## Implementation

### 1 l3draw implementation

```
1  {*initex | package}
2  <@=draw>
3  {*package}
4  \ProvidesExplPackage{l3draw}{2019-10-11}{}{%
5    {L3 Experimental core drawing support}}
6  </package>
7  \RequirePackage { 13color }
8
  Everything else is in the sub-files!
</initex | package>
```

### 2 l3draw-boxes implementation

```
9  {*initex | package}
10 <@=draw>
```

Inserting boxes requires us to “interrupt” the drawing state, so is closely linked to scoping. At the same time, there are a few additional features required to make text work in a flexible way.

```
\l__draw_tmp_box
11 \box_new:N \l__draw_tmp_box
(End definition for \l__draw_tmp_box.)
```

\draw\_box\_use:N  
\\_draw\_box\_use:Nnnn

Before inserting a box, we need to make sure that the bounding box is being updated correctly. As drawings track transformations as a whole, rather than as separate operations, we do the insertion using an almost-raw matrix. The process is split into two so that coffins are also supported.

```
12 \cs_new_protected:Npn \draw_box_use:N #1

26      { \draw_point_transform:n { #4 , #3 } }
27      \_draw_point_process:nn
28      { \_draw_path_update_limits:nn }

57 }
```

(End definition for `\draw_box_use:N` and `\__draw_box_use:Nnnnn`. This function is documented on page ??.)

`\draw_coffin_use:Nnn` Slightly more than a shortcut: we have to allow for the fact that coffins have no apparent width before the reference point.

```

58 \cs_new_protected:Npn \draw_coffin_use:Nnn #1#2#3

### 3.1 User interface

```
\draw_layer_new:n
 73 \cs_new_protected:Npn \draw_layer_new:n #1
 74  {
 75    \str_if_eq:nnTF {#1} { main }
 76    { \msg_error:nnn { draw } { main-reserved } }
 77    {
 78      \box_new:c { g__draw_layer_ #1 _box }
 79      \box_new:c { l__draw_layer_ #1 _box }
 80    }
 81  }
```

(End definition for `\draw_layer_new:n`. This function is documented on page ??.)

`\l__draw_layer_tl` The name of the current layer: we start off with `main`.

```
 82 \tl_new:N \l__draw_layer_tl
 83 \tl_set:Nn \l__draw_layer_tl { main }
```

(End definition for `\l__draw_layer_tl`.)

`\l__draw_layer_close_bool` Used to track if a layer needs to be closed.

```
 84 \bool_new:N \l__draw_layer_close_bool
```

(End definition for `\l__draw_layer_close_bool`.)

`\l_draw_layers_clist` The list of layers to use starts off with just the `main` one.

```
\g__draw_layers_clist
 85 \clist_new:N \l_draw_layers_clist
 86 \clist_set:Nn \l_draw_layers_clist { main }
 87 \clist_new:N \g__draw_layers_clist
```

(End definition for `\l_draw_layers_clist` and `\g__draw_layers_clist`. This variable is documented on page ??.)

`\draw_layer_begin:n` Layers may be called multiple times and have to work when nested. That drives a bit of grouping to get everything in order. Layers have to be zero width, so they get set as we go along.

```
 88 \cs_new_protected:Npn \draw_layer_begin:n #1
 89  {
 90    \group_begin:

 97        \tl_set:Nn \l__draw_layer_tl {#1}
 98        \box_gset_wd:cn { g__draw_layer_ #1 _box } { Opt }
 99        \hbox_gset:cw { g__draw_layer_ #1 _box }

101        \group_begin:
102      }
103      \draw_lineWidth:n { \l__draw_default_lineWidth_dim }
```

```

104      }
105      {
106          \str_if_eq:nnTF {##1} { main }
107              { \msg_error:nnn { draw } { unknown-layer } {##1} }
108              { \msg_error:nnn { draw } { main-layer } }
109      }
110  }
111 \cs_new_protected:Npn \draw_layer_end:
112  {
113      \bool_if:NT \l__draw_layer_close_bool
114      {
115          \group_end:
116          \hbox_gset_end:

## 4 **l3draw-paths** implementation

```

171 <*initex | package>
172 <@=draw>
```

This sub-module covers more-or-less the same ideas as `pgfcorepathconstruct.code.tex`, though using the expandable FPU means that the implementation often varies. At present, equivalents of the following are currently absent:

- `\pgfpatharc`, `\pgfpatharctoprecomputed`: These are extremely specialised and are very complex in implementation. If the functionality is required, it is likely that it will be set up from scratch here.
- `\pgfpathparabola`: Seems to be unused other than defining a TikZ interface, which itself is then not used further.
- `\pgfpathsine`, `\pgfpathcosine`: Need to see exactly how these need to work, in particular whether a wider input range is needed and what approximation to make.
- `\pgfpathcurvebetween`, `\pgfpathcurvebetweencontinues`: These don't seem to be used at all.

`\l__draw_path_tmp_t1` Scratch space.

```

\l__draw_path_tmpa_fp
\l__draw_path_tmpb_fp
173 \tl_new:N \l__draw_path_tmp_t1
174 \fp_new:N \l__draw_path_tmpa_fp
175 \fp_new:N \l__draw_path_tmpb_fp
```

(End definition for `\l__draw_path_tmp_t1`, `\l__draw_path_tmpa_fp`, and `\l__draw_path_tmpb_fp`.)

## 4.1 Tracking paths

```
\g__draw_path_lastx_dim           The last point visited on a path.
\g__draw_path_lasty_dim           \dim_new:N \g__draw_path_lastx_dim
                                  \dim_new:N \g__draw_path_lasty_dim
(End definition for \g__draw_path_lastx_dim and \g__draw_path_lasty_dim.)
```

```
\g__draw_path_xmax_dim            The limiting size of a path.
\g__draw_path_xmin_dim
\g__draw_path_ymax_dim
\g__draw_path_ymin_dim
\dim_new:N \g__draw_path_xmax_dim
\dim_new:N \g__draw_path_xmin_dim
\dim_new:N \g__draw_path_ymax_dim
\dim_new:N \g__draw_path_ymin_dim
(End definition for \g__draw_path_xmax_dim and others.)
```

`\_draw_path_update_limits:nn` Track the limits of a path and (perhaps) of the picture as a whole. (At present the latter is always true: that will change as more complex functionality is added.)

```
\cs_new_protected:Npn \_draw_path_update_limits:nn #1#2
{
    \dim_gset:Nn \g__draw_path_xmax_dim
        { \dim_max:nn \g__draw_path_xmax_dim {#1} }
    \dim_gset:Nn \g__draw_path_xmin_dim
        { \dim_min:nn \g__draw_path_xmin_dim {#1} }
    \dim_gset:Nn \g__draw_path_ymax_dim
        { \dim_max:nn \g__draw_path_ymax_dim {#2} }
    \dim_gset:Nn \g__draw_path_ymin_dim
        { \dim_min:nn \g__draw_path_ymin_dim {#2} }
    \bool_if:NT \l_draw_bb_update_bool
    {
        \dim_gset:Nn \g__draw_xmax_dim
            { \dim_max:nn \g__draw_xmax_dim {#1} }
        \dim_gset:Nn \g__draw_xmin_dim
            { \dim_min:nn \g__draw_xmin_dim {#1} }
        \dim_gset:Nn \g__draw_ymax_dim
            { \dim_max:nn \g__draw_ymax_dim {#2} }
        \dim_gset:Nn \g__draw_ymin_dim
            { \dim_min:nn \g__draw_ymin_dim {#2} }
    }
}
\cs_new_protected:Npn \_draw_path_reset_limits:
{
    \dim_gset:Nn \g__draw_path_xmax_dim { -\c_max_dim }
    \dim_gset:Nn \g__draw_path_xmin_dim { \c_max_dim }
    \dim_gset:Nn \g__draw_path_ymax_dim { -\c_max_dim }
    \dim_gset:Nn \g__draw_path_ymin_dim { \c_max_dim }
}
```

(End definition for \\_draw\_path\_update\_limits:nn and \\_draw\_path\_reset\_limits:.)

`\_draw_path_update_last:nn` A simple auxiliary to avoid repetition.

```
\cs_new_protected:Npn \_draw_path_update_last:nn #1#2
{
    \dim_gset:Nn \g__draw_path_lastx_dim {#1}
    \dim_gset:Nn \g__draw_path_lasty_dim {#2}
}
```

(End definition for `\_draw_path_update_last:nn`.)

## 4.2 Corner arcs

At the level of path *construction*, rounded corners are handled by inserting a marker into the path: that is then picked up once the full path is constructed. Thus we need to set up the appropriate data structures here, such that this can be applied every time it is relevant.

`\l__draw_corner_xarc_dim` The two arcs in use.

```
216 \dim_new:N \l__draw_corner_xarc_dim  
217 \dim_new:N \l__draw_corner_yarc_dim
```

(End definition for `\l__draw_corner_xarc_dim` and `\l__draw_corner_yarc_dim`.)

`\l__draw_corner_arc_bool` A flag to speed up the repeated checks.

```
218 \bool_new:N \l__draw_corner_arc_bool
```

(End definition for `\l__draw_corner_arc_bool`.)

`\draw_path_corner_arc:nn` Calculate the arcs, check they are non-zero.

```
219 \cs_new_protected:Npn \draw_path_corner_arc:nn #1#2  
220 {  
221     \dim_set:Nn \l__draw_corner_xarc_dim {\#1}  
222     \dim_set:Nn \l__draw_corner_yarc_dim {\#2}  
223     \bool_lazy_and:nnTF  
224         { \dim_compare_p:nNn \l__draw_corner_xarc_dim = { Opt } }  
225         { \dim_compare_p:nNn \l__draw_corner_yarc_dim = { Opt } }  
226         { \bool_set_false:N \l__draw_corner_arc_bool }  
227         { \bool_set_true:N \l__draw_corner_arc_bool }  
228 }
```

(End definition for `\draw_path_corner_arc:nn`. This function is documented on page ??.)

`\_draw_path_mark_corner:` Mark up corners for arc post-processing.

```
229 \cs_new_protected:Npn \_draw_path_mark_corner:  
230 {  
231     \bool_if:NT \l__draw_corner_arc_bool  
232     {  
233         \_draw_softpath_roundpoint:VV  
234         \l__draw_corner_xarc_dim  
235         \l__draw_corner_yarc_dim  
236     }  
237 }
```

(End definition for `\_draw_path_mark_corner:..`)

### 4.3 Basic path constructions

\draw\_path\_lineto:n  
\\_draw\_path\_moveto:nn  
\\_draw\_path\_lineto:nn  
\draw\_path\_curveto:nnn  
\\_draw\_path\_curveto:nnnnnn

At present, stick to purely linear transformation support and skip the soft path business: that will likely need to be revisited later.

281 }
```

(End definition for \draw\_path\_moveto:n and others. These functions are documented on page ??.)

\draw\_path\_close: A simple wrapper.

## 4.4 Canvas path constructions

Operations with no application of the transformation matrix.

291 \cs_new_protected:Npn \draw_path_canvas_curveto:nnn #1#2#3
292   {
293     \__draw_point_process:nnnn
294     {
295       \__draw_path_mark_corner:

(End definition for `\draw_path_canvas_moveto:n`, `\draw_path_canvas_lineto:n`, and `\draw_path_canvas_curveto:nnn`. These functions are documented on page ??.)

## 4.5 Computed curves

More complex operations need some calculations. To assist with those, various constants are pre-defined.

A quadratic curve with one control point  $(x_c, y_c)$ . The two required control points are then

$$x_1 = \frac{1}{3}x_s + \frac{2}{3}x_c \quad y_1 = \frac{1}{3}y_s + \frac{2}{3}y_c$$

and

Drawing an arc means dividing the total curve required into sections: using Bézier curves we can cover at most  $90^\circ$  at once. To allow for later manipulations, we aim to have roughly equal last segments to the line, with the split set at a final part of  $115^\circ$ .

The auxiliary is responsible for calculating the required points. The “magic” number required to determine the length of the control vectors is well-established for a right-angle:  $\frac{4}{3}(\sqrt{2} - 1) = 0.552\,284\,75$ . For other cases, we follow the calculation used by pgf but with the second common case of  $60^\circ$  pre-calculated for speed.

We can now calculate the required points. As everything here is non-expandable, that is best done by using x-type expansion to build up the tokens. The three points are calculated out-of-order, since finding the second control point needs the position of the end point. Once the points are found, fire-off the fundamental path operation and update the record of where we are up to. The final point has to be

Drawing an ellipse is an optimised version of drawing an arc, in particular reusing the same constant. We need to deal with the ellipse in four parts and also deal with moving to the right place, closing it and ending up back at the center. That is handled on a per-arc basis, each in a separate auxiliary for readability.

## 4.8 Using paths

`\l__draw_path_use_clip_bool`

Actions to pass to the driver.

```
639 \bool_new:N \l__draw_path_use_clip_bool
640 \bool_new:N \l__draw_path_use_fill_bool
641 \bool_new:N \l__draw_path_use_stroke_bool
```

(End definition for `\l__draw_path_use_clip_bool`, `\l__draw_path_use_fill_bool`, and `\l__draw_path_use_stroke_bool`.)

`\l__draw_path_use_bb_bool`

Actions handled at the macro layer.

```
642 \bool_new:N \l__draw_path_use_bb_bool
643 \bool_new:N \l__draw_path_use_clear_bool
```

(End definition for `\l__draw_path_use_bb_bool` and `\l__draw_path_use_clear_bool`.)

`\draw_path_use:n`

There are a range of actions which can apply to a path: they are handled in a single function which can carry out several of them. The first step is to deal with the special case of clearing the path.

```
644 \cs_new_protected:Npn \draw_path_use:n #1
645 {
646     \tl_if_blank:nF {#1}
647     { \l__draw_path_use:n {#1} }
648 }
649 \cs_new_protected:Npn \draw_path_use_clear:n #1
650 {

652     { \tl_if_blank_p:n {#1} }
653     { \str_if_eq_p:nn {#1} { clear } }
654     {
655         \l__draw_softpath_clear:
656         \l__draw_path_reset_limits:
657     }
658     { \l__draw_path_use:n {#1, clear} }
659 }
```

Map over the actions and set up the data: mainly just booleans, but with the possibility to cover more complex cases. The business end of the function is a series of checks on the various flags, then taking the appropriate action(s).

## 5 **I3draw-points** implementation

```

785 <*initex | package>
786 <@=draw>

```

This sub-module covers more-or-less the same ideas as `pgfcorepoints.code.tex`, though the approach taken to returning values is different: point expressions here are processed by expansion and return a co-ordinate pair in the form `{(x)}{(y)}`. Equivalents of following pgf functions are deliberately omitted:

- `\pgfpointorigin`: Can be given explicitly as `0pt,0pt`.
- `\pgfpointadd`, `\pgfpointdiff`, `\pgfpointscale`: Can be given explicitly.
- `\pgfextractx`, `\pgfextracty`: Available by applying `\use_i:nn/\use_ii:nn` or similar to the x-type expansion of a point expression.
- `\pgfgetlastxy`: Unused in the entire pgf core, may be emulated by x-type expansion of a point expression, then using the result.

In addition, equivalents of the following *may* be added in future but are currently absent:

- `\pgfpointcylindrical`, `\pgfpointspherical`: The usefulness of these commands is not currently clear.
- `\pgfpointborderrectangle`, `\pgfpointborderellipse`: To be revisited once the semantics and use cases are clear.
- `\pgfqpoint`, `\pgfqpointscale`, `\pgfqpointpolar`, `\pgfqpointxy`, `\pgfqpointxyz`: The expandable approach taken in the code here, along with the absolute requirement for  $\varepsilon$ -TeX, means it is likely many use cases for these commands may be covered in other ways. This may be revisited as higher-level structures are constructed.

Execute whatever code is passed to extract the  $x$  and  $y$  co-ordinates. The first argument here should itself absorb two arguments. There is also a version to deal with two co-ordinates: common enough to justify a separate function.

## 5.3 Point expression arithmetic

These functions all take point expressions as arguments.

The outcome is the normalised vector from  $(0,0)$  in the direction of the point, *i.e.*

$$P_x = \frac{x}{\sqrt{x^2 + y^2}} \quad P_y = \frac{y}{\sqrt{x^2 + y^2}}$$

except where the length is zero, in which case a vertical vector is returned.

## 5.4 Intersection calculations

The intersection point  $P$  between a line joining points  $(x_1, y_1)$  and  $(x_2, y_2)$  with a second line joining points  $(x_3, y_3)$  and  $(x_4, y_4)$  can be calculated using the formulae

$$P_x = \frac{(x_1y_2 - y_1x_2)(x_3 - x_4) - (x_3y_4 - y_3x_4)(x_1 - x_2)}{(x_1 - x_2)(y_3 - y_4) - (y_1 - y_2)(x_3 - x_4)}$$

and

$$P_y = \frac{(x_1y_2 - y_1x_2)(y_3 - y_5) - (x_3y_4 - y_3x_4)(y_1 - y_2)}{(x_1 - x_2)(y_3 - y_4) - (y_1 - y_2)(x_3 - x_4)}$$

The work therefore comes down to expanding the incoming data, then pre-calculating as many parts as possible before the final work to find the intersection. (Expansion and argument re-ordering is much less work than additional floating point calculations.)

```
868 \cs_new:Npn \draw_point_intersect_lines:nnnn #1#2#3#4
869   {
870     \__draw_point_process:nnnnn
871     { \__draw_point_intersect_lines:nnnnnnnn }
872     {#1} {#2} {#3} {#4}
873   }
```

At this stage we have all of the information we need, fully expanded:

```
#1 x1
#2 y1
#3 x2
#4 y2
#5 x3
#6 y3
#7 x4
#8 y4
```

so now just have to do all of the calculation.

```
874 \cs_new:Npn \__draw_point_intersect_lines:nnnnnnnn #1#2#3#4#5#6#7#8
875   {
876     \__draw_point_intersect_lines_aux:fffff
877     { \fp_eval:n { #1 * #4 - #2 * #3 } }
878     { \fp_eval:n { #5 * #8 - #6 * #7 } }
879     { \fp_eval:n { #1 - #3 } }
880     { \fp_eval:n { #5 - #7 } }
881     { \fp_eval:n { #2 - #4 } }
882     { \fp_eval:n { #6 - #8 } }
883   }
884 \cs_new:Npn \__draw_point_intersect_lines_aux:nnnnnn #1#2#3#4#5#6
885   {
886     \__draw_point_to_dim:n
887     {
888       ( #2 * #3 - #1 * #4 , #2 * #5 - #1 * #6 )
889       / ( #4 * #5 - #6 * #3 )
```

```

890     }
891   }
892 \cs_generate_variant:Nn \__draw_point_intersect_lines_aux:nnnnnn { ffffff }

```

Another long expansion chain to get the values in the right places. We have two circles, the first with center  $(a, b)$  and radius  $r$ , the second with center  $(c, d)$  and radius  $s$ . We use the intermediate values

$$\begin{aligned} e &= c - a \\ f &= d - b \\ p &= \sqrt{e^2 + f^2} \\ k &= \frac{p^2 + r^2 - s^2}{2p} \end{aligned}$$

in either

$$\begin{aligned} P_x &= a + \frac{ek}{p} + \frac{f}{p} \sqrt{r^2 - k^2} \\ P_y &= b + \frac{fk}{p} - \frac{e}{p} \sqrt{r^2 - k^2} \end{aligned}$$

or

$$\begin{aligned} P_x &= a + \frac{ek}{p} - \frac{f}{p} \sqrt{r^2 - k^2} \\ P_y &= b + \frac{fk}{p} + \frac{e}{p} \sqrt{r^2 - k^2} \end{aligned}$$

depending on which solution is required. The rest of the work is simply forcing the appropriate expansion and shuffling arguments.

```

893 \cs_new:Npn \draw_point_intersect_circles:nnnnn #1#2#3#4#5
894   {
895     \__draw_point_process:nnn
896     { \__draw_point_intersect_circles_auxi:nnnnnnn {#2} {#4} {#5} }
897     {#1} {#3}
898   }
899 \cs_new:Npn \__draw_point_intersect_circles_auxi:nnnnnnn #1#2#3#4#5#6#7
900   {
901     \__draw_point_intersect_circles_auxii:ffnnnnn
902     { \fp_eval:n {#1} } { \fp_eval:n {#2} } {#4} {#5} {#6} {#7} {#3}
903   }

```

At this stage we have all of the information we need, fully expanded:

```

#1 r
#2 s
#3 a
#4 b
#5 c
#6 d

```

```
#7 n
```

Once we evaluate  $e$  and  $f$ , the co-ordinate  $(c, d)$  is no longer required: handy as we will need various intermediate values in the following.

```

904 \cs_new:Npn \__draw_point_intersect_circles_auxii:nnnnnnnn #1#2#3#4#5#6#7
905 {
906     \__draw_point_intersect_circles_auxiii:ffnnnnnn
907     { \fp_eval:n { #5 - #3 } }
908     { \fp_eval:n { #6 - #4 } }
909     {#1} {#2} {#3} {#4} {#7}
910 }
911 \cs_generate_variant:Nn \__draw_point_intersect_circles_auxii:nnnnnnnn { ff }
912 \cs_new:Npn \__draw_point_intersect_circles_auxiii:nnnnnnnn #1#2#3#4#5#6#7
913 {
914     \__draw_point_intersect_circles_auxiv:fnnnnnnn
915     { \fp_eval:n { sqrt( #1 * #1 + #2 * #2 ) } }
916     {#1} {#2} {#3} {#4} {#5} {#6} {#7}
917 }
918 \cs_generate_variant:Nn \__draw_point_intersect_circles_auxiii:nnnnnnnn { ff }
```

We now have  $p$ : we pre-calculate  $1/p$  as it is needed a few times and is relatively expensive. We also need  $r^2$  twice so deal with that here too.

```

919 \cs_new:Npn \__draw_point_intersect_circles_auxiv:nnnnnnnn #1#2#3#4#5#6#7#8
920 {
921     \__draw_point_intersect_circles_auxv:ffnnnnnnn
922     { \fp_eval:n { 1 / #1 } }
923     { \fp_eval:n { #4 * #4 } }
924     {#1} {#2} {#3} {#5} {#6} {#7} {#8}
925 }
926 \cs_generate_variant:Nn \__draw_point_intersect_circles_auxiv:nnnnnnnn { f }
927 \cs_new:Npn \__draw_point_intersect_circles_auxv:nnnnnnnn #1#2#3#4#5#6#7#8#9

932 }
933 \cs_generate_variant:Nn \__draw_point_intersect_circles_auxv:nnnnnnnn { ff }
```

We now have all of the intermediate values we require, with one division carried out up-front to avoid doing this expensive step twice:

```
#1 k
#2 1/p
#3 r2
#4 e
#5 f
#6 a
#7 b
#8 n
```

There are some final pre-calculations,  $k/p$ ,  $\frac{\sqrt{r^2-k^2}}{p}$  and the usage of  $n$ , then we can yield a result.

```

Finding a point on an ellipse arc is relatively easy: find the correct angle between the two given, use the sine and cosine of that angle, apply to the axes. We just have to work a bit with the co-ordinate expansion.

```

982 \cs_new:Npn \draw_point_interpolate_arcaxes:nnnnnnn #1#2#3#4#5#6

```

At this stage, the three co-ordinate pairs are fully expanded but somewhat re-ordered:

```
#1 p
#2 θ₁
#3 θ₂
#4 xc
#5 yc
#6 xa1
#7 ya1
#8 xa2
#9 ya2
```

We are now in a position to find the target angle, and from that the sine and cosine required.

```

Here we start with a proportion of the curve ( $p$ ) and four points

1. The initial point  $(x_1, y_1)$
2. The first control point  $(x_2, y_2)$
3. The second control point  $(x_3, y_3)$
4. The final point  $(x_4, y_4)$

The first phase is to expand out all of these values.

```

1014 \cs_new:Npn \draw_point_interpolate_curve:nnnnnn #1#2#3#4#5
1015 {
1016   \__draw_point_process:nnnnn

1023   { \fp_eval:n {#1} }
1024   {#2} {#3} {#4} {#5} {#6} {#7} {#8} {#9}
1025 }

```

At this stage, everything is fully expanded and back in the input order. The approach to finding the required point is iterative. We carry out three phases. In phase one, we need all of the input co-ordinates

$$\begin{aligned}
x'_1 &= (1-p)x_1 + px_2 \\
y'_1 &= (1-p)y_1 + py_2 \\
x'_2 &= (1-p)x_2 + px_3 \\
y'_2 &= (1-p)y_2 + py_3 \\
x'_3 &= (1-p)x_3 + px_4 \\
y'_3 &= (1-p)y_3 + py_4
\end{aligned}$$

In the second stage, we can drop the final point

$$\begin{aligned}
x''_1 &= (1-p)x'_1 + px'_2 \\
y''_1 &= (1-p)y'_1 + py'_2 \\
x''_2 &= (1-p)x'_2 + px'_3 \\
y''_2 &= (1-p)y'_2 + py'_3
\end{aligned}$$

and for the final stage only need one set of calculations

$$P_x = (1 - p)x_1'' + px_2''$$

$$P_y = (1 - p)y_1'' + py_2''$$

Of course, this does mean a lot of calculations and expansion!

It may be that a coffin construct is better here in the longer term: that may become clearer as the code is completed. As we need to avoid any insertion of baseline skips, the outer box here has to be an `hbox`. To allow for layers, there is some box nesting: notice that we

### 7.1 Managing soft paths

There are two linked aims in the code here. The most significant is to provide a way to modify paths, for example to shorten the ends or round the corners. This means that the path cannot be written piecemeal as specials, but rather needs to be held in macros. The second aspect that follows from this is performance: simply adding to a single macro a piece at a time will have poor performance as the list gets long so we use \tl\_build\_... functions.

Each marker (operation) token takes two arguments, which makes processing more straight-forward. As such, some operations have dummy arguments, whilst others have to be split over several tokens. As the code here is at a low level, all dimension arguments are assumed to be explicit and fully-expanded.

## 7.2 Rounding soft path corners

The aim here is to find corner rounding points and to replace them with arcs of appropriate length. The approach is exactly that in `pgf`: step through, find the corners, find the supporting data, do the rounding.

<code>\__draw_softpath_round_corners:</code>	Rounding corners on a path means going through the entire path and adjusting it. As such, we avoid this entirely if we know there are no corners to deal with. Assuming there is work to do, we recover the existing path and start a loop.

The loop can take advantage of the fact that all soft path operations are made up of a token followed by two arguments. At this stage, there is a simple split: have we round a round point. If so, is there any actual rounding to be done: if the arcs have come through zero, just ignore it. In cases where we are not at a corner, we simply move along the path, allowing for any new part starting due to a `moveto`.

We now have all of the data needed to construct a rounded corner: all that is left to do is to work out the detail! At this stage, we have details of where the corner itself is (#5, #6), and where the next point is (#2, #3). There are two types of calculations to do. First, we need to interpolate from those two points in the direction of the corner, in order to work out where the curve we are adding will start and end. From those, plus the points we already have, we work out where the control points will lie. All of this is done in an expansion to avoid multiple calls to `\tl_put_right:Nx`. The end point of the line is worked out up-front and saved: we need that if dealing with a close-path operation.

To deal with a close-path operation, we need to do some manipulation. It needs to be treated as a line operation for rounding, and then have the close path operation re-added at the point where the curve ends. That means saving the end point in the calculation step (see earlier), and shuffling a lot.

- Likely to be added on further work is done on paths/stroking.

`\g__draw linewidth_dim` Linewidth for strokes: global as the scope for this relies on the graphics state. The inner line width is used for places where two lines are used.

## 9 I3draw-transforms implementation

1711 `<*initex | package>`

1712 `<@=draw>`

This sub-module covers more-or-less the same ideas as `pgfcoretransformations.code.tex`. At present, equivalents of the following are currently absent:

- `\pgfgettransform`, `\pgfgettransformentries`: Awaiting use cases.
- `\pgftransformlineattime`, `\pgftransformarcaxesattime`, `\pgftransformcurveattime`: Need to look at the use cases for these to fully understand them.
- `\pgftransformarrow`: Likely to be done when other arrow functions are added.
- `\pgflowlevelsynccm`, `\pgflowlevel`: Likely to be added when use cases are encountered in other parts of the code.
