# fitch.sty: Fitch-style natural deduction macros 

Peter Selinger<br>Dalhousie University*

Version 0.6
September 4, 2023

## 1 Overview

This document describes how to use the fitch.sty macros for typesetting Fitch-style natural deduction derivations. To load the macros, simply put ntothepreambleofyour$\mathrm{A}_{\mathrm{E}}\mathrm{EX}$file.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Here is a natural deduction derivation, together with the code that produced it:

|  |  |  |
| :--- | :--- | :--- |
| 1 | $P \vee Q$ |  |
| 2 | $\neg Q$ |  |
|  | $\neg$ | $P$ |
| 4 |  | $P$ |
| 5 |  | $\mathrm{R}, 3$ |
| 6 |  |  |
| 7 | $\neg Q$ | $\mathrm{R}, 2$ |
| 8 |  | $\neg \mathrm{E}, 5,6$ |
| 9 | $P$ | $\perp \mathrm{E}, 7$ |

```
1 \[
\(2 \backslash\) begin \(\{\) nd \(\}\)
\hypo \{1\} \{P\vee Q\}
\hypo \{2\} \{\neg Q\}
\open
6 \hypo \{3\} \{P\}
7 \have \{4\} \{P\} \(\backslash \mathrm{r}\{3\}\)
8 \close
9 \open
10 \hypo \{aa\} \{Q\}
11 \have \(\{6\}\{\backslash\) neg \(Q\} \backslash r\{2\}\)
12 \have \{7\} \{\bot\} \ne\{aa,6\}
13 \have \{8\} \{P\} \be\{7\}
14 \close
15 \have \{9\} \{P\} \oe\{1,3-4, aa-8\}
16 \end\{nd\} }
\({ }_{17}\) \]
```

A derivation consists of lines, and each line contains a line number and a formula. Some lines also carry a justification. Moreover, each line is either a hypothesis or a derived formula. Generally, derived formulas carry a justification, whereas hypotheses do not; however, the macros do not enforce this.
nd (env.) Derivations are typeset inside the nd environment, which must be used in math mode.
\hypo The commands \hypo and \have are used to typeset one line of the derivation; \hypo is used for \have hypotheses, and \have for derived formulas. Both commands take a label and a formula as an argument. Note that the labels used to identify lines in the derivation need not be actual line numbers; for instance, in the above example, we used the label $a a$ instead of 5 . In the output, lines are automatically numbered consecutively. Labels may not contain any punctuation characters or spaces.
\open Subderivations are opened and closed with the commands \open and \close. Finally, the following \close commands are provided for annotating lines with justifications:

| \r | reiteration | \oi | or introduction | $\backslash n n e$ | double negation elimination |
| :--- | :--- | :--- | :--- | :--- | :--- |
| \ii | implication introduction | $\backslash$ oe | or elimination | $\backslash A i$ | forall introduction |
| \ie | implication elimination | $\backslash n i$ | not introduction | $\backslash A e$ | forall elimination |
| \ai | and introduction | $\backslash$ ne | not elimination | $\backslash E i$ | exists introduction |
| \ae | and elimination | $\backslash$ be | bottom elimination | $\backslash E e$ | exists elimination |

[^0]Each such command takes a reference list as an argument. A reference list is a string made from labels, commas, and hyphens, for instance $1,3 a-3 b, 4 a-4 d$.

## 2 Details

### 2.1 Guards

Some natural deduction derivations with quantifiers use guards, as in the following example:

| $1 \quad \exists x \forall y \cdot P(x, y)$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 2 | $v$ | $u$ | $\forall y . P(u, y)$ |  |
| 3 |  |  | $P(u, v)$ | $\forall \mathrm{E}, 2$ |
| 4 |  |  | $\exists x . P(x, v)$ | $\exists \mathrm{I}, 3$ |
| 5 |  |  | $P(x, v)$ | $\exists \mathrm{E}, 1,2-5$ |
| 6 |  | $x$. | $(x, y)$ | $\forall \mathrm{I}, 2-5$ |

```
1 \[
\({ }_{2} \backslash\) begin \(\{\) nd \(\}\)
3 \hypo \{1\} \{\exists \(x \backslash\) forall y. \(P(x, y)\}\)
4 \open[v]
5 \open[u]
6 \hypo \(\{2\}\) \{ \({ }^{6}\) forall y.P(u,y)\}
7 \have \(\{3\}\{P(u, v)\} \quad \backslash A e\{2\}\)
8 \have \(\{4\}\) \{ l exists x.P(x,v)\} \Ei\{3\}
9 \close
10 \have \(\{5\}\) \{\exists \(x . P(x, v)\} \quad \backslash E e\)
\(\{1,2-5\}\)
11 \close
12 \have \(\{6\}\) \{ 4 forall \(y \backslash e x i s t s ~ x . P(x, y)\} \backslash A i\)
13 \end\{nd\} }
14 \]
```

The guards $v$ and $u$ in line 2 were typeset by giving optional arguments to the \open commands of the respective subderivations.
\guard For most purposes, the above way of specifying guards is sufficient. However, there is another method, which allows a more flexible placement of guards: before any line, you can give the command \guard\{u\} to add a guard $u$ to the top-level subderivation at that line, or \guard[n] \{u\} to add a guard to the $n$th enclosing subderivation at that line. Thus, the above example could have also been typeset by inserting the two commands \guard\{u\} and \guard[2]\{v\} just after the second \open statement.

### 2.2 Generic justifications

Non-standard justifications can be created with the \by command. This command takes two arguments: a name and a reference list. For instance, the command $\backslash b y\{D e ~ M o r g a n\}\{l a b 3, l a b 4\}$ might produce the output "De Morgan, 3, 4". Note that the justification is typeset in text mode. A comma is automatically inserted between the name and the reference list, unless the reference list is empty.

### 2.3 Label and reference list details

Labels may not contain commas, periods, semicolons, hyphens, parenthesis, or spaces. In a reference list, spaces are ignored (even within a label!), whereas commas, periods, semicolons, parenthesis, and hyphens are copied to the output. All other characters are interpreted as part of a label. Attempting to reference a label which has not been previously defined by any \hypo or \have command produces an error message of the form:

```
! Package fitch Error: Undefined line reference: lab17.
```

### 2.4 Referencing line numbers in the text

\ndref Labels defined in an nd environment can be referenced in the text with the \ndref command. This command takes a reference list as an argument, and produces the corresponding output. However, it is only possible to reference labels after the corresponding derivation has been typeset. There is currently no convenient way of defining forward references. Also, if a label is used more than once, \ndref will always refer to the most recent time it was used.

### 2.5 Scope

The commands \hypo, \have, \open, \close, \r, \ii, and so forth are only available inside an nd environment. These commands may have a different meaning elsewhere in the same document. The only commands provided by the fitch.sty package which are visible outside an nd environment are the command \ndref described in Section 2.4, and the command \nddim and the dimension \ndindent described in Section 2.9.

### 2.6 Breaking it across pages

\ndresume The nd environment is derived from the $\mathrm{LA}_{\mathrm{E}} \mathrm{X}$ array environment, and thus it does not break across pages automatically. However, if a derivation is too long to fit on a single page, it is possible to split it manually into physically independent, but logically consecutive subparts. For this purpose, the ndresume environment is provided to continue a previously interrupted derivation. Here is an example:

```
1 $
2 \begin{nd}
\hypo {1} {P\vee Q}
\hypo {2} {\neg Q}
\open
\hypo {3} {P}
\have {4} {P} \r{3}
\close
\open
\hypo {aa} {Q}
\have {6} {\neg Q} \r{2}
\end{nd}
13 $
14
15 Derivations can be interrupted and
16 resumed at any point.
7
8$
\begin{ndresume}
    \have {7} {\bot} \ne{aa,6}
    \have {8} {P} \be{7}
    \close
\have {9} {P} \oe{1,3-4,aa-8}
\end{ndresume}
25$
```

### 2.7 Custom line numbers

One often needs to write derivation schemas, rather than derivations. This often requires the use of symbolic constants such as $n, n+1$, etc, instead of actual line numbers. The \have and $\backslash$ hypo commands have an optional first argument which is a symbolic constant. For instance, \have [n] will cause the current line to be numbered with the symbolic constant $n$. Subsequent lines are automatically numbered $n+1$ etc. An initial offset can be given as a second optional argument, as in \have[n] [-1], which will cause the current line to be numbered $n-1$, the following line $n$, etc. In an explicit offset is given, the symbolic constant can also be absent: for instance, the command \have [] [7] resets the current line number to 7. The following example illustrates this behavior:

| 1 | $P \vee Q$ |  |
| :---: | :---: | :---: |
| 2 | $P$ |  |
| $\vdots$ | : |  |
| $n-1$ | $A \wedge B$ |  |
| $n$ | $Q$ |  |
| $\vdots$ | - |  |
| $m$ | $A \wedge B$ |  |
| $m+1$ | $A \wedge B$ | $\vee \mathrm{E}, 1,2-(n-1), n-m$ |
| $\vdots$ | : |  |
| 100 | $A$ | $\wedge \mathrm{E}, m+1$ |

```
1 \[
\(2 \backslash\) begin\{nd\}
    \hypo \{1\} \{P\vee Q\}
    \open
    \hypo \{2\} \{P\}
    \have [\vdots] \{3\} \{\vdots\}
    \have [n] [-1] \{4\} \{A\wedge B\}
    \close
    \open
    \hypo \{5\} \{Q\}
    \have [\vdots] \{6\} \{\vdots\}
    have [m] \{7\} \{A\wedge B\}
    \close
    \have \{8\} \{A\wedge B\} \oe\{1,2-(4)
        ,5-7\}
    \have [\vdots] \{9\} \{\vdots\}
16 \have [] [100] \{10\} \{A\} \ae\{8\}
\({ }_{7} \backslash\) end \(\{n d\}\)
18 \]
```

Note that in the justification for line $m+1$, parentheses had to be put around the label 4 . There is currently no way of doing this automatically.

Exercise. How does one typeset an empty line number?
Solution. Since \have[] has a special meaning as explained above, we need to use \have [~] instead.

### 2.8 Continuation lines

Sometimes one has to typeset a very long formula that does not fit on a single line. As of version 0.5 of the fitch.sty macros, it is possible to break a formula into several lines using $\backslash \backslash$ as a line separator. Continuation lines are automatically indented, as shown in the following example.

| 1 | $A \wedge B$ |  |
| :--- | :--- | :--- |
| 2 | $A \wedge B \rightarrow$ |  |
| 3 | $C \wedge D$ |  |
|  | $C \wedge D$ | $A \wedge E, 1,2$ |
| 4 | $A \wedge B \wedge$ |  |
|  | $C \wedge D$ | $\wedge \mathrm{I}, 1,3$ |

```
1 \[
2 \begin{nd}
    \hypo{1} {A\wedge B}
    \hypo{2} {A\wedge B->{} \\
                                    C\wedge D}
    \have{3} {C\wedge D} \ie{1,2}
7 \have{4} {A\wedge B\wedge{} \\
8 C\wedge D} \ai{1,3}
9 \end{nd}
10\]
```

\hypocont Alternatively, the \havecont and \hypocont commands can be used to specify each continuation \havecont line separately, as the following example illustrates.

| 1 | $A \wedge B$ |  |
| :--- | :--- | :--- |
| 2 | $A \wedge B \rightarrow$ |  |
| 3 | $C \wedge D$ |  |
| 3 | $C \wedge D$ | $\Rightarrow \mathrm{E}, 1,2$ |
| 4 | $A \wedge B \wedge$ | $\wedge \mathrm{I}, 1,3$ |
|  | $C \wedge D$ |  |

```
1 \[
2 \begin{nd}
3 \hypo{1} {A\wedge B}
4 \hypo{2} {A\wedge B->{}}
5 \hypocont {C\wedge D}
6 \have{3} {C\wedge D} \ie{1,2}
7 \have{4} {A\wedge B\wedge{}} \ai{1,3}
8 \havecont {C\wedge D}
g \end{nd}
10 \]
```

This latter style gives slightly more flexibility in the placement of justifications, since each line and continuation line can have its own justification and its own guard (via the \guard command). It also allows a derivation to be interrupted between a line and its continuation, as discussed in Section 2.6.

### 2.9 Customizing dimensions

\nddim The relative sizes of the various elements of a natural deduction proof are preset to reasonable values depending on the size of the currently selected font. However, it will sometimes be necessary to customize these dimensions. This can be achieved with the \nddim command. The syntax of the command is as follows:
$\backslash$ nddim $\{\langle$ height $\rangle\}\{\langle$ topheight $\rangle\}\{\langle$ depth $\rangle\}\{\langle$ labelsep $\rangle\}\{\langle$ indent $\rangle\}\{\langle$ hsep $\rangle\}\{\langle$ justsep $\rangle\}\{\langle$ linethickness $\rangle\}$,
where each of the eight parameters is a dimension. The meaning of the first seven parameters is shown in the following illustrations; linethickness is simply the thickness of the lines.

The default dimensions are:

```
\nddim{4.5ex}{3.5ex}{1.5ex}{1em}{1.6em}{.5em}{2.5em}{.2mm}.
```

\ndindent In addition, the dimension \ndindent, controls the amount of extra indentation used on continuation lines as discussed in Section 2.8. It can be changed and is 1 ex by default.

### 2.10 Other comments

The goal was to design a flexible package which would not impose any constraints on the form of derivations, while making typesetting easy. With this package, it is in fact possible to typeset incomplete, ill-formed, or invalid derivations. Sometimes it is pedagogically necessary to do so.

There are no arbitrary limits on the size or nesting depth of a derivation, except for the obvious requirement of fitting horizontally on the printed page.
