8 Running external commands	27
9 Other options	28

1 Loading the package

```
\usepackage[Option]{hvextern}
```

There exists only one option `checkCode` which is only valid for the use of `LuaATEX`. In this case an already existing external file will only be compiled, if the code changed. This doesn't depends on the setting of the option `force`. The package option will speed up the compilation time.

2 Syntax

This package allows to write external METAPOST, `TEX`, `ConTeXt`, `LATEX`, `LuaATEX`, `LuaATEX`, `XETEX`, `XQLATEX`, `Lua`, `Perl`, `Java` and/or `Python` source code, which will then be run via `shell escape` to create a PDF oder text output to include it into the main `LATEX` document.

There is only one environment and one command:

```
\begin{externalDocument}[<options>]{<external filename without extension>}  
...  
source code  
...  
\end{externalDocument}  
  
\runExtCmd[<options>]  
{<command with arguments>}  
{<external filename without extension>}
```

The main document *must* be run with the `-shell-escape` option, otherwise it won't work, e.g.:

```
lualatex --shell-escape <file>
```

The purpose for this package is to show the output of documents which have to be compiled with a different preamble or a different engine or a complete different system, but integrating the output automatically in the main document..

All examples in this document are created on-the-fly while running this `LATEX` document with `lualatex` with the `--shell-escape` option.

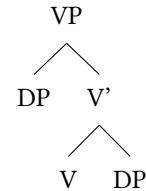

3 First examples

3.1 Without showing the code

This document was run with `LuaATEX`. Suppose you want to insert the output of a document which needs for several reasons a `XETEX` run. Instead of created and running a document outside of the main document and then to insert the output we can do this from within this `LuaATEX` document itself. The external document is compiled with `XETEX` and the output is insert as pdf image: 美好的一天.

Another example which needs a `pdflatex` run. The source code itself is also not shown by the environment `externalDocument`.

```
\begin{externalDocument}[
  compiler=pdflatex,force=false,cleanup]{voss
}
\documentclass[standalone]{%
  StartVisiblePreamble
  \usepackage{fontenc}
  \usepackage{libertinus}
  \usepackage[linguistics]{forest}
  \forestapplylibrarydefaults{linguistics,
    edges}
  StopVisiblePreamble
  \begin{document}
  \begin{forest}
  [VP
    [DP]
    [V
      [V]
      [DP]
    ]
  ]
  \end{forest}
  \end{document}
  \end{externalDocument}
```

3.2 Showing code and output of a Python example

The png image is created on the fly with the following arguments of `externalDocument`:

```
\begin{externalDocument}[
  compiler=python3,
  code,
  ext=py,
  docType=py,
  usefancyvrb,
  grfOptions={width=\linewidth}}{python}
... Python code ...
\end{externalDocument}
```

The code which is declared as header and main can be marked by:

```
\hv@extern@exampleType{py}
{\NumChar StartVisibleMain}
{\NumChar StopVisibleMain}
{\NumChar StartVisiblePreamble}
{\NumChar StopVisiblePreamble}
```

`\NumChar` is the default Python comment character # and needs to be saved with a different category, which is done internally by the package. The complete definition of the code is:

```
\begin{externalDocument}[
  compiler=python3,
  code,
```

```

ext=py,
force=false,
docType=py,
usefancyvrb,
grfOptions={width=\linewidth}{python}
import os
#StartVisiblePreamble
from PIL import Image
import subprocess
# drawing area (xa < xb and ya < yb)
xa = -0.1716
xb = -0.1433
ya = 1.022
yb = 1.044
maxIt = 1024 # iterations
imgx = 1000 # image size
imgy = 750
image = Image.new("RGB", (imgx, imgy))
#StopVisiblePreamble

#StartVisibleMain
for y in range(imgy):
    cy = y * (yb - ya) / (imgy - 1) + ya
    for x in range(imgx):
        cx = x * (xb - xa) / (imgx - 1) + xa
        c = complex(cx, cy)
        z = 0
        for i in range(maxIt):
            if abs(z) > 2.0: break
            z = z * z + c
        r = i % 4 * 6
        g = i % 8 * 32
        b = i % 16 * 16
        image.putpixel((x, y), b * 65536 + g * 256 + r)
#StopVisibleMain
# now get the filename created by the latex document
imageName = os.path.basename(os.path.splitext(__file__)[0])+".png" # get filename
image.save(imageName, "PNG")
\end{externalDocument}

```

And with using this code we get the image as png inserted. The given filename of the external document is internally extended by a consecutive number which isn't known to the Python code. However, it is no problem in any programming language to get the name of a running file. The forlast line in the above code shows how it can be done with Python.

```

from PIL import Image
import subprocess
# drawing area (xa < xb and ya < yb)
xa = -0.1716

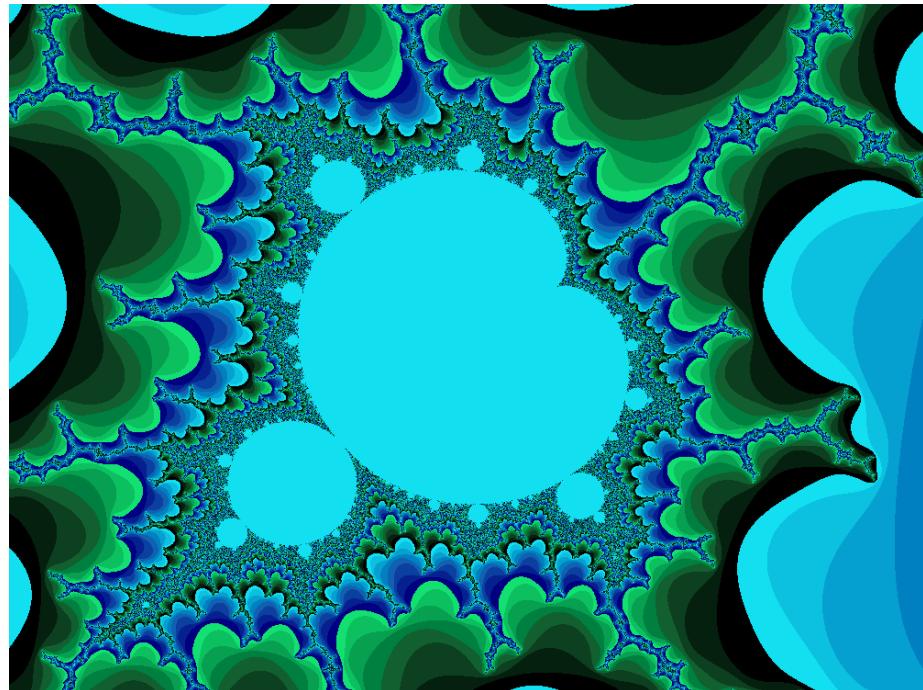

```

```

xb = -0.1433
ya = 1.022
yb = 1.044
maxIt = 1024 # iterations
imgx = 1000 # image size
imgy = 750
image = Image.new("RGB", (imgx, imgy))

for y in range(imgy):
    cy = y * (yb - ya) / (imgy - 1) + ya
    for x in range(imgx):
        cx = x * (xb - xa) / (imgx - 1) + xa
        c = complex(cx, cy)
        z = 0
        for i in range(maxIt):
            if abs(z) > 2.0: break
            z = z * z + c
        r = i % 4 * 6
        g = i % 8 * 32
        b = i % 16 * 16
        image.putpixel((x, y), b * 65536 + g * 256 + r)

```

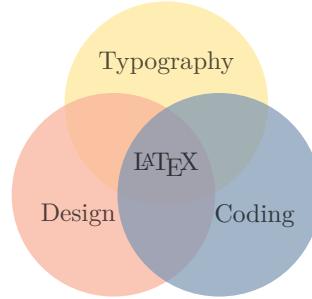

The external filename, extended by a consecutive number, can be printed in the margin by setting the keyword `showFilename`. In general it is printed in the outer margin or in `twocolumn` mode in the outer column. If the example is set in `twocolumn` mode but inside a starred floating environment over both column, then use the keyword `outerFN`. Then `hvextern` doesn't test for `twocolumn` mode.

A vertical shift of the filename is possible by setting a length to the keyword `shiftFN`, e.g. `shiftFN=5ex`.

```
\usepackage{tikz}
\usepackage[hks,pantone,xcolor]{xespotcolor}

\SetPageColorSpace{HKS}
\definecolor{HYellow}{spotcolor}{HKS05N,0.5}
\definecolor{HRed}{spotcolor}{HKS14N,0.5}
\definecolor{HBlue}{spotcolor}{HKS38N,0.5}
\begin{tikzpicture}[scale=0.7,fill opacity=0.7]
\fill[HYellow]( 90:1.2) circle (2);
\fill[HRed] ( 210:1.2) circle (2);
\fill[HBlue] ( 330:1.2) circle (2);
\node at ( 90:2) {Typography};
\node at ( 210:2) {Design};
\node at ( 330:2) {Coding};
\node {\LaTeX};
\end{tikzpicture}
```

4 Setting marker in the source

The marker for the code ranges which should be listed depend to the used programming language:

```
[...]
%StartVisiblePreamble
[... listed preamble code ]
%StopVisiblePreamble
[...]
\begin{document}
[...]
\end{document}
```

everything between `%StartVisiblePreamble` and `%StopVisiblePreamble` will be listed as preamble and in case of a `\LaTeX` source everything between `\begin{document}` and `\end{document}` as body. The marker must be defined with an own macro, e.g.:

```
\hv@extern@exampleType{py}
{\NumChar StartVisibleMain}
{\NumChar StopVisibleMain}
{\NumChar StartVisiblePreamble}
{\NumChar StopVisiblePreamble}
```

`\NumChar` is the comment character `#`, which needs a special handling. This version of `hvextern` supports the following programming languages (option `compiler`): `mpost`, `tex`, `latex`, `lualatex`, `python3`, `perl`, `lua`, `xetex`, `pdflatex`, `lualatex`, `xelatex`, and `context`. The default is `pdflatex`. The option `docType` selects the config file, which must be one of `context`, `lua`, `p1`, `tex`, `latex`, `mp`, and `py`. For Lua it is

```
\hv@extern@exampleType{lua}
{--StartVisibleMain}
```

```
{--StopVisibleMain}
{--StartVisiblePreamble}
{--StopVisiblePreamble}
```

It defines the marker strings for the listed code sequences. In some cases you have to use multiple times the same value for different optional arguments, e.g.

```
ext(lua, compiler(lua, docType(lua, ...
```

5 Optional arguments

The default setting is always shown in brackets.

5.1 Programs and runs

The progpath should only in some rare cases needed. In general all used compilers will be found by the system. A given progpath must be end with a slash, e.g. ./bin/

```
\define@key{hv}{progpath}[]{\def\hv@extern@progpath{\#1}}
\define@key{hv}{compiler}[pdflatex]{\def\hv@extern@compiler{\#1}}
\define@key{hv}{runsequence}[]{\def\hv@extern@runsequence{\#1}}
\define@key{hv}{runs}[1]{\setcounter{hv@extern@runs}{\#1}}
```

Instead of the optional arguments `compiler`, `biber`, and `xindex` one can define an individual command sequence by using the optional argument `runsequence`. It must be comma separated list:

```
runsequence={lualatex,biber,xindex -l de -c AU,lualatex,lualatex}
```

```
\usepackage[ngerman]{babel}
\usepackage{libertinus,hvindex}
\usepackage{makeidx}\makeindex
\usepackage{biblatex}\addbibresource{biblatex-examples.bib}

Sort with xindex \verb|-l DE --config AU|
\blindtext
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Österreich} \Index{Öresund}
\Index{Ödem} \Index{Oligarch} \Index{Oder}
\Index{Goldmann}
\printindex
\nocite{*}\printbibliography
\blindtext
\blindddocument
```

<p>Sort with <code>index -1 ne --conf fg</code>: <i>at This late ist ein Blaident</i> zum Testen von Testangaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Grauwert der Schrift an, da das wirklich so ist! Ich schreibe: „Dass ein Blaident“ oder „Blaident“ ist nicht falsch, aber es ist falsch. Ein Blaident bietet nur wichtige Informationen. An ihm messe ich die Lesbarkeit einer Schrift, ihre Ausnutzung, wie harmonisch die Figuren zusammenpassen, ob sie gut aussehen und so weiter.“ Ein Blaident sollte möglichst viele verschiedene Buchstaben enthalten und in der Originalsprache gesetzt sein. Er muss keinen Sinn ergreifen, sondern kann auch nur aus einem einzigen Wort bestehen. „ipsum“ dieses nicht dem eigentlichen Zweck, da sie eine falsche Ausnutzung vermuten. The following Java-program creates the Mandelbrot set as png image. The valid setting for the environment `externalDocument` is:

```
compiler=java,ext=java,docType=java,
```

```
public static int iterZahl(final double cx, final double cy, int maxIt,
    final double radius) {
    // bestimmt Anzahl der Iterationen
    int zaehler = 0;
    double zx = 0.0, zy = 0.0, tmp;
    do {
        tmp = zx*zx - zy*zy + cx;
        zy = 2*zx*zy + cy; zx = tmp;
        zaehler++;
    } while (zx*zx + zy*zy <= radius && zaehler < maxIt);
    return zaehler;
}

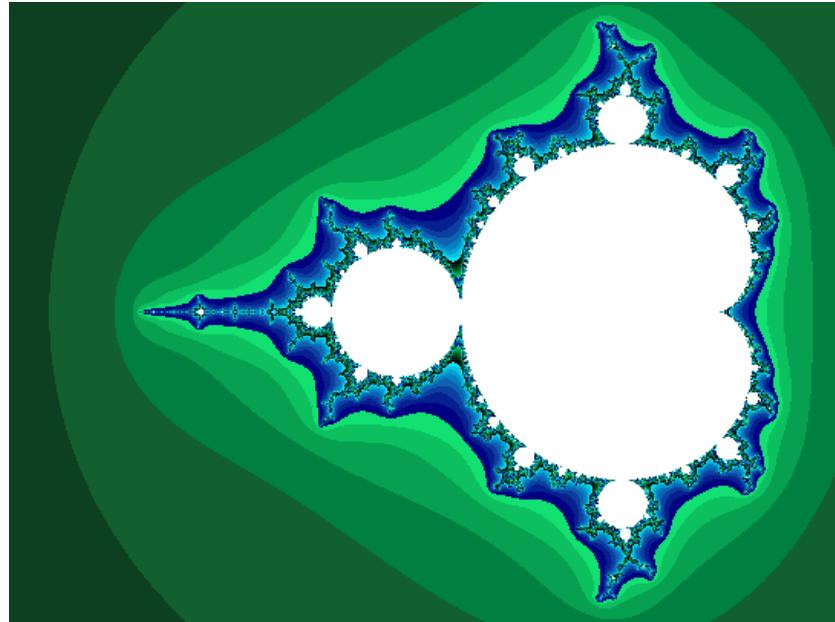

double xa = -2.5, xe = 0.7, ya = -1.2, ye = 1.2; // Ratio 20:15
double dx = (xe-xa)/(imageBreite-1), dy = (ye-ya)/(imageHoehe-1);
double cx, cy; int R, G, B;
double radius = 10.0; int maxIt = 1024;
cx = xa;
for (int sp = 0; sp < imageBreite; sp++) {
    cy = ye; // von oben nach unten
    for (int ze = 0; ze < imageHoehe; ze++) {
        int zIter = iterZahl(cx, cy, maxIt, radius);
        if (zIter == maxIt) {
            g.setColor(Color.WHITE);
            g.drawLine(sp, ze, sp, ze);
        } else {
            R = zIter % 4 * 6 ; G = zIter % 8 * 32; B = zIter % 16 * 16;
            g.setColor(new Color(R,G,B));
            g.drawLine(sp, ze, sp, ze);
        }
        cy = cy - dy;
    } // for ze
}
```

java-6.java

```

    cx = cx + dx;
} // for sp

```

5.2 Grafik options

```
\define@key{hv}{grfOptions}[]{\def\hv@extern@grfOptions{#1}}
```

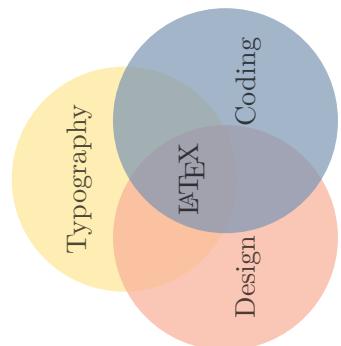

The option is passed to `\includegraphics`, e.g. `angle=90, width=\linewidth` for the following example.

```

vooss-7.tex
\usepackage{tikz}
\usepackage[hks,pantone,xcolor]{xespotcolor}

\SetPageColorSpace{HKS}
\definecolor{HYellow}{spotcolor}{HKS05N,0.5}
\definecolor{HRed}{spotcolor}{HKS14N,0.5}
\definecolor{HBlue}{spotcolor}{HKS38N,0.5}
\begin{tikzpicture}[scale=0.7, fill opacity
=0.7]
\fill[HYellow] ( 90:1.2) circle (2);
\fill[HRed] (210:1.2) circle (2);
\fill[HBlue] (330:1.2) circle (2);
\node at ( 90:2) {Typography};
\node at ( 210:2) {Design};
\node at ( 330:2) {Coding};
\node {\LaTeX};
\end{tikzpicture}

```

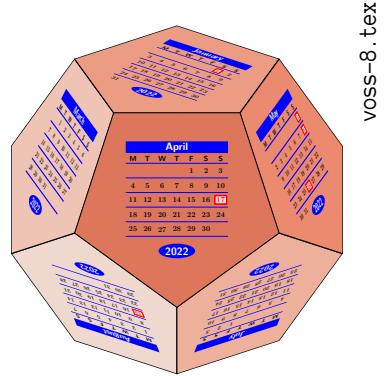

5.3 Listings options

```
\define@key{hv}{1stOptions}[]{\def\hv@extern@1stOptions{#1}}
```

The option is passed either to `\listinputlisting`, or, if `usefancyvrb` is active, to `\VerbatimInput`. The following example uses

```
1stOptions={basicstyle=\sffamily\itshape\scriptsize},
```

```
\usepackage{pst-calend}
\psscalebox{0.3}{%
\psCalDodecaeder[Year=2022,style=april]}
```

5.4 Background color

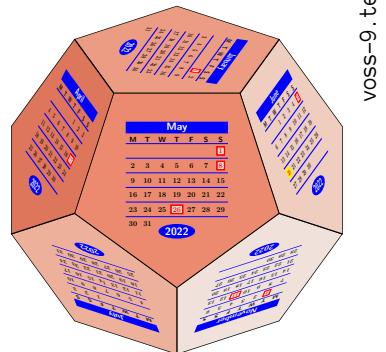

There are different colors for the preamble and body listing: the background and frame color.

```
\define@key{hv}{BGpreamble}[black12]{\def\hv@extern@BGpreamble{#1}}
\define@key{hv}{BGbody}[black8]{\def\hv@extern@BGbody{#1}}
\define@key{hv}{B0preamble}[black12]{\def\hv@extern@B0preamble{#1}}
\define@key{hv}{B0body}[black8]{\def\hv@extern@B0body{#1}}
```

The options are passed to `tcolorbox` and preset to `black!12` and `black!8`. The color of the frame is set to the same values, hence not seen. The following example uses

```
BGpreamble=red!10, B0preamble=red,
BGbody=blue!8, B0body=blue,
```

```
\usepackage{pst-calend}
\pscalebox{0.3}{%
\psCalDodecaeder[Year=2022,style=may]}
```

5.5 Type of the source code

The current version of hvextern supports code written as METAPOST, plain \TeX , \LaTeX , ConTeXt, and Python. Every type has its own keywords for the linerange which should be printed for the preamble and the body. For example the `latex` config is:

```

\hv@extern@exampleType{latex}%
for _all_LaTeX engines

{\string\begin{string}{document\string}}%
{\string\end{string}{document\string}}%
{\perCent StartVisiblePreamble}%
{\perCent StopVisiblePreamble}%

% only for the sequence latex->dvips->ps2pdf
\def\hv@extern@runLATEX#1#2#3#4{%
  % path compiler file extension
  \ifhv@extern@verbose \typeout{>>> running #1#2 #3#4}\fi
  \ShellEscape{#1#2\space #3#4}%
  \ifhv@extern@verbose \typeout{>>> running #1dvips #3}\fi
  \ShellEscape{#1dvips\space #3.dvi}%
  \ifhv@extern@verbose \typeout{>>> running ps2pdf #3.ps}\fi
  \ShellEscape{#1ps2pdf\space -dAutoRotatePages=/None\space -dALLOWPSTRANSparency\space #3.ps}%
}

```

If a source needs more than running the defined compiler, it must be defined by a macro

```
\def\hv@extern@run<NAME>#1#2#3#4{%
  \path #1;
  \compiler #2;
  \file #3;
  \extension #4;
```

The type of the source code can be different to the compiler, e.g. source `latex`, but compiler `lualatex`.

5.6 Output more than one page

The pages which should be printed can be defined by

```
\define@key{hv}{pages}[1]{\def\hv@extern@pages{#1}}
\define@key{hv}{pagessep}[1em]{\hv@extern@pagessep=#1}
\define@boolkey{hv}[hv@extern@]{frame}[true]{}
```

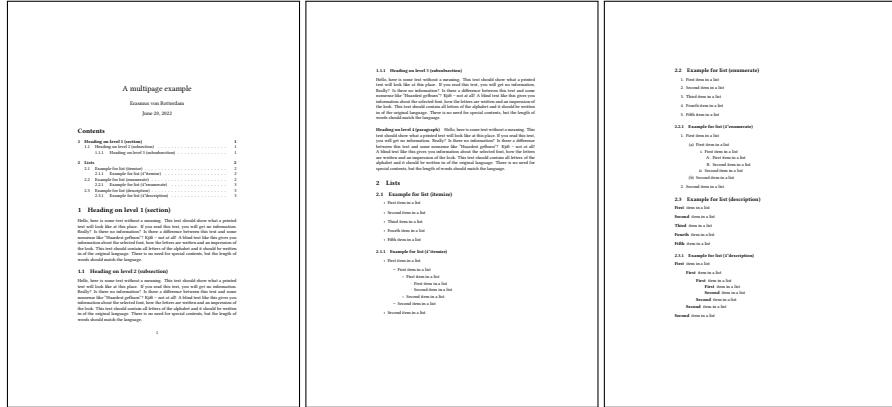

With `frame` the pages can be framed (internally by `\fbox`). It is left to the user to choose the correct image width for the pages. The separation between the pages is defined by the length `pagesep`. The following example uses:

```
pages={1,2,3},  
pagesep=2pt,  
grfOptions={width=0.3\linewidth},  
compiler=lualatex, runs=2, % for the TOC  
frame,
```

1

```
\usepackage[american]{babel}  
\usepackage{libertinus}  
\usepackage{blindtext}
```

```
\title{A multipage example}
\author{Erasmus von Rotterdam}
\maketitle
\tableofcontents
\blinddocument
```

5.7 Output as floating object with caption and label

By default the images are not inserted as a float. This can be changed by the keyword `float`, a caption and a label are optional. The float type is always `figure`.

```
\define@boolkey{hv}[hv@extern@]{float}[true]{}
\define@key{hv}{floatsetting}[]{\def\hv@extern@floatsetting{\#1}}
\define@key{hv}{caption}[]{\def\hv@extern@caption{\#1}}
\define@key{hv}{label}[]{\def\hv@extern@label{\#1}}
```

The image Figure 1 shows an example for a floating object, which uses the floatsetting `!htb`, which is the default. Using a caption and a label are optional.

```
\usepackage{pst-coxeterp}

\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=2]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=3]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=5]\end{pspicture}
\begin{pspicture}(-1,-1)(1,1)\Simplex[dimension=7]\end{pspicture}
```

voss-11.tex

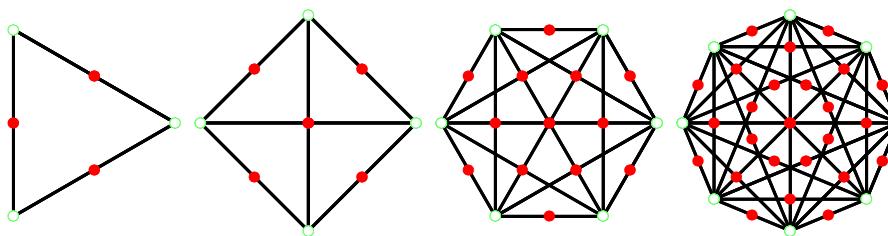

Abbildung 1: An example for Coxeter images

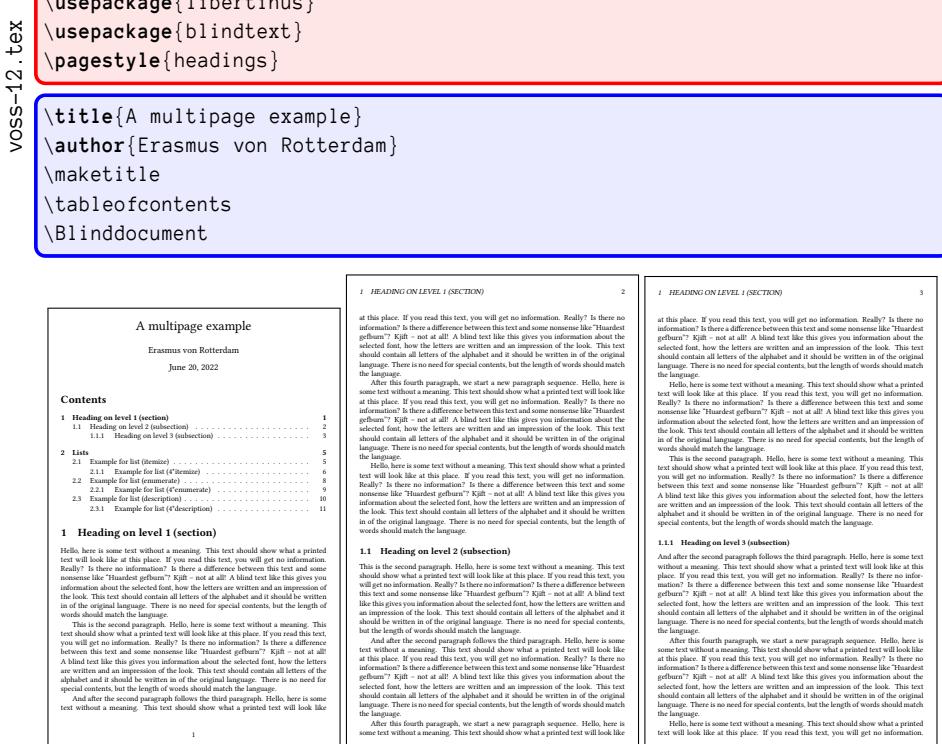

5.8 Cropping the PDF

Instead of using the documentclass `standalone`, which already crops the created PDF, one can use the optional argument `crop`.

```
\define@boolkey{hv}{hv@extern@}[crop][true]{}%
\define@key{hv}{cropmargin}[2]{\def\hv@extern@cropmargin{\#1}}% length in pt
```

It is also possible to crop a document with more than one page. In this case the beginning and end of the pages should be on the same height. Otherwise the pages will have different heights after cropping (see next image). The following example was created with

```
pages={1,2,3},
pagesep=2pt,
grfOptions={width=0.3\linewidth},
compiler=lualatex, runs=2, % for the TOC
frame,
crop, cropmargin=5,%      5pt margin
```

5.9 Code and output side by side

By default the code and the output is on top of each other. With setting the width of a minipage with `mpwidth` greater than 0 pt the output will be side by side.

```
\define@key{hv}{mpwidth}[0pt]{\setlength\hv@extern@mpwidth{\#1}}
\define@key{hv}{mpvalign}[0pt]{\def\hv@extern@mpvalign{\#1}}
```

`mpwidth` is the width of the code. The rest of the line, minus 1em for the space between the minipages, will be the possible width for the output and will be calculated automatically. The two minipages are aligned by defaults to its top. This can be changed by setting `mpvalign` to `c` or `b`.

5.10 Horizontal alignment of the output

```
align=\centering, % default
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\raggedright,
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\raggedleft,
```

```
\rule{0.5\linewidth}{5mm}
```

```
align=\centering, mpwidth=0.5\linewidth, % default for side by side
```

```
\rule{0.25\linewidth}{5mm}
```

```
align=\raggedright, mpwidth=0.5\linewidth,
```

```
\rule{0.25\linewidth}{5mm}
```

```
align=\raggedleft, mpwidth=0.5\linewidth,
```

```
\rule{0.25\linewidth}{5mm}
```

5.11 Inline images

By default code and image are own paragraphs. With the optional argument `inline` the created image can be part of the current line. This may make sense, if you need characters which are not part of your current font.

```
\define@boolkey{hv}[hv@extern@]{inline}[true]{%
  \hv@extern@codefalse
  \hv@extern@showFilenamefalse}
```

With the setting `inline=true` the optional keyword `code` and `showFilename` is automatically set to false. The next Chinese characters % 美好的一天 are inserted as inline image without showing the code. The complete code looks like:

```
With \Lkeyset{inline} the optional argument \Lkeyword{code} is
automatically set to false. The next Chinese characters
\begin{externalDocument}[
  compiler=xelatex, inline, runs=2, grfOptions={height=8pt},
  crop, cropmargin=0, cleanup, force=false, docType=latex]{voss}
\documentclass{ctexart}
\pagestyle{empty}
\begin{document}
\end{document}
\end{externalDocument}
are inserted as inline image without showing the code. The complete
code looks like:
```

5.12 Input text instead of an image

By default the created pdf which can be, of course, only text, will be inserted by `\includegraphics`. If you have only text as output and don't want to create a pdf you can insert this kind of output as verbatim text by setting `includegraphic=false`.

```
\define@boolkey{hv}[hv@extern@]{includegraphic}[true]{}
```

The textfile must have the same main filename with the extension `.txt`. As already mentioned, in every programming language you can get the current used filename from within the code itself. The following Perl example which calculates the Kaprekar constants uses

```
my $filename = $0;          # the current filename
$filename =~ s/\.pl//;      # without extension .pl
$filename = "${filename}.txt"; # for the output
```

Only for some completeness: a Kaprekar constant is a number A with $\max(A) - \min(A) = A$. \max and \min are the sorted digits of the number A : $495 = 954 - 459$.

```

my $zahl = 1;
my $anfang = 1;
my $ende = 9;

print $fh "Finding Kaprekarconstants ...\\n";
while ($zahl < 8) {
    print $fh "{$zahl}-stellig: ";
    foreach ($anfang...$ende) { # for every
        row $_
        @Zeichen = split(//,$_);
        $Min = join("",sort(@Zeichen));
        $Max = reverse($Min);

        $Dif=$Max-$Min;
        if($_ eq $Dif) {
            $found = 1;
            print $fh $_,", ";
        }
    }
    if (!$found) { print $fh "---\\n"; }
    else { print $fh "\\n"; }

    $found = false;
    $zahl = $zahl+1;
    $anfang = $anfang*10;
    $ende = $ende*10;
}

```

Finding Kaprekarconstants

...

1-stellig: ---

2-stellig:

3-stellig: 495,

4-stellig: 6174,

5-stellig:

6-stellig: 549945, 631764,

7-stellig:

voss-20.pl

Another example with running Lua to calculate and print the Pascal's triangle.
The internal filename is available with

```

local filename = arg[0]
local shortFN = str:match("(.+)%..+")
-- delete extension
outFile = io.open(shortFN..".txt","w+")
-- open external file

```

```

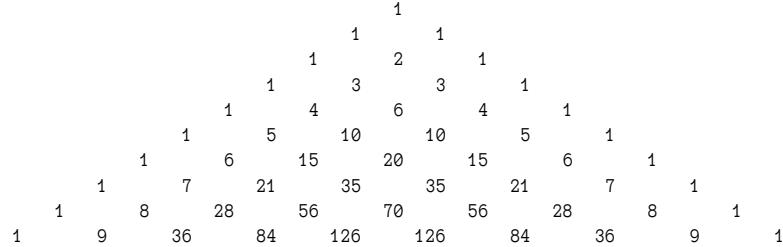

function nextrow(t)
    local ret = {}
    t[0], t[#t+1] = 0, 0
    for i = 1, #t do ret[i] = t[i-1] + t[i] end
    return ret
end

function triangle(n)
    t = {1}
    for i = 1, n do
        m = (n - i)
        for j = 1,m do outFile:write("      ") end
        for k = 1,i do outFile:write(string.format("%8s",t[k])) end
        outFile:write("\\n")
        t = nextrow(t)
    end
end

```

voss-21.lua

```
triangle(10)
```

5.13 Running additional external programs

For a L^AT_EX additional programs for bibliography, index, a.s.o. maybe needed.

```
\define@boolkey{hv}{hv@extern@}{biber}[true]{}
\define@boolkey{hv}{hv@extern@}{xindex}[true]{}
\define@key{hv}{xindexOptions}[]{\def\hv@extern@xindexOptions{\#1}}
\define@key{hv}{runsequence}[]{\def\hv@extern@runsequence{\#1}}
```

The biber run needs no additional options, but for xindex it maybe useful. The following examples uses

```
\begin{externalDocument}[
  compiler=lualatex, runs=2, pages=2, crop,
  xindex, xindexOptions={-l DE --config AU},
  mpwidth=0.6\linewidth, usefancyvrb=false,
  docType=latex,
  ...
]{voss}
```

voss-22.tex

```
\usepackage{makeidx}\makeindex
\usepackage{hvindex}
```

```
Sort with xindex \verb|-l DE --config AU|
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Österreich} \Index{Öresund}
\Index{Ödem} \Index{Oligarch} \Index{Oder}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Obstler} \Index{Öl} \Index{ölen}
\Index{Oder|seealso{Fluss}} \Index{Göbel}
\Index{oder} \index{Fluss!Oder}
\Index{Goethe} \Index{Göthe} \Index{Götz}
\Index{Goldmann}
\printindex
```

Index

F	Obstler, 1
Fluss	oder, 1
- Oder, 1	Oder, 1, <i>siehe auch</i> Fluss
G	Oligarch, 1
Goethe, 1	Ostern, 1
Goldmann, 1	Ö
Göbel, 1	Ödem, 1
Göthe, 1	Öl, 1
Götz, 1	Öresund, 1
O	Österreich, 1
Ober, 1	ö
Oberin, 1	ölen, 1

Instad of using the options compiler, biber, and xindex one can also use only the optional argument runsequence to define an individuell sequence of commands, e.g.:

```
runsequence={lualatex,biber,{xindex -l de -c AU},lualatex,lualatex}
```

```
\usepackage[ngerman]{babel}
\usepackage{libertinus,hvindex}
\usepackage{makeidx}\makeindex
\usepackage[biblatex]{biblatex}\addbibresource{biblatex-examples.bib}
```

```
\blindtext
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober} \Index{Oberin}
\Index{Österreich} \Index{Öresund}
\Index{Ödem} \Index{Oligarch} \Index{Oder}
\Index{Goldmann}
\printindex
\nocite{*}\printbibliography
\blindtext
\blinddocument
```

VOSS-23.tex

<p>Dies hier ist ein Blindtext zum Testen von Textausgaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Gewalt der Schrift an. Ist das wirklich so? Ist es gleichgültig, ob ich schreibe „Dies ist ein Blindtext“ oder „Hast du gestern“? Käff stimmt nicht mit dem Gewalt der Schrift überein. Ich kann nichts tun. An ihm messe ich die Lesbarkeit einer Schrift, ihre Ausnutzung, wie häufig sie die Figuren und Zeichen und phasen, wie bzw. auf welche Weise. Ein Blindtext sollte höchstens in verschiedenen Buchstaben enthalten und in der Originalsprache gesetzt sein. Er muss keinen Sinn ergeben, sollte aber lesbar sein. Freilich kann man einen Blindtext auch so setzen, dass er zu gewöhnlichen Zwecken dient, da sie eine falsche Annahme vermittelte. Kapitel 1

Einführung

1.1 Ein Abschnitt

1.1.1 Ein Unter-Unterabschnitt

1.1.1.1 Ein Unter-Unter-Unterabschnitt

Der normale Paragraph Dies hier ist ein Blödtext zum Testen von Textausgaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Grauwert der Schrift an. Ist das wirklich so? Ist es gleichgültig, ob ich schreibe „Dies ist ein Blödtext“ oder „Ja und gebraun?“ Kijk – raamchen! Ein Blödtext bietet mir wichtige Informationen. An ihm muss ich leicht erkennen, welche Schrift, ihre Ausmaßung, wie harmonisch die Figuren zusammenstehen und wie, wie breit oder schmal sie sind. Ein Blödtext sollte möglichst viele verschiedene Buchstaben enthalten und in der Originalsprache gesetzt sein. Er muss keinen Sinn ergeben, sollte aber lesbar sein. Fremdsprachige Texte wie „Lorem ipsum“ dienen nicht dem eigentlichen Zweck, da sie eine falsche Ausmaßung vermitteln.

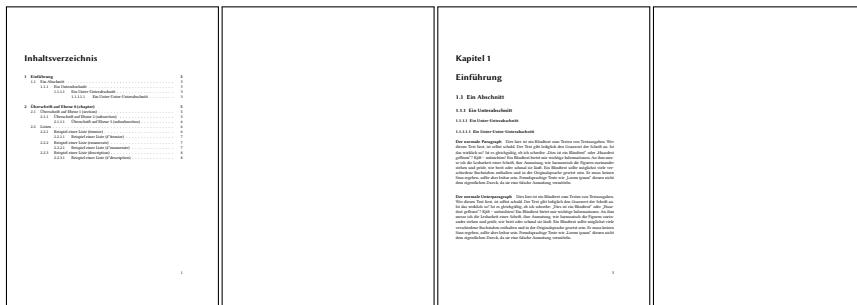

Der normale Unterparagraph Dies hier ist ein Blödtext zum Testen von Textausgaben. Wer diesen Text liest, ist selbst schuld. Der Text gibt lediglich den Grauwert der Schrift an. Ist das wirklich so? Ist es gleichgültig, ob ich schreibe „Dies ist ein Blödtext“ oder „Ja und gebraun?“ Kijk – raamchen! Ein Blödtext bietet mir wichtige Informationen. An ihm muss ich die Lesbarkeit einer Schrift, ihre Ausmaßung, wie harmonisch die Figuren zueinander stehen und prüfe, wie breit oder schmal sie sind. Ein Blödtext sollte möglichst viele verschiedene Buchstaben enthalten und in der Originalsprache gesetzt sein. Er muss keinen Sinn ergeben, sollte aber lesbar sein. Fremdsprachige Texte wie „Lorem ipsum“ dienen nicht dem eigentlichen Zweck, da sie eine falsche Ausmaßung vermitteln.

It also possible to use `\VerbatimInput` from package `fancyvrb`. In general it makes no difference using the optional argument `usefancyvrb` or not.

```
\documentclass[chapterprefix=on,parskip=half-,DIV=12,fontsize=12pt]{scrbook}
\DeclareNewSectionCommand[
  style=section,
  level=4,

5.15 Vertical space

```
\define@key{hv}{aboveskip}[\medskipamount]{%
    \setlength\hv@extern@aboveskip{#1}}
\define@key{hv}{belowpreambleskip}[\smallskipamount]{%
    \setlength\hv@extern@belowpreambleskip{#1}}
\define@key{hv}{belowbodyskip}[\smallskipamount]{%
    \setlength\hv@extern@belowbodyskip{#1}}
\define@key{hv}{belowskip}[\medskipamount]{%
    \setlength\hv@extern@belowskip{#1}}
```

aboveskip Vertical space *before* the environment `externalDocument` or the command
`\runExtCmd` (default `\medskipamount`)

belowpreambleskip Vertical space between preamble and body (default `\smallskipamount`)

belowbodyskip Vertical space between body and output (default `\smallskipamount`)

belowskip Vertical space *after* the environment `externalDocument` or the command
`\runExtCmd` (default `\medskipamount`)

5.16 No output

By default there is an image or text as output of the external run. In a case, where you are only interested in the code, which should be formatted in the same style as other examples, you can set `showoutput` to false.

```
\documentclass[chapterprefix=on,parskip=half-,DIV=12,fontsize=12pt]{scrbook}
\DeclareNewSectionCommand[
    style=section,
    level=4,
    beforeskip=-3.25ex plus -1ex minus -.2ex,
    afterskip=1.5ex plus .2ex,
    font=\normalsize,
    indent=0pt,
    counterwithin=subsubsection
]{subsubsubsection}

\tableofcontents
\chapter{Einführung}
\section{Ein Abschnitt}
\subsection{Ein Unterabschnitt}
\subsubsection{Ein Unter-Unterabschnitt}
\subsubsubsection{Ein Unter-Unter-Unterabschnitt}
\blindtext
```

6 Defining new marker

Suppose you do not want for a L^AT_EX document the complete body part between \begin{ and \end printed. In this case you can define own markers, e.g.:

```
\defMarkerType{ltx}
{\perCent StartVisibleBody}
{\perCent StopVisibleBody}
{\perCent StartVisiblePreamble}
{\perCent StopVisiblePreamble}
```

With this definition and the setting docType=ltx the last example looks like:

```
\DeclareNewSectionCommand[
  style=section,
  level=4,
  beforeskip=-3.25ex plus -1ex minus -.2ex,
  afterskip=1.5ex plus .2ex,
  font=\normalsize,
  indent=0pt,
  counterwithin=subsubsection
]{subsubsubsection}

\subsubsubsection{Ein Unter-Unter-Unterabschnitt}
```

\centerline{\bf Abstract}
\smallskip
{\narrower\noindent
The reconstruction conjecture states that the multiset of unlabeled
vertex-deleted subgraphs of a graph determines the graph, provided it
has at least 3 vertices. A version of the problem was first stated
by Stanis\l aw Ulam. In this paper, we show that the conjecture can
be proved by elementary methods. It is only necessary to integrate
the Lenkle potential of the Broglington manifold over the quantum
supervacillatory measure in order to reduce the set of possible
counterexamples to a small number (less than a trillion). A simple
computer program that implements Pipletti's classification theorem
for torsion-free Aramaic groups with symplectic socles can then
finish the remaining cases.}

Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.</p>	<p>5</p>	

8 Running external commands

Integrating the current directory of this document we can use the macro \runExtCmd with the optional argument redirect

\runExtCmd[redirect]\{ls -la\}\{voss\}

to get the directory listed:

9 Other options

force=false can speed up the comiling time for the document. If a created image/output already exists, there is no need to create it with the next run again and again. This option is not valid if the package option checkCode exists.

cleanup the auxiliary files of a L^AT_EX-run are deleted, preset to aux, log. It must be a comma seperated list of the extensions of the main file, s.g. cleanup={aux,log}.

copyToExampleDir name of a directory for the examples, must first be created by the user himself

ExamplesDir move all examples into a directory

tcolorbox=false Can be used if there are some negative interactions between package listings and package tcolorbox.

framesep Value for \fbox if keyword frame is used.

mpsep Distance between code and output (default 1 em).

pagesep Distance between pages for multipage output (default 1 em).

verbose Print control messages into the terminal and logfile.

eps create an eps from the pdf (historical).
