

# The `hyperxmp` package<sup>\*</sup>

Scott Pakin  
`scott+hyxmp@pakin.org`

September 24, 2020

## Abstract

`hyperxmp` makes it easy for an author to include XMP metadata in a PDF document produced by L<sup>A</sup>T<sub>E</sub>X. `hyperxmp` integrates seamlessly with `hyperref` and requires virtually no modifications to a document that already specifies document metadata through `hyperref`'s mechanisms.

## 1 Introduction

Adobe Systems, Inc. has been promoting XMP [5]—eXtensible Metadata Platform—as a standard way to include metadata within a document. The idea behind XMP is that it is an XML-based description of various document attributes and is embedded as uncompressed, unencoded text within the document it describes. By storing the metadata this way it is independent of the document's file format. That is, regardless of whether a document is in PDF, JPEG, HTML, or any other format, it is trivial for a program (or human) to locate, extract, and—using any standard XML parser—process the embedded XMP metadata.

As of this writing there are few tools that actually do process XMP. However, it is easy to imagine future support existing in file browsers for displaying not only a document's filename but also its title, list of authors, description, and other metadata.

**This is too abstract! Give me an example.** Consider a L<sup>A</sup>T<sub>E</sub>X document with three authors—Jack Napier, Edward Nigma, and Harvey Dent—named in the L<sup>A</sup>T<sub>E</sub>X source in the usual way: “`\author{Jack Napier \and Edward Nigma \and Harvey Dent}`”. With `hyperxmp`, the generated PDF file will contain, among other information, the following stanza of XMP code embedded within it:

```
<dc:creator>
  <rdf:Seq>
    <rdf:li>Jack Napier</rdf:li>
    <rdf:li>Edward Nigma</rdf:li>
```

---

<sup>\*</sup>This document corresponds to `hyperxmp` v5.5, dated 2020/09/24.

```

<rdf:li>Harvey Dent</rdf:li>
</rdf:Seq>
</dc:creator>
```

In the preceding code, the `dc` namespace refers to the Dublin Core schema, a collection of metadata properties. The `dc:creator` property surrounds the list of authors. The `rdf` namespace is the Resource Description Framework, which defines `rdf:Seq` as an ordered list of values. Each author is represented by an individual list item (`rdf:li`), making it easy for an XML parser to separate the authors' names.

Remember that XMP code is stored as *metadata*. It does not appear when viewing or printing the PDF file. Rather, it is intended to make it easy for computer applications to identify and categorize the document.

## 1.1 Supported metadata

`hyperxmp` knows how to embed all of the following types of metadata within a document:

- address of primary author (`Iptc4xmpCore:CreatorContactInfo.CiAdrExtadr`,  
`Iptc4xmpCore:CreatorContactInfo.CiAdrCity`,  
`Iptc4xmpCore:CreatorContactInfo.CiAdrRegion`,  
`Iptc4xmpCore:CreatorContactInfo.CiAdrPcode`, and  
`Iptc4xmpCore:CreatorContactInfo.CiAdrCtry`)
- author(s) (`dc:creator`)
- base URL for relative references (`xmp:BaseURL`)
- book edition (`prism:bookEdition`)
- copyright (`dc:rights` and `xmpRights:Marked`)
- date (`dc:date`, `xmp:CreateDate`, `xmp:ModifyDate`, and `xmp:MetadataDate`)
- DOI (`prism:doi`)
- email address(es) of primary author  
`(Iptc4xmpCore:CreatorContactInfo.CiEmailWork)`
- file format (`dc:format`)
- file name of main L<sup>A</sup>T<sub>E</sub>X source file (`dc:source`)
- file size in bytes (`prism:byteCount`)
- ISBN (`prism:isbn`)
- ISSN—both print (`prism:issn`) and electronic (`prism:elssn`)
- issue number of parent publication (`prism:number`)

- journal article version (jav:journal\_article\_version)
- keywords (pdf:Keywords and dc:subject)
- language used (dc:language)
- license URL (xmpRights:WebStatement)
- metadata writer (photoshop:CaptionWriter)
- page count (prism:pageCount)
- page range(s) (prism:pageRange)
- PDF version (pdf:PDFVersion)
- PDF-generating tool (pdf:Producer and xmp:CreatorTool)
- PDF/A version and conformance level (pdfaid:part and pdfaid:conformance)
- PDF/UA version (pdfuaid:part)
- PDF/X standard compliance (pdfxid:GTS\_PDFXVersion)
- position/title of primary author (photoshop:AuthorsPosition)
- publication name of parent publication (prism:publicationName)
- publisher of the document (dc:publisher)
- rendition variation of the document (xmpMM:RenditionClass)
- summary (dc:description)
- subtitle (prism:subtitle)
- telephone number(s) of primary author (Iptc4xmpCore:CreatorContactInfo.CiTelWork)
- title (dc:title)
- trapping of colors (pdf:trapped)
- type of document (dc:type)
- type of parent publication (prism:aggregationType)
- unique identifier for the document (dc:identifier)
- URL of the document (prism:url)
- URL(s) of the primary author (Iptc4xmpCore:CreatorContactInfo.CiUrlWork)
- UUID for the document (xmpMM:DocumentID)

<pre>\Title{Baking through the ages} \Author{A. Baker\sep C. Kneader} \Language{en-GB} \Keywords{cookies}\sep muffins}\sep cakes} \Publisher{Baking International}</pre>	<pre>\hypersetup{% pdftitle={Baking through the ages}, pdfauthor={A. Baker, C. Kneader}, pdflang={en-GB}, pdfkeywords={cookies, muffins, cakes}, pdfpublisher={Baking International}}</pre>
--	---

(a) `pdfx` (separate `.xmpdata` file)

(b) `hyperxmp` (main document)

Figure 1: Comparison of `pdfx` and `hyperxmp`

- UUID for the document instance (`xmpMM:InstanceID`)
- version identifier for the document (`xmpMM:VersionID`)
- volume number of parent publication (`prism:volume`)

More types of metadata may be added in a future release.

## 1.2 Comparisons with similar packages

**xmpincl** In short, `xmpincl` is more flexible but `hyperxmp` is easier to use. With `xmpincl`, the author manually constructs a file of arbitrary XMP data and the package merely embeds it within the generated PDF file. With `hyperxmp`, the author specifies values for various predefined metadata types and the package formats those values as XMP and embeds the result within the generated PDF file.

`xmpincl` can embed XMP only when running under `pdflatex` and only when in PDF-generating mode. `hyperxmp` additionally works with a few other PDF-producing `LATeX` backends.

`hyperxmp` and `xmpincl` can complement each other. An author may want to use `hyperxmp` to produce a basic set of XMP code, then extract the XMP code from the PDF file with a text editor, augment the XMP code with any metadata not supported by `hyperxmp`, and use `xmpincl` to include the modified XMP code in the PDF file.

**pdfx** The main difference between `hyperxmp` and `pdfx` is that `hyperxmp` tries to integrate as seamlessly as possible into an existing document. It leverages `hyperref`'s `\hypersetup` command and many of `\hypersetup`'s options and defines its own options in a compatible manner. In contrast, `pdfx` requires the user to create a separate `\jobname.xmpdata` file containing `pdfx`-defined commands for each metadata element.

Figure 1 adapts an example appearing in the `pdfx` manual to `hyperxmp`. The two are comparable line-by-line in terms of how one specifies the title, author, document language, keywords, and publisher. However, `hyperxmp` implicitly writes a wealth of additional metadata into the XMP packet such as the document date, creation date, creator tool, file format, PDF version, and unique document and

instance IDs. In fact, if a document omits all of the code shown in Figure 1(b), it will still store the `\title` and `\author` data in the XMP packet.

One can therefore summarize the difference between `hyperxmp` and `pdfx` as follows: `pdfx` requires the author to be fully explicit about the document’s metadata while `hyperxmp` allows some metadata to be specified implicitly, automatically inferring it when possible. In general, `hyperxmp` tries to simplify the author’s task as much as possible.

## 2 Usage

`hyperxmp` works by postprocessing some of the package options honored by `hyperref`. To use `hyperxmp`, merely put a `\usepackage{hyperxmp}` in your document’s preamble. That line can appear anywhere before the `hyperref` PDF options are specified (i.e., with either `\usepackage[...]{hyperref}` or `\hypersetup{...}`). `hyperxmp` will construct its XMP data using the following `hyperref` options:

- `baseurl`
- `pdfauthor`
- `pdfcreationdate`
- `pdfkeywords`
- `pdflang`
- `pdfmoddate`
- `pdfproducer`
- `pdftitle`
- `pdftrapped`
- `pdfsubject`

`hyperxmp` instructs `hyperref` also to accept the following options, which have meaning only to `hyperxmp`:

- `pdfaconformance`
- `pdfapart`
- `pdfauthortitle`
- `pdfbookedition`
- `pdfbytes`
- `pdfcaptionwriter`
- `pdfcontactaddress`
- `pdfcontactcity`
- `pdfcontactcountry`
- `pdfcontactemail`
- `pdfcontactphone`
- `pdfcontactpostcode`
- `pdfcontactregion`
- `pdfcontacturl`
- `pdfcopyright`
- `pdfdate`
- `pdfdocumentid`
- `pdfdoi`
- `pdfeissn`
- `pdfidentifier`
- `pdfinstanceid`
- `pdfisbn`
- `pdfissn`
- `pdfissuenum`
- `pdflicenseurl`
- `pdfmetadate`
- `pdfmetalang`
- `pdfnumpages`
- `pdfpagerange`
- `pdfpublication`
- `pdfpublisher`
- `pdfpubstatus`
- `pdfpubtype`
- `pdfrendition`
- `pdfsource`
- `pdfsubtitle`

- `pdftype`
- `pdfuapart`
- `pdfurl`
- `pdfversionid`
- `pdfvolumenum`
- `pdfxstandard`

## 2.1 Option descriptions

`pdftitle` The document title is specified as normal for `hyperref` with `pdftitle`, but see Note 7 on page 16 for instructions on how to specify a title in multiple languages. If `pdftitle` is not specified it will inherit its value from the document's `\title`. `hyperxmp` introduces a complementary `pdfsubtitle` option:

```
pdftitle={Frankenstein},
pdfsubtitle={The Modern Prometheus},
```

Unfortunately, the subtitle can appear in only one language. It assumed to be the same language as the document language (`pdflang`) but can be overridden by preceding the text with a bracketed ISO 639-1 two-letter language code and an optional ISO 3166-1 two-letter region code. See the example below for `pdfpublication`.

`hyperref`'s `pdfauthor` option specifies the document's author(s). See Note 4 on page 15 for a discussion of the correct syntax. If `pdfauthor` is not specified it will inherit its value from the document's `\author`. `pdfauthortitle` indicates the primary author's position or title. `pdfcaptionwriter` specifies the name of the person who added the metadata to the document.

The next eight items describe how to contact the person or institution responsible for the document (the “contact”). `pdfcontactaddress` is the contact's street address and can include the institution name if the contact is an institution; `pdfcontactcity` is the contact's city; `pdfcontactcountry` is the contact's country; `pdfcontactemail` is the contact's email address (or multiple, comma-separated email addresses); `pdfcontactphone` is the contact's telephone number (or multiple, comma-separated telephone numbers); `pdfcontactpostcode` is the contact's postal code; `pdfcontactregion` is the contact's state or province; and `pdfcontacturl` is the contact's URL (or multiple, comma-separated URLs).

`pdfcopyright` defines the copyright text, and `pdflicenseurl` identifies a URL that points to the document's license agreement.

`pdfmetalang` indicates the natural language in which certain metadata—specifically, the document's title, subject, and copyright statement—are written. The language should be specified using an IETF language tag [11], for example, “`en`” for English, “`en-US`” for specifically United States English, “`de`” for German, and so forth. If `pdfmetalang` is not specified, `hyperxmp` assumes the metadata language is the same as the document language (`hyperref`'s `pdflang` option). If neither `pdfmetalang` nor `pdflang` is specified, `hyperxmp` uses only “`x-default`” as the metadata language.

XMP can include a universally unique identifier (UUID) for each document and for each instance of a given document. By default, `hyperxmp` assigns a version 4 (i.e., pseudorandom) UUID [12] for each of these. However, a document can

<code>pdfinstanceid</code>	alternatively specify a particular document identifier using <code>pdfdocumentid</code> and (not normally recommended) a particular instance identifier using <code>pdfinstanceid</code> . These should be of the form <code>uuid:xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx</code> , where “ <i>x</i> ” is a lowercase hexadecimal number. For example, <code>uuid:53ab7f19-a48c-5177-8bb2-403ad907f632</code> is a valid argument to <code>pdfdocumentid</code> (or <code>pdfinstanceid</code> ). See Leach, Mealling, and Salz’s <code>UUID</code> specification document for details on how to produce the various forms of <code>UUIDs</code> [12]. A more freeform mechanism than <code>pdfinstanceid</code> for versioning documents is available via <code>pdfversionid</code> . The version specified by <code>pdfversionid</code> can be incremented as 1, 2, 3, ...; identified with a hierarchical numbering scheme (e.g., this document is versioned 5.5 to match the package version); or labeled using any other approach. One possibility is to use a revision number or commit hash from the version-control software maintaining the document. For example, the <code>\gitVer</code> macro from the <code>gitver</code> package is an expandable (see Note 8 on page 17) version of the current Git hash that can suitably be passed to <code>pdfversionid</code> . If not specified, <code>pdfversionid</code> defaults to 1.
<code>pdfisbn</code> <code>pdfissn</code> <code>pdfeissn</code> <code>pdfdoi</code>	Already-published documents can be identified in a number of ways. <code>pdfisbn</code> specifies the ISBN. <code>pdfissn</code> refers to the ISSN of the <i>print</i> version of the document while <code>pdfeissn</code> refers to the ISSN of the <i>electronic</i> version of the document. <code>pdfdoi</code> specifies the DOI and should include only the DOI name without any URL prefix. For example, specify <code>pdfdoi={10.1145/3149526.3149532}</code> , <i>not</i> <code>pdfdoi={https://doi.org/10.1145/3149526.3149532}</code> . <code>pdfurl</code> points to the complete URL for the document. In contrast, <code>baseurl</code> points one level up and is used to resolve relative URLs.
<code>pdfidentifier</code>	<code>pdfidentifier</code> provides an alternative mechanism to uniquely identify a document. Its advantage relative to <code>pdfisbn</code> , <code>pdfissn</code> , <code>pdfdoi</code> , etc. is its flexibility; any of a wide variety of identification types can be used. <sup>1</sup> <code>pdfidentifier</code> ’s disadvantage is that it allows only a single identifier per document. For example, a document could use <code>pdfidentifier=urn:iso:std:32000:ed-1:v1:en</code> to identify itself as version 1 of English-language ISO standard 32000-1, but then this same document could not also use <code>pdfidentifier</code> to identify itself by DOI ( <code>info:doi:...</code> ), ISBN ( <code>urn:ISSN:...</code> ), etc. (It can still use the options described in the previous paragraph, though.) If <code>pdfidentifier</code> is not specified explicitly, <code>hyperxmp</code> will use the first non-empty value out of the DOI, electronic ISSN, print ISSN, and ISBN or skip the identifier entirely if all of those are empty.
<code>pdfpublication</code>	Already-published documents can further be identified by the publication in which they appear. <code>pdfpublication</code> specifies the title of the journal, magazine, or other parent document. The title language is assumed to be the same as the document language ( <code>pdflang</code> ) but can be overridden by preceding the text with a bracketed ISO 639-1 two-letter language code and an optional ISO 3166-1 two-letter region code. For example, <code>pdfpublication={[fr]Charlie Hedbo}</code> indicates a French-language title. Were the language or pronunciation differences significant, <code>fr-FR</code> would indicate specifically the French spoken in France, as opposed to that spoken in, say, Canada ( <code>fr-CA</code> ) or Belgium ( <code>fr-BE</code> ). The publisher itself can be

<sup>1</sup>See, for example, <https://www.iana.org/assignments/urn-namespaces/urn-namespaces.xhtml> for the `urn:` URI scheme and <http://info-uri.info/registry/> for the `info:` URI scheme.

Table 1: Valid arguments for `pdftpubstatus`

Value	Meaning
AO	Author's Original
SMUR	Submitted Manuscript Under Review
AM	Accepted Manuscript
P	Proof
VoR	Version of Record
CVoR	Corrected Version of Record
EVoR	Enhanced Version of Record

`pdfpublisher` named using `pdfpublisher`.

`pdftpubtype` indicates the type of publication in which the document was published. This should be one of the PRISM aggregation types [9] such as `book`, `journal`, `magazine`, `manual`, `report`, or `whitepaper`.

`pdfvolumenum` For publications in journals, magazines, and similar periodicals, a document can specify the volume number with `pdfvolumenum` and the issue number within the volume with `pdfissuenum`. `pdfpagerange` indicates the page numbers at which the document appears within the publication. The intention is that this be a comma-separated list of dash-separated ranges, as in `pdfpagerange={1,4-5}`. See Note 9 on page 17 for advice on how to assign `pdfpagerange` semi-automatically. A journal article's publication status can be indicated with `pdftpubstatus`. This option expects to take one of the values listed in Table 1. See the NISO/ALPSP Journal Article Versions recommendation [1] for an explanation of each of those values and when to use them.

`pdfbookedition` For books, `pdfbookedition` names the edition of the book. This is specified as text, not a number. As with `pdfpublication` (above), `pdfbookedition` accepts a bracketed language code, as in `pdfbookedition={[en]}Second edition`.

`pdfdate` XMP metadata can include a number of dates (in fact, timestamps, as they include both date and time components). `pdfdate` specifies the document date. It is analogous to the L<sup>A</sup>T<sub>E</sub>X `\date` command, and, like `\date`, defaults to the date the document was built. It must be specified in either XMP format [5] or PDF format [4]. XMP dates are written in the form YYYY-MM-DDThh:mm:ss+TT:tt.<sup>2</sup> A W3C recommendation [15] discusses this format in more detail, but as an example, 14 hours, 15 minutes, 9 seconds past midnight U.S. Mountain Daylight Time (UTC-6) on the 23rd day of September in the year 2014 should be written as 2014-09-23T14:15:09-06:00. This can be truncated (with loss of information) to 2014-09-23T14:15:09, 2014-09-23T14:15, 2014-09-23, 2014-09, or 2014 but no other subsets. PDF dates are written in the form D:YYYYMMDDhhmmss+TT'tt'. The same date in the preceding example would be written as D:20140923141509-06'00' in PDF format.

The document's creation date, modification date, and metadata date are

<sup>2</sup>Although allowed by XMP, `hyperxmp` does not currently accept fractions of a second in timestamps.

pdfcreationdate	normally set automatically, but <code>pdfcreationdate</code> , <code>pdfmoddate</code> , and <code>pdfmetadata</code> can be used to override the defaults. Like <code>pdfdate</code> , <code>pdfmetadata</code> can be specified in either XMP or PDF format. However, because <code>hyperref</code> defines <code>pdfcreationdate</code> and <code>pdfmoddate</code> and expects these to be written as PDF dates, <code>hyperxmp</code> concomitantly accepts these two dates only in PDF format as well. Note that it's rare that a document would need to specify any of <code>pdfcreationdate</code> , <code>pdfmoddate</code> , or <code>pdfmetadata</code> .
pdftype	<code>pdftype</code> describes the type of document being produced. This refers to “the nature or genre of the resource” [5] such as <code>poem</code> , <code>novel</code> or <code>working paper</code> , as opposed to the file format (always <code>application/pdf</code> when generated by <code>hyperxmp</code> ). Although <code>pdftype</code> can be assigned an arbitrary piece of text, the XMP specification recommends selecting types from a “controlled vocabulary” such as the DCMI Type Vocabulary [6]. The DCMI Type Vocabulary currently consists of only <code>Collection</code> , <code>Dataset</code> , <code>Event</code> , <code>Image</code> , <code>InteractiveResource</code> , <code>MovingImage</code> , <code>PhysicalObject</code> , <code>Service</code> , <code>Software</code> , <code>Sound</code> , <code>StillImage</code> , and <code>Text</code> . <code>pdftype</code> defaults to <code>Text</code> , which refers to “books, letters, dissertations, poems, newspapers, articles, archives of mailing lists,” [6] and other forms of text—all things L <sup>A</sup> T <sub>E</sub> X is commonly used to typeset.
pdfrendition	Sometimes a base document is rendered in different forms. <code>pdfrendition</code> indicates the particular rendition the current document instance represents. The value should come from the following controlled vocabulary [5]: <code>default</code> , <code>draft</code> , <code>low-res</code> , <code>proof</code> , <code>screen</code> , and <code>thumbnail</code> . <code>hyperxmp</code> 's default value is <code>default</code> , which indicates the master document, unless the <code>draft</code> option is passed to <code>\documentclass</code> , in which case <code>hyperxmp</code> defaults to <code>draft</code> .
pdftrapped	<code>hyperxmp</code> honors <code>hyperref</code> 's <code>pdftrapped</code> option. A document can indicate whether it employs color trapping by specifying <code>pdftrapped=True</code> or <code>pdftrapped=False</code> . ( <code>pdftrapped=Unknown</code> is also allowed.)
pdfapart pdfaconformance	<code>pdfapart</code> and <code>pdfaconformance</code> , are used in conjunction with <code>hyperref</code> 's <code>pdfa</code> option to claim a particular PDF/A standard by which the document abides. They default to <code>pdfapart=1</code> and <code>pdfaconformance=B</code> , indicating the PDF/A-1b standard. These can be changed (with caution) to assert that the document abides by a different standard (e.g., PDF/A-2u). A document that conforms to the PDF/UA standard can use <code>pdfuapart</code> to indicate the PDF/UA conformance level. For example, <code>pdfuapart=1</code> asserts that the document respects PDF/UA-1. <code>pdfxstandard</code> indicates the particular PDF/X standard by which the document abides. Unlike <code>pdfapart</code> and <code>pdfaconformance</code> , which accept a number and a letter, respectively, <code>pdfxstandard</code> expects a textual identification of a standard name. The following are the acceptable PDF/X standard names as of at the time of this writing.
pdfuapart pdfxstandard	<ul style="list-style-type: none"> <li>• PDF/X-1a:2001</li> <li>• PDF/X-1a:2003</li> <li>• PDF/X-3:2002</li> <li>• PDF/X-3:2003</li> <li>• PDF/X-4</li> <li>• PDF/X-4p</li> </ul>

For example, one can specify `pdfxstandard={PDF/X-4}` or `pdfxstandard={PDF/X-3:2003}`, but specifying `pdfxstandard={PDF/X-3}` will not pass PDF/X validation. Note that at the time of this writing the use of the PDF/X-4p, PDF/X-5n, and PDF/X-5pg standards has not been tested.

### Rarely needed options

- pdfsource** pdfsource overrides the name of the L<sup>A</sup>T<sub>E</sub>X source file. It defaults to `\jobname.tex` but can be replaced by any other string. If `pdfsource` is given an empty argument, no document source will be specified at all.
- pdfnumpages** The number of pages in the published, print version of the document can be expressed with `pdfnumpages`. This is computed automatically when the document is built using either pdfl<sup>A</sup>T<sub>E</sub>X or LuaL<sup>A</sup>T<sub>E</sub>X.
- pdfbytes** The `pdfbytes` option expresses the document's file size in bytes. The intention is for this to be used to display an estimate of download time to a user or to serve as a quick check on whether a file was transmitted correctly between systems. `pdfbytes` is computed automatically by both pdfl<sup>A</sup>T<sub>E</sub>X and LuaL<sup>A</sup>T<sub>E</sub>X, using the file size from the previous build of the document.

It is usually more convenient to provide values for all of the options presented in this section using `hyperref`'s `\hypersetup` command than on the `\usepackage` command line. See the `hyperref` manual for more information.

## 2.2 A complete example

The following is a sample L<sup>A</sup>T<sub>E</sub>X document that provides values for most of the metadata options that `hyperxmp` recognizes:

```
\documentclass{article}
\usepackage[utf8]{inputenc}
\usepackage{hyperxmp}
\usepackage[unicode]{hyperref}

A profound formal difference exists between the theoretical
concepts that physicists have formed about gases and other
ponderable bodies, and Maxwell's theory of electromagnetic
processes in so-called empty space\ldots
\end{document}

```

Compile the document to PDF using any of the following approaches:

- pdf<sup>L</sup>A<sub>T</sub>E<sub>X</sub>
- Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub>
- X<sub>E</sub><sup>L</sup>A<sub>T</sub>E<sub>X</sub>
- L<sup>A</sup>T<sub>E</sub>X + Dvipdfm
- L<sup>A</sup>T<sub>E</sub>X + Dvips + Adobe Acrobat Distiller

Unfortunately, the L<sup>A</sup>T<sub>E</sub>X + Dvips + Ghostscript path doesn't work. Ghostscript bug report #690066, closed with "WONTFIX" status on 2012-05-28, explains that Ghostscript doesn't honor the **Metadata** tag needed to inject a custom XMP packet. Instead, Ghostscript fabricates an XMP packet of its own based on the metadata it finds in the PDF file's **Info** dictionary (**Author**, **Title**, **Subject**, and **Keywords**).

Once the document is compiled, the resulting PDF file will contain an XMP packet that looks something like that shown in Appendix A. Figure 2 is a screenshot of the XMP metadata as it appears in Adobe Acrobat's "Advanced" metadata dialog box. Further clicking on the "Advanced" item within that dialog box displays all of the document's metadata sorted by schema as shown in Figure 3.

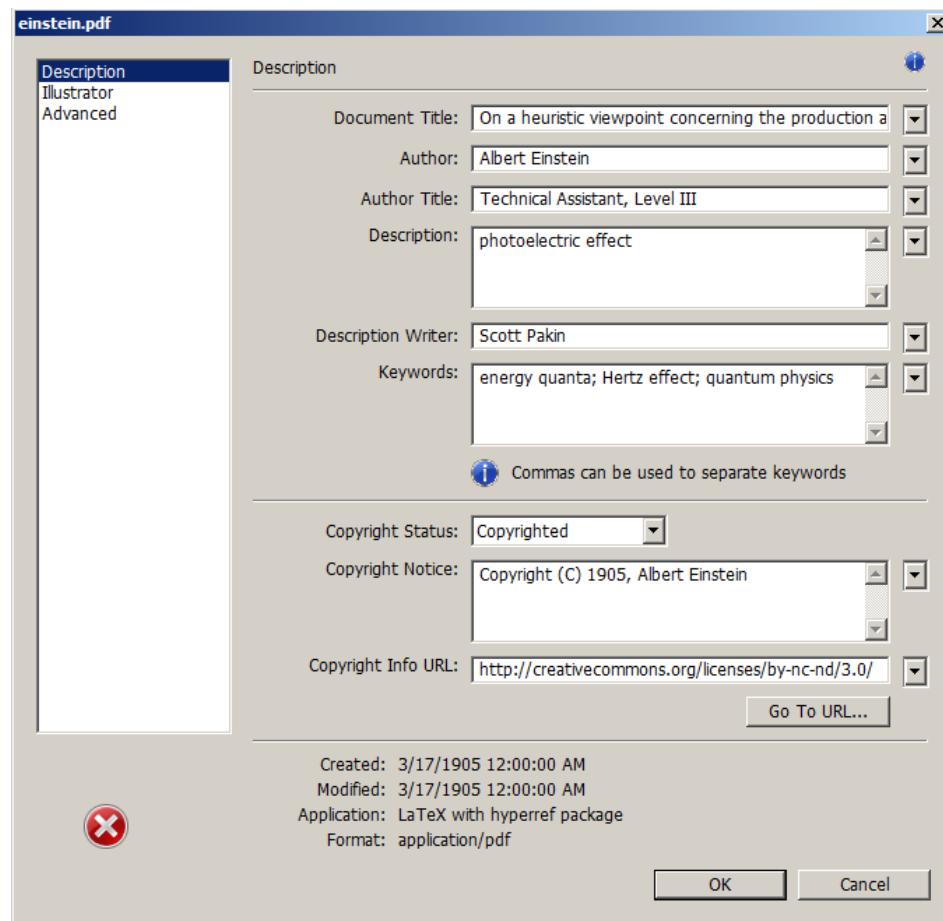

Figure 2: XMP metadata as it appears in Adobe Acrobat

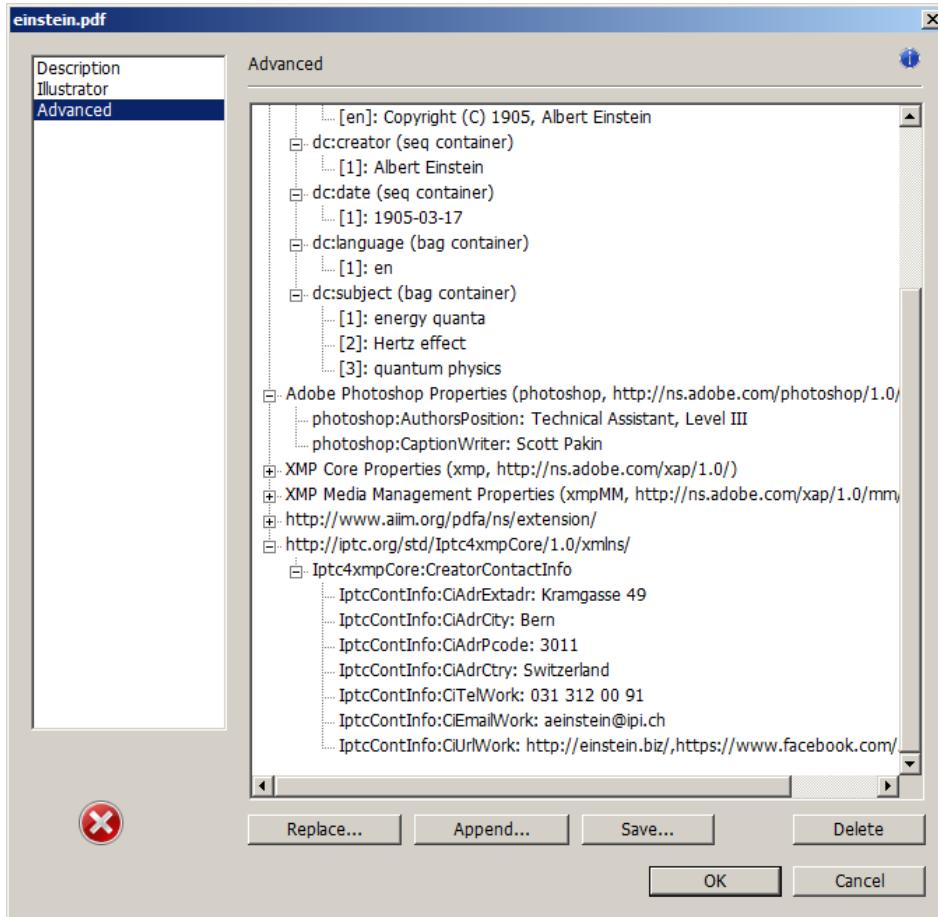

Figure 3: Additional XMP metadata as it appears in Adobe Acrobat

### 2.3 Usage notes

**Note 1: Conflicting metadata in PDF/A documents** A PDF file includes an Info dictionary containing Author, Title, Subject, and Keywords keys. The hyperref package's pdfauthor, pdftitle, pdfsubject, and pdfkeywords options assign values to those keys. The hyperxmp package additionally uses those options to assign values to various XMP metadata: dc:creator, dc:title, dc:description, and pdf:Keywords. The PDF/A specification indicates that values that appear in both the PDF Info dictionary and XMP packet must match. The problem is that in XMP, the author and keywords can be proper lists, as in

```

<dc:creator>
  <rdf:Seq>
    <rdf:li>Curly Howard</rdf:li>
    <rdf:li>Larry Fine</rdf:li>
    <rdf:li>Moe Howard</rdf:li>
  </rdf:Seq>
</dc:creator>

```

while in PDF, the author and keywords are specified as flat strings. Alas, there is no definition of how a list should be collapsed to a flat string: “Curly Howard, Larry Fine, Moe Howard” or “Curly Howard; Larry Fine; Moe Howard” or something else. I have not yet found a form of flat string that passes all PDF/A validators. Furthermore, when Adobe Acrobat—at least Adobe Acrobat DC (2019) and earlier versions—converts a PDF file to PDF/A format, it does so by discarding all but the first author, which is an unsatisfying solution.

`keeppdfinfo`

Starting with version 4.0, `hyperxmp`’s solution is to suppress writing metadata to the PDF `Info` dictionary and write it only to the XMP packet. (`hyperxmp` v5.0+ is more sophisticated. It suppresses only the author and keyword lists.) This appears to pacify PDF/A validators yet retains the author and keyword lists in their non-truncated form. If desired, the `Info` dictionary can be retained by passing the `keeppdfinfo` option to `\hypersetup`.

`\xmplinesep`

**Note 2: Acrobat multiline-field bug** The IPTC Photo Metadata schema states that “the [contact] address is a multiline field” [10]. `hyperxmp` converts commas in `pdfcontactaddress`’s argument to line breaks in the generated XML. Unfortunately, A bug in Adobe Acrobat—at least in Adobe Acrobat DC (2019) and earlier versions—causes that PDF reader to discard line breaks in the contact address. Interestingly, Adobe Illustrator CS5 correctly displays the contact address. If you find Adobe Acrobat’s behavior bothersome, you can redefine the `\xmplinesep` macro as a string to use as an address-line separator. For example, the following replaces all commas appearing in `pdfcontactaddress`’s argument with semicolons:

```
\renewcommand*\xmplinesep{;}
```

**Note 3: Object compression** One intention of XMP is that metadata embedded in a file be readable even without knowledge of the file’s format. That is, the metadata are expected to appear as plain text. Although `hyperxmp` does its best to honor that intention, it faces a few challenges:

1. When run with versions of Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub> earlier than 0.85, `hyperxmp` leaves all PDF objects uncompressed. This is due to Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub> treating object compression as a global parameter, unlike pdfL<sup>A</sup>T<sub>E</sub>X, which treats it as a local parameter. Hence, when `hyperxmp` requests that the XMP packet be left uncompressed, Lua<sup>L</sup>A<sub>T</sub>E<sub>X</sub> in fact leaves *all* PDF streams uncompressed. Beginning with version 3.0, `hyperxmp` includes a workaround that correctly leaves only the

X<sub>E</sub>T<sub>E</sub>X (or, more precisely, the `xvipdfmx` back end) exhibits the opposite problem. It compresses *all* PDF objects, including the ones containing XMP metadata. While Adobe Acrobat can still detect and utilize the XMP metadata, non-PDF-aware applications are unlikely to see the metadata. Three options to consider are to (1) use a different program (e.g., Lua<sub>E</sub>T<sub>E</sub>X), (2) pass the `--output-driver="xvipdfmx -z0"` option to X<sub>E</sub>T<sub>E</sub>X to instruct `xvipdfmx` to turn off all compression (which will of course make the PDF file substantially larger), or (3) postprocess the generated PDF file by loading it into the commercial version of Adobe Acrobat and re-saving it with the Save As... menu option.

**Note 4: Literal commas** `hyperxmp` splits the `pdfauthor` and `pdfkeywords` lists at commas. Therefore, when specifying `pdfauthor` and `pdfkeywords`, you should separate items with commas. Also, omit “and” and other text that does not belong to any list item. The following examples should serve as clarification:

**Wrong:** `pdfauthor={Jack Napier, Edward Nigma, and Harvey Dent}`

**Wrong:** `pdfauthor={Jack Napier; Edward Nigma; Harvey Dent}`

**Right:** `pdfauthor={Jack Napier, Edward Nigma, Harvey Dent}`

`\xmpcomma` If you need to include a literal comma within an author or keyword list (where commas normally separate list items) or a street address (where commas normally separate lines), use the `\xmpcomma` macro to represent it, and wrap the entire entry containing the comma within `\xmpquote{...}` as shown below:

```
pdfauthor=\xmpquote{Jack Napier\xmpcomma\ Jr.},  
                  \xmpquote{Edward Nigma\xmpcomma\ PhD},  
                  \xmpquote{Harvey Dent\xmpcomma\ Esq.}  
  
pdfcontactaddress=[Office of the President,  
                  \xmpquote{Wayne Enterprises\xmpcomma\ Inc.},  
                  One Wayne Blvd]
```

As of version 2.2 of `hyperxmp`, it is acceptable to use `\xmpcomma` and `\xmpquote` within any `hyperxmp` option, not just in those in which a comma normally serves as a separator (i.e., lists and multiline fields). Outside of cases in which a comma serves as a separator, `\xmpcomma` is treated as an ordinary comma, and `\xmpquote` returns its argument unmodified. Hence, it is legitimate to use `\xmpcomma` and `\xmpquote` in cases like the following

```
pdfauthortitle=\xmpquote{Psychiatrist\xmpcomma\ Arkham Asylum}}
```

(Like most `hyperxmp` options, `pdfauthortitle` inserts its argument unmodified in an XMP tag.) When in doubt, use `\xmpcomma` and `\xmpquote`; it should always be safe to do so.

`\xmptilde` Version 2.4 of `hyperxmp` introduces a convenience macro called `\xmptilde`. `\xmptilde` expands to a literal tilde character instead of the nonbreaking space that “~” normally represents. Use it to represent URLs such as `http://www.pakin.org/~scott/` (“`http://www.pakin.org/\xmptilde scott/`”) in options such as `baseurl`, `pdfcontacturl` and `pdflicenseurl`.

**Note 5: Unicode support** Unicode support is provided via the `hyperref` package. If you specify `unicode=true` either as a `hyperref` option or as an argument to the `\hypersetup` command, the document can include Unicode characters in its XMP fields.

**Note 6: Automatically specified metadata** `hyperxmp` attempts to identify certain metadata automatically. The hope is that in many cases, an author can simply include `\usepackage{hyperxmp}` in a document’s preamble and benefit from a modicum of XMP metadata with no additional effort.

Currently, `pdftitle` defaults to the document’s title as specified by `\title{...}`. `pdfauthor` defaults to the document’s author(s) as specified by `\author{...}`. `pdfdate` defaults to the current date and time. `pdfmetalang` defaults to the same value as `pdflang` if non-empty, “x-default” otherwise. `hyperxmp` recognizes some class-specific metadata as well, such as that provided via the Koma letter classes (e.g., `scrletter2`) and the ACM article class (`acmart`).

If a document uses either or `babel` or `polyglossia` package, it is recommended that it *not* explicitly set `pdflang`. `pdflang` accepts only a single language name while `hyperxmp` can automatically query `babel` and `polyglossia` for a list of all languages used in the document and include this list in an XMP `dc:language` element.

`\XMPLangAlt` **Note 7: Multilingual metadata** The `pdfmetalang` option specifies the language in which the document’s metadata is written. It defaults to the value of `pdflang`, which specifies the document language. As of version 3.3 of `hyperxmp`, it is possible to include certain metadata—specifically, the document’s title, subject, and copyright statement—in more than one language. The `\XMPLangAlt` macro provides this functionality. Usage is as follows:

```
\XMPLangAlt {\langle language \rangle} {\langle option \rangle=\langle text \rangle, ... }
```

where `\langle language \rangle` is an ISO 639-1 two-letter country code with an optional ISO 3166-1 two-letter region code (e.g., “en” for English or “en-US” for specifically US English); `\langle option \rangle` is one of “`pdftitle`”, “`pdfsubject`”, or “`pdfcopyright`”; and `\langle text \rangle` is the text as expressed in the specified language. By way, of example, the following code provides the document title in English then specifies an alternative title to use in four other languages:

```
\hypersetup{%
```

```

    pdfmetalang={en},
    pdftitle={English title}
}
\XMPLangAlt{de}{pdftitle={Deutscher Titel}}
\XMPLangAlt{fr}{pdftitle={Titre fran\u00e7ais}}
\XMPLangAlt{it}{pdftitle={Titolo italiano}}
\XMPLangAlt{rm}{pdftitle={Titel rumantsch}}

```

**Note 8: Expandable arguments** All arguments passed to `hyperxmp` options must be expandable, in `TeX` terminology. This implies that any macros that are used in arguments are limited to a relatively small set of operations (such as conditionals and macro expansion) and must produce a string of text. Code (such as macro definitions and arithmetic operations) will be written to XMP as code, not as the result of executing the code.

By way of example, the macros provided by the `texdate` package for typesetting dates are not expandable (at least at the time of this writing). Hence, the `\printfdate{Y}` in the following code snippet is not replaced by the current year, as one might expect:

```

\usepackage{texdate}
\initcurrdate
\hypersetup{%
  pdfcopyright={Copyright \textcopyright\ \printfdate{Y}, Scott Pakin}
}

```

Rather, it generates a `dc:rights` tag of the form “`Copyright \textcopyright\ =2=0=by-1by=02020, Scott Pakin`”. The garbage in that line corresponds to the remnants of the `\printfdate` code after expanding all of the `TeX` primitives and certain other control sequences it uses to the empty string. For example, “`\global\advance\texd@yr by-1`” expands to “`by-1`”.

It is not possible to determine *a priori* whether or not a macro is expandable. The best advice is to carefully inspect the XMP package in the output file to ensure that any macros used in arguments to `hyperxmp` options produced the expected output.

**Note 9: Semi-automatic page ranges** Although `pdfpagerange` is intended to refer to pages in the final, published version of a document, it would be convenient for them to be generated automatically when producing a standalone PDF file that is not intended to be incorporated into a book, journal, or other publication (or if it is known that the pages will not be renumbered for publication). One approach is to use the `totpages` package help generate `pdfpagerange`. For documents numbered from 1 to  $n$ , a simple

```

\hypersetup{%
  pdfpagerange={1-\ref*{TotPages}}
}

```

```
}
```

should suffice. A bit more effort is needed for documents that change numbering schemes, such as using lowercase Roman numerals for the front matter and Arabic numerals for the main matter and back matter. One approach is to use `\label` to mark the first and last page of each numbering scheme and specify `pdfpagerange` as in the following:

```
\hypersetup{%
    pdfpagerange={%
        \pageref*{page:begin-front}-\pageref*{page:end-front},%
        1-\pageref*{TotPages}%
    }%
}
```

I don't know how unnumbered pages (e.g., blank pages and the title page) are supposed to be handled. I suppose blank pages can be omitted from `pdfpagerange`, and the title page can be either omitted or listed as `title`, for example.

It appears that at least with version 2.00 of `totpages`, the `TotPages` label is not defined until after the `\begin{document}`. Consequently, using `TotPages` within a `\hypersetup` invocation in the document's preamble will produce “??” as the page count in the XMP packet. The solution is either to assign `pdfpagerange` after the `\begin{document}` or to ask L<sup>A</sup>T<sub>E</sub>X to do that on your behalf:

```
\AtBeginDocument{%
    \hypersetup{%
        pdfpagerange={1-\ref*{TotPages}}%
    }%
}
```

### 3 Implementation

This section presents the commented L<sup>A</sup>T<sub>E</sub>X source code for `hyperxmp`. Read this section only if you want to learn how `hyperxmp` is implemented.

#### 3.1 Initial preparation

- `\hyxmp@dq@code` The `ngerman` package redefines “ ” as an active character, which causes problems for `hyperxmp` when it tries to use that character. We therefore save the double-quote character's current category code in `\hyxmp@dq@code` and mark the character as category code 12 (“other”). The original category code is restored at the end of the package code (Section 3.8).

```
1 \edef\hyxmp@dq@code{\the\catcode`\"}
2 \catcode`\"=12
```

`\hyxmp@at@end` The `\hyxmp@at@end` macro includes code at the end of the document. When available (as is the case in most modern TeX backends), `\AtEndDocument` works well enough. Otherwise, we invoke `\AtEndDvi` from the `atenddvi` package, which is robust but requires an addition L<sup>A</sup>T<sub>E</sub>X run.

```
3 \@ifundefined{AtEndDocument}{%
4   \RequirePackage{atenddvi}
5   \let\hyxmp@at@end=\AtEndDvi
6 }{%
7   \let\hyxmp@at@end=\AtEndDocument
8 }
```

`\hyxmp@set@jobname` Given an expanded `\jobname` followed by `\relax`, invoke the `\hyxmp@set@jobname@dbl` macro if the job name is surrounded by double quotes and the `\hyxmp@set@jobname@plain` macro otherwise.

```
9 \def\hyxmp@set@jobname#1\relax{%
10  \ifnextchar"\hyxmp@set@jobname@dbl{\hyxmp@set@jobname@plain}#1\relax
11 }
```

`\hyxmp@set@jobname@dbl` Set `\hyxmp@jobname` to to #1, discarding the surrounding double quotes.

```
12 \def\hyxmp@set@jobname@dbl"#1"\relax{\xdef\hyxmp@jobname{#1}}
```

`\hyxmp@set@jobname@plain` Set `\hyxmp@jobname` to to #1.

```
13 \def\hyxmp@set@jobname@plain#1\relax{\xdef\hyxmp@jobname{#1}}
```

Define `\hyxmp@jobname` as a sanitized version of `\jobname`. The problem with using `\jobname` directly is that it surrounds the filename with double quotes if it contains a space character. For example, a source file named `my-file.tex` results in a `\jobname` of “`my-file`”, but a source file named `my file.tex` results in a `\jobname` of ““`my file`””. Trying to access “`my file`”.log (as is done on page 48) will fail because the filename does not in fact contain literal double quotes.

```
14 \expandafter\hyxmp@set@jobname\jobname\relax
```

`\hyxmp@aep@toks` In order for `hyperxmp` to be loaded safely during `\AtEndPreamble` we need to ensure that we perform no `\AtEndPreamble` actions until all top-level macro definitions have been made. The most straightforward approach would be to move all of `hyperxmp`’s `\AtEndPreamble` stanzas to the end of the package. However, this degrades readability of the source code. For instance, an `\AtEndPreamble` stanza related to integration with `hyperref` could no longer appear in the “Integration with `hyperref`” section (Section 3.2). Hence, we instead store in a token list, `\hyxmp@aep@toks`, each `\AtEndPreamble` stanza as we encounter it. This token list is evaluated as one of the package’s final actions (Section 3.8).

```
15 \newtoks{\hyxmp@aep@toks}
```

### 3.2 Integration with `hyperref`

An important design decision underlying `hyperxmp` is that the package should integrate seamlessly with `hyperref`. To that end, `hyperxmp` takes XMP metadata

from `hyperref`'s `baseurl`, `pdfauthor`, `pdfkeywords`, `pdflang`, `pdfproducer`, `pdfsubject`, `pdftrapped`, and `pdftitle` options. It also introduces a number of new options, which are listed on pages 5–6. For consistency with `hyperref`'s document-metadata naming conventions (which are in turn based on L<sup>A</sup>T<sub>E</sub>X's document-metadata naming conventions), we do not prefix metadata-related macro names with our package-specific `\hyxmp@` prefix. That is, we use names like `\@pdfcopyright` instead of `\hyxmp@pdfcopyright`.

We load a bunch of helper packages: `kvoptions` for package-option processing, `pdfescape` and `stringenc` for re-encoding Unicode strings, `intcalc` for performing integer calculations (division and modulo), `iftex` for determining which T<sub>E</sub>X engine is being used, `ifmtarg` for testing if a macro argument is empty or all spaces, `etoolbox` for dynamically patching existing commands (specifically, `hyperref`'s `\PDF@FinishDoc`), and `ifthen` for convenient string comparisons.

```
16 \RequirePackage{kvoptions}
17 \RequirePackage{pdfescape}
18 \RequirePackage{stringenc}
19 \RequirePackage{intcalc}
20 \RequirePackage{iftex}
21 \RequirePackage{ifmtarg}
22 \RequirePackage{etoolbox}
23 \RequirePackage{ifthen}
```

There are a few places where `hyperxmp` can take advantage of L<sup>A</sup>T<sub>E</sub>X features. To simplify the use of L<sup>A</sup>T<sub>E</sub>X we load the `luacode` package.

```
24 \ifLuaTeX
25   \RequirePackage{luacode}
26 \fi
```

`\@ifmtargexp` and `\@ifnotmtarg` do not expand their first argument. Define `\@ifmtargexp` and `\@ifnotmtargexp` as expanding versions of those macros.

```
27 \def\@ifmtargexp#1{\expandafter\@ifmtarg\expandafter{#1}}
28 \def\@ifnotmtargexp#1{\expandafter\@ifnotmtarg\expandafter{#1}}
```

`\@if@def@and@nonempty` This macro combines `\@ifundefined` and `\@ifmtargexp`. If the macro named #1 is both defined and non-empty, evaluate #2. Otherwise, evaluate #3.

```
29 \newcommand*{\@if@def@and@nonempty}[3]{%
30   \@ifundefined{#1}{#3}{%
31     \expandafter\@ifmtargexp\expandafter{\csname#1\endcsname}{#3}{#2}%
32   }%
33 }
```

`\hyxmp@pdfstringdef` Because `hyperxmp` uses underscores to represent hard spaces, we need “`\_`” to map initially to something other than an underscore, in particular the ASCII NAK (`\^U`) character. To accomplish this, we wrap `hyperref`'s `\pdfstringdef` macro with our own version that temporarily does the proper substitution. Later in the execution, after underscores have been replaced with spaces, we replace NAK characters with underscores.

```

34 \newcommand{\hyxmp@pdfstringdef}[2]{%
35   \let\hyxmp@textunderscore=\textunderscore
36   \let\textunderscore=\hyxmp@uscore
37   \pdfstringdef{\#1}{\#2}%
38   \let\textunderscore=\hyxmp@textunderscore
39 }

\@pdfdatetime Prepare to store the document's date and (optionally) time. Whether specified by the author in XMP format or PDF format (see Section 3.4.2) we always store \@pdfdatetime as an XMP-format string.
40 \def\@pdfdatetime{%
41 \define@key{Hyp}{pdfdate}{%

We need to capture list arguments (viz. `pdfauthor` and `pdfkeywords`) before `hyperref` converts them to `PDFDocEncoding`. Otherwise, `\xmpcomma` is permanently replaced with a comma, and we lose our ability to change it to a `\hyxmp@comma`. We therefore need to augment `hyperref`'s option processing with our own. Because `hyperref` has not yet been loaded we need to ensure that our augmentation gets loaded in the future: after the `\usepackage{hyperref}` but before options are passed to that package.

For lack of a better approach, `hyperxmp` redefines `\ProcessKeyvalOptions` to alter the way `hyperref` processes `pdfauthor` and `pdfkeywords`. This is somewhat heavy-handed as it gets executed for *every* subsequently loaded package that uses `\ProcessKeyvalOptions`, but at least it does what we need. `hyperxmp` also redefines `\hypersetup` to do the same thing. This is required in case `hyperref` is loaded before `hyperxmp`.

<code>\hyxmp@pdfauthor</code>	Prepare to store the name of the author and a list of keywords.
<code>\hyxmp@pdfkeywords</code>	<code>225 \def\hyxmp@pdfauthor{}%</code> <code>226 \def\hyxmp@pdfkeywords{}%</code>
<code>\hyxmp@redefine@Hyp</code>	If not already redefined, redefine <code>hyperref</code> 's <code>pdfauthor</code> and <code>pdfkeywords</code> options to properly handle <code>\xmpcomma</code> and <code>\xmpquote</code> .
	<code>227 \newcommand*{\hyxmp@redefine@Hyp}{%</code>
<code>\hyxmp@Hyp@pdfauthor</code>	Store the old definition of <code>\KV@Hyp@pdfauthor</code> in <code>\hyxmp@Hyp@pdfauthor</code> , but only if we see that <code>\KV@Hyp@pdfauthor</code> is defined and <code>\hyxmp@Hyp@pdfauthor</code> isn't. Otherwise, we'd be defining <code>\hyxmp@Hyp@pdfauthor</code> in terms of itself and creating an infinite loop.
	<code>228   \@ifundefined{\KV@Hyp@pdfauthor}{}{%</code> <code>229     \@ifundefined{\hyxmp@Hyp@pdfauthor}{}{%</code> <code>230       \expandafter\let\expandafter\hyxmp@Hyp@pdfauthor</code> <code>231         \csname KV@Hyp@pdfauthor\endcsname</code> <code>232     }{}%</code> <code>233   }%</code>

\KV@Hyp@pdfauthor	Redefine \KV@Hyp@pdfauthor to process its argument twice. The first time, \xmpcomma is defined as a placeholder character (\hyxmp@comma) and \xmpquote as the identity function. The result is stored in \hyxmp@pdfauthor for use in structured lists (those surrounding each entry with <rdf:li>). The second time, \xmpcomma is defined as an ordinary comma, and \xmpquote is defined as a macro that puts its argument within double quotes. The result is stored in \@pdfauthor for use in unstructured lists (those in which the entire list appears within a single pair of tags). In case pdfauthor is left unspecified and we copy \author's argument to pdfauthor, we temporarily redefine \and as the list separator when producing a structured list and as "and" when producing an unstructured list.

Right before we reach the `\begin{document}` we check if `hyperref` was loaded. In normal usage, the document will already have done a `\usepackage{hyperref}` because otherwise, `\hypersetup` will not have been defined, and only a limited amount of metadata will be included. However, in case the author is relying exclusively on `hyperxmp`'s automatically detected metadata, we'll need to load `hyperref` now. As explained in Section 3.1, we defer the invocation of `\AtEndPreamble` to the end of the file.

```

370 \expandafter\hyxmp@aep@toks\expandafter=\expandafter{%
371   \the\hyxmp@aep@toks
372   \AtEndPreamble{%
373     \RequirePackage{hyperref}%

```

Older versions of `hyperref` write the `Info` dictionary to the PDF file at the end of the document. Newer versions of `hyperref` write the `Info` dictionary to the PDF file at the *beginning* of the document. For compatibility with both old and new `hyperref` implementations we suppress writing the `Info` dictionary here, at the beginning of the document.

```
374   \hyxmp@no@info@lists
```

If `pdftitle` is undefined but the author invoked `\title`, we copy the latter to the former. This addresses two problems: (1) handling L<sup>A</sup>T<sub>E</sub>X classes in which `\maketitle` clears `\title` and (2) ensuring that `hyperref` writes the same title to the PDF `Info` dictionary that `hyperxmp` writes to the XMP packet. We do likewise for `\author` → `pdfauthor`.

One tricky bit is that the standard L<sup>A</sup>T<sub>E</sub>X classes do not define `\@title` and `\@author` as empty strings but rather as calls to `\@latex@warning@no@line` that complain about a missing title/author. Hence, we can't simply test if the title and author are empty because they're not. Instead, we first locally redefine `\@latex@warning@no@line` to discard its argument then test if any text remains.

```

375   \begingroup
376     \let\@latex@warning@no@line=\@gobble
377     \hyxmp@use@first@valid{pdftitle}{\@pdftitle}{%
378       \scr@subject@var,%
379       \@title
380     }%
381     \hyxmp@use@first@valid{pdfauthor}{\@pdfauthor}{%
382       \scr@fromname@var,%
383       \@author
384     }%
385   \endgroup
386 }%
387 }

```

When we reach the `\end{document}` we need to gather up the metadata specified explicitly by the user, infer additional metadata where possible, and write the XMP packet to the PDF file.

```
388 \hyxmp@at@end{%
```

Fill in any missing metadata we can using values provided by the author via mechanisms other than the `\hypersetup` command.

```
389   \hyxmp@auto@assign@data
```

If the document claims to comply with one or more PDF standards, check that all of the requisite metadata are present.

```
390   \hyxmp@check@standards
```

We can finally construct the XMP packet and write it to the PDF document catalog.

```

391   \hyxmp@warn@if@no@metadata
392   \hyxmp@embed@packet
393 }

```

### 3.3 Advanced metadata detection

hyperxmp strives to be as convenient and user-friendly as possible. To that end, we try to automatically detect as much metadata as possible. The author can of course augment or override autodetected metadata by explicitly providing values to \hypersetup, but the hope is that we can save the author some effort in many cases.

In this section, we identify additional metadata we can use. Most of the functionality is class- or package-specific. For example, we check for phone numbers provided to the Koma letter classes via \setkomavar{fromphone}{...} and/or \setkomavar{frommobilephone}{...}, street addresses provided to the ACM article class via \affiliation, and languages the polyglossia package is instructed to load via \setdefaultlanguage and \setotherlanguage.

\hyxmp@set@koma@phones Define \hyxmp@koma@phones as a comma-separated list of the phone numbers provided to a Koma letter class (mobile and landline).

```

394 \newcommand*{\hyxmp@set@koma@phones}{%
395   \begingroup
396     \Hy@unicodefalse
397     \@if@def@and@nonempty{scr@frommobilephone@var}{%
398       \@if@def@and@nonempty{scr@fromphone@var}{%
399         \hyxmp@pdfstringdef\hyxmp@koma@phones{\scr@frommobilephone@var,\scr@fromphone@var}%
400       }{%
401         \hyxmp@pdfstringdef\hyxmp@koma@phones{\scr@frommobilephone@var}%
402       }%
403     }{%
404       \@if@def@and@nonempty{scr@fromphone@var}{%
405         \hyxmp@pdfstringdef\hyxmp@koma@phones{\scr@fromphone@var}%
406       }{%
407       }%
408     }%
409   \endgroup
410 }

```

\hyxmp@use@first@valid Given a hyperxmp option (#1), its current value (#2), and a comma-separated list of option names (#3), if the current value is empty, invoke \hypersetup to set the option to the first non-empty item in the list. If all items in the list are empty, do nothing.

```

411 \newcommand*{\hyxmp@use@first@valid}[3]{%
412   \@ifmtargexp[#2]{%
413     \hyxmp@use@first@valid@i{#1}{#3},!,%
414   }{%
415   }{%
416 }

```

\hyxmp@use@first@valid@i This macro performs all the work for \hyxmp@use@first@valid. It loops over a comma-separated list of macros (#2), stopping when it encounters an end-of-list marker (“!”). The first list element that is neither undefined nor empty is assigned to a given option name (#1) using \hypersetup.

```

417 \def\hyxmp@use@first@valid@i#2,{%
418   \def\next{\hyxmp@use@first@valid@i{#1}}%
419   \ifx#2!%
420     \let\next=\relax
421   \else
422     \ifx#2\undefined
423     \else
424       \ifnotmtargetexp{#2}{%
425         \hypersetup{#1={#2}}%
426         \def\next##1!,{}%
427       }%
428     \fi
429   \fi
430   \next
431 }
```

\hyxmp@auto@assign@data If certain metadata are unspecified, try to specify meaningful values using data provided by author via other means (e.g., \title for the document’s title).

```

432 \newcommand*\hyxmp@auto@assign@data{%

458  \hyxmp@use@first@valid{pdfpublisher}{\@pdfpublisher}{%
459    \@publishers
460  }%

```

We handle the `acmart` class specially. `acmart` stores author-provided contact information in a structured format that we can process fairly easily. Note that if the author is not using the `acmart` class, `\hyxmp@parse@acmart` will have been redefined to do nothing.

```
461  \hyxmp@parse@acmart
```

Most PDF standards dictate that if the same metadata appear in both the XMP packet and the PDF `Info` dictionary, the metadata must match. This requirement poses a problem for a user-unspecified `pdfcreationdate` in the context of `XeLATEX`. In this case we explicitly define `\@pdfcreationdate` as `\hyxmp@today@pdf` to prevent the `xvipdfmx` back-end processor from detecting a missing `CreationDate` in the `Info` dictionary and adding its own—typically a few seconds after `hyperxmp` has constructed an `xmp:CreateDate` for the XMP metadata and leading to a metadata mismatch.

```

462  \@ifundefined{XeTeXversion}{}{%
463    \@ifmtargexp{\@pdfcreationdate}{%
464      \let\@pdfcreationdate=\hyxmp@today@pdf
465    }%
466    {}%
467  }%

```

Query the document currently being built for page and byte counts.

```
468  \hyxmp@query@self
469 }
```

`hyperxmp` can directly query the page count using `LuaLATEX` features. When any other `TEX` engine is used, `hyperxmp` employs the `totpages` package to help tally the total number of pages.

```

470 \ifLuaTeX
471 \else
472   \RequirePackage{totpages}
473 \fi

```

Determine the size of the output file from the *previous* run of `LuaLATEX` or `pdflLATEX`. This action has to be performed before the `\begin{document}` because at that point the size of the output file is reset to zero. We use `\jobname.pdf` as the name of the output file even in the `LuaLATEX` case because `status.output_file_name` is not defined at this point.

```
474 \ifLuaTeX
```

```

475   \edef\hyxmp@prev@pdf@size{%
476     \luadirect{%
477 local nbytes = lfs.attributes("\hyxmp@jobname.pdf", "size")

`\affiliation` We want to produce XMP metadata for only a single affiliation. Although `\hyxmp@use@first@valid` will ensure that only the first email, city, country, etc. encountered is considered, we run the first of one affiliation defining, say, a city and state but no country and a subsequent affiliation defining a country. In that case, the XMP would include the first author's city and state and the subsequent author's country. Hence, we define `\affiliation` to "self destruct" after its first use, discarding all further affiliations.

```
541     \def\affiliation##1##2{%

Nullify \hyxmp@parse@acmart if the author is not using the acmart class.  
595 \@ifclassloaded{acmart}{}{\let\hyxmp@parse@acmart=\relax}

\hyxmp@dc@lang \hyxmp@dc@lang is a comma-separated list of all languages used in the document.  
596 \let\hyxmp@dc@lang=\@empty

\hyxmp@detect@langs If pdflang was not specified, try to determine the document language(s) using either babel's or polyglossia's definitions.  
597 \newcommand\*{\hyxmp@detect@langs}%
598 \@ifundefined{mainbcp47id}%
599 \@ifundefined{LocaleForEach}{}%

The document doesn't appear to have loaded either `babel` or `polyglossia`. In this case we have one small task to do. In older versions of `hyperref`, `\@pdflang` is set to `\@empty` if `pdflang` is not specified. In newer versions of `hyperref`, `\@pdflang` is set to `\relax` if `pdflang` is not specified. The latter is a bit problematic for `hyperxmp` because it makes `\@pdflang` non-expandable, which causes a literal "`\@pdflang`" to be written as XMP metadata. To avoid that situation we explicitly set `\@pdflang` to `\@empty` to avoid problems with non-expandable symbols.

```
600      \let\@pdflang=\@empty
601      }%
```

`\hyxmp@dc@lang` Use `babel`'s `\LocaleForEach` and `\getLocaleproperty` to set `\@pdflang` to the document's main language and `\hyxmp@dc@lang` to a comma-separated list of all languages used.

```
602      \BabelEnsureInfo
603      \LocaleForEach{%
604          \getLocaleproperty\hyxmp@lang@tag{##1}{identification/tag.bcp47}%
605          \ifx\hyxmp@dc@lang\@empty
606              \xdef\hyxmp@dc@lang{\hyxmp@lang@tag}%
607          \else

615  }%
616 }%
```

Use `polyglossia`'s `\mainbcp47id` as the document's main language and its `\xpg@bcp@loaded` as a comma-separated list of all document languages.

```
617      \xdef\@pdflang{\csname mainbcp47id\endcsname}%
618      \edef\hyxmp@dc@lang{\xpg@bcp@loaded}%
619  }%
620 }
```

### 3.4 Manipulating author-supplied data

The author provides metadata information to `hyperxmp` via package options to `hyperref` or via `hyperref`'s `\hypersetup` command. The functions in this section convert author-supplied lists (e.g., `pdfkeywords={foo, bar, baz}`) into L<sup>A</sup>T<sub>E</sub>X lists (e.g., `\@elt {foo} \@elt {bar} \@elt {baz}`) that can be more easily manipulated (Section 3.4.1); parse dates in both PDF and XMP formats (Section 3.4.2); trim spaces off the ends of strings (Section 3.4.3); convert text to XML (e.g., from `<scott+hyxmp@pakin.org>` to `&lt;scott+hyxmp@pakin.org&gt;`) (Section 3.4.4); simplify the pretty-printing of a begin tag, XML text, and end tag (Section 3.4.5); and provide metadata in multiple languages (Section 3.4.6).

### 3.4.1 List manipulation

We define a macro for converting a list of comma-separated elements (e.g., the list of PDF keywords) to a list of L<sup>A</sup>T<sub>E</sub>X \@elt-separated elements.

\hyxmp@commas@to@list Given a macro name (#1) and a comma-separated list (#2), define the macro name as the elements of the list, each preceded by \@elt. (Executing the macro therefore applies \@elt to each element in turn.)

```
621 \newcommand*{\hyxmp@commas@to@list}[2]{%
622   \gdef#1{}%
623   \expandafter\hyxmp@commas@to@list@i\expandafter#1#2,,%
624 }
```

\hyxmp@commas@to@list@i Recursively construct macro #1 from comma-separated list #2. Stop if #2 is empty.

```
\next 625 \def\hyxmp@commas@to@list@i#2,{%
626   \gdef\hyxmp@sublist{#2}%
627   \ifx\hyxmp@sublist@\empty
628     \let\next=\relax
629   \else
630     \hyxmp@trimspaces\hyxmp@sublist
631     \@cons{#1}{\{\hyxmp@sublist\}}%
632     \def\next{\hyxmp@commas@to@list@i{#1}}%
633   \fi
634   \next
635 }
```

\xmpcomma Because hyperxmp splits lists at commas, a comma cannot normally be used within a list. We therefore provide an \xmpcomma macro that can expand to either a true comma or a placeholder character depending on the situation. Here, we bind it to a comma so it can be used in *any* hyperxmp option, not just those that treat commas specially.

```
636 \def\xmpcomma{,}%
```

\hyxmp@comma This is what \xmpcomma maps to during list construction. We assume that documents will never otherwise use an ETX (^C) character in their XMP metadata.

```
637 \bgroup
638   \catcode`^C=11
639   \gdef\hyxmp@comma{^C}
640 \egroup
```

\hyxmp@uscore This is what \\_ temporarily maps to during packet construction. Because underscores are replaced by spaces, we need a mechanism to preserve user-specified underscores (e.g., in email addresses). We assume that documents will never otherwise use an NAK (^U) character in their XMP metadata.

```
641 \bgroup
642   \catcode`^U=11
643   \gdef\hyxmp@uscore{^U}
644 \egroup
```

\xmpquote Adobe Acrobat likes to see double quotes around list elements that contain commas when the entire list appears within a single XMP tag (e.g., `<pdf:Keywords>`). However, it doesn't like to see double quotes around list elements that contain commas when the list is broken up into individual components (i.e., using `<rdf:li>` tags). We therefore introduce an `\xmpquote` macro that quotes or doesn't quote its argument based on context. Here, we bind `\xmpquote` to `\relax` to prevent it from prematurely quoting or not quoting.

```
645 \let\xmpquote=\relax
```

\xmptilde As a convenience for the user, we define `\xmptilde` as a category 12 (other) “~” character.

```
646 \bgroup
647   \catcode`~=12%
648   \gdef\xmptilde{~}%
649 \egroup
```

\XMPTruncateList As a workaround for the inability of older Adobe Acrobat versions to display author lists correctly we introduce a hack that replaces a list with its first element.

\hyxmp@temp@str One can then write “`\XMPTruncateList{pdfauthor}`” and have Adobe Acrobat

\@elt display the author list correctly.

```
650 \newcommand{\XMPTruncateList}[1]{%
651   \PackageWarning{hyperxmp}{%
652     \noexpand\XMPTruncateList has been deprecated since\MessageBreak
653     hyperxmp 4.0 and may be removed in future\MessageBreak
654     versions of the package. \noexpand\XMPTruncateList\MessageBreak
655     was found}%
656   \edef\hyxmp@temp@str{\csname hyxmp@\#1\endcsname}%
657   \hyxmp@commas@to@list{\hyxmp@temp@list}{\hyxmp@temp@str}%
658   \def\@elt##1{%
659     \expandafter\gdef\csname @\#1\endcsname{##1}%
660     \let\@elt=\@gobble
661   }
662   \hyxmp@temp@list
663 }
```

### 3.4.2 Date manipulation

`hyperxmp` needs to manipulate two types of date (really, timestamp) formats: PDF format and XMP format. PDF timestamps are of the form “D:YYYYMMDDhhmmss+TT’tt,” (e.g., D:20200924191001-06’00’) [4], while XMP timestamps are of the form “YYYY-MM-DDThh:mm:ss+TT:tt” (e.g., 2020-09-24T19:10:01-06:00) [5]. The `\hyxmp@as@pdf@date` and `\hyxmp@as@xmp@date` macros defined in this section facilitate timestamp conversions to PDF and XMP formats, respectively.

\hyxmp@first@char Return the first character of a string. This macro is fully expandable.

```
664 \def\hyxmp@first@char#1{\hyxmp@first@char@i#1\relax}
665 \def\hyxmp@first@char@i#1#2\relax{#1}
```

- \hyxmp@as@xmp@date If necessary, convert a timestamp to XMP format. That is, if the timestamp is in PDF format, convert it; otherwise, leave it unmodified. This macro is fully expandable.
- ```
666 \def\hyxmp@as@xmp@date#1{%
667   \expandafter\ifnum\expandafter`\\hyxmp@first@char@i#1\relax='D
668     \hyxmp@pdf@to@xmp@date{\#1}%
669   \else
670     #1%
671   \fi
672 }
```
- \hyxmp@pdf@to@xmp@date Convert a timestamp from PDF format to XMP format. This macro is fully expandable.
- ```
673 \def\hyxmp@pdf@to@xmp@date#1:#2#3#4#5#6#7#8#9{%
674   #2#3#4#5-#6#7-#8#9%
675   \hyxmp@parse@time
676 }
```
- \hyxmp@parse@time This is a helper function for \hyxmp@pdf@to@xmp@date. \hyxmp@pdf@to@xmp@date proper parses only the year, month, and day then calls \hyxmp@parse@time. \hyxmp@parse@time parses the hours, minutes, and seconds then calls \hyxmp@parse@tz@char.
- ```
677 \def\hyxmp@parse@time#1#2#3#4#5#6{%
678   T#1#2:#3#4:#5#6%
679   \hyxmp@parse@tz@char
680 }
```
- \hyxmp@parse@tz@char This is another helper function for \hyxmp@pdf@to@xmp@date. So far, the date and time have been parsed. \hyxmp@parse@tz@char parses the first character of the timezone descriptor. This can be one of “+” for eastern timezones (UTC+x, including Asia, Oceania, and most of Europe), “-” for western timezones (UTC-x, primarily the Americas), or “Z” for Zulu time (UTC+0). Timezones beginning with “+” or “-” are followed by an offset in hours and minutes (parsed by \hyxmp@parse@tz; timezones beginning with “Z” are not).
- ```
681 \def\hyxmp@parse@tz@char#1{%
682   #1%

809   \hyxmp@today@xmp@define\hyxmp@today@xmp
810 }  

\hyxmp@today@pdf Define \hyxmp@today@pdf as the current date and (if available) time and timezone  

in PDF date format [4]. To do so we simply convert \hyxmp@today@xmp, defined  

above, from XMP to PDF using \hyxmp@xmp@to@pdf@date.  

811 \expandafter\edef\expandafter\hyxmp@today@pdf\expandafter{%
812   \expandafter\hyxmp@xmp@to@pdf@date\expandafter{\hyxmp@today@xmp}%
813 }  

```

### 3.4.3 Trimming leading and trailing spaces

To make it easier for XMP processors to manipulate our output we define a \hyxmp@trimspace macro to strip leading and trailing spaces from various data fields.

\hyxmp@trimspace Redefine a macro as its previous value but without leading or trailing spaces. This code—as well as that for its helper macros, \hyxmp@trimb and \hyxmp@trimc—was taken almost verbatim from a solution to an *Around the Bend* puzzle [7]. Inline comments are also taken from the solution text.

```

814 \catcode`\Q=3
\hyxmp@trimspace\x redefines \x to have the same replacement text sans leading
and trailing space tokens.
815 \newcommand{\hyxmp@trimspace}[1]{%

```

Use grouping to emulate a multi-token `afterassignment` queue.

```

816  \begingroup
      Put "\toks 0 {" into the afterassignment queue.
817  \aftergroup\toks\aftergroup0\aftergroup{%
      Apply \hyxmp@trimb to the replacement text of #1, adding a leading \noexpand
      to prevent brace stripping and to serve another purpose later.
818  \expandafter\hyxmp@trimb\expandafter\noexpand#1Q Q}%
      Transfer the trimmed text back into #1.
819  \edef#1{\the\toks0}%
820 }

```

\hyxmp@trimb \hyxmp@trimb removes a trailing space if present, then calls \hyxmp@trimc to clean up any leftover bizarre Qs, and trim a leading space. In order for \hyxmp@trimc to work properly we need to put back a Q first.

```

821 \def\hyxmp@trimb#1 Q{\hyxmp@trimc#1Q}

```

\hyxmp@trimc Execute \vfuzz assignment to remove leading space; the \noexpand will now prevent unwanted expansion of a macro or other expandable token at the beginning of the trimmed text. The \endgroup will feed in the \aftergroup tokens after the \vfuzz assignment is completed.

```

822 \def\hyxmp@trimc#1Q#2{\afterassignment\endgroup \vfuzz\the\vfuzz#1}
823 \catcode`Q=11

```

### 3.4.4 Converting text to XML

The “<”, “>”, and “&” characters are significant to XML. We therefore need to escape them in any author-supplied text.

\ifhyxmp@unicodetex X<sub>E</sub>T<sub>E</sub>X and LuaT<sub>E</sub>X natively support Unicode. We define the conditional \ifhyxmp@unicodetex to check for these so we can properly handle encoding conversions. The trick here is that Unicode T<sub>E</sub>X implementations compare decimal 64 to hexadecimal 40 (decimal 64), specified with four carets, and take the TRUE branch; non-Unicode T<sub>E</sub>X implementations compare decimal 64 to character “~” (decimal 94), ignore the “^0040” and the rest of the TRUE branch, and take the FALSE branch.

```

824 \newif\ifhyxmp@unicodetex
825 \ifnum64='^^^^0040\relax
826   \hyxmp@unicodetexttrue
827 \else
828   \hyxmp@unicodetextfalse
829 \fi

```

\SE->pdfdoc@003 Preserve ETX (^C), which is normally an invalid character in PDFDocEncoding. We use it in hyperxmp (and specifically in \hyxmp@xmlify below) as a list-element separator.

```

830 \expandafter\def\csname SE->pdfdoc@03\endcsname{0003}

```

\SE->pdfdoc@15 Preserve NAK (^U), which is normally an invalid character in PDFDocEncoding. We use it in `\hyxmp@xmlify` (and specifically in `\hyxmp@xmlify` below) as a placeholder for an underscore character.

```
831 \expandafter\def\csname SE->pdfdoc@15\endcsname{0015}
```

`\hyxmp@xmlify` Given a piece of text defined using `\pdfstringdef` (i.e., with many special characters redefined to have category code 11), set `\hyxmp@xmlified` to the same text but with all occurrences of "<" replaced with &lt;, all occurrences of ">" replaced with &gt;, and all occurrences of "&" replaced with &amp;.

894     \else
```

dvips wraps text when generating most PostScript code but preserves line breaks within strings. Unfortunately, dvips fails to observe the special case in the PostScript specification that “[b]alanced pairs of parentheses in the string require no special treatment” [3]. Consequently, XMP data containing parentheses (e.g., “Copyright (C) 1605 Miguel de Cervantes”) confuse dvips into thinking that the string has ended after the closing parenthesis and that line breaks can

subsequently be injected safely into the document at arbitrary points for formatting purposes. This leads to erroneous display by PDF viewers, which honor line breaks within XMP tags. The solution is to insert a backslash before all parentheses when in `pdfmark`-generating mode to convince `dvips` that the entire XMP packet must be treated as a single, not-to-be-modified string.

```

895      \@ifundefined{pdfmark}{%

### 3.4.5 Outputting structured XML

An XMP packet consists of structured XML data. We define some helper routines to handle the repetitive tasks of indenting a consistent number of spaces, inserting begin and end tags, and escaping arbitrary text as necessary for XML compatibility.

- \hyxmp@extra@indent This macro is used internally to increase the amount of indentation when writing certain XML data. It is normally defined as empty but can temporarily be redefined to a sequence of \space characters.

```
1022 \newcommand*{\hyxmp@extra@indent}{}%
```

- \hyxmp@add@simple Given an XMP tag (#1) and a string (#2), if the string is nonempty, add a begin tag, the string, and an end tag to the packet. The “simple” in the macro name indicates that the string is output without variations for different languages.

```

1023 \newcommand*{\hyxmp@add@simple}[2]{%
1024   \@ifnotmtargexp{#2}{%
1025     \hyxmp@xmlify{#2}%
1026     \hyxmp@add@to@xml{\hyxmp@extra@indent_____<}%
1027     \xdef\hyxmp@xml{\hyxmp@xml#1}%
1028     \hyxmp@add@to@xml{>}\hyxmp@xmlified</}%
1029     \xdef\hyxmp@xml{\hyxmp@xml#1>^J}%
1030   }%
1031 }%

```

- \hyxmp@add@simple@var Given an XMP tag (#1) and a variable name (#2), if the string is defined, add a begin tag, the string, and an end tag to the packet. The “simple” in the macro name indicates that the string is output without variations for different languages. \hyxmp@add@simple@var differs from \hyxmp@add@simple in that the former includes defined but empty values in the XMP packet while the latter excludes both undefined and defined but empty values.

```

1032 \newcommand*{\hyxmp@add@simple@var}[2]{%
1033   \expandafter\ifx\csname#2\endcsname\relax
1034   \else
1035     \hyxmp@xmlify{\csname#2\endcsname}%
1036     \hyxmp@add@to@xml{%
1037       \hyxmp@extra@indent_____<#1>\hyxmp@xmlified</#1>^J}%
1038   }%
1039 \fi
1040 }%

```

- \hyxmp@add@simple@lang Given an XMP tag (#1) and a string (#2), if the string is nonempty, add a begin tag, the string, and an end tag to the packet. The “simple” in the macro name indicates that the string is output without variations for different languages. However, if the

string begins with a language code in square brackets, specify that as the (sole) language for the tag.

```

1041 \newcommand*{\hyxmp@add@simple@lang}[2]{%
1042   \@ifnotmtarg{#2}{%
1043     \hyxmp@xmlify{#2}%
1044     \expandafter\hyxmp@add@simple@lang@i\hyxmp@xmlified\relax{#1}%
1045   }%
1046 }

```

\hyxmp@add@simple@lang@i This is a helper macro for \hyxmp@add@simple@lang. It takes an optional language code (in brackets), text up to \relax, and a tag, and typesets the text within the XML tag.

```

1047 \newcommand*{\hyxmp@add@simple@lang@i}{%
1048   \@ifnextchar[\hyxmp@add@simple@lang@ii{\hyxmp@add@simple@lang@ii[\@pdfmetalang]}%
1049 }

```

\hyxmp@add@simple@lang@ii This is another helper macro for \hyxmp@add@simple@lang. It takes an mandatory language code (in brackets; can be empty), text up to \relax, and a tag, and typesets the text within the XML tag.

```

1050 \def\hyxmp@add@simple@lang@ii[#1]#2\relax#3{%
1051   \@ifnotmtarg{#2}{%
1052     \hyxmp@xmlify{#2}%
1053     \@ifmtarg{#1}{%
1054       \hyxmp@add@to@xml{%
1055         <#3>\hyxmp@xmlified</#3>^^J%
1056       }%
1057     }{%
1058       \hyxmp@add@to@xml{%
1059         <#3 xml:lang="#1">\hyxmp@xmlified</#3>^^J%
1060       }%
1061     }%
1062   }%
1063 }

```

\hyxmp@add@simple@pfx Given an XMP tag (#1), a—typically hard-wired—prefix string (#2), and a main string (#3), if the main string is nonempty, add a begin tag, both strings, and an end tag to the packet. The “*simple*” in the macro name indicates that the string is output without variations for different languages.

```

1064 \newcommand*{\hyxmp@add@simple@pfx}[3]{%
1065   \@ifnotmtargexp{#3}{%
1066     \hyxmp@add@to@xml{\hyxmp@extra@indent_____<}%
1067     \xdef\hyxmp@xml{\hyxmp@xml#1}%
1068     \hyxmp@pdfstringdef\hyxmp@iprefix{#2}%
1069     \hyxmp@xmlify{\hyxmp@iprefix}%
1070     \hyxmp@add@to@xml{>\hyxmp@xmlified}%
1071     \hyxmp@xmlify{#3}%
1072     \hyxmp@add@to@xml{\hyxmp@xmlified<}%
1073     \xdef\hyxmp@xml{\hyxmp@xml#1>^^J}%

```

```
1074 }%
1075 }
```

### 3.4.6 Providing metadata in multiple languages

Certain XMP tags—dc:title, dc:description, and dc:rights (and others? Let me know.)—can be expressed in multiple languages. The same text is used for both language `pdfmetalang` (default: `pdflang`) and language “x-default”. To express the same metadata in multiple languages, we provide an `\XMPLangAlt` macro to construct a list of alternative forms for a piece of metadata.

- `\hyxmp@alt@title` Each of these macros is a list in which each element is of the form “`\do {language} {text}`” in which `{language}` is an ISO 639-1 two-letter country code with an optional ISO 3166-1 two-letter region code. For example, `\hyxmp@alt@title` may contain an element, “`\do {es-MX} {Este es mi documento}`”.
- `\hyxmp@alt@description`
- `\hyxmp@alt@rights`

```
1076 \def\hyxmp@alt@title{}
1077 \def\hyxmp@alt@description{}
1078 \def\hyxmp@alt@rights{}
```

- `\hyxmp@LA@accept` This macro wraps `\define@key` to make the option “`#1=<value>`” append `<value>` to list #2.

```
1079 \newcommand{\hyxmp@LA@accept}[2]{%
1080   \define@key{hyxmp@LA}{#1}{%
```

- `\hyxmp@value` As Niklas Beisert observed, if the option passed to the current key contains L<sup>A</sup>T<sub>E</sub>X code, this code will be included in the XMP packet, which is undesirable. Hence, we first clean up the string using `\hyxmp@pdfstringdef`.

```
1081   \hyxmp@pdfstringdef\hyxmp@value{##1}%
1082     \xdef#2{\noexpand\do {\hyxmp@cur@lang} {\hyxmp@value}}%
1083   }
1084 }
```

Define `<key>=<value>` options for appending to each of the `\hyxmp@alt<tag>` lists.

```
1085 \hyxmp@LA@accept{pdftitle}{\hyxmp@alt@title}
1086 \hyxmp@LA@accept{pdfsubject}{\hyxmp@alt@description}
1087 \hyxmp@LA@accept{pdfcopyright}{\hyxmp@alt@rights}
```

- `\XMPLangAlt` Argument #1 is a language expressed as a two-letter country code and optional two-letter region code. Argument #2 is a list of `<key>=<value>` pairs. Keys correspond to `\hypersetup` options such as “`pdftitle`”, “`pdfsubject`”, and “`pdfcopyright`”. Values are the alternative-language form of the text provided for the corresponding option.

```
1088 \newcommand{\XMPLangAlt}[2]{%
1089   \let\do=\relax
```

`\hyxmp@cur@lang` Store the provided language, which will be used during option processing.

```
1090 \edef\hyxmp@cur@lang{\#1}%
1091 \setkeys{hyxmp@LA}{\#2}%
1092 }
```

### 3.5 UUID generation

We use a linear congruential generator to produce pseudorandom version 4 UUIDs [12]. True, this method has its flaws but it's simple to implement in TeX and is good enough for producing the XMP `xmpMM:DocumentID` and `xmpMM:InstanceID` fields.

`\hyxmp@modulo@a` Replace the contents of `\@tempcnta` with the contents modulo #1. Note that `\@tempcntb` is overwritten in the process.

```
1093 \def\hyxmp@modulo@a#1{%
1094   \@tempcntb=\@tempcnta
1095   \divide\@tempcntb by #1
1096   \multiply\@tempcntb by #1
1097   \advance\@tempcnta by -\@tempcntb
1098 }
```

`\hyxmp@big@prime` Define a couple of large prime numbers that can still be stored in a TeX counter.

```
\hyxmp@big@prime@ii 1099 \def\hyxmp@big@prime{536870923}
1100 \def\hyxmp@big@prime@ii{536870027}
```

`\hyxmp@seed@rng` Seed hyperxmp's random-number generator from a given piece of text.

```
\hyxmp@one@token 1101 \def\hyxmp@seed@rng#1{%
1102   \@tempcnta=\hyxmp@big@prime
1103   \futurelet\hyxmp@one@token\hyxmp@seed@rng@i\empty
1104 }
```

`\hyxmp@seed@rng@i` Do all of the work for `\hyxmp@seed@rng`. For each character code  $c$  of the input `\hyxmp@one@token` text, assign  $\@tempcnta \leftarrow 3 \cdot \@tempcnta + c \pmod{\hyxmp@big@prime}$ .

```
\next 1105 \def\hyxmp@seed@rng@i{%
1106   \ifx\hyxmp@one@token\empty
1107     \let\next=\relax
1108   \else
1109     \def\next##1{%
1110       \multiply\@tempcnta by 3
1111       \advance\@tempcnta by `##1
1112       \hyxmp@modulo@a{\hyxmp@big@prime}%
1113       \futurelet\hyxmp@one@token\hyxmp@seed@rng@i
1114     }%
1115   \fi
1116   \next
1117 }
```

\hyxmp@set@rand@num Advance \hyxmp@rand@num to the next pseudorandom number in the sequence. Specifically, we assign  $\hyxmp@rand@num \leftarrow 3 \cdot \hyxmp@rand@num + \hyxmp@big@prime@ii$  (mod \hyxmp@big@prime). Note that both \tempcnda and \tempcntb are overwritten in the process.

```

1118 \def\hyxmp@set@rand@num{%
1119   \tempcnda=\hyxmp@rand@num
1120   \multiply\tempcnda by 3
1121   \advance\tempcnda by \hyxmp@big@prime@ii
1122   \hyxmp@modulo@a{\hyxmp@big@prime}%
1123   \xdef\hyxmp@rand@num{\the\tempcnda}%
1124 }
```

\hyxmp@append@hex Append a randomly selected hexadecimal digit to macro #1. Note that both \tempcnda and \tempcntb are overwritten in the process.

```

1125 \def\hyxmp@append@hex#1{%
1126   \hyxmp@set@rand@num
1127   \tempcnda=\hyxmp@rand@num
1128   \hyxmp@modulo@a{16}%
1129   \ifnum\tempcnda<10
1130     \xdef#1{\the\tempcnda}%
1131   \else
```

There *must* be a better way to handle the numbers 10–15 than with \ifcase.

```

1132   \advance\tempcnda by -10
1133   \ifcase\tempcnda
1134     \xdef#1{#1a}%
1135     \or\xdef#1{#1b}%
1136     \or\xdef#1{#1c}%
1137     \or\xdef#1{#1d}%
1138     \or\xdef#1{#1e}%
1139     \or\xdef#1{#1f}%
1140   \fi
1141 \fi
1142 }
```

\hyxmp@append@hex@iii Invoke \hyxmp@append@hex three times.

```

1143 \def\hyxmp@append@hex@iii#1{%
1144   \hyxmp@append@hex#1%
1145   \hyxmp@append@hex#1%
1146   \hyxmp@append@hex#1%
1147 }
```

\hyxmp@append@hex@iv Invoke \hyxmp@append@hex four times.

```

1148 \def\hyxmp@append@hex@iv#1{%
1149   \hyxmp@append@hex@iii#1%
1150   \hyxmp@append@hex#1%
1151 }
```

\hyxmp@create@uuid As per the definition of a version 4 UUID [12], define macro #1 as a UUID of the form “`uuid:xxxxxxxx-xxxx-4xxx-yxxx-xxxxxxxxxx`” in which each “*x*” is a lowercase

hexadecimal digit and “*y*” is one of “8”, “9”, “a”, or “b”. We assume that the random-number generator is already seeded. Note that `\hyxmp@create@uuid` overwrites both `\@tempcnta` and `\@tempcntb`.

```

1152 \def\hyxmp@create@uuid#1{%
1153   \def#1{uuid:}%
1154   \hyxmp@append@hex@iv#1%
1155   \hyxmp@append@hex@iv#1%
1156   \g@addto@macro#1{-}%
1157   \hyxmp@append@hex@iv#1%
1158   \g@addto@macro#1{-4}%
1159   \hyxmp@append@hex@iii#1%
1160   \g@addto@macro#1{-}%

```

Randomly select one of “8”, “9”, “a”, or “b”.

```

1161   \hyxmp@set@rand@num
1162   \@tempcnta=\hyxmp@rand@num
1163   \hyxmp@modulo@a{4}%
1164   \ifcase@\tempcnta
1165     \g@addto@macro#1{8}%
1166     \or\g@addto@macro#1{9}%
1167     \or\g@addto@macro#1{a}%
1168     \or\g@addto@macro#1{b}%
1169   \fi
1170   \hyxmp@append@hex@iii#1%
1171   \g@addto@macro#1{-}%
1172   \hyxmp@append@hex@iv#1%
1173   \hyxmp@append@hex@iv#1%
1174   \hyxmp@append@hex@iv#1%
1175 }

```

`\hyxmp@def@DocumentID` Seed the random-number generator with a function of the current filename, PDF document title, and PDF author, then invoke `\hyxmp@create@uuid` to define `\hyxmp@seed@string` `\hyxmp@DocumentID` as a random UUID.

```

1176 \newcommand*{\hyxmp@def@DocumentID}{%
1177   \edef\hyxmp@seed@string{\hyxmp@jobname:\@pdftitle:\@pdfauthor:}%
1178   \expandafter\hyxmp@seed@rng\expandafter{\hyxmp@seed@string}%
1179   \edef\hyxmp@rand@num{\the\@tempcnta}%
1180   \hyxmp@create@uuid\hyxmp@DocumentID
1181 }

```

`\hyxmp@def@InstanceID` Seed the random-number generator with a function of the current filename, PDF document title, PDF author, and the current timestamp, then invoke `\hyxmp@create@uuid` to define `\hyxmp@InstanceID` as a random UUID. For the current timestamp, we use both the document-specified timestamp from `pdfdate` and the `TeX` time. The former can be more precise (to sub-seconds) but may be less random (as it depends on manual document modifications) while the latter is typically less precise (to minutes) but may be more random (as it is updated automatically).

```
1182 \newcommand*{\hyxmp@def@InstanceID}{%
```

```

1183 \hyxmp@today@xmp@define{\hyxmp@seed@string}%
1184 \edef\hyxmp@seed@string{%
1185   \hyxmp@jobname:\@pdftitle:\@pdfauthor:\hyxmp@today@xmp:\hyxmp@seed@string
1186 }%
1187 \expandafter\hyxmp@seed@rng\expandafter{\hyxmp@seed@string}%
1188 \edef\hyxmp@rand@num{\the\@tempcnta}%
1189 \hyxmp@create@uuid\hyxmp@InstanceID
1190 }

```

### 3.6 Constructing the XMP packet

An XMP packet “shall consist of the following, in order: a header PI, the serialized XMP data model (the XMP packet) with optional white-space padding, and a trailer PI” [5]. (“PI” is an abbreviation for “processing instructions”). The serialized XMP includes blocks of XML for various XMP schemata: Adobe PDF (Section 3.6.2), Dublin Core (Section 3.6.3), XMP Rights Management (Section 3.6.4), XMP Media Management (Section 3.6.5), XMP Basic (Section 3.6.6), Photoshop (Section 3.6.7),

PDF/\* Identification (Section 3.6.8), IPTC Photo Metadata (Section 3.6.9), PRISM Basic Metadata (Section 3.6.10), Journal Article Versions (Section 3.6.11), and XMP Paged-Text (Section 3.6.12). The \hyxmp@construct@packet macro (Section 3.6.14) constructs the XMP packet into \hyxmp@xml. It first writes the appropriate XML header, then calls the various schema-writing macros, then injects \hyxmp@padding as padding, and finally writes the appropriate XML trailer.

#### 3.6.1 XMP utility functions

\hyxmp@add@to@xml Given a piece of text, replace all underscores with category-code 11 (“other”) spaces and all ^C characters with commas, then append the result to the \hyxmp@xml macro.

```

1191 \newcommand*{\hyxmp@add@to@xml}[1]{%
1192   \bgroup
1193   \tempcnta=0
1194   \ifhyxmp@unicodetex
1195     \tempcntb=65536%
1196   \else
1197     \tempcntb=256%
1198   \fi
1199   \loop
1200     \lccode\tempcnta=\tempcnta
1201     \advance\tempcnta by 1
1202     \ifnum\tempcnta<\tempcntb
1203     \repeat
1204     \lccode`\_=' \
1205     \lccode`^=`,
1206     \lccode`~=_
1207     \lowercase{\xdef\hyxmp@new@xml{\#1}}%
1208     \xdef\hyxmp@xml{\hyxmp@xml\hyxmp@new@xml}%
1209   \egroup

```

```

1210 }

\hyxmp@hash Define a category-code 11 (“other”) version of the “#” character.
1211 \bgroup
1212 \catcode`\#=11
1213 \gdef\hyxmp@hash{#}
1214 \egroup

\hyxmp@padding The XMP specification recommends leaving approximately 2000 bytes of whitespace at the end of each XMP packet to facilitate editing the packet in place [5]. \hyxmp@padding is defined to contain 32 lines of 63 spaces and a newline apiece for a total of 2048 characters of whitespace.
1215 \bgroup
1216 \xdef\hyxmp@xml{%
1217 \hyxmp@add@to@xml{%
1218 -----
1219 }
1220 \xdef\hyxmp@padding{\hyxmp@xml}%
1221 \egroup
1222 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
1223 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
1224 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
1225 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}
1226 \xdef\hyxmp@padding{\hyxmp@padding\hyxmp@padding}

\hyxmp@x@default Define an x-default string that we can use in comparisons with \pdfmetalang.
1227 \newcommand*{\hyxmp@x@default}{x-default}

```

### 3.6.2 The Adobe PDF schema

Older versions of `hyperref` defined a default producer; newer versions do not. Instead, they let the TeX engine define the producer itself. This poses a problem for PDF/A compliance because `hyperxmp` sees an empty producer and therefore omits writing a `pdf:Producer` to the XMP packet, causing a mismatch between the data in the XMP packet and the data in the PDF `Info` dictionary. To ensure consistency between XMP and `Info`, we explicitly define our own default `\pdfproducer` here.

```

\pdfproducer Define \pdfproducer using the banner string if available or the TeX engine’s
\hyxmp@define@pdfproducer version number if not.
1228 \newcommand*{\hyxmp@define@pdfproducer}{%
1229 \gdef\pdfproducer{TeX}
1230 \ifLuaTeX
1231 \expandafter\hyxmp@banner@to@producer\expandafter{\luatexbanner}%
1232 \else
1233 \ifPDFTeX
1234 \expandafter\hyxmp@banner@to@producer\expandafter{\pdftexbanner}%
1235 \else
1236 \ifXeTeX

```

```

1237      \edef\@pdfproducer{XeTeX version \the\XeTeXversion\XeTeXrevision}%
1238      \fi
1239      \fi
1240      \fi
1241 }

```

\@pdfproducer Define \@pdfproducer as the TeX engine's banner string (e.g., “This is \hyxmp@banner@to@producer LuaHBTeX, Version 1.12.0 (TeX Live 2020)”), removing the initial “This is” if possible (specifically, when ε-TEx’s \scantokens primitive is available).

```

1242 \def\hyxmp@banner@to@producer#1{%
1243   \ifx\scantokens\relax
1244     \gdef\@pdfproducer{#1}%
1245   \else

`\hyxmp@pdf@schema` Add properties defined by the Adobe PDF schema to the `\hyxmp@xml` macro.

```
1270 \newcommand*{\hyxmp@pdf@schema}{%
```

Add a block of XML to `\hyxmp@xml` that lists the document's keywords (the `pdf:Keywords` property), the tools used to produce the PDF file (the `pdf:Producer` property), and the version of the PDF standard adhered to (the `pdf:PDFVersion` property). Unlike most of the other schemata that hyperxmp supports, the Adobe PDF schema is *always* included in the document, even if all of its keys are empty. This is because PDF/A-1b requires the keywords and producer to be the same in the XMP metadata and the PDF metadata. Because hyperref always specifies the `Keywords` and `Producer` fields, even when they're empty, hyperxmp has to follow suit and define `pdf:Keywords` and `pdf:Producer` in the XMP packet.

```
1271 \hyxmp@add@simple@var{pdf:Producer}{@pdfproducer}%
1272 \hyxmp@add@simple@var{pdf:Keywords}{@pdfkeywords}%
1273 \hyxmp@add@simple{pdf:Trapped}{@pdftrapped}%
1274 \hyxmp@assign@major@minor
1275 \hyxmp@add@simple@var{pdf:PDFVersion}{hyxmp@major@minor}%
1276 }
```

### 3.6.3 The Dublin Core schema

`\ifhyxmp@multi@langs` These macros are used locally to `\hyxmp@rdf@dc`. If the property being processed  
`\hyxmp@multi@langstrue` has values in different languages, `\ifhyxmp@multi@langs` evaluates to TRUE. If it  
`\hyxmp@multi@langsfalse` has a value in only a single language, `\ifhyxmp@multi@langs` evaluates to FALSE.

```
1277 \newif\ifhyxmp@multi@langs
```

`\hyxmp@rdf@dc` Given an optional `\if<something>` statement (#1), a Dublin Core property (#2) and a macro containing some `\pdfstringdef`-defined text (#3), append the appropriate block of XML to the `\hyxmp@xml` macro.

```
1278 \newcommand*{\hyxmp@rdf@dc}[3]{\iffalse}{%
```

Set `\@tempswatrue` only if the given text is nonempty or the provided conditional evaluates to TRUE.

```
1279  \@ifmtargexp[#3]{\@tempswafalse}{\@tempswatrue}%
1280  #1
1281  \@tempswatrue
1282  \fi
```

Append the corresponding XML only if \@tempswattrue.

```
1283  \if@tempswa  
1284    \hyxmp@xmlify{#3}%
```

\hyxmp@value Store the XML-ified version of #3 in \hyxmp@value so we can reuse \hyxmp@xmlified if necessary.

```
1285  \let\hyxmp@value=\hyxmp@xmlified  
1286  \hyxmp@add@to@xml{  
1287  -----<dc:#2>^^J%  
1288  -----<rdf:Alt>^^J%  
1289  }%
```

Record whether property #2 has definitions in multiple languages.

```
1290  \c@if@def@and@nonempty{\hyxmp@alt@#2}{%  
1291    \hyxmp@multi@langtrue  
1292  }{  
1293    \hyxmp@multi@langsfalse  
1294  }%
```

There are now four cases to consider: the cross product of {pdfmetalang = “x-default”, pdfmetalang ≠ “x-default”} and {\XMPLangAlt was specified, \XMPLangAlt was not specified}. We handle each of these in turn.

```
1295  \ifx\@pdfmetalang\hyxmp@x@default  
1296    \ifhyxmp@multi@langs
```

**Case 1:** No pdfmetalang but \XMPLangAlt. We consider this an error because the x-default language will not have a matching non-default language, in violation of the XMP specification’s guidance [5, p. 23]:

An **xml:lang** value of “x-default” may be used to explicitly denote a default item. If used, the “x-default” item shall be first in the array and its simple text value should be repeated in another item in which **xml:lang** specifies its actual language. However, an “x-default” item may be the only item, in which case there is only a default value in no defined language.

```
1297  \PackageError{hyperxmp}{%  
1298    {\string\XMPLangAlt\space was used without specifying  
1299      pdfmetalang\MessageBreak  
1300      or pdflang}{%  
1301      {Be sure to assign a language code to the pdfmetalang key and/or a  
1302        document\MessageBreak  
1303        language to the pdflang key (e.g., \string\hypersetup{pdfmetalang={en}}).}%  
1304    \else
```

**Case 2:** No pdfmetalang and no \XMPLangAlt. Here we specify only x-default as the language, as per the guidance quoted above.

```
1305  \hyxmp@add@to@xml{  
1306  -----<rdf:li xml:lang="\hyxmp@x@default">\hyxmp@value</rdf:li>^^J%  
1307  }%  
1308  \fi  
1309  \else  
1310  \ifhyxmp@multi@langs
```

**Case 3:** Both `pdfmetalang` and `\XMPLangAlt`. In this case, we include an `x-default` followed by the `pdfmetalang` language, followed by all of the language alternatives.

```

1311      \hyxmp@xmlify{@pdfmetalang}%
1312      \hyxmp@add@to@xml{%
1313 -----<rdf:li xml:lang="\hyxmp@x@default">\hyxmp@value</rdf:li>^^J%
1314 -----<rdf:li xml:lang="\hyxmp@xmlified">\hyxmp@value</rdf:li>^^J%
1315      }%
1316      \def\do##1##2{%

1411     \hyxmp@add@simple{dc:identifier}{\@pdfidentifier}%
1412   }%
1413 }
```

### 3.6.4 The XMP Rights Management schema

`\hyxmp@xmpRights@schema` Add properties defined by the XMP Rights Management schema to the `\hyxmp@xml` macro. Currently, these are only the `xmpRights:Marked` property and the `xmpRights:WebStatement` property. If the author specified a copyright statement

we mark the document as copyrighted. If the author specified a license statement we include the URL in the metadata.

```
1414 \newcommand*{\hyxmp@xmpRights@schema}{%
```

\hyxmp@legal Set \hyxmp@rights to YES if either pdfcopyright or pdflicenseurl was specified.

```
1415   \let\hyxmp@rights=\emptyset
1416   \ifx\@pdflicenseurl\emptyset
1417   \else
1418     \def\hyxmp@rights{YES}%
1419   \fi
1420   \ifx\@pdfcopyright\emptyset
1421   \else
1422     \def\hyxmp@rights{YES}%
1423   \fi
```

Include the license-statement URL and/or the copyright indication. The copyright statement itself is included by \hyxmp@dc@schema in Section 3.6.3.

```
1424   \ifx\hyxmp@rights\emptyset
1425   \else
1426     \ifx\@pdfcopyright\emptyset
1427     \else
1428       \hyxmp@add@simple{xmpRights:Marked}{True}%
1429     \fi
1430     \hyxmp@add@simple{xmpRights:WebStatement}{\@pdflicenseurl}%
1431   \fi
1432 }
```

### 3.6.5 The XMP Media Management schema

\hyxmp@mm@schema Add properties defined by the XMP Media Management schema to the \hyxmp@xml macro. According to the XMP specification, the xmpMM:DocumentID property is supposed to uniquely identify a document, and the xmpMM:InstanceID property is supposed to change with each save operation [5]. As seen in Section 3.5, we do what we can to honor this intention from within a TeX-based workflow. We additionally support the xmpMM:VersionID property, whose value is supplied by the author using pdfversionid.

```
1433 \gdef\hyxmp@mm@schema{%
1434   \@ifmtargexp{\hyxmp@DocumentID}{\hyxmp@def@DocumentID}{}%
1435   \@ifmtargexp{\hyxmp@InstanceID}{\hyxmp@def@InstanceID}{}%
1436   \hyxmp@add@simple{xmpMM:DocumentID}{\hyxmp@DocumentID}%
1437   \hyxmp@add@simple{xmpMM:InstanceID}{\hyxmp@InstanceID}%
1438   \hyxmp@add@simple{xmpMM:VersionID}{\@pdfversionid}%
1439   \hyxmp@add@simple{xmpMM:RenditionClass}{\@pdfrendition}%
1440 }
```

### 3.6.6 The XMP Basic schema

\hyxmp@xmp@basic@schema Add properties defined by the XMP Basic schema to the \hyxmp@xml macro. These include a bunch of dates (all set to the same value) and the base URL for the document if specified with `baseurl`.

```
1441 \newcommand*\{\hyxmp@xmp@basic@schema}{%
```

For the document's creation date, use the user-specified \pdfcreationdate if defined and non-empty. Otherwise use our fabricated \hyxmp@today@xmp.

```
1442  \@ifmtargexp{\pdfcreationdate}{%
1443    \hyxmp@add@simple{xmp:CreateDate}{\hyxmp@today@xmp}%
1444  }{%
1445    \hyxmp@add@simple{xmp:CreateDate}{%
1446      \expandafter\hyxmp@as@xmp@date\expandafter{\pdfcreationdate}}%
1447  }%
```

For the document's modification date, use the user-specified \pdfmoddate if defined and non-empty. Otherwise use our fabricated \hyxmp@today@xmp.

```
1448  \@ifmtargexp{\pdfmoddate}{%
1449    \hyxmp@add@simple{xmp:ModifyDate}{\hyxmp@today@xmp}%
1450  }{%
1451    \hyxmp@add@simple{xmp:ModifyDate}{%
1452      \expandafter\hyxmp@as@xmp@date\expandafter{\pdfmoddate}}%
1453  }%
```

For the document's metadata date, use the user-specified \pdfmetadatetime if defined and non-empty. Otherwise use our fabricated \hyxmp@today@xmp.

```
1454  \@ifmtargexp{\pdfmetadatETIME}{%
1455    \hyxmp@add@simple{xmp:MetadataDate}{\hyxmp@today@xmp}%
1456  }{%
1457    \hyxmp@add@simple{xmp:MetadataDate}{\pdfmetadatETIME}%
1458  }%
```

Define the creation tool and the base URL.

```
1459  \hyxmp@add@simple{xmp:CreatorTool}{\pdfcreator}%
1460  \hyxmp@add@simple{xmp:BaseURL}{\baseurl}%
1461 }
```

### 3.6.7 The Photoshop schema

\hyxmp@photoshop@schema Add properties defined by the Photoshop schema to the \hyxmp@xml macro. We currently support only the `photoshop:AuthorsPosition` and `photoshop:CaptionWriter` properties.

```
1462 \gdef\hyxmp@photoshop@schema{%
1463   \edef\hyxmp@photoshop@data{\pdfauthortitle\pdfcaptionwriter}%
1464   \hyxmp@add@simple{photoshop:AuthorsPosition}{\pdfauthortitle}%
1465   \hyxmp@add@simple{photoshop:CaptionWriter}{\pdfcaptionwriter}%
1466 }
```

### 3.6.8 PDF/\* Identification schemata

\hyxmp@pdfa@id@schema Add properties defined by the PDF/A Identification schema [13] to the \hyxmp@xml macro. These properties identify a document as conforming to a particular PDF/A standard. We default to PDF/A-1b if any PDF/A compliance is detected but let the author override the “1” with pdfapart and the “b” with pdfaconformance.

```
1467 \newcommand*{\hyxmp@pdfa@id@schema}{%
1468   \ifHy@pdfa
1469     \hyxmp@add@simple{pdfaid:part}{\@pdfapart}%
1470     \hyxmp@add@simple{pdfaid:conformance}{\@pdfaconformance}%
1471   \fi
1472 }
```

\hyxmp@pdfua@id@schema If the document conforms to a PDF/UA standard, the author can indicate the standard version with pdfuapart.

```
1473 \newcommand*{\hyxmp@pdfua@id@schema}{%
1474   \hyxmp@add@simple{pdfuaid:part}{\@pdfuapart}%
1475 }
```

\hyxmp@pdfx@id@schema If the document conforms to a PDF/X standard, the author can indicate the standard version with pdfxstandard. We separately handle PDF/X-1, PDF/X-2 and PDF/X-3, and PDF/X-4 onwards.

```
1476 \newcommand*{\hyxmp@pdfx@id@schema}{%
1477   \tempcnta=0\hyxmp@pdfx@major\relax
1478   \ifnum\tempcnta=0
1479   \else
1480     \ifnum\tempcnta=1
1481       \hyxmp@add@simple{pdfx:GTS_PDFXVersion}{PDF/X-1:2001}%
1482       \hyxmp@add@simple{pdfx:GTS_PDFXConformance}{\@pdfxstandard}%
1483     \else
1484       \ifnum\tempcnta<4
1485         \hyxmp@add@simple{pdfx:GTS_PDFXVersion}{\@pdfxstandard}%
1486       \else
1487         \hyxmp@add@simple{pdfxid:GTS_PDFXVersion}{\@pdfxstandard}%
1488       \fi
1489     \fi
1490   \fi
1491 }
```

### 3.6.9 The IPTC Photo Metadata schema

\xmplinesep Lines in multiline fields are separated by \xmplinesep in the generated XML. This defaults to an LF (^J) character but written as an XML character entity for consistency across operating systems.

```
1492 \begingroup
1493   \catcode`\&=12
1494   \catcode`\#=12
1495   \gdef\xmplinesep{\#xA;}
```

```

1496 \endgroup

\hyxmp@list@to@lines Given a property (#1) and a macro containing a comma-separated list (#2), replace commas with \xmplinesep. Do nothing if the list is empty.
1497 \newcommand*{\hyxmp@list@to@lines}[2]{%
1498   @ifnotmtargexp{#2}{%
1499     \bgroup

\hyxmp@iptc@schema Add properties defined by the IPTC Photo Metadata schema [10] to the \hyxmp@xml macro. We currently support only the Iptc4xmpCore:CreatorContactInfo property, although this is a structure containing multiple fields.
1518 \gdef\hyxmp@iptc@schema{%
Because we currently support only Iptc4xmpCore:CreatorContactInfo it suffices to check if we have any relevant data. If so, we instantiate a Iptc4xmpCore>ContactInfo structure with all available fields.
1519   \ifx\hyxmp@iptc@data\empty
1520   \else
1521     \hyxmp@add@to@xml{%
1522       <Iptc4xmpCore:CreatorContactInfo rdf:parseType="Resource">^^J%
1523     }%

```

We locally redefine `\hyxmp@extra@indent` to increase the indentation of the assignments to `Iptc4xmpCore:CreatorContactInfo`'s fields.

```

1524      \bgroup
1525          \edef\hyxmp@extra@indent{\hyxmp@extra@indent\space\space}%
1526          \hyxmp@list@to@lines{Iptc4xmpCore:CiAdrExtadr}{\@pdfcontactaddress}%
1527          \hyxmp@add@simple{Iptc4xmpCore:CiAdrCity}{\@pdfcontactcity}%
1528          \hyxmp@add@simple{Iptc4xmpCore:CiAdrRegion}{\@pdfcontactregion}%
1529          \hyxmp@add@simple{Iptc4xmpCore:CiAdrPcode}{\@pdfcontactpostcode}%
1530          \hyxmp@add@simple{Iptc4xmpCore:CiAdrCtry}{\@pdfcontactcountry}%

```

`\xmplinesep` The IPTC standard states that sets of telephone numbers, email addresses, and URLs for the contact person or institution, “[m]ay have to be separated by a comma in the user interface” [10]. This is rather ambiguous: Does the comma appear *only* in the user interface or also in the generated XML? Here we assume the latter interpretation and temporarily redefine `\xmplinesep` as a comma and use `\hyxmp@list@to@lines` to insert the data. Unlike `\hyxmp@add@simple`, this approach trims all spaces surrounding commas.

```

1531      \def\xmplinesep{,}%
1532      \hyxmp@list@to@lines{Iptc4xmpCore:CiTelWork}{\@pdfcontactphone}%
1533      \hyxmp@list@to@lines{Iptc4xmpCore:CiEmailWork}{\@pdfcontactemail}%
1534      \hyxmp@list@to@lines{Iptc4xmpCore:CiUrlWork}{\@pdfcontacturl}%
1535      \egroup

1555     \hyxmp@add@simple{prism:eIssn}{\@pdfeissn}%
1556     \hyxmp@add@simple{prism:doi}{\@pdfdoi}%
1557     \hyxmp@add@simple{prism:url}{\@pdfurl}%

```

```

1558 \hyxmp@add@simple{prism:byteCount}{\@pdfbytes}%
1559 \hyxmp@add@simple{prism:pageCount}{\@pdfnumpages}%
1560 }

```

### 3.6.11 The Journal Article Versions (JAV) schema

\hyxmp@jav@schema Add properties defined by the NISO/ALPSP Journal Article Versions schema [1].

```

1561 \newcommand*{\hyxmp@jav@schema}{%
1562 \hyxmp@add@simple{jav:journal_article_version}{\@pdfpubstatus}%
1563 }

```

### 3.6.12 The XMP Paged-Text schema

\hyxmp@xmptpg@schema The XMP Paged-Text schema [5] includes properties related to the construction of the PDF file itself. We acquire most of this information through LuaTeX mechanisms and therefore include much less information when run from other TeX engines.

```

1564 \newcommand*{\hyxmp@xmptpg@schema}{%
1565 \ifLuaTeX
1566 \luadirect{write_xmp_font_list(\the\hyxmp@cct)}%
1567 \fi
1568 \hyxmp@add@simple{xmpTPg:NPages}{\@pdfnumpages}%
1569 }

```

\hyxmp@cct We store the current category-code table to ensure that `write_xmp_font_list`'s output uses our redefined category codes.

```

1570 \ifLuaTeX
1571 \newcatcodetable\hyxmp@cct
1572 \savecatcodetable\hyxmp@cct
1573 \fi

```

Here we define a Lua function, `write_xmp_font_list`, that writes font information to the XMP packet.

```

1574 \ifLuaTeX
1575 \begin{luacode*}
1576 function write_xmp_font_list (cct)
1577   local function show_field(name, ...)
1578     for i = 1, select("#", ...) do
1579       local val = select(i, ...)
1580       if val then
1581         local xml = string.gsub(val, "&", "&")
1582         xml = string.gsub(xml, "<", "<")
1583         xml = string.gsub(xml, ">", ">")
1584         tex.print(cct, "-----<stFnt:" .. name .. ">" ..
1585                   val .. "</stFnt:" .. name .. ">^J%")
1586       end
1587     end
1588   end

```

```

1589   end
1590   tex.print(cct, "\hyxmp@add@to@xml{%"}
1591   tex.print(cct, "-----<xmpTPg:Fonts>^^J%")
1592   tex.print(cct, "-----<rdf:Bag>^^J%")
1593   for i, f in font.each() do
1594     tex.print(cct, "-----<rdf:li rdf:parseType=\"Resource\">^^J%")
1595     if f.filename then
1596       local info = fontloader.info(f.filename)
1597       show_field("fontFace", info.fullname)
1598       show_field("fontFamily", info.familyname)
1599       show_field("fontName", info.fontname)
1600       show_field("versionString", info.version)
1601       local baseName = string.gsub(f.filename, ".*/[\\"].*", "%1")
1602       show_field("fontFileName", baseName)
1603     else
1604       show_field("fontName", f.psname, f.fullname, f.name)
1605     end
1606     if f.format and f.format ~= "unknown" then
1607       show_field("fontType", f.format)
1608     end
1609     tex.print(cct, "-----</rdf:li>^^J%")
1610   end
1611   tex.print(cct, "-----</rdf:Bag>^^J%")
1612   tex.print(cct, "-----</xmpTPg:Fonts>^^J%")
1613   tex.print(cct, "}")
1614 end
1615 \end{luacode*}
1616 \fi

```

### 3.6.13 XMP extension schemata

Not all of the schemata supported by `hyperxmp` are predefined by XMP. PDF/A conversion would normally fail for documents that employ “custom” schemata. However, this problem can be circumvented by declaring non-standard schemata in the XMP packet itself, following a technique described in a PDF Association technical note [14]. In this section, we declare only those schemata we actually use.

`\hyxmp@check@iptc@data` Define `\hyxmp@iptc@data` as the concatenation of all IPTC photo metadata supplied `\hyxmp@iptc@data` by the document.

```

1617 \newcommand*{\hyxmp@check@iptc@data}{%
1618   \edef\hyxmp@iptc@data{%
1619     \@pdfcontactaddress
1620     \@pdfcontactcity
1621     \@pdfcontactregion
1622     \@pdfcontactpostcode
1623     \@pdfcontactcountry
1624     \@pdfcontactphone
1625     \@pdfcontactemail
1626     \@pdfcontacturl

```

```

1627  }%
1628 }%

\hyxmp@check@prism@data Define \hyxmp@prism@data as the concatenation of all PRISM metadata supplied
\hyxmp@prism@data by the document.

1629 \newcommand*{\hyxmp@check@prism@data}{%
1630   \edef\hyxmp@prism@data{%
1631     \c@pdfbookedition
1632     \c@pdfbytes
1633     \c@pdfdoi
1634     \c@pdffeissn
1635     \c@pdfisbn
1636     \c@pdfissn
1637     \c@pdfissuenum
1638     \c@pdfnumpages
1639     \c@pdfpagerange
1640     \c@pdfpublication
1641     \c@pdfpubtype
1642     \c@pdfsubtitle
1643     \c@pdfurl
1644     \c@pdfvolumenum
1645   }%
1646 }%

\hyxmp@check@jav@data Define \hyxmp@jav@data as the concatenation of all JAV metadata supplied by the
\hyxmp@jav@data document.

1647 \newcommand*{\hyxmp@check@jav@data}{%
1648   \edef\hyxmp@jav@data{%
1649     \c@pdfpubstatus
1650   }%
1651 }

\hyxmp@begin@extension@decls Begin a block of XML tags that indicates we're declaring one or more extension
schemata.

1652 \newcommand*{\hyxmp@begin@extension@decls}{%

### 3.7 Embedding the XMP packet

The PDF specification says that “a metadata stream may be attached to a document through the Metadata entry in the document catalogue” [4] so that’s what we do here.

\hyxmp@embed@packet Determine which `hyperref` driver is in use and invoke the appropriate embedding function.

```
2034 \newcommand*{\hyxmp@embed@packet}{%
2035   \hyxmp@construct@packet
2036   \def\hyxmp@driver{hpdftex}%
2037   \ifx\hyxmp@driver\Hy@driver
2038     \hyxmp@embed@packet@pdftex
2039   \else
2040     \def\hyxmp@driver{hluatex}%
2041     \ifx\hyxmp@driver\Hy@driver
2042       \hyxmp@embed@packet@luatex
2043     \else
2044       \def\hyxmp@driver{hdvipdfm}%
2045       \ifx\hyxmp@driver\Hy@driver
2046         \hyxmp@embed@packet@dvipdfm
2047       \else
2048         \def\hyxmp@driver{hxetex}%
2049         \ifx\hyxmp@driver\Hy@driver
2050           \hyxmp@embed@packet@xetex
2051         \else
2052           \@ifundefined{pdfmark}{%
2053             \PackageWarningNoLine{hyperxmp}{%
2054               Unrecognized hyperref driver '\Hy@driver'.\MessageBreak
2055               \hyxmp@jobname.tex's XMP metadata will *not* be\MessageBreak
2056               embedded in the resulting file}%
2057           }{%
2058             \hyxmp@embed@packet@pdfmark
2059           }%
2060           \fi
2061         \fi
2062       \fi
2063     \fi
2064 }
```

#### 3.7.1 Embedding using pdfTeX

Up to version 0.85, LuaTeX supported the pdfTeX primitives, and `hyperref` didn’t distinguish the two backends. However, from `hyperxmp`’s perspective there is one key difference: the effect of `\pdfcompresslevel` is local to a group in pdfTeX but is global in LuaTeX.

The PDF object representing the XMP packet is supposed to include an uncompressed stream so it can be read by non-PDF-aware tools. However, we don’t want to unnecessarily uncompress *every* PDF stream. The solution, provided by

Hans Hagen on the `luatex` mailing list (thread: “Leaving a single PDF object uncompressed”, 6 JUL 2016), is to provide the `uncompressed` flag to `\pdfobj`. Our definition of `\hyxmp@embed@packet@pdftex` uses the `ifluatex` package to distinguish the `pdftEX` case from the pre-0.85 `LuaTeX` case.

```
2065 \RequirePackage{ifluatex}
```

`\hyxmp@embed@packet@pdftex` Embed the XMP packet using `pdftEX` primitives, which are supported by both `pdftEX` and pre-0.85 `LuaTeX`. The only difference is that in the former case we locally specify `\pdfcompresslevel=0` to leave the PDF object uncompressed while in the latter case we pass the `uncompressed` flag to `\pdfobj` to achieve the same effect.

```
2066 \newcommand*{\hyxmp@embed@packet@pdftex}{%
2067   \bgroup
2068   \ifluatex
2069   \else
2070     \pdfcompresslevel=0
2071   \fi
2072   \immediate\pdfobj \ifluatex uncompressed\fi stream attr {%
2073     /Type /Metadata
2074     /Subtype /XML
2075   }{\hyxmp@xml}%
2076   \pdfcatalog {/Metadata \the\pdflastobj\space 0 R}%
2077 \egroup
2078 }
```

### 3.7.2 Embedding using `LuaTeX 0.85+`

`\hyxmp@embed@packet@luatex` Embed the XMP packet using `LuaTeX 0.85+` primitives.

```
2079 \newcommand*{\hyxmp@embed@packet@luatex}{%
2080   \immediate\pdfextension obj uncompressed stream attr {%
2081     /Type /Metadata
2082     /Subtype /XML
2083   }{\hyxmp@xml}%
2084   \pdfextension catalog {/Metadata \the\numexpr\pdffeedback lastobj\relax\space 0 R}%
2085 }
```

### 3.7.3 Embedding using any `pdfmark`-based backend

`\hyxmp@embed@packet@pdfmark` Embed the XMP packet using `hyperref`’s `\pdfmark` command. I believe `\pdfmark` is used by the `dvipdf`, `dipsone`, `dvips`, `dviwindo`, `nativepdf`, `pdfmark`, `ps2pdf`, `textures`, and `vtexpdfmark` options to `hyperref`, but I’ve tested only a few of those.

```
2086 \newcommand*{\hyxmp@embed@packet@pdfmark}{%
2087   \pdfmark{%
2088     pdfmark=/NamespacePush
2089   }%
2090   \pdfmark{%
2091     pdfmark=/OBJ,
2092     Raw={/_objdef \string{hyxmp@Metadata\string} /type /stream}%
2093 }
```

```

2093 }%
2094 \pdfmark{%
2095   pdfmark=/PUT,
2096   Raw={\string{hyxmp@Metadata\string}}
2097   2 dict begin
2098     /Type /Metadata def
2099     /Subtype /XML def
2100     currentdict
2101   end
2102 }%
2103 }%
2104 \pdfmark{%
2105   pdfmark=/PUT,
2106   Raw={\string{hyxmp@Metadata\string} (\hyxmp@xml)}%
2107 }%
2108 \pdfmark{%
2109   pdfmark=/Metadata,
2110   Raw={\string{Catalog\string} \string{hyxmp@Metadata\string}}%
2111 }%
2112 \pdfmark{%
2113   pdfmark=/NamespacePop
2114 }%
2115 }

```

### 3.7.4 Embedding using dvipdfm

\hyxmp@embed@packet@dvipdfm Embed the XMP packet using dvipdfm-specific \special commands. Note that dvipdfm rather irritatingly requires us to count the number of characters in the \hyxmp@xml stream ourselves.

```

2116 \newcommand*{\hyxmp@embed@packet@dvipdfm}{%
2117   \hyxmp@string@len{\hyxmp@xml}%
2118   \special{pdf: object @hyxmp@Metadata
2119     <<
2120       /Type /Metadata
2121       /Subtype /XML
2122       /Length \the\@tempcnta
2123     >>
2124     stream^~J\hyxmp@xml endstream%
2125   }%
2126   \special{pdf: docview
2127     <<
2128       /Metadata @hyxmp@Metadata
2129     >>
2130   }%
2131 }

```

\hyxmp@string@len Set \@tempcnta to the number of characters in a given string (#1). The approach is first to tally the number of space characters then to tally the number of non-space characters. While this is rather sloppy I haven't found a better way to achieve

the same effect, especially given that all of the characters in #1 have already been assigned their category codes.

```
2132 \newcommand*{\hyxmp@string@len}[1]{%
2133   \tempcnta=0
2134   \expandafter\hyxmp@count@spaces#1 {} %
2135   \expandafter\hyxmp@count@non@spaces#1{}%
2136 }
```

`\hyxmp@count@spaces` Count the number of spaces in a given string. We rely on the built-in pattern matching of TeX's `\def` primitive to pry one word at a time off the head of the input string.

```
2137 \def\hyxmp@count@spaces#1 {%
2138   \def\hyxmp@one@token{#1}%
2139   \ifx\hyxmp@one@token\empty
2140     \advance\tempcnta by -1
2141   \else
2142     \advance\tempcnta by 1
2143   \expandafter\hyxmp@count@spaces
2144   \fi
2145 }
```

`\hyxmp@count@non@spaces` Count the number of non-spaces in a given string. Ideally, we'd count both spaces and non-spaces but TeX won't bind #1 to a space character (category code 10). Hence, in each iteration, #1 is bound to the next non-space character only.

```
2146 \newcommand*{\hyxmp@count@non@spaces}[1]{%
2147   \def\hyxmp@one@token{#1}%
2148   \ifx\hyxmp@one@token\empty
2149   \else
2150     \advance\tempcnta by 1
2151     \expandafter\hyxmp@count@non@spaces
2152   \fi
2153 }
```

### 3.7.5 Embedding using X<sub>E</sub>T<sub>E</sub>X

`\hyxmp@embed@packet@xetex` Embed the XMP packet using `xvipdfmx`-specific `\special` commands. I don't know how to tell `xvipdfmx` always to leave the Metadata stream uncompressed, so the XMP metadata is likely to be missed by non-PDF-aware XMP viewers.

```
2154 \newcommand*{\hyxmp@embed@packet@xetex}{%
2155   \special{pdf:stream @hyxmp@Metadata (\hyxmp@xml)
2156   <<
2157     /Type /Metadata
2158     /Subtype /XML
2159   >>
2160   }%
2161   \special{pdf:put @catalog
2162   <<
2163     /Metadata @hyxmp@Metadata
```

```

2164     >>
2165 }%
2166 }

```

### 3.8 Final clean-up

As explained in Section 3.1, all invocations of `\AtEndPreamble` have been stored in `\hyxmp@aep@toks` rather than executed. Now that `hyperxmp` has been initialized completely, it is finally safe to execute the accumulated `\AtEndPreamble` stanzas.

```
2167 \the\hyxmp@aep@toks
```

Having saved the category code of “`"`” at the start of the package code (Section 3.1), we now restore that character’s original category code.

```
2168 \catcode`\"=\hyxmp@dq@code
```

## 4 Help Wanted

**Comma handling** Ideally, `\xmpquote` should automatically replace all commas with `\xmpcomma`. Unfortunately, my `TeX` skills are insufficient to pull that off. If you know a way to make `\xmpquote{Hello, world}` work with both Unicode and non-Unicode encodings and with all `TeX` engines (`pdfTeX`, `LuaTeX`, `XeTeX`, etc.), please send me a code patch.

## A Sample XMP Packet

The following is an example of a complete XMP packet as may be produced by `hyperxmp`. This packet corresponds to the metadata included in the sample L<sup>A</sup>T<sub>E</sub>X document presented on pages 10–11. For clarity, metadata values, either specified explicitly by the document or introduced automatically by `hyperxmp`, are colored blue.

```

## Change History

v1.0		X <sub>E</sub> T <sub>E</sub> backend ( <code>xdvipdfmx</code> ) . . . 1
General: Initial version . . . . .	1	Added support for the Photoshop schema . . . . . 1
v1.1		Made the package compatible with <code>ngerman</code> . Thanks to Tobias Mueller for the bug report. . . . . 18
\hyxmp@construct@packet:		
Explicitly set the category codes of characters $\langle EF \rangle$ , $\langle BB \rangle$ , and $\langle BF \rangle$ to “letter”. Thanks to Daniel Schömer for the bug report . . . . .	84	v1.3
		General: Introduced the <code>pdfmetalang</code> package option, which enables an author to
v1.2		
General: Added support for the		

specify the language in which he wrote the document's metadata	33
<b>v1.4</b>	
\hyxmp@mm@schema:	Renamed the xapMM namespace prefix to xmpMM . . . . .
\hyxmp@rdf@dc:	Included metadata in the x-default language regardless of the specified metadata language . . . . .
\hyxmp@xmpRights@schema:	Renamed the xapRights namespace prefix to xmpRights . . . . .
<b>v1.5</b>	
General:	Made the XMP inclusion more robust. Thanks to Heiko Oberdiek for the bug report and suggested modifications. . . . .
<b>v2.0</b>	
\ProcessKeyvalOptions:	Added this macro . . . . .
\XMPTruncateList:	Added this macro . . . . .
\hyxmp@ProcessKeyvalOptions:	Added this macro . . . . .
\hyxmp@SpaceOther:	Added by Heiko Oberdiek . . . . .
\hyxmp@add@simple:	Added this macro . . . . .
\hyxmp@add@to@xml:	Updated also to replace commas . . . . .
\hyxmp@bom:	Added by Heiko Oberdiek . . . . .
\hyxmp@comma:	Added this macro . . . . .
\hyxmp@construct@packet:	Modified by Heiko Oberdiek to use an appropriate BOM representation via \hyxmp@bom . . . . .
\hyxmp@crap@convert:	Added by Heiko Oberdiek . . . . .
\hyxmp@crap@test:	Added by Heiko Oberdiek . . . . .
\hyxmp@dc@schema:	Added support for dc:language and dc:source . . . . .
\hyxmp@is@unicode:	Added by Heiko Oberdiek . . . . .
\hyxmp@list@to@xml:	Modified by Heiko Oberdiek to use the new Unicode-processing macros . . . . .
<b>v2.1</b>	
\hypersetup:	Added this macro . . . . .
\hyxmp@photoshop@schema:	Simplified using \hyxmp@add@simple . . . . .
\hyxmp@skiptorelax:	Added by Heiko Oberdiek . . . . .
\hyxmp@skipzeros:	Added by Heiko Oberdiek . . . . .
\hyxmp@toxml:	Added by Heiko Oberdiek . . . . .
\hyxmp@toxml@unicodetex:	Added by Heiko Oberdiek . . . . .
\hyxmp@xetex@crap:	Added by Heiko Oberdiek . . . . .
\hyxmp@xmlify:	Completely rewritten by Heiko Oberdiek to better support Unicode-enabled TeX programs . . . . .
\hyxmp@xmp@basic@schema:	Added this macro . . . . .
\hyxmp@xmpRights@schema:	Modified to include xmpRights:Marked only when pdfcopyright is specified and xmpRights:WebStatement only when pdflicenseurl is specified . . . . .
\hyxmp@zero:	Added by Heiko Oberdiek . . . . .
\ifhyxmp@unicodetex:	Added by Heiko Oberdiek . . . . .
\xmpcomma:	Added this macro . . . . .
\xmpquote:	Added this macro . . . . .
General:	Added support for the XMP Basic schema and miscellaneous other bits of metadata . . . . .
Heiko Oberdiek's major rewrite of the code to better support native-Unicode TeX implementations (XeTeX and LuaTeX) . . . . .	1
New \AtBeginDocument code from Heiko Oberdiek to properly encode \pdfmetalang . . . . .	33

\hyxmp@hypersetup: Added this macro	30	conform to the latest XMP specifications, a detail identified by Florian Breitwieser	68
\hyxmp@redefine@Hyp: Added this macro	28	\hyxmp@parse@time: Added this macro	44
General: Enabled hyperxmp and hyperref to be loaded in either order. This addresses a bug report by Yury Donskoy	28	\hyxmp@parse@tz: Added this macro	44
v2.2		\hyxmp@parse@tz@char: Added this macro	44
\hyxmp@iptc@extensions: Added this macro to support PDF/A generation	80	\hyxmp@pdf@schema: Made \hyxmp@pdf@schema always include the Adobe PDF schema, even when empty. Florian Breitwieser noted that this is necessary for PDF/A-1b compliance	64
\hyxmp@iptc@schema: Added this macro	72	\hyxmp@pdf@to@xmp@date: Added this macro	44
\hyxmp@list@to@lines: Added this macro	72	\hyxmp@pdfa@id@schema: Added this macro	71
\xmpcomma: Changed the default from \relax to an ordinary comma	42	\hyxmp@today@xmp: Modified the code to parse the time and timezone from \pdfcreationdate, as proposed by Florian Breitwieser	47
\xmplinesep: Added this macro	71	\hyxmp@today@xmp@define: Added this macro	47
General: Added support for the IPTC Photo Metadata schema	1	\hyxmp@xmp@to@pdf@date: Added this macro	45
v2.3		\xmptilde: Added this macro	43
\hyxmp@iptc@extensions: Gave the lptc4xmpCore:CreatorContactInfo fields a unique pdfaType:prefix to better support conversion of the document to PDF/A	80	General: Added support for the PDF/A Identification schema, as requested by Florian Breitwieser	1
v2.3a		v2.5	
\hyxmp@detect@langs: Bug fix: Redefine \@pdflang as \@empty when hyperref has set it to \relax	41	\hyxmp@add@to@xml: Updated also to replace underscores and to modify only the text being added, not the already-modified text	61
v2.3b		\hyxmp@textunderscore: Added this macro	20
\XMPTruncateList: Made all definitions local to avoid spurious Too many unprocessed floats errors when running with memoir	43	\hyxmp@uscore: Added this macro	42
v2.4		General: Enabled “\_” to work within email addresses, as requested by Leonid Sinev	1
\hyxmp@add@simple@var: Added this macro	55	v2.6	
\hyxmp@create@uuid: Modified this macro to produce a proper version 4 (random or pseudorandom) UUID	60	General: Added support for a new pdfdate key to explicitly specify	
\hyxmp@dc@schema: Made dc:language a Bag instead of an individual item so as to			

	the document date (and optionally time) . . . . .	1		
v2.7			Robert Schlicht, Leonid Sinev, and David Carlisle for bug reports and to Leonid Sinev for helping test the new <code>hyperxmp</code> code . . . . .	1
	<code>\hyxmp@auto@assign@data:</code>			
	Automatically use <code>\title</code> and <code>\author</code> if <code>pdftitle</code> and <code>pdfauthor</code> are left unspecified. Thanks to Maciej Radziejewski for the suggestion . . . . .	35		
v2.8				
	<code>\hyxmp@add@to@xml:</code> Corrected inadvertent lowercasing of non-Latin characters when run under X <sub>E</sub> LATEX or LuaLATEX (bug reported by Leonid Sinev)	61	<code>\hyxmp@embed@packet@luatex:</code>	
			Updated to use <code>\pdfextension</code> <code>obj uncompressed</code> as suggested by Hans Hagen . . . . .	87
v2.9			<code>\hyxmp@embed@packet@pdftex:</code>	
	<code>\hyxmp@iptc@schema:</code> Use <code>lptc4xmpCore</code> instead of <code>lptc4ContInfo</code> as the contact-information metadata prefix. Leonid Sinev reports that Acrobat's PDF/A validator seems to prefer <code>lptc4xmpCore</code> .	72	Leave the XMP packet—and only the XMP packet—uncompressed in both pdfTEX and pre-0.85 LuaTEX	87
	<code>\hyxmp@pdfa@id@schema:</code> Let the author specify the PDF/A part and conformance IDs, as requested by Leonid Sinev . . .	71		
	General: Force inclusion of <code>dc:creator</code> , <code>dc:title</code> , and <code>dc:description</code> —even if empty—when <code>hyperref</code> is loaded with the <code>pdfa</code> option (suggested by Leonid Sinev) . . . . .	1	<code>\hyxmp@cas@pdf@date:</code> Added this macro . . . . .	45
v3.0			<code>\hyxmp@cas@xmp@date:</code> Added this macro . . . . .	44
	<code>\hyxmp@embed@packet@luatex:</code>		<code>\hyxmp@today@xmp@define:</code>	
	Added this macro . . . . .	87	Modified to include hours and minutes . . . . .	47
	<code>\hyxmp@today@xmp@define:</code>		<code>\hyxmp@xmp@basic@schema:</code> Honor <code>hyperref</code> 's <code>pdfcreationdate</code> and <code>pdfmoddate</code> options plus a new <code>pdfmetadate</code> option. Leonid Sinev requested this additional control and helped test the resulting <code>hyperxmp</code> code . . . . .	70
v3.1				
	<code>\@pdfsource:</code> Added this macro and the corresponding <code>pdfsource</code> option, at Niklas Beisert's request . . . . .	24	<code>\XMPLangAlt:</code> Added this macro based on a request—and some code—by Niklas Beisert to support metadata expressed in multiple languages . . . . .	57
	<code>\hyxmp@rdf@dc:</code> Bug fix: Output the metadata language as correct XML even when <code>hyperref</code> is loaded with the <code>unicode</code> option . . . . .	64		
	General: Don't overwrite an existing <code>pdfmetalang</code> with <code>pdflang</code> or <code>x-default</code> . This addresses a bug report by Niklas Beisert . . . . .	33		

v3.4	
\hyxmp@seed@string:	Correctly handle an author field of all spaces. Bug reported by Gaëtan Leurent . . . . . 60
General:	Use ifmtarg to test for empty arguments, including non-empty but all spaces . . . . . 1
v3.5	
\hyxmp@DocumentID:	Added the pdfdocumentid option, at Michael Osipov's request . . . . . 24
\hyxmp@InstanceID:	Added the pdfinstanceid option, at Michael Osipov's request . . . . . 24
\hyxmp@mme@schema:	Generate \hyxmp@DocumentID and \hyxmp@InstanceID only if the document does not already define these using the pdfdocumentid and pdfinstanceid options . . . . . 69
\hyxmp@seed@string:	Seed with the T <sub>E</sub> X timestamp in addition to the document-specified timestamp . . . . . 60
v4.0	
\XMPTruncateList:	Deprecated this macro . . . . . 43
\hyxmp@add@simple@lang:	Added this macro . . . . . 56
\hyxmp@begin@ext@decl:	Added this macro . . . . . 77
\hyxmp@declare@field:	Replaced \hyxmp@declare@resource with this macro . . . . . 77
\hyxmp@declare@property:	Added this macro . . . . . 77
\hyxmp@end@ext@decl:	Added this macro . . . . . 77
\hyxmp@iptc@extensions:	Moved the header code from here into \hyxmp@begin@extension@decls and the trailer code from here into \hyxmp@end@extension@decls . . . . . 80
Rewrote to more closely honor the XMP specification . . . . . 80	
\hyxmp@iptc@schema:	Moved the definition of \hyxmp@iptc@data from here into
\hyxmp@check@iptc@data	Renamed this macro to \hyxmp@iptc@schema from \hyxmp@photometa@schema . . . . . 72
Rewrote this macro entirely to correct the use of fields within a structure . . . . . 72	
\hyxmp@mme@extensions:	Added this macro . . . . . 78
\hyxmp@mme@schema:	Include xmpMM:VersionID in the XMP packet . . . . . 69
\hyxmp@no@info@lists:	Added this macro . . . . . 27
\hyxmp@pdfa@id@extensions:	Added this macro . . . . . 78
\hyxmp@prism@extensions:	Added this macro . . . . . 81
\hyxmp@prism@schema:	Added this macro . . . . . 73
General:	Include all metadata within a single rdf:Description block . . . . . 1
v4.1	
\hyxmp@singleton@dc:	Added this macro . . . . . 67
General:	Invoke \hyxmp@no@info@lists at the beginning of the document, for compatibility with both newer and older versions of hyperref . . . . . 33
Updated the documentation to refer to \pdfnumpages by its correct name. Thanks to Volker RW Schaa for catching the discrepancy . . . . . 1	
v5.0	
@\pdfredition:	Added the pdfredition option . . . . . 24
@\pdfxstandard:	Added this macro . . . . . 23
\hyxmp@add@simple:	Insert the tag name (#1) verbatim . . . . . 55
\hyxmp@check@standards:	Added this macro . . . . . 32
\hyxmp@check@std:	Added this macro . . . . . 23
\hyxmp@declare@property:	Insert the property name (#2) verbatim . . . . . 77

\hyxmp@define@pdfproducer:	Added this macro .....	62
\hyxmp@no@info@lists:	Renamed this macros from \hyxmp@suppress@pdf@metadata and rewrote it to replace, if possible, only Author and Keywords .....	27
\hyxmp@pdf@extensions:	Added this macro .....	78
\hyxmp@pdf@schema:	Honor pdfrapped .....	64
\hyxmp@pdfua@id@extensions:	Added this macro .....	79
\hyxmp@pdfua@id@schema:	Added this macro .....	71
\hyxmp@pdfx@id@extensions:	Added this macro .....	79
\hyxmp@pdfx@id@schema:	Added this macro .....	71
\hyxmp@today@pdf:	Added this macro .....	48
\hyxmp@today@xmp:	Support X <sub>E</sub> T <sub>X</sub> 's \filemoddate .....	47
\hyxmp@today@xmp@define:	Modified to specify UTC .....	47
General:	Added support for PDF/UA standards, as requested by Robin Schwab .....	1
	Added support for PDF/X standards, as requested by Robin Schwab .....	1
Define a default producer .....	63	
Don't set any document dates (creation, modification, or metadata) from pdfdate .....	1	
v5.1		
\hyxmp@banner@to@producer:	Prevent the category code of "@" from propagating past the \begin{document}. Thanks to Robert Schlicht for noticing this catcode "leak" and providing a correction .....	63
\hyxmp@define@pdfproducer:	Check for LuaT <sub>X</sub> before checking for pdfT <sub>X</sub> to work around luatex85's confusing iftex by defining \pdftexversion. Thanks to	
	Robin Schwab for the bug report .....	62
\hyxmp@timestamp:	Don't rely on \jobname.aux existing to query the current time under X <sub>E</sub> T <sub>X</sub> . Instead, use \jobname.log. Thanks to Ulrike Fischer for the bug report and for her suggestion to use the log file. . .	48
v5.2		
\hyxmp@add@simple@pfx:	Added this macro .....	56
\hyxmp@assign@major@minor:	Added this macro. hyperxmp now correctly specifies pdf:PDFVersion when generating PDF 2.0+. Thanks to Ulrike Fischer for alerting me to PDF 2.0's availability in the T <sub>E</sub> X ecosystem and informing me how to activate it	63
\hyxmp@cond@dc@identifier:	Added this macro .....	67
\ifdraft:	Define \ifdraft only locally, at Niklas Beisert's request .....	24
General:	Introduced the pdfidentifier package option, which enables an author to specify a unique identifier for the document .....	1
v5.3		
\@if@def@and@nonempty:	Added this macro .....	20
\hyxmp@at@end:	Use \AtEndDocument in all T <sub>E</sub> X back ends that provide it. Thanks to Nelson Posse Lago for pointing out why atenddvi is best avoided if possible .....	19
\hyxmp@auto@assign@data:	Consider other author-provided sources of metadata. Thanks to Robin Schwab for proposing that hyperxmp use the Koma letter classes's metadata .....	35
\hyxmp@dc@schema:	Include all languages used in the document in dc:language .....	68

\hyxmp@detect@langs:	Acquire the default language from the <i>polyglossia</i> package, if loaded.	
Thanks to Robin Schwab for bringing that package to my attention . . . . .	40	
\hyxmp@parse@acmart:	Added this macro . . . . .	37
\hyxmp@set@koma@phones:	Added this macro . . . . .	34
\hyxmp@use@first@valid:	Added this macro . . . . .	34
v5.4		
\hyxmp@dc@schema:	Bug fix: Use \hyxmp@today@xmp as the date only if \pdfdate is undefined . . . . .	68
\hyxmp@detect@langs:	Added support for babel . . . . .	41
Refactored language detection into a separate command . . . . .	40	
\hyxmp@parse@acmart:	Bug fix: Correct a missing “else” argument in two invocations of \if@def@and@nonempty . . . . .	39
General:	Moved the automatic assignment of \pdflang and \pdfmetalang from \hyxmp@auto@assign@data to within a call to \hyxmp@at@end . . . . .	33
v5.5		
\hyxmp@auto@assign@data:	Moved the language-detection and X <sub>E</sub> T <sub>E</sub> X date-detection code here from the \hyxmp@at@end block . . . . .	35
Moved title and author autodetection to the \AtEndPreamble . . . . .	35	
Use LuaT <sub>E</sub> X mechanisms, when available, to automatically compute the page count . . . . .	35	
\hyxmp@detect@langs:	Set the language(s) immediately instead of deferring them to \hyxmp@set@dc@lang . . . . .	40
Store the main language in \pdflang. Thanks to Javier Bezos for his help with the hyperxmp code and for		
modifying <i>babel</i> for hyperxmp’s benefit . . . . .	41	
\hyxmp@jav@extensions:	Added this macro . . . . .	83
\hyxmp@jav@schema:	Added this macro . . . . .	74
\hyxmp@mm@extensions:	Corrected the type of xmpMM:RenditionClass.	
Thanks to Thorsten Wißmann for the bug report and patch . . . . .	78	
\hyxmp@query@self:	Added this macro . . . . .	37
\hyxmp@rdf@dc:	List x-default alternatives before language-specific alternatives, as dictated by the XMP specification [5] . . . . .	64
Rewrite the core part of this macro to divide it into four, cleanly defined cases . . . . .	64	
\hyxmp@set@koma@phones:	Support hyperlinks and other markup in frommobilephone and fromphone, as requested by Robin Schwab . . . . .	34
\hyxmp@xmptpg@schema:	Added this macro . . . . .	74
General:	Automatically assign pdfnumpages and pdfbytes under pdfl <sub>A</sub> T <sub>E</sub> X and Lu <sub>A</sub> T <sub>E</sub> X . . . . .	1
Copy \title to pdftitle and \author to pdfauthor at the start of the document to improve consistency between XMP and PDF metadata . . . . .	33	
Correctly handle source files with spaces in their name. Thanks to Peter Dyballa for the bug report . . . . .	19	
Defer \AtEndPreamble execution until the end of the document. This enables hyperxmp itself to be loaded from \AtEndPreamble, as is done by doclicense v2.2.0. Thanks to Tommaso Pecorella for the bug report and help testing . . . . .	1	
Introduced the pdfpubstatus package option, which enables		

an author to specify the document's publication status.	the document does not do so explicitly, as requested by
Thanks to Robin Schwab for pointing me to the Journal Article Versions	Robin Schwab . . . . . 32
recommendation [1] . . . . . 1	Move most of the <code>\AtEndPreamble</code> code to
Load hyperref automatically if	<code>\hyxmp@at@end</code> . . . . . 33

## Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
