## 1 LaTeX System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file texsys.cfg. Thus for operating systems for which the tests here do not result in acceptable settings, a 'hand written' texsys.cfg may be produced.

The macros that must be defined are:

\@currdir

 $\colongraph{\col$ 

\input@path

If the primitive **\openin** searches the same directories as the primitive **\input**, then it is possible to tell (using **\inferf**) whether a file exists before trying to input it. For systems like this, **\input@path** should be left undefined.

If \openin does not 'follow' \input then \input@path must be defined to be a list of directories to search for input files. The format for each directory is as for \@currdir, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if  $\langle dir \rangle$  is an entry in the input path, TEX will try to load the expansion of  $\langle dir \rangle \langle filename \rangle \langle space \rangle$ 

So either  $\langle dir \rangle$  should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the  $\langle filename \rangle$ . This means that for UNIX-like syntax, each  $\langle dir \rangle$  should end with a slash, /.

\input@path should expand to a list of such directories, each in a {} group.

\filename@parse

After a call of the form: \filename@parse{\( filename \)}, the three macros \filename@area,\filename should be defined to be the 'area' (or directory), basename and extension respectively. If there was no extension specified in \( filename \), \filename@ext should be \let to \relax (so this case may be tested with \@ifundefined{filename@ext} and, perhaps a default extension substituted).

Normally one would not need to define this macro in texsys.cfg as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a 'hand produced' parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TEX versions. Currently if the UNIX, VMS or Macintosh parser is not used, \filename@parse is defined to always return an empty area, and to split the argument into basename and extension at the first '.' that occurs in the name. Parsers for other formats may be defined in texsys.cfg, in which case they will be used in preference to the default definitions.

\@TeXversion

\@TeXversion is now set automatically by the initialisation tests in this file. You should not need to set it in texsys.cfg, however the following documentation is left for information. LATeX does not set this variable exactly, the automatic tests set it to:

2 for any version, v, v < 3.0

3 for any version, v,  $3.0 \le v \le 3.14$ 

File a: ltdirchk.dtx

1

 $\langle undefined \rangle$  otherwise.

However these values are accurate enough for LATEX to take appropriate action for these old TEXs.

If your TeX is older than version 3.141, then you should define \@TeXversion (using \def) to be the version number. If you do not do this 1, LATeX will not work around a bug in old TeX versions, and so error messages will appear in a very strange format, with ^^J appearing instead of line breaks:

```
LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX=Companion for explanation.^^JType H <return> for immediate help.
...
.3 \renewcommand{\rubbish}
```

However if you put \def\@TeXversion{3.14} in texsys.cfg the following format will be used:

```
LaTeX Error: \rubbish undefined.

ee the LaTeX manual or LaTeX Companion for explanation.

ype H <return> for immediate help.

...
...
.3 \renewcommand{\rubbish}
```

Note that this has an extra line ! . which does not appear in error messages that use the default settings with a current version of  $T_EX$ , but this should not cause any confusion we hope.

#### 2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

#### 2.1 INITEX

```
1 (*dircheck)
2 (*initex)
3 (initex)\ifnum\catcode'\{=1
4 (initex) \errmessage
5 (initex) {LaTeX must be made using an initex with no format preloaded}
6 (initex)\fi
7 \catcode'\{=1
```

<sup>&</sup>lt;sup>1</sup>Actually if your T<sub>E</sub>X is really old, version 2, LAT<sub>E</sub>X can detect this, and sets \@TeXversion to 2 if it is not set in the cfg file.

```
8 \catcode'\}=2
```

If LuaT<sub>E</sub>X is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of LuaT<sub>E</sub>X do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```
9 \ifx\directlua\undefined
10 \else
11 \ifx\luatexversion\undefined
Enable e-TeX/pdfTeX/Umath primitives with their natural names
12 \directlua{tex.enableprimitives("",%
13 tex.extraprimitives('etex', 'pdftex', 'umath'))}
```

In current formats enable primitives with unprefixed names. the latexrelease guards allow the primitives to be defined with a \luatex prefix if older formats are specified.

```

## 3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file texsys.cfg. If texsys.cfg can not be located by \openin, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if texsys.cfg exists. If it does not, all the text in this file between START and END is copied verbatim to a new file texsys.cfg. If texsys.cfg is found, then it is simply input. This is only done when this file is being used unstripped.

```
113 (*docstrip)
114 \openin15=texsys.cfg
115 \ifeof15
116 \typeout{** Writing a default texsys.cfg}

127 \catcode '\%=12
128 \def\reserved@c{%END}
129 \reserved@d
START
```

#### 3.1 texsys.cfg

This file contains the site specific definitions of the four macros \@currdir, \input@path, \filename@parse and \@TeXversion.

As distributed it only contains comments, however this 'empty' file will work on many systems because of the automatic tests built into ltdirchk.dtx. You are allowed to edit this file to add definitions of these macros appropriate to your system.

File a: ltdirchk.dtx

The macros that must be defined are:

\@currdir

 $\colongraph{\col$ 

\input@path

If the primitive \openin searches the same directories as the primitive \input, then it is possible to tell (using \ifeof) whether a file exists before trying to input it. For systems like this, \input@path should be left undefined.

If  $\operatorname{does}$  not 'follow'  $\operatorname{input}$  then  $\operatorname{input}$  must be defined to be a list of directories to search for input files. The format for each directory is as for  $\operatorname{Qcurrdir}$ , normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if  $\operatorname{dir}$  is an entry in the input path,  $\operatorname{TeX}$  will try to load the expansion of

 $\langle dir \rangle \langle filename \rangle \langle space \rangle$ 

So either  $\langle dir \rangle$  should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the  $\langle filename \rangle$ . This means that for UNIX-like syntax, each  $\langle dir \rangle$  should end with a slash, /. One exception to this rule is that the input path should always contain the empty directory {} as this will allow 'full pathnames' to be used, and the 'current directory' to be searched.

\input@path should expand to a list of such directories, each in a {} group.

\filename@parse

After a call of the form: \filename@parse{\( filename \)}, the three macros \filename@area,\filename should be defined to be the 'area' (or directory), basename and extension respectively. If there was no extension specified in \( filename \), \filename@ext should be \let to \relax (so this case may be tested with \@ifundefined{filename@ext} and, perhaps a default extension substituted).

Normally one would not need to define this macro in texsys.cfg as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that willcover many other cases. However some operating systems may need a 'hand produced' parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TEX versions. Currently if the UNIX or VMS parser is not used, \filename@parse is defined to always return an empty area, and to split the argument into basename and extension at the first '.' that occurs in the name. Parsers for other formats may be defined in texsys.cfg, in which case they will be used in preference to the default definitions.

\@TeXversion

You should not need to set this macro in texsys.cfg. LATEX tests to set this automatically. See the comments in the opening section of ltdirchk.dtx.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

#### 3.2 UNIX (web2c)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

- 130 %\def\@currdir{./}
- 131 %\let\input@path\@undefined

File a: ltdirchk.dtx

#### 3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with /.

```
132 % \def\@currdir{./}
133 % \def\input@path{%
134 % {/usr/local/lib/tex/inputs/distrib/}%
135 % {/usr/local/lib/tex/inputs/contrib/}%
136 % {/usr/local/lib/tex/inputs/local/}%
137 % }
```

#### 3.4 MSDOS (emtex)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\@currdir{./}
139 % \let\input@path\@undefined
```

#### 3.5 MSDOS (other)

Some PC implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with /. This assumes the implementation uses UNIX style / as the directory separator.

```
140 % \def\@currdir{./}
141 % \def\input@path{%
142 % {c:/tex/inputs/distrib/}%
143 % {c:/tex/inputs/contrib/}%
144 % {c:/tex/inputs/local/}%
145 % }
```

#### 3.6 VMS (DECUS T<sub>E</sub>X, PD VMS 3.6)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\@currdir{[]}
147 % \let\input@path\@undefined
```

#### 3.7 VMS (???)

Some VMS implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following:

```
148 % \def\@currdir{[]}
149 % \def\input@path{%
150 % {tex_inputs:}%
151 % {SOMEDISK:[SOME.TEX.DIRECTORY]}%
152 % }
```

#### 3.8 MACINTOSH (OzTeX 1.6)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\@currdir{:}
154 % \let\input@path\@undefined
```

### 3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with:, and they should contain *no* spaces.

```
155 % \def\@currdir{:}
156 % \def\input@path{%
157 % {Hard-Disk:Applications:TeX:TeX-inputs:}%
158 % {Hard-Disk:Applications:TeX:My-inputs:}%
159 % }
```

#### 3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form <area>name For maximum compatibility with macro sets, you want name.ext to be mapped to <ext>name. and <area>name.ext to be mapped to <area.ext>name. \input does this mapping automatically, but \openin does not, and does not look in the same places as \input. <>name is the desired 'current directory' syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%
                                                       \@d@r{#1}#2..\@nil}
    162 % \def\@d@r#1#2.#3.#4\@nil{%
                                                       < ifx\dir = 1 \cdot ifx\dir = 1 
   163 %
   164 %
   165 % \def\@currdir{\@dir{}}
  166 % \def\input@path{%
                                                         {\@dir{area.one}}%
                                                         {\@dir{area.two}}%
   169 % }
END
  170 \immediate\closeout15
If texsys.cfg did exist, then input it.
   172 \typeout{** Using the existing texsys.cfg}
  173 \closein15
  174 \input texsys.cfg
  175 \fi
```

If the stripped version of this file is being used (in latex2e.ltx) then texsys.cfg should be there, so just input it.

```
177 (dircheck)\input texsys.cfg
```

## 4 Setting \@currdir

\@currdir \IfFileExists

\today

186

This is a local definition of \IffileExists. It tries to relocate texsxys.aux. If it succeeds, then the \@currdir syntax has been determined. If all the tests fail then \@currdir will be set to \@empty, and ltxcheck will warn of this when it checks the format.

```
178 \begingroup
179 \count@\time
180 \divide\count@ 60
181 \count2=-\count@
182 \multiply\count2 60
183 \advance\count2 \time

The current date and time stamp.
184 \edef\today{%
185 \the\year/\two@digits{\the\month}/\two@digits{\the\day}:%
```

\two@digits{\the\count@}:\two@digits{\the\count2}}

Create a file texsys.aux (hopefully in the current directory), then try to locate it again.

```
187 \immediate\openout15=texsys.aux
188 \immediate\write15{\today^^J}
189 \immediate\closeout15 %
```

#1 is the file to try, #2 is what to do on success, #3 on failure. Note that this definition is overwritten later on again!

```
\def\IfFileExists#1#2#3{%
     \openin\@inputcheck#1 %
191
     \ifeof\@inputcheck
192
        #3\relax
193
     \else
       \read\@inputcheck to \reserved@a
       \ifx\reserved@a\today
197
         \typeout{#1 found}#2\relax
198
         \typeout{BAD: old file \reserved@a (should be \today)}%
199
         #3\relax
200
       \fi
201
202
     \closein\@inputcheck}
  \endlinechar=-1
```

If \@currdir has not been pre-defined in texsys.cfg then test for UNIX, VMS and Oz-TFX-Mac. syntax.

```
\ifx\@currdir\@undefined

\IfFileExists{./texsys.aux}{\gdef\@currdir{./}}%

\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%

\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}{}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces

a format with no user-interaction. Later if the format is not suitable for the system, texsys.cfg may be edited and the format re-made.

```
\ifx\@currdir\@undefined

look let\@currdir\@empty

typeout{^^J^^J%

!! No syntax for the current directory could be found^^J%
}%

fi
```

Otherwise \@currdir was defined in texsys.cfg. In this case check that the syntax specified works on this system. (In case a complete IATEX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending texsys.cfg and try again.

```
\else
     \IfFileExists{\@currdir texsys.aux}{}{%
       \edef\reserved@a{\errhelp{%
217
         texsys.cfg specifies the current directory syntax to be^^J\%
218
219
          \meaning\@currdir^^J%
220
         but this does not work on this system.^^J%
         Remove texsys.cfg and restart.}}\reserved@a
221
       \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@@end}

             \noexpand\@currdir set to:
               \expandafter\strip@prefix\meaning\@currdir.^^J%
228
229
(End definition for \Ccurrdir, \IffileExists, and \today. These functions are documented on page
??.)
    Stop here if the file is being used unstripped.
230 (*docstrip)
  \relax\endinput
232 (/docstrip)
```

## 5 Setting \input@path

Earlier versions of this file attempted to automatically test whether \input@path was required, and interactively prompt for a path if necessary. This was not found to be very reliable The first-time installer of LATEX  $2_{\varepsilon}$  can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document ltxcheck.tex through LATEX  $2_{\varepsilon}$ . This will check, amongst other things, whether texsys.cfg will need to be edited and the format remade.

\input@path Now set up the \input@path.

\input@path should either be undefined, or a list of directories as described in the introduction.

```
\typeout{^^J%
       Assuming \noexpand\openin and \noexpand\input^^J%
       \ifx\input@path\@undefined
\input@path has not been pre-defined.
         have the same search path. ^^J%
237
\input@path has been defined in texsys.cfg.
         have different search paths.^^J%

## 7 T<sub>F</sub>X Versions

\@TeXversion

TEX versions older than 3.141 require \@TeXversion to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg TEX3.14 would be detected as TEX3, but IATEX only needs to take account of TEX's older than 3, or between 3 and 3.14.

```

#### 8 ltxcheck.tex

After the format has been made, and article.cls moved with the other files to the 'standard input directory' as specified in install.txt, the format may be checked by running the file ltxcheck.tex.

#### File b

# ltplain.dtx

## 1 Plain T<sub>E</sub>X

IATEX includes almost all of the functionality of Knuth's original 'Basic Macros' That is, the plain TeX format described in Appendix B of the TeXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep \magstephalf
\mathhexbox
\vglue \vgl@
\hglue \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

 $\LaTeX$  font definitions are done using NFSS2 so none of PLAIN's font definitions are in  $\LaTeX$ .

LATEX has its own tabbing environment, so PLAIN's is disabled.

LATEX uses its own output routine, so most of the plain one was removed.

```
1 \( *2ekernel \)
2 \catcode'\{=1 % left brace is begin-group character
3 \catcode'\}=2 % right brace is end-group character
4 \catcode'\$=3 % dollar sign is math shift
5 \catcode'\&=4 % ampersand is alignment tab
6 \catcode'\#=6 % hash mark is macro parameter character
7 \catcode'\^=7 % circumflex and uparrow are for superscripts
8 \catcode'\_=8 % underline and downarrow are for subscripts
9 \catcode'\^=10 % ascii tab is a blank space
10 \chardef\active=13 \catcode'\~=\active % tilde is active
11 \catcode'\^^L=\active \def^^L{\par}% ascii form-feed is \par
12 \message{catcodes,}
```

We had to define the  $\c$  atcodes right away, before the message line, since  $\m$  uses the { and } characters. When INITEX (the  $\m$  X initializer) starts up, it has defined the following  $\c$  values:

```
\catcode'\^^@=9 % ascii null is ignored
\catcode'\\^=0 % ascii return is end-line
\catcode'\\=0 % backslash is TeX escape character
\catcode'\\%=14 % percent sign is comment character
\catcode'\\=10 % ascii space is blank space
\catcode'\\^?=15 % ascii delete is invalid
\catcode'\A=11 ... \catcode'\Z=11 % uppercase letters
\catcode'\a=11 ... \catcode'\z=11 % lowercase letters
all others are type 12 (other)
Here is a list of the characters that have been specially catcoded:
```

```
 $$ \left( \frac{do}{\do} \right)^{13}  \do^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\do}^{\d
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make Q signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

#### 15 \catcode'@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

\One Small constants are defined using \chardef.

\tw0 16 \chardef\@ne=1

 $\t 17 \chardef\t 0=2$ 

\sixt@@n 18 \chardef\thr@@=3

\@cclv 19 \chardef\sixt@@n=16
20 \chardef\@cclv=255

(End definition for \One and others. These functions are documented on page ??.)

\@cclvi Constants above 255 defined using \mathchardef.

\@m 21 \mathchardef\@cclvi=256

\@M 22 \mathchardef\@m=1000

\@MM 23 \mathchardef\@M=10000 24 \mathchardef\@MM=20000

(End definition for \@cclvi and others. These functions are documented on page ??.)

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

#### 25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

Historical ATEX 2.09 comments (not necessarily accurate any more):

The following counters are reserved:

- 0 to 9 page numbering
  - 10 count allocation
  - 11 dimen allocation
  - 12 skip allocation
  - 13 muskip allocation
  - 14 box allocation
  - 15 toks allocation
  - 16 read file allocation
  - 17 write file allocation
  - 18 math family allocation
  - 19 language allocation
  - 20 insert allocation
  - 21 the most recently allocated number

```
22 constant -1
                    End of historical LATEX 2.09 comments.
                        New counters are allocated starting with 23, 24, etc. Other registers are allocated
                    starting with 10. This leaves 0 through 9 for the user to play with safely, except that
                    counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed
                    during output). In this scheme, \count 10 always contains the number of the highest-
                    numbered counter that has been allocated, \count 14 the highest-numbered box, etc.
                    Inserts are given numbers 254, 253, etc., since they require a \count, \dimen, \skip,
                    and \box all with the same number; \count 20 contains the lowest-numbered insert that
                    has been allocated. Of course, \box255 is reserved for \output; \count255, \dimen255,
                    and \skip255 can be used freely.
                        It is recommended that macro designers always use \global assignments with re-
                    spect to registers numbered
                    1, 3, 5, 7, 9,
                    and always non-\global assignments with respect to registers
                    0, 2, 4, 6, 8, 255.
                    This will prevent "save stack buildup" that might otherwise occur.
                     26 \count10=22 % allocates \count registers 23, 24, ...
                     27 \count11=9 % allocates \dimen registers 10, 11, ...
                     28 \count12=9 % allocates \skip registers 10, 11, ...
                     29 \count13=9 % allocates \muskip registers 10, 11, ...
                     _{\text{30}} \count14=9 \% allocates \box registers 10, 11, ...
                     31 \count15=9 % allocates \toks registers 10, 11, ...
                     32 \count16=-1 % allocates input streams 0, 1, ...

```
Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and \foo
   \newcount
   \newdimen
             will be defined (with \countdef) to be the next counter.
                  To find out which counter \foo is, you can look at \allocationnumber.
   \newskip
                  Since there's no \boxdef command, \chardef is used to define a \newbox,
  \newmuskip
             \newinsert, \newfam, and so on.
    \newbox
                  ETFX change: remove \outer from \newcount and \newdimen (FMi) This is nec-
   \newtoks
   \newread
             essary to use \newcount inside \if... later on. Also remove from \newskip, \newbox
   \newwrite
             \newwrite and \newfam (DPC) to save later redefinition.
    \newfam

\alloc@ Since \e@alloc was added in 2015, \@alloc has not been used, but was left as some
         legacy code calls it. However the original definition gives spurious errors once the "classic"
         registers run out, so it is now defined to call \e@alloc internally.

     \sh@ft The definition of this macro in plain.tex was improved in about 1997; but as a result its
              usage was changed and its new definition is not appropriate for LATEX.
                  Since the version given here has been in use by IATEX for many years it does not
              seem prudent to remove it now. As far as we can tell it has only been used to define \b
              and \d but this cannot be certain.
              439 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
                   \kern-.0156\dimen@} % compensate for slant in lowered accents
              (End definition for \shOft. This function is documented on page ??.)
             This is the LATEX version of the second incarnation of the plain macro \sh@ft, which
\ltx@sh@ft
              takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount
              proportional to the product of its argument and the slant-per-point (fontdimen 1).
              441 \def\ltx@sh@ft #1{%
                   \dimen@ #1%

                  LATEX change: the text commands such as \d, \b, \c, \copyright, \TeX are now
              defined elsewhere.
                  LATEX change: Make \t work in a moving argument. Now defined elsewhere.
```

\hrulefill IATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them work \dotfill in 'tabular' and 'array' environments. (Change made 24 July 1987). IATEX change:

\leavevmode added at beginning of \dotfill and \hrulefill so that they work as

File b: ltplain.dtx Date: 2020/08/20 Version v2.3d

446 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z0}

expected in vertical mode.

```
\mkern 1.5mu .\mkern 1.5mu;
                 the width of .44em differs from this by .04pt which is probably an acceptable difference
                 within leaders.
                 447 \def\dotfill{%
                      \leavevmode
                      \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
                      \kern\z@}
                 (End definition for \hrulefill and \dotfill. These functions are documented on page ??.)
                     INITEX sets \sfcode x=1000 for all x, except that \sfcode'X=999 for uppercase
                 letters. The following changes are needed:
                 451 \sfcode'\)=0 \sfcode'\'=0 \sfcode'\]=0
                 The \nonfrenchspacing macro will make further changes to \sfcode values.
                     Definitions related to output
                     \magnification doesn't work in LATEX.

# ltvers.dtx

## 1 Version Identification

First we identify the date and version number of this release of LATEX, and set \everyjob so that it is printed at the start of every LATEX run.

\fmtname \fmtversion \latexreleaseversion \patch@level A \patch@level of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

If we put code updates into the kernel that are supposed to go into the next release we set the \patch@level to -1 and the \fmtversion / \latexreleaseversion to the dated of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

If the \patch@level is already at -1 we do nothing here and use the \fmtversion date for any new\IncludeInRelease line when we add further code.

Finally, if we do make a public release we either just set the \patch@level to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the \IncludeInRelease statements that used the "guessed" date.

For more fine grain control there is the possibility to name the current development branch. This is only used when the **\patch@level** is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

\development@branch@name

(End definition for \fmtname and others. These functions are documented on page ??.)

Check that the format being made is not too old. The error message complains about 'more than 5 years' but in fact the error is not triggered until 65 months.

This code is currently not activated as we don't know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

- 12 \iffalse
  13 \def\reserved@a#1/#2/#3\@nil{%

```

If we roll back and the first patch already match then applying that is actually reapplying what is already in the format, i.e., it is useless and possibly allocating new registers. However, it makes the logic simpler so this is the way it is for now. In theory we could always jump overthe first patch because that is only really needed for rolling forward. So maybe one day ...

## File d

# ltluatex.dtx

### 1 Overview

LuaTEX adds a number of engine-specific functions to TEX. Several of these require set up that is best done in the kernel or need related support functions. This file provides basic support for LuaTEX at the LATEX  $2\varepsilon$  kernel level plus as a loadable file which can be used with plain TEX and LATEX.

This file contains code for both TEX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace luatexbase.

The following \count registers are used here for register allocation:

\e@alloc@attribute@count Attributes (default 258)

\e@alloc@ccodetable@count Category code tables (default 259)

\e@alloc@luafunction@count Lua functions (default 260)

\e@alloc@whatsit@count User whatsits (default 261)

\e@alloc@bytecode@count Lua bytecodes (default 262)

\e@alloc@luachunk@count Lua chunks (default 263)

(\count 256 is used for \newmarks allocation and \count 257 is used for \newXeTeXintercharclass with XeTeX, with code defined in ltfinal.dtx). With any  $\LaTeX$  kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the  $\LaTeX$  kernel did not provide any functionality for the extended allocation area).

# 2 Core T<sub>E</sub>X functionality

The commands defined here are defined for possible inclusion in a future LATEX format, however also extracted to the file ltluatex.tex which may be used with older LATEX formats, and with plain TEX.

\newattribute \newattribute $\{\langle attribute \rangle\}$ 

Defines a named \attribute, indexed from 1 (i.e. \attribute0 is never defined). Attributes initially have the marker value -"7FFFFFFF ('unset') set by the engine.

 $\verb|\newcatcodetable| \newcatcodetable{ \langle catcodetable \rangle \}}$ 

Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).

Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so \luafunction0 is not available).

\newwhatsit \newwhatsit $\{\langle whatsit \rangle\}$ 

Defines a custom \whatsit, indexed from 1.

 $\new = \new =$ 

File d: ltluatex.dtx

Allocates a number for Lua bytecode register, indexed from 1.

\newluachunkname

 $newluachunkname\{\langle chunkname \rangle\}$ 

Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the regiser (without backslash) into the lua.name table to be used in stack traces.

\catcodetable@initex \catcodetable@string \catcodetable@latex Predefined category code tables with the obvious assignments. Note that the latex and atletter tables set the full Unicode range to the codes predefined by the kernel.

 $\stattribute{\langle attribute \rangle} {\langle value \rangle}$ 

 $\verb|\catcodetable@atletter | \verb|\unsetattribute| {|} \langle attribute| \rangle |$ 

\setattribute \unsetattribute

Set and unset attributes in a manner analogous to \setlength. Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.

# 3 Plain T<sub>F</sub>X interface

The Itluatex interface may be used with plain TEX using \input{ltluatex}. This inputs ltluatex.tex which inputs etex.src (or etex.sty if used with IATEX) if it is not already input, and then defines some internal commands to allow the Itluatex interface to be defined.

The luatexbase package interface may also be used in plain  $T_EX$ , as before, by inputting the package \input luatexbase.sty. The new version of luatexbase is based on this ltluatex code but implements a compatibility layer providing the interface of the original package.

# 4 Lua functionality

## 4.1 Allocators in Lua

new\_attribute

 $luatexbase.new_attribute(\langle attribute \rangle)$ 

Returns an allocation number for the  $\langle attribute \rangle$ , indexed from 1. The attribute will be initialised with the marker value -"7FFFFFFF ('unset'). The attribute allocation sequence is shared with the TEX code but this function does *not* define a token using \attributedef. The attribute name is recorded in the attributes table. A metatable is provided so that the table syntax can be used consistently for attributes declared in TEX or Lua.

new\_whatsit

luatexbase.new\_whatsit( $\langle whatsit \rangle$ )

Returns an allocation number for the custom  $\langle whatsit \rangle$ , indexed from 1.

new\_bytecode

luatexbase.new\_bytecode( $\langle bytecode \rangle$ )

Returns an allocation number for a bytecode register, indexed from 1. The optional  $\langle name \rangle$  argument is just used for logging.

new\_chunkname

luatexbase.new\_chunkname( $\langle chunkname \rangle$ )

Returns an allocation number for a Lua chunk name for use with  $\directlua$  and  $\label{lua}$  indexed from 1. The number is returned and also  $\langle name \rangle$  argument is added to the lua.name array at that index.

new\_luafunction

 $luatexbase.new_luafunction(\langle functionname \rangle)$ 

Returns an allocation number for a lua function for use with  $\label{luafunction}$ ,  $\label{luafunction}$ , and  $\label{luadef}$ , indexed from 1. The optional  $\langle functionname \rangle$  argument is just used for logging.

These functions all require access to a named T<sub>E</sub>X count register to manage their allocations. The standard names are those defined above for access from T<sub>E</sub>X,

File d: ltluatex.dtx

e.g. \e@alloc@attribute@count, but these can be adjusted by defining the variable  $\langle type \rangle$ \_count\_name before loading ltluatex.lua, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a  $T_EX \setminus (\countdef'd\ token)$  called attributetracker in place of  $\countdef'd\ token)$  called attributeQcount.

## 4.2 Lua access to T<sub>E</sub>X register numbers

registernumber

luatexbase.registernumer( $\langle name \rangle$ )

Sometimes (notably in the case of Lua attributes) it is necessary to access a register by number that has been allocated by TeX. This package provides a function to look up the relevant number using LuaTeX's internal tables. After for example \newattribute\myattrib, \myattrib would be defined by (say) \myattrib=\attribute15. luatexbase.registernumer("myattrib") would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by \attributedef, \countdef or similar commands, the Lua value false is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}%
}}
\test{undefinedrubbish}
\test{space}
\test{hbox}
\test{0MM}
\test{0tempdima}
\test{0tempdimb}
\test{strutbox}
\test{strutbox}
\test{sixt@n}
\attrbutedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with LuaLATEX then the following would be produced in the log and terminal output.

```
undefinedrubbish: \relax bad input
```

space: macro:->
 bad input
hbox: \hbox
 bad input
@MM: \mathchar"4E20
 20000
@tempdima: \dimen14
 14
@tempdimb: \dimen15
 15
strutbox: \char"B
 11
sixt@@n: \char"10
 16
myattr: \attribute12
 12

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return false and so print bad input here. Note also that commands defined by \newbox work and return the number of the box register even though the actual command holding this number is a \chardef defined token (there is no \boxdef).

#### 4.3 Module utilities

provides\_module

 $luatexbase.provides_module(\langle info\rangle)$ 

This function is used by modules to identify themselves; the info should be a table containing information about the module. The required field name must contain the name of the module. It is recommended to provide a field date in the usual LATEX format yyyy/mm/dd. Optional fields version (a string) and description may be used if present. This information will be recorded in the log. Other fields are ignored.

module\_info
module\_warning
module\_error

luatexbase.module\_info( $\langle module \rangle$ ,  $\langle text \rangle$ )
luatexbase.module\_warning( $\langle module \rangle$ ,  $\langle text \rangle$ )
luatexbase.module\_error( $\langle module \rangle$ ,  $\langle text \rangle$ )

These functions are similar to LATEX's \PackageError, \PackageWarning and \PackageInfo in the way they format the output. No automatic line breaking is done, you may still use \n as usual for that, and the name of the package will be prepended to each output line.

Note that luatexbase.module\_error raises an actual Lua error with error(), which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

### 4.4 Callback management

add\_to\_callback

luatexbase.add\_to\_callback( $\langle callback \rangle$ ,  $\langle function \rangle$ ,  $\langle description \rangle$ ) Registers the  $\langle function \rangle$  into the  $\langle callback \rangle$  with a textual  $\langle description \rangle$  of the function. Functions are inserted into the callback in the order loaded.

 ${\tt remove\_from\_callback}$ 

luatexbase.remove\_from\_callback( $\langle callback \rangle$ ,  $\langle description \rangle$ ) Removes the callback function with  $\langle description \rangle$  from the  $\langle callback \rangle$ . The removed function and its description are returned as the results of this function.

 $in\_callback$ 

luatexbase.in\_callback( $\langle callback \rangle$ ,  $\langle description \rangle$ ) Checks if the  $\langle description \rangle$  matches one of the functions added to the list for the  $\langle callback \rangle$ , returning a boolean value.

File d: ltluatex.dtx

disable\_callback

luatexbase.disable\_callback(\langle callback\rangle) Sets the \langle callback\rangle to false as described in the LuaTeX manual for the underlying callback.register built-in. Callbacks will only be set to false (and thus be skipped entirely) if there are no functions registered using the callback.

 ${\tt callback\_descriptions}$ 

A list of the descriptions of functions registered to the specified callback is returned. {} is returned if there are no functions registered.

create\_callback

luatexbase.create\_callback( $\langle name \rangle$ ,metatype, $\langle default \rangle$ ) Defines a user defined callback. The last argument is a default function or false.

call\_callback

luatexbase.call\_callback( $\langle name \rangle, \ldots$ ) Calls a user defined callback with the supplied arguments.

# 5 Implementation

```
1 (*2ekernel | tex | latexrelease)
2 (2ekernel | latexrelease) \ifx\directlua\@undefined\else
```

# 5.1 Minimum LuaT<sub>E</sub>X version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of require(): from version 0.60, LuaTeX will correctly find Lua files in the texmf tree without 'help'.

Two simple LATEX macros from ltdefns.dtx have to be defined here because lt-defns.dtx is not loaded yet when ltluatex.dtx is executed.

```
11 \long\def\@gobble#1{}
12 \long\def\@firstofone#1{#1}
```

### 5.2 Older LATEX/Plain TeX setup

```
13 \langle *tex \rangle
```

Older LATEX formats don't have the primitives with 'native' names: sort that out. If they already exist this will still be safe.

```
//directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}

// ifx\eQalloc\Qundefined

In pre-2014 LATEX, or plain TEX, load etex.{sty,src}.

// ifx\documentclass\Qundefined

// ifx\loccount\Qundefined

// input{etex.src}%

// fi

// catcode'\Q=11 %

// outer\expandafter\def\csname newfam\endcsname

// incompany in the control of the
```

```
{\alloc@8\fam\chardef\et@xmaxfam}}

23 \else

24 \RequirePackage{etex}

25 \expandafter\def\csname newfam\endcsname

26 \{\alloc@8\fam\chardef\et@xmaxfam}\}

27 \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname

28 \fi
```

## 5.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to etex.src which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX. 2015-07-13 higher range in luatex.

```
29 \edef \et@xmaxregs {\ifx\directlua\@undefined 32768\else 65536\fi} luatex/xetex also allow more math fam.
```

```
30 \edef \et@xmaxfam {\ifx\Umathcode\@undefined\sixt@@n\else\@cclvi\fi}
31 \count 270=\et@xmaxregs % locally allocates \count registers
32 \count 271=\et@xmaxregs % ditto for \dimen registers
33 \count 272=\et@xmaxregs % ditto for \skip registers
34 \count 273=\et@xmaxregs % ditto for \muskip registers
35 \count 274=\et@xmaxregs % ditto for \box registers
36 \count 275=\et@xmaxregs % ditto for \toks registers
37 \count 276=\et@xmaxregs % ditto for \marks classes
and 256 or 16 fam. (Done above due to plain/IATEX differences in Itluatex.)
38 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}
```

End of proposed changes to etex.src

#### 5.2.2 luatex specific settings

Switch to global cf luatex.sty to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```
      39 \expandafter\let\csname
      newcount\expandafter\expandafter\endcsname

      40 \csname
      globcount\endcsname

      41 \expandafter\let\csname
      newdimen\expandafter\expandafter\endcsname

      42 \csname
      globdimen\endcsname

      43 \expandafter\let\csname
      newskip\expandafter\expandafter\endcsname

      44 \csname
      globskip\endcsname

      45 \expandafter\let\csname
      newbox\expandafter\expandafter\endcsname

      46 \csname
      globbox\endcsname
```

Define\e@alloc as in latex (the existing macros in etex.src hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```
47 \chardef\e@alloc@top=65535
48 \let\e@alloc@chardef\chardef
49 \def\e@alloc#1#2#3#4#5#6{%
50 \global\advance#3\@ne
51 \e@ch@ck{#3}{#4}{#5}#1%
52 \allocationnumber#3\relax
53 \global#2#6\allocationnumber
54 \wlog{\string#6=\string#1\the\allocationnumber}}%
```

```
\ifnum#1<#2\else
       \int 1=#2\relax
         #1\@cclvi
58
         \ifx\count#4\advance#1 10 \fi
59
60
       \ifnum#1<#3\relax
61
       \else
62
         \errmessage{No room for a new \string#4}%
63
64
    \fi}%
65
   Fix up allocations not to clash with etex.src.
66 \expandafter\csname newcount\endcsname\e@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\e@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\e@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\e@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\e@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\e@alloc@luachunk@count
   End of conditional setup for plain T<sub>E</sub>X / old L<sup>A</sup>T<sub>E</sub>X.
73 (/tex)
```

## 5.3 Attributes

55 \gdef\e@ch@ck#1#2#3#4{%

\newattribute

As is generally the case for the LuaTeX registers we start here from 1. Notably, some code assumes that \attribute0 is never used so this is important in this case.

```
74 \ifx\eQallocQattributeQcount\Qundefined
75 \countdef\eQallocQattributeQcount=258
76 \eQallocQattributeQcount=\zQ
77 \fi
78 \def\newattribute#1{%
79 \eQalloc\attribute\attributedef
80 \eQallocQattributeQcount\mQne\eQallocQtop#1%
81 }
(End definition for \newattribute. This function is documented on page ??.)
```

\setattribute \unsetattribute

Handy utilities.

82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

(End definition for \setattribute and \unsetattribute. These functions are documented on page ??.)

### 5.4 Category code tables

\newcatcodetable

Category code tables are allocated with a limit half of that used by LuaTEX for everything else. At the end of allocation there needs to be an initialisation step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```
84 \ifx\eQalloc@ccodetable@count\@undefined
85 \countdef\e@alloc@ccodetable@count=259
86 \e@alloc@ccodetable@count=\z@
87 \fi
```

```
% \def\newcatcodetable#1{%
% \e@alloc\catcodetable\chardef
% \e@alloc@ccodetable@count\m@ne{"8000}#1%
% \initcatcodetable\allocationnumber
% }

(End definition for \newcatcodetable. This function is documented on page ??.)
```

\catcodetable@initex \catcodetable@string \catcodetable@latex \catcodetable@atletter Save a small set of standard tables. The Unicode data is read here in using a parser simplified from that in load-unicode-data: only the nature of letters needs to be detected.

```
93 \newcatcodetable\catcodetable@initex
  \newcatcodetable\catcodetable@string
95
  \begingroup
     \def\setrangecatcode#1#2#3{%
       \ifnum#1>#2 %

172 \endgroup
```

 $(End\ definition\ for\ \verb|\catcodetable@initex|\ and\ others.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:catcodetable@initex}.)$ 

### 5.5 Named Lua functions

\newluafunction

Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```
ifx\e@alloc@luafunction@count\@undefined
    \countdef\e@alloc@luafunction@count=260
    \e@alloc@luafunction@count=\z@
    \fi
    \def\newluafunction{%
    \e@alloc\luafunction\e@alloc@chardef
    \e@alloc@luafunction@count\m@ne\e@alloc@top
    \e@alloc@luafunction. This function is documented on page ??.)
```

### 5.6 Custom whatsits

\newhatsit These are only settable from Lua but for consistency are definable here.

```
181 \ifx\eQallocQwhatsitQcount\Qundefined
182 \countdef\eQallocQwhatsitQcount=261
183 \eQallocQwhatsitQcount=\zQ
184 \fi
185 \def\newwhatsit#1{%
186 \eQalloc\whatsit\eQallocQchardef
187 \eQallocQwhatsitQcount\mQne\eQallocQtop#1%
188 }
```

 $(End\ definition\ for\ \verb|\newwhatsit|.\ This\ function\ is\ documented\ on\ page\ \ref{eq:constraint}??.)$ 

# 5.7 Lua bytecode registers

\newluabytecode

These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytecode@count\@undefined
190 \countdef\e@alloc@bytecode@count=262
191 \e@alloc@bytecode@count=\z@
192 \fi
193 \def\newluabytecode#1{%
194 \e@alloc\luabytecode\e@alloc@chardef
195 \e@alloc@bytecode@count\m@ne\e@alloc@top#1%
196 }
```

 $(\mathit{End \ definition \ for \ } \verb|lnewluabytecode|. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.)$ 

## 5.8 Lua chunk registers

\newluachunkname

As for bytecode registers, but in addition we need to add a string to the lua.name table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
197 \ifx\e@alloc@luachunk@count\@undefined
     \countdef\e@alloc@luachunk@count=263
     \e@alloc@luachunk@count=\z@
199
200 \fi
  \def\newluachunkname#1{%
201
     \e@alloc\luachunk\e@alloc@chardef
202
       \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
203
       {\escapechar\m@ne
204
       \directlua{lua.name[\the\allocationnumber]="\string#1"}}%
205
206 }
```

(End definition for \newluachunkname. This function is documented on page ??.)

#### 5.9 Lua loader

Lua code loaded in the format often has to to be loaded again at the beginning of every job, so we define a helper which allows us to avoid duplicated code:

```
207 \def\now@and@everyjob#1{%
208 \everyjob\expandafter{\the\everyjob
209 #1%
```

```
210 }%
211 #1%
212 }
```

Load the Lua code at the start of every job. For the conversion of TEX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```
(2ekernel) \now@and@everyjob{%
           \begingroup
214
                \attributedef\attributezero=0 %
                                             \charzero
                \chardef
216
Note name change required on older luatex, for hash table access.
                \countdef

## 5.10 Lua module preliminaries

```
279 (*lua)
```

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase

Set up the table for the returned functions. This is used to expose all of the public functions.

```
luatexbase = luatexbase or { }
local luatexbase = luatexbase

(End definition for luatexbase. This function is documented on page ??.)

Some Lua best practice: use local versions of functions where possible.

local string_gsub = string.gsub

local tex_count = tex.count

local tex_setattribute = tex.setattribute

local tex_setcount = tex.setcount

local texio_write_nl = texio.write_nl

local luatexbase_warning

local luatexbase_error
```

#### 5.11 Lua module utilities

#### 5.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
289 local modules = modules or { }
```

(End definition for modules. This function is documented on page ??.)

provides\_module Local function to write to the log.

```
290 local function luatexbase_log(text)
291 texio_write_nl("log", text)
292 end
```

Modelled on \ProvidesPackage, we store much the same information but with a little more structure.

```
293 local function provides_module(info)
    if not (info and info.name) then
      luatexbase_error("Missing module name for provides_module")
    local function spaced(text)
297
      return text and (" " .. text) or ""
299
    luatexbase_log(
300
       "Lua module: " .. info.name
301
         .. spaced(info.date)
302
         .. spaced(info.version)
         .. spaced(info.description)
    )
305
    modules[info.name] = info
306
307 end
308 luatexbase.provides_module = provides_module
```

(End definition for provides\_module. This function is documented on page ??.)

### 5.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from TeX. For errors we have to make some changes. Here we give the text of the error in the LATeX format then force an error from Lua to halt the run. Splitting the message text is done using \n which takes the place of \MessageBreak.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```
309 local function msg_format(mod, msg_type, text)
    local leader = ""
310
    local cont
311
    local first_head
    if mod == "LaTeX" then
      cont = string_gsub(leader, ".", " ")
      first_head = leader .. "LaTeX: "
316
      first_head = leader .. "Module " .. msg_type
317
      cont = "(" .. mod .. ")"
318
         .. string_gsub(first_head, ".", " ")
319
      first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
320
321
     if msg_type == "Error" then
322
      first_head = "\n" .. first_head
323
     if string.sub(text,-1) \sim= "\n" then
```

```
text = text .. " "
                 326
                 327
                      return first_head .. " "
                 328
                       .. string_gsub(
                 329
                 330
                             text
                    .. "on input line "
                 331
                             .. tex.inputlineno, "\n", "\n" .. cont .. " "
                 332
                 333
                       .. "\n"
                 334
                 335 end
   module_info
                 Write messages.
module_warning
                 336 local function module_info(mod, text)
  module_error
                      texio_write_nl("log", msg_format(mod, "Info", text))
                 337
                 338 end
                 339 luatexbase.module_info = module_info
                 340 local function module_warning(mod, text)
                      texio_write_nl("term and log",msg_format(mod, "Warning", text))
                 343 luatexbase.module_warning = module_warning
                 344 local function module_error(mod, text)
                      error(msg_format(mod, "Error", text))
                 345
                 346 end
                 347 luatexbase.module_error = module_error
                 (End definition for module_info, module_warning, and module_error. These functions are documented
                 on page ??.)
                      Dedicated versions for the rest of the code here.
                 348 function luatexbase_warning(text)
                      module_warning("luatexbase", text)
                 351 function luatexbase_error(text)
                      module_error("luatexbase", text)
                 353 end
```

### 5.12 Accessing register numbers from Lua

Collect up the data from the  $T_EX$  level into a Lua table: from version 0.80, Lua $T_EX$  makes that easy.

```
354 local luaregisterbasetable = { }
355 local registermap = {
    attributezero = "assign_attr"
    charzero = "char_given"
358 CountZero = "assign_int"
359 dimenzero = "assign_dimen
                   = "assign_dimen"
mathcharzero = "math_given"
    muskipzero = "assign_mu_skip"
361
    skipzero
                   = "assign_skip"
362
                   = "assign_toks"
    tokszero
363
364 }
365 local createtoken
366 if tex.luatexversion > 81 then
     createtoken = token.create
368 elseif tex.luatexversion > 79 then
```

```
createtoken = newtoken.create
371 local hashtokens
                       = tex.hashtokens()
372 local luatexversion = tex.luatexversion
373 for i,j in pairs (registermap) do
    if luatexversion < 80 then
       luaregisterbasetable[hashtokens[i][1]] =
375
         hashtokens[i][2]
376
    else
377
       luaregisterbasetable[j] = createtoken(i).mode
378
    end
379
380 end
```

registernumber

Working out the correct return value can be done in two ways. For older LuaT<sub>E</sub>X releases it has to be extracted from the hashtokens. On the other hand, newer LuaT<sub>E</sub>X's have newtoken, and whilst .mode isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```
381 local registernumber
382 if luatexversion < 80 then
     function registernumber(name)
       local nt = hashtokens[name]
       if(nt and luaregisterbasetable[nt[1]]) then
         return nt[2] - luaregisterbasetable[nt[1]]
387
       else
         return false
388
389
       end
     end
390
391 else
     function registernumber(name)
392
       local nt = createtoken(name)
393
       if(luaregisterbasetable[nt.cmdname]) then
394
         return nt.mode - luaregisterbasetable[nt.cmdname]
       else
         return false
397
398
       end
     end
399
400 end
401 luatexbase.registernumber = registernumber
```

# 5.13 Attribute allocation

new\_attribute As attributes are used for Lua manipulations its useful to be able to assign from this end.

(End definition for registernumber. This function is documented on page ??.)

```
402 local attributes=setmetatable(
403 {},
404 {
405 __index = function(t,key)
406 return registernumber(key) or nil
407 end}
408 )
409 luatexbase.attributes = attributes
```

```
410 local attribute_count_name =
                        attribute_count_name or "e@alloc@attribute@count"
411
412 local function new_attribute(name)
     tex_setcount("global", attribute_count_name,
413
                              tex_count[attribute_count_name] + 1)
414
     if tex_count[attribute_count_name] > 65534 then
415
       luatexbase_error("No room for a new \\attribute")
416
417
     attributes [name] = tex_count [attribute_count_name]
418
     luatexbase_log("Lua-only attribute " .. name .. " = " ..
419
                     tex_count[attribute_count_name])
420
    return tex_count[attribute_count_name]
421
423 luatexbase.new_attribute = new_attribute
```

(End definition for new\_attribute. This function is documented on page ??.)

#### 5.14 Custom whatsit allocation

new\_whatsit Much the same as for attribute allocation in Lua.

```
424 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
425 local function new_whatsit(name)
     tex_setcount("global", whatsit_count_name,
                             tex_count[whatsit_count_name] + 1)
427
     if tex_count[whatsit_count_name] > 65534 then
428
       luatexbase_error("No room for a new custom whatsit")
429
430
     luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
431
                     tex_count[whatsit_count_name])
432
     return tex_count[whatsit_count_name]
433
435 luatexbase.new_whatsit = new_whatsit
(End definition for new_whatsit. This function is documented on page ??.)
```

### 5.15 Bytecode register allocation

new\_bytecode

Much the same as for attribute allocation in Lua. The optional  $\langle name \rangle$  argument is used in the log if given.

```
436 local bytecode_count_name =
                             bytecode_count_name or "e@alloc@bytecode@count"
438 local function new_bytecode(name)
     tex_setcount("global", bytecode_count_name,
                             tex_count[bytecode_count_name] + 1)
440
     if tex_count[bytecode_count_name] > 65534 then
441
      luatexbase_error("No room for a new bytecode register")
442
443
    luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
444
                    tex_count[bytecode_count_name])
445
    return tex_count[bytecode_count_name]
446
448 luatexbase.new_bytecode = new_bytecode
```

(End definition for new\_bytecode. This function is documented on page ??.)

### 5.16 Lua chunk name allocation

new\_chunkname As for bytecode registers but also store the name in the lua.name table.

```
449 local chunkname_count_name =
                            chunkname_count_name or "e@alloc@luachunk@count"
450
451 local function new chunkname(name)
     tex_setcount("global", chunkname_count_name,
452
                             tex_count[chunkname_count_name] + 1)
453
     local chunkname_count = tex_count[chunkname_count_name]
     chunkname_count = chunkname_count + 1
455
     if chunkname_count > 65534 then
       luatexbase_error("No room for a new chunkname")
     lua.name[chunkname_count] = name
459
    luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
460
                    chunkname_count .. "\n")
461
    return chunkname_count
462
463 end
464 luatexbase.new_chunkname = new_chunkname
```

(End definition for new\_chunkname. This function is documented on page ??.)

### 5.17 Lua function allocation

 ${\tt new\_luafunction}$ 

Much the same as for attribute allocation in Lua. The optional  $\langle name \rangle$  argument is used in the log if given.

```
465 local luafunction_count_name =
                             luafunction_count_name or "e@alloc@luafunction@count"
466
467 local function new_luafunction(name)
     tex_setcount("global", luafunction_count_name,
468
                             tex_count[luafunction_count_name] + 1)
469
470
     if tex_count[luafunction_count_name] > 65534 then
       luatexbase_error("No room for a new luafunction register")
     luatexbase_log("Lua function " .. (name or "") .. " = " ..
473
474
                     tex_count[luafunction_count_name])
     return tex_count[luafunction_count_name]
475
476 end
477 luatexbase.new_luafunction = new_luafunction
(End definition for new_luafunction. This function is documented on page ??.)
```

## 5.18 Lua callback management

The native mechanism for callbacks in  $\text{LuaT}_{E\!X}$  allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

#### 5.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as func and

the identifying description as description. Only callbacks with a non-empty list of functions have an entry in this list.

```
478 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
479 local list, data, exclusive, simple, reverselist = 1, 2, 3, 4, 5
480 local types = {
                 = list,
    list
    data
                 = data.
482
    exclusive
                 = exclusive,
483
    simple
                 = simple,
484
    reverselist = reverselist,
485
486 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye
```

in plain LuaT<sub>E</sub>X. (Some undocumented callbacks are omitted as they are to be removed.)

```
487 local callbacktypes = callbacktypes or {
```

Section 8.2: file discovery callbacks.

```
find_read_file
                         = exclusive,
    find_write_file
                         = exclusive,
489
    find_font_file
                         = data,
490
    find_output_file
                        = data,
491
    find_format_file
                        = data,
492
    find_vf_file
                         = data,
493
    find_map_file
                        = data,
    find_enc_file
                        = data,
    find_pk_file
                        = data,
    find_data_file
                        = data,
497
    find_opentype_file = data,
498
    find_truetype_file = data,
499

callback.register

Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```
565 local callback_register = callback_register or callback.register
566 function callback.register()
567 luatexbase_error("Attempt to use callback.register() directly\n")
568 end
```

(End definition for callback.register. This function is documented on page ??.)

#### 5.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

**simple** is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of data for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values true or false. The functions are chained the same way as for data except that for the following. If one function returns false, then false is immediately returned and the following functions are not called. If one function returns true, then the same head is passed to the next function. If all functions return true, then true is returned, otherwise the return value of the last function not returning true is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

**exclusive** is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

```
Handler for data callbacks.
569 local function data_handler(name)
     return function(data, ...)
       for _,i in ipairs(callbacklist[name]) do
         data = i.func(data,...)
573
       end
574
       return data
     end
575
576 end
Default for user-defined data callbacks without explicit default.
577 local function data_handler_default(value)
    return value
579 end
Handler for exclusive callbacks. We can assume callbacklist[name] is not empty:
otherwise, the function wouldn't be registered in the callback any more.
580 local function exclusive_handler(name)
     return function(...)
       \verb"return callbacklist[name]" [1]". \verb"func" (...)
     end
583
584 end
Handler for list callbacks.
585 local function list_handler(name)
    return function(head, ...)
587
       local ret
       local alltrue = true
588
       for _,i in ipairs(callbacklist[name]) do
589
         ret = i.func(head, ...)
590
         if ret == false then
591
           luatexbase_warning(
592
              "Function '" .. i.description .. "' returned false\n"
                .. "in callback '" .. name .."'"
            )
            break
597
         end
         if ret ~= true then
598
           alltrue = false
599
           head = ret
600
         end
601
602
603
       return alltrue and true or head
Default for user-defined list and reverselist callbacks without explicit default.
606 local function list_handler_default()
    return true
608 end
Handler for reverselist callbacks.
609 local function reverselist_handler(name)
    return function(head, ...)
       local ret
       local alltrue = true
```

```
local callbacks = callbacklist[name]

# 1 **expl3**-dependent code

## 1.1 Loader

First define some blank commands, so that in case something goes wrong while loading expl3, we won't get strange Undefined control sequence errors.

```
1 (*2ekernel)
2 \def\@expl@sys@load@backend@@{}
3 \def\@expl@push@filename@@{}
4 \def\@expl@push@filename@@@{}
5 \def\@expl@pop@filename@@{}
6 (/2ekernel)
Create a hook for last-minute expl3 material.
7 (*2ekernel)
8 \def\@expl@finalise@setup@@{}
9 (/2ekernel)
```

Now define some basics to support loading expl3. These macros can be defined here safely, because they are redefined later on by the kernel, so we define simpler versions just to suit our needs.

```
10 (*2ekernel)
11 \long\def\@gobble#1{}
12 \long\def\@firstofone#1{#1}
13 \long\def\@firstoftwo#1#2{#1}
14 \long\def\@secondoftwo#1#2{#2}
15 \long\def\IfFileExists#1{%
    \openin\@inputcheck"#1" %
    \ifeof\@inputcheck
      \expandafter\@secondoftwo
    \else
      \closein\@inputcheck
20
      \expandafter\@firstoftwo
21
    \fi}
23 \long\def\@ifnextchar#1#2#3{%
    \let\reserved@d=#1%
    \def\reserved@a{#2}%
    \def\reserved@b{#3}%
    \futurelet\@let@token\@ifnch}
  \def\@ifnch{%
    \ifx\@let@token\reserved@d
      \expandafter\reserved@a
30
    \else
      \expandafter\reserved@b
    \fi}
34 (/2ekernel)
```

If we are doing a rollback with a format containing expl3 we aren't reloading it as that creates havoc. This may need a refined version!

```
35 (*2ekernel | latexrelease)
```

```
36 (latexrelease)\IncludeInRelease{2020/10/01}%
37 (latexrelease)

## 1.2 Using expl3 code

In order to ease the implementation of some new features in IATEX  $2_{\varepsilon}$  we may (temporarily) use some coding based on the expl3-code. Such macros will eventually vanish and may be changed unannounced. They are there for internal use in the IATEX  $2_{\varepsilon}$  kernel and are not meant to be used in third-party packages. These macros will always have the @expl@ prefix in their name.

The rest of the name matches the expl3 name but with all underscores replaced by @s and the : replaced by @s, e.g.,

```
\cs_new_eq:NN \@expl@tl@trim@spaces@apply@@nN \tl_trim_spaces_apply:nN if that expl3 command is needed in places that are others coded in LATEX 2_{\varepsilon} conventions. LExplSyntaxOn
```

In this file, each release of LaTeX adds an \IncludeInRelease block, in which the macros copied for that release were defined. In case a rollback is requested, the entire block is changed.

Each macro copied has a \changes entry to explain when and why it was copied, so that further to that may spot it easily.

Here \cs\_gset\_eq:NN is used, instead of the new variant because if different releases use that same name for different purposes, each can copy the macro without worrying about redefinitions.

```
\label{lambda} $$ \langle \text{latexrelease} \rangle \\ IncludeInRelease \{2020/10/01\} \{ \exp 13^2 2020 - 10 - 01 \} \% $$ $$ \langle \text{latexrelease} \rangle $$ $$ \{ \exp 13^2 \mod \text{of or the $2020 - 10 - 01 } \text{release} \} \% $$
```

```

# 1 Definitions

This section contains commands used in defining other macros.

1 (\*2ekernel)

## 1.1 Initex initialisations

```
\two@digits Prefix a number less than 10 with '0'.
                   2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}</pre>
                  (End definition for \two@digits. This function is documented on page ??.)
     \typeout Display something on the terminal.
                   ₃ ⟨/2ekernel⟩
                   4 <*2ekernel | latexrelease>
                   _{5} \langle latexrelease \rangle \setminus IncludeInRelease \{2020/10/01\}\%
                   6 (latexrelease)
                                                         {\typeout}{Allow "par" in \typeout}%
                   7 \protected\long\def\typeout#1{\begingroup
                       \set@display@protect
                       \def \pi^{^J^^J}\%
                        \immediate\write\@unused{#1}\endgroup}
                   11 (/2ekernel | latexrelease)
                   12 (latexrelease)\EndIncludeInRelease
                   13 \langle latexrelease \rangle \setminus IncludeInRelease \{0000/00/00\} \%
                   _{14} \langle latexrelease \rangle
                                                        {\typeout}{Allow "par" in \typeout}%
                   _{15} \langle latexrelease \rangle
                   16 (latexrelease)\def\typeout#1{\begingroup\set@display@protect
                                       \immediate\write\@unused{#1}\endgroup}
                   17 (latexrelease)
                   18 (latexrelease)\EndIncludeInRelease
                   19 (*2ekernel)
                 (End definition for \typeout. This function is documented on page ??.)
                A char to be used as new-line in output to files.
\newlinechar
                   20 \newlinechar'\^^J
                  (End definition for \mbox{\ensuremath{\text{newlinechar}}}. This function is documented on page \ref{eq:constraints}.)
```

## 1.2 Saved versions of T<sub>F</sub>X primitives

The TeX primitive \foo is saved as \@@foo. The following primitives are handled in this way:

```
\@@par
```

```
21 \let\@@par=\par
22 %\let\@@input=\input %%% moved earlier
23 %\let\@@end=\end %%%

(End definition for \@@par. This function is documented on page ??.)
```

```
\@@hyph Save original primitive definition.
                    24 \let\@@hyph=\-
                   (End definition for \CChyph. This function is documented on page ??.)
\@@italiccorr Save the original italic correction.
                    25 \let\@@italiccorr=\/
                   (End definition for \@@italiccorr. This function is documented on page ??.)
                  The following definitions save token space. E.g., using \@height instead of height saves
                   5 tokens at the cost in time of one macro expansion.
       \@depth
       \@width
                    26 \def\@height{height} \def\@depth{depth} \def\@width{width}
       \@minus
                    27 \def\@minus{minus}
         \@plus
                    28 \def\@plus{plus}
                   The next one is another 100 tokens worth.
                    29 \def\hb@xt@{\hbox to}
                   (End definition for \Cheight and others. These functions are documented on page ??.)
                    30 \message{hacks,}
       \hb@xt@
                           Command definitions
                   This section defines the following commands:
     \@namedef
                        \{\langle NAME \rangle\}
                   Expands to \langle NAME \rangle, except name can contain any characters.
     \@nameuse
                        \{\langle NAME \rangle\}
                   Expands to \{\langle NAME \rangle\}.
                        X\{\langle YES \rangle\}\{\langle NO \rangle\}
 \@ifnextchar
                   Expands to \langle YES \rangle if next character is an 'X', and to \langle NO \rangle otherwise.
                                                                                                                  (Uses
                   \reserved@a-\reserved@c.) NOTE: GOBBLES ANY SPACE FOLLOWING IT.
      \@ifstar
                        \{\langle YES \rangle\}\{\langle NO \rangle\}
                   Gobbles following spaces and then tests if next the character is a '*'. If it is, then it
                   gobbles the '*' and expands to \langle YES \rangle, otherwise it expands to \langle NO \rangle.
      \@dblarg
                        \{\langle CMD \rangle\}\{\langle ARG \rangle\}
                   Expands to \{\langle CMD \rangle\} [\langle ARG \rangle] \{\langle ARG \rangle\}. Use \@dblarg\CS when \CS takes arguments
                   [ARG1] {ARG2}, where default is ARG1 = ARG2.
                        \{\langle NAME \rangle\}\{\langle YES \rangle\}\{\langle NO \rangle\}
\@ifundefined
                   : If \NAME is undefined then it executes \langle YES \rangle, otherwise it executes \langle NO \rangle. More pre-
                   cisely, true if \NAME either undefined or = \rule \
                        \AME\{\langle YES\rangle\}\ Executes \langle YES\rangle if the user is allowed to define \AME, otherwise it
\@ifdefinable
                   gives an error. The user can define \NAME if \@ifundefined{NAME} is true, 'NAME' \neq
  \newcommand
```

'relax' and the first three letters of 'NAME' are not 'end', and if \endNAME is not defined.  $*{\langle F00 \rangle} [\langle i \rangle] {\langle TEXT \rangle}$ 

User command to define  $\Gamma$ 00 to be a macro with i arguments (i = 0 if missing) having the definition  $\langle TEXT \rangle$ . Produces an error if \F00 already defined.

Normally the command is defined to be \long (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as \long and a blank line in any argument to the command would generate an error.

\renewcommand  $*\{\langle FOO \rangle\} [\langle i \rangle] \{\langle TEXT \rangle\}$ 

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

```
Same as \newcommand, except it checks if \FOO already defined.
                          *{\langle FOO \rangle} [\langle i \rangle] {\langle DEF1 \rangle} {\langle DEF2 \rangle}
  \newenvironment
                     equivalent to:
                     (or the appropriate star forms).
\renewenvironment
                     Obvious companion to \newenvironment.
                          : See description of \output routine.
            \@cons

  \Onewcommand Handling arguments for \newcommand.
      \@argdef
                  70 \def\@newcommand#1[#2]{%
     \@xargdef
                      \kernel@ifnextchar [{\@xargdef#1[#2]}%
                                      {\@argdef#1[#2]}}
```

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

Define #1 if it is definable.

Both here and in \@xargdef the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```
73 \long\def\@argdef#1[#2]#3{%

74 \@ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}}

Handle the second optional argument.
```

76 \@ifdefinable#1{%

Define the actual command to be:

## \def\foo{\@protected@testopt\foo\\foo{default}}

where \\foo is a csname generated from applying \csname and \string to \foo, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of (re)newcommand.

```
77  \expandafter\def\expandafter#1\expandafter{%
78   \expandafter
79   \QprotectedQtestopt
80   \expandafter
81   #1%
82   \csname\string#1\endcsname
83   {#3}}%
```

Now we define the internal macro ie \\foo which is supposed to pick up all arguments (optional and mandatory).

(End definition for \Gnewcommand, \Gargdef, and \Gxargdef. These functions are documented on page ??.)

\@testopt

This macro encapsulates the most common call to \@ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [ need not be a single token but can be any sequence of commands that 'expects' to be followed by [. If this command were only used in \newcommand definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```
89 \long\def\@testopt#1#2{%
90 \kernel@ifnextchar[{#1}{#1[{#2}]}}
```

(End definition for \Otestopt. This function is documented on page ??.)

\@protected@testopt

Robust version of \@testopt. The extra argument (#1) must be a single token. If protection is needed the call expands to \protect applied to this token, and the 2nd and 3rd arguments are discarded (by \@x@protect). Otherwise \@testopt is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the \ifx test.

```
91 \def\@protected@testopt#1{%
92 \ifx\protect\@typeset@protect
93 \expandafter\@testopt
```

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

```
94 \else
95 \@x@protect#1%
96 \fi}
```

(End definition for \OprotectedOtestopt. This function is documented on page ??.)

\@yargdef
\@yargd@f

These generate a primitive argument specification, from a LaTeX [ $\langle digit \rangle$ ] form; in fact  $\langle digit \rangle$  can be anything such that  $\rangle$ number  $\langle digit \rangle$  is single digit.

Reorganised slightly so that \renewcommand{\reserved@a}[1]{foo} works. I am not sure this is worth it, as a following \newcommand would over-write the definition of \reserved@a.

Recall that IATEX2.09 goes into an infinite loop with \renewcommand[1]{\Qtempa}{foo} (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using #2 = \two as the flag to surround the first argument with []. But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) \number was added later in 1999.

It is not clear why these are still \long.

```
97 \long \def \@yargdef #1#2#3{%
     \int x#2 tw0
       \def\reserved@b##11{[####1]}%
99
     \else
100

                  umented on page ??.)
                  Define a new user environment. #1 is the environment name. #2# Grabs all the tokens up
 \newenvironment
                  to the first {. These will be any optional arguments. They are not parsed at this point,
                  but are just passed to \Onewenv which will eventually call \newcommand. Any optional
                  arguments will then be parsed by \newcommand as it defines the command that executes
                  the 'begin code' of the environment.
                       This #2# trick removed with version 1.2i as it fails if a { occurs in the optional
                  argument. Now use \@ifnextchar directly.
                   136 \def\newenvironment{\@star@or@long\new@environment}
\new@environment
                   137 \def\new@environment#1{%
                        \@testopt{\@newenva#1}0}
                   139 \def\@newenva#1[#2]{%
       \@newenva
                         141 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][{#3}]}}
       \@newenvb
```

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

(End definition for \newenvironment and others. These functions are documented on page ??.)

#### \renewenvironment

Redefine an environment. For \renewenvironment disable \@ifdefinable and then call \newenvironment. It is OK to \let the argument to \relax here as there should not be a @temp... environment.

142 \def\renewenvironment{\@star@or@long\renew@environment}

#### \renew@environment

```
143 \def\renew@environment#1{%
144 \@ifundefined{#1}%
145 {\@latex@error{Environment #1 undefined}\@ehc
146 }\relax
147 \expandafter\let\csname#1\endcsname\relax
148 \expandafter\let\csname end#1\endcsname\relax
149 \new@environment{#1}}
```

(End definition for \renewenvironment and \renew@environment. These functions are documented on page ??.)

#### \@newenv

The internal version of \newenvironment.

Call  $\newcommand$  to define the  $\langle begin\text{-}code \rangle$  for the environment.  $\def$  is used for the  $\langle end\text{-}code \rangle$  as it does not take arguments. (but may contain  $\pars$ )

Make sure that an attempt to define a 'graf' or 'group' environment fails.

```
150 \long\def\@newenv#1#2#3#4{%
151 \@ifundefined{#1}%
152 {\expandafter\let\csname#1\expandafter\endcsname
153 \csname end#1\endcsname}%
154 \relax
155 \expandafter\new@command
156 \csname #1\endcsname#2{#3}%
167 \l@ngrel@x\expandafter\def\csname end#1\endcsname{#4}}
```

(End definition for \Onewenv. This function is documented on page ??.)

#### \newif

f And here's a different sort of allocation: For example, \newif\iffoo creates \footrue, \foofalse to go with \iffoo.

```
158 \def\newif#1{%
159 \count@\escapechar \escapechar\m@ne
160 \let#1\iffalse
161 \@if#1\iffrue
162 \@if#1\iffalse
163 \escapechar\count@}
```

```
\@if 164 \def\@if#1#2{%
```

(End definition for  $\mbox{\em newif}$  and  $\em \mbox{\em Gif.}$  These functions are documented on page  $\em \mbox{\em ??.}$ )

\providecommand

\providecommand takes the same arguments as \newcommand, but discards them if #1 is already defined, Otherwise it just acts like \newcommand. This implementation currently leaves any discarded definition in \reserved@a (and possibly \\reserved@a) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

\def\providecommand{\@star@or@long\provide@command}

#### \provide@command

```
169 \def\provide@command#1{%
170 \begingroup
171 \escapechar\m@ne\xdef\@gtempa{{\string#1}}%
172 \endgroup
173 \expandafter\@ifundefined\@gtempa
174 {\def\reserved@a{\new@command#1}}%
175 {\def\reserved@a{\renew@command\reserved@a}}%
```

(End definition for \providecommand and \provide@command. These functions are documented on page ??.)

\CheckCommand

\CheckCommand takes the same arguments as \newcommand. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state befor a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: \newcommand\xxx[2][a]{(#1)(#2)} then \CheckCommand\xxx[2][b]{(#1)(#2)} would not generate a warning, but, for instance \CheckCommand\xxx[2]{(#1)(#2)} would.

177 \def\CheckCommand{\@star@or@long\check@command}

\CheckCommand is only available in the preamble part of the document.

178 \@onlypreamble\CheckCommand

#### \check@command

```
179 \def\check@command#1#2#{\@check@c#1{#2}}
180 \@onlypreamble\check@command
```

(End definition for \CheckCommand and \check@command. These functions are documented on page ??.)

\@check@c

\CheckCommand itself just grabs all the arguments we need, without actually looking for [ optional argument forms. Now define \reserved@a. If \\reserved@a is then defined, compare it with the "\#1' otherwise compare \reserved@a with #1.

```
181 \long\def\@check@c#1#2#3{%

182 \expandafter\let\csname\string\reserved@a\endcsname\relax
183 \renew@command\reserved@a#2{#3}%

# 1.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in LATEX's commands. Whilst typesetting documents, LATEX makes use of many of TEX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by LATEX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an \edef, \message, \mark, or other command which evaluates its argument fully.

The method LATEX uses for making fragile commands robust is to precede them with \protect. This can have one of five possible values:

- \relax, for normal typesetting. So \protect\foo will execute \foo.
- \string, for writing to the screen. So \protect\foo will write \foo.
- \noexpand, for writing to a file. So \protect\foo will write \foo followed by a space.
- \QunexpandableQprotect, for writing a moving argument to a file. So \protect\foo will write \protect\foo followed by a space. This value is also used inside \edefs, \marks and other commands which evaluate their arguments fully. More precisely, whenever the content of an \edef or \xdef etc. can contain arbitrary user input not under the direct control of the programmer, one should use \protectedQedef instead of \edef, etc., so that \protect has a suitable definition and the user input will not break if it contains fragile commands.

### \@unexpandable@protect

210 \def\@unexpandable@protect{\noexpand\protect\noexpand}

(End definition for \QunexpandableOprotect. This function is documented on page ??.)

\DeclareRobustCommand \declare@robustcommand This is a package-writers command, which has the same syntax as \newcommand, but which declares a protected command. It does this by having

 $\verb|\DeclareRobustCommand| foo$ 

define \foo to be \protect\foo<space>,

and then use \newcommand\foo<space>.

Since the internal command is \foo<space>, when it is written to an auxiliary file, it will appear as \foo.

We have to be a bit cleverer if we're defining a short command, such as  $\setminus$ , in order to make sure that the auxiliary file does not include a space after the command, since  $\setminus$  a and  $\setminus$ a aren't the same. In this case we define  $\setminus$  to be:

\x@protect\\_\protect\\_<space>

which expands to:

```
\ifx\protect\@typeset@protect\else
   \@x@protect@\_
\fi
\protect\_<space>
```

Then if \protect is \@typeset@protect (normally \relax) then we just perform \\_<space>, and otherwise \@x@protect@ gobbles everything up and expands to \protect\\_.

Note: setting \protect to any value other than \relax whilst in 'typesetting' mode will cause commands to go into an infinite loop! In particular, setting \protect to \@empty will cause \\_ to loop forever. It will also break lots of other things, such as protected \ifmmodes inside \haligns. If you really have to do such a thing, then please set \@typeset@protect to be \@empty as well. (This is what the code for \patterns does, for example.)

More fun with \expandafter and \csname.

```
211 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
```

```
\def\declare@robustcommand#1{%
      \ifx#1\Qundefined\else\ifx#1\relax\else
         \@latex@info{Redefining \string#1}%
214
      \fi\fi
      \edef\reserved@a{\string#1}%
216
      \def\reserved@b{#1}%
218
      \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
      \edef#1{%
         \ifx\reserved@a\reserved@b
            \noexpand\x@protect
            \noexpand#1%
         \fi
         \noexpand\protect
224
         \expandafter\noexpand\csname
225
            \expandafter\@gobble\string#1 \endcsname
226
227
228
      \let\@ifdefinable\@rc@ifdefinable
229
      \expandafter\new@command\csname
         \expandafter\@gobble\string#1 \endcsname
230
231 }
```

(End definition for \DeclareRobustCommand and \declare@robustcommand. These functions are documented on page ??.)

# \@x@protect \x@protect

```
232 \def\x@protect#1{%
233  \ifx\protect\@typeset@protect\else
234  \@x@protect#1%
235  \fi
236 }
237 \def\@x@protect#1\fi#2#3{%
238  \fi\protect#1%
239 }
```

(End definition for \@x@protect and \x@protect. These functions are documented on page ??.)

# \@typeset@protect

We set \@typeset@protect to \relax rather than \@empty to make sure that the protection mechanism stops the look-ahead and expansion performed at the start of \halign cells.

```
240 \let\@typeset@protect\relax
```

(End definition for \@typeset@protect. This function is documented on page ??.)

\set@display@protect \set@typeset@protect These macros set \protect appropriately for typesetting or displaying.

- 241 \def\set@display@protect{\let\protect\string}
- 242 \def\set@typeset@protect{\let\protect\@typeset@protect}

 $(End\ definition\ for\ \verb+\setQdisplayQprotect+\ and\ \verb+\setQtypesetQprotect+.\ These\ functions\ are\ documented)$ on page ??.)

\protected@edef \protected@xdef \unrestored@protected@xdef \restore@protect The commands \protected@edef and \protected@xdef perform 'safe' \edefs and \xdefs, saving and restoring \protect appropriately. For cases where restoring \protect doesn't matter, there's an 'unsafe' \unrestored@protected@xdef, useful if you know what you're doing!

```
243 \def\protected@edef{%

           (End definition for \protected@edef and others. These functions are documented on page ??.)
\protect The normal meaning of \protect
```

260 \set@typeset@protect

(End definition for \protect. This function is documented on page ??.)

\MakeRobust

This macro makes an existing fragile macro robust, but only if it hasn't been robust in the past, i.e., it checks for the existence of the macro \<name>u and if that exists it assumes that \<name> is already robust. In that case either undefine the inner macro first or use \DeclareRobustCommand to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between \long macros and others and also take into account that sometimes the top-level is deliberately dones manually (like with \begin).

The macro firstly checks if the control sequence in question exists at all.

```
261 (/2ekernel)
262 (latexrelease)\IncludeInRelease{2020/10/01}{\MakeRobust}{\MakeRobust}}
263 (*2ekernel | latexrelease)
264 \def\MakeRobust#1{%
     \count@=\escapechar
```

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

```
\escapechar='\\
267 \@ifundefined{\expandafter\@gobble\string#1}{%

\@latex@error{The control sequence '\string#1' is undefined!%

269 \MessageBreak There is nothing here to make robust}%

270 \@eha
271 }%
```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely \foo\_\pu. If it is already defined do nothing, otherwise set \foo\_\pu equal to \foo and redefine \foo so that it acts like a macro defined with \DeclareRobustCommand. We use \@kernel@rename@newcommand to copy \foo over to \foo\_\pu, including a possible default optional argument.

```
\@ifundefined{\expandafter\@gobble\string#1\space}%
273
274
         \expandafter\@kernel@rename@newcommand
275
           \csname\expandafter\@gobble\string#1\space\endcsname

           \fi
           \noexpand\protect\expandafter\noexpand
285
           \csname\expandafter\@gobble\string#1\space\endcsname}%
286
       ጉ%
287
       {\@latex@info{The control sequence '\string#1' is already robust}}%
288
     ጉ%
     \escapechar=\count@
290
291 }%
```

\@kernel@rename@newcommand

This macro renames a command, possibly with an optional argument (defined with \newcommand) from #2 to #1, by renaming the internal macro \\#2 to \\#1 and defining \\#1 appropriately, then undefining \\#2 and \\\#2. The \afterassignment trick is to make both definitions in \\@copy@newcommand global (which are local by default).

In case the macro was defined with \newcommand and an optional argument, to replicate exactly the behaviour of \DeclareRobustCommand we have to move also the internal \\foo to \\foo\_\. In that case, #1 will be a parameterless macro (\robust@command@chk@safe checks that), and \@if@newcommand will return true (both defined below in this file). If so, we can use \@copy@newcommand rather than plain \let to copy the command over. \@kernel@rename@newcommand does this test and carries out the renaming.

#### \kernel@make@fragile

The opposite of \MakeRobust execpt that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if latexrelease requests a rollback of the kernel. For this reason we pretend that this command existed in all earler versions of IATEX i.e., we are not rolling it back since we need it precisely then. But we have to get it into the latexrelease file so that a roll forward is possible too.

```

# 1.5 Acting on robust commands

```
399 \(\/2ekernel\)
400 \(\lambda \text{latexrelease} \tag{2020-10-01}{\robust@command@act}\)
401 \(\lambda \text{latexrelease} \) \{\text{Add \robust@command@act}\}\'
402 \(\lambda \text{2ekernel | latexrelease}\)
```

(End definition for \kernel@make@fragile. This function is documented on page ??.)

With most document level commands being robust now there is more of a requirement to have a standard way of aliasing (or copying) a command to a new name, for example to save an original definition before changing a command. \DeclareCommandCopy is analogous to TeX's \let, except that it copes with the different types of robust commands defined by LATeX's mechanisms.

A couple of "types of robustness" are defined by the LATEX  $2\varepsilon$  kernel, namely robust commands defined with \DeclareRobustCommand and commands with optional arguments defined with \newcommand. However there are other types of robust commands that are frequently used, which are not defined in the LATEX  $2\varepsilon$  kernel, like commands defined with xparse's \NewDocumentCommand and etoolbox's \newrobustcmd.

In this section we will define a generic extensible machinery to act on robust commands. This code will then be used to test if a command is robust, considered the different types of robustness, and then either copy that definition, if \DeclareCommandCopy (or similar) is used, or show the definition of the command, if \ShowCommand is used.

The looping machinery is generic and knows nothing about what is to be done for each case. The syntax of the main macro \robust@command@act is:

```
\label{eq:commandQact} $$\operatorname{commandQact}(action-list)(robust-cmd)$$$ $$\langle fallback-action\rangle(act-arg)$$$$ $\langle action-list\rangle$ is a token list of the form: $$$ $\{\langle if\text{-}type\text{-}1\rangle \ \langle act\text{-}type\text{-}1\rangle \}$$$ $\{\langle if\text{-}type\text{-}2\rangle \ \langle act\text{-}type\text{-}2\rangle \}$$$}
```

\robust@command@act will iterate over the  $\langle action-list \rangle$ , evaluating each  $\langle if\text{-}type\text{-}n \rangle \langle robust\text{-}cmd \rangle \{\langle true \rangle\} + \langle if\text{-}type\text{-}n \rangle \rangle$  conditional returns  $\langle true \rangle$ , then  $\langle act\text{-}type\text{-}n \rangle \langle act\text{-}arg \rangle$  is executed, and the loop ends. If the conditional returns  $\langle false \rangle$ , then  $\langle if\text{-}type\text{-}n+1 \rangle$  is executed in the same way, until either one of the conditionals return  $\langle true \rangle$ , or the end of the  $\langle action\text{-}list \rangle$  is reached. If the end is reached, then  $\langle fallback\text{-}action \rangle \langle act\text{-}arg \rangle$  is executed before \robust@command@act exits.

\robust@command@act will start by using \robust@command@act@chk@args to check if the  $\langle robust\text{-}cmd \rangle$  (#2) is a parameterless (possibly \protected) macro. If it is not, the command is not a robust command: these always start with a parameterless user-level macro; in that case, \robust@command@act@end is used to short-circuit the process and do the  $\langle fallback\text{-}action \rangle$  (#3). This first test is necessary because later on we need to be

\robust@command@act

able to expand the  $\langle robust\text{-}cmd \rangle$  without the risk of it Breaking Badly, and as a bonus, this speeds up the process in case we used  $\ensuremath{\mathsf{NewCommandCopy}}$  in a "normal" macro.

```
403 \long\def\robust@command@act#1#2#3#4{%
404 \robust@command@chk@safe#2%
405 {\expandafter\robust@command@act@loop
406 \expandafter#2%
407 #1{\@nnil\@nnil}%
408 \robust@command@act@end}%
409 {\robust@command@act@end}%
410 {#3}{#4}}%
```

\robust@command@act@loop \robust@command@act@loop@aux \robust@command@act@do If \robust@command@act@chk@args branched to false, then \robust@command@act@loop will loop over the list of items in the  $\langle action-list \rangle$  (#1), and process each item as described earlier. If the  $\langle if$ -type- $n \rangle$  command expands to  $\langle true \rangle$  then \robust@command@act@do is used to execute  $\langle act$ -type- $n \rangle$  on the  $\langle act$ -arg  $\rangle$ , otherwise the loop resumes with the next item

```
\long\def\robust@command@act@loop#1#2{\robust@command@act@loop@aux#1#2}
412 \long\def\robust@command@act@loop@aux#1#2#3{%
     \int x^0 \pi dx
     \else
       #2{#1}%
415
         {\robust@command@act@do{#3}}%
416
         {\expandafter\robust@command@act@loop\expandafter#1}%

## 1.5.1 Copying robust commands

```
449 \(\frac{2ekernel}{\}\)
450 \(\lambda \text{latexrelease} \tag{10-10-01} \DeclareCommandCopy}\)
451 \(\lambda \text{latexrelease} \tag{10-10-01} \RenewCommandCopy, \RenewCommandCopy, \rangle \text{data} \text{latexrelease}\)
452 \(\lambda \text{*2ekernel} | \text{latexrelease} \rangle \text{*2ekernelease} | \text{latexrelease} | \text{latexrelease} | \text{latexrelease} | \text{latexrelease} | \
```

\NewCommandCopy \RenewCommandCopy \DeclareCommandCopy NewCommandCopy starts by checking if #1 is already defined, and raises an error if so, otherwise the definition is carried out. \RenewCommandCopy does (almost) the opposite. If the command is *not* defined, then an error is raised. But the definition is carried out anyhow, so the behaviour is consistent with \renewcommand.

A \ProvideCommandCopy isn't defined because it's not reasonably useful. \provide... commands mean "define this if there's no other definition", but copying a command (usually) implies that the command being copied is defined, so \ProvideCommandCopy doesn't make a lot of sense. But more importantly, the most common use case of copying a command is to redefine it later, while preserving the old definition, as in:

```
\ProvideComandCopy \A \B
\renewcommand \B { ... \A ... }
```

then, if  $\A$  is already defined the first line is skipped, an in this case  $\B$  won't work as expected.

The three versions call the internal  $\ensuremath{\mbox{\sc declare@commandcopy}}$  with the proper action.  $\ensuremath{\mbox{\sc defirstofone}}$  will carry out the copy. The only case when the copy is not made is the  $\ensuremath{\sc false}$  case for  $\ensuremath{\sc NewCommandCopy}$ , in which the command already exists and the definition is aborted.

```
453 \def\NewCommandCopy{%
     \declare@commandcopy
       {\@firstofone}%
455
       {\@firstoftwo\@notdefinable}}
  \def\RenewCommandCopy{%
     \declare@commandcopy
458
       {\@latex@error{Command \@backslashchar\reserved@a\space undefined}\@ehc
459
        \@firstofone}%
460
       {\@firstofone}}
461
  \def\DeclareCommandCopy{%
462
     \declare@commandcopy
463
       {\@firstofone}%
464
       {\@firstofone}}
```

Start by checking if the command is already defined. The proper action is taken by each specific command above. If all's good, then \robust@command@act is called with the proper arguments as described earlier, with \@declarecommandcopylisthook as the  $\langle action\mbox{-}list\rangle$  and \declare@commandcopy@let as the  $\langle fallback\mbox{-}action\rangle$ .

\declare@commandcopy

```
466 \long\def\declare@commandcopy#1#2#3#4{%
467 \edef\reserved@a{\@expl@cs@to@str@@N#3}%
468 \@ifundefined\reserved@a{#1}{#2}%
469 {\robust@command@act
470 \@declareCommandcopylisthook#4%
471 \declare@commandcopy@let{#3#4}}
```

The initial definition of \@declarecommandcopylisthook contains the tests for the two types of robust command in the kernel.

```
472 \def\@declarecommandcopylisthook{%
```

473 {\@if@DeclareRobustCommand \@copy@DeclareRobustCommand}%

74 {\@if@newcommand \@copy@newcommand}}

The initial definition of \@declarecommandcopylisthook contains the tests for the two types of robust command in the kernel.

475 \long\def\declare@commandcopy@let#1#2{\let#1=#2\relax}

\declare@commandcopy@let

\@declarecommandcopylisthook

Now the rollback code.

```

487 (\*2ekernel)

(End definition for \NewCommandCopy and others. These functions are documented on page ??.)

## 1.5.2 Showing robust commands

\ShowCommand

Most of the machinery defined for \NewCommandCopy can be used to show the definition of a robust command, in a similar fashion to texdef. The difference is that after the command's is detected to has a given type of robustness, rather than making a copy, we use a separate routine to show its definition.

With all the machinery in place, \ShowCommand itself is quite simple: use \robust@command@act to iterate through the \@showcommandlisthook list, and if nothing is found, fallback to \show.

\@showcommandlisthook

The initial definition of \@showcommandlisthook contains the same tests as used for copying, but \@show@... commands instead of \@copy@.... Same as before, it is initialised to cope with \DeclareRobustCommand and \newcommand with optional arguments.

```
496 \def\@showcommandlisthook{%
     {\@if@DeclareRobustCommand \@show@DeclareRobustCommand}%
     {\@if@newcommand \@show@newcommand}}
    Now the rollback code.

511 (latexrelease)
512 (*2ekernel | latexrelease)
```

#### 1.5.3 Commands defined with \DeclareRobustCommand

\@if@DeclareRobustCommand

Now that we provided a generic way to copy one macro to another, we need to define a way to check if a command is one of LATEX  $2\varepsilon$ 's robust types. These tests are heavily based on Heiko's \LetLtxMacro, but chopped into separate macros.

 $\label{lem:command} $$ \operatorname{Command \ cmd \ was \ defined \ by \ DeclareRobustCommand.}$$ The test returns true if the expansion of \cmd is exactly \protect\cmd_{\sqcup}.$ 

```
513 \long\def\@if@DeclareRobustCommand#1{%
     \begingroup
514
        \escapechar='\\
        \edef\reserved@a{\string#1}%
516
        \edef\reserved@b{\detokenize{#1}}%
517
        \xdef\@gtempa{%
518
          \ifx\reserved@a\reserved@b
519
              \noexpand\x@protect
520
              \noexpand#1%
521
          \fi
          \noexpand\protect
523
          \expandafter\noexpand\csname\@expl@cs@to@str@@N#1 \endcsname}%
524
525
     \endgroup
     \footnotemath{\mbox{ifx}\mbox{\mbox{\tt Qgtempa#1}relax}}
526
       \expandafter\@firstoftwo
527
528
       \expandafter\@secondoftwo
529
530
```

\@copy@DeclareRobustCommand \copy@kernel@robust@command If a command was defined by  $\DeclareRobustCommand$  (that is,  $\CifCDeclareRobustCommand$  returns true), then to make a copy of  $\cmalcolored$  into  $\cmalcolored$  we define the latter such that it expands to  $\cmalcolored$ , then make  $\cmalcolored$  equal to  $\cmalcolored$ .

There is one detail we need to take care of: if a command was defined with \DeclareRobustCommand it may still have an optional argument, in which case there is one more macro layer before the actual definition of the command. We use \@if@newcommand to check that and \@copy@newcommand to do the copying.

```
\long\def\@copy@DeclareRobustCommand#1#2{%
     \begingroup
532
       \escapechar='\\
       \edef\reserved@a{\string#1}%
534
       \edef\reserved@b{\detokenize{#1}}%
535
       \edef\reserved@a{%
536
     \endgroup
537
     \def\noexpand#1{%
       \ifx\reserved@a\reserved@b
          \noexpand\x@protect
540
          \verb|\noexpand#1%|
541
       \fi
542
       \noexpand\protect
543
       \expandafter\noexpand\csname\@expl@cs@to@str@@N#1 \endcsname}%
544
     \noexpand\copy@kernel@robust@command
545
       \expandafter\noexpand\csname\@expl@cs@to@str@@N#1 \endcsname
546
       \expandafter\noexpand\csname\@expl@cs@to@str@@N#2 \endcsname}%
     \reserved@a}
   \long\def\copy@kernel@robust@command#1#2{%
     \robust@command@chk@safe#2%
       {\@if@newcommand#2%
          {\@copy@newcommand}%
          {\declare@commandcopy@let}}
       {\declare@commandcopy@let}%
554
555
```

\@show@DeclareRobustCommand \show@kernel@robust@command Showing the command is pretty simple. This command prints the top-level expansion as TEX's \show would, but with robust macro: rather than just macro:, then a blank line and then \show the inner command. For a macro defined with, say, \DeclareRobustCommand\foo[1]{bar}, it will print:

```
> \foo=robust macro:
->\protect \foo .
> \foo =\long macro:
#1->bar.
```

If the inner command is defined with an optional argument, then \@show@newcommand is also used.

The value of \escapechar is deliberately not enforced, so \ShowCommand behaves more like \show.

```
\long\def\@show@DeclareRobustCommand#1{%

typeout{> \string#1=robust macro:}%

typeout{->\@expl@cs@replacement@spec@@N#1.^^J}%

expandafter\show@kernel@robust@command

\csname\@expl@cs@to@str@@N#1 \endcsname}
```

File f: ltdefns.dtx Date: 2020/08/21 Version v1.5m

```
561 \long\def\show@kernel@robust@command#1{%
562 \robust@command@chk@safe#1%
563 {\@if@newcommand#1%
564 {\@show@newcommand}%
565 {\show}}%
566 {\show}%
```

(End definition for \@if@DeclareRobustCommand and others. These functions are documented on page ??.)

## 1.5.4 Commands defined with \newcommand (with optional argument)

\@if@newcommand

A command  $\c d$  (or  $\c d$ , if it was defined with  $\c d$ ) with an optional argument will expand to  $\c d$ ). To check that we look at the first three tokens in the expansion of  $\c d$ , and return true or false accordingly.

This test requires that the command be a parameterless macro, otherwise it will not work (and probably break). This is ensured with \robust@command@chk@safe before calling \@if@newcommand.

```
\long\def\@if@newcommand#1{%
     \edef\reserved@a{%
569
       \noexpand\@protected@testopt
       \noexpand#1%
571
       \expandafter\noexpand\csname\@backslashchar\@expl@cs@to@str@@N#1\endcsname}%
572
     \edef\reserved@b{%
573

576
       \expandafter\@firstoftwo
     \else
578
       \expandafter\@secondoftwo
579
     \fi}
580
```

\@copy@newcommand

Then, if a command \cmd takes an optional argument, we copy it to \foo by defining the latter to expand to \@protected@testopt\foo\\foo{<opt>}.

```
\long\def\@copy@newcommand#1#2{%

ledef#1{\noexpand\@protected@testopt

noexpand#1%

expandafter\noexpand\csname\@backslashchar\@expl@cs@to@str@@N#1\endcsname

unexpanded\expandafter\expandafter

{\expandafter\@gobblethree#2}}%

expandafter

let\csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname

\csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname

\csname\@backslashchar\@expl@cs@to@str@@N#2\endcsname}
```

\@show@newcommand

A command being \shown here is guaranteed to have an optional argument. Start by showing the top-level expansion of the command (using \typeout to avoid TeX asking for interaction and extra context lines), then call \@show@newcommand@aux with the internal command, which contains the actual definition, and with the expansion of the command to extract the default value of the optional argument.

```
590 \long\def\@show@newcommand#1{%
591 \typeout{> \string#1=robust macro:}%
```

```
typeout{->\@expl@cs@replacement@spec@@N#1.^^J}%
   \expandafter\@show@newcommand@aux
   \csname\@backslashchar\@expl@cs@to@str@@N#1\expandafter\endcsname
   \expandafter{#1}}

For a macro defined with, say, \newcommand\foo[1][opt]{bar}, it will print:

> \foo=robust macro:
   ->\@protected@testopt \foo \\foo {opt}.

> \\foo=\long macro:
   default #1=opt.
[#1]->bar.
```

If the command was defined with  $\DeclareRobustCommand$ , then another pair of lines show the top-level expansion  $\protect_{\sqcup}\foo_{\sqcup\sqcup}$ .

The extra gymnastics with \showtokens ensures that \showtokens itself, and the internals of this macro aren't showed in the context lines.

```
\long\def\@show@newcommand@aux#1#2{%
     \typeout{> \string#1=\@expl@cs@prefix@spec@@N#1macro:}%
597
     \edef\reserved@a{%
598
       default \string##1=\expandafter\detokenize\@gobblethree#2.^^J%
       \@expl@cs@argument@spec@@N#1->\@expl@cs@replacement@spec@@N#1}%
     \showtokens\expandafter\expandafter\expandafter{\expandafter\reserved@a}}
    Now the rollback code.

659 \langle latexrelease \rangle \setminus EndIncludeInRelease
660 (*2ekernel)
```

(End definition for \@ifundefined. This function is documented on page ??.)

\Qqend The following define \Qqend and \Qqrelax to be the strings 'end' and 'relax' with the \Qqrelax characters \catcoded 12.

```
661 \edef\@qend{\expandafter\@cdr\string\end\@nil}
662 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

(End definition for \Qqued and \Qquedax. These functions are documented on page ??.)

\@ifnextchar

**\@ifnextchar** peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```
663 \long\def\@ifnextchar#1#2#3{%
664 \let\reserved@d=#1%
665 \def\reserved@a{#2}%
666 \def\reserved@b{#3}%
667 \futurelet\@let@token\@ifnch}
```

(End definition for \@ifnextchar. This function is documented on page ??.)

\kernel@ifnextchar

This macro is the kernel version of \@ifnextchar which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an fd file is loaded in a random place then the optional argument to \ProvidesFile could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the amsmath package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

668 \let\kernel@ifnextchar\@ifnextchar

(End definition for \kernel@ifnextchar. This function is documented on page ??.)

**\Oifnch \Oifnch** is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls xifnch.

```
\def\@ifnch{%
     \ifx\@let@token\@sptoken
670
       \let\reserved@c\@xifnch
671
     \else
672
       \ifx\@let.@t.oken\reserved@d
673
         \let\reserved@c\reserved@a
674
       \else
675
         \let\reserved@c\reserved@b
       \fi
677
     \fi
678
     \reserved@c}
```

(End definition for \@ifnch. This function is documented on page ??.)

\@sptoken

The following code makes \@sptoken a space token. It is important here that the control sequence \: consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a \let may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of \: as math medium space.

```
^{680} \ensuremath{\mbox{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{\mbox{$\sim$}}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mbox{$\sim$}}\ensuremath{\mb

into the definition.
                      681 \def\:{\@xifnch} \expandafter\def\: {\futurelet\@let@token\@ifnch}
                      (End definition for \@xifnch. This function is documented on page ??.)
                      The new implementation below avoids passing the \langle true\ code \rangle Through one more \def
           \@ifstar
                      than the \langle false\ code \rangle, which previously meant that # had to be written as #### in one
                      argument, but ## in the other. The * is gobbled by \@firstoftwo.
                       682 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}
                      (End definition for \ensuremath{\texttt{Qifstar}}. This function is documented on page \ref{eq:constraint}.)
           \@dblarg
          \@xdblarg
                      \long\def\@dblarg#1{\kernel@ifnextchar[{#1}{\@xdblarg{#1}}}
                      684 \long\def\@xdblarg#1#2{#1[{#2}]{#2}}
                      (End definition for \Odblarg and \Oxdblarg. These functions are documented on page ??.)
                      The command \@sanitize changes the catcode of all special characters except for braces
         \@sanitize
                      to 'other'. It can be used for commands like \index that want to write their arguments
                      verbatim. Needless to say, this command should only be executed within a group, or
                      chaos will ensue.
                       685 \def\@sanitize{\@makeother\ \@makeother\\\@makeother\$\@makeother\&%
                      686 \@makeother\#\@makeother\^\@makeother\_\@makeother\%\@makeother\~}
                      (End definition for \@sanitize. This function is documented on page ??.)
                      This makes the whole "meaning" of #1 (its one-level expansion) into catcode 12 tokens:
\@onelevel@sanitize
                      it could be used in \DeclareRobustCommand.
                           If it is to be used on default float specifiers, this should be done when they are
                      defined.
                       687 \def \@onelevel@sanitize #1{%
                           \edef #1{\expandafter\strip@prefix
                                     \meaning #1}%
                      689
                      690 }
                      (End definition for \ConelevelCsanitize. This function is documented on page ??.)
      \makeatletter Make internal control sequences accessible or inaccessible.
       \makeatother
                      692 \DeclareRobustCommand\makeatother{\catcode'\@12\relax}
```

(End definition for \makeatletter and \makeatother. These functions are documented on page ??.)

\@xifnch In the following definition of \@xifnch, \: is again used to get a space token as delimiter

## 2 Discretionary Hyphenation

\@dischyph

Moved here to be after the definition of \DeclareRobustCommand.

The primitive  $\$  command adds a discretionary hyphen using the current font's  $\$  hyphenchar. Monospace fonts are usually declared with  $\$  hyphenchar set to -1 to suppress hyhenation.

 $\LaTeX$ , from  $\LaTeX$ 2.09 in 1986 defined \- by

```
\def\-{\discretionary{-}{}}}
```

The following comment was added when these commands were first set up, 19 April 1986:

the  $\-$  command is redefined to allow it to work in the  $\t _{tfamily}$  type style, where automatic hyphenation is suppressed by setting  $\t _{tx}$  definition is saved as  $\t _{tx}$  definition is saved as  $\t _{tx}$  definition is saved as  $\t _{tx}$ 

IFTEX  $2_{\varepsilon}$ , between 1993 and 2017, had a comment at this point saying that the definition "would probably change" because the definition always uses –. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older LATEX definition accessible via latexrelease as usual.

In Lual $\mbox{L}\mbox{TEX}$  the primitive definition of  $\mbox{-}$  is used directly because it's use of extended hyphenation parameters means that  $\mbox{-}$  works correctly even with  $\mbox{hyphenchar}$  set to -1. This change makes  $\mbox{-}$  under Lual $\mbox{L}\mbox{TEX}$  compatible with language specific hyphenation characters.

Temporary definition of \@latex@info, final definition is later.

```

                                                                            Globally add to the end of a macro.
                                                                                776 \long\def\g@addto@macro#1#2{%}
                                                                                                      \begingroup
                                                                                                                \text{toks@expandafter}{#1#2}%
                                                                               778
                                                                                                                779
                                                                                                      \endgroup}
                                                                               780
                                                                             (End definition for \g@addto@macro. This function is documented on page ??.)
                                                                               781 (/2ekernel)
```

### Contents

### 1 Introduction

Hooks are points in the code of commands or environments where it is possible to add processing code into existing commands. This can be done by different packages that do not know about each other and to allow for hopefully safe processing it is necessary to sort different chunks of code added by different packages into a suitable processing order.

This is done by the packages adding chunks of code (via \AddToHook) and labeling their code with some label by default using the package name as a label.

At \begin{document} all code for a hook is then sorted according to some rules (given by \DeclareHookRule) for fast execution without processing overhead. If the hook code is modified afterwards (or the rules are changed), a new version for fast processing is generated.

Some hooks are used already in the preamble of the document. If that happens then the hook is prepared for execution (and sorted) already at that point.

## 2 Package writer interface

The hook management system is offered as a set of CamelCase commands for traditional  $\LaTeX$  2 $_{\mathcal{E}}$  packages (and for use in the document preamble if needed) as well as expl3 commands for modern packages, that use the L3 programming layer of  $\LaTeX$ . Behind the scenes, a single set of data structures is accessed so that packages from both worlds can coexist and access hooks in other packages.

## 2.1 Lagrangian 2.1 Lagrangian 2.2 interfaces

#### 2.1.1 Declaring hooks and using them in code

With two exceptions, hooks have to be declared before they can be used. The exceptions are hooks in environments (i.e., executed at \begin and \end) and hooks run when loading files, e.g. before and after a package is loaded, etc. Their hook names depend on the environment or the file name and so declaring them beforehand is difficult.

\NewHook

 $\NewHook {\langle hook \rangle}$ 

Creates a new  $\langle hook \rangle$ . If this is a hook provided as part of a package it is suggested that the  $\langle hook \rangle$  name is always structured as follows:  $\langle package-name \rangle / \langle hook-name \rangle$ . If necessary you can further subdivide the name by adding more / parts. If a hook name is already taken, an error is raised and the hook is not created.

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\NewReversedHook

 $\NewReversedHook \{\langle hook \rangle\}$ 

Like  $\$  declares a new  $\langle hook \rangle$ . the difference is that the code chunks for this hook are in reverse order by default (those added last are executed first). Any rules for the hook are applied after the default ordering. See sections 2.3 and 2.4 for further details.

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\NewMirroredHookPair

 $\label{local_noise} $$\operatorname{NewMirroredHookPair} \{\langle hook-1 \rangle\} \ \{\langle hook-2 \rangle\}$$ 

A shorthand for  $\ensuremath{\mbox{NewHook}}{\langle hook-1\rangle}\$  NewReversedHook ${\langle hook-2\rangle}$ .

The  $\langle hooks \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\UseHook

 $\UseHook \{\langle hook \rangle\}$ 

Execute the hook code inside a command or environment.

Before \begin{document} the fast execution code for a hook is not set up, so in order to use a hook there it is explicitly initialized first. As that involves assignments using a hook at those times is not 100% the same as using it after \begin{document}.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

\UseOneTimeHook

\UseOneTimeHook  $\{\langle hook \rangle\}$ 

Some hooks are only used (and can be only used) in one place, for example, those in \begin{document} or \end{document}. Once we have passed that point adding to the hook through a defined \\addto-cmd\\circ command (e.g., \AddToHook or \AtBeginDocument, etc.) would have no effect (as would the use of such a command inside the hook code itself). It is therefore customary to redefine \\addto-cmd\\circ to simply process its argument, i.e., essentially make it behave like \@firstofone.

\UseOneTimeHook does that: it records that the hook has been consumed and any further attempt to add to it will result in executing the code to be added immediately.

FMi: Maybe add an error version as well?

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

#### 2.1.2 Updating code for hooks

\AddToHook

```
\AddToHook {\langle hook \rangle} [\langle label \rangle] {\langle code \rangle}
```

Adds  $\langle code \rangle$  to the  $\langle hook \rangle$  labeled by  $\langle label \rangle$ . If the optional argument  $\langle label \rangle$  is not provided, if \AddToHook is used in a package/class, then the current package/class name is used, otherwise top-level is used (see section 2.1.3).

If there already exists code under the  $\langle label \rangle$  then the new  $\langle code \rangle$  is appended to the existing one (even if this is a reversed hook). If you want to replace existing code under the  $\langle label \rangle$ , first apply \RemoveFromHook.

The hook doesn't have to exist for code to be added to it. However, if it is not declared later then obviously the added  $\langle code \rangle$  will never be executed. This allows for hooks to work regardless of package loading order and enables packages to add to hook of other packages without worrying whether they are actually used in the current document. See section 2.1.5.

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\RemoveFromHook

```
\verb|\RemoveFromHook| \{\langle hook \rangle\} [\langle label \rangle]|
```

Removes any code labeled by  $\langle label \rangle$  from the  $\langle hook \rangle$ . If the optional argument  $\langle label \rangle$  is not provided, if  $\AddToHook$  is used in a package/class, then the current package/class name is used, otherwise top-level is used.

If the optional argument is \*, then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about!

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

In contrast to the voids relationship between two labels in a \DeclareHookrule this is a destructive operation as the labeled code is removed from the hook data structure, whereas the relationship setting can be undone by providing a different relationship later.

A useful application for this declaration inside the document body is when one wants to temporarily add code to hooks and later remove it again, e.g.,

```
\AddToHook{env/quote/before}{\small}
\begin{quote}
    A quote set in a smaller typeface
\end{quote}
...
\RemoveFromHook{env/quote/before}
... now back to normal for further quotes
```

Note that you can't cancel the setting with

```
\AddToHook{env/quote/before}{}
```

because that only "adds" a further empty chunk of code to the hook. Adding \normalsize would work but that means the hook then contained \small\normalsize which means to font size changes for no good reason.

The above is only needed if one wants to typeset several quotes in a smaller typeface. If the hook is only needed once then **\AddToHookNext** is simpler, because it resets itself after one use.

```
\AddToHookNext {\langle hook \rangle} {\langle code \rangle}
```

Adds  $\langle code \rangle$  to the next invocation of the  $\langle hook \rangle$ . The code is executed after the normal hook code has finished and it is executed only once, i.e. it is deleted after it was used.

Using the declaration is a global operation, i.e., the code is not lost, even if the declaration is used inside a group and the next invocation happens after the group. If the declaration is used several times before the hook is executed then all code is executed in the order in which it was declared.<sup>2</sup>

It is possible to nest declarations using the same hook (or different hooks), e.g.,

```
\label{local_decomposition} $$ \AddToHookNext{\langle hook \rangle} {\langle code-2 \rangle} $$
```

will execute  $\langle code-1 \rangle$  next time the  $\langle hook \rangle$  is used and at that point puts  $\langle code-2 \rangle$  into the  $\langle hook \rangle$  so that it gets executed on following time the hook is run.

A hook doesn't have to exist for code to be added to it. This allows for hooks to work regardless of package loading order. See section 2.1.5.

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

#### 2.1.3 Hook names and default labels

It is best practice to use  $\AddToHook$  in packages or classes without specifying a  $\langle label \rangle$  because then the package or class name is automatically used, which is helpful if rules are needed, and avoids mistyping the  $\langle label \rangle$ .

Using an explicit  $\langle label \rangle$  is only necessary in very specific situations, e.g., if you want to add several chunks of code into a single hook and have them placed in different parts of the hook (by providing some rules).

The other case is when you develop a larger package with several sub-packages. In that case you may want to use the same  $\langle label \rangle$  throughout the sub-packages in order to avoid that the labels change if you internally reorganize your code.

It is not enforced, but highly recommended that the hooks defined by a package, and the  $\langle labels \rangle$  used to add code to other hooks contain the package name to easily identify the source of the code chunk and to prevent clashes. This should be the standard practice, so this hook management code provides a shortcut to refer to the current package in the name of a  $\langle hook \rangle$  and in a  $\langle label \rangle$ . If  $\langle hook \rangle$  name or  $\langle label \rangle$  consist just of a single dot (.), or starts with a dot followed by a slash (./) then the dot denotes the  $\langle default\ label \rangle$  (usually the current package or class name—see \DeclareDefaultHookLabel). A "." or "./" anywhere else in a  $\langle hook \rangle$  or in  $\langle label \rangle$  is treated literally and is not replaced.

For example, inside the package mypackage.sty, the default label is mypackage, so the instructions:

```
\NewHook {./hook}
\AddToHook {./hook}[.]{code} % Same as \AddToHook{./hook}{code}
\AddToHook {./hook}[./sub]{code}
\DeclareHookRule{begindocument}{.}{before}{babel}
\AddToHook {file/after/foo.tex}{code}

are equivalent to:
\NewHook {mypackage/hook}
\AddToHook {mypackage/hook}[mypackage]{code}
```

 $<sup>^{2}</sup>$ There is no mechanism to reorder such code chunks (or delete them).

```
\AddToHook {mypackage/hook}[mypackage/sub]{code}
\DeclareHookRule{begindocument}{mypackage}{before}{babel}
\AddToHook {file/after/foo.tex}{code} % unchanged
```

The \(\lambda default \ label\)\) is automatically set to the name of the current package or class (using \(\mathbb{Q}\currname\)\). If \(\mathbb{Q}\currname\) is not set (because the hook command is used outside of a package, or the current file wasn't loaded with \(\mathbb{U}\sepackage\) or \(\documentclass\)\), then the top-level is used as the \(\delta default \ label\)\.

This syntax is available in all  $\langle label \rangle$  arguments and most  $\langle hook \rangle$ , both in the LATEX  $2\varepsilon$  interface, and the LATEX3 interface described in section 2.2.

Note, however, that the replacement of . by the \( \lambda default \label \rangle \) takes place when the hook command is executed, so actions that are somehow executed after the package ends will have the wrong \( \lambda default \label \rangle \) if the dot-syntax is used. For that reason, this syntax is not available in \UseHook (and \hook\_use:n) because the hook is most of the time used outside of the package file in which it was defined. This syntax is also not available in the hook conditionals \IfHookEmptyTF (and \hook\_if\_empty:nTF) and \IfHookExistsTF (and \hook\_if\_exist:nTF) because these conditionals are used in some performance-critical parts of the hook management code, and because they are usually used to refer to other package's hooks, so the dot-syntax doesn't make much sense.

In some cases, for example in large packages, one may want to separate it in logical parts, but still use the main package name as  $\langle label \rangle$ , then the  $\langle default\ label \rangle$  can be set using  $\Delta label$ 

\DeclareDefaultHookLabel

\DeclareDefaultHookLabel {\default label}}

Sets the  $\langle default\ label \rangle$  to be used in  $\langle label \rangle$  arguments. If  $\ensuremath{\texttt{Qcurrname}}$  is not used in the current package,  $\ensuremath{\texttt{Qcurrname}}$  is used instead. If  $\ensuremath{\texttt{Qcurrname}}$  is not set, the code is assumed to be in the main document, in which case top-level is used.

The effect of \DeclareDefaultHookLabel holds for the current file, and is reset to the previous value when the file is closed.

### 2.1.4 Defining relations between hook code

The default assumption is that code added to hooks by different packages is independent and the order in which it is executed is irrelevant. While this is true in many case it is obviously false in many others.

Before the hook management system was introduced packages had to take elaborate precaution to determine of some other package got loaded as well (before or after) and find some ways to alter its behavior accordingly. In addition is was often the user's responsibility to load packages in the right order so that code added to hooks got added in the right order and some cases even altering the loading order wouldn't resolve the conflicts.

With the new hook management system it is now possible to define rules (i.e., relationships) between code chunks added by different packages and explicitly describe in which order they should be processed.

\DeclareHookRule

 $\label{locality} $$ \DeclareHookRule $$ {\langle hook \rangle} {\langle label1 \rangle} {\langle relation \rangle} {\langle label2 \rangle} $$$ 

Defines a relation between  $\langle label1 \rangle$  and  $\langle label2 \rangle$  for a given  $\langle hook \rangle$ . If  $\langle hook \rangle$  is ?? this defines a default relation for all hooks that use the two labels, i.e., that have chunks of code labeled with  $\langle label1 \rangle$  and  $\langle label2 \rangle$ . Rules specific to a given hook take precedence over default rules that use ?? as the  $\langle hook \rangle$ .

Currently, the supported relations are the following:

before or  $\langle Code \text{ for } \langle label1 \rangle \text{ comes before code for } \langle label2 \rangle$ .

after or > Code for  $\langle label1 \rangle$  comes after code for  $\langle label2 \rangle$ .

incompatible-warning Only code for either  $\langle label1 \rangle$  or  $\langle label2 \rangle$  can appear for that hook (a way to say that two packages—or parts of them—are incompatible). A warning is raised if both labels appear in the same hook.

incompatible-error Like incompatible-error but instead of a warning a LATEX error is raised, and the code for both labels are dropped from that hook until the conflict is resolved.

voids Code for  $\langle label1 \rangle$  overwrites code for  $\langle label2 \rangle$ . More precisely, code for  $\langle label2 \rangle$  is dropped for that hook. This can be used, for example if one package is a superset in functionality of another one and therefore wants to undo code in some hook and replace it with its own version.

unrelated The order of code for  $\langle label1 \rangle$  and  $\langle label2 \rangle$  is irrelevant. This rule is there to undo an incorrect rule specified earlier.

There can only be a single relation between two labels for a given hook, i.e., a later \DeclareHookrule overwrites any previous delcaration.

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\ClearHookRule

 $\label{local_local_local} $$ \end{argune} $$ \clearHookRule{$\langle hook \rangle$} {\langle label1 \rangle} {\langle label2 \rangle} $$$ 

Syntactic sugar for saying that  $\langle label1 \rangle$  and  $\langle label2 \rangle$  are unrelated for the given  $\langle hook \rangle$ .

\DeclareDefaultHookRule

 $\label{locality} $$\DeclareDefaultHookRule{$\langle label1\rangle$} {\langle relation\rangle$} {\langle label2\rangle$}$$ 

This sets up a relation between  $\langle label1 \rangle$  and  $\langle label2 \rangle$  for all hooks unless overwritten by a specific rule for a hook. Useful for cases where one package has a specific relation to some other package, e.g., is incompatible or always needs a special ordering before or after. (Technically it is just a shorthand for using \DeclareHookRule with ?? as the hook name.)

Declaring default rules is only supported in the document preamble.<sup>3</sup>

The  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

#### 2.1.5 Querying hooks

Simpler data types, like token lists, have three possible states; they can:

• exist and be empty;

<sup>&</sup>lt;sup>3</sup>Trying to do so, e.g., via \DeclareHookRule with ?? has bad side-effects and is not supported (though not explicitly caught for performance reasons).

- exist and be non-empty; and
- not exist (in which case emptiness doesn't apply);

Hooks are a bit more complicated: they have four possible states. A hook may exist or not, and either way it may or may not be empty. This means that even a hook that doesn't exist may be non-empty.

This seemingly strange state may happen when, for example, package A defines hook A/foo, and package B adds some code to that hook. However, a document may load package B before package A, or may not load package A at all. In both cases some code is added to hook A/foo without that hook being defined yet, thus that hook is said to be non-empty, whereas it doesn't exist. Therefore, querying the existence of a hook doesn't imply its emptiness, neither does the other way around.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its "next" token list. The hook doesn't need to be declared to have code added to its code pool. A hook is said to exist when it was declared with \NewHook or some variant thereof.

\IfHookEmptyTF \*

 $\IfHookEmptyTF \{\langle hook \rangle\} \{\langle true\ code \rangle\} \{\langle false\ code \rangle\}$ 

Tests if the  $\langle hook \rangle$  is empty (i.e., no code was added to it using either \AddToHook or \AddToHookNext), and branches to either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  depending on the result.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

 $\IfHookExistsTF *$ 

 $\label{lem:linear_loss} $$ \left(\frac{hook}{Hook}\right) \ \left(\frac{code}{Hook}\right) \ \left(\frac{hook}{Hook}\right) \ \left(\frac{hook}{Hook}\right)$ 

Tests if the  $\langle hook \rangle$  exists (if it was created with either \NewHook, \NewReversedHook, or \NewMirroredHookPair), and branches to either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  depending on the result.

The existence of a hook usually doesn't mean much from the viewpoint of code that tries to add/remove code from that hook, since package loading order may vary, thus the creation of hooks is asynchronous to adding and removing code from it, so this test should be used sparingly.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

FMi: Would be helpful if we provide some use cases

#### 2.1.6 Displaying hook code

If one has to adjust the code execution in a hook using a hook rule it is helpful to get some information about the code associated with a hook, its current order and the existing rules.

\ShowHook

 $\ \ \ \ \{\langle hook \rangle\}\$ 

Displays information about the  $\langle hook \rangle$  such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

#### 2.1.7 Debugging hook code

\DebugHooksOn \DebugHooksOff \DebugHooksOn

Turn the debugging of hook code on or off. This displays changes made to the hook data structures. The output is rather coarse and not really intended for normal use.

### 2.2 L3 programming layer (expl3) interfaces

This is a quick summary of the  $\LaTeX$  programming interfaces for use with packages written in expl3. In contrast to the  $\LaTeX$   $2\varepsilon$  interfaces they always use mandatory arguments only, e.g., you always have to specify the  $\langle label \rangle$  for a code chunk. We therefore suggest to use the declarations discussed in the previous section even in expl3 packages, but the choice is yours.

\hook\_new:n
\hook\_new\_reversed:n
\hook\_new\_pair:nn

 $\hook_new:n\{\langle hook \rangle\}$ 

Creates a new  $\langle hook \rangle$  with normal or reverse ordering of code chunks. \hook\_new\_-pair:nn creates a pair of such hooks with  $\{\langle hook-2 \rangle\}$  being a reversed hook. If a hook name is already taken, an error is raised and the hook is not created.

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\hook\_use:n

 $\hook\_use:n \{\langle hook \rangle\}$ 

Executes the  $\{\langle hook \rangle\}$  code followed (if set up) by the code for next invocation only, then empties that next invocation code.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

\hook\_use\_once:n

 $\verb|\hook_use_once:n {|\langle hook \rangle|}|$ 

Changes the  $\{\langle hook \rangle\}$  status so that from now on any addition to the hook code is executed immediately. Then execute any  $\{\langle hook \rangle\}$  code already set up.

FMi: better L3 name?

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

\hook\_gput\_code:nnn

 $\begin{tabular}{ll} $$ \begin{tabular}{ll} $$ \begin{tabular}{ll} $$ \code:nnn $$ \{\langle hook \rangle\}$ & $$ \{\langle label \rangle\}$ & $$ \{\langle code \rangle\}$ & $$ \end{tabular}$ 

Adds a chunk of  $\langle code \rangle$  to the  $\langle hook \rangle$  labeled  $\langle label \rangle$ . If the label already exists the  $\langle code \rangle$  is appended to the already existing code.

If code is added to an external  $\langle hook \rangle$  (of the kernel or another package) then the convention is to use the package name as the  $\langle label \rangle$  not some internal module name or some other arbitrary string.

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\hook\_gput\_next\_code:nn

 $\verb|\hook_gput_next_code:nn {$\langle hook \rangle$} {\langle code \rangle$}$ 

Adds a chunk of  $\langle code \rangle$  for use only in the next invocation of the  $\langle hook \rangle$ . Once used it is gone.

This is simpler than \hook\_gput\_code:nnn, the code is simply appended to the hook in the order of declaration at the very end, i.e., after all standard code for the hook got executed.

Thus if one needs to undo what the standard does one has to do that as part of  $\langle code \rangle$ .

The  $\langle hook \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\hook\_gremove\_code:nn

 $\hook\_gremove\_code:nn {\langle hook \rangle} {\langle label \rangle}$ 

Removes any code for  $\langle hook \rangle$  labeled  $\langle label \rangle$ .

If the code for that  $\langle label \rangle$  wasn't yet added to the  $\langle hook \rangle$ , an order is set so that when some code attempts to add that label, the removal order takes action and the code is not added.

If the second argument is \*, then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about, so think twice before using that!

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3.

\hook\_gset\_rule:nnnn

 $\label{look_gset_rule:nnnn} $$ \langle hook \rangle $ {\langle label1 \rangle} {\langle relation \rangle} {\langle label2 \rangle} $$$ 

Relate  $\langle label1 \rangle$  with  $\langle label2 \rangle$  when used in  $\langle hook \rangle$ . See \DeclareHookRule for the allowed  $\langle relation \rangle$ s. If  $\langle hook \rangle$  is ?? a default rule is specified.

The  $\langle hook \rangle$  and  $\langle label \rangle$  can be specified using the dot-syntax to denote the current package name. See section 2.1.3. The dot-syntax is parsed in both  $\langle label \rangle$  arguments, but it usually makes sense to be used in only one of them.

\hook\_if\_empty\_p:n \*
\hook\_if\_empty:nTF \*

 $\label{look_if_empty:nTF} $$ \langle hook \rangle $ {\langle true\ code \rangle} $ {\langle false\ code \rangle} $$$ 

Tests if the  $\langle hook \rangle$  is empty (i.e., no code was added to it using either \AddToHook or \AddToHookNext), and branches to either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  depending on the result.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

```
\hook_if_exist_p:n *
\hook_if_exist:nTF *
```

```
\label{local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_loc
```

Tests if the  $\langle hook \rangle$  exists (if it was created with either \NewHook, \NewReversedHook, or \NewMirroredHookPair), and branches to either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  depending on the result.

FMi: what are the results for generic hooks that do not need to be declared?

The existence of a hook usually doesn't mean much from the viewpoint of code that tries to add/remove code from that hook, since package loading order may vary, thus the creation of hooks is asynchronous to adding and removing code from it, so this test should be used sparingly.

The  $\langle hook \rangle$  cannot be specified using the dot-syntax. A leading . is treated literally.

\hook\_debug\_on: \hook\_debug\_off:

\hook\_debug\_on:

Turns the debugging of hook code on or off. This displays changes to the hook data.

#### 2.3 On the order of hook code execution

Chunks of code for a  $\langle hook \rangle$  under different labels are supposed to be independent if there are no special rules set up that define a relation between the chunks. This means that you can't make assumptions about the order of execution!

Suppose you have the following declarations:

```
\NewHook{myhook}
\AddToHook{myhook} [packageA] {\typeout{A}}
\AddToHook{myhook} [packageB] {\typeout{B}}
\AddToHook{myhook} [packageC] {\typeout{C}}
```

then executing the hook with \UseHook will produce the typeout A B C in that order. In other words, the execution order is computed to be packageA, packageB, packageC which you can verify with \ShowHook{myhook}:

```
The hook 'myhook':

Code chunks:

packageA -> \typeout {A}

packageB -> \typeout {C}

Extra code next invocation:

---

Rules:
---

Execution order:

packageA, packageB, packageC
```

The reason is that the code chunks are internally saved in a property list and the initial order of such a property list is the order in which key-value pairs got added. However, that is only true if nothing other than adding happens!

Suppose, or example, you want to replace the code chunk for packageA, e.g.,

```
\RemoveFromHook{myhook}[packageA]
\AddToHook{myhook}[packageA]{\typeout{A alt}}
```

then your order becomes packageB, packageC, packageA because the label got removed from the property list and then re-added (at its end).

While that may not be too surprising, the execution order is also sometimes altered if you add a redundant rule, e.g. if you specify

#### \DeclareHookRule{myhook}{packageA}{before}{packageB}

instead of the previous lines we get

```
The hook 'myhook':

Code chunks:

packageA -> \typeout {A}

packageB -> \typeout {C}

Extra code next invocation:

---

Rules:

packageA|packageB with relation before

Execution order (after applying rules):

packageA, packageC, packageB
```

As you can see the code chunks are still in the same order, but in the execution order for the labels packageB and packageC have swapped places. The reason is that, with the rule there are two orders that satisfy it, and the algorithm for sorting happened to pick a different one compared to the case without rules (where it doesn't run at all as there is nothing to resolve). Incidentally, if we had instead specified the redundant rule

```
\DeclareHookRule{myhook}{packageB}{before}{label-3}
```

the execution order would not have changed.

In summary: it is not possible to rely on the order of execution unless there are rules that partially or fully define the order (in which you can rely on them being fulfilled).

### 2.4 The use of "reversed" hooks

You may have wondered why you can declare a "reversed" hook with \NewReversedHook and what that does exactly.

In short: the execution order of a reversed hook (without any rules!) is exactly reversed to the order you would have gotten for a hook declared with <code>\NewHook</code>.

This is helpful if you have a pair of hooks where you expect to see code added that involves grouping, e.g., starting an environment in the first and closing that environment in the second hook. To give a somewhat contrived example<sup>4</sup>, suppose there is a package adding the following:

```
\AddToHook{env/quote/before}[package-1]{\begin{itshape}} \AddToHook{env/quote/after} [package-1]{\end{itshape}}
```

As a result, all quotes will be in italics. Now suppose further that the user wants the quotes also in blue and therefore adds:

<sup>&</sup>lt;sup>4</sup>there are simpler ways to achieve the same effect.

```
\usepackage{color}
\AddToHook{env/quote/before}{\begin{color}{blue}}
\AddToHook{env/quote/after} {\end{color}}
```

Now if the env/quote/after hook would be a normal hook we would get the same execution order in both hooks, namely:

```
package-1, top-level
(or vice versa) and as a result, would get:
   \begin{itshape}\begin{color}{blue} ...
   \end{itshape}\end{color}
```

and an error message that \begin{color} ended by \end{itshape}. With env/quote/after declared as a reversed hook the execution order is reversed and so all environments are closed in the correct sequence and \ShowHook would give us the following output:

```
The hook 'env/quote/after':
  Code chunks:
    package-1 -> \end {itshape}
    top-level -> \end {color}
Extra code next invocation:
    ---
Rules:
    ---
Execution order (after reversal):
    top-level, package-1
```

The reversal of the execution order happens before applying any rules, so if you alter the order you will probably have to alter it in both hooks, not just in one, but that depends on the use case.

### 2.5 Difference between "normal" and "one-time" hooks

When executing a hook a developer has the choice of using either \UseHook or \UseOneTimeHook (or their expl3 equivalents \hook\_use:n and \hook\_use\_once:n). This choice affects how \AddToHook is handled after the hook has been executed for the first time.

With normal hooks adding code via \AddToHook means that the code chunk is added to the hook data structure and then used each time \UseHook is called.

With one-time hooks it this is handled slightly differently: After \UseOneTimeHook has been called, any further attempts to add code to the hook via \AddToHook will simply execute the  $\langle code \rangle$  immediately.

This has some consequences one needs to be aware of:

- If \(\langle code \rangle\) is added to a normal hook after the hook was executed and it is never
  executed again for one or the other reason, then this new \(\langle code \rangle\) will never be
  executed.
- In contrast if that happens with a one-time hook the  $\langle code \rangle$  is executed immediately.

In particular this means that construct such as

works for one-time hooks<sup>5</sup> (all three code chunks are executed one after another), but it makes little sense with a normal hook, because with a normal hook the first time \UseHook{myhook} is executed it would

- execute  $\langle code-1 \rangle$ ,
- then execute \AddToHook{myhook}{code-2} which adds the code chunk \( \code-2 \)\)
  to the hook for use on the next invocation,
- and finally execute  $\langle code-3 \rangle$ .

The second time  $\$ UseHook is called it would execute the above and in addition  $\langle code-2\rangle$  as that was added as a code chunk to the hook in the meantime. So each time the hook is used another copy of  $\langle code-2\rangle$  is added and so that code chunk is executed  $\langle \# \ of \ invocations \rangle - 1$  times.

### 2.6 Private LaTeX kernel hooks

There are a few places where it is absolutely essential for LATEX to function correctly that code is executed in a precisely defined order. Even that could have been implemented with the hook management (by adding various rules to ensure the appropriate ordering with respect to other code added by packages). However, this makes every document unnecessary slow, because there has to be sorting even through the result is predetermined. Furthermore it forces package writers to unnecessarily add such rules if they add further code to the hook (or break LATEX).

For that reason such code is not using the hook management, but instead private kernel commands directly before or after a public hook with the following naming convention:  $\ensuremath{\mbox{\tt Qkernel@before@}(hookname)}$  or  $\ensuremath{\mbox{\tt Qkernel@after@}(hookname)}$ . For example, in  $\ensuremath{\mbox{\tt hookname}}$  or  $\ensuremath{\mbox{\tt Gkernel@after@}(hookname)}$ .

```
\UseHook{enddocument}% \@kernel@after@enddocument
```

which means first the user/package-accessible enddocument hook is executed and then the internal kernel hook. As their name indicates these kernel commands should not be altered by third-party packages, so please refrain from that in the interest of stability and instead use the public hook next to it.<sup>6</sup>

### 2.7 Legacy $\LaTeX$ 2 $\varepsilon$ interfaces

 $\LaTeX$   $2\varepsilon$  offered a small number of hooks together with commands to add to them. They are listed here and are retained for backwards compatibility.

With the new hook management several additional hooks have been added to LATEX and more will follow. See the next section for what is already available.

<sup>&</sup>lt;sup>5</sup>This is sometimes used with \AtBeginDocument which is why it is supported.

<sup>&</sup>lt;sup>6</sup>As with everything in TEX there is not enforcement of this rule, and by looking at the code it is easy to find out how the kernel adds to them. The main reason of this section is therefore to say "please don't do that, this is unconfigurable code!"

\AtBeginDocument

 $AtBeginDocument [\langle label \rangle] \{\langle code \rangle\}$ 

If used without the optional argument  $\langle label \rangle$ , it works essentially like before, i.e., it is adding  $\langle code \rangle$  to the hook begindocument (which is executed inside \begin{document} \begin{document} \]. However, all code added this way is labeled with the label top-level if done outside of a package or class or with the package/class name if called inside such a file.

This way one can add further code to the hook using \AddToHook or \AtBeginDocument using a different label and explicitly order the code chunks as necessary, e.g., run some code before or after the top-level code. When using the optional argument the call is equivalent to running \AddToHook {begindocument}  $[\langle label \rangle]$  { $\langle code \rangle$ }.

For important packages with known order requirement we may over time add rules to the kernel (or to those packages) so that they work regardless of the loading-order in the document.

\AtEndDocument

 $\Lambda t End Document [\langle label \rangle] \{\langle code \rangle\}$ 

Like \AtBeginDocument but for the enddocument hook.

\AtBeginDvi

 $AtBeginDvi [\langle label \rangle] \{\langle code \rangle\}$ 

This hook is discussed in conjunction with the shipout hooks.

The few hooks that existed previously in LaTeX  $2\varepsilon$  used internally commands such as \@begindocumenthook and packages sometimes augemented them directly rather than working through \atBeginDocumement. For that reason there is currently support for this, that is, if the system detects that such an internal legacy hook command contains code it adds it to the new hook system under the label legacy so that it doesn't get lost.

However, over time the remaining cases of direct usage need updating because in one of the future release of LATEX we will turn this legacy support off, as it does unnecessary slow down the processing.

## 2.8 Lagrangian ETEX $2\varepsilon$ commands and environments augmented by hooks

intro to be written

#### 2.8.1 Generic hooks for all environments

Every environment  $\langle env \rangle$  has now four associated hooks coming with it:

- env/(env)/before This hook is executed as part of \begin as the very first action, in particular prior to starting the environment group. Its scope is therefore not restricted by the environment.
- env/\(\langle\)egin This hook is executed as part of \begin directly in front of the code
  specific to the environment start (e.g., the second argument of \newenvironment).
  Its scope is the environment body.
- env/(env)/end This hook is executed as part of \end directly in front of the code specific to the end of the environment (e.g., the third argument of \newenvironment).

env/\(\langle\)env/\(\delta\)fter This hook is executed as part of \(\langle\)end after the code specific to the environment end and after the environment group has ended. Its scope is therefore not restricted by the environment.

The hook is implemented as a reversed hook so if two packages add code to  $env/\langle env \rangle$ /before and to  $env/\langle env \rangle$ /after they can add surrounding environments and the order of closing them happens in the right sequence.

Generic environment hooks are never one-time hooks even with environments that are supposed to appear only once in a document.<sup>7</sup> In contrast to other hooks there is also no need to declare them using \NewHook.

The hooks are only executed if  $\lceil \langle env \rangle \rceil$  and  $\lceil \langle env \rangle \rceil$  is used. If the environment code is executed via low-level calls to  $\lceil \langle env \rangle \rceil$  and  $\lceil env \rangle \rceil$  (e.g., to avoid the environment grouping) they are not available. If you want them available in code using this method, you would need to add them yourself, i.e., write something like

#### \UseHook{env/quote/before}\quote

\endquote\UseHook{env/quote/after}

to add the outer hooks, etc.

\BeforeBeginEnvironment

 $\BeforeBeginEnvironment [\langle label \rangle] \{\langle code \rangle\}$ 

This declaration adds to the  $env/\langle env \rangle$ /before hook using by default the current package or class name as a label or top-level if used in the document directly.

\AtBeginEnvironment

 $AtBeginEnvironment [\langle label \rangle] \{\langle code \rangle\}$ 

Like \BeforeBeginEnvironment but adds to the env/ $\langle env \rangle$ /begin hook.

\AtEndEnvironment

\AtEndEnvironment  $[\langle label \rangle]$   $\{\langle code \rangle\}$ 

Like \BeforeBeginEnvironment but adds to the env/ $\langle env \rangle$ /end hook.

\AfterEndEnvironment

\AfterEndEnvironment  $[\langle label \rangle]$   $\{\langle code \rangle\}$ 

Like \BeforeBeginEnvironment but adds to the env/ $\langle env \rangle$ /after hook.

#### 2.8.2 Hooks provided by \begin{document}

Until 2020 \begin{document} offered exactly one hook that one could add to using \AtBeginDocument. Experiences over the years have shown that this single hook in one place was not enough and as part of adding the general hook management system a number of additional hooks have been added at this point. The places for these hooks have been chosen to provide the same support as offered by external packages, such as etoolbox and others that augmented \document to gain better control.

Supported are now the following hooks (all of them one-time hooks):

begindocument/before This hook is executed at the very start of \document, one can think of it as a hook for code at the end of the preamble section and this is how it is used by etoolbox's \AtEndPreamble.

<sup>&</sup>lt;sup>7</sup>Thus if one adds code to such hooks after the environment has been processed, it will only be executed if the environment appears again and if that doesn't happen the code will never get executed.

begindocument This hook is added to when using \AtBeginDocument and it is executed after the .aux file as be read in and most initialization are done, so they can be altered and inspected by the hook code. It is followed by a small number of further initializations that shouldn't be altered and are therefore coming later.

The hook should not be used to add material for typesetting as we are still in LATEX's initialization phase and not in the document body. If such material needs to be added to the document body use the next hook instead.

begindocument/end This hook is executed at the end of the \document code in other words at the beginning of the document body. The only command that follows it is \ignorespaces.

The generic hooks executed by \begin also exist, i.e., env/document/before and env/document/begin, but with this special environment it is better use the dedicated one-time hooks above.

#### 2.8.3 Hooks provided by \end{document}

LaTeX  $2\varepsilon$  always provided \atendDocument to add code to the execution of \end{document} just in front of the code that is normally executed there. While this was a big improvement over the situation in LaTeX 2.09 it was not flexible enough for a number of use cases and so packages, such as etoolbox, atveryend and others patched \enddocument to add additional points where code could be hooked into.

Patching using packages is always problematical as leads to conflicts (code availability, ordering of patches, incompatible patches, etc.). For this reason a number of additional hooks have been added to the **\endocument** code to allow packages to add code in various places in a controlled way without the need for overwriting or patching the core code.

Supported are now the following hooks (all of them one-time hooks):

enddocument The hook associated with \AtEndDocument. It is immediately called at the beginning of \enddocument.

When this hook is executed there may be still unprocessed material (e.g., floats on the deferlist) and the hook may add further material to be typeset. After it, \clearpage is called to ensure that all such material gets typeset. If there is nothing waiting the \clearpage has no effect.

enddocument/afterlastpage As the name indicates this hook should not receive code that generates material for further pages. It is the right place to do some final housekeeping and possibly write out some information to the .aux file (which is still open at this point to receive data). It is also the correct place to set up any testing code to be run when the .aux file is re-read in the next step.

After this hook has been executed the .aux file is closed for writing and then read back in to do some tests (e.g., looking for missing references or duplicated labels, etc.).

enddocument/afteraux At this point, the .aux file has been reprocessed and so this is a possible place for final checks and display of information to the user. However, for the latter you might prefer the next hook, so that your information is displayed after the (possibly longish) list of files if that got requested via \listfiles.

enddocument/info This hook is meant to receive code that write final information messages to the terminal. It follows immediately after the previous hook (so both could have been combined, but then packages adding further code would always need to also supply an explicit rule to specify where it should go.

This hook already contains some code added by the kernel (under the labels kernel/filelist and kernel/warnings), namely the list of files when \listfiles has been used and the warnings for duplicate labels, missing references, font substitutions etc.

enddocument/end Finally, this hook is executed just in front of the final call to \@@end.

There is also the hook shipout/lastpage. This hook is executed as part of the last \shipout in the document to allow package to add final \special's to that page. Where this hook is executed in relation to those from the above list can vary from document to document. Furthermore to determine correctly which of the \shipouts is the last one, IATEX needs to be run several times, so initially it might get executed on the wrong page. See section 2.8.4 for where to find the details.

It is in also possible to use the generic env/document/end hook which is execuded by \end, i.e., just in front of the first hook above. Note however that the other generic \end environment hook, i.e., env/document/after will never get executed, because by that time LATFX has finished the document processing.

#### 2.8.4 Hooks provided \shipout operations

There are several hooks and mechanisms added to LATEX's process of generating pages. These are documented in ltshipout-doc.pdf or with code in ltshipout-code.pdf.

#### 2.8.5 Hooks provided by file loading operations

There are several hooks added to LATEX's process of loading file via its high-level interfaces such as \input, \include, \usepackage, etc. These are documented in ltfilehook-doc.pdf or with code in ltfilehook-code.pdf.

#### 2.8.6 Hooks provided in NFSS commands

In languages that need to support for more than one script in parallel (and thus several sets of fonts), e.g., Latin and Japanese fonts, NFSS font commands, such as \sffamily, need to switch both the Latin family to "Sans Serif" and in addition alter a second set of fonts.

To support this several NFSS have hooks in which such support can be added.

rmfamily After \rmfamily has done its initial checks and prepared a any font series update this hook is executed and only afterwards \selectfont.

sffamily Like the rmfamily hook but for the \sffamily command.

ttfamily Like the rmfamily hook but for the \ttfamily command.

normalfont The \normalfont command resets font encoding family series and shape to their document defaults. It then executes this hook and finally calls \selectfont.

expand@font@defaults The internal \expand@font@defaults command expands and saves the current defaults for the meta families (rm/sf/tt) and the meta series (bf/md). If the NFSS machinery has been augmented, e.g., for Chinese or Japanese fonts, then further defaults may need to be set at this point. This can be done in this hook which is executed at the end of this macro.

bfseries/defaults, bfseries If the \bfdefault was explicitly changed by the user its new value is used to set the bf series defaults for the meta families (rm/sf/tt) when \bfseries is called. In the bfseries/defaults hook further adjustments can be made in this case. This hook is only executed if such a change is detected. In contrast the bfseries hook is always executed just before \selectfont is called to change to the new series.

mdseries/defaults, mdseries These two hooks are like the previous ones but used in \mdseries command.

## 3 The Implementation

### 3.1 Loading further extensions

```
1 (@@=hook)
```

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

```
2 (*2ekernel|latexrelease)
3 (latexrelease)\IncludeInRelease{2020/10/01}%
4 (latexrelease) {\NewHook}{The hook management}%
5 \ExplSyntaxOn
```

#### 3.2 Debugging

```
Holds the current debugging state.
\g__hook_debug_bool
                        6 \bool_new:N \g__hook_debug_bool
                      (End definition for \g_hook_debug_bool.)
    \hook_debug_on: Turns debugging on and off by redefining \__hook_debug:n.
   \hook_debug_off:
                        7 \cs_new_eq:NN \__hook_debug:n \use_none:n
    \__hook_debug:n
                        8 \cs_new_protected:Npn \hook_debug_on:
  _hook_debug_gset:
                              \bool_gset_true:N \g__hook_debug_bool
                              \__hook_debug_gset:
                       12
                           }
                         \verb|\cs_new_protected:Npn \hook_debug_off:
                       13
                           {
                       14
                              \bool_gset_false:N \g_hook_debug_bool
                       15
                              \__hook_debug_gset:
                       16
                           }
                       17
                          \cs_new_protected:Npn \__hook_debug_gset:
                       18
                       19
                           {
                              \cs_gset_protected:Npx \__hook_debug:n ##1
                       20
                                { \bool_if:NT \g_hook_debug_bool {##1} }
                       21
                            }
                      (End definition for \hook_debug_on: and others. These functions are documented on page 108.)
```

### 3.3 Borrowing from internals of other kernel modules

```
\_hook_str_compare:nn
                             Private copy of \__str_if_eq:nn
                              _{23} \cs_new_eq:NN \__hook_str_compare:nn \__str_if_eq:nn
                              (End definition for \__hook_str_compare:nn.)
                              3.4
                                    Declarations
                             Scratch boolean used throughout the package.
        \l__hook_tmpa_bool
                              24 \bool_new:N \l__hook_tmpa_bool
                              (End definition for \l_hook_tmpa_bool.)
        \l_hook_return_tl Scratch variables used throughout the package.
          \l_hook_tmpa_tl
                              25 \tl_new:N \l__hook_return_tl
          \l_hook_tmpb_tl
                              26 \tl_new:N \l__hook_tmpa_tl
                              27 \tl_new:N \l__hook_tmpb_tl
                              (End\ definition\ for\ \l_hook\_return\_tl, \l_hook\_tmpa\_tl, and \l_hook\_tmpb\_tl.)
          \g_hook_all_seq In a few places we need a list of all hook names ever defined so we keep track if them in
                              this sequence.
                               28 \seq_new:N \g_hook_all_seq

### 3.5 Providing new hooks

```
\g_hook_..._code_prop
\g_hook_..._code_tl
\g_hook_..._code_next_tl
```

Hooks have a  $\langle name \rangle$  and for each hook we have to provide a number of data structures. These are

- \g\_hook\_\(\name\)\_code\_prop A property list holding the code for the hook in separate chunks. The keys are by default the package names that add code to the hook, but it is possible for packages to define other keys.
- $\g_{name}\rule_{\alpha}label1\alpha|\alpha}label2\$ tl A token list holding the relation between  $\langle label1\alpha|$  and  $\langle label2\alpha|$  in the  $\langle name \rangle$ . The  $\langle labels \rangle$  are lexically (reverse) sorted to ensure that two labels always point to the same token list. For global rules, the  $\langle name \rangle$  is  $\ref{name}$  is  $\ref{name}$ ?
- \g\_hook\_\(name\)\_code\_tl The code that is actually executed when the hook is called in the document is stored in this token list. It is constructed from the code chunks applying the information.
- $\g_{\text{hook}_{\text{name}}_{\text{preversed}_{\text{tl}}}$  Some hooks are "reversed". This token list stores a for such hook so that it can be identified. The character is used because  $\langle reversed \rangle 1$  is +1 for normal hooks and -1 for reversed ones.
- \g\_hook\_\(\name\)\_code\_next\_tl Finally there is extra code (normally empty) that is used on the next invocation of the hook (and then deleted). This can be used to define some special behavior for a single occasion from within the document. This token list is called code\_next rather than next\_code because otherwise a hook called \(\lamble\name\)\_next would have its code-token list named \(\sigma\_n\)\_hook\_\(\lamble\name\)\_-code\_next\_tl, which would clash with the next code-token list of a hook called \(\lamble\name\).

```
(End\ definition\ for\ \g_hook_...\_code\_prop\ ,\ \g_hook_...\_code\_t1\ ,\ and\ \g_hook_...\_code\_next\_t1.)
```

\hook\_new:n The \hook\_new:n declaration declare a new hook and expects the hook  $\langle name \rangle$  as its argument, e.g., begindocument.

We check for one of the internal data structures and if it already exists we complain.

```
43 \hook_if_exist:nTF {#1}
44 {\msg_error:nnn { hooks } { exists } {#1} }
```

Otherwise we add the hook name to the list of all hooks and allocate the necessary data structures for the new hook.

```
{ \seq_gput_right: Nn \g_hook_all_seq {#1}
```

This is only used by the actual code of the current hook, so declare it normally:

```
\tl_new:c { g_hook_#1_code_tl }
```

Now ensure that the base data structure for the hook exists:

```
\_hook_declare:n {#1}
```

The \g\_hook\_\(hook\)\_labels\_clist holds the sorted list of labels (once it got sorted). This is used only for debugging.

```
\clist_new:c {g_hook_#1_labels_clist}
```

Some hooks should reverse the default order of code chunks. To signal this we have a token list which is empty for normal hooks and contains a - for reversed hooks.

```
\tl_new:c { g_hook_#1_reversed_tl }
```

The above is all in L3 convention, but we also provide an interface to legacy IAT<sub>F</sub>X  $2\varepsilon$ hooks of the form \@...hook, e.g., \@begindocumenthook. there have been a few of them and they have been added to using \g@addto@macro. If there exists such a macro matching the name of the new hook, i.e., \@\(hook-name\)\hook and it is not empty then we add its contents as a code chunk under the label legacy.

#### Warning: this support will vanish in future releases!

```
\__hook_include_legacy_code_chunk:n {#1}
50
51
52 }
```

(End definition for \hook\_new:n. This function is documented on page 106.)

This function declares the basic data structures for a hook without actually declaring the hook itself. This is needed to allow adding to undeclared hooks. Here it is unnecessary to check whether both variables exist, since both are declared at the same time (either both exist, or neither).

```
53 \cs_new_protected:Npn \__hook_declare:n #1
    {
54
      \_hook_if_exist:nF {#1}
55
56
           \prop_new:c { g_hook_#1_code_prop }
57
           \tl_new:c { g__hook_#1_code_next_tl }
58
59
    }
60
```

(End definition for \\_\_hook\_declare:n.)

\hook\_new\_reversed:n Declare a new hook. The default ordering of code chunks is reversed, signaled by setting the token list to a minus sign.

```
61 \cs_new_protected:Npn \hook_new_reversed:n #1 {
    \hook_new:n {#1}
```

If the hook already exists the above will generate an error message, so the next line should be executed (but it is — too bad).

```
\tl_gset:cn { g_hook_#1_reversed_tl } { - }
64 }
```

File g: lthooks.dtx

(End definition for \hook\_new\_reversed:n. This function is documented on page 106.)

\hook new pair:nn A shorthand for declaring a normal and a (matching) reversed hook in one go.

```
65 \cs_new_protected:Npn \hook_new_pair:nn #1#2 {
    \hook_new:n {#1} \hook_new_reversed:n {#2}
```

(End definition for \hook\_new\_pair:nn. This function is documented on page 106.)

\ hook include legacy code chunk:n

The LATEX legacy concept for hooks uses with hooks the following naming scheme in the  $code: \c ... hook.$ 

If this macro is not empty we add it under the label legacy to the current hook and then empty it globally. This way packages or classes directly manipulating commands such as \@begindocumenthook still get their hook data added.

#### Warning: this support will vanish in future releases!

```
68 \cs_new_protected:Npn \__hook_include_legacy_code_chunk:n #1
```

If the expl3 code is run with checking on then assigning or using non L3 names such as \@enddocumenthook with expl3 functions will trigger warnings so we run this code with debugging explicitly suspended.

\debug\_suspend:

If the macro doesn't exist (which is the usual case) then nothing needs to be done.

```
\tl_if_exist:cT { @#1hook }
```

Of course if the legacy hook exists but is empty, there is no need to add anything under legacy the legacy label.

```
\tl_if_empty:cF { @#1hook }
74
              \exp_args:Nnnv \__hook_hook_gput_code_do:nnn {#1}
                                     { legacy } { @#1hook }
```

Once added to the hook, we need to clear it otherwise it might get added again later if the hook data gets updated.

```
\tl_gclear:c { @#1hook }
78
         }
79
       \debug_resume:
80
```

(End definition for \\_\_hook\_include\_legacy\_code\_chunk:n.)

#### 3.6 Parsing a label

\ hook parse label default:nn

This macro checks if a label was given (not \c\_novalue\_t1), and if so, tries to parse the \\_hook\_parse\_label\_default: Vn label looking for a leading . to replace for \@currname. Otherwise \\_\_hook\_currname\_or\_default:n is used to pick \@currname or the fallback value.

```
82 \cs_new:Npn \__hook_parse_label_default:nn #1 #2
    {
      \tl_if_novalue:nTF {#1}
84
        { \_hook_currname_or_default:n {#2} }
```

```
{ \tl_trim_spaces_apply:nN {#1} \__hook_parse_dot_label:nn {#2} }

87     }

88 \cs_generate_variant:Nn \__hook_parse_label_default:nn { V }

(End definition for \__hook_parse_label_default:nn.)
```

 Start by checking if the label is empty, which raises an error, and uses the fallback value. If not, split the label at a ./, if any, and check if no tokens are before the ./, or if the only character is a .. If these requirements are fulfilled, the leading . is replaced with \\_hook\_currname\_or\_default:n. Otherwise the label is returned unchanged.

```
89 \cs_new:Npn \__hook_parse_dot_label:nn #1 #2
     {
90
       \tl_if_empty:nTF {#1}
91
         {
92
            \msg_expandable_error:nnn { hooks } { empty-label } {#2}
93
           #2
94
         }
95
         {
96
            \str_if_eq:nnTF {#1} { . }
97
              { \_hook_currname_or_default:n {#1} }
              { \_hook_parse_dot_label:nw {#2} #1 ./ \s_hook_mark }
100
     }
   \cs_new:Npn \__hook_parse_dot_label:nw #1 #2 ./ #3 \s__hook_mark
102
103
       \tl_if_empty:nTF {#2}
104
         { \_hook_parse_dot_label_aux:nw {#1} #3 \s_hook_mark }
105
106
            \tl_if_empty:nTF {#3}
107
              {#2}
              { \_hook_parse_dot_label_cleanup:w #2 ./ #3 \s_hook_mark }
109
110
     }
   \cs_new:Npn \__hook_parse_dot_label_cleanup:w #1 ./ \s__hook_mark {#1}
   \cs_new:Npn \__hook_parse_dot_label_aux:nw #1 #2 ./ \s__hook_mark
     { \_hook_currname_or_default:n {#1} / #2 }
(End\ definition\ for\ \_\ hook\_parse\_dot\_label:nn\ and\ others.)
```

\\_\_hook\_currname\_or\_default:n

Uses \g\_hook\_hook\_curr\_name\_tl if it is set, otherwise tries \@currname. If neither is set, uses the fallback value #1 (usually top-level).

(End definition for \\_\_hook\_currname\_or\_default:n.)

File g: lthooks.dtx

\hook\_gput\_code:nnn

\\_\_hook\_gput\_code:nnn \\_\_hook\_gput\_code:nxv \\_hook\_hook\_gput\_code\_do:nnn With  $\hook_gput_code:nnn\{\langle hook\rangle\}\{\langle label\rangle\}\{\langle code\rangle\}\$  a chunk of  $\langle code\rangle$  is added to an existing  $\langle hook\rangle$  labeled with  $\langle label\rangle$ .

First check if the current  $\langle hook \rangle / \langle label \rangle$  pair was marked for removal, in which case \\_\_hook\_unmark\_removal:nn is used to remove that mark (once). This may happen when a package removes code from another package which was not yet loaded: the removal order is stored, and at this stage it is executed by not adding to the hook.

If no removal is queued, we are free to add. Start by checking if the hook exists.

```
\hook_if_exist:nTF {#1}
```

If so we simply add (or append) the new code to the property list holding different chunks for the hook. At \begin{document} this is then sorted into a token list for fast execution.

```
137 {
138 \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}
```

However, if there is an update within the document we need to alter this execution code which is done by \\_\_hook\_update\_hook\_code:n. In the preamble this does nothing.

If the hook does not exist, however, before giving up try to declare it as a generic hook, if its name matches one of the valid patterns.

This macro will unconditionally add a chunk of code to the given hook.

```
145 \cs_new_protected:Npn \__hook_hook_gput_code_do:nnn #1 #2 #3
146 {
```

However, first some debugging info if debugging is enabled:

```
\_hook_debug:n{\iow_term:x{****~ Add~ to~

\hook_if_exist:nF {#1} { undeclared~ }

hook~ #1~ (#2)

\on@line\space <-~ \tl_to_str:n{#3}} }
```

Then try to get the code chunk labeled #2 from the hook. If there's code already there, then append #3 to that, otherwise just put #3.

(End definition for \hook\_gput\_code:nnn, \\_hook\_gput\_code:nnn, and \\_hook\_hook\_gput\_code\_-do:nnn. This function is documented on page 107.)

\ hook gput undeclared hook:nnn

Often it may happen that a package A defines a hook foo, but package B, that adds code to that hook, is loaded before A. In such case we need to add code to the hook before its declared.

```
158 \cs_new_protected:Npn \__hook_gput_undeclared_hook:nnn #1 #2 #3
159 {
160 \__hook_declare:n {#1}
161 \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}
162 }
```

(End definition for \\_\_hook\_gput\_undeclared\_hook:nnn.)

\\_hook\_try\_declaring\_generic\_hook:nnn \\_hook\_try\_declaring\_generic\_next\_hook:nn These entry-level macros just pass the arguments along to the common \\_hook\_try\_-declaring\_generic\_hook:nNNnn with the right functions to execute when some action is to be taken.

The wrapper \\_hook\_try\_declaring\_generic\_hook:nnn then defers \hook\_-gput\_code:nnn if the generic hook was declared, or to \\_hook\_gput\_undeclared\_-hook:nnn otherwise (the hook was tested for existence before, so at this point if it isn't generic, it doesn't exist).

The wrapper \\_\_hook\_try\_declaring\_generic\_next\_hook:nn for next-execution hooks does the same: it defers the code to \hook\_gput\_next\_code:nn if the generic hook was declared, or to \\_\_hook\_gput\_next\_do:nn otherwise.

```
\cs_new_protected:Npn \__hook_try_declaring_generic_hook:nnn #1
    {
164
         _hook_try_declaring_generic_hook:nNNnn {#1}
165
166
         \hook_gput_code:nnn \__hook_gput_undeclared_hook:nnn
167
   \cs_new_protected:Npn \__hook_try_declaring_generic_next_hook:nn #1
168
    {
169
         _hook_try_declaring_generic_hook:nNNnn {#1}
170
         \hook_gput_next_code:nn \__hook_gput_next_do:nn
    }
```

\\_hook\_try\_declaring\_generic\_hook:nNNnn now splits the hook name at the first / (if any) and first checks if it is a file-specific hook (they require some normalization) using \\_hook\_if\_file\_hook:wTF. If not then check it is one of a predefined set for generic names. We also split off the second component to see if we have to make a reversed hook. In either case the function returns  $\langle true \rangle$  for a generic hook and  $\langle false \rangle$  in other cases.

\\_hook\_try\_declaring\_generic\_hook:nNNnn hook\_try\_declaring\_generic\_hook\_split:nNNnn \ hook try declaring generic hook:wn<u>TF</u>

```
183
         _hook_try_declaring_generic_hook:wnTF #1 / / / \scan_stop: {#1}
184
         { #2 }
185
         { #3 } {#1}
186
     }
187
   \prg_new_protected_conditional:Npnn \__hook_try_declaring_generic_hook:wn
188
       #1 / #2 / #3 / #4 \scan_stop: #5 { TF }
189
190
       \tl_if_empty:nTF {#2}
191
         { \prg_return_false: }
192
            \prop_if_in:NnTF \c__hook_generics_prop {#1}
194
195
                \hook_if_exist:nF {#5} { \hook_new:n {#5} }
```

After having declared the hook we check the second component (for file hooks) or the third component for environment hooks) and if it is on the list of components for which we should have declared a reversed hook we alter the hook data structure accordingly.

Now that we know that the hook is declared we can add the code to it.

(End definition for \\_\_hook\_try\_declaring\_generic\_hook:nnn and others.)

\\_\_hook\_if\_file\_hook\_p:w
\\_ hook\_if\_file\_hook:wTF

\\_hook\_if\_file\_hook:wTF checks if the argument is a valid file-specific hook (not, for example, file/before, but file/before/foo.tex). If it is a file-specific hook, then it executes the \(\lambda true\rangle\) branch, otherwise \(\lambda false \rangle\).

A file-specific hook is  $file/\langle position \rangle/\langle name \rangle$ . If any of these parts don't exist, it is a general file hook or not a file hook at all, so the conditional evaluates to  $\langle false \rangle$ . Otherwise, it checks that the first part is file and that the  $\langle position \rangle$  is in the  $\c_--hook\_generics\_file\_prop$ .

A property list is used here to avoid having to worry with catcodes, because expl3's file name parsing turns all characters into catcode-12 tokens, which might differ from hand-input letters.

```
{ \prg_return_true: }
                                                                      219
                                                                                                              { \prg_return_false: }
                                                                                          }
                                                                                               \prg_return_false: }
                                                                                 }
                                                                      224
                                                                      (End definition for \__hook_if_file_hook:wTF.)
                    \ hook file hook normalize:n

                                                                      (\mathit{End} \ \mathit{definition} \ \mathit{for} \ \texttt{\c_hook\_generics\_reversed\_ii\_prop}, \ \texttt{\c_hook\_generics\_reversed\_iii\_prop}, \ \texttt
                                                                      and \c_hook_generics_file_prop.)
                 \hook_gremove_code:nn
                                                                     With \hook_gremove\_code:nn{\langle hook \rangle}{\langle label \rangle} any code for \langle hook \rangle stored under \langle label \rangle
            \__hook_gremove_code:nn
                                                                     is removed.
```

\cs\_new\_protected:Npn \hook\_gremove\_code:nn #1 #2

{ \\_hook\_parse\_label\_default:nn {#1} { top-level } }

\exp\_args:Nxx \\_\_hook\_gremove\_code:nn

\prop\_if\_in: NnTF \c\_\_hook\_generics\_file\_prop {#2}

240 241

242

{

```
{ \_hook_parse_label_default:nn {#2} { top-level } }

245 }

246 \cs_new_protected:Npn \_hook_gremove_code:nn #1 #2

247 {
```

First check that the hook code pool exists. \hook\_if\_exist:nTF isn't used here because it should be possible to remove code from a hook before its defined (see section 2.1.5).

```
248 \__hook_if_exist:nTF {#1}
```

Then remove the chunk and run \\_hook\_update\_hook\_code:n so that the execution token list reflects the change if we are after \begin{document}.

Check if the label being removed exists in the code pool. If it does, just call \\_\_hook\_-gremove code do:nn to do the removal, otherwise mark it to be removed.

Finally update the code, if the hook exists.

If the code pool for this hook doesn't exist it means that nothing tried to add to it before, so we just queue this removal order for later.

```
261 { \_hook_mark_removal:nn {#1} {#2} }
262 }
```

```
263 \cs_new_protected:Npn \__hook_gremove_code_do:nn #1 #2
264 { \prop_gremove:cn { g__hook_#1_code_prop } {#2} }
```

(End definition for  $\hook\_gremove\_code:nn$ ,  $\hook\_gremove\_code:nn$ , and  $\hook\_gremove\_code\_do:nn$ . This function is documented on page 107.)

\\_\_hook\_mark\_removal:nn

\ hook gremove code do:nn

Marks  $\langle label \rangle$  (#2) to be removed from  $\langle hook \rangle$  (#1). The number of removals should be fairly small, and  $\t1_gremove\_once:Nx$  is fairly efficient even for longer token lists, so we use a single global token list, rather than one for each hook.

\\_\_hook\_unmark\_removal:nn

Unmarks  $\langle label \rangle$  (#2) to be removed from  $\langle hook \rangle$  (#1). \tl\_gremove\_once:Nx is used rather than \tl\_gremove\_all:Nx so that two additions are needed to cancel two marked removals, rather than only one.

\_hook\_if\_marked\_removal:nnTF

Checks if the  $\g_hook_removal_list_tl$  contains the current  $\langle label \rangle$  (#2) and  $\langle hook \rangle$  (#1).

```
275 \prg_new_protected_conditional:Npnn \__hook_if_marked_removal:nn #1 #2 { TF }
276 {
277    \exp_args:NNx \tl_if_in:NnTF \g__hook_removal_list_tl
278    { \__hook_removal_tl:nn {#1} {#2} }
279    { \prg_return_true: } { \prg_return_false: }
280 }
```

 $(End\ definition\ for\ \verb|\__hook_if_marked_removal:nnTF.)$ 

\\_\_hook\_removal\_tl:nn

Builds a token list with #1 and #2 which can only be matched by #1 and #2. The  $\&_4$  anchors a removal, so that #1 can't be mistaken by #2 and vice versa, and the two  $\$_3$  delimit the two arguments

```
281 \cs_new:Npn \__hook_removal_tl:nn #1 #2
282 { & \tl_to_str:n {#2} $ \tl_to_str:n {#1} $ }
(End definition for \__hook_removal_tl:nn.)
```

\g\_hook\_??\_code\_prop \g\_hook\_??\_code\_tl \g\_hook\_??\_reversed\_tl Initially these variables simply used an empty "label" name (not two question marks). This was a bit unfortunate, because then 13doc complains about \_\_ in the middle of a command name when trying to typeset the documentation. However using a "normal" name such as default has the disadvantage of that being not really distinguishable from a real hook name. I now have settled for ?? which needs some gymnastics to get it into the csname, but since this is used a lot things should be fast, so this is not done with c expansion in the code later on.

\g\_hook\_??\_code\_tl isn't used, but it has to be defined to trick the code into thinking that ?? is actually a hook.

```
283 \prop_new:c {g_hook_??_code_prop}
284 \prop_new:c {g_hook_??_code_tl}
```

Default rules are always given in normal ordering (never in reversed ordering). If such a rule is applied to a reversed hook it behaves as if the rule is reversed (e.g., after becomes before) because those rules are applied first and then the order is reversed.

```
285 \tl_new:c {g_hook_??_reversed_tl}
(End definition for \g_hook_??_code_prop, \g_hook_??_code_tl, and \g_hook_??_reversed_tl.)
```

### 3.7 Setting rules for hooks code

\hook\_gset\_rule:nnnn \\_hook\_gset\_rule:nnnn FMi: needs docu correction given new implementation

With  $\hook_gset_rule:nnnn\{\langle hook\rangle\}\{\langle label1\rangle\}\{\langle relation\rangle\}\{\langle label2\rangle\}$  a relation is defined between the two code labels for the given  $\langle hook\rangle$ . The special hook ?? stands for any hook describing a default rule.

```
\cs_new_protected:Npn \hook_gset_rule:nnnn #1#2#3#4
286
     {
287
       \use:x
288
289
            \_\_hook\_gset\_rule:nnnn
290
             { \_hook_parse_label_default:nn {#1} { top-level } }
             { \_hook_parse_label_default:nn {#2} { top-level } }
             {#3}
             { \_hook_parse_label_default:nn {#4} { top-level } }
294
295
     }
   \cs_new_protected:Npn \__hook_gset_rule:nnnn #1#2#3#4
297
```

First we ensure the basic data structure of the hook exists:

```
99 \__hook_declare:n {#1}
```

Then we clear any previous relationship between both labels.

```
00 \_hook_rule_gclear:nnn {#1} {#2} {#4}
```

Then we call the function to handle the given rule. Throw an error if the rule is invalid.

(End definition for \hook\_gset\_rule:nnnn and \\_hook\_gset\_rule:nnnn. This function is documented on page 107.)

\\_hook\_rule\_before\_gset:nnn
\\_hook\_rule\_after\_gset:nnn
\\_hook\_rule<<\_gset:nnn
\\_hook\_rule\_>\_gset:nnn

Then we add the new rule. We need to normalize the rules here to allow for faster processing later. Given a pair of labels  $l_A$  and  $l_B$ , the rule  $l_A > l_B$  is the same as  $l_B < l_A$  only presented differently. But by normalizing the forms of the rule to a single representation, say,  $l_B < l_A$ , reduces the time spent looking for the rules later considerably.

Here we do that normalization by using  $\P$  to lexically sort labels  $l_A$  and  $l_B$  to a fixed order. This order is then enforced every time these two labels are used together.

Here we use  $\_\noindent [label_pair:nn {\langle hook \rangle} {\langle l_A \rangle} {\langle l_B \rangle}$  to build a string  $l_B | l_A$  with a fixed order, and use  $\_\noindent [label]$  ordered:nnTF to apply the correct rule to the pair of labels, depending if it was sorted or not.

```
311 \cs_new_protected:Npn \__hook_rule_before_gset:nnn #1#2#3
312 {
313 \tl_gset:cx { g_hook_#1_rule_ \_hook_label_pair:nn {#2} {#3} _tl }
```

File g: lthooks.dtx

```
}
                                315
                                   \cs_new_eq:cN { __hook_rule_<_gset:nnn } \__hook_rule_before_gset:nnn
                                   \cs_new_protected:Npn \__hook_rule_after_gset:nnn #1#2#3
                                318
                                       \tl_gset:cx { g_hook_#1_rule_ \_hook_label_pair:nn {#3} {#2} _tl }
                                319
                                         { \_hook_label_ordered:nnTF {#3} {#2} { < } { > } }
                                322 \cs_new_eq:cN { __hook_rule_>_gset:nnn } \__hook_rule_after_gset:nnn
                                (End\ definition\ for\ \_hook\_rule\_before\_gset:nnn\ and\ others.)
                               This rule removes (clears, actually) the code from label #3 if label #2 is in the hook #1.
 \__hook_rule_voids_gset:nnn

                                (End definition for \_hook_rule_unrelated_gset:nnn and \_hook_rule_gclear:nnn.)
                               Ensure that the lexically greater label comes first.
       \_hook_label_pair:nn
                                335 \cs_new:Npn \__hook_label_pair:nn #1#2
                                336
                                       \if_case:w \__hook_str_compare:nn {#1} {#2} \exp_stop_f:
                                337
                                338
                                               #1 | #1 % 0
                                               #1 | #2 % +1
                                330
                                       \or:
                                       \else: #2 | #1 % -1
                                340
                                       \fi:
                                341
                                (End definition for \__hook_label_pair:nn.)
```

{ \\_hook\_label\_ordered:nnTF {#2} {#3} { < } { > } }

```
\_hook_label_ordered_p:nn
\_hook_label_ordered:nnTF
```

Check that labels #1 and #2 are in the correct order (as returned by \\_\_hook\_label\_-pair:nn) and if so return true, else return false.

(End definition for \\_\_hook\_label\_ordered:nnTF.)

\_\_hook\_if\_label\_case:nnnnn

To avoid doing the string comparison twice in \\_\_hook\_initialize\_single:NNNn (once with \str\_if\_eq:nn and again with \\_\_hook\_label\_ordered:nn), we use a three-way branching macro that will compare #1 and #2 and expand to \use\_i:nnn if they are equal, \use\_ii:nn if #1 is lexically greater, and \use\_iii:nn otherwise.

\\_\_hook\_update\_hook\_code:n

Before \begin{document} this does nothing, in the body it reinitializes the hook code using the altered data.

```
358 \cs_new_eq:NN \__hook_update_hook_code:n \use_none:n
(End definition for \__hook_update_hook_code:n.)
```

\\_hook\_initialize\_all:

Initialize all known hooks (at \begin{document}), i.e., update the fast execution token lists to hold the necessary code in the right order.

```
359 \cs_new_protected:Npn \__hook_initialize_all: {
```

First we change \\_hook\_update\_hook\_code:n which so far was a no-op to now initialize one hook. This way any later updates to the hook will run that code and also update the execution token list.

```
\cs_gset_eq:NN \_hook_update_hook_code:n \_hook_initialize_hook_code:n Now we loop over all hooks that have been defined and update each of them.
```

```
\_hook_debug:n { \prop_gclear:N \g_hook_used_prop }
\seq_map_inline:Nn \g_hook_all_seq
\seq_\hook_update_hook_code:n {##1}
\}
```

If we are debugging we show results hook by hook for all hooks that have data.

After all hooks are initialized we change the "use" to just call the hook code and not initialize it (as it was done in the preamble.

```
\cs_gset_eq:NN \hook_use:n \__hook_use_initialized:n
\cs_gset_eq:NN \__hook_preamble_hook:n \use_none:n
\}
(End definition for \__hook_initialize_all:.)
```

\\_hook\_initialize\_hook\_code:n

Initializing or reinitializing the fast execution hook code. In the preamble this is selectively done in case a hook gets used and at \begin{document} this is done for all hooks and afterwards only if the hook code changes.

```
376 \cs_new_protected:Npn \__hook_initialize_hook_code:n #1 {
377 \__hook_debug:n{ \iow_term:x{^^JUpdate~ code~ for~ hook~
378 '#1' \on@line :^^J} }
```

This does the sorting and the updates. First thing we do is to check if a legacy hook macro exists and if so we add it to the hook under the label legacy. This might make the hook non-empty so we have to do this before the then following test.

```
\_hook_include_legacy_code_chunk:n {#1}
```

If there aren't any code chunks for the current hook, there is no point in even starting the sorting routine so we make a quick test for that and in that case just update \g\_--hook\_\hook\code\_tl to hold the next code. If there are code chunks we call \\_\_hook\_-initialize\_single:NNNn and pass to it ready made csnames as they are needed several times inside. This way we save a bit on processing time if we do that up front.

By default the algorithm sorts the code chunks and then saves the result in a token list for fast execution by adding the code one after another using \tl\_gput\_right:NV. When we sort code for a reversed hook, all we have to do is to add the code chunks in the opposite order into the token list. So all we have to do in preparation is to change two definitions used later on.

```
\_hook_if_reversed:nTF {#1}

{ \cs_set_eq:NN \_hook_tl_gput:NV \tl_gput_left:NV \
cs_set_eq:NN \_hook_clist_gput:NV \clist_gput_left:NV }

{ \cs_set_eq:NN \_hook_tl_gput:NV \tl_gput_right:NV \
cs_set_eq:NN \_hook_clist_gput:NV \clist_gput_right:NV }
```

When sorting, some relations (namely voids) need to act destructively on the code property lists to remove code that shouldn't appear in the sorted hook token list, so we temporarily save the old code property list so that it can be restored later.

```
$\prop_set_eq:Nc \l__hook_work_prop { g__hook_#1_code_prop }
$\__hook_initialize_single:cccn
$\{ g__hook_#1_code_tl \} { g__hook_#1_code_next_tl \}
$\{ g__hook_#1_labels_clist \} {\}\$$\$$\$$
```

For debug display we want to keep track of those hooks that actually got code added to them, so we record that in plist. We use a plist to ensure that we record each hook name only once, i.e., we are only interested in storing the keys and the value is arbitrary.

```
401 \cs_new:Npn \__hook_tl_csname:n #1 { l__hook_label_#1_tl }
402 \cs_new:Npn \__hook_seq_csname:n #1 { l__hook_label_#1_seq }
(End definition for \ hook tl csname:n and \ hook seq csname:n.)
```

\l\_\_hook\_labels\_seq
\l\_\_hook\_labels\_int
 \l\_\_hook\_front\_tl
 \l\_\_hook\_rear\_tl
\l\_\_hook\_label\_0\_tl

For the sorting I am basically implementing Knuth's algorithm for topological sorting as given in TAOCP volume 1 pages 263–266. For this algorithm we need a number of local variables:

• List of labels used in the current hook to label code chunks:

```
403 \seq_new:N \l__hook_labels_seq
```

• Number of labels used in the current hook. In Knuth's algorithm this is called N:

```
404 \int_new:N \l__hook_labels_int
```

• The sorted code list to be build is managed using two pointers one to the front of the queue and one to the rear. We model this using token list pointers. Knuth calls them F and R:

```
405 \tl_new:N \l__hook_front_tl
406 \tl_new:N \l__hook_rear_tl
```

• The data for the start of the queue is kept in this token list, it corresponds to what Don calls QLINK[0] but since we aren't manipulating individual words in memory it is slightly differently done:

```
\tl_new:c { \__hook_tl_csname:n { 0 } }
(End definition for \l_hook_labels_seq and others.)
```

\\_hook\_initialize\_single:NNNn \\_hook\_initialize\_single:cccn \\_hook\_initialize\_single:NNNn implements the sorting of the code chunks for a hook and saves the result in the token list for fast execution (#3). The arguments are  $\langle hook\text{-}code\text{-}plist \rangle$ ,  $\langle hook\text{-}code\text{-}tl \rangle$ ,  $\langle hook\text{-}next\text{-}code\text{-}tl \rangle$ ,  $\langle hook\text{-}ordered\text{-}labels\text{-}clist \rangle$  and  $\langle hook\text{-}name \rangle$  (the latter is only used for debugging—the  $\langle hook\text{-}rule\text{-}plist \rangle$  is accessed using the  $\langle hook\text{-}name \rangle$ ).

The additional complexity compared to Don's algorithm is that we do not use simple positive integers but have arbitrary alphanumeric labels. As usual Don's data structures are chosen in a way that one can omit a lot of tests and I have mimicked that as far as possible. The result is a restriction I do not test for at the moment: a label can't be equal to the number 0!

FMi: Needs checking for, just in case

We loop over the property list holding the code and record all labels listed there. Only rules for those labels are of interest to us. While we are at it we count them (which gives us the N in Knuth's algorithm. The prefix label\_ is added to the variables to ensure that labels named front, rear, labels, or return don't interact with our code.

Steps T2 and T3: Sort the relevant rules into the data structure...

This loop constitutes a square matrix of the labels in  $\l_hook_work_prop$  in the vertical and the horizontal directions. However since the rule  $l_A \langle rel \rangle l_B$  is the same as  $l_B \langle rel \rangle^{-1} l_A$  we can cut the loop short at the diagonal of the matrix (i.e., when both labels are equal), saving a good amount of time. The way the rules were set up (see the implementation of  $\l_hook_rule_before_gset:nnn$  above) ensures that we have no rule in the ignored side of the matrix, and all rules are seen. The rules are applied in  $\l_hook_apply_label_pair:nnn$ , which takes the properly-ordered pair of labels as argument.

```
\prop_map_inline: Nn \l__hook_work_prop
420
421
         \prop_map_inline:Nn \l__hook_work_prop
422
423
             \_hook_if_label_case:nnnnn {##1} {####1}
424
                { \prop_map_break: }
                { \_hook_apply_label_pair:nnn {##1} {####1} }
426
                { \_hook_apply_label_pair:nnn {####1} {##1} }
                    {#4}
428
           }
       }
```

```
Take a breath and take a look at the data structures that have been set up:
     \__hook_debug:n { \__hook_debug_label_data:N \l__hook_work_prop }
    Step T4:
     \tl_set:Nn \l__hook_rear_tl { 0 }
432
     \tl_set:cn { \__hook_tl_csname:n { 0 } } { 0 }
433
     \seq_map_inline: Nn \l_hook_labels_seq
434
           \int_compare:nNnT { \cs:w \_hook_tl_csname:n {##1} \cs_end: } = 0
436
437
                  \tl_set:cn { \__hook_tl_csname:n { \l__hook_rear_tl } }{##1}
438
                 430
440
441
     \tl_set_eq:Nc \l__hook_front_tl { \__hook_tl_csname:n { 0 } }
442
     \tl_gclear:N #1
443
     \clist_gclear:N #3
444
    The whole loop combines steps T5–T7:
     \bool_while_do:nn { ! \str_if_eq_p:Vn \l_hook_front_tl { 0 } }
445
446
This part is step T5:
            \int_decr:N \l__hook_labels_int
            \prop_get:NVN \l_hook_work_prop \l_hook_front_tl \l_hook_return_tl
448
            \__hook_tl_gput:NV #1 \l__hook_return_tl
449
            \_hook_clist_gput:NV #3 \l_hook_front_tl
450
            \_hook_debug:n{ \iow_term:x{Handled~ code~ for~ \l_hook_front_tl} }
451
    This is step T6 except that we don't use a pointer P to move through the successors,
but instead use ##1 of the mapping function.
            \seq_map_inline:cn { \__hook_seq_csname:n { \l__hook_front_tl } }
452
453
                   \tl_set:cx { \__hook_tl_csname:n {##1} }
454
                              { \int_eval:n
455
                                  { \cs:w \__hook_tl_csname:n {##1} \cs_end: - 1 }
                              }
                   \int_compare:nNnT
                       { \cs:w \_hook_tl_csname:n {##1} \cs_end: } = 0
450
                         \tl_set:cn { \__hook_tl_csname:n { \l__hook_rear_tl } } {##1}
461
                         \tl_set:Nn \l__hook_rear_tl
                                                                 {##1}
462
463
                }
464
and step T7:
             \tl_set_eq:Nc \l__hook_front_tl
465
                            { \_hook_tl_csname:n { \l_hook_front_tl } }
466
    This is step T8: If we haven't moved the code for all labels (i.e., if \l__hook_-
labels_int is still greater than zero) we have a loop and our partial order can't be
flattened out.
```

467 }
468 \int\_compare:nNnF \l\_\_hook\_labels\_int = 0
469 {

```
\iow_term:x{============}
\iow_term:x{Error:~ label~ rules~ are~ incompatible:}
```

This is not really the information one needs in the error case but will do for now ...

```
FMi: fix
```

After we have added all hook code to #1 we finish it off with adding extra code for a one time execution. That is stored in #2 but is normally empty.

```
475 \tl_gput_right:Nn #1 {#2}
476 \debug_resume:
477 }
478 \cs_generate_variant:Nn \__hook_initialize_single:NNNn {ccc}
(End definition for \__hook_initialize_single:NNNn.)
```

\\_hook\_tl\_gput:NV \\_hook\_clist\_gput:NV These append either on the right (normal hook) or on the left (reversed hook). This is setup up in \\_hook\_initialize\_hook\_code:n, elsewhere their behavior is undefined.

```
479 \cs_new:Npn \__hook_tl_gput:NV {\ERROR}
480 \cs_new:Npn \__hook_clist_gput:NV {\ERROR}

(End definition for \__hook_tl_gput:NV and \__hook_clist_gput:NV.)
```

\\_\_hook\_apply\_label\_pair:nnn \ hook label if exist apply:nnnF This is the payload of steps T2 and T3 executed in the loop described above. This macro assumes #1 and #2 are ordered, which means that any rule pertaining the pair #1 and #2 is  $\g_hook_{\rhoook}_{rule}_{fl}$ , and not  $\g_hook_{\rhoook}_{rule}_{fl}$ . This also saves a great deal of time since we only need to check the order of the labels once.

\\_hook\_label\_if\_exist\_apply:nnnF will check if the rule exists for the given hook, and if so call \\_hook\_apply\_rule:nnn.

```
481 \cs_new_protected:Npn \__hook_apply_label_pair:nnn #1#2#3
482 {
```

Extra complication: as we use default rules and local hook specific rules we first have to check if there is a local rule and if that exist use it. Otherwise check if there is a default rule and use that.

```
483 \_hook_label_if_exist_apply:nnnF {#1} {#2} {#3}
484 {
```

If there is no hook-specific rule we check for a default one and use that if it exists.

What to do precisely depends on the type of rule we have encountered. If it is a before rule it will be handled by the algorithm but other types need to be managed differently. All this is done in \\_hook\_apply\_rule:nnnN.

```
491 \__hook_apply_rule:nnn {#1} {#2} {#3}

492 \exp_after:wN \use_none:n

493 \else:

494 \use:nn

495 \fi:

496 }
```

(End definition for \\_hook\_apply\_label\_pair:nnn and \\_hook\_label\_if\_exist\_apply:nnnF.)

\\_\_hook\_apply\_rule:nnn

This is the code executed in steps T2 and T3 while looping through the matrix This is part of step T3. We are about to apply the next rule and enter it into the data structure. The arguments are  $\langle label1 \rangle$ ,  $\langle label2 \rangle$ ,  $\langle hook-name \rangle$ , and  $\langle hook-code-plist \rangle$ .

```
497 \cs_new_protected:Npn \__hook_apply_rule:nnn #1#2#3
498 {
499    \cs:w __hook_apply_
500    \cs:w g__hook_#3_reversed_tl \cs_end: rule_
501    \cs:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end: :nnn \cs_end:
502    {#1} {#2} {#3}
503 }
(End definition for \__hook_apply_rule:nnn.)
```

\\_\_hook\_apply\_rule\_<:nnn
\\_\_hook\_apply\_rule\_>:nnn

The most common cases are < and > so we handle that first. They are relations  $\prec$  and  $\succ$  in TAOCP, and they dictate sorting.

```
504 \cs_new_protected:cpn { __hook_apply_rule_<:nnn } #1#2#3</pre>
505
        \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }
506
        \tl_set:cx { \__hook_tl_csname:n {#2} }
507
            { \left. \left. \right. \right. \ \left. \right. \ \left. \right. \ \left. \right. \ \left. \right. } 
        \ensuremath{\sc q_put\_right:cn\{ \__hook\_seq\_csname:n \{#1} }{\#2}
     }
510
   \cs_new_protected:cpn { __hook_apply_rule_>:nnn } #1#2#3
511
512
        \__hook_debug:n { \__hook_msg_pair_found:nnn {#1} {#2} {#3} }
513
        \tl_set:cx { \__hook_tl_csname:n {#1} }
514
            { \left. \left. \right. \right. \ \left. \right. \ \left. \right. \ \left. \right. \ \left. \right. } 
515
        \seq_put_right:cn{ \__hook_seq_csname:n {#2} }{#1}
516
```

 $(End\ definition\ for\ \verb|\_hook_apply_rule_<:nnn}\ and\ \verb|\__hook_apply_rule_>:nnn.)$ 

\\_\_hook\_apply\_rule\_xE:nnn \\_\_hook\_apply\_rule\_xW:nnn These relations make two labels incompatible within a hook. xE makes raises an error if the labels are found in the same hook, and xW makes it a warning.

\\_\_hook\_apply\_rule\_->:nnn \\_\_hook\_apply\_rule\_<-:nnn If we see -> we have to drop code for label #3 and carry on. We could do a little better and drop everything for that label since it doesn't matter where we sort in the empty code. However that would complicate the algorithm a lot with little gain.<sup>8</sup> So we still unnecessarily try to sort it in and depending on the rules that might result in a loop that is otherwise resolved. If that turns out to be a real issue, we can improve the code.

Here the code is removed from \l\_hook\_cur\_hook\_t1 rather than #3 because the latter may be ??, and the default hook doesn't store any code. Removing from \l\_-hook\_cur\_hook\_t1 makes default rules -> and <- work properly.

```

is executed with #1 =  $\langle relation \rangle$ , #2 =  $\langle label_1 \rangle \mid \langle label_2 \rangle$ , and #3 =  $\langle hook \rangle$  (the latter may

be the argument #1 to \\_hook\_list\_rules:nn, or ?? if it is a default rule).

## 3.8 Specifying code for next invocation

\hook\_gput\_next\_code:nn

```
\cs_new_protected:Npn \hook_gput_next_code:nn #1
    {
686
       \exp_args:Nx \__hook_gput_next_code:nn
687
         { \_hook_parse_label_default:nn {#1} { top-level } }
688
689
   \cs_new_protected:Npn \__hook_gput_next_code:nn #1 #2
690
    {
691
       \__hook_declare:n {#1}
692
       \hook_if_exist:nTF {#1}
693
         { \_hook_gput_next_do:nn {#1} {#2} }
           \_hook_try_declaring_generic_next_hook:nn {#1} {#2} }
    }
696
  \cs_new_protected:Npn \__hook_gput_next_do:nn #1
697
    {
698
       \exp_args:Nc \__hook_gput_next_do:Nnn
699
700
         { g_hook_#1_code_next_tl } {#1}
     }
```

First check if the "next code" token list is empty: if so we need to add a \tl\_gclear:c to clear it, so the code lasts for one usage only. The token list is cleared early so that nested usages don't get lost. \tl\_gclear:c is used instead of \tl\_gclear:N in case the hook is used in an expansion-only context, so the token list doesn't expand before \tl\_gclear:N: that would make an infinite loop. Also in case the main code token list is empty, the hook code has to be updated to add the next execution token list.

(End definition for \hook\_gput\_next\_code:nn. This function is documented on page 107.)

## 3.9 Using the hook

\hook\_use:n

\\_\_hook\_use\_initialized:n
\\_\_hook\_preamble\_hook:n

\hook\_use:n as defined here is used in the preamble, where hooks aren't initialized by default. \\_hook\_use\_initialized:n is also defined, which is the non-\protected version for use within the document. Their definition is identical, except for the \\_-hook\_preamble\_hook:n (which wouldn't hurt in the expandable version, but it would be an unnecessary extra expansion).

\\_hook\_use\_initialized:n holds the expandable definition while in the preamble. \\_hook\_preamble\_hook:n initializes the hook in the preamble, and is redefined to \use\_none:n at \begin{document}.

Both versions do the same internally: check if the hook exist as given, and if so use it as quickly as possible. If it doesn't exist, the a call to \\_\_hook\_use:wn checks for file hooks.

At \begin{document}, all hooks are initialized, and any change in them causes an update, so \hook\_use:n can be made expandable. This one is better not protected

so that it can expand into nothing if containing no code. Also important in case of generic hooks that we do not generate a \relax as a side effect of checking for a csname. In contrast to the TEX low-level \csname ...\endcsname construct \tl\_if\_exist:c is careful to avoid this.

```
710 \cs_new_protected:Npn \hook_use:n #1
711
       \tl_if_exist:cTF { g__hook_#1_code_tl }
713
             _hook_preamble_hook:n {#1}
714
           \cs:w g_hook_#1_code_tl \cs_end:
715
716
           \__hook_use:wn #1 / \s__hook_mark {#1} }
     }
718
719
   \cs_new:Npn \__hook_use_initialized:n #1
720
       \tl_if_exist:cTF { g__hook_#1_code_tl }
         { \cs:w g_hook_#1_code_tl \cs_end: }
         { \__hook_use:wn #1 / \s__hook_mark {#1} }
    }
724
725 \cs_new_protected:Npn \__hook_preamble_hook:n #1
     { \__hook_initialize_hook_code:n {#1} }
```

(End definition for  $hook\_use:n$ ,  $hook\_use\_initialized:n$ , and  $hook\_preamble\_hook:n$ . This function is documented on page 106.)

\\_hook\_use:wn \\_hook\_try\_file\_hook:n \\_hook\_if\_exist\_use:n \\_hook\_use:wn does a quick check to test if the current hook is a file hook: those need a special treatment. If it is not, the hook does not exist. If it is, then \\_hook\_-try\_file\_hook:n is called, and checks that the current hook is a file-specific hook using \\_hook\_if\_file\_hook:wTF. If it's not, then it's a generic file/ hook and is used if it exist.

If it is a file-specific hook, it passes through the same normalization as during declaration, and then it is used if defined. \\_\_hook\_if\_exist\_use:n checks if the hook exist, and calls \\_\_hook\_preamble\_hook:n if so, then uses the hook.

```
\cs_new:Npn \__hook_use:wn #1 / #2 \s__hook_mark #3
     {
728
       \str_if_eq:nnTF {#1} { file }

754
            \hook_use:n {#1}
755
756
     }
```

(End definition for \hook\_use\_once:n. This function is documented on page 106.)

#### 3.10Querying a hook

Simpler data types, like token lists, have three possible states; they can exist and be empty, exist and be non-empty, and they may not exist, in which case emptiness doesn't apply (though \tl\_if\_empty:N returns false in this case).

Hooks are a bit more complicated: they have four possible states. A hook may exist or not, and either way it may or may not be empty (even a hook that doesn't exist may be non-empty).

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its "next" token list. The hook doesn't need to be declared to have code added to its code pool (it may happen that a package A defines a hook foo, but it's loaded after package B, which adds some code to that hook. In this case it is important that the code added by package B is remembered until package A is loaded).

A hook is said to exist when it was declared with \hook\_new:n or some variant thereof.

\hook\_if\_empty\_p:n \hook\_if\_empty:nTF Test if a hook is empty (that is, no code was added to that hook). A hook being empty means that both its  $\g_hook_{hook}\code_prop$  and its  $\g_hook_{hook}\code_prop$ code\_next\_tl are empty.

```
\prg_new_conditional:Npnn \hook_if_empty:n #1 { p , T , F , TF }
759
       \_hook_if_exist:nTF {#1}
           \bool_lazy_and:nnTF
               { prop_if_empty_p:c { g_hook_#1_code_prop } }
763
               { \tl_if_empty_p:c { g_hook_#1_code_next_tl } }
764
             { \prg_return_true: }
765
             { \prg_return_false: }
766
767
           \prg_return_true: }
768
    }
769
```

```
\hook_if_exist:nTF
```

\hook\_if\_exist\_p:n A canonical way to test if a hook exists. A hook exists if the token list that stores the sorted code for that hook, \g\_hook\_\code\_tl, exists. The property list \g\_hook\_\langle hook\\_code\_prop cannot be used here because often it is necessary to add code to a hook without knowing if such hook was already declared, or even if it will ever be (for example, in case the package that defines it isn't loaded).

```
770 \prg_new_conditional:Npnn \hook_if_exist:n #1 { p , T , F , TF }
      \tl_if_exist:cTF { g_hook_#1_code_tl }
         { \prg_return_true: }
         { \prg_return_false: }
774
```

(End definition for  $\hook_if_exist:nTF$ . This function is documented on page 108.)

\\_hook\_if\_exist\_p:n \\_\_hook\_if\_exist:nTF An internal check if the hook has already been declared with \\_\_hook\_declare:n. This means that the hook was already used somehow (a code chunk or rule was added to it), but it still wasn't declared with \hook\_new:n.

```
\prg_new_conditional:Npnn \__hook_if_exist:n #1 { p , T , F , TF }
       \prop_if_exist:cTF { g__hook_#1_code_prop }
778
         { \prg_return_true: }
779
         { \prg_return_false: }
780
    }
781
```

(End definition for \\_\_hook\_if\_exist:nTF.)

\\_\_hook\_if\_reversed\_p:n \\_hook\_if\_reversed:nTF An internal conditional that checks if a hook is reversed.

```
\prg_new_conditional:Npnn \__hook_if_reversed:n #1 { p , T , F , TF }
783
       \if_int_compare:w \cs:w g__hook_#1_reversed_tl \cs_end: 1 < 0 \exp_stop_f:
784
         \prg_return_true:
785
       \else:
786
         \prg_return_false:
787
788
       \fi:
789
```

(End definition for \\_\_hook\_if\_reversed:nTF.)

\g\_hook\_execute\_immediately\_clist

List of hooks that from no on should not longer receive code.

 $\label{eq:clist_new} $$\clist_new:N \g_hook_execute_immediately_clist.$$$ 

(End definition for \g\_hook\_execute\_immediately\_clist.)

\NewReversedHook

\AddToHook

\AddToHookNext

\NewMirroredHookPair

(End definition for \AddToHookNext. This function is documented on page 102.)

### \RemoveFromHook

```
NewDocumentCommand \RemoveFromHook { m o }

{ \hook_gremove_code:nn {#1} {#2} }

(End definition for \RemoveFromHook. This function is documented on page 101.)
```

### \DeclareDefaultHookLabel

\\_\_hook\_curr\_name\_push:n
\\_\_hook\_curr\_name\_pop:

The token list \g\_hook\_hook\_curr\_name\_tl stores the name of the current package/file to be used as label for hooks. Providing a consistent interface is tricky, because packages can be loaded within packages, and some packages may not use \DeclareDefaultHookLabel to change the default label (in which case \@currname is used, if set).

To pull that off, we keep a stack that contains the default label for each level of input. The bottom of the stack contains the default label for the top-level. Since the string top-level is hardcoded, here this item of the stack is empty. Also, since we're in an input level, add lthooks to the stack as well. This stack should never go empty. An empty entry is added to the stack to account for the top-level. The item is empty so that the hard-coded default is used, but a call to \DeclareDefaultHookLabel will change it if needed.

```
841 \seq_gpush:Nn \g_hook_name_stack_seq { }
```

Two commands keep track of the stack: when a file is input, \\_hook\_curr\_name\_-push:n pushes an (empty by default) label to the stack:

and when an input is over, the topmost item of the stack is popped, since the label will not be used again, and \g\_hook\_hook\_curr\_name\_tl is updated to the now topmost item of the stack:

The token list \g\_hook\_hook\_curr\_name\_tl is but a mirror of the top of the stack. Now define a wrapper that replaces the top of the stack with the argument, and updates \g\_hook\_hook\_curr\_name\_tl accordingly.

```
NewDocumentCommand \DeclareDefaultHookLabel { m }

{

| Ked_gpop:NN \g_hook_name_stack_seq \l_hook_return_tl
| Ked_hook_curr_name_push:n {#1}
| Ked_hook_curr_name_push:n {#1}
```

```
(End definition for \DeclareDefaultHookLabel, \__hook_curr_name_push:n, and \__hook_curr_name_-
                         pop:. This function is documented on page 103.)
               \UseHook Avoid the overhead of xparse and its protection that we don't want here (since the hook
        \UseOneTimeHook should vanish without trace if empty)!
                          863 \newcommand \UseHook
                                                          { \hook_use:n }
                          864 \newcommand \UseOneTimeHook { \hook_use_once:n }
                          (End definition for \UseHook and \UseOneTimeHook. These functions are documented on page 100.)

```

## 3.13 Internal commands needed elsewhere

Here we set up a few horrible (but consistent)  $\LaTeX 2_{\varepsilon}$  names to allow for internal commands to be used outside this module. We have to unset the @@ since we want double "at" sign in place of double underscores.

```
879 (@@=)
```

### \@expl@@initialize@all@@

\@expl@@hook@curr@name@push@@n \@expl@@hook@curr@name@pop@@

### 886 \ExplSyntaxOff

Rolling back here doesn't undefine the interface commands as they may be used in packages without rollback functionality. So we just make them do nothing which may or may not work depending on the code usage.

```

### 1 Counters

```
This section deals with counter and other variable allocation.
```

1 (\*2ekernel)

The following are from plain T<sub>F</sub>X:

\z@ A zero dimen or number. It's more efficient to write \parindent\z@ than \parindent Opt.

\One The number 1.

\m@ne The number -1.

\tw@ The number 2.

\sixt@On The number 16.

\@m The number 1000.

\@MM The number 20000.

\@xxxii The constant 32.

2 \chardef\@xxxii=32

(End definition for \@xxxii. This function is documented on page ??.)

\@Mi Constants 10001-10004.

\@Mii 3 \mathchardef\@Mi=10001

4 \mathchardef\@Mii=10002 \@Miii \@Miv 5 \mathchardef\@Miii=10003

6 \mathchardef\@Miv=10004

(End definition for \@Mi and others. These functions are documented on page ??.)

Scratch count registers used by LATEX kernel commands. \@tempcnta

\@tempcntb

7 \newcount\@tempcnta

8 \newcount\@tempcntb

(End definition for \Otempcnta and \Otempcntb. These functions are documented on page ??.)

\if@tempswa General boolean switch used by LATEX kernel commands.

9 \newif\if@tempswa

(End definition for \if@tempswa. This function is documented on page ??.)

\Otempdima Scratch dimen registers used by LATEX kernel commands.

\@tempdimb

10 \newdimen\@tempdima

\@tempdimc

11 \newdimen\@tempdimb 12 \newdimen\@tempdimc

## 1 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

Historical LATEX 2.09 comments (not necessarily accurate any more):

```
1 (*2ekernel)
2 \message{control,}
\@whilenum TEST \do {BODY}
\Owhiledim TEST \do {BODY} : These implement the loop
          while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.
\Owhilesw SWITCH \fi {BODY} : Implements the loop
              while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.
\Officer NAME := LIST \do \{BODY\} : Assumes that LIST expands to A1,A2,
     ... ,An .
     Executes BODY n times, with NAME = Ai on the i-th iteration.
     Optimized for the normal case of n = 1. Works for n=0.
\Otfor NAME := LIST \do {BODY}
     if, before expansion, LIST = T1 \dots Tn where each Ti is a
     token or {...}, then executes BODY n times, with NAME = Ti
     on the i-th iteration. Works for n=0.
 NOTES: 1. These macros use no \@temp sequences.
        2. These macros do not work if the body contains anything that
        looks syntactically to TeX like an improperly balanced \if
        \else \fi.
\colon TEST \do \{BODY\} ==
BEGIN
   if TEST
     then BODY
           \@iwhilenum{TEST \relax BODY}
 END
\@iwhilenum {TEST BODY} ==
 BEGIN
   if TEST
     then BODY
           \langle enextwhile = def(\langle eiwhilenum \rangle)
```

```
else \ensuremath{\texttt{Qnextwhile}} = \det(\ensuremath{\texttt{Qwhilenoop}})
                                                       fi
                                                       \Onextwhile {TEST BODY}
                                                END
                                              \@whilesw SWITCH \fi {BODY} ==

## 1 Error handling and tracing

This section defines LATEX's error commands.

```
1 (*2ekernel)
```

The '2ekernel' code ensures that a \usepackage{autoerr} is essentially ignored if a 'full' format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion

### 1.1 General commands

\MessageBreak

This command prints a new-line inside a message, followed by a continuation line begun with \@msg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \@message@break.

3 \let\MessageBreak\relax

(End definition for \MessageBreak. This function is documented on page ??.)

\GenericInfo

This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5    \begingroup
6    \def\MessageBreak{^^J#1}%
7    \set@display@protect
8    \immediate\write\m@ne{#2\on@line.}%
9    \endgroup
10 }
```

(End definition for \GenericInfo. This function is documented on page ??.)

\GenericWarning

This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12  \begingroup
13  \def\MessageBreak{^^J#1}%

 $(\textit{End definition for } \verb|\GenericWarning|. \textit{This function is documented on page } \verb|??.|)$ 

\GenericError

This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing h to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```
18 \bgroup
19 \lccode'\@='\ %
20 \lccode'\~='\ %
21 \lccode'\}='\ %
22 \lccode'\T='\T%
24 \lccode'\H='\H%
25 \catcode'\ =11\relax%
26 \lowercase{%
27 \egroup%
```

Unfortunately T<sub>E</sub>X versions older than 3.141 have a bug which means that ^J does not force a linebreak in \message and \errmessage commands. So for these old T<sub>E</sub>X's we use \typeout to produce the message, and then have an empty \errmessage command. This causes an extra line of the form

.

To appear on the terminal, but if you do not like it, you can always upgrade your TEX! In order for your format to use this version, you must define the macro \@TeXversion to be the version number, e.g., 3.14 of the underlying TEX. See the comments in ltdircheck.dtx.

```
28 \dimen@\ifx\@TeXversion\@undefined4\else\@TeXversion\fi\p@%

\PackageError
\PackageWarning
\PackageWarningNoLine
\PackageInfo
\ClassError
\ClassWarning
\ClassWarningNoLine
\ClassInfo

These commands are intended for use by package and class writers, to give information to authors. The syntax is:

```
\label{eq:condition} $$ \operatorname{\arge}(package)}_{\langle package\rangle}_{\langle package\rangle}
```

and similarly for classes. The Error commands print the  $\langle error \rangle$  message, and present the interactive prompt; if the author types h, then the  $\langle help \rangle$  information is displayed. The Warning commands produce a warning but do not present the interactive prompt. The WarningNoLine commands do the same, but don't print the input line number. The Info commands write the message to the log file. Within the messages, the command \MessageBreak can be used to break a line, \protect can be used to protect command names, and \space is a space, for example:

```
\newcommand{\foo}{FOO}
   \PackageWarning{ethel}{%
      Your hovercraft is full of eels,\MessageBreak
      and \protect\foo\space is \foo}
produces:
   Package ethel warning: Your hovercraft is full of eels,
                             and \foo is FOO on input line 54.

                        \@latex@error{Command \protect#1 invalid in math mode}\@ehc
                 236
                237
                (End definition for \@inmatherr. This function is documented on page ??.)
\@invalidchar
                An error for use with invalid characters. This is commented out, since we decided to use
                catcode 15 instead.
                238 %\def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}
                (\textit{End definition for $\setminus$Cinvalidchar}. \ \textit{This function is documented on page \ref{eq:constraint}.)}
                     As well as the above error commands some error messages are directly coded to save
                space. The messages already present in LATEX2.09 include:
                     Environment --- undefined
                Issued by \begin for undefined environment.
                     Tab overflow
                Occurs in \= when maximum number of tabs exceeded.
                     \< in mid line</pre>
                Occurs in \< when it appears in middle of line.
                     Float(s) lost
                In output routine, caused by a float environment or \marginpar occurring in inner vertical
                mode.
```

## 1.3 Tracing

The trace package implements the commands \traceon and \traceoff that work similar to \tracingall but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros \conditionally@traceoff and \contionally@traceon.

For the kernel code the **trace** package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to \traceon we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between trace being loaded or not.

\conditionally@traceon \conditionally@traceoff

These are only dummy definitions. For details see the trace package.

## File k

# ltpar.dtx

## 1 Paragraphs

This section of the kernel declares the commands used to set \par and \everypar when ever their function needs to be changed for a long time.

## 1.1 Implementation

There are two situations in which \par may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change \par in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn \par into a noop: tabbing, array and tabular.
- Temporary changes, in which \par is restored to its previous value the next time it is executed. The following are all such uses.
  - \end when preceded by \@endparenv, which is called by \endtrivlist
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

\@setpar

To permit the proper interaction of these two situations, long-term changes are made by the  $\ensuremath{\tt Qsetpar}\{\langle VAL\rangle\}\$  command. It's function is:

To set \par. It \def's \par and \@par to  $\langle VAL \rangle$ .

\@restorepar

Short-term changes are made by the usual \def\par commands. The original values are restored after a short-term change by the \@restorepar commands.

\@@par \everypar \@@par always is defined to be the original TeX \par.

\everypar is changed only for the short term. Whenever \everypar is set non-null, it should restore itself to null when executed.

The following commands change \everypar in this way:

- \item
- \end when preceded by \@endparenv, which is called by endtrivlist
- \minipage

When dealing with \par and \everypar remember the following two warnings:

1. Commands that make short-term changes to \par and \everypar must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, \everypar is executed inside a group whenever a new paragraph begins with a left brace. The \everypar command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace where \everypar has been redefined).

File k: ltpar.dtx Date: 1995/04/29 Version v1.1c

Thus, if \everypar is redefined to do an \everypar{} it could take several executions of \everypar before the restoration "holds". This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new \everypar from being done twice.

- 2. Commands that change \everypar should remember that \everypar might be supposed to set the following switches false:
  - @nobreak
  - @minipage

they should do the setting if necessary.

- 1 (\*2ekernel)
- 2 \message{par,}

@setpar @par

\@setpar Initiate a long-term change to \par.

 $\label{lem:condition} $$ \def\@\text{par}{1}\def\@\text{par}{1}}$$ 

The default definition of \@par will ensure that if \@restorepar defines \par to execute \@par it will redefine itself to the primitive \@@par after one iteration.

4 \def\@par{\let\par\@@par\par}

(End definition for \Osetpar and \Opar. These functions are documented on page ??.)

\@restorepar

Restore from a short-term change to \par.

- 5 \def\@restorepar{\def\par{\@par}}
- 6 </2ekernel>

(End definition for \Crestorepar. This function is documented on page ??.)

### File 1

## ltspace.dtx

### 1 Spacing

This section deals with spacing, and line- and page-breaking.

### 1.1 User Commands

```
[\langle i \rangle] : \langle i \rangle = 0,...,4.
\nopagebreak
                                                                 Default argument = 4. Puts a penalty into the vertical list output as follows:
                                                  0: penalty = 0
                                                  1: penalty = \@lowpenalty
                                                  2: penalty = \@medpenalty
                                                  3: penalty = \qbelownerse \qb
                                                  4 : penalty = 10000
                                                                 [\langle i \rangle]: same as except negatives of its penalty
       \pagebreak
                                                                 [\langle i \rangle]: analog of the above
       \linebreak
\nolinebreak
                                                                 [\langle i \rangle]: analog of the above
                                                                 : inhibits page breaking most places by setting the following penalties to 10000:
          \samepage
                                                  \interlinepenalty
                                                  \postdisplaypenalty
                                                  \interdisplaylinepenalty
                                                  \@beginparpenalty
                                                  \@endparpenalty
                                                  \@itempenalty
                                                  \@secpenalty
                                                  \interfootnotelinepenalty
                                                                 : initially defined to be \newline
                                                                 \lceil \langle length \rangle \rceil: initially defined to be \lceil \langle length \rangle \rceil newline
                                                  Note: \\* adds a \vadjust{\penalty 10000}
                                                                OBSOLETE COMMANDS (which never made it into the manual):
                                                                 \color{location} \operatorname{defines} < \operatorname{CR} > == \\operatorname{location}
                                                  \restorecr: restores < CR > to its usual meaning.
```

### 1.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- \unskip is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an \ifdim test on \lastskip (see below);
- \ignorespaces is used to ignore space-tokens yet to come.

The test done on \lastskip is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where \unskip is often used is just before a \par (which itself internally does an \unskip) and one bit of code (in \@item) even has two \unskips before a \par. These uses may be fossil code but if they are necessary, maybe \@killglue would be even safer.

Such removal of glue by \unskip may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an \hskip\z@ after the glue that should not be removed. This protects that glue against one \unskip with no test but not against more than one. It does work for 'tested \unskips'. This is used by \hspace\* but not by \hspace; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-\unskip and protection by \hskip\z@ would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from \hspace. Should they still produce 'just one space'? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an \hspace{...} should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command \nolinebreak is implemented this way (and \linebreak should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an 'empty' line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the \index command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of \index, \marginpar, \linebreak, \pagebreak and \vspace are somewhat different. [For example, is \vspace ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are \hskip 1sp and, possibly better but more complex, \hskip -1sp \hskip 1sp. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as \unskip does not work on the main vertical list. The complexity of the tests done by \addvspace have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.
\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

#### 1.3 Some immediate actions

- Fix bug in \linebreak.
- Fix bug in \\\*.
- Reimplement \\, etc, removing extra \vadjusts and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether \\, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) \unskips include test for zero skip (rather than other tests or no test).
- Consider replacing \hskip 1sp by something better (here called an 'infinitesimal' skip).
- Look at all \hskip\z@ (or similar) to see if they should be changed to an 'infinitesimal' skip.

- Resolve the inconsistency between \hspace and \hspace\*.
- Remove unnecessary \unskips.
- Investigate and rationalise the 'newline' code.
- Find better algorithms for all sorts of things or, easier(?), fix TEX itself.

51
```

(End definition for  $\ensuremath{\verb{QnoQlnbk}}$ . This function is documented on page  $\ref{eq:lnbk}$ .)

The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

- 1. efficient execution of plain \\;
- 2. efficient execution of \\[...];
- 3. memory use;
- 4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use \reserved@e and \reserved@f here (other reserved macros are somewhat disastrous).

These changes made  $\newline$  even less robust than it had been, so now it is explicitly robust, like  $\.$ 

The internal definition of the 'normal' definition of  $\setminus \setminus$ .

```

\@bsphack

\@bsphack and \@esphack used by macros such as \index and \begin{@float} ...\end{@float} that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with \@bsphack and end with \@esphack. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when 'invisible commands' appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following \addvspace, etc sees the correct glue in \lastskip.

In fact, these improved versions should be used for other cases of 'whatsits, thingies etc' which should be invisible. They are only for commands, not environments (see notes on \@Esphack).

BTW, anyone know why the standard hacks are surrounded by  $\infty$  rather than simply  $\infty$ 

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
def \@bsphack{%
  \relax \ifvmode
  \@savsk \lastskip
  \ifdim \lastskip=\z@
  \else
    \vskip -\lastskip
  \fi
  \else
    \ifhmode
    \@savsk \lastskip
    \@savsf \spacefactor
  \fi
  \fi
```

I think that, in vmode, it is the safest to put in a **\nobreak** immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
def \@esphack{%
  \relax \ifvmode
  \nobreak
  \ifdim \@savsk=\z@
  \else
    \vskip\@savsk
  \fi
  \else
  \ifhmode
    \spacefactor \@savsf
  \ifdim \@savsk>\z@
    \ignorespaces
  \fi
```

```
\fi
\fi
```

For the moment we are going to ignore the vertical versions until they are correct.

```
125 \def\@bsphack{%
126 \relax
127 \ifhmode
128 \@savsk\lastskip
129 \@savsf\spacefactor
130 \fi}
```

(End definition for \Obsphack. This function is documented on page ??.)

\@esphack

Companion to \@bsphack. If this command is not properly paired with \@bsphack one might end up with a low-level TeX error: "BAD spacefactor". One possible cause is calling \@bsphack in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling \@esphack. Even if no error is generated that is wrong, because \@esphack will then use the saved values for \@savsk and \@savsf from some earlier invocation of \@bsphack which will have nothing to do with the current situation.

\@vbsphack

Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```
\def \@vbsphack{ %
  \relax \ifvmode
  \leavevmode
  \@savsk 1sp
  \@savsf \spacefactor
  \else
  \ifhmode
   \@savsk \lastskip
   \@savsf \spacefactor

### 1.5 Vertical spacing

 $\LaTeX$  supports the plain  $\Tau$ EX commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \vskip.

Extra vertical space is added by the command  $\addvspace{\langle skip \rangle}$ , which adds a vertical skip of  $\langle skip \rangle$  to the document. The sequence

```
\addvspace{\langle s1 \rangle} \addvspace{\langle s2 \rangle} is equivalent to \addvspace{\langle maximum\ of\ s1,\ s2 \rangle}.
```

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the  $\addpenalty{\langle penalty\rangle}$  command. It works properly when  $\addpenalty$  and  $\addvspace$  commands are mixed.

The **@nobreak** switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```
\addvspace{SKIP} ==
BEGIN
if vmode
then if @minipage
```

```
else if \lastskip =0
                                           \vskip SKIP
                                     then
                                           if \lastskip < SKIP
                                     else
                                               then \vskip -\lastskip
                                                       \vskip SKIP
                                               else if SKIP < 0 and \lastskip >= 0
                                                        then \vskip -\lastskip
                                                              \vskip \lastskip + SKIP

```

Fix provided by Donald (though the original fix was not good enough). In 2005 Plamen Tanovski discovered that this fix wasn't good enough either as the \vskip kept getting bigger if several \addpenalty commands followed each other. Donald kindly send a new fix.

```
\def\addpenalty#1{%
     \ifvmode
       \if@minipage
276
       \else
277
          \if@nobreak
278
          \else
279
            \ifdim\lastskip=\z@
              \penalty#1\relax
281
282
            \else
              \@tempskipb\lastskip
283
```

\addpenalty

We have to make sure the final \vskip seen by TEX is the correct one, namely \@tempskipb. However we may have to adjust for \prevdepth when placing the penalty but that should not affect the skip we pass on to TEX.

```
\begingroup
284
                \@tempskipa\@tempskipb
285
                \advance \@tempskipb
286
                  \ifdim\prevdepth>\maxdepth\maxdepth\else
287
If \prevdepth is -1000pt due to \nointerlineskip we better not add it!
                      \left( \frac{1}{2} \right) = -\left( \frac{1}{2} \right) 
288
                   \fi
289
                 \vskip -\@tempskipb
290
                 \penalty#1%
291
                 \ifdim\@tempskipa=\@tempskipb
```

```
Do nothing if the \prevdepth check made no adjustment.
Combine the prevdepth adjustment into a single skip.
                     \advance\@tempskipb -\@tempskipa
294
                     \vskip \@tempskipb
The final skip is always the specified length.
                   \vskip \@tempskipa

\vspace \@vspace \@vspacer The new code for these commands depends on the following facts:

- The value of prevdepth is changed only when a box or rule is created and added to a vertical list;
- The value of prevdepth is used only when a box is created and added to a vertical list;
- The value of prevdepth is always local to the building of one vertical list.

### 1.6 Horizontal space (and breaks)

\nobreakdashes

This idea is borrowed from the amsmath package but here we define a robust command. This command is a low-level command designed for use only before hyphens or dashes (such as -, --, or ---).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final \nobreak).

Note that even if it is not followed by a '-', it still leaves vmode and sets the space-factor; so use it carefully!

```
406 \DeclareRobustCommand{\nobreakdashes}{%
407 \leavevmode
408 \toks@{}%
409 \def\reserved@a##1{\toks@\expandafter{\the\toks@-}%
410 \futurelet\@let@token \reserved@b}%
411 \def\reserved@b {\ifx\@let@token -%
```

(End definition for \nobreakdashes. This function is documented on page ??.)

## \nobreakspace \@xobeysp

This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active ~ to expand to it since this is the documented behaviour of ~. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the IATEX internal commands.

The braces in the definition of  $\sim$  are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  and  $\colongraph$  are in  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as it is widely used; so here it is let to the non-robust command  $\colongraph$  as  $\colongraph$  and  $\colongraph$  and  $\colongraph$  are  $\colongraph$  as  $\colongraph$  and  $\colongraph$  and  $\colongraph$  are  $\colongraph$  and  $\colongraph$  and  $\colongraph$  are  $\colongraph$  and  $\colongraph$  are  $\colongraph$  and  $\colongraph$  and  $\colongraph$  are  $\colongraph$  and  $\colongraph$  and  $\colongraph$  are  $\colongraph$  and

```
420 \DeclareRobustCommand{\nobreakspace}{%
421  \leavevmode\nobreak\}
422 \catcode '\~=13
423 \def~{\nobreakspace{}}
424 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

(End definition for \nobreakspace and \@xobeysp. These functions are documented on page ??.)
```

\@ Placed before a ", makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

(End definition for \LaTeXe. This function is documented on page ??.)

### File n

## ltfiles.dtx

### 1 File Handling

The following user commands are defined in this part:

\document (ie \begin{document})

Reads in the .AUX files and \catcode's @ to 12.

\nofiles

Suppresses all file output by setting \Ofilesw false.

\includeonly

 $\{\langle NAME1, ..., NAMEn \rangle\}$ 

Causes only parts NAME1, ..., NAMEn to be read by their \include commands. Works by setting partsw true and setting \@partlist to NAME1, ..., NAMEn.

\include

 $\{\langle NAME \rangle\}$ 

Does an \input NAME unless \@partsw is true and NAME is not in \@partlist. If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.

\input

 $\{\langle NAME \rangle\}$ 

The same as TeX's \input, except it allows optional braces around the file name. In  $\LaTeX$  2 $\varepsilon$ , it also avoids the primitive 'missing file' error, if the file can not be found.

\IfFileExists

 ${\langle NAME \rangle} {\langle then \rangle} {\langle else \rangle}$ 

If the file exists on the system, execute *then* otherwise execute *else*.

\InputIfFileExists

 $\{\langle NAME \rangle\} \{\langle then \rangle\} \{\langle else \rangle\}$ If the file exists on the system, execute then and input NAME otherwise execute.

If the file exists on the system, execute then and input NAME otherwise execute else. Historical  $\LaTeX$  2.09 comments (not necessarily accurate any more):

1 (\*2ekernel)

2 \message{files,}

VARIABLES, SWITCHES AND INTERNAL COMMANDS:

\Cmainaux : Output file number for main .AUX file.

\@partaux : Output file number for current part's .AUX file. \@auxout : Either \@mainout or \@partout, depending on

which .AUX file output goes to.

 $\ensuremath{\mbox{\tt @input\{foo\}}}$  : If file foo exists, then  $\ensuremath{\mbox{\tt input's}}$  it,

otherwise types a warning message.

@filesw : Switch - set false if no .AUX, .TOC, .IDX etc

files are to be written

@partsw : Set true by a \includeonly command.

\Opartlist : Set to the argument of the \includeonly command.

\cp@FOO : The checkpoint for \include'd file FOO.TEX, written

by \@writeckpt at the end of file FOO.AUX

\includeonly{FILELIST} ==

- 14  $\langle *2ekernel \mid latexrelease \rangle$
- 15 \def\document{%

We do cancel the grouping as part of the \begin handling (this is now done inside \begin instead) so that the env/\(\left(\env)\right) begin hook is not hidden inside \begingroup ... \endgroup.

- 16 % \endgroup
- \UseOneTimeHook{begindocument/before}%
- \@kernel@after@begindocument@before

Added hook to load l3backend code:

```
\@expl@sys@load@backend@@
19
    \ifx\@unusedoptionlist\@empty\else
21
      \@latex@warning@no@line{Unused global option(s):^^J%
               \@spaces[\@unusedoptionlist]}%
    \fi
23
    \@colht\textheight
24
    \@colroom\textheight \vsize\textheight
25
    \columnwidth\textwidth
    \@clubpenalty\clubpenalty
27
28
    \if@twocolumn
      \advance\columnwidth -\columnsep
      \divide\columnwidth\tw@ \hsize\columnwidth \@firstcolumntrue
31
    \fi
    \hsize\columnwidth \linewidth\hsize
32
33
    \begingroup\@floatplacement\@dblfloatplacement
      \makeatletter\let\@writefile\@gobbletwo
34
      \global \let \@multiplelabels \relax
      \@input{\jobname.aux}%
    \endgroup
37
    \if@filesw
      \immediate\openout\@mainaux\jobname.aux
39
      \immediate\write\@mainaux{\relax}%
40
41
```

Dateline 1991/03/26: FMi added \process@table to support NFSS; This will also work with old lfonts if no other style defines \process@table. The following line forces the initialization of the math fonts.

```
42 \process@table
43 \let\glb@currsize\@empty % Force math initialization.
44 \normalsize
45 \everypar{}%
```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define  $\normalsfcodes$  directly, in case that definition will be used. (This is an old bug, problem existed in  $\normalsfcodes$  and plain  $\normalsfcodes$ )

```
46 \ifx\normalsfcodes\@empty
47 \ifnum\sfcode'\.=\@m
48 \let\normalsfcodes\frenchspacing
49 \else
50 \let\normalsfcodes\nonfrenchspacing
51 \fi
52 \fi
```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of \language at this spoint.

```
53 \ifx\document@default@language\m@ne
54 \chardef\document@default@language\language
55 \fi
```

Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

- 56 \@noskipsecfalse
- 57 \let \@refundefined \relax

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by \AtBeginDocument. Also disable the gathering of the file list, if no \listfiles has been issued. \AtBeginDocument is redefined at this point so that and such commands that get into the hook do not chase their tail...

- 58 \@kernel@before@begindocument
- 59 \UseOneTimeHook{begindocument}%
- 60 \@kernel@after@begindocument

Most of the following assignments will be done globally in case the user adds something like \begin{multicols} to the document hook, i.e. starts are group in \begin{document}.

Since a value of exactly 0pt for \topskip causes \twocolumn[] to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

- 61 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
- 62 \global\@maxdepth\maxdepth
- 63 \global\let\@begindocumenthook\@undefined
- 64 \ifx\@listfiles\@undefined
- 65 \global\let\@filelist\relax
- 66 \global\let\@addtofilelist\@gobble
- 67 \fi

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

- \gdef\do##1{\global\let ##1\@notprerr}%
- 69 \@preamblecmds

The next line saves tokens and also allows \@nodocument to be used directly to trap preamble errors.

70 \global\let \@nodocument \relax

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

- 71 \global\let\do\noexpand
- 72 \UseOneTimeHook{begindocument/end}%

Use of the hook might mean that we are already in horizontal mode, so ignore the space after \begin{document}.

73 \ignorespaces}

The begindocument hook already existed in the kernel since 1994 under the name \atbegindocumenthook the additional ones are originally from the etoolbox package under the names \@endpreamblehook \afterpreamble.

192

- 74 \NewHook{begindocument}
- 75 \NewHook{begindocument/before}
- 76 \NewHook{begindocument/end}

\@kernel@after@begindocument@before
\@kernel@before@begindocument
\@kernel@after@begindocument

Above we used two kernel only hooks to be run after the public begindocument/before and after begindocument hooks.

In \@kernel@after@begindocument@before we already place one action: drop the fast execution code for the env/document/begin hook. That hook marks the end of the preamble and should therefore only be run once. In a normal document that is anyway the case (so the code would just sit there taking up space afterwards, which these days is rather harmless), however, in more complicated scenarios where several full documents are combined to a single document it might get applied several times with harmful effects. We therefore explicitly drop it at this point. the coing is somewhat obscure due to the name of the macro which requires constructing.

```

\normalsfcodes

The setting of \@empty is just a flag. This command may be defined in a class or package file. If it is still \@empty at \begin{document} it will be defined to be \frenchspacing or \nonfrenchspacing, depending on which of those appears to be in effect at that point.

199 \let\normalsfcodes\@empty

(End definition for \normalsfcodes. This function is documented on page ??.)

 $\n$ 

Set \Offileswfalse which suppresses the places where LATEX makes \immediate writes. The \makeindex and \makeglossary are disabled. \protected@write is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a \( \lambda \text{whatsit} \rangle \) node is still created, and so spacing is not affected by the \nofiles command; to ensure this more generally, the \ifOnobreak test is needed.

```
200 \def\nofiles{%
201 \Offileswfalse
202 \typeout{No auxiliary output files.^^J}%
203 \long\def\protected@write##1##2##3%
204 {\write\m@ne{}\if@nobreak\ifvmode\nobreak\fi\fi}%
205 \let\makeindex\relax
206 \let\makeglossary\relax}
207 \Oonlypreamble\nofiles

(End definition for \nofiles. This function is documented on page ??.)
```

\protected@write

This takes three arguments: an output stream, some initialization code, and some text to write. It then writes this, with appropriate handling of \protect and \thepage.

\include \includeonly

In the definition of \include, \def\reserved@b changed to \edef\reserved@b to be consistent with the \edef in \includeonly. (Suggested by Rainer Schöpf & Frank Mittelbach. Change made 20 Jul 88.)

Changed definition of \include to allow space at end of file name — otherwise, typing \include{foo} would cause LATEX to overwrite foo.tex. Change made 24 May 89, suggested by Rainer Schöpf and Frank Mittelbach

Made \include check for being used inside an \include'd file, as this will not work and cause surprising results.

```
219 \( //2ekernel \)
220 \( \frac{*2ekernel | latexrelease}{2020/10/01}\)
221 \( \latexrelease \rangle \lambda \l
```

Here the normalisation will add .tex for all files, (it uses the the same normalisation as the hooks), so we need to remove that manually. \@strip@tex@ext does that.

```
\set@curr@file{#1}%

\edef\@curr@file{\@strip@tex@ext\@curr@file}%
```

For historical reasons \@include expects an argument delimited by a space. This is kept (though uncessary now) to avoid errors in other packages that use \@include directly.

```
\expandafter\@include\expandafter{\@curr@file} % deliberate space
\fi|
Here in \includeonly we also need to strip .tex after normalisation:
231 \def\includeonly#1{%
```

Because the argument to  $\$ includeonly is a comma-separated list of filenames where there may be comma's precedeing some of the filenames or trailing them. Therefore we need to take the list apart, remove the unwanted spaces while leaving the spaces in the filenames intact.

```
let\@partlist\@empty
Ofor\reserved@a:=#1 \do
```

\@partswtrue

```
{%
         \expandafter\set@curr@file\expandafter{\reserved@a}%
236
         \ifx\@partlist\@empty
            \edef\@partlist{\@strip@tex@ext\@curr@file}%
238
         \else
239
            \edef\@partlist{\@partlist,\@strip@tex@ext\@curr@file}%
240
         \fi
241
       }%
242
243
244 \@onlypreamble\includeonly
```

(End definition for \include and \includeonly. These functions are documented on page ??.)

\@strip@tex@ext \@strip@tex@ext@aux These macros take a (\detokenized file name and remove any .tex extension). Extra care is taken to not remove the string .tex from the middle of a file name: it is only removed if it's the very last thing in the file name.

```
245 \def\reserved@a#1{%

### 1.1 Safe Input Macros

\@curr@file \set@curr@file File name handling is done by generating a csname from the provided file name (which means that UTF-8 octets gets turned into strings as this is what happens if they appear in a csname due to the code in utf8.def). By setting \escapchar to -1 we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes. Sometimes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

For compatibility with existing code using {abc}.tex or {one.two}.png an initial brace group is discarded before expansion and \string is applied The content of the brace group is discarded. This means that a leading space will be lost unless protected (by { } or " " or \space) but filenames with a space are hopefully rare.

The definition below is from 2019 and only used during kernel bootstrapping, later on in ltfilehook.dtx it will get overwritten.

```
390 \def\set@curr@file#1{%

 $(\textit{End definition for $\setminus$Ciinput. This function is documented on page \ref{eq:constraint}.)}$ 

\@input Define \@input in terms of \IfIfileExists. So this is a 'safe input' command, but the files input are not listed by \listfiles.

We don't want .aux, .toc files etc be listed by \listfiles. However, something like .bbl probably should be listed and thus should be implemented not by \@input.

```
\lambda \def\\@input#1{\% \IfFileExists{#1}{\\@@input\\@filef@und}{\typeout{\No file #1.}}}

(End definition for \\@input. This function is documented on page ??.)
```

\@input@ Version of \@input that does add the file to \@filelist.
535 \def\@input@#1{\InputIfFileExists{#1}{}{\typeout{No file #1.}}}

(End definition for \@input@. This function is documented on page ??.)

\@missingfileerror

This 'error' command avoids TEX's primitive missing file loop.

Missing file error. Prompt for a new filename, offering a default extension.

Changes to  $\mbox{\ensuremath{\texttt{Cmissingfileerror}}}$ : rather than trying to input the file by force, now  $\mbox{\ensuremath{\texttt{Cmissingfileerror}}}$  and the caller macro is responsible for doing the right thing with it.

#### File o

## ltoutenc.dtx

## 1 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including omlenc.def, omsenc.def, tlenc.def and otlenc.def files, which define the OLM, OMS, T1 and OT1 encodings, and the fontenc package for selecting encodings.

The fontenc package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {tlenc.def}
\input {otlenc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard inputenc package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

This command is like \newcommand, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of \1 in the OT1 encoding is:

```
\DeclareTextCommand{\l}{0T1}{{\@xxxii l}}
```

\DeclareTextCommand takes the same optional arguments as \newcommand.

```
\label{eq:command} $$ \Pr \operatorname{Command}_{\langle command \rangle} {\langle encoding \rangle} = [\langle number \rangle] [\langle default \rangle] {\langle commands \rangle}
```

This acts like \DeclareTextCommand, but does nothing if the command is already defined.

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the \DeclareTextSymbol is faster.

```
\verb|\DeclareTextAccent{|} \langle command \rangle \} \{ \langle encoding \rangle \} \{ \langle slot \rangle \}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{\"}{0T1}{127}
\DeclareTextCommand{\"}{0T1}{\add@accent {127}}
```

have the same effect.

```
\label{lem:command} $$ \end{are Text Composite } {$ \langle encodinq \rangle } { \langle encodinq \rangle } { \langle argument \rangle } { \langle slot \rangle } $$
```

This command declares a composite letter, for example in the T1 encoding \'{a} is slot 225, which is declared by:

The *command* will normally have been declared with \DeclareTextAccent, or as a one-argument \DeclareTextCommand.

\DeclareTextComposite is the most common example of using the more general declaration \DeclareTextCompositeCommand, which can define a composite to be an arbitrary piece of text.

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{0T1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@\ht\z@\advance\dimen@-1ex%
\rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with \DeclareTextAccent, or as a one-argument \DeclareTextCommand.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example \ss. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling \UseTextSymbol:

```
\verb|\UseTextSymbol|{|\langle encoding\rangle|}{|\langle command\rangle|}
```

For example,  $\UseTextSymbol{OT1}{\ss}$  has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling \UseTextAccent:

```
\label{localized} $$\UseTextAccent{$\langle encoding\rangle$} {\langle command\rangle} {\langle text\rangle}$}
```

For example, if the current encoding is OT2 then  $\UseTextAccent{OT1}{\'}{a}$  has the same effect as:

```
{\fontencoding{OT1}\selectfont\', {\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\verb|\DeclareTextCommandDefault{|} \langle command| \} \{ \langle definition \rangle \}
```

For example, the default definition of the command \textonequarter (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac14}}
```

There is a matching **\Provide** command which will not override an existing default definition:

```
\verb|\ProvideTextCommandDefault{|} \langle command| \} \{ \langle definition \rangle \}|
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

are short for:

For example, to make OT1 the default encoding for \ss and \' you say:

```
\DeclareTextSymbolDefault{\ss}{0T1}
\DeclareTextAccentDefault{\'}{0T1}
```

Note that you can use these commands on any zero- or one-argument commands declared with \DeclareText\* or \ProvideText\*, not just those defined using \DeclareTextSymbol or \DeclareTextAccent.

#### 1.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for textdollar in OT1 is a hack since s and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flacky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 IATEX will still find the encoding specific-definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing LATEX to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

#### 1.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file fonttext.ltx currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via \usepackage[T1]{fontenc}) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the textcomp package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

## 1.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

#### 1.4 Definitions for the kernel

#### 1.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in .def files, for example otlenc.def contains the definitions for the OT1 encoding.

```
1 (*2ekernel)
2 \message{font encodings,}
Far too many macros in one block here!
```

\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
\@dec@text@cmd
\chardef@text@cmd
\@changed@cmd
\@changed@x
\TextSymbolUnavailable

\@inmathwarn

```
\DeclareTextCommand{\foo}{T1}...
```

If you say:

then  $\foo$  is defined to be  $\T1-cmd\ foo\ T1\foo$ , where  $\T1\foo$  is *one* control sequence, not two! We then call  $\ensuremath{\mbox{newcommand}}$  to define  $\T1\foo$ .

```
3 \def\DeclareTextCommand{%
     \@dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
     \@dec@text@cmd\providecommand}
7 \def\@dec@text@cmd#1#2#3{%
     \expandafter\def\expandafter#2%
        \expandafter{%
9
10
           \csname#3-cmd\expandafter\endcsname
           \expandafter#2%
           \csname#3\string#2\endcsname
12
        ጉ%
     \let\@ifdefinable\@rc@ifdefinable
14
     \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in \@dec@text@cmd without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both \newcommand and \providecommand (used just above) both handle the resetting of \@ifdefinable (following its disabling in \@dec@text@cmd), the primitive \chardef neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17    \let\@ifdefinable\@@ifdefinable
18    \chardef
19    }
20 \def\DeclareTextSymbol#1#2#3{%
21    \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22    }
    The declarations are only available before \begin{document}.
23 \@onlypreamble\DeclareTextCommand
```

24 \@onlypreamble\DeclareTextSymbol

The sneaky bit in all this is what \T1-cmd \foo \T1\foo does. There are five possibilities, depending on the current values of \protect, \cf@encoding and \ifmmode:

- If \protect is \@typeset@protect and \cf@encoding is T1, then we execute \T1\foo. This should be the normal behaviour, and is optimized for speed.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, and \OT1\foo is defined, then we execute \OT1\foo.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, we're in text mode, and \OT1\foo is undefined, then we define \OT1\foo to be the default value of \foo, and execute \OT1\foo.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, we're in math mode, and \OT1\foo is undefined, then we execute the default value of \foo. (This is necessary so that things like \$X\_\copyright\$ work properly.)
- If \protect is not \@typeset@protect then we execute \noexpand\foo. For example, if we are writing to a file, then this results in \foo being written. If we are in a \mark, then \foo will be put in the mark—since \foo is robust, it will then survive all the things which may happen to it whilst it's a \mark.

So after all that, we will either execute the appropriate definition of \foo for the current encoding, or we will execute \noexpand\foo.

The default value of \foo is \?\foo if it is defined, and an error message otherwise. When the encoding is changed from T1 to OT1, \T1-cmd is defined to be \@changed@cmd and \OT1-cmd is defined to be \@current@cmd. This means that the test for what the current encoding is can be performed quickly.

```
25 \def\@current@cmd#1{%
                     \ifx\protect\@typeset@protect
                                 \@inmathwarn#1%
27
                     \else
28
                                 \noexpand#1\expandafter\@gobble
29
30
31 \det \ensuremath{\mbox{\sc def}\mbox{\sc d
                     \ifx\protect\@typeset@protect
32
                                 \@inmathwarn#1%
33
                                 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
34
                                              \expandafter\ifx\csname ?\string#1\endcsname\relax
35
                                                         \expandafter\def\csname ?\string#1\endcsname{%
36
                                                                      \TextSymbolUnavailable#1%
37

```

File o: ltoutenc.dtx Date: 2020/08/10 Version v2.0s

The command \@inmathwarn produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call \relax before the \ifmmode. This means that it is possible for the warning to fail to be issued at the beginning of a row of an halign whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a \relax would break ligatures and kerning between text symbols.

A more efficient solution would be to make \@inmathwarn and \@inmatherr equal to \@empty and \relax by default, and to have \everymath reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

- 53 \def\@inmathwarn#1{%
- 54 \ifmmode
- 55 \@latex@warning{Command \protect#1 invalid in math mode}%
- 56 \fi}

(End definition for \DeclareTextCommand and others. These functions are documented on page ??.)

# \DeclareTextCommandDefault \ProvideTextCommandDefault

These define commands with encoding?.

Note that \DeclareTextCommandDefault can only be used in the preamble, but that the \Provide version is allowed in inputenc .def files, so is allowed anywhere.

- 57 \def\DeclareTextCommandDefault#1{%
- 58 \DeclareTextCommand#1?}
- 59 \def\ProvideTextCommandDefault#1{%
- 60 \ProvideTextCommand#1?}
- 61 \@onlypreamble\DeclareTextCommandDefault
- $\% \$  %\Conlypreamble\ProvideTextCommandDefault

They require \?-cmd to be initialized as \@changed@cmd.

63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd

(End definition for  $\ensuremath{\mathsf{NProvideTextCommandDefault}}$  and  $\ensuremath{\mathsf{NProvideTextCommandDefault}}$ . These functions are documented on page  $\ref{page}$ .)

#### \DeclareTextAccent

This is just a disguise for defining a TFX \accent command.

- 64 \def\DeclareTextAccent#1#2#3{%
- 5 \DeclareTextCommand#1{#2}{\add@accent{#3}}}
- 66 \@onlypreamble\DeclareTextAccent

 $(\mathit{End \ definition \ for \ } \mathsf{DeclareTextAccent}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:content_page}.)$ 

#### \add@accent

To save space this code is shared between all text accents that are set using the \accent primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve \setbox operations which also inhibit the mechanism of the \accent primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

67 \def\add@accent#1#2{\hmode@bgroup

Turn off the group in \UseTextSymbol in case this is used inside the argument of \add@accent.

- 68 \let\hmode@start@before@group\@firstofone
- 69 \setbox\@tempboxa\hbox{#2%

When presetting the argument in a box we record its \spacefactor for later use after the accent got typeset. This way something like \'A gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

70 \global\mathchardef\accent@spacefactor\spacefactor}%

The accent primitive doesn't allow things \begingroup to interfere between accent and base character. Therefore we need to avoid that (they are some hidden inside \maybe@load@fontshape). As we don't have to load the fontshape in this case (as that happened in the box above if necessary, we simply disable that part of the code temporally. We also ignore \ignorespaces which has the same issue and may show up as part of \normalfont if that is used.

- 71 \let\maybe@load@fontshape\relax
- 72 \let\ignorespaces\relax
- 73 \accent#1 #2\egroup\spacefactor\accent@spacefactor}

Default definition for \accent@spacefactor prevents a horrible death of the above macro inside an unprotected \edef.

74 \let\accent@spacefactor\relax

(End definition for \add@accent. This function is documented on page ??.)

\hmode@bgroup

75 \def\hmode@bgroup{\leavevmode\bgroup}

 $(\textit{End definition for } \verb|\hmode@bgroup|. \textit{This function is documented on page \ref{eq:page-1}.})$ 

\DeclareTextCompositeCommand
\DeclareTextComposite
\QtextQcompositeQx
\QstripQargs

Another amusing game to play with \expandafter, \csname, and \string. When you say \DeclareTextCompositeCommand{\foo}{T1}{a}{bar}, we look to see if the expansion of \T1\foo begins with \@text@composite, and if it doesn't, we redefine \T1\foo to be:

#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}

where ... is the previous definition of  $T1\foo$ . Finally, we define  $\T1\foo-a$  to expand to bar.

- 76 (/2ekernel)

   ⟨latexrelease⟩\EndIncludeInRelease
  ⟨*2ekernel⟩
125 \@onlypreamble\DeclareTextCompositeCommand
```

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to  $\T1\foo-A$  if  $\T1\foo-A$  has been defined, and  $\{\ldots\}$  otherwise.

Note that \@text@composite grabs the first token of the argument and puts just that in the csname. This is so that \'{\textit{e}} will work—it checks whether \\T1\'-\textit is defined (which presumably it isn't) and so expands to {\accent 1 \textit{e}}.

This trick won't always work, for example \'{{\itshape e}} will expand to (with spaces added for clarity):

```
\csname \string \T1\' - \string {\itshape e} \@empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use \csname lookups as a fast way of accessing composites.

This has an unfortunate 'misfeature' though, which is that in the T1 encoding, \'{aa} produces \(\alpha\). This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the \@empty is used in \@text@composite so that accents will work even when the argument is empty. If you say \'{} then this looks up \\T1\'-\@empty, which ought to be \relax, and so all is well. If we didn't include the \@empty, then \'{} would expand to:

```
\csname \string \T1\' - \string \endcsname
```

so the \endcsname would be \string'ed and the whole of the rest of the document would be put inside the \csname. This would not be good.

```
126 \def\@text@composite#1#2#3\@text@composite{%
127 \expandafter\@text@composite@x
128 \csname\string#1-\string#2\endcsname}
```

Originally the \@text@composite@x macro had two arguments and if #1 was not \relax it was executed, otherwise #2 was executed. All this happened within the \ifx code so that neither #1 nor #2 could have picked up any additional arguments form the input stream. This has now being changed using the typical \@firstoftwo / \@secondoftwo coding. This way the final expansion will happen without any \else or \fi intervening in the case that we need to get a further token from the input stream.

```
129 \def\@text@composite@x#1{%
130 \ifx#1\relax
131 \expandafter\@secondoftwo
132 \else
133 \expandafter\@firstoftwo
134 \fi
135 #1}
```

The command \DeclareTextComposite uses \DeclareTextCompositeCommand to declare a command which expands out to a single glyph.

```
136 \catcode\z@=11\relax
   \def\DeclareTextComposite#1#2#3#4{%
138
      \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
139
140

   ⟨latexrelease⟩\EndIncludeInRelease
   ⟨*2ekernel⟩
    Switch to a different text encoding without any grouping for use in \UseTextAccent
or \UseTextSymbol (and for \oldstylenums).
   \def\@use@text@encoding#1{%
      \edef\f@encoding{#1}%
178
      \xdef\font@name{%
179
          \csname\curr@fontshape/\f@size\endcsname}%
181
      \pickup@font
```

(End definition for \UseTextAccent, \UseTextSymbol, and \QuseQtextQencoding. These functions are documented on page ??.)

\hmode@start@before@group

The \hmode@start@before@group starts hmode and should be immediately followed by an explicit {...}. Its purpose is to ensure that hmode is started before this group is opened. Inside \add@accent and \UseTextAccent it is redefined to remove this group so that it doesn't conflict with the \accent primitive.

For a detailed discussion see pr/3160.

\font@name

\@@enc@update}

182

184 \let\hmode@start@before@group\leavevmode

(End definition for \hmode@start@before@group. This function is documented on page ??.)

\DeclareTextSymbolDefault \DeclareTextAccentDefault

Some syntactic sugar. Again, these should probably be optimized for speed.

```
185 \def\DeclareTextSymbolDefault#1#2{%
186 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}#1}}
187 \def\DeclareTextAccentDefault#1#2{%
188 \DeclareTextCommandDefault#1{\UseTextAccent{#2}#1}}
189 \@onlypreamble\DeclareTextSymbolDefault
190 \@onlypreamble\DeclareTextAccentDefault
```

(End definition for \DeclareTextSymbolDefault and \DeclareTextAccentDefault. These functions are documented on page ??.)

\UndeclareTextCommand

This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
191 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without eTeX we can't do anything about that).

```
192 \expandafter\ifx\csname#2\string#1\endcsname\relax
193 \else
```

Else: throw away that declaration.

```
194 \global\expandafter\let\csname#2\string#1\endcsname
195 \Qundefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command \foo would look similar to \T1-cmd \foo \T1\foo (three tokens).

Of course, instead of T1 one could see a different encoding name; which one depends the encoding for which \foo was declared last.

Now assume we have just removed the declaration for \foo in T1 and the top-level of \foo expands to the above. Then we better change that pretty fast otherwise we do get an "undefined csname error" when we try to typeset \foo within T1 instead of getting the default definition for \foo. And what is the best way to change that top-level definition? Well, the only "encoding" we know for sure will still be around is the default encoding denoted by ?.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like \?-cmd \foo \?\foo which is done by the following (readable?) code:

 $(\mathit{End \ definition \ for \ } \backslash \mathtt{UndeclareTextCommand}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:local_englare}.)}$ 

#### 1.4.2 Hyphenation

\patterns \@@patterns \hyphenation \@@hyphenation We redefine \patterns and \hyphenation to allow the use of commands declared with \DeclareText\* to be used inside them.

```
205 %\let\@@patterns\patterns
206 %\let\@@hyphenation\hyphenation
207 %\def\patterns{%
208 %
       \bgroup
209 %
           \let\protect\@empty
           \let\@typeset@protect\@empty
210 %
211 %
           \let\@changed@x\@changed@x@mouth
212 %
       \afterassignment\egroup
213 %
       \@@patterns
214 %}
215 %\def\hyphenation{%
216 %
       \bgroup
217 %
           \let\protect\@empty
218 %
           \let\@typeset@protect\@empty
219 %
          \let\@changed@x\@changed@x@mouth
220 %
       \afterassignment\egroup
221 %
       \@@hyphenation
222 %}
```

(End definition for \patterns and others. These functions are documented on page ??.)

#### 1.4.3 Miscellania

The \a command is used to access the accent commands even when they have been redefined (for example by the tabbing environment). Its internal name is \@tabacckludge.

The \string within the \csname guards against something like ' being active at the point of use.

```
223 \def\@tabacckludge#1{\expandafter\@changed@cmd
224 \csname\string#1\endcsname\relax}
225 \let\a=\@tabacckludge

(End definition for \a. This function is documented on page ??.)
```

## 1.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like \ae and \ss) or by the TeX Users Group Technical Working Group on multi-lingual typesetting (like \th and \ng) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like \guillemotleft and \quotedblbase). Unfortunately, this naming scheme won't work for all glyphs, since some names (like \space) are already used, and some (like \endash) are very likely to be defined by users. So we're now using the naming scheme of \text followed by the Adobe name, (like \textcompus textcap). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like \textcompwordmark). Sigh.

```
Some accents from OT1:
  \DeclareTextAccentDefault{\"}{OT1}
   \DeclareTextAccentDefault{\',}{OT1}
  \DeclareTextAccentDefault{\.}{OT1}
  \DeclareTextAccentDefault{\=}{0T1}
  \DeclareTextAccentDefault{\H}{OT1}
  \DeclareTextAccentDefault{\^}{OT1}
  \DeclareTextAccentDefault{\'}{OT1}
  \DeclareTextAccentDefault{\b}{OT1}
  \DeclareTextAccentDefault{\c}{OT1}
  \DeclareTextAccentDefault{\d}{OT1}
  \DeclareTextAccentDefault{\r}{OT1}
237 \DeclareTextAccentDefault{\u}{0T1}
238 \DeclareTextAccentDefault{\v}{0T1}

   \DeclareTextSymbolDefault{\textquoteleft}{OT1}
   \DeclareTextSymbolDefault{\textquoteright}{OT1}
   \DeclareTextSymbolDefault{\textsterling}{OT1}
Some symbols from OMS:
   \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
   \DeclareTextSymbolDefault{\textbackslash}{OMS}
   \DeclareTextSymbolDefault{\textbar}{OMS}
   \DeclareTextSymbolDefault{\textbardbl}{OMS}
   \DeclareTextSymbolDefault{\textbraceleft}{OMS}
   \DeclareTextSymbolDefault{\textbraceright}{OMS}
```

 $\verb|\DeclareTextSymbolDefault{\textbullet}{OMS}|$ 

```
274 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
   \DeclareTextSymbolDefault{\textdagger}{OMS}
  \DeclareTextSymbolDefault{\textparagraph}{OMS}
277 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
278 \DeclareTextSymbolDefault{\textsection}{OMS}
279 \DeclareTextAccentDefault{\textcircled}{OMS}
    Some symbols from OML:
280 \DeclareTextSymbolDefault{\textless}{OML}
281 \DeclareTextSymbolDefault{\textgreater}{OML}
282 \DeclareTextAccentDefault{\t}{OML}
    Some defaults we can fake.
    The interface for defining \copyright changed, it used to use \expandafter to add
braces at the appropriate points.
  \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
284 % \expandafter\def\expandafter
                     \copyright\expandafter{\copyright}}
285 %
   \DeclareTextCommandDefault{\textasciicircum}{\^{}}
   \DeclareTextCommandDefault{\textasciitilde}{\~{}}
   \DeclareTextCommandDefault{\textunderscore}{%
     \leavevmode \kern.06em\vbox{\hrule\@width.3em}}
    There is no good reason anymore to fake \textcompwordmark.
290 %\DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
   \DeclareTextSymbolDefault{\textcompwordmark}{T1}
   \DeclareTextCommandDefault{\textvisiblespace}{%
292
      \mbox{\kern.06em\vrule \@height.3ex}%
293
      \vbox{\hrule \@width.3em}%
294
      \hbox{\vrule \@height.3ex}}
    Using \fontdimen3 in the next definition is some sort of a kludge (since it is the
interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since
there it is zero).
296 \DeclareTextCommandDefault{\textellipsis}{%
      .\kern\fontdimen3\font
      .\kern\fontdimen3\font
298
      .\kern\fontdimen3\font}

## 1.5 Definitions for the OT1 encoding

The definitions for the 'TEX text' (OT1) encoding. Declare the encoding.

```
376 \langle *OT1 \rangle
377 \DeclareFontEncoding{OT1}{}{}
```

Declare the accents.

```
378 \DeclareTextAccent{\"}{0T1}{127}
379 \DeclareTextAccent{\'}{0T1}{19}
380 \DeclareTextAccent{\\}{0T1}{95}
381 \DeclareTextAccent{\\}{0T1}{22}
382 \DeclareTextAccent{\'}{0T1}{94}
383 \DeclareTextAccent{\'}{0T1}{18}
384 \DeclareTextAccent{\\}{0T1}{126}
385 \DeclareTextAccent{\\}{0T1}{125}
386 \DeclareTextAccent{\\}{0T1}{21}
387 \DeclareTextAccent{\\}{0T1}{21}
388 \DeclareTextAccent{\\}{0T1}{23}
```

Some accents have to be built by hand: Note that **\ooalign** and **\oolign** must be inside a group. In these definitions we no longer use the helper function **\shOft** from plain.tex since that now has two incompatible definitions.

```
389 \DeclareTextCommand{\b}{0T1}[1]

    Here we are adding some more composite commands to the OT1 encoding. This
makes the use of certain accents with i compatible with their use with the T1 encoding;
this enables them to become true IATEX internal representations. However, it will make
these accents work a little less fast since a check will always be made for the existence of
a composite.
449 \DeclareTextComposite{\.}{OT1}{i}{'\i}
450 \DeclareTextComposite{\.}{OT1}{\i}{'\i}
452 \DeclareTextCompositeCommand{\'\}{OT1}{i}{\Otabacckludge'\i}
453 \DeclareTextCompositeCommand{\^}{OT1}{i}{\^\i}
\label{lem:compositeCommand} $$ \end{\label{lem:compositeCommand} $$ \operatorname{CompositeCommand}(\")_{i}_{i}_{i}$$
    T1 encoding is given more extensive set of overloads for \c But here we just adjust
\c{g}.

## 1.7 Definitions for the OMS encoding

The definitions for the 'TeX math symbol' (OMS) encoding. Even though this is meant to be a math font, it includes some of the standard LaTeX text symbols.

Declare the encoding.

```
709 \langle *OMS \rangle
710 \DeclareFontEncoding{OMS}{}{}
```

Declare the symbols. Note that slot 13 has in places been named \Orb: please root out and destroy this impolity wherever you find it!

```
\DeclareTextSymbol{\textasteriskcentered}{OMS}{3}
                                                        % "03
                                                        % "6E
  \DeclareTextSymbol{\textbackslash}{OMS}{110}
  \DeclareTextSymbol{\textbar}{OMS}{106}
                                                        % "6A
                                                        % "6B
  \DeclareTextSymbol{\textbardbl}{OMS}{107}
                                                        % "66
  \DeclareTextSymbol{\textbraceleft}{OMS}{102}
716 \DeclareTextSymbol{\textbraceright}{OMS}{103}
                                                        % "67
  \DeclareTextSymbol{\textbullet}{OMS}{15}
                                                        % "OF
718 \DeclareTextSymbol{\textdaggerdbl}{OMS}{122}
                                                        % "7A
                                                        % "79
  \DeclareTextSymbol{\textdagger}{OMS}{121}
720 \DeclareTextSymbol{\textparagraph}{OMS}{123}
                                                        % "7B
                                                        % "01
  \DeclareTextSymbol{\textperiodcentered}{OMS}{1}
  \DeclareTextSymbol{\textsection}{OMS}{120}
                                                        % "78
                                                        % "OD
  \DeclareTextSymbol{\textbigcircle}{OMS}{13}
  \DeclareTextCommand{\textcircled}{OMS}[1]{\hmode@bgroup
      \ooalign{%
         \hfil \raise .07ex\hbox {\upshape#1}\hfil \crcr
726
         \char 13 % "OD
727
     }%
728
   \egroup}
729
730 (/OMS)
```

## 1.8 Definitions for the OML encoding

The definitions for the 'TEX math italic' (OML) encoding. Even though this is meant to be a math font, it includes some of the standard LATEX text symbols.

Declare the encoding.

```
_{731} \langle ^*\mathsf{OML} \rangle
_{732} \mathsf{DeclareFontEncoding\{OML}\{\}\{\}\}
```

Declare the symbols.

```
733 \DeclareTextSymbol{\textless}{OML}{'\<}
734 \DeclareTextSymbol{\textgreater}{OML}{'\>}
735 \DeclareTextAccent{\t}{OML}{127} % "7F
736 \( /OML \)
```

### 1.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the 'TEX text' (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The LATEX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

```
Metafont sources ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip; Font files ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip. Declare the encoding.
```

```
737 (*OT4)
738 \DeclareFontEncoding{OT4}{}}
739 \DeclareFontSubstitution{OT4}{cmr}{m}{n}
```

Declare the accents.

```
740 \DeclareTextAccent{\"}{0T4}{127}
741 \DeclareTextAccent{\'}{0T4}{19}
742 \DeclareTextAccent{\.}{0T4}{95}
743 \DeclareTextAccent{\-}{0T4}{22}
744 \DeclareTextAccent{\'}{0T4}{94}
745 \DeclareTextAccent{\'}{0T4}{18}
746 \DeclareTextAccent{\'}{0T4}{126}
747 \DeclareTextAccent{\H}{0T4}{125}
748 \DeclareTextAccent{\\U}{0T4}{21}
749 \DeclareTextAccent{\\V}{0T4}{20}
750 \DeclareTextAccent{\\T}{0T4}{23}
```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```
751 \DeclareTextCommand{\k}{0T4}[1]{%
752 \TextSymbolUnavailable{\k{#1}}#1}
```

In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```
Declare the text symbols.
      \DeclareTextSymbol{\AE}{OT4}{29}
      \DeclareTextSymbol{\OE}{OT4}{30}
      \DeclareTextSymbol{\0}{0T4}{31}
      \DeclareTextSymbol{\L}{0T4}{138}
      \DeclareTextSymbol{\ae}{0T4}{26}
      \DeclareTextSymbol{\guillemetleft}{0T4}{174}
      \DeclareTextSymbol{\guillemetright}{OT4}{175}
 769 % old Adobe names
      \DeclareTextSymbol{\guillemotleft}{OT4}{174}
      \DeclareTextSymbol{\guillemotright}{0T4}{175}

## 1.10 Definitions for the TS1 encoding

```
823 (*TS1)
824 \DeclareFontEncoding{TS1}{}{}
825 \DeclareFontSubstitution{TS1}{cmr}{m}{n}
```

Some accents have to be built by hand. Note that **\ooalign** and **\oolign** must be inside a group.

Accents for capital letters.

These commands can be used by the end user either directly or through definitions of the type

\DeclareTextCompositeCommand{\',}{T1}{X}{\capitalacute X}

None of the latter definitions are provided by default, since they are probably rarely used.

Tie accents.

00 = 0

The tie accent was borrowed from the cmmi font. The tc fonts now provide four tie accents, the first two are done in the classical way with assymetric glyphs hanging out of

their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

```
843 \DeclareTextAccent{\t}{TS1}{26}
844 \DeclareTextAccent{\capitaltie}{TS1}{27}
845 \DeclareTextAccent{\newtie}{TS1}{28}
846 \DeclareTextAccent{\capitalnewtie}{TS1}{29}
    Compund word marks.
    The text companion fonts contain two compound word marks of different heights,
one has cap_height, the other asc_height.

## 1.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package fontspec as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here Cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted form the inputenc UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to IATEX LICR commands.

A few additional names for character which were supported in the original fontspec version of this file have also been added, even though they are not currently in the default inputenc UTF-8 declarations.

```
963 (*TU)
```

In the base interface the Unicode encoding is always known as TU But we parameterise the encoding name to allow for modelling differences in Unicode support by different fonts

964 \providecommand\UnicodeEncodingName{TU}

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then about this file, switching back to T1 encoding.

```
\begingroup\expandafter\expandafter\expandafter\endgroup
  \expandafter\ifx\csname XeTeXrevision\endcsname\relax
     \begingroup\expandafter\expandafter\expandafter\endgroup
    \expandafter\ifx\csname directlua\endcsname\relax
    Not LuaTeX or XeTeX, abort with a warning.
      \PackageWarningNoLine{fontenc}
969
         {\UnicodeEncodingName\space
          encoding is only available with XeTeX and LuaTeX.\MessageBreak
         Defaulting to T1 encoding}
972
         \def\encodingdefault{T1}
973
       \expandafter\expandafter\expandafter\endinput
974
975
```

LuaTeX. For LuaTeX 1.10+, define a Lua function to disable any handing by the font code. Otherwise we reload the font without TeX ligatures.

           \font\remove@tlig
986
           \expandafter\@remove@tlig\expandafter{\fontname\font}%
987
           \remove@tlig
           \char#1\relax
           \endgroup
         }
       \else
992
         \newluafunction\@remove@tlig@@@@
```

Now we can define the function. Mostly we just have to insert a protected glyph node, which is a glyph node with subtype 256. But we have to keep track of the current mode to avoid inserting the glyph into a vlist.

```
\now@and@everyjob{\directlua{
            local rawchar_func = token.create'@remove@tlig@@@@'.index
995
            local forcehmode = tex.forcehmode
            local put_next = token.put_next
997
998
            local glyph_id = node.id'glyph'
            local rawchar_token = token.new(rawchar_func, token.command_id'lua_call')
aga
            lua.get_functions_table()[rawchar_func] = function()
1000
              local mode = tex.nest.top.mode
1001
              if mode == 1 or mode == -1 then
1002
                put_next(rawchar_token)
1003
                return forcehmode(true)
```

```
1005
              end
              local n = node.new(glyph_id, 256)
1006
              n.font = font.current()
1007
              n.char = token.scan_int()
1008
              return node.write(n)
1009
1010
            end
            token.set_lua('@remove@tlig@@@', rawchar_func, 'global', 'protected')
1011
1012
Now \remove@tlig can be implemented almost as in XeTeX.

### 2 Package files

This file now also contains some packages that provide access to the more specialised encodings.

#### 2.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding FOO, the package looks to see if the encoding FOO has already been declared. If it has not, the file fooenc.def is loaded. The default encoding is set to be FOO.

In addition the package at the moment contains extra code to extend the **\Quclclist** (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
1464 (*package)
```

Here we define a macro that extends the **\Quclclist** if needed and afterwards turns itself in a noop.

```

1491
     \cyrzhdsc\CYRZHDSC}%
    \let\update@uclc@with@cyrillic\relax
1494 }
    Here we process each option:
   \DeclareOption*{%
```

\let\encodingdefault\CurrentOption

From 2020/02/02 release onward we only load the encoding files if they haven't be loaded already. To check this we look if \T@encoding is already defined. If not we load (indicated by setting the switch @tempswa to true and we always load if we run in an older format (or rather in a rollback situation).

```
\@tempswafalse
1497
       \ensuremath{\tt 0ifl@t@r\fmtversion\{2020/02/02\}\%}
1498
           {\expandafter\ifx\csname T@\CurrentOption\endcsname\relax
1499
             \@tempswatrue\fi}%
1500
           {\@tempswatrue}%
1501
Load if necessary:
       \if@tempswa
1502
         \edef\reserved@f{%
1503
           \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1504
         \reserved@f
1505
         \InputIfFileExists\reserved@f
1506
              {}{\PackageError{fontenc}%
                {Encoding file '\reserved@f' not found.%
                 \MessageBreak
                  You might have misspelt the name of the encoding}%
                {Necessary code for this encoding was not
                loaded.\MessageBreak
1512
                Thus calling the encoding later on will
1513
                produce further error messages.}}%
1514
        \let\reserved@f\relax
1515
```

In case the current encoding is one of a list of known cyrillic ones we extend the \@uclclist:

```
\expandafter\in@\expandafter{\CurrentOption}%
1516
                                         {T2A, T2B, T2C, X2, LCY, OT2}%
1517
1518
```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the \@uclclist gets unnecessarily big, slowing down the processing at runtime.

```
\expandafter\in@\expandafter\cyra\expandafter
1519
                                          {\@uclclist}%
1520
            \ifin@
1521
            \else
              \update@uclc@with@cyrillic
1523
            \fi
1524
        \fi
1525
      \fi
1526
1527 }
```

1528 \ProcessOptions\*

We select the new font encoding default (i.e., the last encoding specified in the option list. But this encoding may not work with the current \f@shape, e.g., LY1 is not defined for cmr and therefore packages switching to LY1 usually also change \rmdefault. But that only applies at \begin{document} so we get a spurious warning if we use what LATEX previously used:

1529 %\fontencoding\encodingdefault\selectfont

So instead we do this here:

1530 \usefont\encodingdefault\familydefault\seriesdefault\shapedefault

To save some space we get rid of the macro extending the \@uclclist (might have happened already).

1531 \let\update@uclc@with@cyrillic\relax

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```

## ltcounts.dtx

## 1 Counters and Lengths

```
Commands for defining and using counters. This file defines:
                           To define a new counter.
     \newcounter
                          To set the value of counters.
    \setcounter
  \addtocounter
                          Increase the counter #1 by the number #2.
                          Increase a counter by one.
   \stepcounter
\refstepcounter
                          Increase a counter by one, also setting the value used by \label.
                          For accessing the value of the counter as a TFX number (as opposed to \the\counter)
           \value
                     which expands to the printed representation of \langle counter \rangle)
                           \arabic{\langle counter \rangle}: 1, 2, 3, \dots
          \arabic
                           \mbox{roman}{\langle counter \rangle}: i, ii, iii, ...
           \roman
                           \mathbb{C}  (Counter): I, II, III, ...
           \Roman
            \alph
                           \Lambda \left( counter \right) : A, B, C, \dots
            \Alph
       \fnsymbol
                           \footnotemark: *, †, ‡, ...
 \counterwithin
                           \counterwithin{\langle counter \rangle} {\langle within-counter \rangle}: Resets \langle counter \rangle \ whenever \langle within-counter \rangle
                     is stepped. Also redefines \the\langle counter\rangle command to produce \the\langle within\text{-}counter\rangle. \arabic\{\langle counter\rangle\}
                     Star form omits redefining the print representation.
\counterwithout
                           \counter \text{\(\counter\)} \{\(\counter\)}\): Removes \(\counter\) from the reset
                     list of \langle within\text{-}counter \rangle. Also redefines \text{\the}\langle counter \rangle command to produce \text{\the}\langle counter \rangle.
                     Star form omits redefining the print representation.
```

#### 1.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences: \c@foo Contains the counter's numerical value. It is defined by \newcount\foocounter. \thefoo Macro that expands to the printed value of \foocounter. For example, if sections are numbered within chapters, and section headings look like Section II-3. The Nature of Counters then \thesection might be defined by: \def\thesection {\@Roman{\c@chapter}-\@arabic{\c@section}} \p@foo Macro that expands to a printed 'reference prefix' of counter foo. Any \ref to a value created by counter foo will produce the expansion of \p@foo\thefoo when the \label command is executed. See file ltxref.dtx for an extension of this mechanism. \cl@foo List of counters to be reset when foo stepped. \@elt{countera}\@elt{counterb}\@elt{counterc}.

#### NOTE:

1 (\*2ekernel)

\thefoo and \p@foo must be defined in such a way that \edef\bar{\thefoo} or \edef\bar{\p@foo} defines \bar so that it will evaluate to the counter value at the

time of the \edef, even after \foocounter and any other counters have been changed. This will happen if you use the standard commands \@arabic, \@Roman, etc.

The following commands are used to define and modify counters.

 $\rcsin {\langle foo \rangle}$ 

Same as \stepcounter, but it also defines \@currentreference so that a subsequent \label{\label{\label}} command causes \ref{\langle bar\rangle} to generate the current value of counter \langle foo\rangle.

 $\ensuremath{\texttt{Qdefinecounter}}$ 

Initializes counter  $\{\langle foo \rangle\}$  (with empty reset list), defines \p@foo and \thefoo to be null. Also adds  $\langle foo \rangle$  to \cl@ckpt – the reset list of a dummy counter @ckpt used for taking checkpoints for the \include system.

 $\cdot \cdot \cdot\cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot$ 

 $\ensuremath{\mbox{\tt Qremovefromreset}\{\langle foo\rangle\}\}\{\langle bar\rangle\}\ : \mbox{Removes counter }\langle foo\rangle\ \mbox{to the list of counters}\ \ensuremath{\mbox{\tt ClQbar}\ }\ \mbox{to be reset when counter }\langle bar\rangle\ \mbox{is stepped}.$ 

\setcounter \setcounter $\{\langle foo\rangle\}\{\langle val\rangle\}$ : Globally sets \foocounter equal to  $\langle val\rangle$ .

- 2 \def\setcounter#1#2{%
- 3 \@ifundefined{c@#1}%
- 4 {\@nocounterr{#1}}%
- 5 {\global\csname c@#1\endcsname#2\relax}}

(End definition for \setcounter. This function is documented on page ??.)

\addtocounter \addtocounter{ $\langle foo \rangle$ }{ $\langle val \rangle$ } Globally increments \foocounter by  $\langle val \rangle$ .

- 6 \def\addtocounter#1#2{%
- 7 \@ifundefined{c@#1}%
- 8 {\@nocounterr{#1}}%
- {\global\advance\csname c@#1\endcsname #2\relax}}

(End definition for \addtocounter. This function is documented on page ??.)

\newcounter

\newcounter{ $\langle newctr \rangle$ } [ $\langle oldctr \rangle$ ] Defines  $\langle newctr \rangle$  to be a counter, which is reset when counter  $\langle oldctr \rangle$  is stepped. If  $\langle newctr \rangle$  already defined produces 'conewctr' already defined' error.

- 10 \def\newcounter#1{%
- 11 \expandafter\@ifdefinable \csname c@#1\endcsname
- 12 {\@definecounter{#1}}%
- 13 \@ifnextchar[{\@newctr{#1}}{}}

(End definition for \newcounter. This function is documented on page ??.)

\value \value{ $\langle ctr \rangle$ } produces the value of counter  $\langle ctr \rangle$ , for use with a \setcounter or \addtocounter command.

14 \def\value#1{\csname c@#1\endcsname}

(End definition for  $\$  This function is documented on page ??.)

\@newctr

- 15 \def\@newctr#1[#2]{%
- \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}

(End definition for \Onewctr. This function is documented on page ??.)

```
\stepcounter \stepcounterfoo Globally increments counter \c@FOO and resets all subsidiary counters.
                     17 \def\stepcounter#1{%
                         \addtocounter{#1}\@ne
                     19
                         \begingroup

```

\Offinsymbol Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.

This macro is another example of an ever recurring problem in TeX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an \edef or \write where an \ifmmode test would be executed prematurely. Hence in the implementation below, \@fnsymbol is not robust in itself but the parts doing the actual typesetting are.

In the case of \@fnsymbol we make use of the robust command \TextOrMath which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a \relax token if run under regular TeX, which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use eTeX as engine for LaTeX (as recommended) this unfortunate side effect is not present.

```

\TextOrMath

When using regular TEX, we make this command robust so that it always selects the correct branch in an \ifmmode switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic \IeC from inputenc but then it wil have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell. However, users of eTEX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTEX but making sure not to permanently turn \protected into \relax.

```
150 (/2ekernel)
151 (latexrelease)\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
152 (*2ekernel | latexrelease)
153 \text{begingroup}\text{expandafter}\text{expandafter}\text{endgroup}
154 \text{expandafter}\text{ifx}\csname \text{protected}\text{endcsname}\text{relax}
```

In case of ordinary TEX we define **\TextOrMath** as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
155 \DeclareRobustCommand\TextOrMath{%
156 \ifmmode \expandafter\@secondoftwo
157 \else \expandafter\@firstoftwo \fi}
158 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
159 \else
```

For eTEX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
160 \protected\expandafter\def\csname TextOrMath\space\endcsname{% 161 \iffmode \expandafter\@secondoftwo
```

```
le2 \else \expandafter\Offirstoftwo \fi}
le3 \edef\TextOrMath#1#2{%
le4 \expandafter\noexpand\csname TextOrMath\space\endcsname
le5 {#1}{#2}}
le6 \fi

```

\@settopoint This macro takes the contents of the skip register that is supplied as its argument and removes the fractional part to make it a whole number of points. This can be used in class files to avoid values like 345.466666pt when calulating a dimension.

- ${\tt 22} $$ \end{center} $$ \e$
- $_{23}$   $\langle /2ekernel \rangle$

(End definition for  $\ensuremath{\backslash} \mathtt{Csettopoint}$ . This function is documented on page  $\ref{eq:condition}$ .)

#### File r

## ltfssbas.dtx

This file contains the main implementation of the 'low level' font selection commands. See other parts of the  $\LaTeX$  distribution, or  $\texttt{The} \oiint \texttt{TEX}$  Companion for higher level documentation of the  $\LaTeX$  'New' Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

## 1 Preliminary macros

We define a number of macros that will be used later.

\@nomath

**\@nomath** is used by most macros that will have no effect in math mode. It issues a warning message.

- 1 (\*2ekernel)
- 2 \def\@nomath#1{\relax\ifmmode
- 3 \@font@warning{Command \noexpand#linvalid in math mode}\fi}

(End definition for \Onomath. This function is documented on page ??.)

\no@alphabet@error

The macro \no@alphabet@error is called whenever the user requests a math alphabet that is not available in the current version. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math alphabet. The \relax at the beginning is necessary to prevent TeX from scanning too far in certain situations.

```
4 \gdef\no@alphabet@error#1{\relax \iffmode
5 \@latex@error{Math\space alphabet\space identifier\space
6 \noexpand#1is\space undefined\space in\space math\space
7 version\space '\math@version'}%
8 {Your\space requested\space math\space alphabet\space
9 is\space undefined\space in\space the\space current\space
10 math\space version.^^JCheck\space the\space spelling\space
11 or\space use\space the\space \noexpand\SetMathAlphabet\space
12 command.}
13 \fi}
```

(End definition for \no@alphabet@error. This function is documented on page ??.)

\new@mathgroup \mathgroup

We also give a new name to \newfam and \fam to avoid verbal confusion (see the introduction).

- 14 %\def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@@n}
- 15 \let\mathgroup\fam
- 16 %\let\newfam\new@mathgroup
- 17 \@onlypreamble\new@mathgroup

 $(End\ definition\ for\ \verb|\new@mathgroup|\ and\ \verb|\mathgroup|.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:constraint}??.)$ 

<sup>&</sup>lt;sup>9</sup>For the same reason it seems advisable to **\let\fam** and **\newfam** equal to **\relax**, but this is commented out to retain compatibility to existing style files.

## 2 Macros for setting up the tables

\DeclareFontShape

The macro \DeclareFontShape takes 6 arguments:

18 \def\DeclareFontShape{\begingroup

First we restore the catcodes of all characters used in the syntax.

19 \nfss@catcodes

We use \expandafter \endgroup to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

```
20 \expandafter\endgroup
21 \DeclareFontShape@}
```

(End definition for \DeclareFontShape. This function is documented on page ??.)

#### \DeclareFontShape@

```
22 \( /2ekernel \)
23 \( \angle *2ekernel \) | latexrelease \\
24 \( \latexrelease \) \( \lambda \) | latexrelease \( \lambda \) | \( \lambda \) | latexrelease \( \lambda \) | \( \lambd
```

If the series value is incorrectly specified with an extra "m", e.g., "mc" instead of just "c", drop the surplus "m" but keep the "m" if it is by its own. In that case also issue a warning that the declaration needs correction.

For this we compare the given value #3 with one where we may have dropped an "m". If nothing has changes, fine. Otherwise there was a wrong value which is now corrected in \reservedb so we use that and also issue a warning.

```
\edef\reserved@a{#3}%
       \series@maybe@drop@one@m\reserved@a\reserved@b
31
       \ifx\reserved@a\reserved@b\else
32
         \@latex@warning{Font shape declaration has incorrect series
           value '#3'.\MessageBreak It should not contain an 'm'!
           Please correct it.\MessageBreak Found}%
35
       \fi
36
37
       \expandafter
         \xdef\csname#1/#2/\reserved@b/#4\endcsname
38
                    {\expandafter\noexpand\csname #5\endcsname}%
39
40 %
```

Most of the time #6 is empty so using \let to \@empty saves on space compared to using \def. That's really one of the old space saving techniques and probably not necessary these days.

```
\def\reserved@a{#6}%
41
42
        \expandafter\let\csname#5\expandafter\endcsname
43
           \ifx\reserved@a\@empty
44
             \@empty
45
           \else
46
             \reserved@a
           \fi
48
     \fi
49
    }
```

```
52 (latexrelease)\EndIncludeInRelease
                         53 (latexrelease)\IncludeInRelease{0000/00/00}%
                         54 (latexrelease)
                                                           {\DeclareFontShape@}{Maybe drop one m}%
                         55 (latexrelease)
                         56 (latexrelease)\def\DeclareFontShape@#1#2#3#4#5#6{%

#### \DeclareFontFamily

#### 93 \def\DeclareFontFamily#1#2#3{%

If we want fast checking for the encoding scheme we can just check for  $\T0...$  being defined.

Now we have to define the macro  $\langle \#1 \rangle + \langle \#2 \rangle$  to contain #3. But since most of the time #3 will be empty we use \let in a tricky way rather than a simple \def since this will save internal memory. We store the argument #3 in a temporary macro \reserved@a.

```
\def\reserved@a{#3}%
```

We compare \reserved@a with \@empty If these two are the same we \let the 'extra' macro equal to \@empty which is not the same a doing a \let to \reserved@a — the latter would blow one extra memory location rather then reusing the one from \@empty.

(End definition for \DeclareFontFamily. This function is documented on page ??.)

#### \cdp@list

We initialize the code page list to be empty.

```
114 \let\cdp@list\@empty
115 \@onlypreamble\cdp@list
```

 $(\textit{End definition for } \verb|\cdp@list|. \textit{This function is documented on page \ref{eq:page-1}.})$ 

#### \cdp@elt

```
116 \let\cdp@elt\relax
117 \@onlypreamble\cdp@elt
```

(End definition for \cdp@elt. This function is documented on page ??.)

#### \DeclareFontEncoding

118 \def\DeclareFontEncoding{%

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```
\begingroup
119
      \nfss@catcodes
120
      \expandafter\endgroup
121
      \DeclareFontEncoding@}
  \@onlypreamble\DeclareFontEncoding
  \def\DeclareFontEncoding@#1#2#3{%

\text{\csname#1-cmd\endcsname\@changed@cmd}
\text{\csname}
\text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\csname} \text{\c
```

Keep a record of the last encoding being declared:

```
137 \xdef\LastDeclaredEncoding{#1}%
138 }
139 \@onlypreamble\DeclareFontEncoding@
```

(End definition for \DeclareFontEncoding. This function is documented on page ??.)

\LastDeclaredEncoding

The last encoding being declared by \DeclareFontEncoding.

```
140 \def\LastDeclaredEncoding{}
```

(End definition for \LastDeclaredEncoding. This function is documented on page ??.)

#### \DeclareFontSubstitution

```
141 \def\DeclareFontSubstitution#1#2#3#4{%
142 \expandafter
143 \ifx\csname T@#1\endcsname\relax
144 \@latex@error{Encoding scheme '#1' unknown}\@eha
145 \else
146 \begingroup
```

We loop through the \cdp@list and rebuild it anew in \toks@ thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in \reserved@a since it might just be \LastDeclaredEncoding that is passed as #1.

```
\edef\reserved@a{#1}%
\toks@{}%
\def\cdp@elt##1##2##3##4{%
\def\reserved@b{##1}%
\ifx\reserved@a\reserved@b
```

```
Here we use the new defaults but we use ##1 (i.e., the encoding name already stored previously) since we know that it is expanded.
```

```
152
             \else
153
If \reserved@a and \reserved@b differ then we simply copy from the old list to the new.

\DeclareFontEncodingDefaults

\default@T
\default@M

{%

188

\DeclarePreloadSizes

Don't know at the moment what this group here does!

```
.89 \begingroup
```

We define a macro  $\reserved @f^{10}$  that grabs the next size and loads the corresponding font. This is done by delimiting  $\reserved @f'$ s only argument by the token, (comma).

```
190 \def\reserved@f##1,{%
```

The end of the list will be detected when there are no more elements, i.e. when \reserved@f's argument is empty. The trick used here is explained in Appendix D of the TEXbook: if the argument is empty the \if will select the first clause and \let \reserved@f equal to \relax. (We use the > character here since it cannot appear in font file names.)

```
191     \if>##1>%
192     \let\reserved@f\relax
193     \else
```

Otherwise, we define \font@name appropriately and call \pickup@font to do the work. Note that the requested \curr@fontshape combination must have been defined, or you will get an error. The definition of \font@name is carried out globally to be consistent with the rest of the code in this file.

```
194 \xdef\font@name{\csname#1/#2/#3/#4/##1\endcsname}\%
195 \pickup@font
```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to \relax. This means that later on, when the font is first used, the macro \define@newfont is called again to execute the 'extra' macro for this font.

```
\global\expandafter\let\font@name\relax
197 \fi
```

Finally we call \reserved@f again to process the next *size*. If \reserved@f was \let equal to \relax this will end the macro.

```
ys \reserved@f}%
```

We finish with reinserting the list of sizes after the \reserved@f macro and appending an empty element so that the end of the list is recognized properly.

(End definition for \DeclarePreloadSizes. This function is documented on page ??.)

\ifmath@fonts

We need a switch to decide if we have to switch math fonts. For this purpose we provide \ifmath@fonts that can be set to true or false by the \SQ... macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```
204 \newif\ifmath@fonts \math@fontstrue
```

(End definition for \ifmath@fonts. This function is documented on page ??.)

<sup>&</sup>lt;sup>10</sup>We cannot use \@tempa since it is needed in \pickup@font.

\DeclareMathSizes \DeclareMathSizes\*

\DeclareMathSizes takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right \SQ... macro.

```
205 \def\DeclareMathSizes{%
206 \@ifstar{\@DeclareMathSizes\math@fontsfalse}%

### 3 Selecting a new font

#### 3.1 Macros for the user

\fontencoding \f@encoding

As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros \f@family, \f@series, and \f@shape, resp. We use \edef's so that the arguments can also be macros.

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a \selectfont in-between we can save processing by making sure that \enc@update is \relax.

```
257 \let\enc@update\relax
258 \else
```

If current and new encoding differ we define the macro \enc@update to contain all updates necessary at \selectfont time.

(End definition for \fontencoding and \fOencoding. These functions are documented on page ??.)

#### \@@enc@update

#### 263 \def\@@enc@update{%

When \@@enc@update is executed \f@encoding holds the encoding name for the new encoding and \cf@encoding the name of the last active encoding.

We start by setting the init command for encoding dependent macros to \@changed@cmd.

```
\expandafter
\let
\csname\cf@encoding -cmd\endcsname
\@changed@cmd
```

Then we turn the one for the new encoding to \@current@cmd (see ltoutenc.dtx for further explanations).

We execute the default settings \default@T, followed by the one for the new encoding.

271

```
\default@T
\csname T@\f@encoding\endcsname
```

File r: ltfssbas.dtx Date: 2020/02/27 Version v3.2g

```
Finally we change the default substitution values, disable \enc@update and make \f@encoding officially the current encoding.
```

```
\csname D@\f@encoding\endcsname
              275
                          \let\enc@update\relax
              276
                          \let\cf@encoding\f@encoding
              277 }
              (End definition for \@@enc@update. This function is documented on page ??.)
              The default action in \selectfont is to do nothing.
\enc@update
              278 \let\enc@update\relax
              (End definition for \enc@update. This function is documented on page ??.)
\fontfamily
  \f@familv
              279 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{#1}}
\fontseries
              There are now defined later (and differently).
  \f@series
              280 %\DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}
 \fontshape
              281 %\DeclareRobustCommand\fontshape [1]{\edef\f@shape{#1}}
   \f@shape
```

(End definition for \fontfamily and others. These functions are documented on page ??.)

\usefont

Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a \fontsize command first.

\fontencoding needs to do some setup work so we call that, but instead of calling \fontfamily, \fontseries and \fontshape it earlier versions of this code did, we now set \fontseries, etc. directly. If we would call \fontseries or \fontshape as it was done in the past, they would now interact with the existing series and shape which is not desired if we intend to use an explicit font shape!

```
282 \DeclareRobustCommand\usefont[4] {\fontencoding{#1}%
283 \edef\f@family{#2}%
284 \edef\f@series{#3}%
285 \edef\f@shape{#4}\selectfont
286 \ignorespaces}

(End definition for \usefont. This function is documented on page ??.)
```

\linespread

The command \linespread changes the current \baselinestretch by calling \set@fontsize. The values for \f@size and \f@baselineskip will be left unchanged.

```
287 \DeclareRobustCommand\linespread[1]
288 {\set@fontsize{#1}\f@size\f@baselineskip}
```

(End definition for \linespread. This function is documented on page ??.)

\fontsize

We also define a macro that allows to specify a size. In this case, however, we also need the value of \baselineskip. As the first argument to \set@fontsize we pass the current value of \baselinestretch. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using \renewcommand. If we would pass the internal \f@linespread such a change would be effectively overwritten by a size change.

```
289 \DeclareRobustCommand\fontsize[2]
290 {\set@fontsize\baselinestretch{#1}{#2}}
(End definition for \fontsize. This function is documented on page ??.)
```

File r: ltfssbas.dtx Date: 2020/02/27 Version v3.2g

```
\f@linespread This macro holds the current internal value for \baselinestretch.
                 291 \let\f@family\@empty
                 292 \let\f@series\@empty
                 293 \let\f@shape\@empty
                 294 \let\f@size\@empty
                 295 \let\f@baselineskip\@empty
                 296 \let\f@linespread\@empty
                 (End definition for \fClinespread. This function is documented on page ??.)
  \cf@encoding
                 297 \let\f@encoding\@empty
                 298 \let\cf@encoding\@empty
                 (End definition for \cf@encoding. This function is documented on page ??.)
\@defaultunits
                The function \@defaultunits when wrapped around a dimen or skip assignment supplies
                 default units. Usage:
                      \@defaultunits\dimen@=#1pt\relax\@nnil
                     Note: the \relax is *important*. Other units can be substituted for the 'pt' if
                      We use \remove@to@nnil as an auxiliary macros for \@defaultunits. It just has
                 to gobble the supplied default unit 'pt' or whatever, if it wasn't used in the assignment.
                 299 \def\@defaultunits{\afterassignment\remove@to@nnil}
                 (End definition for \ensuremath{\verb|Cdefaultunits|}). This function is documented on page ??.)
                This macro strips the characters pt produced by using \the on a dimen register.
     \strip@pt
       \rem@pt
                 300 \begingroup
                      \catcode'P=12
                      \catcode'T=12
                      \lowercase{
                         \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}}
                      \expandafter\endgroup\x
                 306 \def\strip@pt{\expandafter\rem@pt\the}
                 (End definition for \strip@pt and \rem@pt. These functions are documented on page ??.)
                \mathversion takes the math version name as argument, defines \math@version appro-
  \mathversion
                priately and switches to the font selected forcing a call to \glb@settings if the version
 \math@version
                 is known to the system.
                 307 \DeclareRobustCommand\mathversion[1]
                              {\@nomath\mathversion
                               \expandafter\ifx\csname mv@#1\endcsname\relax
                               \@latex@error{Math version '#1' is not defined}\@eha\else
                 310
                               \edef\math@version{#1}%
```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting \glb@currsize to an invalid value since this will trigger the setup when the formula starts.

\gdef\glb@currsize{}%

312

When the scope of the current \mathversion ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is todo the setting only if the version really has changed after all. This might be interesting in case of amstext and boldsymbol.

```
313 \aftergroup\glb@settings
314 \fi}
```

 $(\textit{End definition for } \verb|\mathversion| and \verb|\mathversion|. These functions are documented on page \ref{eq:constraints})|) \\$ 

If TEX would support a hook just before the end of a formula (opposite of \everymath so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in LATEX the use of \$ (as the primitive TEX command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a \$ couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct TEX function must be hidden.

Anyway, since we don't have this and won't have it in LATEX  $2\varepsilon$  we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks \everymath and \everydisplay. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

## \frozen@everymath \frozen@everydisplay

New internal names for \everymath and \everydisplay.

- 315 \let\frozen@everymath\everymath
- 316 \let\frozen@everydisplay\everydisplay

(End definition for  $\footnote{ongeverymath}$  and  $\footnote{ongeverydisplay}$ . These functions are documented on page  $\rootnote{ongeverymath}$ .)

\everymath \everydisplay

Now we provide now user hooks that will be called in the frozen internals.

317 \newtoks\everymath
318 \newtoks\everydisplay

(End definition for \everymath and \everydisplay. These functions are documented on page ??.)

\frozen@everymath

Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.

```
319 \frozen@everymath = {\check@mathfonts
320 \the\everymath}
```

(End definition for \frozen@everymath. This function is documented on page ??.)

\frozen@everydisplay

Ditto for the display hook.

```
321 \frozen@everydisplay = {\check@mathfonts
322 \the\everydisplay}
```

 $(\mathit{End \ definition \ for \ } \texttt{Irozen@everydisplay}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.)}$ 

\curr@math@size

This holds locally the current math size.

323 \let\curr@math@size\@empty

(End definition for \curr@math@size. This function is documented on page ??.)

File r: ltfssbas.dtx Date: 2020/02/27 Version v3.2g

#### 3.2 Macros for loading fonts

\pickup@font

The macro \pickup@font which is used in \selectfont is very simple: if the font name is undefined (i.e. not known yet) it calls \define@newfont to load it.

```
324 \def\pickup@font{%
325 \expandafter \ifx \font@name \relax
326 \define@newfont
327 \fi}
```

(End definition for \pickup@font. This function is documented on page ??.)

\split@name

\pickup@font assumes that \font@name is set but it is sometimes called when \f@family, \f@series, \f@shape, or \f@size may have the wrong settings (see, e.g., the definition of \getanddefine@fonts). Therefore we need a macro to extract font family, series, shape, and size from the font name. To this end we define \split@name which takes the font name as a list of characters of \catcode 12 (without the backslash at the beginning) delimited by the special control sequence \@nil. This is not very complicated: we first ensure that / has the right \catcode

```
328 {\catcode'\/=12
```

and define \split@name so that it will define our private \f@encoding, \f@family, \f@series, \f@shape, and \f@size macros.

```
329 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
330 \def\f@family{#2}%
331 \def\f@series{#3}%
332 \def\f@shape{#4}%
333 \def\f@size{#5}}}
```

(End definition for  $\split@name$ . This function is documented on page  $\ref{eq:local_property}$ .)

\curr@fontshape

Abbreviation which may get removed again for speed.

334 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}

(End definition for \curr@fontshape. This function is documented on page ??.)

\define@newfont

Now we can tackle the problem of defining a new font.

```
335 \def\define@newfont{%
```

We have already mentioned that the token list that  $\split@name$  will get as argument must not start with a backslash. To reach this goal we will set the  $\split@name$  to -1 so that the  $\split@name$  primitive will not generate an escape character. To keep this change local we open a group. We use  $\split@name$  for this purpose since  $\split@name$  might be called in math mode, and an empty  $\split@name$  would add an empty  $\split@name$  or datom to the math list and thus affect the spacing.

Also locally redefine \typeout so that 'No file ...fd' Warnings become Font Info message just sent to the log file.

```
336 \begingroup
337 \let\typeout\@font@info
338 \escapechar\m@ne
```

Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four \expandafter's so that \font@name is expanded first, then \string, and finally \split@name.

```
\text{\parameter}\expandafter\expandafter \\
\text{\parame}\expandafter\string\font@name\@nil}
```

If the \curr@fontshape combination is not available, (i.e. undefined) we call the macro \wrong@fontshape to take care of this case. Otherwise \extract@font will load the external font for us.

```
341 % \expandafter\ifx
342 % \csname\curr@fontshape\endcsname \relax
343 \try@load@fontshape % try always
344 % \fi
345 \expandafter\ifx
346 \csname\curr@fontshape\endcsname \relax
347 \wrong@fontshape\else
```

To allow substitution we call the curr@fontshape macro which usually will expand to \relax but may hold code for substitution (see \subst@fontshape definition).

```
348 % \csname\curr@fontshape\endcsname
349 \extract@font\fi
```

We are nearly finished and must only restore the \escapechar by closing the group.

```
350 \endgroup}
351 \def\try@load@fontshape{%
352 \expandafter
353 \ifx\csname \f@encoding+\f@family\endcsname\relax
354 \@font@info{Trying to load font information for
355 \f@encoding+\f@family}%
```

We predefine this combination to be \@empty which means that next time we don't try again unnecessary in case we don't find a .fd file. If the file contains a \DeclareFontFamily command than this setting will be overwritten.

```
356 \global\expandafter\let
357 \csname\f@encoding+\f@family\endcsname\@empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
\nfss@catcodes
\let\nfss@catcodes\relax
```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

(End definition for \define@newfont. This function is documented on page ??.)

\nfss@catcodes

This macro should contain the standard \catcode assignments to all characters which are used in the commands found in an .fd file and which might have special \catcodes in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of \expandafter, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes \expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by \DeclareFontShape, thus it probably should not be misused as a general purpose hook.

```
366 \def\nfss@catcodes{%
```

We start by making @ a letter and ignoring all blanks and newlines.

```
367 \makeatletter
368 \catcode'\ 9%
369 \catcode'\^^19%
370 \catcode'\^^M9%
```

Then we set up  $\setminus$ ,  $\{$ ,  $\}$ , # and % in case an .fd file is loaded during a verbatim environment.

```
371 \catcode'\\z@
372 \catcode'\{\@ne
373 \catcode'\}\tw@
374 \catcode'\#6%
375 \catcode'\^7%
376 \catcode'\%14%
```

The we make sure that the important syntax parts have the right \catcode.

```
\@makeother\<%
378
      \@makeother\>%
      \@makeother\*%
379
      \@makeother\.%
      \@makeother\-%
      \@makeother\/%
382
      \@makeother\[%
383
      \@makeother\]%
384
      \@makeother\'%
385
      \@makeother\'%
386
387
      \@makeother\"%
388 }
```

 $(\mathit{End \ definition \ for \ } \texttt{\ Laticodes}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:laticodes}.)$ 

#### \LoadFontDefinitionFile

Load and .fd files for some encoding and family (if it exists).

```
389 (/2ekernel)
   \(*2ekernel | latexrelease\)
   ⟨latexrelease⟩ \IncludeInRelease{2020/02/02}%
  (latexrelease)
                                   {\LoadFontDefinitionFile}{Loading .fd files}%
  \def\LoadFontDefinitionFile#1#2{%
393
     \begingroup
       \edef\f@encoding{#1}%
395
       \edef\f@family{#2}%
396
       \try@load@fontshape
397
     \endgroup
398
399 }
400 (/2ekernel | latexrelease)
401 (latexrelease)\EndIncludeInRelease
402 (latexrelease)\IncludeInRelease{0000/00/00}%
403 (latexrelease)
                                   {\LoadFontDefinitionFile}{Loading .fd files}%
404 (latexrelease)
```

File r: ltfssbas.dtx Date: 2020/02/27 Version v3.2g

```
405 (latexrelease)\let\LoadFontDefinitionFile\@undefined
406 (latexrelease)\EndIncludeInRelease
407 (*2ekernel)
(End definition for \LoadFontDefinitionFile. This function is documented on page ??.)
```

421

422

\DeclareFontFamilySubstitution The idea for this macro is stolen from the substitutefont package by Günter Milde, with some modifications and a new name.

> Its purpose is to provide characters in a special encoding the are not available in the current font family to be taken from a different family that is visually compatible (or not if you choose badly). For example, you can match the GFS Didot Greek characters with T<sub>E</sub>X Gyre Pagella (Palatino) by specifying

#### \DeclareFontFamilySubstitution{LGR}{qpl}{udidot}

This way if you ask for the LGR encoding in for the qpl family you get the characters from the udidot family substituted.

We need to ensure that the macro is defined with \nfss@catcodes in force (not quite sure why at the moment to be honest).

```
408 (/2ekernel)
   (*2ekernel | latexrelease)
   (latexrelease)\IncludeInRelease{2020/02/02}%
411 (latexrelease)
                       {\DeclareFontFamilySubstitution}{Provide family substituation}%
412 \begingroup
413 \nfss@catcodes
414 \gdef\DeclareFontFamilySubstitution#1#2#3{%
```

We only provide a set of silent substitutions. The package also (re)declared the family, but this is incorrect in my eyes and it is better to handle that differently.

Of course the families may still need loading at this point and so we arange for this. Otherwise we might run into trouble because the necessary \DeclareFontFamily has not been seen.

```
415
   \LoadFontDefinitionFile{#1}{#2}%
416
   \LoadFontDefinitionFile{#1}{#3}%
   \DeclareFontShape{#1}{#2}{m}{it}{<->ssub * #3/m/it}{}%
417
   \DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}%
418
   419
```

These days a few more shapes might be around, so we declare those too. If they don't exist then after the first substitution normal fallbacks will happen. 

```
423
Same game with b and bx, for other weights you are on your own:
 \DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/b/n}{}%
425
 426
 427
 428
 429
430
 431
```

```
\ensuremath{\mbox{DeclareFontShape}$\{\#1\}_{\#2}_{bx}_{n}$$<->ssub * $\#3/bx/n}_{\%}$
   433
   436
   437
438 }
 \endgroup
439
 (/2ekernel | latexrelease)
440
 ⟨latexrelease⟩\EndIncludeInRelease
  (latexrelease)\IncludeInRelease{0000/00/00}%
 (latexrelease)
             {\DeclareFontFamilySubstitution}{Provide family substituation}%
 (latexrelease)
 ⟨latexrelease⟩\let\DeclareFontFamilySubstitution\@undefined
 ⟨latexrelease⟩\EndIncludeInRelease
447 (*2ekernel)
```

(End definition for \DeclareFontFamilySubstitution. This function is documented on page ??.)

#### \DeclareErrorFont

Declare the last resort shape! We assume that in this fontshape there is a 10pt font but it doesn't really matter. We only loose one macro name if the assumption is false. But at least the font should be there!

```
448 \(/2ekernel\)
449 \(\frac{*2ekernel}{latexrelease}\)
450 \(\lambda\texrelease\rangle\) \(\la
```

Initialize all those internal variables which may or may not have values in the first seconds of NFSS' bootstraping process. Later on such values will be updated when an encoding is selected, etc.

We definitely don't want to set \footnote{Gencoding}; we can set all the others since if they are left "blank" any selection would grap "error default values" as well. However, this probably should go also—and now it did.

```
\gdef\f@encoding{#1}%
          \gdef\default@family{#2}%
          \gdef\default@series{#3}%
          \gdef\default@shape{#4}%
461 }
   ⟨/2ekernel | latexrelease⟩
   ⟨latexrelease⟩\EndIncludeInRelease
  ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
  (latexrelease)
                                  {\DeclareErrorFont}{No side effects please}%
   (latexrelease)
   ⟨latexrelease⟩\def\DeclareErrorFont#1#2#3#4#5{%
   (latexrelease)
                     \xdef\error@fontshape{%
469 (latexrelease)
                          \noexpand\expandafter\noexpand\split@name\noexpand\string
470 (latexrelease)
                          \ensuremath{\texttt{vandafter}}\csname #1/#2/#3/#4/#5\endcsname
471 (latexrelease)
                          \noexpand\@nil}%
472 (latexrelease)
                      \gdef\default@family{#2}%
```

```
473 (latexrelease)
                      \gdef\default@series{#3}%
   (latexrelease)
                      \gdef\default@shape{#4}%
   (latexrelease)
                      \global\let\f@family\default@family
   (latexrelease)
                      \global\let\f@series\default@series
   (latexrelease)
                      \global\let\f@shape\default@shape
   (latexrelease)
                      \gdef\f@size{#5}%
   (latexrelease)
                      \gdef\f@baselineskip{#5pt}%
   ⟨latexrelease⟩}
   ⟨latexrelease⟩\EndIncludeInRelease
482 (*2ekernel)
483 \@onlypreamble\DeclareErrorFont
```

(End definition for \DeclareErrorFont. This function is documented on page ??.)

\wrong@fontshape

Before we come to the macro \extract@font we have to take care of unknown \curr@fontshape combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails TEX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```
484 \(/2ekernel\)
485 \(\lambda \text{latexrelease} \)\IncludeInRelease{2015/01/01}{\wrong@fontshape}\)
486 \(\lambda \text{latexrelease} \)
487 \(\lambda \text{2ekernel | latexrelease} \)
488 \(\lambda \text{def} \wrong@fontshape{\%}
489 \csname D@\f@encoding\endcsname \% install defaults if in math
```

We remember the wanted \curr@fontshape combination which we will need in a moment.

```
490 \edef\reserved@a{\csname\curr@fontshape\endcsname}%

491 \ifx\last@fontshape\reserved@a

492 \errmessage{Corrupted NFSS tables}%

493 \error@fontshape

494 \else
```

Then we warn the user about the mess and set the shape to its default.

```
495 \let\f@shape\default@shape
```

If the combination is not known, try the default series.

```
496 \expandafter\ifx\csname\curr@fontshape\endcsname\relax
497 \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
498 \expandafter
499 \ifx\csname\curr@fontshape\endcsname\relax
500 \let\f@family\default@family
```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in "NFSS tables corruped". After begin document that will not happen as all .fd files involved in substituation are loaded at \begin{document}.

```
501 \begingroup
502 \try@load@fontshape
503 \endgroup
504 \fi \fi
505 \fi
```

At this point a valid \curr@fontshape combination must have been found. We inform the user about this fact.

The \expandafter\string here stops TEX adding the space that it usually puts after command names in messages. The similar construction with \@undefined just produces 'undefined', but saves a few tokens.

\@wrong@font@char is locally redefined in \UseTextSymbol from its normal (empty) definition, to report the symbol generating the font switch.

```
\(\text{\contours}\) \(\text{\
```

We change \@defaultsubs to produce a warning at the end of the document. The macro \@defaultsubs is initially \relax but gets changed here if some default font substitution happens. It is then executed in \enddocument.

```
510 \gdef\@defaultsubs{%
511 \@font@warning{Some font shapes were not available, defaults
512 substituted.\@gobbletwo}}%
```

If we substitute a \curr@fontshape combination by the default one we don't want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally \let the macro corresponding to the wanted combination equal to its substitution. This requires the use of four \expandafter's since \csname...\endcsname has to be expanded before \reserved@a (i.e. the requested combination), and this must happen before the \let is executed.

```
513 \global\expandafter\expandafter\let
514 \expandafter\reserved@a
515 \csname\curr@fontshape\endcsname
```

Now we can redefine \font@name accordingly. This must be done globally since it might occur in the group opened by \define@newfont. If we would this definition were local the closing \endgroup there would restore the old meaning of \font@name and then switch to the wrong font at the end of \selectfont although the correct font was loaded.

The last thing this macro does is to call \pickup@font again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
\pickup@font}
  ⟨/2ekernel | latexrelease⟩
520  \lambda latexrelease \rangle \text{EndIncludeInRelease}
522 (latexrelease)
                                {Font substituation in preamble}%
523 (latexrelease)\def\wrong@fontshape{%
524 (latexrelease)
                  \csname D@\f@encoding\endcsname
525 (latexrelease)
                  \edef\reserved@a{\csname\curr@fontshape\endcsname}%
  (latexrelease)
                \ifx\last@fontshape\reserved@a
  ⟨latexrelease⟩
                   \errmessage{Corrupted NFSS tables}%
  ⟨latexrelease⟩
                   \error@fontshape
529 (latexrelease)
                \else
530 (latexrelease)
                  \let\f@shape\default@shape
531 (latexrelease)
                  \expandafter\ifx\csname\curr@fontshape\endcsname\relax
532 (latexrelease)
                     \let\f@series\default@series
533 (latexrelease)
                      \expandafter
```

```
535 (latexrelease)
                                                     \let\f@family\default@family
                             (latexrelease)
                                                  \fi \fi
                          537 (latexrelease)
                                           \fi
                          538 (latexrelease)
                                               \@font@warning{Font shape

                          548 (latexrelease)
                          549 (latexrelease)
                                                     \csname\curr@fontshape\endcsname
                          550 (latexrelease)
                                              \xdef\font@name{%
                          551 (latexrelease)
                                               \csname\curr@fontshape/\f@size\endcsname}%
                          552 (latexrelease)
                                              \pickup@font}
                          553 (latexrelease)\EndIncludeInRelease
                          554 (*2ekernel)
                         (End definition for \wrong@fontshape. This function is documented on page ??.)
    \@wrong@font@char
                         Normally empty but redefined in \UseTextSymbol so that the Font shape undefined
                         message can refer to the symbol causing the problem.
                          555 \let\@wrong@font@char\@empty
                         (End definition for \@wrong@font@char. This function is documented on page ??.)
       \@@defaultsubs
                         See above.
        \@defaultsubs
                          556 \let\@defaultsubs\relax
                         (End definition for \@defaultsubs and \@defaultsubs. These functions are documented on page ??.)
        \strip@prefix In \extract@font we will need a way to recover the replacement text of a macro. This is
                         done by the primitive \meaning together with the macro \strip@prefix (for the details
                         see appendix D of the T<sub>E</sub>Xbook, p. 382).
                          557 \def\strip@prefix#1>{}
                         (End definition for \strip@prefix. This function is documented on page ??.)
                               Assigning math fonts to versions
                         This is just another name for \gdef but we can redefine it if necessary later on.
\install@mathalphabet
                          558 \let\install@mathalphabet\gdef
                         (End definition for \install@mathalphabet. This function is documented on page ??.)
           \math@fonts
                          559 \let\math@fonts\@empty
                         (End definition for \math@fonts. This function is documented on page ??.)
```

\ifx\csname\curr@fontshape\endcsname\relax

534 (latexrelease)

\select@group

\select@group has four arguments: the new  $\langle math\ alphabet\ identifier \rangle$  (a control sequence), the  $\langle math\ group\ number \rangle$ , the extra macro for math mode and the \curr@fontshape definition macro name. We first check if we are in math mode.

#### 560 %\def\select@group#1#2#3{\relax\ifmmode

We do these things locally using \begingroup instead of \bgroup to avoid the appearance of an empty Ord atom on the math list.

```
561 % \begingroup
```

We set the math fonts for the *family* in question by calling \getanddefine@fonts in the correct environment.

```
562 % \escapechar\m@ne
```

563 % \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%

We globally select the math fonts...

```
564 % \globaldefs\@ne \math@fonts
```

... and close the group to restore \globaldefs and \escapechar.

```
565 % \endgroup
```

As long as no size or version change occurs the  $\langle math \ alphabet \ identifier \rangle$  should simply switch to the installed  $math \ group$  instead of calling \select@group unnecessarily. So we globally redefine the first argument (the new  $\langle math \ alphabet \ identifier \rangle$ ) to expand into a \mathgroup switch and then select this alphabet. Note that this redefinition will be overwritten by the next call to a version macro. The original code for the end of \select@group was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the  $\langle math \ alphabet \ identifier \rangle$  and then calling the new definition to switch to the wanted  $\langle math \ group \rangle$ . Now we define the  $\langle math \ alphabet \ identifier \rangle$  as a call to the \use@mathgroup command.

```
566 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
567 % {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro  $\mbox{\tt mvQ}(\mbox{\tt version})$  so that it calls  $\mbox{\tt getanddefine@fonts}$  directly in future as well. We use the macro  $\mbox{\tt extract@alph@from@version}$  to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```
568 % \ \expandafter\extract@alph@from@version
569 % \ \csname mv@\math@version\expandafter\endcsname
570 % \ \expandafter\number\csname c@mv@\math@version\endcsname}%
571 % #1%
572 % \stepcounter\{mv@\math@version\}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of \use@mathgroup or more exactly the argument of \math@egroup if the margid option is in force) which would swallow our closing \fi. So we use the \expandafter technique to remove the \fi before the \use@mathgroup is expanded.

```
573 %\expandafter #1\fi}
```

(End definition for \select@group. This function is documented on page ??.)

\extract@alph@from@version

We proceed to the definition of the macro \extract@alph@from@version. As stated above, it takes a math alphabet identifier and a math version macro (e.g. \mv@normal) as its arguments.

```
574 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```
\install@mathalphabet\sample alphabet identifier\rangle #3{% \sample Definitions for \rangle #3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro \reserved@a.

```
\def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When \reserved@a is expanded, it will have the tokens preceding the definition in question in its first argument (##1), the following tokens in its third argument (##3), and the replacement text for the math alphabet identifier #3 in its second argument. (##2). This is then recorded for later use in a temporary macro \reserved@b.

```
\def\reserved@b{##2}%
```

Additionally, we define a macro \reserved@c to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (##1 and ##3) and the yet to build new definitions for the math alphabet identifier #3.

```
def\reserved@c###1{\gdef#1{##1###1##3}}}%
```

Then we execute our auxiliary macro.

```
\expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group\(math alphabet identifier\)
```

```
\langle math\ group\ number \rangle \langle math\ extra\ part \rangle
```

```
⟨curr@fontshape definition⟩
```

So we define a new temporary macro \reserved@a that extracts these parts.

```
def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling  $\ensuremath{\texttt{\sc version}}$ 

File r: ltfssbas.dtx Date: 2020/02/27 Version v3.2g

```
In addition it defines the alphabet the way it should be used from now on.
```

```
\gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
        \use@mathgroup##1{#2}}}%
```

Finally, we only have to call this macro \reserved@a on the old definitions recorded in \reserved@b:

```
\expandafter\reserved@a\reserved@b\@nil
        }
588
```

(End definition for \extract@alph@from@version. This function is documented on page ??.)

### \math@bgroup \math@egroup

Here are the default definitions for \math@bgroup and \math@egroup. We use \bgroup instead of \begingroup to avoid 'leaking out' of style changes. This has the side effect of always producing mathord atoms.

```
589 \let\math@bgroup\bgroup
590 \def\math@egroup#1{#1\egroup}
```

(End definition for \mathCbgroup and \mathCegroup. These functions are documented on page ??.)

#### \calculate@math@sizes

Here is the default definition for \calculate@math@sizes a more elaborate interface is under testing in mthscale.sty.

```
\gdef\calculate@math@sizes{%
     \Ofont@info{Calculating\space math\space sizes\space for\space
                 size\space <\f@size>}%
     \dimen@\f@size \p@
594
     \@tempdimb \defaultscriptratio \dimen@
595
     \dimen@ \defaultscriptscriptratio \dimen@
596
     \expandafter\xdef\csname S@\f@size\endcsname{%
597
       \gdef\noexpand\tf@size{\f@size}%
598
       \gdef\noexpand\sf@size{\strip@pt\@tempdimb}%
599
       \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
600
       \noexpand\math@fontstrue}}
```

(End definition for \calculate@math@sizes. This function is documented on page ??.)

#### \defaultscriptratio \defaultscriptscriptratio

The default ratio for math sizes is:

 $1\ \mathrm{to}\ \backslash \mathtt{defaultscriptratio}$  to  $\backslash \mathtt{defaultscriptscriptratio}.$ 

By default this is 1 to .7 to .5.

```
602 \def\defaultscriptratio{.7}
```

 $\verb| | def \efaults cripts criptratio {.5}| \\$ 

(End definition for \defaultscriptratio and \defaultscriptscriptratio. These functions are documented on page ??.)

\noaccents@ If we don't have a definition for \noaccents@ we provide a dummy.

```
604 \ifx\noaccents@\@undefined
605
   \let\noaccents@\@empty
```

(End definition for \noaccents@. This function is documented on page ??.)

\showhyphens The \showhyphens command must be redefined since the version in plain.tex uses \tenm. We have also made some further adjustments for its use in LATEX.

```
⟨/2ekernel⟩
   (latexrelease)\IncludeInRelease{2017/01/01}{\showhyphens}%
   (latexrelease)
                                  {XeTeX support for \showhyphens}%
   ⟨*2ekernel | latexrelease⟩
   \ifx\XeTeXcharclass\@undefined
Version for engines other than XeT<sub>E</sub>X.
   \DeclareRobustCommand\showhyphens[1]{%
     \setbox0\vbox{%
613
       \color@begingroup
       \everypar{}%
       \parfillskip\z@skip\hsize\maxdimen
       \normalfont
617
       \pretolerance\m@ne\tolerance\m@ne\hbadness\z@\showboxdepth\z@\ #1%
618
       \color@endgroup}}
619
620 \else
```

XeTeX version. When using system fonts XeTeX reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that \tracingonline is locally zero.

```
\DeclareRobustCommand\showhyphens[1]{%
     \setbox0\vbox{%
622
       \usefont{TU}{lmr}{m}{n}%
623

#### File s

# ltfssaxes.dtx

This file contains the implementation for handling extra axes splitting the series and the values into sub-categories. selection commands. See other parts of the LATEX distribution, or *The LATEX Companion* for higher level documentation of the LATEX Font Selection Scheme.

Everything in the this file got introduced 2020/02/02, so we do a single rollback (for now).

- 1 (\*2ekernel)
- $_2$   $\langle/2ekernel\rangle$
- 3 (\*2ekernel | latexrelease)
- 4 (latexrelease)\IncludeInRelease{2020/02/02}%
- 5 (latexrelease) {\DeclareFontSeriesChangeRule}{Series change rules}%

### 1 Changing the font series

In the original NFSS implementation the series was a single attribute stored in \fcseries and so one always had to specify both weight and width together. This means it was impossible to typeset, a paragraph in a condensed font and inside have a few words in bold weight (but still condensed) without doing this manually by requesting \fontseries{bc}\selectfont.

The new implementation now works differently by looking both at the current value of \foseries and the requested new series and out of that combination selects a resulting series value. Thus, if the current series is c and we ask for b we now get bc.

This is done by consulting a simple lookup table. This table is configurable (though most likely that flexibility will seldom of ever be needed) Adding or changing entries in this table are done with \DeclareFontSeriesChangeRule.

### 1.1 The series lookup table

 $\verb|\DeclareFontSeriesChangeRule| \\$ 

The \DeclareFontSeriesChangeRule defines entries in a simple database (implemented as a set of commands) that define mappings between from an existing series and requested new series and maps that to a result series (and additionally offers an alternative if the desired one is not existing):

- #1 current \f@series
- #2 requested new series
- #3 result (if that exist for the given font family
- #4 alternative result (if #3 does not exist)

If an .fd file has its own substitution rules then #3 exist and thus #4 is not applied.

If there is no matching database entry or if neither the result nor the alternate result exist in the font family the requested new series is used (which then may trigger substitutions later on.

- 6 \def\DeclareFontSeriesChangeRule#1#2#3#4{%
- 7 \Qnamedef{seriesQ#1Q#2}{{#3}{#4}}}

 $(End\ definition\ for\ \verb|\DeclareFontSeriesChangeRule|.\ This\ function\ is\ documented\ on\ page\ \ref{thm:linear}??.)$ 

### 1.2 Mapping rules for series changes

The rules set up use explicit series values not \..default indirections; my current feeling is that this is in fact better.

With 9 weights and 9 width classes this table is getting a bit large in the end (324 entries) but on the other hand it doesn't change and accessing speed and it is fast this way.

We could alternatively split the axis and maintain weight and width separately, but that would take more processing time and would not allow for setting up explicit exceptions nicely (not sure that this would ever get used though).

Design considerations for mapping entries:

- We make m to reset both weight and width (as this is how it always worked). To reset just the width ?m is provided and to reset just the weight m?.
- We do support "mwidth" and "weightm", e.g., mec to mean "go to medium weight and extra-condensed width". At the end of the process we automatically drop any leftover m in the series name (unless it is just a single m).
- If there is no table entry then the target series is used unconditionally. This means that any request to set both weight and width (e.g. bx or ulc) needs no table entries. For that reason there are no entries which have a weight+width as request (i.e., second argument).
  - In particular this is also true for cases involving m, e.g., bm (bold medium width) which automatially gets reduced result in b or mc (medium weight condensed) which becomes c as a result.
- Only a few entries have "alterative" values and perhaps most of them should get dropped. Or maybe not ... needs some thought perhaps.
  - The idea is that you don't want the normal substitution to kick in because that would reset the shape first and it may be better to stay with b when a change to c is requested and bc doesn't exist, than to go to first change the shape to n and then find that bc/n doesn't exist either and thus ending up wth m/n.
- Also: while I did set up all nine standard weight values from ul to ub I only bothered to provide entries for ec, sc, c and x, because other levels of compression/expansion are not in any real fonts that I know.

290

Could and perhaps should be eventually extended to cover the whole set.

Special rules for lm etc. aren't needed because if the target lm is request it will used if there is no rule and that id then reduced to l automatically. Same for lm and friends. Only ?lm and lm? need rules.

So here are the special rules for m?:

```
\DeclareFontSeriesChangeRule {bc}{m?}{c}{}
\DeclareFontSeriesChangeRule {bec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {bsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {bx}{m?}{x}{}
\DeclareFontSeriesChangeRule {b}{m?}{m}{}
\DeclareFontSeriesChangeRule {c}{m?}{c}{}
\DeclareFontSeriesChangeRule {ebc}{m?}{c}{}
\DeclareFontSeriesChangeRule {ebec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {ebsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {ebx}{m?}{x}{}
\DeclareFontSeriesChangeRule {eb}{m?}{m}{}
\DeclareFontSeriesChangeRule {ec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {elc}{m?}{c}{}
\DeclareFontSeriesChangeRule {elec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {elsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {elx}{m?}{x}{}
\DeclareFontSeriesChangeRule {el}{m?}{m}{}
\DeclareFontSeriesChangeRule {lc}{m?}{c}{}
\DeclareFontSeriesChangeRule {lec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {1}{m?}{m}{}
\DeclareFontSeriesChangeRule {m}{m?}{m}{}
\DeclareFontSeriesChangeRule {sbc}{m?}{c}{}
\DeclareFontSeriesChangeRule {sbec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {sbsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {sbx}{m?}{x}{}
\DeclareFontSeriesChangeRule {sb}{m?}{m}{}
\DeclareFontSeriesChangeRule {sc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {slc}{m?}{c}{}
\DeclareFontSeriesChangeRule {slec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {slsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {slx}{m?}{x}{}
\DeclareFontSeriesChangeRule {sl}{m?}{m}{}
\DeclareFontSeriesChangeRule {ubc}{m?}{c}{}
\DeclareFontSeriesChangeRule {ubec}{m?}{ec}{}
\DeclareFontSeriesChangeRule {ubsc}{m?}{sc}{}
\DeclareFontSeriesChangeRule {ubx}{m?}{x}{}
\DeclareFontSeriesChangeRule {ub}{m?}{ub}{}
\DeclareFontSeriesChangeRule {ulc}{m?}{c}{}
\DeclareFontSeriesChangeRule {ulx}{m?}{x}{}
```

```
329 \DeclareFontSeriesChangeRule {ul}{m?}{m}{}
  \DeclareFontSeriesChangeRule {x}{m?}{x}{}
   And there the special rules for ?m:
  \DeclareFontSeriesChangeRule {bc}{?m}{b}{}
  \DeclareFontSeriesChangeRule {bec}{?m}{b}{}
  \DeclareFontSeriesChangeRule {bsc}{?m}{b}{}
  \DeclareFontSeriesChangeRule {bsc}{?m}{b}{}
  \DeclareFontSeriesChangeRule {bx}{?m}{b}{}
  \DeclareFontSeriesChangeRule {b}{?m}{b}{}
  \DeclareFontSeriesChangeRule {c}{?m}{m}{}
  \DeclareFontSeriesChangeRule {ebc}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {ebec}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {ebsc}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {ebsc}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {ebx}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {eb}{?m}{eb}{}
  \DeclareFontSeriesChangeRule {ec}{?m}{m}{}
  \DeclareFontSeriesChangeRule {elc}{?m}{el}{}
  \DeclareFontSeriesChangeRule {elec}{?m}{el}{}
  \DeclareFontSeriesChangeRule {elsc}{?m}{el}{}
  \DeclareFontSeriesChangeRule {elsc}{?m}{el}{}
  \DeclareFontSeriesChangeRule {elx}{?m}{el}{}
  \DeclareFontSeriesChangeRule {el}{?m}{el}{}
  \DeclareFontSeriesChangeRule {lc}{?m}{l}{}
  \DeclareFontSeriesChangeRule {lec}{?m}{1}{}
  \DeclareFontSeriesChangeRule {lsc}{?m}{1}{}
  \DeclareFontSeriesChangeRule {lsc}{?m}{1}{}
  \DeclareFontSeriesChangeRule {lx}{?m}{1}{}
  \DeclareFontSeriesChangeRule {1}{?m}{1}{}
  \DeclareFontSeriesChangeRule {m}{?m}{m}{}
  \DeclareFontSeriesChangeRule {sbc}{?m}{sb}{}
  \DeclareFontSeriesChangeRule {sbec}{?m}{sb}{}
  \DeclareFontSeriesChangeRule {sbsc}{?m}{sb}{}
  \DeclareFontSeriesChangeRule {sbsc}{?m}{sb}{}

### 1.3 Changing to a new series

\if@forced@series

If the series gets forced we need to know that fact later on.

385 \newif\if@forced@series

(End definition for \if@forced@series. This function is documented on page ??.)

\fontseriesforce

To change unconditionally to a new series you can use \fontseriesforce. Of course, if the series doesn't exist for the current family substitution still happens, but there is not dependency on the current series.

386 \DeclareRobustCommand\fontseriesforce[1]{\@forced@seriestrue\edef\f@series{#1}}

(End definition for \fontseriesforce. This function is documented on page ??.)

\fontseries

The \fontseries command takes one argument which is the requested new font series. In the original implementation it simply saved the expanded value in \footnote{o}series. Now we do a bit more processing and look up the final value in the font series data base. This is done by \merge@font@series.

387 \DeclareRobustCommand\fontseries[1]{\@forced@seriesfalse\merge@font@series{#1}}

(End definition for \fontseries. This function is documented on page ??.)

\merge@font@series

We look up the data base value by expanding the right command twice. If no such value exist then the result will be \relax otherwise it will be the two brace groups: the desired result and the alternate result. The first case means that the third argument to \merge@font@series will be empty.

```
388 \def\merge@font@series#1{%
389 \expandafter\expandafter
390 \merge@font@series@
391 \csname series@\f@series @#1\endcsname
392 {#1}%
393 \@nil
394 }
```

 $(\textit{End definition for } \verb|\merge@font@series|. \textit{This function is documented on page \ref{page}??.})$ 

\merge@font@series@

This now defines the new \f@series:

395 \def\merge@font@series@#1#2#3\@nil{%

If the third argument is empty there is no database entry for the combination and the second argument holds the new series so we return that.

Originally the test was simply \ifx!#3! but that actually dies if #3 starts with a conditional and in the definition of \AmSfort that is actually the case.

```
396 %\ifcat\expandafter X\detokenize{#1}X%
397 \def\reserved@a{#3}%
398 \ifx\reserved@a\@empty
399 \set@target@series{#2}%
400 \else
```

Otherwise we check if the desired result for the series (#1) exists for the font family and the current shape. As the .fd is perhaps not loaded yet, we first have to do that, otherwise the test would fail even if the face is actually available.

```
401 \maybe@load@fontshape
402 \edef\reserved@a{\f@encoding /\f@family /#1/\f@shape}%
403 \ifcsname \reserved@a \endcsname
```

If the desired result is available then we use that. However, we do need some post-processing because we need to drop surplus ms due to the way naming convention was designed in the '90s (sigh).

```
\set@target@series{#1}%
```

If not, then we try the alternate result (#2).

```
405 \else
406 \ifcsname \f@encoding /\f@family /#2/\f@shape \endcsname
```

If the alternate result exist we use that and also issue a warning (or rather a log entry) that we didn't managed to change to the desired font.

```
\set@target@series{#2}%
\@font@shape@subst@warning
```

If that doesn't exist either, then we use the requested series unmodified (again with a warning).

```
409 \else
410 \set@target@series{#3}%
411 \@font@shape@subst@warning
412 \fi
413 \fi
414 \fi
415 }
```

It is possible that the previous font and the new one are actually identical (and the font was not found because it still needs loading) in which case a warning would look rather odd. So we make a quick check for that (which is the reason why we defined \@reserveda above.

(End definition for \merge@font@series@. This function is documented on page ??.)

### \maybe@load@fontshape

A small helper that we use a couple of times: try loading a fontshape (in a group because \try@load@fontshape normalizes catcodes).

423 \def\maybe@load@fontshape{\begingroup\try@load@fontshape\endgroup}

#### \set@target@series

Finally the code for normalizing the \foseries value.

The combined series value determined by the mapping may still contain an m that we have to remove (as the .fd files use c not mc to denote a medium weight condensed series, etc.). We do this in all branches above because a user might have written

```
eclareFontSeriesChangeRule {m}{sc}{msc}{mc}
```

instead of using sc and c as needed in the .fd file.

```
424 \def\set@target@series#1{%
```

We need to \edef the argument first in case it starts with a conditional. Then we check (and perhaps drop) an "m" from the value and assign the result to \fcseries.

```
425 \edef\f@series{#1}%
426 \series@maybe@drop@one@m\f@series\f@series
427 }
```

(End definition for \set@target@series. This function is documented on page ??.)

\series@maybe@drop@one@m

If the series value is in NFSS notation then it should not contain any "m" unless it is just an "m" by it own. So we need to drop surplus "m"s. But we better don't do this for full names, such as "semibold" as used by autoinst, for example. So we test against the possible explicit values that should drop an "m". After that we assign the result to #2 for further use.

```
428 \def\series@maybe@drop@one@m#1{%
429 \expandafter\series@maybe@drop@one@m@x\expandafter{#1}}
430
431 \def\series@maybe@drop@one@m@x#1#2{%
```

The code below is an inline version of the \in@ macro without the group, so that it works in \accent.

```
432 \def\in@0##1,#1,{}%
433 \series@check@toks\expandafter{\in@0
434 ,ulm,elm,lm,slm,mm,sbm,bm,ebm,ubm,muc,mec,mc,msc,msx,mx,mex,mux,{}{},#1,}%
435 \edef\in@0{\the\series@check@toks}%
436 \ifx\in@0\@empty
```

The default definition for \bfdefault etc is actually b\@empty so that we can detect if the user has changed the default. However that means a) the above test will definitely fail (maybe something to change) and b) we better use \edef on the next line to get rid of it as otherwise the test against #2 (e.g. \bfdef@ult) will fail in other places.

```
437 \edef#2{#1}%

438 \else

439 \edef#2{\expandafter\series@drop@one@m #1m\series@drop@one@m}%

440 \fi

441 }
```

As a precaution we use a private toks register not \toks@ as that is no longer hidden inside the group.

442 \newtoks\series@check@toks

 $(End\ definition\ for\ \verb|\series@maybe@drop@one@m.|\ This\ function\ is\ documented\ on\ page\ \ref{thm:local_page_series}.)$ 

\series@drop@one@m

Drop up to two ms but keep one if that makes the series value empty. Actually, with the current implementation we know that there is at least one in the series value itself and we added one after it, so all we have to do is now returning #1#2 and dropping the rest.

```
443 \def\series@drop@one@m#1m#2m#3\series@drop@one@m{%
444 % \ifx\relax#1#2\relax m\else#1#2\fi
445 #1#2%
446 }

(End definition for \series@drop@one@m. This function is documented on page ??.)
```

## 2 Changing the shape

Shapes are also split in two axes (though it could be more if that is desirable), essentially building in an "sc" axis).

\DeclareFontShapeChangeRule

The database for shapes is done in exactly the same way, only that it is much smaller and we usually have no alternative shape (or rather it is empty thus not used).

```
\label{lem:conton} $$ \def\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\end{conton} $$ \def\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\\end{conton} $$ \def\\\end{conton} $$\def\\\end{conton} $$\def\\\end{co
```

(End definition for \DeclareFontShapeChangeRule. This function is documented on page ??.)

There is kind of the same problem with returning back from sc to normal. It sort of needs its own letter. In fontspec this was solved by the first time \upshape changes it or sl back (so only sc remains) and second time it changes then sc back to normal. Maybe that's not a bad way to handle it, but decided for a slightly different approach: n always returns to "normal", ie resets everything and up changes italic or slanted to upright and ulc undoes small caps.

So we now offer \normalshape (using \shapedefault which is normally the same as calling both \ulcshape and \upshape, only more efficient.

\ulcshape \textulc \ulcdefault To request going back to upper/lowercase we need a new command. It uses ulc as shape name but this shape is virtual, i.e., it doesn't exist as a real shape, it is only used as part of the database table entries and thus only appears in the second argument there (but not in the first).

```
449 \DeclareRobustCommand\ulcshape
450 {\not@math@alphabet\ulcshape\relax
451 \fontshape\ulcdefault\selectfont}
452 \let\ulcdefault\@undefined % for rollback
453 \newcommand\ulcdefault{ulc}
```

(End definition for \ulcshape, \textulc, and \ulcdefault. These functions are documented on page ??)

\swshape \textsw \swdefault New command to select a swash shape. The standard rules put this in the same category as italics or slanted, i.e., if you ask for it then italics are undone. One could provide more complicated rules so that it + sw becomes swit but given that there are only very few fonts that have swash letters that level of flexibility (these days) would be just resulting in a lot of combinations that do not exist.

```
454 \DeclareRobustCommand\swshape
455 {\not@math@alphabet\swshape\relax
456 \fontshape\swdefault\selectfont}
457 \let\swdefault\@undefined % for rollback
458 \newcommand\swdefault{sw}
```

(End definition for \swshape, \textsw, and \swdefault. These functions are documented on page ??.)

\sscshape \textssc \sscdefault New command to select spaced small capitals. This is only here because fontaxes offered it. There isn't a single free font that supports it. However, some commercial ones do, so we offer it so that at some point fontaxes could be retired.

So far there aren't any rules for it—probably there should be some putting it in the same category as sc.

```
459 \DeclareRobustCommand\sscshape
460 {\not@math@alphabet\sscshape\relax
```

```
461 \fontshape\sscdefault\selectfont\}
462 \let\sscdefault\@undefined % for rollback
463 \newcommand\sscdefault{ssc}
```

(End definition for  $\scalebox{ scshape}$ ,  $\textssc$ , and  $\scalebox{ scdefault}$ . These functions are documented on page  $\scalebox{ ??.}$ )

### 2.1 Mapping rules for shape combinations

Many of the entries are commented out as we will get that result without any entry.

```
464 %\DeclareFontShapeChangeRule {n}{n}
                                          {n}
                                                {}
  \DeclareFontShapeChangeRule {n}{it}
                                         {it}
                                               {sl}
  \DeclareFontShapeChangeRule {n}{sl}
  %\DeclareFontShapeChangeRule {n}{sw}
                                                {}
  %\DeclareFontShapeChangeRule {n}{sc}
  \DeclareFontShapeChangeRule {n}{ulc} {n}
                                               {}
470 \DeclareFontShapeChangeRule {n}{up} {n}
471 %\DeclareFontShapeChangeRule {it}{n}
                                                   {}
472 %\DeclareFontShapeChangeRule {it}{it}
                                                   {}
  \DeclareFontShapeChangeRule {it}{sl} {sl}
                                                  {it}
474 %\DeclareFontShapeChangeRule {it}{sw} {sw}
                                                   {}
```

If neither scit nor scsl exist then sc will be used as a fallback albeit with a log entry, so except for the latter there will be no change for CM or Latin Modern fonts.

```
\DeclareFontShapeChangeRule {it}{sc} {scit}
                                               {scsl}
  \DeclareFontShapeChangeRule {it}{ulc} {it}
                                               {}
  \DeclareFontShapeChangeRule {it}{up} {n}
                                               {}
  %\DeclareFontShapeChangeRule {sl}{n}
                                                {}
  \DeclareFontShapeChangeRule {sl}{it}
                                               {sl}
  %\DeclareFontShapeChangeRule {sl}{sl}
                                                {}
  {}
  \DeclareFontShapeChangeRule {sl}{sc} {scsl}
                                               {scit}
  \DeclareFontShapeChangeRule {sl}{ulc} {sl}
                                               {}
  \DeclareFontShapeChangeRule {sl}{up} {n}
                                               {}
485 %\DeclareFontShapeChangeRule {sc}{n}
                                                {}
  \DeclareFontShapeChangeRule {sc}{it}
                                               {scsl}
  \DeclareFontShapeChangeRule {sc}{sl}
                                       {scsl}
                                               {scit}
  \DeclareFontShapeChangeRule {sc}{sw}
                                       {scsw}
                                               {sw}
489 %\DeclareFontShapeChangeRule {sc}{sc}
                                                {}
490 \DeclareFontShapeChangeRule {sc}{ulc} {n}
                                               {}
```

The next rule might be a bit surprising and rightly so. Correct would be that sc is not affected by up, i.e., remains sc as showed in the commented out rule. However, for nearly three decades commands such as sc or \textup changed small caps back to the "normal" shape. So for backward compatibility we keep hat behavior.

As a result you are currently typesetting in scit or scsl using \upshape twice will return you to the normal shape too, the first will change to sc and the second (because of the rule below) change that to n. This is the way fontspec implemented its version on this interface, so this rule means we are also compatible with the way fontspec behaved. Still it remains an odditywhic I would rather liked to have avoided.

```
491 %\DeclareFontShapeChangeRule {sc}{up} {sc} {}
492 \DeclareFontShapeChangeRule {sc}{up} {n} {}
```

```
493 %\DeclareFontShapeChangeRule {scit}{n}
494 \DeclareFontShapeChangeRule {scit}{it}
                                             {scit}
                                                     {}
495 \DeclareFontShapeChangeRule {scit}{sl}
                                                     {scit}
                                             {scsl}
496 \DeclareFontShapeChangeRule {scit}{sw}
                                             {scsw}
                                                     {sc}
                                                              % or scit?
497 \DeclareFontShapeChangeRule {scit}{sc}
                                             {scit}
                                                     {}
498 \DeclareFontShapeChangeRule {scit}{ulc} {it}
                                                     {}
499 \DeclareFontShapeChangeRule {scit}{up} {sc}
                                                     {}
```

The previous rule assumes that if scit exists then it exists as well. If not, the mechanism will save ulc in \f@series which most certainly doesn't exist. So when a font is later selected that would result in a substitution (so no harm done really). Alternatively, we could in this case use n as aternative, which may be a bit faster, but such a setup would be so weird in the first place that this isn't worth the effort.

```
500 %\DeclareFontShapeChangeRule {scsl}{n}
  \DeclareFontShapeChangeRule {scsl}{it}
                                            {scit}
                                                     {scsl}
  \DeclareFontShapeChangeRule {scsl}{sl}
                                            {scsl}
                                                     {}
  \DeclareFontShapeChangeRule {scsl}{sw}
                                                     {sc}
                                                             % or scsl?
                                            {scsw}
504 \DeclareFontShapeChangeRule {scsl}{sc}
                                            {scsl}
                                                     {}
  \DeclareFontShapeChangeRule {scsl}{ulc} {sl}
                                                     {}
   \DeclareFontShapeChangeRule {scsl}{up}
                                                     {}
                                              {sc}
507 %\DeclareFontShapeChangeRule {scsw}{n}
                                              {n}
                                                      {}
   \DeclareFontShapeChangeRule {scsw}{it}
                                            {scit}
                                                     {scsw}
   \DeclareFontShapeChangeRule {scsw}{sl}
                                                     {}
   \DeclareFontShapeChangeRule {scsw}{sw}
                                                     {}
   \DeclareFontShapeChangeRule {scsw}{sc}
                                                     {}
   \DeclareFontShapeChangeRule {scsw}{ulc} {sw}
                                                     {}
  \DeclareFontShapeChangeRule {scsw}{up} {sc}
                                                     {}
514 %\DeclareFontShapeChangeRule {sw}{n}
                                                    {}
515 %\DeclareFontShapeChangeRule {sw}{it}
                                                    {}
516 %\DeclareFontShapeChangeRule {sw}{sl}
                                                    {}
517 %\DeclareFontShapeChangeRule {sw}{sw} {sw}
                                                    {}
518 \DeclareFontShapeChangeRule {sw}{sc} {scsw}
                                                   {}
519 \DeclareFontShapeChangeRule {sw}{ulc} {sw}
                                                   {}
520 \DeclareFontShapeChangeRule {sw}{up} {n}
                                                   {}
```

#### 2.2 Changing to a new shape

\fontshape Again the \fontshape now has to do a lookup to get to its new value in \fontshape. The method is exactly the same as in \fontseries.

```
521 \DeclareRobustCommand\fontshape[1]{\merge@font@shape{#1}}
```

(End definition for \fontshape. This function is documented on page ??.)

\fontshapeforce The unconditional version:

522 \DeclareRobustCommand\fontshapeforce[1]{\edef\f@shape{#1}}

 $(\mathit{End \ definition \ for \ } \mathsf{Intshapeforce}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:continuous}.)}$ 

\merge@font@shape Look up the database entry (if existing) and act accordingly.

```
1523 \def\merge@font@shape#1{%
1524 \expandafter\expandafter
1525 \merge@font@shape@
1526 \csname shape@\f@shape @#1\endcsname
```

```
527 {#1}%
528 \@nil
529 }
```

(End definition for \merge@font@shape. This function is documented on page ??.)

\merge@font@shape@

Same game now, except that we look at shapes not series values and we can set the shape without the complication of dropping "m"s from the name as we had to for the series.

```
\def\merge@font@shape@#1#2#3\@nil{%
     \def\reserved@a{#3}%
     \ifx\reserved@a\@empty
        \left( \frac{1}{2} \right)
     \else
534
        \maybe@load@fontshape
535
        \edef\reserved@a{\f@encoding /\f@family /\f@series/#1}%
536
         \ifcsname \reserved@a\endcsname
537
           \edef\f@shape{#1}%
538
        \else
539
           \ifcsname \f@encoding /\f@family /\f@series/#2\endcsname
540
              \ensuremath{\mbox{def}\f@shape{\#2}}\%
541
              \@font@shape@subst@warning
542
              \left( \frac{43}{\%} \right)
544
              \@font@shape@subst@warning
545
           \fi
546
        \fi
547
     \fi
548
549 }
```

 $(\mathit{End \ definition \ for \ } \texttt{\ local} \texttt{@ShapeQ}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:local}??.)$ 

\normalshape

\normalshape resets both sub-axes if the default rules are used.

```
550 \protected\def\normalshape
551 {\not@math@alphabet\normalshape\relax
552 \fontshape\shapedefault\selectfont}%
```

(End definition for \normalshape. This function is documented on page ??.)

### 3 Make sure we win ...

This code implements one aspect of what the package fontaxes provide. So its redefinitions for the various shape commands, such as \itshape should no longer happen. We therefore force the standard definitions at \AtBeginDocument (later when this is defined. Once fontaxes is no longer doing such redefinitions that could be taken out again.

We use a separate macro so that we can easily disable this (in case of rollback).

\reinstall@nfss@defs

I use \protected here not \DeclareRobustCommand to avoid extra status lines.

```
553 \def\reinstall@nfss@defs{%
554 \protected\def\upshape
555 {\not@math@alphabet\upshape\relax
556 \fontshape\updefault\selectfont}%
557 \protected\def\slshape
558 {\not@math@alphabet\slshape\relax
```

```
\fontshape\sldefault\selectfont}%
     \protected\def\scshape
560
              {\not@math@alphabet\scshape\relax
               \fontshape\scdefault\selectfont}%
     \protected\def\itshape
563
              {\not@math@alphabet\itshape\mathit
               \fontshape\itdefault\selectfont}%
565
     \protected\def\ulcshape
566
              {\not@math@alphabet\ulcshape\relax
567
               \fontshape{ulc}\selectfont}%
568
     \protected\def\swshape
569
              {\not@math@alphabet\swshape\relax
               \fontshape\swdefault\selectfont}%
     \protected\def\sscshape
              {\not@math@alphabet\sscshape\relax
               \fontshape\sscdefault\selectfont}%
574
575 }
(End definition for \reinstallOnfssOdefs. This function is documented on page ??.)

### File t

# ltfsstrc.dtx

### 1 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing. The package accepts the following options:

**errorshow** Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the tracefut package is not loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the tracefnt package is loaded.

**debugshow** In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output.

loading Show the name of external fonts when they are loaded. This option shows only "newly" loaded fonts not those already preloaded in the format or the class file before the tracefnt package became active.

pausing Turn all font warnings into errors so that LATEX will stop.

### 2 A driver for this document

The next bit of code contains the documentation driver file for TEX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by  $\LaTeX$  this will produce the documentation as well.

## 3 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

The  $\mathtt{debug}$  module makes use of commands contained in a special package file named  $\mathtt{trace.sty.}^{11}$ 

```
_{16}~\langle + debug \rangle \input trace.sty
```

### 4 Handling Options

\tracingfonts

Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in fam.dtx) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

The \count@ in the line above will remove the number after \tracingfonts. Note that this definition will be overwritten be the next line if one of these modules are included.

```
24 (*package, trace, debug)
25 \newcount\tracingfonts
26 \tracingfonts=0
27 (/package, trace, debug)
```

(End definition for  $\t$  This function is documented on page  $\ref{eq:condition}$ .)

The option errorshow turns off all warnings so that only real errors are shown. warningshow corresponds to the NFSS default (when tracefnt is not loaded). infoshow is the default for this package here; and debugshow, loading, and pausing extend the amount of information even further.

 $<sup>^{11}</sup>$ This package is not in distribution at the moment (and probably doesn't any longer work). Think of this part of the code as being historical artefacts.

```
\def\@font@warning#1{%
            \GenericInfo{(Font)\@spaces\@spaces\space\space\%
                           {LaTeX Font Warning: #1}}%
        }
   \DeclareOption{warningshow}{%
37
      \def\@font@info#1{%
38
            \GenericInfo{(Font)\@spaces\@spaces\space\space}%
39
                        {LaTeX Font Info: \space\space\space#1}}%
40
       \def\@font@warning#1{%
41
            \GenericWarning{(Font)\@spaces\@spaces\space\space\}%
42
                           {LaTeX Font Warning: #1}}%
        }
44
   \DeclareOption{infoshow}{%
45
      \def\@font@info#1{%
46
            \GenericWarning{(Font)\@spaces\@spaces\space\space}%
47
                        {LaTeX Font Info: \space\space\space#1}}%
48
       \def\@font@warning#1{%
49
            \GenericWarning{(Font)\@spaces\@spaces\space\space}%
50
                           {LaTeX Font Warning: #1}}%
51
        }
52
   \DeclareOption{loading}{%
       \tracingfonts\tw@
54
55
   \DeclareOption{debugshow}{%
       \ExecuteOptions{infoshow}%
       \tracingfonts\thr@@
     }
  \DeclareOption{pausing}{%
60
       \def\@font@warning#1{%
61
         \GenericError
                {(Font)\@spaces\@spaces\space\space}%
                {LaTeX Font Warning: #1}%
                {See the LaTeX Companion for details.}%
65
                {I'll stop for every LaTeX Font Warning because
66
                 you requested\MessageBreak the 'pausing' option
67
                 to the tracefnt package.}}%
68
We make infoshow the default, which in turn defines \font@warning and \font@info.
70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 (/package)
    We also need a default definition inside the kernel:
73 (*2ekernel)
  \def\@font@info#1{%
            \GenericInfo{(Font)\@spaces\@spaces\space\space}%
                        {LaTeX Font Info: \space\space\space#1}}%
   \def\@font@warning#1{%
           \GenericWarning{(Font)\Ospaces\Ospaces\Spaces\space\space}%
                           {LaTeX Font Warning: #1}}%
80 (/2ekernel)
```

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

### 5 Macros common to fam.tex and tracefnt.sty

In the first versions of tracefnt.dtx some macros of fam.dtx<sup>12</sup> were redefined to included the extra tracing information. Now these macros are all defined in this file (i.e. removed from fam.dtx) and different production versions can be obtained simply by specifying a different set of modules to include when generating ltfss.dtx.

### 5.1 General font loading

\extract@font

This macro organizes the font loading. It first calls \get@external@font which will return in \external@font the name of the external font file (the .tfm) as it was determined by the NFSS tables.

Then the external font is loaded and assigned to the font identifier stored inside \font@name (for this reason we need \expandafter).

When tracing we typeout the internal and external font name.

Finally we call the corresponding "loading action" macros to finish things. First the font is locally selected to allow the use of \font inside the loading action macros.

```
o \font@name \relax
```

The next two lines execute the "loading actions" for the family and then for the individual font shape.

The \relax at the end needs to be explained. This is inserted to prevent TeX from scanning too far when it is executing the replacement text of the loading code macros.

(End definition for \extract@font. This function is documented on page ??.)

\get@external@font

This function tries to find an external font name. It will place the name into the macro \external@font. If no font is found it will return the one that was defined via \DeclareErrorFont.

```
96 (*2ekernel)
97 \def\get@external@font{%
```

We don't know the external font name at the beginning.

```
198  \let\external@font\@empty
199  \edef\font@info{\expandafter\expandafter\expandafter\string
100  \csname \curr@fontshape \endcsname}%
101  \try@size@range
```

 $<sup>^{12}</sup>$ This file is currently not distributed in documented form. Its code is part of ltfss.dtx.

If this failed, we'll try to substitute another size of the same font. This is done by the \try@size@substitution macro. It "knows about" \do@extract@font, \font@name, \f@size, and so on.

 $(End\ definition\ for\ \verb+\getQexternalQfont+.\ This\ function\ is\ documented\ on\ page\ \ref{eq:constraint}??.)$ 

\selectfont

The macro \selectfont is called whenever a font change must take place.

```
112 (*2ekernel|package)
113 \DeclareRobustCommand\selectfont
```

When debug is specified we actually want something like 'undebug'. The font selection is now stable so that using \tracingall on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as \tracingfonts is less than 4.

```
115 (+debug) \pushtracing
116 (+debug) \ifnum\tracingfonts<4 \tracingoff
117 (+debug) \else \tracingon\p@selectfont \fi</pre>
```

If \baselinestretch was redefined by the user it will not longer match its internal counterpart \f@linespread. If so we call \set@fontsize to prepare \size@update.

```
\ifx\f@linespread\baselinestretch \else
\set@fontsize\baselinestretch\f@size\f@baselineskip \fi
```

Then we generate the internal name of the font by concatenating family, series, shape, and current size, with slashes as delimiters between them. This is much more readable than standard LATEX's \twfbf, etc. We define \font@name globally, as always. The reason for this is explained later on.

```
\xdef\font@name{%
    \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro \pickup@font which will load the font if necessary.

```
122 \pickup@font
```

Then we select the font.

```
23 \font@name
```

If \tracingfonts is greater than 2 we also show the font switch. We do this before \glb@settings is called since this macro might redefine \font@name.

```
124 (*trace)
125  \ifnum \tracingfonts>\tw0
126  \@font@info{Switching to \font@name}\fi
127 (/trace)
```

Finally we call \size@update. This macro is normally empty but will contain actions (like setting the \baselineskip) that have to be carried out when the font size, the base \baselineskip or the \baselinestretch have changed.

```
128 \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from \relax by \fontencoding.

```
29 \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
\langle +debug \rangle \setminus poptracing
```

(End definition for \selectfont. This function is documented on page ??.)

\set@fontsize

The macro \set@fontsize does the actual work. First it assigns new values to \f@size, \f@baselineskip and \f@linespread.

```
132 \def\set@fontsize#1#2#3{%
133     \@defaultunits\@tempdimb#2pt\relax\@nnil
134     \edef\f@size{\strip@pt\@tempdimb}%
135     \@defaultunits\@tempskipa#3pt\relax\@nnil
136     \edef\f@baselineskip{\the\@tempskipa}%
137     \edef\f@linespread{#1}%
```

For backward compatibility and for later testing within \selectfont the internal value of \f@linespread is passed back to \baselinestretch.

```
138 \let\baselinestretch\f@linespread
```

Additional processing will happen within \selectfont. For this reason the macro \sizeQupdate (which will be called in \selectfont) will be defined to be:

```
\def\size@update{%
```

First calculate the new \baselineskip and also store it in normalbaselineskip

```
140 \baselineskip\f@baselineskip\relax

141 \baselineskip\f@linespread\baselineskip

142 \normalbaselineskip\baselineskip
```

then to set up a new \strutbox

```
\setbox\strutbox\hbox{%

vrule\@height.7\baselineskip

depth.3\baselineskip

@width\z@}%
```

We end with a bit of tracing information.

```
147 (*trace)
      \ifnum \tracingfonts>\tw@
148
         \ifx\f@linespread\@empty
149
            \let\reserved@a\@empty
150
         \else
151
            \def\reserved@a{\f@linespread x}%
152
         \OfontOinfo{Changing size to \fOsize/\reservedOa
154
                    \f@baselineskip}%
         \aftergroup\type@restoreinfo \fi
157 (/trace)
```

When all this is processed \sizeQupdate redefines itself to \relax so that in later calls of \selectfont no extra code will be executed.

```
158 \let\size@update\relax}%
159 }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use **\let!** 

(End definition for \set@fontsize. This function is documented on page ??.)

\size@update

Normally this macro does nothing; it will be redefined by \set@fontsize to initiate an update.

160 \let\size@update\relax

(End definition for \sizeQupdate. This function is documented on page ??.)

\type@restoreinfo This macro produces some info when a font size and/or baseline change will get restored.

```
⟨*trace⟩
161
       \def\type@restoreinfo{%
162
          \ifx\f@linespread\@empty
163
            \let\reserved@a\@empty
164
          \else
165
            \def\reserved@a{\f@linespread x}%
166
          \fi
167
          \OfontOinfo{Restoring size to
                     \f@size/\reserved@a\f@baselineskip}}
170 (/trace)
(End definition for \type@restoreinfo. This function is documented on page ??.)
```

\glb@settings \glb@currsize

The macro \glb@settings globally selects all math fonts for the current size if necessary.

171 \def\glb@settings{%

When \glb@settings gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every math group the new assignments are appended to \math@fonts. But this happens only if the math@fonts switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the S@... macro is not defined we have to first calculate the three sizes.

```
172 \expandafter\ifx\csname S@\f@size\endcsname\relax
173 \calculate@math@sizes
174 \fi
```

The effect of this is that \calculate@math@sizes may or may not define the S@... macro. In the first case the next time the same size is requested this macro is used, otherwise \calculate@math@sizes is called again. This also sets the math@fonts switch. If it is true we must switch the math fonts.

```
175 \csname SQ\f@size\endcsname
176 \ifmath@fonts
177 \langle*trace\
178 \ifnum \tracingfonts>\tw@
179 \@font@info{Setting up math fonts for
```

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

```
180 \f@size/\f@baselineskip}\fi
181 \(/trace\)
```

Inside a group we execute the macro for the current math version. This sets \math@fonts to a list of \textfont... assignments. \getanddefine@fonts (which may be called at this point) needs the \escapechar parameter to be set to -1.

```
\begingroup
ls3 \escapechar\m@ne
ls4 \csname mv@\math@version \endcsname
```

Then we set \globaldefs to 1 so that all following changes are done globally. The math font assignments recorded in \math@fonts are executed and \glb@currsize is set equal to \f@size. This signals that the fonts for math in this size are set up.

```
\globaldefs\@ne
\math@fonts
\let \glb@currsize \f@size
\endgroup
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within \globaldefs\@ne as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

#### \the\every@math@size

Otherwise we announce that the math fonts are not set up for this size.

 $(End\ definition\ for\ \verb|\glb@settings|\ and\ \verb|\glb@currsize|.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:constraint}??.)$ 

\baselinestretch

In \selectfont we used \baselinestretch as a factor when assigning a value to \baselineskip. We use 1 as a default (i.e. no stretch).

```
199 (*2ekernel)
200 \def\baselinestretch{1}
```

(End definition for \baselinestretch. This function is documented on page ??.)

(End definition for \every@math@size. This function is documented on page ??.)

\every@math@size

We must still define the hook \every@math@size we used in \glb@settings. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```
201 \newtoks\every@math@size
202 \every@math@size={}
203 \langle /2ekernel \rangle
```

## 5.2 Math fonts setup

## 5.2.1 Outline of algorithm for math font sizes

TEX uses the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

## $a=b+c \mod {\ Small for all $b$ and $c\in Z$}$

Here the inner formulae b and c\in Z are typeset in \small but we have to return to \normalsize before we reach the closing \$ of the outer formula.

This is handled in the following way:

- 1. At any point in the document the global variable \gbl@currsize contains the point size for which the math fonts currently are set up.
- 2. Whenever we start a formula we compare its value with the local variable \fcsize that describes the current text font size.
- 3. If both are the same we assume that we can use the current math font setup without adjustment.
- 4. If they differ we call \gbl@settings which changes the math font setup and updates \gbl@currsize.
  - (a) If we are recursively inside another formula (\if@inmath) we ensure that \gbl@settings is executed again in the outer formula, so that the old setup is automatically restored.
  - (b) Otherwise, we set the switch @inmath locally to true so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
  - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
  - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesetable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of \aftergroup commands and checks. Compared to the original algorithm this involves additional checks (2 × \( \text{non-math levels} \) per inner formula).

(End definition for \restglb@settings. This function is documented on page ??.)
```

### 5.2.3 Other code for math

\use@mathgroup

The \use@mathgroup macro should be used in user macros to select a math group. Depending on whether or not the margid option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```
253 \def\use@mathgroup#1#2{\relax\ifmmode
254 \def\use@mathgroup#1#2{\relax\ifmmode
255 \ifnum \tracingfonts>\tw@
256 \count@#2\relax
257 \@font@info{Using \noexpand\mathgroup
258 (\the\count@) #2}\fi
259 \def\useparture{\text{trace}}
```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call \mathgroup to select the group given by argument two and finally we place #1 (i.e. the argument of the \( \frac{math alphabet identifier} \) at the end. This part of the code is surrounded by two commands which behave like \( \text{begingroup} \) and \( \text{endgroup} \) if we want \( \frac{math alphabet identifier} \) s but will expand into \( \text{Qempty} \) if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a \relax. Otherwise something like \mit{1} \) would switch to math group 11 (and back) instead of printing an oldstyle 1.

```
260 \math@bgroup
261 \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
262 #1\fi
263 \mathgroup#2\relax
```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the  $\langle math\ alphabet\ identifier \rangle$  isn't called in math mode, we remove the \fi with the \expandafter trick. This is necessary if the token is actually an macro with arguments. In such a case the \fi will be misinterpreted as the first argument which would be disastrous.

```
264 \expandafter\math@egroup\fi}%
```

The surrounding macros equal  $\ensuremath{\verb|begingroup|}$  and  $\ensuremath{\verb|centum|}$  But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in  $\mathcal{AMS}$ -TFX macros for placing accents.

(End definition for \use@mathgroup. This function is documented on page ??.)

\math@egroup

If the margid option is in force (which can be tested by looking at the definition of  $\mbox{math@bgroup}$  we change the  $\mbox{math@egroup}$  command a bit to display the current  $\mbox{math}$  group number after it closes the scope of  $\mbox{math alphabet}$  with  $\mbox{endgroup}$ .

```
265 (*trace)
266 \ifx\math@bgroup\bgroup
267 \def\math@egroup#1{#1\egroup
268 \ifnum \tracingfonts>\tw@
269 \@font@info{Restoring \noexpand\mathgroup
270 (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271 }\fi
272 \fi
273 (/trace)
```

(End definition for \math@egroup. This function is documented on page ??.)

#### \getanddefine@fonts

\getanddefine@fonts has two arguments: the  $\langle math\ group\ number \rangle$  and the family/series/shape name as a control sequence.

274 \def\getanddefine@fonts#1#2{%

First we turn of tracing when \tracingfonts is less than 4.

```
275 (+debug) \pushtracing
276 (+debug) \ifnum\tracingfonts<4 \tracingoff
277 (+debug) \else \tracingon\getanddefine@fonts \fi

278 (*trace)
279 \ifnum \tracingfonts>\tw@
280 \count@#1\relax
281 \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
282 \string#2 \tf@size/\sf@size/\ssf@size}\fi
283 (/trace)
```

We append the current \tf@size to #2 to obtain the font name. Again, font@name is defined globally, for the reasons explained in the description of \wrong@fontshape.

```
\xdef\font@name{\csname \string#2/\tf@size\endcsname}%
```

Then we call \pickup@font to load it if necessary. We remember the internal name as \textfont@name.

pickup@font \let\textfont@name\font@name

Same game for \scriptfont and \scriptscriptfont:

```
\xdef\font@name{\csname \string#2/\sf@size\endcsname}%

\pickup@font \let\scriptfont@name\font@name
\xdef\font@name{\csname \string#2/\ssf@size\endcsname}%

\pickup@font
\pickup@font
```

Then we append the new \textfont... assignments to the \math@fonts.

```
290 \edef\math@fonts{\math@fonts
291 \textfont#1\textfont@name
292 \scriptfont#1\scriptfont@name
293 \scriptscriptfont#1\font@name};
```

 $<sup>^{13}</sup>$ One might ask why this expansion does not generate a macro name that starts with an additional \ character. The solution is that \escapechar is set to -1 before \generatedgetanddefine@fonts is called.

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
294 (+debug) \poptracing
295 }
296 (/2ekernel | package)

(End definition for \getanddefine@fonts. This function is documented on page ??.)
```

## 6 Scaled font extraction

\ifnot@nil

We begin with a simple auxiliary macro. It checks whether its argument is the token \@nil. If so, it expands to \@gobble which discards the following argument, otherwise it expands to \@firstofone which reproduces it argument.

```
297 (*2ekernel)
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
299 \ifx\reserved@a\@nnil \expandafter\@gobble
300 \else \expandafter\@firstofone\fi}
(End definition for \ifnot@nil. This function is documented on page ??.)
```

\remove@to@nnil \remove@angles \remove@star Three other auxiliary macros will be needed in the following: \remove@to@nnil gobbles up everything up to, and including, the next \@nnil token, and \remove@angles and \remove@star do the same for the character > and \*, respectively, instead of \@nnil.

```
301 \def\remove@to@nnil#1\@nnil{}
302 \def\remove@angles#1>{\set@simple@size@args}
303 \def\remove@star#1*{#1}
```

(End definition for \remove@to@nnil, \remove@angles, and \remove@star. These functions are documented on page ??.)

\extract@sizefn

This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
def\extract@sizefn#1*#2\@nil{%
if>#2>\set@size@funct@args#1\@nil
let\sizefn@info\@empty
lelse\expandafter\set@size@funct@args\remove@star#2\@nil
lef\sizefn@info{#1}\fi
}
```

(End definition for \extract@sizefn. This function is documented on page ??.)

\try@simple@size

This function tries to extract the given size (specified by \fosize) for the requested font shape. The font information must already be present in \font@info. The central macro that does the real work is \extract@fontinfo. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: encoding scheme 'OT1', family 'cm', series 'sansserif', shape 'normal', and size '12'. The corresponding font definitions have already been extracted from the macro \OT1/cm/sansserif/normal and stored in font@info. (Otherwise \extract@fontinfo doesn't get called.) This information consists of a token list made of characters of category code 12 of the form

<10\*>cmss10<12\*>cmss12<17\*>cmss17

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro \extract@fontinfo to find the external font name ('cmss12') for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \set@simple@size@args#3<#4\@nnil
  \execute@size@function{#2}}</pre>
```

so that when it gets called via

#1 will contain all characters before <12\*>, #2 will be empty, #3 will be exactly cmss12, and #3 will be 17>cmss17. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument set to empty and its mandatory argument set to cmss12 by \set@simple@size@args. As we discussed earlier, the effect of the default size function is to load the given external font (cmss12) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list \font@info. And the simple definition of \extract@fontinfo we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define \extract@fontinfo as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
\ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nnil
    \execute@size@function{#2}%
}}%</pre>
```

How does this work? We call \extract@fontinfo via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending <12\*>\@nil<\@nnil. If the size ('12' in this case) appears in \font@info everything works as explained above, the only difference being that argument #4 of \extract@fontinfo additionally gets the tokens <12\*>\@nil<\@nnil. However, if the size is not found everything up to the final <12\*> is in argument #1, #3 gets \@nil, and #2 and #4 are empty. The macro \ifnot@nil will discard the calls to \set@simple@size@args and execute@size@function, and hence \font@info will continue to be equal to \@empty. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in \set@simple@size@args below.

The macros are hidden inside other control sequences so that we have to build \extract@fontinfo in several steps.

So here's the actual definition of \extract@font in \try@simple@size.

```
_{310} % % this could be replaced by \try@size@range making the subst slower! _{311} \def\try@simple@size{%
```

\reserved@a is made an abbreviation for the head of the definition of the macro \extract@fontinfo.

```
12 \def\reserved@a{\def\extract@fontinfo####1}%
```

Now we can define \extract@fontinfo. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the \* character.

```
\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\tinx{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\tinx{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\ti}\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\te
```

Now we call \extract@fontinfo. Note the <\@nil tokens at the end.

(End definition for \try@simple@size. This function is documented on page ??.)

#### \set@simple@size@args

As promised above, the macro \set@simple@size@args will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character <. By starting the definition as follows,

```
322 \def\set@simple@size@args#1<{%
```

parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling \remove@angles for empty #1 and \extract@sizefn otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by \remove@to@nnil. Note also the use of Kabelschacht's method.

```
323     \if<#1<%
324     \expandafter\remove@angles
325     \else
326     \extract@sizefn#1*\@nil
327     \expandafter\remove@to@nnil
328     \fi}</pre>
```

 $(\mathit{End \ definition \ for \ } \verb+setOsimpleOsizeOargs+. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.})$ 

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macors for extraction of size range specification.

#### \extract@rangefontinfo

\extract@rangefontinfo goes through a font shape definition in the input until it recognizes the tokens <\@nil->. It looks for font ranges with font size functions. It's operation is rather simple: it discards everything up to the next size specification and passes this on to \is@range for inspection. The specification (parameter #2 is inserted again, in case it is needed later.

```
329 \def\extract@rangefontinfo#1<#2>{%
330 \is@range#2->\@nil#2>}
```

 $(\mathit{End \ definition \ for \ } \backslash \mathtt{extract@rangefontinfo}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.)})$ 

\is@range

\is@range is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls \extract@rangefontinfo to continue the search. Otherwise it calls \check@range to check the requested size against the specified range.

From the way \is@range is called inside \extract@rangefontinfo we see that #2 is the character > if the size specification found is a simple one (as it does not contain a - character. This is checked easily enough and \extract@rangefontinfo called again. Note that the extra tokens inserted after the \@nil in the call to \is@range appear at the beginning of the first argument to \extract@rangefontinfo and are hence ignored.

```
def\is@range#1-#2\@nil{%
    \if>#2\expandafter\check@single\else
    \expandafter\check@range\fi}
```

(End definition for \is@range. This function is documented on page ??.)

\check@range

\check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil \font@info is exhausted and we can stop searching.

```
334 \def\check@range#1-#2>#3<#4\@nnil{%
335 \ifnot@nil{#3}{%
```

If #3 wasn't \@nil we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
36 \def\reserved@f{\extract@rangefontinfo<#4\@nnil}%</pre>
```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If  $\protect\operatorname{hupper@bound}$  is zero after the assignment we set it to  $\protect\operatorname{hupper}$  open range). We need to use a  $\protect\operatorname{dimen}$  register for the scan since we may have a decimal number as the boundary.

```
\upper@bound0#2\p@
ifdim\upper@bound=\z@\upper@bound\maxdimen\fi
```

Now we check the upper boundary against \f@size. If it is larger or equal than \f@size this range is no good and we have to recurse.

```
\ifdim \f@size \p@<\upper@bound
```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If \footnotensity for is smaller than the boundary we have to recurse.

```
340 \lower@boundO#1\p@
341 \ifdim \f@size \p@<\lower@bound
342 \else</pre>
```

If both tests are passed we can try executing the size function.

```
\set@simple@size@args#3<#4\@nnil
\execute@size@function\sizefn@info</pre>
```

If the function was successful it should have left an external font name in **\externalOfont**. We use this to see if we can stop scanning. Otherwise we recurse.

```
345 \ifx\external@font\@empty
346 \else
347 \let\reserved@f\@empty
348 \fi
349 \fi
```

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

```
350 \fi
351 \reserved@f}}
```

 $(\mathit{End \ definition \ for \ } \backslash \mathsf{check@range}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:check@range}.)$ 

# \lower@bound \upper@bound

We use two dimen registers \lower@bound and \upper@bound to store the lower and upper endpoints of the range we found.

- 352 \newdimen\lower@bound
- 353 \newdimen\upper@bound

(End definition for \lower@bound and \upper@bound. These functions are documented on page ??.)

#### \check@single

\check@single takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
354 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
55 \def\reserved@f{\extract@rangefontinfo<#3\@nnil}%</pre>
```

Now we check the size against \f@size. If it is not equal \f@size it is no good and we have to recurse.

```
356 \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
\set@simple@size@args#2<#3\@nnil \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in **\externalQfont**. We use this to see if we can stop scanning. Otherwise we recurse.

```
359 \ifx\external@font\@empty
360 \else
361 \let\reserved@f\@empty
362 \fi
363 \fi
364 \reserved@f\
```

(End definition for \check@single. This function is documented on page ??.)

## \set@size@funct@args \set@size@funct@args@

This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token \@nil.

```
365 \def\set@size@funct@args{\@ifnextchar[%
366 \set@size@funct@args@{\set@size@funct@args@[]}}
367 \def\set@size@funct@args@[#1]#2\@nil{%
368 \def\mandatory@arg{#2}%
369 \def\optional@arg{#1}}
370 \(\langle / 2ekernel \rangle \)
```

(End definition for \set@size@funct@args and \set@size@funct@args@. These functions are documented on page ??.)

\DeclareSizeFunction This function defines a new size function hiding the internal from the designer. The body of the size function may use \optional@arg and \mandatory@arg denoting the optional and mandatory argument that may follow the size specification <...>.

```
371 (*2ekernel)
372 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
373 \@onlypreamble\DeclareSizeFunction
374 (/2ekernel)
```

(End definition for \DeclareSizeFunction. This function is documented on page ??.)

\execute@size@function

This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a \relax).

```
375 (*2ekernel | package)
376 \def\execute@size@function#1{%
  ⟨*trace⟩
377
             \@ifundefined{s@fct@#1}%
378
                {\errmessage{Undefined font size function #1}%
379
                 \s@fct@}%
380
                {\csname s@fct@#1\endcsname}%
381
382 (/trace)
383 (-trace)
                 \csname s@fct@#1\endcsname
384 }
385 </2ekernel | package>
```

(End definition for \execute@size@function. This function is documented on page ??.)

\try@size@range

This macro tries to find a suitable range for requested size (specified by \f@size) in \font@info. All the relevant action is done in \extract@rangefontinfo. All that needs to be done is to stuff in the token list in \font@info so that \extract@rangefontinfo can inspect it. Note the <-\*\@nil>< token at the end to stop scanning.

```
(*2ekernel)
  \def\try@size@range{%
       \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
388
389 }
```

(End definition for \try@size@range. This function is documented on page ??.)

\try@size@substitution

This is the last thing that can be tried. If the desired \fosize is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```
390 \gdef\try@size@substitution{%
```

First we do some initializations. \Qtempdimb will hold the difference between the wanted size and the best solution found so far, so we initialise it with \maxdimen. The macro \best@size will hold the best size found, nothing found is indicated by the empty value.

```
\@tempdimb \maxdimen
391
     \let \best@size \@empty
Now we loop over the specification
     \expandafter \try@simples \font@info <\number\@M>\@nil<\@nnil
394 }
(End definition for \try@size@substitution. This function is documented on page ??.)
```

\font@submax \fontsubfuzz

The macro \font@submax records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at \end{document}. The macro \fontsubfuzz contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```
395 \def\font@submax{0pt}
396 \def\fontsubfuzz{.4pt}
397 \langle /2ekernel \rangle
398 \def\fontsubfuzz{0pt}
```

(End definition for \font@submax and \fontsubfuzz. These functions are documented on page ??.)

\try@simples

\try@simples goes through a font shape definition in the input until it recognizes the tokens <\*\@nil><. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```
399 (*2ekernel)
400 \gdef\try@simples#1<#2>{%
401 \tryif@simple#2->\tryif@simple}
(End definition for \try@simples. This function is documented on page ??.)
```

\tryis@simple

\tryis@simple is similar to \is@range. If it sees a simple size, it checks it against the value of \f@size and sets \lower@font@size or \higher@font@size. In the latter case, it stops the iteration. By adding <\number\@M> at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
402 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for \reserved@f first:

```
403 \let \reserved@f \try@simples
404 \if>#2%
```

If so, it compares it to the value of **\f@size**. This is done using a dimen register since there may be fractional numbers.

```
\dimen@ #1\p@
\ifdim \dimen@<\@M\p@
```

If  $\dim 0$  is 0 we have reached the end of the fontspec (hopefully) otherwise we compare the value with f0 and compute in 0 the absolute value of the difference between the two values.

```
407 \ifdim \f@size\p@<\dimen@
408 \@tempdimc \dimen@
409 \advance\@tempdimc -\f@size\p@
410 \else
411 \@tempdimc \f@size\p@
412 \advance\@tempdimc -\dimen@
413 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in \@tempdimc is smaller) we have found a size which is a better approximation so we make it the \best@size and adjust \@tempdimb.

```
414 \ifdim \@tempdimc<\@tempdimb
415 \@tempdimb \@tempdimc
416 \def \best@size{#1}%
417 \fi</pre>
```

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called \subst@size.

```
418 \else
```

\subst@size

This macro substitutes the size recorded in \best@size for the unavailable size \f@size. \font@submax records the maximum difference between desired size and selected size in the whole run.

```
419 % %\subst@size
                                %% coded inline
420 % %\def\subst@size{%
     \ifx \external@font\@empty
421
       \ifx \best@size\@empty
422
423
         \ifdim \@tempdimb>\font@submax \relax
           \xdef \font@submax {\the\@tempdimb}%
         \let \f@user@size \f@size
427
         \let \f@size \best@size
428
         \ifdim \@tempdimb>\fontsubfuzz\relax
429
           \@font@warning{Font\space shape\space
430
                '\curr@fontshape'\space in\space size\space
431
                 <\f@user@size>\space not\space available\MessageBreak
432
                 size\space <\f@size>\space substituted}%
433
         \fi
434
         \try@simple@size
         \do@subst@correction
437
       \fi
   \fi
438
439 % %}
```

This brings us back into the main part of \tryif@simple. Finally we get rid of any rubbish left over on the input stack.

```
440 \let \reserved@f \remove@to@nnil
441 \fi
442 \fi
```

If it's a range iterate also.

443 \reserved@f}

 $(\textit{End definition for $\tt tryis@simple and $\tt subst@size. These functions are documented on page \ref{eq:constraints}.)$ 

### 6.1 Sizefunctions

In the following we define some useful size functions.

\s@fct(

This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to \f@size if no optional argument is present, and to \f@size multiplied by the optional argument otherwise.

```
444 \DeclareSizeFunction{}{\empty@sfcnt\@font@warning}
445 \DeclareSizeFunction{s}{\empty@sfcnt\@font@info}
```

(End definition for \s@fct@. This function is documented on page ??.)

## \s@fct@gen \s@fct@sgen

This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to \f@size if no optional argument is present, and to \f@size multiplied by the optional argument otherwise.

```
456 \DeclareSizeFunction{gen}{\gen@sfcnt\@font@warning}
457 \DeclareSizeFunction{sgen}{\gen@sfcnt\@font@info}
458 \def\gen@sfcnt{%
459 \edef\mandatory@arg{\mandatory@arg\f@size}%
460 \empty@sfcnt}
```

(End definition for \s@fct@gen and \s@fct@gen. These functions are documented on page ??.)

## \s@fct@genb \s@fct@sgenb

This size function is similar to gen, but for fonts where the size is encoded in the font name in centipoints, as in the DC fonts version 1.2. The font is scaled to \f@size if no optional argument is present, and to \f@size multiplied by the optional argument otherwise.

```
| DeclareSizeFunction{genb}{\genb@sfcnt\@font@warning} |
| DeclareSizeFunction{sgenb}{\genb@sfcnt\@font@info} |
| def genb@sfcnt{% |
| def mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@@}% |
| def genb@sfcnt} |
```

 $(\textit{End definition for } \verb+sOfctOgenb+ and \verb+sOfctOgenb+. These functions are documented on page \ref{eq:page-1}.)$ 

\genb@x The auxiliary macros \genb@x and \genb@y are used to convert the \f@size into centi-\genb@y points.

```
\label{lem:defgenb} $$ \def\genb@x#1.#2.#3\\@{\two@digits{#1}\genb@y#200\\@{\def\genb@y#1#2#3\\@{\#1#2}$}
```

(End definition for \genb@x and \genb@y. These functions are documented on page ??.)

#### \s@fct@sub

This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.

```
468 \DeclareSizeFunction{sub}{\sub@sfcnt\@font@warning}
469 \DeclareSizeFunction{ssub}{\sub@sfcnt\@font@info}
470 \def\sub@sfcnt#1{%
471 \edef\mandatory@arg{\f@encoding/\mandatory@arg}%
```

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

Next action is split the arg into its individual components and allow for a late font shape load.

```
\text{\left} \text{\left}
```

Then we record the current \f@size since it may get clobbered.

```
76 \let\f@user@size\f@size
```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to \error@fontshape.

Otherwise we warn the user about the substitution taking place.

Then we restart the font specification scan by calling \get@external@font.

```
\def\f@size{\f@user@size}%

def\f@size{\f@user@size}%

def\f@size{\f@user@size}%
```

Finally \do@subst@correction is called to get the font name right.

```
491 \do@subst@correction
492 }
```

(End definition for \s@fct@sub. This function is documented on page ??.)

\@font@aliasinfo

Sometimes a substitution is only done to map a long font name to a standard shape or series, e.g.,

```
DeclareFontShape{T1}{Roboto-LF}{b}{it}{<-> alias * Roboto-LF/bold/it}{}
```

Using the ssub function in that case will give a strange (and incorrect) warning. As an alternative we therefore offer the size function alias. It will still add some info into the .log file, but no longer complains that the font shape is not available. It is implemented by grabbing the default warning text and replacing it with a new one.

File t: ltfsstrc.dtx Date: 2020/02/03 Version v3.0l

```
503 ⟨latexrelease⟩\EndIncludeInRelease
504 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
505 ⟨latexrelease⟩ {\@font@aliasinfo}{alias size function}%
506 ⟨latexrelease⟩\let\s@fct@alias\@undefined
507 ⟨latexrelease⟩\let\@font@aliasinfo\@undefined
508 ⟨latexrelease⟩
509 ⟨latexrelease⟩\EndIncludeInRelease
510 ⟨*2ekernel⟩
```

(End definition for \OfontOaliasinfo. This function is documented on page ??.)

\s@fct@subf

The subf size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
511 \DeclareSizeFunction{subf}{\subf@sfcnt\@font@warning}
512 \DeclareSizeFunction{ssubf}{\subf@sfcnt\@font@info}
513 \def\subf@sfcnt#1{%
514  #1{Font\space shape\space '\curr@fontshape'\space in\space
515  size\space \f@size\space not\space available\MessageBreak
516  external\space font\space '\mandatory@arg'\space used}%
517  \empty@sfcnt#1%
518 }
```

(End definition for \s@fct@subf. This function is documented on page ??.)

\s@fct@fixed

The fixed size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the 'at' size for the font. Otherwise the font is loaded at its design size.

```
519 \DeclareSizeFunction{fixed}{\fixed@sfcnt\@font@warning}
  \DeclareSizeFunction{sfixed}{\fixed@sfcnt\@font@info}
  \def\fixed@sfcnt#1{%
522
     \ifx\optional@arg\@empty
       \let\external@font\mandatory@arg
523
     \else
524
       \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
525
526
527
     #1{External\space font\space '\external@font'\space loaded\space
528
        for\space size\MessageBreak
529
        <\f@size>\}%
530 }
531 (/2ekernel)
```

(End definition for  $\scalebox{SQfctQfixed}$ . This function is documented on page  $\ref{eq:condition}$ .)

## File u

## ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original 'NFSS1' release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was "current" only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via latexrelease package so that backward compatibility remains ensured for very old documents.

```
1 (*latexrelease)
                   2 \IncludeInRelease{2015/01/01}{\new@fontshape}%
                                                    {NFSS version1 commands}%
                   4 \let\new@fontshape\@undefined
                   5 \let\warn@rel@i\@undefined

## File v

## ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the  $\LaTeX$  distribution, or *The \LaTeX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

## 1 Interface Commands

\ino \@in is a utility macro with two arguments. It determines whether its first argument occurs in its second and sets the switch \ifin@ accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```
1 (*2ekernel)
2 \def\in@#1#2%
    {%
        \begingroup
           \def\in@@##1#1{}%
           \toks@\operatorname{in@@#2{}}{}\#1}\%
           \ensuremath{\ensuremath{\text{def}\in\ensuremath{\ensuremath{\text{line}@{\tilde{\ensuremath{\ensuremath{\text{de}}}}\%}}}
        \expandafter\endgroup
8
        \ifx\in@@\@empty
           \in@false
10
        \else
           \in@true
12
        \fi
13
14 }
15 \newif\ifin@
```

(End definition for \in@ and \ifin@. These functions are documented on page ??.)

Before the \begin{document} command several  $\langle math \ versions \rangle$  and  $\langle math \ alphabet \ identifiers \rangle$  may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

• the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

```
\verb|\versionQelt| \langle version_1 \rangle \\ \verb|\versionQelt| \langle version_2 \rangle ... \\ \verb|\versionQelt| \langle version_n \rangle \\
```

335

• the list of all math alphabet identifiers. Here every entry has the form:

```
\label{lem:condition} $$ \operatorname{default\ group\ number} \ {(\ default\ family)}{(\ default\ series)}}{(\ default\ shape)}.
```

File v: ltfssdcl.dtx Date: 2020/03/19 Version v3.0v

• Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

where  $\langle font \ info \rangle$  is either \reserved@e (if the combination is not defined yet) or

```
\{\{\langle family\rangle\}\{\langle series\rangle\}\{\langle shape\rangle\}\}
```

\version@list We initialize the version list to be empty.

- 16 \let\version@list=\@empty
- 17 \@onlypreamble\version@list

(End definition for \version@list. This function is documented on page ??.)

\version@elt

- 18 \let\version@elt\relax
- 19 \@onlypreamble\version@elt

(End definition for \version@elt. This function is documented on page ??.)

\new@mathversion

The macro \new@mathversion is called with the version control sequence as its argument.

20 %\def\new@mathversion#1{%

The first thing this macro does is to check if the version identifier is already present in \version@list. We enclose \version@list in braces since it might be empty (if no version is defined yet). But this means that we need a suitable number of \expandafter primitives.

- 21 % \expandafter\in@\expandafter#1\expandafter{\version@list}%
- 22 % \ifin@

If so it prints an error message. The \next macro is used to get rid of the four characters \mv@ that would otherwise appear at the begin of the version name in the error message.

```
23 % \@latex@error{Math version
24 % '\expandafter\@gobblefour\string#1'
25 % already defined}\@eha
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to \version@list. This is very easy: we define \version@elt (which is the delimiter in \version@list) to protect itself and the following token from being expanded and simply redefine \version@list.

```
26 % \else
27 % \global\expandafter\newcount\csname c@\expandafter
28 % \Qgobble\string#1\endcsname
29 % \global\csname c@\expandafter
30 % \Qgobble\string#1\endcsname\@ne
31 % \Qdef\version@elt{\noexpand\version@elt\noexpand}%
32 % \edef\version@list{\version@list\version@elt#1}%
```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use \reserved@c as delimiter, and that there appears the control sequence \reserved@e that must not be expanded. Therefore we take suitable precautions.

- 33 % \def\reserved@c{\noexpand\reserved@c\noexpand}%
- 34 % \let\reserved@e\relax

We will now go through the \alpha@list to process every \( \) math alphabet identifier \( \) in turn. Since this list has \group@elt as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

#### 35 % \def\group@elt##1##2##3{%

The first of these arguments is the \( \)math alphabet identifier \). We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for \reserved@c and \reserved@c made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro \remove@nil which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

Finally we call  $\alpha@list$  which will now execute the macro  $\group@elt$  once for every defined  $\mbox{\it (math alphabet identifier)}$ . And that's all for now.

```
41 % \alpha@list
42 % \fi}
```

 $(\mathit{End \ definition \ for \ } \verb| new@mathversion|. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.)$ 

\alpha@list

As we explained above every entry in \alpha@list has the form

```
\alpha@elt
```

 $\langle alphabet\ identifier \rangle \langle internal\ group\ number \rangle \langle default\ font\ assignments \rangle \dots$ 

We initialize it to \@empty.

- 43 \let\alpha@list\@empty
- 44 \@onlypreamble\alpha@list

(End definition for \alpha@list. This function is documented on page ??.)

\alpha@elt

- 45 \let\alpha@elt\relax
- 46 \@onlypreamble\alpha@elt

(End definition for \alpha@elt. This function is documented on page ??.)

\newgroup

Start the group (fam) allocation at 0. (Doesn't belong here.)

47 \count18=-1

(End definition for \newgroup. This function is documented on page ??.)

\stepcounter

(End definition for \stepcounter. This function is documented on page ??.)

File v: ltfssdcl.dtx Date: 2020/03/19 Version v3.0v

We surround \select@group with braces so that functions using it can be used directly after \_ or ^. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if \math@bgroup is not \bgroup) we need to get rid of the extra group.

If the legacy interface is used, e.g., \$\sf -1\$ the math alphabet #1 does not take an argument so we better do not surround #4 with braces, because then we get {\relax} into the formula and introduce an extra Ord atom. The two different cases can be distinguished by looking at the current value of \math@bgroup.

                                     \@gobble\string#1\endcsname
287
       \def\version@elt{\noexpand\version@elt\noexpand}%
288
       \edef\version@list{\version@list\version@elt#1}%
289
     \fi
290
```

\toks@ is used to gather all tokens for the math version. \count@ will be used to count the math groups we add to this version.

```
291 \toks@{}%
292 \count@\z@
```

Now we loop over \group@list to add all math groups defined so far to the version and at the same time to count them.

```
293 \def\group@elt##1##2{%
294 \advance\count@\@ne
295 \addto@hook\toks@{\getanddefine@fonts##1##2}%
296 }%
297 \group@list
```

We set the counter for this math version to the number of math groups found in \group@list.

```
298 \global\csname c@\expandafter\@gobble\string#1\endcsname\count@
```

Now we loop over \alpha@list to add all math alphabets known so far. We have to distinguish the case that an alphabet by default should produce an error in new versions.

```
\def\alpha@elt##1##2##3{%
          \ifx##2\no@alphabet@error
300
            \verb|\toks@\expandafter{\the\toks@\install@mathalphabet##1\%|}|
301
                 {\no@alphabet@error##1}}%
302
          \else
303
             \toks@\expandafter{\the\toks@\install@mathalphabet##1%
304
                 {\select@group##1##2##3}}%
305
          \fi
306
             }%
     \alpha@list
```

```
Finally we define the math version to expand to the contents of \toks@.

 $(\mathit{End \ definition \ for \ } \backslash \mathtt{DeclareMathDelimiter}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:local_page})})$ 

#### \@xxDeclareMathDelimiter

This macro checks if the second arg is a "math type" such as \mathopen. The undocumented original code didn't use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

#### 790 \def\@xxDeclareMathDelimiter#1#2#3#4{%

7 is the default value returned in the case that \mathchar@type is passed something unexpected, like a math symbol font name. We locally move \mathalpha out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```
791 \begingroup
792 \let\mathalpha\mathord
793 \ifnum7=\mathchar@type{#2}%
794 \endgroup
```

If this branch is taken we have old syntax (5 arguments).

```
795 \expandafter\@firstofone
796 \else
```

If this branch is taken \mathchar@type is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```
797 \endgroup
798 \DeclareMathSymbol#1{#2}{#3}{#4}%
```

Then we arrange that  $\c$  as it does not expect a math type as argument.

```
799 \expandafter\@firstoftwo
800 \fi

                                     \fi
                                   \fi}
                              990 \@onlypreamble\mathchar@type
                              (End definition for \mathchar@type. This function is documented on page ??.)
 \DeclareSymbolFontAlphabet
                              991 \def\DeclareSymbolFontAlphabet#1#2{%
                                    \expandafter\DeclareSymbolFontAlphabet@
                                      \csname \expandafter\@gobble\string#1\space\endcsname{#2}#1}
                              994 \@onlypreamble\DeclareSymbolFontAlphabet
                              (End definition for \DeclareSymbolFontAlphabet. This function is documented on page ??.)
\DeclareSymbolFontAlphabet@
                              995 \def\DeclareSymbolFontAlphabet@#1#2#3{%
                              We use the switch \if@tempswa to decide if we can declare this symbol font alphabet.
                                      \@tempswatrue
                              First check if #2 is known to be a symbol font
                                   \expandafter\in@\csname sym#2\expandafter\endcsname
                                       \expandafter{\group@list}%
                              998
                              999
                              Check if #1 is defined as a math alphabet defined via \DeclareMathAlphabet:
                                      \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
                              1000
                                     \ifin@
                              1001
                              If so remove it from the \alpha@list and from all math version macros.
                                        \@font@info{Redeclaring math alphabet \string#3}%
                              1002
                                        \toks@{}%
                              1003
                                        \def\alpha@elt##1##2##3{%
                              1004
                                            \alpha@list
                                        \xdef\alpha@list{\the\toks@}%
```

Now we loop over all versions and remove the math alphabet:

```
\def\version@elt##1{%
              \begingroup
1009
                 \toks@{}%
                 \def\getanddefine@fonts###1###2{%
                    \addto@hook\toks@{\getanddefine@fonts#######2}}%
                 \def\install@mathalphabet###1###2{%
                    \ifx####1#1\else
1014
                      \addto@hook\toks@{\install@mathalphabet
1015
                                          ####1{####2}}\fi}%
1016
                ##1%
1017
                 \xdef##1{\theta\toks@}%
1018
1019
              \endgroup
              }%
          \version@list
1021
        \else
1022
```

If #3 is not defined as a math alphabet check if it is defined at all:

```
\
\text{\csname}\expandafter\ifx
\text{\csname}\expandafter\@gobble\string#1\space\endcsname
\text{\relax}
\]
\[
\text{\relax}
\]
\[
\text{\csname}\expandafter\@gobble\string#1\space\endcsname
\text{\csname}\expandafter\@gobble\string#1\space\endcsname
\]
\[
\text{\csname}\expandafter\@gobble\string#1\space\endcame
\]
\[
\text{\csname}\expandafter\@gobble\string#1\space\endcame
\]
\[
\text{\csname}\expandafter\@gobble\endcame
\]
\[
\text{\csname}\expandafter\@gobble\string#1\space\endcame
\]
\[
\text{\csname}\expandafter\@gobble\string#1\space\endcame
\]
\[
\text{\csname}\expandafter\@gobble\endcame
\]
\[
\text{\csname}\expandafter\@gobble\endcame
\]
\[
\text{\csname}\expandafter\@gobble\@gobble\endcame
\]
\[
\text{\csname}\expandafter\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobble\@gobb
```

If it is undefined, fine otherwise check if it is a math alphabet defined via \DeclareSymbolFontAlphabet:

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```
1033 \Qtempswafalse

1034 \QlatexQerror{Command '\string#3' already defined}\Qeha

1035 \fi

1036 \fi

1037 \fi

1038 \else
```

Since the symbol font is not known we better skip defining this alphabet.

```
1039 \@tempswafalse

1040 \@latex@error{Unknown symbol font '#2'}\@eha

1041 \fi

1042 \if@tempswa
```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup\ \langle math\text{-}settings \rangle\ \sym\langle name \rangle
```

The  $\langle math\text{-}settings \rangle$  are the one for the encoding that is used in the font shape where  $\langle \text{sym} \rangle = \text{is pointing to}$ . This means that we have to get it from the information stored in  $\langle \text{group@list}$ . Thus we loop through that list after defining  $\langle \text{group@elt} = \text{in a suitable way}$ .

```
1043 \def\group@elt##1##2{%
```

```
\expandafter\ifx\csname sym#2\endcsname##1%
1044
1045
                                                       \expandafter\reserved@a\string##2\@nil
1046
                                                       fi}%
                                         1047
                                                       1048
                                         \group@list
1049
                                         \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
1050
                                         \ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath}\amb}\amb}\amb}}}}}}}}}}}}}}
1051
                                                                                 \noexpand\use@mathgroup
1052
                                                                                \expandafter\noexpand\csname M@\reserved@a\endcsname

```

#### File w

# ltfssini.dtx

This file contains the top level LATEX interface to the font selection scheme commands. See other parts of the LATEX distribution, or *The LATEX Companion* for higher level documentation of these commands.

### 1 NFSS Initialisation

Finally, there are six commands that are to be used in LATEX and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

```
1 (*2ekernel)
```

#### 1.1 Providing math versions

LATEX provides two versions. We call them normal and bold, respectively.

- 2 \DeclareMathVersion{normal}
- 3 \DeclareMathVersion{bold}

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

(Actually most are now defined further down in the file.)

First the changes to another family:

```
4 %\DeclareRobustCommand\rmfamily
            {\not@math@alphabet\rmfamily\mathrm
 5 %
             \fontfamily\rmdefault\selectfont}
 6 %
 7 %\DeclareRobustCommand\sffamily
 8 %
            {\not@math@alphabet\sffamily\mathsf
             \fontfamily\sfdefault\selectfont}
10 %\DeclareRobustCommand\ttfamily
            {\not@math@alphabet\ttfamily\mathtt
12 %
             \fontfamily\ttdefault\selectfont}
Then the commands changing the series:
13 %\DeclareRobustCommand\bfseries
            {\not@math@alphabet\bfseries\mathbf
15 %
             \fontseries\bfdefault\selectfont}
16 %\DeclareRobustCommand\mdseries
            {\not@math@alphabet\mdseries\relax
             \fontseries\mddefault\selectfont}
19 \DeclareRobustCommand\upshape
           {\not@math@alphabet\upshape\relax
20
            \fontshape\updefault\selectfont}
21
Then the commands changing the shape:
22 \DeclareRobustCommand\slshape
           {\not@math@alphabet\slshape\relax
            \fontshape\sldefault\selectfont}
```

File w: ltfssini.dtx Date: 2020/08/27 Version v3.2c

{\not@math@alphabet\scshape\relax

25 \DeclareRobustCommand\scshape

```
27 \fontshape\scdefault\selectfont}
28 \DeclareRobustCommand\itshape
29 {\not@math@alphabet\itshape\mathit}
30 \fontshape\itdefault\selectfont}
```

## 2 Custom series settings for main document families

This section was introduced 2020/02/02 and for now we support a full rollback (may need splitting later).

One problem with the NFSS approach of handling the series axis turned out to be that (especially with respect to "boldness") different font families implemented different strategies. For example, with Computer Modern fonts you normally only have bx whereas most PostScript fonts offered only b but not bx. As a result LaTeX's standard setting for \bfdefault didn't work with such fonts, but if it got changed to produce b, then that didn't work with Computer Modern if the fonts got combined (e.g., using Computer Modern Typewriter with such fonts).

The solution back then was to provide substitution rules in the font .fd such that if a bx series got requested the b series got used. While this works in that particular case, it isn't a very general solution. For example, if you happen to have a font family that has several weights you may want to typeset the whole document in a somewhat lighter or darker font but if you then modify \mddefault to allow for this, then of course your change only works with that particular family but not with the typewriter or sans serif family you also want to use.

A better solution was provided by the mweights package by Bob Tennent that offers defaults on the level of the three main font families in the document: for "rm", "sf" and "tt" so that font packages could define defaults for the sans serif document font by providing \bfseries@sf which then was used when \bfseries got executed and the current family was the \sffamily.

We now support this concept directly from within LATEX and for use in font packages (or the document preamble) we offer \DeclareFontSeriesDefault. This declaration takes three arguments:

document family interface: Can either be rm, sf or tt. This is optional and if not given the overall default.

document series interface: Can be md or bf.

series value: This is the value that is going to be used with the combination is requested.

For example, \DeclareFontSeriesDefault[rm]{bf}{sb} would use sb (semi-bold) when \rmfamily \bfseries is asked for.

If used without the optional argument, e.g., \DeclareFontSeriesDefault{bf}{b} then this is like redefining \bfdefault or \mddefault.

\DeclareFontSeriesDefault

If some family specify defaults aren't given, e.g. if there are no declarations for, say, tt then the format defaults of  $\mbox{mddefault}$  and  $\mbox{bfdefault}$  are assumed. If those are later changed this is not reflected!<sup>14</sup>

\DeclareFontSeriesDefault

The command to declare font series defaults for the "rm", "sf" or "tt" family.

No optional argument: set up general default.

Adding \@empty allows us to detect if the default gets redefined with \renewcommand or \def by the user.

Optional argument given, set up specific default.

If the interface is used we remove the frozen kernel default. This way, we know that something was explicitly set up (even if the setup has the same value as the default).

```
\expandafter\let
            \csname #2series@#1@kernel\endcsname\@undefined
55
56
      \else
          \ClatexCerror{Wrong syntax for \string\DeclareFontSeriesDefault}%
57
             {Optional argument must be 'rm', 'sf', or 'tt'. \MessageBreak
58
              Mandatory first argument must be 'md' or 'bf'.}
59
      \fi
60
    \fi
61
62 }
```

(End definition for \DeclareFontSeriesDefault. This function is documented on page ??.)

\mdseries@rm
\mdseries@sf
\mdseries@tt
\bfseries@rm
\bfseries@sf
\bfseries@tt

We initialize the family specific default at the end of the format generation. Later on they may get overwritten in the preamble or a package via \DeclareFontSeriesDefault (or possibly directly).

Conceptual change: The **\bfdefault** will be b not bx because that is what it should be really for nearly every font except Computer/Latin Modern.

<sup>&</sup>lt;sup>14</sup>I see no easy way to achieve this without compromising compatibility with existing packages that currently use mweights and directly define (some) of the \mdseries@.. commands but not others.

To account for the fact that by default we typeset in CM or LM we set up the \bfseries@.. defaults to use bx instead.

This means that it behaves like before because if the default fonts are used then \bfseries@rm etc kick in and make \textbf use bx. However, if the font gets changed then \bfdefault will get used.

- 63 \def\bfseries@rm{bx}
- 64 \def\bfseries@sf{bx}
- 65 \def\bfseries@tt{bx}

Frozen version of the kernel defaults so we can see if they have changed.

- 66 \let\bfseries@rm@kernel\bfseries@rm
- 67 \let\bfseries@sf@kernel\bfseries@sf
- 68 \let\bfseries@tt@kernel\bfseries@tt

The default for the medium series is m and this will be interpreted as resetting both weight and width. To reset only one of them the virtual value ?m and m? are available.

- 69 \def\mdseries@rm{m}
- 70 \def\mdseries@sf{m}
- 71 \def\mdseries@tt{m}

(End definition for \mdseries@rm and others. These functions are documented on page ??.)

#### \series@change@debug

For debugging, but right now none of this code is extracted. The idea is to have a separate package with debugging code one day.

- 72 **(\*debug**)
- 73 \let\series@change@debug\typeout
- 74 \let\series@change@debug\@gobble
- 75 (/debug)

 $(\mathit{End \ definition \ for \ \backslash series@change@debug. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:change}??.)}$ 

#### \prepare@family@series@update

This is core command that prepares for the family update. The big difference to the documented code above is that the nested \iff statements seem to be missing. Instead we loop through an internal list that holds the names of the three meta families. This approach allows us to extend the mechanism at a later stage to allow for additional named meta families.

Here is the current definition of that list:

#### \@meta@family@list

- 76 \def\@meta@family@list{\@elt{rm}\@elt{sf}\@elt{tt}}
- 77 \def\prepare@family@series@update#1#2{%
- 78 \if@forced@series
- 79 (+debug) \series@change@debug{No series preparation (forced \f@series)\on@line}%
- 80 \fontfamily#2%
- 81 \else
- $_{82}$   $\langle +debug \rangle$  \series@change@debug{Prepearing for switching to #1 (#2)\on@line}%
- 83 \expand@font@defaults

We prepare for changing the current series. We have to find it before changing the family as discussed above.

- 84 \let\target@series@value\@empty
- 85 \def\target@meta@family@value{#1}%

As the very last item in the meta family list we add \@elt{??} and define this pseudo meta family to be the current font family. So if none of the real meta families matched then this will match. This will cover the following case:

- \bfseries is called for a family using bx (e.g., CMR)
- Switch to a font family that is none of the meta families, e.g., via \fontfamily{ptm}\selectfont
- Then none of the real meta families, match but the final \@elt{??} will.
- Therefore if the current series is \mddefault or \bfdefault it will be detected and the corresponding target series selected.

#### %6 \expandafter\edef\csname ??def@ult\endcsname{\f@family}%

To find it we loop over the meta family list with a suitable definition of \@elt.

```
87 \let\@elt\update@series@target@value
88 \@meta@family@list
```

Last resort pseudo meta family. Will only be looked at f none of the real ones have matched.

```
89 \@elt{??}%
90 \let\@elt\relax
```

That will figure out the correct series value to use without updating it. Now we can change the family.

1 \fontfamily#2%

After that we update the series. That code is again like the one above.

The \target@series@value may contain something like cm (coming from a default) and so we can't directly asign it to \f@series be have to drop any surplus m first.

```
102 % \let\f@series\target@series@value

103 \series@maybe@drop@one@m\target@series@value\f@series

104 \fi

105 \fi

106 \fi

107 }
```

 $(End\ definition\ for\ \verb|\prepareQfamilyQseriesQupdate|\ and\ \verb|\QmetaQfamilyQlist|.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:constraint}.)$ 

\update@series@target@value

In this macro used in the look you basically find the nested \ifxs from the outline above. The only difference is that is it is parameterized instead of being written out and only for one block of tests because the code is called reatedly when looping over the meta family list. From the list we get each meta family name in turn.

108 \def\update@series@target@value#1{%

There is one additional test at the beginning, because the list contains all meta families and we need to ignore the case where current one from the list and target one are identical.

```
109 \def\reserved@a{#1}%
110 \ifx\target@meta@family@value\reserved@a % rm -> rm do nothing
111 \else
112 \(\frac{+\debug}\) \series@change@debug{Trying to match #1: \csname#1\def@ult\endcsname
113 \(\frac{+\debug}\) \space = \frac{f@family\space ?}%
```

We only "do" something if the current font family matches the current meta family.

```
\expandafter\ifx\csname#1def@ult\endcsname\f@family
```

If that's the case we know that this is the block that applies (only one meta family can match). So to speed things up we change \@elt so that the rest of the loop gets gobbled.

```
lis \let\@elt\@gobble
```

Then we try to find the right new value for the series (as explained above). The two macros defined first are only there because we now need to use \csname and this way the code will be a little faster.

```
\texpandafter\let\expandafter\reserved@b
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\let\expandafter\reserved@c
\texpandafter\reserved@c
\texpandafter\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved@c\reserved
```

This here is now identical to the nested \ifx block from the outline, except that it there appeared twice in \rmfamily. This is now covered by looping and stopping the loop when a match was found.

We have to sanitize the default value first because it may contain something like mc and that would never match \f@series because there it would be called c with the m dropped. It would be probably better to do that differently these days, but it is hard to adjust without causing a lot of issues, so we do the dropping in various places instead.

```
\expandafter\series@maybe@drop@one@m
              \csname mdseries@#1\endcsname\reserved@d
         \ifx\reserved@d\f@series
124
              \series@change@debug{mdseries@#1 matched -> \reserved@b}%
125
   (+debug)
                                           \let\target@series@value\reserved@b
126
         \else
127
Again do some sanitizing.
           \expandafter\series@maybe@drop@one@m

     \fi
139
140 }
(End definition for \update@series@target@value. This function is documented on page ??.)
```

\init@series@setup

This is code to be run at begin document ...

```
141 \def\init@series@setup{%
```

We only want bx in \bfseries@rm if the roman font is Computer Modern or Latin Modern, otherwise it should be b. It was set to bx in the kernel so that any font use with the default families in the preamble get this value. Now at the real document start we check if the fonts have been changed. If there was a \DeclareFontSeriesDefault declaration or \bfseries@rm was directly altered then it differs from \bfseries@rm@kernel and we do nothing. Otherwise we check if \rmdefault is one of the CM/LM font families and if so we keep bx otherwise we change it to b.

This approach doesn't cover one case: CM/LM got changed to a different family that supports bx, but the support package for that family used \def\bfseries@rm{bx} instead of using \DeclareFontSeriesDefault. In that case the code here changes it to b. Solution: use the \DeclareFontSeriesDefault interface.

```
\ifx\bfseries@rm@kernel\bfseries@rm
        \expandafter\in@\expandafter{\rmdefault}%
143
                         {cmr,cmss,cmtt,lcmss,lcmtt,lmr,lmss,lmtt}%
144
       \ifin@ \else \def\bfseries@rm{b}\fi\fi
145
Same approach for \bfseries@sf and \bfseries@tt:
     \ifx\bfseries@sf@kernel\bfseries@sf
146
       \expandafter\in@\expandafter{\sfdefault}%
147
                        {cmr,cmss,cmtt,lcmss,lcmtt,lmr,lmss,lmtt}%
148
       \ifin@ \else \def\bfseries@sf{b}\fi\fi
149
     \ifx\bfseries@tt@kernel\bfseries@tt
150
       \expandafter\in@\expandafter{\ttdefault}%
                        {cmr,cmss,cmtt,lcmss,lcmtt,lmr,lmss,lmtt}%
       \ifin@ \else \def\bfseries@tt{b}\fi\fi
```

If the document preamble has changed the \familydefault or if the if the \rmdefault contains a new font family, we may have to adjust the series defaults accordingly, before starting typesetting.

Similarly, if the user has changed the \mddefault or the medium series for the family selected as document font we may also have to adjust the \seriesdefault.

On the other hand if the document font is still CM or LM then \bfdefault is wrong, because it is now saying b and not bx as it should for such fonts.

To fix all this we first run \reset@font (the internal kernel name for \normalfont). This will set up the document encoding, family, series and shape based on the current values of \encodingdefault, \familydefault, \seriesdefault and \shapedefault. However, if the family (from \familydefault) has special medium default we should switch to that (and not use what is current value from \seriesdefault). This can be achieved by afterwards calling \mediumseries and then changing \seriesdefault to the now current series value (in \f@series).

But what should happen if \seriesdefault got explicitly changed? In that case the explicit change should surive and we should not alter \seriesdefault. This is solved by comparing the current value of \seriesdefault with a kernel version saved in the format and if they differ we do not call \mdseries or change \seriesdefault.

```
\reset@font
iss \ifx\seriesdefault\seriesdefault@kernel
ise \mdseries
ise \fi
ise \fi
ise \fi
```

```
(End definition for \init@series@setup. This function is documented on page ??.)
```

As the kernel code now implements the same functionality as mweights, albeit internally coded slightly differently, that package shouldn't be loaded any more. We therefore pretend that it already got loaded. Thus, a font package that tries to load it and then sets \mdseries@.., etc. will continue to work but will now use the kernel code.

Of course, mid-term such package should probably use \DeclareFontSeriesDefault instead of making using low-level definitions.

197 }
```

(End definition for \expand@font@defaults and others. These functions are documented on page ??.)

\bfseries

This document command switches to the bold series.

```
198 \DeclareRobustCommand\bfseries{%
199 \not@math@alphabet\bfseries\mathbf
```

In the original NFSS definition it then called \fontseries with the value \bfdefault. In the new scheme we have more alternatives and therefore check if the current family (\f@family) is the current \rmdef@ult, \sfdef@ult or \ttdef@ult and the select the correct family default in that case.

```
200 \expand@font@defaults
```

If \bfdefault and \befdefault@previous are different then the default got changed directly through the legacy interface (i.e., via \def or \renewcommand. In that case we reset all meta family defaults so that the document behaves like it was the case before the new mechanism was introduced.

```
201 \ifx\bfdefault\bfdefault@previous\else
```

We add \@empty and then let \bfdefault@previous to \bfdefault so that we can detect any further change.

```
\expandafter\def\expandafter\bfdefault
expandafter{\bfdefault\@empty}%

let\bfseries@previous\bfdefault
```

And we reset the meta family defaults (\bfdef@ult is an expanded version of \bfdefault.

```
205 \let\bfseries@rm\bfdef@ult
206 \let\bfseries@sf\bfdef@ult
207 \let\bfseries@tt\bfdef@ult
```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add resets here. Not that this hook is only run when resets are necessary.

```
VJseHook{bfseries/defaults}%

| Variable | V
```

```
213 \else \fontseries\bfdefault
214 \fi\fi\
```

This hook in contrast is always executed.

```
215 \UseHook{bfseries}%
216 \selectfont
217 }
```

(End definition for \bfseries. This function is documented on page ??.)

This document command switches to the medium series.

```
218 \DeclareRobustCommand\mdseries{%
     \not@math@alphabet\mdseries\relax
220
     \expand@font@defaults

                                     \fontseries\mddefault
       \fi\fi\fi
     \UseHook{mdseries}%
234
     \selectfont
236 }
```

(End definition for \mdseries. This function is documented on page ??.)

\rmfamily Here are the document level commands for changing the main font families, or rather, here is a documented outline of the code, the actual code is then streamlined and somewhat generalized.

```
DeclareRobustCommand\rmfamily{%
 \not@math@alphabet\rmfamily\mathrm
```

If families are changed then we have to do a bit more work. In the original NFSS implementation a family change kept encoding, series shape and size unchanged but now we can't any longer simply reuse the current series value. Instead we may have to change it from one family default to the next.

#### \expand@font@defaults

We have to do the testing while the current family is still unchanged but we have to do the adjustment of the series after it got changed (because the new family might has different sets of shapes available and we certainly don't want to see substituation going on. So we use \target@series@value to hold the target series (if any).

#### \let\target@series@value\@empty

Thus, if the current family is the sans family

```
\ifx\f@family\sfdef@ult
```

and if we using the medium series of the sans family

```
\ifx\f@series\mdseries@sf
```

then lets switch to the medium series for the serif family

and if we use the bold series of the sans family switch to the bold default of the serif family:

```
\else\ifx\f@series\bfseries@sf \let\target@series@value\bfseries@rm
```

However, the sans family may not have any specific defaults set, so we also compare with the overall defaults.

```
\else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
```

If neither test was true we leave the series alone. This way a special manual setting such as \fontseries{lc} is not undone if the family changes (of course there may not be any support for it in the new family but then the NFSS substitution kicks in and sorts it out).

```
\fi\fi\fi\fi
```

We need to do the same if the current family is the typewriter family:

With these preparations for series out of the way we can now change the font family to \rmdefault.

```
\fontfamily\rmdefault
```

If \target@series@value is still empty there is nothing more to do other than selecting the new family. However, if not then we should update the font series now as well. But there is one further subtle issue. We may not have loaded an .fd file for our target font family yet. In the past that was done in \selectfont if necessary but since we are now doing all the comparisons in \fontseries we need to make sure that the font family specifications are already loaded prior to calling \fontseries.

```
\ifx\target@series@value\@empty \else
\maybe@load@fontshape
```

Updating the series in this case means directly changing \f@series to the target value. We don't want to go through \fontseries because that would apply the mappings and then bx + b would keep bx instead of changing to b as desired. as

```
\let\f@series\target@series@value
\fi
\selectfont}
```

So now for the real definition: most of the code above gets delegated to a helper command \prepare@family@series@update so that the definition becomes again fairly short. In addition we add a hook, mainly for our Japanese friends so that the code can be extended prior to the call to \selectfont.

```
237 \DeclareRobustCommand\rmfamily{%
238 \not@math@alphabet\rmfamily\mathrm
```

This holds all the code discussed above, first argument is the meta family, i.e., rm in this case, and second argument is the default family name, e.g., cmr indirectly accessed via \rmdefault. This is calling \fontfamily and if necessary \fontseries as outline above.

\prepare@family@series@update{rm}\rmdefault

Then comes the hook code (by default a no-op) and finally the call to \selectfont.

- 240 \UseHook{rmfamily}%
- 241 \selectfont}

The definitions for \sffamily and \ttfamily are similar, the differences are only in what font families get checked.

\sffamily \ttfamily

```
242 \DeclareRobustCommand\sffamily{%
```

- \not@math@alphabet\sffamily\mathsf
- \prepareOfamilyOseriesOupdate{sf}\sfdefault
- 245 \UseHook{sffamily}%
- 246 \selectfont}
- 247 \DeclareRobustCommand\ttfamily{%
- 248 \not@math@alphabet\ttfamily\mathtt
- $\verb|\prepareQfamily@seriesQupdate{tt}\ttdefault|$
- UseHook{ttfamily}%
- 251 \selectfont}

(End definition for \rmfamily, \sffamily, and \ttfamily. These functions are documented on page ??.)

rmfamily Declare the hooks used above.

sffamily 252 \NewHook{rmfamily} ttfamily 253 \NewHook{sffamily} normalfont 254 \NewHook{ttfamily}

expand@font@defaults 255 \NewHook{normalfont}
bfseries 256 \NewHook{expand@font@defaults}

bfseries/defaults 257 \NewHook{bfseries}

mdgaring 258 \NewHook{bfseries/defaults}

mdseries 258 \NewHook{Diseries/

mdseries/defaults 259 \newhook\mdseries/
260 \newhook\mdseries/defaults}

(End definition for rmfamily and others. These functions are documented on page ??.)

\@rmfamilyhook
\@sffamilyhook
\@ttfamilyhook

These four hooks have legacy versions used in 2020/02/02 so we should support them until they aren't any longer used.

- 261 \let\@rmfamilyhook\@empty
  262 \let\@sffamilyhook\@empty
- ${\tt 263} \ \verb|\lettfamilyhook|@empty|$
- 264 \let\@defaulfamilyhook\@empty

(End definition for \@rmfamilyhook, \@sffamilyhook, and \@ttfamilyhook. These functions are documented on page ??.)

\IfFontSeriesContextTF

With the ability for \bfseries or \mdseries to be mapped to different NFSS axis values it becomes important to have the ability to determine the current context as we can no longer look at \fcseries to answer a question such as "am I currently typsetting in a bold typeface?"

This is provided by the test \IffontSeriesContextTF. It takes three arguments:

- The context we try to check (either bf for bold or md for medium, i.e., the same that can go into the first mandatory argument of \DeclareFontSeriesDefault),
- what to do if we are in this context (true case) and
- what to do if we are not (false case).

This allows you to define commands like \IfBold, e.g.,

\newcommand\IfBold[2]{\IfSeriesContextTF{bf}{#1}{#2}}

and then do

This is \IfBold{bold}{non-bold} text.

and get the appropriate result.

```
346 \langle /2ekernel \rangle
347 \langle *2ekernel \mid latexrelease \rangle
348 \langle latexrelease \rangle \setminus IncludeInRelease \{2020/10/01\}\%
349 \langle latexrelease \rangle \langle latexrelease \rangle \langle latexrelease \rangle \langle latexrelease \rangle \langle latexrelease \rangle
```

File w: ltfssini.dtx Date: 2020/08/27 Version v3.2c

```
350 \DeclareRobustCommand\IfFontSeriesContextTF[1]{%
351 \expand@font@defaults
```

In the beginning we haven't found the context we are loking for.

\0font@series@contextfalse

We store the requested context away for use in the tests.

```
353 \def\requested@test@context{#1}%
```

The next definition is there to ensure that get a final match during testing even if the current family is non of the meta families (rm, sf or tt). This will then basically tests if the current font family matches the overall default.

```
>>> \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

Then we run through the meta family list (currently containing just the three values) followed by the artifical meta family ?? and test each of them in turn using \test@font@series@context as the testing command.

```
355 \let\@elt\test@font@series@context
356 \@meta@family@list
357 \@elt{??}%
358 \let\@elt\relax
```

Following that we evaluate the status of \if@font@series@context to determine which of the remaining arguments (true/false case) we have to execute.

```
359 \if@font@series@context
360 \expandafter\@firstoftwo
361 \else
362 \expandafter\@secondoftwo
363 \fi
364 }
```

(End definition for \IffontSeriesContextTF. This function is documented on page ??.)

\test@font@series@context

This tests the context (stored in **\requested@test@context**) and updates the bookean if the right context is found.

```
365 \def\test@font@series@context#1{%
```

First task is to figure out whether the current family matches \rmfamily, \sffamily, etc. so in \reserved@a we store the value of \rmdef@ult (or whatever the given meta family is) and compare that to \f@family.

```
366 \edef\reserved@a{\csname #1def@ult\endcsname}%
367 \ifx\f@family\reserved@a
```

If they match we have found the right meta family so we don't need to test any of the remaining meta family and therefore change \@elt to \@gobble.

```
let\@elt\@gobble
```

Now we have to test if \f@series matches the requested context (e.g., whether \bfseries@rm has that value if the current meta family is rm and we are looking for the bf context).

```
\text{\square} \expandafter\ifx \csname\requested@test@context series@#1\endcsname\f@series
```

If yes we change the boolean and are done.

```
\@font@series@contexttrue
```

If not then maybe the reason is that nothing special was set up for that meta family so we also check now check if \footnote{Outeries} matches the overall default (e.g., \bfdef@ult if we are looking for the bold context). If that matches we change the boolean.

```
\else
           \expandafter\ifx
373
                        \csname\requested@test@context def@ult\endcsname\f@series
374
             \@font@series@contexttrue
      \fi\fi\fi
376
377 }
(End definition for \test@font@series@context. This function is documented on page ??.)
The boolean to signal if we found the requested font series context.
378 \newif\if@font@series@context

# 3 Supporting nested emphasis

⟨latexrelease⟩\EndIncludeInRelease

⟨\*2ekernel⟩

By default  $\LaTeX$   $2_{\varepsilon}$  supports two levels of nested emphasis: if the current font has an upright shape then it switches to \itshape otherwise to \eminnershape (which defaults to \upshape). This means nested emphasis will ocssilate between italic and upright shapes.

Sometimes it would be nice to allow for a more lengthly sequence, but instead of providing a fixed one LATEX now offers a general mechanism that allows to define arbitrary sequences.

\DeclareEmphSequence \emforce

\if@font@series@context

This declaration expects a comma separated list of (font) change declarations corresponding to increasing levels of emphasis. The mechanism tries to be "smart" and verifies that the declarations actually alter the font. If not it will ignore this level and tries the next one—the assumption being that there was a manual font change in the document to the font that is now supposed to be used for emphasis. Of course, this only works if the declarations in the list actually change the font and not, say, just the color. In such a case one has to use \empforce to which directs the mechanism to use the level even if the font attributes haven't changed.

\emreset

If the nesting is so deep, that the specified levels are exhausted then \emperset is used as a final set of declarations (which by default returns back to the upright shape). Any additional nesting levels will then reuse the list from its beginning.

\DeclareEmphSequence

\DeclareEmphSequence expects a clist of declaration. Spaces in the argument are dropped to avoid surious spaces in the output. The declarations are additive. At the very end the shape is reset using \empset and \empforce so that this case is never skipped. Further nested calls restart at the beginning.

```
391 \( \/2ekernel \)
392 \( \frac{*2ekernel}{latexrelease} \)
393 \( \latexrelease \rangle \line \lambda \line \lambda \line \lambda \lam
```

By default the it is empty, in which case \eminnershape is used by LATEX.

398 \let\emfontdeclare@clist\@empty

(End definition for \DeclareEmphSequence. This function is documented on page ??.)

\emrest

Reset the font to upright and upper/lower case. With the default rules using \shapedefault does that for us but to be on the safe side we do it like this:

399 \DeclareRobustCommand\emreset{\upshape\ulcshape}

(End definition for \emrest. This function is documented on page ??.)

\em The new definition for \em (and implicitly \emph is like it was before if \emfontdeclare@clist is empty.

```
400 \DeclareRobustCommand\em{%
401 \@nomath\em
402 \ifx\emfontdeclare@clist\@empty
403 \ifdim \fontdimen\@ne\font >\z@
404 \eminnershape \else \itshape \fi
405 \else
```

But if not we use the list to decide how to do emphasis.

We use the current font to check if the declarations have any effect, so even a size change is allowed and identified as a modification (but a color change, for example, isn't). So first we save the current status.

\edef\em@currfont{\csname\curr@fontshape/\f@size\endcsname}%

Then we grab the next element from the list and check if it can be used.

```
407 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
408 \fi
409 }
410 \def\eminnershape{\upshape}
```

(End definition for \em. This function is documented on page ??.)

\do@emfont@update

We know that the list (if not empty) has at least 2 elements separated by a comma, so we pick up the first in #1 and the rest in #2.

411 \def\do@emfont@update#1,#2\do@emfont@update{%

First action is to alter the list and move the first entry to the end

\def\emfontdeclare@clist{#2,#1}%

 $<sup>^{15}</sup>$ Maybe we should not add \emforce but allow that case to be skipped as well. Of course, that might result in an endless loop if somebody defines a sequence without any font change and without \emforce but ...

Then we execute current declaration. Appending \selectfont means one can write just \fontshape{it}} and that works then too.

```
413 % \typeout{Use: \detokenize{#1}}%
414 #1\selectfont
```

We then compare the current font with our saved version, but with a slight twist: we add \em@force at the end of the name. Normally this is empty so has no effect but if there was an \emforce as part of #1 it will append a / to the font name (making it invalid) thus this will then always fail the test.

If the test fails we are done and the declarations will be used. Otherwise we will try the next declaration in the sequence.

\expandafter\ifx\csname \curr@fontshape/\f@size\em@force

For the comparison with \ifx we have to exand \em@currfont once as the relevant info is inside.

```
\text{\left\text{\cond} \text{\cond} \text{\
```

If \emforce was used, we have to undo its effect:

```
419 \else

420 \let\em@force\@empty

421 \fi

422 }
```

(End definition for \do@emfont@update. This function is documented on page ??.)

# \emforce \em@force

The definition of \emforce is simple: change \em@force to make the above test always invalid.

```
423 \protected\def\em@force{/}}
424 \let\em@force\@empty
425 \(//2ekernel | latexrelease)\
426 \(\left(latexrelease)\)
426 \(\left(latexrelease)\)

427 \(\left(latexrelease)\)
428 \(\left(latexrelease)\)
428 \(\left(latexrelease)\)
429 \(\left(latexrelease)\)
429 \(\left(latexrelease)\)
420 \(\left(latexr
```

 $(\textit{End definition for } \verb|\emcforce| and \verb|\emcforce|. These functions are documented on page \verb|??.|)$ 

\em

These are the older definitions for \em, prior to 2020.

#### \eminnershape

We also have to define the *emphasize* font change command (i.e. \em). This command will look is the current font is sloped (i.e. has a positive \fontdimen1) and will then select either \upshape or \itshape.

```
427 (latexrelease)\IncludeInRelease{2015/01/01}{\DeclareEmphSequence}{Nested emph}%
428 (latexrelease)\let\DeclareEmphSequence\@undefined
429 (latexrelease)\let\emfontdeclare@clist\@undefined
430 (latexrelease)\let\emreset\@undefined
431 (latexrelease)\let\do@emfont@update\@undefined
432 (latexrelease)\let\emforce\@undefined
433 (latexrelease)\let\em@force\@undefined
434 (latexrelease)
  ⟨latexrelease⟩\DeclareRobustCommand\em
   (latexrelease)
                       {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
   (latexrelease)
                                        \eminnershape \else \itshape \fi}%
   ⟨latexrelease⟩\EndIncludeInRelease
  (latexrelease)
440 (latexrelease)\IncludeInRelease{0000/00/00}{\DeclareEmphSequence}{Nested emph}%
```

(End definition for \em and \eminnershape. These functions are documented on page ??.)

#### \not@math@alphabet

This function generates an error message when it is called in math mode. The same function should be defined in newlfont.sty.

```
447 \def\not@math@alphabet#1#2{%
      \relax
449
      \ifmmode
        \@latex@error{Command \noexpand#1invalid in math mode}%
450
           ۲%
451
            Please
452
            \ifx#2\relax
453
                define a new math alphabet^^J%
454
                if you want to use a special font in math mode%
455
```

We have to a \noexpand below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

 $(\mathit{End \ definition \ for \ } \texttt{\ locumented \ on \ page \ \ref{eq:locumented}.})$ 

Finally we provide two abbreviations to switch to the LATEX versions.

```
463 \DeclareRobustCommand\boldmath\\@nomath\boldmath
464 \mathversion\bold\}
465 \DeclareRobustCommand\unboldmath\\@nomath\unboldmath
466 \mathversion\normal\}
```

Here we switch to the default math version by defining the internal macro \math@version. We dare not to call \mathversion at this place because this would call \glb@settings.

467 \def\math@version{normal}

#### 3.1 Legacy

We start by defining a few macros that are part of standard LATEX's user interface. The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

\newfont

 $(\textit{End definition for $\backslash$ newfont. This function is documented on page \ref{eq:constraint}.)}$ 

```
\symbol
          469 (/2ekernel)
             \(*2ekernel | latexrelease\)
             ⟨latexrelease⟩ \IncludeInRelease{2020/10/01}%
             (latexrelease)
                                             {\symbol}{XeTeX change for math}%
             \ifdefined\XeTeXversion
                \DeclareRobustCommand\symbol[1]{\Ucharcat#1 12\relax}
                \DeclareRobustCommand\symbol[1]{\char#1\relax}
          476
          477 \fi
          478 (/2ekernel | latexrelease)
          479 (latexrelease)\EndIncludeInRelease
             ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
           481 (latexrelease)
                                             {\symbol}{XeTeX change for math}%
          482 (latexrelease)
          483 (latexrelease)\DeclareRobustCommand\symbol[1]{\char#1\relax}
          484 (latexrelease)
           485 (latexrelease)\EndIncludeInRelease
           486 (*2ekernel)
```

(End definition for \symbol. This function is documented on page ??.)

#### 3.2 Miscellaneous

\@setfontsize \@setsize

This abbreviation is used by LATEX's user level size changing commands, such as \large.

487 \def\@setfontsize#1#2#3{\@nomath#1%

For the benefit of people relying on keeping the name of the current font command saved in \@currsize we define it. To ensure that \@setfontsize keeps being robust we omit this assignment during times where \protect differs from \@typeset@protect.

```
488 \ifx\protect\@typeset@protect
489 \let\@currsize#1%
490 \fi
491 \fontsize{#2}{#3}\selectfont}
For compatibility we also define \@setsize the 209 command
```

```
492 (*compat)
493 \def\@setsize#1#2#3#4{\@setfontsize#1{#4}{#2}}
494 (/compat)
```

 $(\textit{End definition for } \verb|\Cosetfontsize| and \verb|\Cosetsize|. These functions are documented on page \verb|??.|)$ 

\hexnumber@

To set up LATEX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple \ifcase.

```
495 \def\hexnumber@#1{\ifcase\number#1
496   O\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
497   9\or A\or B\or C\or D\or E\or F\fi}
```

(End definition for \hexnumber@. This function is documented on page ??.)

\nfss@text

In it simplest form \nfss@text is an \mbox. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed.

With the amstex style option one will get a sub style called amstext which will redefine the \nfss@text macro to produce correct text in all sizes.

We have to use \def instead of the shorter \let since \mbox is undefined when we reach this point.

```
498 \def\nfss@text#1{{\mbox{#1}}}
```

(End definition for \nfss@text. This function is documented on page ??.)

#### \copyright

The definition of \copyright was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

- 499 %\DeclareRobustCommand\copyright
- ${\{\ooalign{\hfil}$ 500 %
- 501 % \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
- 502 % \mathhexbox20D}}}

(End definition for \copyright. This function is documented on page ??.)

#### \normalfont \reset@font

The macro \reset@font is used in IATEX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new LATEX version above but nevertheless are able to run all kind of mixtures.

The user interface name for \reset@font is \normalfont:

- 503 (/2ekernel) 504 (\*2ekernel | latexrelease)
- ⟨latexrelease⟩ \IncludeInRelease{2020/02/02}%
- (latexrelease) {\normalfont}{Add hook to \normalfont}%
- 507 \DeclareRobustCommand\normalfont{%

Instead of calling \usefont, as it was done in the past, we inline the code from \usefont as we want to add the hook before \selectfont, but after all the font attributes are set.

- \fontencoding\encodingdefault
- \edef\f@family{\familydefault}% 509
- \edef\f@series{\seriesdefault}%
- \edef\f@shape{\shapedefault}% 511
- \UseHook{normalfont}%

This is the old name for the hook introduced in 2020/02/02. It will be removed in one of the future releases!

- 513 \@defaultfamilyhook
- % hookname from 2020/02 will vanish
- \selectfont}
- 515 \let\reset@font\normalfont

(End definition for \normalfont and \reset@font. These functions are documented on page ??.)

\@defaultfamilyhook By default the hooks do nothing.

516 \let\@defaultfamilyhook\@empty %FMi sort out

```
(End definition for \@defaultfamilyhook. This function is documented on page ??.)
517 (/2ekernel | latexrelease)
 518 (latexrelease)\EndIncludeInRelease
              ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
              (latexrelease)
                                                                                                                                                       {\normalfont}{Add hook to \normalfont}%
              (latexrelease)
               \label{lem:lemmand} $$ \langle latexrelease \rangle \end{temperature} $$ Lorentz Tommand \end{t
               ⟨latexrelease⟩
                                                                                                              {\usefont\encodingdefault
              (latexrelease)
                                                                                                                                                            \familydefault
              (latexrelease)
                                                                                                                                                            \seriesdefault
              (latexrelease)
                                                                                                                                                            \shapedefault
                                                                                                                                                            \relax}
              (latexrelease)
              ⟨latexrelease⟩\let\reset@font\normalfont
              (latexrelease)
              ⟨latexrelease⟩\let\@defaultfamilyhook\@undefined
532 (latexrelease)\EndIncludeInRelease
 533 (*2ekernel)
```

We left out the special LATEX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```
\def\not@base#1{\@latex@error
     {Command \noexpand#1not provided in base LaTeX2e}%
     {Load the latexsym or the amsfonts package to
536
      define this symbol}}
537
538 \def\mho{\not@base\mho}
  \def\Join{\not@base\Join}
  \def\Box{\not@base\Box}
   \def\Diamond{\not@base\Diamond}
  \def\leadsto{\not@base\leadsto}
  \def\sqsubset{\not@base\sqsubset}
544 \def\sqsupset{\not@base\sqsupset}
545 \def\lhd{\not@base\lhd}
546 \def\unlhd{\not@base\unlhd}
547 \def\rhd{\not@base\rhd}
548 \def\unrhd{\not@base\unrhd}
```

We now initialize all variables set by \DeclareErrorFont. These values are not really important since they will be overwritten later on by the definition in fontdef.ltx.

However, if fontdef.cfg is corrupted then at least a hopefully suitable error font is present.

```
549 \DeclareErrorFont{OT1}{cmr}{m}{n}{10} %% don't modify this setting
550 %% overwrite it in fontdef.cfg
551 % if necessary
```

We also set some default values for \f@family etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by \DeclareErrorFont.

```
552 \fontfamily{cmr}
553 \fontseries{m}
554 \fontshape{n}
555 \fontsize{10}{10}
```

The initial fontenc package load list. This will get overwritten in fonttext and is only provided in case an old fonttext.cfg does not define the command:

556 \def\@fontenc@load@list{\@elt{T1,OT1}}

We now load the customizable parts of NFSS.

```
557 \InputIfFileExists{fonttext.cfg}
            {\typeout{=====
558
                     ^^J%
559
                      Local config file fonttext.cfg used^^J%
560
                     ^^J%
561
                     ========}%
562
              \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
            {\input{fonttext.ltx}}
566 \let\@addtofilelist\@gobble
   Ditto for math although I don't think that we will get a lot of customisation :-)
  \InputIfFileExists{fontmath.cfg}
567
            {\typeout{======^^J%
                      ^^J%
                      Local config file fontmath.cfg used^^J%
                     ^^J%
                     -----}%
              \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
573
574
            {\input{fontmath.ltx}}
575
  \let\@addtofilelist\@gobble
```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file preload.ltx.

\seriesdefault \seriesdefault@kernel

After \seriesdefault got defined inside fonttext.ltx or a .cfg file overwriting it, we alter its value by appending \@empty to it. This will vanish if expanded but allows us to check if the default gets altered (even to the same value) in the document preamble. All we have to do is to save the current value somewhere and later compare the two. For this we use \seriesdefault@kernel.

```
587 \expandafter\def\expandafter\seriesdefault\expandafter{\seriesdefault\@empty}
588 \let\seriesdefault@kernel\seriesdefault
```

(End definition for \seriesdefault and \seriesdefault@kernel. These functions are documented on page ??.)

```
\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they can be restored by a minipage inside a tabbing environment.

\@acciii be restored by a minipage inside a tabbing environment.

\@acciii be restored by a minipage inside a tabbing environment.

\@acciii be restored by a minipage inside a tabbing environment.

\@acciii be restored by a minipage inside a tabbing environment.

\@acciii and \@acciii\=

(End definition for \@acci, \@accii, and \@acciii. These functions are documented on page ??.)

\mathref{End definition for \cal and \mit. These functions are documented on page ??.)}

\mathref{End definition for \cal and \mit. These functions are documented on page ??.)}}

\mathref{End definition for \cal and \mit. These functions are documented on page ??.)}}

\mathref{End definition for \cal and \mit. These functions are documented on page ??.)}}

#### File x

# fontdef.dtx

<-latexrelease> [2020/08/01 v3.0i LaTeX Kernel (<-latexrelease> font setup)]

#### 1 Introduction

This file is used to generate the files fonttext.ltx (text font declarations) and fontmath.ltx (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

#### $\mathbf{2}$ Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of fonttext.ltx under the name fonttext.cfg and change this copy. If  $\text{IAT}_{EX} 2_{\mathcal{E}}$  finds a file of this name it will use it, otherwise it uses the standard file which is fontdef.ltx.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own fonttext.cfg. Look at the comments below (docstrip module 'text') to see what should should go into such a file.

To change the math font setup use a copy of fontmath.ltx under the name fontmath.cfg and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised LATEX versions. Thus, before sending in a bug report please try your test file with a LATEX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of font....cfg to guarantee that all LATEX installations behave in the same way.

> T1 Cork T<sub>E</sub>X text encoding OT1 old T<sub>E</sub>X text encoding U unknown encoding

OML old T<sub>F</sub>X math letters encoding old TEX math symbols encoding OMS

**OMX** old T<sub>F</sub>X math extension symbols encoding

TU Unicode

File x: fontdef.dtx Date: ? Version ?

Notice that some of these encodings are 'old' in the sense that we hope that they will be superseded soon by encoding standards defined by the TEX user community. Therefore this set of default encodings may change in the future.

The first candidate is  $\mathtt{OT1}$  which will soon be replaced by  $\mathtt{T1}$ , the official  $\mathtt{TEX}$  text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all LATEX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

## 3 The docstrip modules

The following modules are used to direct docstrip in generating external files:

```
driver produce a documentation driver file text produce the file fonttext.ltx math produce the file fontmath.ltx cfgtext produce a dummy fonttext.cfg file cfgmath produce a dummy fontmath.cfg file
```

A typical docstrip command file would then have entries like:

generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}

## 4 A driver for this document

The next bit of code contains the documentation driver file for TEX, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5 \DocInput{fontdef.dtx}
6 \end{document}
7 (/driver)
```

### 5 The fonttext.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```
8 (*text)
9 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}
```

#### 5.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in ltoutenc.dtx.

By convention, text encoding specific declarations, including the declaration  $\ensuremath{\texttt{NDClareFontEncoding}}$  are kept in separate file of the form  $\langle enc \rangle \texttt{enc.def}$ , e.g. otlenc.def. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the inputenc package depends on this.

```
10 \input {omlenc.def}
11 \input {omsenc.def}
```

Documents containing a lot of accented characters should really be using T1 fonts. We therefore load this last so that T1 encoding specific commands are executed as fast as possible (encoding files are no longer reloaded in fontenc.

```
12 \input {otlenc.def}
13 \input {tlenc.def}
14 \input{tslenc.def}
```

15 \ifx\Umathcode\@undefined

We then set the default text font encoding. This will hopefully change some day to T1. This setting should not be changed to produce a portable format.

16 \fontencoding{OT1}

The initial fontenc package load list if an 8-bit  $T_EX$  engine is used:

```
17 \def\@fontenc@load@list{\@elt{T1,0T1}}
18 \def\rmsubstdefault{cmr}
19 \def\sfsubstdefault{cmss}
20 \def\ttsubstdefault{cmtt}
21 \LoadFontDefinitionFile{TS1}{cmr}
22 \else
```

Unicode.

```
23 \input {tuenc.def}
24 \fontencoding{TU}
```

The initial fontenc package load list if a Unicode engine is used:

```
The initial fontenc package load list if a

25 \def\@fontenc@load@list{\@elt{TU}}

26 \DeclareFontSubstitution{TU}{lmr}{m}{n}

27 \LoadFontDefinitionFile{TU}{lmr}

28 \LoadFontDefinitionFile{TU}{lmss}

29 \LoadFontDefinitionFile{TU}{lmtt}

30 \def\rmsubstdefault{lmr}

31 \def\sfsubstdefault{lmss}

32 \def\ttsubstdefault{lmtt}

33 \LoadFontDefinitionFile{TS1}{lmr}
```

#### 34 \DeclareFontSubstitution{TU}{lmr}{m}{n}

End of Unicode branch.

35 \fi

If different encodings for text fonts are in use one could put the common setup into \DeclareFontEncodingDefaults. There is now a better mechanism so using this interface is discouraged!

#### 36 \DeclareFontEncodingDefaults{}{}

Then we define the default substitution for every encoding. This release of  $\text{IATEX} 2\varepsilon$  assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

- 37 \DeclareFontSubstitution{T1}{cmr}{m}{n}
- 38 \DeclareFontSubstitution{OT1}{cmr}{m}{n}

For every encoding declaration,  $\LaTeX$   $2_{\varepsilon}$  will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the  $\ensuremath{\texttt{Vegin}\{\texttt{document}\}}$  is encountered.  $\LaTeX$  will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a VeclareFontShape declaration for this combination. We will therefore load the corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at  $\texttt{begin}\{\texttt{document}\}$  which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these .fd files since LaTeX  $2_{\mathcal{E}}$  will not read .fd files if it already knows about the encoding/family combination.

The \nfss@catcodes ensures that white space is ignored in any definitions made in the fd files.

- 39 \begingroup
- 40 \nfss@catcodes
- 41 \input {t1cmr.fd}
- 42 \input {ot1cmr.fd}
- 43 \endgroup

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every TEX installation, while the amount of main memory is not a limiting factor at most installations.)

- 44 \begingroup
- 45 \nfss@catcodes
- 46 \input {ot1cmss.fd}
- 47 \input {ot1cmtt.fd}
- 48 \endgroup

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

49 \DeclareErrorFont{OT1}{cmr}{m}{10}

This means, "if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding". You can change the font used but the encoding should be the same as the one specified with \fontencoding above.

#### 5.2 Defaults

To allow the use of \rmfamily, \sffamily, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for \encodingdefault) without making documents non-portable.

\encodingdefault \rmdefault \sfdefault \ttdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and \ttfamily.

```
50 \ifx\Umathcode\@undefined
51 \newcommand\encodingdefault{OT1}
52 \newcommand\rmdefault{cmr}
53 \newcommand\sfdefault{cmss}
54 \newcommand\ttdefault{cmtt}
55 \else
56 \newcommand\encodingdefault{TU}
57 \newcommand\rmdefault{lmr}
58 \fontfamily{\rmdefault}
  \newcommand\sfdefault{lmss}
  \newcommand\ttdefault{lmtt}

                      \begin{macrocode}
              102 %
             103 \renewcommand\updefault{up}
             We append \@empty to the series value so that we can detect if it got changed via \def
             or \renewcommand later.
              104 \renewcommand\bfdefault{b\@empty}
             105 \renewcommand\mddefault{m\@empty}
             106 \let\bfdefault@previous\bfdefault
             107 \let\mddefault@previous\mddefault
             108 (/text | latexrelease)
             109 (latexrelease)\EndIncludeInRelease
             110 (latexrelease)\IncludeInRelease{0000/00/00}%
             111 (latexrelease)
                                               {\updefault}{font defaults change}%
             112 (latexrelease)
             113 (latexrelease)\renewcommand\updefault{n}
             114 (latexrelease)\renewcommand\bfdefault{bx}
             115 (latexrelease)
             116 (latexrelease)\let\bfdefault@previous\undefined
             117 (latexrelease)\let\mddefault@previous\undefined
             118 (latexrelease)\EndIncludeInRelease
             119 (*text)
```

\familydefault \seriesdefault \shapedefault Finally we have the hooks that describe the behaviour of the \normalfont command. To stay portable, the definition of \encodingdefault should not be changed and should match the setting above for \fontencoding. All other values can be set according to your taste.

```
120 \newcommand\familydefault{\rmdefault}
121 \newcommand\seriesdefault{\rmddefault}
```

In previous releases \shapedefault pointed to \updefault which resolved to n, but these days that is no longer the case (and up is wrong when you want to do a reset. So we now use n explicitly.

```
122 \newcommand\shapedefault{n}
```

 $(End\ definition\ for\ \verb|\familydefault|,\ \verb|\seriesdefault|,\ and\ \verb|\shapedefault|.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:familydefault})$ 

This finishes the low-level setup in fonttext.ltx.

123 (/text)

#### 6 The fontmath.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```
124 (*math)
125 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}
```

#### 6.1 The font encodings used

```
126 \DeclareFontEncoding{OML}{}{}
127 \DeclareFontEncoding{OMS}{}{}
128 \DeclareFontEncoding{OMX}{}{}
```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up \noaccents@ providing for AMS-IATEX. This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from \breve) are obtained from some other font that has them.

```
129 \DeclareFontEncoding{U}{}{\noaccents@}
```

```
The encodings for math are next:
```

```
130 \DeclareFontSubstitution{OML}{cmm}{m}{it}
131 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
132 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
133 \DeclareFontSubstitution{U}{cmr}{m}{n}
134 \begingroup
135 \nfss@catcodes
136 \input {omlcmm.fd}
137 \input {omscmsy.fd}
138 \input {omxcmex.fd}
139 \input {ucmr.fd}
140 \endgroup
```

#### 6.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by LaTeX. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. operators with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```
141 \DeclareSymbolFont{operators} {OT1}{cmr} {m}{n}
142 \DeclareSymbolFont{letters} {OML}{cmm} {m}{it}
143 \DeclareSymbolFont{symbols} {OMS}{cmsy}{m}{n}
144 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}
145 \SetSymbolFont{operators}{bold}{OT1}{cmr} {bx}{n}
146 \SetSymbolFont{letters} {bold}{OML}{cmm} {b}{it}
147 \SetSymbolFont{symbols} {bold}{OMS}{cmsy}{b}{n}
```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```
148 \DeclareSymbolFontAlphabet{\mathrm} {operators}
149 \DeclareSymbolFontAlphabet{\mathral}{letters}
150 \DeclareSymbolFontAlphabet{\mathcal} {symbols}
151 \DeclareMathAlphabet {\mathbf}{0T1}{cmr}{bx}{n}
152 \DeclareMathAlphabet {\mathsf}{0T1}{cmr}{m}{n}
153 \DeclareMathAlphabet {\mathit}{0T1}{cmr}{m}{it}
154 \DeclareMathAlphabet {\mathit}{0T1}{cmr}{m}{it}
155 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
156 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
157 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
158 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}{n}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}{m}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}
159 \DeclareMathAlphabet {\mathit}{0T1}{cmtt}
159 \DeclareMathit
15
```

Given the currently available fonts we cannot bold-en \mathbf and \mathtt but in principle one could use 'ultra bold' or something. The alphabets defined via \DeclareSymbolFontAlphabet will change automatically in a new math version if the corresponding symbol font changes.

```
\lambda \SetMathAlphabet\mathsf{bold}{OT1}{cmss}{bx}{n} \SetMathAlphabet\mathit{bold}{OT1}{cmr}{bx}{it}
```

#### 6.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```
157 \DeclareMathSizes{5}{5}{5}

158 \DeclareMathSizes{6}{6}{5}{5}

159 \DeclareMathSizes{7}{7}{5}{5}

160 \DeclareMathSizes{8}{8}{6}{5}

161 \DeclareMathSizes{9}{9}{6}{5}

162 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}

163 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}

164 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}

165 \DeclareMathSizes{\@xipt}{\@xipt}{\@xpt}{7}

166 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}

167 \DeclareMathSizes{\@xvipt}{\@xviipt}{\@xivpt}{\@xipt}{\@xipt}}

168 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxvpt}{\@xivpt}{\@xiipt}}

#### 6.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by IniTeX. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

#### 6.3.1 The letters

```
\DeclareMathSymbol{a}{\mathalpha}{letters}{'a}
\DeclareMathSymbol{b}{\mathalpha}{letters}{'b}
\DeclareMathSymbol{c}{\mathalpha}{letters}{'c}
\DeclareMathSymbol{d}{\mathalpha}{letters}{'d}
\DeclareMathSymbol{e}{\mathalpha}{letters}{'e}
\DeclareMathSymbol{f}{\mathalpha}{letters}{'f}
\DeclareMathSymbol{g}{\mathalpha}{letters}{'g}
\DeclareMathSymbol{h}{\mathalpha}{letters}{'h}
\DeclareMathSymbol{i}{\mathalpha}{letters}{'i}
\DeclareMathSymbol{j}{\mathalpha}{letters}{'j}
\DeclareMathSymbol{k}{\mathalpha}{letters}{'k}
\DeclareMathSymbol{1}{\mathalpha}{letters}{'1}
\DeclareMathSymbol{m}{\mathalpha}{letters}{'m}
\DeclareMathSymbol{n}{\mathalpha}{letters}{'n}
\DeclareMathSymbol{o}{\mathalpha}{letters}{'o}
\DeclareMathSymbol{p}{\mathalpha}{letters}{'p}
\DeclareMathSymbol{q}{\mathalpha}{letters}{'q}
\DeclareMathSymbol{r}{\mathalpha}{letters}{'r}
\DeclareMathSymbol{s}{\mathalpha}{letters}{'s}
\DeclareMathSymbol{t}{\mathalpha}{letters}{'t}
\DeclareMathSymbol{u}{\mathalpha}{letters}{'u}
\DeclareMathSymbol{v}{\mathalpha}{letters}{'v}
\DeclareMathSymbol{w}{\mathalpha}{letters}{'w}
\DeclareMathSymbol{x}{\mathalpha}{letters}{'x}
\DeclareMathSymbol{y}{\mathalpha}{letters}{'y}
\DeclareMathSymbol{z}{\mathalpha}{letters}{'z}
\DeclareMathSymbol{A}{\mathalpha}{letters}{'A}
\DeclareMathSymbol{B}{\mathalpha}{letters}{'B}
\DeclareMathSymbol{C}{\mathalpha}{letters}{'C}
\DeclareMathSymbol{D}{\mathalpha}{letters}{'D}
\DeclareMathSymbol{E}{\mathalpha}{letters}{'E}
\DeclareMathSymbol{F}{\mathalpha}{letters}{'F}
\DeclareMathSymbol{G}{\mathalpha}{letters}{'G}
\DeclareMathSymbol{H}{\mathalpha}{letters}{'H}
\DeclareMathSymbol{I}{\mathalpha}{letters}{'I}
\DeclareMathSymbol{J}{\mathalpha}{letters}{'J}
\DeclareMathSymbol{K}{\mathalpha}{letters}{'K}
\DeclareMathSymbol{L}{\mathalpha}{letters}{'L}
\DeclareMathSymbol{M}{\mathalpha}{letters}{'M}
\DeclareMathSymbol{N}{\mathalpha}{letters}{'N}
\DeclareMathSymbol{0}{\mathalpha}{letters}{'0}
\DeclareMathSymbol{P}{\mathalpha}{letters}{'P}
\DeclareMathSymbol{Q}{\mathalpha}{letters}{'Q}
\DeclareMathSymbol{R}{\mathalpha}{letters}{'R}
\DeclareMathSymbol{S}{\mathalpha}{letters}{'S}
```

File x: fontdef.dtx Date: ? Version ?

```
214 \DeclareMathSymbol{T}{\mathalpha}{letters}{'T}
   \DeclareMathSymbol{U}{\mathalpha}{letters}{'U}
   \DeclareMathSymbol{V}{\mathalpha}{letters}{'V}
  \DeclareMathSymbol{W}{\mathalpha}{letters}{'W}
  \DeclareMathSymbol{X}{\mathalpha}{letters}{'X}
   \DeclareMathSymbol{Y}{\mathalpha}{letters}{'Y}
   \DeclareMathSymbol{Z}{\mathalpha}{letters}{'Z}
       The digits
6.3.2
221 \DeclareMathSymbol{0}{\mathalpha}{operators}{'0}
   \DeclareMathSymbol{1}{\mathalpha}{operators}{'1}
   \DeclareMathSymbol{2}{\mathalpha}{operators}{'2}
   \DeclareMathSymbol{3}{\mathalpha}{operators}{'3}
   \DeclareMathSymbol{4}{\mathalpha}{operators}{'4}
   \DeclareMathSymbol{5}{\mathalpha}{operators}{'5}
   \DeclareMathSymbol{6}{\mathalpha}{operators}{'6}
   \DeclareMathSymbol{7}{\mathalpha}{operators}{'7}
   \DeclareMathSymbol{8}{\mathalpha}{operators}{'8}
   \DeclareMathSymbol{9}{\mathalpha}{operators}{'9}
       Punctuation, brace, etc. keys
   \DeclareMathSymbol{!}{\mathclose}{operators}{"21}
   \DeclareMathSymbol{*}{\mathbin}{symbols}{"03} % \ast
   \DeclareMathSymbol{+}{\mathbin}{operators}{"2B}
   \DeclareMathSymbol{,}{\mathpunct}{letters}{"3B}
   \DeclareMathSymbol{-}{\mathbin}{symbols}{"00}
   \DeclareMathSymbol{.}{\mathord}{letters}{"3A}
   \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
   \DeclareMathSymbol{;}{\mathpunct}{operators}{"3B}
   \DeclareMathSymbol{=}{\mathrel}{operators}{"3D}
240 \DeclareMathSymbol{?}{\mathclose}{operators}{"3F}
The following symbols are defined as delimiters below which automatically defines them
as math symbols.
% %\DeclareMathSymbol{(){\mathopen}{operators}{"28}
242 %\DeclareMathSymbol{)){\mathclose}{operators}{"29}
243 %\DeclareMathSymbol{/}{\mathord}{letters}{"3D}
244 %\DeclareMathSymbol{[]{\mathopen}{operators}{"5B}
245 %\DeclareMathSymbol{]}{\mathclose}{operators}{"5D}
246 %\DeclareMathSymbol{|}{\mathord}{symbols}{"6A}
247 %\DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
248 %\DeclareMathSymbol{>}{\mathrel}{letters}{"3E}
    Should all of the following being activated by default? Probably not.
   %\DeclareMathSymbol{'\{}{\mathopen}{symbols}{"66}
250 %\DeclareMathSymbol{'\}}{\mathclose}{symbols}{"67}
```

#### 6.3.4 Delimitercodes for characters

\mathcode'\ ="8000 % \space
\mathcode'\'="8000 % ^\prime

254 \mathcode'\\_="8000 % \\_

[to be completed]

Finally,  $IniT_EX$  sets all  $\ensuremath{\texttt{Vdelcode}}$  values to -1, except  $\ensuremath{\texttt{Vdelcode}}$  .=0

```
255 \DeclareMathDelimiter{(){\mathopen} {operators}{"28}{largesymbols}{"00}
256 \DeclareMathDelimiter{()}{\mathclose}{operators}{"29}{largesymbols}{"01}
257 \DeclareMathDelimiter{[]{\mathopen} {operators}{"5B}{largesymbols}{"02}
258 \DeclareMathDelimiter{[]}{\mathclose}{operators}{"5D}{largesymbols}{"03}
```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain TeX. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```
259 \DeclareMathDelimiter{<}{\mathopen}{symbols}{"08}{largesymbols}{"0A}
260 \DeclareMathDelimiter{>}{\mathclose}{symbols}{"69}{largesymbols}{"0B}
261 \DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
262 \DeclareMathSymbol{>}{\mathrel}{letters}{"3E}
```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```
\largesymbols\{"OE} \\ \text{\mathord}\{\text{operators}\{"2F}\{\text{largesymbols}\{"0E}\\ \text{\mathord}\{\text{letters}\{"3D}\\ \text{\mathord}\{\text{symbols}\{"6A}\{\text{largesymbols}\{"0C}\\ \text{\mathord}\{\text{symbols}\{"6A}\{\text{largesymbols}\{"0C}\\ \text{\mathord}\{\text{symbols}\{\text{symbols}\{\text{largesymbols}\{\text{"0F}}\\ \text{\mathord}\{\text{symbols}\{\text{"6E}\{\text{largesymbols}\{\text{"0F}}\\ \text{\mathord}\{\text{symbols}\{\text{"6E}\{\text{largesymbols}\{\text{"0F}}\\ \text{\mathord}\{\text{symbols}\{\text{\mathord}\}\}
```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

#### 6.4 Symbols accessed via control sequences

#### 6.4.1 Greek letters

```

```

Here cometh much profligate robustification of math constructs. Warning: some of these commands may become non-robust if an AMS package is loaded.

Further potential problems: some math font packages may make unfortunate assumptions about some of these definitions that are not true of the robust versions we need.

```
456

```

In contrast to plain.tex \Relbar got braces around the equal sign to guard against it being "math active" expanding to \futurelet.... This might be the case when packages are implementing shorthands for math, e.g. => meaning \Rightarrow etc. It would actually be better not to use = in such definitions but instead define something like \mathequalsign and use this. However we can't do this now as it would break other math layouts where characters are in different places (since those wouldn't know about the need for a new command name).

```

#### 6.4.8 Math accents

```
DeclareMathAccent{\acute}{\mathalpha}{operators}{"13}

DeclareMathAccent{\grave}{\mathalpha}{operators}{"12}

DeclareMathAccent{\ddot}{\mathalpha}{operators}{"7F}

DeclareMathAccent{\tilde}{\mathalpha}{operators}{"7E}

DeclareMathAccent{\bar}{\mathalpha}{operators}{"16}

DeclareMathAccent{\breve}{\mathalpha}{operators}{"15}

DeclareMathAccent{\check}{\mathalpha}{operators}{"14}

DeclareMathAccent{\hat}{\mathalpha}{operators}{"5E}

DeclareMathAccent{\vec}{\mathalpha}{operators}{"5E}

DeclareMathAccent{\vec}{\mathalpha}{operators}{"5F}

DeclareMathAccent{\dot}{\mathalpha}{operators}{"5F}

DeclareMathAccent{\dot}{\mathalpha}{operators}{"5F}

DeclareMathAccent{\widetilde}{\mathord}{largesymbols}{"65}

DeclareMathAccent{\widehat}{\mathord}{largesymbols}{"65}
```

For some reason plain  $T_EX$  never bothered to provide a ring accent in math (although it is available in the fonts), but since we got a request for it here we go:

528 \DeclareMathAccent{\mathring}{\mathalpha}{operators}{"17}

#### 6.4.9 Radicals

529 \DeclareMathRadical{\sqrtsign}{symbols}{"70}{largesymbols}{"70}

#### 6.4.10 Over and under something, etc

```
\DeclareRobustCommand\overrightarrow[1]{\vbox{\m@th\ialign{##\crcr

   \DeclareMathDelimiter{\lfloor}
606
      {\mathopen}{symbols}{"62}{largesymbols}{"04}
```

\lgroup \rgroup \bracevert There are three plain T<sub>E</sub>X delimiters which are not fully supported by NFSS, since they partly point into a bold cmr font. Allocating a full symbol font, just to have three delimiters seems a bit too much given the limited space available. For this reason only the extensible sizes are supported. If this is not desired one can use, without losing portability, define \mathbf and \mathtt as font symbol alphabet (setting up cmr/bx/n and cmtt/m/n as symbol fonts first) and modify the delimiter declarations to point with their small variant to those symbol fonts. (This is done in oldlfont.dtx so look there for examples.)

```
ObeclareMathDelimiter{\lgroup} % extensible ( with sharper tips

(\mathopen){\largesymbols}{\"3A}{\largesymbols}{\"3A}

(\text{DeclareMathDelimiter}{\rgroup} % extensible ) with sharper tips

(\mathclose){\largesymbols}{\"3B}{\largesymbols}{\"3B}}

(\text{DeclareMathDelimiter}{\text{bracevert}} % the vertical bar that extends braces

(\mathord){\largesymbols}{\"3E}{\largesymbols}{\"3E}}
```

(End definition for \lgroup, \rgroup, and \bracevert. These functions are documented on page ??.)

#### 6.5 Math versions of text commands

The \mathunderscore here is really a text definition, so it has been put back into ltoutenc.dtx (by Chris, 30/04/97) and should be removed from here.

These symbols are the math versions of text commands such as  $\P$ , \$, etc.

```
\mathparagraph
\mathsection
\mathdollar
\mathsterling
\mathunderscore
```

```
These math symbols are not in plain T<sub>E</sub>X.
```

- 614 \DeclareMathSymbol{\mathparagraph}{\mathord}{symbols}{"7B}
  615 \DeclareMathSymbol{\mathord}{symbols}{"78}
  616 \DeclareMathSymbol{\mathord}{operators}{"24}
- Openior 

  DeclareRobustCommand\mathsterling{\mathit{\mathchar"7024}}
- 618 \DeclareRobustCommand\mathunderscore{\kern.06em\vbox{\hrule\@width.3em}}

(End definition for \mathparagraph and others. These functions are documented on page ??.)

\mathellipsis

This is plain T<sub>E</sub>X's \ldots.

619 \DeclareRobustCommand\mathellipsis{\mathinner{\ldotp\ldotp\ldotp}}%

(End definition for \mathellipsis. This function is documented on page ??.)

#### 6.6 Other special functions and parameters

#### 6.6.1 Biggggg

```
620 (/math)
621 (*math | latexrelease)
622 (latexrelease)\IncludeInRelease{2018/12/01}%
                                    {\Big}{Start LR-mode}%
   (latexrelease)
   \DeclareRobustCommand\big[1]{\leavevmode@ifvmode
      {\hbox{$\left\langle \frac{1}{vbox to8.5\p0{}\right\rangle.}}

      {\hbox{$\left\langle \frac{1}{vbox to14.5\p0{}\right\rangle .n0space}}}
   \DeclareRobustCommand\Bigg[1]{\leavevmode@ifvmode
      {\hbox{$\left\langle \frac{1}{vbox to17.5\p0{}\right\rangle .n0space}}}
   ⟨/math | latexrelease⟩
```

```
633 ⟨latexrelease⟩\EndIncludeInRelease
634 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
635 ⟨latexrelease⟩ {\Big}{Start LR-mode}%
636 ⟨latexrelease⟩\def\big#1{{\hbox{$\left#1\vbox to8.5\p0{}\right.\n0space$}}}
637 ⟨latexrelease⟩\def\Big#1{{\hbox{$\left#1\vbox to11.5\p0{}\right.\n0space$}}}
638 ⟨latexrelease⟩\def\bigg#1{{\hbox{$\left#1\vbox to14.5\p0{}\right.\n0space$}}}
639 ⟨latexrelease⟩\def\Bigg#1{{\hbox{$\left#1\vbox to17.5\p0{}\right.\n0space$}}}
640 ⟨latexrelease⟩\EndIncludeInRelease
641 ⟨*math⟩
642 \def\n0space{\nulldelimiterspace\z0 \m0th}
```

#### 6.6.2 The log-like functions

\operator@font

The \operator@font determines the symbol font used for log-like functions.

643 \def\operator@font{\mathgroup\symoperators}

(End definition for \operator@font. This function is documented on page ??.)

#### 6.6.3 Parameters

```
644 \thinmuskip=3mu
645 \medmuskip=4mu plus 2mu minus 4mu
646 \thickmuskip=5mu plus 5mu
This finishes the low-level setup in fontmath.ltx.
647 \( //math \)
```

## 7 Default cfg files

We provide default cfg files here to ensure that on installations that search large file trees we do not pick up some strange customisation files from somewhere.

```
648 (*cfgtext | cfgmath | cfgprel)
649 %%
650 %%
651 %%
652 %% Load the standard setup:
653 %%
654 (+cfgtext)\input{fonttext.ltx}
655 \(\rightarrow\)cfgmath\\input\{fontmath.ltx\}
656 \(\rightarrow\) \(\text{input}\) preload.ltx}
658 %% Small changes could go here; see documentation in cfgguide.tex for
659 %% allowed modifications.
661 %% In particular it is not allowed to misuse this configuration file
662 %% to modify internal LaTeX commands!
663 %%
_{664} %% If you use this file as the basis for configuration please change
665 %% the \ProvidesFile lines to clearly identify your modification, e.g.,
\langle +cfgtext \rangle \%  \ProvidesFile{fonttext.cfg}[2001/06/01]
668 \(\rightarrow\text\) \(\ri
 \langle +cfgprel \rangle \%  \ProvidesFile{preload.cfg}[2001/06/01]
670 %%
                                                                                                                                     Customised local font setup]
671 %%
```

```
72 %%
```

 $_{673}$   $\langle / cfgtext \mid cfgmath \mid cfgprel \rangle$ 

## File y

# preload.dtx

#### 1 Overview

This file contains an number of possible settings for preloading fonts during installation of NFSS2 (which is used by  $\LaTeX$  2 $\varepsilon$ ). It will be used to generate the following files:

```
minimal subset of fonts necessary to run NFSS2
preload.min
preload.ori
               preload of CM fonts similar to the old lfonts.tex
preload.ltx
               The standard selection of preloads
cmpreloa.xpt
               preload of CM fonts for 10pt document size
cmpreloa.xip
               preload of CM fonts for 11pt document size
cmpreloa.xii
               preload of CM fonts for 12pt document size
dcpreloa.xpt
               preload of DC fonts for 10pt size
               preload of DC fonts for 11pt size
dcpreloa.xip
dcpreloa.xii
               preload of DC fonts for 12pt size
```

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is preload.ltx which is used during format generation. You are not allowed to change this file.

### 2 Customization

You can customize the preloaded fonts in your  $\LaTeX$  system by installing a file with the name preload.cfg. If this file exists it will be used in place of the system file preload.ltx. You can, for example, copy one of the files mentioned above (that can be generated from this source) to preload.cfg.

Or you can define completely other preloads. In that case start from preload.min since that contains the fonts that have to be preloaded by \*all\* LATEX  $2_{\varepsilon}$  systems.

Avoid using preload.ori, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by LATEX 2.09.

If you normally use other fonts than Computer Modern preload.min might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a fontdef.cfg configuration file (see the documentation in the file fontdef.dtx). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

# 3 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

```
driver
         produce a documentation driver file
preload
         produce a preload...file
         for OT1 encoded Computer Modern
cm
dc
         for T1 encoded Computer Modern
         produce minimal subset
\min
         produce 10pt preloads
xpt
xipt
         produce 11pt preloads
         produce 12pt preloads
xiipt
         produce preloads similar to old lfonts.tex
ori
         produce preload.ltx
tex
```

A typical docstrip command file would then have entries like:

```
generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
for generating preload files.
```

## 4 A driver for this document

The next bit of code contains the documentation driver file for TEX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

### 5 The code

We begin by loading the math extension font (cmex10) and the LATEX line and circle fonts. It is necessary to do this explicitly since these are used by lplain.tex and latex.tex. Since the internal font name contains / characters and digits we construct the name via \csname. These are the only fonts (!) that must be loaded in this file.

All \DeclarePreloadSizes can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

File y: preload.dtx Date: 2014/09/29 Version v2.1g

```

### File z

# ltfntcmd.dtx

#### Abstract

The commands defined in this file ltfntcmd are part of the kernel code for LATEX  $2\varepsilon/NFSS2$ .

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions

## 1 Introduction

Font changes such as \bfseries, \sffamily, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next \end of some environment or by explicitly using a group, e.g., writing something like {\bfseries...} in the source. If you make the mistake of writing \bfseries{...} (thinking of \bfseries as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the TEX system and for several reasons it is better to avoid them on the user level whenever possible. In LATEX3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with \text..) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list \nocorrlist. 16 The default definition for this list is produced by the following.

#### \newcommand \nocorrlist {,.}

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only

<sup>&</sup>lt;sup>16</sup>Any package that changes the **\catcode** of a character inside **\nocorrlist** must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

Command	Corresponds to	Action
	\normalfont	Typeset argument in normal family
	\rmfamily	Typeset argument in roman family
	\sffamily	Typeset argument in sans serif family
	$\texttt{\ttfamily}$	Typeset argument in typewriter family
	\mdseries	Typeset argument in medium series
	\bfseries	Typeset argument in <b>bold</b> series
	\upshape	Typeset argument in normal shape
	\itshape	Typeset argument in <i>italic</i> shape
	\slshape	Typeset argument in slanted shape
	\scshape	Typeset argument in SMALL CAPS shape
	\em	Typeset argument emphasized

Table 1: Font-change commands with arguments

The font change commands provided here all start with **\text.**. to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

```
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help LATEX by adding a \nocorr command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

This gives:

- This environment produces boldface items.
- It is defined in terms of I<sup>A</sup>T<sub>E</sub>X's itemize environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with \/.

It is also possible to suppress the italic correction in individual instances. For this, the command \nocorr is provided.

The \nocorr must appear as the first or last token inside the braces of the argument of the \text... commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a \/ in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of \/ in amstex.sty is used as this version can cause space to be removed immediately before the \/.

## 2 The implementation

\DeclareTextFontCommand

This is the creator function for **\text.**. commands. It gives a warning if **\foo** or **\fragfoo** is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where \nocorr occurs within it. This sets the \check@ic commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the 'nocorr' list. At the end of the text this is done after closing the group so as to check the 'outer font'. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the \aftergroup\maybe@ic at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the \fi from the token list before the group ends; this is done by adding an \expandafter just before the closing brace.

```
(*2ekernel)
  \def \DeclareTextFontCommand #1#2{%
    \DeclareRobustCommand#1[1]{%
      \ifmmode
         \nfss@text{#2##1}%

              (End definition for textulc, textsw, and textssc. These functions are documented on page ??.)
      \emph Finally we have the \em font change declaration of LATEX. The corresponding definition
              with argument is
               42 \DeclareTextFontCommand{\emph}{\em}
              (End definition for \emph. This function is documented on page ??.)
    \nocorr This is just a label, so it does nothing; it should also be unexpandable.
               43 \let \nocorr \relax
```

(End definition for \nocorr. This function is documented on page ??.)

\check@icl We define these defaults in case some error causes them to be expanded at the wrong \check@icr time.

```
44 \let \check@icl \@empty
45 \let \check@icr \@empty
```

(End definition for \check@icl and \check@icr. These functions are documented on page ??.)

# \text@command \check@nocorr@

This checks for a \nocorr as the first token in its argument and also for one in any other position not protected within braces (the latter is treated as if it were at the end of the argument).

Is this the correct action in the 'empty' case? It is efficient but typographically it is, strictly, incorrect!

```
46 \def \text@command #1{%
47 \def \reserved@a {#1}%
48 \ifx \reserved@a \@empty
49 \let \check@icl \@empty
50 \let \check@icr \@empty
51 \else
```

\space is a reserved word in LaTeX or actually already in plain TeX. If somebody really redefines it so many things will break that I don't see any reason to make this routine here slower than necessary.

```
52 %
        \def \reserved@b { }%
53 %
        \ifx \reserved@a \reserved@b
       \ifx \reserved@a \space
         \let \check@icl \@empty
55
         \let \check@icr \@empty
56
57
         \check@nocorr@ #1\nocorr\@nil
58
       \fi
59
60
61 }
62 \def \check@nocorr@ #1#2\nocorr#3\@nil {%
```

The two checks are initialised here to their values in the normal case.

In this case there is a \nocorr at the start but not at the end, so \check@icl should be empty.

```
70 \let \check@icl \@empty
71 \else
```

Otherwise there is a \nocorr both at the start and elsewhere, so no italic corrections should be added.

```
72 \let \check@icl \Gempty
73 \let \check@icr \Gempty
74 \fi
```

```
75 \else
76 \ifx \reserved@c \@empty
```

In this case there is no **\nocorr** anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```
77 \else
```

In this case there is no \nocorr at the start but there is one elsewhere, so no \aftergroup is needed.

(End definition for \text@command and \check@nocorr@. These functions are documented on page ??.)

\ifmaybe@ic

Switch used soley within \maybe@ic not interfering with other switches.

82 \newif\ifmaybe@ic

(End definition for \ifmaybe@ic. This function is documented on page ??.)

\maybe@ic
\maybe@ic@

These macros implement the italic correction.

- 83 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
- 84 \def \maybe@ic@ {%

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

85 \ifdim \fontdimen\@ne\font>\z@
86 \else
87 \maybe@ictrue

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

% \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%

We have to hide the \@let@token in the macro \t@st@ic rather than testing it directly in the loop since it might be \let to a \fi or \else, which would result in chaos.

90 \do \t@st@io

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of \nolinebreak.

```
91 \ifmaybe@ic \sw@slant \fi
92 \fi
93 }
```

 $(\textit{End definition for $\maybe@ic and $\maybe@ic@. These functions are documented on page \ref{eq:constraints}.)$}$ 

\textsize The next token in the input stream is stored in \@let@token via a \let, the current token from \nocorrlist is stored via \def in \reserved@a. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an \if thus their catcodes would not matter; but this will not work whilst \futurelet is used above.

```
94 \def \t@st@ic {%
95 \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
96 \ifx\reserved@b\@let@token
```

If they are the same we record the fact and jump out of the loop.

```
97 \maybe@icfalse
98 \@break@tfor
99 \fi
100 }
```

101 \def \sw@slant {%

(End definition for  $\t Cst Cic.$  This function is documented on page  $\ref{eq:Cic.}$ )

\sw@slant \fix@penalty The definition of the mysterious \sw@slant command is as follows.

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as \hfill), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from ~ (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```
102 \ifdim \lastskip=\z@
103 \fix@penalty
104 \else
105 \skip@ \lastskip
106 \unskip
107 \fix@penalty
108 \hskip \skip@
109 \fi
110 }
```

The above code means: "If there is a non-zero space just before the current position (\ifdim...) save the amount of that space (\skip@\lastskip), remove it (\unskip), then do a similar thing if there is a penalty just before the skip, and finally put the space back in."

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an **\hskip** in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of \unpenalty in standard LATEX code?

```
111 \def \fix@penalty {%
112 \ifnum \lastpenalty=\z@
113 \@@italiccorr
114 \else
115 \count@ \lastpenalty
116 \unpenalty
117 \@@italiccorr
```

```
118     \penalty \count@
119     \fi
120 }

(End definition for \sw@slant and \fix@penalty. These functions are documented on page ??.)
```

\nocorrlist

This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```
121 \def \nocorrlist {,.}
```

(End definition for \nocorrlist. This function is documented on page ??.)

\nfss@text

This command will by default behave like a LATEX \mbox but may be redefined by packages such as amstext.sty to be a bit cleverer.

```
122 \ifx \nfss@text\@undefined
123 \def \nfss@text {\leavevmode\hbox}
124 \fi
```

(End definition for \nfss@text. This function is documented on page ??.)

\DeclareOldFontCommand

This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage:  $\DeclareOldFontCommand \fn{\langle font-change decls \rangle} \ \langle math-alphabet \rangle$ 

Here fn is the font-declaration command being defined,  $\langle font\text{-}change\ decls \rangle$  is the declaration it will expand to in text-mode, and  $\langle math\text{-}alphabet \rangle$  is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```
\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm} \DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf} \DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt} \\
125 \def \DeclareOldFontCommand #1#2#3{% \\
126 \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}% \\
127 \}
(End definition for \DeclareOldFontCommand. This function is documented on page ??.)
```

\@fontswitch
\@@math@egroup
\@@math@egroup

These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```
128 \def \@fontswitch #1#2{%
129 \ifmmode
130 \let \math@bgroup \relax
131 \def \math@egroup {\let \math@bgroup \@@math@bgroup
132 \let \math@egroup \@@math@egroup}%
```

We need to have a \relax in the following line in case the #2 is something like \mathsf grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
133  #2\relax
134  \else
135  #1%
136  \fi
137 }
138 \let \@@math@bgroup \math@bgroup
139 \let \@@math@egroup \math@egroup
```

(End definition for  $\dots$  witch,  $\dots$  and  $\dots$  and  $\dots$  are documented on page  $\ref{eq:constraint}$ .)

These commands are available only in the preamble.

```
140 \@onlypreamble \DeclareTextFontCommand
141 \@onlypreamble \DeclareOldFontCommand
```

## 3 Initialization

\normalsize

This is defined to produce an error.

 $(\mathit{End \ definition \ for \ } \mathsf{Normalsize}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:normalsize}.)}$ 

#### File A

# lttextcomp.dtx

This file contains the implementation for accessing the glyphs provided by the TS1 encoding (Text Companion Encoding). This is now offered as part of the kernel and so the textcomp package which used to provide the definitions is now mainly needed for compatibility reasons (and doesn't do much any more).

\oldstylenums \legacyoldstylenums Preserve the old definition of **\oldstylenums** under a different name.

This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

Provide spacing using the interword space of the current font.

6 \spaceskip\fontdimen\tw@\font

\tc@errorwarn

21

22

23

25

Then switch to the math italic font. We don't change the current value of \fcseries which means that you can use bold numerals if \bfseries is in force. As family we use \rmdefault which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard LATEX fonts even though they only contain substitutions).

```
\usefont{OML}{\rmdefault}{\f@series}{it}%
      \mathgroup\symletters #1%
     \endgroup
10 }

 $_{59}$   $\langle latexrelease \rangle \setminus IncludeInRelease {2020/02/02} %$ 

60 (latexrelease) {\DeclareEncodingSubset}{Text companion symbols}%

\DeclareEncodingSubset

The declaration takes 3 mandatory arguments: an *encoding* for which a subsetting is wanted (currently always TS1, and most likely forever), the *font family* for which we declare the subset and finally the *subset* number (between 0 (all of the encoding is supported) and 9 many glyphs are missing.

For TS1 the numbers have been choosen in a way that most fonts can be fairly correctly categorized, but the default settings are always conservative, that is they may claim that less glyphs are supported than there actually are.

As these days many font families are set up to end in -LF (lining figures), -OsF (oldstyle figures), etc. the declaration supports a shortcut: if the *font family* name ends in -\* then the star gets replaced by these common ending, e.g.,

\DeclareEncodingSubset{TS1}{Alegreya-\*}{2}

is the same as writing

```
\DeclareEncodingSubset{TS1}{Alegreya-LF}{2} \DeclareEncodingSubset{TS1}{Alegreya-OsF}{2} \DeclareEncodingSubset{TS1}{Alegreya-TLF}{2} \DeclareEncodingSubset{TS1}{Alegreya-TOsF}{2}
```

If only some are needed then one can define them individually but in many cases all four are wanted, hence the shortcut.

The coding of the declaration has no error checking as it is mostly for internal use.

```
61 \def\DeclareEncodingSubset#1#2{%
62 \DeclareEncodingSubset@aux{#1}#2*\DeclareEncodingSubset@aux
63 }
```

64 \def\DeclareEncodingSubset@aux#1#2\*#3\DeclareEncodingSubset@aux#4{%

if #3 is empty then there was no star, otherwise we define all four variants.

```
65 \expandafter\ifx\expandafter X\detokenize{#3}X%
66 \@DeclareEncodingSubset{#1}{#2}{#4}%
67 \else
68 \@DeclareEncodingSubset{#1}{#2LF}{#4}%
69 \@DeclareEncodingSubset{#1}{#2TLF}{#4}%
70 \@DeclareEncodingSubset{#1}{#2TDsF}{#4}%
71 \@DeclareEncodingSubset{#1}{#2TOsF}{#4}%
72 \fi
73 }
```

The subset info is stored in a command with the name  $\int family: subset$  so if that already exists we change otherwise declare a subset.

```
74 \def\@DeclareEncodingSubset#1#2#3{%
75 \@ifundefined{#1:#2}%
76 {\@font@info{Setting #2 sub-encoding to #1/#3}}%
77 {\@font@info{Changing #2 sub-encoding to #1/#3}}%
78 \@namedef{#1:#2}{#3}}
```

Any reason to allow those in the middle of documents?

- 79 \@onlypreamble\DeclareEncodingSubset
- 80 \@onlypreamble\DeclareEncodingSubset@aux
- 81 \@onlypreamble\@DeclareEncodingSubset

 $(\mathit{End \ definition \ for \ } \texttt{\ LeclareEncodingSubset}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:lectalphase}.)})$ 

\CheckEncodingSubset

The command \CheckEncodingSubset will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either \UseTextSymbol, \UseTextAccent depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of \CheckEncodingSubset.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute #1{#2}#5 otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
\def\CheckEncodingSubset#1#2#3#4#5{%
      \ifnum #4>%
83
         \expandafter\ifx\csname #2:\f@family\endcsname\relax
           0\csname #2:?\endcsname
85
           \csname #2:\f@family\endcsname
         \fi
88
     \relax
89
     \expandafter\@firstoftwo
90
    \else
91
     \expandafter\@secondoftwo
92
   \fi
93
    {#1{#2}}{#3}%
94
    #5%
95
96 }
```

(End definition for \CheckEncodingSubset. This function is documented on page ??.)

To set up the glyphs for the subsets we need a number helpers.

\tc@errorwarn

To we produce errors, warnings, or only info in the transcripts if glyphs require substitutions? By default it is "info" only. With the textcomp package that can be changed.

```
97 \def\tc@errorwarn#1#2{\@latex@info{#1}}
```

(End definition for \tc@errorwarn. This function is documented on page ??.)

\tc@subst

```
98 \def\tc@subst#1{%
      \tc@errorwarn
       {Symbol \string#1 not provided by\MessageBreak
100
        font family \f@family\space
        in TS1 encoding.\MessageBreak Default family used instead}\@eha
     \bgroup
103
104
         \expand@font@defaults
         \ifx\f@family\rmdef@ult
105
            \fontfamily\rmsubstdefault
106
         \else\ifx\f@family\sfdef@ult
107
            \fontfamily\sfsubstdefault
108
         \else\ifx\f@family\ttdef@ult
109
            \fontfamily\ttsubstdefault
         \else
            \fontfamily\textcompsubstdefault
         \fi\fi\fi
```

Whatever default was chosen, we claim now (locally hopefully) that it can handle all slots (even if not true) to avoid looping in certain situations, e.g., when something was set up incorrectly.

File A: lttextcomp.dtx Date: 2020/04/29 Version v1.0d

(End definition for \tc@subst. This function is documented on page ??.)

\tc@fake@euro

\tc@fake@euro is an example of a "fake" definition to use in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce a poor man's Euro symbol by combining a "C" with a "=".

```
\def\tc@fake@euro#1{%
      \leavevmode
      \@font@info{Faking \noexpand#1for font family
                              \f@family\MessageBreak in TS1 encoding}%
      \valign{##\cr
         \vfil\hbox to 0.07em{\dimen@\f@size\p@
                               \math@fontsfalse
124
                                \fontsize{.7\dimen@}\z@\selectfont=\hss}%
125
         \vfil\cr%
126
         \hbox{C}\crcr
127
128
129 }
```

(End definition for \tc@fake@euro. This function is documented on page ??.)

\tc@check@symbol \tc@check@accent

These are two abbreviations that we use below to check symbols and accents in TS1. Only there to save some space, e.g., we can then write

DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurreny is not available.

130 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}

Accents and been mad an error in the textcomp package when not available. Now that we provide the functionality in the kernel we avoid the error by swapping in a T1 accent if the TS1 accent is not available.

```
131 %\def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
```

```
\label{local_to_cont} $$132 \det tc@check@accent#1{CheckEncodingSubset}UseTextAccent{TS1}{\tc@swap@accent#1}$$ \def\tc@swap@accent#1#2{\UseTextAccent{T1}#1}$
```

(End definition for \tc@check@symbol and \tc@check@accent. These functions are documented on page ??.)

# 1 Sub-encodings

Here are the default definitions for the TS1 symbols. First those that we assume are always available if a font implements TS1.

Using \UndeclareTextCommand above is enough only if the encoding definition files are not reloaded afterwards. In the past that happened if fontenc was used in the document preamble (not any longer). So in some sense it is better to fully remove them from the encoding files, but for rollbacks it is easier to keep them in for now.

These are the standard itemize and footnote symbols originally taken from OMS and now from TS1:

```
140 \DeclareTextSymbolDefault{\textasteriskcentered}{TS1}
141 \DeclareTextSymbolDefault{\textbullet}{TS1}
142 \DeclareTextSymbolDefault{\textdaggerdbl}{TS1}
143 \DeclareTextSymbolDefault{\textdagger}{TS1}
144 \DeclareTextSymbolDefault{\textparagraph}{TS1}
145 \DeclareTextSymbolDefault{\textperiodcentered}{TS1}
146 \DeclareTextSymbolDefault{\textsection}{TS1}
```

And here are the other TS1 glyphs that are implemented by every font (or nearly everyone—a few are commented out and moved to sub-encoding 9, because they aren't around in one or two fonts.

```
147 %%\DeclareTextSymbolDefault{\textbardbl}{TS1} % subst in sub-enc 9 above
  \DeclareTextSymbolDefault{\textbrokenbar}{TS1}
149 %%\DeclareTextSymbolDefault{\textcelsius}{TS1} % subst in sub-enc 9 above
  \DeclareTextSymbolDefault{\textcent}{TS1}
  \DeclareTextSymbolDefault{\textcopyright}{TS1}
  \DeclareTextSymbolDefault{\textdegree}{TS1}
  \DeclareTextSymbolDefault{\textdiv}{TS1}
154 \DeclareTextSymbolDefault{\textlnot}{TS1}
155 \DeclareTextSymbolDefault{\textonehalf}{TS1}
156 \DeclareTextSymbolDefault{\textonequarter}{TS1}
157 %%\DeclareTextSymbolDefault{\textonesuperior}{TS1} % subst in sub-enc 9 above
159 \DeclareTextSymbolDefault{\textordmasculine}{TS1}
160 \DeclareTextSymbolDefault{\textpm}{TS1}
  \DeclareTextSymbolDefault{\textquotesingle}{TS1}
  \DeclareTextSymbolDefault{\textquotestraightbase}{TS1}
  \DeclareTextSymbolDefault{\textquotestraightdblbase}{TS1}
  \DeclareTextSymbolDefault{\textregistered}{TS1}
165 %%\DeclareTextSymbolDefault{\textthreequartersemdash}{TS1} % subst in sub-enc 9 above
166 \DeclareTextSymbolDefault{\textthreequarters}{TS1}
167 %%\DeclareTextSymbolDefault{\textthreesuperior}{TS1} % subst in sub-enc 9 above
168 \DeclareTextSymbolDefault{\texttimes}{TS1}
169 \DeclareTextSymbolDefault{\texttrademark}{TS1}
170 %%\DeclareTextSymbolDefault{\texttwelveudash}{TS1} % subst in sub-enc 9 above
171 %%\DeclareTextSymbolDefault{\texttwosuperior}{TS1} % subst in sub-enc 9 above
172 \DeclareTextSymbolDefault{\textyen}{TS1}
  \DeclareTextSymbolDefault{\textcapitalcompwordmark}{TS1}
  \DeclareTextSymbolDefault{\textascendercompwordmark}{TS1}
```

In the following sections the remaining default definitions are ordered by subencoding in which they are become unavailable (i.e., they are not provided in the subencoding with that number and all sub-encodings with higher numbers.

Thus the symbols that are available in sub-encoding x are the symbols above (always available) and the symbols list in the sections for sub-encodings x + 1 and higher.

# 1.1 Sub-encoding 1 (drop symbols not working in Latin Modern)

The \textcircled is available but the glyph is simply too small so we keep using the OMS glyph.

```
175 \DeclareTextCommandDefault{\textcircled}
176 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{0MS}}1\textcircled}
```

# 1.2 Sub-encoding 2 (majority of new OTF fonts via autoinst)

```
177 \DeclareTextCommandDefault{\t}
178 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OML}}2\t}
```

Capital accents are really only very seldom implemented, so from sub-encoding 2 onwards we use the normal T1 accents if they are asked for in the document.

In Unicode engines we don't implement them at all but always use the basic accents instead. whether that works or not really depends on the font, something like "X usually comes out wrong in Unicode engines.

```
\ifx\Umathcode\@undefined
     \DeclareTextCommandDefault{\capitalacute}
                                                       {\tc@check@accent{\'}2\capitalacute}
     \DeclareTextCommandDefault{\capitalbreve}
                                                       {\tc@check@accent{\u}2\capitalbreve}
181
                                                       {\tc@check@accent{\v}2\capitalcaron}
     \DeclareTextCommandDefault{\capitalcaron}
                                                       {\tt \{\c@check@accent\{\c}2\capitalcedilla\}}
     \DeclareTextCommandDefault{\capitalcedilla}
183
     \DeclareTextCommandDefault{\capitalcircumflex}
                                                       {\tc@check@accent{\^}2\capitalcircumflex}
184
                                                       {\tc@check@accent{\"}2\capitaldieresis}
     \DeclareTextCommandDefault{\capitaldieresis}
185
     \DeclareTextCommandDefault{\capitaldotaccent}
                                                       {\tc@check@accent{\.}2\capitaldotaccent}
186
     \DeclareTextCommandDefault{\capitalgrave}
                                                       {\tc@check@accent{\'}2\capitalgrave}
187
     \DeclareTextCommandDefault{\capitalhungarumlaut}{\tc@check@accent{\H}2\capitalhungarumlaut}
188
     \DeclareTextCommandDefault{\capitalmacron}
                                                       {\tc@check@accent{\=}2\capitalmacron}
     \DeclareTextCommandDefault{\capitalogonek}
                                                       {\tc@check@accent{\k}2\capitalogonek}
190
     \DeclareTextCommandDefault{\capitalring}
                                                       {\tc@check@accent{\r}2\capitalring}
191
     \DeclareTextCommandDefault{\capitaltie}
                                                       {\tc@check@accent{\t}2\capitaltie}
192
     \DeclareTextCommandDefault{\capitaltilde}
                                                       {\tc@check@accent{\~}2\capitaltilde}
For \newtie and \capitalnewtie this is actually wrong, they should pick up the accent
from the substitution font (not done yet).
     \DeclareTextCommandDefault{\newtie}
                                                       {\tc@check@accent{\t}2\newtie}
     \DeclareTextCommandDefault{\capitalnewtie}
                                                       {\tc@check@accent{\t}2\capitalnewtie}
195
    In Unicode engines we just execute the simple accents:
     \DeclareTextCommandDefault\capitalacute{\@tabacckludge'}
     \DeclareTextCommandDefault\capitalbreve{\u}
     \DeclareTextCommandDefault\capitalcaron{\v}
     \DeclareTextCommandDefault\capitalcedilla{\c}
     \DeclareTextCommandDefault\capitalcircumflex{\^}
201
     \DeclareTextCommandDefault\capitaldieresis{\"}
     \DeclareTextCommandDefault\capitaldotaccent{\.}
     \DeclareTextCommandDefault\capitalgrave{\@tabacckludge'}
     \DeclareTextCommandDefault\capitalhungarumlaut{\H}
     \DeclareTextCommandDefault\capitalmacron{\@tabacckludge=}
     \DeclareTextCommandDefault\capitalnewtie{\t}
     \DeclareTextCommandDefault\capitalogonek{\k}
209
     \DeclareTextCommandDefault\capitalring{\r}
     \DeclareTextCommandDefault\capitaltie{\t}
     \DeclareTextCommandDefault\capitaltilde{\~}
211
```

File A: lttextcomp.dtx Date: 2020/04/29 Version v1.0d

```
\DeclareTextCommandDefault\newtie{\t}
213 \fi
    The next two symbols exist in some fonts (faked?), but we ignore that to keep the
subsets reasonable compact and most important linear.
214 \DeclareTextCommandDefault{\textlbrackdbl}
                                                    {\tc@check@symbol2\textlbrackdbl}
   \DeclareTextCommandDefault{\textrbrackdbl}
                                                     {\tc@check@symbol2\textrbrackdbl}
    Old style numerals are again in some fonts but using -0sF, etc. is the better approach
to get them, so we claim they aren't in sub-encoding 2 as that's true for most fonts.
   \DeclareTextCommandDefault{\texteightoldstyle}
                                                    {\tc@check@symbol2\texteightoldstyle}
   \DeclareTextCommandDefault{\textfiveoldstyle}
                                                     {\tc@check@symbol2\textfiveoldstyle}
   \DeclareTextCommandDefault{\textfouroldstyle}
                                                     {\tc@check@symbol2\textfouroldstyle}
   \DeclareTextCommandDefault{\textnineoldstyle}
                                                     {\tc@check@symbol2\textnineoldstyle}
   \DeclareTextCommandDefault{\textoneoldstyle}
                                                     {\tc@check@symbol2\textoneoldstyle}
   \DeclareTextCommandDefault{\textsevenoldstyle}
                                                    {\tc@check@symbol2\textsevenoldstyle}
   \DeclareTextCommandDefault{\textsixoldstyle}
                                                     {\tc@check@symbol2\textsixoldstyle}
   \DeclareTextCommandDefault{\textthreeoldstyle}
                                                    {\tc@check@symbol2\textthreeoldstyle}
   \DeclareTextCommandDefault{\texttwooldstyle}
                                                     {\tc@check@symbol2\texttwooldstyle}
  \DeclareTextCommandDefault{\textzerooldstyle}
                                                     {\tc@check@symbol2\textzerooldstyle}
    The next set of glyphs is special to TeX fonts (and available with a few older PS
fonts supported in the virtual fonts), but not any longer in the majority of fonts provided
through autoinst, so we pretend there aren't available in sub-encoding 2 and below.
   \DeclareTextCommandDefault{\textacutedbl}
                                                    {\tc@check@symbol2\textacutedbl}
   \DeclareTextCommandDefault{\textasciiacute}
                                                    {\tc@check@symbol2\textasciiacute}
   \DeclareTextCommandDefault{\textasciibreve}
                                                    {\tc@check@symbol2\textasciibreve}
   \DeclareTextCommandDefault{\textasciicaron}
                                                     {\tc@check@symbol2\textasciicaron}
   \DeclareTextCommandDefault{\textasciidieresis}
                                                    {\tc@check@symbol2\textasciidieresis}
   \DeclareTextCommandDefault{\textasciigrave}
                                                     {\tc@check@symbol2\textasciigrave}
   \DeclareTextCommandDefault{\textasciimacron}
                                                    {\tc@check@symbol2\textasciimacron}
   \DeclareTextCommandDefault{\textgravedbl}
                                                    {\tc@check@symbol2\textgravedbl}
   \DeclareTextCommandDefault{\texttildelow}
                                                     {\tc@check@symbol2\texttildelow}
    Finally those below are only available in CM-based fonts but in no font that has its
origin outside of the TFX world.
   \DeclareTextCommandDefault{\textbaht}
                                                     {\tc@check@symbol2\textbaht}
   \DeclareTextCommandDefault{\textbigcircle}
                                                     {\tc@check@symbol2\textbigcircle}
   \DeclareTextCommandDefault{\textborn}
                                                    {\tc@check@symbol2\textborn}
   \DeclareTextCommandDefault{\textcentoldstyle}
                                                    {\tc@check@symbol2\textcentoldstyle}
   \DeclareTextCommandDefault{\textcircledP}
                                                    {\tc@check@symbol2\textcircledP}
   \DeclareTextCommandDefault{\textcopyleft}
                                                     {\tc@check@symbol2\textcopyleft}
   \DeclareTextCommandDefault{\textdblhyphenchar}
                                                    {\tc@check@symbol2\textdblhyphenchar}
   \DeclareTextCommandDefault{\textdblhyphen}
                                                    {\tc@check@symbol2\textdblhyphen}
   \DeclareTextCommandDefault{\textdied}
                                                     {\tc@check@symbol2\textdied}
   \DeclareTextCommandDefault{\textdiscount}
                                                    {\tc@check@symbol2\textdiscount}
   \DeclareTextCommandDefault{\textdivorced}
                                                     {\tc@check@symbol2\textdivorced}
   \DeclareTextCommandDefault{\textdollaroldstyle}
                                                    {\tc@check@symbol2\textdollaroldstyle}
   \DeclareTextCommandDefault{\textguarani}
                                                     {\tc@check@symbol2\textguarani}
   \DeclareTextCommandDefault{\textleaf}
                                                     {\tc@check@symbol2\textleaf}
   \DeclareTextCommandDefault{\textlquill}
                                                     {\tc@check@symbol2\textlquill}
   \DeclareTextCommandDefault{\textmarried}
                                                     {\tc@check@symbol2\textmarried}
   \DeclareTextCommandDefault{\textmho}
                                                     {\tc@check@symbol2\textmho}
```

\DeclareTextCommandDefault{\textmusicalnote}

\DeclareTextCommandDefault{\textopenbullet}

\DeclareTextCommandDefault{\textnaira}

{\tc@check@symbol2\textmusicalnote}

{\tc@check@symbol2\textopenbullet}

{\tc@check@symbol2\textnaira}

```
255 \DeclareTextCommandDefault{\textpeso} {\tc@check@symbol2\textpeso}
256 \DeclareTextCommandDefault{\textpilcrow} {\tc@check@symbol2\textpilcrow}
257 \DeclareTextCommandDefault{\textrecipe} {\tc@check@symbol2\textrecipe}
258 \DeclareTextCommandDefault{\textrecipe} {\tc@check@symbol2\textrecipe}
259 \DeclareTextCommandDefault{\textrquill} {\tc@check@symbol2\textrquill}
260 \DeclareTextCommandDefault{\textservicemark} {\tc@check@symbol2\textservicemark}
261 \DeclareTextCommandDefault{\textsurd} {\tc@check@symbol2\textsurd}
```

The \textpertenthousand also belongs in this group but here we have a choice: in T1 there is definition for \textpertenthousand making the symbol up from % and \char 24 (twice) but in many fonts that char doesn't exist and the slot is reused for random ligatures. So better not use it because often it is wrong. But pointing to TS1 is also not great as only a few fonts have it as a real symbol, so we get a substitution to CM or LM.

Alternatively we could just state that the symbol is unavailable in those fonts. For now I substitute.

# 1.3 Sub-encoding 3

Sub-encoding 2 is the one where we loose many symbols. In the higher-numbered sub-encodings we see only a few dropped additionally.

```
264 \DeclareTextCommandDefault{\textlangle} {\tc@check@symbol3\textlangle}
265 \DeclareTextCommandDefault{\textrangle} {\tc@check@symbol3\textrangle}
```

### 1.4 Sub-encoding 4

```
266 \DeclareTextCommandDefault{\textcolonmonetary}
                                                    {\tc@check@symbol4\textcolonmonetary}
  \DeclareTextCommandDefault{\textdong}
                                                    {\tc@check@symbol4\textdong}
268 \DeclareTextCommandDefault{\textdownarrow}
                                                    {\tc@check@symbol4\textdownarrow}
269 \DeclareTextCommandDefault{\textleftarrow}
                                                    {\tc@check@symbol4\textleftarrow}
270 \DeclareTextCommandDefault{\textlira}
                                                    {\tc@check@symbol4\textlira}
271 \DeclareTextCommandDefault{\textrightarrow}
                                                    {\tc@check@symbol4\textrightarrow}
272 \DeclareTextCommandDefault{\textuparrow}
                                                    {\tc@check@symbol4\textuparrow}
273 \DeclareTextCommandDefault{\textwon}
                                                    {\tc@check@symbol4\textwon}
```

# 1.5 Sub-encoding 5 (most older PS fonts)

Most older PS fonts (supported in TEX since the early nineties when virtual fonts became available) are sorted under this sub-encoding. But in reality, many of them don't have all glpyhs that should be available in sub-encoding 5. Instead they show little squares, i.e., they produce "tofu" if you are unlucky.

But the coverage is so random that it is impossible to sort them properly and if we tried to ensure that they only typeset those glyphs that are really always available wouput put them all into sub-encoding 9 so that's a compromise really.

Modern fonts that don't typeset a tofu character if a glyph is missing are only cataloged as sub-encoding 5 if they really support of its glyph set.

```
274 \DeclareTextCommandDefault{\textestimated} {\tc@check@symbol5\textestimated}
275 \DeclareTextCommandDefault{\textnumero} {\tc@check@symbol5\textnumero}
```

#### Sub-encoding 6 1.6

```
276 \DeclareTextCommandDefault{\textflorin}
                                                    {\tc@check@symbol6\textflorin}
  \DeclareTextCommandDefault{\textcurrency}
                                                    {\tc@check@symbol6\textcurrency}
```

#### Sub-encoding 7 1.7

```
\verb|\DeclareTextCommandDefault{\textfractionsolidus}{\tc@check@symbol7} \\ textfractionsolidus{\textfractionsolidus} \\
\DeclareTextCommandDefault{\textohm}
                                                      {\tc@check@symbol7\textohm}
\DeclareTextCommandDefault{\textmu}
                                                       {\tc@check@symbol7\textmu}
\DeclareTextCommandDefault{\textminus}
                                                      {\tc@check@symbol7\textminus}
```

#### 1.8 Sub-encoding 8

```
282 \DeclareTextCommandDefault{\textblank}
                                                    {\tc@check@symbol{8}\textblank}
283 \DeclareTextCommandDefault{\textinterrobangdown}{\tc@check@symbol{8}\textinterrobangdown}
  \DeclareTextCommandDefault{\textinterrobang}
                                                    {\tc@check@symbol{8}\textinterrobang}
```

Fonts with this sub-encoding don't have a Euro symbol, but instead of substituting we fake it.

```
285 \DeclareTextCommandDefault{\texteuro}
```

{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@fake@euro{8}\texteuro}

#### 1.9 Sub-encoding 9 (most missing)

```
287 \DeclareTextCommandDefault{\textcelsius}{\tc@check@symbol{9}\textcelsius}
288 \DeclareTextCommandDefault{\textonesuperior}{\tc@check@symbol{9}\textonesuperior}
289 \DeclareTextCommandDefault{\textthreequartersemdash}{\tc@check@symbol{9}\textthreequartersemd
```

290 \DeclareTextCommandDefault{\textthreesuperior}{\tc@check@symbol{9}\textthreesuperior} 291 \DeclareTextCommandDefault{\texttwelveudash}{\tc@check@symbol{9}\texttwelveudash}

292 \DeclareTextCommandDefault{\texttwosuperior}{\tc@check@symbol{9}\texttwosuperior}

\DeclareTextCommandDefault{\textbardbl}{\tc@check@symbol{9}\textbardbl}

#### 2 Unicode engine specials

If we are using a unicode engine we handle some glyphs differently, so this here are the definitions for the Unicode encoding (overwriting the defaults above).

```
294 \ifx \Umathcode\@undefined \else
```

This set should be taken from TS1 encoding even if it means you get it from the default font for that encoding.

```
295 %\DeclareTextSymbol{\textcopyleft}{TS1}{171}
296 %\DeclareTextSymbol{\textdblhyphen}{TS1}{45}
297 %\DeclareTextSymbol{\textdblhyphenchar}{TS1}{127}
298 %\DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
299 %\DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
300 %\DeclareTextSymbol{\textleaf}{TS1}{108}
301 %\DeclareTextSymbol{\texttwelveudash}{TS1}{21}
302 %\DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}
```

If oldstyle numerals are asked for we just use \oldstylenums.

```
303 \DeclareTextCommand{\textzerooldstyle} \UnicodeEncodingName{\oldstylenums{0}}
304 \DeclareTextCommand{\textoneoldstyle} \UnicodeEncodingName{\oldstylenums{1}}
305 \DeclareTextCommand{\texttwooldstyle} \UnicodeEncodingName{\oldstylenums{2}}
306 \DeclareTextCommand{\textthreeoldstyle}\UnicodeEncodingName{\oldstylenums{3}}
307 \DeclareTextCommand{\textfouroldstyle} \UnicodeEncodingName{\oldstylenums{4}}
308 \DeclareTextCommand{\textfiveoldstyle} \UnicodeEncodingName{\oldstylenums{5}}
```

```
309 \DeclareTextCommand{\textsixoldstyle} \UnicodeEncodingName{\oldstylenums{6}}
310 \DeclareTextCommand{\textsevenoldstyle}\UnicodeEncodingName{\oldstylenums{7}}
  \DeclareTextCommand{\texteightoldstyle}\UnicodeEncodingName{\oldstylenums{8}}
312 \DeclareTextCommand{\textnineoldstyle} \UnicodeEncodingName{\oldstylenums{9}}
These have Unicode slots so this should be integrated into TU explictly
313 \DeclareTextSymbol{\textpilcrow}
                                          \UnicodeEncodingName{"00B6}
314 \DeclareTextSymbol{\textborn}
                                          \UnicodeEncodingName{"002A}
315 \DeclareTextSymbol{\textdied}
                                          \UnicodeEncodingName{"2020}
316 \DeclareTextSymbol{\textlbrackdbl}
                                          \UnicodeEncodingName{"27E6}
317 \DeclareTextSymbol{\textrbrackdbl}
                                          \UnicodeEncodingName{"27E7}
318 \DeclareTextSymbol{\textguarani}
                                          \UnicodeEncodingName{"20B2}
We could make \textcentoldstyle and \textdollaroldstyle point to dollar and cent
in the Unicode encoding
\UnicodeEncodingName{"00A2}
320 %\DeclareTextSymbol{\textdollaroldstyle}
                                                    \UnicodeEncodingName{"0024}
but I think it is better to pick them up from TS1 even if that usually means LMR fonts
  \DeclareTextSymbol{\textdollaroldstyle}{TS1}{138}
  \DeclareTextSymbol{\textcentoldstyle} {TS1}{139}
```

# 3 Font family sub-encodings setup

We declare the subsets for a good number of fonts in the kernel . . .

But first the default for anything that is not declared. We use 9 which is most likely much too conservative, but with the advantage that we aren't getting missing glyphs (or at least that this is very unlikely). For nearly all font in the  $T_EX$  Live distribution of 2019 "correct" classifications are given below, so that this default is only used for new font families, and over time the right classifications can be added here too.

% --- END of Unicode engines specials

```
324 \DeclareEncodingSubset{TS1}{?}{9}
```

323 **\fi** 

This first block contains the fonts that have been already supported by the textcomp package way back, i.e., the font families that have TEX support since the mid-nineties.

```

Below are the newer fonts that have support files for LATEX. With very few exceptions the classifications are done so that all characters are correctly produced (either being available in the font or substituted.

There are a few fonts that contain "tofu" squares in places (instead of a real glyph) and in a few cases some really seldom needed chars are unavailable, i.e., produce missing glyphs (to avoid that a large number of available chars are unnecessarily substituted.

```

# 5 The textcomp package

```
722 (*TS1sty)
723 \providecommand\DeclareRelease[3]{}
724 \providecommand\DeclareCurrentRelease[2]{}
725
726 \DeclareRelease{}{2018-08-11}{textcomp-2018-08-11.sty}
727 \DeclareCurrentRelease{}{2020-02-02}
728
729 \ProvidesPackage{textcomp}
730 [2020/02/02 v2.0n Standard LaTeX package]
```

A precaution in case this is used without rebuilding the format.

731 \NeedsTeXFormat{LaTeX2e}[2020/02/02]

```
This is implemented by defining the default subset:

732 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}

733 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}

734 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{8}}

735 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{9}}
```

The default is set up in the kernel is "safe" these days for unknown fonts but LaTeX has definitions for most families so it seldom applies.

If a different default is used then one needs to check the results to ensure that there aren't "missing glyphs".

The next set of options define the warning level (default in the kernel is info only). Using the package options you can change this behavior.

```
736 \DeclareOption{error}{\gdef\tc@errorwarn{\PackageError{textcomp}}}
737 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2{\PackageWarning{textcomp}{#1}}}
738 \DeclareOption{info}{\gdef\tc@errorwarn#1#2{\PackageInfo{textcomp}{#1}}}
739 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2{}}
```

The "force" option basically changes the sub-encoding to that of the default (which, unless changes, is 9 these days), i.e., it no longer depends on the font in use. This is mainly there because it might have been used in older documents, but not somehting that is recommended.

```
\DeclareOption{force}{%
       \def\CheckEncodingSubset#1#2#3#4#5{%
741
         \ifnum #4>%
              0\csname #2:?\endcsname
               \relax
         \expandafter\@firstoftwo
        \else
         \expandafter\@secondoftwo
747
       \fi
748
        {#1{#2}}{#3}%
749
        #5}%
750
751 }
  \ExecuteOptions{info}
  \ProcessOptions\relax
```

There is not much else to do nowadays, because everything is already set up in the LATEX kernel.

```
\tag{\Timestartailing \texts{textcomp.cfg}} \tag{\PackageInfo{textcomp}{Local configuration file used}}{} \
```

### 5.1 The old textcomp package code

This section contains the old code for the textcomp package and its documentation. It is only used if we roll back prior to 2020. Thus all the rest is mainly for historians. Note that the old code categorised in the sub-encodings only into 6 classes not 10.

```
757 (*TS1oldsty)
758 \ProvidesPackage{textcomp}
759 [2018/08/11 v2.0j Standard LaTeX package]
```

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file TS1enc.def and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

- #5 those TS1 symbols that are also in the ISO-Adobe character set; without textcurrency, which is often misused for the Euro. Older Type1 fonts from the non-TEX world provide only this subset.
- #4 = #5 + texteuro. Most newer fonts provide this.
- #3 = #4 + \textomega. Can also be described as  $TS1 \cap (ISO-Adobe \cup MacRoman)$ . (Except for the missing "currency".)
- #2 = #3 + textestimated + textcurrency. Can also be described as TS1  $\cap$  Adobe-Western-2. This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.
- #1 = TS1 without \textcircled and \t. These two glyphs are often not implemented and if their kernel defaults are changed commands like \copyright unnecessarily fail.
- #0 = full TS1

And here a summary to go in the transcript file:

```
\PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
      \space\space 5 = only ISO-Adobe without
761
                                 \string\textcurrency\MessageBreak
      \space\space 4 = 5 + \string\texteuro\MessageBreak
763
      \space\space 3 = 4 + \string\textohm\MessageBreak
764
      \space\space 2 = 3 + \noexpand\textestimated+
765
                                   \string\textcurrency\MessageBreak
766
      \space\space 1 = TS1 - \noexpand\textcircled-
767
                                                \string\t\MessageBreak
      \space\space 0 = TS1 (full)\MessageBreak
      Font families with sub-encoding setting implement\MessageBreak
      only a restricted character set as indicated.\MessageBreak
      Family '?' is the default used for unknown fonts.\MessageBreak
      See the documentation for details\@gobble}
```

\DeclareEncodingSubset

An encoding subset to which a font family belongs is declared by the command \DeclareEncodingSubset that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., cmr), and the subset encoding id as a third, (e.g., 0 for cmr).

The default encoding subset to use when nothing is known about the current font family is named ?.

```
774 \def\DeclareEncodingSubset#1#2#3{%
775 \@ifundefined{#1:#2}%
```

```
{\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
{\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%

\Qnamedef{#1:#2}{#3}}

\Qonlypreamble\DeclareEncodingSubset

(End definition for \DeclareEncodingSubset. This function is documented on page ??.)

The options for the package are the following:
```

safe for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

euro enables the "safe" symbols plus the \texteuro command. Most newer fonts provide this.

full enables all TS1 commands; useful only with fonts like EC or CM bright.

almostfull same as "full", except that \textcircled and \t are not redefined from their defaults to avoid that commands like \copyright suddenly no longer work.

force ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

\iftc@forced Switch used to implement the force option

780 \newif\iftc@forced \tc@forcedfalse

(End definition for \iftc@forced. This function is documented on page ??.)

This is implemented by defining the default subset:

- 781 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
- $\label{local-conding-subset-TS1} $$\DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}$$
- 783 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
- 784 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}

The default is "almostfull" which means that old documents will work except that \textcircled and \t will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn't implement these glyphs.

The "force" option simply sets the switch to true.

785 \DeclareOption{force}{\tc@forcedtrue}

The suggestions to user is to use the "safe" option always unless that balks in which case they could switch to "almostfull" but then better check their output manually.

- 786 \def\tc@errorwarn{\PackageError}
- 788 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2#3{}}
- 789 \ExecuteOptions{almostfull}
- 790 \ProcessOptions\relax

\CheckEncodingSubset

The command \CheckEncodingSubset will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either \UseTextSymbol, \UseTextAccent depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of \CheckEncodingSubset.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute #1{#2}#5 otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

### 791 \iftc@forced

If the "force" option was given we always use the default for testing against.

In normal circumstances the test is a bit more complicated: first check if there exists a macro  $\langle arg2 \rangle$ :  $\langle current$ -family $\rangle$  and if so use that value to test against, otherwise use the default to test against.

```
\def\CheckEncodingSubset#1#2#3#4#5{%
                   \ifnum #4>%
                      \expandafter\ifx\csname #2:\f@family\endcsname\relax
                        0\csname #2:?\endcsname
            807
                      \else
                        \csname #2:\f@family\endcsname
                      \fi
            810
                  \relax
            811
                  \expandafter\@firstoftwo
            812
            813
                  \expandafter\@secondoftwo
            814
                 {#1{#2}}{#3}%
                 #5%
            817
            818 }
            819 \fi
            (End definition for \CheckEncodingSubset. This function is documented on page ??.)
\tc@subst
            820 \def\tc@subst#1{%
                  \tc@errorwarn{textcomp}%
            821
                   {Symbol \string#1 not provided by\MessageBreak
            822
                    font family \f@family\space
            823
                    in TS1 encoding.\MessageBreak Default family used instead}\@eha
                 \bgroup\fontfamily\textcompsubstdefault\selectfont#1\egroup
            825
            826 }
```

File A: lttextcomp.dtx Date: 2020/04/29 Version v1.0d

(End definition for \tc@subst. This function is documented on page ??.)

\tc@error

\tc@error is going to be used in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```
827 % error commands take argument:
828 % #1 symbol to be used
829 \def\tc@error#1{%
830  \PackageError{textcomp}% % should be latex error if general
831  {Accent \string#1 not provided by\MessageBreak
832  font family \f@family\space
833  in TS1 encoding}\@eha
834 }
```

(End definition for \tc@error. This function is documented on page ??.)

\tc@fake@euro

\tc@fake@euro is an example of a "fake" definition to use in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a "C" with a "=".

```
\def\tc@fake@euro#1{%
      \leavevmode
836
      \PackageInfo{textcomp}{Faking \noexpand#1for font family
837
                               \f@family\MessageBreak in TS1 encoding}%
838
      \valign{##\cr
839
         \vfil\hbox to 0.07em{\dimen@\f@size\p@
840
                                \math@fontsfalse
841
                                \fontsize{.7\dimen0}\z0\selectfont=\hss}%
         \vfil\cr%
843
         \hbox{C}\crcr

      ጉ%
```

 $(\textit{End definition for $\backslash $tc@fake@euro.$ This function is documented on page \ref{eq:constraints}.)}$ 

\tc@check@symbol \tc@check@accent

These are two abbreviations that we use below to check symbols and accents in TS1. Only there to save some space, e.g., we can then write

DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}

to ensure that **\textcurrency** is only typeset if the current font has a TS1 subset id of less than 3. Otherwise **\tc@error** is called telling the user that for this font family **\textcurreny** is not available.

```
\label{tc@check@symbol{CheckEncodingSubset} with the conting Subset \end{TS1} \end{TS2} \end{TS2} \end{TS2} \end{TS2} \end{TS2} \end{T
```

(End definition for  $\tc@check@symbol$  and  $\tc@check@accent$ . These functions are documented on page  $\ref{eq:check@symbol}$ .)

We start with the commands that are "safe" and which can be unconditionally set up, first the accents...

1030
        {\tc@check@symbol2\textsurd}
1031
```

The \textcircled and \t are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the math font encodings, i.e., the third argument to \CheckEncodingSubset uses \UseTextAccent to get them from there.

```
1032 \DeclareTextCommandDefault{\textcircled}
1033 {\CheckEncodingSubset\UseTextAccent{TS1}%
1034 {\UseTextAccent{OMS}}1\textcircled}
1035 \DeclareTextCommandDefault{\t}
1036 {\CheckEncodingSubset\UseTextAccent{TS1}%
1037 {\UseTextAccent{OML}}1\t}
```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimised for this encoding (and not for the default encoding).

```
1038 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to IFTEX which will prevent the usage of the TS1 versions. So we better get rid of them:

```
1039 \UndeclareTextCommand{\textsterling}{0T1}
1040 \UndeclareTextCommand{\textdollar} {0T1}
```

Similar declarations should probably be made for other encodings like 0T4 if they are in use.

```
1041 %\UndeclareTextCommand{\textsterling}{0T4}
1042 %\UndeclareTextCommand{\textdollar} {0T4}
```

From the T1 encoding there are two candidates for removal: ‰ and ‱ since these are both constructed from % followed by a tiny 'o' rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in ‰ rather than ‰ while the real glyph (at least for \textperthousand) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for \textperthousand but keeping the one for \textpertenthousand. This will have the effect that with Computer Modern fonts everything will come out (although ‰ and ‱ are not taken from the same physical font) and with PostScript fonts ‰ will come out correctly while ‱ will most likely look like ‰ — which is probably an improvement over just getting a single '∎' to indicate a completely missing glyph, which would happen if we also 'undeclared' \textpertenthousand.

```
1043 \UndeclareTextCommand{\textperthousand}{T1}
1044 \UndeclareTextCommand{\textpertenthousand}{T1}
```

### 5.1.1 Supporting oldstyle digits

```
\DeclareRobustCommand\oldstylenums[1]{%
    \begingroup
1046
      \ifmmode
       \mathgroup\symletters #1%
      \else

       \CheckEncodingSubset\@use@text@encoding{TS1}%
1050
           {\PackageWarning{textcomp}%
1051
              {Oldstyle digits unavailable for
1052
               family \f@family.\MessageBreak
1053
               Lining digits used instead}}%
1054
           \tw@{#1}%
1055
       \fi
1056
    \endgroup
1058 }
```

### 5.1.2 Subset encoding defaults

For many font families commonly used in the TEX world we provide the subset encoding data here. Users can add additional font families in the file textcomp.cfg if they own other fonts.

However, if the option "forced" was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

1060 \DeclareEncodingSubset{TS1}{cmr} {0}
```

```
1060 \DeclareEncodingSubset{TS1}{cmr}
   \DeclareEncodingSubset{TS1}{cmss}
                                          {0}
1062 \DeclareEncodingSubset{TS1}{cmtt}
                                          {0}
1063 \DeclareEncodingSubset{TS1}{cmvtt}
                                          {0}
1064 \DeclareEncodingSubset{TS1}{cmbr}
                                          {0}
   \DeclareEncodingSubset{TS1}{cmtl}
                                          {0}
   \DeclareEncodingSubset{TS1}{ccr}
                                          {0}
     PSNFSS fonts:
1067 \DeclareEncodingSubset{TS1}{ptm}
                                          {4}
   \DeclareEncodingSubset{TS1}{pcr}
                                          {4}
   \DeclareEncodingSubset{TS1}{phv}
                                          {4}
1070 \DeclareEncodingSubset{TS1}{ppl}
                                          {3}
```

# File B

# ltpageno.dtx

# 1 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that \c@page contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. \c@page is defined to be \count0, rather than a count assigned by \newcount.

\pagenumbering

The user sets the pagenumber style with the  $\pagenumbering{\langle foo\rangle}\$  command, which sets the page counter to 1 and defines  $\$  be  $\$  For example,  $\pagenumbering{roman}\$  causes pages to be numbered i, ii, etc.

```
1 (*2ekernel)
2 \message{page nos.,}
3 \countdef\c@page=0 \c@page=1
4 \def\cl@page{}
5 \def\pagenumbering#1{%
6 \global\c@page \@ne \gdef\thepage{\csname @#1\endcsname}
7 \c@page}}
8 (/2ekernel)
```

# File C

# ltxref.dtx

# 1 Cross Referencing

The user writes  $\label{\langle foo \rangle}$  to define the following cross-references:

 $\mathbf{ref}\{\langle foo\rangle\}$ : value of most recently incremented referenceable counter. in the current environment. (Chapter, section, theorem and enumeration counters are referenceable, footnote counters are not.)

 $\pageref{foo}$ : page number at which  $\label{foo}$  command appeared. where foo can be any string of characters not containing '\', '{'} or '}'.

Note: The scope of the \label command is delimited by environments, so \begin{theorem} \label{foo} ... \end{theorem} \label{bar} defines \ref{foo} to be the theorem number and \ref{bar} to be the current section number.

Note: \label does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

# 1.1 Cross Referencing

```
Historical LATEX 2.09 comments (not necessarily accurate any more):
     1 (*2ekernel)
    2 \message{x-ref,}
       This is implemented as follows. A referencable counter CNT is
       incremented by the command \refstepcounter{CNT} , which sets
       \colone{line} 
                                                                                                                                                                                                                  The command
       \label{FOO} then writes the following on file \@auxout :
                                 \newlabel{FOO}{{eval(\@currentlabel)}{eval(\thepage)}}
       ref{FOO} ==
                BEGIN
                        if \r@foo undefined
                                 then @refundefined := G T
                                                          Warning: 'reference foo on page ... undefined'
                                                     \@car \eval(\r@F00)\@nil
                                 else
                        fi
                END
       \pageref{foo} =
                BEGIN
                        if \r@foo undefined
                                 then @refundefined := G T
                                                          Warning: 'reference foo on page ... undefined'
                                                     \@cdr \eval(\r@F00)\@nil
                        fi
```

END

End of historical LATEX 2.09 comments.

\labelformat

A reference via \ref produces by default the data associated with the corresponding \label command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as "equation (number)", one has to code "equation (\ref \{key\})". With \labelformat there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```
\labelformat{section}{section~#1}
\labelformat{equation}{equation~(#1)}}
```

\Ref

A side effect of using \labelformat is that, depending on the defined formatting, it becomes impossible to use \ref at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command \Ref that behave like \ref except that it uppercases the first token of the generated string.

To make \Ref work properly the very first token in the second argument of \labelformat has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write \labelformat{figure}{{\'a}bra~\thefigure} or use \labelformat{figure}{{\'a}bra~\thefigure} which avoids the brace problem.

\G@refundefinedtrue \@refundefined This does not save on name-space (since \G@refundefinedfalse was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, \G@refundefinedtrue does not correspond to an \if command, and there is no matching ...false. It would be more natural to call the command \G@refundefined (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a \ref-like command that mimicked the definition of \ref, calling \G@refundefinedtrue. Inspection of the TEX archives revealed several such packages, and so this command has been named ...true so that the definition of \ref need not be changed, and the packages will work without change.

                                   {\refstepcounter}{Add \@currentcounter}%
```

\refstepcounter Step the counter and allow for labels to point to its current value.

- 40 \def\@currentcounter{}
- 41 \def\refstepcounter#1{\stepcounter{#1}%
- \edef\@currentcounter{#1}%
- \protected@edef\@currentlabel

By generating the second c<br/>sname first the  $\pq...$  command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that \csname the#1\endcsname is turned into a single token before \pc... is expanded further. This way, if the \pc... command is a macro with one argument it will receive \the.... With the original kernel code (i.e., without the \expandafter) it will instead pick up \csname which would be disastrous.

Using \expandafter instead of braces delimiting the argument is better because, assuming that the \pc... command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by \the... and surrounding glyphs.

```
44
         {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
45 }
```

(End definition for \refstepcounter. This function is documented on page ??.)

\labelformat

A shortcut to set the \p@... macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

46 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}

(End definition for \labelformat. This function is documented on page ??.)

\Ref This macro expands the result of \ref and then uppercases the first token. Only useful if the label was generated via \labelformat and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., \"a instead of a UTF-8 character like ä) one has to surround everything that needs uppercasing in a brace group in the definition of \labelformat. 17

- 47 \DeclareRobustCommand\Ref[1]{\protected@edef\@tempa{\ref{#1}}%

#### 1 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including document, The math environments and related commands, the 'flushing' environments, (center, flushleft, flushright), and verbatim.

```
1 (*2ekernel)
2 \message{environments,}
```

#### **Environments**

\begin{foo} and \end{foo} are used to delimit environment foo.

\begin{foo} starts a group and calls \foo if it is defined, otherwise it does nothing. \end{foo} checks to see that it matches the corresponding \begin and if so, it calls \endfoo and does an \endgroup. Otherwise, \end{foo} does nothing.

If \end{foo} needs to ignore blanks after it, then \endfoo should globally set the

```
@ignore switch true with \@ignoretrue (this will automatically be global).
    NOTE: \@@end is defined to be the \end command of TEX82.
    \enddocument is the user's command for ending the manuscript file.
    \stop is a panic button — to end TeX in the middle.
Historical LATEX 2.09 comments (not necessarily accurate any more):

#### \@enddocument@kernel@warnings

#### 42 \def\@enddocument@kernel@warnings{%

First we check for font size substitution bigger than \fontsubfuzz. The \relax is necessary because this is a macro not a register.

43 \ifdim \font@submax >\fontsubfuzz\relax

In case you wonder about the \@gobbletwo inside the message below, this is a horrible hack to remove the tokens \on@line. that are added by \@font@warning at the end.

```
\OfontOwarning{Size substitutions with differences\MessageBreak
44
45
                  up to \font@submax\space have occurred.\@gobbletwo}%
```

The macro \@defaultsubs is initially \relax but gets redefined to produce a warning if there have been some default font substitutions.

#### \@defaultsubs

The macro \@refundefined is initially \relax but gets redefined to produce a warning if there are undefined refs.

#### \@refundefined

If a label is defined more than once, \@tempswa will always be true and thus produce a "Label(s) may ..." warning. But since a rerun will not solve that problem (unless one uses a package like varioref that generates labels on the fly), we suppress this message.

```
\if@filesw
49
       \ifx \@multiplelabels \relax
         \if@tempswa
           \@latex@warning@no@line{Label(s) may have changed.
52
                Rerun to get cross-references right}%
53
         \fi
54
       \else
55
         \@multiplelabels
56
       \fi
57
       \ifx \@extra@page@added \relax
58
            \@latex@warning@no@line{Temporary extra page added at the end.
59
                Rerun to get it removed}%
       \fi
```

We could think of adding a warning that nothing can be corrected while \nofiles is in force. In the past the warnings related to the aux file are simply suppressed in this case.

```
62
       \fi
63 }

```
108 \def\@testdef #1#2#3{%
109 \def\reserved@a{#3}\expandafter \ifx \csname #1@#2\endcsname
110 \reserved@a \else \@tempswatrue \fi}
```

(End definition for  $\ensuremath{\texttt{VCtestdef}}$ . This function is documented on page  $\ref{thm:page}$ .)

Reading data from auxiliary files (like .toc normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by TEX during that process.

However, especially the .toc file might be read in L-R mode (in cases the **\tableofcontents** attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using \endlinechar=-1 but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used \nofiles to preserve it.

So the approach taken instead is this:

• \addcontentsline adds the command \protected@file@percent to the end of the second argument of \@writefile that is written to the .aux. As the name indicates this is a protected macro so it doesn't change if it is written out.

- When the .aux is read back in at the end of the run, \@writefile is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change \@writefile slightly: basically it looks at the second argument and if the last token in there is \protected@file@percent then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued \addtocontents, or from some package that uses \@writefile for writing its own files) then the command behaves exactly as before.

\protected@file@percent

Dummy cs to be replaced by a percent sign inside \@writefile. If it survives (when used incorrectly) it will expand to nothing in a typsetting context.

(End definition for \protected@file@percent. This function is documented on page ??.)

\add@percent@to@temptokena

Helper function which is used to inspect a sequence of tokens (the second argument of \@writefile and it the last token is \protected@file@percent it will replace it by a harmless percent. The result is saved in \@temptokena for later use.

When we call this macro in \@writefile we stick in \@empty at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The \expandafter then expands this extra token away again.

```
{\expandafter\ifx\expandafter X\detokenize{#2}X\expandafter\dont@add@percent@to@temptokenize{#1}}

\expandafter\do@add@percent@to@temptokena\fi{#1}}

\long\def\dont@add@percent@to@temptokena#1{%
```

122 \@temptokena\expandafter{#1}}

latexrelease will read this code in high-speed mode in certain situations. During that it will only look for \if tests but not actually execute the \catcode change above. As a result it will drop anything after the % character in the definition. Therefore the \fi needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```

```

Before the \document code is executed we have to first undo the \endgroup as there should be none for this environment to avoid that changes on top-level unnecessarily go to T<sub>F</sub>X's savestack, and we have to initialize all hooks in the hook system. So we need to test for this environment name. But once it has be found all this testing is no longer needed and so we redefine \@execute@begin@hook to simply use the hook.

```

```

A version that doesn't start out with \relax when in typesetting mode would be the following, but since \begin issues a \begingroup it wouldn't help much with respect to allowing things like \noalign or \multicolumn inside.

```
225 %\edef\begin
      {\unexpanded{%
226 %
227 %
           \ifx\protect\@typeset@protect
228 %
             \expandafter\@gobble
229 %
           \fi
           \protect
230 %
231 %
         }%
232 %
       \expandafter\noexpand\csname begin \endcsname
233 % }
234 %\@namedef{begin }#1{%
      \@ifundefined{#1}%
235 %
        {\def\reserved@a{\@latex@error{Environment #1 undefined}\@eha}}%
236 %
        {\def\reserved@a{\def\@currenvir{#1}%
237 %
         \edef\@currenvline{\on@line}%
238 %
239 %
         \csname #1\endcsname}}%
240 %
      \@ignorefalse
      \begingroup\@endpefalse\reserved@a}
```

While \begin was made robust simply by using \DeclareRobustCommand we need to be a bit more subtle with \end as there are packages out there that try to look into the top-level contents of \end{foo} (that is at the expansion of \end{foo}) to see if it contains certain macros. This is done by hitting \end{foo} with three \expandafters, the first to get

\csname endfoo\endcsname \@checkend{foo}% etc.

the second to expand the \csname, i.e., to get to

```
\endfoo \@checkend{foo}% etc.
```

and the third to finally get to the top-level content of \endfoo, i.e.

```
<top-level content of \endfoo> \@checkend{foo}\% etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of \end should either produce \protect\end\_\( \) (when not doing typesetting) or it should produce \end\_\( \) (without the \protect) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as \end\_\( \) (which is the original fragile definition of \end) when you expand either of them twice, i.e.,

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use \romannumeral to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many \expandafters inside that are all going to be executed when \romannumeral is hit by a single \expandafter.

```

#### 1.3 Verbatim

391 \message{verbatim,}

The verbatim environment uses the fixed-width \ttfamily font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters \, \{, \\$, etc. are \catcode'd to 'other'.

The command \verb produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., \verb #...# takes '...' as its argument, and sets it verbatim in \ttfamily font.

The \*-variants of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

### \@vobeyspaces

\@xobeysp

\@@par

\@setupverbvisiblespace

In pdfTEX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In XeTEX or LuaTEX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of \verbvisiblespace and if it is \asciispace we assume that the char32 can be used (e.g., in pdfTEX). We then redefine \@xobeysp so that after running \@vobeyspaces we get characters from slot 32 for each active space.

```
459 \def\@setupverbvisiblespace{%

460 \ifx\verbvisiblespace\asciispace

461 \let\@xobeysp\asciispace

462 \else
```

Otherwise we measure the width of a character in the mon-spaced current font and place a \verbvisiblespace into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing \verbvisiblespace one could use, for example, the \textvisiblespace of the current typewriter font.

```
\setbox\z@\hbox{x}\%
\setbox\@verbvisiblespacebox\hbox to\wd\z@{\hss\verbvisiblespace\hss}\%
\def\@xobeysp{\leavevmode\copy\@verbvisiblespacebox}\%
\fi
466 \fi
467 }
```

(End definition for \@setupverbvisiblespace. This function is documented on page ??.)

\@verbvisiblespacebox

The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

468 \newbox\@verbvisiblespacebox

(End definition for \@verbvisiblespacebox. This function is documented on page ??.)

verbatim\*

For verbatim\* we also set up the correct visible space character definition and then run \@vobeyspaces. As this code is not called as part of the normal verbatim environment (the method is done the other way around this time) we don't have to check if space is already active—it shouldn't be.

```
469 \@namedef{verbatim*}{\@verbatim
     \@setupverbvisiblespace
470
     \frenchspacing\@vobeyspaces\@sxverbatim}

485 (*2ekernel)
```

\@sverb Definitions of \@sverb and \@verb changed so \verb+ foo+ does not lose leading blanks when it comes at the beginning of a line. Change made 24 May 89. Suggested by Frank Mittelbach and Rainer Schöpf.

```
486 \(\sqrt{2ekernel}\)
487 \(\sqrt{*2ekernel | latexrelease}\)
488 \(\sqrt{latexrelease}\)\)
489 \(\sqrt{latexrelease}\)
480 \(\sqrt{latexrelease}\)
```

If the users types \verb !~! foo then surprisingly we would get the space as the delimiter and thus "!~!foo" in the output. To avoid this scenario we check if #1 has the character code of a space, if so we recurse otherwise we call \@@sverb (which is the original definition of \@sverb.

```
490 \def\@sverb#1{\if\noexpand#1 \expandafter\@sverb\else\@@sverb{#1}\fi}

491 \def\@gsverb#1{%

## 1.3 External options to the standard document classes

#### 1.3.1 Left equation numbering

\@eqnnum

To put the equation number on the left side of an equation we have to use a little trick. The number is shifted \displaywidth to the left inside a box of (approximately) zero width. This fails when the quation is too wide, the equation number than may overprint the equation itself.

```
420 \langle *leqno \rangle
421 \renewcommand\eqnnum{\hb@xt@.01\p@{}%}
422 \rlap{\normalfont\normalcolor}
423 \hskip -\displaywidth(\theequation)}
424 \langle /leqno \rangle
```

 $(\textit{End definition for } \backslash \texttt{Ceqnnum}. \ \textit{This function is documented on page \ref{eq:normalized}.})$ 

# 1.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of  $\LaTeX$  2 $\varepsilon$ 's displayed math environments.

\mathindent

The amount of indentation of the equations is stored in a register.

```
425 (*fleqn)
426 \newskip\mathindent
```

The setting of \mathindent has to be deferred until the class file has been processed, because \leftmargini is still 0pt wide at the moment fleqn.clo is read in.

```
427 \AtEndOfClass{\mathindent\leftmargini}
```

 $(\mathit{End \ definition \ for \ } \mathtt{Mathindent}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:constraint}?}.)$ 

\[ Begin display math;

## 1 List, and related environments

The generic commands for creating an indented environment – enumerate, itemize, quote, etc – are:

```
\left\langle LABEL\right\rangle \left\langle COMMANDS\right\rangle \right\rangle ... \endlist
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command \item[ITEMLABEL] which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the \list command is used as the item label.

The label is formed by putting  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$  in an hbox whose width is either its natural width or else  $\mathbf{L}(ITEMLABEL)$ .

```
\mbox{\mbox{\tt makelabel}} {\mbox{\tt AR}G} == {\rm BEGIN \mbox{\tt hfil}} {\rm ARG \mbox{\tt END}}
```

which, for a label of width less than \labelwidth, puts the label flushright, \labelsep to the left of the item's text. However, \makelabel can be \let to another command by the \list's COMMANDS argument.

A  $\scalebox{\s$ 

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the \end command. This is accomplished by the \@endparenv command.

Blank lines are ignored every other reasonable place-i.e.:

- Between the \begin{list} and the first \item,
- Between the \item and the text of that item.
- Between the end of the last item and the \end{list}.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting \quotation == \list{}{...}\item\relax. (Note the \relax, there in case the first character in the environment is a '['.') The spacing parameters provide a great deal of flexability in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

 $\$  causes no indentation of left margin

 $\$  see below for precise effect this has.

\itemindent = 0: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have \parindent indentation. To give first paragraph same indentation, set \itemindent = \parindent before the \item[].

Every \item in a trivlist environment must have an argument—in many cases, this will be the null argument (\item[]). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an \item command in an enclosing list.

#### 1.1 List and Trivlist

The following variables are used inside a list environment:

**\Ctotalleftmargin** The distance that the prevailing left margin is indented from the outermost left margin,

\linewidth The width of the current line. Must be initialized to \hsize.

\@listdepth A count for holding current list nesting depth.

\makelabel A macro with a single argument, used to generate the label from the argument (given or implied) of the \item command. Initialized to \@mklab by the \list command. This command must produce some stretch—i.e., an \hfil.

\@inlabel A switch that is false except between the time an \item is encountered and the time that TEX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of \everypar.

\box\@labels When @inlabel = true, it holds the labels to be put out by \everypar.

@noparitem A switch set by \list when @inlabel = true. Handles the case of a \list
being the first thing in an item.

**@noparlist** A switch set true for a list that begins an item. No \topsep space is added before or after \item's such a list.

Onewlist Set true by \list, set false by the first text (by \everypar).

**Cnoitemarg** Set true when executing an \item with no explicit argument. Used to save space. To save time, make two separate \Citem commands.

**Combrlist** Set true by \usecounter command, causes list to be numbered.

\@listctr \def'ed by \usecounter to name of counter.

**\@noskipsec** A switch set true by a sectioning command when it is creating an in-text heading with \everypar.

Throughout a list environment, \hsize is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use \linewidth instead of \hsize.

Here are the parameters of a list that can be set by commands in the \list's COMMANDS argument. These parameters are all TeX skips or dimensions (defined by \newskip or \newdimen), so the usual TeX or LaTeX commands can be used to set them. The commands will be executed in vmode if and only if the \list was preceded by a \par (or something like an \end{list}), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

## 1.2 Vertical Spacing (skips)

**\topsep:** Space between first item and preceding paragraph.

\partopsep: Extra space added to \topsep when environment starts a new paragraph (is called in vmode).

\itemsep: Space between successive items.

\parsep: Space between paragraphs within an item - the \parskip for this environment.

#### 1.3 Penalties

\Obeginparpenalty: put at the beginning of a list

\@endparpenalty: put at end of list

\@itempenalty: put between items.

## 1.4 Horizontal Spacing (dimens)

\leftmargin: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

\rightmargin: analogous.

\listparindent: extra indentation at beginning of every paragraph of a list except the one started by the \item command. May be negative! Usually, labeled lists have \listparindent equal to zero.

\itemindent: extra indentation added right BEFORE an item label.

\labelwidth: nominal width of box that contains the label. If the natural width of the label <= \labelwidth, then the label is flushed right inside a box of width \labelwidth (with an \hfil). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

\labelsep: space between end of label box and text of first item.

### 1.5 Default Values

Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, one of the commands \@listi, \@listii, ..., \@listvi is called, depending upon the current level of the list. The \@list ... commands should be defined by the document style. A convention that the document style should follow is to set \leftmargin to \leftmargini,..., \leftmarginvi for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. Historical \mathbb{L}TEX 2.09 comments (not necessarily accurate any more):

```
\list{LABEL}{COMMANDS} ==
BEGIN
if \@listdepth > 5
    then LaTeX error: 'Too deeply nested'
    else \@listdepth :=G \@listdepth + 1
```

```
fi
          \rightmargin

#### \@trivlist

Because \par is sometimes made a no-op it is possible for a missing \item to produce a loop that does not fill memory and so never gets trapped by TeX. We thus need to trap this here by seting \par to count the number of times a paragraph ii is called with no progress being made started.

(End definition for \endtrivlist. This function is documented on page ??.)

### \@endparenv \@doendpe

\if@endpe \@endpefalse

\@endpeltrue

To suppress the paragraph indentation in text immediately following a paragraph-making environment, \everypar is changed to remove the space, and \par is redefined to restore \everypar. Instead of redefining \par and \everypar, \@endparenv was changed to set the @endpe switch, letting \end redefine \par and \everypar.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

```
123 \def\@endparenv{%
124 \addpenalty\@endparpenalty\addvspace\@topsepadd\@endpetrue}
125 \def\@doendpe{\Clubpenalty fix}%
126 \def\@doendpe{\Cendpetrue
127 \def\par{\Crestorepar
```

If a section heading changes \clubpenalty to keep lines after it together then this modification is restored via the \everypar mechanism at the start of the next paragraph. As we destroy the contents of this token here we explicitly set \clubpenalty back to its default.

```
\clubpenalty\@clubpenalty
\everypar{}\par\@endpefalse}\everypar
```

Use \setbox0=\lastbox instead of \hskip -\parindent so that a \noindent becomes a no-op when used before a line immediately following a list environment(23 Oct 86).

This \if@inlabel check is needed in case an item starts of inside a group so that \everypar does not become empty outside that group.

```
\if@inlabel
183 \global\@inlabelfalse
```

The paragraph indent is now removed by using \setbox... since this makes \noindent a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an hskip to a kern to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in raggedright setting. If \noindent was used after \item want to cancel the \itemindent skip. This case can be detected as the indentation box will be void.

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of \clubpenalty it is local so will have no effect if the item starts in a group.

Only resetting \@nobreak when it is true is now essential since now it is sometimes set locally.

### 1.6 Itemize and Enumerate

Enumeration is done with four counters: enumi, enumii, enumii and enumiv, where enumN controls the numbering of the Nth level enumeration. The label is generated by the commands \labelenumi ... \labelenumiv, which should be defined by the document style. Note that \p@enumN\theenumN defines the output of a \ref command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumii{(\theenumii)}
```

which will print the labels as '(a)', '(b)', ... and print a \ref as '3a'.

The item numbers are moved to the right of the label box, so they are always a distance of **\labelsep** from the item.

\@enumdepth holds the current enumeration nesting depth.

Itemization is controlled by four commands: \labelitemi, \labelitemii, \labelitemiii, and \labelitemiv. To cause the second-level list to be bulleted, you just define \labelitemii to be •. \@itemspacing and \@itemdepth are the analogs of \@enumspacing and \@enumdepth.

```
Historical \LaTeX 2.09 comments (not necessarily accurate any more): 
\enumerate == BEGIN
```

#### File G

# ltboxes.dtx

## 1 LATEX Box commands

\makebox

 $\mbox[\langle wid \rangle][\langle pos \rangle]\{\langle obj \rangle\}$ 

Puts  $\langle obj \rangle$  in an \hbox of width  $\langle wid \rangle$ , positioned by  $\langle pos \rangle$ .

The possible  $\langle pos \rangle$  are:

- s stretched,
- 1 flushleft,
- r flushright,
- c (default) centred.

If  $\langle wid \rangle$  is missing, then  $\langle pos \rangle$  is also missing and  $\langle obj \rangle$  is put in an \hbox of its natural width.

```
\mbox(\langle x \rangle, \langle y \rangle) [\langle pos \rangle] \{\langle obj \rangle\}
```

Puts  $\langle obj \rangle$  in an \hbox of width x \* length and height y \* length.  $\langle pos \rangle$  arguments are s, l, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the bottom of the text as documented. If you want to align on the baseline use \makebox( , )[b]{\raisebox{0pt}[height][0pt]{xyz}}} or \makebox( , )[b]{\smash{xyz}}

\mbox

 $\mbox{\langle obj\rangle}$  The same as  $\mbox{\langle obj\rangle}$ , but is more efficient as no checking for optional arguments is done.

\newsavebox \savebox

\newsavebox{\cmd}: If \cmd is undefined, then defines it to be a TEX box register.
\savebox{\cmd} ...: \cmd is defined to be a TEX box register, and the '...' are any
\makebox arguments. It is like \makebox, except it doesn't produce text but saves the
value in \box \cmd.

\sbox

 $\scalebox{\langle cmd\rangle}{\langle obj\rangle}$  is an efficient abbreviation for  $\scalebox{\langle cmd\rangle}{\langle obj\rangle}$ .

lrbox

 $\label{lem:local_local} $$ \operatorname{lrbox}_{\langle cmd\rangle}_{\langle text\rangle} \in \mathbb{L} $$ is equivalent to $$ \sox_{\langle cmd\rangle}_{\langle text\rangle}$$$ 

except that any white space at the beginning and end of  $\langle text \rangle$  is ignored.

\framebox

\framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text - except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.

\fbox \parbox  $\langle obj \rangle$  is an abbreviation for  $\langle obj \rangle$ .

\par \\ \-\', \' \=

```
Resets the following parameters:
                  \parindent
                                                                     added 20 Jan 87
                  \parskip
                                        = 0pt
                  \linewidth
                                        = \hsize
                  \cdot 0totalleftmargin = 0pt
                  \leftskip
                                            0pt
                  \rightskip
                                            0pt
                  \@rightskip
                                        = 0pt
                  \parfillskip
                                        = 0pt plus 1fil
                  \lineskip
                                        = \normallineskip
                  \baselineskip
                                        = \normalbaselineskip
                 Calls \sloppy
                 Note: \@arrayparboxrestore same as \@parboxrestore but it doesn't restore \\.
                 minipage: Similar to \parbox, except it also makes this look like a page by setting
 minipage
                 changes footnotes by redefining:
            \ensuremath{\verb|Compfn|} == mpfootnote
            \thempfn == \thempfootnote
            \@footnotetext == \@mpfootnotetext
                 resets the following list environment parameters:
            \@listdepth == \@mplistdepth
            where \@mplistdepth is initialized to zero,
                 and executes \@minipagerestore to allow the document style to reset any other
            parameters it desires. It sets @minipage true, and resets \everypar to set it false. This
            switch keeps \addvspace from putting space at the top of a minipage.
                 Change added 24 May 89: \minipage sets @minipage globally; \endminipage resets
     \rule
                 \underline{\langle text \rangle}: Makes an underlined abox with \langle text \rangle in it.
\underline
 \raisebox
                 Raises \langle box \rangle up by \langle distance \rangle length (down if \langle distance \rangle negative). Makes T<sub>F</sub>X think that
            the new box extends \langle height \rangle above the line and \langle depth \rangle below, for a total vertical length
            of \langle height \rangle + \langle depth \rangle. Default values of \langle height \rangle & \langle depth \rangle = \text{actual height and depth of}
            box in new position.

#### \@arrayparboxrestore

Restore various paragraph parameters.

272 (/2ekernel)

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \set@nobreak; otherwise this command will be redundant.

\@finalstrut

This macro adds a special strut the *depth* of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in 'p' columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect \prevdepth to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular 'p' columns.

The  $\nobel{local}$  was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

- 437 \def\@finalstrut#1{%
- \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}

(End definition for \Ofinalstrut. This function is documented on page ??.)

#### 1.1 Some low-level constructs

The following commands are basically inherited from plain TEX.

```
These macros place text on a full line either centred or left or right adjusted.

## 1 Tabbing, Tabular and Array Environments

This section deals with 'Lining It Up in Columns'. First the tabbing environment is defined, and then in second part, tabular together with its variants, tabular\* and array.

Note that the tabular defined here is essentially the original LATEX 2.09 version, not the extended version described in *The LATEX Companion*. Use the array package to obtain the extended version.

### 1.1 tabbing

Historical IAT<sub>E</sub>X 2.09 comments (not necessarily accurate any more):

```
\dim(\Omega) = \dim(\Omega) = \dim G if margin 0 \le i \le 15 (?).
```

\dimen\Offirsttab is initialized to \Ototalleftmargin, so it starts at the prevailing left margin.

```
\mbox{\colored} = number of highest defined tab register probably = \mbox{\colored} = \mbox{\colored} 12
```

\@nxttabmar = tab stop number of next line's left margin \@curtabmar = tab stop number of current line's left margin \@curtab = number of the current tab. At start of line,

it equals \@curtabmar

\Ohightab = largest tab number currently defined.

 $\c depth of \pushtab's$ 

 $\begin{tabular}{ll} \begin{tabular}{ll} \beg$ 

skip, and excluding contents of current field

\box\@curfield = contents of current field

@rifield = switch: T iff the last field of the line should

be right-justified at the right margin.

\tabbingsep = distance left by the \' command between the

current position and the field that is

"left-shifted".

### UTILITY MACROS

\Ostopfield : closes the current field

Qaddfield: adds the current field to the current line.

**\Ocontfield** : continues the current field **\Ostartfield** : begins the next field

\Ostopline : closes the current line and outputs it

File H: lttab.dtx Date: 2020/04/24 Version v1.1r

```
\Ostartline : starts the next line
 \Oifatmargin : an \if that is true iff the current line.

                   array and tabular environments
             Historical LATEX 2.09 comments (not necessarily accurate any more):
              ARRAY PARAMETERS:
               \arraycolsep
                     : half the width separating columns in an array environment
                     : half the width separating columns in a tabular environment
               \arrayrulewidth
                     : width of rules
               \doublerulesep
                     : space between adjacent rules in array or tabular
               \arraystretch
                     : line spacing in array and tabular environments is done by
                       placing a strut in every row of height and depth
                       \arraystretch times the height and depth of the strut
                       produced by an ordinary \strut command.
              PREAMBLE:
               The PREAMBLE argument of an array or tabular environment can
               contain the following:
                 l,r,c: indicate where entry is to be placed.
                         : for vertical rule
                 @{EXP} : inserts the text EXP in every column.
                             \arraycolsep or \tabcolsep spacing is suppressed.
                 *{N}{PRE} : equivalent to writing N copies of PRE in the preamble.
                               PRE may contain *{N'}{EXP'} expressions.
                 p{LEN}: makes entry in parbox of width LEN.
```

SPECIAL ARRAY COMMANDS:

```
\multicolumn{N}{FORMAT}{ITEM} : replaces the next N column
  items by ITEM, formatted according to FORMAT.
 FORMAT should contain at most one l,r or c.
  If it contains none, then ITEM is ignored.
 \vline : draws a vertical line the height of the current row. May
         appear in an array element entry.
 \hline: draws a horizontal line between rows. Must appear either
         before the first entry (to appear above the first row) or
          right after a \\ command. If followed by another \hline,
          then adds a \vskip of \doublerulesep.
 \cline{i-j}: draws horizontal lines between rows covering columns
              i through j, inclusive. Multiple commands may follow
              one another to provide lines covering several disjoint
              columns
 \extracolsep{WIDTH} : for use inside an @ in the preamble. Causes
            a WIDTH space to be added between columns for the rest
             of the columns. This is in addition to the ordinary
             intercolumn space.

 \@tabarray RmS 91/11/04 added \m@th.
              \def\@tabarray{\m@th\@ifnextchar[\@array{\@array[c]}}
              (End definition for \Otabarray. This function is documented on page ??.)
                   RmS 1993/11/03 changed \halign to \ialign and removed superfluous \tabskip
              assignment
```

\Otabularcr and \Oargtabularcr same as \Oarraycr and \Oargarraycr

\@array

```
\def\@array[#1]#2{%
\if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi
\hgroup
```

This next bit of code sets up the strut and then builds the halign and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the \@arstrut below is expanded and contains an \ifmode then it could produce an unnecessary extra box in every row, thus wasting 'lots of' main memory.

```
\setbox\@arstrutbox\hbox{%
\vrule \@height\arraystretch\ht\strutbox
\@depth\arraystretch \dp\strutbox
\@width\z@}%
\@mkpream{#2}%
\edef\@preamble{%
\ialign \noexpand\@halignto
\bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
```

That is the end of setting up the preamble; now we reset things before executing the halign built-up in \@preamble. The restorations could be done by introducing an extra group, thus saving tokens.

```
193 \let\@startpbox\@@startpbox \let\@endpbox\@@endpbox
194 \let\tabularnewline\\%
195 \let\par\@empty
196 \let\@sharp##%
197 \set@typeset@protect
198 \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there my be some characters left which TEX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the \halign expects vertical mode thus issues a \par but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

  \@preamble
  \endgroup
```

End of historical LATEX 2.09 comments.

END

The command \def\@addamp{} was removed from \multicolumn on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the \multicolumn command had two column specifiers.

8 Feb 89 — \hbox{} added after \@preamble to correct bug that occurred if \multicolumn preceded \\[D] with D > 0, caused by \\[] command doing an \unskip, which removed \tabcolsep glue inserted by \multicolumn.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

File H: 1ttab.dtx Date: 2020/04/24 Version v1.1r

\cline \@cline The old IATEX2.09 implementation of \cline used up quite a lot of memory and two precious count registers. This new (1995/09/14) implementation does not use any count registers. It is coded in a way that depends heavily on the definition of \multispan so that command has been moved here from the file ltplain.dtx.

These counters are no longer declared.

\newcount\@cla
\newcount\@clb

- 367 \def\cline#1{\@cline#1\@nil}
- 368 \def\@cline#1-#2\@nil{%
- 369 \omit

Use the counter from \multispan.

- 370 \@multicnt#1%
- 371 \advance\@multispan\m@ne
- 372 \ifnum\@multicnt=\@ne\@firstofone{&\omit}\fi
- 373 \@multicnt#2%
- 374 \advance\@multicnt-#1%
- 375 \advance\@multispan\@ne

The original had \unskip at this point, but how could a skip get here ???

- 376 \leaders\hrule\@height\arrayrulewidth\hfill
- 377 \cr

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make \cline look ahead for a following \cline as does \hline. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

noalign{\vskip-\arrayrulewidth}}

(End definition for \clime and \@clime. These functions are documented on page ??.)

\mscount

The \mscount counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

(End definition for \mscount. This function is documented on page ??.)

\multispan \@multispan Modify \multispan slightly from its plain TeX definition to allow more efficient code sharing with \multicolumn. Also share a count register with \multiput.

\sp@n 379 \def\multispan{\omit\@multispan}

- 380 \def\@multispan#1{%
- 381 \@multicnt#1\relax
- \loop\ifnum\@multicnt>\@ne \sp@n\repeat}
- 383 \def\sp@n{\span\omit\advance\@multicnt\m@ne}

(End definition for \multispan, \@multispan, and \sp@n. These functions are documented on page ??.)

\@startpbox
\@endpbox

Helper macros for 'p' columns.

 $\verb| def \@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}| \\$ 

File H: lttab.dtx Date: 2020/04/24 Version v1.1r

```
\verb| | def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}|
```

14 Jan 89: Def of \@endpbox changed from \def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil} so vertical spacing works out right if the last line of a 'p' entry has a descender.

 $(\textit{End definition for } \verb|\Costartpbox| and \verb|\Coendpbox|. These functions are documented on page \verb|\|??.)$ 

## \@@startpbox \@@endpbox

- 386 \let\@@startpbox=\@startpbox
- 387 \let\@@endpbox=\@endpbox

(End definition for \@@startpbox and \@@endpbox. These functions are documented on page ??.)

388 ⟨/2ekernel⟩

## File I

## ltpictur.dtx

## 1 Picture Mode

Picture mode commands. In addition to the commands available in LaTeX2.09, This section adds the new \quad \quad text command for drawing curves.

\qbezier

\quad \quad

\bezier

In addition, to be compatible with the old bezier package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

Historical LATEX 2.09 comments (not necessarily accurate any more):

```

```

\@defaultunitsset Set a length register, #1, accepting number or an etex length expression, #2, with default unit, #3.

> The register name in #1 can be prefixed by \advance so that the register is incremented by the supplied value.

\@defaultunitsset{\advance\@vxx}{\textwidth-15pt}\unitlength

#3 can be a literal unit such as cm or a length register such as \unitlength.

This is used in all picture commands that take picture coordinates. So \put(2,2) as previously but now \put(\textwidth-5cm,0.4\texteight) Note that you can only use expressions with lengths, \put(1+2,0) is not supported.

```

Historical LATEX 2.09 comments (not necessarily accurate any more):
 CIRCLES AND OVALS
  USER COMMANDS:
```

- $\label{eq:circle} $$ \circle{D} : Produces the circle with the diameter as close as possible to D * \unitlength. \put(X,Y){\circle{D}} puts the circle with its center at (X,Y).$
- $\operatorname{\text{\foral}}(X,Y):$  Makes an oval as round as possible that fits in the rectangle of width X \* \unitlength and height Y \* \unitlength. The reference point is the center.
- \covvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical

rule. The width of the box will be \@tempdima.

DELTA1 and DELTA2 are added to the character number in \@tempcnta
to get the characters for the top and bottom quarter circle pieces.

\Covhorz: Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval.

The width of the box will be \Covxx.

```
\Ogetcirc {DIAM} : Sets \Otempcnta to the character number
                of the top-right quarter circle with the largest
                diameter less than or equal to DIAM.
                Sets \@tempboxa to an hbox containing that character.
                Sets \ensuremath{\texttt{Otempdima}} to \ensuremath{\texttt{Wd}} \ensuremath{\texttt{Otempboxa}}, which is the distance
                from the circle's left outside edge to its right
                inside edge.
                (These characters are like those described in the
                TeXbook, pp. 389-90.)

## 1 Theorem Environments

The user creates his own theorem-like environments with the command  $\mbox{\mbox{$\mbox{$newtheorem}{\langle name\rangle}}_{\langle counter\rangle}$ or <math display="block">\mbox{\mbox{$\mbox{$newtheorem}{\langle name\rangle}}_{\langle counter\rangle}_{\langle counter\rangle}$ 

This defines the environment  $\langle name \rangle$  to be just as one would expect a theorem environment to be, except that it prints  $\langle text \rangle$  instead of "Theorem".

If  $\langle oldname \rangle$  is given, then environments  $\langle name \rangle$  and  $\langle oldname \rangle$  use the same counter, so using a  $\langle name \rangle$  environment advances the number of the next  $\langle name \rangle$  environment, and vice-versa.

If  $\langle counter \rangle$  is given, then environment  $\langle name \rangle$  is numbered within  $\langle counter \rangle$ .

E.g., if  $\langle counter \rangle = \text{subsection}$ , then the first  $\langle name \rangle$  in subsection 7.2 is numbered  $\langle text \rangle$  7.2.1.

The way  $\langle name \rangle$  environments are numbered can be changed by redefining  $\text{ he}\langle name \rangle$ . Historical  $\text{ $PT_FX 2.09 comments (not necessarily accurate any more):}$ 

### DOCUMENT STYLE PARAMETERS

\@thmcounter{COUNTER} : A command such that \edef\theCOUNTER}}

defines  $\$  the COUNTER to produce a number for a theorem environment. The default is:

BEGIN \noexpand\arabic{COUNTER} END

\@thmcountersep: A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, \@thmcountersep should be \def'ed to '-'. Its default is '.'.

\@begintheorem{NAME}{NUMBER}: A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' - e.g., \@begintheorem{Lemma}{3.7} starts Lemma 3.7.

### \@opargbegintheorem{NAME}{NUMBER}{OPARG} :

A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' with optional argument OPARG – e.g., \Obegintheorem{Lemma}{3.7}{Jones} starts 'Lemma 3.7 (Jones):'.

\@endtheorem : A command that ends a theorem environment.

\newtheorem ought really be allowed only in the preamble Which would be good docu-
                                         ment style, and allow some main memory to be saved by declaring these commands to
                                         be \Conlypreamble. Unfortunately the LATEX book indicates that \newtheorem may be
                                          used anywhere in the document...

# ltsect.dtx

## 1 Sectioning Commands

This file defines the declarations such as \author which are used by \maketitle. \maketitle itself is defined by each class, not in the LATEX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as \chapter. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 (*2ekernel)
2 \message{title,}
```

### 1.1 The Title

\title
\author
\date
\thanks
\and
\maketitle

The user defines the title and author by the declarations  $\title{\langle name \rangle}$ ,  $\advalent{\langle name \rangle}$ . Similarly the date is declared with  $\advalent{\langle date \rangle}$ .

Inside these, the  $\hat{\langle footnote\ text\rangle}$  command may be used to make acknowledgements, notice of address, etc. in a footnote. If there are multiple authors, they have to be separated with the  $\hat{\langle footnote\ text\rangle}$ 

And finally, the \maketitle command produces the actual title, using the information previously saved with the other commands.

```
3 \(\lambda/2\)ekernel\\
4 \(\frac{*2ekernel}{latexrelease}\)
5 \(\lambda\) title}{\(\lambda\) title}{\(\lambda\)ke commands robust}\(\lambda\)
```

\title \title for use in \maketitle. If not given \maketitle will produce an error message.

7 \DeclareRobustCommand\title[1]{\gdef\@title{#1}}

(End definition for \title. This function is documented on page ??.)

\author \author for use in \maketitle. If not given \maketitle will produce a warning message.

(End definition for \author. This function is documented on page ??.)

\date \date for use in \maketitle. If not given \maketitle will produce \today as the default.

(End definition for \date. This function is documented on page ??.)

\thanks

```
10 \DeclareRobustCommand\thanks[1] {\footnotemark
11 \protected@xdef\@thanks{\Qthanks
12 \protect\footnotetext[\the\c@footnote]{#1}}%
13 }

(End definition for \thanks. This function is documented on page ??.)
```

```
\and
                   14 \DeclareRobustCommand\and{%
                                                      % \begin{tabular}

  \if@noskipsec
                  Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the
\@noskipsectrue
                  preamble and to false in \document. This was done to trap lists and related text in the
                  preamble but it does not catch everything.
                   38 \newif\if@noskipsec \@noskipsectrue
```

585

#### \@startsection

 ${\langle afterskip \rangle} {\langle style \rangle} * [\langle altheading \rangle] {\langle heading \rangle}$  command is the mother of all the user level sectioning commands. The part after the \*, including the \* is optional.

name: e.g., 'subsection'

**level:** a number, denoting depth of section - e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

**beforeskip:** Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

**afterskip:** if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as \MakeUppercase or \fbox that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, \bfseries\MakeUppercase would produce bold, uppercase headings.

If '\*' is missing, then increment the counter. If it is present, then there should be no  $[\langle altheading \rangle]$  argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

Warning: The \@startsection command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
      \paragraph{...}
      \endgroup}
```

### 1.3 Table of Contents etc.

## 1.3.1 Convention

 $\texttt{\tf@}\langle foo \rangle = \text{file number for output for table foo.}$  The file is opened only if @filesw = true.

### 1.3.2 Commands

A  $\log(type) \{ \langle entry \rangle \} \{ \langle page \rangle \}$  Macro needs to defined by document style for making an entry of type  $\langle type \rangle$  in a table of contents, etc. E.g., the document style should define  $\log(type) \}$  10section, etc.

**Note:** When the \protect command is used in the  $\langle entry \rangle$  or  $\langle text \rangle$  of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an \addcontentsline or \addtocontents command argument, the commands: \index, \glossary, and \label are no-ops. This could cause a problem if the user puts an \index or \label into one of the commands he writes, or into the optional 'short version' argument of a \section or \caption command.

\@starttoc

The  $\c (ext)$  command is used to define the commands:

\tableofcontents, \listoffigures, etc.

For example:  $\ensuremath{\texttt{Qstarttoc\{lof\}}}$  is used in  $\ensuremath{\texttt{listoffigures}}$ . This command reads the  $.\langle ext \rangle$  file and sets up to write the new  $.\langle ext \rangle$  file.

Historical LATEX 2.09 comments (not necessarily accurate any more):

\@starttoc{EXT} ==

```
BEGIN
     \begingroup
        \makeatletter
        read file \jobname.EXT
        IF @filesw = true
           THEN open \jobname.EXT as file \tf@EXT
        @nobreak :=G FALSE %% added 24 May 89
     \endgroup
   END
End of historical LATEX 2.09 comments.
  \def\@starttoc#1{%
     \begingroup
150
       \makeatletter
       \@input{\jobname.#1}%
152
       \if@filesw
         \expandafter\newwrite\csname tf@#1\endcsname
         \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156
157
       \@nobreakfalse
     \endgroup}
158
```

(End definition for \@starttoc. This function is documented on page ??.)

\addcontentsline

The \addcontentsline{ $\langle table \rangle$ }{ $\langle type \rangle$ }{  $\langle entry \rangle$ } command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry \contentsline{ $\langle type \rangle$ }{ $\langle entry \rangle$ }{ $\langle page \rangle$ } to the  $.\langle table \rangle$  file.

This macro is implemented as an application of \addtocontents. Note that \thepage is not expandable during \protected@write therefore one gets the page number at the time of the \shipout.

177 (latexrelease) \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}}
178 (latexrelease)\EndIncludeInRelease
179 (*2ekernel)
```

(End definition for \addcontentsline. This function is documented on page ??.)

\addtocontents

The \addtocontents{ $\langle table \rangle$ }{ $\langle text \rangle$ } command adds  $\langle text \rangle$  to the . $\langle table \rangle$  file, with no page number.

```
180 \long\def\addtocontents#1#2{%

181 \protected@write\@auxout

182 {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%

183 {\string\@writefile{#1}{#2}}}
```

(End definition for \addtocontents. This function is documented on page ??.)

\contentsline

The \contentsline{ $\langle type \rangle$ }{ $\langle entry \rangle$ }{ $\langle page \rangle$ } macro produces a  $\langle type \rangle$  entry in a table of contents, etc. It will appear in the .toc or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```
\contentsline{subsection}
    {\makebox{30pt}[r]{1.4.3} Gnats and Gnus}{22}
```

The \protect command causes command sequences to be written without expanding them.

```
184 \def\contentsline#1{\csname l@#1\endcsname}
```

(End definition for \contentsline. This function is documented on page ??.)

 $\ensuremath{\mbox{Qdottedtocline}{\langle level\rangle}}{\langle indent\rangle}{\langle numwidth\rangle}}{\langle title\rangle}{\langle page\rangle}}$ : Macro to produce a table of contents line with the following parameters:

**level** If  $\langle level \rangle > \texttt{c@tocdepth}$ , then no line produced.

**indent** Total indentation from the left margin.

**numwidth** Width of box for number if the  $\langle title \rangle$  has a \numberline command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with \def's.

pnumwidth Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be \def'd to a number like 2 or 1.7

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an \hbox to escape to the surrounding text font.

We finish off by preventing any protrusion if that is enabled. If protrusion happens the number may shift to the right and as a result you may end up with an additional dot in the toc line in some situations.

 $\n$ 

This command, if placed directly to the right (or left) of a word, will prevent protrusion of that word into the margin. It is used in the toc entry lines as they shouldn't protrude. It is implemented as to kerns that cancel each other but being there hide the word so that protrusion is not added. Note that a zero kern or an empty box would not work as the protrusion mechanism will skip over those.

207 \DeclareRobustCommand\noprotrusion{\leavevmode\kern-\p@\kern\p@}

**Note:** \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multipleline contents entries would line up properly.

\numberline

 $\mbox{numberline}(\mbox{number})$ : For use in a \contentsline command. It puts  $\mbox{number}$  flush-left in a box of width \@tempdima (Before 25 Jan 88 change, it also added \@tempdima to the hanging indentation.)

(End definition for \numberline. This function is documented on page ??.)

## File L

# ltfloat.dtx

## 1 Floats

The different types of floats are identified by a  $\langle type \rangle$  name, which is the name of the counter for that kind of float. For example, figures are of type 'figure' and tables are of type 'table'. Each  $\langle type \rangle$  has associated a positive  $\langle type \ number \rangle$ , which is a power of two. E.g.,

figures might be have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a  $\langle placement\ specifier \rangle$ , which is a list of the possible locations, each denoted by a letter as follows:

```
h: here — at the current location in the text.
t: top — at the top of a text page.
b: bottom — at the bottom of a text page.
p: page — on a separate float page
```

In addition, in conjunction with these, you can use '!' which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on 'p', float page positioning.) For example, 'pht' specifies that the float can appear in any of three locations: page, here or top.

## 1.1 Floating Environments

```
1 (*2ekernel)
2 \message{floats,}
```

Historical №T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
: Number of floats allowed at the top of a column.
\c@topnumber
                   : Fraction of column that can be devoted to floats.
\topfraction
\c@dbltopnumber, \dbltopfraction
                   : Same as above, but for double-column floats.
\c@bottomnumber, \bottomfraction
                   : Same as above for bottom of page.
                   : Number of floats allowed in a single column,
\c@totalnumber
                          including in-text floats.
\textfraction
                   :Minimum fraction of column that must contain text.
\floatpagefraction: Minimum fraction of page that must be taken
                          up by float page.
\dblfloatpagefraction
```

: Same as above, for double-column floats.

The document style must define the following. \fps@TYPE : The default placement specifier for floats of type \ftype@TYPE: The type number for floats of type TYPE. : The file extension indicating the file on which the \ext@TYPE contents list for float type TYPE is stored. For example, \ext@figure = 'lof'. \fnum@TYPE : A macro to generate the figure number for a caption. For example, \fnum@TYPE == Figure \thefigure.  $\c \mathbb{NUM} {TEXT} :$ A macro to make a caption, with NUM the value produced by \fnum@... and TEXT the text of the caption. It can assume it's in a \parbox of the appropriate width. \Offloat{TYPE}[PLACEMENT]: This macro begins a float environment for a single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by \fps@TYPE. The environment is ended by \end@float. E.g., \figure == \Ofloat{figure}, \endfigure == \endOfloat. \Ofloat{TYPE}[PLACEMENT] == **BEGIN** if hmode then \@bsphack  $\ensuremath{\texttt{Ofloatpenalty}} := -10002$ else  $\ensuremath{\texttt{Offloatpenalty}} := -10003$  $\c =L TYPE$ \@dblflset ==L PLACEMENT \@fps \@onelevel@sanitize \@fps add default PLACEMENT if at most! in PLACEMENT == \@fpsadddefault if inner then LaTeX Error: 'Not in outer paragraph mode.'  $\backslash @floatpenalty := 0$ else if \@freelist nonempty then \@currbox :=L head of \@freelist \Ofreelist := G tail of \Ofreelist  $\count\cou$ bits determined by PLACEMENT

18    \begingroup
```

The paragraph setting parameters are normalised at this point, however \@parboxrestore resets \everypar which is not correct in this context so \@setminipage is called if needed.

The float mechanism, like minipage, sets the flag <code>@minipage</code> true before executing the user-supplied text. Many LATEX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates TeX's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of <code>\everypar</code>, but the call to <code>\@parboxrestore</code> removes that redefinition, so it is re-inserted if needed. If the flag is already false then the <code>\caption</code> was not the first entry in the float, and so some other paragraph has already activated the special <code>\everypar</code>. In this case no further action is needed.

```
\@parboxrestore
                  \if@minipage

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

\@floatboxreset

The rational for allowing these normally global flags to be set locally here, via \@parboxrestore, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \set@nobreak; otherwise this command will be redundant.

```
\set@nobreak; otherwise this command will be redundant.

Historical ¼TEX 2.09 comments (not necessarily accurate any more):

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the **\output** routine. Marginal notes are distinguished from floats by having a negative placement specification. The command **\marginpar** [LTEXT] {RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

\marginparwidth : Width of marginal notes.
\marginparsep : Distance between marginal note and text.
 the page layout to determine how to move the marginal
 note into the margin. E.g., \@leftmarginskip ==
 \hskip -\marginparwidth \hskip -\marginparsep .
\marginparpush : Minimum vertical separation between \marginpar's

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command \reversemarginpar reverses the side where they are put. \normalmarginpar undoes \reversemarginpar. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```

343
       \color@endbox
345 }
```

(End definition for \@savemarbox. This function is documented on page ??.)

#### \@marginparreset

The rational for allowing these normally global flags to be set locally here, via \@parboxrestore was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \set@nobreak; otherwise this command will be redundant.

(End definition for \@marginparreset. This function is documented on page ??.)

#### \@xympar

Setting the box here is done only because the code uses \end@float; it will be empty and gets discarded.

```
def \@xympar{%

365 \message{footnotes,}

#### 1.2 Footnotes

Historical LATEX 2.09 comments (not necessarily accurate any more):

\footnote{NOTE} : User command to insert a footnote.

\footnote[NUM]{NOTE}: User command to insert a footnote numbered NUM, where NUM is a number - 1, 2, etc. For example, if footnotes are numbered \*, \*\*, etc. within pages, then \footnote[2]{...} produces footnote '\*\*. This command does not step the footnote counter.

\footnotemark[NUM] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[NUM]{TEXT} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

\footnotesize : Size-changing command for footnotes.

\footnotesep : The height of a strut placed at the beginning of

every footnote.

\skip\footins : Space between main text and footnotes. The rule

separating footnotes from text occurs in this space. This space lies above the strut of height \footnotesep which is at the beginning of the

first footnote.

\footnoterule : Macro to draw the rule separating footnotes from

text. It is executed right after a \vspace of \skip\footins. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies.

(See PLAIN.TEX.)

\interfootnotelinepenalty: Interline penalty for footnotes.

\thefootnote : In usual LaTeX style, produces the footnote number.

If footnotes are to be numbered within pages, then
the document style file must include an \@addtoreset

command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

\Othefnmark: Holds the current footnote's mark-e.g., \dag or '1' or 'a'.

\@mpfnnumber : A macro that generates the numbers for \footnote and \footnotemark commands. It == \thefootnote outside a minipage environment, but can be changed inside to generate numbers for \footnote's.

\@makefnmark : A macro to generate the footnote marker from **\Othernmark** The default definition was  $\hbox{$^\circ\endown}.$ 

> This is now replaced by \textsuperscript{\@thefnmark}

#### \@makefntext{NOTE} :

Must produce the actual footnote, using \@thefnmark as the mark of the footnote and NOTE as the text. It is called when effectively inside a \parbox, with \hsize = \columnwidth.

For example, it might be as simple as \$^{\@thefnmark}\$ NOTE

In a minipage environment, \footnote and \footnotetext are redefined so that

- (a) they use the counter mpfootnote
- (b) the footnotes they produce go at the bottom of the minipage. The switch is accomplished by letting  $\mbox{Qmpfn} == footnote$  or mpfootnote and \thempfn == \thefootnote or \thempfootnote, and by redefining \Ofootnotetext to be \Ompfootnotetext in the minipage.

## ltbibl.dtx

## 1 Bibliography Generation

A bibliography is created by the thebibliography environment, which generates a title such as "References", and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the \bibliography command. With BIBTEX, the following commands will be used.

\bibliography

\bibliographystyle thebibliography

\bibliography{ $\langle file1, file2, ..., filen \rangle$ }: specifies the bibdata files. Writes a \bibdata entry on the .aux file and tries to read in mainfile.bbl.

\bibliographystyle $\{\langle style \rangle\}$ : Writes a \bibstyle entry on the .aux file.

The thebibliography environment is a list environment. To save the use of an extra counter, it should use enumiv as the item counter. Instead of using \item, items in the bibliography are produced by the following commands:

\bibitem $\{\langle name \rangle\}$ : Produces a numbered entry cited as  $\langle name \rangle$ .

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the thebibliography environment. This environment has a single argument, which is the widest bibliography label—e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The \thebibliography command must begin a list environment, which the \endthebibliography command ends.

\cite \nocite Entries are cited by the command  $\langle \text{cite} \{\langle name \rangle \}$ .

 $\colon cite{\langle citations \rangle}$  puts information on the .aux file that causes BibTEX to include the  $\{\langle citations \rangle\}$  list in the bibliography, but puts nothing in the text.

\nocite{\*} is special: it tells BibTeX to put the whole of a collection of references into the bibliography.

```
1 (*2ekernel)
2 \message{bibliography,}
```

Historical  $\LaTeX$  2.09 comments (not necessarily accurate any more):

PARAMETERS

\@cite : A macro such that \@cite{LABEL1,LABEL2}{NOTE}
 produces the output for a \cite[NOTE]{FOO1,FOO2} command,
 where entry FOOi is defined by \bibitem[LABELi]{FOOi}.
 The switch @tempswa is true if the optional NOTE argument
 is present.
 The default definition is :

```
he default definition is :

\@cite{LABELS}{NOTE} ==

BEGIN [LABELS

IF @tempswa = T THEN , NOTE FI

]

END
```

\Obiblabel: A macro to produce the label in the bibliography entry. For \bibitem[LABEL]{NAME}, the label is

```
generated by \Obiblabel{LABEL}. It has the default definition \Obiblabel{LABEL} -> [LABEL].
```

#### CONVENTION

```
\b@F00 : The name or number of the reference created by \cite{FOO} E.g., if \cite{FOO} -> [17] , then \b@F00 -> 17.
```

End of historical LATEX 2.09 comments.

(End definition for  $\$  This function is documented on page  $\r$ ?:)

\@citex \penalty\@m added to definition of \@citex to allow a line break after the ',' in citations like [Jones80,Smith77] (Added 23 Oct 86)

space added after the ',' (21 Nov 87)

- 14 \def\@citex[#1]#2{\leavevmode
- 15 \let\@citea\@empty
- 17 {\@citea\def\@citea{,\penalty\@m\ }%
- $\verb|\ef| @ citeb{\expandafter@firstofone@citeb@empty}| % \\$
- 19 \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi

Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO-B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the \@cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

                     (Added 14 Jun 85)
           \nocite
                          This puts information on the .aux file that causes BibTEX to include the citation
                      list in the bibliography, but puts nothing in the text.
```

RmS 93/08/06: Made loop for \nocite like that for \@citex, to get rid of leading

39 \def\nocite#1{\@bsphack

With the implementation designed already in IATEX 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the "reference" will appear on the terminal and nothing else will happen.

This would be easy to fix, but then a document using the fix will silently fail on an older release of LaTeX, missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a LaTeX  $2\varepsilon$  successor.

40 \ifx\@onlypreamble\document

Since we are after \begin{document} we can do the citations:

```
41  \@for\@citeb:=#1\do{%
42      \edef\@citeb{\expandafter\@firstofone\@citeb}%
43      \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi
44      \@ifundefined{b@\@citeb}{\G@refundefinedtrue
45      \@latex@warning{Citation '\@citeb' undefined}}{}}%
46      \else
```

But before \begin{document} we raise an error message:

47 \@latex@error{Cannot be used in preamble}\@eha

Without the compatibility problems we could fix the problem as follows:

```
48 % \AtBeginDocument{\nocite{#1}}
49 \fi
50 \@esphack}
```

Since \nocite{\*} should not produce a warning about undefined citation keys (seee PR 557), we need to set the control sequence '\b@\*' to something other than \relax. As a result \cite{\*} will not warn either (but that never worked with BiBTEX in the first place).

51 \expandafter\let\csname b@\*\endcsname\@empty

(End definition for \nocite. This function is documented on page ??.)

#### 1.1 Default definitions

This hook determines the 'relative formatting' of the two logical parts of a citation with comment.

\@cite

```
52 \def\@cite#1#2{[{#1\if@tempswa , #2\fi}]}
(End definition for \@cite. This function is documented on page ??.)
```

\@cite@ofmt

This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of b@\@citeb; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

53 \let\@cite@ofmt\hbox

 $(\textit{End definition for } \verb+\CciteCofmt+. \textit{This function is documented on page \ref{eq:compared})}$ 

\@biblabel

```
54 \def\@biblabel#1{[#1]}
55 \langle/2ekernel\rangle
(End definition for \@biblabel. This function is documented on page ??.)
```

## 1 Page styles and related commands

### 1.1 Page Style Commands

 $\pagestyle{\langle style \rangle}$ : sets the page style of the current and succeeding pages to style  $\thispagestyle{\langle style \rangle}$ : sets the page style of the current page only to style. To define a page style style, you must define  $\ps@style$  to set the page style parameters.

## 1.2 How a page style makes running heads and feet

The \ps@...command defines the macros \@oddhead, \@oddfoot, \@evenhead, and \@evenfoot to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, etc., where \chaptermark{ $\langle text \rangle$ } is called by \chapter to set a mark. The \...mark commands and the \...head macros are defined with the help of the following macros.

(All the \...mark commands should be initialized to no-ops.)

## 1.3 marking conventions

LATEX extends TEX's \mark facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

 $\mathbf{\hat{\langle}} left > \{\langle right \rangle\} : Adds both marks.$ 

 $\mathsf{Markright}(\langle right \rangle) : Adds a 'right' mark.$ 

\leftmark: Used in the output routine, gets the current 'left' mark. Works like TEX's \botmark.

\rightmark: Used in the output routine, gets the current 'right' mark. Works like TEX's \firstmark. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if 2 \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \@mkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \@gobbletwo to do nothing.

1 (\*2ekernel)

\pagestyle User command to set the page style for this and following pages.

- 2 \def\pagestyle#1{%
- 3 \@ifundefined{ps@#1}%
- 4 \undefinedpagestyle
- ${\c {\c Qnameuse \{ps@#1\}}}$

(End definition for \pagestyle. This function is documented on page ??.)

```
\thispagestyle User command to set the page style for this page only.
                  6 \def\thispagestyle#1{%
                      \@ifundefined{ps@#1}%
                        \undefinedpagestyle
                        {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
                 (\mathit{End \ definition \ for \ } \mathsf{thispagestyle}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:pagestyle}.)
                The empty page style: No head or foot line.
     \ps@empty
                  10 \def\ps@empty{%
                      \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
                      \let\@evenhead\@empty\let\@evenfoot\@empty}
                 (End definition for \ps@empty. This function is documented on page ??.)
                The plain page style: No head, centred page number in foot.
                  \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
                  15
                         \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
                 (End definition for \ps@plain. This function is documented on page ??.)
    \@leftmark We implement \@leftmark and \@rightmark in terms of already defined commands to
                save token space. We can't get rid of them since they are sometimes used in applications.

## File P

# ltclass.dtx

## 1 Introduction

This file implements the following declarations, which replace \documentstyle in LaTeX  $2\varepsilon$  documents.

Note that old documents containing \documentstyle will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of 'style files': 'class files' which define elements and provide a default formatting for them; and 'packages' which provide extra functionality. One difference between  $\LaTeX$  2 $\varepsilon$  and  $\LaTeX$ 2 $\varepsilon$  and  $\LaTeX$ 2.09 is that  $\LaTeX$ 2 $\varepsilon$  packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

## 2 User interface

 $\documentclass[\langle main-option-list \rangle] \{\langle class \rangle\} [\langle version \rangle]$ 

There must be exactly one such declaration, and it must come first. The  $\langle main\text{-}option\text{-}list \rangle$  is a list of options which can modify the formatting of elements which are defined in the  $\langle class \rangle$  file as well as in all following \usepackage declarations (see below). The  $\langle version \rangle$  is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

 $\documentstyle[\langle main-option-list\rangle]\{\langle class\rangle\}[\langle version\rangle]$ 

The \documentstyle declaration is kept in order to maintain upward compatibility with  $\LaTeX$  2.09 documents. It is similar to \documentclass, but it causes all options in  $\langle main\text{-}option\text{-}list \rangle$  that the  $\langle class \rangle$  does not use to be passed to \RequirePackage after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in  $\LaTeX$  2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors  $\LaTeX$  2.15 generates. This flag does affect the definition of font commands, and \sloppy.

 $\usepackage [\langle package-option-list \rangle] \{\langle package-list \rangle\} [\langle version \rangle]$ 

There can be any number of these declarations. All packages in  $\langle package\text{-}list \rangle$  are called with the same options.

Each  $\langle package \rangle$  file defines new elements (or modifies those defined in the  $\langle class \rangle$ ), and thus extends the range of documents which can be processed. The  $\langle package\text{-}option\text{-}list \rangle$  is a list of options which can modify the formatting of elements defined in the  $\langle package \rangle$  file. The  $\langle version \rangle$  is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the  $\langle package\text{-}option\text{-}list \rangle$ , each package processes the  $\langle main\text{-}option\text{-}list \rangle$ . This means that options that affect all of the packages can be given globally, rather than repeated for every package.

filecontents

Note that class files have the extension .cls, packages have the extension .sty.

The environment filecontents is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a 'current directory' or 'default directory') then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option force or overwrite will allow for overwriting existing files, option nosearch will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of TEX. Finally, you can use noheader to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before \documentclass). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use \input to retrieve it where needed.

The begin and end tags should each be on a line by itself.

### 2.1 Option processing

When the options are processed, they are divided into two types: local and global:

- For a class, the options in the \documentclass command are local.
- For a package, the options in the \usepackage command are local, and the options in the \documentclass command are global.

The options for \documentclass and \usepackage are processed in the following way:

- 1. The local and global options that have been declared (using \DeclareOption as described below) are processed first.
  - In the case of \ProcessOptions, they are processed in the order that they were declared in the class or package.
  - In the case of \ProcessOptions\*, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.
- 2. Any remaining local options are dealt with using the default option (declared using the \DeclareOption\* declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when \begin{document} is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

## 3 Class and Package interface

#### 3.1 Class name and version

\ProvidesClass

A class can identify itself with the  $\ProvidesClass{\langle name \rangle}[\langle version \rangle]$  command. The  $\langle version \rangle$  should begin with a date in the format YYYY/MM/DD.

## 3.2 Package name and version

\ProvidesPackage

A package can identify itself with the  $\ProvidesPackage{\langle name \rangle}[\langle version \rangle]$  command. The  $\langle version \rangle$  should begin with a date in the format YYYY/MM/DD.

### 3.3 Requiring other packages

\RequirePackage

Packages or classes can load other packages using  $\ensuremath{\mbox{RequirePackage}} [\langle options \rangle] \{\langle name \rangle\} [\langle version \rangle].$ 

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called. Similar to \RequirePackage, but for classes, may not be used in package files.

\LoadClass \PassOptionsToPackage

Packages can pass options to other packages using:

 $\PassOptionsToPackage{\langle options \rangle} {\langle package \rangle}.$ 

\PassOptionsToClass

This adds the  $\langle options \rangle$  to the options list of any future \RequirePackage or \usepackage command. For example:

\PassOptionsToPackage{foo,bar}{fred}

is the same as:

\RequirePackage[foo,bar,baz]{fred}

\LoadClassWithOptions

\RequirePackageWithOptions

 $\LoadClassWithOptions{\langle name \rangle} [\langle version \rangle]:$ 

This is similar to  $\LoadClass$ , but it always calls class  $\langle name \rangle$  with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by  $\LoadClass$ .  $\RequirePackageWithOptions$  is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

\LoadClassWithOptions{article}

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using \LoadClassWithOptions is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

631

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the article class will be called with option landscape precisely when the current class is called with this option; but in the second example it will not as in that case article is only passed options by the default option handler, which is not used for landscape as that option is explicitly declared.

\@ifpackageloaded
 \@ifclassloaded
 \@ifpackagelater

To find out if a package has already been loaded, use

 $\ensuremath{\mbox{\tt Oifpackageloaded}} \ensuremath{\mbox{\tt (}package)} \ensuremath{\mbox{\tt (}true)} \ensuremath{\mbox{\tt (}false)}.$ 

To find out if a package has already been loaded with a version equal to or more recent than  $\langle version \rangle,$  use

\@ifclasslater
\@ifpackagewith
\@ifclasswith

 $\verb|\difpackage| ater{\langle package \rangle} + {\langle version \rangle} + {\langle true \rangle} + {\langle false \rangle}.$ 

To find out if a package has already been loaded with at least the options  $\langle options \rangle$ , use  $\ensuremath{\mbox{options}} {\langle options \rangle} {\langle true \rangle} {\langle false \rangle}$ .

There exists one package that can't be tested with the above commands: the fontenc package pretends that it was never loaded to allow for repeated reloading with different options (see ltoutenc.dtx for details).

## 3.4 Declaring new options

Options for classes and packages are built using the same macros.

\DeclareOption \DeclareOption\*

To define a builtin option, use  $\DeclareOption\{\langle name\rangle\}\{\langle code\rangle\}$ .

To define the default action to perform for local options which have not been declared, use  $\DeclareOption*{\langle code \rangle}$ .

Note: there should be no use of

Possible uses for \DeclareOption\* include:

\DeclareOption\*{}

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.) \DeclareOption\*{\Qunkownoptionerror}

Complain about unknown local options. (The initial setting for package files.)

 $\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{\langle pkg-name \rangle}}$ 

Handle the current option by passing it on to the package  $\langle pkg-name \rangle$ , which will presumably be loaded via  $\ensuremath{\texttt{RequirePackage}}$  later in the file. This is useful for building 'extension' packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\label{lem:lem:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:current:curre
```

Handle the option foo by loading the file xx-foo.yyy if it exists, otherwise do nothing, but declare that the option was not used. Actually the \OptionNotUsed declaration is only needed if this is being used in class files, but does no harm in package files.

#### Safe Input Macros 3.5

\InputIfFileExists

 $\InputIfFileExists{\langle file \rangle}{\langle then \rangle}{\langle else \rangle}$ 

Inputs  $\langle file \rangle$  if it exists. Immediately before the input,  $\langle then \rangle$  is executed. Otherwise  $\langle else \rangle$  is executed.

\IfFileExists

As above, but does not input the file.

\@missingfileerror

One thing you might like to put in the  $\langle else \rangle$  clause is

This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering x quits the current run,

This has been redefined from the LATEX2.09 definition, in terms of the new commands \InputIfFileExists and \@missingfileerror.

\listfiles

\input

Giving this declaration in the preamble causes a list of all files input via the 'safe input' commands to be listed at the end. Any strings specified in the optional argument to \ProvidesPackage are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

#### Implementation 4

1 (\*2ekernel)

\if@compatibility The flag for compatibility mode.

2 \newif\if@compatibility

(End definition for \if@compatibility. This function is documented on page ??.)

\@documentclasshook

This legacy hook is called after the first \documentclass command. It is not integrated with the new 2020 hook management system! By default this checks to see if \Onormalsize is undefined, and if so, sets it to \normalsize.

```
\def\@documentclasshook{%
     \ifx\@normalsize\@undefined
        \let\@normalsize\normalsize
     \fi
6
7 }
```

(End definition for \@documentclasshook. This function is documented on page ??.)

\@declaredoptions

This list is automatically built by \DeclareOption. It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the the corresponding  $\dsecondsecondsecondsecondseconds are executed.$  All local  $\langle option \rangle$ s which are not declared will be processed in the order defined by the optional argument of \documentclass or \usepackage.

8 \let\@declaredoptions\@empty

 $(\mathit{End \ definition \ for \ \backslash Qdeclared options}.\ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}}).$ 

\@classoptionslist List of options of the main class.

- 9 \let\@classoptionslist\relax
- 10 \@onlypreamble\@classoptionslist

(End definition for \@classoptionslist. This function is documented on page ??.)

```
\@unusedoptionlist List of options of the main class that haven't been declared or loaded as class option files.
                       11 \let\@unusedoptionlist\@empty
                       12 \@onlypreamble\@unusedoptionlist
                      (End definition for \Qunusedoptionlist. This function is documented on page ??.)
    \CurrentOption Name of current package or option.
                       13 \let\CurrentOption\@empty
                      (End definition for \CurrentOption. This function is documented on page ??.)
        \@currname
                    Name of current package or option.
                      14 \let\@currname\@empty
                      (End definition for \@currname. This function is documented on page ??.)
         \@currext The current file extension.
                       15 \global\let\@currext=\@empty
                      (End definition for \@currext. This function is documented on page ??.)
    \@clsextension The two possible values of \@currext.
    \@pkgextension
                       16 \def\@clsextension{cls}
                       17 \def\@pkgextension{sty}
                       18 \@onlypreamble\@clsextension
                       19 \@onlypreamble\@pkgextension
                      (End definition for \@clsextension and \@pkgextension. These functions are documented on page ??.)
    \@pushfilename
                     Commands to push and pop the file name and extension.
     \@popfilename
                     #1 current name.
                     #2 current extension.
   \@currnamestack
                      #3 current catcode of @.
                      #4 Rest of the stack.
                       20 (/2ekernel)

```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

268 \@onlypreamble\@defdefault@ds

(End definition for \DeclareOption and \DeclareOption\*. These functions are documented on page ??.)

 $\verb|\OptionNotUsed|$ 

If we are in a class file, add \CurrentOption to the list of unused options. Otherwise, in a package file do nothing.

```
269 \def\OptionNotUsed{%
270 \ifx\@currext\@clsextension
271 \xdef\@unusedoptionlist{%
272 \ifx\@unusedoptionlist\@empty\else\@unusedoptionlist,\fi
273 \CurrentOption}%
274 \fi}
275 \@onlypreamble\OptionNotUsed
```

(End definition for \OptionNotUsed. This function is documented on page ??.)

\default@ds

The default option code. Set by \@onefilewithoptions to either \OptionNotUsed for classes, or \@unknownoptionerror for packages. This may be reset in either case with \DeclareOption\*.

276 % \let\default@ds\OptionNotUsed

 $(\mathit{End \ definition \ for \ } \backslash \mathtt{default@ds}. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:constraint}.)$ 

\ProcessOptions \ProcessOptions\*

\ProcessOptions calls \ds@option for each known package option, then calls \default@ds for each option on the local options list. Finally resets all the declared options to \relax. The empty option does nothing, this has to be reset on the off chance it's set to \relax if an empty element gets into the \@declaredoptions list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

                          {\@fileswith@pti@ns#1[{#2}]#3[]}}
                     469 \@onlypreamble\@fileswith@ptions
```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of  ${\tt Q}$ .

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```
 \begin{array}{lll} & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & \\ & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & & \\

\@onlypreamble\@fileswith@pti@ns

This macro is used when loading packages or classes.

#### \load@onefilewithoptions

Have the main argument as #1, so we only need one \expandafter above.

```
\langle /2ekernel \rangle
(*2ekernel | latexrelease)
⟨latexrelease⟩\IncludeInRelease{2020/10/01}%
(latexrelease)
                   {\@onefilewithoptions}{Hooks and unused options issue}%
\def\@onefilewithoptions#1[#2][#3]#4{%
  \@pushfilename
  \xdef\@currname{#1}%
  \global\let\@currext#4%
```

The command  $\forall ere(file).(ext)$  is used to signal that a package is already loaded, either because it is in fact loaded, or because it's loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with ver@(file).(ext), so before checking if the file exists we have to check that we do need to load it with \@ifl@aded. If we don't, then there's no point in checking for a typo or load-disabling.

#### \@ifl@aded\@currext\@currname

If the package is already loaded, check that there were no option clashes:

```
{\@if@ptions\@currext{\@currname}{#2}{}%
         {\@latex@error
540
           {Option clash for \@cls@pkg\space \@currname}%
541
           {The package \@currname\space has already been loaded
542
            with options:\MessageBreak
543
            \space\space[\@ptionlist{\@currname.\@currext}]\MessageBreak
544
            There has now been an attempt to load it
545
            with options\MessageBreak
546
            \space\space[#2]\MessageBreak
            Adding the global options:\MessageBreak
            \space\space
                 \@ptionlist{\@currname.\@currext},#2\MessageBreak
            to your \noexpand\documentclass declaration may fix this.%
551
            \MessageBreak
552
            Try typing \space <return> \space to proceed.}}%
553
        \@firstofone}%
554
       {\makeatletter
```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```
\@reset@ptions
```

First we take the  $\langle name \rangle$  and  $\langle ext \rangle$  given in the argument and check if the file exists, and issue an error otherwise asking for a correction with  $\backslash missingfileerror$ .

```
557 \IffileExists{\@currname.\@currext}{}%
558 {\@missing@onefilewithoptions{#2}}%
```

If  $\langle Currname$  is empty (the user replied to the "Enter file name" prompt with  $\langle RETURN \rangle$ ), so stop here (do  $\langle Cpopfilename$  to pop the item just added above).

This \@gobble omits the date check at the end.

```
\ifx\@currname\@empty
560 \expandafter\@gobble
561 \else
```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with \OffilehookOffileOpush then call \setOcurrOffile to set \OcurrOffile (and do any required substitution), then actually load the class/package with \loadOonefileOwithoptions.

Now just clean up and exit.

```
567 \@expl@@@filehook@file@pop@@}%
568 \expandafter\@firstofone
569 \fi}%
```

Except in the case where \@currname is empty, the date is checked against the date marked in the package file:

```
{\@ifl@ter\@currext{\@currname}{#3}{}%
570
         {\@latex@warning@no@line
571
           {You have requested, \on@line,
572
            version\MessageBreak
573
               '#3' of \@cls@pkg\space \@currname,\MessageBreak
            but only version\MessageBreak
575
             '\csname ver@\@currname.\@currext\endcsname'\MessageBreak
576
            is available}}%
        \ifx\@currext\@clsextension\let\LoadClass\@twoloadclasserror\fi}%
578
       \@popfilename
579
       \@reset@ptions}
580
581 \@onlypreamble\@onefilewithoptions
    The kernel no longer uses \Qunprocessedoptions
582 \let\@unprocessedoptions\@undefined
```

Now the action taken when a file is not found.

```
\@missing@onefilewithoptions
```

```
\def\@missing@onefilewithoptions#1{%

@missingfileerror\@currname\@currext

kdef\@currname{\@missingfile@area\@missingfile@base}%

global\let\@currext\@missingfile@ext}
```

Now the code that actually does the file loading:

\load@onefile@withoptions

```
587 \def\load@onefile@withoptions#1{%
588 \let\CurrentOption\@empty
589 \@reset@ptions
```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```
\def\reserved@a{%

'\pass@ptions\@currext{#1}{\@currname}\%

\global\expandafter

\let\csname ver@\@currname.\@currext\endcsname\@empty
```

We initialize \...-h@@k here and only if we load the file so that it remains undefined otherwise.

```
\expandafter\let\csname\@currname.\@currext-h@@k\endcsname\@empty
```

When the current extension is **\@pkgextension** we are loading a package otherwise, if it is **\@clsextension**, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```
596 \ifx\@currext\@pkgextension
597 \UseHook{package/before}%
598 \UseHook{package/before/\@currname}%
599 \else
600 \ifx\@currext\@clsextension
601 \UseHook{class/before}%
602 \UseHook{class/before/\@currname}%
603 \fi
```

Now actually load the file (at this point we are certain it exists, but use \InputIfFileExists so that file hooks are executed):

```
605 \InputIfFileExists{\@currname.\@currext}{}{}% 606 %------
```

In older versions of the code \@unprocessedoptions would generate an error for each specified option in a package unless a \ProcessOptions has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interferences in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```
\expandafter\let\csname unprocessedoptions-\@currname.\@currext\endcsname \@@unprocessedoptions \csname\@currname.\@currext-h@@k\endcsname \expandafter\let\csname\@currname.\@currext-h@@k\endcsname \@undefined
```

Catch the case where the packages has handled the options and redefined \@unprocessedoptions to \relax (old interface). In that case no error should be produced.

```
1612 \ifx\@unprocessedoptions\relax
1613 \let\@unprocessedoptions\@undefined
```

Otherwise run the per package set of unused options.

```
    \else
    \csname unprocessedoptions-\@currname.\@currext\endcsname
    \fi
```

In either case we drop the macro afterwards as it is no longer needed.

```
617 \expandafter\let
618 \csname unprocessedoptions-\@currname.\@currext\endcsname
619 \@undefined
```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```
620
                   \ifx\@currext\@pkgextension
621
                         \UseHook{package/after/\@currname}%
622
623
                         \UseHook{package/after}%
                   \else
                        \ifx\@currext\@clsextension
                              \UseHook{class/after/\@currname}%
                              \UseHook{class/after}%
 627
                        \fi
628
                   fi}%

#### 4.1 Hooks

Allow code to be saved to be executed at specific later times.

Save things in macros, I considered using toks registers, (and \addto@hook from the NFSS code, that would require stacking the contents in the case of required packages, so just generate a new macro for each package.

```

# 5 Package/class rollback mechanism

```
1149 \(/2ekernel\)
1150 \(*2ekernel | latexreleasefirst\)
```

#### \pkgcls@debug

For testing we have a few extra lines of code that by default do nothing but one can set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be dropped.

(End definition for \pkgcls@debug. This function is documented on page ??.)

#### \requestedLaTeXdate

The macro (!) \requestedLaTeXdate holds the globally requested rollback date (via latexrelease) or zero if no such request was made.

1155 \def\requestedLaTeXdate{0}

(End definition for \requestedLaTeXdate. This function is documented on page ??.)

### \pkgcls@targetdate \pkgcls@targetlabel \pkgcls@innerdate

If a rollback for a package or class is requested then \pkgcls@targetdate holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of \requestedLaTeXdate) and \pkgcls@targetlabel will be empty. If there was a request for a named version then \pkgcls@targetlabel holds the verion name and \pkgcls@targetdate is set to 1.

\pkgcls@targetdate=0 is used to indicate that there was no rollback request. While loading an old release \pkgcls@targetdate is also reset to zero so that \DeclareRelease declarations are bypassed.

In contrast \pkgcls@innerdate will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain TeX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```
1156 \ifx\pkgcls@targetdate\@undefined
1157 \newcount\pkgcls@targetdate
1158 \fi
1159 \let\pkgcls@targetlabel\@empty
1160 \def\pkgcls@innerdate{\maxdimen}
```

(End definition for  $\beta$  \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate. These functions are documented on page  $\ref{pkgcls}$ .)

## \pkgcls@candidate \pkgcls@releasedate

When looping through the \DeclareRelease declarations we record if the release is the best candidate we have seen so far. This is recorded in \pkgcls@candidate and we update it whenever we see a better one.

In \pkgcls@releasedate we keep track of the release date of that candidate.

```
1161 \let\pkgcls@candidate\@empty
1162 \let\pkgcls@releasedate\@empty
```

 $(\textit{End definition for } \verb|\pkgcls@candidate| and \verb|\pkgcls@releasedate|. These functions are documented on page \ref{eq:conditions})) and $$($^2$).$ 

\load@onefilewithoptions \@onefilewithoptions the best place to add the rollback code is at the point where \@onefilewithoptions is called to load a single class or package.

To make things easy we save the old definition as  $\load@onefilewithoptions$  and then provide a new interface.

Important: as this code is also unconditionally placed into latexrelease we can only do this name change once otherwise both macros will contain the same code.

```
1163 \ifx\load@onefilewithoptions\@undefined
1164 \let\load@onefilewithoptions\@onefilewithoptions
1165 \def\@onefilewithoptions#1[#2][#3]#4{%
```

First a bit of tracing normally disabled.

Two of the arguments are needed later on in error/warning messages so we save them.

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set \pkgcls@targetdate, \pkgcls@targetlabel and \pkgcls@mindate.

```
1175 \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candiates in \pkgcls@candidate and initially we don't have any:

```
1176 \let\pkgcls@candidate\@empty
```

If we had a rollback request then #3 may contain data but not necessarily a "minimal date" so instead of passing it on we pass on the content of \pkgcls@mindate. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

(End definition for \load@onefilewithoptions and \@onefilewithoptions. These functions are documented on page ??.)

\pkgcls@parse@date@arg

The \pkgcls@parse@date@arg command parses the second optional argument of \usepackage, \RequirePackage or \documentclass for a rollback request setting the values of \pkgcls@targetdate and \pkgcls@targetlabel.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature

is actually available, or a certain bug has been fixed). When the package gets loaded the information in \Provides... will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at tht date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with "=" then the \pkgcls@targetdate is set to the date of the overall rollback request (via latexrelease) or if that was not given it is set to 0. In either case \pkgcls@targetlabel will be made empty.

If the argument doesn't start with "=" then it is supposed to be a "minimal date" and we therefore save the value in \pkgcls@mindate, otherwise this macro is made empty.

So in summary we have:

```
Input
                                              \pkgcls@targetdate
                                                                                                         \pkgcls@targetlabel
                                                                                                                                                             \pkgcls@mindate

=\langle version \rangle
                                                                                                                        \langle version \rangle
                                                                                                                                                                        \langle empty \rangle
  \langle other \rangle
                                    \langle global\text{-}rollbackdate\text{-}as\text{-}number \rangle
                                                                                                                                                                         \langle other \rangle
                                                                                                                        \langle empty \rangle
```

where  $\langle global\text{-}rollbackdate\text{-}as\text{-}number\rangle$  is a date request given via latexrelease or if there wasn't one 0.

```
1186 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from latexrelease which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
1187 \ifx\@nil#1\@nil
1188 \pkgcls@targetdate\requestedLaTeXdate\relax
1189 \let\pkgcls@targetlabel\@empty
1190 \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

The actual parsing work then happens in \pkgcls@parse@date@arg@:

```
1195 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set \pkgcls@targetdate depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
196 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with **\@parse@version**, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
1197 \ifx\@nil#1\@nil
1198 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to \pkgcls@targetdate and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change \pkgcls@targetdate and set \pkgcls@targetlabel to the version name (after stripping off the trailing =.

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of \pkgcls@targetdate):

```
\requestedLaTeXdate\relax
1209 \let\pkgcls@targetlabel\@empty
1210 \def\pkgcls@innerdate{\maxdimen}%
1211 \def\pkgcls@mindate{#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```
\ifnum \pkgcls@targetdate > \z@
            \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
1213
1214
              \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
                A minimal date of #1 has been specified for
                 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
1216
                 But this is in conflict
1217
                 with a rollback request to \requestedpatchdate}
1219
            \fi
1220
          \fi
       \fi
1222 }
```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```
1223 \def\pkgcls@parse@date@arg@version#1={%
1224 \def\pkgcls@targetlabel{#1}}
```

(End definition for \pkgcls@parse@date@arg. This function is documented on page ??.)

\DeclareRelease

First argument is the "name" of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be  $\langle pkg/cls-name \rangle - \langle date \rangle \cdot \langle extension \rangle$  but this is not enforced and through this argument one can overwrite it.

```
1225 \def\DeclareRelease#1#2#3{%
1226 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1227 \langle*tracerollback\\
1228 \pkgcls@debug{---\string\DeclareRelease:}%
1229 \pkgcls@debug{\@spaces 1: #1}%
1230 \pkgcls@debug{\@spaces 2: #2}%
```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

```
\text{\pkgcls@debug{\@spaces 3: #3}%} \text{\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcls@debug{\\pkgcl
```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a "beta" release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```
\ifx\@nil#2\@nil
           \ifnum\pkgcls@targetdate=\@ne % named request
1234
             \def\reserved@a{#1}%
1235
             \ifx\pkgcls@targetlabel\reserved@a
1236
               \pkgcls@use@this@release{#3}{}%
    ⟨*tracerollback⟩
1238
             \else
1239
               \pkgcls@debug{Label doesn't match}%
    ⟨/tracerollback⟩
             \fi
1242
    ⟨*tracerollback⟩
1243
           \else
1244
             \pkgcls@debug{Date request: ignored}%
1245
    (/tracerollback)
1246
           \fi
1247
        \else
1248
```

If the value of \pkgcls@targetdate is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```
\ifnum\pkgcls@targetdate>\@ne % a real request
```

So we parse the date of this release to check if it is before or after the request date.

```
\ifnum\@parse@version#2//00\@nil
>\pkgcls@targetdate
```

1249

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exists. So we make a complained to the user.

```
1252 \ifx\pkgcls@candidate\@empty
1253 \pkgcls@rollbackdate@error{#2}%
1254 \pkgcls@use@this@release{#3}{#2}%
1255 \else
1256 \pkgcls@use@this@release\pkgcls@candidate
1257 \pkgcls@releasedate
1258 \fi
1259 \else
```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

File P: 1tclass.dtx Date: 2020/08/29 Version v1.3p

If we end up in this branch we have a named version request. So we check if \pkgcls@targetlabel matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```
\def\reserved@a{#1}%
             \ifx\pkgcls@targetlabel\reserved@a
1268
               \pkgcls@use@this@release{#3}{#2}%
1269
    ⟨*tracerollback⟩
1270
             \else
1271
               \pkgcls@debug{Label doesn't match}%
1273
    ⟨/tracerollback⟩
1274
             \fi
           \fi
        \fi
1276
      \fi
1278 }
```

(End definition for \DeclareRelease. This function is documented on page ??.)

#### \pkgcls@use@this@release

If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
1279 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
pkgcls@show@selection{#1}{#2}%
```

We then set the \pkgcls@targetdate to zero so that any \DeclareRelease or \DeclareCurrentRelease in the file we now load are bypassed 18 and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue \endinput. Note that the \relax before that is essential to ensure that the \endinput is only happening after the file has been fully processed, otherwise it would act after the first line of the \@@input!

```
1281 \pkgcls@targetdate\z@
1282 \@@input #1\relax
1283 \endinput
1284 }
```

 $(\mathit{End \ definition \ for \ } \verb|pkgcls@useQthisQrelease|. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:local_property}.)$ 

#### \pkgcls@show@selection

This command records what selection was made. As that is needed in two places (and it is rather lengthly) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

 $<sup>^{18}</sup>$ The older release may also have such declarations inside if it was a simply copy of the .sty or .cls file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

```
date

'ifnum\requestedLaTeXdate=\pkgcls@targetdate

'requestedpatchdate

'else

'expandafter\@gobble\pkgcls@arg

'fi.\MessageBreak
```

Instead of "best approximation" we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```
1299
           Best approximation is
1300
        \else
            version '\pkgcls@targetlabel'.\MessageBreak
1301
           This corresponds to
        \fi
1303
        \int x^0ni1#2\0ni1
1304
           a special release%
1305
        \else
1306
           the release introduced on #2%
1307
        \fi
1308
        \@gobble}%
1309
1310
```

(End definition for \pkgcls@show@selection. This function is documented on page ??.)

\pkgcls@rollbackdate@error

This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```
1311 \def\pkgcls@rollbackdate@error#1{%
1312 \@latex@error{Suspicious rollback date given}%
1313 {The \@cls@pkg\space'\@currname' claims that it
1314 came into existence on #1 which\MessageBreak
1315 is after your requested rollback date --- so
1316 something is wrong here.\MessageBreak
1317 Continue and we use the earliest known release.}}
```

 $(\mathit{End \ definition \ for \ \backslash pkgcls@rollbackdate@error. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:constraint}.})}$ 

\DeclareCurrentRelease

This declares the date (and possible name) of the current version of a package or class.

```
1318 \def\DeclareCurrentRelease#1#2{%
```

First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```
% some sort of rollback request % tracerollback  
% tracerollback  
% tracerollback  
% tracerollback  
% pkgcls@debug{---DeclareCurrentRelease}%  
% pkgcls@debug{ 1: #1}%  
% pkgcls@debug{ 2: #2}%  
% (/tracerollback)
```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```
\ifnum\pkgcls@targetdate>\@ne % a date request
ifnum\@parse@version#2//00\@nil
>\pkgcls@targetdate
```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a \DeclareCurrentRelease but no declared older releases (so basically the use of the declaration is a bit dubious).

```
1328 \ifx\pkgcls@candidate\@empty
1329 \pkgcls@rollbackdate@error{#2}%
1330 \else
1331 \pkgcls@use@this@release\pkgcls@candidate
1332 \pkgcls@releasedate
```

Otherwise the curent file is the right release, so we record that in the transcript and then carry on.

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```
\def\reserved@a{#1}%
1338
          \ifx\pkgcls@targetlabel\reserved@a
1339
            \pkgcls@show@selection{current version}{#2}%
1340
          \else
1341
            \@latex@error{Requested version '\pkgcls@targetlabel' for
1342
               \@cls@pkg\space'\@currname' is unknown}\@ehc
1343
1344
          \fi
        \fi
      \fi
1346
1347 }
```

(End definition for \DeclareCurrentRelease. This function is documented on page ??.)

\IfTargetDateBefore

This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the "latest" version of the file.

Most often the second argument (before-date-code) will be empty.

```
\DeclareRobustCommand\IfTargetDateBefore[1]{%
1348
      \ifnum\pkgcls@innerdate <%
1349
             \expandafter\@parse@version\expandafter0#1//00\@nil
1350
        \typeout{Exclude code introduced on #1}%
1351
        \expandafter\@firstoftwo
1352
1353
        \typeout{Include code introduced on #1}%
        \expandafter\@secondoftwo
1355
      \fi
1357 }
(End definition for \IfTargetDateBefore. This function is documented on page ??.)
1358 </2ekernel | latexreleasefirst>
```

File P: ltclass.dtx Date: 2020/08/29 Version v1.3p

# 6 After Preamble

Finally we declare a package that allows all the commands declared above to be \@onlypreamble to be used after \begin{document}.

# File Q ltfilehook.dtx

# Contents

# 1 Introduction

## 1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed. Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all "include files" or all "packages", and there are also hooks that are specific to a single file, e.g., do something after the package foo.sty has been loaded.

# 1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as \input, \include, \usepackage, etc. They are not called for files read using internal low-level methods, such as \@input or \openin.

file/before
file/before/...
file/after/...
file/after

These are:

file/before, file/before/\langle file-name \rangle These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching \langle file-name \rangle allowing you to specify code that only applies to one file.

file/after/\langle file-name \rangle, file/after These hooks are after the file with name \langle file-name \rangle has been fully consumed. The order is swapped (the specific one comes first) so that the before and after hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both /before and /after hooks.

So the overall sequence of hook processing for any file read through the user interface commands of  $I^AT_FX$  is:

```
\label{local_set_one} $$\UseHook{\langle file/before \rangle} $$\UseHook{\langle file/before \rangle} $$\UseHook{\langle file/after \rangle} $$\UseHook{\langle file/after \rangle} $$\UseHook{\langle file/after \rangle} $$
```

The file hooks only refer to the file by its name and extension, so the  $\langle file\ name \rangle$  should be the file name as it is on the filesystem with extension (if any) and without paths. Different from \input and similar commands, the .tex extension is not assumed in hook  $\langle file\ name \rangle$ , so .tex files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that TEX prioritizes .tex files, so if two files foo and foo.tex exist in the search path, only the latter will be seen.

When a file is input, the  $\langle file\ name \rangle$  is available in \CurrentFile, which is then used when accessing the file/before/ $\langle file\ name \rangle$  and file/after/ $\langle file\ name \rangle$ .

# \CurrentFile

The name of the file about to be read (or just finished) is available to the hooks through \CurrentFile (there is no expl3 name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, \input{sample} and \input{app/sample.tex} would both have \CurrentFile being sample.tex.

#### \CurrentFilePath

The path to the current file (complement to \CurrentFile) is available in \CurrentFilePath if needed. The paths returned in \CurrentFilePath are only user paths, given through \input@path (or expl3's equivalent \l\_file\_search\_path\_seq) or by directly typing in the path in the \input command or equivalent. Files located by kpsewhich get the path added internally by the TEX implementation, so at the macro level it looks as if the file were in the current folder, so the path in \CurrentFilePath is empty in these cases (package and class files, mostly).

#### \CurrentFileUsed \CurrentFilePathUsed

In normal circumstances these are identical to \CurrentFile and \CurrentFilePath. They will differ when a file substitution has occurred for \CurrentFile. In that case, \CurrentFileUsed and \CurrentFilePathUsed will hold the actual file name and path loaded by IATEX, while \CurrentFile and \CurrentFilePath will hold the names that were asked for. Unless doing very specific work on the file being read, \CurrentFile and \CurrentFilePath should be enough.

# 1.3 Hooks for package and class files

Commands to load package and class files (e.g., \usepackage, \RequirePackage, \LoadPackageWithOptions, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., file/after/array.sty would be called after the array package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

package/before package/after package/before/... package/after/... class/before class/after class/before/... class/after/... These are:

package/before, package/after These hooks are called for each package being loaded.

package/before/ $\langle name \rangle$ , package/after/ $\langle name \rangle$  These hooks are additionally called if the package name is  $\langle name \rangle$  (without extension).

class/before, class/after These hooks are called for each class being loaded.

class/before/ $\langle name \rangle$ , class/after/ $\langle name \rangle$  These hooks are additionally called if the class name is  $\langle name \rangle$  (without extension).

All /after hooks are implemented as reversed hooks.

The overall sequence of execution for \usepackage and friends is therefore:

```
\UseHook{\package/before\}
\UseHook{\package/before\package name\package name\package
```

and similar for class file loading, except that package/ is replaced by class/ and \AtEndOfPackage by \AtEndOfClass.

If a package or class is not loaded (or it was loaded before the hooks were set) none of the hooks are executed!

# 1.4 Hooks for \include files

To manage \include files, IATEX issues a \clearpage before and after loading such a file. Depending on the use case one may want to execute code before or after these \clearpages especially for the one that is issued at the end.

Executing code before the final \clearpage, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places. <sup>19</sup> None of the hooks are executed when an \include file is bypassed because of an \includeonly declaration. They are, however, all executed if LATEX makes an attempt to load the \include file (even if it doesn't exist and all that happens is "No file \( \frac{filename}{\).tex").

<sup>&</sup>lt;sup>19</sup>If you want to execute code before the first **\clearpage** there is no need to use a hook—you can write it directly in front of the **\include**.

include/before
include/end
include/end/...
include/after
include/after/...

These are:

include/before, include/before/(name) These hooks are executed (in that order) after the initial \clearpage and after .aux file is changed to use \( name \).aux, but before the \( name \).tex file is loaded. In other words they are executed at the very beginning of the first page of the \include file.

include/end/(name), include/end These hooks are executed (in that order) after LATEX has stopped reading from the \include file, but before it has issued a \clearpage to output any deferred floats.

include/after/(name), include/after These hooks are executed (in that order) after IATEX has issued the \clearpage but before is has switched back writing to the main .aux file. Thus technically we are still inside the \include and if the hooks generate any further typeset material including anything that writes to the .aux file, then it would be considered part of the included material and bypassed if it is not loaded because of some \includeonly statement.<sup>20</sup>

# 1.5 High-level interfaces for LATEX

We do not provide any high-level LATEX commands (like filehook or scrlfile do) but think that for package writers the commands from for hook management are sufficient.

# 1.6 Internal interfaces for LATEX

\declare@file@substitution \undeclare@file@substitution

If  $\langle file \rangle$  is requested for loading replace it with  $\langle replacement\text{-}file \rangle$ . \CurrentFile remains pointing to  $\langle file \rangle$  but \CurrentFileUsed will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of LATEX kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases.

The  $\underline \$  a substitution made earlier.

Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementating the same functionality as the original one!

<sup>&</sup>lt;sup>20</sup>For that reason another **\clearpage** is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

```
\label{local-package} $$ \disable@package@load {$\langle package \rangle$} $$ \end{tabular} $$ \end{t
```

If  $\langle package \rangle$  is requested do not load it but instead run  $\langle alternate-code \rangle$  which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files.

# 1.7 A sample package for structuring the log output

As an application we provide the package structuredlog that adds lines to the .log when a file is opened and closed for reading keeping track of nesting level es well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
  (LEVEL 1 START) ltfilehook-doc.hd
= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) ot1lmr.fd
== (LEVEL 2 STOP) ot1lmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxlmex.fd
== (LEVEL 2 STOP) omxlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) ts1lmr.fd
== (LEVEL 2 STOP) ts1lmr.fd
== (LEVEL 2 START) t1lmss.fd
== (LEVEL 2 STOP) t1lmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx
```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

# 2 The Implementation

- 1 (\*2ekernel)
  2 (@@=filehook)
- 2.1 Document and package-level commands

\CurrentFile \CurrentFilePath \CurrentFileUsed \CurrentFilePathUsed

User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested \input). The versions \...Used hold the actual file name and path that is loaded by IATEX, whereas the other two hold the name as requested. They will differ in case there's a file substitution.

```
3 (/2ekernel)
  ⟨*2ekernel | latexrelease⟩
  ⟨latexrelease⟩\IncludeInRelease{2020/10/01}%

\\_filehook\_file\_parse\_full\_name:nN \\_\_filehook\_full\_name:nn \ filehook set curr file assign:nnnNN

A utility macro to trigger expl3's file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalisation takes place.

The output of  $\_$  file\_parse\_full\_name:nN is passed on to the #2—a 3-argument macro that takes the  $\langle path \rangle$ ,  $\langle base \rangle$ , and  $\langle ext \rangle$  parts of the file name.

```

# 2.3 Declaring the file-related hooks

All hooks starting with file/include/, class/ or package/ are generic and will be allocated if code is added to them. Thus there is no need to explicitly declare any hook in the code below.

Furthermore, those named .../after or .../end are automatically declared as reversed hooks if filled with code, so this is also automatically taken care of.

# 2.4 Patching LATEX's \InputIfFileExists command

Most of what we have to do is adding  $\UseHook$  into several LATEX  $2_{\varepsilon}$  core commands, because of some circular dependencies in the kernel we do this only now and not in ltfiles.

\InputIfFileExists

\InputIffileExists loads any file if it is available so we have to add the hooks file/before and file/after in the right places. If the file doesn't exist no hooks should be executed.

```
94 \let\InputIfFileExists\@undefined
95 \DeclareRobustCommand \InputIfFileExists[2]{%
96 \IfFileExists{#1}%
97 {%
98 \@expl@@@filehook@file@push@@
99 \@filehook@set@CurrentFile
```

If the file exists then \CurrentFile holds its name. But we can't rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restored it for the file/after/... hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for \CurrentFile which usually is the same as \CurrentFileUsed. In the case of a file replacement, the \CurrentFileUsed holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

expl3's \file\_full\_name:n normalizes the file name (to factor out differences in the .tex extension), and then does a file lookup to take into account a possible path from \l\_file\_search\_path\_seq and \input@path. However only the file name and extension are returned so that file hooks can refer to the file by their name only. The path to the file is returned in \CurrentFilePath.

```

#### Selecting a file (\set@curr@file) 2.6

\set@curr@file \@curr@file \@curr@file@reqd Now we hook into \set@curr@file to resolve a possible file substitution, and add \@expl@@filehook@set@curr@file@@N at the end, after \@curr@file is set.

A file name is built using \expandafter\string\csname\filename\\endcsname to avoid expanding utf8 active characters. The \csname expands the normalisation machinery and the routine to resolve a file substitution, returning a control sequence with the same name as the file.

It happens that when  $\langle filename \rangle$  is empty, the generated control sequence is \csname\endcsname, and doing \string on that results in the file csnameendcsname.tex. To guard against that we \ifx-compare the generated control sequence with the empty csname. To do so, \csname\endcsname has to be defined, otherwise it would be equal to

\relax and we would have false positives. Here we define \csname\endcsname to expand to itself to avoid it matching the definition of some other control sequence.

Two file names are set here: \@curr@file@reqd which is the file requested by the user, and \@curr@file which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. \@curr@file is resolved first, to check if a substitution happens. If it doesn't, \@expl@@@filehook@if@file@replaced@@TF short-cuts and just copies \@curr@file, otherwise the full normalisation procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default .tex is *not* added to \@curr@file because for applications other than \input (graphics, for example) the default extension may not be .tex. First check if the input has an extension, then if the input had no extension, call \@expl@@@filehook@drop@extension@@N. In case of a file substitution, \@curr@file will have an extension.

```

```

\@filehook@set@CurrentFile \@kernel@make@file@csname \@set@curr@file@aux Todo: This should get internalized using @expl@ names

This auxiliary compares  $\langle filename \rangle$  with  $\langle filename \rangle$  with  $\langle filename \rangle$  to check if the empty .tex file was requested.

```
241 \def\@set@curr@file@aux#1{%
242 \expandafter\ifx\csname\endcsname#1%
243 .tex\else\string#1\fi}
```

Then we call \@expl@@filehook@set@curr@file@@N once for \@curr@file to set \CurrentFile(Path)Used and once for \@curr@file@reqd to set \CurrentFile(Path).

Here too the slower route is only used if a substitution happened, but here \@expl@@filehook@if@file@can't be used because the flag is reset at the \endgroup above, so we check if \@curr@file and \@curr@file@reqd differ. This macro is issued separate from \set@curr@file because it changes \CurrentFile, and side-effects would quickly get out of control.

```
244 \def\@filehook@set@CurrentFile{%

#### 2.7 Replacing a file and detecting loops

\\_filehook\_resolve\_file\_subst:w \\_\_filehook\_normalize\_file\_name:w \\_\_filehook\_file\_name\_compose:nnn

Start by sanitising the file with \\_\_filehook\_file\_parse\_full\_name:nN then do \\_\_filehook\_file\_subst\_begin:nnn{ $\langle path \rangle$ }{ $\langle name \rangle$ }{ $\langle ext \rangle$ }.

```
279 (/2ekernel)
280 (*2ekernel | latexrelease)
281 (latexrelease)\IncludeInRelease{2020/10/01}%
                        {\__filehook_resolve_file_subst:w}{Replace files detect loops}%
282 (latexrelease)
283 \ExplSyntaxOn
284 \cs_new:Npn \__filehook_resolve_file_subst:w #1 \@nil
     { \ filehook file parse full name:nN {#1} \ filehook file subst_begin:nnn }
   \cs_new:Npn \__filehook_normalize_file_name:w #1 \@nil
     { \__filehook_file_parse_full_name:nN {#1} \__filehook_file_name_compose:nnn }
288 \cs_new:Npn \__filehook_file_name_compose:nnn #1 #2 #3
     { \tl_if_empty:nF {#1} { #1 / } #2#3 }
```

\ filehook if file replaced:TF

Since the file replacement is done expandably in a \csname, use a flag to remember if flagu\_filehook\_file\_replaced a substitution happened. We use this in \set@curr@file to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimising).

```
290 \flag_new:n { __filehook_file_replaced }
291 \cs_new:Npn \__filehook_if_file_replaced:TF #1 #2
      { \flag_if_raised:nTF { __filehook_file_replaced } {#1} {#2} }
```

\ filehook file subst begin:nnn

First off, start by checking if the current file  $(\langle name \rangle + \langle ext \rangle)$  has a declared substitution. If not, then just put that as the name (including a possible  $\langle path \rangle$  in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary \\_\_filehook\_file\_subst\_tortoise\_hare:nn sees that there's no replacement for #2#3 and does nothing else.

```
293 \cs_new:Npn \__filehook_file_subst_begin:nnn #1 #2 #3
294
   {
```

```
\_filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }

{ \__filehook_file_name_compose:nnn {#1} {#2} {#3} }

{ \__filehook_file_name_compose:nnn {#1} {#2} {#3} }

```

### 2.7.1 The Tortoise and Hare algorithm

\\_filehook\_file\_subst\_tortoise\_hare:nn \\_filehook\_file\_subst\_loop:NN \\_filehook\_file\_subst\_loop:cc If there is a substitution ( $\langle true \rangle$  in the first  $\cs_{if_exist:cTF}$  below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the  $\flootsigned file_replaced$  is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put TEX in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below,  $\__file\_output$  the subst loop: cc is called with  $\_file\_output$  and  $\_file\_output$  and the substution of that substution: the Tortoise walks one step while the Hare walks two.

Within  $\__$ filehook\_file\_subst\_loop:NN the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's no loop,  $\__$ filehook\_file\_subst\_tortoise\_hare:nn is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the  $\c_$ if\_exist:cTF below will go  $\c$ false $\c$  and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

319
```

File Q: ltfilehook.dtx

```
320 }
321 { #3 }
322 }
```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the .tex file is used as fallback and \\_\_filehook\_file\_subst\_-cycle\_error:cN is called to report the error.

\\_\_filehook\_file\_subst\_cycle\_error:NN \ filehook file subst cycle error:cN

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```
333

# 2.9 High-level interfaces for LATEX

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

# 2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent)  $\LaTeX 2_{\varepsilon}$  names to allow for internal commands to be used outside this module (and in parts that still use  $\LaTeX 2_{\varepsilon}$  syntax. We have to unset the **QQ** since we want double "at" sign in place of double underscores.

#### 3 A sample package for structuring the log output

```
⟨*structuredlog⟩
⟨@@=filehook⟩
\ProvidesExplPackage
    {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
    {Structuring the TeX transcript file}
```

\g\_filehook\_nesting\_level\_int Stores the current package nesting level.

```
405 \int_new:N \g__filehook_nesting_level_int
```

Initialise the counter with the number of files in the \@currnamestack (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

```
406 \int_gset:Nn \g__filehook_nesting_level_int
     { ( \tl_count:N \@currnamestack ) / 3 - 1 }
(End definition for \g_filehook_nesting_level_int.)
```

\\_\_filehook\_log\_file\_record:n

This macro is responsible for increasing and decresing the file nesting level, as well as printing to the log. The argument is either STOPTART or STOP and the action it takes on the nesting integer depends on that.

```
\cs_new_protected:Npn \__filehook_log_file_record:n #1
       \str_if_eq:nnT {#1} {START} { \int_gincr:N \g__filehook_nesting_level_int }
410
411
       \iow_term:x
412
           \prg_replicate:nn { \g_filehook_nesting_level_int } { = } ~
413
           ( LEVEL ~ \int_use:N \g_filehook_nesting_level_int \c_space_tl #1 ) ~
414
           \CurrentFileUsed
415
```

If there was a file replacement, show that as well:

```
\str_if_eq:NNF \CurrentFileUsed \CurrentFile
             { ~ ( \CurrentFile \space requested ) }
418
           \iow_newline:
419
       \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g_filehook_nesting_level_int }
420
421
```

Now just hook the macro above in the generic file/before...

```
422 \AddToHook{file/before}{ \__filehook_log_file_record:n { START } }
```

... and file/after hooks. We don't want to install the file/after hook immediately, because that would mean it is the first time executed when the package finishes. We therefore put the declaration inside \AddToHookNext so that it gets only installed when we have left this package.

```
423 \AddToHookNext{file/after}
     { \AddToHook{file/after}{ \__filehook_log_file_record:n { STOP } } }
(End\ definition\ for\ \verb|\__filehook_log_file_record:n.)
426 (/structuredlog)
```

# Package emulations

# Package atveryend emulation

With the new hook management and the hooks in \endocument all of atveryend is taken care of. We can make an emulation only here after the substitution functionality is available:

```
427 (*2ekernel)
428 \declareOfileOsubstitution{atveryend.sty}{atveryend-ltx.sty}
    Here is the package file we point to:
   ⟨*atveryend-ltx⟩
  \ProvidesPackage{atveryend}
      [2020/08/19 v1.0a
        Emulation of the original atvery package^^Jwith kernel methods]
433
```

Here are new definitions for its interfaces now pointing to the hooks in \enddocument

```
434 \newcommand\AfterLastShipout {\AddToHook{enddocument/afterlastpage}}
```

435 \newcommand\AtVeryEndDocument {\AddToHook{enddocument/afteraux}}

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in enddocument/info.

```
\newcommand\AtEndAfterFileList{\AddToHook{enddocument/info}}
```

```
437 \newcommand\AtVeryVeryEnd
                                 {\AddToHook{enddocument/end}}
```

\BeforeClearDocument

This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```
438 \ExplSyntaxOn
  \newcommand\BeforeClearDocument[1]
    { \AtEndDocument{#1}
       \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
442
```

```
443 \cs_new:Npn\atveryend@DEPRECATED #1

444 {\iow_term:x{=====~DEPRECATED~USAGE~#1~======}}

445 \ExplSyntaxOff

(End definition for \BeforeClearDocument. This function is documented on page ??.)

446 \( / \atveryend-ltx \)
```

# 4.2 Package filehook emulation

This is a partial implementation of the filehook interfaces. It is only meant for guidance in case that package gets updated to use the hook management.

Not implemented are:

```
\AtBeginOfFiles
\AtEndOfFiles
\AtBeginOfInputs
\AtEndOfInputs
\AtBeginOfInputFile
\AtEndOfInputFile
447 (*filehook-draft)
  \newcommand\AtBeginOfEveryFile [1]
    {\AddToHook{file/before}{#1}}
  \newcommand\AtEndOfEveryFile [1]
450
    {\AddToHook{file/after}{#1}}
451
  \newcommand\AtBeginOfIncludes [1]
    {\AddToHook{include/before}{#1}}
  \newcommand\AtEndOfIncludes [1]
    {\AddToHook{include/end}{#1}}
  \newcommand\AfterIncludes [1]
    {\AddToHook{include/after}{#1}}
  \newcommand\AtBeginOfPackages [1]
    {\AddToHook{package/before}{#1}}
  \newcommand\AtEndOfPackages [1]
    {\AddToHook{package/after}{#1}}
  \newcommand\AtBeginOfClasses [1]
462
    {\AddToHook{class/before}{#1}}
463
  \newcommand\AtEndOfClasses [1]
464
    {\AddToHook{class/after}{#1}}
    For normal files we drop the .tex extension for now:
  \newcommand\AtBeginOfFile [2]
    {\AddToHook{file/before/#1}{#2}}
  \newcommand\AtEndOfFile [2]
    {\AddToHook{file/after/#1}{#2}}
  \DeclareDocumentCommand \AtBeginOfPackageFile {smm}
470
     {\IfBooleanTF{#1}%
471
       {\@ifpackageloaded{#2}%
472
            {#3}%
473
            {\AddToHook{package/before/#2}{#3}}}%
       {\AddToHook{package/before/#2}{#3}}%
     }
```

```
477 \DeclareDocumentCommand \AtEndOfPackageFile {smm}
478 {\IfBooleanTF{#1}%
479 {\@ifpackageloaded{#2}%
480 {#3}%
481 {\AddToHook{package/after/#2}{#3}}}%
482 {\AddToHook{package/after/#2}{#3}}%
483 }
```

Are the \* forms here of any use? I know they are use 3–4 times on CTAN but I wonder if those are real or mistaken usages.

```
\DeclareDocumentCommand \AtBeginOfClassFile {smm}
     {\IfBooleanTF{#1}%
485
        {\@ifclassloaded{#2}%
486
            {#3}%
487
            {\AddToHook{class/before/#2}{#3}}}%
488
        {\AddToHook{class/before/#2}{#3}}%
  \DeclareDocumentCommand \AtEndOfClassFile {smm}
     {\IfBooleanTF{#1}%
       {\@ifclassloaded{#2}%
493
            {#3}%
101

# File R ltshipout.dtx

# Contents

# 1 Introduction

The code provides an interface to the \shipout primitive of TeX which is called when a finished pages is finally "shipped out" to the target output file, e.g., the .dvi or .pdf file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages atbegshi and atenddvi even though the interfaces are somewhat different.<sup>21</sup>

# 1.1 Overloading the \shipout primitive

## \shipout

With this implementation TEX's shipout primitive is no longer available for direct use. Instead \shipout is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed \vbox or \hbox or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

\ShipoutBox \l\_shipout\_box

This box register is called \ShipoutBox (alternatively available via the L3 name \1\_-shipout\_box).

\l\_shipout\_box\_ht\_dim
\l\_shipout\_box\_dp\_dim
\l\_shipout\_box\_wd\_dim
\l\_shipout\_box\_ht\_plus\_dp\_dim

The shipout box dimensions are available in the L3 registers  $\l_shipout_box_ht_dim$ , etc. (there are no LATEX  $2_{\varepsilon}$  names).<sup>22</sup> These variables can be used inside the hook code for shipout/before, shipout/foreground and shipout/background if needed.

 $<sup>^{21}</sup>$ Heiko's interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

 $<sup>^{22}\</sup>mathrm{Might}$  need changing, but HO's version as strings is not really helpful I think).

# 1.2 Provided hooks

shipout/before shipout/foreground shipout/background shipout/firstpage shipout/lastpage

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

shipout/before This hook is executed after the finished page has been stored in
\ShipoutBox / \l\_shipout\_box). It can be used to alter that box content or
to discard it completely (see \DiscardShipoutBox below).

shipout/background This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a \unitlength of 1pt.

It should therefore only receive **\put** commands or other commands suitable in a **picture** environment and the vertical coordinate values would normally be negative

Technically this is implemented by adding a zero-sized \hbox as the very first item into the \ShipoutBox containing that picture environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

shipout/foreground This hook adds a picture environment into the foreground of the page with the (0,0) coordinate in the top-left corner using a \unitlength of 1pt.

Technically this is implemented by adding a zero-sized \hbox as the very last item into the \ShipoutBox and raising it up so that it still has its (0,0) point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

shipout/firstpage The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain \special or similar commands needed to direct post processors handling the .dvi or .pdf output.<sup>23</sup>

shipout/lastpage The corresponding hook to add \specials at the very end of the output file. It is only executed on the very last page — or rather on the page that LATEX believes is the last one.

It may not be possible for IATEX to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then IATEX will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

As mentioned above the hook shipout/before is executed first and can manipulate the prepared shipout box stored in \ShipoutBox or set things up for use in \write during the actual shipout. The other hooks are added inside hboxes to the box being shipped out in the following order:

 $<sup>^{23} \</sup>text{In IATEX} \, 2\varepsilon$  that was already existing, but implemented using a box register with the name <code>\@begindvibox</code>.

shipout/firstpage only on the first page
shipout/background
\lambda boxed content of \ShipoutBox \shipout/foreground
shipout/lastpage only on the last page

If any of the hooks has no code then that particular no box is added at that point.

In a document that doesn't produce pages, e.g., only makes \typeouts, none of the hooks are executed (as there is no \shipout) not even the shipout/lastpage hook.

#### \AtBeginDvi \AtEndDvi

\AtBeginDvi is the existing LATEX  $2\varepsilon$  interface to fill the shipout/firstpage hook. This is not really a good name as it is not just supporting .dvi but also .pdf output or .dvx.

\AtEndDvi is the counterpart that was not available in the kernel but only through the package atenddvi. It fills the shipout/lastpage hook.

Todo: better names? Any suggestions?

# 1.3 Special commands for use inside the hooks

\DiscardShipoutBox \shipout\_discard\_box: \AddToHookNext {shipout/before} {...\DiscardShipoutBox...}

The \DiscardShipoutBox declaration (L3 name \shipout\_discard\_box:) requests that on the next shipout the page box is thrown away instead of being shipped to the .dvi or .pdf file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that LATEX output routine is called in an asynchronous manner!

Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it.

In the atbegshi package there are a number of additional commands for use inside the shipout/before hook. They should normally not be needed any more as one can instead simply add code to the hooks shipout/before, shipout/background or shipout/foreground. If atbegshi gets loaded then those commands become available as public functions with their original names as given below.

<sup>&</sup>lt;sup>24</sup>If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

## 1.4 Information counters

\ReadonlyShipoutCounter \g\_shipout\_readonly\_int \ifnum\ReadOnlyShipoutCounter=... \int\_use:N \g\_shipout\_readonly\_int % expl3 usage

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the shipout/before hook (because that might discard the page)!

Just like with the page counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that but if you do, chaos will be the result. To emphasize this fact it is not provided as a LATEX counter but as a TEX counter (i.e., a command), so \Alph{\\ReadonlyShipoutCounter\}\} etc, would not work.

totalpages \g\_shipout\_totalpages\_int \arabic{totalpages}

\int\_use:N \g\_shipout\_totalpage\_int % expl3 usage

In contrast to \ReadonlyShipoutCounter, the totalpages counter is a LATEX counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again shipout/before sees the counter before it is incremented).

Furthermore, while it is incremented for each page, its value is never used by LATEX. It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by LATEX but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

\PreviousTotalPages

 $\verb|\thetotalpages|| Previous TotalPages||$ 

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command to a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use \Roman on that counter.

# 1.5 Debugging shipout code

\DebugShipoutsOn \DebugShipoutsOff \shipout\_debug\_on: \shipout\_debug\_off: \DebugShipoutsOn

Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.

Todo: This needs some rationalizing and may not stay this way.

# 2 Emulating commands from other packages

The packages in this section are no longer necessary but as they are used in other packages they are emulated when they are loaded via \usepackage or \RequirePackage.

File R: ltshipout.dtx

# 2.1 Emulating atbegshi

\AtBeginShipoutUpperLeft \AtBeginShipoutUpperLeftForeground

\AddToHook {shipout/before} {...\AtBeginShipoutUpperLeft{\(\lambda code\)\}...\}

This adds a picture environment into the background of the shipout box expecting  $\langle code \rangle$  to contain picture commands. The same effect can be obtained by simply using kernel features as follows:

 $\verb|\AddToHook{shipout/background}| \{\langle code \rangle\}|$ 

There is one technical difference: if  $\Delta tBeginShipoutUpperLeft$  is used several times each invocation is put into its own box inside the shipout box whereas all  $\langle code \rangle$  going into shipout/background ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

\AtBeginShipoutUpperLeftForeground is similar with the difference that the picture environment is placed in the foreground. To model it with the kernel functions use the hook shipout/foreground instead.

\AtBeginShipoutAddToBox \AtBeginShipoutAddToBoxForeground These work like  $\AtBeginShipoutUpperLeft$  and  $\AtBeginShipoutUpperLeftForeground$  with the difference that  $\langle code \rangle$  is directly placed into an  $\AtBeginShipoutUpperLeftForeground$  and not surrounded by a picture environment.

To emulate them using shipout/background or shipout/foreground you may have to wrap  $\langle code \rangle$  into a \put statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

\AtBeginShipoutBox

This is the name of the shipout box as atbegshi knows it.

\AtBeginShipoutInit

By default atbegshi delayed its action until \beg{document}. This command was forcing it in an earlier place. With the new concept it does nothing.

\AtBeginShipout \AtBeginShipoutNext  $\label{local_code} $$ AddToHook{shipout/before}{\langle code\rangle} $$ AddToHookNext{shipout/before}{\langle code\rangle} $$ AddToHookNext{shipout/before}{\langle code\rangle} $$$ 

This is equivalent to filling the shipout/before hook by either using \AddToHook or \AddToHookNext, respectively.

\AtBeginShipoutFirst \AtBeginShipoutDiscard The atbegshi names for \AtBeginDvi and \DiscardShipoutBox.

# 2.2 Emulating everyshi

\EveryShipout

 $\verb|\EveryShipout|{\langle code \rangle}| \equiv \verb|\AddToHook{shipout/before}|{\langle code \rangle}|$ 

\AtNextShipout

 $\Lambda t = \Lambda dd = \Lambda$ 

File R: ltshipout.dtx

# 2.3 Emulating atenddvi

The atenddvi package implemented only a single command: \AtEndDvi and that is now available out of the box.

# 2.4 Emulating everypage

This page takes over the original \@begindvi hook and replaces it. It should be all covered by the hooks offered here (details need checking) and thus could simply use the provided hooks rather than defining its own.

# 3 The Implementation

```
1 (@@=shipout)
```

At the moment the whole module rolls back in one go, but if we make any modifications in later releases this will then need splitting.

# 3.1 Debugging

\g\_\_shipout\_debug\_bool

Holds the current debugging state.

```
6 \bool_new:N \g__shipout_debug_bool (End definition for \g_shipout_debug_bool.)
```

```
\shipout_debug_on:
\shipout_debug_off:
\__shipout_debug:n
\__shipout_debug_gset:
```

Turns debugging on and off by redefining \\_\_shipout\_debug:n.

```
7 \cs_new_eq:NN \__shipout_debug:n \use_none:n
8 \cs_new_protected:Npn \shipout_debug_on:
9
    {
      \bool_gset_true:N \g__shipout_debug_bool
10
       \__shipout_debug_gset:
    }
12
  \verb|\cs_new_protected:Npn \ \shipout_debug_off:
13
    {
14
      \bool_gset_false:N \g__shipout_debug_bool
15
       \__shipout_debug_gset:
16
    }
17
  \cs_new_protected:Npn \__shipout_debug_gset:
18
19
      \cs_gset_protected:Npx \__shipout_debug:n ##1
        { \bool_if:NT \g__shipout_debug_bool {##1} }
21
    }
22
```

(End definition for \shipout\_debug\_on: and others. These functions are documented on page 697.)

\ShipoutBox \l\_shipout\_box

\ShipoutBox The box filled with the page to be shipped out (both L3 and LATEX  $2\varepsilon$  name).

```
23 \box_new:N \l_shipout_box
24 \cs_set_eq:NN \ShipoutBox \l_shipout_box
```

(End definition for \ShipoutBox and \l\_shipout\_box. These functions are documented on page 694.)

This is going to the be the code run by \shipout. The code follows closely the ideas \\_\_shipout\_execute: from atbegshi, so not documenting that here for now. \cs\_set:Npn\\_\_shipout\_execute: { \tl\_set:Nx \l\_\_shipout\_group\_level\_tl { \int\_value:w \tex\_currentgrouplevel:D } \tex\_afterassignment:D \\_\_shipout\_execute\_test\_level: \tex\_setbox:D \l\_shipout\_box 30 } (End definition for \\_\_shipout\_execute:.) \shipout Overloading the \shipout primitive: 31 \cs\_gset\_eq:NN \shipout \\_\_shipout\_execute: (End definition for \shipout. This function is documented on page 694.) \l\_\_shipout\_group\_level\_tl Helper token list to record the group level at which \\_\_shipout\_execute: is encountered. 32 \tl\_new:N \l\_\_shipout\_group\_level\_tl (End definition for \l\_\_shipout\_group\_level\_tl.) If the group level has changed then we are still constructing \l\_shipout\_box and to con-\ shipout execute test level: tinue we need to wait until the current group has finished, hence the \tex\_aftergroup:D. \cs\_new:Npn \\_\_shipout\_execute\_test\_level: { \int compare:nNnT \l\_shipout\_group\_level\_tl < \tex\_currentgrouplevel:D</pre> \tex\_aftergroup:D \\_\_shipout\_execute\_cont:

(End definition for \\_\_shipout\_execute\_test\_level:.)

 $\_\_$ shipout\_execute\_cont:

When we have reached this point the shipout box has been processed and is available in \l\_shipout\_box and ready for real ship out (perhaps)..

First we quickly check if it is void (can't happen in the standard LATEX output routine but \shipout might be called from a package that has some special processing logic). If it is void we aren't shipping anything out and processing ends.<sup>25</sup>

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of \protect while we are running the hook code). We also save the current \protect state to restore it later.

```
\bool_gset_false:N \g_shipout_discard_bool
\cs_set_eq:NN \_shipout_saved_protect: \protect
\set@typeset@protect
```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.  $^{26}$ 

```
\_shipout_get_box_size:N \l_shipout_box
```

convenient.

<sup>&</sup>lt;sup>25</sup>In that case we don't reset the deadcyles, that would be up to the OR processing logic to do. <sup>26</sup>This is not really necessary as the code could access them via \box\_ht:N, etc., but it is perhaps

Then we execute the shipout/before hook.

```
\hook_use:n {shipout/before}
```

In \g\_shipout\_totalpages\_int we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a \shipout.

We increment it after running the above hook so that the values for \g\_shipout\_-totalpages\_int and \ are in sync while the hook is executed (in the case that totalpages isn't manually altered or through discarding pages that is).

```
\int_gincr:N \g_shipout_totalpages_int
```

The above hook might contain code that requests the page to be discarded so we now test for it.

```
49 \bool_if:NTF \g__shipout_discard_bool
50 {\PackageInfo{ltshipout}{Completed~ page~ discarded}}
51 \bool_gset_false:N \g__shipout_discard_bool
```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset TEX's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```
\tex_deadcycles:D \c_zero_int
```

Todo: In atbegshi the box was dropped but is that actually needed? Or the resetting of \protect to its kernel value?

Even if there was no explicit request to discard the box it is possible that the code for the hook shipout/before has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```
{ \box_if_empty:NTF \l_shipout_box
} { \PackageWarning{ltshipout}{

Shipout~ box~ was~ voided~ by~ hook,\MessageBreak
ignoring~ shipout~ box }
```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.<sup>27</sup>

<sup>&</sup>lt;sup>27</sup>Doing that earlier would be wrong because we might end up with the last page counted but discard and then we have no place to add the final objects into the output file.

Then we store the box sizes again (as they may have changed) and then look at the hooks shipout/foreground and shipout/background. If either or both are non-empty we add a picture environment to the box (in the foreground and or in the background) and execute the hook code inside that environment.

We then run \\_shipout\_execute\_firstpage\_hook: that adds the content of the hook shipout/firstpage to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```
77 \__shipout_execute_firstpage_hook:
```

The we check if we have to add the shipout/lastpage hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```
\int_compare:nNnT \@abspage@last = \g_shipout_readonly_int
78
                   { \hook_if_empty:nF {shipout/lastpage}
79
                       { \__shipout_debug:n { \typeout{Executing~ lastpage~ hook~
80
                             on~ page~ \int_use:N \g_shipout_readonly_int }
                                                                                      }
81
                         \__shipout_add_foreground_box:n { \UseHook{shipout/lastpage}
82
                                                       \@kernel@after@shipout@lastpage }
83
84
                       \bool_gset_true:N \g__shipout_lastpage_handled_bool
85
```

Finally we run the actual TEX primitive for shipout. As that will expand delayed \write statements inside the page in which protected commands should not expand we first change \protect to the appropriate definition for that case.

Restore the value of \protect in case \shipout is called outside of the output routine (where it is automatically restored because of the implicit group).

(End definition for \\_\_shipout\_execute\_cont:.)

\_\_shipout\_saved\_protect:

Remeber the current \protect state.

```
94 \cs_new_eq:NN \__shipout_saved_protect: \protect
```

(End definition for \\_\_shipout\_saved\_protect:.)

shipout/before shipout/foreground shipout/background shipout/firstpage shipout/lastpage Declaring all hooks for the shipout code.

```
95 \hook_new:n{shipout/before}
96 \hook_new:n{shipout/foreground}
97 \hook_new:n{shipout/background}
```

File R: ltshipout.dtx

```
98 \hook_new:n{shipout/firstpage}
99 \hook_new:n{shipout/lastpage}
```

(End definition for shipout/before and others. These functions are documented on page 695.)

\@kernel@after@shipout@lastpage \@kernel@before@shipout@background

And here are the internal kernel hooks going before or after the public ones where needed.

- 100 \let\@kernel@after@shipout@lastpage\@empty
- 101 \let\@kernel@before@shipout@background\@empty

 $(End\ definition\ for\ \verb|\c kernel@after@shipout@lastpage\ and\ \verb|\c kernel@before@shipout@background|.\ These\ and\ \verb|\c kernel@shipout@shipout@background|.\ These\ and\ \verb|\c kernel@shipout$ functions are documented on page ??.)

\\_shipout\_execute\_firstpage\_hook:

This command adds any specials into a box and adds that to the very beginning of the first box shipped out. After that we redefine it to do nothing on later pages.

```
102 \cs_new:Npn \__shipout_execute_firstpage_hook: {
```

Adding something to the beginning means adding it to the background as that layer is done first in the output. Of course that is only needed if the hook actually contains anything.

```
\hook_if_empty:nF {shipout/firstpage}
103
          { \__shipout_add_background_box:n { \UseHook{shipout/firstpage} } }
104
```

Once we are here we change the definition to do nothing next time and we also change the command used to implement \AtBeginDvi to become a warning and not add further material to a hook that is never used again.

```
\cs_gset_eq:NN \__shipout_execute_firstpage_hook: \prg_do_nothing:
     \cs_gset:Npn \__shipout_add_firstpage_material:Nn ##1 ##2 {
106
       \@latex@warning{
           First~ page~ is~ already~ shipped~ out,~ ignoring\MessageBreak
108
           \string##1 }
109
    }
110
111 }
```

(End definition for \\_\_shipout\_execute\_firstpage\_hook:.)

\g shipout lastpage handled bool A boolean to signal if we have already handled the shipout/lastpage hook.

112 \bool\_new:N \g\_shipout\_lastpage\_handled\_bool

(End definition for \g\_shipout\_lastpage\_handled\_bool.)

\ shipout add firstpage material:Nn

This command adds material to the shipout/firstpage hook. It is used in \AtBeginDvi, etc. The first argument is the command through which is it called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

```
\cs_new:Npn \__shipout_add_firstpage_material:Nn #1#2 {
      \AddToHook{shipout/firstpage}{#2}
114
115 }
(End definition for \__shipout_add_firstpage_material:Nn.)
```

\\_\_shipout\_get\_box\_size:N

Store the box dimensions in dimen registers.

Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.

```
116 \cs_new:Npn \__shipout_get_box_size:N #1 {
                                     \dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }
                                     \dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }
                                     \dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }
                                     \dim_set:\n \l_shipout_box_ht_plus_dp_dim { \l_shipout_box_ht_dim +
                                120
                                                                               \l_shipout_box_dp_dim }
                                122 }

                                Then we reconstruct \l_shipout_box ...
                                            \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
                                139
                                140
                                    the material in #1 is placed into a horizontal box with zero dimensions.
                                                   \hbox_set:Nn \l__shipout_tmp_box
                                141
                                                         { \l_shipout_saved_badness_tl #1 }
                                142
                                                   \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
                                                   \box_set_ht: Nn \l__shipout_tmp_box \c_zero_dim
                                                   \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
```

The we typeset that box followed by whatever was in \l\_shipout\_box before (unpacked).

```
\skip_zero:N \baselineskip
\skip_zero:N \lineskip

\skip_zero:N \lineskiplimit

\box_use:N \l_shipout_tmp_box
\vbox_unpack:N \l_shipout_box
```

The \kern ensures that the box has no depth which is afterwards explicitly corrected.

```
\text{kern \c_zero_dim}
\text{152} \\
\text{153} \\box_set_ht:\text{Nn \l_shipout_box \l_shipout_box_ht_dim}}
\text{154} \\box_set_dp:\text{Nn \l_shipout_box \l_shipout_box_dp_dim}}
```

Todo: The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

\\_shipout\_init\_page\_origins:
\c\_\_shipout\_horigin\_tl
\c\_\_shipout\_vorigin\_tl

Two constants holding the offset of the top-left with respect to the media box. Setting the constants this way is courtesy of Bruno.

We delay setting the constants to the last possible place as there might be updates in the preamble or even in the begindocument hook that affects their setup.

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```
245 \cs_gset_eq:NN \__shipout_init_page_origins: \prg_do_nothing:
246 }

(End definition for \__shipout_init_page_origins:, \c__shipout_horigin_tl, and \c__shipout_-vorigin_tl.)
```

\_shipout\_picture\_overlay:n

Put the argument into a picture environment that doesn't take up any size and uses 1pt for \unitlength.

Todo: Could perhaps be generalized as it might be useful elsewhere. For not it is not.

```
247 \cs_new:Npn \__shipout_picture_overlay:n #1 {
```

The very first time this is executed we have ot initializes (and freeze) the origins.

```

\\_\_shipout\_add\_background\_picture:n

Put a picture env in the background of the shipout box with its reference point in the top-left corner.

```
261 \cs_new:Npn \__shipout_add_background_picture:n #1 {
262 \__shipout_add_background_box:n { \__shipout_picture_overlay:n {#1} }
263 }
```

File R: ltshipout.dtx

\ shipout add foreground picture:n Put a picture env in the foreground of the shipout box with its reference point in the top-left corner.

```
264 \cs_new:Npn \__shipout_add_foreground_picture:n #1 {
      \__shipout_add_foreground_box:n { \__shipout_picture_overlay:n {#1} }
(End definition for \__shipout_add_foreground_picture:n.)
```

\shipout\_discard:

Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case IATEX looks ahead and is not using the position for on the next page).

```
267 \cs_new:Npn \shipout_discard: {
     \bool_gset_true:N \g__shipout_discard_bool
(End definition for \shipout_discard: This function is documented on page ??.)
```

#### 3.2Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

\g\_shipout\_readonly\_int \ReadonlyShipoutCounter We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

```
270 \int_new:N \g_shipout_readonly_int
```

For  $\LaTeX 2_{\varepsilon}$  it is available as a command (i.e., a TeX counter only.

```
271 \cs_new_eq:NN \ReadonlyShipoutCounter \g_shipout_readonly_int
```

(End definition for \g\_shipout\_readonly\_int and \ReadonlyShipoutCounter. These functions are documented on page 697.)

\g\_shipout\_totalpages\_int \c@totalpages

We count every shipout attempt (even those that are discarded) in tis counter. It is not used in the code but may get used in user code.

```
272 \int_new:N \g_shipout_totalpages_int
```

For LATEX  $2_{\mathcal{F}}$  this is offered as a LATEX counter so can be easily typeset inside the output routine to display things like "\thepage/\thetotalpages", etc.

```
273 \cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int
274 \cs_new:Npn \thetotalpages { \arabic{totalpages} }
```

(End definition for \g\_shipout\_totalpages\_int and \c@totalpages. These functions are documented on page 697.)

\@abspage@last

In \@abspage@last record the number of pages from the last run. This is written to the .aux and this way made available to the next run. In case there is no .aux file or the statement is missing from it we initialize it with the largest possible number in T<sub>F</sub>X. We use this as the default because then we are inserting the shipout/lastpage on the last page (or after the last page but not on page 1 for a multipage document.

```
275 \xdef\@abspage@last{\number\maxdimen}
```

(End definition for \QabspageQlast. This function is documented on page ??.)

\enddocument

Instead of using the hooks enddocument and enddocument/afterlastpage we add this code to private kernel hooks to be 100% when it is executed and to avoid cluttering the hooks with data that is always there.

Inside \enddocument there is a \clearpage. Just before that we execute this code here. There is a good change that we are on the last page. Therefore, if we don't know the value from the last run, we assume that the current page is the right one. So we set \@abspage@last and as a result the next shipout will run the shipout/lastpage code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

\@kernel@after@enddocument

```
% \g@addto@macro \@kernel@after@enddocument { \int_compare:nNnT \@abspage@last = \maxdimen } { \text{We use LATEX } 2_{\varepsilon}$ coding as \@abspage@last is not an L3 name. \int_eval:n {\g_shipout_readonly_int + 1} } \rightarrow \text{280} \rightarrow \rightarrow \text{281}}
```

\@kernel@after@enddocument@afterlastpage

Once the \clearpage has done its work inside \enddocument we know for sure how many pages this document has, so we record that in the .aux file for the next run.

```
282 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to ran the shipout/lastpage is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
\int_compare:nNnF \g_shipout_readonly_int = 0
284 {
```

This ends up in the .aux so we use LATEX  $2\varepsilon$  names here.

Todo: This needs an interface for \nofiles in expl3, doesn't at the moment!

```
\lambda \ifOfilesw
\iow_now:Nx \Qauxout {
\gdef\string\QabspageQlast {\int_use:N \g_shipout_readonly_int}}
\fi
```

But we may have guessed wrongly earlier and we still have to run the **shipout/lastpage** even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy.

```
\bool_if:NF \g__shipout_lastpage_handled_bool {
```

However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if \@kernel@after@shipout@lastpage contains any code. If both are empty we omit the page generation.

```
bool_lazy_and:nnF
{ \hook_if_empty_p:n {shipout/lastpage} }

{ \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```
\__shipout_excuse_extra_page:
300 \null
301 }
```

At this point we also signal to LATEX's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested \enddocument.

 $(End\ definition\ for\ \verb|\end| ocument|,\ \verb|\end| \ and\ \verb|\end| \ and\ \verb|\end| \ and\ \end| \end| \ and\ \end| \end| \ and\ \end| \$

```

(End definition for \\_\_shipout\_excuse\_extra\_page:.)

\PreviousTotalPages \@kernel@before@begindocument In the preamble before the aux file was read \PreviousTotalPages is always zero.

322 \def\PreviousTotalPages{0}

In the aux file there should be an update for \@abspage@last recording the number of pages from the previous run. If not that macro holds the value of \maxdimen. So we test for it and update \PreviousTotalPages if there was a real value. This should happen just before the begindocument hook is executed so that the value can be used inside that hook.

```
323 \g@addto@macro\@kernel@before@begindocument
324 {\ifnum\@abspage@last<\maxdimen
325 \xdef\PreviousTotalPages{\@abspage@last}\fi}</pre>
```

\topmargin : Extra space added to top of page.

@twoside : boolean. T if two-sided printing

 $\verb|\oddsidemargin|: IF @two side = T|\\$ 

THEN extra space added to left of odd-numbered

pages.

ELSE extra space added to left of all pages.

 $\ensuremath{\mbox{\sc demargin}}$  : IF @twoside = T

THEN extra space added to left of even-numbered

pages.

\headheight : height of head

\headsep : separation between head and text

\footskip : distance separation between baseline of last

line of text and baseline of foot.

Note difference between \footSKIP and \headSEP. : height of text on page, excluding head and foot

 $\begin{tabular}{lll} \verb+\textwidth & : width of printing on page \\ \verb+\columnsep & : IF @twocolumn = T \\ \end{tabular}$ 

 $\begin{array}{lll} \text{sep} & : \text{IF } @ \text{twocolumn} = \text{T} \\ & \text{THEN width of space between columns} \end{array}$ 

\columnseprule : IF @twocolumn = T

THEN width of rule between columns (0 if none).

\columnwidth : IF @twocolumn = T

THEN (\textwidth - \columnsep)/2

ELSE \textwidth

It is set by the \twocolumn and

\onecolumn commands.

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

\Otextbottom : Command executed at bottom of vbox holding text of

page (including figures). The \raggedbottom

command almost \let's this to \vfil (actually sets

it to  $\$ vskip  $\$ z@ plus.0001fil).

Should have depth 0pt.

\Otexttop : Command executed at top of vbox holding text of

page (including figures). Used by letter style; can also be used to produce centered pages.

Let to \relax by \raggedbottom and \flushbottom.

Page layout must initialize \@colht and \@colroom to \textheight.

#### PAGE STYLE PARAMETERS:

\floatsep : Space left between floats.

\textfloatsep : Space between last top float or first bottom float

and the text.

\topfigrule : Command to place rule (or whatever) between floats

at top of page and text. Executed in inner vertical mode right before the **\textfloatsep** skip separating the floats from the text. Must occupy

zero vertical space. (See \footnoterule.)

\botfigrule : Same as \topfigrule, but put after the

\textfloatsep skip separating text from the

floats at bottom of page.

\intextsep : Space left on top and bottom of an in-text float.

\dblfloatsep : Space between double-column floats. \dbltextfloatsep : Space between top double-column floats

and text.

\dblfigrule : Similar to \topfigrule, but for double-column

floats.

\Ofptop : Glue to go at top of float column - must be 0pt +

stretch

\Ofpsep : Glue to go between floats in a float column.

\Ofpbot : Glue to go at bottom of float column

- must be 0pt +

stretch

\@dblfptop, \@dblfpsep, \@dblfpbot

: Analogous for double-column float page in

two-column format.

FOOTNOTES: As in PLAIN, footnotes use \insert\footins.

#### PAGE LAYOUT SWITCHES AND MACROS

@twocolumn : Boolean. T if two columns per page globally.

#### PAGE STYLE MACROS AND SWITCHES

 $\colon Coddhead$ : IF @twoside = T

THEN macro to generate head of odd-numbered

pages.

ELSE macro to generate head of all pages.

 $\colon \colon \colon$ 

THEN macro to generate head of even-numbered

pages.

\@oddfoot : IF @twoside = T

THEN macro to generate foot of odd-numbered

pages.

ELSE macro to generate foot of all pages.

**\@evenfoot** : IF @twoside = T

THEN macro to generate foot of even-numbered

pages.

@specialpage : boolean. T if current page is to have a special

format.

\@specialstyle : If its value is foo then

IF @specialpage = T

THEN the command \ps@foo is executed to temporarily reset the page style parameters

before composing the current page.

This command should execute only \def's and

\edef's, making only local definitions.

#### FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro  $\ensuremath{\texttt{Qfloatplacement}}$ .

When  $\ensuremath{\mbox{\tt Ofloatplacement}}$  is called,

\@colht is the height of the page or column being built. I.e.:

\* For single-column page it equals \textheight.

\* For double-column page it equals \textheight - height of double-column floats on page.

Note that some are set globally and some locally:

 $\label{eq:continuous} \mbox{\tt $$\tt $C$ lowed on the top of a column.}$ 

\@toproom :=G Maximum amount of top of column devoted to floatsexcluding \textfloatsep separation below the floats

and \floatsep separation between them. For two-column output, should be computed as a function

of \@colht.

\@botnum, \@botroom

: Analogous to above.

 $\verb|\Qcolnum| := G Maximum number of floats allowed in a column,$ 

including in-text floats.

**%%** 27 Sep 85 : made local to

%% \@addtocurcol and \@addtonextcol

It is now also used locally in processing double

floats.

\@fpmin :=L Minimum height of floats in a float column.

The macro \@dblfloatplacement sets the following parameters.

 $\$  :=G Maximum number of double-column floats allowed at the top of a two-column page.

\@dbltoproom :=G Maximum height of double-column floats allowed at top of two-column page.

 $\ensuremath{\verb|Qfpmin||} := L$  Minimum height of floats in a float column. It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

 $\begin{tabular}{lll} $$ \end{tabular} $$ \end{tabular} $$ :=L \end{tabular} $$ \end{tabular} $$ \end{tabular} $$ \end{tabular} $$ :=L \end{tabular} $$ \end{t$ 

#### OUTPUT ROUTINE VARIABLES

\@colht: The total height of the current column. In single column style, it equals \textheight. In two-column style, it is \textheight minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO \textheight.

\@colroom : The height available in the current column for text and footnotes. It equals \@colht minus the height of all floats committed to the top and bottom of the current column

**\Otextfloatsheight**: The total height of in-text floats on the current page.

\footins : Footnote insertion number.

\@maxdepth : Saved value of TeX's \maxdepth. Must be set when any routine sets \maxdepth.

# CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

reason
\pagebreak \newpage
\clearpage (\penalty -10000  \penalty -10001)
float insertion, called from horizontal mode
float insertion, called from vertical mode.
float insertion.

Note: A float or marginpar puts the following sequence in the output list: (i) a penalty of -10004,

- (ii) a null \vbox
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

- 1. If the float comes right after a \newpage or \clearpage, then the first penalty is ignored, but the second one invokes the output routine.
- 2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

#### THE OUTPUT ROUTINE

### FUNCTIONS USED IN THE OUTPUT ROUTINE:

\@outputpage : Produces an output page with the contents of box \@outputbox as the text part.

Also sets  $\colongreent Colon := G \textheight.$ 

The page style is determined as follows.

IF @thispagestyle = true

THEN use \thispagestyle style ELSE use ordinary page style.

\Otryfcolumn\FLIST: Tries to form a float column composed of floats from \FLIST (if nonempty) with the following parameters:

**\@colht** : height of box

**\Ofpmin**: minimum height of floats in the box

 $\label{lem:condition} $$ \ensuremath{\tt Qfpsep} : interfloat space \\ \ensuremath{\tt Qfptop} : glue \ at \ top \ of \ box \\$ 

**\@fpbot** : glue at bottom of box.

If it succeeds, then it does the following:

\* @fcolmade :=G true

\* \FLIST :=G \FLIST - floats put in box

\*  $\ensuremath{\texttt{Ofreelist}}$  :=G  $\ensuremath{\texttt{Ofreelist}}$  + floats put in box

If it fails, then:

\* @fcolmade :=G false

NOTE: BIT MUST BE A SINGLE TOKEN!

\@makefcolumn \FLIST: Same as \@tryfcolumn except that it fails to make a float column only if \FLIST is empty. Otherwise, it makes a float column containing at least the first box in \FLIST, disregarding \@fpmin.

#### \@startcolumn :

Calls  $\ensuremath{\texttt{Qtryfcolumn}}\ensuremath{\texttt{Qdeferlist}}.$  If  $\ensuremath{\texttt{Qtryfcolumn}}$  returns with (globally set) @fcolmade = false, then:

\* Globally sets \@toplist and \@botlist to floats

from \@deferlist to go at top and bottom of column, deleting them from \@deferlist. It does this using \@colht as the total height, the page style parameters \@floatsep and \@textfloatsep, and the float placement parameters \@topnum, \@toproom, \@botnum, \@botroom, \@colnum and \textfraction.

\* Globally sets \@colroom to \@colht minus the height of the added floats.

#### **\@startdblcolumn**:

Calls \Otryfcolumn\Odbldeferlist{8}. If \Otryfcolumn returns with (globally set) Ofcolmade = false, then:

- \* Globally sets \@dbltoplist to floats from \@dbldeferlist to go at top and bottom of column, deleting them from \@dbldeferlist.

  It does this using \textheight as the total height, and the parameters \@dblfloatsep, etc.

  \* Clobally sets \@colbt to \texthoight minus the height.
- \* Globally sets \@colht to \textheight minus the height of the added floats.

\@combinefloats : Combines the text from box
\@outputbox with the floats from \@toplist and \@botlist,
putting the new box in \@outputbox. It uses \floatsep
and \textfloatsep for the appropriate separations.
It puts the elements of \TOPLIST and \BOTLIST onto
\@freelist, and makes those lists null.

\@makecol: Makes the contents of \box255 plus the accumulated footnotes, plus the floats in \@toplist and \@botlist, into a single column of height \@colht (unless the page height has been locally changed), which it puts into box \@outputbox. It puts boxes in \@midlist back onto \@freelist and restores \maxdepth.

 $\label{eq:continuous} \begin{tabular}{ll} \tt Outputs a column whose text is in box \verb|\Ooutputbox| \\ \tt If @twocolumn = false, then it calls \verb|\Ooutputbage|, \\ \tt sets \verb|\Ocolht| := G \verb|\textheight|, and calls \verb|\Ootputbage|, \\ \end{tabular}$ 

If @twocolumn = true, then:

If @firstcolumn = true, then it puts box \@outputbox into \@leftcolumn and sets @firstcolumn :=G false.

If @firstcolumn = false, then it puts out the current two-column page, any possible two-column float pages, and determines \@dbltoplist for the next page.

\twocolumn[BOX]: starts a new page, changing to twocolumn setting and puts BOX in a parbox of width \textwidth across the top.
Useful for full-width titles for double-column pages.
SURPRISE: The stretch from \@dbltextfloatsep will be inserted between the BOX and the top of the two columns.

#### FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the **\Offreelist** (see below for a description of list manipulation), puts the float into box B and sets **\count** B to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: \vadjust{\penalty -10002}
- In vmode: \penalty -10003.

For a double-column float, it puts B onto the \@dbldeferlist.

The float specifier has two components:

- \* A PLACEMENT SPECIFICATION, describing where the float may be placed.
- \* A TYPE, which is a power of two-e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
_	<del></del> -
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

```
6 1 iff a type 2 float etc.
```

A negative float specifier is used to indicate a marginal note.

#### MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes  $\begin{tabular}{l} \begin{tabular}{l} \b$ 

```
     \@elt \boxa ... \@elt \boxN
where \boxI is defined by
     \newinsert\boxI
```

Normally, \@elt is \let to \relax. A test can be performed on the entire float list by locally \def'ing \@elt appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

\@bitor\NUM\LIST: Globally sets switch @test to the disjunction for all I of bit log2 \NUM of the float specifiers of all the floats in \LIST.

I.e., @test is set to true iff there is at least one float in \LIST having bit  $\log 2$  \NUM of its float specifier equal to 1.

Note:  $\log 2$  [(\count I)/32] is the bit number corresponding to the type of float I. To see if there is any float in \LIST having the same type as float I, you run \@bitor with \NUM = [(\count I)/32] \* 32.

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

```
\LIST
 END
\@cons\LIST\NUM : Globally sets \LIST := \LIST * \@elt \NUM
\@cons\LIST\NUM ==
 \LIST := G \LIST \@elt \NUM
BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS
                   : List of empty boxes for placing new floats.
   \@freelist
   \@toplist
                  : List of floats to go at top of current column.
   \@midlist
                  : List of floats in middle of current column.
                 : List of floats to go at bottom of current column.
   \@botlist
   \Odeferlist: List of floats to go after current column.
   \Odbltoplist: List of double-col. floats to go at top of current
                     page.
   \@dbldeferlist : List of double-column floats to go on subsequent
                     pages.
FLOAT-PLACEMENT ALGORITHMS
\@addtobot : Tries to put insert \@currbox on \@botlist.
               Called only when:
                  * \ht BOX < \@colroom
                  * type of \@currbox not on \@deferlist
                  * \c olnum > 0
                  * @insert = false
              If it succeeds, then:
                  * sets @insert true
                  * decrements \@botroom by \ht BOX
                  * decrements \oldsymbol{Q} to \oldsymbol{Q} decrements \oldsymbol{Q} to \oldsymbol{Q}
                  * decrements \colonome by \ht BOX + either \floatsep
                    or \textfloatsep, as appropriate.
                  * sets \mbox{\mbox{maxdepth}} to \mbox{\mbox{Opt}}
\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                    \@botlist.
                    Called only under same conditions as \@addtobot.
                    If it succeeds, then:
                       * sets @insert true
                       * decrements \@toproom or \@botroom by \ht BOX
```

\* decrements \@colnum and either \@topnum or

\* decrements  $\colonomby \ht BOX + \floatsep$ 

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

 $\begin{tabular}{ll} \begin{tabular}{ll} \beg$ 

```
or \textfloatsep, as appropriate.
```

\@addtonextcol : Tries to add \@currbox to the next column, setting @insert true if it succeeds, false otherwise.

\@addtodblcol : Tries to add \@currbox to the next double-column page, adding it to \@dbltoplist if it succeeds and \@dbldeferlist if it fails.

```

#### \@maxdepth

This is not the right place to set this; it needs to be set in a class/style file when \maxdepth is set.

Also, many settings to \maxdepth should be to \@maxdepth, probably?

- 91 \newdimen\@maxdepth
- 92 \@maxdepth = \maxdepth

(End definition for \@maxdepth. This function is documented on page ??.)

### \paperheight \paperwidth

New \paper... registers.

93 \newdimen\paperheight 94 \newdimen\paperwidth

(End definition for \paperheight and \paperwidth. These functions are documented on page ??.)

Local switches first: \if@insert

\if@fcolmade

95 \newif \if@insert

\if@specialpage \if@firstcolumn

These should definitely be global:

\if@twocolumn \if@twoside

- 96 \newif \if@fcolmade
- 97 \newif \if@specialpage \@specialpagefalse

\if@reversemarginpar

\if@mparswitch \col@number

These should be global but are not always set globally in other files.

98 \newif \if@firstcolumn \@firstcolumntrue

99 \newif \if@twocolumn \@twocolumnfalse

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be 'preamble only' commands)? Are these three such things?

- 100 \newif \if@twoside \@twosidefalse
- 101 \newif \if@reversemargin \@reversemarginfalse
- 102 \newif \if@mparswitch \@mparswitchfalse

\newpage

The two checks at the beginning ensure that an item label or run-in section title immediately before a **\newpage** get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a \leavevmode.

```
150 (/2ekernel | fltrace)
   (latexrelease)\IncludeInRelease{2017/04/15}%
   (latexrelease)
                                   {\newpage}{Check depth of page}%
   ⟨*2ekernel | latexrelease | fltrace⟩
   \def \newpage {%

165
166
```

The \vfil at the end of the macro before the break penalty will normally result in the page being run short, even with \flushbottom in effect (in contrast to the behavior of \pagebreak). However, if there is some explicit stretch on the page, say, a \vfill, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of \prevdepth is no longer taken into account by TeX. So we back up by that amount (or by \maxdepth if it is really huge), to mimic the normal behavior without the \newpage.

               (End definition for \Qemptycol. This function is documented on page ??.)
               There are several bug fixes to the two-column stuff here.
 \twocolumn
\@topnewpage
                199 \def \twocolumn {%
                     \clearpage
                200
                     \global\columnwidth\textwidth
                     \global\advance\columnwidth-\columnsep
                     \global\divide\columnwidth\tw@
                     \global\hsize\columnwidth
                     \global\linewidth\columnwidth
                     \global\@twocolumntrue
                206
                     \global\@firstcolumntrue
                207
                     \col@number \tw@
                208
               There is no reason to put a \@dblfloatplacement here since \@topnewpage ignores these
               settings. The \Ofloatplacement is needed in case this comes after some changes.
                     \@ifnextchar [\@topnewpage\@floatplacement
                210 }
```

Note that here, getting a box from the freelist can assume success since this comes just after a \clearpage.

```
211 \long\def \@topnewpage [#1]{%
     \@nodocument
     \@next\@currbox\@freelist{}{}%
     \global \setbox\@currbox
       \color@vbox
216
         \normalcolor
         \vbox {%
           \hsize\textwidth
218
           \@parboxrestore
219
           \col@number \@ne
220
           #1%
           \vskip -\dbltextfloatsep
                 }%
       \color@endbox
224
```

Added size test and warning message; perhaps we should use an error message.

```
225 \ifdim \ht\@currbox>\textheight
226 \ht\@currbox \textheight
227 \fi
```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from **\@addtodblcol**, plus some extra checks for error trapping.

```
\global \count\@currbox \tw@
228
     \@tempdima -\ht\@currbox
229
     \advance \@tempdima -\dbltextfloatsep
230
     \global \advance \@colht \@tempdima
231
     \ifx \@dbltoplist \@empty
     \else
       \@latexerr{Float(s) lost}\@ehb
235
       \let \@dbltoplist \@empty
     \fi
236
     \@cons \@dbltoplist \@currbox
237
```

This setting of \@dbltopnum is used only to change the typesetting in \@combinedblfloats.

```
238 \global \@dbltopnum \m@ne
239 \alpha*trace\
240 \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
241 \alpha/trace\
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by \output, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra \@emptycol will be invoked in the second column by the conditional code guarded by the \if@firstcolumn test.

I now think that the cut-off point here should be 3\baselineskip, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the 'top-box', the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```
\ifdim \@colht<2.5\baselineskip
242
       \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
243
                     too tall on page \thepage}%
244
245
       \@emptycol
       \if@firstcolumn
       \else
248
         \@emptycol
       \fi
249
     \else
250
       \global \vsize \@colht
251
       \global \@colroom \@colht
252
       \@floatplacement
253
     \fi
254
255 }
```

 $(\textit{End definition for $\setminus$twocolumn and $\setminus$@topnewpage}. \ \textit{These functions are documented on page \ref{eq:constraints}.)}$ 

# \@specialoutput

This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of \par to the output routine. This avoids problems when the output routine is called within a list where \par may be a no-op.

```
\output {%
     \let \par \@@par
     \ifnum \outputpenalty<-\@M
       \@specialoutput
     \else
261
       \@makecol
       \@opcol
262
Moved to \@opcol: \@floatplacement.
```

\@startcolumn

This loop could be replaced by an \expandafter tail recursion in \@startcolumn.

```
\@whilesw \if@fcolmade \fi
265
   \langle *\mathsf{trace} \rangle
266
            \fl@trace{PAGE: float \if@twocolumn column \else page \fi
267
                            completed}%
268
269 (/trace)
            \@opcol\@startcolumn}%
271
     \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of \@colroom.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the **\output** itself; in the second column there will still not be enough room left so **\@emptycol** will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within **\output** may not get executed with the correct value of **\ifoficirstcolumn**.

```
\ifdim \@colroom<1.5\baselineskip
273
         \ifdim \@colroom<\textheight
274
           \@latex@warning@no@line {Text page \thepage\space

Historical \not\vdash T_{EX} 2.09 comments (not necessarily accurate any more):
 CHANGES TO \@specialoutput:
   \penalty\z@ changed to \penalty\interlinepenalty so \samepage
   works properly with figure and table environments.
   (Changed 23 Oct 86)
 * Definition of \@specialoutput changed 26 Feb 88 so \@pageht and
   \@pagedp aren't changed for a marginal note.
   (Change suggested by Chris Rowley.)
End of historical LATEX 2.09 comments.
294 \gdef\@specialoutput{%
      \ifnum \outputpenalty>-\@Mii
295
        \@doclearpage
296
```

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

```
297  \else
298  \ifnum \outputpenalty<-\@Miii
299  \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
300  \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301  \else</pre>
```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore \Oholdpg should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: \setbox\@tempboxa \box \@cclv.

The last box which is removed is the box put there by the double-penalty mechanism. The \unskip then removes the \topskip which is put there since the box is the first on the page.

```
\lambda \global \setbox\@holdpg \vbox{\%}
\unvbox\@holdpg
\unvbox\@cclv
```

We must now remove the box added by the float mechanism and the \topskip glue therefore added above it by TeX.

```
\setbox\@tempboxa \lastbox
unskip
}
```

These two are needed as separate dimensions only by \@addmarginpar; for other purposes we put the whole size into \@pageht (see below).

We want to make the adjustment due to this insert only if the non-star form is used. The \*-form will probably not work with floats, but maybe it still could make some adjustment here even so?

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
\@reinserts
               \@addtocurcol
328
             \else
329
               \@reinserts
330
               \@addmarginpar
             \fi
             }\@latexbug
```

A 2e change: use \addpenalty instead of \penalty here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a \nobreak must be correct.

```
\ifnum \outputpenalty<\z@
334
              \if@nobreak
335
                 \nobreak
               \else
337
                 \addpenalty \interlinepenalty
339
              \fi
            \fi
340
         \fi
341
       \fi
342
343 }
344 (/2ekernel | fltrace)
```

(End definition for \output and \Ospecialoutput. These functions are documented on page ??.)

# \@testwrongwidth \f@depth

Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

#### \@doclearpage

This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test  $\{box\}$  at suitable places. That is at places where a box is taken off the deferlist.

            (End definition for \@opcol. This function is documented on page ??.)
            We must rewrite this macro to allow for variations in page-makeup required by changes
\@makecol
            in page-length.
                 This uses a different macro if a special-length column is being produced.
               \langle *2ekernel \rangle
                \gdef \@makecol {%
            481
                   \ifvoid\footins
                     \setbox\@outputbox \box\@cclv
             483
                     \setbox\@outputbox \vbox {%
```

This \boxmaxdepth setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use \@maxdepth otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```
\boxmaxdepth \@maxdepth
487 %
            \@tempdima\dp\@cclv
           \unvbox \@cclv
488
            \vskip-\@tempdima
489 %
           \vskip \skip\footins
490
           \color@begingroup
491
492
             \normalcolor
             \footnoterule
493
             \unvbox \footins
494
           \color@endgroup
495
           }%
496
497
```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```
498     \let\@elt\relax
499     \xdef\@freelist{\@freelist\@midlist}%
500     \global \let \@midlist \@empty
501     \@combinefloats
```

The variations start here in case \enlargethispage has been used.

```
502 \ifvbox\@kludgeins
503 \@makespecialcolbox
504 \else
```

This extra reboxing is only needed to add the \@texttop and \@textbotttom but this could be done earlier, when the floats are added.

The \boxmaxdepth resetting here will have no effect unless \@textbottom ends with a box or rule. So is this (or possibly \@maxdepth) the correct value?

The \vskip -\dimen@ ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If **\@textbottom** ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the 'special case'.

Also, the \boxmaxdepth setting here affects what happens within \@texttop and \@textbottom, should it? Is it needed at all?

RmS 91/10/22: Replaced \dimen128 by \dimen0.

```
\setbox\@outputbox \vbox to\@colht {%
\boxmaxdepth \maxdepth \%??

\@texttop
\dimen@ \dp\@outputbox
\unvbox \@outputbox
```

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

\@reinserts

This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```
516 \gdef \@reinserts{%
517 \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518 \ifvbox\@kludgeins\insert\@kludgeins
519 {\unvbox\@kludgeins}\fi
520 }
521 \( //2\ellow\footins \)
```

(End definition for \@reinserts. This function is documented on page ??.)

\@makespecialcolbox

This implements certain variations in page-makeup.

```
522 \ *2ekernel | fltrace \)
523 \ \gdef \@makespecialcolbox \ {%
524 \ \*trace \}
525 \ \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
526 \ dp \the\dp\@kludgeins\space
527 \ wd \the\wd\@kludgeins}\%
528 \ \/trace \>
630 \ \floor \fl
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this 'special case'.

```
\setbox\@outputbox \vbox {%

\@texttop

\dimen@ \dp\@outputbox

\unvbox\@outputbox

\vskip-\dimen@

\%

\@tempdima \@colht

\ifdim \wd\@kludgeins>\z@
```

Note that in this case (the \*-version), the height of the **\@kludgeins** box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size **\@colht** using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the T<sub>F</sub>X level!).

This needs TeX3 otherwise \pageshrink is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for bothe flush- and ragged-bottom setting since it makes the contents no smaller than the size (\@colht) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the \boxmaxdepth setting here.

```
\advance \@tempdima -\ht\@outputbox
537
        \advance \@tempdima \pageshrink
   \langle *trace \rangle
539
        \fl@trace {Natural ht of col: \the \ht\@outputbox}%
540
        \fl@trace {\string \@colht: \the \@colht}%
541
        \fl@trace {Pageshrink added: \the \pageshrink}%
542
        \fl@trace {Hence, space added: \the \@tempdima}%
543
544
   ⟨/trace⟩
        \setbox\@outputbox \vbox to \@colht {%
545
           \boxmaxdepth \maxdepth
546 %
           \unvbox\@outputbox
547
548
           \vskip \@tempdima
           \@textbottom
549
          }%
550
```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size \@colht with \vss at the bottom.

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set \boxmaxdepth here since the \@outputbox ends with glue.

```
\setbox \@outputbox \vbox to \@colht {%
560
           \vbox to \@tempdima {%
561
             \unvbox\@outputbox
562
             \@textbottom}%
563
           \vss}%
564
      \fi
565
Finally we need to explicitly make the insert box void.
      {\setbox \@tempboxa \box \@kludgeins}%

\@outputpage \@shipoutsetup \@writesetup The \color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This is because it must have the value \relax before macros coming from other uses of \aftergroup within this box are expanded.

Putting this into the \aftergroup token list does not affect the definition used in expanding the \writes because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an **\aftergroup** within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
590 \/2ekernel\/
591 \/atexrelease\\IncludeInRelease{2017/04/15}%

```
The \endgroup is put in by \aftergroup.
```

#### 595 \begingroup

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command \@writesetup.

596 \let \protect \noexpand

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset \language to the value current at \begin{document}. In particular this ensures that a pagebreak in verbatim does not prevent hyphenation in the page head.

597 \language\document@default@language

The  $\c$  10 was removed as it was considered useless (presumably because nothing gets tokenised during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

#### 598 \@resetactivechars

If a page break happens between the start of a list and its first item the **@newlist** will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

- \global\let\@@if@newlist\if@newlist
- 600 \global\@newlistfalse

This next hook replaces the following:

```
\let\-\@dischyph
\let\'\@acci\let\'\@accii\let\=\@acciii
\let\\\@normalcr
\let\par\@@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z0
\parskip\z0skip
\everypar{}%
\leftskip\z0skip
\rightskip\z0skip
\parfillskip\0flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy
```

601 \@parboxrestore

... to here was in the command \@writesetup.

```
602 \shipout \vbox{%
```

- \set@typeset@protect
- \aftergroup \endgroup

Correct? or just restore by ending the group?

\aftergroup \set@typeset@protect

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \@shipoutsetup.

```

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdfTEX and LuaTEX. We therefore unbox \@outputbox here (which only contains a single \hbox) so that this case has the same boxing level as a normal twocolumn page without top floats.

(End definition for  $\complet$ ,  $\complet$ ,  $\complet$ , and  $\complet$  decombined bifloats. These functions are documented on page  $\complet$ ?.)

\@startcolumn \@startdblcolumn We could combine (most of) these two into \@startcol list>. Note that \@xstartcol was only used once (i.e. in \@startcolumn); it has therefore been removed. This is not quite as efficient but it now has the same structure as \@startdblcolumn.

The empty-list test has been moved to \@tryfcolumn.

1146
1147 (/trace)
```

## CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```
\if@nobreak
1148
                           \nobreak
1149
                           \@nobreakfalse
1150
                           \everypar{}%
                           \addpenalty \interlinepenalty
1153
                        \fi
                        \vskip \intextsep

```

Next set of docstrip guards are a bit weird, essentially \@addtotoporbot ends up inside the kernel and the fltrace package and \@addtobot shows up in the flafter package. Guess that could have been done a bit more obvious:-)

                                         \@flsettextmin
This is a new adjustment which is quite a major change in functionality; but it im-
plements the documentation. Note that \@reqcolroom will include the whole of the
page-so-far, and hence includes \@textfloatsheight of floats, so before comparing it
with \@textmin, we add this to \@textmin also.

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

#### CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```
1314 (latexrelease | fltrace | flafter)
                                                            \if@nobreak

                                                       \else
```

Next set of docstrip guards are a bit weird, essentially \@addtotoporbot ends up inside the kernel and the fltrace package and \@addtotoporbot shows up in the flafter package. Guess that could have been done a bit more obvious:-)

1839
        \global \dp\@marbox \z@
1840
Sticking (rather than gluing:-) the 'marbox' to the line above, changed vskip to kern:
1841
        \kern -\@pagedp
        \nointerlineskip
1842
        \hb@xt@\columnwidth
          { \dim \mathbb{Z} } 
1844
              \hskip\columnwidth \hskip\marginparsep
1845
           \else
1846
              \hskip -\marginparsep \hskip -\marginparwidth
1847
           \fi
1848
           \box\@marbox \hss}%
For this reason the following code can vanish:
    \nobreak
                            %% No longer needed.
                                                       CAR92/12
    \vskip -\@tempdima
                            %% No longer needed.
                                                       CAR92/12
        \nointerlineskip
1850
        \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}
(End definition for \Qaddmarginpar. This function is documented on page ??.)
```

### 1.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for LATEX2e.

\enlargethispage{<dim>}

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

\enlargethispage\*{<dim>}

Similar to \enlargethispage but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with \pagebreak) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a **\clearpage**: please give keep them clear of such places.

\@kludgeins

The insert which makes TeX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1852 \newinsert \@kludgeins
1853 \global\dimen\@kludgeins \maxdimen
1854 \global\count\@kludgeins 1000
```

 $(End\ definition\ for\ \verb|\Ckludgeins|.\ This\ function\ is\ documented\ on\ page\ \verb||?|.)$ 

\enlargethispage \enlargethispage\* The user command.

```
1855 \gdef \enlargethispage {%
       \@ifstar
1857
         {%
1858 (*trace)
           \fl@trace{Enlarging page height * }%

1863 (*trace)
           \fl@trace{Enlarging page height exactly---}%
1864
          \@enlargepage\@empty}%
1867 }
```

(End definition for \enlargethispage and \enlargethispage\*. These functions are documented on page ??.)

\@enlargepage

This actually inserts the insert, after checking for extreme values of the change.

```

## 1.1.2 Float control

This part implements controllable floats and other changes to the float mechanism. It provides, at the document level, the following command for inclusion in LATEX2e.

# \suppressfloats

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinh are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```
Set-up tracing for floats independent of other tracing as it produces mega-output. Default
       \fl@trace
 \tracefloatsoff
                  is no tracing.

Manipulation of float placement and type; both their strings and the corresponding count registers.

## \@fpstype \@reqcolroom \@textfloatsheight

First a new count register to go with \@currtype.

Then a new skip register, for information needed to remove the **\@maxsep** conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of **\@addtocurcol** which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```
1986 \newcount \@fpstype
1987 \newdimen \@reqcolroom
1988 \newdimen \@textfloatsheight
1989 \langle /2ekernel \rangle
```

(End definition for \Ofpstype, \Oreqcolroom, and \Otextfloatsheight. These functions are documented on page ??.)

### \@fpsadddefault

Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```
{\tt def \ \ \ \ \ \ } \{\%
```

```
1990 \langle *2ekernel \mid fltrace \rangle
1991 \def \@fpsadddefault {%
   ⟨*trace⟩
1992
       \fl0trace{fps changed from: \0fps}%
1993
1994 (/trace)
       \edef \@fps {\@fps\csname fps@\@captype \endcsname}%
1995
       \@latex@warning {%
1996
         No positions in optional float specifier.\MessageBreak
1997
         Default added (so using '\@fps')}%
1998
1999 }
```

 $(\textit{End definition for $\setminus 0$ fpsadddefault}. \ \textit{This function is documented on page \ref{eq:constraint}.)}$ 

```
Sets counters \@fpstype and \@currtype.

    (/trace)
2069 }
(End definition for \@resethfps. This function is documented on page ??.)
     Special stuff for BANG floats.
```

\@flsetnum

Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the 'bang float') with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist.

Almost identical considerations pertain to \@addtodblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

2070 \def \0flsetnum #1{%

```

File S: ltoutput.dtx Date: 2020/08/21 Version v1.4f

(End definition for \Oflupdates. This function is documented on page ??.)

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

- 1. The value \textfraction does not affect the processing of doublecol floats: this seems sensible, but should be documented.
- 2. \twocolumn floatplacement was wrong: dbl not needed, ord needed.
- 3. \Offloatplacement was not called after \Ostartdblcol or \Otopnewpage. This has been changed; it is clearly a bug fix.
- 4. The use \@topnewpage when \dblfigrule is non-trivial produced a rule in the wrong place. This has been fixed by not using \dblfigrule when processing the 'float' from \@topnewpage.
- 5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a 'th': this is only an error-recovery action, putting just h or !h should be deprecated.
- 6. \@dblmaxsep was 'the maximum of \dblfloatsep and \dbltexfloatsep'. But it was never used! Now gone completely, like \@maxsep.
- 7. After an h float is put on a page, it was counted as text when applying the \textfraction test; this is possibly too big a change although it is a bug fix?
- 8. Two consecutive h floats are separated by twice \intextsep: this could be changed to one by use of \addvspace, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
- 9. Now \@addtocurcol checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
- 10. \@tryfcolumn now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from \@startcolumn. As Frank pointed out, this makes \@startcolumn less efficient. But it is now the same as \@startdblcolumn: I can see no reason why they should be different, but which is best?
- 11. Why is \@colroom set in \@doclearpage?
- 12. Footnotes. Check what \clearpage does when footnotes are left over. Footnotes are not put on float pages and, also, \@addtonextcol ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
- 13. \clearpage can still lose non-boxes, at least when floats are involved. It also moves some to the 'wrong page', but this may be a coding problem.
- 14. The ! option makes it necessary to check in \output that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set \@textmin too close to zero! A similar danger existed also if the text in a \twocolumn[text] entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than \baselineskip, with a warning: is this OK? Should it be made generic (another parameter)?

15. There are four possibilities for supporting this:

\twocolumn[\maketitle more text]

One is to change \maketitle slightly to allow this. Another is to change \@topnewpage so that more than one \twocolumn[] command is allowed; in this case \maketitle\twocolumn[more text] will work. The former is more robust from the user's viewpoint, but makes the code for \maketitle rather ad hoc (maybe it is already?). Another is to misuse the global twocolumn flag locally within \@topnewpage. Yet another is to move the column count register from the multicol package into the kernel. This has been done.

- 16. Where should the reinserts be put to maximise the probability that footmotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
- 17. Should we continue to support (as much as possible) \samepage? Some of its intended functionality is now advertised as being provided by \enlargethispage. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
- 18. Is the adjustment of space to cause shrinking in the kludge-\* case correct? Should it be limited to 0pt?
- 19. Is the setting of \boxmaxdepth in makecol and friends needed? It only has any effect if \@textbottom ends with a box or rule, in which case the vskip to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
  - It would perhaps be better to document that **\@textbottom** and **\@texttop** must have natural height 0pt.
- 20. I cannot see why the vskip adjustment for the depth is needed if boxmaxdepth is used to ensure that there is never a too deep box.
- 21. The value of \boxmaxdepth should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.
  - It is interesting to note that the value of \boxmaxdepth is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
- 22. Should \@maxdepth store the setting of \maxdepth from lplain? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

**\@opcol** should do **\@floatplacement**, but where? Right at the end, since it always occurs at the start of a column.

\def\@opcol{%
 % Why is this done first?
 \global \@mparbottom \z@

2196 (/2ekernel | fltrace | latexrelease)
```

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with \@textbottom adding nothing.

Thus again it is essential for \@textbottom to have depth Opt.

```
2198 ⟨latexrelease | fltrace⟩ {\@outputdblcol}{2 column marks}%
2199 ⟨*2ekernel | fltrace | latexrelease⟩
```

This is just a change to the single command \@outputdblcol so that it saves mark information for the first column and restores it in the second column.

In case of \enlargethispage we will have infinite negative glue at the bottom of the page (coming from \vss) and that will earn us an error message if we \vsplit to get at the marks. So we need to remove the last glue (if any) at the end of \@outputbox as we are only interested in marks that change doesn't matter.

```
\setbox\@outputbox\vbox\\unvbox\@outputbox\unskip}\% \setbox\@outputbox\vsplit\@outputbox to\maxdimen
```

One minor difference from the current fixmarks package, pass the marks through a token register to stop any # tokens causing an error in a \def.

```
2209 \toks@\expandafter{\topmark}%
2210 \xdef\@firstcoltopmark{\the\toks@}%
2211 \toks@\expandafter{\splitfirstmark}%
2212 \xdef\@firstcolfirstmark{\the\toks@}%
```

This test does not work if truly empty marks have been inserted, but LATEX marks should always have (at least) two brace groups. (Except before the first mark is used, when the marks are empty, but that is OK here.)

```

### 1.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

### Limits for the placement of floating objects

\c@topnumber

This counter holds the maximum number of floats that can appear at the top of a text page or column.

```
2288 (*2ekernel)
2289 \newcount\c@topnumber
2290 \setcounter{topnumber}{2}

(End definition for \c@topnumber. This function is documented on page ??.)
```

\topfraction

This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```
2291 \newcommand\topfraction{.7}
```

(End definition for \topfraction. This function is documented on page ??.)

\c@bottomnumber

This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

```
2292 \newcount\c@bottomnumber
2293 \setcounter{bottomnumber}{1}
```

 $(\textit{End definition for $\setminus$c@bottomnumber. This function is documented on page \ref{eq:constraint}.)}$ 

\bottomfraction

This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

```
{\tt 2294} \verb|\newcommand\bottomfraction{.3}
```

(End definition for \bottomfraction. This function is documented on page ??.)

\c@totalnumber

This counter holds the maximum number of floats that can appear on any text page or column.

```
2295 \newcount\c@totalnumber
2296 \setcounter{totalnumber}{3}

(End definition for \c@totalnumber. This function is documented on page ??.)
```

\textfraction This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

2297 \newcommand\textfraction{.2}

(End definition for \textfraction. This function is documented on page ??.)

\floatpagefraction

This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a 'float page' is produced.

2298 \newcommand\floatpagefraction{.5}

(End definition for \floatpagefraction. This function is documented on page ??.)

\c@dbltopnumber

This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

```
2299 \newcount\c@dbltopnumber
2300 \setcounter{dbltopnumber}{2}
```

(End definition for \c@dbltopnumber. This function is documented on page ??.)

\dbltopfraction

This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

2301 \newcommand\dbltopfraction{.7}

(End definition for \dbltopfraction. This function is documented on page ??.)

\dblfloatpagefraction

This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a 'double-column float page' is produced.

2302 \newcommand\dblfloatpagefraction{.5}

(End definition for \dblfloatpagefraction. This function is documented on page ??.)

### Floats on a text page

\textfloatsep \intextsep When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

\floatsep is the space between adjacent floats that are placed at the top or bottom of the text page or column.

\textfloatsep is the space between the main text and floats at the top or bottom of the page or column.

\intextsep is the space between in-text floats and the text.

```
2303 \newskip\floatsep
```

2304 \newskip\textfloatsep

2305 \newskip\intextsep

2306 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}

 $2307 \ \text{cplus } 2\p0 \end{20p0} \$ 

 $^{2308} \end{minus} $$ 12\p@ \end{minus} 2\p@$ 

(End definition for \floatsep, \textfloatsep, and \intextsep. These functions are documented on page ??.)

\dblfloatsep \dbltextfloatsep

When double-column floats (floating objects that span the whole \textwidth) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep. They are rubber lengths.

**\dblfloatsep** is the space between adjacent double-column floats placed at the top of the text page.

\dbltextfloatsep is the space between the main text and double-column floats at the top of the page.

```
% \lambda \ \text{10atsep} \\ \text{12\p0 \cent{0plus 2\p0 \cent{0minus 2\p0}} \\ \text{2310 \cent{0plus 2\p0 \cent{0minus 2\p0}} \\ \text{2311 \setlength\dbltextfloatsep} \{ 20\p0 \cent{0plus 2\p0 \cent{0minus 4\p0}} \\ \text{2312 \setlength\dbltextfloatsep} \{ 20\p0 \cent{0plus 2\p0 \cent{0minus 4\p0}} \\ \text{20\p0} \\ \text{20
```

(End definition for \dblfloatsep and \dbltextfloatsep. These functions are documented on page ??.)

### Floats on their own page or column

\@fptop
\@fpsep
\@fpbot

When floating objects are placed on a separate page or column, called a 'float page', the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page \@fptop is inserted; typically this supplies some stretchable whitespace. At the bottom of the page \@fpbot ais inserted. Between adjacent floats \@fpsep is inserted.

These parameters are used for all floating objects on a 'float page' in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters \Ofptop and \Ofptot should contain a plus ...fil so as to fill the remaining empty space.

```
2313 \newskip\@fptop
2314 \newskip\@fpsep
2315 \newskip\@fpbot
2316 \setlength\@fptop{0\p@ \@plus 1fil}
2317 \setlength\@fpsep{8\p@ \@plus 2fil}
2318 \setlength\@fpbot{0\p@ \@plus 1fil}
(End definition for \@fptop, \@fpsep, and \@fpbot. These functions are documented on page ??.)
```

\@dblfptop

Double-column 'float pages' in two-column mode use similar parameters.

```
\label{eq:continuous_problem} $$ \end{center} $$ \end{center
```

2322 \setlength\@dblfptop{0\p@ \@plus 1fil} 2323 \setlength\@dblfpsep{8\p@ \@plus 2fil}

2324 \setlength\@dblfpbot{0\p@ \@plus 1fil}

(End definition for \@dblfptop, \@dblfpsep, and \@dblfpbot. These functions are documented on page ??.)

\topfigrule
\botfigrule
\dblfigrule

The macros can be used to put in rules between floats and text; whatever they insert should be vertical mode material which takes up zero space.

```
2325 \let\topfigrule=\relax
2326 \let\botfigrule=\relax
2327 \let\dblfigrule=\relax
```

2328 (/2ekernel)

 $(End\ definition\ for\ \verb+\topfigrule+,\ \verb+\botfigrule+,\ and\ \verb+\dblfigrule+.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:continuous})$ 

### File T

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into IATEX. Most of this will end up in a file called hyphen.ltx. If you wish to customize your IATEX system in respect of hyphenation patterns, write a file hyphen.cfg. If this file exists, it will be loaded instead of hyphen.ltx. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through LATEX  $2_{\varepsilon}$ .

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 (/driver)
```

The default file hyphen.ltx loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file hyphen.cfg. This is best done by starting from hyphen.ltx.

For backward compatibility, the default file, hyphen.ltx, first tries to load the file hyphen.tex. If this file exists, an information message is issued and the appropriate defaults for TEX's internal parameters are set: \language is initialized to 0, and \lefthyphenmin and \righthyphenmin to 2 and 3, respectively, to disallow x- or -xx breaks.

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking \@@end (which is the  $\LaTeX$  rame for T<sub>E</sub>X's \end primitive).

```
{\errhelp{The configuration for hyphenation is incorrectly installed.^^J%

If you don't understand this error message you need to seek^^Jexpert advice.}%

\errmessage{OOPS! I can't find any hyphenation patterns for US english.^^J \space Think of getting some or the latex2e setup will never succeed}\@Qend}

\[
\left{\quad default}\right{\quad d
```

The following example describes the possible contents of a file hyphen.cfg that will load both US English and German hyphenation patterns, making the former the default. It sets \language to 0 for the US patterns and to 1 for the German patterns. Then \language is set to 0 to make this the default and the default values of \lefthyphenmin and \righthyphenmin are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyph31
```

language=0
lefthyphenmin=2
righthyphenmin=3
endinput

Another possibility is to use the package babel, by Johannes Braams. That package is distributed with a suitable hyphen.cfg file.

### File U

## ltfinal.dtx

#### 1 Final settings

This section contains the final settings for LATEX. It initialises some debugging and typesetting parameters, sets the default \catcodes and uc/lc codes, and inputs the hyphenation file.

#### Debugging 1.1

By default,  $\LaTeX$  shows statistics:

- 1 (\*2ekernel)
- 2 \tracingstats1

### Typesetting parameters

\@lowpenalty \@medpenalty \@highpenalty These are penalties used internally.

- 3 \newcount\@lowpenalty
- 4 \newcount\@medpenalty
- 5 \newcount\@highpenalty

Allocate extended marks types if etex is active. Placed here at the end of the format to increase compatibility with count allocations in earlier releases.

- 6 (/2ekernel)
- 7 (\*2ekernel | latexrelease)
- 8 (latexrelease)\IncludeInRelease{2015/01/01}%

### 1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is enginenative working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded here but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

File U: ltfinal.dtx Date: 2020-08-21 Version v2.2i

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
157 \lccode'\- ='\- % default hyphen char
```

The alternative is that a "traditional" engine is in use.

```
158 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```
159 \def\reserved@a#1#2{%
      \@tempcnta#1\relax
160
      \@tempcntb#2\relax
161
      \reserved@b
162
163 }
   \def\reserved@b{%
      \ifnum\@tempcnta>\@tempcntb\else
         \reserved@c\@tempcnta
         \advance\@tempcnta\@ne
167
         \expandafter\reserved@b
168
      \fi
169
170 }
```

Depending on the TEX version, we might not be allowed to do this for non-ASCII characters.

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

File U: 1tfinal.dtx Date: 2020-08-21 Version v2.2i

Finally here is one that helps hyphenation in the OT1 encoding.

And we also set the \lccode of \- and \textcompwordmark so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

End of the conditional to select either Unicode or T1 encoding defaults.

200 \fi

At this stage, we can install any last-minute expl3 set-up.

```
201 \@expl@finalise@setup@@
202 \def\@expl@finalise@setup@@{}
```

This is as good a place as any to active a few XeT<sub>F</sub>X-specific settings

```
203 \ifx\XeTeXuseglyphmetrics\@undefined
204 \else
205 \XeTeXuseglyphmetrics=1 %
206 \XeTeXdashbreakstate=1 %
207 \fi
```

### 1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of hyphen.cfg in inputs that file if found. Otherwise it inputs hyphen.ltx. Note that these are loaded in *before* the \catcodes are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

\1@nohyphenation

```
216 \ifx\l@nohyphenation \@undefined
217 \newlanguage\l@nohyphenation
218 \fi
```

(End definition for \landbase londyphenation. This function is documented on page ??.)

\document@default@language

Default document language. -1 acts as language 0, but used as a flag in \document to see if it has been set in the preamble.

      \errhelp{Only stopped, to give you time to
239
               read the above message.}
240
241
```

We reset the macro. Otherwise every user will get a warning on every job.

```
242 \def\font@submax{Opt}
243 \fi
```

#### 1.6 Input encoding

Starting with the 2018 LATEX release default the input encoding to UTF-8. Unless the format is being used with luatex, xetex, enctex or mltex.

This is done in a way largely compatible with older releases: utf8.def is input just as if

### \usepackage[utf8]{inputenc}

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

430 \reserved@a{'\a}{'\z}
All the characters in the range 0-31 and 127-255 are illegal, except tab (^1), nl (^1),
```

All the characters in the range 0–31 and 127–255 are illegal, except tab ( $^{I}$ ), nl ( $^{I}$ ) ff ( $^{L}$ ) and cr ( $^{M}$ ).

### 1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their \uccode and \lccode values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the TeX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeTeX and LuaTeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```
431 \ifnum 0%
     \ifx\Umathcode\@undefined\else 1\fi
     \ifx\XeTeXmathcode\@undefined\else 1\fi
    >\z@
435 \else
436 \def\reserved@c#1{%
      \count@=#1\advance\count@ by -"20
437
      \uccode#1=\count@
438
      \label{lccode}1=#1
439
440 }
441 \reserved@a{'\a}{'\z}
442 \reserved@a{"A0}{"BC}
443 \reserved@a{"E0}{"FF}
```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```
444 \def\reserved@c#1{%

445 \count@=#1\advance\count@ by "20

446 \uccode#1=#1

447 \lccode#1=\count@

448 \sfcode#1=999

449 }

450 \reserved@a{'\A}{'\Z}

451 \reserved@a{"80}{"9C}

452 \reserved@a{"CO}{"DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

Finally here is one that helps hyphenation in the OT1 encoding.

```
461 \lccode'\^^[='\^^[ % oe in OT1
462 \fi % End of reset block for 8-bit engines
```

\MakeUppercase \MakeUppercase \Quclclist And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```
463 \DeclareRobustCommand{\MakeUppercase}[1]{{%

464 \def\i{I}\def\j{J}%

465 \def\reserved@a##1##2{\let##1##2\reserved@a}%

466 \expandafter\reserved@a\@uclclist\reserved@b\@gobble}%
```

Tell UTF-8 processing to process chars even though we are in an \protected@edef.

```
\let\UTF@two@octets@noexpand\@empty
        \let\UTF@three@octets@noexpand\@empty
        \let\UTF@four@octets@noexpand\@empty
        \protected@edef\reserved@a{\uppercase{#1}}%
        \reserved@a
471
     }}
472
  \DeclareRobustCommand{\MakeLowercase}[1]{{%
473
        \def\reserved@a##1##2{\left| +#2##1
\right| }%
474
        \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
475
        \let\UTF@two@octets@noexpand\@empty
476
        \let\UTF@three@octets@noexpand\@empty
477
        \let\UTF@four@octets@noexpand\@empty
        \protected@edef\reserved@a{\lowercase{#1}}%
        \reserved@a
480
     }}
481
  \def\@uclclist{\oe\OE\o\O\ae\AE
```

The above code works, but has the nasty side-effect that if you say something like:

```
\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}
```

In order to get round this, we redefine \MakeUppercase and \MakeLowercase to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```
\protected@edef\MakeUppercase#1{\MakeUppercase{#1}}
\protected@edef\MakeLowercase#1{\MakeLowercase{#1}}
```

 $(End\ definition\ for\ \verb+\AmakeUppercase+,\ \verb+\AmakeUppercase+,\ and\ \verb+\Cuclclist+.\ These\ functions\ are\ documented\ on\ page\ \ref{eq:cut-suppercase+}.)$ 

### 1.8 Applying Patch files

Between major releases, small patches will be distributed in files ltpatch.ltx which must be added at this point.

Patch file code removed.

### 1.9 Freeing Memory

527 \let\reserved@a\@filelist

\batchmode \@@end

\let\fmtversion@topatch\relax

\reserved@a \reserved@b

\toks

And just to make sure nobody relies on those definitions of \reserved@b and friends. These macros are reserved for use in the kernel. Do not use them as general scratch macros.

```
1528 \let\reserved@b=\Qundefined
1520 \let\reserved@c=\Qundefined
1530 \let\reserved@d=\Qundefined
1531 \let\reserved@e=\Qundefined
1532 \let\reserved@f=\Qundefined
1532 \let\reserved@f=\Qundefined
1534 (End definition for \reserved@a and \reserved@b. These functions are documented on page ??.)
```

```
533 \toks0{}
534 \toks2{}
535 \toks4{}
```

523 %

524 **%** 525 **%** 

526 %

\fi

}{}

File U: ltfinal.dtx Date: 2020-08-21 Version v2.2i

```
536 \toks6{}
537 \toks8{}
```

(End definition for \toks. This function is documented on page ??.)

\errhelp Empty the error help message, which may have some rubbish:

```
538 \errhelp{}
```

(End definition for \errhelp. This function is documented on page ??.)

### Initialise file list

\@providesfile

Initialise for use in the document. During initex a modified version has been used which leaves debugging information for latexbug.tex.

```
539 \def\@providesfile#1[#2]{%
       \wlog{File: #1 #2}%
540
       \expandafter\xdef\csname ver@#1\endcsname{#2}%
541
     \endgroup}
```

(End definition for \Oprovidesfile. This function is documented on page ??.)

\@addtofilelist

\@filelist Reset \@filelist so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to \reserved@a where it will be overwritten as soon as almost any LATEX command is issued in a class file. However the latexbug.tex program will be able to access this information and insert it into a bug report.

```
543 \let\@filelist\@gobble
\label{limit} $$^{44} \left( \frac{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath}\
```

(End definition for \Offilelist and \Oaddtofilelist. These functions are documented on page ??.)

#### 1.11 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

#### Some last minute initializations ... 1.12

#### Dumping the format 1.13

Finally we make @ into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```
545 \makeatother
546 \errorstopmode
547 \dump
_{548} \langle/2ekernel\rangle
```

1994-05-13 ltdefns.dtx v1.0r	Renamed
General: (ASAJ) Added logging	$\DeclareProtectedCommand to$
message to	\DeclareRobustCommand 208
\DeclareProtectedCommand 69	Replaces \space by '' in \csname. 208
Added logging message to	1994-05-13 ltpictur.dtx v0.1d
\DeclareProtectedCommand 78	General: Removed surplus braces from
1994-05-13 ltdefns.dtx v1.0s	\@if constructions 548
General: (ASAJ) Added	1994-05-13 lttab.dtx v1.0d
\@backslashchar69	\@contfield: Colour support 529
(ASAJ) Coded \@ifdefinable more	<b>\@startfield</b> : Colour support $\dots$ 529
efficiently	\@stopfield: Colour support 529
Coded more efficiently, thanks to	\a: moved to ltoutenc 527
FMi	1994-05-14 fontdef.dtx v2.1f
1994-05-13 ltfiles.dtx LaTeX2e	General: Removed .def files 388
\listfiles: Stop \listfiles being	1994-05-14 ltfssbas.dtx v2.1m
run twice	\enc@update: Macro added

1994-05-14 ltfssbas.dtx v2.1n	1994-05-16 ltfssbas.dtx v2.1p
General: Set defaults for all \fc 272	\fontsize: Pass \baselinstretch not
\DeclareErrorFont: Don't set	\f@linespread $272$
\f@encoding 279	\linespread: Remove surplus braces 272
$\DeclareFontEncoding: Log if$	1994-05-16 ltfssini.dtx v2.1m
encoding is redeclared 267	<b>\@acciii</b> : Define saved versions of
Only init enc change cmd when new	accents
encoding	1994-05-16 ltlogos.dtx v1.1a
1994-05-14 ltfssini.dtx v2.1k	General: (ASAJ) Split from ltinit.dtx. 187
General: Init error font just before	1994-05-16 ltmath.dtx v1.0k
checking for fontdef.cfg 383	\ensuremath: Use
\reset@font: Remove surplus braces 382	\DeclareRobustCommand and add
1994-05-14 ltfsstrc.dtx v2.3h	extra braces in math mode 488
\selectfont: Added \enc@update . 312	1994-05-16 ltoutenc.dtx 1.5h
1994-05-14 ltoutenc.dtx 1.5d	General: \pounds was still using u
General: Moved the driver to the top. 211	rather than ui shape 224
1994-05-14 ltoutenc.dtx v1.5c	1994-05-16 ltoutenc.dtx v1.5f
General: Added the fontenc package 250	General: enc files now have uc
Added the fontenc package 208	encoding name parts (FMi) 208
Fixed a bug which caused an	Revert code so that the encoding
infinite loop if \f@encoding was	given is used in
incorrectly set	\DeclareTextCommand (FMi) 208
Moved fontsmpl to its own dtx file. 208	1994-05-16 ltoutenc.dtx v1.5g
1994-05-14 ltoutenc.dtx v1.5d	General: Made fontenc.sty use the new
General: Rewrote	mixed-case encoding files 208
\DeclareTextCommand to define its	Removed the lowercasing of the filename
argument to use the current encoding by default, rather than	filename
the encoding provided to \DeclareTextCommand 208, 212	General: Added \NG, \ng, \TH, \th, \DH, \dh, \DJ and \dj 208
Tidied up the documentation 208	\DH, \dh, \DJ and \dj 208 Added \r (ring accent) and \k
1994-05-14 ltoutenc.dtx v1.5e	(ogonek) accents 208
General: Replaced \ENC@cmd by	Fixed a bug with \pounds 208
\ENC-cmd	Removed \P from the OT1
1994-05-15 ltfssbas.dtx v2.1o	definitions file 208
General: encoding cmds changed to	1994-05-16 ltoutenc.dtx v1.5i
enc-cmd	General: Fixed a bug with \d 208
1994-05-16 fontdef.dtx v2.1g	1994-05-16 ltoutput.dtx v1.0q
General: Removed	\@writesetup: Changed setting of
\DeclareFontEncoding for ot1 and	accents (FMi): with the new
t1 and input .def files instead 388	encoding setup they can use \let.
1994-05-16 ltalloc.dtx v1.1a	It could also use the new internal
General: (ASAJ) Split from ltinit.dtx. 150	commands?
1994-05-16 ltcntrl.dtx v1.0a	General: Changed setting of accents
General: (ASAJ) Split from ltinit.dtx. 152	(FMi)
1994-05-16 ltdefns.dtx v1.1a	1994-05-16 ltpar.dtx v1.1a
General: (ASAJ) Split from ltinit.dtx. 69	General: (ASAJ) Split from ltinit.dtx. 166
1994-05-16 lterror.dtx v1.1a	1994-05-16 ltplain.dtx v1.0h
General: (ASAJ) Completely new	General: Comment out encoding
error interface	specific commands
(ASAJ) Split from ltinit.dtx 156	Remove $\ensuremath{\texttt{Qacci}}$ and friends again . 30
1994-05-16 ltfinal.dtx v1.0i	Remove unnecessary def for \item 29
General: moved output enc stuff to	\loop: Use Kabelschacht method 28
lfonts	\m@th: Remove unnecessary space 29

1994-05-16 ltspace.dtx v1.1a	Replaced \defaultencoding with
General: (ASAJ) Split from ltinit.dtx. 168	\encodingdefault 208
1994-05-17 ltclass.dtx v1.0e	1994-05-19 ltbibl.dtx v1.1a
\@use@ption: Execute option after	General: Initial version of ltbibl.dtx,
removing from list, not before 643	split from ltidxbib.dtx 621
1994-05-17 ltdefns.dtx 1.1b	1994-05-19 ltcounts.dtx v1.1a
General: (ASAJ) Added the	General: Extracted file from ltcntlen. 253
\@protect@ commands 79	1994-05-19 ltdefns.dtx v1.1d
1994-05-17 ltdefns.dtx v1.1b	General: (RmS) Added definitions for
General: (ASAJ) Added definitions for	\@namedef and \@nameuse again 69
protect 69	1994-05-19 ltfinal.dtx v0.1k
(ASAJ) Removed warnings and	General: Removed \makeat 791
logging to lterror.dtx 69	1994-05-19 ltidxglo.dtx v1.1a
Added the discussion of protected	General: Initial version of ltidxglo.dtx,
commands, defined the values that	split from ltidxbib.dtx 618
\protect should have 79	1994-05-19 ltlength.dtx v1.1a
1994-05-17 ltdefns.dtx v1.1c	General: Extract file ltlength from
General: (ASAJ) Redid definitions for	ltcntlen
protect 69	1994-05-19 ltpageno.dtx v1.1a
1994-05-17 lterror.dtx v1.1b	General: Extract file ltpageno from
General: (ASAJ) Moved error stuff	ltcntlen
from ltdefns.dtx	1994-05-19 ltplain.dtx v0.1k ltfinal
1994-05-17 ltfssini.dtx v2.1n	\showoutput: used \maxdimen not
\copyright: Really add extra braces 382	99999
\nfss@text: Added braces to allow	\showoverfull: used \@ne not 1 31
use in subscripts 382	1994-05-19 ltxref.dtx v1.1a
1994-05-17 ltmath.dtx v1.0i	General: Extract file ltxref from
General: Replaced \let by \gdef, for	ltcntlen
indirect definition	1994-05-20 ltdefns.dtx v1.1e
1994-05-17 ltoutenc.dtx v1.5j	General: Changed command name
General: Added braces to \pounds so	from \@checkcommand to
it works as a subscript	\CheckCommand 69
General: (ASAJ) Renamed the	\CheckCommand: Changed name from
commands, and removed one	\@checkcommand to
which is no longer needed 79	\CheckCommand 77
1994-05-18 ltdefns.dtx v1.1c	1994-05-20 lterror.dtx v1.1c
General: Redid the discussion and	General: (ASAJ) Added
definitions, in line with the	$\c$ 0latex0info@no@line 156
proposed new setting of \protect	(ASAJ) Added missing full stops. 156
in the output routine	(ASAJ) Fixed a bug with
1994-05-18 ltfinal.dtx v0.1j	\@inmatherr 156
General: Corrected the lccode for	1994-05-20 ltfinal.dtx v0.1l
d-bar	General: Use new font warning
1994-05-18 ltlogos.dtx v1.1b	commands
General: (ASAJ) Added the T <sub>E</sub> X	1994-05-20 ltfloat.dtx v1.0h
logo	\@endfloatbox: Restore outer value of
(ASAJ) Made the L <sup>A</sup> T <sub>E</sub> X $2\varepsilon$ logo use	@nobreak switch 606
the text font '2' rather than the	\outer@nobreak: Macro added:
math font '2'	default is to do nothing 606
1994-05-18 ltoutenc.dtx v1.5k	1994-05-20 ltfntcmd.dtx v3.3h
General: Made dotted-i produce 'i' 208	General: Use new error commands $\cdot$ . 410
Removed braces from \pounds and	1994-05-20 ltfssbas.dtx v $2.1q$
\dollar	General: Use new error commands . 263

1994-05-20 ltfsstrc.dtx v2.3i	(ASAJ) Replaced \\ and tilde by
General: Use new error command	\MessageBreak and \space 156
names 307	(ASAJ) Replaced
1994-05-20 ltmiscen.dtx v1.0l	\@generic@message and
\@writefile: Added correct setting of	\@generic@error by
\protect 462	\GenericError, \GenericWarning
1994-05-20 ltmiscen.dtx v1.0m	and \GenericInfo $156$
General: Use new warning commands 456	(ASAJ) Replaces \string by
1994-05-20 ltoutput.dtx v1.0s	\protect in some messages 156
\@writesetup: Added setting of	1994-05-22 lterror.dtx v1.2d
\protect during \shipout 743	\GenericError: (DPC) Alternative
General: Added setting of \protect	version added for old TeXs 157
during \shipout 716	(DPC) New version using long
1994-05-20 ltpage.dtx v1.0d	command name
\markright: Changed setting for	1994-05-22 ltfloat.dtx v1.0i
\protect 626	General: Use new warning commands 597
1994-05-20 ltsect.dtx v1.0c	1994-05-22 ltoutput.dtx v1.0t
General: Correct setting of \protect. 594	General: Changed warnings and infos
\addcontentsline: Correct setting of	to new commands 716
\protect	1994-05-22 ltpictur.dtx v0.1e
1994-05-21 ltbibl.dtx v1.1b	General: Use new warning cmds 548
General: Use new warning commands 621	1994-05-23 ltclass.dtx v1.0h
1994-05-21 lterror.dtx v1.1d	\NeedsTeXFormat: Don't stop
General: (ASAJ) Made the error	completely when format is wrong 646
commands robust	\usepackage: Remove argument if
1994-05-21 ltfiles.dtx v1.0h	possible
General: Use new error commands $$ . 188 1994-05-21 ltlists.dtx v1.0f	1994-05-23 ltdirchk.dtx v1.0f
General: Use new error commands . 492	General: Document \@TeXversion 1
1994-05-21 ltmiscen.dtx v1.0n	1994-05-23 ltfsstrc.dtx v2.3j
General: Use new error commands . 456	General: Removed def of
1994-05-21 ltsect.dtx v1.0d	\f@warn@break 324
General: Use new error commands . 584	
1994-05-21 lttab.dtx v1.0f	1994-05-23 ltoutput.dtx v1.0u \@activechar@info: Added
General: Use new error commands . 523	•
1994-05-21 ltxref.dtx v1.1b	\MessageBreak
General: Use new warning commands 451	\@writesetup: Changed resetting of
\newlabel: Use new warning	\protect after shipout to use
commands	\aftergroup
1994-05-22 ltclass.dtx v1.0f	General: Added \MessageBreak 716
