

The `intopdf` package*

Marcel Krüger
`tex@2krueger.de`

May 28, 2019

This package defines a command `\attachandlink` which allows to attach an arbitrary file to your PDF document and linking to it from the main text. It is inspired by the T_EXStack Exchange question [Embed non-PDF files \(e.g., BibTeX\) into PDF with hyperlink in the PDF](#). The engines pdfL^AT_EX and LuaL^AT_EX are supported.

1 Usage

`\attachandlink` [*filespec*] {*filename*} [*mime-type*] {*Description*} {*link text*}

The text *link text* is inserted, linking to the file *filename* which is attached to the document.

Description should be a description of the file and will be shown by the PDF viewer in the attached files section and sometimes in a mouseover tooltip.

mime-type should be the MIME-Type of *filename*. Currently *mime-type* is mandatory but I hope to make it optional in a later release. Additionally *filespec* can be used to specify the filename which will be shown in the PDF viewer. If this is not given, it will default to *filename*.

2 Example

The source of the document is attached here.

```
The source of the document is attached
\attachandlink{intopdf.dtx}[application/x-tex]
{The source of this document}{here}.
```

3 The implementation

`1 <@=intopdf>`

Only pdfL^AT_EX and LuaL^AT_EX are supported. For other engines we show an error.

```
2 \msg_new:nnnn{intopdf}{engine-unsupported}
3   {Your~TeX~engine~is~not~supported~by~intopdf.}
4   {To~use~intopdf,~you~have~to~use~pdfLaTeX~or~LuaLaTeX.}
```

Then we define some wrappers for the primitives.

*This document corresponds to `intopdf` 0.2.1, dated 2019/05/28.

```

Change History

v0.0.1

General: Initial version

v0.1.0

General: Added LuaL^AT_EX support ...

v0.2.0

\intopdf_attach_link:nnnn: Added
filespec support. (The first

optional argument) Added

\intopdf_attach_link:nnnnn. . . 3
