# The fixdif Package 

Zhang Tingxuan

2023/01/27 Version 1.6*

#### Abstract

The fixdif package redefines the $\backslash d$ command in $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ and provides an interface to define commands for differential operators.

The package is compatible with pdfT $\mathrm{E}_{\mathrm{E}} \mathrm{X}, \mathrm{X}_{\mathrm{H}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ and $\mathrm{Lua}_{\mathrm{E}} \mathrm{X}$. Furthermore, the package is compatible with unicode-math package in $\mathrm{X}_{\mathrm{H}_{\mathrm{E}}} \mathrm{T}_{\mathrm{E}}$ and LuaTEX.

## 1 The background

It's usually recommended that one should reserve a small skip between the differential operator and the expression before it ${ }^{1}$. Take the following cases as an example:

$$
f(x) \mathrm{d} x \quad \text { and } \quad f(x) \mathrm{d} x .
$$

We usually consider that the example on the right side is better than the one on the left side. The little skip between $f(x)$ and $\mathrm{d} x$ can be regarded as a symbol of the product of $f(x)$ and $\mathrm{d} x$.

So some users prefer to define a macro like this:
}\)
This macro works well in "display math" and "text math", but we still face the following three problems:

1. The skip before "d" would still be reserved in "text fraction", which is regarded bad. For example, $\$ \backslash \mathrm{~d} y / \backslash \mathrm{d} x \$$ produces $\mathrm{d} y / \mathrm{d} x$;
2. This \d command cannot be used out of math mode. In other words, \d\{o\} would not produce " O " in text;
3. The skip between " d " and the expression before it can be regarded as a product operator. A product operator is definitely a binary operator.
Take $\backslash \operatorname{cdot}(\cdot)$ as an example. A binary operator reserves small skips before and after itself when in "display math" or "text math" such as $x \cdot y$, but the skips will disappear in "script math" or "script script math" such as $a^{x \cdot y}$. Thus the small skip should also disappear in script, but $\$ \mathrm{a} \wedge\{\mathrm{f}(\mathrm{x}) \backslash \mathrm{d} x\} \$$ still produces $a^{f(x) \mathrm{d} x}$ but not $a^{f(x) \mathrm{d} x}$.

To solve these problems, you can try this package.

[^0]
## 2 Introduction

To load this package, write
ackage\{fixdif\}inthepreamble.Inyourdocument,$\backslash\left[f(x)\backslashdx,\backslashquad\backslashfrac\{\backslashdy\}\{\backslashdx\},\backslashquad\backslashdy/\backslashdx,\backslashquada\_\{y\backslashdx\}.\backslash\right]$willproduceundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

$$
f(x) \mathrm{d} x, \quad \frac{\mathrm{~d} y}{\mathrm{~d} x}, \quad \mathrm{~d} y / \mathrm{d} x, \quad a^{y \mathrm{~d} x}
$$

### 2.1 When using unicode-math

If you are using unicode-math package with $\mathrm{X}_{-1} \mathrm{~T}_{\mathrm{E}} \mathrm{X} / \mathrm{LuaT} \mathrm{E}_{\mathrm{E}} \mathrm{X}$ in your document, you must pay attention to the following items:

- If you want to use amsmath package, make sure that the unicode-math package is loaded after amsmath.
- You had better specify the math font through the \setmathfont command provided by unicode-math in order to avoid bad skip in text fraction like $\mathrm{d} y / \mathrm{d} x$.
- Load the fixdif package after unicode-math.

Therefore the correct order is

```
\usepackage{amsmath}
\usepackage{unicode-math}
\setmathfont{...}[...]
\usepackage{fixdif}
```

### 2.2 When using hyperref

If you want to use the hyperref package simultaneously, remember to load hyperref before the fixdif package, otherwise the hyperref package will cause conflicts.

### 2.3 Basic commands and package options

\d The fixdif package provides a \d command for the differential operator "d" in math mode. When in text, \d behaves just like the old $\backslash d$ command in $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ or plain $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ as an accent command. For example,
$\$ \backslash \mathrm{~d} x \$$ and $\backslash \mathrm{d} \mathrm{x}$
will produce " $\mathrm{d} x$ and x ".

Set the font of erearetwobasicpackageoptionstocontrolthe\d'sstyleinmathmode-rmandnormal.Thedefaultoptionisrm,inwhichcase$\$\mathrm{f}(\mathrm{x})\backslash\mathrm{d}\mathrm{x}\$$produces$f(x)\mathrm{d}x$.Ifyouchosethenormaloption,forexample\usepackage[normal]\{fixdif\}$\$\mathrm{f}(\mathrm{x})\backslash\mathrm{d}\mathrm{x}\$$wouldproduces$f(x)dx$.\resetdfontBesidestheprevioustwooptionalfonts,youcanresetthefontofdifferentialoperator"d"through\resetdfontcommandinpreamble:\resetdfont\{\mathsf\}then$\backslash\mathrm{d}\mathrm{x}$willproduce$\mathrm{d}x$.\partialControlthebehaviorof\partialIndefault,\partialwillalsoberegardedasadifferentialoperatorinthispackage.Ifyoudon'tlikethisdefaultsetting,youcanusethenopartialoption:\usepackage[nopartial]\{fixdif\}undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

If you use the default setting, \partialnondif yields the ordinary symbol $\partial$.

## 3 Define commands for differential operators

Attention! The commands in this section can be used in preamble only!

### 3.1 Define commands with a single command name

$\backslash$ letdif $\backslash$ letdif $\{\langle c m d\rangle\}\{\langle c s n a m e\rangle\}$ (preamble only)
The \letdif command has two arguments - the first is the newly-defined command and the second is the control sequence name of a math character, that is, a command without its backslash. For example,
\letdif\{\vr\}\{delta\}
then $\backslash \mathrm{vr}$ will produce a $\delta$ ( $\backslash$ delta) with automatic skip before it.
Through the \letdif command, we can redefine a math character command by its name. For example,
\letdif\{\delta\}\{delta\}
then \delta itself will be a differential operator.
The second argument $\langle$ csname $\rangle$ of \letdif command can be used repeatedly. If you want to get the ordinary symbol of $\backslash\langle$ csname $\rangle$, you can input $\backslash$ partialnondif $\backslash\langle$ csname $\rangle$ nondif in math mode. For example, in default, \partialnondif yields
the old partial symbol " $\partial$ ".
$\backslash$ letdif* \letdif*\{〈cmd $\rangle\}\{\langle c s n a m e\rangle\}$ (preamble only)

This command is basically the same as \letdif, but this command will patch a correction after the differential operator. This is very useful when a math font is setted through unicode-math package. For example,

```
\usepackage{unicode-math}
\setmathfont{TeX Gyre Termes Math}
\usepackage{fixdif}
\letdif{\vr}{updelta}
```

this will cause bad negative skip after \vr, but if you change the last line into
\letdif*\{\vr\}\{updelta\}
you will get the result correct.

### 3.2 Define commands with multi commands or a string

\newdif $\backslash$ newdif $\{\langle c m d\rangle\}\{\langle m u l t i-c m d\rangle\}$
(without correction, preamble only)
$\backslash$ newdif* \newdif*\{〈cmd $\rangle\}\{\langle$ multi-cmd $\rangle\}$
(with correction, preamble only)
The first argument of these commands is the newly-defined command; and the second argument should contain more than one tokens. For example, if you have loaded the xcolor package, you can use the following line:
\newdif $\{\backslash$ redsfd $\}\{\backslash$ textsf $\{\backslash \operatorname{color}\{$ red $\} d\}\}$

Then you get the \redsfd as a differential operator. Take another example,
\newdif $\{\backslash \mathrm{D}\}\{\backslash$ mathrm\{D\}\}

Then you get $\backslash D$ for an uppercase upright " $D$ " as a differential operator.
If your second argument contains only one command like \Delta, it's recommended to use \letdif or \letdif* instead.
$\backslash$ newdif and $\backslash$ newdif* will check whether $\langle c m d\rangle$ has been defined already. If so, an error message will be given.
$\backslash$ renewdif $\backslash$ renewdif $\{\langle c m d\rangle\}\{\langle m u l t i-c m d\rangle\} \quad$ (without correction, preamble only)
$\backslash$ renewdif* \renewdif*\{
These two commands are basically the same as \newdif and \newdif*. The only difference is that \renewdif and \renewdif* will check whether $\langle c m d\rangle$ has not been defined yet. If so, an error message will be given.

## 4 Using differential operators temporarily

\mathdif \mathdif $\{\langle$ symbol $\rangle\}$
\mathdif* \mathdif*\{〈symbol $\rangle\}$
(without correction, in math mode only)
(with correction, in math mode only)

These two commands can be used in math mode only, more specifically, after $\backslash$ begin\{document\}. For example, $\$ \mathbf{x} \backslash$ mathdif $\{\backslash$ Delta $\backslash$ psi $\$$ will get $x \Delta \psi$.

## 5 Examples

This section shows how to use this package properly in your document.
Take the two examples below:

```
\letdif{\Delta}{Delta} % Example 1, in preamble
\letdif{\nabla}{nabla} % Example 2, in preamble
```

Actually, the second example is more reasonable. Sometimes, we take " $\Delta$ " as laplacian (equivalent to $\nabla^{2}$ ), while " $\Delta$ " can also be regarded as a variable or function at some other times. Consequently, it's better to save a different command for " $\Delta$ " as laplacian while reserve \Delta as a command for an ordinary math symbol " $\Delta$ ". However, in the vast majority of cases, " $\nabla$ " is regarded as nabla operator so there is no need to save a different command for " $\nabla$ ". Then we can correct the code above:
\letdif\{\laplacian\}\{Delta\} \% Example 1, corrected, in preamble
With the xparse package, we can define the command in another method:

```
\letdif{\nabla}{nabla}
\DeclareDocumentCommand{ \laplacian }{ s }{
    \IfBooleanTF{#1}{\mathdif{\Delta}}{\nabla^2}
}
```

Then \laplacian produces $\nabla^{2}$ and \laplacian* produces $\Delta$.
Dealing with "+" and "-" If you input $\$-\backslash \mathrm{d} \mathbf{x} \$$, you'll get " $-\mathrm{d} x$ " in your document. However, if you think " $-\mathrm{d} x$ " is better, you can input $-\{\backslash \mathrm{d} x\}$. The "\d x" in a group will be regarded ordinary but not inner so that the small skip will disappear. Maybe " $-\mathrm{d} x$ " is just okay.

## 6 The source code <br> $1\langle *$ package〉

Check the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ format and provides the package name.

```
2\NeedsTeXFormat{LaTeX2e}
3\ProvidesPackage{fixdif}[2023/01/27 Interface for defining differential operators.]
```

### 6.1 Control the skip between slashes and differential operator

Change the math code of slash (/) and backslash $(\backslash)$ so that the skip between slashes and differential operators can be ignored.

```
4\@ifpackageloaded{unicode-math}{\AtBeginDocument{%
```

If the unicode-math package has been loaded, use the $\mathrm{X}_{-} \mathrm{T}_{\mathrm{E}} \mathrm{X} / \mathrm{Lua} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ primitive \Umathcode to change the type of slashes. The numeral "4" stands for "open".

```
\Umathcode`\/="4 \symoperators "002F
\Umathcode"2044="4 \symoperators "2044
\Umathcode"2215="4 \symoperators "2215
\Umathcode"2F98="4 \symoperators "2F98
\Umathcode`\\="4 \symoperators "005C
\Umathcode"2216="4 \symoperators "2216
\Umathcode"29F5="4 \symoperators "29F5
\Umathcode"29F9="4 \symoperators "29F9
}}{
```

If the unicode-math package has not been loaded, use the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ primitive $\backslash$ mathcode to change the type of slashes. The \backslash needs to be redefined through \delimiter primitive too.

```
\mathcode`\/="413D
\mathcode`\\="426E % \backslash
\def\backslash{\delimiter"426E30F\relax}
```

$17\}$

### 6.2 Patch the skips around the differential operator

\mup@tch The following \mup@tch patches the skip after the differential operator.

```
18\def\mup@tch{\mathchoice{\mskip-\thinmuskip}{\mskip-\thinmuskip}{}{}{}}
```

The \s@beforep@tch patches the commands with star (\letdif*, etc).
$19 \backslash \operatorname{def} \backslash s @ b e f o r e p @ t c h\{\backslash$ mathchoice $\}\}\{\backslash \operatorname{mbox}\}\}\{\backslash \operatorname{mbox}\}\}\}$

### 6.3 Declare the package options

Declare the options of the package and execute them.

```
20 \DeclareOption{rm}{\@ifpackageloaded{unicode-math}
21 {\def\@@dif{\symrm{d}}}{\def\@@dif{\mathrm{d}}}}
22\DeclareOption{normal}{\def\@@dif{d}}
23\DeclareOption{partial}{\@tempswatrue}
24\DeclareOption{nopartial}{\@tempswafalse}
25\ExecuteOptions{rm,partial}
26\ProcessOptions\relax
```

Control the behavior of \partial.
27 \if@tempswa
28 \AtEndOfPackage\{\letdif $\{\backslash$ partial\}\{partial\}\}
29 \fi
\resetdfont Define the \resetdfont command.

```
30\gdef\resetdfont#1{\let\@@dif\relax%
```

31 \def \@@dif\{\#1\{d\}\}\}

### 6.4 Deal with the \d command

\@dif \@dif is the differential operator produced by \d in math mode. Here we prefer $\backslash$ mathinner to \mathbin to make the skip.
$32 \backslash$ def \@dif $\{\backslash$ mathinner $\{\backslash @ @ d i f\} \backslash m u p @ t c h\}$
\d@accent Restore the \d command in text by \d@accent with the \let primitive.
$33 \backslash$ AtBeginDocument \{\let\d@accent \d
\d Redefine the \d command. In text, we need to expand the stuffs after \d
34 \DeclareRobustCommand \d\{\ifmmode\@dif \else\expandafter\d@accent $\backslash f i\}\}$
6.5 User's interface for defining new differential operators
\letdif Define the \letdif and \letdif* command. The internal version of \letdif is \letdif* \@letdif, of \letdif* is \s@letdif.

35 \def \@letdif\#1\#2\{\AtBeginDocument $\{\%$
\#1 is the final command; \#2 is the "control sequence name" of \#1's initial definition. Here we create a command (\csname\#2nonfif \endcsname) to restore \#2.

```
\ifcsname #2nondif\endcsname\else%
\expandafter\let\csname #2nondif \expandafter\endcsname
    \csname #2\endcsname%
\fi%
```

Finally let \#1 be the new command.

```
\gdef#1{\mathinner{\csname #2nondif\endcsname}\mup@tch}%
```

41 \}\}

The definition of \s@letdif is similar, but with the patch for negative skips.

```
\def\s@letdif#1#2{\AtBeginDocument{%
    \ifcsname #2nondif\endcsname\else%
    \expandafter\let\csname #2nondif\expandafter\endcsname
        \csname #2\endcsname%
    \fi%
    \gdef#1{\mathinner{\s@beforep@tch\csname #2nondif\endcsname\hbox{}}\mup@tch}%
48}}
49\def\letdif{\@ifstar\s@letdif\@letdif}
```

\newdif Define the \newdif and \newdif* commands. \#1 is the final command; \#2 is the \newdif* "long" argument.

```
0 \long\def\@newdif#1#2{\AtBeginDocument{%
    \ifdefined#1
        \PackageError{fixdif}{\string#1 is already defined.}
            {Try another command instead of \string#1.}%
    \else
        \long\gdef#1{\mathinner{#2}\mup@tch}%
    \fi%
}}
\long\def\s@newdif#1#2{\AtBeginDocument{%
    \ifdefined#1
    \PackageError{fixdif}{\string#1 is already defined.}
            {Try another command instead of \string#1.}%
    \else
        \long\gdef#1{\s@beforep@tch\mathinner{#2\mbox{}}\mup@tch}%
    \fi%
65}}
66\def\newdif{\@ifstar\s@newdif\@newdif}
```

    \renewdif Define the \renewdif and \renewdif* commands.
    \renewdif*
67 \long\def \@renewdif\#1\#2\{\AtBeginDocument\{\%
\ifdefined\#1
\long\gdef\#1\{\mathinner\{\#2\}\mup@tch\}\%
\else
\PackageError\{fixdif\}\{\string\#1 has not been defined yet.\}
\{You should use \string\newdif instead of \string\renewdif.\}\%
\fi\%
4\}
\long\def\s@renewdif\#1\#2\{\AtBeginDocument\{\%
\ifdefined\#1
\long\gdef\#1\{\s@beforep@tch \mathinner\{\#2\mbox\{\}\}\mup@tch\}\%
\else
\PackageError\{fixdif\}\{\string\#1 has not been defined yet.\}
$\{$ You should use \string\newdif instead of \string\renewdif.\}\%
\fi\%
\}\}
83 \def $\backslash r e n e w d i f\{\backslash @ i f s t a r \backslash s @ r e n e w d i f \backslash @ r e n e w d i f\}$

### 6.6 In-document commands: \mathdif and \mathdif*

$84 \backslash$ def \@mathdif\#1\{\mathinner\{\#1\} $\backslash$ mup@tch $\}$
$85 \backslash$ def \s@mathdif\#1\{\s@beforep@tch $\backslash$ mathinner $\{\# 1 \backslash \operatorname{mbox}\}\} \backslash$ mup@tch $\}$
$86 \backslash$ DeclareRobustCommand\mathdif\{\@ifstar\s@mathdif \@mathdif\}
End of the package.
87 〈/package〉
