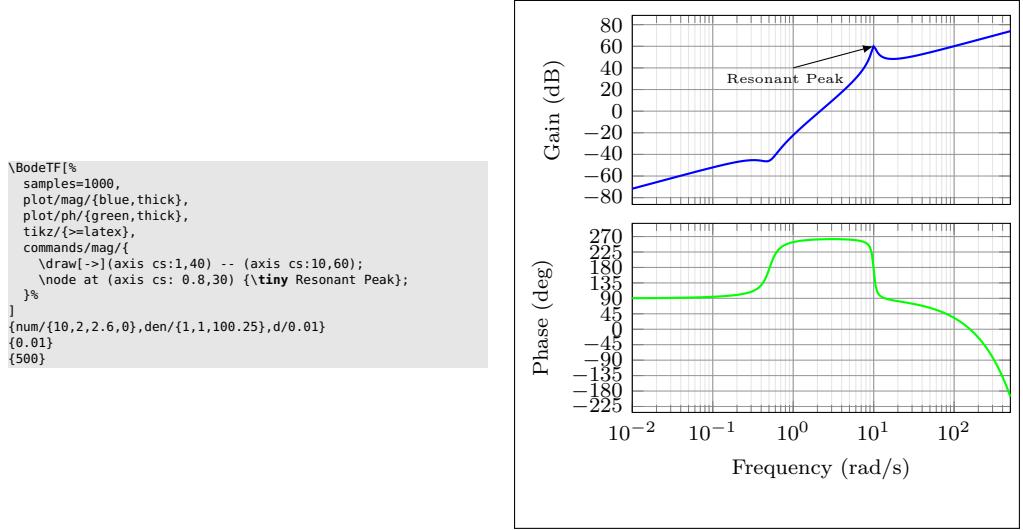

All Bode plots in this section are for the transfer function (with and without a transport delay)

$$G(s) = 10 \frac{s(s + 0.1 + 0.5i)(s + 0.1 - 0.5i)}{(s + 0.5 + 10i)(s + 0.5 - 10i)} = \frac{s(10s^2 + 2s + 2.6)}{(s^2 + s + 100.25)}. \quad (3)$$

Bode plot in ZPK format

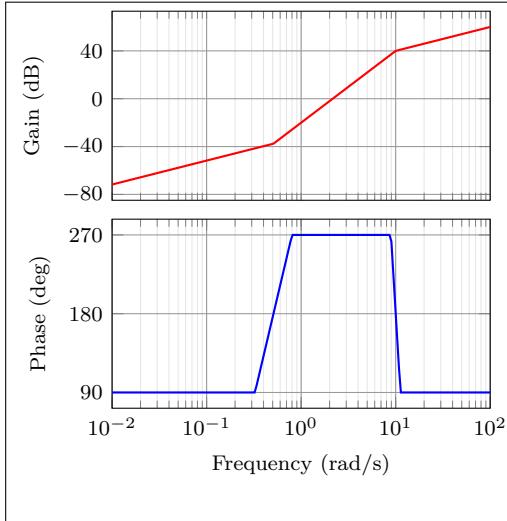

Bode plot in TF format with arrow decoration, transport delay, and color customization (the phase plot will show wrapping if the `pgf` package option is used)

---

### Linear approximation with customization

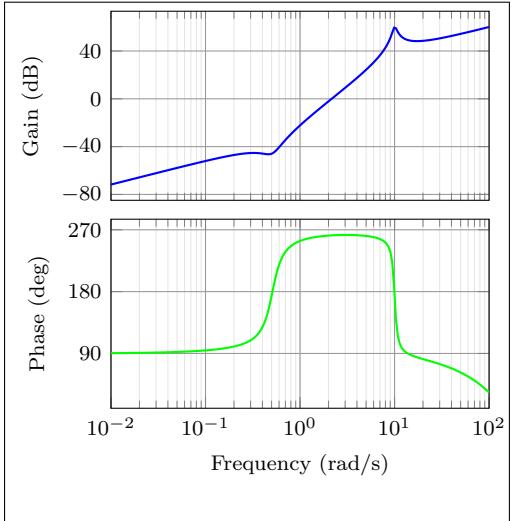

```
\BodeZPK[%
  plot/mag/{red,thick},
  plot/ph/{blue,thick},
  axes/mag/ytick distance=40,
  axes/ph/ytick distance=90,
  approx/linear
]%
z/{0,{-0.1,-0.5},{-0.1,0.5}},
p/{{-0.5,-10},{-0.5,10}},
k/10
]{0.01}
{100}
```

---

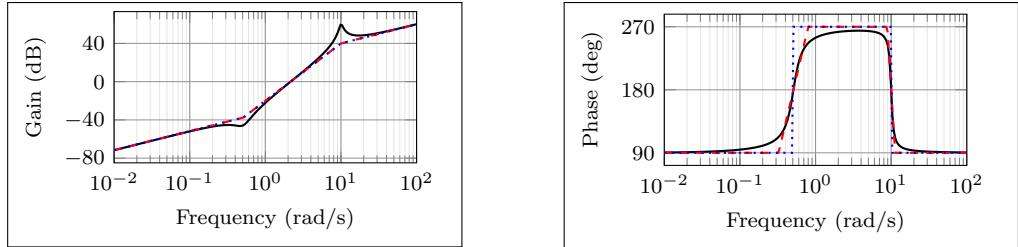

### Plot with delay customization

```
\BodeZPK[
  plot/mag/{blue,thick},
  plot/ph/{green,thick},
  axes/mag/ytick distance=40,
  axes/ph/ytick distance=90
]%
z/{0,{-0.1,-0.5},{-0.1,0.5}},
p/{{-0.5,-10},{-0.5,10}},
k/10,
d/0.01
]{0.01}
{100}
```

---

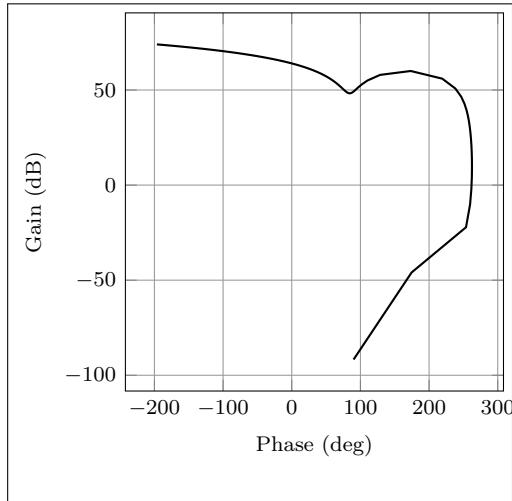

Individual gain and phase plots with more customization

```
\begin{BodeMagPlot}[%  
    axes/{height=2cm,  
        width=4cm}  
]  
{0.01}  
{100}  
\addBodeZPKplots[%  
    true/{black,thick},  
    linear/{red,dashed,thick},  
    asymptotic/{blue,dotted,thick}%  
]  
{magnitude}  
{%  
z/{0,{ -0.1,-0.5},{ -0.1,0.5}},  
p/{{-0.5,-10},{-0.5,10}},  
k/10  
}  
\end{BodeMagPlot}
```

```
\begin{BodePhPlot}[%  
    height=2cm,  
    width=4cm,  
    ytick distance=90  
]  
{0.01}  
{100}  
\addBodeZPKplots[%  
    true/{black,thick},  
    linear/{red,dashed,thick},  
    asymptotic/{blue,dotted,thick}%  
]  
{phase}  
{%  
z/{0,{ -0.1,-0.5},{ -0.1,0.5}},  
p/{{-0.5,-10},{-0.5,10}},  
k/10  
}  
\end{BodePhPlot}
```

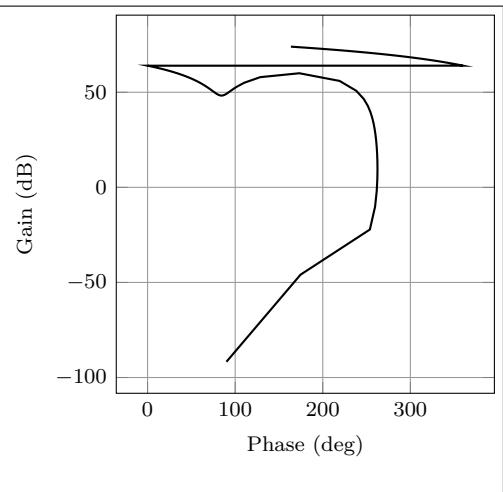

Nichols chart

```
\NicholsZPK[samples=1000]  
{%  
z/{0,{ -0.1,-0.5},{ -0.1,0.5}},  
p/{{-0.5,-10},{-0.5,10}},  
k/10,  
d/0.01  
}  
{0.001}  
{500}
```

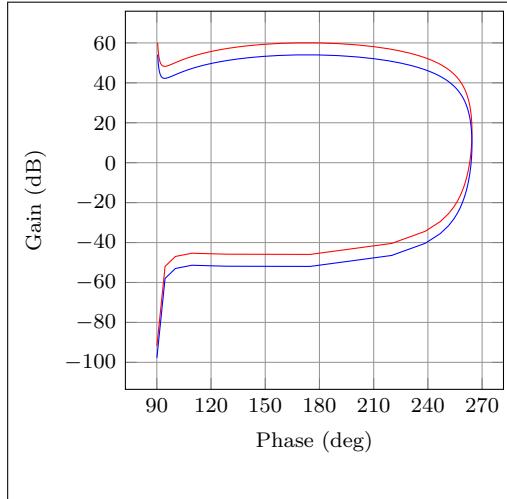

Same Nichols chart in TF format (shows phase wrapping discontinuity)

```
\NicholsTF[samples=1000]  
{num/{10,2,2.6,0},den/{1,1,100.25},d/0.01}  
{0.001}  
{500}
```

---

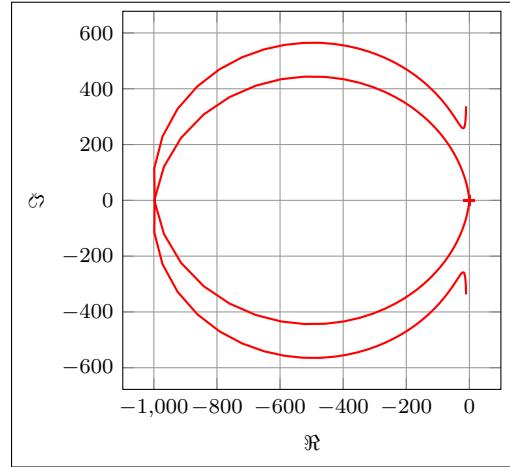

### Multiple Nichols charts with customization

```
\begin{NicholsChart}[%  
    ytick distance=20,  
    xtick distance=30  
]  
{0.001}  
{100}  
    \addNicholsZPKChart [red,samples=1000] {  
        z/{0,{-0.1,-0.5},{-0.1,0.5}},  
        p/{{-0.5,-10},{-0.5,10}},  
        k/10  
    };  
    \addNicholsZPKChart [blue,samples=1000] {  
        z/{0,{-0.1,-0.5},{-0.1,0.5}},  
        p/{{-0.5,-10},{-0.5,10}},  
        k/5  
    };  
\end{NicholsChart}
```

---

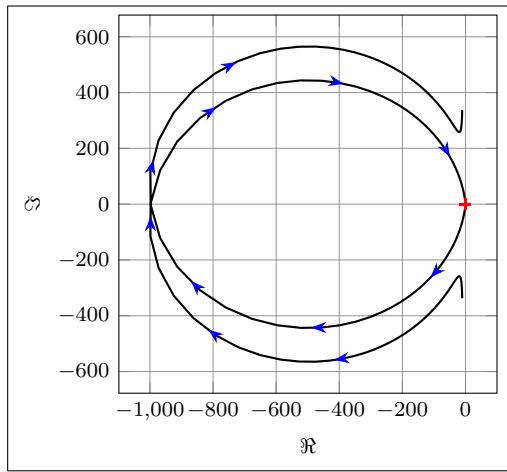

### Nyquist plot

```
\NyquistZPK[plot/{red,thick,samples=1000}]  
{  
    z/{0,{-0.1,-0.5},{-0.1,0.5}},  
    p/{{-0.5,-10},{-0.5,10}},  
    k/10  
}  
{-30}  
{30}
```

---

### Nyquist plot in TF format with arrows

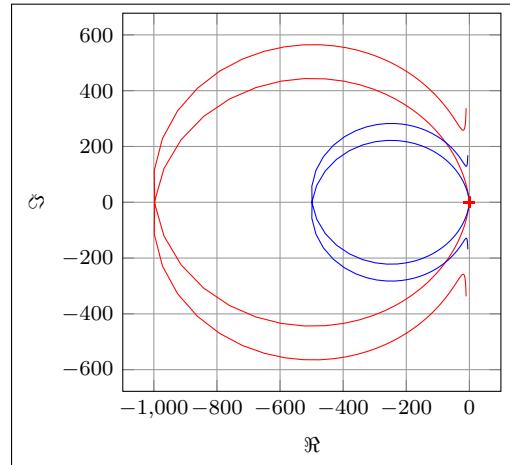

```
\NyquistTF[%  
plot/{%  
    samples=1000,  
    postaction=decorate,  
    decoration={%  
        markings,  
        mark=between positions 0.1 and 0.9 step 5em with {  
            \arrow{Stealth [length=2mm, blue]}  
        }  
    }%  
}]{  
    num/{10,2,2.6,0},den/{1,1,100.25}}  
{-30}  
{30}
```

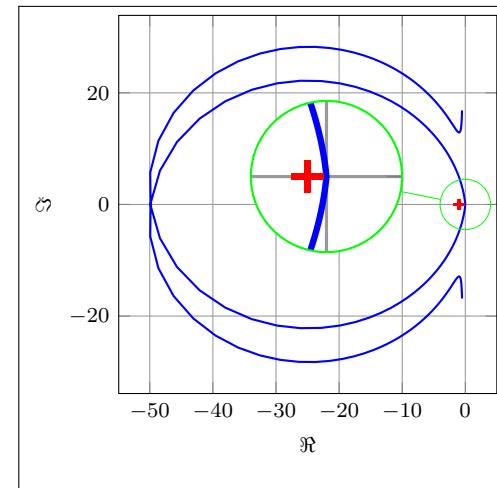

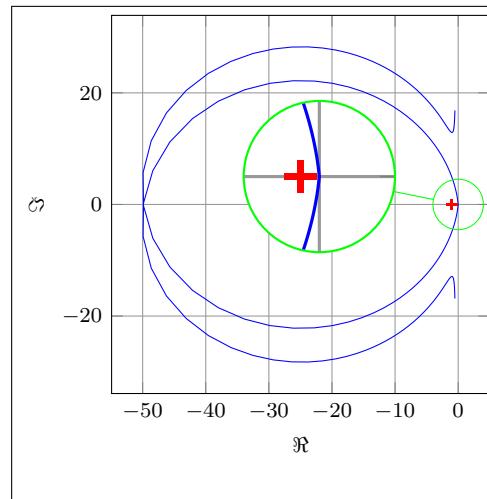

---

### Multiple Nyquist plots with customization

```
\begin{NyquistPlot}{-30}{30}
\addNyquistZPKPlot [red,samples=1000] {%
z/{0,{-0.1,-0.5},{-0.1,0.5}},%
p/{{-0.5,-10},{-0.5,10}},%
k/10
};
\addNyquistZPKPlot [blue,samples=1000] {%
z/{0,{-0.1,-0.5},{-0.1,0.5}},%
p/{{-0.5,-10},{-0.5,10}},%
k/5
};
\end{NyquistPlot}
```

Nyquist plots with additional commands, using two different macros

```
\begin{NyquistPlot}[-30]{30}
\tikz{%
\spy using outlines={%
circle,
magnification=3,
connect spies,
size=2cm
}%
}
\addNyquistZPKPlot [blue,samples=1000] {%
z/{0,{-0.1,-0.5},{-0.1,0.5}},%
p/{{-0.5,-10},{-0.5,10}},%
k/0.5
};
\coordinate (spyon) at (axis cs:0,0);
\coordinate (spyat) at (axis cs:-22,5);
\spy [green] on (spyon) in
node [fill=white] at (spyat);
\end{NyquistPlot}
```

```
\NyquistZPK[%]
plot{blue,samples=1000},
\tikz{%
\spy using outlines={%
circle,
magnification=3,
connect spies,
size=2cm
}%
},
commands/{%
\coordinate (spyon) at (axis cs:0,0);
\coordinate (spyat) at (axis cs:-22,5);
\spy [green] on (spyon) in
node [fill=white] at (spyat);
}%
{
z/{0,{-0.1,-0.5},{-0.1,0.5}},%
p/{{-0.5,-10},{-0.5,10}},%
k/0.5
}
{-30}
{30}
```

### 3 Usage

#### 3.1 Bode plots

```
\BodeZPK \BodeZPK [obj1/typ1/{opt1},obj2/typ2/{opt2},...]
  {{z/{zeros}},p/{poles},k/{gain},d/{delay}}
  {{min-freq}} {{max-freq}}
```

Plots the Bode plot of a transfer function given in ZPK format using the **groupplot** environment. The three mandatory arguments include: (1) a list of tuples, comprised of the zeros, the poles, the gain, and the transport delay of the transfer function, (2) the lower end of the frequency range for the *x*-axis, and (3) the higher end of the frequency range for the *x*-axis. The zeros and the poles are complex numbers, entered as a comma-separated list of comma-separated lists, of the form  `{{real part 1,imaginary part 1}, {real part 2,imaginary part 2},...}`. If the imaginary part is not provided, it is assumed to be zero.

The optional argument is comprised of a comma separated list of tuples, either `obj/typ/{opt}`, or `obj/{opt}`, or just `{opt}`. Each tuple passes options to different **pgfplots** macros that generate the group, the axes, and the plots according to:

- Tuples of the form `obj/typ/{opt}`:
  - `plot/typ/{opt}`: modify plot properties by adding options `{opt}` to the `\addplot` macro for the magnitude plot if `typ` is `mag` and the phase plot if `typ` is `ph`.
  - `axes/typ/{opt}`: modify axis properties by adding options `{opt}` to the `\nextgroupplot` macro for the magnitude plot if `typ` is `mag` and the phase plot if `typ` is `ph`.
  - `commands/typ/{opt}`: add any valid TikZ commands (including the parametric function generator macros in this package, such as `\addBodeZPKPlots`, `\addBodeTFPlot`, and `\addBodeComponentPlot`) to the magnitude plot if `typ` is `mag` and the phase plot if `typ` is `ph`. The commands passed to `opt` need to be valid TikZ commands, separated by semicolons as usual. For example, a TikZ command is used in the description of the `\BodeTF` macro below to mark the gain crossover frequency on the Bode Magnitude plot.
- Tuples of the form `obj/{opt}`:
  - `plot/{opt}`: adds options `{opt}` to `\addplot` macros for both the magnitude and the phase plots.
  - `axes/{opt}`: adds options `{opt}` to `\nextgroupplot` macros for both the magnitude and the phase plots.
  - `group/{opt}`: adds options `{opt}` to the **groupplot** environment.
  - `tikz/{opt}`: adds options `{opt}` to the **tikzpicture** environment.
  - `approx/linear`: plots linear approximation.
  - `approx/asymptotic`: plots asymptotic approximation.
- Tuples of the form `{opt}` add all of the supplied options to `\addplot` macros for both the magnitude and the phase plots.

The options `{opt}` can be any **key=value** options that are supported by the **pgfplots** macros they are added to.

For example, given a transfer function

$$G(s) = 10 \frac{s(s + 0.1 + 0.5i)(s + 0.1 - 0.5i)}{(s + 0.5 + 10i)(s + 0.5 - 10i)}, \quad (4)$$

its Bode plot over the frequency range [0.01, 100] can be generated using `\BodeZPK [blue,thick]`

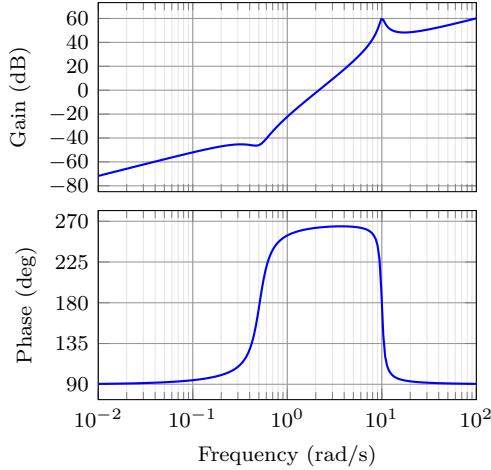

Figure 1: Output of the default \BodeZPK macro.

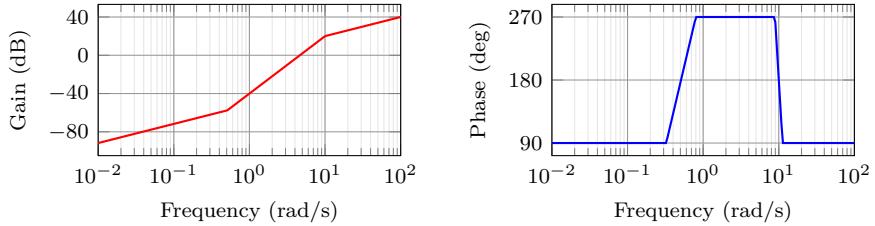

Figure 2: Customization of the default \BodeZPK macro.

```
{z/{0,{-0.1,-0.5},{-0.1,0.5}},p/{{-0.5,-10},{-0.5,10}},k/10}
{0.01}{100}
```

which generates the plot in Figure 1. If a delay is not specified, it is assumed to be zero. If a gain is not specified, it is assumed to be 1. By default, each of the axes, excluding ticks and labels, are 5cm wide and 2.5cm high. The width and the height, along with other properties of the plots, the axes, and the group can be customized using native `pgf` keys as shown in the example below.

As demonstrated in this example, if a single comma-separated list of options is passed, it applies to both the magnitude and the phase plots. Without any optional arguments, we get a thick black Bode plot.

A linear approximation of the Bode plot with customization of the plots, the axes, and the group can be generated using

```
\BodeZPK[plot/mag/{red,thick},plot/ph/{blue,thick},
axes/mag/{ytick distance=40,xmajorticks=true,
xlabel={Frequency (rad/s)}},axes/ph/{ytick distance=90},
group/{group style={group size=2 by 1, horizontal sep=2cm,
width=4cm,height=2cm}},approx/linear]
{z/{0,{-0.1,-0.5},{-0.1,0.5}},p/{{-0.5,-10},{-0.5,10}},k/10}
{0.01}{100}
```

which generates the plot in Figure 2.

```
\BodeTF \BodeTF [{obj1/typ1/{<opt1>},obj2/typ2/{<opt2>},...}]
{<num/<coeffs>},den/{<coeffs>},d/{<delay>})
{<min-freq>} {<max-freq>}
```

Plots the Bode plot of a transfer function given in TF format. The three mandatory arguments include: (1) a list of tuples comprised of the coefficients in the numerator and the denominator of the transfer function and the transport delay, (2) the lower end of the frequency range for the  $x$ -axis, and (3) the higher end of the frequency range for the  $x$ -axis. The coefficients are entered as a comma-separated list, in order

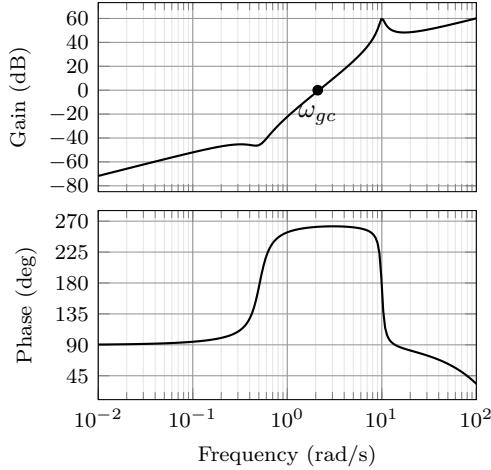

Figure 3: Output of the `\BodeTF` macro with an optional TikZ command used to mark the gain crossover frequency.

from the highest degree of  $s$  to the lowest, with zeros for missing degrees. The optional arguments are the same as `\BodeZPK`, except that linear/asymptotic approximation is not supported, so `approx/...` is ignored.

For example, given the same transfer function as (4) in TF form and with a small transport delay,

$$G(s) = e^{-0.01s} \frac{s(10s^2 + 2s + 2.6)}{(s^2 + s + 100.25)}, \quad (5)$$

its Bode plot over the frequency range [0.01, 100] can be generated using

```
\BodeTF[commands/mag/{\node at (axis cs: 2.1,0)
  [circle,fill,inner sep=0.05cm,label=below:{$\omega_{gc}$}]{};}]
{num/{10,2,2.6,0},den/{1,1,100.25},d/0.01}
{0.01}{100}
```

which generates the plot in Figure 3. Note the 0 added to the numerator coefficients to account for the fact that the numerator does not have a constant term in it. Note the semicolon after the TikZ command passed to the `\commands` option.

```
BodeMagPlot (env.) \begin{BodeMagPlot}[\langle obj1/\{\langle opt1\rangle\},obj2/\{\langle opt2\rangle\},...]
  {\langle min-frequency\rangle}{\langle max-frequency\rangle}
  \addBode...
\end{BodeMagPlot}
```

The `BodeMagPlot` environment works in conjunction with the parametric function generator macros `\addBodeZPKPlots`, `\addBodeTFPlot`, and `\addBodeComponentPlot`, intended to be used for magnitude plots. The optional argument is comprised of a comma separated list of tuples, either `obj/\{opt\}` or just `{opt}`. Each tuple passes options to different `pgfplots` macros that generate the axes and the plots according to:

- Tuples of the form `obj/\{opt\}`:
  - `tikz/\{opt\}`: modify picture properties by adding options `{opt}` to the `tikzpicture` environment.
  - `axes/\{opt\}`: modify axis properties by adding options `{opt}` to the `semilogaxis` environment.
  - `commands/\{opt\}`: add any valid TikZ commands inside `semilogaxis` environment. The commands passed to `opt` need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form `{opt}` are passed directly to the `semilogaxis` environment.

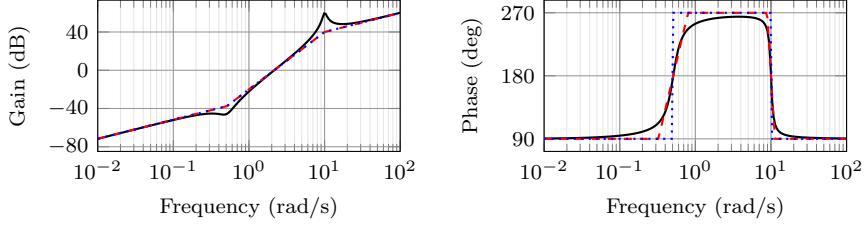

Figure 4: Superimposed approximate and true Bode plots using the **BodeMagPlot** and **BodePhPlot** environments and the **\addBodeZPKPlots** macro.

The frequency limits are translated to the x-axis limits and the domain of the **semilogaxis** environment. Example usage in the description of **\addBodeZPKPlots**, **\addBodeTFPlot**, and **\addBodeComponentPlot**.

```
BodePhPlot (env.)     \begin{BodePhPlot}[\langle obj1/\{\langle opt1\rangle\},obj2/\{\langle opt2\rangle\},...]
{⟨min-frequency⟩}{⟨max-frequency⟩}
\addBode...
\end{BodePhPlot}
```

Intended to be used for phase plots, otherwise same as the **BodeMagPlot** environment

```
\addBodeZPKPlots     \addBodeZPKPlots [\langle approx1/\{\langle opt1\rangle\},approx2/\{\langle opt2\rangle\},...]
{⟨plot-type⟩}
{⟨z/⟨zeros⟩⟩,p/⟨poles⟩,k/⟨gain⟩,d/⟨delay⟩⟩}
```

Generates the appropriate parametric functions and supplies them to multiple **\addplot** macros, one for each **approx/{opt}** pair in the optional argument. If no optional argument is supplied, then a single **\addplot** command corresponding to a thick true Bode plot is generated. If an optional argument is supplied, it needs to be one of **true/{opt}**, **linear/{opt}**, or **asymptotic/{opt}**. This macro can be used inside any **semilogaxis** environment as long as a domain for the x-axis is supplied through either the **approx/{opt}** interface or directly in the optional argument of the **semilogaxis** environment. Use with the **BodePlot** environment supplied with this package is recommended. The second mandatory argument, **plot-type** is either **magnitude** or **phase**. If it is not equal to **phase**, it is assumed to be **magnitude**. The last mandatory argument is the same as **\BodeZPK**.

For example, given the transfer function in (4), its linear, asymptotic, and true Bode plots can be superimposed using

```
\begin{BodeMagPlot}[height=2cm,width=4cm] {0.01} {100}
\addBodeZPKPlots[
  true/{black,thick},
  linear/{red,dashed,thick},
  asymptotic/{blue,dotted,thick}]
{magnitude}
{z/{0,{-.1,-.5},{-.1,.5}},p/{{-0.5,-10},{-0.5,10}},k/10}
\end{BodeMagPlot}

\begin{BodePhPlot}[height=2cm, width=4cm, ytick distance=90] {0.01} {100}
\addBodeZPKPlots[
  true/{black,thick},
  linear/{red,dashed,thick},
  asymptotic/{blue,dotted,thick}]
{phase}
{z/{0,{-.1,-.5},{-.1,.5}},p/{{-0.5,-10},{-0.5,10}},k/10}
\end{BodePhPlot}
```

which generates the plot in Figure 4.

```
\addBodeTFPlot     \addBodeTFPlot[\langle plot-options\rangle]
{⟨plot-type⟩}
{⟨num/⟨coeffs⟩⟩,den/⟨coeffs⟩,d/⟨delay⟩})}
```

Generates a single parametric function for either Bode magnitude or phase plot of a transfer function in TF form. The generated parametric function is passed to the `\addplot` macro. This macro can be used inside any `semilogaxis` environment as long as a domain for the x-axis is supplied through either the `plot-options` interface or directly in the optional argument of the container `semilogaxis` environment. Use with the `BodePlot` environment supplied with this package is recommended. The second mandatory argument, `plot-type` is either `magnitude` or `phase`. If it is not equal to `phase`, it is assumed to be `magnitude`. The last mandatory argument is the same as `\BodeTF`.

`\addBodeComponentPlot`    `\addBodeComponentPlot[<plot-options>]{<plot-command>}`

Generates a single parametric function corresponding to the mandatory argument `plot-command` and passes it to the `\addplot` macro. The plot command can be any parametric function that uses `t` as the independent variable. The parametric function must be `gnuplot` compatible (or `pgfplots` compatible if the package is loaded using the `pgf` option). The intended use of this macro is to plot the parametric functions generated using the basic component macros described in Section 3.1.1 below.

### 3.1.1 Basic components up to first order

`\TypeFeatureApprox`    `\TypeFeatureApprox{<real-part>}{<imaginary-part>}`

This entry describes 20 different macros of the form `\TypeFeatureApprox` that take the real part and the imaginary part of a complex number as arguments. The `Type` in the macro name should be replaced by either `Mag` or `Ph` to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The `Feature` in the macro name should be replaced by one of `K`, `Pole`, `Zero`, or `Del`, to generate the Bode plot of a gain, a complex pole, a complex zero, or a transport delay, respectively. If the `Feature` is set to either `K` or `Del`, the `imaginary-part` mandatory argument is ignored. The `Approx` in the macro name should either be removed, or it should be replaced by `Lin` or `Asymp` to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively. If the `Feature` is set to `Del`, then `Approx` has to be removed. For example,

- `\MagK{k}{0}` or `\MagK{k}{400}` generates a parametric function for the true Bode magnitude of  $G(s) = k$
- `\PhPoleLin{a}{b}` generates a parametric function for the linear approximation of the Bode phase of  $G(s) = \frac{1}{s-a-ib}$ .
- `\PhDel{T}{200}` or `\PhDel{T}{0}` generates a parametric function for the Bode phase of  $G(s) = e^{-Ts}$ .

All 20 of the macros defined by combinations of `Type`, `Feature`, and `Approx`, and any `gnuplot` (or `pgfplot` if the `pgf` class option is loaded) compatible function of the 20 macros can be used as `plot-command` in the `addBodeComponentPlot` macro. This is sufficient to generate the Bode plot of any rational transfer function with delay. For example, the Bode phase plot in Figure 4 can also be generated using:

```
\begin{BodePhPlot}[ytick distance=90]{0.01}{100}
  \addBodeComponentPlot[black,thick]{\PhZero{0}{0} + \PhZero{-0.1}{-0.5} +
  \PhZero{-0.1}{0.5} + \PhPole{-0.5}{-10} + \PhPole{-0.5}{10} +
  \PhK{10}{0}}
  \addBodeComponentPlot[red,dashed,thick] {\PhZeroLin{0}{0} +
  \PhZeroLin{-0.1}{-0.5} + \PhZeroLin{-0.1}{0.5} +
  \PhPoleLin{-0.5}{-10} + \PhPoleLin{-0.5}{10} + \PhKLin{10}{20}}
  \addBodeComponentPlot[blue,dotted,thick] {\PhZeroAsymp{0}{0} +
  \PhZeroAsymp{-0.1}{-0.5} + \PhZeroAsymp{-0.1}{0.5} +
  \PhPoleAsymp{-0.5}{-10} + \PhPoleAsymp{-0.5}{10} + \PhKAsymp{10}{40}}
\end{BodePhPlot}
```

which gives us the plot in Figure 5.

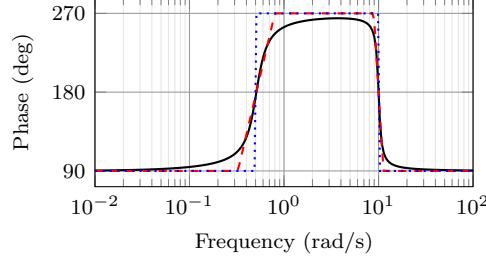

Figure 5: Superimposed approximate and true Bode Phase plot using the **BodePh-Plot** environment, the `\addBodeComponentPlot` macro, and several macros of the `\TypeFeatureApprox` form.

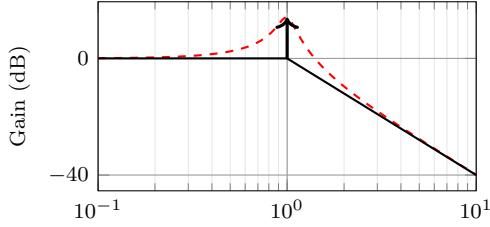

Figure 6: Resonant peak in asymptotic Bode plot using `\MagSOPolesPeak`.

### 3.1.2 Basic components of the second order

`\TypeS0FeatureApprox \TypeS0FeatureApprox{<a1>}{<a0>}`

This entry describes 12 different macros of the form `\TypeS0FeatureApprox` that take the coefficients  $a_1$  and  $a_0$  of a general second order system as inputs. The **Feature** in the macro name should be replaced by either **Poles** or **Zeros** to generate the Bode plot of  $G(s) = \frac{1}{s^2 + a_1 s + a_0}$  or  $G(s) = s^2 + a_1 s + a_0$ , respectively. The **Type** in the macro name should be replaced by either **Mag** or **Ph** to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The **Approx** in the macro name should either be removed, or it should be replaced by **Lin** or **Asymp** to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively.

`\MagS0FeaturePeak \MagS0FeaturePeak[<draw-options>]{<a1>}{<a0>}`

This entry describes 2 different macros of the form `\MagS0FeaturePeak` that take the the coefficients  $a_1$  and  $a_0$  of a general second order system as inputs, and draw a resonant peak using the `\draw` TikZ macro. The **Feature** in the macro name should be replaced by either **Poles** or **Zeros** to generate a peak for poles and a valley for zeros, respectively. For example, the command

```
\begin{BodeMagPlot}[ xlabel={}]{0.1}{10}
  \addBodeComponentPlot[red,dashed,thick]{\MagS0Poles{0.2}{1}}
  \addBodeComponentPlot[black,thick]{\MagS0PolesLin{0.2}{1}}
  \MagS0PolesPeak[thick]{0.2}{1}
\end{BodeMagPlot}
```

generates the plot in Figure 6.

`\TypeCSFeatureApprox \TypeCSFeatureApprox{<zeta>}{<omega-n>}`

This entry describes 12 different macros of the form `\TypeCSFeatureApprox` that take the damping ratio,  $\zeta$ , and the natural frequency,  $\omega_n$  of a canonical second order system as inputs. The **Type** in the macro name should be replaced by either **Mag** or **Ph** to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The **Feature** in the macro name should be replaced by either **Poles** or **Zeros** to generate the Bode plot of  $G(s) = \frac{1}{s^2 + 2\zeta\omega_n s + \omega_n^2}$  or  $G(s) = s^2 + 2\zeta\omega_n s + \omega_n^2$ , respectively. The **Approx** in the macro name should either be removed, or it should be

replaced by `Lin` or `Asymp` to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively.

<code>\MagCSFeaturePeak</code>	<code>\MagCSFeaturePeak[<i>draw-options</i>]{<i>zeta</i>}{<i>omega-n</i>}</code>
	This entry describes 2 different macros of the form <code>\MagCSFeaturePeak</code> that take the damping ratio, $\zeta$ , and the natural frequency, $\omega_n$ of a canonical second order system as inputs, and draw a resonant peak using the <code>\draw</code> TikZ macro. The <b>Feature</b> in the macro name should be replaced by either <b>Poles</b> or <b>Zeros</b> to generate a peak for poles and a valley for zeros, respectively.
<code>\MagCCFeaturePeak</code>	<code>\MagCCFeaturePeak[<i>draw-options</i>]{<i>real-part</i>}{<i>imaginary-part</i>}</code>
	This entry describes 2 different macros of the form <code>\MagCCFeaturePeak</code> that take the real and imaginary parts of a pair of complex conjugate poles or zeros as inputs, and draw a resonant peak using the <code>\draw</code> TikZ macro. The <b>Feature</b> in the macro name should be replaced by either <b>Poles</b> or <b>Zeros</b> to generate a peak for poles and a valley for zeros, respectively.

### 3.2 Nyquist plots

```
\NyquistZPK \NyquistZPK [plot/{opt},axes/{opt}]
  {z/{zeros},p/{poles},k/{gain},d/{delay}}
  {min-freq}{max-freq}
```

Plots the Nyquist plot of a transfer function given in ZPK format with a thick red + marking the critical point (-1,0). The mandatory arguments are the same as `\BodeZPK`. Since there is only one plot in a Nyquist diagram, the `\typ` specifier in the optional argument tuples is not needed. As such, the supported optional argument tuples are `plot/{opt}`, which passes `{opt}` to `\addplot`, `axes/{opt}`, which passes `{\opt}` to the `axis` environment, and `tikz/{opt}`, which passes `{\opt}` to the `tikzpicture` environment. Asymptotic/linear approximations are not supported in Nyquist plots. If just `{opt}` is provided as the optional argument, it is interpreted as `plot/{opt}`. Arrows to indicate the direction of increasing  $\omega$  can be added by adding `\usetikzlibrary{decorations.markings}` and `\usetikzlibrary{arrows.meta}` to the preamble and then passing a tuple of the form

```
plot/{postaction=decorate,decoration={markings,
  mark=between positions 0.1 and 0.9 step 5em with
  {\arrow{Stealth [length=2mm, blue]}}}}
```

**Caution:** with a high number of samples, adding arrows in this way may cause the error message ! Dimension too big.

For example, the command

```
\NyquistZPK[plot/{red,thick,samples=2000},axes/{blue,thick}]
  {z/{0,-0.1,-0.5},{-0.1,0.5}},p/{-0.5,-10},{-0.5,10},k/10
  {-30}{30}
```

generates the Nyquist plot in Figure 7.

```
\NyquistTF \NyquistTF [plot/{opt},axes/{opt}]
  {num/{coeffs},den/{coeffs},d/{delay}}
  {min-freq}{max-freq}
```

Nyquist plot of a transfer function given in TF format. Same mandatory arguments as `\BodeTF` and same optional arguments as `\NyquistZPK`. For example, the command

```
\NyquistTF[plot/{green,thick,samples=500,postaction=decorate,
  decoration={markings,
  mark=between positions 0.1 and 0.9 step 5em
  with{\arrow{Stealth[length=2mm, blue]}}}]
  {num/{10,2,2.6,0},den/{1,1,100.25}}
  {-30}{30}]
```

generates the Nyquist plot in Figure 8.

```
NyquistPlot (env.) \begin{NyquistPlot}[\iotaobj1/{opt1},\iotaobj2/{opt2},...]
  {min-frequency}{max-frequency}
  \addNyquist...
\end{NyquistPlot}
```

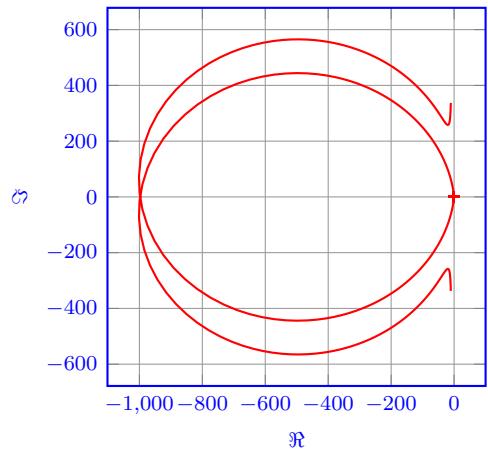

Figure 7: Output of the `\NyquistZPK` macro.

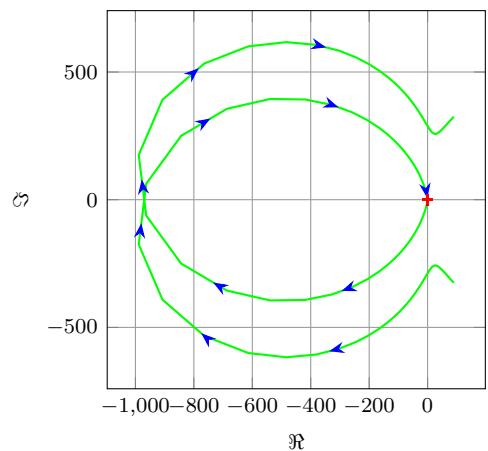

Figure 8: Output of the `\NyquistTF` macro with direction arrows. Increasing the number of samples can cause `decorations.markings` to throw errors.

The **NyquistPlot** environment works in conjunction with the parametric function generator macros `\addNyquistZPKPlot` and `\addNyquistTFPlot`. The optional argument is comprised of a comma separated list of tuples, either `obj/{opt}` or just `{opt}`. Each tuple passes options to different `pgfplots` macros that generate the axes and the plots according to:

- Tuples of the form `obj/{opt}`:
  - `tikz/{opt}`: modify picture properties by adding options `{opt}` to the `tikzpicture` environment.
  - `axes/{opt}`: modify axis properties by adding options `{opt}` to the `axis` environment.
  - `commands/{opt}`: add any valid TikZ commands inside `axis` environment. The commands passed to `opt` need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form `{opt}` are passed directly to the `axis` environment.

The frequency limits are translated to the x-axis limits and the domain of the `axis` environment.

```
\addNyquistZPKPlot  \addNyquistZPKPlot[\langle plot-options\rangle]
                  {\langle z/\{\langle zeros\rangle\},p/\{\langle poles\rangle\},k/\{\langle gain\rangle\},d/\{\langle delay\rangle\}\rangle}
```

Generates a twp parametric functions for the magnitude and the phase a transfer function in ZPK form. The generated magnitude and phase parametric functions are converted to real and imaginary part parametric functions and passed to the `\addplot` macro. This macro can be used inside any `axis` environment as long as a domain for the x-axis is supplied through either the `plot-options` interface or directly in the optional argument of the container `axis` environment. Use with the **NyquistPlot** environment supplied with this package is recommended. The mandatory argument is the same as `\BodeZPK`.

```
\addNyquistTFPlot  \addNyquistTFPlot[\langle plot-options\rangle]
                  {\langle num/\{\langle coeffs\rangle\},den/\{\langle coeffs\rangle\},d/\{\langle delay\rangle\}\rangle}
```

Similar to `\addNyquistZPKPlot`, with a transfer function input in the TF form.

### 3.3 Nichols charts

```
\NicholsZPK \NicholsZPK [\langle plot/\{\langle opt\rangle\},axes/\{\langle opt\rangle\}\rangle]
                  {\langle z/\{\langle zeros\rangle\},p/\{\langle poles\rangle\},k/\{\langle gain\rangle\},d/\{\langle delay\rangle\}\rangle}
                  {\langle min-freq\rangle}\{\langle max-freq\rangle\}
```

Nichols chart of a transfer function given in ZPK format. Same arguments as `\NyquistZPK`.

```
\NicholsTF \NicholsTF [\langle plot/\{\langle opt\rangle\},axes/\{\langle opt\rangle\}\rangle]
                  {\langle num/\{\langle coeffs\rangle\},den/\{\langle coeffs\rangle\},d/\{\langle delay\rangle\}\rangle}
                  {\langle min-freq\rangle}\{\langle max-freq\rangle\}
```

Nichols chart of a transfer function given in TF format. Same arguments as `\NyquistTF`. For example, the command

```
\NicholsTF[plot/{green,thick,samples=2000}]
          {num/{10,2,2.6,0},den/{1,1,100.25},d/0.01}
          {0.001}{100}
```

generates the Nichols chart in Figure 9.

```
NicholsChart (env.) \begin{NicholsChart}[\langle obj1/\{\langle opt1\rangle\},obj2/\{\langle opt2\rangle\},...\rangle]
                                         {\langle min-frequency\rangle}\{\langle max-frequency\rangle\}
                                         \addNichols...
                                         \end{NicholsChart}
```

The **NicholsChart** environment works in conjunction with the parametric function generator macros `\addNicholsZPKChart` and `\addNicholsTFChart`. The optional argument is comprised of a comma separated list of tuples, either `obj/{opt}` or just `{opt}`. Each tuple passes options to different `pgfplots` macros that generate the axes and the plots according to:

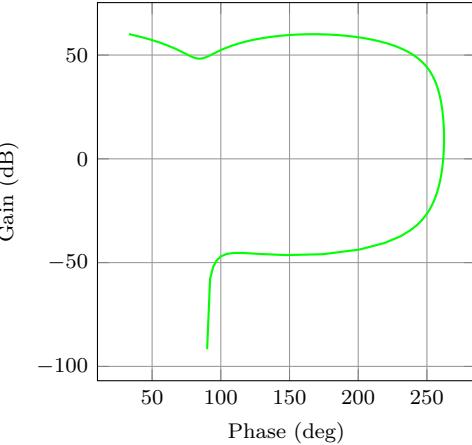

Figure 9: Output of the `\NyquistZPK` macro.

- Tuples of the form `obj/{opt}`:
  - `tikz/{opt}`: modify picture properties by adding options `{opt}` to the `tikzpicture` environment.
  - `axes/{opt}`: modify axis properties by adding options `{opt}` to the `axis` environment.
  - `commands/{opt}`: add any valid TikZ commands inside `axis` environment. The commands passed to `opt` need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form `{opt}` are passed directly to the `axis` environment.

The frequency limits are translated to the x-axis limits and the domain of the `axis` environment.

```
\addNicholsZPKChart  \addNicholsZPKChart[\langle plot-options\rangle]
                     {\langle z/\{\langle zeros\rangle\},p/\{\langle poles\rangle\},k/\{\langle gain\rangle\},d/\{\langle delay\rangle\}\} }
```

Generates two parametric functions for the magnitude and the phase of a transfer function in ZPK form. The generated magnitude and phase parametric functions are passed to the `\addplot` macro. This macro can be used inside any `axis` environment as long as a domain for the x-axis is supplied through either the `plot-options` interface or directly in the optional argument of the container `axis` environment. Use with the `NicholsChart` environment supplied with this package is recommended. The mandatory argument is the same as `\BodeZPK`.

```
\addNicholsTFChart \addNicholsTFChart[\langle plot-options\rangle]
                     {\langle num/\{\langle coeffs\rangle\},den/\{\langle coeffs\rangle\},d/\{\langle delay\rangle\}\} }
```

Similar to `\addNicholsZPKChart`, with a transfer function input in the TF form.

## 4 Implementation

### 4.1 Initialization

\pdfstrcmp The package makes extensive use of the \pdfstrcmp macro to parse options. Since that macro is not available in `lualatex`, this code is needed.

```
1 \RequirePackage{ifluatex}%
2 \ifluatex
3   \let\pdfstrcmp\pdfstrcmp
4 \fi
```

\n@mod This code is needed to support both `pgfplots` and `gnuplot` simultaneously. New \n@pow macros are defined for the `pow` and `mod` functions to address differences between the `gnuplot@id` two math engines. We start by processing the class options.

```
gnuplot@prefix 5 \newif\if@pgfarg@\pgfargfalse
6 \DeclareOption{pgf}{%
7   \@pgfargtrue
8 }
9 \newif\if@declutterarg@\declutterargfalse
10 \DeclareOption{declutter}{%
11   \@declutterargtrue
12 }
13 \newif\if@radarg@\radargfalse
14 \DeclareOption{rad}{%
15   \@radargtrue
16 }
17 \ProcessOptions\relax
```

Then, we define two new macros to unify `pgfplots` and `gnuplot`.

```
18 \newcommand{\n@mod}[2]{(#1) - (\floor{(#1)/(#2)} * (#2))}
19 \if@pgfarg
20   \newcommand{\n@pow}[2]{(#1)^{(#2)}}
21   \pgfplotsset{%
22     trig format plots=rad%
23   }
24 \else
25   \newcommand{\n@pow}[2]{(#1)**(#2)}
```

Then, we create a counter so that a new data table is generated and for each new plot. If the plot macros have not changed, the tables, once generated, can be reused by `gnuplot`, which reduces compilation time. The `declutter` option is used to enable the `gnuplot` directory to declutter the working directory.

```
26 \newcounter{gnuplot@id}
27 \setcounter{gnuplot@id}{0}
28 \if@declutterarg
29   \tikzset{%
30     gnuplot@prefix/.style={%
31       id=\arabic{gnuplot@id},
32       prefix=gnuplot/\jobname
33     }%
34   }
35 \else
36   \tikzset{%
37     gnuplot@prefix/.style={%
38       id=\arabic{gnuplot@id},
39       prefix=\jobname
40     }%
41   }
42 \fi
```

If the operating system is not Windows, and if the `declutter` option is not passed, we create the `gnuplot` folder if it does not already exist.

```
43 \ifwindows\else
44   \if@declutterarg
```

```

45      \immediate\write18{mkdir -p gnuplot}
46    \fi
47  \fi
48 \fi

bode@style Default axis properties for all plot macros are collected in this pgf style.
49 \pgfplotsset{%
50   bode@style/.style = {%
51     label style={font=\footnotesize},
52     tick label style={font=\footnotesize},
53     grid=both,
54     major grid style={color=gray!80},
55     minor grid style={color=gray!20},
56     x label style={at={(ticklabel cs:0.5)}, anchor=near ticklabel},
57     y label style={at={(ticklabel cs:0.5)}, anchor=near ticklabel},
58     scale only axis,
59     samples=200,
60     width=5cm,
61   }%
62 }

ph@filter These macros create pgf filters to convert plots from radians to degrees.
ph@x@filter
63 \if@radarg
64   \pgfplotsset{ph@filter/.style = {ytick distance=pi/4, yla-
65   bel={Phase (rad)}}}%
66   \pgfplotsset{ph@x@filter/.style = {xlabel={Phase (rad)}}}%
67 \else
68   \pgfplotsset{ph@filter/.style = {y filter/.expression={y*180/pi}, yt-
69   ick distance=45, ylabel={Phase (deg)}}}%
70   \pgfplotsset{ph@x@filter/.style = {x filter/.expression={x*180/pi}, xla-
71   bel={Phase (deg)}}}%
72 \fi

```

## 4.2 Parametric function generators for poles, zeros, gains, and delays.

**\MagK** True, linear, and asymptotic magnitude and phase parametric functions for a pure gain  
**\MagKAsymp**  $G(s) = k + 0i$ . The macros take two arguments corresponding to real and imaginary  
**\MagKLIn** part of the gain to facilitate code reuse between delays, gains, poles, and zeros, but only  
**\PhK** real gains are supported. The second argument, if supplied, is ignored.

```

70 \newcommand*{\MagK}[2]{(20*log10(abs(#1)))}
71 \newcommand*{\MagKAsymp}{\MagK}
72 \newcommand*{\MagKLIn}{\MagK}
73 \newcommand*{\PhK}[2]{(#1<0?-pi:0)}
74 \newcommand*{\PhKAsymp}{\PhK}
75 \newcommand*{\PhKLIn}{\PhK}

```

**\PhKAsymp** True magnitude and phase parametric functions for a pure delay  $G(s) = e^{-Ts}$ . The  
**\PhKLIn** macros take two arguments corresponding to real and imaginary part of the gain to  
facilitate code reuse between delays, gains, poles, and zeros, but only real gains are  
supported. The second argument, if supplied, is ignored.

```

76 \newcommand*{\MagDel}[2]{0}
77 \newcommand*{\PhDel}[2]{-#1*t}

```

**\MagPole** These macros are the building blocks for most of the plotting functions provided by this  
**\MagPoleAsymp** package. We start with Parametric function for the true magnitude of a complex pole.

```

78 \newcommand*{\MagPole}[2]
79   {(-20*log10(sqrt(\n@pow{#1}{2} + \n@pow{t - (#2)}{2})))}
\PhPole Parametric function for linear approximation of the magnitude of a complex pole.
\PhPoleLin
80 \newcommand*{\MagPoleLin}[2]{(t < sqrt(\n@pow{#1}{2} + \n@pow{#2}{2})) ? 
81   -20*log10(sqrt(\n@pow{#1}{2} + \n@pow{#2}{2})) :

```

```

82    -20*log10(t)
83  )}
Parametric function for asymptotic approximation of the magnitude of a complex pole,
same as linear approximation.
84 \newcommand*{\MagPoleAsymp}{\MagPoleLin}
Parametric function for the true phase of a complex pole.
85 \newcommand*{\PhPole}[2]{(#1 > 0 ? (#2 > 0 ?
86   (\n@mod{-atan2((t - (#2)), -(#1))}{2*pi}) :
87   (-atan2((t - (#2)), -(#1)))) :
88   (-atan2((t - (#2)), -(#1))))]
Parametric function for linear approximation of the phase of a complex pole.
89 \newcommand*{\PhPoleLin}[2]{%
90   (abs(#1)+abs(#2) == 0 ? -pi/2 :
91   (t < (sqrt(\n@pow{#1}{2} + \n@pow{#2}{2}) /
92     (\n@pow{10}{sqrt(\n@pow{#1}{2}/(\n@pow{#1}{2} + \n@pow{#2}{2}))})) ?
93   (-atan2(-(#2), -(#1))) :
94   (t >= (sqrt(\n@pow{#1}{2} + \n@pow{#2}{2}) *
95     (\n@pow{10}{sqrt(\n@pow{#1}{2}/(\n@pow{#1}{2} + \n@pow{#2}{2}))})) ?
96   (#2>0?#1>0?3*pi/2:-pi/2):-pi/2) :
97   (-atan2(-(#2), -(#1)) + (log10(t/(sqrt(\n@pow{#1}{2} + \n@pow{#2}{2}) /
98     (\n@pow{10}{sqrt(\n@pow{#1}{2}/(\n@pow{#1}{2} +
99     \n@pow{#2}{2}))}))) * ((#2>0?#1>0?3*pi/2:-pi/2):-pi/2) + atan2(-
100  (#2), -(#1)))/
101  (log10(\n@pow{10}{sqrt((4*\n@pow{#1}{2})/
102  (\n@pow{#1}{2} + \n@pow{#2}{2}))})))
Parametric function for asymptotic approximation of the phase of a complex pole.
103 \newcommand*{\PhPoleAsymp}[2]{(t < (sqrt(\n@pow{#1}{2} + \n@pow{#2}{2})) ?
104   (-atan2(-(#2), -(#1))) :
105   (#2>0?#1>0?3*pi/2:-pi/2):-pi/2))}

```

\MagZero Plots of zeros are defined to be negative of plots of poles. The  $0-$  is necessary due to a \MagZeroAsymp bug in `gnuplot` (fixed in version 5.4, patchlevel 3).

\MagZeroLin 105 \newcommand\*{\MagZero}{0-\MagPole}

\PhZero 106 \newcommand\*{\MagZeroLin}{0-\MagPoleLin}

\PhZeroAsymp 107 \newcommand\*{\MagZeroAsymp}{0-\MagPoleAsymp}

\PhZeroLin 108 \newcommand\*{\PhZero}{0-\PhPole}

109 \newcommand\*{\PhZeroLin}{0-\PhPoleLin}

110 \newcommand\*{\PhZeroAsymp}{0-\PhPoleAsymp}

### 4.3 Second order systems.

Although second order systems can be dealt with using the macros defined so far, the following dedicated macros for second order systems involve less computation.

\MagCSPoles Consider the canonical second order transfer function  $G(s) = \frac{1}{s^2+2\zeta w_n s+w_n^2}$ . We start with true, linear, and asymptotic magnitude plots for this transfer function.

\MagCSPolesLin 111 \newcommand\*{\MagCSPoles}[2]{(-20\*log10(sqrt(\n@pow{\n@pow{#2}{2}})

\PhCSPoles 112 - \n@pow{t}{2}}{2} + \n@pow{2\*#1\*#2\*t}{2}))}}

\PhCSPolesAsymp 113 \newcommand\*{\MagCSPolesLin}[2]{(t < #2 ? -40\*log10(#2) : -

\PhCSPolesLin 40\*log10(t))}

\MagCSZeros 114 \newcommand\*{\MagCSPolesAsymp}{\MagCSPolesLin}

\MagCSZerosAsymp Then, we have true, linear, and asymptotic phase plots for the canonical second order transfer function.

\MagCSZerosLin 115 \newcommand\*{\PhCSPoles}[2]{(-atan2((2\*(#1)\*(#2)\*t), (\n@pow{#2}{2}

\PhCSZerosAsymp 116 - \n@pow{t}{2})))}

\PhCSZerosLin 117 \newcommand\*{\PhCSPolesLin}[2]{(t < (#2 / (\n@pow{10}{abs(#1)})) ?

118 0 :

119 (t >= (#2 \* (\n@pow{10}{abs(#1)})) ?

120 (#1>0 ? -pi : pi) :

```

121  (#1>0 ? (-pi*(log10(t*(\n@pow{10}{#1})/#2))/(2*#1)) :
122    (pi*(log10(t*(\n@pow{10}{abs(#1)})/#2))/(2*abs(#1))))}
123 \newcommand*{\PhCSPolesAsymp}[2]{#1>0?(t<#2?0:-pi):(t<#2?0:pi)}
Plots of the inverse function  $G(s) = s^2 + 2\zeta\omega_n s + \omega_n^2$  are defined to be negative of plots of poles. The  $\Theta$ - is necessary due to a bug in gnuplot (fixed in version 5.4, patchlevel 3).
124 \newcommand*{\MagCSZeros}{0-\MagCSPoles}
125 \newcommand*{\MagCSZerosLin}{0-\MagCSPolesLin}
126 \newcommand*{\MagCSZerosAsymp}{0-\MagCSPolesAsymp}
127 \newcommand*{\PhCSZeros}{0-\PhCSPoles}
128 \newcommand*{\PhCSZerosLin}{0-\PhCSPolesLin}
129 \newcommand*{\PhCSZerosAsymp}{0-\PhCSPolesAsymp}

```

**\MagCSPolesPeak** These macros are used to add a resonant peak to linear and asymptotic plots of canonical second order poles and zeros. Since the plots are parametric, a separate **\draw** command is needed to add a vertical arrow.

```

130 \newcommand*{\MagCSPolesPeak}[3][]%
131   \draw[#1,->] (axis cs:{#3},{-40*log10(#3)}) --
132   (axis cs:{#3},{-40*log10(#3)-20*log10(2*abs(#2)))})
133 }
134 \newcommand*{\MagCSZerosPeak}[3][]%
135   \draw[#1,->] (axis cs:{#3},{40*log10(#3)}) --
136   (axis cs:{#3},{40*log10(#3)+20*log10(2*abs(#2)))})
137 }

```

**\MagSOPoles** Consider a general second order transfer function  $G(s) = \frac{1}{s^2+as+b}$ . We start with true, **\MagSOPolesAsymp** linear, and asymptotic magnitude plots for this transfer function.

```

\MagSOPolesLin 138 \newcommand*{\MagSOPoles}[2]{%
\PhSOPoles 139   (-20*log10(sqrt(\n@pow{#2 - \n@pow{t}{2}}{2} + \n@pow{#1*t}{2})))}
\PhSOPolesAsymp 140 \newcommand*{\MagSOPolesLin}[2]{%
\PhSOPolesLin 141   (t < sqrt(abs(#2)) ? -20*log10(abs(#2)) : - 40*log10(t))}

\MagSOPoles 142 \newcommand*{\MagSOPolesAsymp}{\MagSOPolesLin}

```

**\MagSOPolesAsymp** Then, we have true, linear, and asymptotic phase plots for the general second order **\MagSOPolesLin** transfer function.

```

\PhSOPoles 143 \newcommand*{\PhSOPoles}[2]{(-atan2((#1)*t,((#2 - \n@pow{t}{2})))}
\PhSOPolesAsymp 144 \newcommand*{\PhSOPolesLin}[2]{#2>0 ?
\PhSOPolesLin 145   \PhCSPolesLin{#1/(2*sqrt(#2))}{(sqrt(#2))} :
146   (#1>0 ? -pi : pi))}
147 \newcommand*{\PhSOPolesAsymp}[2]{#2>0 ?
148   \PhCSPolesAsymp{#1/(2*sqrt(#2))}{(sqrt(#2))} :
149   (#1>0 ? -pi : pi))}

```

Plots of the inverse function  $G(s) = s^2 + as + b$  are defined to be negative of plots of poles. The  $\Theta$ - is necessary due to a bug in **gnuplot** (fixed in version 5.4, patchlevel 3).

```

150 \newcommand*{\MagSOPoles}{0-\MagSOPoles}
151 \newcommand*{\MagSOPolesLin}{0-\MagSOPolesLin}
152 \newcommand*{\MagSOPolesAsymp}{0-\MagSOPolesAsymp}
153 \newcommand*{\PhSOPoles}{0-\PhSOPoles}
154 \newcommand*{\PhSOPolesLin}{0-\PhSOPolesLin}
155 \newcommand*{\PhSOPolesAsymp}{0-\PhSOPolesAsymp}

```

**\MagSOPolesPeak** These macros are used to add a resonant peak to linear and asymptotic plots of general second order poles and zeros. Since the plots are parametric, a separate **\draw** command is needed to add a vertical arrow.

```

156 \newcommand*{\MagSOPolesPeak}[3][]%
157   \draw[#1,->] (axis cs:{sqrt(abs(#3))},{-20*log10(abs(#3)))}) --
158   (axis cs:{sqrt(abs(#3))},{-20*log10(abs(#3)) -
159   20*log10(abs(#2/sqrt(abs(#3))))});}
160 }
161 \newcommand*{\MagSOPolesPeak}[3][]%
162   \draw[#1,->] (axis cs:{sqrt(abs(#3))},{20*log10(abs(#3)))}) --

```

```

163   (axis cs:{sqrt(abs(#3))},{20*log10(abs(#3))} +
164    20*log10(abs(#2/sqrt(abs(#3))))));
165 }

```

## 4.4 Commands for Bode plots

### 4.4.1 User macros

**\BodeZPK** This macro takes lists of complex poles and zeros of the form `{re,im}`, and values of gain and delay as inputs and constructs parametric functions for the Bode magnitude and phase plots. This is done by adding together the parametric functions generated by the macros for individual zeros, poles, gain, and delay, described above. The parametric functions are then plotted in a `tikzpicture` environment using the `\addplot` macro. Unless the package is loaded with the option `pgf`, the parametric functions are evaluated using `gnuplot`.

```
166 \newcommand{\BodeZPK}[4][approx=true]{%
```

Most of the work is done by the `\parse@opt` and the `\build@ZPK@plot` macros, described in the ‘Internal macros’ section. The former is used to parse the optional arguments and the latter to extract poles, zeros, gain, and delay from the first mandatory argument and to generate macros `\func@mag` and `\func@ph` that hold the magnitude and phase parametric functions.

```

167  \parse@opt{#1}%
168  \gdef\func@mag{}%
169  \gdef\func@ph{}%
170  \build@ZPK@plot{\func@mag}{\func@ph}{\opt@approx}{#2}%

```

The `\noexpand` macros below are needed to so that only the macro `\opt@group` is expanded.

```

171  \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unex-
172   panded\expandafter{\opt@tikz}]%
173   \noexpand\begin{groupplot}[%
174     bode@style,
175     xmin={#3},
176     xmax={#4},
177     domain=#3:#4,
178     height=2.5cm,
179     xmode=log,
180     group style = {group size = 1 by 2,vertical sep=0.25cm},
181     \opt@group
182   ]%
183 }%
184 \temp@cmd

```

To ensure frequency tick marks on magnitude and the phase plots are always aligned, we use the `groupplot` library. The `\expandafter` chain below is used to expand macros in the plot and group optional arguments.

```

184  \edef\temp@mag@cmd{\noexpand\nextgroupplot[ytick dis-
185   tance=20, ylabel={Gain (dB)}, xmajorticks=false, \optmag@axes]
186  \noexpand\addplot[variable=t, thick, \optmag@plot]}
187  \edef\temp@ph@cmd{\noexpand\nextgroupplot[ph@filter, xla-
188   bel={Frequency (rad/s)}, \optph@axes]
189  \noexpand\addplot[variable=t, thick, \optph@plot]}

```

In `gnuplot` mode, we increment the `gnuplot@id` counter before every plot to make sure that new and reusable `.gnuplot` and `.table` files are generated for every plot.

```

188  \if@pgfarg\else
189  \edef\temp@mag@cmd{\noexpand\stepcounter{gnuplot@id} \unex-
190   panded\expandafter{\temp@mag@cmd} gnuplot[gnuplot@prefix]}
191  \edef\temp@ph@cmd{\noexpand\stepcounter{gnuplot@id} \unex-
192   panded\expandafter{\temp@ph@cmd} gnuplot[gnuplot@prefix]}
193  \fi
194  \temp@mag@cmd {\func@mag};
195  \optmag@commands

```

```

194      \temp@ph@cmd {\func@ph};
195      \optph@commands
196      \end{groupplot}
197 \end{tikzpicture}
198 }

```

**\BodeTF** Implementation of this macro is very similar to the **\BodeZPK** macro above. The only difference is the lack of linear and asymptotic plots and slightly different parsing of the mandatory arguments.

```

199 \newcommand{\BodeTF}[4][]{%
200   \parse@opt{#1}%
201   \gdef\func@mag{}%
202   \gdef\func@ph{}%
203   \build@TF@plot{\func@mag}{\func@ph}{#2}%
204   \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unexpanded\expandafter{\opt@tikz}]%

231   \fi
232   \optph@commands
233   \end{groupplot}
234 \end{tikzpicture}
235 }

```

**\addBodeZPKPlots** This macro is designed to issues multiple **\addplot** macros for the same set of poles, zeros, gain, and delay. All of the work is done by the **\build@ZPK@plot** macro.

```

236 \newcommand{\addBodeZPKPlots}[3][true/{}]{%
237   \foreach \approx/\opt in {#1} {%
238     \gdef\plot@macro{}%
239     \gdef\temp@macro{}%
240     \ifnum\pdfstrcmp{#2}{phase}=0
241       \build@ZPK@plot{\temp@macro}{\plot@macro}{\approx}{#3}%
242     \else
243       \build@ZPK@plot{\plot@macro}{\temp@macro}{\approx}{#3}%
244     \fi

```

```

245      \if@pgfarg
246          \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\opt]{%
247              \temp@cmd {\plot@macro};}
248      \else
249          \stepcounter{gnuplot@id}%
250          \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\opt]{%
251              \temp@cmd gnuplot[gnuplot@prefix] {\plot@macro};}
252      \fi
253  }%
254 }

```

**\addBodeTFPlot** This macro is designed to issues a single `\addplot` macros for the set of coefficients and delay. All of the work is done by the `\build@TF@plot` macro.

```

255 \newcommand{\addBodeTFPlot}[3][thick]{%
256   \gdef\plot@macro{}%
257   \gdef\temp@macro{}%
258   \ifnum\pdfstrcmp{\#2}{phase}=0
259     \build@TF@plot{\temp@macro}{\plot@macro}{\#3}%
260   \else
261     \build@TF@plot{\plot@macro}{\temp@macro}{\#3}%
262   \fi
263   \if@pgfarg
264     \ifnum\pdfstrcmp{\#2}{phase}=0

291           ph@filter,
292           bode@style,
293           xmin=\#2,
294           xmax=\#3,
295           domain=\#2:\#3,

```

```

295      height=2.5cm,
296      xlabel={Frequency (rad/s)},
297      \unexpanded\expandafter{\opt@axes}
298    ]%
299  }
300 \temp@cmd
301 }{
302   \end{semilogxaxis}
303 \end{tikzpicture}
304 }

```

**BodeMagPlot** (*env.*) An environment to host magnitude plot macros that pass parametric functions to `\addplot` macros. Uses the defaults specified in `bode@style` to create a shortcut that includes the `tikzpicture` and `semilogaxis` environments.

```

305 \newenvironment{BodeMagPlot}[3][]{%
306   \parse@env{\opt{\#1}}%
307   \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unex-
308     panded\expandafter{\opt{tikz}}]
309       \noexpand\begin{semilogxaxis}[%
310         bode@style,
311         xmin=\#2,
312         xmax=\#3,
313         domain=\#2:\#3,
314         height=2.5cm,
315         xlabel={Frequency (rad/s)},
316         ylabel={Gain (dB)},
317         ytick distance=40,
318         \unexpanded\expandafter{\opt@axes}
319       ]%
320     }
321   \temp@cmd
322 }{
323   \end{semilogxaxis}
324 \end{tikzpicture}
325 }

```

**BodePlot** (*env.*) Same as `BodeMagPlot`. The `BodePlot` environment is deprecated as of v1.1.0, please use the `BodePhPlot` and `BodeMagPlot` environments instead.

```

326 \PackageWarning{bodeplot}{Since v1.1.0, the BodePlot environment re-
327 turns phase plots in radian units only. Please use the BodePhPlot envi-
328 ronment if degree units are needed.}%
329 \parse@env{\opt{\#1}}%
330 \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unex-
331     panded\expandafter{\opt{tikz}}]
332       \noexpand\begin{semilogxaxis}[%
333         bode@style,
334         xmin=\#2,
335         xmax=\#3,
336         domain=\#2:\#3,
337         height=2.5cm,
338         xlabel={Frequency (rad/s)},

343 }{
344   \end{semilogxaxis}
345 \end{tikzpicture}
346 }

```

#### 4.4.2 Internal macros

**\add@feature** This is an internal macro to add a basic component (pole, zero, gain, or delay), described using one of the macros in Section 3.1.1 (input #2), to a parametric function stored in a global macro (input #1). The basic component value (input #3) is a complex number of the form {re,im}. If the imaginary part is missing, it is assumed to be zero. Implementation made possible by [this StackExchange answer](#).

```

344 \newcommand*{\add@feature}[3]{%
345   \ifcat$ \detokenize\expandafter{#1}$%
346     \xdef#1{\unexpanded\expandafter{#1 0+#2}}%
347   \else
348     \xdef#1{\unexpanded\expandafter{#1+#2}}%
349   \fi
350   \foreach \y [count=\n] in #3 {%
351     \xdef#1{\unexpanded\expandafter{#1}{\y}}%
352     \xdef\Last@LoopValue{\n}%
353   }%
354   \ifnum\Last@LoopValue=1%
355     \xdef#1{\unexpanded\expandafter{#1}{0}}%
356   \fi
357 }
```

**\build@ZPK@plot** This is an internal macro to build parametric Bode magnitude and phase plots by concatenating basic component (pole, zero, gain, or delay) macros (Section 3.1.1) to global magnitude and phase macros (inputs #1 and #2). The **\add@feature** macro is used to do the concatenation. The basic component macros are inferred from a **feature/{values}** list, where **feature** is one of z,p,k, and d, for zeros, poles, gain, and delay, respectively, and **{values}** is a comma separated list of comma separated lists (complex numbers of the form {re,im}). If the imaginary part is missing, it is assumed to be zero.

```

358 \newcommand{\build@ZPK@plot}[4]{%
359   \foreach \feature/\values in {#4} {%
360     \ifnum\pdfstrcmp{\feature}{z}=0

```

**\parse@opt** Parses options supplied to the main Bode macros. A **for** loop over tuples of the form **\obj/\typ/\opt** with a long list of nested if-else statements does the job. If the input **\obj** is **plot**, **axes**, **group**, **approx**, or **tikz** the corresponding **\opt** are passed, unexpanded, to the **\addplot** macro, the **\nextgroupplot** macro, the **groupplot** environment, the **\build@ZPK@plot** macro, and the **tikzpicture** environment, respectively. If **\obj** is **commands**, the corresponding **\opt** are stored, unexpanded, in the macros **\optph@commands** and **\optmag@commands**, to be executed in appropriate **axis** environments.

```

## 4.5 Nyquist plots

### 4.5.1 User macros

**\NyquistZPK** Converts magnitude and phase parametric functions built using `\build@ZPK@plot` into real part and imaginary part parametric functions. A plot of these is the Nyquist plot. The parametric functions are then plotted in a `tikzpicture` environment using the `\addplot` macro. Unless the package is loaded with the option `pgf`, the parametric functions are evaluated using `gnuplot`. A large number of samples is typically needed to get a smooth plot because frequencies near 0 result in plot points that are very close to each other. Linear frequency sampling is unnecessarily fine near zero and very coarse for large  $\omega$ . Logarithmic sampling makes it worse, perhaps inverse logarithmic sampling will help, pull requests to fix that are welcome!

```

558 \newcommand{\NyquistZPK}[4][]{%
559   \parse@N@opt{\#1}%
560   \gdef\func@mag{}%
561   \gdef\func@ph{}%
562   \build@ZPK@plot{\func@mag}{\func@ph}{}{\#2}%
563   \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unex-
      panded\expandafter{\opt@tikz}]%
564     \noexpand\begin{axis}[% 
565       bode@style,
566       domain=#3:#4,
567       height=5cm,
568       xlabel={$\text{Re}$},
569       ylabel={$\text{Im}$},
570       samples=500,
571       \unexpanded\expandafter{\opt@axes}
572     ]%
573   }%
574   \temp@cmd
575     \addplot [only marks,mark=+,thick,red] (-1 , 0);
576     \edef\temp@cmd{\noexpand\addplot[variable=t, thick, \unex-
      panded\expandafter{\opt@plot}]}%
577     \if@pgfarg
578       \temp@cmd ( {\n@pow{10}{((\func@mag)/20)}*\cos(\func@ph)},%
579                   {\n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)} );
580     \opt@commands
581   \else
582     \stepcounter{gnuplot@id}%
583     \temp@cmd gnuplot[parametric,gnuplot@prefix] {%
584       \n@pow{10}{((\func@mag)/20)}*\cos(\func@ph),
585       \n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)};
586     \opt@commands
587   \fi
588   \end{axis}
589 \end{tikzpicture}
590 }

```

**\NyquistTF** Implementation of this macro is very similar to the `\NyquistZPK` macro above. The only difference is a slightly different parsing of the mandatory arguments via `\build@TF@plot`.

```

591 \newcommand{\NyquistTF}[4][]{%
592   \parse@N@opt{#1}%
593   \gdef\func@mag{}%
594   \gdef\func@ph{}%

601       xlabel={$\text{Re}$},  

602       ylabel={$\text{Im}$},  

603       samples=500,  

604       \unexpanded\expandafter{\opt@axes}%
605     ]%
606   }%
607   \temp@cmd
608     \addplot [only marks,mark=+,thick,red] (-1 , 0);
609     \edef\temp@cmd{\noexpand\addplot[variable=t, thick, \unexpanded\expandafter{\opt@plot}]}%
610     \if@pgfarg
611       \temp@cmd ( {\n@pow{10}{((\func@mag)/20)}*\cos(\func@ph)},  

612                   {\n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)} );
613     \opt@commands
614   \else
615     \stepcounter{gnuplot@id}%
616     \temp@cmd gnuplot[parametric,gnuplot@prefix]{%
617       \n@pow{10}{((\func@mag)/20)}*\cos(\func@ph),  

618       \n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)};
619     \opt@commands
620   \fi
621   \end{axis}
622 \end{tikzpicture}
623 }

```

**\addNyquistZPKPlot** Adds Nyquist plot of a transfer function in ZPK form. This macro is designed to pass two parametric function to an `\addplot` macro. The parametric functions for phase (`\func@ph`) and magnitude (`\func@mag`) are built using the `\build@ZPK@plot` macro, converted to real and imaginary parts and passed to `\addplot` commands.

```

624 \newcommand{\addNyquistZPKPlot}[2][]{%
625   \gdef\func@mag{}%
626   \gdef\func@ph{}%
627   \build@ZPK@plot{\func@mag}{\func@ph}{#2}%
628   \if@pgfarg
629     \addplot[variable=t,#1] ( {\n@pow{10}{((\func@mag)/20)}*\cos(\func@ph)},  

630                   {\n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)} );
631   \else
632     \stepcounter{gnuplot@id}%
633     \addplot[variable=t,#1] gnuplot[parametric,gnuplot@prefix]{%
634       \n@pow{10}{((\func@mag)/20)}*\cos(\func@ph),  

635       \n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)};
636   \fi
637 }

```

**\addNyquistTFPlot** Adds Nyquist plot of a transfer function in TF form. This macro is designed to pass two parametric function to an `\addplot` macro. The parametric functions for phase (`\func@ph`) and magnitude (`\func@mag`) are built using the `\build@TF@plot` macro, converted to real and imaginary parts and passed to `\addplot` commands.

```

638 \newcommand{\addNyquistTFPlot}[2][]{%
639   \gdef\func@mag{}%
640   \gdef\func@ph{}%
641   \build@TF@plot{\func@mag}{\func@ph}{#2}%

```

```

642 \if@pgfarg
643   \addplot[variable=t,#1] ( {\n@pow{10}{((\func@mag)/20)}*\cos(\func@ph)},%
644   {\n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)} );
645 \else
646   \stepcounter{gnuplot@id}%
647   \addplot[variable=t,#1] gnuplot[parametric,gnuplot@prefix]{%
648     \n@pow{10}{((\func@mag)/20)}*\cos(\func@ph),
649     \n@pow{10}{((\func@mag)/20)}*\sin(\func@ph)};
650 \fi
651 }

```

**NyquistPlot** An environment to host `\addNyquist...` macros that pass parametric functions to `\addplot`. Uses the defaults specified in `bode@style` to create a shortcut that includes the `tikzpicture` and `axis` environments.

```

652 \newenvironment{NyquistPlot}[3][]{%
653   \parse@env@opt{#1}%
654   \edef\temp@cmd{\noexpand\begin{tikzpicture} [\unexpanded\expandafter{\opt@tikz}]%
655     \noexpand\begin{axis}[%  

656       bode@style,  

657       height=5cm,  

658       domain=#2:#3,  

659       xlabel={$\text{Re}$},  

660       ylabel={$\text{Im}$},  

661       \unexpanded\expandafter{\opt@axes}%
662     ]%
663   }%
664   \temp@cmd
665   \addplot [only marks,mark=+,thick,red] (-1 , 0);
666 }{%
667   \end{axis}
668   \end{tikzpicture}
669 }

```

#### 4.5.2 Internal commands

**\parse@N@opt** Parses options supplied to the main Nyquist and Nichols macros. A `for` loop over tuples of the form `\obj/\opt`, processed using nested if-else statements does the job. If the input `\obj` is `plot`, `axes`, or `tikz` then the corresponding `\opt` are passed, unexpanded, to the `\addplot` macro, the `axis` environment, and the `tikzpicture` environment, respectively.

```

670 \newcommand{\parse@N@opt}[1]{%
671   \gdef\opt@axes{}%
672   \gdef\opt@plot{}%
673   \gdef\opt@commands{}%
674   \gdef\opt@tikz{}%
675   \foreach \obj/\opt in {#1} {%
676     \ifnum\pdfstrcmp{\unexpanded\expandafter{\obj}}{axes}=0

## Change History

v1.0		\parse@env@opt:	Added tikz option to environments . . . . .	29			
	General: Initial release . . . . .						
v1.0.1		\parse@N@opt:	Added commands and tikz options . . . . .	32			
	\addBodeZPKPlots:	Improved optional argument handling. . . . .	23	\parse@opt:	Added Tikz option . . . . .	28	
	\BodeZPK:	Pass arbitrary TikZ commands as options. . . . .	22	NyquistPlot:	Added tikz option to environments . . . . .	31	
v1.0.2							
	gnuplot@prefix:	Fixed issue #1 . . . . .	18	v1.0.4	General: Fixed unintended optional argument macro expansion . . . . .	1	
v1.0.3							
	\BodePlot:	Added tikz option to environments . . . . .	25	v1.0.5	\parse@opt:	Fixed a bug . . . . .	28
	\BodeTF:	Added Tikz option . . . . .	22	v1.0.6	General: Fixed issue #3 . . . . .	1	
	\BodeZPK:	Added Tikz option . . . . .	22	v1.0.7	General: Removed unnecessary semicolons . . . . .	1	
	\NicholsChart:	Added tikz option to environments . . . . .	32		Updated documentation . . . . .	1	
	\NicholsTF:	Added commands and tikz options . . . . .	32	v1.0.8	General: Added a new class option ‘declutter’ . . . . .	1	
	\NicholsZPK:	Added commands and tikz options . . . . .	32		\build@TF@plot:	Included phase due to delay in wrapping. . . . .	27
	\gnuplot@prefix:	Added jobname to gnuplot prefix . . . . .	18		gnuplot@prefix:	Fixed issue #6 . . . . .	18
	\NyquistTF:	Added commands and tikz options . . . . .	30	v1.1.0	General: Fixed phase wrapping in		
	\NyquistZPK:	Added commands and tikz options . . . . .	29				

gnuplot mode . . . . .	1	environments for phase and magnitude plots . . . . .	24
<b>\addBodeTFPlot:</b> Fixed phase wrapping in gnuplot mode . . . . .	23	<b>BodePlot:</b> Deprecated BodePlot environment . . . . .	25
<b>BodeMagPlot:</b> Added separate environments for phase and magnitude plots . . . . .	24	<b>\BodeTF:</b> Fixed phase wrapping in gnuplot mode . . . . .	22
<b>BodePhPlot:</b> Added separate
