## 1 Loading the package

```
\usepackage[Option]{hvextern}
```

There exists only one option `checkCode` which is valid for all  $\text{\TeX}$ -compiler. In this case an already existing external file will only be compiled, if the external code changed. This doesn't depends on the setting of the option `force`. `checkCode` can speed up the compilation time.

## 2 Syntax

This package allows to write external METAPOST,  $\text{\TeX}$ , ConTeXt,  $\text{\LaTeX}$ ,  $\text{\LUA\TeX}$ ,  $\text{\X\TeX}$ ,  $\text{\X\LaTeX}$ , Lua, Perl, Java and/or Python source code, which will then be run via `shell escape` to create a PDF oder text output to include it into the main  $\text{\LaTeX}$  document.

There is only one environment and one command:

```
\begin{externalDocument}[<options>]{<external filename without extension>}  
...  
source code  
...  
\end{externalDocument}  
  
\runExtCmd[<options>]  
  {<command with arguments>}  
  {<external filename without extension>}
```

The very first compilation run of the main document must be done with the `-shell-escape` command-line option, otherwise it won't work. Follow-up runs, for example, to resolve references, should usually be done without `-shell-escape`. The currently used filename for the example is saved in the macro `\hvExternFilename`.

```
lualatex --shell-escape <file>
```

The purpose for this package is to show the output of documents which have to be compiled with a different preamble or a different engine or a complete different system, but integrating the output automatically in the main document..

*All examples in this document are created on-the-fly while running this  $\text{\LaTeX}$  document with lualatex with the `--shell-escape` option.*

## 3 First examples

### 3.1 Without showing the code

This document was run with  $\text{\LUA\TeX}$ . Suppose you want to insert the output of a document which needs for several reasons a  $\text{\X\TeX}$  run. Instead of created and running a document outside of the main document and then to insert the output we can do this from within this  $\text{\LUA\TeX}$  document itself. The external document is compiled with  $\text{\X\TeX}$  and the output is insert as pdf image: 美好的一天. The current filename of

the above example is voss-1 and for the source see page 16.

Let's show another example which needs a pdf $\text{\LaTeX}$  run. The source code itself is also not shown by the environment `externalDocument`.

```
\begin{externalDocument}[
  compiler=pdflatex, force=true, cleanup]{voss}
\documentclass{standalone}
%StartVisiblePreamble
\usepackage{fontenc}
\usepackage{libertinus}
\usepackage[linguistics]{forest}
\forestset{apply library=defaults{linguistics,
  edges}}
%StopVisiblePreamble
\begin{document}
\begin{forest}
[VP
  [DP]
  [’V
    [V]
    [DP]
  ]
]
\end{forest}
\end{document}
\end{externalDocument}
```

## 3.2 Showing code and output of a Python example

The png image is created on the fly with the following arguments of `externalDocument`:

```
\begin{externalDocument}[
  compiler=python3,
  code,
  ext=py,
  docType=py,
  usefancyvrb,
  grfOptions={width=\ linewidth]}{python}
... Python code ...
\end{externalDocument}
```

The code which is declared as header and main can be marked by:

```
\hv@extern@exampleType{py}
{\NumChar StartVisibleMain}
{\NumChar StopVisibleMain}
{\NumChar StartVisiblePreamble}
{\NumChar StopVisiblePreamble}
```

`\NumChar` is the default Python comment character `#` and needs to be saved with a different category, which is done internally by the package. The complete definition of the code is:

```
\begin{externalDocument}[
    compiler=python3,
    code,
    ext=py,
    force=true,
    docType=py,
    usefancyvrb,
    grfOptions={width=\linewidth}\{python\}
]
import os
#StartVisiblePreamble
from PIL import Image
import subprocess
# drawing area (xa < xb and ya < yb)
xa = -0.1716
xb = -0.1433
ya = 1.022
yb = 1.044
maxIt = 1024 # iterations
imgx = 1000 # image size
imgy = 750
image = Image.new("RGB", (imgx, imgy))
#StopVisiblePreamble

#StartVisibleMain
for y in range(imgy):
    cy = y * (yb - ya) / (imgy - 1) + ya
    for x in range(imgx):
        cx = x * (xb - xa) / (imgx - 1) + xa
        c = complex(cx, cy)
        z = 0
        for i in range(maxIt):
            if abs(z) > 2.0: break
            z = z * z + c
        r = i % 4 * 6
        g = i % 8 * 32
        b = i % 16 * 16
        image.putpixel((x, y), b * 65536 + g * 256 + r)
#StopVisibleMain
# now get the filename created by the latex document
imageName = os.path.basename(os.path.splitext(__file__)[0])+".png" # get filename
image.save(imageName, "PNG")
\end{externalDocument}
```

And with using this code we get the image as png inserted. The given filename of the external document is internally extended by a consecutive number which isn't known to the Python code. However, it is no problem in any programming language to get the name of a running file. The forlast line in the above code shows how it can be done with Python.

```

from PIL import Image
import subprocess
# drawing area (xa < xb and ya < yb)
xa = -0.1716
xb = -0.1433
ya = 1.022
yb = 1.044
maxIt = 1024 # iterations
imgx = 1000 # image size
imgy = 750
image = Image.new("RGB", (imgx, imgy))

for y in range(imgy):
    cy = y * (yb - ya) / (imgy - 1) + ya
    for x in range(imgx):
        cx = x * (xb - xa) / (imgx - 1) + xa
        c = complex(cx, cy)
        z = 0
        for i in range(maxIt):
            if abs(z) > 2.0: break
            z = z * z + c
        r = i % 4 * 6
        g = i % 8 * 32
        b = i % 16 * 16
        image.putpixel((x, y), b * 65536 + g * 256 + r)

```

The external filename, extended by a consecutive number, can be printed in the margin by setting the keyword `showFilename`. In general it is printed in the outer

margin or in twocolumn mode in the outer column. If the example is set in twocolumn mode but inside a starred floating environment over both column, then use the keyword outerFN. Then hvextern doesn't test for twocolumn mode.

A vertical shift of the filename is possible by setting a length to the keyword shiftFN, e.g. shiftFN=5ex.

```
\usepackage{tikz}
\usepackage[hks,pantone,xcolor]{xespotcolor}

\SetPageColorSpace{HKS}
\definecolor{HYellow}{spotcolor}{HKS05N,0.5}
\definecolor{HRed}{spotcolor}{HKS14N,0.5}
\definecolor{HBlue}{spotcolor}{HKS38N,0.5}
\begin{tikzpicture}[scale=0.7, fill opacity =0.7]
\fill[HYellow]( 90:1.2) circle (2);
\fill[HRed] (210:1.2) circle (2);
\fill[HBlue] (330:1.2) circle (2);
\node at ( 90:2) {Typography};
\node at ( 210:2) {Design};
\node at ( 330:2) {Coding};
\node {\LaTeX};
\end{tikzpicture}
```

## 4 Setting marker in the source

The marker for the code ranges which should be listed depend to the used programming language:

```
[...]
%StartVisiblePreamble
[... listed preamble code ]
%StopVisiblePreamble
[...]
\begin{document}
[...]
\end{document}
```

everything between %StartVisiblePreamble and %StopVisiblePreamble will be listed as preamble and in case of a LATEX source everything between \begin{document} and \end{document} as body. The marker must be defined with an own macro, e.g.:

```
\hv@extern@exampleType{py}
{ \NumChar StartVisibleMain}
{ \NumChar StopVisibleMain}
{ \NumChar StartVisiblePreamble}
{ \NumChar StopVisiblePreamble}
```

\NumChar is the comment character #, which needs a special handling. This version of hvextern supports the following programming languages (option compiler): mpost, tex, latex, luatex, python3, perl, lua, xetex, pdflatex, lualatex, xelatex, and context. The default is pdflatex. The option docType selects the config file, which must be one of context, lua, pl, tex, latex, mp, and py. For Lua it is

```
\hv@extern@exampleType{lua}
{--StartVisibleMain}
{--StopVisibleMain}
{--StartVisiblePreamble}
{--StopVisiblePreamble}
```

It defines the marker strings for the listed code sequences. In some cases you have to use multiple times the same value for different optional arguments, e.g.

```
ext=lua, compiler(lua, docType=lua, ...
```

## 5 Optional arguments

The default setting is always shown in brackets.

### 5.1 Programs and runs

The proxpath should only in some rare cases needed. In general all used compilers will be found by the system. A given proxpath must be end with a slash, e.g. ./bin/

```
\define@key{hv}{proxpath} []{\def\hv@extern@proxpath{\#1}}
\define@key{hv}{compiler}[pdflatex]{\def\hv@extern@compiler{\#1}}
\define@key{hv}{runsequence} []{\def\hv@extern@runsequence{\#1}}
\define@key{hv}{runs}[1]{\setcounter{hv@extern@runs}{\#1}}
```

Instead of the optional arguments `compiler`, `biber`, and `xindex` one can define an individual command sequence by using the optional argument `runsequence`. It must be comma separated list:

```
runsequence={lualatex,biber,xindex -l de -c AU,lualatex,lualatex}
```

vooss-5.tex

```
\usepackage[ngerman]{babel}
\usepackage{libertinus,hvindex}
\usepackage{makeidx}\makeindex
\usepackage{biblatex}\addbibresource{biblatex-examples.bib}

Sort with xindex \verb|-l DE --config AU|
\blindtext
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Österreich} \Index{Öresund}
\Index{Ödem} \Index{Oligarch} \Index{Oder}
\Index{Goldmann}
\printindex
\nocite{*}\printbibliography
\blindtext
\blinddocument
```

<p>Sort with index -1 ne --conf fg at This here is a BlaBlaText zum Testen von Testangaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Grauwert der Schrift an, da das wirklich so ist e gleichgültig, ob ich schreibe „Dies ist ein BlaBlaText“ oder „Das ist ein BlaBlaText“. Ein BlaBlaText bietet nur wichtige Informationen. An ihm messe ich die Lesbarkeit einer Schrift, ihre Ausnutzung, wie harmonisch die Figuren aussehen, ob sie gut für den Druck geeignet sind, usw. Ein BlaBlaText sollte möglichst viele verschiedene Buchstaben enthalten und in der Originalsprache gesetzt sein. Er muss keinen Sinn ergibt, aber er muss einen Sinn haben. „Hab mir eine Säule aus ipsum“ diesen nicht dem eigentlichen Zweck, da sie eine falsche Ausnutzung vermutet. The following Java-program creates the Mandelbrot set as png image. The valid setting for the environment externalDocument is:

```
compiler=java,ext=java,docType=java,
```

```
public static int iterZahl(final double cx, final double cy, int maxIt,
    final double radius) {
    // bestimmt Anzahl der Iterationen
    int zaehler = 0;
    double zx = 0.0, zy = 0.0, tmp;
    do {
        tmp = zx*zx - zy*zy + cx;
        zy = 2*zx*zy + cy; zx = tmp;
        zaehler++;
    } while (zx*zx + zy*zy <= radius && zaehler < maxIt);
    return zaehler;
}

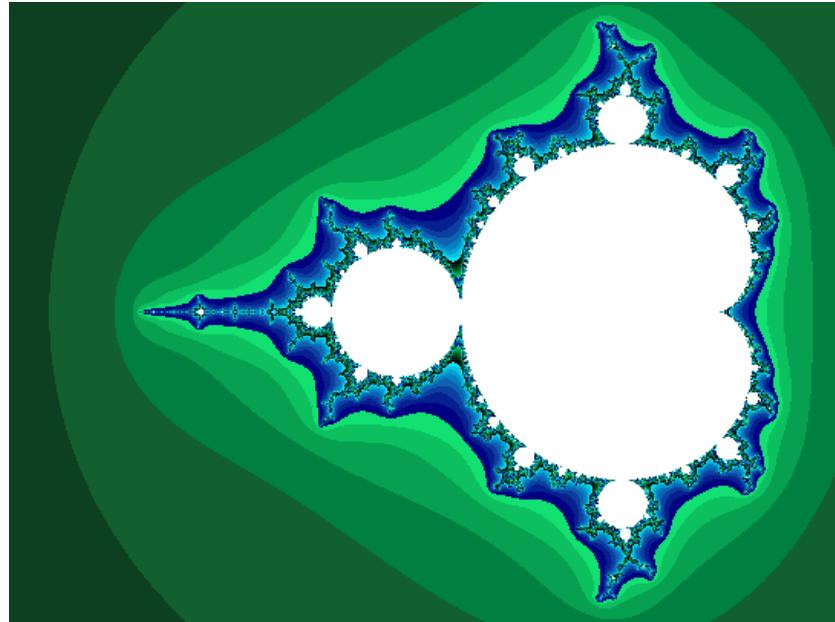

double xa = -2.5, xe = 0.7, ya = -1.2, ye = 1.2; // Ratio 20:15
double dx = (xe-xa)/(imageBreite-1), dy = (ye-ya)/(imageHoehe-1);
double cx, cy; int R, G, B;
double radius = 10.0;  int maxIt = 1024;
cx = xa;
for (int sp = 0; sp < imageBreite; sp++) {
    cy = ye; // von oben nach unten
    for (int ze = 0; ze < imageHoehe; ze++) {
        int zIter = iterZahl(cx, cy, maxIt, radius);
        if (zIter == maxIt) {
            g.setColor(Color.WHITE);
            g.drawLine(sp, ze, sp, ze);
        } else {
            R = zIter % 4 * 6 ; G = zIter % 8 * 32; B = zIter % 16 * 16;
            g.setColor(new Color(R,G,B));
            g.drawLine(sp, ze, sp, ze);
        }
        cy = cy - dy;
    } // for ze
}
```

java-6.java

```

    cx = cx + dx;
} // for sp

```

## 5.2 Grafik options

```
\define@key{hv}{grfOptions}[]{\def\hv@extern@grfOptions{#1}}
```

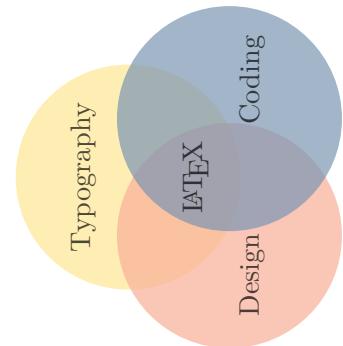

The option is passed to `\includegraphics`, e.g. `angle=90, width=\linewidth` for the following example.

```

voss-7.tex
\usepackage{tikz}
\usepackage[hks,pantone,xcolor]{xspotcolor}

\SetPageColorSpace{HKS}
\definecolor{HYellow}{spotcolor}{HKS05N,0.5}
\definecolor{HRed}{spotcolor}{HKS14N,0.5}
\definecolor{HBlue}{spotcolor}{HKS38N,0.5}
\begin{tikzpicture}[scale=0.7, fill opacity =0.7]
\fill[HYellow] ( 90:1.2) circle (2);
\fill[HRed] (210:1.2) circle (2);
\fill[HBlue] (330:1.2) circle (2);
\node at ( 90:2) {Typography};
\node at ( 210:2) {Design};
\node at ( 330:2) {Coding};
\node {\LaTeX};
\end{tikzpicture}

```

### 5.3 Listings options

```
\define@key{hv}{1stOptions}[]{\def\hv@extern@1stOptions{#1}}
```

The option is passed either to `\listinputlisting`, or, if `usefancyvrb` is active, to `\VerbatimInput`. The following example uses

```
1stOptions={basicstyle=\sffamily\itshape\scriptsize},
```

```
\usepackage{pst-calend}
\psscalebox{0.3}{%
\psCalDodecaeder[Year=2022, style=april]}
}
```

vooss-8.tex

### 5.4 Background color

There are different colors for the preamble and body listing: the background and frame color.

```
\define@key{hv}{BGpreamble}[black12]{\def\hv@extern@BGpreamble{#1}}
\define@key{hv}{BGbody}[black8]{\def\hv@extern@BGbody{#1}}
\define@key{hv}{B0preamble}[black12]{\def\hv@extern@B0preamble{#1}}
\define@key{hv}{B0body}[black8]{\def\hv@extern@B0body{#1}}
```

The options are passed to `tcolorbox` and preset to `black!12` and `black!8`. The color of the frame is set to the same values, hence not seen. The following example uses

```
BGpreamble=red!10, B0preamble=red,
BGbody=blue!8, B0body=blue,
```

```
\usepackage{pst-calend}
\pscalebox{0.3}{%
\psCalDodecaeder[Year=2022, style=may]}
}
```

vooss-9.tex

## 5.5 Type of the source code

The current version of hvextern supports code written as METAPOST, plain TeX, L<sup>A</sup>T<sub>E</sub>X, ConTeXt, and Python. Every type has its own keywords for the linerange which should be printed for the preamble and the body. For example the latex config is:

```
\hv@extern@exampleType{latex}%                                for _all_LaTeX engines
  {\string\begin\string{document\string}}%
  {\string\end\string{document\string}}%
  {\perCent StartVisiblePreamble}%
  {\perCent StopVisiblePreamble}%

% only for the sequence latex->dvips->ps2pdf
\def\hv@extern@runLATEX#1#2#3#4{%
  \ifhv@extern@verbose \typeout{>>> running #1#2 #3#4}\fi
  \ShellEscape{#1#2\space #3#4}%
  \ifhv@extern@verbose \typeout{>>> running #1dvips #3}\fi
  \ShellEscape{#1dvips\space #3.dvi}%
  \ifhv@extern@verbose \typeout{>>> running ps2pdf #3.ps}\fi
  \ShellEscape{#1ps2pdf\space -dAutoRotatePages=/None\space -dALLOWPSTRANSIENCY\space #3.ps}%
}
```

If a source needs more than running the defined compiler, it must be defined by a macro

```
\def\hv@extern@run<NAME>#1#2#3#4{%
  \def\hv@extern@pages{#1}%
  \def\hv@extern@pagessep{#2}%
  \def\hv@extern@frame{#3}%
  \def\hv@extern@compiler{lualatex}%
  \def\hv@extern@runs{#4}%
}
```

The type of the source code can be different to the compiler, e.g. source latex, but compiler lualatex.

## 5.6 Output more than one page

The pages which should be printed can be defined by

```
\define@key{hv}{pages}[1]{\def\hv@extern@pages{\#1}}
\define@key{hv}{pagessep}[1em]{\def\hv@extern@pagessep{\#1}}
\define@boolkey{hv}[hv@extern@]{frame}[true]{}
```

With frame the pages can be framed (internally by \fbox). It is leaved to the user to choose the correct image width for the pages. The separation between the pages is defined by the length pagesep. The following example uses:

```
pages={1,2,3},
pagesep=2pt,
grfOptions={width=0.3\linewidth},
compiler=lualatex, runs=2, % for the TOC
frame,
```

```
\usepackage[american]{babel}
\usepackage{libertinus}
```

```
\usepackage{blindtext}
```

```
\title{A multipage example}
\author{Erasmus von Rotterdam}
\maketitle
\tableofcontents
\blinddocument
```

## 5.7 Output as floating object with caption and label

By default the images are not inserted as a float. This can be changed by the keyword `float`, a caption and a label are optional. The float type is always `figure`.

```
\define@boolkey{hv}[hv@extern@]{float}[true]{}
\define@key{hv}{floatsetting}[]{\def\hv@extern@floatsetting{\#1}}
\define@key{hv}{caption}[]{\def\hv@extern@caption{\#1}}
\define@key{hv}{label}[]{\def\hv@extern@label{\#1}}
```

The image Figure 1 shows an example for a floating object, which uses the float-setting `!htb`, which is the default. Using a caption and a label are optional.

```
\usepackage{pst-coxeterp}
```

```
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=2]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=3]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=5]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=7]\end{pspicture}
```

## 5.8 Cropping the PDF

Instead of using the documentclass `standalone`, which already crops the created PDF, one can use the optional argument `crop`.

```
\define@boolkey{hv}[hv@extern@]{crop}[true]{}
\define@key{hv}{cropmargin}[2]{\def\hv@extern@cropmargin{\#1 }}% length in pt
```

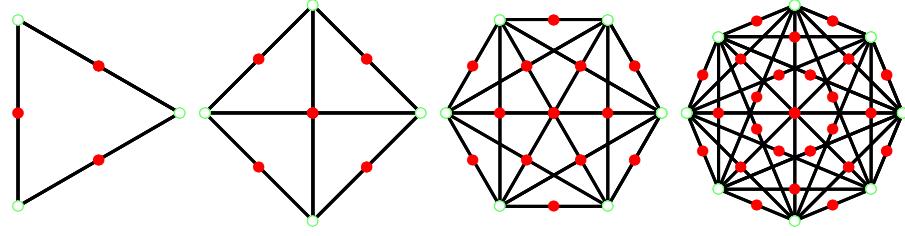

Figure 1: An example for Coxeter images

It is also possible to crop a document with more than one page. In this case the beginning and end of the pages should be on the same height. Otherwise the pages will have different heights after cropping (see next image). The following example was created with

```
pages={1,2,3},
pagesep=2pt,
grf0options={width=0.3\linewidth},
compiler=lualatex, runs=2, % for the TOC
frame,
crop, cropmargin=5%, 5pt margin
```

## 5.9 Code and output side by side

By default the code and the output is on top of each other. With setting the width of a minipage with `mpwidth` greater than 0 pt the output will be side by side.

```
\define@key{hv}{mpwidth}[0pt]{\setlength\hv@extern@mpwidth{\#1}}
\define@key{hv}{mpvalign}[0pt]{\def\hv@extern@mpvalign{\#1}}
```

`mpwidth` is the width of the code. The rest of the line, minus 1em for the space between the minipages, will be the possible width for the output and will be calculated automatically. The two minipages are aligned by defaults to its top. This can be changed by setting `mpvalign` to `c` or `b`.

## 5.10 Horizontal alignment of the output

```
align=\centering, % default
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\raggedright,
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\raggedleft,
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\centering, mpwidth=0.5\linewidth, % default for side by side
```

```
\rule{0.25\linewidth}{5mm}
```

```
align=\raggedright, mpwidth=0.5\linewidth,
```

```
\rule{0.25\linewidth}{5mm}
```

```
align=\raggedleft, mpwidth=0.5\linewidth,
```

```
\rule{0.25\linewidth}{5mm}
```

## 5.11 Inline images

By default code and image are own paragraphs. With the optional argument `inline` the created image can be part of the current line. This may make sense, if you need characters which are not part of your current font.

```
\define@boolkey{hv}[hv@extern@]{inline}[true]{%
  \hv@extern@codefalse
  \hv@extern@showfilenamefalse}
```

With the setting `inline=true` the optional keyword `code` and `showfilename` is automatically set to false. The next Chinese characters 美好的一天 are inserted as inline image without showing the code. The complete code looks like:

```
With \Lkeyset{inline} the optional argument \Lkeyword{code} is
automatically set to false. The next Chinese characters
\begin{externalDocument}[vshift=-1pt,
  compiler=xelatex, inline, runs=2, grfOptions={height=8pt},
  crop, cropmargin=0, cleanup, force=true, docType=latex}{voss}
\documentclass{ctexart}
\pagestyle{empty}
\begin{document}
美好的一天
\end{document}
\end{externalDocument}
are inserted as inline image without showing the code. The complete
code looks like:
```

With the keyword `vshift` the inserted image can be moved in vertically direction.

## 5.12 Input text instead of an image

By default the created pdf which can be, of course, only text, will be inserted by `\includegraphics`. If you have only text as output and don't want to create a pdf you can insert this kind of output as verbatim text by setting `includegraphic=false`.

```
\define@boolkey{hv}[hv@extern@]{includegraphic}[true]{}
```

The textfile must have the same main filename with the extension `.txt`. As already mentioned, in every programming language you can get the current used filename from within the code itself. The following Perl example which calculates the Kaprekar constants uses

```
my $filename = $_;                      # the current filename
$filename =~ s/\.\pl//;                  # without extension .pl
$filename = "${filename}.txt"; # for the output
```

Only for some completeness: a Kaprekar constant is a number  $A$  with  $\max(A) - \min(A) = A$ .  $\max$  and  $\min$  are the sorted digits of the number  $A$ :  $495 = 954 - 459$ .

```

my $zahl = 1;
my $anfang = 1;
my $ende = 9;

print $fh "Finding Kaprekarconstants ... \n";
while ($zahl < 8) {

    print $fh "{$zahl}-stellig: ";
    foreach ($anfang...$ende) { # for every

        my @_ = split(//, $_);
        my $Min = join("", sort(@_));
        my $Max = reverse($Min);

        my $Dif = $Max - $Min;
        if ($_ eq $Dif) {

            my $found = 1;
            print $fh $_, " ";
        }
    }

    if (!$found) { print $fh " --- \n"; }
    else { print $fh "\n"; }

    $found = false;
    $zahl = $zahl + 1;

    $anfang = $anfang * 10;
    $ende = $ende * 10;
}

```

## Finding Kaprekarconstants

...  
1-stellig: ---  
2-stellig:  
3-stellig: 495,  
4-stellig: 6174,  
5-stellig:  
6-stellig: 549945, 631764,  
7-stellig:

voSS-20.pdf

Another example with running Lua to calculate and print the Pascal's triangle.  
The internal filename is available with

```

local filename = arg[0]
local shortFN = str:match("(.)%..+")
outFile = io.open(shortFN .. ".txt", "w+")
-- open external file

```

```

function nextrow(t)
    local ret = {}
    t[0], t[#t+1] = 0, 0
    for i = 1, #t do ret[i] = t[i-1] + t[i] end
    return ret
end

function triangle(n)
    t = {1}
    for i = 1, n do
        m = (n - i)
        for j = 1, m do outFile:write("      ") end

```

```

voss-21.lua
for k = 1,i do outFile:write(string.format("%8s",t[k])) end
outFile:write("\n")
t = nextrow(t)
end
end

triangle(10)

      1
      1   1
      1   2   1
      1   3   3   1
      1   4   6   4   1
      1   5   10  10  5   1
      1   6   15  20  15  6   1
      1   7   21  35  35  21  7   1
      1   8   28  56  70  56  28  8   1
      1   9   36  84  126 126 84  36  9   1
      1

```

## 5.13 Running additional external programs

For a L<sup>A</sup>T<sub>E</sub>X additional programs for bibliography, index, a.s.o. maybe needed.

```

\define@boolkey{hv}[hv@extern@]{biber}[true]{}
\define@boolkey{hv}[hv@extern@]{xindex}[true]{}
\define@key{hv}{xindexOptions}[]{\def\hv@extern@xindexOptions{\#1}}
\define@key{hv}{runsequence}[]{\def\hv@extern@runsequence{\#1}}

```

The biber run needs no additional options, but for xindex it maybe useful. The following examples uses

```

\begin{externalDocument}[
  compiler=lualatex, runs=2, pages=2,crop,
  xindex, xindexOptions={-1 DE --config AU},
  mpwidth=0.6\linewidth, usefancyvrb=false,
  docType=latex,
  ...
]{voss}

```

voss-22.tex

```

\usepackage{makeidx}\makeindex
\usepackage{hvindex}

```

```

Sort with xindex \verb|-1 DE --config AU|
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Österreich} \Index{Öresund}
\Index{Ödem} \Index{Oligarch} \Index{Oder}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Obstler} \Index{Öl} \Index{ölen}
\Index{Oder|seealso{Fluss}} \Index{Göbel}
\Index{oder} \index{Fluss!Oder}
\Index{Goethe} \Index{Göthe} \Index{Götz}
\Index{Goldmann}
\printindex

```

## Index

<b>F</b>	Obstler, 1
Fluss	oder, 1
	- Oder, 1
	Oder, 1, <i>siehe auch</i> Fluss
<b>G</b>	Oligarch, 1
Goethe, 1	Ostern, 1
Goldmann, 1	Ö
Göbel, 1	Ödem, 1
Göthe, 1	Öl, 1
Götz, 1	Öresund, 1
<b>O</b>	Österreich, 1
Ober, 1	ö
Oberin, 1	ölen, 1

In stead of using the options `compiler`, `biber`, and `xindex` one can also use only the optional argument `runsequence` to define an individuell sequence of commands, e.g.:

```
runsequence={lualatex,biber,{xindex -l de -c AU},lualatex,lualatex}
```

```
\usepackage[ngerman]{babel}
\usepackage{libertinus,hvindex}
\usepackage{makeidx}\makeindex
\usepackage[biblatex]{biblatex}\addbibresource{biblatex-examples.bib}
```

```
\blindtext
\Index{\Oesterreich} \Index{\Oresund}
\Index{\Ostern} \Index{\Ober} \Index{\Oberin}
\Index{\Oesterreich} \Index{\Oresund}
\Index{\Odem} \Index{\Oligarch} \Index{\Oder}
\Index{\Goldmann}
\printindex
\nocite{*}\printbibliography
\blindtext
\blindeddocument
```

Dies hier ist ein Blindtext zum Testen von Textausgaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Grauwert der Schrift an. Ist das wirklich so? Ist es gleichgültig, ob ich schreibe "Ober" oder "Oberin"? Oder ist es besser, wenn ich "Ober" – mitteilernden. Ein Blindtext bietet mir wichtige Informationen. An ihm messe ich die Lesbarkeit einer Schrift, ihrer Ausnutzung, wie häufig sie benutzt wird und ob sie in einem Dokument sehr benutzt oder selten sie läuft. Ein Blindtext sollte möglichst viele verschiedene Buchstaben enthalten und in der Originalsprache geschrieben werden. Es ist nicht erlaubt, aus dem eigenen und aus fremdsprachige Texte wie "Lorem ipsum" dienen nicht dem eigentlichen Zweck, da sie eine falsche Ausnutzung vermitteln. Österreich, Oder, Oberin, Obersund, Oden, Oligarch, Oder, Goldmann.

## Index

G	Goldmann, 1
O	Ober, 1 Oberin, 1 Oder, 1 Oligarch, 1 Ostern, 1
Ö	Odem, 1 Oresund, 1 Österreich, 1

## 5.14 Using listings

The default is using `\lstinputlisting` for the printed code sequences.

```
\documentclass[chapterprefix=on,parskip=half-,DIV=12,fontsize=12pt]{scrbook}
}
\DeclareNewSectionCommand[
  style=section,
  level=4,
  beforeskip=-3.25ex plus -1ex minus -.2ex,
  afterskip=1.5ex plus .2ex,
  font=\normalsize,
  indent=0pt,
  counterwithin=subsubsection
]{subsubsubsection}
\RedeclareSectionCommand[
  level=5,
  toplevel=5,
  tocindent=13em,
  tocnumwidth=5.9em,
  counterwithin=subsubsubsection
]{paragraph}
\RedeclareSectionCommand[
  level=6,
  toplevel=6,
  tocindent=15em,
  tocnumwidth=6.8em
]{ subparagraph}
\setcounter{secnumdepth}{\subsubsubsectionnumdepth}
\setcounter{tocdepth}{\subsubsubsectiontocdepth}
```

voSS-24.tex

```

  level=6,
  toplevel=6,
  tocindent=15em,
  tocnumwidth=6.8em
]{subparagraph}
\setcounter{secnumdepth}{\subsubsubsection}
\setcounter{tocdepth}{\subsubsubsection}

\tableofcontents
\chapter{Einführung}
```

```
\section{Ein Abschnitt}
\subsection{Ein Unterabschnitt}
\subsubsection{Ein Unter-Unterabschnitt}
\subsubsubsection{Ein Unter-Unter-Unterabschnitt}
\paragraph{Der normale Paragraph}
\blindtext
\subparagraph{Der normale Unterparagraph}
\blindtext
\blinddocument
```

## 5.15 Vertical space

```
\define@key{hv}{aboveskip}[\medskipamount]{%
    \setlength{\v@extern@aboveskip{#1}}}
\define@key{hv}{belowpreambleskip}[\smallskipamount]{%
    \setlength{\v@extern@belowpreambleskip{#1}}}
\define@key{hv}{belowbodyskip}[\smallskipamount]{%
    \setlength{\v@extern@belowbodyskip{#1}}}
\define@key{hv}{belowskip}[\medskipamount]{%
    \setlength{\v@extern@belowskip{#1}}}
```

**aboveskip** Vertical space *before* the environment `externalDocument` or the command  
`\runExtCmd` (default `\medskipamount`)

**belowpreambleskip** Vertical space between preamble and body (default `\smallskipamount`)

**belowbodyskip** Vertical space between body and output (default `\smallskipamount`)

**belowskip** Vertical space *after* the environment `externalDocument` or the command  
`\runExtCmd` (default `\medskipamount`)

The listings environment uses its own keywords `aboveskip` and `belowskip`, also preset to `\medskipamount`. These ones can be changed by using the keyword `lstOptions`:

```
..., lstOptions = {aboveskip=..., belowskip=...}, ...
```

## 5.16 No output

By default there is an image or text as output of the external run. In a case, where you are only interested in the code, which should be formatted in the same style as other examples, you can set `showoutput` to `false`.

```
\documentclass[chapterprefix=on,parskip=half-,DIV=12,fontsize=12pt]{scrbook}
\DeclareNewSectionCommand[
  style=section,
  level=4,
  beforeskip=-3.25ex plus -1ex minus -.2ex,
  afterskip=1.5ex plus .2ex,
  font=\normalsize,
  indent=0pt,
  counterwithin=subsubsection
]{subsubsubsection}

\tableofcontents
\chapter{Einführung}
\section{Ein Abschnitt}
\subsection{Ein Unterabschnitt}
\subsubsection{Ein Unter-Unterabschnitt}
\subsubsubsection{Ein Unter-Unter-Unterabschnitt}
\blindtext
```

VOSS-26.tex

## 6 Defining new marker

Suppose you do not want for a L<sup>A</sup>T<sub>E</sub>X document the complete body part between \begin{ and \end printed. In this case you can define own markers, e.g.:

```
\defMarkerType[ltx]
{ \perCent StartVisibleBody}
{ \perCent StopVisibleBody}
{ \perCent StartVisiblePreamble}
{ \perCent StopVisiblePreamble}
```

Whith this definition and the setting docType=ltx the last example looks like:

```
\DeclareNewSectionCommand[
  style=section,
  level=4,
  beforeskip=-3.25ex plus -1ex minus -.2ex,
  afterskip=1.5ex plus .2ex,
  font=\normalsize,
  indent=0pt,
  counterwithin=subsubsection
]{subsubsubsection}
\subsubsubsection{Ein Unter-Unter-Unterabschnitt}
```

## Inhaltsverzeichnis

<b>1 Einführung</b>	<b>2</b>
1.1 Ein Abschnitt . . . . .	2
1.1.1 Ein Unterabschnitt . . . . .	2
1.1.1.1 Ein Unter-Unterabschnitt . . . . .	2
1.1.1.1.1 Ein Unter-Unter-Unterabschnitt . . . . .	2

## 7 Supported engines

### 7.1 METAPOST example

Needs the run sequence setting to get a pdf from the created dvi output. It is already internally defined.

```
defaultfont:="ptmr8r";
warningcheck:=0;

draw fullcircle shifted (0.5,0.6) xscaled 8cm yscaled 3.5cm
  withpen pencircle scaled 5bp withcolor red;
special( " /Times-Roman findfont 150 scalefont setfont " &
  " 0 10 moveto (MPost) false charpath clip stroke gsave 150 70 translate "
  &
  " 2 4 600 {dup 0 moveto 0 exch 0 exch 0 360 arc stroke} for grestore ");
```

## 7.2 plainTeX example

Needs the run sequence setting to get a pdf from the created dvi output. It is already internally defined.

\centerline{\bf Abstract}
\smallskip
{\narrower\noindent
The reconstruction conjecture states that the multiset of unlabeled
vertex-deleted subgraphs of a graph determines the graph, provided it
has at least 3 vertices. A version of the problem was first stated
by Stanis\l aw Ulam. In this paper, we show that the conjecture can
be proved by elementary methods. It is only necessary to integrate
the Lenkle potential of the Broglington manifold over the quantum
supervacillatory measure in order to reduce the set of possible
counterexamples to a small number (less than a trillion). A simple
computer program that implements Pipletti's classification theorem
for torsion-free Aramaic groups with symplectic socles can then
finish the remaining cases.}

\bigskip
\begin{section} 1. Introduction.

This is the start of the introduction.
```

voss-29.tex

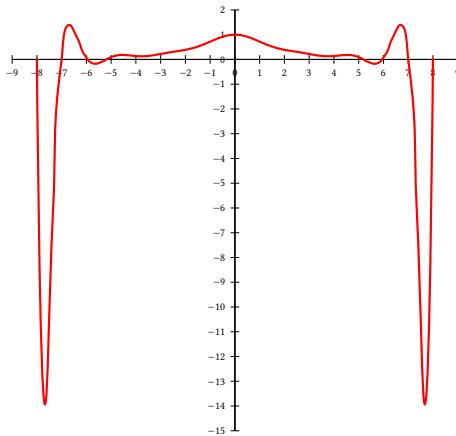

### 7.3 *Lua<sup>AT</sup>E<sub>X</sub>* example

With *Lua<sup>AT</sup>E<sub>X</sub>* and and using PostScript code the intermediate GhostScript run is not needed. The pdf is directly created.

```

## 8 Running external commands

Integrating the current directory of this document we can use the macro \runExtCmd with the optional argument redirect

```
\runExtCmd[redirect]{ls -la}{voss}
```

```
to get the directory listed:
```

```
total 4912
drwxr-xr-x  18 voss  staff      576 29 Aug 09:07 .
drwxr-xr-x 191 voss  staff    6112 27 Aug 17:55 ..
drwxr-xr-x   3 voss  staff      96 24 Apr  2022 .ctan

## 9 Other options

**vshift** A length for a vertical shift of the object, only valid for the inline mode. See document source of example on page 16.

**force=false** can speed up the comiling time for the document. If a created image/output already exists, there is no need to create it with the next run again and again. This option is not valid if the package option checkCode exists.

**cleanup** the auxiliary files of a L<sup>A</sup>T<sub>E</sub>X-run are deleted, preset to aux, log. It must be a comma seperated list of the extensions of the main file, s.g. cleanup={aux,log}.

**moveToExampleDir** move all examples into a directory, must be set *before* the option ExampleDir.

**ExampleDir** name of a directory for the examples, must first be created by the user himself.

**tclbox=false** Can be used if there are some negative interactions between package listings and package tcolorbox.

**framesep** Value for \fbox if keyword frame is used.

**mpsep** Distance between code and output (default 1 em).

**pagesep** Distance between pages for multipage output (default 1 em).

**verbose** Print control messages into the terminal and logfile.

**eps** create an eps from the pdf (historical).
