L<sup>A</sup>T<sub>E</sub>X HTML<sup>5</sup>

## The lwarp package

L<sup>A</sup>T<sub>E</sub>X to HTML

### Abstract

The `lwarp` package converts L<sup>A</sup>T<sub>E</sub>X to HTML by using L<sup>A</sup>T<sub>E</sub>X to process the user's document and directly generate HTML tags. External utility programs are only used for the final conversion of text and images. Math may be represented by SVG images or MATHJAX. More than 500 L<sup>A</sup>T<sub>E</sub>X packages and classes are supported, of which more than 90 also support MATHJAX.

Documents may be produced by DVI or PDF L<sup>A</sup>T<sub>E</sub>X, LuaL<sup>A</sup>T<sub>E</sub>X, XeL<sup>A</sup>T<sub>E</sub>X; by several CJK engines, classes, and packages; or by customized systems such as `pertex` and `pythontex`. A `texlua` script automates compilation, index, glossary, and batch image processing, and also supports `latexmk`. Configuration is semi-automatic at the first manual compile. Support files are self-generated. Print and HTML versions of each document may coexist.

Assistance is provided for HTML import into EPUB conversion software and word processors.

Requirements include the commonly-available POPPLER utilities (included with M<sup>I</sup>K<sup>T</sup>E<sup>X</sup>) and PERL. Detailed installation instructions are included for each of the major operating systems and T<sub>E</sub>X distributions.

A quick-start tutorial is provided, as well as extensive documentation for special cases, a general index, and a troubleshooting index. Automatic error testing is provided for configuration files, package load order, and image generation.

SVG math and many other generated images include L<sup>A</sup>T<sub>E</sub>X expressions in the alt tags. MATHJAX may be used with advanced equation numbering under the direct control of `lwarp`.

Complicated tables are supported, which copy/paste well into LIBREOFFICE WRITER.

Supported classes and packages include `memoir` and `koma-script`, `cleveref`, `caption`, `mdframed`, `siunitx`, and many popular packages for tabulars, floats, graphics, theorems, the title page, bibliography, indexing, footnotes, and editorial work, as well as a number of CJK-related classes and packages.

T<sub>E</sub>X is a self-modifying tokenized macro-expansion language. Since `lwarp` is written directly in L<sup>A</sup>T<sub>E</sub>X, it is able to interpret the document's meaning at a deeper level than external conversions which merely approximate T<sub>E</sub>X. HTML5 and CSS3 are leveraged to provide advanced features such as `booktabs trim`, `multicolumns`, `side-by-side minipages`, and `JAVASCRIPT-free navigation`.

[For a quick-start tutorial, see section 5, Tutorial.](#)

[For a list of supported features, see table 2: Supported packages and features.](#)

[To update existing projects, see section 1: Updates.](#)

**Lwarp is still in development. Changes are likely.**

## Support T<sub>E</sub>X development

T<sub>E</sub>X and related projects:

- are mostly open-sourced and a volunteer effort;
- benefit students, academics, scientists, engineers, and businesses;
- help drive education, public and private research, and commercial activity;
- are used in the fields of mathematics, science, engineering, and humanities;
- are international in reach;
- span decades of development;
- are enduring — many older packages are still actively used and maintained;
- are largely backwards compatible;
- are portable across all the major computing platforms;
- are usable even on older computers and away from internet access;
- are continuing to maintain relevance with modern improvements;
- require no yearly subscription fees;
- and are supported by an active community of knowledgeable volunteers.

Please consider helping by joining and/or contributing to the T<sub>E</sub>X Users Group, a United States 501(c)(3) tax-exempt charitable organization. Contributions are accepted by credit card, check, or Pay Pal, via the United Way, or by USA or European bank transfer. Membership in TUG supports the development of T<sub>E</sub>XLive, the major T<sub>E</sub>X distribution.

Donations may be directed towards individual projects:

**TUG Bursary Fund:** Assistance for attending annual TUG meetings.

**CTAN:** The Comprehensive T<sub>E</sub>X Archive Network — Central storage for T<sub>E</sub>X.

**TeX Development Fund:** Support for specific projects.

**EduTeX:** Teaching and using T<sub>E</sub>X in schools and universities.

**GUST e-foundry fonts:** Enhanced for math and additional language groups.

**LaTeX Project:** Modernizing the L<sup>A</sup>T<sub>E</sub>X core.

**Libre Font Fund:** Fonts, tools (FontForge), and distribution (the Open Font Library).

**LuaTeX:** Combining the PDF T<sub>E</sub>X engine and the Lua language.

**MetaPost:** Postscript graphics.

**MacTeX:** T<sub>E</sub>X for Mac.

**PDF Accessibility:** Modern PDF standards.

**Other:** Additional projects may be specified.

# 1 Updates

The following is a summary of updates to `lwarp`, highlighting new features and any special changes which must be made due to improvements or modifications in `lwarp` itself.

For a detailed list of the most recent changes, see the end of the Change History on page [1333](#).

**v0.909:** `\ref` fix.

- Fixed `\ref*`, `beamerarticle`, `lyluatex`, `realscripts`.
- Updated `mismath`, `nicematrix`, `pablance`, `pdfpages`, `simplebnf`, `tagpdf`.
- The `lwarp` documentation index is not yet fully updated to the latest `doc` package changes. Index categories and some hyperlinks are not yet working.

**v0.908:** Bug fix.

- Fixed obscure cross-reference issue, seen in some citations.

**v0.907:** Bug fix.

- Fixed `svg` images for `WINDOWS`.

**v0.906:** Screen readers

- For each `tabular`, add a hidden `HTML` header cell to convince screen readers that the tables are data not layout. Also hide from the screen reader any final row used only to produce bottom borders.
- Adjusted `svg` math for a margin change in `pdfcrop`.
- Added `\Ref`.
- Added docs regarding math in custom environments. See section [8.7](#).

**v0.905:** Bug fixes, internal improvements.

- Fixed conflict between `cleveref` and `splitidx`.
- Improved coexistence with `\AtEndDocument`.
- `acronym`: Updated to v1.47, added hyper links.

**v0.904a:** Fixed missing `lwarp-common-mathjax-siunitx` package.

**v0.904:** Added `siunitx` v3.

- Fixed `HTML` tags inside non-Latin text.
- `MATHJAX` now defaults to `svg` rendering.
- Added `siunitx` v3. Updated `siunitx-v2`. See section [8.7.15](#) for limitations.
- Updated `caption`, `chemmacros`, `fbox`, `hyperref`, `multicol`, `wrapfig2`.

**v0.903:** Various updates and improvements.

*lwarpmk*

- Error if *pdftotext* not available. Ensures that POPPLER programs are installed.

core

- *ps2pdf*: Allow transparency due to recent changes in *ps2pdf*.

⚠ New images

- Due to changes in how automatically-generated SVG image file names are computed, after `lwarpmk html` use `lwarpmk cleanimages` a single time, and then `lwarpmk images` to generate the new images.

- Improved back refs.

- Fixed `verbatim*`.

- Various internal updates for recent L<sup>A</sup>T<sub>E</sub>X release.

packages

- `cuted`: Updated to v2.0.

- `flushend`: Updated to v4.0.

- `mathalpha`: Updated for v1.14+.

- `minted`: Updated to v2.6.

- `cases`: Updated to v3.2.

- `siunitx` with MATHJAX: Improved `\per`, `\numlist`, `\SIlist`, comma decimal points.

- Added `showlabels`, `wrapfig2`.

**v0.902:** beamerarticle, footnotes, paragraph tags.

core

- Fixed footnotes inside descriptions, `minipages`, `amsthm`, `\nameref`.

- Improved various paragraph tags.

packages

- Improved `parnotes`, `sympytex`.

- Added `beamerarticle`.

- Updated `luatexko`, `xetexko`, `tagpdf`.

MATHJAX

- Added missing standard international text symbols for MATHJAX.

**v0.901:** Tabular columns, float caption CSS, MATHJAX packages.

core

- Added `warpsvg` to isolate SVG math, as opposed to `warpMathJax`.

- Improved float caption CSS for newer browsers.

- Improved emulation of `\newcolumnntype`.

- Added `\HTMLnewcolumnntype`. See section 7.6,

- `>\centering\arraybackslash`, etc. now sets HTML CSS `text-align`. Also detects `\itshape`, `\bfseries`, and `\bfseries\itshape`. See section 8.10.1.

MATHJAX

- Now uses MATHJAX 3.2 packages for `centernot`, `colortbl`, `gensymb`, `mathtools`, `textcomp`, `upgreek`.

packages

- `dcolumn`: Now works inside a `lateximage`.

- Added `mwe`.

- Added `lATEX-tascmac`, which fixed `ascmac`.

**v0.900:** Package updates.

core  
packages

- Fix for detecting `\usepackage{lwarp}`.
- `amsmath`: Fixed `alignat` with `MATHJAX`.
- `changes`: Updated to v4.2.1.
- `froufrou`: Updated to v1.4.0.
- `lipsum`: Updated to v2.3.

**v0.899:** Minor updates.

core  
packages

- `lwarpmk`: Warns if `\usepackage{lwarp}` is not detected.
- `graphics`: Added support for `keepaspectratio`.
- `keyfloat`: Fix: `lw` with `h`.
- `multicol`: Improved `css`.

**v0.898:** Minor updates.

- Fewer `underfull \hbox` warnings.
- `wrapfig`: Improved integration with `keyfloat`.

**v0.897:** `siunitx` rollback.

docs

- Added a table of file extensions to use with `\includegraphics`. See table 9.

core  
packages

- Added tests for additional incompatible packages.
- `siunitx`: Supports rollback to v2. Does not yet support v3.
- `fixme`: Improved to work if the user modifies layouts.
- `float`: Improved integration with `newfloat`, `keyfloat`.
- Added `centerlastline`, `decorule`, `fancypar`, `froufrou`, `pbalance`.
- Verified works as-is with `fnpct`.

**v0.896:** Back references, accessibility.

- **Due to changes in cross referencing, execute `lwarpmk clean` before recompiling.**

- Increased sectioning nesting stack depth. Error if overflow stack.
- Fixed footnotes at the end of the document, or inside a description label.

MATHJAX  
theorems

- Added an error if using braces inside `\usepackage` options.
- Fixed footnotes in bracket display math with `MATHJAX`.
- `LATEX` `theorems`, `amsthm`, `ntheorem`, `theorem`: Print theorem footnotes following theorems.

accessibility

- Added HTML `<main>` element to each page.
- Added ARIA math role to SVG math images, and note role to margin notes, footnotes, etc.

packages

- Improved citation backreferences for various packages.
- `chemfig`: Updated to v1.6a.
- `bigdelim`: Updated to v2.8.
- `xetexko`: Updated to v3.1.

- hyperxmp: Fix: Accept and discard additional keys.
- hyperref: Fix: Added `\*autorefname` macros.
- biblatex: Fix: Back references.
- tocloft: Fix: `\cftpagenumbersoff`, `\cftpagenumberson`.
- threeparttable: Fix: `\TPTL@tnotex`.
- amsthm: Fix: Footnotes inside environment optional argument.
- listings: Fixed labels. Accepts but ignores escapes w/o error.
- pdfscape: Fix: Added landscape environment.
- Added ccicons, classicthesis, orcidlink.
- Added enotez.
- Verified support for doi, doipubmed.

**v0.895:** Vector packages, greatly improved MATHJAX for siunitx.

- core
  - Fixed quotes in HTML tags while using old font packages with Xe<sub>L</sub>AT<sub>E</sub>X and Lua<sub>L</sub>AT<sub>E</sub>X.
- MATHJAX packages
  - Added `\ifblank` and `\ifstrequal` to MATHJAX emulation.
  - multirow: Allow `\par` per v2.7.
  - acro: Updated to v3.5.
  - fancyhdr: Updated to v4.0.
  - changes: Updated to v4.0.1.
  - epsfig, rotating: Now work inside lateximage.
  - amscdx: Verified to work with svg math. Warning added about use with MATHJAX.
  - Added MATHJAX emulation for isomath, mattens, maybemath, skmath, tensor.
  - Improved MATHJAX emulation for siunitx `\ang`, `\num`, `\SI`.
  - Added epsf, impnattypo, isotope, lpic, luavlna, mdwmath, pinlabel, rlepsz, tikz-image-labels, xe<sub>v</sub>l<sub>n</sub>a.
  - Verified to work as-is: tensind.

**v0.894:** MATHJAX additions and improvements.

- MATHJAX packages
  - Improved warning message for enabling SVG graphics for select math expressions while using MATHJAX.
  - Accept and ignore a star for `\hspace`.
  - Ignores `\arabic`, `\number`, `\noalign`.
  - Added MATHJAX emulation for backnaur, colortbl, nicematrix.
  - booktabs: MATHJAX emulation now absorbs and discards trim.
  - menukeys: Updated to v1.6.1.

**v0.893:** Minor fixes, more packages.

- MATHJAX packages
  - Added MATHJAX emulation for `\mathnormal`.
  - Fixed pstricks `pspicture*`.
  - Fixed tikz font macros.
  - braket: Now uses the MATHJAX extension.

- Added `esvect`, `fixmath`, `keystroke`, `mathastext`, `menukeys`, `picinpar`, `plimsoll`, `repltext`, `selectp`, `seqsplit`, `simplebnf`, `statistics`, `swfigure`.
  - Added MATHJAX emulation for `mathspec`.
  - Verified to work as-is for `apxproof`, `syntaxdi`, `venndiagram`.
- v0.892:** `minted`, `fvextra`, MATHJAX `\left/\right`.
- MATHJAX packages
- `fourier`, `libertinustlmath`, `newpxmath`, `newtxmath`, `newtxsf`, `unicode-math`: Added MATHJAX `\left/\right` support for additional delimiters.
  - `textpos`: Updated to v1.10.
  - `xcolor`: Fixed optional args for `\fcolorbox` and related.
  - Added `fvextra`, `minted`.
- v0.891:** MATHJAX additions and improvements.
- core
- Now displays inline `\verb` text as `\texttt`.
  - Fixed `alltt` and `verbatim`s with L<sup>A</sup>T<sub>E</sub>X lists.
  - Now generates an error if nested each of `warpHTML`, `warpprint`, `warpMathJax` inside itself.
- MATHJAX packages
- Added MATHJAX *textmacros* extension, allowing formatting inside `\text`.
  - `biblatex`, `hyperref`: Added back page references.
  - `fancyvrb`: Fixed `BVerbatim` with a label.
  - `listings`: Fixed MATHJAX with captions, improved HTML sanitation.
  - `babel-french`: Fixed `\texorpdfstring` conflict.
  - Now honors Greek package options for `mathdesign`, `mathpazo`, `mathptmx`, `newpxmath`, `newtxmath`.
  - Improved MATHJAX for `colonequals`, `mathdesign`, `mathdots`, `mathfixs`, `mathtools`, `multiobjective`, `nicefrac`, `shuffle`, `units`.
  - `unicode-math`: Added Greek macros, as well as macros for the first several categories listed in `texdoc unimath-symbols`. Improved symbol shape macros with Greek. Improved documentation.
  - Added `bussproofs`, `cmbright`, `fourier`, `kpfonts`, `kpfonts-otf`, `libertinustlmath`, `scalerel`, `txgreek`s.
- v0.89:** Additional MATHJAX support.
- core
- Adapted to upcoming L<sup>A</sup>T<sub>E</sub>X kernel changes.
  - Allows load of `amsmath` before `lwarp`.
- lwarpmk
- Also removes `*.bbl` when cleaning aux files.
- MATHJAX packages
- `MATHJAX`: Neutralized `\protect`, `\mathcode` and related, ligatures. Fixed nested environments.
  - `caption`: Updated for v3.5, fix for label sep.
  - `thmtools`: Updated for v0.72. Fixed `swapnumber`, `margin`.
  - Improved MATHJAX for `centernot`, `mathtools`, `mismath`, `Slunits`, `siunitx`, `statmath`.
  - Added MATHJAX emulation for accents, `hepunits`, `hhtensor`, `mathalpha`, `mathdesign`, `mathpazo`, `mathptmx`, `mleftright`, `newpxmath`, `newtxmath`, `newtxsf`, `pxfonts`, `shuffle`, `txfonts`, `upgreek`, `ushort`.
  - Verified to work as-is: `authoraftertitle`.

**v0.88:** Indexing, boxing, theorems.

- **Now has programmed support for more than 500 packages and classes, of which more than 60 also support MATHJAX.**
- core**
  - Fixed: `\ref*`, and also added MATHJAX emulation.
  - If starting a new paragraph, `\hrulefill` creates a `<div>` with a thin horizontal line across the page. Use instead of `\hrule`.
  - Fixed: Use `\chaptername` where appropriate.
  - Fixed: Inline links causing extraneous paragraphs.
- lwarpmk**
  - Added `lwarpmk -v` to print the version number.
- indexing**
  - Added the `IndexRef` option to control the display of index entries. See section 7.5.
  - Added `\IndexPageSeparator` and `\IndexRangeSeparator` for custom index styles.
  - Added support for `gindex`, `xindex`.
  - Verified to work as-is with `varindex`.
- packages**
  - `cleveref`, `varioref`: Fix for starred macros.
  - `varioref`: Removed page-related text from HTML output.
  - `xfakebold`: Updated to v0.08, using `pdfrender`.
  - `caption`, `scrextend`: Fixed `\caption*`.
  - Added `fbox`, `shadethm`, `tcolorbox`, `termcal`, `thmbox`, `thmtools`.

**v0.87:** MATHJAX, bibliography packages.

- core**
  - Added boolean `FixSmallCaps` for fonts which render small caps as all caps.
  - Fixed `\bibliography` to use the HTML version's `.bbl` file. Previously the HTML bibliography relied on the print version's `.bbl`, thus would fail if the print document had not yet been created.
- MATHJAX**
  - Added `\ifstar` and `\ifnextchar` to MATHJAX, and removed `\DeclareIfstar`. See section 8.7.7.
- Removed `\DeclareIfstar` packages**
  - `physics`: Now supports the MATHJAX v3 extension.
  - `mathtools`: Improved `\underbracket`, `\overbracket` for MATHJAX.
  - `nccmath`: Improved `\underrel` for MATHJAX.
  - `mhchem`: Now supports the MATHJAX v3 extension for `\ce` inside math.
  - `cancel`: Now supports the MATHJAX v3 extension.
  - `embrac`: Neutralized kerning for improved HTML conversion.
  - Added `citeref`, `drftcite`, `jurabib`, `multibib`, `splitbib`.
  - Verified to work as-is with `bibtopic`, `collref`, `mciteplus`.

**v0.86:** MATHJAX major updates.

- core**
  - Fixed: Filename if named files with `*`, parens, period in section name.
  - Fixed: Labels in `eqnarray`, `lateximage`.
- MATHJAX**
  - Updated to MATHJAX v3. New repository.
  - Fixed forward references for MATHJAX.

## packages

- Improved MATHJAX equation number formatting, now compatible with `amsmath \numberwithin` for chapters, sections, subsections, as well as `amsmath subequations`. See section 8.7.7.
- Added `\DeclareIfstar` to define starred T<sub>E</sub>X macros in MATHJAX. See section 8.7.7.
- Generates an error if `\MathJaxFilename` file does not exist.
- `mathtools`, `nccmath`, `physics`: Added starred macros for MATHJAX.
- `nccmath`: Fixed `\nr`, `\displaybreak` for MATHJAX.
- `xcolor`: Fixed `\textcolor` with `babel-french`.

## v0.85: fontspec

## packages

## ⚠ acro formats

- `fontspec`: Fixed core font change macros for world languages.
- `acro`: Due to v3 changes, when defining acronym formats, use `\textbf` instead of `\bfseries`, etc.
- Fixed `idxlayout`, `mathtools`, `titlesec`, `url`.

## v0.84: Previous/next page links, numerous fixes.

## docs

## ⚠ home page footer changed

- Added documentation of `BlockClass` and `\InlineClass` for CSS `<div>s` and `<span>s`. See section 7.8.
- Added `\LinkPrevious`, `\LinkNext` page links. See section 7.6.
- Added `\FirstPageBottom`. Home page no longer shares `\PageBottom`. See section 7.6.
- Improved coexistence with `comment`, support for nested environments.

## core

## ⚠

- No longer requires but still supports the `caption` package.
- Improved filenames and HTML titles when using special characters.
- Change: Append `-0` to section named `Index` previously `_index` to distinguish from `index.html`
- Fixed style tags for `\multicolumn`, `\multirow`.
- Fixed spacing in tabbing.
- Fixed `lateximage` for: `quote`, `quotation`, `verse`, `center`, `flushleft`, `flushright`, `<par>` tags, packages `verbatim`, `alltt`, `epigraph`.
- Fixed `textcomp` due to integration into L<sup>A</sup>T<sub>E</sub>X kernel.
- Fixed `\itshape`, etc. Adapted to L<sup>A</sup>T<sub>E</sub>X fontaxes integration.
- Fixed `\@fnsymbol`.
- Warns about section names with dollar-delimited math.
- Warns about a `<span>` containing a float, caption, section, `mdframed`, or other `<div>` object.
- Only warn about X<sub>Y</sub>T<sub>E</sub>X logo and `graphics` if actually used `\Xe`.
- `lwarpmk clean` also removes `comment_*.cut`.
- `scrextend`, `scrartcl`, `scrbook`: Added `\titlehead`, `\subject`, `\subtitle`, `\publishers`.
- `titling`: Fixed `\printthanks`.
- `memoir`, `abstract`: Fixed for updated memoir.
- `memoir`: Fixed `\newcomment`, `pagenotes`, `crossreferences`. Fixed setting a recursive name.

## lwarpmk

## packages

- Fixed or improved: amsthm, backref, biblatex, fixme, nfssect-cfr, ntheorem, parcolumns, realscripts, rotfloat, titling.
  - Added boxedminipage, renamed from boxedminipage2e per author.
  - Verified to work as-is with mcite.
- v0.83:** memoir fixes.
- packages
- memoir: Various fixes and updates.
  - physunits: Updated to v1.0.4.
- v0.82:** MATHJAX notes, xpinyin improvements, various updates.
- MATHJAX
- Improved footnotes with MATHJAX.
  - Added MATHJAX emulation for endnotes, marginnote, nccfoots, pagenote, parnotes, sidenotes.
- packages
- xpinyin: Added pinyin with modern HTML.
  - luatexko: Added `\dotemph`, `\ruby`, `\uline`, etc.
  - soul: Fixed `\<`.
  - chemfig: Updated to v1.5.
  - draftwatermark: Updated to v2.0.
  - ulem: Fixed: `\dashuline`.
  - amsmath: Fixed: `\intertext` with MATHJAX.
  - endnotes: Fixed: Marks in print mode.
  - tocvsec2, tableof: Verified to work as-is.
  - Added etoc (nullified).
- v0.81:** MATHJAX speedup and additional emulations.
- core
- Improved warning regarding SVG math sizing/baselines and graphics/ graphicx. See section 8.7.
- MATHJAX
- Improved MATHJAX emulation processing speed.
  - Added MATHJAX emulation for accsupp, axessibiltiy, colonequals, decimal, dotlessi, econometrics, engtlc, multiobjective, physunits, Slunits, stackrel, statmath.
- packages
- axessibility: Updated to 2020/01/08 version.
  - gridset: Updated to v0.3.
  - Slunits: Fixed for math mode.
  - Added DotArrow, nolbreaks, luamplib, returntograd, statex2, tagpdf.
  - Verified to work as-is with icomma, mathpunctspace, textualicomma.
- v0.80:** MATHJAX, biblatex.
- MATHJAX
- Added docs and warning/info messages re: avoiding slow MATHJAX compilation. See section 8.7.7, [Customizing MATHJAX](#).
  - Added MATHJAX emulation for accessibility, autobreak, centernot, extarrows, fouridx, gensymb, leftidx, mathcomp, mathdots, mathfixs, mismath, nccmath, noitcrul, pdfcomment, relsize, rmathbr, subsubscripts, xfrac.
  - Improved MATHJAX emulation for unicode-math.
- packages
- biblatex, url: Now create hyperlinks.

- `amsmath`: Fix to center starred environments.
- `xcolor`, `graphics`: Made more macros robust.
- `colortbl`: Fix: Rule color in a `lateximage`.
- `chemmacros`: Updated to v5.10.
- Added `fewerfloatpages`, `ghsystem`, `hline`, `mismath`, `nccmath`.

**v0.79:** `MATHJAX`, nested `tabular`.

- MATHJAX**
  - Added or improved `MATHJAX` emulation for `amsmath`, `ar`, `arydshln`, `bm`, `bigdelim`, `bigstrut`, `booktabs`, `braket`, `mathtools`, `multirow`, `physics`, `siunitx`, `slashed`, `unicode-math`, `xfakebold`.
  - Warn if using certain packages not supported by `MATHJAX`.
- core**
  - `tabular`: Now may be nested.
  - `minipage`, `\parbox`, `fminipage`, `\makebox`, `\framebox`: Fix: Adjust for virtual page size.
  - Uses new `iftex`.
- packages**
  - `graphicx`: Fix: Negative angles.
  - `caption`: Fix: `\captionlistentry` with `longtable`.
  - `multirow`: Fix: Centered vertical alignment.
  - `siunitx`: Fix: `\square`, `\cubed`.
  - `booktabs`: Fix: `memoir` with `lateximage`.
  - `babel` and `polyglossia`: Added troubleshooting warnings.
  - `fontawesome`, `fontawesome5`: Supports text color and size.
  - `transparent`: Fix: `lateximages`.
  - `epigraph`: Updated to v1.5e.
  - `xurl`: Updated to v0.08.
  - `subcaption`: Fixed with `memoir`.
  - `floatrow`: Fix: `\linewidth`. No longer require `float`, `graphics`.
  - `floatflt`, `wrapfig`, `niceframe`: Fix: Adjust for virtual page size.
  - Added `widetable`, `witharrows`, `steinmetz`.
  - Added `awesomebox`, `catoptions`.
  - Added `svg`, supports `svg-extract`.
  - Added `parcolumns`, `pdfcolparcolumns`,
  - Added `parallel`, `pdfcolparallel`.
  - Added `pdfcol`, `pdfcolfoot`, `pdfcolmk`.

**v0.78:** Fixes for support files, `alt` tags, hyperlinks, and the 2019/10 `LATEX` release.

- docs**
  - Docs: Improved documentation regarding package options. See section 8.1.
  - Fix to overwrite existing support files using new `filecontents` environment.
- packages**
  - `breqn`: Previously broken by the 2019/10 `LATEX` update, but now working again.
  - `graphics`: Fix for `\includegraphics alt` tags.
  - `babel-french`: Fix for hyperlinks.
  - `media9`, `movie15`, `multimedia`: Fix for the 2019/10 `LATEX` update.
  - `accessibility`: Added.

**v0.77:** Updates to fix recently-broken packages.

- **booktabs:** Updated to v1.6180339.
- **chemformula:** Updated to v4.15.

**v0.76:** MATHJAX, updates for L<sup>A</sup>T<sub>E</sub>X 2019/10 release.

docs  
MATHJAX  
packages

- Docs: Expanded documentation regarding the use of multiple projects in the same directory. See section 5.17.
- MATHJAX: Updated to v2.7.6.
- xr: Updated to v5.05.
- xr-hyper: Updated to v6.1.
- Verified works as-is with xcite.
- acro: Updated to v2.10.
- Currently broken in print mode by the 2019/10 L<sup>A</sup>T<sub>E</sub>X update, and waiting for fixes: breqn, grffile, multimedia, movie15.

⚠ broken

**v0.75:** keyfloat, wrapfig

packages

- **\minipage:** Fix for \linewidth.
- **keyfloat:** Improved color control.
- **wrapfig:** Fix for \linewidth.

**v0.74:** Docs, SVG math, *lwarpmk*, HTML alt and title text, lyuatex

docs

- Added to the tutorial the section **What next?**. See section 5.19.
- Added documentation about localization options. See section 7.1.
- Added documentation about accessibility options. See section 7.2.
- Renamed and updated HTML alt text macros:

⚠ HTML alt text  
changed names

Old	New
(hard coded as “image”)	<code>\ImageAltText</code>
<code>\mathimagename</code>	<code>\MathImageAltText</code>
<code>\packagediagramname</code>	<code>\PackageDiagramAltText</code>

- Added `\ImageAltText` for the default HTML alt text for an image. See section 7.6.
- Added `\ThisAltText`, which may be used to assign a one-time HTML alt tag to the very next image generated by *lwarp*, such as a `lateximage`, `picture`, `tikzpicture`, an image generated by various chemistry or engineering packages, or an SVG math image. This macro also adds a title tag to a reference or hyperlink. See section 7.6.

SVG math

- Adjusted `\LateximageFontSize` default from .75 to 1.
- Fix: Font control for SVG math.

misc

- Fix: Ignores negative `\hspace`.
- Warning if `SideTOCDepth < FileDepth`.

*lwarpmk*

- *lwarpmk*: `lwarpmk clean` removes additional files.
- *lwarpmk*: `lwarpmk epstopdf` and `lwarpmk pdftosvg` now honor directories.

packages

- *lyuatex*: Split images by system or per fullpage, improved margins and scaling.
- Tested to work as-is with *mathspec*, *unicode-math*.

**v0.73:** `\include`, `memoir`, `koma-script`, `caption`, `xy`, `datatool`, music scores.

packages

- Fix for `\include`.
- Warning for a `tabular` inside a `<span>`.
- `\color`: Added HTML support for rules and frames, but not inline text. Use `\textcolor` if possible.
- Improved many HTML tags, reducing *tidy* warnings. See Change History.
- `memoir`: Fixes for `\frontmatter*` and `\mainmatter*`. Added `\book`.
- `koma-script`: Fix for starred captions in the TOC.
- `caption`: Fix for starred captions.
- `datatool`: Added pie, bar, and plot charts.
- `threeparttable`: Added `measuredfigure`.
- `intopdf`: Updated to v0.2.1.
- `tocdata`: Updated to v2.03.
- `quotchap`: Updated to v1.2.
- `versonotes`: Updated to v0.4.
- `backnaur`: Now uses SVG images. Updated to v3.1.
- `xy`: Fix for `\xybox`, improved `xy`, also now compatible with `qcircuit`.
- `fancyvrb`: Fix for label HTML tags.
- Added `stackengine`.
- Added `lyluatex`. (Music scores.)
- `musicography`: Updated to 2019/05/28. Added support for `lateximages`.

music

**v0.72:** Font control, `\multicolumn`, `xr` and `xr-hyper`.

⚠ images

- Due to internal changes, images for inline SVG math and `lateximages` will have new hash values, and will have to be regenerated using
 

```
Enter ⇒ lwarpmk cleanimages
```

 and
 

```
Enter ⇒ lwarpmk limages
```

packages

- Docs: Color-codes package names in the table of supported packages and features, table 2, according to each package's level of support by `lwarp`.
- `\multicolumn`: Fix for paragraph columns.
- `xr`, `xr-hyper`: Fixes for references, `\externaldocument`.
- `soulutf8`: Fix: Loads `soul` for emulation.
- `boxedminipage2e`: Added support for `lateximages`.
- `zhlineskip`: Updated to v1.0e.
- Added `fontaxes`, `slantsc`, `tabfigures`.
- Added `nfssect-cfr`, thus supporting `cfr-lm` and several other font packages.
- Added `backnaur`, `hypbmsec`, `minibox`, `pdfcrypt`, `shapepar`.

**v0.71:** Error handling, multimedia, tabular.

- tabular: Added support for ‘\*’ columns. Fix for paragraph tags.
- quotation: Fix for HTML tag.
- Docs: Added a section about error conditions tested by lwarp. See section 13.1.
- *lwarpmk*: If file `lwarpmk.conf` is an older version, or the incorrect operating system, displays the print command to use to recompile.
- packages
  - chemfig: Updated for v1.4.
  - endfloat: Updated for v2.7.
  - textpos: Updated for v1.9.1.
- multimedia
  - Added `media9`, `movie15`, `multimedia`.

**v0.70:** Error handling, MATHJAX, mathtools.

- Error handling for “Label(s) changed.” Refuses to `lwarpmk` `limages` until recompile first.
- Fix: If Computer Modern font is used, ensures `cm-super` or `lmodern` is used.
- Fixes for `\makebox`.
- Fixes for `\parbox` inside a `<span>`.
- MATHJAX: Updated to v2.7.5. Loads the `autoload-all.js` extension. Added `\MathJaxFilename` to select custom scripts.
- packages
  - textcomp, xunicode: Fix for `\textinterrobang`.
  - mhchem: Works with MATHJAX. See section 410.
  - changes: Updated to v3.1.2.
  - Added `autonum`, `changelayout`, `inputtrc`, `mathtools`, `metalogox`.

**v0.69:** Error handling, many fixes, improved keyfloat / tocdata.

- Fix for HTML corruption of `lateximage` displays.
- `\makebox`, `\framebox`: Fix for  $(\langle width, height \rangle)$  arguments.
- `fminipage`: Honors `\minipagefullwidth`.
- packages
  - `array`, `longtable`: Fix for `\tabularnewline`.
  - `tabularx`, `tabulary`: Fix to require the `array` package.
  - `supertabular`, `xtab`: Fix to clear caption after use.
  - `graphics`: Added a warning if used the `\includegraphics` `scale` option.
  - `multirow`: Added an error if didn’t use `\mrowcell` or `\mcolrowcell` when using `\multirow` or `\multicolumnrow`.
  - `keyfloat`: Updated for v2.00, additional improvements.
  - Added `ctable`, `eqlist`, `eqparbox`, `ftcap`, `listliketab`, `minitoc`, `tocdata`, `topcapt`.

**v0.68:** Error handling, tabulars, footnotes.

- lwarpmk*
  - *lwarpmk*: Improved error handling for image generation if compile was incomplete.
- packages
  - `tabular`: Fix for `\warpprintonly`.
  - `longtable`: Improved flexibility for `\endhead`, etc. Improved error reporting if `\endhead`, etc. incorrect for `lwarp`.

- `threeparttable`: Fix for caption type.
- `hyperref`: Fix for options with braces.
- `morefloats`: Fix to be loaded early for print output.
- `listings`: Updated for v1.7.
- Added `bigfoot`, `fnpara`, `footnotebackref`, `manyfoot`, `tablefootnote`, `threeparttablex`.
- Added `layouts`, `niceframe`, `perpage`, `showtags`.
- Prevented `alg`, `algorithmic`, `pdfcpot`, `fncylab`.

**v0.67:** Filename generation, symbol fonts.

`docs`

- Documentation fix for `<project>-images`, `<project>-images.txt`.
- Added discussion regarding section names. See section 8.4.

`filenames`

- Added `\FilenameNullify` and `\FilenameSimplify` for filename generation. See section 8.4.
- `Core`, `textcomp`, `xunicode`: Nullified additional symbols during filename generation.

`packages`

- `color`: Fix for version number warnings.
- Added `academicons`, `bbding`, `dingbat`, `eurosym`, `fontawesome`, `fontawesome5`, `marvosym`, `pifont`, `typicons`.
- Added `changes`, `easyReview`, `fitbox`, `foreign`, `gloss`, `karnaugh-map`, `multicap`, `nomencl`, `notes`, `struktex`, `umoline`, `xfakebold`.
- Tested to work as-is with `askmaps`, `curves`, `euro`, `karnaughmap`, `tikz-karnaugh`.

**v0.66:** `xr`, multiple projects, image names/directory, HTML formatting

⚠ `Reset the configuration`

- Due to changes in `lwarpmk`, **recompile any existing project a single time** using `pdflatex filename.tex` or similar, after which `lwarpmk` may then be used with the new configuration files.

`lateximage`

- Adds options `ImagesDirectory` and `ImagesName` to assign directory and name prefixes for `lateximage` images. The new defaults include the `jobname`, allowing the image directories for multiple projects to coexist.

⚠ `existing projects`

- To reuse existing `lateximage` directories, add `lwarp` options

```
\usepackage[
  ImagesDirectory={lateximages},
  ImagesName={lateximage-}
]{lwarp}
```

If not reused, the existing `lateximages` directory and `lateximages.txt` file may be removed.

`filenames`

- Added `\FilenameLimit` to control the maximum length of the filenames generated by `lwarp`.

⚠ `Possible filename changes`

- Improved filename generation when special characters or macros are used in section names.

`WINDOWS`

- Fix for `lwarpmk cleanimages` with `WINDOWS`.

`floats`

- Fixes for floats in the home page.

`lists, table notes`

- Improved css for definition lists, table notes.

`tabular`

- `tabular`: Fixes for `\par` in column specifier, `minipage` inside `tabular`.

`indexing`

- `Indexing`: Fix for a long line of multiple entries.

`minipage`

- `\minipagefullwidth`: Fix for global changes.

- Added `\UseMinipageWidths` and `\IgnoreMinipageWidths`. See section 8.3.3.
- colors
  - Improved `\fbox`, `\fboxBlock`, `\fminipage` to use current text color.
- HTML
  - Improved HTML output formatting.
- docs
  - Added discussion regarding invalid HTML. See section 8.1.1.
  - Added discussion regarding math in section names, `\imagegraphics` scale option. See section 6.
  - Added discussion regarding international languages in section names. See section 8.14.
- packages
  - `caption`: Fix for options clash.
  - `xr`, `xr-hyper`: Now compatible.
  - `subcaption`: Improved horizontal spacing.
  - `multicol`: Fix for minipage inside `multicols`.
  - `multicolrule`: Updated for v1.2.
  - `tocbasic`: Minor update.
  - `acronym`: Fix for acronym in float caption.
  - `kotexutf`: Patch with *pdflatex* and new lwarp labels.
  - `extramarks`, `fancyhdr`: Updated for v3.10.
  - `memoir`: Added docs regarding version numbers. See section 8.13.
  - `zref`: No longer required.
  - Added `ar`, `ed`, `indentfirst`, `nameauth`, `truncate`.
  - Verified to work as-is with `changelog`.
  - Prevented `colortab`, `epsf`, `hyper`, `picinpar`, `picins`, `sistyle`, `ucs`.
- v0.65:** css layout, alt tags, Japanese.
- page layout
  - Moved the `sidetoc` to the left side, allowing improved css for margin notes.
  - Improved page layout css.
- image alt tags
  - `graphicx \includegraphics`: Added the alt key to assign an alt tag to an image. Default is “image”, assigned to pass validation.
- duplicate HTML files
  - Detects and causes an error if duplicate HTML file names are generated, caused by identical or similar sectioning names.
- fixes
  - Fix for `tabular*`.
  - Fix for `tabular` border colors.
  - Fixes `\quad`, `\enskip`, and figure captions to pass validation.
- Japanese
  - Added `ltj*` classes, `bounddvi`, `gentombow`, `ltxtext`, `plarydshln`, `plext`, `plextarydshln`, `plextcolortbl`, `pxatbegshi`, `pxeveryshi`, `pxftnright`, `pxjahyper`, `tascmac`.
  - Verified to work with `plarray`, `plautopatch`, `plextarray`, `plextdelarray`, `pxgentombow`, `plsiunitx`, `pxpdfpages`, `pxpgfrcs`, `pxpgfmark`.
- packages
  - Added support for `fontspec \textsi` and `\sishape`.
  - Added `multicol's \docolaction`.
  - Added `embrace`, `footnoterange`, `multicolrule`, `versionotes`.

**v0.64:** Koma-Script, Japanese, Chinese.

- Japanese
  - Added `utarticle` and related classes.
  - Improved `ujarticle` and related classes.
- Chinese
  - Fix for `biblatex` with `CTEX` and other classes.
- Koma-Script packages
  - Fixes for `sclayer`, `sclayer-scrpage`.
  - `addlines`: Updated to v0.3.
  - Added `bsheaders`, `gmeometric`, `marginal`, `rmpage`, `scrpage2`.

**v0.63:** mdframed, Chinese, Japanese, Korean

- localization
  - Added `\linkhomename`: A user-definable name for the **Home** link.
  - Documented `\sidetocname`: A user-definable name for the `sideroc`.
- fixes
  - Fix: `\LinkHome` for print output.
- optimizations
  - Moved package load checks to the `lwarp` core to reduce the number of `lwarp-*` files.
- packages
  - `mdframed`: Fix with `amsthm`, improved titles and font control. Improved rule widths.
- Chinese
  - Fixes for `xeCJK`.
  - Added `xpinyin`, `zhlineskip`.
- Japanese
  - Verified to work with `zsjatype`, `luatexja`, `luatexja-fontspec`.
  - Added `bxjsarticle` and related classes.
  - Added `ltsarticle` and related classes.
  - Added `pLATEX`, `upLATEX`, `ujarticle` and related classes.
  - Prevented `utarticle` and related classes.
  - Prevented `bcjkatype`.
- Korean
  - Verified to work with `kotex`, `xetexko`, `luatexko`.

**v0.62:** MiKTeX docs, HTML title, CTeX, xeCJK, bitpattern.

- docs
  - Docs: Setting a UTF-8 locale. See section 9.9.
- MiKTeX
  - MiKTeX: Docs for *MiKTeX Console* and `miktex-poppler-bin`.
- HTML <title>
  - HTML subpage titles: Added `\HTMLTitleBeforeSection` and `\HTMLTitleAfterSection` to select whether the HTML `<title>` displays the website name before or after the section name. See section 7.6.
- fixes
  - Fix for package options handling.
  - Fixes for horizontal white space between `fminipage`, `fcolorminipage`, `colorboxBlock`, `fcolorboxBlock`.
  - Logos: Fix for XeTeX logo, improved css, made robust, improved search-engine optimization.
  - `\[$1]`: Additional HTML `<br>` if `$1 > 0 pt`.
  - Fixes for `\includgraphics` filename, and with `FormatWP`.
  - Fix: css for `\textup`.
  - Fix: Added `\slshape`.
- Chinese
  - Added `ctex` package and related classes, `xeCJK`.
  - Prevented `CJK`, `CJKutf8` unless `xeCJK`, `ctex` are used.

## packages

- chemfig: Docs for new macro `\polymerdelim`.
- asymptote: Docs for compilation.
- chngpage: Fix to load `lwarp-changepage`.
- algorithm2e: Fix with non-book classes.
- register: Updated to v1.8.
- nicefrac: Improved font control and css, honors nice and ugly.
- units: Improved font control and css, honors tight and loose.
- xfrac: Improved css.
- textcomp and xunicode: Fix conflicts with `\textcircled`.
- ulem: Improved compatibility with CJKulem, `lateximage`.
- MATHJAX and siunitx: Removed inoperable extension.
- Added bitpattern, pdfcomment, pdfmarginpar, tram, unitsdef, xexchangebar.
- Added musicography, octave, semantic-markup.
- Added 2in1, flippdf, notespages, rviewport, twoup.

**v0.61:** Custom compilation, EPS-related packages, documentation, indexes.

## docs

- Split index into multiple indexes.
- Improved documentation regarding font selection. See section 7.4.
- Added documentation regarding debugging options. See section 35.
- Added documentation regarding HTML entities inside program listings. See section 8.2.1.

## custom compiling

- Added options to specify the shell commands to execute for `lwarpmk print` and `lwarpmk html`, allowing the use of `lwarp` with `perltex`, `pythontex`, etc. If not specified, these are set automatically depending on the L<sup>A</sup>T<sub>E</sub>X engine, `--shell-escape`, and `lwarp` options. See section 9.

 changed names

- Changed macro names to match `\displaymathother`, `\displaymathnormal`:

Old	New
<code>\StartDynamicMath</code>	<code>\inlinemathother</code>
<code>\StopDynamicMath</code>	<code>\inlinemathnormal</code>

## fixes

- Fix: Paragraph tags in a tabular.
- Fix: `supertabular` and `xtab` captions.
- Fix: DVI L<sup>A</sup>T<sub>E</sub>X `\includegraphics` EPS images.
- Fix: `newfloat` lists.
- Fix: css footnotes text align, minipage tabular and footnote margins.

## packages

- Added `epsfig`, `psfrag`, `psfragx`, `pstool`.
- Added `copyrightbox`, `pdfprivacy`, `thinsp`, `threadcol`, `uspace`.
- Added `chkfloat`, `cmdtrack`, `dprogress`, `lua-visual-debug`, `refcheck`, `srcltx`, `srctex`, `vpe`, `xbmks`.

**v0.60:** Fixes for `longtable`, listings.

## fixes

- `longtable`, etc.: Fixes for slowdown and memory management for very long tables.
- listings: Fix for HTML entities, and also when used inside a list.
- `diagbox`: Fix for incorrect HTML par tags.

## packages

- Added 2up, booklet.
- Added bophook, drafftfigure, fullminipage, grid-system, layaureo.
- Added leading, widows-and-orphans.
- Added fancytabs, thumb, thumbs.

**v0.59:** DVI *latex*, MATHJAX, asymptote, pdftricks and pstricks, epstopdf, brqen.

⚠ Reset the configuration

- Due to changes in *lwarpmk*, **recompile any existing project a single time** using `pdflatex filename.tex` or similar, after which *lwarpmk* may then be used with the new configuration files.

*lwarpmk*

- Added an error if `lwarpmk.conf`'s format has changed and the document must be recompiled.
- Added a warning if the `lwarpmk.conf` configuration file appears to be for the wrong operating system, in case files are transferred between systems.
- Added
 

```
lwarpmk epstopdf <list-of-EPS-files>
```

 to quickly convert a document's EPS images to PDF or SVG. See section 8.8.

DVI *latex*

- Added support for DVI *latex*. See section 7.5.

*latexmk*

- Fix for `--shell-escape` with *latexmk*.

## math

- Updated MATHJAX script to v2.7.4.
- Fix: MATHJAX chapter number removed from non-numeric tagged equations.
- Added MATHJAX support for nicefrac, units.
- Fix for `\[` and `\]` with `\displaymathnormal`.

## images

- Fix for `\includegraphics` filename expansion.
- `\includegraphics` now works with `.pdf` and `.eps` filename extensions.

## packages

- Moved `amsmath` out of the *lwarp* core.
- Fix for `chemformula \NMR`.
- Added `asymptote`, `pdftricks`, `pstricks`, `pst-eps`.
- Added `breqn`, `Slunits`.
- Added `bxpapersize`, `canoniclayout`, `draftcopy`, `fnbreak`, `nccfancyhdr`.
- Added `accsupp`, `axessibility`.
- Added `xunicode`.
- Improved and now supports `epstopdf`.
- Tested to work as-is: `eepic`, `sepfootnotes`.

## docs

- Added information about setting up a development version of *lwarp*.

**v0.58:** Extensive improvements in indexing, glossaries. Adds PDF-inclusion packages.

⚠ Reset the configuration

- Due to changes in *lwarpmk*, **recompile any existing project a single time** using `pdflatex filename.tex` or similar, after which *lwarpmk* may then be used with the new configuration files.

*lwarpmk*

- *lwarpmk*: Added the `-p` option to specify the project name.

## glossaries

- *lwarpmk*: Now uses `makeglossaries` for glossary generation, allowing the processing of multiple glossaries at once.

## index and glossary

- Added `lwarp` option `GlossaryCmd` to specify the shell command used by `lwarpmk printglossary` and `lwarpmk htmlglossary`. Defaults to `makeglossaries`.
- Docs: Extra indexing options. See section 8.6.14.
- Added support for `makeindex`. (Previously supported only `xindy`.) Also added indexing packages listed below.
- Added `lwarp` options `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to specify shell commands used by `lwarpmk printindex`, `lwarpmk htmlindex`, and `latexmk`. May be preset with the `makeindex` or `xindy` `lwarp` options. See section 7.5.
- Added `lwarp` options `makeindex` and `xindy` to set `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to sensible values for a typical single index. See section 7.5.
- Added `lwarp` option `makeindexStyle` to tell `lwarpmk` to use a custom style instead of `lwarp.ist`. See section 8.6.20.

## misc. fixes

- Fix for index entries with `\see`, `\seealso`, `\emph`, `\textbf`, etc.
- Replaced each `\csuse` with `\@nameuse` for improved error detection.
- Additional internal `print/HTML` macro selection improvements.
- Fix: `\printindex` finishes pending `\index` writes first.
- Fixes for `memoir`: `makeidx`, `ccaption`, multiple indexes, `\specialindex`.

## packages

- Fixes for `komascript`: Indexing improvements.
- Added `imakeidx`, `index`, `repeatindex`, `splitidx`.
- Added `attachfile`, `attachfile2`, `intopdf`, `pdfpages`, `pdfx`.
- Added `cases`.
- Tested to work as-is: `notes2bib`, `hvinde`.

**v0.57:** `algorithm2e`, float styles, tabular packages, internal improvements.

## MathJax

## math macros

## dynamic math

- Added support for `MATHJAX` equations with `\footnote`, `\footnotemark`.
- Added `\StartDefiningMath` and `\StopDefiningMath` for use when defining macros in the preamble which contain `$`. See section 8.7.9.
- Added `\inlinemathother` and `\inlinemathnormal` to delimit math expressions which depend on a variable condition such as a counter. Such expressions will not be hashed for reuse, and will be converted to `svg` math images even when `MATHJAX` is enabled. See section 8.7.10.
- Renamed `\EndDefiningTabulars` to `\StopDefiningTabulars`.

## △ new name

## lateximage alt tags

- Improved localization for `lateximage` `HTML alt` tags. For `svg` math images, the `alt` tag under some conditions will be set to `\MathImageAltText`, which defaults to `math image`. For packages, the `alt` tag is set using the package name followed by `\PackageDiagramAltText`, which defaults to `diagram`. Ex:

```
(-xy- diagram)
```

See section 7.6.

- Fix: Improved `print/HTML` macro selection.
- Fix: `\href` text catcodes.
- Fix: `\subref` text.

## misc. fixes

- packages
  - Fixes: Colored `\rule` and `\boxframe`.
  - float, rotfloat: Adds support for float styles ruled and boxed.
  - float: Fix: Do not create `\l@<type>` until `\listof` is used.
  - marginnote: Fix: Long optional argument.
  - ellipsis: Adds `\midwordellipsis`.
  - breakurl: Fix for text catcodes.
  - Added `algorithm2e`, `register`, `ltablex`, `xltabular`, `xellipsis`, `trimclip`, `errata`, `vowel`, `xpiano`.
  - Prevents `glossary`.
  - Tested to work as-is with `gauss`, `phonrule`, `piano`, `Slunits`, `tikzcodeblocks`.

**v0.56:** Shell escape, tabular packages.

- lwarpmk
  - Added
    - `lwarpmk pdftosvg <list-of-PDF-files>`
    - to quickly convert a document's PDF images to SVG, for use with HTML. See section 8.8.
  - Added support for `--shell-escape`. See section 7.3.
- tabular
  - Added support for array `w` and `W` columns.
  - Fix: `\multicolumn` parameter handling.
  - Added support for double `\hlines`, `\midrules`, and vertical rules.
  - Added support for `arydshln` dashed lines with HTML `tabular`, but reverts to plain rules for `lateximage` and `svg math array`.
- misc. fixes
  - Fix: `\thinspace`.
  - Fix: `paralist` compact environments.
- packages
  - Added `parnotes`, `quoting`, `lua-check-hyphen`, `tocenter`, `underscore`.
  - Added `bibunits`.
  - Tested to work as-is with `babelbib`, `bodegraph`, `fast-diagram`, `nicematrix`, `structmech`.

**v0.55:** Various fixes.

- misc fixes
  - Fix: Extraneous space in file links, which also prevented *Calibre* EPUB conversions.
  - Fix: Float optional argument regression.
  - Fix: `\ForceHTMLTOC` with `\phantomsection`.
  - Fix: Overfull boxes in `lateximages`.
  - Fix: QED symbols in `lateximage`.
- packages
  - `koma-script`: Fix: Figure with `\centering`, etc.
  - Added `clrdblpg`.

**v0.54:** Float `\centering`, improved image checks.

- ⚠ Reset the configuration
  - Due to changes in *lwarpmk*, **recompile any existing project a single time** using `pdflatex filename.tex` or similar, after which *lwarpmk* may then be used with the new configuration files.
- lwarpmk
  - `lwarpmk limages` checks for the presence of the HTML version of the document and valid image references before attempting to create the `lateximages`.

- Floats now honor `\centering`, `\raggedright`, `\raggedleft`, and their `ragged2e` equivalents, when placed directly after:

```
\begin{floattype}
\centering
```

- `tikz`: `\pgfpicture`, `fit`, `align`, `font`.
- `ragged2e`: `\centering` etc.
- `hyperref`: `\hypertarget` was creating duplicate of `\label`.
- `hyperref`: Active chars inside `\hyperref`, `\hyperlink`.
- `hyperref`: `\ref` inside `\hyperlink` caused a nested HTML link.
- `glossaries`: Fix when not using `babel` or `polyglossia`.
- `textcomp`: `\textperthousand`.
- L<sup>A</sup>T<sub>E</sub>X core verse environment: line spacing.
- Removed `\citetitle`, adjusted `\attribution`.
- `memoir`: Minor update for v3.7g.
- Added `inputenx`, `bibunits`, `chnpage`, `forest`, `magaz`, `gridset`.
- Prevents loading `ae`, `aecc`, `tlenc`, and `wasysym`.

**v0.53:** Improved image checks.

*lwarpmk*

- *lwarpmk*: Added a warning about corrupted images due to the need to recompile the document one more time.
- *lwarpmk*: Added the `lwarpmk cleanimages` command.
- Added documentation for `lwarpmk cleanimages` and `lwarpmk pdftohtml`.

**v0.52:** Improved footnotes, SVG math.

- Improved install instructions regarding `lwarp_baseline_marker.png`.
- Added documentation regarding footnotes in section headings, and footnotes with `\VerbatimFootnotes` from `fancybox`, `fancyvrb`. See section 8.5.4.
- Added documentation regarding font selection when using X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or Lua<sup>A</sup>T<sub>E</sub>X with `fontspec` and traditional font packages. See section 7.4.
- Fix: Limit the number of background tasks when generating `Lateximages`.

- Added user-adjustable svg math font scaling. See section 84.3.
  - Added warnings if `lwarp_baseline_marker.png` is not present, or if `graphicx` or `graphics` is not loaded.
  - Improved `\ensuremath` hashing expansion.
  - Fix: `equation*` with `split`.
  - `tabbing` now works inside a `lateximage`. Use for math in `tabbing`.
  - Fix: `MATHJAX` script was not executing in some conditions.
  - Added `\CustomizeMathJax` to add custom functions. See section 8.7.
- MathJax**
- Fix: Footnote numbering when using `HTMLDebugComments`.
- footnotes**
- Fix: Footnote paragraph tags.
  - Fix: `FootnoteDepth` defaults to `\subsubsection`.
- misc. fixes**
- Fix: `\kill` in a `lateximage`.
  - Fix: `\FileDepth`, `misc. others`, when input encoding is not `utf8`.
  - Fix: `\texorpdfstring` in a section name.
- packages**
- `hyperref` emulation: Fix for `#`, `%`, `&`, `~`, `_` characters in URLs.
  - `fancybox`, `fancyvrb`: Initial support for `\VerbatimFootnotes`.
  - `nicefrac`: Added with fix for `\ensuremath`.
  - `graphicx`: Fix for option defaults. Added `v1.1a/b` options.
  - `endfloat`: Updated for `v2.6`.
  - `url`: Fixes for active characters.

## 2 Introduction

The `lwarp` project aims to allow a rich `LATEX` document to be converted to a reasonable `HTML5` interpretation, with only minor intervention on the user's part. No attempt has been made to force `LATEX` to provide for every `HTML`-related possibility, and `HTML` cannot exactly render every possible `LATEX` concept. Where compromise is necessary, it is desirable to allow the print output to remain typographically rich, and compromise only in the `HTML` conversion.

Several “modern” features of `HTML5`, `CSS3`, and `SVG` are employed to allow a fairly feature-rich document without relying on the use of `JAVASCRIPT`. Limited testing on older browsers shows that these new features degrade gracefully.

---

`lwarp` is a native `LATEX` package, and operates by either patching or emulating various functions. Source-level compatibility is a major goal, but occasional user intervention is required in certain cases.

As a package running directly in `LATEX`, `lwarp` has some advantages over other methods of `HTML` conversion. `TEX` itself is still used, allowing a wider range of `TEX` trickery to be understood. `Lua` expressions are still available with `LuaTEX`. Entire categories of `LATEX` packages work as-is when used with `lwarp`: definitions, file handling, utilities, internal data structures and calculations, specialized math-mode typesetting for various fields of science and engineering, and anything generating plain-text output. Blocks of `PDF` output may be automatically converted to `SVG` images while using the same font and spacing as the original print document, directly supporting `TikZ` and `picture`. Numerous packages are easily adapted for `HTML` versions, either by loading and patching the originals, or by creating nullified or emulated replacements, and all without resorting to external programming. As a result, several hundred packages have already been adapted (table 2), and an uncounted number more work as-is.

Packages have been selected according to several criteria: perceived importance, popularity lists, recent `CTAN` updates, `CTAN` topics, mention in other packages, support by other `HTML` conversion methods, and from sample documents taken from public archives. These include some “obsolete” packages as well.<sup>1</sup>

---

Assistance is also provided for modifying the `HTML` output to suit the creation of `EPUB` documents, and for modifying the `HTML` output to ease import into a word processor.

---

`pdflatex`, `xelatex`, or `lualatex` may be used, allowing `lwarp` to process the usual image formats. While generating `HTML` output, `SVG` files are used in place of `PDF`. Other formats such as `PNG` and `JPG` are used as-is.

---

<sup>1</sup>An amazing number of decades-old packages are still in use today.

svg images may be used for math, and are also used for `picture`, `TikZ`, and similar environments. The svg format has better browser and e-book support than MathML (as of this writing), while still allowing for high-quality display and printing of images (again, subject to potentially bug-ridden<sup>2</sup> browser support).

Furthermore, svg images allow math to be presented with the same precise formatting as in the print version. Math is accompanied by `<alt>` tags holding the L<sup>A</sup>T<sub>E</sub>X source for the expression, allowing it to be copy/pasted into other documents.<sup>3</sup> Custom L<sup>A</sup>T<sub>E</sub>X macros may be used as-is in math expressions, since the math is evaluated entirely inside L<sup>A</sup>T<sub>E</sub>X. An MD5 hash is used to combine multiple instances of the same inline math expression into a single image file, which then needs to be converted to svg only a single time.

The MATHJAX JavaScript display engine may be selected for math display instead of using svg images. Subject to browser support and Internet access, MATHJAX allows an HTML page to display math without relying on a large number of external image files.<sup>4</sup> `lwarp` maintains L<sup>A</sup>T<sub>E</sub>X control for cross-referencing and equation numbering, and attempts to force MATHJAX to tag equations accordingly.

---

A *texlua* program called *lwarpmk* is used to process either the print or HTML version of the document. A few external utility programs are used to finish the conversion from a L<sup>A</sup>T<sub>E</sub>X-generated PDF file which happens to have HTML5 tags, to a number of HTML5 plain-text files and accompanying images.

`lwarp` automatically generates the extra files necessary for the HTML conversion, such as CSS and `.xdy` files, and configuration files for the utility *lwarpmk*. Also included is a parallel version of the user's source document, `<sourcename>-html.tex`, which selects HTML output and then inputs the user's own source. This process allows both the printed and HTML versions to co-exist side-by-side, each with their own auxiliary files.

When requesting packages during HTML conversion, `lwarp` first looks to see if it has its own modified version to use instead of the standard L<sup>A</sup>T<sub>E</sub>X version. These `lwarp-packagename.sty` files contain code used to emulate or replace functions for HTML output.

---

<sup>2</sup>FIREFOX has had an on-again/off-again bug for quite some time regarding printing svgs at high resolution.

<sup>3</sup>There seems to be some debate as to whether MathML is actually an improvement over L<sup>A</sup>T<sub>E</sub>X for sharing math. The author has no particular opinion on the matter, except to say that in this case L<sup>A</sup>T<sub>E</sub>X is much easier to implement!

<sup>4</sup>One svg image file per math expression, except that duplicate inline math expressions are combined into a single file according to the MD5 hash function of its contents. A common scientific paper can easily include several thousand files, and in one case the MD5 hash cut the number of files in half and the rendering time by 30%.

## 2.1 Typesetting conventions

Font weight, family, and style are used to indicate various objects:

Table 1: Typesetting conventions

<code>package</code>	L <sup>A</sup> T <sub>E</sub> X package.
<i>program</i>	Program's executable name.
<code>option</code>	Program or package option.
<code>filename</code>	File name in the operating system.
<code>BRAND NAME</code>	Proper name for a program, operating system, etc.
<b>commands</b>	Commands to be entered by the user.
<code>code</code>	Program code.
<code>\macroname</code>	L <sup>A</sup> T <sub>E</sub> X macro.
<code>environment</code>	L <sup>A</sup> T <sub>E</sub> X environment.
<code>counter</code>	L <sup>A</sup> T <sub>E</sub> X counter.
<code>boolean</code>	L <sup>A</sup> T <sub>E</sub> X boolean.
<code>&lt;element&gt;</code>	HTML element.
<code>attribute</code>	HTML attribute.
<b>User Interface</b>	A user-interface item.
<code>ACRO</code>	Acronym.

**subjects** Blue-colored tags in the left margin aid in quickly identifying the subject of each paragraph. These are often the targets of index entries.

**index entries** Black-colored tags in the left margin are used to identify programming objects such as files, packages, environments, booleans, and counters. Items without a tag are command macros. Each of these also appears in the index as individual entries, and are also listed together under “files”, “packages”, “environments”, “booleans”, and “counters”.

 **warnings** Special warnings are marked with a warning icon.

## 2.2 Supported packages and features

Table 2 lists some of the various L<sup>A</sup>T<sub>E</sub>X features and packages which may be used.

Package names are colored according to their support level:

**name:** Supported as-is.

**name:** Modified to work with HTML output, and perhaps also as print output in SVG math or `lateximage` environments.

**name:** Emulated for HTML output.

**name:** Ignored for HTML output, but provides source-level compatibility.

**MJ:** Supported as-is for MATHJAX, subject to limitations.

**MJ:** Emulated for MATHJAX using custom macros, subject to limitations.

**MJ:** Ignored by MATHJAX, but may be used in the document source. May be converted to SVG images.

Margins:	<code>fullwidth</code> , <code>hanging</code> , <code>midpage</code> .
Line numbering:	<code>fnlineno</code> , <code>lineno</code> .

---

Direct formatting:	<code>\emph</code> , <code>\textsuperscript</code> , <code>\textbf</code> , etc are supported. <code>\bfseries</code> , etc. are only supported in some cases. <code>cancel</code> <sup>MJ</sup> , <code>ellipsis</code> , <code>embrac</code> , <code>enparen</code> , <code>hyphenat</code> , <code>lettrine</code> , <code>lips</code> , <code>lua-check-hyphen</code> , <code>luacolor</code> , <code>magaz</code> , <code>moresize</code> , <code>nolbreaks</code> , <code>normalcolor</code> , <code>pdfcol</code> , <code>pdfcolmk</code> , <code>pdfrender</code> , <code>realscripts</code> , <code>resize</code> <sup>MJ</sup> , <code>scalegnt</code> , <code>seqsplit</code> <sup>MJ</sup> , <code>soul</code> , <code>soulpos</code> , <code>soulutf8</code> , <code>stackengine</code> , <code>textfit</code> , <code>thinsp</code> , <code>trimclip</code> , <code>truncate</code> , <code>ulem</code> , <code>umoline</code> , <code>underscore</code> , <code>uspace</code> , <code>xellipsis</code> .
Acronyms:	<code>acro</code> , <code>acronym</code> .
Ordinals:	<code>engord</code> , <code>fmtcount</code> , <code>nth</code> .
Text ligatures:	Ligatures for symbols are supported. Ligatures for f, q, t are intentionally turned off because many simpler browsers do not display them correctly. Modern full-featured browsers re-create these ligatures on-the-fly.
Horizontal space:	HTML output for <code>thin-unbreakable</code> , <code>unbreakable</code> , <code>\enskip</code> , <code>\quad</code> , <code>\qquad</code> , <code>\hspace</code> .
Rules:	<code>\rule</code> with <code>width</code> , <code>height</code> , <code>raise</code> , <code>text color</code> .

### 3 Alternatives

Summarized below are several other ways to convert a  $\text{\LaTeX}$  or other document to  $\text{HTML}$ . Where an existing  $\text{\LaTeX}$  document is to be converted to  $\text{HTML}$ , `lwarp` may be a good choice. For new projects with a large number of documents, it may be worth investigating the alternatives before decided which path to take.

#### 3.1 internet class

`internet` (*Cls*) The closest to `lwarp` in design principle is the `internet` class by Andrew Stacey—an interesting project which directly produces several versions of `markdown`, and also `HTML` and `EPUB`. <https://github.com/loopspace/latex-to-internet>

#### 3.2 $\text{TeX4HT}$

`TeX4ht` (*Prog*) <http://tug.org/tex4ht/>

`htlatex` (*Prog*)

This system uses native  $\text{\LaTeX}$  processing to produce a `DVI` file containing special commands, and then uses additional post-processing for the `HTML` conversion by way of numerous configuration files. In some cases `lwarp` provides a better `HTML` conversion, and it supports a different set of packages. `TeX4ht` produces several other forms of output beyond `HTML`, including `ODT` and a direct path to `EPUB`, and is still being developed.

#### 3.3 Translators

These systems use external programs to translate a subset of  $\text{\LaTeX}$  syntax into `HTML`. Search for each on `CTAN` (<http://ctan.org>).

`Hevea` (*Prog*) **H<sup>E</sup>v<sup>E</sup>a**: <http://hevea.inria.fr/> (not on `CTAN`)

`TtH` (*Prog*) **T<sub>T</sub>H**: <http://hutchinson.belmont.ma.us/tth/>

`GELLMU` (*Prog*) **GELLMU**: <http://www.albany.edu/~hammond/gellmu/>

`LaTeXML` (*Prog*)  **$\text{\LaTeX}$ XML**: <http://dlmf.nist.gov/LaTeXML/>

`Plastex` (*Prog*) **PlasTeX**: <https://github.com/tiarno/plastex>

`LaTeX2HTML` (*Prog*)  **$\text{\LaTeX}$ 2HTML**: <http://www.latex2html.org/>  
and <http://ctan.org/pkg/latex2html>.

`TeX2page` (*Prog*) **TeX2page**: <http://ds26gte.github.io/tex2page/index.html>

Finally, `GladTeX` may be used to directly insert  $\text{\LaTeX}$  math into `HTML`:

`GladTeX` (*Prog*) **GladTeX**: <http://humenda.github.io/GladTeX/>

### 3.4 ASCIIDOC and ASCIIDOCTOR

AsciiDoc is one of the most capable markup languages, providing enough features to produce the typical technical-writing document with cross-references, and it writes L<sup>A</sup>T<sub>E</sub>X and HTML.

AsciiDoc (*Prog*) **Asciidoctor:** <http://asciidoctor.org/> (More active.)

AsciiDoctor (*Prog*) **AsciiDoc:** <http://asciidoc.org/> (The original project.)

#### 3.4.1 ASCIIDOCTOR-L<sup>A</sup>T<sub>E</sub>X

The AsciiDoctor-LaTeX project is developing additional L<sup>A</sup>T<sub>E</sub>X-related features.

##### Asciidoctor-LateX:

Asciidoctor-LaTeX (*Prog*) <https://github.com/asciidoctor/asciidoctor-latex>

### 3.5 PANDOC

Pandoc (*Prog*) A markup system which also reads and writes L<sup>A</sup>T<sub>E</sub>X and HTML.

**Pandoc:** <http://pandoc.org/>

(Watch for improvements in cross-references to figures and tables.)

### 3.6 Word processors

Word (*Prog*) It should be noted that the popular word processors have advanced through the years in their abilities to represent math with a L<sup>A</sup>T<sub>E</sub>X-ish input syntax, unicode math fonts, and high-quality output, and also generate HTML with varying success. LibreOffice (*Prog*) OpenOffice (*Prog*) See recent developments in MICROSOFT<sup>®</sup> *Word*<sup>®</sup> and LIBREOFFICE<sup>™</sup> *Writer*.

### 3.7 Commercial systems

Adobe (*Prog*) Likewise, several professional systems exist whose abilities have been advancing in the areas of typesetting, cross-referencing, and HTML generation. See ADOBE<sup>®</sup> FrameMaker<sup>®</sup>, ADOBE *InDesign*<sup>®</sup>, and MADCAP *Flare*<sup>™</sup>.

Madcap (*Prog*)

### 3.8 Comparisons

AsciiDoc, Pandoc, and various other markup languages typically have a syntax which tries to be natural and human-readable, but the use of advanced features tends to require many combinations of special characters, resulting in a complicated mess of syntax. By contrast, L<sup>A</sup>T<sub>E</sub>X spells things out in readable words but takes longer to type, although integrated editors exist which can provide faster

entry and a graphic user interface. For those functions which are covered by the typical markup language it is arguable that L<sup>A</sup>T<sub>E</sub>X is comparably easy to learn, while L<sup>A</sup>T<sub>E</sub>X provides many more advanced features where needed, along with a large number of pre-existing packages which provide solutions to numerous common tasks.

Text-based document-markup systems share some of the advantages of L<sup>A</sup>T<sub>E</sub>X vs. a typical word processor. Documents formats are stable. The documents themselves are portable, work well with revision control, do not crash or become corrupted, and are easily generated under program control. Formatting commands are visible, cross-referencing is automatic, and editing is responsive. Search/replace with regular expressions provides a powerful tool for the manipulation of both document contents and structure. Markup systems and some commercial systems allow printed output through a L<sup>A</sup>T<sub>E</sub>X back end, yielding high-quality results especially when the L<sup>A</sup>T<sub>E</sub>X template is adjusted, but they lose the ability to use L<sup>A</sup>T<sub>E</sub>X macros and other L<sup>A</sup>T<sub>E</sub>X source-document features.

The effort required to customize the output of each markup system varies. For print output, L<sup>A</sup>T<sub>E</sub>X configuration files are usually used. For HTML output, a CSS file will be available, but additional configuration may require editing some form of control file with a different syntax, such as XML. In the case of lwarp, CSS is used, and much HTML output is adjusted through the usual L<sup>A</sup>T<sub>E</sub>X optional macro parameters, but further customization may require patching L<sup>A</sup>T<sub>E</sub>X code.

The popular word processors and professional document systems each has a large base of after-market support including pre-designed styles and templates, and often include content-management systems for topic reuse.

## 4 Installation

Table 3 shows the tools which are used for the L<sup>A</sup>T<sub>E</sub>X to HTML conversion. In most cases, these will be available via the standard package-installation tools.

Detailed installation instructions follow.

Table 3: Required software programs

**Provided by your L<sup>A</sup>T<sub>E</sub>X distribution:**

From T<sub>E</sub>XLive: <http://tug.org/texlive/>.

**L<sup>A</sup>T<sub>E</sub>X:** *pdflatex*, *xelatex*, or *lualatex*.

**The lwarp package:** This package.

**The *lwarpmk* utility:** Provided along with this package. This should be an operating-system executable in the same way that *pdflatex* or *latexmk* is. It is possible to have the *lwarp* package generate a local copy of *lwarpmk* called `lwarpmk.lua`. See table 4.

***luatex*:** Used by the *lwarpmk* program to simplify and automate document generation.

***xindy*:** The *xindy* program is used by *lwarp* to create indexes. On a MiK<sub>T</sub>E<sub>X</sub> system this may have to be acquired separately, but it is part of the regular installer as of mid 2015.

***latexmk*:** Optionally used by *lwarpmk* to compile L<sup>A</sup>T<sub>E</sub>X code. On a MiK<sub>T</sub>E<sub>X</sub> system, *Perl* may need to be installed first.

***pdfcrop*:** Used to pull images out of the L<sup>A</sup>T<sub>E</sub>X PDF.

**POPPLER PDF utilities:**

***pdftotext*:** Used to convert PDF to text.

***pdfseparate*:** Used to pull images out of the L<sup>A</sup>T<sub>E</sub>X PDF.

***pdftocairo*:** Used to convert images to SVG.

These might be provided by your operating-system package manager, and MiK<sub>T</sub>E<sub>X</sub> provides `miktex-poppler-bin-*` packages.

From POPPLER: [poppler.freedesktop.org](http://poppler.freedesktop.org).

For MACOS<sup>®</sup>, see <https://brew.sh/>, install *Homebrew*, then

```
Enter ⇒ brew install poppler
```

For WINDOWS, see MiK<sub>T</sub>E<sub>X</sub> `miktex-poppler-bin-*`, or:

<https://sourceforge.net/projects/poppler-win32/> and:  
<http://blog.alivate.com.au/poppler-windows/>

**Perl:**

This may be provided by your operating-system package manager, and may be required for some of the POPPLER PDF utilities.

[strawberryperl.com](http://strawberryperl.com) (recommended), [perl.org](http://perl.org)

**Automatically downloaded from the internet as required:**

**MATHJAX:** Optionally used to display math. From: [mathjax.org](http://mathjax.org)

## 4.1 Installing the lwarp package

There are several ways to install lwarp. These are listed here with the preferred methods listed first:

**Pre-installed:** Try entering into a command line:

```
Enter ⇒ kpsewhich lwarp.sty
```

If a path to lwarp.sty is shown, then lwarp is already installed and you may skip to the next section.

**TeX Live:** If using a TeX Live distribution, try installing via *tlmgr*:

```
Enter ⇒ tlmgr install lwarp
```

**MiKTeX:**

1. For newer versions of MiKTeX, install or update lwarp using the *MiKTeX Console* program.
2. For older versions of MiKTeX, to install lwarp the first time, use the *MiKTeX Package Manager (Admin)*. To update lwarp, use *MiKTeX Update (Admin)*.
3. Either way, also update the package miktex-misc, which will install and update the *lwarpmk* executable.

**Operating-system package:** The operating-system package manager may already have lwarp, perhaps as part of a set of TeX-related packages.

**CTAN TDS archive:** lwarp may be downloaded from the Comprehensive TeX Archive:

1. See <http://ctan.org/pkg/lwarp> for the lwarp package.
2. Download the TDS archive: lwarp.tds.zip
3. Find the TeX local directory:

**TeX Live:**

```
Enter ⇒ kpsewhich -var-value TEXMFLOCAL
```

**MiKTeX:**

In the **Settings** window, **Roots** tab, look for a local TDS root.

This should be something like:

```
/usr/local/texlive/texmf-local/
```

4. Unpack the archive in the TDS local directory.
5. Renew the cache:

```
Enter ⇒ mktexlsr
```

— OR —

```
Enter ⇒ texhash
```

Or, for WINDOWS MiKTeX, start the program called *MiKTeX Settings (Admin)* and click on the button called **Refresh FNDB**.

**CTAN .dtx and .ins files:** Another form of TeX package is .dtx and .ins source files. These files are used to create the documentation and .sty files.

1. See <http://ctan.org/pkg/lwarp> for the lwarp package.
2. Download the zip archive lwarp.zip into your own lwarp directory.
3. Unpack lwarp.zip.

4. Locate the contents `lwarp.dtx` and `lwarp.ins`

5. Create the `.sty` files:

```
Enter ⇒ pdflatex lwarp.ins
```

6. Create the documentation:

---

```
pdflatex lwarp.dtx (several times)
makeindex -s gglo.ist -o lwarp.gls lwarp.glo
makeindex -s gind.ist lwarp.idx
pdflatex lwarp.dtx (several times)
```

---

7. Copy the `.sty` files somewhere such as the T<sub>E</sub>X Live local tree found in the previous CTAN TDS section, under the subdirectory:

```
<texlocal>/tex/latex/local/lwarp
```

8. Copy `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` to the same place as the `.sty` files.

9. Copy the documentation `lwarp.pdf` to a source directory in the local tree, such as:

```
<texlocal>/doc/local/lwarp
```

10. Renew the cache:

```
Enter ⇒ mktextlsr
```

— or —

```
Enter ⇒ texhash
```

Or, for WINDOWS MiK<sub>T</sub>E<sub>X</sub>, start the program called *MiKTeX Settings (Admin)* and click on the button called **Refresh FNDB**.

11. See section 4.2.1 to generate your local copy of *lwarpmk*.

12. Once the local version of `lwarpmk.lua` is installed, it may be made available system-wide as per section 4.2.

**Project-local CTAN `.dtx` and `.ins` files:** The `.dtx` and `.ins` files may be downloaded to a project directory, then compiled right there, alongside the document source files. The resultant `*.sty` and `lwarpmk.lua` files may be used as-is, so long as they are in the same directory as the document source. The files `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` must also be copied as well. This approach is especially useful if you would like to temporarily test *lwarp* before deciding whether to permanently install it.

Just testing!

## 4.2 Installing the *lwarpmk* utility

(Note: If *lwarpmk* is not already installed, it is easiest to use a local copy instead of installing it system-wide. See section 4.2.1.)

After the *lwarp* package is installed, you may need to setup the *lwarpmk* utility:

1. At a command line, try executing **lwarpmk**. If the *lwarpmk* help message appears, then *lwarpmk* is already set up. If not, it is easiest to generate and use a local copy. See section 4.2.1.
2. For MiK<sub>T</sub>E<sub>X</sub>, try updating the `miktex-misc` package. This may install the *lwarpmk* executable for you.

Otherwise, continue with the following:

3. Locate the file `lwarpmk.lua`, which should be in the `scripts` directory of the TDS tree. On a T<sub>E</sub>X Live or MiK<sub>T</sub>E<sub>X</sub> system you may use

Enter ⇒ `kpsewhich lwarpmk.lua`

(If the file is not found, you may also generate a local copy and use it instead. See section 4.2.1.)

4. Create *lwarpmk*:

**Unix:** Create a symbolic link and make it executable:

- (a) Locate the T<sub>E</sub>X Live binaries:

Enter ⇒ `kpsewhich -var-value TEXMFROOT`

This will be something like:

`/usr/local/texlive/<year>`

The binaries are then located in the `bin/<arch>` directory under the root:

`/usr/local/texlive/<year>/bin/<architecture>/`

In this directory you will find programs such as *pdflatex* and *makeindex*.

- (b) In the binaries directory, create a new symbolic link from the binaries directory to `lwarpmk.lua`:

Enter ⇒ `ln -s <path to lwarpmk.lua> lwarpmk`

- (c) Make the link executable:

Enter ⇒ `chmod 0755 lwarpmk`

**WINDOWS T<sub>E</sub>X Live:** Create a new `lwarpmk.exe` file:

- (a) Locate the T<sub>E</sub>X Live binaries as shown above for UNIX.
- (b) In the binaries directory, make a *copy* of `runscript.exe` and call it `lwarpmk.exe`. This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

**WINDOWS MiK<sub>T</sub>E<sub>X</sub>:** Create a new `lwarpmk.bat` file:

- (a) Locate the MiK<sub>T</sub>E<sub>X</sub> binaries. These will be in a directory such as:

`C:\Program Files\MiKTeX 2.9\miktex\bin\x64`

In this directory you will find programs such as `pdflatex.exe` and `makeindex.exe`.

- (b) Create a new file named `lwarpmk.bat` containing:

`texlua "C:\Program Files\MiKTeX 2.9\scripts\lwarp\lwarp.texlua" %*`

This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

### 4.2.1 Using a local copy of *lwarpmk*

It is also possible to use a local version of *lwarpmk*:

1. When compiling the tutorial in section 5, use the `lwarpmk` option for the `lwarp` package:

```
\usepackage[lwarpmk]{lwarp}
```

2. When the tutorial is compiled with *pdflatex*, the file `lwarpmk.lua` will be generated along with the other configuration files.
3. `lwarpmk.lua` may be used for this project:

**Unix:**

- (a) Make
- `lwarpmk.lua`
- executable:

Enter ⇒ `chmod 0755 lwarpmk.lua`

- (b) Compile documents with

Enter ⇒ `./lwarpmk.lua html`Enter ⇒ `./lwarpmk.lua print`

etc.

- (c) It may be useful to rename or link to a version without the
- `.lua`
- suffix.

**WINDOWS:**

Compile documents with either of the following, depending on which command shell is being used:

Enter ⇒ `texlua lwarpmk.lua html`Enter ⇒ `texlua lwarpmk.lua print`

etc.

Or:

Enter ⇒ `lwarpmk html`Enter ⇒ `lwarpmk print`

etc.

### 4.3 Installing additional utilities

**To test for the existence of the additional utilities:**

Enter the following in a command line. If each program's version is displayed, then that utility is already installed. See table 3 on page 77.

Enter ⇒ `luatex --version`Enter ⇒ `xindy --version`Enter ⇒ `latexmk --version`Enter ⇒ `perl --version`Enter ⇒ `pdfcrop --version`Enter ⇒ `pdftotext -v`Enter ⇒ `pdfseparate --version`Enter ⇒ `pdftocairo -v`**To install *xindy*, *latexmk*, and *pdfcrop*:**The T<sub>E</sub>X utilities *xindy*, *latexmk*, and *pdfcrop* may be installed in *TeXLive* with *tlmgr*, installed by *MiKTeX*, provided by your operating system's package manager, or downloaded from the CTAN archive:<http://ctan.org/pkg/xindy><http://ctan.org/pkg/latexmk><http://ctan.org/pkg/pdfcrop>pdftotext (*Prog*)**To install the POPPLER utilities to a UNIX/LINUX system:**pdfseparate (*Prog*)

The tools from the POPPLER project should be provided by your operating system's package manager.

pdftocairo (*Prog*)**To install the POPPLER utilities to a MACOS machine:**

1. Install
- Homebrew*
- from
- <https://brew.sh/>
- :

`/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"`

2. Install the POPPLER utilities:

Enter ⇒ **brew install poppler**

#### To install the POPPLER utilities to a WINDOWS machine:

If using MikTEX, install a miktex-poppler-bin-\* package. Otherwise:

1. See table 3 on page 77.
2. Download and extract the POPPLER utilities *pdftotext*, *pdfseparate*, and *pdfseparate* to a directory, such as Poppler.
3. In the **Start** window, type "Path" to search for results related to Path. Or, open the control panel and search for "Path".
4. Choose **Edit the system environment variables** in the control panel.
5. Choose the **Environment Variables** button.
6. Choose the **Path** variable, then the **Edit** button.
7. Choose the **New** button to make an additional entry.
8. Enter the bin directory of the POPPLER utilities, such as:  
C:\Users\\Desktop\Poppler\poppler-0.5\_x86\poppler-0.5\bin  
Be sure to include \bin.
9. Click **Ok** when done.

#### perl (Prog) To install PERL to a WINDOWS machine:

1. Download and install a version of PERL, such as STRAWBERRY PERL, to a directory without a space in its name, such as C:\Strawberry.
2. Edit the **Path** as seen above for the POPPLER utilities.
3. Enter the bin directory of the *perl* utility, such as:  
C:\Strawberry\perl\bin  
Be sure to include \bin.
4. Click **Ok** when done.

**Any utilities installed by hand must be added to the PATH.**

## 5 Tutorial

This section shows an example of how to create an lwarp document.

Need help?

---

See the [General Index](#) for “how-to”, and the [Troubleshooting Index](#) if something doesn’t work. A [Troubleshooting](#) section is also available. The [Index of Objects](#) contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

---

### 5.1 Starting a new project

1. Create a new project directory called `tutorial`.

`tutorial.tex` (*file*)

2. Inside the `tutorial` directory, create a new file called `tutorial.tex`. This may be done several ways:

**Copy from the documentation PDF:**

A listing is in [fig. 1](#), which may be copied/pasted from the figure directly into your own editor, depending on the quality of the PDF viewer and editor, or:

**Copy from the lwarp documentation directory:**

Another copy may be found by entering into a command line:

Enter ⇒ `texdoc -l lwarp_tutorial.txt`

This should be in the `doc/latex/lwarp/` directory along with this PDF documentation. Copy `lwarp_tutorial.txt` directly into your `tutorial` directory, renamed as `tutorial.tex`.

`lwarp_tutorial.txt` (*file*)

⚠ Note: `.txt` suffix!

*When using Windows, use an editor other than Notepad, since Notepad does not accept the end-of-line from a Unix text file.*

⚠ Bad formatting!

3. Compile the project:

Enter ⇒ `pdflatex tutorial.tex`

(several times)

(*xelatex* or *lualatex* may be used as well. *lwarp* also supports DVI *latex* for use with `.eps` images.)

4. View the resulting `tutorial.pdf` with a PDF viewer.

A number of new files are created when `tutorial.tex` is compiled, as shown in [table 4](#). These files are created by the *lwarp* package.

(Two of the new files are configuration files for the helper program *lwarpmk*. Whenever a print version of the document is created, the configuration files for *lwarpmk* are updated to record the operating system, L<sup>A</sup>T<sub>E</sub>X engine (*latex*, *pdflatex*, *xelatex*, or *lualatex*), the filenames of the source code and HTML output, and whether the additional helper program *latexmk* will be used to compile the document.)

Table 4: Configuration files created by print version

- tutorial.pdf:** The PDF output from L<sup>A</sup>T<sub>E</sub>X. The print version of the document.
- tutorial\_html.tex:** A small .tex file used to create a parallel HTML version of the document, which co-exists with usual the PDF version, and which will have its own auxiliary files. In this way, both PDF and HTML documents may co-exist side-by-side.
- Auxiliary files:** The usual L<sup>A</sup>T<sub>E</sub>X files .aux, .log, .out, .toc, .lof, .idx. When an HTML version of the document is created, \_html versions of the auxiliary files will also be generated.
- lwarpmk.conf:** A configuration file for *lwarpmk*, which is used to automate the compilation of PDF or HTML versions of the document.
- tutorial.lwarpmkconf:** Another configuration file used by *lwarpmk*, which is only useful if you wish to have several projects residing in the same directory.
- .css files:** *lwarp.css*, *lwarp\_formal.css*, *lwarp\_sagebrush.css* These files are standard for *lwarp*, and are not meant to be modified by the user.
- sample\_project.css:** An example of a user-customized css file, which may be used for project-specific changes to the *lwarp* defaults.
- lwarp.ist:** Used by *lwarp* while creating an index using *makeindex*. This file should not be modified by the user. A custom file may be used instead, if necessary.
- lwarp.xdy:** Used by *lwarp* while creating an index using *xindy*. This file should not be modified by the user. A custom file may be used instead, if necessary.
- lwarp\_one\_limage.txt:** For WINDOWS only. Used to process SVG images in the background. Copied to *lwarp\_one\_limage.cmd* when images are generated.
- lwarp\_mathjax.txt:** Inserted into the HTML files when MATHJAX is used to display math. Do not modify, see `\MathJaxFilename` instead.
- comment\_\*.cut:** Temporary files used by *lwarp* to conditionally process blocks of text. These files may be ignored.

---

When the *lwarpmk* option is given to the *lwarp* package:

**lwarpmk.lua:** A local copy of the *lwarpmk* utility.

On UNIX-related operating systems this file must be made executable:

```
chmod u+x lwarpmk.lua
```

This may be useful to have to archive with a project for future use.

## 5.2 Compiling the print version with *lwarpmk*

The *lwarpmk* utility program is used to compile either the printed or the HTML version of the document.

`lwarpmk print` is used to recompile a printed version of the document.

### ⚠ Enable *lwarpmk*

1. If you have not yet done so, add `\usepackage{lwarp}` to the document, then compile the project a single time using *pdflatex*, *lualatex*, or *xelatex*. This generates the file `lwarpmk.conf`, which then allows the *lwarpmk* program to be used.

2. Re-compile the print version:

Enter ⇒ **lwarpmk print**

*lwarpmk* prints an introduction then checks to see if the document must be recompiled. If it seems that the files are up-to-date, then *lwarpmk* informs you of that fact and then exits.

3. Make a small change in the original document, such as adding a space character.

4. Recompile again.

Enter ⇒ **lwarpmk print**

The document is recompiled when a change is seen in the source. Several compilations may be necessary to resolve cross-references.

5. Force a recompile to occur.

Enter ⇒ **lwarpmk again**

Enter ⇒ **lwarpmk print**

`lwarpmk again` updates the date code for the file, triggering a recompile the next time the document is made.<sup>5</sup>

6. Process the index.<sup>6 7</sup>

Enter ⇒ **lwarpmk printindex**

7. Recompile again to include the index.

Enter ⇒ **lwarpmk print**

8. To force a single recompile when needed, even if no changes were detected:

Enter ⇒ **lwarpmk print1**

Note that the HTML customization commands are ignored while making the print version.

<sup>5</sup>Although, when using the utility *latexmk* (introduced later), the changed date is ignored and an actual change in contents must occur to cause a recompile.

<sup>6</sup>The command `lwarpmk printglossary` is also available to process a glossary produced with the `glossaries` package. See section 8.6.12.

<sup>7</sup>Also see section 8.6.15 for index options.

### 5.3 Compiling the HTML version with *lwarpmk*

`lwarpmk html` is used to recompile an HTML version of the document.

#### ⚠ Enable *lwarpmk*

1. If you have not yet done so, add `\usepackage{lwarp}` to the document, then compile the project a single time using *pdflatex*, *lualatex*, or *xelatex*. This generates the file `lwarpmk.conf`, which then allows the *lwarpmk* program to be used.

2. Compile the HTML version:

```
Enter ⇒ lwarpmk html
```

- (a) *lwarpmk* uses L<sup>A</sup>T<sub>E</sub>X to process `tutorial_html.tex` to create `tutorial_html.pdf`.
- (b) *pdftotext* is then used to convert to the file `tutorial_html.html`. This file is a plain-text file containing HTML tags and content for the entire document.
- (c) *lwarpmk* manually splits `tutorial_html.html` into individual HTML files according to the HTML settings. For this tutorial, the result is `tutorial.html` (the home page), along with `First-chapter.html`<sup>8</sup>, `Some-math.html`, and the document's index in `_Index.html`.<sup>9</sup>

3. View the HTML page in a web browser.

Open the file `tutorial.html` in a web browser.

#### math images

Note that math images have not yet been generated, so math is still displayed as its `alt` tag, which is set to the plain-text L<sup>A</sup>T<sub>E</sub>X source for that expression. Math may be displayed as SVG images (section 5.4) or by a MATHJAX script (section 5.5).

4. Force a recompile:

```
Enter ⇒ lwarpmk again
```

```
Enter ⇒ lwarpmk html
```

```
Enter ⇒ lwarpmk print
```

5. Process the HTML index and recompile:<sup>1011</sup>

```
Enter ⇒ lwarpmk htmlindex
```

```
Enter ⇒ lwarpmk html
```

`_Index.html` is updated for the new L<sup>A</sup>T<sub>E</sub>X index.

6. Reload the web page to see the added index.

7. To force a single recompile when needed, even if no changes were detected:

```
Enter ⇒ lwarpmk html1
```

<sup>8</sup>`First-chapter.html` also contains the first section, even though the second section is its own HTML page. This behavior is controlled by the boolean `CombineHigherDepths`.

<sup>9</sup>`index.html` is commonly used as a homepage, so the document index is in `_Index.html`.

<sup>10</sup>The command `lwarpmk htmlglossary` is also available to process a glossary produced with the `glossaries` package. See section 8.6.12.

<sup>11</sup>Also see section 8.6.15 for index options.

## 5.4 Generating the SVG images

**math as SVG images** By default `lwarp` represents math as SVG images, with the  $\LaTeX$  source included in `alt` attributes. In this way, the math is displayed as it was drawn by  $\LaTeX$ , and the  $\LaTeX$  source may be copied and pasted into other documents.

**picture and TikZ** `lwarp` uses the same mechanism for `picture` and `TikZ` environments.

1. Create the SVG images:

Enter  $\Rightarrow$  `lwarpmk limages`

Enter  $\Rightarrow$  `lwarpmk html`

2. Move to the tutorial's HTML math page and reload the document in the browser.
3. The math images are displayed using the same font and formatting as the printed version.
4. Copy/paste a math expression into a text editor to see the  $\LaTeX$  source.

 **adding/removing** When a math expression, `picture`, or `TikZ` environment is added or removed, the SVG images must be re-created by entering `lwarpmk limages` to maintain the proper image-file associations. Inline SVG math may be hashed and thus not need to be recreated, but display math and objects such as `TikZ` may move to new image numbers when the document is changed.

**recompile first** Before attempting to create the SVG image files, `lwarpmk` verifies that the HTML version of the document exists and has correct internal image references.<sup>12</sup> If it is necessary to recompile the document's HTML version one more time, `lwarpmk` usually will inform the user with an error message, but there are some conditions which cannot be detected, so the user should watch for the  $\LaTeX$  recompile warnings.

 **HTML instead of images** If HTML appears where an SVG image should be, recompile the document one more time to get the page numbers back in sync, then remake the images one more time.

 **page counter** Incorrect SVG images will also occur if the document changes the page counter:

```
\setcounter{page}{<value>}
```

The page counter must *not* be adjusted by the user.

**Lots of files!** Expressing math as SVG images has the advantage of representing the math exactly as  $\LaTeX$  would, but has the disadvantage of requiring an individual file for each math expression. For inline math, and some other objects, `lwarp` uses an MD5 hash on its  $\LaTeX$  source to combine multiple instances of identical inline expressions into a single image file, but display math and other environments such as `picture` and `TikZ` require one image file each. For a document with a large amount of math, see section 5.5 to use `MATHJAX` instead.

<sup>12</sup>This becomes important when dealing with a document containing thousands of images.

## 5.5 Using MATHJAX for math

[math with MATHJAX](#) Math may also be represented using the MATHJAX JAVASCRIPT project.

1. In the tutorial's source code, uncomment the mathjax package option for lwarp:

```
mathjax, % Use MathJax to display math.
```

2. Recompile

```
Enter ⇒ lwarpmk html
```

3. Reload the math page.

 **MATHJAX requirements** MATHJAX requires web access unless a local copy of MATHJAX is available, and it also requires that JAVASCRIPT is enabled for the web page. The math is rendered by MATHJAX. Right-click on math to see several options for rendering, and for copying the L<sup>A</sup>T<sub>E</sub>X source.

While using MATHJAX has many advantages, it may not be able to represent complex expressions or spacing adjustments as well as L<sup>A</sup>T<sub>E</sub>X, and it may not support some math-related packages.

## 5.6 Changing the css style

For a formal css style, add to the preamble:

```
\usepackage{lwarp}  
...  
\CSSfilename{lwarp_formal.css}  
...  
\begin{document}
```

For a modern css style, `lwarp_sagebrush.css` is also provided:

```
\CSSfilename{lwarp_sagebrush.css}
```

See section 7.7 for more information about modifying the css styling of the document.

## 5.7 Customizing the HTML output

A number of settings may be made to control the HTML output, including filename generation, automatic compilation, math output, document splitting, meta data, and page headers and footers.

See section 7.6 for more information.

## 5.8 Using *latexmk*

*latexmk* is a L<sup>A</sup>T<sub>E</sub>X utility used to monitor changes in source files and recompile as needed.

1. In the tutorial's source code uncomment the *latexmk* option for the *lwarp* package:

```
latexmk, % Use latexmk to compile.
```

2. Recompile the printed version of the document.

```
Enter ⇒ lwarpmk print
```

*lwarp* updates its own configuration files (*lwarpmk.conf* and *tutorial.lwarpmkconf*) whenever the printed version of the document is compiled. These configuration files remember that *lwarpmk* should use *latexmk* to compile the document.

3. Recompile the document.

```
Enter ⇒ lwarpmk print
```

and/or

```
Enter ⇒ lwarpmk html
```

Changes are detected by comparing checksums rather than modification times, so *lwarpmk* again will not trigger a recompile, but *latexmk* has a much better awareness of changes than the *lwarpmk* utility does and it is likely to correctly know when to recompile. A recompile may be forced by making a small change to the source, and a single recompile may be forced with:

```
Enter ⇒ lwarpmk print1
```

and/or

```
Enter ⇒ lwarpmk html1
```

[forced single-pass recompile](#)

## 5.9 Using Xe<sub>Λ</sub>TeX or Lua<sub>Λ</sub>TeX

Xe<sub>Λ</sub>TeX or Lua<sub>Λ</sub>TeX may be used instead of <sub>Λ</sub>TeX.

1. Remove the auxiliary files for the project:

```
Enter ⇒ lwarpmk cleanall
```

2. Use *xelatex* or *lualatex* to compile the printed version a single time.

```
Enter ⇒ xelatex tutorial.tex
```

— *or* —

```
Enter ⇒ lualatex tutorial.tex
```

When the compile occurs, the configuration files for *lwarpmk* are modified to remember which TeX engine was used. Xe<sub>Λ</sub>TeX or Lua<sub>Λ</sub>TeX will be used for future runs of *lwarpmk*.

3. To recompile the document:

```
Enter ⇒ lwarpmk print
```

-and-

```
Enter ⇒ lwarpmk html
```

4. Also remember to update the indexes and recompile again:

```
Enter ⇒ lwarpmk htmlindex
```

```
Enter ⇒ lwarpmk html
```

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk print
```

## 5.10 Using DVI <sub>Λ</sub>TeX

Traditional DVI <sub>Λ</sub>TeX may also be used along with .eps image files. An svg version of each image must also be provided. *lwarpmk* may be used to convert image formats.

To convert EPS files to PDF:

```
Enter ⇒ lwarpmk epstopdf *.eps (or a list of files)
```

To convert PDF files to SVG:

```
Enter ⇒ lwarpmk pdftosvg *.pdf (or a list of files)
```

 **bitmapped fonts** See section 7.4 regarding font selection to avoid the use of bitmapped fonts.

## 5.11 Using a glossary

lwarp supports the `gloss` and `glossaries` packages, although this tutorial does not supply an example.

### 5.11.1 `gloss` package

See section [8.6.11](#).

### 5.11.2 `glossaries` package

To process the glossary for the print version:

```
Enter ⇒ lwarpmk printglossary
```

(If `makeglossaries` is not found, see section [8.6.12](#).)

To process the glossary for the HTML version:

```
Enter ⇒ lwarpmk htmlglossary
```

In each case, the document will have to be recompiled afterwards:

```
Enter ⇒ lwarpmk html1
```

```
Enter ⇒ lwarpmk html
```

```
Enter ⇒ lwarpmk print1
```

```
Enter ⇒ lwarpmk print
```

See section [8.6.12](#) to set options for processing glossaries.

## 5.12 Cleaning auxiliary files

To remove the auxiliary files `.aux`, `.toc`, `.lof`, `.lot`, `.idx`, `.ind`, `.log`, and `.gl*`, and a few others:

```
Enter ⇒ lwarpmk clean
```

## 5.13 Cleaning auxiliary and output files

To remove the auxiliary files, and also remove the `.pdf` and `.html` files:

```
Enter ⇒ lwarpmk cleanall
```

## 5.14 Cleaning the images from the `<project>-images` directory

The `<project>-images` directory contains SVG images automatically generated for inline and display math, `tikz`, etc. To remove all the images from the `<project>-images` directory:

```
Enter ⇒ lwarpmk cleanimages
```

## 5.15 Converting PDF or EPS images to SVG

HTML cannot display PDF or EPS images, so any external PDF graphics images must be converted to SVG format. `pdftocairo` and `epstopdf` may be used one image at a time, but `lwarpmk` also provides a way to convert PDF or EPS images in bulk:

```
Enter ⇒ lwarpmk epstopdf *.eps (or a list of files)
```

```
Enter ⇒ lwarpmk pdftosvg *.pdf (or a list of files)
```

Be sure to always provide SVG files for HTML output.

## 5.16 Creating HTML from an incomplete compile

During testing it may be useful to finish the HTML conversion even when the document had errors and did not compile successfully. To attempt an HTML conversion of an incomplete document:

```
Enter ⇒ lwarpmk pdftohtml [-p project]
```

## 5.17 Processing multiple projects in the same directory

 `xr`, `xr-hyper`, `xcite`

It is possible to have several projects in the same directory. `lwarpmk` has an optional parameter which is the document to compile.

To create each project:

```
Enter ⇒ pdflatex project_a
```

```
Enter ⇒ pdflatex project_b
```

Each project is given its own configuration file:

```
project_a.lwarpmkconf, project_b.lwarpmkconf
```

To compile each project with `lwarpmk`:

```
Enter ⇒ lwarpmk print -p project_a
```

```
Enter ⇒ lwarpmk print -p project_b
```

```
Enter ⇒ lwarpmk html -p project_a
```

```
Enter ⇒ lwarpmk html -p project_b
```

To generate each project's images:

```
Enter ⇒ lwarpmk limages -p project_a
```

```
Enter ⇒ lwarpmk limages -p project_b
```

To clean each project's images:

```
Enter ⇒ lwarpmk cleanlimages -p project_a
```

```
Enter ⇒ lwarpmk cleanlimages -p project_b
```

To clean each project's auxiliary files:

```
Enter ⇒ lwarpmk cleanall -p project_a
```

```
Enter ⇒ lwarpmk cleanall -p project_b
```

If using *bibtex*, for example, the HTML version must also be processed:

```
Enter ⇒ bibtex project_a_html
```

## 5.18 Using the *make* utility

*lwarpmk* has an action which may be useful for integration with the common *make* utility:

```
lwarpmk pdftohtml [-p project]
```

*make* may be used to compile the code to PDF with HTML tags (`project_html.pdf`), then *lwarpmk* may be used to convert each target to HTML files.

## 5.19 What next?

**Shell escape:** See section [7.3, Shell escape](#).

**css customization:** See section [7.7, Customizing the css](#).

**MATHJAX customization:** See section [8.7.7, Customizing MATHJAX](#).

**Localization:** (languages) — See section [7.1, Localization](#).

**Accessibility:** (alt and title tags) — See section [7.2, Accessibility](#).

**Converting an existing document:** See section [6, Converting an existing document](#).

**EPUB conversion:** See section [10, EPUB conversion](#).

**Word processor conversion:** See section [11, Word-processor conversion](#).

## 6 Converting an existing document

To convert an existing document for use with lwarp:

1. Arrange the document in the following order:

- (a) Declare the `\documentclass`.
- (b) Load text fonts.
- (c) Load `inputenc` or `inputenx`, `fontenc`, or `fontspec`.
- (d) Load `lwarp`.
- (e) Load remaining packages.

2. Modify the document:

- (a) If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the toc entry without the math, or use `\texorpdfstring` from the `hyperref` package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

- (b) Avoid using the `\includegraphics scale` option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

- (c) Possible changes to `tabular` environments include: `* columns`, `multirow`, `longtable`, `supertabular`, `xtable`, `bigdelim`. See section 8.10.1.

- (d) If using braces in package options, such as with `caption`, see section 8.1.

- (e) Possible option clashes with `memoir`. See section 8.13.

- (f) If using `indexes`, see section 8.6.15.

- (g) If using many `indexes`, `glossaries`, `.aux` files, etc., see section 8.6.15 regarding `morewrites`. If `morewrites` is already used, be sure to add the setup with `allocate=10`.

- (h) Other changes as per [Special cases and limitations](#), section 8.

3. Convert any PDF images to SVG. See section 8.8.

4. Manually compile the print version with `latex`, `pdflatex`, `lualatex`, or `xelatex`.

5. `lwarpmk print` to finish the print version.

6. `lwarpmk html` to create the HTML version.

7. `lwarpmk limages` to create the SVG images of any SVG math, `lateximage`, `TikZ`, etc.

Table 5: Localization settings

**Object names:** L<sup>A</sup>T<sub>E</sub>X provides redefinable names for various objects, and lwarp adds a few more. Use `\renewcommand` to change these.

**\abstractname:** This macro is honored by lwarp.

**\linkhomename:** Displayed by the link to the homepage.

**\linkpreviousname:** Displayed by the link to the previous page

**\linknextname:** Displayed by the link to the next page.

**\sitetocname:** Displayed at the head of the sidenav.

**HTML settings:** See table 8 and section 7.6 for details.

**\HTMLLanguage:** The language to declare for each web page.

**\ImageAltText, \MathImageAltText, \PackageDiagramAltText, \AltTextOpen, \AltTextClose:** The defaults used for HTML alt text for images. See section 7.2.

**\CSSFilename:** The name of the css file to use.

**\MathJaxFilename:** The name of the MATHJAX script to use.

**Package options:**

**ImagesName and ImagesDirectory:** These options control the filenames used by lwarp when it automatically generates images. See table 7 and section 7.5.

**xindyStyle, xindyLanguage, xindyCodepage:** When using *xindy*, these options may be set according to local use. See section 8.6.21.

**pdftotextEnc:** To adjust the encoding of *pdftotext*.

## 7 Additional details

### 7.1 Localization

Regional localization is supported by lwarp via the package options and macros shown in table 5.

### 7.2 Accessibility

lwarp provides several methods for improving access to the document using tools such as text-only browsers, copy/paste, text-to-speech readers, or Braille readers. lwarp can use the HTML alt text attribute for images, as describe below. lwarp can also use the HTML title attribute, which usually generates a pop-up text. lwarp can add this to a reference or hyperlink. lwarp also uses standard HTML5 elements which are pre-assigned ARIA roles for increased accessibility, and lwarp assigns the math role for SVG math images, and the note role for footnotes, end notes, margin paragraphs and notes, etc. MATHJAX also has provisions for improved accessibility as well. See table 6.

Table 6: Accessibility settings

**\ImageAltText:** The default HTML alt text for `\includegraphics` and `lateximages`. Set with `\renewcommand`.

**\includegraphics alt key:** For `\includegraphics`, `lwarp` adds the alt key/value. For example:

```
\includegraphics[alt={Some text.}]{filename}
```

**svg math:** For simple svg math, `lwarp` places the L<sup>A</sup>T<sub>E</sub>X math expression in the alt text, so that the L<sup>A</sup>T<sub>E</sub>X expression may be copied and pasted to another document as plain text.

**\MathImageAltText:** For complicated svg math, such as enclosed in `\InlineMathOther`/`\InlineMathNormal`, or `\DisplayMathOther`/`\DisplayMathNormal`, the HTML alt text will be set to `\MathImageAltText`. Set with `\renewcommand`.

**MATHJAX:** For MATHJAX, the accessibility tools provided by MATHJAX are enabled by default by `lwarp`'s MATHJAX scripts.

**\PackageDiagramAltText:** Various packages create diagrams which `lwarp` converts into svg images. These are given alt text set to `\PackageDiagramAltText`. Set with `\renewcommand`.

**\ThisAltText:** The HTML alt text of the next image may be set with:

```
\ThisAltText{Custom text about the image.}
<SVG math, Tikz, picture, etc.>
```

The next single image will be generated with the given text, and the following images will revert to back to their defaults.

`\ThisAltText` may also be used to assign an HTML title to the next reference or hyperlink.

```
\ThisAltText{Custom text about the link.}
Text ... \ref{label_name} ... text.
```

See section 7.6.

**\AltTextOpen and \AltTextClose:** By default, HTML alt text is enclosed by parentheses. This may be changed by redefining `\AltTextOpen` and `\AltTextClose`. Set with `\renewcommand`.

### 7.3 Shell escape

`-\\-shell-escape` (*Opt*) Some documents require the use of an external program, which is allowed when using the `--shell-escape` command-line option. When the document is first compiled manually, and also whenever the print version is recompiled, `lwarp` detects and remembers whether shell escape is enabled. If so, it will also be enabled when the document is recompiled with `lwarpmk`.

### 7.4 Font and UTF-8 support

⚠ **type 3 bitmapped fonts** `lwarp` uses `pdftotext` to convert PDF output into UTF-8-encoded text. This process requires that UTF-8 information be embedded in the PDF file, which may prevent the use of older “type 3” bit-mapped fonts, and of older packages such as `ae`. The `lwarp` option `pdftotextEnc` may be useful in some situations. See section 7.5.

**vector fonts** While using DVI `latex` or PDF `pdflatex`, if no font-related package is specified then the default COMPUTER MODERN font is used, which may be a “type 3” bit-mapped font which may not convert well to plain text. A “type 1” vector font is required.

Computer Modern

⚠ `pdflatex`

⚠ `DVI latex`

`cm-super` (*Pkg*)

To use the updated `cm-super`’s type 1 fonts instead of Computer Modern, install the `cm-super` font package.

`lmodern` (*Pkg*)

To use Latin Modern instead, add

```
usepackage{lmodern}
```

to the preamble.

`dejavu` (*Pkg*)

Another useful option is the Deja Vu series of fonts, which have an increased coverage of language and glyphs:

```
\usepackage{dejavu}
```

`latex`, `pdflatex`, T1, UTF8

While using DVI `latex` or PDF `pdflatex`, `lwarp` automatically loads `fontenc` with T1 encoding. `fontenc` may be loaded with an additional encoding after `lwarp`. `inputenc` is automatically loaded with UTF8 encoding if it has not yet been loaded, but may also be specified with another encoding such as `latin1`. See the next section regarding index encoding.

⚠ `xelatex`, `lualatex`,  
`fontspec`

X<sub>Ǝ</sub>L<sup>A</sup>T<sub>E</sub>X and Lua<sup>A</sup>T<sub>E</sub>X users must use the `fontspec` package. Do NOT use `fontenc`!

Place `fontspec` or `fontenc`, `xunicode`, and other font and UTF-8 related commands after the `\documentclass` command and before `\usepackage{lwarp}`.

⚠ **package conflicts**

In some cases, a package conflict may require that a font package be loaded after `lwarp`, which should work as well:

1. `documentclass{article/book/report}` comes first, followed by any of:

2. Font and UTF-8 related commands:

- For X<sub>Ǝ</sub>L<sup>A</sup>T<sub>E</sub>X or Lua<sup>A</sup>T<sub>E</sub>X:

`fontspec` (*Pkg*)

- `fontspec` and font choices

**ligatures**

`lwarp` sets the following to turn off T<sub>E</sub>X ligatures during the generation of HTML tags, and turn off common ligatures in regular text,

since older browsers may not display them correctly and newer browsers can automatically re-create them.

---

```
\defaultfontfeatures[\rmfamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\sffamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\ttfamily]{Ligatures=NoCommon}
```

---

- For *pdflatex*:

<code>lmodern</code> ( <i>Pkg</i> )	(a) <code>\usepackage{lmodern}</code> , or other font-related packages
<code>fontenc</code> ( <i>Pkg</i> )	(b) <code>\usepackage[T1]{fontenc}</code>
<code>inputenc</code> ( <i>Pkg</i> )	(c) <code>\usepackage[utf8]{inputenc}</code> , or <code>latin1</code> , etc. Or use <code>inputenx</code> .
<code>inputenx</code> ( <i>Pkg</i> )	(d) <code>\usepackage{newunicodechar}</code> along with related definitions.
<code>newunicodechar</code> ( <i>Pkg</i> )	(e) To assist with the PDF-HTML conversion:
<code>glyphtounicode.tex</code> ( <i>file</i> )	i. <code>\input glyphtounicode.tex</code>
	ii. <code>\input glyphtounicode-cmr.tex</code> % from the pdfx package
	iii. <code>\pdfgentounicode=1</code>
	(f) Another option to assist with the PDF-HTML conversion, such as the dotless j ( <code>\j</code> ):
 <b>dotless j</b>	- <code>\usepackage{cmap}</code> — or —
<code>cmap</code> ( <i>Pkg</i> )	- <code>\usepackage{mmap}</code> — or —
<code>mmap</code> ( <i>Pkg</i> )	- <code>\usepackage[noTeX]{mmap}</code>
<code>textcomp</code> ( <i>Pkg</i> )	(g) <code>\usepackage{textcomp}</code>

3. `\usepackage{newtxmath}` or other math-related font packages. Many of these load `amsmath`, which may now be loaded before `lwarp`.

4. `\usepackage{lwarp}` (section 7.5) is placed after any of the above, followed by:

 **fontspec with monospaced fonts**

5. `\setmonofont{TeX Gyre Cursor}` or similar may be required if using X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or Lua<sup>A</sup>T<sub>E</sub>X and `fontspec` along with traditional font packages such as `txfonts`, `newtxtext`, etc. This is required to turn off the monospaced font's ligatures with `fontspec` after loading the traditional font packages. Monospaced output ligatures must be turned off to produce the correct HTML characters.

Any monospace font with built-in ligatures may require these ligatures to be disabled for HTML. In one example, JETBRAIN MONO, it is required to use

```
\setmonofont{JetBrains Mono}[%
...
Contextuals=AlternateOff,
]
```

After `lwarp` is loaded, the ligature may be re-enabled for print mode by using `\setmonofont` again inside a `warpprint` environment.

6. ... the rest of the preamble and the main document.

 **JETBRAIN MONO**  
 **HTML corrupted**

 **UTF-8 locale** In some cases, an external program may require a UTF-8 “locale”. See section 9.9.

### 7.4.1 Indexes, glossaries, and encoding

`lwarp` supports `makeindex`, `xindy`, `xindex`, and `glossaries`, `gloss`, and `nomencl`.

See section 8.6.14 for indexing, and section 8.6.12 for the `glossaries` package.

## 7.5 lwarp package loading and options

lwarp supports book, report, and article classes, as well as the equivalent KOMA-script classes and memoir, and various CJK-related classes and packages.

Load the lwarp package immediately after the font and UTF-8 setup commands.

Package options may be set while loading lwarp, or later with

```
\lwarpsetup{<key=value, . . . >}
```

lwarp (*Pkg*) lwarp package options are as follows:

`mathsvg` (*Opt*) **mathsvg** and **mathjax**: Selects SVG images or MATHJAX for math display. See section 8.7.

`mathjax` (*Opt*)

Default: `mathsvg`

`latexmk` (*Opt*) **latexmk**: Tells *lwarpmk* to use *latexmk* to recompile the document several times if necessary. Otherwise, *lwarpmk* attempts to determine for itself whether to recompile. See section 7.6.

Default: `false`

`dvips` (*Opt*) **dvips**: Tells *lwarpmk* to use *dvips* and *ps2pdf* to convert DVI output to PDF.

Default: `false`

`dvipdfm` (*Opt*) **dvipdfm**: Tells *lwarpmk* to use *dvipdfm* to convert DVI output to PDF.

Default: `false`

`dvipdfmx` (*Opt*) **dvipdfmx**: Tells *lwarpmk* to use *dvipdfmx* to convert DVI output to PDF.

Default: `false`

`HomeHTMLFilename` (*Opt*) **HomeHTMLFilename**:

Default: `\BaseJobname`

Filename of the homepage, without the “.html” suffix. Defaults to the `\BaseJobname`. A common setting is:

```
HomeHTMLFilename=index
```

causing the homepage to be the file `index.html`. Underscores are allowed in `HomeHTMLFilename` and `HTMLFilename` options, but may need to be escaped elsewhere, such as when appearing in a list:

```
\item [\href{file\_name.pdf}{text}] \
```

See section 7.6.1 for examples of naming and numbering HTML files.

`HTMLFilename` (*Opt*) **HTMLFilename**: A filename prefix for the rest of the HTML web pages. Useful for numbered web pages with a common prefix. May be empty. See section 7.6.1 for examples of naming and numbering HTML files.

Default: `<empty>`

`ImagesName` (*Opt*) **ImagesName**: The prefix for the images automatically generated by lwarp for objects such as `svg math` and `lateximages`.

Default: `image-`

`ImagesDirectory` (*Opt*) **ImagesDirectory**: The directory for the images automatically generated by lwarp for objects such as `svg math` and `lateximages`. By default, these images will appear in a directory named `<jobname>-images`, and the images will be named and numbered `image-<nn>`.

Default: `\jobname-images`

### filename underscores

Table 7: Lwarp package options

Option	Description
<code>mathsvg</code>	Show math using SVG images.
<code>mathjax</code>	Show math using MATHJAX.
<code>latexmk</code>	Use <i>latexmk</i> for compiling documents.
<code>dvips</code>	Use <i>dvips</i> and <i>ps2pdf</i> to convert DVI documents.
<code>dvipdfm</code>	Use <i>dvipdfm</i> to convert DVI documents.
<code>dvipdfmx</code>	Use <i>dvipdfmx</i> to convert DVI documents.
<code>HomeHTMLFilename</code>	The filename of the home page.
<code>HTMLFilename</code>	A prefix for the filenames of the remaining web pages.
<code>ImagesName</code>	A prefix for the filenames of generated images.
<code>ImagesDirectory</code>	The directory used to hold generated images.
<code>PrintLatexCmd</code>	The shell commands for <b>lwarpmk print</b> .
<code>HTMLLatexCmd</code>	The shell commands for <b>lwarpmk html</b> .
For indexing (section 8.6.15) and glossaries (section 8.6.12):	
<code>makeindex</code>	Use <i>makeindex</i> to generate indices.
<code>makeindexStyle</code>	Set a custom style for <i>makeindex</i> .
<code>xindy</code>	Use <i>xindy</i> to generate indices.
<code>xindyStyle</code>	Set a custom style for <i>xindy</i> .
<code>xindyLanguage</code>	The <i>xindy</i> language option used for index generation.
<code>xindyCodepage</code>	The <i>xindy</i> codepage option used for index generation.
<code>xindex</code>	Use <i>xindex</i> to generate indices.
<code>xindexConfig</code>	Set a custom configuration file for <i>xindex</i> .
<code>PrintIndexCmd</code>	Shell commands executed by <b>lwarpmk printindex</b> .
<code>HTMLIndexCmd</code>	Shell commands executed by <b>lwarpmk htmlindex</b> .
<code>LatexmkIndexCmd</code>	Shell commands executed by <i>latexmk</i> .
<code>IndexRef</code>	How to format index links.
<code>GlossaryCmd</code>	Shell command executed by <b>lwarpmk printglossary</b> and <b>lwarpmk htmlglossary</b> .
Seldom necessary:	
<code>OSWindows</code>	Force compatibility with MS-WINDOWS.
<code>pdftotextEnc</code>	Set the encoding for <i>pdftotext</i> .
<code>lwarpmk</code>	Generate a local copy of <code>lwarpmk.lua</code> .
Used internally by lwarp:	
<code>warpprint</code>	Generate print output, and also generate configuration files.
<code>warphTML</code>	Generate HTML output.
<code>BaseJobname</code>	The <code>\jobname</code> to use. Set to the <code>\jobname</code> of the printed version even while generating HTML.

- `PrintLatexCmd (Opt)` **PrintLatexCmd:** Sets the shell commands executed by `lwarpmk print`. If not specified, will automatically be set according to the detected L<sup>A</sup>T<sub>E</sub>X engine and the use of `--shell-escape`.  
Default: `<automatic>`
- `HTMLLatexCmd (Opt)` **HTMLLatexCmd:** Sets the shell commands executed by `lwarpmk html`. If not specified, will automatically be set according to the detected L<sup>A</sup>T<sub>E</sub>X engine and the use of `--shell-escape`.  
Default: `<automatic>`
- `makeindex (Opt)` **makeindex:** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use `makeindex` when generating indexes with `lwarpmk printindex`, `lwarpmk htmlindex`, or `latexmk`. If neither `makeindex` nor `xindy` is used, `makeindex` is assumed.  
Default: `makeindex`
- `makeindexStyle (Opt)` **makeindexStyle:** If you wish to use a custom `.ist` file for index generation, see section 8.6.20.  
Default: `lwarp.ist`
- `xindy (Opt)` **xindy:** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use `xindy` when generating indexes with `lwarpmk printindex`, `lwarpmk htmlindex`, or `latexmk`.  
Default: `makeindex`
- `xindyStyle (Opt)` **xindyStyle:** If you wish to use a custom `.xdy` file for index generation, see section 8.6.21.  
Default: `lwarp.xdy`
- `xindyLanguage (Opt)` **xindyLanguage:** If using an index or glossary, see section 29.  
Default: `english`
- `xindyCodepage (Opt)` **xindyCodepage:** If using an index, see section 29.  
Default: `utf8`
- `xindex (Opt)` **xindex:** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use `xindex` when generating indexes with `lwarpmk printindex`, `lwarpmk htmlindex`, or `latexmk`.  
Default: `makeindex`
- `xindexConfig (Opt)` **xindexConfig:** If you wish to use a custom `xindex-*.lua` file for index generation, see section 8.6.22.  
Default: `<empty>`
- `PrintIndexCmd (Opt)` **PrintIndexCmd:** Sets the shell commands executed by `lwarpmk printindex`. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.  
Default: `<automatic>`

Examples:

```
makeindex -s lwarp.ist projectname.idx (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname.idx (xindy)
```

#### automatic setting

The use of the `makeindex` or `xindy` options sets `PrintIndexCmd` to sensible values for each of those programs while compiling a single index. `lwarp`'s `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options will be used if specified.

#### ⚠ xindy

If specifying `PrintIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the `lwarp` `xindyLanguage` and `xindyCodepage` options are not used for the `PrintIndexCmd` option when it is set manually.

This option is stored in the configuration files `lwarpmk.conf` and `*.lwarpmkconf`, and is then passed by the `lwarpmk printindex` command to the operating system to compile the print indexes. Since the command string is parsed by `TeX`, written to a file, read from the file by `LuaTeX`, and finally passed to the operating system, any attempt at quoting will be problematic. For complicated commands, it would be best to create a shell script, and simply refer to the script with the `lwarp PrintIndexCmd` option.

**HTMLIndexCmd** (*Opt*) **HTMLIndexCmd:** Sets the shell commands executed by `lwarpmk htmlindex`. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.

Default: `<automatic>`

#### ⚠ filenames

Example settings are similar to `PrintIndexCmd`, but append `_html` to the filenames:

```
makeindex -s lwarp.ist projectname_html.idx      (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname_html.idx
(xindy)
```

#### automatic setting

The use of the `makeindex` or `xindy` options sets `HTMLIndexCmd` to sensible values for each of those programs while compiling a single index. `lwarp`'s `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options will be used if specified.

#### ⚠ xindy

If specifying `HTMLIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C xindy` options, as the `lwarp xindyLanguage` and `xindyCodepage` options are not used for the `HTMLIndexCmd` option when it is set manually.

As with `PrintIndexCmd`, to generate complicated indexes it may be worthwhile to use a shell script, then refer to that script with `HTMLIndexCmd`.

**LatexmkIndexCmd** (*Opt*) **LatexmkIndexCmd:** Sets the shell commands executed by `latexmk`. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include any filenames, which will be provided instead by `latexmk`. See section 8.6.15.

Default: `<automatic>`

Example settings are similar to `PrintIndexCmd`, but without a filename:

```
makeindex -s lwarp.ist                                (makeindex)
xindy -M lwarp.xdy -L english -C utf8                 (xindy)
```

#### automatic setting

The use of the `makeindex` or `xindy` options sets `LatexmkIndexCmd` to either of the two settings show above. `lwarp`'s `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options will be used if specified. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `latexmk` uses either of the single-line settings of `LatexmkIndexCmd` shown above to compile each of multiple indexes if necessary.

#### ⚠ xindy

If specifying `LatexmkIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C xindy` options, as the `lwarp xindyLanguage` and `xindyCodepage` options are not used for the `LatexmkIndexCmd` option when it is set manually.

**IndexRef** (*Opt*) **IndexRef:** Describes how to display the index entries for HTML output. Possible values are `ref`, `nameref`, `refnameref`, `cref`, `crefnameref`, `autoref`, or a text string such as `(link)` or `(*)` for each index entry reference. (Adding parentheses around a single character makes the link larger and easier to click on.) The default is `cref`, which is available even if the print document does

Default: `cref`

not use `cleveref`, as the `lwarp` package relies on `cleveref` during HTML output. Option `autoref` gives the same results as `cref`.

`\ref` and `\cref` to starred or otherwise unknown links will display as (\*) instead of ??.

If using `cref` (the default), and if a reference appears as ?? with a non-functional link, use `cleveref`'s `\crefname` to give a name to that type of label.

In general, `crefnameref` gives the most information, but the index can become quite verbose. Using (\*) or similar yields a very compact index.

`GlossaryCmd` (*Opt*) **GlossaryCmd:** Sets the shell command executed by `lwarpmk printglossary` and `lwarpmk htmlglossary`. The print or HTML glossary filename is appended to this command. See section 8.6.12.  
 Default: `makeglossaries`

`OSWindows` (*Opt*) **OSWindows:** `lwarp` attempts to automatically sense WINDOWS, but it may be forced with this option. See section 7.9.

`pdftotextEnc` (*Opt*) **pdftotextEnc:** Used to specify the encoding used by `pdftotext` during the PDF-HTML conversion. In most situations, the default is the correct choice.  
 Default: `UTF-8`

`lwarpmk` (*Opt*) **lwarpmk:** If you wish to have `lwarp` generate a local copy of `lwarpmk.lua` for archival or local-installation purposes, compile the print version with the `lwarpmk` option set. See section 29.

---

The following options are used internally by `lwarp`, and usually are not used in the user's document:

---

`warpprint` (*Opt*) **warpprint** and **warpHTML:** Usually controlled by `lwarpmk`, and not set in the document. Select the `warpprint` option to generate print output (default), or the `warpHTML` option to generate HTML5 output. The default is print output, so the print version may be compiled with the usual `pdflatex`, etc. When `lwarp` is loaded in print mode, it creates `<project>_html.tex`, which sets the `warpHTML` option before calling the user's source code `<project>.tex`. In this way, `<project>.tex` can `\usepackage{lwarp}` without any options to create a printed version, while `<project>_html.tex` will create an HTML version.

`BaseJobname` (*Opt*) **BaseJobname:** Not intended for the user. Used internally by `lwarp` when creating the `*_html.tex` file used to compile the HTML version. See section 29.  
 Default: `\jobname`

## 7.6 Customizing the HTML output

 **Placement!** Table 8 shows several settings may be used to customize the HTML output. Watch for the correct placement of each!

 **Changes!** Note that if changes are made, it is best to first:

1. Clear all the HTML, PDF, and auxiliary files:

Enter ⇒ `lwarpmk cleanall`

2. Recompile the print version in order to recreate the configuration files for *lwarpmk*:

Enter ⇒ `lwarpmk print`

3. Finally, recompile the HTML version with the new settings:

Enter ⇒ `lwarpmk html`

### Placed in the preamble before `\begin{document}`:

<code>\HTMLFirstPageTop</code> Default: <empty>	<b><code>\HTMLFirstPageTop</code></b> : $\{\langle contents \rangle\}$ A user-definable custom action applied to the top of the home page. Useful for logos, etc. <code>\LinkNext</code> may be used to link to the next web page. Defaults empty. Ignored in print output.
<code>\HTMLFirstPageBottom</code> Default: <empty>	<b><code>\HTMLFirstPageBottom</code></b> : $\{\langle contents \rangle\}$ A user-definable custom action applied to the bottom of the home page. Useful for logos, etc. <code>\LinkNext</code> may be used to link to the next web page. Defaults empty. Ignored in print output.
<code>\linkhomename</code> Default: Home	<b><code>\linkhomename</code></b> : Name of the link to the home page. Paragraphs are allowed. Redefine with <code>\renewcommand</code> .
<code>\linkpreviousname</code> Default: Previous	<b><code>\linkpreviousname</code></b> : Name of the link to the previous page. Paragraphs are allowed. Redefine with <code>\renewcommand</code> .
<code>\linknextname</code> Default: Next	<b><code>\linknextname</code></b> : Name of the link to the next page. Paragraphs are allowed. Redefine with <code>\renewcommand</code> .
<code>tocdepth (Ctr)</code>	<b><code>tocdepth</code></b> : Sectioning depth of the table of contents. See section 16 for a list of L <sup>A</sup> T <sub>E</sub> X stack depths.
<code>SideTOCDepth (Ctr)</code> Default: 1  <code>sideroc</code>	<b><code>SideTOCDepth</code></b> : Sectioning depth of the sideroc. Defaults to 1, causing the sideroc to show sections but not subsections.  Each subpage of the website has its own small table of contents on the side (the “sideroc”). Its depth is set by <code>SideTOCDepth</code> . This sideroc is only shown if the browser display is wide enough. When using a narrow web browser window, “responsive web design” is used to show the sideroc at the top of the page, as well as a link back to <b>Home</b> at the top and bottom.  It is recommended to set: <pre style="padding-left: 40px;">SideTOCDepth=FileDepth</pre> or

Table 8: HTML settings

Macro/Cntr/Bool	Loc*	Description
<code>\linkhomename</code>	P	Name of the link to the homepage.
<code>\linkpreviousname</code>	P	Name of the link to the previous page.
<code>\linknextname</code>	P	Name of the link to the next page.
<code>SideTOCDepth</code>	P	Sectioning depth of the sideroc.
<code>\sidetocname</code>	P	Name of the sideroc.
<code>FileDepth</code>	P	Sectioning depth of the file splits.
<code>CombineHigherDepths</code>	P	Combine higher section levels.
<code>FileSectionNames</code>	P	Use section names for file names, else use numbers.
<code>\FilenameLimit</code>	P	Maximum length of the generated filenames.
<code>FootnoteDepth</code>	P	Sectioning depth of footnotes.
<code>\abstractname</code>	P	The name of the abstract.
<code>\ImageAltText</code>	PD	<code>\includegraphics</code> and other images' alt tag.
<code>\ThisAltText {&lt;text&gt;}</code>	PD	Assigns an alt / title tag for the next image or link.
<code>\MathImageAltText</code>	PD	The svg math image <code>lateximage</code> alt tag.
<code>\PackageDiagramAltText</code>	PD	The suffix for a package's <code>lateximage</code> alt tags.
<code>\AltTextOpen</code>	PD	Start an HTML alt tag.
<code>\AltTextClose</code>	PD	End an HTML alt tag.
<code>\CSSFilename</code>	PS	The css for the following files.
<code>\MathJaxFilename</code>	PS	The MATHJAX script for the following files.
<code>\HTMLLanguage</code>	PS	The HTML lang tag.
<code>\HTMLTitle</code>	PS	The homepage's <title>, overriding <code>\title</code> .
<code>\HTMLTitleBeforeSection</code>	PS	Set subpage <title>s to <code>\HTMLTitle - sectionname</code>
<code>\HTMLTitleAfterSection</code>	PS	Set subpage <title>s to <code>sectionname - \HTMLTitle</code>
<code>\HTMLAuthor</code>	PS	The HTML author meta tag, overriding <code>\author</code> .
<code>\HTMLDescription</code>	PS	The HTML description meta tag.
<code>\HTMLFirstPageTop</code>	P	Heading for the home page.
<code>\HTMLFirstPageBottom</code>	P	Footer for the home page.
<code>\HTMLPageTop</code>	PS	Heading for the other pages.
<code>\HTMLPageBottom</code>	PS	Footer for the other pages.
<code>\HTMLnewcolumntype</code>	D	<code>\newcolumntype</code> for HTML.
<code>\IndexPageSeparator</code>	P	Index page list separator.
<code>\IndexRangeSeparator</code>	P	Index page range separator.
<code>FixSmallCaps</code>	P	Set true if small caps rendered as all caps.
<code>HTMLDebugComments</code>	P	Boolean to generate HTML comments.

\* **P:** Preamble, **D:** Anywhere in the document. **S:** Before a section.

SideTOCDepth = FileDepth + 1

 **inaccessible pages**

If SideTOCDepth < FileDepth, web pages will be inaccessible via the sideroc.

\sidedocname  
Default: Contents

**\sidedocname:** Name of the sideroc. Paragraphs are allowed. Redefine with \renewcommand.

FileDepth (Ctr)  
Default: -5

**FileDepth:** Sectioning depth of file splits. Defaults to -5, causing the entire HTML website to be one single file.

- To place the entire file into one HTML page, use:  
  \setcounter{FileDepth}{-5}
- To split the HTML file at \section depth, use:  
  \setcounter{FileDepth}{1}
- To ensure that the HTML pages/files are accessible:  
  Place a \tableofcontents somewhere before the first section break (therefore in the “home page”), and set  
  tocdepth >= FileDepth

CombineHigherDepths (bool)  
Default: true

**CombineHigherDepths:** Combine a higher section with its first lower subsections, down to the FileDepth. Defaults to true. Set to false to simulate the concept of a chapter opening on its own page, for example.

The file splits are controlled by the counter FileDepth and the boolean CombineHigherDepths. Setting FileDepth to 0 splits the file at chapters, 1 at sections, etc. CombineHigherDepths controls whether to combine pages at levels higher than the chosen FileDepth, such as in this tutorial where the page which opens the chapter also contains the first section. Be careful to set tocdepth and SideTOCDepth to allow access to each page of the website. Set tocdepth and SideTOCDepth to be greater than or equal to FileDepth.

 **Inaccessible pages!**

 **Lost in an old page!**

When making changes to the file structure, it is possible to end up with the web browser pointing to an old file which is no longer in use. When this occurs, changes to the web site will not appear in the browser, even if reloading the page, because that page is no longer in use. It is best to return to the home page, clean the files (lwarpmk cleanall), change FileDepth and/or CombineHigherDepths, then finally recompile and navigate to the desired page using the new file structure.

FileSectionNames (bool)  
Default: true

**FileSectionNames:** If true, web page filenames are derived from a sanitized version of the section names. If false, web pages are numbered. Either way, the HTMLFilename option is used as a prefix. See section 7.6.1 for examples of naming and numbering HTML files. The user must ensure that filenames are unique after begin sanitized. For example, math in the section name is removed before creating the filename, so the rest of the filename must be sufficiently unique to avoid name collisions.

 **Unique filename!**

\FilenameLimit  
Default: 80

**\FilenameLimit:** The maximum length of the filenames generated by lwarp. “.html” is added to this length. Redefine with \renewcommand.

FootnoteDepth (Ctr)  
Default: 3

**FootnoteDepth:** Determines where to place pending footnotes. 3 places footnotes before each break down to the \subsubsection level. 1 places footnotes before each \section break. Any pending footnotes are also placed at the bottom of each page before each file break.

FixSmallCaps (bool)  
Default: false

**FixSmallCaps:** Set true if SMALL CAPS are rendering in all caps (“SMALL

CAPS”). May be required for some fonts (erewhon, utopia, fbb, et al.), and packages such as embrac.

HTMLDebugComments ( <i>bool</i> ) Default: false	<b>HTMLDebugComments:</b> Set true to generate HTML comments, such as which section or <div> is being opened or closed.
\abstractname Default: Abstract	<b>\abstractname:</b> The name of the abstract. This may also be over-written by the babel package. Defaults to “Abstract”. Redefine with \renewcommand.
\IndexPageSeparator Default: “, ”	<b>\IndexPageSeparator:</b> Index page list separator. Adjust to match index style file. If using gindex, this is set automatically to gindex’s \indexpagesep.
\IndexRangeSeparator Default: “--”	<b>\IndexRangeSeparator:</b> Index page range separator. Adjust to match index style file. If using gindex, this is set automatically to gindex’s \indexrangesep.

**Placed before \begin{document}, or before any sectioning command which causes a file break:**

\CSSFilename Default: lwarp.css	<b>\CSSFilename:</b> $\{\langle filename.css \rangle\}$ Sets the css file to use for the following files. May be changed before each each sectioning command which would cause a file split.
------------------------------------	--

The css styles of the web pages are set by the \CSSFilename command. If \CSSFilename is not used, a default plain style is used to mimic printed L<sup>A</sup>T<sub>E</sub>X output. lwarp\_sagebrush.css is a semi-fancy colored style as shown in this tutorial. Change it to lwarp\_formal.css for a more formal look, or comment out the \CSSFilename command to see the default. \CSSFilename may be used before each file break to set the css for individual pagess of the website.

\MathJaxFilename Default: lwarp_mathjax.txt	<b>\MathJaxFilename:</b> $\{\langle filename \rangle\}$ Sets the MATHJAX script file to use for the following files. May be changed before each each sectioning command which would cause a file split.
--	---

The MATHJAX script file is copied into the head of each HTML file. This may be used to point to a local repository, add extensions, or change the script somewhere in the middle of the document. \MathJaxFilename may be used before each file break to set the script file for individual pages of the website.

\HTMLLanguage Default: en-US	<b>\HTMLLanguage:</b> $\{\langle langauge \rangle\}$ The HTML file’s HTML lang meta tag. Defaults to en-US.
---------------------------------	---

\HTMLTitle Default: \thetitle	<b>\HTMLTitle:</b> $\{\langle title \rangle\}$ Overrides \title for the HTML header’s meta title. Defaults to \thetitle, which is set by \title, or empty otherwise. Unlike the author, \thetitle is set by \title even if not using the titling package.
----------------------------------	---

\HTMLTitleBeforeSection Default: \HTMLTitleBeforeSection	<b>\HTMLTitleBeforeSection:</b> Sets subpage <title> tags to show the website title followed by the section name.
---	---

\HTMLTitleAfterSection	<b>\HTMLTitleAfterSection:</b> Sets subpage <title> tags to show the section name followed by the website title.
------------------------	--

**custom <title>** To customize subpage <title>s, redefine \theHTMLTitleSection, which defaults to:

```
\def\theHTMLTitleSection{%
  \theHTMLTitle\theHTMLTitleSeparator\theHTMLSection%
}
```

<code>\HTMLAuthor</code> Default: <code>\theauthor</code>	<b>\HTMLAuthor:</b> $\{\langle author \rangle\}$ The HTML header's meta author. Defaults to <code>\theauthor</code> , which is set by <code>\author</code> if using the <code>titling</code> package, but is empty otherwise. There are several ways to represent the author and affiliations, especially if using the <code>authblk</code> package, most of which do not result in a sensible <code>\theauthor</code> , so <code>\HTMLAuthor</code> is useful to create a list of authors without their affiliations.
<code>\HTMLDescription</code> Default: <code>&lt;empty&gt;</code>	<b>\HTMLDescription:</b> $\{\langle description \rangle\}$ Sets the HTML description tag for the following files. May be changed before each each sectioning command which would cause a file split.
<code>\HTMLPageTop</code> Default: <code>&lt;empty&gt;</code>	<b>\HTMLPageTop:</b> $\{\langle contents \rangle\}$ A user-definable custom action applied to the top of pages other than the home page. Useful for logos, etc. Defaults empty. <code>\LinkHome</code> may be used to place a link back to the homepage, as well as <code>\LinkPrevious</code> and <code>\LinkNext</code> . Ignored in print output.
<code>\HTMLPageBottom</code> Default: <code>&lt;empty&gt;</code>	<b>\HTMLPageBottom:</b> $\{\langle contents \rangle\}$ A user-definable custom action applied to the bottom of pages other than the home page. Useful for authors, copyright notices, contact information, etc. Defaults empty. <code>\LinkHome</code> may be used to place a link back to the homepage, as well as <code>\LinkPrevious</code> and <code>\LinkNext</code> . Ignored in print output.
<code>\LinkHome</code>	<b>\LinkHome:</b> Creates a link to the home page. Usually used in <code>\HTMLPageTop</code> and related.
<code>\LinkPrevious</code>	<b>\LinkPrevious:</b> Creates a link to the previous HTML page, unless already at the home page. Usually used in <code>\HTMLPageTop</code> and related.
<code>\LinkNext</code>	<b>\LinkNext:</b> Creates a link to the next HTML page, unless already at the end. Usually used in <code>\HTMLPageTop</code> and related.

**Placed in the home page before the first sectioning command which causes a file break:**

<code>\tableofcontents</code> △ TOC on the homepage!	<b>\tableofcontents:</b> Used to place a table of contents on the home page. This command must be used before the first file split, so that a way is available to navigate to other files from the homepage.  Links to each chapter/section are provided, as selected by <code>tocdepth</code> .
---	--

**Placed in the document wherever necessary:**

<code>\ImageAltText</code> Default: <code>image</code>	<b>\ImageAltText:</b> Redefine with <code>\renewcommand</code> . <code>\includegraphics</code> and other images are assigned an HTML alt tag according to <code>\ImageAltText</code> along with <code>\AltTextOpen</code> and <code>\AltTextClose</code> . This text is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "image", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following <code>\includegraphics</code> and other images.
<code>\ThisAltText</code>	<b>\ThisAltText:</b> $\{\langle text \rangle\}$ <code>\ThisAltText</code> can be used to assign an HTML alt text attribute to the next image generated by a <code>lateximage</code> , <code>picture</code> , <code>tikzpicture</code> , or any other similar environment which generates an image, or the next SVG math expression. This tag is cleared after use. The tag is also cleared after each MATHJAX expression, in case the user changes between SVG math and MATHJAX.

`\ThisAltText` also may be used to add an HTML title to a reference or hyperlink, such as a `\ref`, `\cref`, `\href`, `\url`, `\hyperref`, or `\hyperlink`. In each case, the alternative text is cleared after use.

`\MathImageAltText`  
Default: `math image`

**`\MathImageAltText`:** Redefine with `\renewcommand`. When creating an svg math image, its HTML alt tag may be set to the math expression, which may be hashed for image reuse. In the case of `\ensuremath` or after `\inlinemathother`, where the contents require a unique image for each instance of the same expression, the alt tag is set to `\MathImageAltText`, along with `\AltTextOpen` and `\AltTextClose`, and the image is not reused.

This alt expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is “math image”, and it may be changed according to the document’s language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following svg math images.

`\PackageDiagramAltText`  
Default: `diagram`

**`\PackageDiagramAltText`:** Redefine with `\renewcommand`. For many packages, the output is placed inside a `lateximage` with an HTML alt tag set to the package name followed by `\PackageDiagramAltText`. For example:

`(-xy- diagram)`

This expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is “diagram”, and may it be changed according to the document’s language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following package diagrams.

`\AltTextOpen`  
Default: (  
`\AltTextClose`  
Default: )

**`\AltTextOpen`:** Redefine with `\renewcommand`.

**`\AltTextClose`:** Redefine with `\renewcommand`. HTML alt text is enclosed by the macros `\AltTextOpen` and `\AltTextClose`, which default to an opening and closing parenthesis.

`\HTMLnewcolumnntype`

**`\HTMLnewcolumnntype`:** `\newcolumnntype` may not always work with `lwarp` for HTML output, since it often involves `TEX` boxes and fills. To provide a simplified column type for HTML, add `\HTMLnewcolumnntype` in addition.

`warpprint (env.)`

**`warpprint`:** An environment which is only used while generating print output. Place inside anything which does not apply to HTML and which may cause problems with `lwarp`. If `lwarp` knows about and emulates or supports a package then its related macros, lengths, counters, etc. probably won’t have to be placed inside a `warpprint` environment, but unknown packages may cause problems which may be isolated from `lwarp` using this environment.

*Do not place anything else on the same line as `\end{warpprint}`. Also do not nest `warpprint` inside itself.*

`warpHTML (env.)`

**`warpHTML`:** An environment which is only included while generating HTML output. This is useful for website logos and other items which have no purpose in printed output.

*Do not place anything else on the same line as `\end{warpHTML}`. Also do not nest `warpHTML` inside itself.*

`\warpprintonly`

**`\warpprintonly`:** `{<contents>}` A macro version of the `warpprint` environ-

ment.

`\warpHTMLonly`      **`\warpHTMLonly: {<contents>}`**      A macro version of the `warpHTML` environment.

### 7.6.1 Example HTML file naming

Examples of ways to name or number HTML files:

#### Numbered HTML nodes:

Example: Homepage `index.html`, and `node-1`, `node-2`.<sup>13</sup>

---

```
\usepackage[
  HomeHTMLFilename=index,
  HTMLFilename={node-}
]{lwarp}
\boolfalse{FileSectionNames}
```

---

#### Named HTML sections, no prefix:

Example: `index.html`, and `About.html`, `Products.html`

---

```
\usepackage[
  HomeHTMLFilename=index,
  HTMLFilename={}
]{lwarp}
\booltrue{FileSectionNames}
```

---

#### Named HTML sections, with prefix:

Example: Homepage `mywebsite.html`, and additional pages such as `mywebsite-About.html`, `mywebsite-Products`, etc.

---

```
\usepackage[
  HomeHTMLFilename=mywebsite,
  HTMLFilename={mywebsite-}
]{lwarp}
\booltrue{FileSectionNames}
```

---

## 7.7 Customizing the css

`\CSSFilename`      `{<filename>}`  
 Default: `lwarp.css`

`\CSSFilename` may be used to choose which `.css` file is used to display each page of the web site. Use `\CSSFilename` before `\begin{document}` to assign the style of the home page. If different parts of the website should have different styles, call `\CSSFilename` again before each section heading which creates a new file. This may be changed numerous times throughout the file, resulting in different HTML pages having different css files assigned:

<sup>13</sup>See `\SetHTMLFileNumber` to number in groups by chapter, for example.

```

...
\CSSFilename{myCSS.css}
\chapter{Another Chapter}
...

```

The styles provided by `lwarp` include:

**lwarp.css:** A default style if `\CSSFilename` is not used. This style is comparable to a plain `LATEX` document. To set this style, you may use `\CSSFilename{lwarp.css}`, or no `\CSSFilename` call at all.

**lwarp\_formal.css:** A formal style with a serif fonts and a traditional look.

**lwarp\_sagebrush.css:** A style with muted colors, gradient backgrounds, additional borders, and rounded corners.

To see each style in use, change the `\CSSFilename` entry in the tutorial, `lwarpmk.html` again, and then reload the tutorial webpage.

**Custom css** A customized style may also be created. For each new project a file called `sample_project.css` is generated. This may be renamed to `<project>.css` then used by assigning `\CSSFilename{<project>.css}`.

 **Rename it!** Note that `sample_project.css` is overwritten whenever `lwarp` is loaded in print mode. It is therefore important to rename the file to something like `<project>.css` before using it, so that your own changes are not overwritten.

`<project>.css` has an entry which loads `lwarp.css`, and this entry may be changed to load `lwarp_formal.css` or `lwarp_sagebrush.css` if desired. Additional changes to the css may be made by making entries later in the `<project>.css` file.

`lwarp.css` (*file*) It is best to make a local project-specific css file such as `project.css`, containing only things which are different from `lwarp.css`. The file `project.css` should refer to `lwarp.css` as follows:

---

```

/* ( --- Start of project.css --- ) */
/* ( --- A sample project-specific CSS file for lwarp --- ) */

/* Uncomment one of the following: */
@import url("lwarp.css") ;
/* @import url("lwarp_formal.css") ; */
/* @import url("lwarp_sagebrush.css") ; */

/* Project-specific CSS setting follow here. */
/* . . . */

/* ( --- End of project.css --- ) */

```

---

Finally use `\CSSFilename{<project>.css}` in the document to activate the custom css.

## 7.8 Assigning css classes and styles

HTML CSS classes and styles may be assigned to fragments of the document.

BlockClass (*env.*) [*<style>*] [*<class>*]

An entire block of text, including paragraphs, may be assigned a CSS class and optional CSS style using the BlockClass environment. The result is placed inside a `<div>`. A BlockClass may nest other BlockClasses or \InlineClasses.

\InlineClass (*<wp css style>*) [*<web css style>*] [*<css class>*] [*<text>*]

A section of text without paragraphs may be assigned a CSS class and optional CSS style using the \InlineClass macro. The result is placed inside a `<span>`. \InlineClass may be nested, but per the HTML standard it must not contain BlockClass, nor may it contain a paragraph, nor several other objects such as HTML figures. \InlineClass also accepts a second optional parameter, enclosed inside parentheses, which assigns the style while generating output for a word processor, while ignoring the web style.

Nullified versions of BlockClass and \InlineClass are provided for the print version, so they may be used in the document without placing them inside `warpHTML` or `\warpHTMLonly`.

## 7.9 Selecting the operating system

- Unix (*Prog*) `lwarp` tries to detect which operating system is being used. UNIX / MAC OS / LINUX is the default (collectively referred to as “UNIX” in the configuration files), and MS-WINDOWS is supported as well.
- Mac OS (*Prog*)
- Linux (*Prog*)
- MS-Windows (*Prog*) If MS-WINDOWS is not correctly detected, use the `lwarp` option `OSWindows`.
- Windows (*Prog*)
- OSWindows (*Opt*) When detected or specified, the operating-system path separator used by `lwarp` is modified, and the boolean `usingOSWindows` is set true. This boolean may be tested by the user for later use.

## 7.10 Selecting actions for print, HTML, or MATHJAX output

The following environments and macros are used to select actions which only apply to either traditional L<sup>A</sup>T<sub>E</sub>X print-formatted PDF generation, or to HTML generation, or to HTML with MATHJAX.

For most of built-in L<sup>A</sup>T<sub>E</sub>X and many additional packages there is user-level source code support or emulation, so no special handling will be required. For those cases which `lwarp` does not handle by itself, the following environments and macros may be used to isolate sections of code for print-only or HTML-only.

These environments are also useful for creating a special version of the titlepage for print and another for HTML.

- `warpHTML` (*env.*) Anything which is to be done only for HTML5 output is surrounded by a `warpHTML` environment:

---

```
\begin{warpHTML}
... something to be done only during \HTML\ generation
\end{warpHTML}
```

---

- ⚠ `\end{warpHTML}` Do *not* place anything else on the same line as `\end{warpHTML}`. The exact phrase is used to mark the end of the environment. Do not nest `warpHTML` inside itself. `warpMathJax` may be used inside `warpHTML`.

`warpprint (env)` Anything which is to be done only for print output is surrounded by a `warpprint` environment:

---

```
\begin{warpprint}
... something to be done only during traditional \PDF\ generation
\end{warpprint}
```

---

- ⚠ `\end{warpprint}` As above, do not place anything else on the line with `\end{warpprint}`. Do not nest `warpprint` inside itself.

⚠ `nesting`

`warpall (env)` Anything which is to be done for any output may be surrounded by a `warpall` environment. Doing so is optional.

---

```
\begin{warpall}
... something to be done during print \PDF\ or \HTML\ output
\end{warpall}
```

---

- ⚠ `\end{warpall}` As above, do not place anything else on the line with `\end{warpall}`. Do not nest `warpall` inside itself.

⚠ `nesting`

Macros are also provided for print-only or HTML-only code:

`\warpprintonly` `{\actions}`

Performs the given actions only when print output is being generated.

`\warpHTMLonly` `{\actions}`

Performs the given actions only when HTML output is being generated.

`warpMathJax (env)` Anything which is to be done only while using HTML output with MATHJAX is surrounded by a `warpMathJax` environment. Usually, this is `\CustomizeMathJax`, used to add emulation macros. `\end{warpMathJax}` must appear on its own line. Do not nest `warpMathJax` inside itself. `warpMathJax` may be used inside `warpHTML`.

⚠ `\end{warpMathJax}`

⚠ `nesting`

`warpsvg (env)` Anything which is to be done only while using print output or HTML output with SVG math is surrounded by a `warpsvg` environment. `\end{warpsvg}` must appear on its own line. Do not nest `warpsvg` inside itself. `warpsvg` may be used inside `warpHTML`.

⚠ `\end{warpsvg}`

⚠ `nesting`

`\LWR@formatted` To define macros or environments which behave differently depending on print or HTML output, see section 36.

## 7.11 Commands to be placed into the warpprint environment

Certain print-related commands should always be placed inside a `warpprint` environment, or may need other special handling. These are unrelated to HTML output, but are hard to isolate automatically. For example:

- Paragraph formatting: `\parindent` `\parskip`
- Manual page positions such as the `textpos` package, which is emulated but only in a limited way.
- Anything changing the page counter. `lwarp` requires that the page counter not be adjusted during HTML output.

Some packages require additional setup commands. Where these packages are emulated for HTML, setup commands may work for the emulated HTML output as well as for print output. See the details for each package in this document for more information.

Also see section 13: [Troubleshooting](#).

## 7.12 Title page

In the preamble, place an additional block of code to set the following:

---

```
\title{Document Title} % One line only
\author{Author One\affiliation{Affiliation One} \and
  Author Two\affiliation{Affiliation Two} }
\date{Optional date}
```

---

The title is used in the meta tags in the HTML files, unless overridden by `\HTMLTitle`, and the rest are used in `\maketitle`. To use a `\subtitle` or `\published` field, see section 69.8.

`\maketitle` Use `\maketitle` just after the `\begin{document}`, as this will establish the title of the homepage. Optionally, use a `titlepage` environment instead.

`titlepage (env.)` The `titlepage` environment may be used to hold a custom title page. The `titlepage` will be set in a `<div>` class `titlepage`, and `\printtitle`, etc. may be used inside this environment.

`titlingpage (env.)` Another form of custom title page, where `\maketitle` is allowed, and additional information may be included as well.

`\title` `{\title}`

 **HTML corrupted** Avoid newlines in the `\title`; these will interfere with the file break and CSS detection. Use a `\subtitle` command instead (section 69.8). The title will appear in the document `\maketitle` as a heading `<h1>`. The HTML meta title tag will also have this title, unless `\HTMLTitle` is used to set the meta title to something else instead.

 **newlines**

`\author` `{\author}`

In `\author`, `\protect` may be needed before some formatting commands. In HTML, the author will appear in a `<div>` of class `author` in the `\maketitle`. If the `titling` package is used, the author will also appear in a HTML meta tag, but `\HTMLAuthor` may be necessary to create a plain list of names if `\author` had affiliations added. `\affiliation` is a new addition to `lwarp`.

`\date` `{\date}`

`\date` works as expected. In HTML, this will appear in a `<div>` class titled `date`.

`\thanks` `{\text}`

`\thanks` are allowed in the titlepage fields, and will be rendered as HTML notes at the bottom of the title page.

### 7.13 HTML page meta descriptions

`\HTMLDescription` `{\text}`

Default: (none)

Each page of HTML output should have its own HTML meta description, which usually shows up in web search results, is limited to around 150 characters in length, and should not include the ASCII double quote character (").

#### limitations

#### placement

Use `\HTMLDescription` just before `\begin{document}` to set the description of the home page, and also just before each sectioning command such as `\chapter` or `\section` where a new file will be generated, depending on `FileDepth`. For example, if `FileDepth` is 1, use `\HTMLDescription` just before each `\section` command, and that description will be placed inside the HTML page for that `\section`. The same description will be used for all following HTML files as well, until reset by a new `\HTMLDescription`. It is best to use a unique description for each HTML file.

**disabling** To disable the generation of HTML description meta tags, use:

```
\HTMLDescription{}
```

### 7.14 HTML homepage meta title

`\HTMLTitle` `{\text}`

Default: `\HTMLtitle{\thetitle}`

Sets the contents of the web page `<meta name="title">` element. May be set empty to cancel the meta title tag.

See section 7.6 for `\HTMLTitleBeforeSection` and `\HTMLTitleAfterSection`, used to set the title for HTML subpages.

### 7.15 HTML page meta author

`\HTMLAuthor` `{\text}`

Default: `\HTMLAuthor{\theauthor}`

Sets the contents of the web page `<meta name="author">` element. May be set empty to cancel the meta author tag.

`\author` may be used to create a list of authors and their affiliations, in several formats if using `authblk`, and these may not successfully parse properly into a sensible list for `\theauthor`. `\HTMLAuthor` may be used to set the meta tag to a simple list of names.

## 8 Special cases and limitations

Some commonly-used L<sup>A</sup>T<sub>E</sub>X expressions should be modified as follows to allow for a smooth conversion to both HTML and print-formatted outputs.

---

### 8.1 Things to avoid

In the document, avoid the following:

 **options with braces** **Package options:** Package options may cause problems with lwarp, especially if they include curly braces.

If selecting options with braces in `\usepackage` does not work:

```
\usepackage[font={it,small}]{caption}% does not work
```

... try instead selecting the package options before loading lwarp:

```
\PassOptionsToPackage{font={it,small}}{caption}
```

```
...
```

```
\usepackage\{lwarp\}
```

```
...
```

```
\usepackage\{caption\}
```

... or try setting package options after the package has been loaded:

```
\usepackage{caption}
```

```
\captionsetup{font={it,small}}
```

**page counter:** Do not adjust the page counter. If doing so is required for the print version, place the adjustment inside a `warpprint` environment.

**Custom math environment macros:** Do not use expressions such as `\beq` as a replacement for `\begin{equation}`.

**Custom macros in section, figure, table names:** Custom macros which appear in sectioning commands or float captions then appear in the `.toc`, `.lof`, and `.lot` lists, and should be made robust using `\newrobustcmd` or `\robustify` from `etoolbox`, `xparse`, etc.

When setting `FileSectionNames` to true to name the HTML files from the section names, the file names are created from sanitized versions of the chapter or section names, but the section names must be plain text or something which expands into plain text. Robust macros will not work at the sectioning level which is used for file names, but a robust macro or other complicated name may be used for the mandatory argument of `\chapter`, `\section`, etc., if a plain-text version is also included in the optional argument:

```
\chapter[Plain Name]{\ARobustMacro\{Fancy Name\}}
```

#### 8.1.1 Invalid HTML

Additionally, some objects are valid L<sup>A</sup>T<sub>E</sub>X, but invalid HTML. An example is a tabular inside `\textbf`, since HTML does not allow a table inside a span. lwarp

will create the table, and the browser may support it, but the result is technically invalid.

## 8.2 Formatting

### 8.2.1 Text formatting

⚠ `\bfseries`, etc. `\textbf`, etc. are supported, but `\bfseries`, etc. work only in some situations.

⚠ **HTML special chars** `&`, `<`, and `>` have special meanings in HTML. If `\&`, `\textless`, and `\textgreater` are used, proper HTML entities will be used, but there may be HTML parsing problems if these special characters occur unescaped in program listings or other verbatim text.

**program listings** For program listings, the `listings` package is supported, and its `literate` option is used to convert `&`, `<`, and `>` to proper HTML entities.

**verbatim** The various verbatim-related environments do not convert `&`, `<`, and `>`, so care must be taken to avoid accidentally including valid HTML code inside these environments. Adding a space on either side may be sufficient.

### 8.2.2 Small caps

`FixSmallCaps` (*bool*) Some fonts, such as `erewhon`, `utopia`, or `fbf`, and some packages such as `embrac`, copy/paste “SMALL CAPS” as all caps (“SMALL CAPS”), which `lwarp` then reads as all caps, so the text is printed in all caps. If small caps are being rendered as all caps, set:

```
\booltrue{FixSmallCaps}
```

⚠ **CJK fonts** Some CJK fonts may not work if `FixSmallCaps` is set true.

### 8.2.3 Horizontal and vertical space and rules

`\hspace` `\hspace` is converted to an inline HTML span of the given width, except that `0` width is ignored, a width of `.16667em` is converted to an HTML thin breakable space (`U+2009`), and a `\fill` is converted to a `\quad`.

`\vspace` `\vspace` is ignored for HTML.  
`~` `~` and `\,` are converted to HTML entities.

`\kern` `\kern` and `\hskip` are entered into the HTML PDF output as-is, then interpreted by `pdftotext`, and thus usually appear as a single space.

`\rule` `\rule` is converted to an HTML rule of the same dimensions, of the currently selected text color.

`\hrule` Both `\hrule` and `\vrule` are ignored for HTML. To create a horizontal dividing rule across the page, use `\hrulefill` in its own paragraph.

`\hrulefill` `\hrulefill` usually creates a one-inch rule, similar to a “fill in the blank”. If it

is used at the start of a new paragraph, it creates a `<div>` with a thin horizontal border across the page, as would often be done with `\hrule`.

### 8.2.4 Text alignment

Use the environments `center`, `flushright`, `flushleft` instead of the macros `\centering`, `\raggedright`, `\raggedleft`.

 **figure & table alignment** `\centering`, etc. are honored in a figure or table if they are the first command inside the float:

```
\begin{table*}
\centering
\caption{A Table}
...
```

### 8.2.5 Accents

Native  $\LaTeX$  accents such as `\`` will work, but many more kinds of accents are available when using Unicode-aware  $\XeLaTeX$  and  $\LuaLaTeX$ . If using accents in section names which will become file names, it is recommended to use the  $\LaTeX$  accents such as `\`` and `\v` instead of Unicode accents. The  $\LaTeX$  accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

### 8.2.6 textcomp package

`textcomp` (*Pkg*) Some `textcomp` symbols do not have Unicode equivalents, and thus are not supported.

 **missing symbols** Many `textcomp` symbols are not supported by many system/browser fonts. In the CSS try referencing fonts which are more complete, but expect to see gaps in coverage.

### 8.2.7 Superscripts and other non-math uses of math mode

Use `\textsuperscript{x}` instead of  $x^x$

### 8.2.8 Empty `\item` followed by a new line of text or a nested list:

**lists** Use a trailing backslash: `\item[label] \`

### 8.2.9 Filenames and URLs in lists or footnotes

**filename underscore** Escape underscores in the filenames:

```
\item[\href{file\_name.pdf}{text}]
```

### 8.2.10 relsize package

`relsize (Pkg)` For HTML, only the inline macros are supported: `\textlarger`, `\textsmaller`, and `\textscale`. Each becomes an inline span of a modified font-size.

`\relsize`, `\larger`, `\smaller`, and `\relscale` are ignored.

While creating SVG math for HTML, the original definitions are temporarily restored, and so should work as expected.

 **not small** The HTML browser's setting for minimum font size may limit how small the output will be displayed.

## 8.3 Boxes and minipages

### 8.3.1 Marginpars

`\marginpar` [*left*] {*right*} `\marginpar` may contain paragraphs, but in order to remain inline with the surrounding text `lwarp` nullifies block-related macros inside the `\marginpar`. Paragraph breaks are converted to `<br />` tags.

`\marginparBlock` [*left*] {*right*} To include block-related macros, use `\marginparBlock`, which takes the same arguments but creates a `<div>` instead of a `<span>`. A line break will occur in the text where the `\marginBlock` occurs.

### 8.3.2 Save Boxes

 **HTML corrupted**

 **boxes** TEX boxes are placed inline and do not allow line breaks, so boxes with long contents may overflow the line during HTML conversion. `lwarp` uses methods which help avoid this problem.

 **minipage, \parbox** `\savebox` and related do not (yet) support `minipage` or `\parbox`.

### 8.3.3 Minipages

 **inline** A line of text with an inline `minipage` or `\parbox` will have the `minipage` or `\parbox` placed onto its own line, because a paragraph is a block element and cannot be made inline-block.

**placement** `minipages` and `\parboxes` will be placed side-by-side in HTML unless you place a `\newline` between them.

**side-by-side** Side-by-side `minipages` may be separated by `\quad`, `\qquad`, `\enskip`, `\hspace`, `\hfill`, or a `\rule`. When inside a center environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side `minipages` and these spacing commands, but not at the start or end of the paragraph.

 **minipage in a span** There is limited support for `minipages` inside an HTML `<span>`. An HTML `<div>` cannot appear inside a `<span>`. While in a `<span>`, `minipages`, and `\parboxes`, and any enclosed lists have limited HTML tags, resulting in an “inline” format, without markup except for HTML breaks. Use `\newline` or `\par` for an HTML break.

- ⚠ **minipage size** When using `minipage`, `\parbox`, and `fminipage`, a virtual  $6 \times 9$  inch text area is used for `\linewidth`, `\textwidth`, and `\textheight`, both for sizing the minipage, and also for its contents.
- if width is `\linewidth` If a minipage or `\parbox` is assigned a width of exactly `\linewidth`, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it appears in print output.
- full-width if HTML A new macro `\minipagefullwidth` requests that, during HTML output, the next single minipage or `\parbox` be generated without an HTML width attribute, allowing it to be the full width of the display rather than the declared print-output width. This may be useful where the printed version's width makes no sense in HTML.
- ⚠ **tabular, multicols** Inside a `tabular` or `multicols` environment, where the width depends on the browser window, `\minipagefullwidth` is effectively used by default for every minipage or `\parbox` inside the environment. `\UseMinipageWidths` may be used to tell `lwarp` to honor the specified widths of all following minipages and `\parboxes` until the end of the local scope, and `\IgnoreMinipageWidths` may be used to tell `lwarp` to ignore the specified widths.
- ⚠ **multicol** Inside a `multicols`, `\linewidth` is divided by the specified number of columns.
- ⚠ **text alignment** Nested minipages adopt their parent's text alignment in HTML, whereas in regular L<sup>A</sup>T<sub>E</sub>X PDF output they do not. Use a `flushleft` or similar environment in the child minipage to force a text alignment.

### 8.3.4 Side-by-side minipages

Place side-by-side minipages inside a `center` environment, with horizontal space between them, such as `\quad`, `\qquad`, `\hspace`, or `\hfill`. The result is similar in print and HTML. Do not use space commands at the start or end of the line.

### 8.3.5 Framed minipages and other environments

`\fbox` can only be used around inline `<span>` items during HTML output, but HTML cannot place a block element such as a `<div>` for a minipage or a list inside of a `<span>`. Several options are provided for framing an object, depending on which kind of object and which packages are loaded:

- `\fbox` For a framed object, options include:
- `\fboxBlock`
- `fminipage (env)`
- To remove the frame in HTML output:** Place the `\fbox` command and its closing brace inside `warpprint` environments. This will nullify the frame for HTML output.
- To frame the contents inline with some formatting losses in HTML:** This is the default action of `\fbox` when enclosing a minipage. During HTML output, `\fbox` nullifies the HTML tags for `minipage`, `\parbox`, and lists. The contents are included as inline text inside the `\fbox`'s `<span>` of class `framebox`. For lists, line breaks are converted to HTML breaks. The result is a plain-text inline version of the contents, framed inline with the surrounding text, but lacking any extra HTML markup.
- To frame the contents on their own line with improved formatting in HTML:** A new command `\fboxBlock` is included, intended to be a direct replacement

For inline text:

For inline minipage and lists:

for `\fbox` for cases where the `\fbox` surrounds a minipage, table, or list. For print output, this behaves as `\fbox`. For HTML output, the contents are placed inside an HTML `<div>` with the class `framed`, resulting in the contents being placed on their own line with a frame surrounding them. The contents preserve their HTML formatting, so lists and minipages look nicer, and valid HTML is created for a `tabular`. While an `\fbox` containing a `tabular` is valid L<sup>A</sup>T<sub>E</sub>X code, the result in HTML is problematic since a table is a `<div>` not a `<span>`, so use `\fboxBlock` around a `tabular`, or else place the `tabular` inside a minipage, or use `fminipage`, described next. Also see below regarding the “Misplaced alignment tab character &.” error.

For display `tabular`,  
minipages, and lists:

**To create a framed minipage in both print and HTML:** A new environment `fminipage` is included. For print output, this is identical to `minipage`, except that it is also framed. For HTML output, this forms a `<div>` of class `framed`, the contents preserve their HTML formatting, and valid HTML is created for a `tabular`. Also see section 89 for a new environment `fcolorminipage`. Also see below regarding the “Misplaced alignment tab character &.” error.

colored boxes and frames:

**To create colored frames and boxes:** See section 674 for `xcolor`’s `\colorbox` and `\fcolorbox`, and `lwarp`’s additional `\colorboxBlock` and `\fcolorboxBlock`.

⚠ Misplaced alignment  
tab character &

**To frame tables or verbatim environments:** Place the contents inside a `fminipage`, or perhaps a `\fboxBlock` for a `tabular`. Also, if using `\fboxblock` with `tabular`, you will have to use `\StartDefiningTabulars` before the start of the macro which uses `\fboxBlock` and the `tabular`, and `\StopDefiningTabulars` afterwards. Also see the `lwarp` documentation for the `fancybox` package.

**To frame equations:** See section 259 for the `fancybox` package.

**For fancy framed minipages:** See packages `boxedminipage`, `shadow`, `fancybox`, `framed`, `mdframed`.

**Custom environments:** Use a custom environment to create a sidebar, containing a `BlockClass` environment with custom CSS formatting, and `\warpprintonly{\hrule}` command:

---

```
\begin{BlockClass}{frameminipage}% ignored in print output
  % use \CSS\ to format div class framedminipage
\warpprintonly{\hrule} % only appears in print output
Contents
\warpprintonly{\hrule} % only appears in print output
\end{BlockClass}
```

---

### 8.3.6 fancybox package

`fancybox` (*Pkg*)  
framed equation example

`fancybox`’s documentation has an example `FramedEqn` environment which combines `math`, `\Sbox`, a `minipage`, and an `\fbox`. This combination requires that the entire environment be enclosed inside a `lateximage`, which is done by adding `\lateximage` at the very start of `FramedEqn`’s beginning code, and `\endlateximage` at the very end of the ending code. Unfortunately, the HTML `alt` attribute is not used here.

```

\newenvironmentFramedEqn
{
\lateximage% NEW
\setlength{\fboxsep}{15pt}
... }{...
\[\fbox{\TheSbox}\]
\endlateximage% NEW
}

```

**framing alternatives** `\fbox` works with `fancybox`. Also see `lwarp`'s `\fboxBlock` macro and `fminipage` environment for alternatives to `\fbox` for framing environments.

**framed table example** The `fancybox` documentation's example of a framed table using an `\fbox` containing a `tabular` does not work with `lwarp`, but the `FramedTable` environment does work if `\fbox` is replaced by `\fboxBlock`. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a `fminipage` environment. The caption may be placed either inside or outside the `fminipage`:

```

\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
...
\end{tabular}
\end{fminipage}
\end{table}

```

 **framed verbatim** `lwarp` does not support the `verbatim` environment inside a `span`, `box`, or `fancybox`'s `\Sbox`, but a `verbatim` may be placed inside a `fminipage`. The `fancybox` documentation's example `FramedVerb` may be defined as:

```

\newenvironment{FramedVerb}[1] % width
{
\VerbatimEnvironment
\fminipage{#1}
\beginVerbatim
}{
\endVerbatim
\endfminipage
}

```

**framed \VerbBox** `fancybox`'s `\VerbBox` may be used inside `\fbox`.

**indented alignment** `LVerbatim`, `\LVerbatimInput`, and `\LUseVerbatim` indent with horizontal space which may not line up exactly with what `pdftotext` detects. Some lines may be off slightly in their left edge.

### 8.3.7 mdframed package

`mdframed` (*Pkg*) Most basic functionality is supported, including frame background colors and **support** single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for `mdframed` environments and frame titles.

 **loading** When used, `lwarp` loads `mdframed` in HTML with `framemethod=none`.

**font** For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the `mdframed` source). Since `lwarp` does not support `\bfseries` and friends, only one font selection may be made at a time.

**theoremtitlefont** `theoremtitlefont` is not supported, since the following text is not in braces in the `mdframed` source.

**ignored options** `userdefinedwidth` and `align` are currently ignored.

**css classes** Environments created or encapsulated by `mdframed` are enclosed in a `<div>` of class `mdframed`, and also class `md<environmentname>` for new environments.

Frame titles are placed in a `<div>` of class `|mdframedtitle|`. Subtitles are in a `<div>` of class `|mdframedsubtitle|`, and likewise for subsubtitles.

### 8.3.8 tcolorbox package

`tcolorbox` (*Pkg*) `tcolorbox` is emulated for `HTML` and `MATHJAX`, and supported as-is inside a `lateximage` or `SVG math`.

What has been tested to work (at least partly) includes:

- `tcolorbox`, `\tcbox`.
- Title, subtitle.
- Upper, lower parts.
- Colors and title fonts.
- Floating objects.
- Some layered box features.
- Counters, labels, references.
- `listings`, `listingsutf8`.
- theorems: Theorems are supported. `math`, `ams equation`, etc. are not supported. Use a `tcolorbox` with regular `math` inside it. `\tcboxmath` and `\tcbhighmath` are supported in `SVG math`, and emulated in `MATHJAX`.
- Fitting features: `\tcboxfit` becomes `\tcbox` in `HTML`.
- Footnote numbering does not match the printed output.
- `MATHJAX` emulation is provided for common macros.

 **math**

 **footnotes**

 **undefined references** If using `cleveref`, it may be necessary to name theorems such as:

```
\crefname{tcb@cnt@mytheo}{my theorem}{my theorems}
```

## 8.4 Section names

If using named `HTML` files, by selecting `\booltrue{FileSectionNames}`, the generated filenames may be simplified by using `\FilenameSimplify` and `\FilenameNullify`:

```
\FilenameSimplify {<text>}
```

To remove common short words from the automatically-generated filenames, replacing each with a single hyphen “-”, use `\FilenameSimplify`:

```
\FilenameSimplify*{-in-}
\FilenameSimplify*{A-}
```

The first example removes the word “in” in the middle of a filename, and the second example removes “A” at the start of the filename. The star forces the arguments to be detokenized, which is required for a plain-text comparison. (The unstarred form is used for a token-sensitive comparison, which is seldom required by the user.) After simplification, repeated hyphen characters will be further simplified to a single hyphen “-”. Finally, single hyphens at the start or end of the filename are removed.

```
\FilenameNullify {⟨macros⟩}
```

- ⚠ **macros in section names** Macro names may appear in the automatically-generated file names. To remove these, create *non-robust* nullified versions of the macros, ensuring that each line ends with a percent character % as shown below. These are placed inside `\FilenameNullify`, which adds them to the list of macros which are nullified during filename generation. Low-level macros such as `\begingroup` will cause problems when nullified. Many macros such as `\textbf` are already nullified. `lwarp` also already nullifies built-in symbol and `textcomp` macros, including if defined by `xunicode`, but not all `xunicode` macros. See the definition of `\LWR@nullfonts` for a complete list.

```
\FilenameNullify{%
  \renewcommand*{\macroname}[1]{#1}%
  \renewcommand*{\anothermacro}{}%
}
```

- ⚠ **duplicate filename** Avoid duplicate file names. Section names at levels which result in HTML file splits must be unique. `lwarp` will generate an error if a duplicate HTML filename is generated. Use the optional `toc caption` entry parameter for formatting. Remember to `\protect` L<sup>A</sup>T<sub>E</sub>X commands which appear in section names and toc captions.

- ⚠ **math in section names** If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the toc entry without the math, or use `\texorpdfstring` from the `hyperref` package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

## 8.5 Cross-references

- labels** Labels with special characters may be a problem. It is best to stick with alphanumeric, hyphen, underscore, and perhaps the colon (if not French).
- ⚠ **label characters**
- `\nameref` `\nameref` refers to the most recently-used section where the `\label` was defined.
- ⚠ **empty link** If no section has been defined before the `\label`, the link will be empty. Index entries also use `\nameref` and have the same limitation.

### 8.5.1 Page references

- △ **L<sup>A</sup>T<sub>E</sub>X page numbers** The printed page does not translate to the HTML page, so `\pageref` references are converted to parentheses containing `\pagerefPageFor`, which defaults to “see”, followed by a hyperlink to the appropriate object.

Ex:

```
\ref{sec:name} on page \pageref{sec:name}
in HTML becomes:
“Sec. 1.23 on page (see sec. 1.23)”.
```

`\pagerefPageFor` may be redefined to “page for”, empty, etc. See page 503.

### 8.5.2 `cleveref` and `varioref` packages

`cleveref` (*Pkg*) `cleveref` and `varioref` are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for `\cpageref` and `\cpagerefrange`.  
`varioref` (*Pkg*) This phrase includes `\cpagerefFor`, which defaults to “for”.

- △ **cleveref page numbers**

Ex:

```
\cpageref{tab:first,tab:second}
in html becomes:
“pages for table 4.1 and for table 4.2”
```

See `\cpagerefFor` at page 734 to redefine the message which is printed for page number references.

- △ **varioref types** `cleveref` changes the behavior of `varioref` in that the reference type is automatically printed if `cleveref` is loaded. `Lwarp` requires `cleveref`, so the HTML version will always automatically print the reference types even if the print mode does not. The simplest way to make them match is to require the `cleveref` package for the document.

### 8.5.3 Hyperlinks, `hyperref`, and `url`

`hyperref` (*Pkg*) `lwarp` emulates `hyperref`, including the creation of active hyperlinks, but does not require that `hyperref` be loaded by the document.  
`url` (*Pkg*)

- △ **comments between arguments** Do not place a comment with a % character between arguments for `\hyperref`, etc., as it is neutralized for inclusion in HTML URLs.

`lwarp` can also load `url`, but `url` should not be used at the same time as `hyperref`, since they both define the `\url` command. `lwarp` does not (yet) attempt to convert `url` links into hyperlinks during HTML output, nor does the print version of `url` create hyperlinks.

- △ **backref** When generating HTML, `lwarp`'s emulation of `hyperref` does not automatically load `backref`, so `backref` must be loaded explicitly.

### 8.5.4 Footnotes, endnotes, and page notes

lwarp uses native L<sup>A</sup>T<sub>E</sub>X footnote code, although with its own `\box` to avoid the L<sup>A</sup>T<sub>E</sub>X output routine. The usual functions mostly work as-is.

**footnote numbering** To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For `bigfoot`, `manyfoot`, or `perpage`:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by `FootnoteDepth`, which is not necessarily by HTML page. This is recommended for `\alph`, `\Alph`, or `\fnsymbol` footnotes, due to the limited number of symbols which are available.

**MATHJAX** Also for MATHJAX, `\footnotename` is used for a `\footnotemark` if the actual footnote number is not known. To redefine it, provide it before loading `lwarp`:

```
\providecommand{\footnotename}{something}
\usepackage{lwarp}
```

Similar for sidenotes. For endnotes:

```
\def\endnotename{something}% \def allows name to start with
"end"
```

For the `pagenote` package, there is no `\pagenotename` to define, since there is no `\pagenotemark` command.

**footmisc** The `footmisc stable` option is emulated by `lwarp`.

 **sectioning commands** When using footnotes in sectioning commands, to generate consistent results between print and HTML, use the `footmisc` package with the `stable` option, provide a short TOC entry, and `\protect` the `\footnote`:

```
\usepackage[stable]{footmisc}
. . .
\subsection[Subsection Name]
{Subsection Name\protect\footnote{A footnote.}}
```

**memoir with footmisc** If using `memoir` class, with which `lwarp` preloads `footmisc`, the `stable` option must be declared before `lwarp` is loaded:

 **memoir**

```
\PassOptionsToPackage{stable}{footmisc}
\usepackage{lwarp}
. . .
```

Do not use a starred sectioning command. As an alternative, it may be possible to adjust `\secnumdepth` instead.

**fancybox, fancyvrb** If using `fancybox` or `fancyvrb` with `\VerbatimFootnotes`, and using footnotes in a sectioning command or display math, use `\footnotemark` and `\footnotetext`:

 **\VerbatimFootnotes**  
 **sectioning or displaymath**

```
\subsection[Subsection Name]
{Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbatim+.
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when `\VerbatimFootnotes` are selected. The browser usually compensates.

**pfnote** While emulating `pfnote`, `lwarp` is not able to reset HTML footnote numbers per page number to match the printed version, as HTML has no concept of page numbers. `lwarp` therefore uses continuous footnote numbering even for `pfnote`.

△ **pfnote numbers**

**bigfoot, manyfoot** Verbatim footnotes are not yet supported.

△ **verbatim**

If using the `bigfoot` package, and possibly also `manyfoot`, problems may occur with counter allocation because `lwarp` uses many counters, and there is a difference in how counters numbered 256 and up are handled in PDF L<sup>A</sup>T<sub>E</sub>X. With `bigfoot` this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining `bigfoot` or `manyfoot` footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or LuaL<sup>A</sup>T<sub>E</sub>X instead of PDF L<sup>A</sup>T<sub>E</sub>X.

### 8.5.5 `xr`, `xr-hyper`, and `xcite` packages

See section 5.17.

## 8.6 Front and back matter

### 8.6.1 Custom classes with multiple authors and affiliations

Some classes allow multiple authors and affiliations. Often it is possible to emulate these using a standard class along with `authblk`:

```
%\documentclass{customclass} % for print document
\documentclass{article} % for html document

\usepackage{lwarp}
\begin{warpHTML}
\usepackage{authblk}
\let\affiliation\affil % maybe required
\end{warpHTML}
```

### 8.6.2 Starred chapters and sections

**HTML page and TOC** The following describes `\ForceHTMLPage` and `\ForceHTMLTOC`, which may be used for endnotes, glossaries, `tocbibind`, bibliographies, and the index. See the following sections where applicable. Continue here if interested in the reason for adding these commands to `lwarp`.

Some packages use `\chapter*` or `\section*` to introduce reference material such as notes or lists, often to be placed in the back matter of a book. These starred sections are placed inline instead of on their own HTML pages, and they are not given TOC entries.

lwarp provides a method to cause a starred section to be on its own HTML page, subject to `FileDepth`, and also a method to cause the starred section to have its own TOC entry during HTML output.

`\ForceHTMLPage` To place a starred section on its own HTML page, use `\ForceHTMLPage` just before the `\chapter*` or `\section*`. lwarp will create a new page for the starred sectional unit.

A starred sectional unit does not have a TOC entry unless one is placed manually. The typical method using `\phantomsection` and `\addcontentsline` works for inline text but fails when the new starred section is given its own webpage after the TOC entry is created, or when creating an EPUB where the TOC entry will point to the page before the starred section. If the starred section has its own HTML page but no correct TOC entry pointing to that page, the page will be inaccessible unless some other link is created.

`\ForceHTMLTOC` To automatically force the HTML version of the document to have a TOC entry for a starred section, use `\ForceHTMLTOC` just before the `\chapter*` or `\section*`, and place `\phantomsection` and `\addcontentsline` inside a `warpprint` environment.

For print output, `\ForceHTMLTOC` and `\ForceHTMLPage` have no effect.

### 8.6.3 abstract package

`abstract (Pkg)` If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

### 8.6.4 titling and authblk

`titling (Pkg)` lwarp supports the native L<sup>A</sup>T<sub>E</sub>X titling commands, and also supports the packages `authblk` and `titling`. If both are used, `authblk` should be loaded before `titling`.

package support

`\published` and `\subtitle`

If using the `titling` package, additional titlepage fields for `\published` and `\subtitle` may be added by using `\AddSubtitlePublished` in the preamble. See section 69.8.

### 8.6.5 tocloft package

`titles (Opt)` If using `tocloft` with `tocbibind`, `anonchapp`, `fncychap`, or other packages which change chapter title formatting, load `tocloft` with its `titles` option, which tells `tocloft` to use standard L<sup>A</sup>T<sub>E</sub>X commands to create the titles, allowing other packages to work with it.

`tocloft (Pkg)`

`tocloft (Pkg)`

`\published` and `\subtitle`

△ tocloft & other packages

### 8.6.6 appendix package

-  **incorrect TOC link** `appendix (Pkg)` During HTML conversion, the option `toc` without the option `page` results in a TOC link to whichever section was before the `appendices` environment. It is recommended to use both `toc` and `also page` at the same time.

### 8.6.7 pagenote package

`pagenote (Pkg)` `pagenote` works as-is, but the `page` option is disabled.

-  **labels** Note that labels in page notes do not appear as expected, even in the print version.

### 8.6.8 endnotes package

`endnotes (Pkg)` To place the endnotes in the TOC, use:  
**table of contents**

```
\usepackage{endnotes}
\appto\enoteheading{\addcontentsline{toc}{section}{\notesname}}
\renewcommand*{\notesname}{Endnotes} % optional
```

**HTML page** To additionally have the endnotes on their own HTML page, if `FileDepth` allows:

```
\ForceHTMLPage
\theendnotes
```

-  **\endnotemark numbering** If using `MATHJAX`, see section 8.5.4 regarding the use of `\endnotemark` and `\endnotetext`.

### 8.6.9 BibTeX

`\etalchar` Displays a superscript “+” to indicate “and others”.

-  **Modify \*.bib** When enough authors are cited for a source, `BIBTEX` may use the `\etalchar` command to display a math superscript with a + character to indicate “and others”. Without modification, this will result in an “Improper \prevdepth” error. At present, `lwarp` requires that `\etalchar` be replaced by a text superscript. To do so, add to the start of the `.bib` file the following:

```
@PREAMBLE{"\let\etalchar\relax \newcommand{\etalchar}[1]{\textsuperscript{#1}}}
```

### 8.6.10 xcite package

See section 5.17.

### 8.6.11 gloss package

`gloss (Pkg)` To process the HTML glossary:

-  **compiling** `bibtex <projectname>_html.gls`

### 8.6.12 glossaries package

`glossaries` (*Pkg*) *lwarpmk* has the commands `lwarpmk printglossary` and `lwarpmk htmlglossary`, which process the glossaries created by the `glossaries` package using that package's `makeglossaries` program.

`processing glossaries`  
`GlossaryCmd` (*Opt*)  
 Default: `makeglossaries`  
`printglossary` (*Opt*)  
`htmlglossary` (*Opt*)

The shell command to execute is set by the `lwarp` option `GlossaryCmd`, which defaults to `makeglossaries`. The print or HTML glossary filename is appended to this command.

⚠ **`makeglossaries` not found** In some situations it may be required to modify the default command, such as to add the `perl` command in front:

```
\usepackage[
  GlossaryCmd={perl makeglossaries},
] {lwarp}
```

`xindy` language To set the language to use for processing glossaries with *xindy*:

```
\usepackage[
  GlossaryCmd={makeglossaries -L english},
] {lwarp}
```

Other options for *makeglossaries* may be set as well.

`placement and toc options` The glossaries may be placed in a numbered or unnumbered section, given a toc entry, and placed inline or on their own HTML page:

#### Numbered section, on its own HTML page:

```
\usepackage[xindy,toc,numberedsection= nolabel]{glossaries}
...
\printglossaries
```

#### Unnumbered section, inline with the current HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\printglossaries
```

#### Unnumbered section, on its own HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\ForceHTMLPage
\printglossaries
```

⚠ **`glossary style`** The default `style=item` option for `glossaries` conflicts with `lwarp`, so the style is forced to `index` instead.

⚠ **`number list`** The page number list in the printed form would become `\namer{efs}` in HTML, which could become a very long string if many items are referenced. For now, the number list is simply turned off.

`print/HTML versions` The print and HTML versions of the glossary differ in their internal page numbers. Separate commands for generating print and HTML glossaries are used, even though the page number is currently ignored.

### 8.6.13 nomencl package

nomencl (*Pkg*) To process the HTML nomenclature:

```
makeindex <project>_html.nlo -s nomencl.ist -o
<project>_html.nls
```

### 8.6.14 Indexing overview

There are many ways to process indexes for a L<sup>A</sup>T<sub>E</sub>X document, including native L<sup>A</sup>T<sub>E</sub>X capabilities, a number of packages and classes, the possible availability of shell escape and *latexmk*, and the need to process print and HTML versions. *lwarp* attempts to provide easy recompilation of indexes along with the rest of the document, but the various indexing options must be set correctly. Numerous examples are given below. Some differ in minor details, so the important parts are highlighted in red, and options are in green.

Once set up properly, the entire document may be recompiled with **lwarpmk print** and **lwarpmk html**. In some cases, it will also be necessary to compile the indexes with **lwarpmk printindex** and **lwarpmk htmlindex**. A recompile may then be forced with **lwarpmk print1** and **lwarpmk html1**.

**manual processing** The user may continue to process indexes manually or by shell script without the use of *lwarpmk*, but adjustments will be required to process HTML indexes as well. In general, \*.idx and \*.ind files will be accompanied by \*\_html.idx and \*\_html.ind files.

**custom index style** If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

**link appearance** To control how the index links appear in the HTML output, see the IndexRef option in section 7.5, page 106.

**source code** See section 79 for *lwarp*'s core index and glossary code, section 340 for index, section 571 for splitidx, section 338 for imakeidx, section 628 for tocbibind, and section 695.17 for memoir's indexing patches.

### 8.6.15 Indexing with makeidx, makeindex, xindy, xindex, gindex

**lwarpmk processing** The following allow the user to process indexes automatically, or using *lwarpmk*'s commands:

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

makeindex (*Prog*) **For a single index using *makeindex*:**

```
\usepackage[makeindex,latexmk] {lwarp}
```

The usual .idx and .ind files will be used, along with the new lwarp.ist style file. When creating the HTML index, "\_html" is automatically appended to each of the names.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

```
Enter ⇒ lwarpmk printindex
```

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.20.

*xindy (Prog)* **For a single index using *xindy*:**

```
\usepackage[
  xindy,
  xindyLanguage=english,           <optional>
  xindyCodepage=utf8,             <optional>
  latexmk                           <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used, along with the new `lwarp.xdy` style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.21.

*xindex (Prog)* **For a single index using *xindex*:**

```
\usepackage[
  xindex,
  latexmk                           <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.22.

*gindex (Pkg)* **For a single index using *gindex*:**

```
\usepackage[
  makeindex,
  makeindexStyle=gindex.ist,
  ... or ...
  makeindexStyle=gindexh.ist,
  latexmk                           <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, copy `gindex.ist` to a new file, modify, then specify it with `MakeindexStyle` as above. *lwarp* will automatically adapt to *gindex*'s `\indexpagesep` and `\indexrangesep` settings.

### 8.6.16 Indexing with index

index (*Prog*)

lwarp is told how to use *makeindex* using the `PrintIndexCmd` and `HTMLIndexCmd` options. The file `lwarp.ist` is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

#### For multiple indexes using *makeindex* and *index*:

(Assuming that the second index has file extensions `.sist` and `.sind`)

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist
      -o <projectname>.sind <projectname>.sidx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist
      -o <projectname>_html.sind <projectname>_html.sidx
  }
]{lwarp}
\usepackage{index}
...
\makeindex
\newindex{secondname}{sidx}{sind}{Second Index}
```

⚠ WINDOWS

For Windows, replace the two “;” characters with “&”.

When creating the HTML index, “\_html” is automatically appended to the index filenames.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

If the `latexmk` option is selected for `lwarp`, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

### 8.6.17 Indexing with splitidx

splitidx (*Prog*)

lwarp is told how to use *splitindex* using the `PrintIndexCmd` and `HTMLIndexCmd` options. The file `lwarp.ist` is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

If the `latexmk` option is selected for `lwarp`, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

⚠ \thepage When using `\AtWriteToIndex` or `\AtNextWriteToIndex`, the user must not refer

to `\thepage` during HTML output, as the concept of a page number is meaningless. Instead, do

```
\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the `\index`-like action occurs, and then refer to `\arabic{LWR@autoindex}` instead of `\thepage` where the reference should occur.

See section 695.17 in the `lwarp-patch-memoir` package for the `\@@wrspindexhyp` macro as an example.

#### For multiple indexes using *makeindex* and *splitidx*:

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    splitindex <projectname> -- -s lwarp.ist
  },
  HTMLIndexCmd={
    splitindex <projectname>_html -- -s lwarp.ist
  }
]{lwarp}
\usepackage{splitidx}
...
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, “\_html” is automatically appended to each of the names.

Use

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

to compile the indexes.

#### For multiple indexes using *xindy* and *splitidx*:

```
\usepackage[
  xindy, latexmk,
  PrintIndexCmd={
    splitindex -m xindy <projectname> -- -M lwarp.xdy
    -L english -C utf8 <optional>
  },
  HTMLIndexCmd={
    splitindex -m xindy <projectname>_html -- -M
    lwarp.xdy
    -L english -C utf8 <optional>
  }
]{lwarp}
\usepackage{splitidx}
...
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, “\_html” is automatically appended to each of the names.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

### 8.6.18 Indexing with imakeidx

*imakeidx (Prog)*

Due to the number of methods which may be used to process multiple indexes, the options for style file and *xindy* language and codepage must be specified in one of several different ways. These are described in detail later in this section, but are summarized here.

If shell escape is used, *imakeidx* will automatically compile the indexes by itself. Options specifying a custom style file and *xindy* language and codepage must be specified for each `\makeindex` command using its `options=` option, which must include *lwarp*'s special `lwarp.ist` or `lwarp.xdy` file, or a file based on them. If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

The `splitindex` option is also available if shell escape is used, in which case the `splitidx` package and *splitindex* program will also be used.

If shell escape is not possible, *latexmk* may be used to automatically compile the indexes. The style, language, and codepage options are specified with *lwarp*'s `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options. These are passed to *latexmk* by *lwarpmk*'s **lwarpmk printindex** and **lwarpmk htmlindex** commands.

Where shell escape and *latexmk* are not possible, *lwarpmk* may be used to manually compile the indexes. *lwarp*'s `PrintIndexCmd` and `HTMLIndexCmd` options are used.

#### For a single or multiple indexes using *makeindex* and *imakeidx*:

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```
\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]
```

*imakeidx* will automatically compile the indexes. Shell escape is not required while using *makeindex*. *latexmk* may be specified, and if so it will be used for **lwarpmk print** and **lwarpmk html**, but *imakeidx* will actually create the indexes.

#### For a single or multiple indexes using *makeindex* and *splitindex* with *imakeidx*:

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```

\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]

```

⚠ enable shell escape

Shell escape is required while using *splitindex*. For the first compile, use

```
Enter ⇒ pdflatex --shell-escape projectname.tex
```

```
Enter ⇒ pdflatex --enable-write18 projectname.tex (MiKTeX)
```

or similar with *xelatex* or *lualatex*. *lwarp* will remember that shell escape was used.

*imakeidx* will automatically execute *splitindex*, and will also use *makeindex* to compile the indexes.

*latexmk* may be specified, and if so it will be used for **lwarpmk print** and **lwarpmk html**, but *imakeidx* will actually create the indexes.

### For multiple indexes using *xindy* and *imakeidx*, using shell escape:

Options may be given to *imakeidx*'s `\makeindex` command. The style file `lwarp.xdy` is automatically used for HTML output, and is not necessary for print output since the output will be similar. If language or codepage must be set, they should be specified as options for `\makeindex`, since *imakeidx* will process the indexes.

```

\usepackage[xindy,latexmk] {lwarp}
\usepackage[xindy,splitindex]{imakeidx}
. . .
\makeindex[
  options={ -M lwarp.xdy -L english -c utf8 }
]
\makeindex[
  name=secondname,
  options={ -M lwarp.xdy -L english -c utf8 }
]

```

⚠ enable shell escape

For the first compile, use

```
Enter ⇒ pdflatex --shell-escape projectname.tex
```

```
Enter ⇒ pdflatex --enable-write18 projectname.tex (MiKTeX)
```

or similar with *xelatex* or *lualatex*. *lwarp* will remember that shell escape was used.

*imakeidx* will automatically execute *splitindex* if selected, and will also use *xindy* to compile the indexes.

If selected, *latexmk* will automatically recompile the entire document as necessary.

**For indexes using *xindy* and *imakeidx*, without shell escape, but *with latexmk*:**

lwarp's options are used, and are passed to *latexmk*.

```

\usepackage[
  xindy,
  xindyLanguage=english,           <optional>
  xindyCodepage=utf8,             <optional>
  latexmk,
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]

```

*latexmk* will create the indexes automatically when `lwarpmk print` and `lwarpmk html` are executed.

**For indexes using *xindy* and *imakeidx*, without shell escape, and *without latexmk*:**

*lwarpmk* must be told how to create the indexes:

```

\usepackage[
  xindy,
  PrintIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
    <projectname>.idx ;
    xindy -M lwarp.xdy -L english -C utf8
    secondname.idx
  },
  HTMLIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
    <projectname>_html.idx ;
    xindy -M lwarp.xdy -L english -C utf8
    secondname_html.idx
  }
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]

```

**⚠ WINDOWS**

For Windows, replace the two “;” characters with “&”.

<projectname> is the \jobname: if compiling “name.tex”, use the filenames name.idx and name\_html.idx.

Use

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

to compile the indexes.

**For multiple indexes using *xindex* and *imakeidx*, using shell escape:**

*xindex*, *makeindex*, *imakeidx*, and *splitindex* can all work together:

```

\usepackage[%
  xindex,
  xindexConfig=-imakeidx,
  latexmk
] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[%
  options={ -s lwarp.ist} }
]
\makeindex[
  name=secondname,
  options={ -s lwarp.ist} }
]

```

⚠ enable shell escape

For the first compile, use:

```
Enter ⇒ pdflatex --shell-escape projectname.tex
```

```
Enter ⇒ pdflatex --enable-write18 projectname.tex (MiKTeX)
```

or similar with *xelatex* or *lualatex*. *lwarp* will remember if shell escape was used.

*xindex* will use *imakeidx*, and *imakeidx* will automatically execute *splitindex* if selected.

If selected, *latexmk* will automatically recompile the entire document as necessary.

### 8.6.19 Indexes with memoir

**For a single index with memoir and *makeindex*:**

```

\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex

```

The usual *.idx* and *.ind* files will be used, along with the *lwarp.ist* style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

to compile the indexes.

**For multiple indexes with memoir and *makeindex*, using *latexmk*:**

*lwarp*'s options are used, and are passed to *latexmk*.

```

\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex
\makeindex[secondname]

```

*lwarpmk* will use *latexmk* to create the indexes automatically when the user executes *lwarpmk print* and *lwarpmk html*.

**For multiple indexes with memoir and *makeindex*, without latexmk:**

*lwarpmk* must be told how to create the indexes:

```
\documentclass{memoir}
\usepackage[
  makeindex,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist secondname.idx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist secondname_html.idx
  }
]{lwarp}
...
\makeindex
\makeindex[secondname]
```

**⚠ WINDOWS**

For Windows, replace the two “;” characters with “&”.

<projectname> is the \jobname: if compiling “name.tex”, use the filenames name.idx and name\_html.idx.

Use

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

to compile the indexes.

**For a single index with memoir and *xindy*:**

```
\documentclass{memoir}
\usepackage[
  xindy,
  xindyLanguage=english,           <optional>
  xindyCodepage=utf8,             <optional>
  latexmk                          <optional>
]{lwarp}
...
\xindyindex
\makeindex
```

The usual .idx and .ind files will be used, along with the lwarp.xdy style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

```
Enter ⇒ lwarpmk printindex
```

```
Enter ⇒ lwarpmk htmlindex
```

to compile the indexes.

**For multiple indexes with memoir and xindy, using latexmk:**

lwarp's options are used, and are passed to *latexmk*.

```

\documentclass{memoir}
\usepackage[
  xindy,
  xindyLanguage=english,           <optional>
  xindyCodepage=utf8,             <optional>
  latexmk
]{lwarp}
...
\xindyindex
\makeindex
\makeindex[secondname]

```

*lwarpmk* will use *latexmk* to create the indexes automatically.

**For multiple indexes with memoir and xindy, without latexmk:**

*lwarpmk* must be told how to create the indexes:

```

\documentclass{memoir}
\usepackage[
  xindy,
  PrintIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
    <projectname>.idx ;
    xindy -M lwarp.xdy -L english -C utf8
    secondname.idx
  },
  HTMLIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
    <projectname>_html.idx ;
    xindy -M lwarp.xdy -L english -C utf8
    secondname_html.idx
  }
]{lwarp}
...
\xindyindex
\makeindex
\makeindex[secondname]

```

**⚠ WINDOWS**

For Windows, replace the four “;” characters with “&”.

<projectname> is the \jobname: if compiling “name.tex”, use the filenames name.idx and name\_html.idx.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

**8.6.20 Using a custom *makeindex* style file**

`makeindex` (*Prog*) When using *makeindex*, *lwarpmk* uses the file `lwarp.ist` to process the index. This file is over-written by *lwarp* whenever a print version of the document is processed.

`lwarp.ist` (*file*)

To use a custom *makeindex* style file:

1. Copy `lwarp.ist` to a new filename such as `projectname.ist`
2. Make changes to `projectname.ist`. Keep the lines which refer to `\hyperindexref`. These lines creates the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.

3. If changing

```
delim_n -and- delim_r
```

in `projectname.ist`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

`makeindexStyle (Opt)`

4. In the document source use the `makeindexStyle` option for `lwarp`:

```
\usepackage[
... other options ...
makeindex,
makeindexStyle=projectname.ist,
]{lwarp}
```

Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes `lwarp` to rewrite the `lwarpmk.conf` configuration file. This tells `lwarpmk` to use the custom `projectname.ist` file instead of `lwarp.ist`.

### 8.6.21 Using a custom *xindy* style file

`xindy (Prog)` When using *xindy*, `lwarpmk` uses the file `lwarp.xdy` to process the index. This file is over-written by `lwarp` whenever a print version of the document is processed.

`lwarp.xdy (file)`

To use a custom *xindy* style file:

1. Copy `lwarp.xdy` to a new filename such as `projectname.xdy`
2. Make changes to `projectname.xdy`.

Keep the lines which refer to `\hyperindexref`:

```
(define-attributes (("hyperindexref"))
(markup-locref :open "\hyperindexref{" :close "}")
...
(markup-locref :open "\textit{\hyperindexref{" :close "}}" :attr "textit")
```

These lines create the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.

To create custom styles, refer to the lines for `\textbf` and `\textit`.

3. If changing any of

```
markup-locref-list :sep
markup-locclass-list :open
markup-locclass-list :sep
markup-crossref-layer-list :sep
markup-range :sep
```

in `projectname.xdy`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

`xindyStyle` (*Opt*)

4. In the document source use the `xindyStyle` option for `lwarp`:

```
\usepackage[
  ... other options ...
  xindy,
  xindyStyle=projectname.xdy,
]{lwarp}
```

Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes `lwarp` to rewrite the `lwarpmk.conf` configuration file. This tells `lwarpmk` to use the custom `projectname.xdy` file instead of `lwarp.xdy`.

### 8.6.22 Using a custom *xindex* style file

`xindex` (*Prog*) To use a custom *xindex* style file:

 **filename**

1. Copy `xindex-cfg.lua` to a new filename such as `xindex-projectname.lua`. The filename must start with `xindex-` and end with `.lua`.
2. Make changes to `xindex-projectname.lua`.
3. If changing

```
itemPageDelimiter -and- rangeSymbol
```

in `xindex-projectname.lua`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

`xindexConfig` (*Opt*)

4. In the document source use the `xindexConfig` option for `lwarp`:

```
\usepackage[
  ... other options ...
  xindex,
  xindexConfig=projectname, % (without xindex- or .lua)
]{lwarp}
```

Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes `lwarp` to rewrite the `lwarpmk.conf` configuration file. This tells `lwarpmk` to use the custom `xindex-projectname.lua` file instead of the default `xindex-cfg.lua`.

### 8.6.23 Additional indexing limitations

- ⚠ *xindy* with *hyperref* *xindy* and *hyperref* may not work well together for print output with “see”, “see also”, reference ranges, or stylized index references. It may be necessary to turn off hyper-referencing for indexes:

```
\usepackage[hyperindex=false]{hyperref}
```

- ⚠ *empty index* If an HTML index is empty, it may be necessary to add the following before *lwarp* is loaded:

```
\usepackage{morewrites}
\morewritessetup{allocate=10}
. . .
\usepackage{lwarp}
```

- makeindex* custom display styles When using *makeindex*, custom display styles are possible:

```
\begin{warpprint}
\newcommand{\notesstyle}[1]{#1nn}
\end{warpprint}

\begin{warpHTML}
\makeatletter
\newcommand{\notesstyle}[1]{\LWR@doindexentry{#1} notes }
\makeatother
\end{warpHTML}
. . .
A sentence.\index{key|notesstyle}
```

- xindy* custom display styles For custom styles with *xindy*, see *lwarp.xdy* for `\textbf` and `\textit` as examples.

### 8.6.24 Index positions, toc, tocbibind

- placement and toc options An index may be placed inline with other HTML text, or on its own HTML page:

- makeidx* (*Pkg*) **Inline, with a manual toc entry:**

A commonly-used method to introduce an index in a L<sup>A</sup>T<sub>E</sub>X document:

```
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\printindex
```

- makeidx* (*Pkg*) **On its own HTML page, with a manual toc entry:**

```
\begin{warpprint}
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\end{warpprint}
\ForceHTMLPage
\ForceHTMLTOC
\printindex
```

- tocbibind* (*Pkg*) **Inline, with an automatic toc entry:**

The *tocbibind* package may be used to automatically place an entry in the TOC.

```

\usepackage[nottoc]{tocbibind}
...
\cleardoublepage
\phantomsection % to fix print-version index link
\printindex

```

tocbibind (*Pkg*) **On its own HTML page, with an automatic TOC entry:**

```

\usepackage[nottoc]{tocbibind}
...
\cleardoublepage
\phantomsection % to fix print-version index link
\ForceHTMLPage
\printindex

```

numindex (*Opt*) Use the tocbibind numindex option to generate a numbered index. Without this option, the index heading has no number.

numbered index section

Other packages, such as imakeidx, may also have options for including the index in the Table of Contents.

tocloft (*Pkg*) If using tocloft with tocbibind, anonchap, fncychap, or other packages which change chapter title formatting, load tocloft with its titles option, which tells tocloft to use standard L<sup>A</sup>T<sub>E</sub>X commands to create the titles, allowing other packages to work with it.

⚠ tocloft & other packages

## 8.7 Math

### 8.7.1 Math in section names

⚠ math in section names If using named HTML files, in section names use paren math  $\(x+y\)$  instead of dollar math  $\$x+y\$$ . (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```

\section{Some math \texorpdfstring{\$1+2=3\$}{three}}

```

### 8.7.2 Math in custom environments

To create an environment which places its contents inside math, instead of:

```

\newenvironment{mymathenv}{ \ ( starting math ){ending math \ }

```

use:

```

\NewDocumentEnvironment{mymathenv}{b}
{
  \inlinemathother
  \ ( starting math #1 ending math \ )
  \inlinemathnormal
}
{}

```

or:

```

\usepackage{environ}
\NewEnviron{mymathenv}{
  \inlinemathother
  \(\ starting math \BODY ending math \)
  \inlinemathnormal
}

```

For display math, use `\[, \]`, `\displaymathother`, and `\displaymathnormal`.

### 8.7.3 Rendering tradeoffs

**Math rendering** Math may be rendered as SVG graphics or using the MATHJAX JavaScript display engine.

**SVG files** Rendering math as images creates a new SVG file for each expression, except that an MD5 hash is used to combine identical duplicates of the same inline math expression into a single file, which must be converted to SVG only once. Display math is still handled as individual files, since it may contain labels or references which are likely to change.

**SVG inline** The SVG images are currently stored separately, but they could be encoded inline directly into the HTML document. This may reduce the number of files and potentially speed loading the images, but slows the display of the rest of the document before the images are loaded.

**PNG files** Others L<sup>A</sup>T<sub>E</sub>X-to-HTML converters have used PNG files, sometimes pre-scaled for print resolution but displayed on-screen at a scaled down size. This allows high-quality print output at the expense of larger files, but SVG files are the preferred approach for scalable graphics.

**MathML** Conversion to MathML might be a better approach, among other things allowing a more compact representation of math than SVG drawings. Problems with MathML include limited browser support and some issues with the fine control of the appearance of the result. Also see section 10 regarding EPUB output with MATHJAX.

### 8.7.4 SVG option

**SVG math option** For SVG math, math is rendered as usual by L<sup>A</sup>T<sub>E</sub>X into the initial PDF file using the current font<sup>14</sup>, then is captured from the PDF and converted to SVG graphics via a number of utility programs. The SVG format is a scalable-vector web format, so math may be typeset by L<sup>A</sup>T<sub>E</sub>X with its fine control and precision, then displayed or printed at any size, depending on (sometimes broken) browser support. An HTML `alt` attribute carries the L<sup>A</sup>T<sub>E</sub>X code which generated the math, allowing copy/paste of the L<sup>A</sup>T<sub>E</sub>X math expression into other documents.

**SVG image font size** For the `lateximage` environment, the size of the math and text used in the SVG image may be adjusted by setting `\LateximageFontSizeName` to a font size name — *without the backslash*, which defaults to:

```
\renewcommand{\LateximageFontSizeName}{normalsize}
```

For inline SVG math, font size is instead controlled by `\LateximageFontScale`, which defaults to:

<sup>14</sup>See section 680 regarding fonts and fractions.

```
\newcommand*{\LateximageFontScale}{.75}
```

**svg math copy/paste** For SVG math, text copy/paste from the HTML `<alt>` tags lists the equation number or tag for single equations, along with the L<sup>A</sup>T<sub>E</sub>X code for the math expression. For  $\mathcal{A}\mathcal{M}\mathcal{S}$  environments with multiple numbers in the same environment, only the first and last is copy/pasted, as a range. No tags are listed inside a starred  $\mathcal{A}\mathcal{M}\mathcal{S}$  environment, although the `\tag` macro will still appear inside the L<sup>A</sup>T<sub>E</sub>X math expression.

⚠ **svg math size, baseline** SVG math sizing and baselines are improved if the `graphics` or `graphicx` package is loaded. An almost-invisible marker is placed at either end of the image to assist in cropping and computing the baseline. A warning is issued at the end of the compile if `graphics` or `graphicx` are not used.

⚠ **svg math in T<sub>E</sub>X boxes** SVG math does not work inside T<sub>E</sub>X boxes, since a `\newpage` is required before and after each image.

### 8.7.5 MATHJAX option

**MATHJAX math option** The MATHJAX ([mathjax.org](http://mathjax.org)) L<sup>A</sup>T<sub>E</sub>X-math to HTML converter may be used to display math.  
MathJax (*Prog*)

When MATHJAX is enabled, math is rendered twice:

1. As regular L<sup>A</sup>T<sub>E</sub>X PDF output placed inside an HTML comment, allowing equation numbering and cross referencing to be almost entirely under the control of L<sup>A</sup>T<sub>E</sub>X, and
2. As detokenized printed L<sup>A</sup>T<sub>E</sub>X commands placed directly into the HTML output for interpretation by the MATHJAX display scripts. An additional script is used to pre-set the equation number format and value according to the current L<sup>A</sup>T<sub>E</sub>X values, and the MATHJAX equation numbering system is ignored in favor of the L<sup>A</sup>T<sub>E</sub>X internal system, seamlessly integrating with the rest of the HTML output, including any math appearing in non-MATHJAX SVG output.

### ⚠ fonts 8.7.6 MATHJAX rendering options

MATHJAX v3 may render using CHTML or SVG. SVG display renders italic characters correctly. To select SVG rendering, right-click on some math, and select

**Math Settings** → **Math Renderer** → **SVG**

Wait a moment for the math to rerender.

### 8.7.7 Customizing MATHJAX

**equation numbering** lwarp detects and adjusts MATHJAX equation numbering format for article and book style equations as well as `amsmath \numberwithin` for chapters, sections, and subsections. Custom equation number formats may be set as follows, for example:

```

\renewcommand*\theequation{\Alph{section}.\arabic{equation}}
\AtBeginDocument{
  \renewcommand*\theMathJaxsection{\Alph{section}.}
}

```

⚠ **subequation** The `amsmath` subequations environment is supported, but only with `\alpha` subequation numbering.

**global customizations** MATHJAX does not have preexisting support every possible math function. Additional MATHJAX function definitions may be defined in the preamble. These will be declared at the start of each HTML page, and thus will have a global effect across all HTML pages.

Examples:

```

\begin{warpMathJax}
\CustomizeMathJax{
  \newcommand{\expval}[1]{\langle#1\rangle}
  \newcommand{\abs}[1]{\lvert#1\rvert}
}
\CustomizeMathJax{\newcommand{\arcsinh}{\text{arcsinh}}}
\CustomizeMathJax{\newcommand{\arccosh}{\text{arccosh}}}
\CustomizeMathJax{\newcommand{\NN}{\mathbb{N}}}
\end{warpMathJax}

```

⚠ **slow compilation** To avoid a slowdown in compile speed, use the `warpMathJax` environment to prevent its contents from being processed in print or `svg` math output. Also, place each new definition inside its own `\CustomizeMathJax`. A warning to this effect is issued if an overly-long definition is attempted.

`lwarp` already provides MATHJAX customizations for some packages.

**siunitx** When using `siunitx`, a similar process may be used to add custom units:

```

\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\myunit}{\mathrm{WXYZ}}}
\CustomizeMathJax{\newcommand{\umyunit}{\mathrm{\micro\myunit}}}
\end{warpMathJax}

```

**advanced control** For more advanced control over dynamically creating custom definitions, see as an example the `lwarp` definition for `\DeclarePairedDelimiterX`, in section 399, [mathtools](#).

**local customizations** For customizations local to the current HTML page only, macros may be defined as follows:

```

\begin{warpMathJax}
\(\newcommand{\macroname}{. . .} \)
\(\newcommand{\anothername}{. . .} \)
\end{warpMathJax}

```

To maintain compile speed, use the `warpMathJax` environment, and use a separate math environment for each definition.

`\ifstar` For MATHJAX, use `\ifstar` instead of `\@ifstar`:

```

\CustomizeMathJax{
  \def\myname{
    \ifstar\starredaction\unstarredaction
    % (Do not place anything after!)
  } }

```

`\ifnextchar` For MATHJAX, use `\ifnextchar` instead of `\@ifnextchar`:

```
\CustomizeMathJax{\def\myname{\ifnextchar X \found\notfound}}
```

“X” may be a single ASCII character, or a hex number inside braces, ex:

```
\CustomizeMathJax{\def\myname{\ifnextchar{0x7B}\found\notfound}}
```

Use “(” or “{0x28}” for a left parenthesis, “{0x7B}” for a left brace, “{0x7D}” for a right brace, or “{0x5C}” for a backslash.

### 8.7.8 MATHJAX limitations

**MATHJAX limitations** Limitations when using MATHJAX include:

MathJax (*Prog*)

`\multicolumn`, `\multirow`

- MATHJAX does not support `\multicolumn` or `\multirow`. These may be used in text tabulars or SVG math, but in MATHJAX math arrays they are emulated. `\multicolumn` only fills a single cell, resulting in a short row. `\multirow` simply prints its text on the first line.

footnotes

- Footnotes are emulated when used inside a MATHJAX expression. For an equation with a single footnote, the correct footnote number is used. For non-equations, `\footnotename` is used instead, since the actual number cannot be tracked. See section 8.5.4 regarding the use of footnotes with MATHJAX.

references

- Inside a MATHJAX expression, references to equations work within the same HTML web page, but do not work when referring to an equation in a different HTML web page. Outside of a MATHJAX expression, in the text body, references work as expected.

`lateximage`

- Math appearing inside a `lateximage`, and therefore also inside a `TikZ` or `picture` environment, is rendered as SVG math even if MATHJAX is used in the rest of the document.

`siunitx`

- For `siunitx`, see [siunitx package](#), section 8.7.15.

`physics`

- For `physics`, see [physics package](#), section 8.7.17.

`tabbing`

- A `tabbing` environment is emulated using an HTML `<pre>`. While MATHJAX is enabled inside `tabbing`, the browser may not correctly render the horizontal alignment of the math and text following after on the same line.

`\text`

- MATHJAX includes the `textmacros` extension, which supports various macros which are commonly used inside `\text`, such as `\textbf` and text accents. Lwarp supports this extension.

Unicode

- If using DVI  $\LaTeX$  or PDF  $\LaTeX$ , unicode input may not appear correctly in MATHJAX. Either use  $\XeLaTeX$  or  $\LuaLaTeX$ , or replace Unicode special characters such as

```
\text{special character æ}
```

with their special macros, such as

```
\text{special character \ae}
```

other macros and packages

- Many other math-related macros and packages are not directly supported by MATHJAX, including `\ensuremath` and occasionally-used macros such as `\relax`. While using MATHJAX, `lwarp` provides emulation for many of these

macros, as well as for footnotes and emulation for dozens of packages (see table 2). In many cases these emulations simply ignore the package in a source-compatible way. Others produce a result which represents the meaning, even if they don't look exact. Look up each package in this document for a description of the limitations of each.

### 8.7.9 Catcode changes

#### preamble macros with math

The math shift character  $\$$  is not set for HTML output until after the preamble. Macros defined in the preamble which contain  $\$$  must be enclosed between `\StartDefiningMath` and `\StopDefiningMath` to temporarily change to the HTML meaning of  $\$$ :

```
\StartDefiningMath
\newcommand{. . . }
\StopDefiningMath
```

As an alternative, use `\(` and `\)` instead of  $\$$ , in which case `\StartDefiningMath` and `\StopDefiningMath` are not necessary.

If a package defines macros using  $\$$ , it may be necessary to use `\StartDefiningMath` and `\StopDefiningMath` before and after loading the package.

### 8.7.10 Complicated inline math objects

#### `\inlinemathnormal` `\inlinemathother` changing contents complicated alt tag MATHJAX limitations

An inline math expression is usually converted to a reusable hashed SVG math image, or a MATHJAX expression. The hash or expression depends on the contents of the math expression. In most cases this math expression is static, such as  $x+1$ , so the image can be reused for multiples instances of the same expression. In some cases, the math expression includes a counter or other object which may change between uses. Another problem is complicated contents which do not expand well in an alt tag. Yet another problem is math packages which are only partially emulated in MATHJAX. The macro `\inlinemathother` may be used before a sequence of dynamic or complicated math expressions, and `\inlinemathnormal` after. Doing so tells lwarp to use unhashed SVG math images for those particular expressions, even if MATHJAX is otherwise in use. See section 44.

### 8.7.11 Complicated display math objects

#### `\displaymathnormal` `\displaymathother` MATHJAX unsupported complicated alt tag

By default, or when selecting `\displaymathnormal`, MATHJAX math display environments print their contents as text into HTML for MATHJAX to interpret, and SVG display math environments render their contents as SVG images and use their contents as the alt tag of HTML output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated TikZ pictures, compilation will fail.

When selecting `\displaymathother`, it is assumed that the contents are more complicated than "pure" math. An example is an elaborate TikZ picture, which will not render in MATHJAX and will not make sense as an HTML alt tag. In this mode, MATHJAX is turned off, math display environments become SVG images, even if MATHJAX is selected, and the HTML alt tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as TikZ pictures are more likely to compile successfully.

### 8.7.12 Theorems

- ⚠ **cref reference format undefined** If the print version does not use `cleveref`, place all `\theoremstyle` and `\newtheorem` declarations in the preamble inside `\AtEndPreamble`.<sup>15</sup> For some theorems, it may also be required to add inside `\AtEndPreamble` something such as:

```
\usepackage{etoolbox} % for \ifdef, \AtEndPreamble
\AtEndPreamble{ % if not using cleveref package
  \theoremstyle{definition}
  \newtheorem{dtheorem}{Definition}
  . . .
  \ifdef{\cref}{
    \crefname{Proof}{Proof}{Proofs}
  }{}
}
```

### 8.7.13 ntheorem package

- `ntheorem (Pkg)` This conversion is not total. Font control is via CSS, and the custom L<sup>A</sup>T<sub>E</sub>X font settings are ignored.
- ⚠ **Font control**
- ⚠ **Equation numbering** `ntheorem` has a bug with equation numbering in  $\mathcal{A}\mathcal{M}\mathcal{S}$  environments when the option `thref` is used. `lwarp` does not share this bug, so equations with `\split`, etc, are numbered correctly with `lwarp`'s HTML output, but not with the print output. It is recommended to use `cleveref` instead of `ntheorem`'s `thref` option.

### 8.7.14 mathtools package

- `mathtools (Pkg)` `showonlyrefs` is disabled, as it conflicts with `cleveref`, which is used by `lwarp`. Equation numbers may not match the print version.
- ⚠ **equation numbering**
- ⚠ **italic correction** `mathic` is not emulated for HTML.
- ⚠ **MATHJAX** If using `MATHJAX`:

- `mathtools disallowspace` does not work for `MATHJAX`. Protect brackets which are not optional arguments, such as:

```
\begin{gathered}{}
[p]=1 . . .
\end{gathered}
```

- `showonlyrefs` does not work in `MATHJAX`, and will result in a difference in equation numbering compared to the print version.
- `alignat` in `MATHJAX` requires math mode, but in L<sup>A</sup>T<sub>E</sub>X it doesn't. It may be required to use `warpHTML` and `warpprint` to isolate a version for each mode.
- `\DeclarePairedDelimiter` and related must be in the preamble before `\begin{document}`.

<sup>15</sup>`lwarp` uses `cleveref` for the HTML conversion, and loads `cleveref \AtEndPreamble`, just before `\AtBeginDocument`. This is also before the `.aux` file is read.

### 8.7.15 siunitx package

siunitx (*Pkg*) siunitx is well supported by lwarp.

**Limitations** Some general limitations:

**fractions** Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

`\cancel` is not currently supported for siunitx v3.

Negative values are not automatically colored.

**tabular** Tabular S and s columns are rendered as simple c columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for `drop-exponent`, without which the value will be shown incorrectly.

**drop-exponent**

**table-auto-round** `table-auto-round` is ignored.

**Math rendering** Math may be rendered in several ways in the same document:

**For math mode with svg display:** The original siunitx code is used while generating the SVG image.

**For HTML text mode:** lwarp uses siunitx code patched for HTML, and simplified units.

**For math expressions while using MATHJAX:** A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

**Custom units** siunitx allows customized units:

```
\DeclareSIUnit {<name>} {<definition>}
```

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in `svg math` or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

```
\HTMLDeclareSIUnit {<name>} {<definition>}
```

**v3 only!** Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit` declares a simplified version of the unit for HTML, for example if the print-mode unit uses `TeX boxes` or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MATHJAX:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

**Predefined units** Most units work as-is with HTML. For the following units, `lwarp` has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

### ⚠ MathJax

#### Document modifications required for MATHJAX

##### ⚠ `\sisetup`

- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MATHJAX. The MATHJAX emulation also ignores most macro options.

##### ⚠ complex numbers

- Complex numbers are displayed as entered, ignoring `output-complex-root`.

##### custom units

- Custom units may be added with `\CustomizeMathJax`. For example, from `lwarp-common-mathjax-siunitx`:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_{\mathrm{h}}}}
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

##### ⚠ unit spacing

- Units work better using `~` between units instead of using periods.

##### ⚠ `\square`, `\cubic`

- To square or cube compound units, enclose the following compound units in braces:

```
\cubic{\centi\meter}
```

Single units do not require braces.

- For `\numlist`, the argument is printed as text as-is, so use space between semicolons for improved readability.

##### ⚠ Missing \$ inserted

- If using `parse-numbers = false`, also use `\num` or `\qty`. `siunitx=siunitx>Missing $ inserted`.

Also see [MATHJAX option](#), section 8.7.5.

#### 8.7.16 units and nicefrac packages

`units` (*Pkg*) `units` and `nicefrac` work with `lwarp`, but MATHJAX does not have an extension for `units` or `nicefrac`. These packages do work with `lwarp`'s option `svgmath`.

#### 8.7.17 physics package

`physics` (*Pkg*) `physics` works as-is for HTML with SVG math.

For MATHJAX, the MATHJAX v3 `physics` extension is used.

### 8.8 Graphics

`graphics` (*Pkg*) Per table 9, image filenames may be specified either with or without an extension. `graphicx` (*Pkg*) If an extension is given it will be used as-is, for either print or HTML output. If [file extensions](#) no extension is given, a list of possible extensions is tried, which depends on whether print or HTML is being generated. This allows a PDF file for print and a SVG file for HTML, for example. If no extension is given, the automatic search will only return lowercase extensions, even if the filename actually has an uppercase

##### ⚠ case sensitive

Table 9: `\includegraphics` and file names

Print image file	HTML image file	Command to use
image.pdf <sup>a</sup>	image.svg <sup>a</sup>	<code>\includegraphics{image}</code>
image.eps <sup>a</sup>	image.svg <sup>a</sup>	<code>\includegraphics{image}</code>
image.jpg	— <sup>b</sup>	<code>\includegraphics{image}</code>
image.png	— <sup>b</sup>	<code>\includegraphics{image}</code>
image.JPG	— <sup>b</sup>	<code>\includegraphics{image.JPG}</code> <sup>c</sup>
image.PNG	— <sup>b</sup>	<code>\includegraphics{image.PNG}</code> <sup>c</sup>
image.jpg	image.gif	<code>\includegraphics{image}</code>

<sup>a</sup>: Must be a lowercase file extension.

<sup>b</sup>: The same file is used for print and HTML.

<sup>c</sup>: The uppercase extension must be specified.

extension, and `lwarp` cannot get around this problem, so image file extensions must be lowercase to be seen by the HTML browser with `lwarp`. For example, name the image file `image.pdf` instead of `image.PDF`, but refer to it in the source as `image`, without an extension. For images which may be used as-is with either print or HTML, such as `JPG` or `PNG`, you may use a capitalized extension if it is specified in the source, such as `image.JPG`.

#### `\includegraphics` file formats

For `\includegraphics` with `.pdf` or `.eps` files, the user must provide a `.pdf` or `.eps` image file for use in print mode, and also a `.svg`, `.png`, or `.jpg` version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, `lwarp` will automatically choose the `.pdf` or `.eps` format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a `.pdf` or `.eps` image is referred to with its file extension, the extension will be changed to `.svg` for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html
\includegraphics{filename.eps} % uses .svg in html
```

`pdftocairo` (*Prog*) To convert a PDF image to SVG, use the utility `pdftocairo`:

PDF to SVG

```
Enter ⇒ pdftocairo -svg filename.pdf
```

`lwarpmk pdftosvg` (*Prog*) For a large number of images, use `lwarpmk`:

```
Enter ⇒ lwarpmk pdftosvg *.pdf (or a list of filenames)
```

`lwarpmk epstopdf` (*Prog*) For EPS images converted to PDF using the package `epstopdf`, use

`epstopdf` (*Prog*)

`epstopdf` package

```
Enter ⇒ lwarpmk pdftosvg *.PDF
```

to convert to SVG images.

**DVI L<sup>A</sup>T<sub>E</sub>X** When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ `lwarpmk epstopdf *.eps` (or a list of filenames)

Enter ⇒ `lwarpmk pdftosvg *.pdf` (or a list of filenames)

**PNG and JPG** For PNG or JPG while using *pdf<sub>l</sub>atex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

**GIF** GIF files may be used for HTML, but another format must also be provided for print output.

**file extension priorities** If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

**duplicate files** A complication occurs if a file of the same name exists elsewhere in the T<sub>E</sub>X tree, such as a test image from some L<sup>A</sup>T<sub>E</sub>X package. T<sub>E</sub>X looks in the local document directory before considering the directories specified by `\graphicspath`, but the T<sub>E</sub>X tree is found as “local”, so any file in the tree is found before the directories in `\graphicspath`. To use such an image, it must be copied to the document’s directory to be used for HTML, and furthermore must be in the document’s base directory instead of an images subdirectory.

⚠ **image not displayed**

⚠ **graphics vs. graphicx** If using the older `graphics` syntax, use both optional arguments for `\includegraphics`. A single optional parameter is interpreted as the newer `graphicx` syntax. Note that

⚠ **viewport** viewports are not supported by `lwarp`—the entire image will be shown.

**units** For `\includegraphics`, avoid px and % units for width and height, or enclose them inside `warpHTML` environments. For font-proportional image sizes, use ex or em. For fixed-sized images, use cm, mm, in, pt, or pc. Use the keys `width=.5\linewidth`, or similar for `\textwidth` or `\textheight` to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the `scale` option, since it is not well supported by HTML browsers.

**options** `\includegraphics` accepts `width` and `height`, `origin`, `rotate` and `scale`, plus new `class` and `alt` keys. (`alt` has recently been incorporated into `graphicx` itself.)

**HTML class** With HTML output, `\includegraphics` accepts an optional `class=xyz` keyval combination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

**HTML alt tags** Likewise, the `\includegraphics alt` key adds an HTML `alt` tag to an image, and is ignored for print output. If not assigned, each image is given an `alt` tag according to `\ImageAltText`.

⚠ **scale** Avoid using the `\includegraphics scale` option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

**\rotatebox** `\rotatebox` accepts the optional `origin` key.

⚠ **browser support** `\rotatebox`, `\scalebox`, and `\reflectbox` depend on modern browser support. The CSS3 standard declares that when an object is transformed the whitespace

which they occupied is preserved, unlike L<sup>A</sup>T<sub>E</sub>X, so expect some ugly results for scaling and rotating.

### 8.8.1 tikz package

 **displaymath and matrices** `tikz` (*Pkg*) If using display math with `tikzpicture` or `\tikz`, along with matrices with the `&` character, the document must be modified as follows:

```
\usepackage{tikz}
\tikzset{every picture/.style={ampersand replacement=\&}}
```

and each instance of `&` in the `tikz` expression must be replaced with `\&`.

### 8.8.2 grffile package

 **matching PDF and SVG** `grffile` (*Pkg*) `grffile` is supported as-is. File types known to the browser are displayed, and unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

### 8.8.3 color package

`color` (*Pkg*) `color` is superseded by `xcolor`, and `lwarp` requires several of the features of `xcolor`. When `color` is requested, `xcolor` is loaded as well.

### 8.8.4 xcolor package

`xcolor` (*Pkg*) `\colorboxBlock` and `\fcolorboxBlock` are provided for increased HTML compatibility, and they are identical to `\colorbox` and `\fcolorbox` in print mode. In HTML mode they place their contents into a `<div>` instead of a `<span>`. These `<div>`s are set to display: `inline-block` so adjacent `\colorboxBlock`s appear side-by-side in HTML, although text is placed before or after each.

Print-mode definitions for `\colorboxBlock` and `\fcolorboxBlock` are created by `lwarp`'s core if `xcolor` is loaded.

**background: none** `\colorbox` and `\fcolorboxBlock` allow a background color of `none`, in which case only the frame is drawn, which can be useful for HTML.

**color support** Color definitions, models, and mixing are fully supported without any changes required.

**colored tables** `\rowcolors` is supported, except that the optional argument is ignored so far.

**colored text and boxes** `\textcolor`, `\colorbox`, and `\fcolorbox` are supported.

**\color and \pagecolor** `\color` and `\pagecolor` are ignored. Use CSS or `\textcolor` where possible.

### 8.8.5 epstopdf package

`epstopdf` (*Pkg*) Images with an `.eps` extension will be converted to `.pdf`. The HTML output uses

⚠ **convert to .svg** the .svg version, so use

```
Enter ⇒ lwarpmk pdftosvg <listofPDFfiles>
```

to generate .svg versions.

### 8.8.6 pstricks package

pstricks (*Pkg*) All pstricks content should be contained inside a pspicture environment.

⚠ **use pspicture**

### 8.8.7 pdftricks package

pdftricks (*Pkg*) The pdftricks image files <jobname>-fig\*.pdf must be converted to .svg, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

⚠ **convert image files**

```
Enter ⇒ lwarpmk pdftosvg <jobname>-fig*.pdf
```

### 8.8.8 psfrag package

psfrag (*Pkg*) The psfrags environment is modified to use lateximage to encapsulate the image. Always use a psfrags environment to contain any local \psfrag macros and the associated \includegraphics or \epsfig calls. Outside of a psfrags environment, psfrags adjustments will not be seen by lwarp.

⚠ **use psfrags**

⚠ **Tip:** Use a mono-spaced font for the tags in the EPS file.

### 8.8.9 pstool package

pstool (*Pkg*) \graphicspath is ignored, and the file directory must be stated.

⚠ **path and filename** The filename must not have a file extension.

Use

```
Enter ⇒ lwarpmk html
```

followed by

```
Enter ⇒ lwarpmk limages
```

.

### 8.8.10 asymptote package

asymptote (*Pkg*) To compile:

```
pdflatex project.tex
asy project-*.asy
pdflatex project.tex

lwarpmk print
asy project-*.asy
lwarpmk print1
lwarpmk print1

lwarpmk html
asy project_html-*.asy
lwarpmk html1
lwarpmk html1
lwarpmk limages
```

### 8.8.11 overpic package

overpic (*Pkg*) The macros `\overpicfontsize` and `\overpicfontskip` are used during HTML generation. These are sent to `\fontsize` to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the `overpic` and `Overpic` environments.

 **scaling**

### 8.8.12 Multimedia packages

multimedia (*Pkg*) The packages `multimedia`, `movie15`, and `media9` are supported.

movie15 (*Pkg*) HTML5 `<audio>` and `<video>` objects are created for `.mp3` and `.mp4` files.

media9 (*Pkg*)

HTML5 `<embed>` objects are created for `http` and `ftp` links.

`\href` links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For `media9`, a multimedia object is inserted for each `addressource=`, as well as each `flashvars source=` and `src=`. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside `\warpprintonly` or the `warpprint` environment.

Each HTML multimedia object includes the poster text, except for `<embed>` objects. For `movie15`, the `text` option is supported to specify the poster text.

The `width`, `height`, and `totalheight` options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

`media9 \addmediapath` is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each `<audio>` and `<video>` object.

`media9` slideshows are not supported.

`\hyperlinkmovie`, `\movieref`, and `\mediabutton` are not supported.

3D objects are not supported.

If using a YOUTUBE™ video, use an “embedded” URL with `.../embed/...` instead of `.../v/...`

## 8.9 Tabbing

The tabbing environment works, except that SVG math and `lateximages` do not yet work inside the environment.

⚠ `math in tabbing` If math is used inside tabbing, place tabbing inside a `lateximage` environment, which will render the entire environment as a single SVG image.

## 8.10 Tabular

### 8.10.1 tabular environment

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, `multirows`, `siunitx S` columns, or the packages `multirow`, `longtable`, `supertabular`, or `xtab`.

#### Defining macros and environments:

- When defining environments or macros which include `tabular` and instances of the `&` character, it may be necessary to make `&` active before the environment or macro is defined, then restore `&` to its default catcode after, using the following commands. These are ignored in print mode.

```
\StartDefiningTabulars
<define macros or environments using tabular and &
here>
\StopDefiningTabulars
```

This includes before and after defining any macro which used `\ttabbox` from `floatrow`.

- When creating a new environment which contains a `tabular` environment, `lwarp`'s emulation of the `tabular` does not automatically resume when the containing environment ends, resulting in corrupted HTML rows. To fix this, use `\ResumeTabular` as follows. This is ignored in print mode.

⚠ Misplaced alignment  
tab character `&`

⚠ `floatrow`

⚠ `tabular` inside another  
environment

```

\StartDefiningTabulars % (& is used in a
definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars

```

#### For developers:

- To automate the use of `\StartDefiningTabulars` and `\EndDefiningTabulars`, these macros may be embedded inside an `HTML` environment definition to automatically change the catcode of `&` before absorbing the arguments. Another environment may be embedded as well.

```

% Does the work after the catcode has been changed:
\newcommand*\LWR@HTML@subsomename}[2]{%
  . . .
  \otherenvironmentname [<args>] {<args>} % for
example
}
% Change catcode before absorbing arguments:
\newcommand*\LWR@HTML@somename{%
  \StartDefiningTabulars
  \LWR@HTML@subsomename
}
% Change catcode again at the end:
\newcommand*\LWR@HTML@endsomename}{%
  . . .
  \endotherenvironmentname % for example
  \StopDefiningTabulars
}
% Combine with the existing print definition:
\LWR@formattedenv{somename}

```

#### Cell contents:

##### ⚠ macro in a table

- Using a custom macro inside a tabular data cell may result in an extra `HTML` data cell tag, corrupting the `HTML` table. To avoid this, use `\TabularMacro` just before the macro. This is ignored in print mode.

```
\TabularMacro\somemacro & more row contents \\
```

#### Column specifiers:

##### ⚠ math

- Due to the way math is gathered for processing, column specifiers such as `>{<math>c</math><{<math>` do not work with `lwarp`. Instead, each cell must specify math mode individually.

##### @ and !

- Only one each of `@` and `!` is used at each column, and they are used in that order.

##### \multirow

- In `\multirow` cells, the print version may have extra instances of `<`, `>`, `@`, and `!` cells on the second and later rows in the `\multirow` which do not appear in the `HTML` version.

##### ⚠ \newcolumn type

- If `\newcolumn type` does not work for `HTML`, add a simplified column type using `\HTMLnewcolumn type`.

## font and alignment

- `lwarp` detects each of the following, and sets HTML CSS appropriately:
  - >{\centering\arraybackslash}
  - >{\raggedright\arraybackslash}
  - >{\raggedleft\arraybackslash}
  - >{\itshape}
  - >{\bfseries}
  - >{\bfseries\itshape}
 These may be used with `\newcolumntype`, such as:
 

```
\newcolumntype{P}[1]{>{\centering\arraybackslash}p{#1}}
```

## Rules:

## vertical rules

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.
- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

## width and trim

- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with `@` or `!` columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

## combined rules

- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:
 

```
\cmidrule{2-3} \[-2ex]
\bottomrule
```

 The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

⚠ `\warpprintonly`⚠ Misplaced `\noalign`

- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warppHTML` environment, if a “Misplaced `\noalign`” error occurs, change
 

```
This & That \endhead
```

 to
 

```
\warpprintonly{This & That \endhead}
```

 and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevant to HTML output.

## Other:

## longtable headings

- `tabularx` ignores the width, but `X` columns do produce paragraph columns or multicolumns.
- For `longtable`, place headings and footings which do not apply to HTML inside `\warpprintonly\{\}`.

⚠ `S` columns

- For `S` columns (from the `siunitx` package), while producing print output, anything non-numeric must be placed inside `{}` braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by `lwarp`'s tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:

```
\warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
\warppHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
```

⚠ `tabular` inside a `<span>`

- In  $\LaTeX$ , a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

### 8.10.2 multirow package

`vposn` • Note that recent versions of `multirow` include a new optional `vposn` argument.

`multirow cells` • For `multirow`, insert `\mrowcell` into any empty multi-row cells. This will be a null function for the print output, and is a placeholder for parsing the table for HTML output. An error is generated if this is missed.

```
... & \multirow{2}{.5in}{text} & ...
... & \mrowcell & ...
```

`colored cells` • The `multirow` documentation regarding colored cells recommends using a negative number of rows. This will not work with `lwarp`, so `\warpprintonly` and `\warpHTMLonly` must be used to make versions for print and HTML.

with `\multicolumn` • See section 429.2 for `\multicolumnrow`.

⚠ `\multicolumn & \multirow` `lwarp` does not support directly combining `\multicolumn` and `\multirow`. Use `\multicolumnrow` instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for `\multicolumn` come first, followed by the five arguments for `\multirow`, many of which are optional, followed by the contents.

⚠ `skipped cells` As per `\multirow`, skipped cells to the right of the `\multicolumnrow` statement are not included in the source code on the same line. On the following lines, `\mcolrowcell` must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

```
... & \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text} & ...
... & \mcolrowcell & \mcolrowcell & ...
... & \mcolrowcell & \mcolrowcell & ...
```

⚠ `MathJax` • `MATHJAX` does not support `multirow`, so it is emulated to only print its text on the first row. `\multirow` works as expected in text tabulars or SVG math.

### 8.10.3 longtable package

`longtable (Pkg)` Use one of either `\endhead` or `\endfirsthead` for both print and HTML, and use a `\warpprintonly` macro to disable the other head phrase, and also the `\endfoot` and `\endfirstfoot` phrases. (See section 8.10.4 if using `threeparttablex`.)

```
\begin{longtable}[column specifiers] }
[ ... ] \endfirsthead % or \endhead, for print and HTML
\warpprintonly{ % not used in HTML
[ ... ] \endhead % or \endfirsthead
[ ... ] \endfoot
[ <lastfoot macros> ] \endlastfoot
}
... table contents ...
\warpHTMLonly{
[ <lastfoot macros> ] % HTML last footer, without \endfoot
% or \endlastfoot.
}
\end{longtable}
```

⚠ **Misplaced `\noalign`** Use the `\warpprintonly` macro instead of the `warpprint` environment. Doing so helps avoid “Misplaced `\noalign`.” when using `\begin{warpprint}`.

⚠ **`\kill`** `\kill` is ignored, place a `\kill` line inside

```
\begin{warpprint} . . . \end{warpprint}
```

or place it inside `\warpprintonly`.

⚠ **lateximage** `longtable` is not supported inside a `lateximage`.

#### 8.10.4 threeparttablex package

`threeparttablex` (*Pkg*) `threeparttablex` is used with `longtable` and `booktabs` as follows:

```
\begin{longtable}[column specifiers] {
[ . . . ] \endfirsthead % or \endhead, for print and HTML
\warpprintonly{ % not used in HTML
[ . . . ] \endhead % or \endfirsthead
[ . . . ] \endfoot
\bottomrule \insertTableNotes \endlastfoot
}
. . . table contents . . .
\warpprintonly{ % HTML last footer
\bottomrule
\UseMinipageWidths % optional
\insertTableNotes
\endlastfoot
}
\end{longtable}
```

**table width** The table notes are created using a `\multicolumn`. By default the width is not specified to the browser, so long table notes can cause the table to be spread out horizontally. For HTML output, `lwarp` guesses the width of the table depending on the number of columns, then restricts its guess to a min/max range. To use this guess for the width of the table notes, use `\UseMinipageWidths` before `\insertTableNotes`. The width is then specified, and in many cases the result is an improvement in overall table layout.

#### 8.10.5 supertabular and xtab packages

`supertabular` (*Pkg*) For `\tablefirsthead`, etc., enclose them as follows:

`xtab` (*Pkg*)

```
\StartDefiningTabulars
\tablefirsthead
. . .
\StopDefiningTabulars
```

⚠ **Misplaced alignment tab character &**

See section 8.10.1.

⚠ **lateximage** `supertabular` and `xtab` are not supported inside a `lateximage`.

### 8.10.6 colortbl package

colortbl (*Pkg*) Only use `\rowcolor` and `\cellcolor` at the start of a row, in that order.

⚠ **row/cell color** colortbl ignores the overhang arguments.

### 8.10.7 ctable package

⚠ **Misplaced alignment tab character &** Use `\StartDefiningTabulars` before one or more `\ctables`, and `\StopDefiningTabulars` after. These change the meaning of the ampersand `&` character.

### 8.10.8 bigdelim package

⚠ **use `\mrowcell`** `\ldelim` and `\rdelim` use `\multirow`, so `\mrowcell` must be used in the proper number of empty cells in the same column below `\ldelim` or `\rdelim`, but not in cells which are above or below the delimiter:

---

```

\begin{tabular}{lll}
<empty> & a & b \\
\ldelim{\}{3}{.25in}[left ] & c & d \\
\mrowcell & e & f \\
\mrowcell & g & h \\
<empty> & i & j \\
\end{tabular}

```

---

```

<->   a   b
      {
left  { c   d
      { e   f
      { g   h
<->   i   j

```

---

For MATHJAX, limited emulation is provided which merely prints the delimiter and optional text in the first row.

## 8.11 Floats

### 8.11.1 Float contents alignment

⚠ **figure & table alignment** `\centering`, etc. are honored in a figure or table if they are the first command inside the float:

```

\begin{table*}
\centering
\caption{A Table}
...

```

### 8.11.2 float, trivfloat, and/or algorithmicx together

float (*Pkg*) If using `\newfloat`, `trivfloat`, and/or `algorithmicx` together, see section [639.1](#).  
trivfloat (*Pkg*)  
algorithmicx (*Pkg*)

⚠ **package conflicts**

### 8.11.3 caption and subcaption packages

`caption (Pkg)` `subcaption (Pkg)` Package options may cause problems with `lwarp`, especially if they include curly braces.

If selecting options with braces in `\usepackage` does not work:

```
\usepackage[font={it,small}]{caption}% does not work
```

... try instead selecting the package options before loading `lwarp`:

```
\PassOptionsToPackage{font={it,small}}{caption}
...
\usepackage\{lwarp\}
...
\usepackage\{caption\}
```

... or try setting package options after the package has been loaded:

```
\usepackage{caption}
\captionsetup{font={it,small}}
```

 **numbering** To ensure proper float numbering, set caption positions such as:

```
\captionsetup[figure]{position=bottom}
\captionsetup[subfigure]{position=bottom}
\captionsetup[table]{position=top}
\captionsetup[subtable]{position=top}
```

Similarly for `longtable`. These positions depend on where the user places the `\caption` command inside each float.

### 8.11.4 subfig package

`subfig (Pkg)`

 **table numbering** To have correct sub table numbers:

```
\usepackage{caption}
\captionsetup[table]{position=top}
```

 **lof/lotdepth** At present, the package options for `lofdepth` and `lotdepth` are not working. These counters must be set separately after the package has been loaded.

 **horizontal spacing** In the document source, use `\hfill` and `\hspace*` between subfigures to spread them apart horizontally. The use of other forms of whitespace may cause paragraph tags to be generated, resulting in subfigures appearing on the following lines instead of all on a single line.

### 8.11.5 floatrow package

`floatrow (Pkg)` Use `\StartDefiningTabulars` and `\StopDefiningTabulars` before and after defining macros using `\ttabbox` with a tabular inside. See section 8.10.1.

 **Misplaced alignment tab character & subfig package**

When combined with the `subfig` package, while inside a `subfloatrow` `\ffigbox` and `\ttabbox` must have the caption in the first of the two of the mandatory arguments.

⚠ `\FBwidth, \FBheight`

The emulation of `floatrow` does not support `\FBwidth` or `\FBheight`. These values are pre-set to `.3\linewidth` and `2in`. Possible solutions include:

- Use fixed lengths. `lwarp` will scale the HTML lengths appropriately.
- Use `warpprint` and `warpHTML` environments to select appropriate values for each case.
- Inside a `warpHTML` environment, manually change `\FBwidth` or `\FBheight` before the `\ffigbox` or `\ttabbox`. Use `\FBwidth` or `\FBheight` normally afterwards; it will be used as expected in print output, and will use your custom-selected value in HTML output. This custom value will be used repeatedly, until it is manually changed to a new value.

### 8.11.6 keyfloat package

`keyfloat` (*Pkg*) If placing a `\keyfig[H]` inside a `keywrap`, use an absolute width for `\keyfig`, instead of `lw`-proportional widths. (The `[H]` option forces the use of a minipage, which internally adjusts for a virtual 6-inch wide minipage, which then corrupts the `lw` option.)

⚠ `keywrap`

For wrapped figures, overhang and number of lines are ignored.

## 8.12 KOMA-SCRIPT classes

`komascript` (*Cls*) Many features are ignored during the HTML conversion. The goal is source-level compatibility.

`\captionformat`, `\figureformat`, and `\tableformat` are not yet emulated.

⚠ **Not fully tested!** [Please send bug reports!](#)

Some features have not yet been tested. Please contact the author with any bug reports.

## 8.13 MEMOIR class

`memoir` (*Cls*) `lwarp` uses `caption`, which causes a warning from `memoir`. This is normal. Adjust captions via `caption`, instead of `memoir`.

⚠ `captions`

While emulating `memoir`, `lwarp` pre-loads a number of packages (section 695.1). This can cause an options clash when the user's document later loads the same packages with options. To fix this problem, specify the options before loading `lwarp`:

⚠ `options clash`

```
\documentclass{memoir}
...
\PassOptionsToPackage{options_list}{package_name}
...
\usepackage{\lwarp\}
...
\usepackage\{package\_name\}
```

⚠ **version numbers** memoir emulates a number of packages, and declares a version date for each which often does not match the date of the corresponding freestanding package. This can cause warnings about incorrect version numbers. Since `lwarp` is intended to support the freestanding packages, which are often newer than the date declared by memoir, it is hoped that memoir will update and change its emulated version numbers to match.

`\label(bookmark){tag}` `\label` accepts an optional (bookmark) argument, but this is ignored in HTML.

⚠ **comment** The `comment` environment is from the `comment` package, and thus requires that the `\begin` and `\end` each be on its own line:

```
\begin{comment}
This is a comment.
\end{comment}
```

`\newcomment` Comments defined with `\newcomment` use memoir's definitions, and behave as expected, where the `\begin` and `\end` do have to each be on its own line.

⚠ **verbatim footnotes** `\verbfootnote` is not supported.

⚠ **\newfootnoteseries** `\newfootnoteseries`, etc. are not supported.

⚠ **page notes** `lwarp` loads `pagenote` to perform memoir's pagenote functions, but there are minor differences in `\pagenotesubhead` and related macros.

**page notes with cleveref** To add support for pagenotes with `cleveref`, add:

```
\crefname{pagenote}{page note}{page notes}
\Crefname{pagenote}{Page note}{Page notes}
```

**page note \nameref** Note that for print mode, `\nameref` print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

⚠ **poems** Poem numbering is not supported.

⚠ **verbatim** The `verbatim` environment does not yet support the memoir enhancements. It is currently recommended to load and use `fancyvrb` instead.

⚠ **glossaries** The memoir glossary system is not yet supported by `lwarpmk`. The `glossaries` package may be used instead, but does require the glossary entries be changed from the memoir syntax to the `glossaries` syntax.

⚠ **framewithtitle, titledframe** The custom frame commands in the memoir manual may be emulated by placing the original definitions in the preamble inside `warpprint` environments, and then providing an HTML equivalent:

```
\begin{warpHTML}
\newcommand{\FrameTitle}[2]{%
\textbf{#2}
}

\newenvironment{framewithtitle}[2][\FrameFirst@Lab\ (cont.)]{%
\begin{minipage}{\linewidth}
\textbf{#2}
\begin{minipage}{\linewidth}
}
{\end{minipage}\end{minipage}}
```

```

\newcommand{\TitleFrame}[2]{%
  \par
  \textbf{#1}\par
  \fboxBlock{#2}
}

\newenvironment{titledframe}[2][\FrameFirst@Lab\ (cont.)]{%
  \par
  \textbf{#2}
  \begin{fminipage}{\linewidth}
}
{\end{fminipage}}
\end{warpHTML}

```

## 8.14 International languages

 **section and file names** If using *pdf<sub>l</sub>atex* with the setting `\booltrue{FileSectionNames}`, non-ASCII text in section names can result in corrupted HTML file names. *pdf<sub>l</sub>atex* may be used if setting `\boolfalse{FileSectionNames}`, in which case HTML file numbers will be generated.

For correct HTML file names, use *x<sub>e</sub>l<sub>a</sub>tex*, *l<sub>u</sub>a<sub>l</sub>at<sub>e</sub>x*, or dedicated document classes / engines.

(As of this writing, this warning is only relevant to the *kotex* package.)

## 8.15 Miscellaneous packages

### 8.15.1 verse and memoir

*verse* (*Pkg*) When using *verse* or *memoir*, always place a `\\` after each line.

*memoir* (*Cls*) The documentation for the *verse* and *memoir* packages suggest defining an `\attrib` command, which may already exist in current documents, but it will only work for print output. *lwarp* provides `\attribution`, which works for both print and HTML output. To combine the two so that `\attrib` is used for print and `\attribution` is used for HTML:

```

\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}

```

`\leftskip` (*Len*) These lengths are used by *verse* and *memoir* to control the left margin, and they may already be set by the user for print output. New lengths `\HTMLleftskip` and `\HTMLleftmargini` are provided to control the margins in HTML output. These new lengths may be set by the user before any *verse* environment, and persist until they are manually changed again. One reason to change `\HTMLleftmargini` is if there is a wide `\flagverse` in use, such as the word “Chorus”, in which case the value of `\HTMLleftmargini` should be set to a wide enough length to contain “Chorus”. The default is wide enough for a stanza number.

 **spacing** Horizontal spacing relies on *pdftotext*’s ability to discern the layout (`-layout` option) of the text in the HTML-tagged PDF output. For some settings of `\HTMLleftmargini`

⚠ **verse margin**

or `\HTMLleftskip` the horizontal alignment may not work out exactly, in which case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

### 8.15.2 newclude package

`newclude (Pkg)` `newclude` modifies `\label` in a non-adaptive way, so `newclude` must be loaded before `lwarp` is loaded:

⚠ **loading**

```
\documentclass\{article\}
... <font setup>
\usepackage\{newclude\}
\usepackage[warpHTML]\{lwarp\}
...
```

### 8.15.3 babel package

`babel (Pkg)` When French is used, the caption separator is changed to a dash. To restore it to a colon, the following may be placed before `lwarp` is loaded:

⚠ **\CaptionSeparator**

```
\renewcommand*\CaptionSeparator}{:~}
```

**punctuation spaces**

Also when French is used, `lwarp` creates fixed-width space around punctuation by patching `\FBcolonspace`, `\FBthinspace`, `\FBguillspace`, `\FBmedkern`, `\FBthickkern`, `\FBtextellipsis`, and the tilde. If the user's document also

⚠ **customized spacing**

changes these parameters, the user's changes should be placed inside a `warpprint` environment so that the user's changes do not affect the HTML output.

### 8.15.4 polyglossia package

`polyglossia (Pkg)` `lwarp` uses `cleveref`, which has some limitations when using `polyglossia`, possibly resulting in the error

```
! Undefined control sequence. . . . \_\_hook begindocument
```

To test compatibility, add

```
\usepackage{cleveref}
```

near the end of the preamble (as the last package to be loaded), and try to compile the print version. It may be necessary to set

```
\setdefaultlanguage{english}
```

or some other language supported by `cleveref`, then select other languages using `\setotherlanguages`.

Once the print version works with `cleveref` and `polyglossia`, the HTML version should work as well using `lwarp`.

### 8.15.5 todonotes and luatodonotes packages

`todonotes` (*Pkg*) The documentation for `todonotes` and `luatodonotes` have an example with a todo inside a caption. If this example does not work it will be necessary to move the todo outside of the caption.

`luatodonotes` (*Pkg*)

### 8.15.6 fixme

`fixme` (*Pkg*) External layouts (`\fxloadlayouts`) are not supported.

#### ⚠ external layouts

Customized layouts are overwritten by `lwarp`'s versions `\AtBeginDocument` in order to provide the HTML conversion. If creating a new layout, see `lwarp`'s changes to provide similar for the new layout, inside a `warpHTML` environment.

User control is provided for setting the HTML styling of the “faces”. The defaults are as follows, and may be changed in the preamble after `fixme` is loaded:

```
\def\FXFaceInlineHTMLStyle{font-weight:bold}
\def\FXFaceEnvHTMLStyle{font-weight:bold}
\def\FXFaceSignatureHTMLStyle{font-style:italic}
\def\FXFaceTargetHTMLStyle{font-style:italic}
```

### 8.15.7 acro package

⚠ **formats** Define acronymn formats using `\textbf` instead of `\bfseries` etc.

### 8.15.8 chemfig package

If using `\polymerdelim` to add delimiters to a `\chemfig`, wrap both inside a single `lateximage`:

```
\begin{lateximage}[-chemfig-~\PackageDiagramAltText]
\chemfig{. . . }
\polymerdelim[. . . ]{. . . }
\end{lateximage}
```

### 8.15.9 chemformula package

⚠ **chemformula with MATHJAX** `chemformula` works best without `MATHJAX`. If `MATHJAX` is used, `\displaymathother` must be used before `array`, and then `\displaymathnormal` may be used after. (The `chemformula` package adapts to `array`, but does not know about `MATHJAX`, and `MATHJAX` does not know about `chemformula`.)

While using `MATHJAX`, `\displaymathother` may also be used for other forms of display and inline math which contain `chemformula` expressions.

### 8.15.10 mhchem package

See section 410.

### 8.15.11 kotex package

kotex (*Pkg*) See section 8.14 regarding *pdflatex* and Korean section names.

 Korean section names

## 9 Compiling using custom shell commands

`lwarp` and `lwarpmk` try to make it easy to process print and HTML compilation tasks in most situations. Depending on the operating system, command-line options, T<sub>E</sub>X engine, and `lwarp` options, the commands `lwarpmk print` and `lwarpmk html` are automatically set up to correctly recompile the project. These actions may be overridden using `lwarp` options, thus allowing the use of packages such as `perltex` and `pythontex`.

### 9.1 Command options

`PrintLatexCmd` (*Opt*) The `lwarp` options `PrintLatexCmd` and `HTMLLatexCmd` are used to set customized commands to be executed by `lwarpmk print` and `lwarpmk html`.  
`HTMLLatexCmd` (*Opt*)

`PrintLatexCmd` should be set to shell commands which take `project.tex` and generate `project.pdf`.

`HTMLLatexCmd` should be set to take `project_html.tex` and generate `project_html.pdf`.  
`lwarpmk` will then take `project_html.pdf` and automatically convert it and generate `project.html`.

### 9.2 Literal character macros

The `lwarp` package options are parsed by T<sub>E</sub>X, and so some characters require the use of a special macro to represent them. See table 10. `\LWRopquote` and `\LWRopseq` may be used to increase operating-system portability. `\jobname` must have `_html` appended for processing HTML. `\space` may be necessary between other macros.

 **macro not found** To use these macros, either `kvoptions-patch` must be loaded before `lwarp`:

---

```
\usepackage{kvoptions-patch}
\usepackage[
  PrintLatexCmd={ ... } ,
  HTMLLatexCmd={ ... }
]{lwarp}
```

---

Table 10: Literal character macros

Character	Macro	Comment
%	\LWRpercent	
\$	\LWRdollar	
&	\LWRamp	
%	\LWRhash	
\	\LWRbackslash	
' or "	\LWRopquote	Depends on the operating system.
& or &&	\LWRopseq	Depends on the operating system.
(space)	\space	Forces an extra space.
(jobname)	\jobname	Without file extension.

or `\lwarpsetup` must be used to set `PrintLatexCmd` and `HTMLLatexCmd`:

---

```

\usepackage[...]{lwarp}
\lwarpsetup{
  PrintLatexCmd=
  {
    latex tm \LWRopseq
    dvips -o tm-pics.ps tm.dvi \LWRopseq
    ps2pdf -dALLOWPSTRANSOPRENCY tm-pics.ps \LWRopseq
    pdflatex tm.tex
  } ,
  HTMLLatexCmd=
  {
    latex tm_html \LWRopseq
    dvips -o tm_html-pics.ps tm_html.dvi \LWRopseq
    ps2pdf -dALLOWPSTRANSOPRENCY tm_html-pics.ps \LWRopseq
    pdflatex tm_html.tex
  }
}

```

---

### 9.3 *latexmk*

`latexmk` (*Prog*) If *latexmk* is used for a project, it may be easiest to continue using it.

`latexmk project.tex` would create `project.pdf` as normal.

`latexmk project_html.tex` would create `project_html.pdf`, then

`lwarpmk pdftohtml project_html.pdf` would take `project_html.pdf` and convert it to `project.html`.

`sagetex` (*Pkg*) *latexmk* may simplify the use of packages such as `sagetex`.

## 9.4 perltex package

`perltex (Pkg)` The `lwarp` package option settings to use `perltex` would be similar to:

```
\usepackage[
  . . .
  PrintLatexCmd={perltex -latex=pdflatex project.tex} ,
  HTMLLatexCmd={perltex -latex=pdflatex project_html.tex} ,
  . . .
]{lwarp}
```

 **“impure” math** Place `perltex` math expressions between `\displaymathother` and `\displaymathnormal`, or `\inlinemathother` and `\inlinemathnormal`. See section 8.7.11.

## 9.5 pythontex package

`pythontex (Pkg)` An example using `pythontex`:

```
\usepackage[
  . . .
  PrintLatexCmd={
    pdflatex project.tex \LWRopseq
    pythontex project \LWRopseq
    pdflatex project.tex
  } ,
  HTMLLatexCmd={
    pdflatex project_html.tex \LWRopseq
    pythontex project_html \LWRopseq
    pdflatex project_html.tex
  } ,
  . . .
]{lwarp}
```

Another possibility is to use `latexmk`, placing the `latexmk . . .` commands in the `PrintLatexCmd` and `HTMLLatexCmd` options. While using these options, the `lwarp` option `latexmk` would not be used.

 **“impure” math** No attempt has yet been made to make `pythontex` robust with HTML output. Some math objects must be surrounded by `\displaymathother ... \displaymathnormal`, or `\inlinemathother ... \inlinemathnormal`. Displays of code may have to be

 **HTML look-alike** enclosed inside a `lateximage` environment to prevent `<`, `>` and similar from being interpreted by the browser as HTML entities.

## 9.6 sympytex package

`sympytex (Pkg)` For `sympytex`:

```

\usepackage[
  . . .
  PrintLatexCmd={
    pdflatex project.tex \LWRopseq
    python project.sympy \LWRopseq
    pdflatex project.tex
  } ,
  HTMLLatexCmd={
    pdflatex project_html.tex \LWRopseq
    python project_html.sympy \LWRopseq
    pdflatex project_html.tex
  } ,
  . . .
]{lwarp}

```

Also see the warnings for `pythontex`, above.

## 9.7 Other packages

`rterface` (*Pkg*) Other packages such as `rterface` would be set up similar to `pythontex`, and the same warnings would apply.

## 9.8 `make` program

`make` (*Prog*) To use `lwarp` with the `make` program, have the makefile take `project.tex` and generate the print version `project.pdf`, as normal. `\usepackage{lwarp}` must be used, and it generates `lwarpmk.conf` when the print version is created.

To generate HTML, first have `project_html.tex` be compiled to generate `project_html.pdf`. This must be in PDF format. Finally, have `project_html.pdf` be converted to HTML using `lwarpmk pdftohtml project_html.pdf`, and convert SVG math with `lwarpmk limages`.

## 9.9 UTF-8 locale

⚠ **UTF-8 locale** `lwarpmk` uses the `texlua` program, which sets the “locale” to “C”, including for external operating-system calls such as when executing `lwarpmk html`. In some cases, an external program called from the user’s document may require the use of a UTF-8 “locale”. For UNIX-related operating systems, it may be required to use `lwarp`’s custom compilation options to add a locale change:

```

\usepackage{lwarp}[
  PrintLatexCmd={
    env LC_CTYPE=en_US.UTF-8
    xelatex -shell-escape project.tex
  }
  HTMLLatexCmd={
    env LC_CTYPE=en_US.UTF-8
    xelatex -shell-escape project_html.tex
  }
]

```

---

`ditaa (Pkg)` The only example seen so far where this is required is the `ditaa` package, where the locale change allows the use of UTF-8 with Xe $\LaTeX$  and `ditaa`. To use Lua $\LaTeX$  instead, the locale change would have to be made inside the `ditaa` package where its calls the *ditaa* program.

## 10 EPUB conversion

lwarp does not produce EPUB documents, but it may be told to modify its HTML output to greatly assist in the conversion. An external program may then be used to finish the conversion to EPUB.

**<meta> author** To assign the author's name for regular lwarp HTML files, and also for the EPUB, use `\HTMLAuthor {<name>}`. This assigns the name to the `<meta>` author element. It may be set empty, and it defaults to `\theauthor`.

A special boolean is provided to simplify the process of converting lwarp HTML output to EPUB:

	FormatEPUB
FormatEPUB ( <i>bool</i> ) Default: <code>false</code>	FormatEPUB changes HTML output for easy EPUB conversion via an external program. Removes per-file headers, footers, and nav. Adds footnotes per chapter/section.

To help convert lwarp HTML output to EPUB, add

```
\booltrue{FormatEPUB}
```

to the project's source preamble after `\usepackage{lwarp}`. The EPUB version of the document cannot co-exist with the regular HTML version, so

```
Enter ⇒ lwarpmk cleanall
```

```
Enter ⇒ lwarpmk html
```

```
Enter ⇒ lwarpmk images
```

to recompile with the FormatEPUB boolean turned on. Several changes are then made to the HTML output:

- Headers, footers, and navigation are removed at file splits.
- Any accumulated footnotes are printed at the bottom of each section.

The resulting files will be ready to be loaded into an EPUB conversion program, such as the open-source program *Calibre* (<https://calibre-ebook.com/>).

### search order

The EPUB conversion program must know what order the files are included. For lwarp projects, set the EPUB conversion software to do a breadth-first search of the files. For *Calibre*, this option is found in

**Preferences → Plugins → File type plugins → HTML to Zip**

### encoding

Check the box **Add linked files in breadth first order**. Set the document encoding as `utf-8`, which is what lwarp generates for HTML, even if the original printed document uses some other encoding.

### section breaks

The EPUB-conversion program must also know where the section breaks are located. For a list of lwarp's section headings, see table 12. For example, an article class document would break at `\section`, which is mapped to HTML heading level

<h4>, whereas a book class document would break at `\chapter`, which is HTML heading level <h3>. For *Calibre*, this option is found in

**Preferences → Conversion (Common Options) → Structure Detection → Detect chapters at (XPath expression)**

Select the “magic wand” to the right of this entry box, and set the first entry

**Match HTML tags with tag name:**

to “h4”. (Or “h3” for document classes with `\chapters`.) The Detect chapters at field should then show

**//h:h4** — or — **//h:h3**

This option is also available on the main tool bar at the Convert books button.

Once these settings have been made, the *lwarp*-generated HTML files may be loaded by *Calibre*, and then converted to an EPUB.

#### *MathJax support*

---

MATHJAX may be used in EPUB documents. Some e-readers include MATHJAX, but any given reader may or may not have a recent version, and may or may not include extensions such as support for `siunitx`.

*lwarp* adds some modifications to MathML to support equations numbered by chapter. These modifications may not be compatible with the e-reader’s version of MATHJAX, so *lwarp* requests that a known version be loaded instead. In some cases chapter numbering of equations still doesn’t work.

Until math support in EPUB documents is improved, it is recommended to use SVG images instead of MATHJAX, especially for equations numbered by chapter, or where `siunitx` support is important.

---

## 11 Word-processor conversion

lwarp may be told to modify its HTML output to make it easier to import the HTML document into a word processor. At the time of this writing, it seems that LIBREOFFICE works best at preserving table layout, but it still has some limitations, such as an inability to automatically assign figure and table frames and captions according to user-selected HTML classes. lwarp provides some assistance in locating these frame boundaries, as shown below.

### 11.1 Activating word-processor conversion

A special boolean is provided to simplify the process of converting lwarp HTML output to EPUB:

	FormatWP
FormatWP ( <i>bool</i> ) Default: false	Changes HTML output for easier conversion by a word processor. Removes headers and nav, prints footnotes per section, and also forces single-file output and turns off HTML debug comments. Additionally, honors the booleans WPMarkFloats, WPMarkMinipages, WPMarkTOC, and WPMarkLOFT.

To help modify lwarp HTML output for easier import to a word processor, add

```
\booltrue{FormatWP}
```

#### formatting adjustments

to the project's source preamble after lwarp is loaded. The following changes are then made to the HTML output:

- If using a class without chapters, \section and lower are shifted up in level for the HTML heading tags. The CSS has not been changed, so the section heading formats will not match the normal HTML output, but when imported to *LibreOffice Writer* the higher section headings will import as **Heading 1** for the title, **Heading 2** for \section, etc.
- Headers, footers, and navigation are removed at file splits.
- Any accumulated footnotes are printed at the bottom of each section.
- Forces single-file output.
- Turns off HTML debugging comments. These are comments appearing inside the HTML code, marking the opening/closing of sections and <div>s, but they are no longer useful when the document has been imported into a word processor.
- An additional <div> with an id encapsulates each float and minipage, which on import into *LibreOffice Writer* causes a thin frame to appear around the text block for each.
- Float captions are given an explicit italic formatting.
- Tabular rule borders are made explicit for *LibreOffice Writer*. LIBREOFFICE displays a light border around each cell while editing, even those which have

no border when printed, and `lwarp` also uses a light border for thin rules, so it will be best to judge the results using the print preview instead of while editing in `LIBREOFFICE`.

- `\includegraphics` and `svg` math width and height are made explicit for `LIBREOFFICE`.
- `\hspace` is approximated by a number of `\quads`, and rules are approximated by a number of underscores.
- Explicit `HTML` styles are given to:
  - `\textsc`, etc.
  - `\underline`, `soul` and `ulem` markup.
  - `center`, `flushleft`, `flushright`.
  - `\marginpar`, `keyfloat`, `sidenotes`, `floatflt`, and `wrapfig`.
  - `fancybox` `\shadowbox`, etc.
  - The `LATEX` and `TEX` logos.

- Honors several booleans:

**WPMarkFloats:** Marks the begin and end of floats.

**WPMarkMinipages:** Marks the begin and end of minipages.

**WPMarkTOC:** Marks the location of the Table of Contents.

**WPMarkLOFT:** Marks the locations of the List of Figures/Tables.

**WPMarkMath:** Prints `LATEX` math instead of using images.

**WPTitleHeading:** Adjusts title and section headings.

Several of these may be used to add markers to the `HTML` text which help determine where to adjust the word processor document after import.

## 11.2 Additional modifications

### WPMarkFloats

---

WPMarkFloats (*bool*)

Default: `false`

Adds

```
=== begin table ===
. . .
=== end ===
```

or

```
=== begin figure ===
. . .
=== end ===
```

around floats while formatting for word processors. This helps identify boundaries of floats to be manually converted to word-processor frames and captions.

---

### WPMarkMinipages

---

WPMarkMinipages (*bool*)

Default: `false`

Adds

```

=== begin minipage ===
. . .
=== end minipage ===

```

around minipages while formatting for word processors. This helps identify boundaries of minipages to be manually converted to word-processor frames.

---

#### WPMarkTOC

---

WPMarkTOC (*bool*)  
 Default: *true*

While formatting for word processors, adds  
 === table of contents ===

where the Table of Contents would have been. This helps identify where to insert the actual toc.

*If set false, the actual toc is printed instead.*

---

#### WPMarkLOFT

---

WPMarkLOFT (*bool*)  
 Default: *false*

While formatting for word processors, adds  
 === list of figures === *and/or*  
 === list of tables ===

where each of these lists would have been. This helps identify where to insert the actual lists.

*If set false, the actual lists are printed instead.*

---

#### WPMarkMath

---

[siunitx](#)  
 WPMarkMath (*bool*)  
 Default: *false*  
 TeXMaths (*Prog*)

While formatting for word processors, prints math as L<sup>A</sup>T<sub>E</sub>X code instead of creating svg images or MATHJAX. This is useful for cut/paste into the *LibreOffice Writer TeXMaths* extension.

When using the *siunitx* package, enter

```
\usepackage{siunitx}
```

in the *TeXMaths* preamble. Equation numbering is problematic for  $\mathcal{A}\mathcal{M}\mathcal{S}$  math environments.

---

#### WPTitleHeading

---

WPTitleHeading (*bool*)  
 Default: *false*  
[section headings](#)

While formatting for word processors, *true* sets the document title to <h1>, which is expected for HTML documents, but also causes the lower-level section headings to start at **Heading 2** when imported into LIBREOFFICE. Set to *false* to cause the title to be plain text, and the section headings to begin at **Heading 1**.

Table 11: Section HTML headings for word-processor conversion

Section	HTML headings*			
	With \chapter		Without \chapter	
	WPTitleHeading true	WPTitleHeading false	WPTitleHeading true	WPTitleHeading false
Title	<h1>	plain	<h1>	plain
\book	<div>	<div>	<div>	<div>
\part	<h2>	<h1>	<h2>	<h1>
\chapter	<h3>	<h2>	—	—
\section	<h4>	<h3>	<h3>	<h2>
\subsection	<h5>	<h4>	<h4>	<h3>
\paragraph	<h6>	<h5>	<h5>	<h4>
\subparagraph	<span>	<h6>	<h6>	<h5>

\* For default depths when not FormatWP, see table 12 on page 201.

See table 11 on page 185.

### 11.3 Recommendations

**TOC, LOF, LOT** For use with *LibreOffice Writer*, it is recommended to:

1. Set `\booltrue{FormatWP}`
2. Set `\booltrue{WPMarkTOC}` and `\boolfalse{WPMarkLOFT}`
3. Use `lwarp` to generate the HTML document.
4. Copy/paste from the HTML document into an empty *LibreOffice Writer* document.
5. Manually insert a LIBREOFFICE TOC in the LIBREOFFICE document.
6. Manually add frames around each float, adding a caption which is cut/pasted from each float's simulated caption.
7. Manually create cross references.

This process yields a document with an actual LIBREOFFICE Table of Contents, but a simulated List of Figures and List of Tables.

**siunitx** For `siunitx`, remember to adjust the preamble as mentioned above.

**LO view border options** LIBREOFFICE has options in the **View** menu to turn on/off the display of thin borders around table cells and text objects.

## 11.4 Limitations

Floats and captions are not explicitly converted to `LIBREOFFICE` floats with their own captions. Floats are surrounded by a thin frame in the `LIBREOFFICE` editor, and may be marked with `WPMarkFloats`, but are not given a proper `LIBREOFFICE` object frame. Captions are given an explicit italic formatting, but not a proper `LIBREOFFICE` paragraph style.

Cross references are not actual `LIBREOFFICE` linked cross references.

The List of Figures and List of Tables are not linked. The pasted pseudo `LOF` and `LOT` match the numbering of the `LATEX` and `HTML` versions.

Equation numbering is not automatic, but the equation numbers in `svg math` will match the `LATEX` and `HTML` output. `svg math` is recommended when using the `AMS` environments, which may have multiple numbered equations per object.

As of when last checked, `LIBREOFFICE` ignores the following:

- Minipage alignment.
- Tabular cell vertical alignment.
- Image rotation and scaling.
- Rounded border corners, which are also used by:
  - `\textcircled`
  - `booktabs trim`
- `\hspace` and rules, also used by `algorithmic`.
- Coloring of text decorations, used by `soul` and `ulem`.
- Overline text decoration, used by `romanbar`.

`LIBREOFFICE` also has limitations with frames and backgrounds:

- Multiple lines in an object are framed individually instead of as a whole.
- Nested frames are not handled correctly.
- Images inside boxes are not framed correctly.
- Spans with background colors and frames are not displayed correctly.

## 12 Modifying lwarp

- locating something** To quickly find the source for a package in `lwarp.dtx`, search for `*packagename`, such as `*siunitx`.
- Likewise, to quickly find the source for a file in `lwarp.dtx`, search for `*filename`, such as `*lwarp.css`.
- Purely text-based packages probably will work as-is when generating HTML.
- Look to existing code for ideas on how to expand into new code.
- image of TeX output** An environment may be converted to a `lateximage` then displayed with an image of the resulting L<sup>A</sup>T<sub>E</sub>X output. See section 93 for an example of the picture environment.
- css classes** To create a custom HTML block or inline CSS class, see section 52.10.
- print/HTML macros** To create print and HTML versions of the same macro or environment, see section 36.
-  **TeX boxes** Any TeX boxes must be undone, as `svg math` or `lateximages` require `\newpage`, which will not work in a TeX box.

### 12.1 Creating a development system

The following creates a local development system for `lwarp` on a TeXLive system in a UNIX-like environment. Doing so allows anything requesting `lwarp` to use the development version instead of whichever version is installed in TeXLive.

#### Create a development directory:

Place into this directory `lwarp.dtx` and `lwarp.ins`.

To create `lwarp.sty`, execute

```
Enter ⇒ pdflatex lwarp.ins
```

which creates `lwarp.sty` and several hundred additional `lwarp-*.sty` files for the various packages which are supported.

To create the initial documentation `lwarp.pdf`, execute

```
Enter ⇒ pdflatex lwarp.dtx
```

#### To make the development files visible to other projects:

Create the directory

```
/usr/local/texlive/texmf-local/tex/latex/local/lwarp
```

Inside this directory, create the file `update`, containing:

---

```
rm lwarp-*.sty
ln -s /path_to_dev_directory/lwarp*.sty .
ln -s /path_to_dev_directory/lwarp_baseline_marker.png .
ln -s /path_to_dev_directory/lwarp_baseline_marker.eps .
mktexlsr
```

---

Run `./update` now, and whenever a new `lwarp-*` package is added.

### To make the development version of *lwarpmk* visible to other projects:

---

```
cd /opt
ln -s /usr/local/texlive/texmf-local/bin/x86_64-linux texbin_local
cd texbin_local
ln -s ../../scripts/lwarp/lwarpmk.lua lwarpmk
cd /usr/local/texlive/texmf-local/scripts/
mkdir lwarp
cd lwarp
ln -s /path_to_dev_directory/lwarpmk.lua lwarpmk
```

---

Verify that the correct version is found with

Enter  $\Rightarrow$  **which lwarpmk**

### To make the local versions visible to the shell:

Paths must be set by the shell startup, such as in `.bashrc` and `.cshrc`:

In `.bashrc`:

---

```
PATH=/opt/texbin_local:/opt/texbin:$PATH
```

---

In `.cshrc`:

---

```
setenv PATH ${HOME}/bin:/opt/texbin_local:/opt/texbin:${PATH}
```

---

### To fully compile the *lwarp* documentation and indexes:

```
pdflatex lwarp.ins
pdflatex lwarp.dtx
pdflatex lwarp.dtx <if necessary>
makeindex -s gglo.ist -o lwarp.gls lwarp.glo <indexes>
splitindex lwarp.idx - -s gind.ist
pdflatex lwarp.dtx
pdflatex lwarp.dtx <if necessary>
makeindex -s gglo.ist -o lwarp.gls lwarp.glo <indexes>
splitindex lwarp.idx - -s gind.ist <again>
pdflatex lwarp.dtx
pdflatex lwarp.dtx <if necessary>
```

(The second round of index processing is required to fully resolve the final Index of Indexes.)

To make it easier to update the documentation after a minor change, it is useful to create a command script called `make_index`, containing:

```
makeindex -s gglo.ist -o lwarp.gls lwarp.glo
splitindex lwarp.idx -- -s gind.ist
```

### references

Note that Index of Indexes and the cross-references to the indexes may not be correct until the above has been accomplished.

## 12.2 Modifying a package for lwarp

If a class loads additional packages, it will be required to modify the class for lwarp, since lwarp must be loaded before most other packages.

To work with lwarp, a class must first set up anything which replicates the functions of the basic L<sup>A</sup>T<sub>E</sub>X classes, load any required fonts, then load lwarp, then finally load and adjust any other required packages.

When creating HTML, lwarp redefines the `\usepackage` and `\RequirePackage` macros such that it first looks to see if a `lwarp-<packagename>.sty` version exists. If so, the lwarp version is used instead. This modular system allows users to create their own versions of packages for lwarp to use for HTML, simply by creating a new package with a `lwarp-` prefix. If placed in the local directory along with the source code, it will be seen by that project alone. If placed alongside the other lwarp-packages where T<sub>E</sub>X can see it, then the user's new package will be seen by any documents using lwarp. (Remember `mktexlsr` or `texhash`.)

An `lwarp-<packagename>.sty` package is only used during HTML generation. Its purpose is to pretend to be the original package, while modify anything necessary to create a successful HTML conversion. For many packages it is sufficient to simply provide nullified macros, lengths, counters, etc. for anything which the original package does, while passing the raw text on to be typeset. See the pre-existing `lwarp-` packages for examples.

Anything the user might expect of the original package must be replaced or emulated by the new `lwarp-` package, including package options, user-adjustable counters, lengths, and booleans, and conditional behaviors. In many of these packages, most of the new definitions have a “local” prefix according to the package name, and `@` characters inside the name, which hides these names from the user. In most cases these macros will not need to be emulated for HTML output. Only the “user-facing” macros need to be nullified or emulated.

Each `lwarp-*` package should first call either of:

```
\LWR@ProvidesPackage\textblue {Drop}
— or —
\LWR@ProvidesPackage\textblue {Pass}
```

If “Drop”ped, the original print-version package is ignored, and only the `lwarp-` version is used. Use this where the original print version is useless for HTML. If “Pass”ed, the original package is loaded first, with the user-supplied options, then the `lwarp-` version continues loading as well. See section 457 ([ntheorem](#)) for an example of selectively disabling user options for a package. Use this when HTML output only requires some modifications of the original package. For a case where the original package is usable without changes, there is no need to create a `lwarp-` version.

### 12.2.1 Adding a package to the `lwarp.dtx` file

When adding a package to `lwarp.dtx` for permanent inclusion in lwarp, provide the `lwarp-<packagename>` code in `lwarp.dtx`, add its entry into `lwarp.ins`, and also remember to add

```
\LWR@loadafter{<packagename>}
```

to `lwarp.dtx` in section 20.1. This causes `lwarp` to stop with an error if `packagename` is loaded before `lwarp`. Finally, add an entry in table 2, **Supported packages and features**, and also the Updates section.

### 12.3 Modifying a class for lwarp

If a class loads additional packages, it will be required to modify the class for `lwarp`, since `lwarp` must be loaded before most other packages.

To work with `lwarp`, a class must first set up anything which replicates the functions of the basic L<sup>A</sup>T<sub>E</sub>X classes, load any required fonts, then load `lwarp`, then finally load and adjust any other required packages.

### 12.4 Testing lwarp

Compiling `lwarp.ins` generates all the `*.sty` files for `lwarp`. It can be useful to create additional `*.ins` files to be able to recompile only the pieces which have changed.

#### compiling individual packages

`core.ins` (*file*)

For example, to be able to recompile the `lwarp` core alone, copy `lwarp.ins` to `core.ins`, then modify `core.ins` to only compile:

```
\generate{
\file{lwarp.sty}{\from{lwarp.dtx}{package}}
}
```

For individual packages, create `packagename.ins`, set to compile only:

```
\generate{
\file{lwarp-packagename.sty}{\from{lwarp.dtx}{packagename}}
}
```

When changes have been made, test the print output before testing the HTML. The print output compiles faster, and any errors in the printed version will be easier to figure out than the HTML version.

#### compiling css and other generated files

Remember that the configuration files are only rewritten when compiling the printed version of the document.

When changing the source to *lwarpmk* or a css file in `lwarp.dtx`:

1. Change the source in `lwarp.dtx`.
2. `pdflatex lwarp.ins -or- pdflatex core.ins`
3. `pdflatex lwarp.dtx`
4. If modifying *lwarpmk* the new version should now be active.
5. If modifying css files or other files generated by `lwarp`:
  - (a) For the document, `lwarpmk print` to update the css files in the project.
  - (b) Reload the HTML document to see the effect of the new css files.

Sometimes it is worth checking the `<project>_html.pdf` file, which is the PDF containing HTML tags. Also, `<project>_html.html` has the text conversion of these tags, before the file is split into individual HTML files.

It is also worth checking the browser's tools for verifying the correctness of HTML and CSS code.

## 12.5 Modifying *lwarpmk*

`lwarpmk` (*Prog*) In most installations, `lwarpmk.lua` is an executable file located somewhere the operating system knows about, and it is called by typing **lwarpmk** into a terminal.

`lwarpmk.lua` (*file*)

A project-local copy of `lwarpmk.lua` may be generated, modified, and then used to compile documents:

1. Add the `lwarpmk` option to the `lwarp` package.
2. Recompile the printed version of the document. The `lwarpmk` option causes `lwarp` to create a local copy of `lwarpmk.lua`
3. The `lwarpmk` option may now be removed from the `lwarp` package.
4. Copy and rename `lwarpmk.lua` to a new file such as `mymake.lua`.
5. Modify `mymake.lua` as desired.
6. If necessary, make `mymake.lua` executable.
7. Use `mymake.lua` instead of `lwarpmk.lua`.

## 13 Troubleshooting

### 13.1 lwarp package error conditions and warnings

lwarp tests for a number of error conditions and prints appropriate warnings. The following is a summary of these conditions.

#### 13.1.1 Configuration file `lwarpmk.conf`

**File does not exist:** The configuration file must exist for `lwarpmk`.

**Incorrect Unix /Windows selection:** The operating system which was detected by `lwarp`. So far only Unix and Windows are supported.

**Incorrect delimiter characters.** Older versions of *lwarpmk* used a different delimiter.

**Source name is set to lwarp:** `lwarp` has recently been recompiled in this directory, which overwrote the project's configuration files. This also occurs if *lwarpmk* is executed in `lwarp`'s source directory.

**Incorrect operating system:** The configuration file was set for a different operating system, perhaps due to sharing in a collaborative project.

**Outdated configuration files:** `lwarp` has been updated since this project was last compiled. If there appears to be a valid print command in the file, `lwarpmk` displays this to instruct the user how to recompile the print version, which then updates the configuration files.

**The designated source file does not exist:** For whatever reason...

**Unknown engine:** `lwarp` cannot determine which engine is being used. Supported are DVI L<sup>A</sup>T<sub>E</sub>X, PDF L<sup>A</sup>T<sub>E</sub>X, X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X, LuaL<sup>A</sup>T<sub>E</sub>X, and upL<sup>A</sup>T<sub>E</sub>X.

#### 13.1.2 Image generation with `lwarpmk limages`

**“Wait a moment for the images to complete before reloading page.”:**

Images are generated by background tasks. If the document is reloaded before these tasks are complete, some images may not yet be generated. *lwarpmk* tries to wait for background tasks to complete before exiting.

**HTML version does not exist:** Images are extracted from the HTML version, which must be compiled before images are generated.

**\*-images.txt does not exist:** This file tells which images to extract from the HTML file. If the file does not exist, it may be that no SVG math or `lateximages` were used. If so, `lwarpmk limages` is not necessary.

**Cross references are not correct:** The document must have up-to-date cross references to locate the images to extract. A number of conditions may cause incorrect cross references.

**“WARNING: Images will be incorrect.”:** An image reference was not found. Re-compile.

**lwarpmk epstopdf \* or lwarpmk pdftosvg \*:** Errors if filenames are not found.

### 13.1.3 Default bitmapped font

lwarp requires the use of a vector font. If lwarp detects that the document uses the default COMPUTER MODERN font, and the cm-super package is not installed, it is assumed that the font is bitmapped. An error is generated, along with the recommendation to install cm-super or use lmodern.

### 13.1.4 Packages

**Loaded before lwarp:** Some packages and classes must be loaded before lwarp. These include input and font encoding, morewrites and newclude, and a number of CJK-related packages and classes.

**Loaded after lwarp:** Most packages which are modified by lwarp must be loaded after lwarp.

**Loaded never:** Some packages do not work with lwarp. An error is generated, along with a list of alternatives to consider.

**Specific packages:** Some packages enforce a specific load order vs. certain other packages.

**Patching error:** lwarp tries to patch some packages using xpatch. If the original package has been updated more recently than lwarp, a patch may not work. It may be necessary to use an older version of the package until lwarp is updated.

**longtable:** lwarp's longtable package issues detailed error messages regarding the use of the table headers and footers.

**polyglossia:** If used, an informative message is printed to instruct the user to be sure to set a language, without which an error will occur.

**babel or polyglossia:** An informative message is printed to note that not all languages are supported by cleveref.

### 13.1.5 Compiling

**SideTOCDepth < FileDepth:** A warning is displayed if these counters are set such that the sideroc will not be able to access all pages of the website.

**Filenames:** lwarp may generate file names from section names. While doing so, the filenames are simplified, and special characters and math are removed. If this process generates a duplicate filename, and error is generated, describing the filename and which section name generated it. A warning is issued if dollar-delimited math is used. Parenthesis-delimited math is recommended instead.

 **HTML corrupted** **Multirow:** When \multirow or \multicolrow are used, \mrowcell or \mcolrowcell must be placed in the appropriate cells to avoid corrupted HTML output.

**(width,height) missing a comma:** \makebox and \framebox can accept a parenthesis-delimited width and height, which must be separated by a comma.

**“Load graphicx or graphics for improved svg math baselines.”:** svg math sizing and baselines are improved if either of these packages are used.

**“Load graphicx or graphics for improved XeTeX logo.”:** If these packages are loaded, the Xe<sub>La</sub>TeX logo can use the reversed “E”.

**“It is recommended to use [width=xx\linewidth] instead of [scale=yy] ”:** Browser support of scale does not have the same effect as in L<sup>A</sup>T<sub>E</sub>X.

## 13.2 Using the lwarp package

The following address problems which may occur, and possible solutions to each.

△ **HTML corrupted** **Text is not converting correctly / corrupted HTML tags:**

- Font-related UTF-8 information must be embedded in the PDF file. See section 7.4 regarding bitmapped vs. vector fonts.
- See section 8.2.1 regarding HTML entities and the characters &, <, and >.

△ **dotlessj** **Dotless j (\j):** See section 7.4 regarding cmap, mmap.

**Undefined HTML settings:**

- See the warning regarding the placement of the HTML settings at section 7.6.

**Tabular problems:** See section 8.10.1.

**Obscure error messages:**

**Print first:** Be sure that a print version of the document compiles and that your document’s L<sup>A</sup>T<sub>E</sub>X code is correct, before attempting to generate an HTML version.

`\end{warpHTML}, \end{warpprint}, \end{warpall}, \end{warpMathJax}:`

Each of these must be without any other characters on the same line.

**“Runaway argument? File ended while scanning use of \next:**

Don’t use warpHTML, warpprint, warpall, or warpMathJax inside itself.

**Options clash:** If using memoir, see section 8.13.

**“Missing \begin{document}.”:** Some packages require that their options be specified before lwarp is loaded, or via the package’s setup macro, especially if these options include the use of braces. See section 8.1.

**“No room for a new \write.”:** Before `\usepackage{lwarp}`, add:

```
\usepackage{morewrites}
\morewritessetup{allocate=10}
```

**“! TeX capacity exceeded, sorry [text input levels=15].”:** Packages were nested too many levels deep. Locate the file `texmf.cnf` for your distribution, and add the line

```
max_in_open = 30
```

**“Missing \$ inserted.”:** If using a filename or URL in a footnote or `\item`, escape underscores with `\_.`

△ [warpHTML](#), [warpprint](#),  
[warpMathJax](#), [warpall](#)

**“Label(s) may have changed. Rerun to get cross-references right.”:**

This warning may repeat endlessly if a math expression is used in a caption. Simple math expressions such as  $X=1$  may be replaced with

```
\textit{X}\,=\,1
```

**“Temporary page! LaTeX was unable to guess the total number of pages ...”:**

Harmless. Recompile the document one more time.

**“Leaders not followed by proper glue”:**

This can be caused by a missing `l@<floastype>` or `l@<sectiontype>` definition. See `lwarp`'s definitions for examples.

**“Improper \prevdepth”:** `lateximages` and `svg` math require `\newpage`, which cannot work inside `TEX` boxes or `\ensuremath`. Anything using `\newsavebox`, `\newbox`, `Lrbox`, `\savebox`, `\hbox`, `\vbox`, `\usebox`, `\sbox`, etc., must be modified to work without box commands.

If you find something using `\ensuremath`, have it temporarily set:

```
\LetLtxMacro\@ensuredmath\LWR@origensuredmath
```

inside a group first.

`LWR@texboxdepth`

As a stop-gap measure, you may wish to try incrementing the counter `LWR@texboxdepth` before the problematic macro, and then decrementing it after. Doing so tells `lwarp` to avoid using a `\newpage` inside the macro, which may avoid this error.

⚠ macros in section, table, figure names

Also, custom macros which appear inside a section, figure, or table name should be made robust since they appear inside the `.toc`, `.lof`, or `.lot` files. Use `\newrobustcmd` or `\robustify` from `etoolbox`, `xparse`, etc.

⚠ BibTeX

If using BibTeX, see section 8.6.9.

⚠ polyglossia

**“! Undefined control sequence. . . \\_\\_hook begindocument”:**  
See section 8.15.4 if using `polyglossia`.

⚠ custom macros for environments

**“\begin{equation} ended by \end{document}”:** Do not use custom macros such as `\beq` and `\eeq` to replace

```
\begin{equation}
. . .
\end{equation}
```

⚠ `\LWR@formatted`

**“Misplaced \omit”:** If using `\LWR@formatted` to define new macros for print and HTML modes, see section 36 regarding `\LWR@expandableformatted`.

**“Token not allowed in a PDF string”:** This `hyperref` warning appears while creating the print-mode document, not HTML. A low-level macro is being used in a section name which appears in the PDF bookmarks. `hyperref` removes this macro from the bookmark, and warns of doing so. To avoid this warning, use `\pdfstringdefDisableCommands` in the preamble to define simplified replacement macros for each, or use `\texorpdfstring` in the `\section` or related macro to declare what to use for the `TEX` text, v.s. the PDF bookmark. See the `hyperref` manual.

⚠ quote character

**“Command \textquoteright invalid in math mode”:** This can occur when the document source has math containing the slanted quote `'` character, instead of using the upright quote `'` character.

⚠ “impure” math objects

**Complicated objects inside math:** Some objects, such as `TikZ`, may not compile in `lwarp`'s normal math emulation. Insert

`\displaymathother` — *or* — `\inlinemathother`  
 before the math, and then  
`\displaymathnormal` — *or* — `\inlinemathnormal`  
 when displaying “normal” math. See section 8.7.11.

**Slow compilation of math objects:** Complicated math objects can also cause problems with alt tags, resulting in very slow compilation, large alt tags, and possible crashes. Use `\inlinemathother ... \inlinemathnormal` or `\displaymathother ... \displaymathnormal` around the math expression.

⚠ **MATHJAX Incorrect MATHJAX:** Some objects do not convert to MATHJAX. Use `\displaymathother` before these objects, then `\displaymathnormal` to return to “normal” display math. See section 8.7.11.

**Missing sections:** See section 7.6 regarding the `FileDepth` and `SideTOCDepth` counters, and the use of `\tableofcontents` in the home page.

**Misnumbered footnotes from section headings:** See section 8.5.4.

**Missing HTML files:**

- See the warning regarding changes to the HTML settings at section 7.6.
- Ensure that the filenames are unique after math and short words are removed. See `FileSectionNames` at section 7.6.

**Missing / incorrect cross-references:**

- Use `lwarpmk` again followed by `lwarpmk html` or `lwarpmk print` to compile the document one more time.
- Labels with special characters may be a problem. It is best to stick with alpha-numeric, hyphen, underscore, and perhaps the colon (if not French).  
`\nameref` refers to the most recently-used section where the `\label` was defined. If no section has been defined before the `\label`, the link will be empty. Index entries also use `\nameref` and have the same limitation.
- `cleveref` and `varioref` are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for `\cpageref` and `\cpagerefrange`. This phrase includes `\cpagerefFor`, which defaults to “for”.

Ex:

```
\cpageref{tab:first,tab:second}
```

in html becomes:

“pages **for** table 4.1 and **for** table 4.2”

See `\cpagerefFor` at page 734 to redefine the message which is printed for page number references.

**BibTeX errors with `\etalchar`:** See section 8.6.9.

**Malformed URLs:** Do not use the % character between arguments of `\hyperref`, etc., as this character is among those which is neutralized for inclusion in HTML URLs.

**Em-dashes or En-dashes in listing captions and titles:**

Use `XQLATEX` or `LuaATEX`.

labels

⚠ label characters

`\nameref`

⚠ empty link

⚠ cleveref page numbers

**Floats out of sequence:**

**Mixed “Here” and floating:** Floats [H]ere and regular floats may become out of order. `\clearpage` if necessary.

**Caption setup:** With `\captionsetup` set the positions for the captions above or below to match their use in the source code.

**Images are appearing in strange places:**

- When images are added or removed, Enter `lwarpmk limages` to refresh the `lateximage` images.

**svg images:**

⚠ adding/removing

When a math expression, picture, or TikZ environment is added or removed, the svg images must be re-created by entering `lwarpmk limages` to maintain the proper image-file associations. Inline svg math may be hashed and thus not need to be recreated, but display math and objects such as TikZ may move to new image numbers when the document is changed.

recompile first

Before attempting to create the svg image files, `lwarpmk` verifies that the HTML version of the document exists and has correct internal image references.<sup>16</sup> If it is necessary to recompile the document’s HTML version one more time, `lwarpmk` usually will inform the user with an error message, but there are some conditions which cannot be detected, so the user should watch for the L<sup>A</sup>T<sub>E</sub>X recompile warnings.

⚠ HTML instead of images

If HTML appears where an svg image should be, recompile the document one more time to get the page numbers back in sync, then remake the images one more time.

⚠ page counter

Incorrect svg images will also occur if the document changes the page counter:

```
\setcounter{page}{<value>}
```

The page counter must *not* be adjusted by the user.

⚠ Lots of files!

Expressing math as svg images has the advantage of representing the math exactly as L<sup>A</sup>T<sub>E</sub>X would, but has the disadvantage of requiring an individual file for each math expression. For inline math, and some other objects, `lwarp` uses an MD5 hash on its L<sup>A</sup>T<sub>E</sub>X source to combine multiple instances of identical inline expressions into a single image file, but display math and other environments such as `picture` and `TikZ` require one image file each. For a document with a large amount of math, see section 5.5 to use MATHJAX instead.

**Plain-looking document:**

- The document’s css stylesheet may not be available, or may be linked incorrectly. Verify any `\CSSFilename` statements point to a valid css file.

⚠ HTML corrupted

**Broken fragments of HTML:**

- Check the PDF file used to create HTML to see if the tags overflowed the margin. (This is why such large page size and margins are used.)

**Changes do not seem to be taking effect:**

<sup>16</sup>This becomes important when dealing with a document containing thousands of images.

- Be sure to `lwarpmk clean`, recompile, then start by reloading the home page. You may have been looking at an older version of the document. If you changed a section name, you may have been looking at the file for the old name.
- See the warning regarding changes to the HTML settings at section 7.6.
- Verify that the proper CSS is actually being used.
- The browser may compensate for some subtle changes, such as automatically generating ligatures, reflowing text, etc.

#### Un-matched conditional compiles:

- Verify the proper begin/end of `warpprint`, `warpHTML`, and `warpall` environments.

### 13.2.1 Debug tracing output

`\tracinglwarp` When `\tracinglwarp` is used, `lwarp` will add extra tracing messages to the `.log` file. The last several messages may help track down errors.

Place `\tracinglwarp` just after `\usepackage{lwarp}` to activate tracing.

## 13.3 Compiling the `lwarp.dtx` file

**lwarp\_tutorial.tex:** Copy or link `lwarp_tutorial.txt` from the TDS doc directory to the source directory, or wherever you wish to compile the documentation. This file is included verbatim in the documentation, but is in the doc directory so that it may be found by *texdoc* and copied by the user.

#### Illogical error messages caused by an out-of-sync `lwarp.sty` file:

1. Delete the `lwarp.sty` file.
2. Enter `pdflatex lwarp.ins` to generate a new `lwarp.sty` file.
3. Enter `pdflatex lwarp.dtx` to recompile the `lwarp.pdf` documentation.

#### Un-nested environments:

Be sure to properly nest:

- `\begin{macrocode}` and `\end{macrocode}`
- `\begin{macro}` and `\end{macro}`
- `\begin{environment}` and `\end{environment}`

## 15 Implementation

This package is perhaps best described as a large collection of smaller individual technical challenges, in many cases solved through a number of ~~erude~~ ~~haeks~~ clever tricks. Reference sources are given for many of the solutions, and a quick internet search will provide additional possibilities.

Judgement calls were made, and are often commented. Improvements are possible. The author is open to ideas and suggestions.

Packages were patched for re-use where they provided significant functionality. Examples include `xcolor` with its color models and conversion to HTML color output, and `siunitx` which provides many number and unit-formatting options, almost all of which are available in pure-text form, and thus easily used by *pdftotext*.

Packages were emulated where their primary purpose was visual formatting which is not relevant to HTML output. For example, packages related to sectioning are already patched by numerous other packages, creating a difficult number of combinations to try to support, and yet in HTML output all of the formatting is thrown away, so these packages are merely emulated.

Packages with graphical output are allowed as-is, but must be nested inside a `lateximage` environment to preserve the graphics.

Testing has primarily been done with the Iceweasel/Firefox browser.

Table 12: Section depths and HTML headings

Section	L <sup>A</sup> T <sub>E</sub> X depth	HTML headings *

listitem	7	new for this package, used for list items

\* If FormatWP is true, section headings may be adjusted, depending on WPTitleHeading. See table 11 on page 185.

## 16 Section depths and HTML headings

Stacks are created to track depth inside the L<sup>A</sup>T<sub>E</sub>X document structure. This depth is translated to HTML headings as shown in table 12. “Depth” here is not depth in the traditional computer-science stack-usage sense, but rather a representation of the nesting depth inside the L<sup>A</sup>T<sub>E</sub>X document structure.

When starting a new section, the program first must close out any existing sections and lists of a deeper level to keep the HTML tags nested correctly.

Support for the memoir package will require the addition of a book level, which may push the HTML headings down a step, and also cause subsubsection to become a <div> due to a limit of six HTML headings.

It is possible to use HTML5 <section> and <h1> for all levels, but this may not be well-recognized by older browsers.

Fixed levels for parts and chapters allow the CSS to remain fixed as well.

## 17 Source code

This is where the documented source code for `lwarp` begins, continuing through the following sections all the way to the change log and index at the end of this document.

The following sections document the actual implementation of the `lwarp` package.

**line numbers** The small numbers at the left end of a line refer to line numbers in the `lwarp.sty` file.

**subjects** Blue-colored tags in the left margin aid in quickly identifying the subject of each paragraph. These are often the targets of index entries.

**index entries** Black-colored tags in the left margin are used to identify programming objects such as files, packages, environments, booleans, and counters. Items without a tag are command macros. Each of these also appears in the index as individual entries, and are also listed together under “files”, “packages”, “environments”, “booleans”, and “counters”.

 **warnings** Special warnings are marked with a warning icon.

**for HTML output:**  
**for PRINT output:**  
**for HTML & PRINT:** Green-colored tags in the left margin show which sections of source code apply to the generation of HTML, print, or both forms of output.

## 20 Package load order

Several packages must never be used with `lwarp`, others should only be loaded before `lwarp`, and others should only be loaded after. The `lwarp` core checks most

of these cases. In some `lwarp-*` packages, `\LWR@loadbefore` is used to trigger an error if they are loaded after `lwarp`, while additional code provides necessary patches for when they are loaded before.

Packages which must be loaded after `lwarp` are enforced by a large number of `\LWR@loadafter` statements, below. Some packages are emulated by `memoir`, and so these are tested by `\LWR@notmemoirloadafter`, which does not cause an error if `memoir` is used.

`\LWR@checkloadfilename` is used to check each filename to see if it must never be loaded, or must always be loaded before `lwarp`.

## 20.1 Tests of package load order

`\LWR@checkloadnever {<badpackagename>} {<replacementpkgname>}`

The first package is not supported, so tell the user to use the second instead.

When `lwarp` is first loaded, this is set to `\LWR@earlyloadnever` to check for incompatible packages which were loaded before `lwarp`. After `lwarp` is loaded, this is changed to `\LWR@afterloadnever` to check for incompatible packages during `\usepackage`.

```
233 \LetLtxMacro\LWR@checkloadnever\LWR@earlyloadnever
```

Now check for incompatible packages which have been loaded before `lwarp`:

```
234 \LWR@checkloadnevers
```

The older CJK and CJKutf8 only work with `xeCJK`:

```

235 \IfPackageLoadedTF{xeCJK}{}{
236   \LWR@checkloadnever{CJK}{ctex, xeCJK}
237   \LWR@checkloadnever{CJKutf8}{ctex, xeCJK}
238 }

```

Some classes do not work with `lwarp`:

```

239 \LWR@earlyclassloadnever{beamer}{beamerarticle}
240 \LWR@earlyclassloadnever{jarticle}{ujarticle}
241 \LWR@earlyclassloadnever{jbook}{ujbook}
242 \LWR@earlyclassloadnever{jreport}{ujreport}
243 \LWR@earlyclassloadnever{tarticle}{utarticle}
244 \LWR@earlyclassloadnever{tbook}{utbook}
245 \LWR@earlyclassloadnever{treport}{utreport}
246 \LWR@earlyclassloadnever{novel}{}
247 \LWR@earlyclassloadnever{powerdot}{}

```

### 20.3 Enforcing package loading after lwarp

Packages which should only be loaded after `lwarp` are tested here to trip an error of they have already been loaded.

The following packages must be loaded after `lwarp`:

## 21 MD5 hashing

The MD5 hash is used for lateximage filenames for svg math.

```

827 \newcommand{\LWR@mdfive}[1]{%
828   \PackageError{lwarp}
829     {No MD5 macro was found}
830     {%
831       Lwarp must find the macros \protect\pdfmdfivesum\space
832       or \protect\mdfivesum.%
833     }
834 }

```

The default for PDF<sup>L</sup>ATEX, DVI<sup>L</sup>ATEX, up<sup>L</sup>ATEX, etc:

```
835 \let\LWR@mdfive\pdfmdfivesum
```

For Lua<sup>L</sup>ATEX:

```

836 \ifLuaTeX
837 \RequirePackage{pdfdoccmds}

```

```
838 \let\LWR@mdfive\pdf@mdfivesum
839 \fi
```

For X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X:

```
840 \ifXeTeX
841 \@ifundefined{pdf@mdfivesum}{}
842   {\let\LWR@mdfive\pdf@mdfivesum}
843 \@ifundefined{mdfivesum}{}
844   {\let\LWR@mdfive\mdfivesum}
845 \fi
```

## 22 PDF L<sup>A</sup>T<sub>E</sub>X T1 and UTF-8 encoding

When using PDF L<sup>A</sup>T<sub>E</sub>X, lwarp requires T1 font encoding, and recommends UTF-8 input encoding.

If some other input encoding is already defined, lwarp will try to use it instead, and hope for the best.

X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X and LuaL<sup>A</sup>T<sub>E</sub>X are both UTF-8 by nature.

`\LWR@pdfencoding` Sets T1, and also utf8 if not already set.

```
846 \newcommand*\LWR@pdfencoding}{%
847   \RequirePackage[T1]{fontenc}
848
849   \IfPackageLoadedTF{inputenc}{}{
850     \IfPackageLoadedTF{inputenx}{}{
851       \RequirePackage[utf8]{inputenc}
852     }
853   }
854 }

855 \ifPDFTeX% pdflatex or dvi latex
856   \LWR@pdfencoding
857 \fi
858
859 \ifpTeX
860   \LWR@pdfencoding
861 \fi
```

## 23 Unicode input characters

**for HTML & PRINT:** If using *pdf<sub>l</sub>atex*, convert a minimal set of Unicode characters. Additional characters may be defined by the user, as needed.

A commonly-used multiply symbol is declared to be `\texttimes`.

The first arguments of `\newunicodechar` below are text ligatures in the source code, even though they are not printed in the following listing.

```
862 \ifpTeX
```

```

863 \else
864 \RequirePackage{newunicodechar}
865
866 \newunicodechar{x}{\texttimes}
867
868 \ifPDFTeX% pdflatex or dvi latex
869 \newunicodechar{ff}{ff}% Here, the first arguments are ligatures.
870 \newunicodechar{fi}{fi}
871 \newunicodechar{fl}{fl}
872 \newunicodechar{ffi}{ffi}
873 \newunicodechar{ffl}{ffl}
874 \newunicodechar{-}{---}
875 \newunicodechar{-}{--}
876 \fi
877
878 \fi

```

## 24 Avoid a bitmapped font

If DVI or PDF L<sup>A</sup>T<sub>E</sub>X, and if the default Computer Modern is the selected font family, ensure that cm-super or lmodern is used to provide a vector font.

```

879 \ifxetexorluatex
880 \else
881   \ifdefstring{\f@family}{cmr}{
882     \IfFileExists{type1ec.sty}% found in cm-super
883     {}
884     {% cm-super not installed
885       \IfFileExists{lmodern.sty}{
886         \PackageInfo{lwarp}{cm-super not installed, loading lmodern}
887         \RequirePackage{lmodern}
888       }{
889         \PackageError{lwarp}
890         {%
891           Lwarp requires a vector font.\MessageBreak
892           Install and load cm-super, lmodern, or another\MessageBreak
893           Type-1 vector font before loading lwarp.\MessageBreak
894           Enter 'H' for possible solutions%
895         }
896         {%
897           Install cm-super or lmodern.\MessageBreak
898           If lmodern, load it before lwarp:\MessageBreak
899           \space\space\protect\usepackage{lmodern}\MessageBreak
900           \space\space\protect\usepackage{lwarp}%
901         }
902       }
903     }% cm-super not installed
904   }{% f@family
905 \fi

```

## 25 Upright quotes

In PDF T<sub>E</sub>X, preserve upright quotes in verbatim text. upquote also loads textcomp.

```

906 \ifPDFTeX
907 \RequirePackage{upquote}
908 \fi
909
910 \ifpTeX
911   \RequirePackage{upquote}
912 \fi

```

## 26 Avoid bad font combinations

For Xe<sub>L</sub>ATEX and Lua<sub>L</sub>ATEX, certain font combinations cause problems with lwarp.

libertinus-otf has special handling for `\textquotedbl`. Search for `\LWR@orig@textquotedbl`.

```

913 \ifxetexorluatex
914   \AtBeginDocument{
915     \IfPackageLoadedTF{kpfonts}{
916       \PackageError{lwarp}
917         {%
918           When using XeLaTeX or LuaLaTeX, \MessageBreak
919             use kpfonts-otf instead of kpfonts%
920         }
921       {%
922         Replace: \protect\usepackage{kpfonts}\MessageBreak
923           with: \protect\usepackage{kpfonts-otf}
924       }
925     }{}
926   }
927 \fi

```

## 27 Miscellaneous tools

### 27.1 Variables

```

928 \newlength{\LWR@templengthone}
929 \newlength{\LWR@templengthtwo}
930 \newlength{\LWR@templengththree}
931 \newcounter{\LWR@tempcountone}

```

### 27.2 Lengths and units

`\LWR@providelength` `{\lengthname}` Provides the length if it isn't defined yet.

Used to provide source compatibility for lengths which will be ignored, but might or might not be already provided by other packages.

```

932 \newcommand*\LWR@providelength[1]{%
933   \ifdeflength{#1}{\newlength{#1}}%
934 }

```

`\LWR@convertto` `{\dest unit}` `{\length}`

Prints a length in the given units, without printing the unit itself.

```
935 \newcommand*\LWR@convertto}[2]{\strip@pt\dimexpr #2*65536/\number\dimexpr 1#1}
```

```
\LWR@printpercentlength {<smaller>} {<larger>}
```

Prints a percent ratio of the two lengths.

```
936 \newcommand*\LWR@printpercentlength}[2]{%
937   \setcounter{LWR@tempcountone}{100*\ratio{#1}{#2}}%
938   \arabic{LWR@tempcountone}%
939 }
```

### 27.3 Counters

```
\defaddtocounter {<name>} {<value>}
```

Locally add to a counter.

```
940 \providecommand*\defaddtocounter}[2]{%
941   \defcounter{#1}{\value{#1}+#2}%
942 }
```

### 27.4 Patching macros

```
\LWR@patcherror {<packagename>} {<macroname>}
```

Prints an error if could not patch a macro.

```
943 \newcommand*\LWR@patcherror}[2]{%
944   \PackageError{Lwarp}%
945   {%
946     Unable to patch package #1,\MessageBreak
947     macro \LWRbackslash #2.\MessageBreak
948     Lwarp or #1 may need to be updated%
949   }%
950   {Please contact the maintainer of the Lwarp package.}%
951 }
```

### 27.5 Copying macros

```
\csNewCommandCopycs {<dest csname>} {<source csname>}
```

Given a cs-name for each, copies a macro to a new definition.

```
952 \providecommand*\csNewCommandCopycs}[2]{%
953   \expandafter\NewCommandCopy\csname#1\expandafter\endcsname%
954   \csname#2\endcsname%
955 }
```

```
\NewEnvironmentCopy {<dest>} {<source>}
```

Copies an environment to a new definition.

```
956 \providecommand*\NewEnvironmentCopy}[2]{%
957   \csNewCommandCopycs{#1}{#2}%
958   \csNewCommandCopycs{end#1}{end#2}%
959 }
```

## 27.6 Chinese text isolation

`\LWR@isolate`  $\langle text \rangle$  Isolates Chinese characters from the surrounding text. This is required to avoid extra spaces on either side of the Chinese characters, especially when written to a file.

```
960 \newcommand{\LWR@isolate}[1]{#1}%
961
962 \IfPackageLoadedTF{ctexpatch}{
963   \renewcommand{\LWR@isolate}[1]{\null#1\null}%
964 }{}
965
966 \IfPackageLoadedTF{xeCJK}{
967   \renewcommand{\LWR@isolate}[1]{\null#1\null}%
968 }{}
```

`\LWR@disablepinyin` Disable xpinyin during file, sideroc, and footnote generation. Set by xpinyin.

```
969 \newcommand*\LWR@disablepinyin{}
```

## 27.7 Inserting vertical space

`\LWR@forceemptyline` Extra vertical space in the HTML output. Use after `\LWR@stoppars`.

```
970 \newcommand*\LWR@forceemptyline{}%
971   \LWR@origrule{0pt}{1\baselineskip}%
972   \LWR@orignewline%
973 }
```

## 27.8 Argument selection

`\LWR@thirdofthree`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$

`\LWR@fourthoffour`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$   $\langle fourth \rangle$

`\LWR@firstoffive`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$   $\langle fourth \rangle$   $\langle fifth \rangle$

`\LWR@secondoffive`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$   $\langle fourth \rangle$   $\langle fifth \rangle$

`\LWR@thirdoffive`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$   $\langle fourth \rangle$   $\langle fifth \rangle$

`\LWR@fourthoffive`  $\langle first \rangle$   $\langle second \rangle$   $\langle third \rangle$   $\langle fourth \rangle$   $\langle fifth \rangle$

```
\LWR@fifthoffive {<first>} {<second>} {<third>} {<fourth>} {<fifth>}
```

Expands to the nth of the five arguments. Used for extra cross referencing.

## 27.9 Inside boxes

Greater than zero if currently inside a T<sub>E</sub>X box, thus should not use `\LWR@orignewpage`. See section 13.2.

```
982 \newcounter{LWR@texboxdepth}
983 \setcounter{LWR@texboxdepth}{0}
```

`\LWR@maybe@orignewpage` Only do `\LWR@orignewpage` if not inside a T<sub>E</sub>X box.

```
984 \newcommand*{\LWR@maybe@orignewpage}{%

## 27.11 Converting a macro name to a cs name

\macrotoaname { $\langle$ *macro name with backslash* $\rangle$ }

Results in the macro name without the leading backslash.

Ref: <https://tex.stackexchange.com/questions/42318/removing-a-backslash-from-a-character-sequence>

```

1017 \newcommand*\macrotoaname[1]{%

## 27.13 LetLtxMacros

\LWR@LetLtxMacros { $\langle$ *newcsname* $\rangle$ } { $\langle$ *oldcsname* $\rangle$ }

\LetLtxMacro with cs names.

```

1028 \newcommand*\LWR@LetLtxMacros[2]{%

## 27.14 Absorbing a star

`\LWR@absorbstar {⟨csname⟩}`

Modifies a macro to absorb a star. Used for `cleveref`, since `hyperref` is emulated, so the starred macros are not created by `cleveref`.

```
1032 \newcommand*{\LWR@absorbstar}[1]{%
1033   \LWR@LetLtxMacros{\LWR@origins@#1}{#1}%

```

## 28 Operating-System portability

- Unix (*Prog*) `lwarp` tries to detect which operating system is being used. UNIX / MAC OS / LINUX is the default (collectively referred to as “UNIX” in the configuration files), and MS-WINDOWS is supported as well.
- Mac OS (*Prog*)
- Linux (*Prog*)
- MS-Windows (*Prog*) If MS-WINDOWS is not correctly detected, use the `lwarp` option `OSWindows`.
- Windows (*Prog*)
- OSWindows (*Opt*) When detected or specified, the operating-system path separator used by `lwarp` is modified, and the boolean `usingOSWindows` is set true. This boolean may be tested by the user for later use.

### 28.1 Literal characters

Literal characters to be used in `PrintLatexCmd` and `HTMLLatexCmd`. These are defined without `@` to easily allow their inclusion in the user’s document.

The literal `%` character:

```
1037 \let\LWRpercent\@percentchar
```

The literal `$` character:

```
1038 \catcode'\$=12
1039 \def\LWRdollar{$}
1040 \def\LWRdollar{$}% syntax highlighting
1041 \catcode'\$=3
```

The literal `&` character:

```
1042 \catcode'\&=12
1043 \def\LWRamp{&}
1044 \catcode'\&=4
```

The literal `\` character. The ampersand is temporarily set to the escape character during the definition of the backslash macro.

```
1045 \catcode'\&=0
1046 &catcode'\=12
1047 &def&LWRbackslash{\}
```

```
1048 &catcode'\=0
1049 \catcode'\&=4
```

The literal { character. The ampersand is temporarily set to the begin group character during the definition of the leftbrace macro.

```
1050 \catcode'\&=1
1051 \catcode'\{=12
1052 \def\LWRleftbrace&{ }
1053 \catcode'\{=1
1054 \catcode'\&=4
```

The literal } character. The ampersand is temporarily set to the end group character during the definition of the leftbrace macro.

```
1055 \catcode'\&=2
1056 \catcode'\}=12
1057 \def\LWRrightbrace}&{ }
1058 \catcode'\}=2
1059 \catcode'\&=4
```

The literal # character:

```
1060 \catcode'\#=12
1061 \def\LWRhash{#}
1062 \catcode'\#=6
```

`\LWRopquote` The operating system's quote mark, UNIX default. For WINDOWS, see `\LWR@setOSWindows`, below.

```
1063 \def\LWRopquote{' }
```

`\LWRopseq` The operating system's sequential execution command, UNIX default. For WINDOWS, see `\LWR@setOSWindows`, below.

```
1064 \def\LWRopseq{\space\LWRamp\LWRamp\space\space}
```

## 28.2 Common portability code

`usingOSWindows` (*bool*) Set if the OSWindows option is used, or if WINDOWS is automatically detected.

```
1065 \newbool{usingOSWindows}
1066 \boolfalse{usingOSWindows}
```

## 28.3 UNIX, LINUX, and MAC OS

`\OSPathSymbol` Symbol used to separate directories in a path.

```
1067 \newcommand*{\OSPathSymbol}{/}
```

## 28.4 MS-WINDOWS

For MS-WINDOWS:

`\LWR@setOSWindows` Set defaults for the MS-WINDOWS operating system. `lwarp` attempts to auto-detect the operating system, and the `OSWindows` option may also be used to force MS-WINDOWS compatibility.

```
1068 \newcommand*\LWR@setOSWindows}
1069 {
1070 \booltrue{usingOSWindows}
1071 \renewcommand*\OSPathSymbol{\@backslashchar}
1072 \def\LWRopquote{"}
1073 \def\LWRopseq{\space\LWRamp\space\space}
1074 }
```

Test for windows during compile. The user may also specify `OSWindows` package option in case this test fails.

```
1075 \ifwindows
1076 \LWR@setOSWindows
1077 \fi
```

## 29 Package options

`kvoptions` (*pkg*) Allows key/value package options.

```
1078 \RequirePackage{kvoptions}
1079 \SetupKeyvalOptions{family=LWR,prefix=LWR@}
```

`\lwarpssetup` A user interface to set the keys:

```
1080 \newcommand{\lwarpssetup}[1]{\setkeys{LWR}{#1}}
```

`warpingprint` (*bool*)

`warpingHTML` (*bool*)

`mathjax` (*bool*)

Set to true/false depending on the package option selections for print/HTML/EPUB output and mathsvg/mathjax.

`LWR@origmathjax` (*bool*)

`LWR@origmathjax` remembers the original setting to be restored by `\displaymathnormal`.

```
1081 \newbool{warpingprint}
1082 \newbool{warpingHTML}
1083 \newbool{mathjax}
1084 \newbool{LWR@origmathjax}
```

**defaults** The default is print output, and svg math if the user chose HTML output.

```
1085 \booltrue{warpingprint}%
1086 \boolfalse{warpingHTML}%
1087 \boolfalse{mathjax}%
```

`warpdisable` (*Opt*) If the `warpdisable` option is given, both boolean `warpingprint` and boolean `warpingHTML` are false, and may be used for `\ifbool` tests.

```
1088 \DeclareVoidOption{warpdisable}{%
1089   \PackageInfo{lwarp}{Using option 'warpdisable'}
1090   \boolfalse{warpingprint}%
1091   \boolfalse{warpingHTML}%
1092 }
```

`warpprint` (*Opt*) If the `warpprint` option is given, boolean `warpingprint` is true and boolean `warpingHTML` is false, and may be used for `\ifbool` tests.

```
1093 \DeclareVoidOption{warpprint}{%
1094   \PackageInfo{lwarp}{Using option 'warpprint'}
1095   \booltrue{warpingprint}%
1096   \boolfalse{warpingHTML}%
1097 }
```

`warpHTML` (*Opt*) Anything in the `warpHTML` environment will be generated for HTML output only.

`warpHTML` (*Opt*) If the `warpHTML` option is given, boolean `warpingHTML` is true and boolean `warpingprint` is false, and may be used for `\ifbool` tests.

```
1098 \DeclareVoidOption{warpHTML}{%
1099   \PackageInfo{lwarp}{Using option 'warpHTML'}%
1100   \booltrue{warpingHTML}%
1101   \boolfalse{warpingprint}%
1102 }
```

`mathsvg` (*Opt*) Option `mathsvg` selects SVG math display: If the `mathsvg` option is given, boolean `mathjax` is false, and may be used for `\ifbool` tests.

```
1103 \DeclareVoidOption{mathsvg}{%
1104   \PackageInfo{lwarp}{Using option 'mathsvg'}
1105   \boolfalse{mathjax}%
1106   \boolfalse{LWR@origmathjax}%
1107 }
```

`mathjax` (*Opt*) Option `mathjax` selects MATHJAX math display: If the `mathjax` option is given, boolean `mathjax` is true, may be used for `\ifbool` tests.

```
1108 \DeclareVoidOption{mathjax}{%
1109   \PackageInfo{lwarp}{Using option 'mathjax'}
1110   \booltrue{mathjax}%
1111   \booltrue{LWR@origmathjax}%
1112 }
```

`BaseJobname` (*Opt*) Option `BaseJobname` sets the `\BaseJobname` for this document.

Default: `\jobname`

This is the `\jobname` of the printed version, even if currently compiling the HTML version. I.e. this is the `\jobname` without `_html` appended. This is used to set `\HomeHTMLFilename` if the user did not provide one.

```
1113 \DeclareStringOption[\jobname]{BaseJobname}
```

`ImagesDirectory` (*Opt*) Option `ImagesDirectory` sets the name of the directory to use for the `lateximage` images.  
 Default: `\jobname-images`

```
1114 \DeclareStringOption[\BaseJobname-images]{ImagesDirectory}
```

`ImagesName` (*Opt*) Option `ImagesName` sets the prefix to use for the `lateximage` images.  
 Default: `image-`

```
1115 \DeclareStringOption[image-]{ImagesName}
```

`makeindexStyle` (*Opt*) Selects a custom `.ist` file. A customized file should be based on `lwarp.ist`. See section 8.6.20.  
 Default: `lwarp.ist`

```
1116 \DeclareStringOption[lwarp.ist]{makeindexStyle}
```

`xindyStyle` (*Opt*) Selects a custom `.xdy` file. A customized file should be based on `lwarp.xdy`. See section 8.6.21.  
 Default: `lwarp.xdy`

```
1117 \DeclareStringOption[lwarp.xdy]{xindyStyle}
```

`xindyLanguage` (*Opt*) Sets the *xindy* language to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index and glossary.  
 Default: `english`

```
1118 \DeclareStringOption[english]{xindyLanguage}
```

`xindyCodepage` (*Opt*) Sets the *xindy* codepage to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index.  
 Default: `utf8`

```
1119 \DeclareStringOption[utf8]{xindyCodepage}
```

`xindexConfig` (*Opt*) Selects a custom `xindex-*.lua` file. A customized file should be based on `xindex-cfg.lua`. See section 8.6.22.  
 Default: `<empty>`

```
1120 \DeclareStringOption[]{}{xindexConfig}
```

`pdftotextEnc` (*Opt*) The option `pdftotextEnc` sets the encoding used by *pdftotext*. This is passed to *pdftotext* using its `-enc` option, and is used when converting L<sup>A</sup>T<sub>E</sub>X PDF output with HTML tags into a plain-text file with HTML tags.  
 Default: `UTF-8`

```
1121 \DeclareStringOption[UTF-8]{pdftotextEnc}
```

`lwarpmk` (*Opt*) Tells `lwarp` to generate a local copy of *lwarpmk* called `lwarpmk.lua`. Useful for archiving for future use. This file may be made executable and acts just like *lwarpmk*.

If `lwarpmk` option, creates a local copy of `lwarpmk.lua`:

```
1122 \newbool{LWR@creatinglwarpmk}
1123 \boolfalse{LWR@creatinglwarpmk}
1124
1125 \DeclareVoidOption{lwarpmk}{
1126   \PackageInfo{lwarpmk}{Using option 'lwarpmk'}
1127   \booltrue{LWR@creatinglwarpmk}
1128 }
```

`OSWindows` (*Opt*) Tells `lwarp` to use MS-WINDOWS compatibility. Auto-detection of the operating system is attempted, and this option is only necessary if the auto-detection fails. See the automatically-generated `lwarpmk.conf` file to find out whether the operating system was detected correctly.

```
1129 \DeclareVoidOption{OSWindows}{
1130   \PackageInfo{lwarp}{Using option 'OSWindows'}
1131   \LWR@setOSWindows
1132 }
```

`HomeHTMLFilename` (*Opt*) The filename of the homepage. The default is the jobname. This option is stored into `\LWR@HomeHTMLFilename`, and later transferred into `\HomeHTMLFilename` for internal use.

Default: `\BaseJobname`

```
1133 \DeclareStringOption[]{HomeHTMLFilename}
```

`HTMLFilename` (*Opt*) The filename prefix of web pages after the homepage. The default is empty, no prefix. This option is stored into `\LWR@HTMLFilename`, and later transferred into `\HTMLFilename` for internal use.

Default: `<empty>`

```
1134 \DeclareStringOption[]{HTMLFilename}
```

`PrintLatexCmd` (*Opt*) The shell commands to use to compile the print document.

Default: `<automatic>`

```
1135 \DeclareStringOption[]{PrintLatexCmd}
```

`HTMLLatexCmd` (*Opt*) The shell commands to use to compile the HTML document.

Default: `<automatic>`

```
1136 \DeclareStringOption[]{HTMLLatexCmd}
```

`PrintIndexCmd` (*Opt*) The shell commands to use to compile the print indexes.

Default: `<empty>`

```
1137 \DeclareStringOption[]{PrintIndexCmd}
```

`HTMLIndexCmd` (*Opt*) The shell commands to use to compile the HTML indexes.

Default: `<empty>`

```
1138 \DeclareStringOption[]{HTMLIndexCmd}
```

`LatexmkIndexCmd` (*Opt*) The shell commands to be used by `latexmk` to compile the print indexes. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include the filename, which will be provided by `latexmk`.

Default: `<empty>`

```
1139 \DeclareStringOption[]{LatexmkIndexCmd}
```

`makeindex` (*Opt*) Tells `lwarp` to use `makeindex` for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for `makeindex` with a single index file.

```
1140 \DeclareBoolOption[false]{makeindex}
```

`xindy` (*Opt*) Tells `lwarp` to use `xindy` for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for `xindy` with a single index file.

```
1141 \DeclareBoolOption[false]{xindy}
```

`xindex (Opt)` Tells `lwarp` to use `xindex` for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for `xindex` with a single index file.

```
1142 \DeclareBoolOption[false]{xindex}
```

`IndexRef (Opt)` Tells `lwarp` how to display the index entries in HTML output. See section 7.5.

Default: `cref`

```
1143 \DeclareStringOption[cref]{IndexRef}
```

`GlossaryCmd (Opt)` The shell command to use to compile the glossary. The print or HTML version of the glossary filename will be appended to this command.

Default: `makeglossaries`

```
1144 \DeclareStringOption[makeglossaries]{GlossaryCmd}
```

`latexmk (Opt)` Option `latexmk` tells `lwarpmk` to use `latexmk` when compiling documents.

```
1145 \DeclareBoolOption[false]{latexmk}
```

`dvips (Opt)` Option `dvips` tells `lwarpmk` to use `dvips` when compiling DVI `latex` documents.

```
1146 \DeclareBoolOption[false]{dvips}
```

`dvipdfm (Opt)` Option `dvipdfm` tells `lwarpmk` to use `dvipdfm` when compiling DVI `latex` documents.

```
1147 \DeclareBoolOption[false]{dvipdfm}
```

`dvipdfmx (Opt)` Option `dvipdfmx` tells `lwarpmk` to use `dvipdfmx` when compiling DVI `latex` documents.

```
1148 \DeclareBoolOption[false]{dvipdfmx}
```

**Execute options** Execute the package options, with the defaults which have been set just above:

```
1149 \ProcessKeyvalOptions*\relax
```

## 29.1 Additional options support

Assign the `\BaseJobname` if the user hasn't provided one:

```
1150 \providecommand*\BaseJobname{\LWR@BaseJobname}
```

Defaults unless already over-ridden by the user:

```
1151 \ifcseempty{LWR@HomeHTMLFilename}{
1152   \newcommand*\HomeHTMLFilename{\BaseJobname}
1153 }{
1154   \csedef{HomeHTMLFilename}{LWR@HomeHTMLFilename}
1155 }
1156
1157 \csedef{HTMLFilename}{LWR@HTMLFilename}
```

Special handling for underscores in labels and filenames.

`\LWR@sanitized` The sanitized version of what was given to `\LWR@sanitize`. Characters are set to their detokenized versions. Required for underscores in labels and filenames.

```
1158 \newcommand*{\LWR@sanitized}{}
```

`\LWR@sanitize`  $\langle text \rangle$

Sanitizes the text and returns the result in `\LWR@sanitized`.

```
1159 \newcommand*{\LWR@sanitize}[1]{%
1160 \edef\LWR@sanitized{#1}%
1161 \edef\LWR@sanitized{\detokenize\expandafter{\LWR@sanitized}}%
1162 }
```

Sanitize some string options to neutralize underscores.

```
1163 \LWR@sanitize{\LWR@BaseJobname}
1164 \edef\LWR@BaseJobname{\LWR@sanitized}
1165
1166 \LWR@sanitize{\LWR@ImagesDirectory}
1167 \edef\LWR@ImagesDirectory{\LWR@sanitized}
1168
1169 \LWR@sanitize{\LWR@ImagesName}
1170 \edef\LWR@ImagesName{\LWR@sanitized}
```

`\LWR@PrintIndexCmd` and `\LWR@HTMLIndexCmd` are tested to see if they are empty. If so, they are set to a reasonable defaults for a single index using *makeindex*, then possibly set to defaults for *xindy* if the `lwarp xindy` option was selected, then likewise for *xindex* if the `xindex` option was selected.

## 29.2 Conditional compilation

`\warpprintonly` {<*contents*>}

Only process the contents if producing printed output.

```
1254 \newcommand{\warpprintonly}[1]{\ifbool{warpingprint}{#1}{}}
```

`\warpHTMLonly` {<*contents*>}

Only process the contents if producing HTML output.

`comment` (*Pkg*) Provides conditional code blocks.

Attempts to use `versions` or `verbatim` fail in some cases, and do not provide much of a speed benefit even when they do work.

```
1256 \RequirePackage{comment}
```

`\LWR@includecomment` {<*env name*>} {<*partial filename*>}

`\LWR@excludecomment` {<*env name*>} {<*partial filename*>}

Use many `comment` cut files to avoid collision in case the user uses the `comment` package. Each filename is “comment\_#2.cut”. Based on the `comment` package.

## 30 Required packages

These packages are automatically loaded by `lwarp` when generating HTML output. Some of them are also automatically loaded when generating print output, but some are not.

**for HTML output:** `1332 \begin{warpHTML}`

`fontspec` (*Pkg*) Load `fontspec` if necessary:

```

1333 \ifxetexorluatex
1334 \IfPackageLoadedTF{fontspec}{}{
1335   \usepackage[no-math]{fontspec}
1336 }

```

The monospaced font is used for HTML tags, so turn off its TeX ligatures and common ligatures:

```

1337 \defaultfontfeatures[\rmfamily]{Ligatures={NoCommon,TeX}}
1338 \defaultfontfeatures[\sffamily]{Ligatures={NoCommon,TeX}}
1339 \defaultfontfeatures[\ttfamily]{Ligatures=NoCommon}
1340 \else

```

**pdf<sub>l</sub>atex only:** Only pre-loaded if *pdf<sub>l</sub>atex* is being used.

`microtype` (*Pkg*)

**ligatures** Older browsers don't display ligatures. Turn off letter ligatures, keeping  $\LaTeX$  dash and quote ligatures, which may fail on older browsers but at least won't corrupt written words.

```

1341 \RequirePackage{microtype}
1342
1343 \microtypesetup{
1344   protrusion=false,
1345   expansion=false,
1346   tracking=false,
1347   kerning=false,
1348   spacing=false}
1349 % \begin{macrocode}
1350 %

```

```

1351% Disable ligatures for typewriter fonts.
1352% The comma was causing issues with \MathJax\ and \cs{,} followed by a comma.
1353% Ligatures for f, q, t, etc used to be disabled for non-typewriter fonts, but
1354% are now allowed.
1355% \changes{v0.89}{2020/08/01}{Disable typewriter ligatures.}
1356% ^^A \DisableLigatures[,{,},f,q,t,T,Q]{encoding = *,family = *}% previous
1357% \begin{macrocode}
1358 \DisableLigatures{encoding = *,family = tt*}

1359 \fi

1360 \end{warpHTML}

```

`geometry` (*Pkg*) Tactics to avoid unwanted page breaks and margin overflow:

- Uses a very long and wide page to minimize page breaks and margin overflow.
- Uses a `scriptsize` font.
- Uses extra space at the margin to avoid HTML tag overflow off the page.
- Forces a new PDF page before some environments.
- Forces line break between major pieces of long tags.

**for HTML output:** 1361 `\begin{warpHTML}`

If `geometry` has not yet been loaded, use the preexisting page and text sizes to be preserved for later reuse. These will be replaced by `lwarp \AtBeginDocument` with a very large page size to reduce HTML tag overflow off the page.

```

1362 \IfPackageLoadedTF{geometry}
1363 {}{
1364   \RequirePackage[
1365     reset,
1366     paperwidth=\paperwidth,
1367     paperheight=\paperheight,
1368     textwidth=\textwidth,
1369     textheight=\textheight,
1370     left=\oddsidemargin,
1371     top=\topmargin,
1372     marginparsep=\marginparsep,
1373     marginparwidth=\marginparwidth,
1374   ]{geometry}
1375 }

```

Remember the original definitions for later reuse. If the `geometry` package is loaded by the user, `lwarp-geometry` will nullify the user-level originals.

```

1376 \LetLtxMacro\LWR@origgeometry\geometry
1377 \LetLtxMacro\LWR@orignewgeometry\newgeometry
1378 \LetLtxMacro\LWR@origrestoregeometry\restoregeometry
1379 \LetLtxMacro\LWR@origsavegeometry\savegeometry
1380 \LetLtxMacro\LWR@origloadgeometry\loadgeometry

```

`LWR@allowanothergeometry` `geometry` may be loaded by the user before `lwarp`, after `lwarp`, or not at all. If (*bool*) before `lwarp`, it will have already been loaded by now and its page layout has

already been saved. If `geometry` is loaded after `lwarp`, its layout will be set at that time and the user macros nullified. `\AtEndPreamble` this layout will be saved. If the user never loads `geometry`, `lwarp-geometry` will be loaded `\AtBeginDocument`, but it should not change the page layout set here. This is controlled by the boolean `LWR@allowanothergeometry`. Geometry may be adjusted throughout the preamble until `\AtEndPreamble`, when this boolean is set false.

```
1381 \newbool{LWR@allowanothergeometry}
1382 \booltrue{LWR@allowanothergeometry}
```

Use `\AtEndPreamble` to avoid class and option conflict by changing settings after other packages load, instead of using `geometry` package options:

```
1383 \AtEndPreamble{
```

Whatever `geometry` choices the user has made in the preamble, either before or after `lwarp` was loaded, are now saved for possible temporary reuse, such as by `lyluatex`.

See the `lwarp-geometry` section for what happens if `geometry` is loaded after `lwarp`.

```
1384 \LWR@origsavegeometry{LWR@usergeometry}
```

The user's paper size is saved for later reuse, such as by the `pdfpages` or `parallel` packages.

```
1385 \newlength{LWR@userspaperwidth}
1386 \setlength{LWR@userspaperwidth}{\paperwidth}
1387
1388 \newlength{LWR@userspaperheight}
1389 \setlength{LWR@userspaperheight}{\paperheight}
1390
1391 \newlength{LWR@usersmarginparwidth}
1392 \setlength{LWR@usersmarginparwidth}{\marginparwidth}
1393
1394 \newlength{LWR@userstextwidth}
1395 \setlength{LWR@userstextwidth}{\textwidth}
1396
1397 \newlength{LWR@userstextheight}
1398 \setlength{LWR@userstextwidth}{\textheight}
```

For `lwarp`, use a very large page and margins to help avoid letting `HTML` tags run off the edge:

```
1399 \LWR@origgeometry{
1400   reset,
1401   paperheight=190in,
1402   paperwidth=20in,
1403   left=2in,
1404   right=6in,
1405   top=1in,
1406   bottom=1in,
1407   heightrounded,%
1408 }
```

The `lwarp` page geometry is saved for future restore:

```
1409 \LWR@origsavegeometry{LWR@lwarpgeometry}
```

No longer adjust the page layout when `lwarp-geometry` is loaded `\AtBeginDocument`:

```
1410 \boolfalse[LWR@allowanothergeometry]%
```

`ltjsbook` and other classes can print vertically, and require these to be reset by `lwarp`:

```
1411 \setlength{\textheight}{0.8\paperheight}
1412 \setlength{\textwidth}{0.7\paperwidth}
1413
1414 \@twosidefalse
1415 \@mparswitchfalse
1416 }% \AtEndPreamble
1417
1418 \end{warpHTML}

## 31 Loading packages

`\RequirePackage` and `\usepackage` are modified to error-check for certain packages, and for HTML they load the `lwarp-` version if it exists.

**for HTML & PRINT:** 1476 \begin{warpall}

Remember the original `\RequirePackage`:

```
1477 \LetLtxMacro\LWR@origRequirePackage\RequirePackage
```

```
1478 \LetLtxMacro\LWR@origRequirePackageWithOptions\RequirePackageWithOptions
```

`\LWR@requirepackagenames` Stores the list of required package names.

```
1479 \newcommand*\LWR@requirepackagenames{}
```

`\LWR@parsedrequirepackagenames` Stores the parsed list of required package names after spaces are removed and `lwarp-` is prepended.

```
1480 \newcommand*\LWR@parsedrequirepackagenames{}
```

`\LWR@nullifycomment` Remove the preexisting comment environment. Certain packages define it for their own use.

```
1481 \newcommand*\LWR@nullifycomment{%
1482   \PackageInfo{lwarp}%
1483   {Nullifying the comment environment before loading \LWR@strresulttwo,}%
1484   \let\comment\relax%
1485   \let\endcomment\relax%
1486 }
```

`\LWR@findword` [*1: separator*] [*2: list*] [*3: index*] [*4: destination*]

Note that argument 4 is passed directly to `\StrBetween`.

```
1487 \newcommand*\LWR@findword[3][,]{%
1488   \StrBetween[#3,\numexpr#3+1]{#1#2#1}{#1}{#1}%
1489 }
```

`\LWR@checkloadnever` {*bad package name*} {*replacement package names*}

From now on, check for incompatible packages loaded via `\usepackage`, instead of packages loaded before `lwarp`:

```
1490 \LetLtxMacro\LWR@checkloadnever\LWR@afterloadnever
```

`\LWR@checkloadfilename` {*filename*} Checks if this filename should be loaded after `lwarp`, or never at all.

```
1491 \newcommand*\LWR@checkloadfilename[1]{%
```

Remember the package name to compare with, to be used by `\LWR@checkloadnever` and `\LWR@checkloadbefore`.

```
1492   \edef\LWR@tempone{#1}%
```

Check against the list of packages which should never be loaded:

```
1493   \LWR@checkloadnevers
```

The following should only be loaded before `lwarp`:

```
1494   \LWR@checkloadbefore{ctex}

1496   \LWR@checkloadbefore{inputenc}
1497   \LWR@checkloadbefore{inputenx}
1498   \LWR@checkloadbefore{nfssect-cfr}
```

```

1499 \LWR@checkloadbefore{fontaxes}
1500 \LWR@checkloadbefore{kotex}
1501 \LWR@checkloadbefore{kpfonts}% textcomp option clash
1502 \LWR@checkloadbefore{luatexja}
1503 \LWR@checkloadbefore{luatexja-fontspec}
1504 \LWR@checkloadbefore{luatexko}
1505 \LWR@checkloadbefore{morewrites}
1506 \LWR@checkloadbefore{newclude}
1507 \LWR@checkloadbefore{newunicodechar}
1508 \LWR@checkloadbefore{pnext}
1509 \LWR@checkloadbefore{xeCJK}
1510 \LWR@checkloadbefore{xetexko}
1511 \LWR@checkloadbefore{zxjatype}
1512 }

```

`\LWR@lookforpackagename` {<*index*>}

If HTML, and if this is an lwarp-supported package name, re-direct it to the lwarp version by renaming it lwarp- followed by the original name.

Looks index deep into the list of package names, \LWR@requirepackagenames, and builds \LWR@parsedrequirepackagenames which is the modified list of names.

```
1513 \newcommand*{\LWR@lookforpackagename}[1]{%

```
2. <filename>\_html\_inc.tex is then \included instead of <filename>.tex.
3. <filename>\_html\_inc.aux is automatically generated and used by L<sup>A</sup>T<sub>E</sub>X.

## 36 Defining print and HTML versions of macros and environments

The following refers to defining objects inside `lwarp`, and may also be of some use for package authors to adapt their packages for `lwarp`. The following is not for the user's document.

Many macros and environments must be provided as both print and HTML versions.

While generating the print version of a document, the original macros as defined by  $\text{\LaTeX}$  and its packages are used as-is.

While generating the HTML version of a document, the original macro or environment is redefined to call a new HTML version or a copy of the original print version. The new HTML versions of macros and environments are used most of the time. Copies of the print versions are used inside a `lateximage` environment, which draws and remembers an image of the printed output, and also several other places.

The general structure for providing print and HTML versions of a macro or environment is as follows:

**For a preexisting macro:** An HTML version is provided with a special name, inside a `warpHTML` environment, then `\LWR@formatted` is used to redefine and patch various macros:

```
\begin{warpHTML}
\newcommand{\LWR@HTML@name}{...}

\LWR@formatted{name}
\end{warpHTML}
```

`\LWR@formatted{name}` copies the original print version to a new name `\LWR@print@<name>`, then redefines `\name` to use either the print or HTML version depending on which mode `lwarp` is using.

**For a preexisting environment:** The process is similar. Note the use of `\LWR@formattedenv` instead of `\LWR@formatted`.

```

\begin{warpHTML}
\newenvironment{LWR@HTML@name}{...}{..}

\LWR@formattedenv{name}
\end{warpHTML}

```

**For a new macro or environment:** The print version is defined inside `warpall`, so that it can also be seen and modified by during HTML output.

```

\begin{warpall}
\newcommand{\name}{...}% The print version.
\end{warpall}

\begin{warpHTML}
\newcommand{\LWR@HTML@name}{...}

\LWR@formatted{name}
\end{warpHTML}

```

Similar for an environment, using `\formattedenv`.

In general, `\LWR@formatted` or `\LWR@formattedenv` are placed inside a `warpHTML` environment, and while producing an HTML document they do the following:

- Macros are modified:
  1. The pre-existing print version `\name` is saved as `\LWR@print@<name>`, unless `\LWR@print@<name>` is already defined.
  2. The original `\name` is redefined to call either the print or HTML version depending on which format is in use at the moment, as set by `\LWR@formatting`, which is defined as either “print” or “HTML”.
- When `lwarp` is producing a print document, the original definitions are used, as well as any new definitions defined in `warpall` above.
- When `lwarp` is generating HTML output, `\LWR@formatting` is set to “HTML”, and `\name` is directed to `\LWR@HTML@<name>`. For an environment, `\endname` is directed to `\endLWR@HTML@<name>`.
- When `lwarp` is generating HTML output but enters a `lateximage` environment, or for some other reason needs to draw images using the original print definitions, `\LWR@formatting` is changed to “print” and `\name` is then redirected to `\LWR@print@<name>`, which was the original `\name`.
- Since the new `\name` does not process any arguments, they are processed by `\LWR@print@name` or `\LWR@HTML@name`.

Expandable versions are also provided as well. These usually are necessary for anything which could appear inside a `tabular`, without which a “Misplaced `\omit`” error may occur.

```

\LWR@expandableformatted
\LWR@expandableformattedenv

```

Misplaced `\omit` error

(Older versions of `lwarp` used `\LetLtxMacro` for everything, but this could fail when using macros defined by `xparse`. This older system is still in use for many definitions.)

Print or disabled versions:

**for HTML & PRINT:** 1743 `\begin{warpall}`

1746 \newcommand*\LWR@formattedenv}[1]{}
1747 \newcommand*\LWR@expandableformattedenv}[1]{}

1748 \end{warpall}
```

**for HTML output:** HTML versions:

```
1749 \begin{warpHTML}
```

`\LWR@formatting` Remembers if selected print/HTML formatting.

Used while `\LWR@restoreorigformatting`, such as in an `lateximage`. May be set to either “print” or “HTML”.

## 37 HTML-conversion output modifications

These booleans modify the HTML output in various ways to improve conversion to EPUB or word processor imports.

**for HTML & PRINT:** 1850 `\begin{warpall}`

### 37.1 User-level controls

`FormatEPUB` (*bool*) Changes HTML output for easy EPUB conversion via an external program. Removes per-file headers, footers, and nav. Adds footnotes per chapter/section.  
**Default:** `false`

```
1851 \newbool{FormatEpub}
1852 \boolfalse{FormatEpub}
```

`FormatWP` (*bool*) Changes HTML output for easier conversion by a word processor. Removes headers and nav, prints footnotes per section, and also forces single-file output and turns off HTML debug comments.

Default: `false`

```
1853 \newbool{FormatWP}
1854 \boolfalse{FormatWP}
```

`WPMarkFloats` (*bool*) Adds

Default: `false`

```
=== begin table ===
. . .
=== end ===
```

or

```
=== begin figure ===
. . .
=== end ===
```

around floats while formatting for word processors. This helps identify boundaries of floats to be manually converted to word-processor frames and captions.<sup>18</sup>

```
1855 \newbool{WPMarkFloats}
1856 \boolfalse{WPMarkFloats}
```

`WPMarkMinipages` (*bool*) Adds

Default: `false`

```
=== begin minipage ===
. . .
=== end minipage ===
```

around minipages while formatting for word processors. This helps identify boundaries of minipages to be manually converted to word-processor frames.

```
1857 \newbool{WPMarkMinipages}

```

`WPMarkTOC` (*bool*) While formatting for word processors, adds

Default: `true`

```
=== table of contents ===
```

where the Table of Contents would have been. This helps identify where to insert the actual TOC.

*If set false, the actual toc is printed instead.*

```
1859 \newbool{WPMarkTOC}
1860 \booltrue{WPMarkTOC}
```

`WPMarkLOFT` (*bool*) While formatting for word processors, adds

Default: `false`

```
=== list of figures === and/or
=== list of tables ===
```

<sup>18</sup>Perhaps some day word processors will have HTML import options for identifying <figure> and caption tags for figures and tables.

where each of these lists would have been. This helps identify where to insert the actual lists.

*If set false, the actual lists are printed instead.*

```
1861 \newbool{WPMarkLOFT}
1862 \boolfalse{WPMarkLOFT}
```

**WPMarkMath** (*bool*) While formatting for word processors, prints math as L<sup>A</sup>T<sub>E</sub>X code instead of creating SVG images or MATHJAX. This is useful for cut/paste into the *LibreOffice Writer TeXMaths* extension.  
**Default:** false

```
1863 \newbool{WPMarkMath}
1864 \boolfalse{WPMarkMath}
```

**WPTitleHeading** (*bool*) While formatting for word processors, true sets the document title to <h1>, which is expected for HTML documents, but also causes the lower-level section headings to start at **Heading 2** when imported into LIBREOFFICE. Set to false to cause the title to be plain text, and the section headings to begin at **Heading 1**.  
**Default:** false

See table 11 on page 185.

```
1865 \newbool{WPTitleHeading}
1866 \boolfalse{WPTitleHeading}
```

```
1867 \end{warppall}
```

## 37.2 Heading adjustments

If formatting the HTML for a word processor, adjust heading levels.

If WPTitleHeading is true, adjust so that part is **Heading 1**.

If WPTitleHeading is false, use <h1> for the title, and set part to **Heading 2**.

## 38 Remembering original formatting macros

**for HTML output:** 1929 \begin{warpHTML}

Remember original definitions of formatting commands. Will be changed to HTML commands for most uses. Will be temporarily restored to original meaning inside any `lateximage` environment and inside a `tabbing` environment. Also nullify unused commands.

Some packages redefine `\#`, which is used to generate HTML, so the original must be remembered here.

### 39 Accents

Native L<sup>A</sup>T<sub>E</sub>X accents such as `\`` will work, but many more kinds of accents are available when using Unicode-aware X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X and LuaL<sup>A</sup>T<sub>E</sub>X. If using accents in section names which will become file names, it is recommended to use the L<sup>A</sup>T<sub>E</sub>X accents such as `\`` and `\v` instead of Unicode accents. The L<sup>A</sup>T<sub>E</sub>X accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

**for HTML output:** 2002 \begin{warpHTML}

Without `\AtBeginDocument`, `\t` was being re-defined somewhere.

```
2003 \AtBeginDocument{
```

The following are restored for print when inside a `lateximage`.

For Unicode engines, only `\t` needs to be redefined:

```
2004 \LetLtxMacro\LWR@origtie\t
```

For PDF L<sup>A</sup>T<sub>E</sub>X, additional work is required:

```

2005 \ifPDFTeX% pdf\latex or dvi\latex
2006 \LetLtxMacro\LWR@origgraveaccent\`
2007 \LetLtxMacro\LWR@origacuteaccent\'
2008 \LetLtxMacro\LWR@origcircumflexaccent\^
2009 \LetLtxMacro\LWR@origtildeaccent\~
2010 \LetLtxMacro\LWR@origmacronaccent\=
2011 \LetLtxMacro\LWR@origbreve\u
2012 \LetLtxMacro\LWR@origdotaccent\.

2017 \LetLtxMacro\LWR@origcedillaaccent\c
2018 \LetLtxMacro\LWR@origmacronbelowaccent\b

```

The HTML redefinitions follow.

For PDF L<sup>A</sup>T<sub>E</sub>X, Unicode diacritical marks are used:

```

2019 \renewcommand*{\`}[1]{#1\HTMLUnicode{0300}}
2020 \renewcommand*{\'}[1]{#1\HTMLUnicode{0301}}
2021 \renewcommand*{\^}[1]{#1\HTMLUnicode{0302}}
2022 \renewcommand*{\~}[1]{#1\HTMLUnicode{0303}}
2023 \renewcommand*{\=} [1]{#1\HTMLUnicode{0304}}
2024 \renewcommand*{\u}[1]{#1\HTMLUnicode{0306}}
2025 \renewcommand*{\.}[1]{#1\HTMLUnicode{0307}}
2026 \renewcommand*{\"}[1]{#1\HTMLUnicode{0308}}
2027 \renewcommand*{\H}[1]{#1\HTMLUnicode{030B}}
2028 \renewcommand*{\v}[1]{#1\HTMLUnicode{030C}}
2029 \renewcommand*{\d}[1]{#1\HTMLUnicode{0323}}
2030 \renewcommand*{\c}[1]{#1\HTMLUnicode{0327}}
2031 \renewcommand*{\b}[1]{#1\HTMLUnicode{0331}}
2032 \fi

```

For all engines, a Unicode diacritical tie is used:

```

2033 \def\LWR@t#1#2{#1\HTMLUnicode{0361}#2}
2034 \renewcommand*{\t}[1]{\LWR@t#1}

```

`\LWR@restoreorigaccents` Called from `\restoreoriginalformatting` when a lateximage is begun.

## 40 Configuration files

### 40.1 Decide whether to generate configuration files

Configuration files are only written if processing the print version of the document, and not processing a `pstool` image. `pstool` uses an additional compile for each image using the original document's preamble, which includes `lwarp`, so the `lwarp` configuration files are turned off if `-pstool` is part of the `\jobname`.

Default to no configuration files:

```
2059 \LWR@exludecomment{LWRwriteconf}{writeconf}
```

Generate configuration files if print mode and not `-pstool`:

```
for PRINT output: 2060 \begin{warpprint}
2061 \fullexpandarg%
2062 \IfSubStr*{\jobname}{-pstool}
2063   {
2064     \PackageInfo{lwarp}{%
2065       Jobname with -pstool is found.\MessageBreak
2066       Not generating lwarp configuration files,%
2067     }
2068   }
2069   {
2070     \PackageInfo{lwarp}{Generating lwarp configuration files,}%
2071     \LWR@includecomment{LWRwriteconf}{writeconf}
2072   }
2073 \end{warpprint}
```

### 40.2 <project>\_html.tex

`*_html.tex` (*file*) Used to allow an HTML version of the document to exist alongside the print version.

```
Config file: 2074 \begin{LWRwriteconf}
2075 \immediate\openout\LWR@quickfile=\jobname_html.tex
2076 \immediate\write\LWR@quickfile{%
2077 \detokenize{\PassOptionsToPackage}%

2082 }
2083 \immediate\closeout\LWR@quickfile
2084 \end{LWRwriteconf}
```

### 40.3 *lwarpmk* configuration files

```
Config file: 2085 \begin{LWRwriteconf}
```

`\LWR@lwarpcnfversion` The version number of the configuration file, allowing *lwarpmk* to detect an obsolete configuration file format. Incremented by one each time the configuration file format changes. (This is NOT the same as the `lwarp` version number.)

2086 \newcommand\*{\LWR@lwarpcnfversion}{2}% also in lwarpmk.lua

### 40.3.1 Helper macros

`\LWR@shellescapecmd` The LaTeX compile option for shell escape, if used.

```

2090   \def\LWR@shellescapecmd{}

```

`\LWR@compilecmd`  $\langle engine \rangle$   $\langle suffix \rangle$

Used to form the basic compilation command for a document, adding the optional shell escape.

Engine is *pdf<sub>l</sub>atex*, etc. Suffix is empty or `_html`

```
2092 \newcommand*{\LWR@compilecmd}[2]{%

```

`\LWR@addcompilecmd`  $\langle cmd \rangle$   $\langle suffix \rangle$

Adds to the compilation command.

Cmd is *dvipdfmx*, etc. Suffix is empty or `_html`

```
2095 \newcommand*{\LWR@addcompilecmd}[2]{%

2106 }
```

`\LWR@latexmkvar`  $\langle varname \rangle$   $\langle value \rangle$

Adds a *latexmk* variable assignment.

```
2107 \newcommand*{\LWR@latexmkvar}[2]{%
2108   -e
2109   \LWRopquote%
2110   \LWRdollar #1=q/#2/%
2111   \LWRopquote
2112 }
```

`\LWR@Latexmkcmd` {*⟨latexmk options⟩*}

Sets a call to *latexmk* with the given options, possibly adding `--shell-escape`, and also adding the indexing program.

```
2113 \newcommand*\LWR@Latexmkcmd[1]{%
2114   latexmk \space \LWR@shellescapecmd \space #1 \space
2115   -recorder \space
2116   \LWR@Latexmkvar{makeindex}\LWR@LatexmkIndexCmd}%
2117 }
```

`\LWR@Latexmkdvipdfm` {*⟨dvipdfm or dvipdfmx⟩*}

Adds the options settings for *dvipdfm* or *dvipdfmx*.

```
2118 \newcommand*\LWR@Latexmkdvipdfm[1]{%
2119   -pdfdvi \space
2120   \LWR@Latexmkvar{dvipdf}{%

`\LWR@compileuplatex` Sets compile options for upL<sup>A</sup>T<sub>E</sub>X with *ujarticle* or related classes.

```
2127 \newcommand*\LWR@compileuplatex{
2128   \def\LWR@tempprintlatexcmd{%

2133   \LWR@compilecmd{uplatex}{_html}
2134   \LWR@addcompilecmd{dvipdfmx}{_html}
2135 }
2136 }
```

`\LWR@PrintLatexCmd` If not set by the user, the following sets the command to use to compile the source `\LWR@HTMLLatexCmd` to PDF form.

If using *latexmk*, a complicated string is created, eventually resulting in something such as:

For *xelatex* with `--shell-escape`:

---

```
[[latexmk -xelatex --shell-escape -recorder
  -e '$makeindex = q/makeindex -s lwarp.ist/' <jobname>_html]]
```

---

For *dvipdfmx*:

---

```
[[latexmk -pdfdvi -e '$dvipdf=q/dvipdfmx %0 -o %D %S/'
  -recorder
  -e '$makeindex=q/makeindex -s lwarp.ist/' <jobname>_html]]
```

---

For the following, temporary values are computed, but the permanent values are only set if the originals were not assigned by the user.

`\LWR@writeconf {<filename>}`

Common code for each of `lwarpmk.conf` and `<project>.lwarpmkconf`. Each entry is a variable name, the equal sign, and a quoted string inside `[[` and `]]`, which are *lua*'s long quote characters, allowing the use of single and double quotes inside.

### 40.3.2 lwarpmk.conf

`lwarpmk.conf` (*file*) `lwarpmk.conf` is automatically (re-)created by the `lwarp` package when executing `pdflatex <project.tex>`, or similar for `xelatex` or `lualatex`, in print-document generation mode, which is the default unless the `warpHTML` option is given. `lwarpmk.conf` is then used by the utility `lwarpmk`.

**Config file:** 2265 \begin{LWRwriteconf}  
2266  
2267 \AtBeginDocument{\LWR@writeconf{lwarpmk.conf}}  
2268  
2269 \end{LWRwriteconf}

### 40.3.3 <project>.lwarpmkconf

`project.lwarpmkconf` (*file*) A project-specific configuration file for `lwarpmk`.

The `makeindex` and `xindy` options have already been handled for `lwarp.conf`.

**Config file:** 2270 \begin{LWRwriteconf}  
2271  
2272 \AtBeginDocument{\LWR@writeconf{\jobname.lwarpmkconf}}  
2273  
2274 \end{LWRwriteconf}

## 40.4 lwarp.css

`lwarp.css` (*file*) This is the base css layer used by `lwarp`.

This must be present both when compiling the project and also when distributing the HTML files.

## 40.10 lwarp\_one\_limage.cmd

lwarp\_one\_limage.cmd (*file*) Used by lwarp to help make lateximages when using WINDOWS.

This must be present when compiling the project, but does not need to be present when distributing the resulting HTML files.

The arguments are each of the three fields from <project>-images.txt, and also the base name of the source file.

*MiKTeX* does not allow file lwarp\_one\_limage.cmd to be created directly by *lwarpmk*, so lwarp\_one\_limage.txt is created instead, then copied to lwarp\_one\_limage.cmd by *lwarpmk*. This occurs each time *lwarpmk* used to create lateximages.

## 40.11 lwarp\_mathjax.txt

(Emulates or patches code by DAVIDE P. CERVONE.)

`lwarp_mathjax.txt` (*file*) The default MATHJAX script used by `lwarp` when using MATHJAX. A recent version of MATHJAX is used, as served by the recommended repository. Adjustments are made to allow L<sup>A</sup>T<sub>E</sub>X to control the equation tags and provide for starred macros.

`\MathJaxFilename` determines which script file is copied into the HTML pages, and defaults to `lwarp_mathjax.txt`. The script files must be present when compiling the project, but do not need to be present when distributing the resulting HTML files.

**custom script** To generate a custom script, such as to use a local repository, copy `lwarp_mathjax.txt` to a new file, make changes while keeping `lwarp`'s adjustments for equation numbering and starred macros, and use `\MathJaxFilename` to select the new filename.

## 40.12 lwarpmk.lua — lwarpmk option

lwarpmk (*Opt*) Creates a local copy of *lwarpmk*.

lwarpmk (*Prog*) Command-line utility to process lwarp files and images.

[parallel processing](#) lateximages and SVG math images are generated using multiple processes in parallel. For UNIX and LINUX, every 32 images the wait command is issued to wait for the previous batch of images to finish processing before starting a new batch. For WINDOWS, every 32 images one task is dispatched with

```
START /B /WAIT /BELOWNORMAL
```

which causes the operating system to wait until this lesser-priority tasks finishes, hopefully also waiting for the normal priority tasks which were already in progress to also complete. Afterwards, the next batch of images is started.

The following is only generated if the lwarpmk option was given to lwarp.

```

## 41 Stacks

for HTML output: 5806 `\begin{warpHTML}`

Stacks are used to remember how to close sections and list items. Before a new section is started, previously nested sections and items must be closed out (un-nested) in proper order. Note that starting a new section may close several levels of previously nested items at the same time. For example, starting a new `\section` would close any currently open subsection, subsubsection, and paragraph. General environments are not nested on the stack since they have their own close mechanism. List environments are nested, and items inside those environments are nested one level deeper still. List environments may be nested inside other list environments, and list items are nested inside list environments as well. Thus, the stack may have items which are not necessarily in order, since a description may contain an enumerate, for example. Depths to be recorded in `\LWR@closedepthone`, etc.

### 41.1 Assigning depths

initial depths for empty stack entries:

```
5807 \newcommand*\LWR@depthnone}{-5}
```

All sectioning depths are deeper than `LWR@depthfinished`:

```
5808 \newcommand*\LWR@depthfinished}{-4}
5809 \newcommand*\LWR@depthbook}{-2}
5810 \newcommand*\LWR@depthpart}{-1}
5811 \newcommand*\LWR@depthchapter}{0}
5812 \newcommand*\LWR@depthsection}{1}
5813 \newcommand*\LWR@depthsubsection}{2}
5814 \newcommand*\LWR@depthsubsubsection}{3}
5815 \newcommand*\LWR@depthparagraph}{4}
5816 \newcommand*\LWR@depthsubparagraph}{5}
```

Used by `\itemize`, `\enumerate`, `\description`:

```
5817 \newcommand*\LWR@depthlist}{6}
```

Used by `\item`:

```
5818 \newcommand*\LWR@depthlistitem}{7}
5819 \let\LWR@depthdescitem\LWR@depthlistitem
```

### 41.2 Closing actions

A stack to record the action to take to close each nesting level: Add more levels of stack if necessary for a very deeply nested document, adding to `\pushclose` and `\popclose` as well.

```
5820 \newcommand*\LWR@closeone}{% top of the stack
5821 \newcommand*\LWR@closetwo}{%
5822 \newcommand*\LWR@closethree}{%
5823 \newcommand*\LWR@closefour}{%
```

```

5824 \newcommand*\LWR@closefive{}
5825 \newcommand*\LWR@closesix{}
5826 \newcommand*\LWR@closeseven{}
5827 \newcommand*\LWR@closeeight{}
5828 \newcommand*\LWR@closenine{}
5829 \newcommand*\LWR@closeten{}
5830 \newcommand*\LWR@closeeleven{}
5831 \newcommand*\LWR@closetwelve{}
5832 \newcommand*\LWR@closethirteen{}
5833 \newcommand*\LWR@closefourteen{}
5834 \newcommand*\LWR@closefifteen{}
5835 \newcommand*\LWR@closesixteen{}
5836 \newcommand*\LWR@closeseventeen{}
5837 \newcommand*\LWR@closeeighteen{}
5838 \newcommand*\LWR@closenineteen{}

```

### 41.3 Closing depths

A stack to record the depth of each level:

Note that nested L<sup>A</sup>T<sub>E</sub>X structures may push depths which are non-sequential.

*Ex:*

---

```

\begin{itemize}
  \item{A}
  \begin{description}
    \item{B}
  \end{description}
\end{itemize}

```

---

```

5839 \newcommand*\LWR@closedepthone{\LWR@depthnone}% top of the stack
5840 \newcommand*\LWR@closedepthtwo{\LWR@depthnone}
5841 \newcommand*\LWR@closedepththree{\LWR@depthnone}
5842 \newcommand*\LWR@closedepthfour{\LWR@depthnone}
5843 \newcommand*\LWR@closedepthfive{\LWR@depthnone}
5844 \newcommand*\LWR@closedepthsix{\LWR@depthnone}
5845 \newcommand*\LWR@closedepthseven{\LWR@depthnone}
5846 \newcommand*\LWR@closedeptheight{\LWR@depthnone}
5847 \newcommand*\LWR@closedepthnine{\LWR@depthnone}
5848 \newcommand*\LWR@closedepthten{\LWR@depthnone}
5849 \newcommand*\LWR@closedeptheleven{\LWR@depthnone}
5850 \newcommand*\LWR@closedepthtwelve{\LWR@depthnone}
5851 \newcommand*\LWR@closedepththirteen{\LWR@depthnone}
5852 \newcommand*\LWR@closedepthfourteen{\LWR@depthnone}
5853 \newcommand*\LWR@closedepthfifteen{\LWR@depthnone}
5854 \newcommand*\LWR@closedepthsixteen{\LWR@depthnone}
5855 \newcommand*\LWR@closedepthseventeen{\LWR@depthnone}
5856 \newcommand*\LWR@closedeptheighteen{\LWR@depthnone}
5857 \newcommand*\LWR@closedepthnineteen{\LWR@depthnone}

```

### 41.4 Pushing and popping the stack

```
\LWR@pushclose {<sectiontype>}
```

Pushes one return action and its L<sup>A</sup>T<sub>E</sub>X depth onto the stacks.

```

5858 \NewDocumentCommand{\LWR@pushclose}{m}

## 42 Data arrays

These macros are similar to the `arrayjobx` package, except that `\LWR@setexparray's` argument is expanded only once when assigned.

`name` has no backslash, `index` can be a number or a text name, and an empty value must be `\relax` instead of empty.

To assign an empty value:

```
\LWR@setexparray{name}{index}{}
```

**for HTML output:** 5946 \begin{warpHTML}

```
\LWR@setexparray {<name>} {<index>} {<contents>}
```

```
5947 \newbool{LWR@setexparray@doingparhooks}
5948
5949 \NewDocumentCommand{\LWR@setexparray}{m m m}{%
```

Temporarily disable paragraph handling during the assignment. This is not done in a group with global assignments because a table may be nested.

```
5950   \let\ifLWR@setexparray@doingparhooks\ifLWR@doingparhooks%
5951   \setbool{LWR@doingparhooks}{false}%
5952   \let\LWR@setexparray@par\par%
5953   \let\par\relax%
```

The name of the control sequence is the given name with the index appended.

```
5954   \xdef\LWR@thisexparrayname{#1#2}%
```

Locally assign the value to the control sequence:

```
5955   \ifstrempy{#3}%
5956     {\csdef{\LWR@thisexparrayname}{}}%
5957     {\csdef{\LWR@thisexparrayname}{#3}}%
```

Restore the paragraph handling:

```
5958   \let\ifLWR@doingparhooks\ifLWR@setexparray@doingparhooks%
5959   \let\par\LWR@setexparray@par%
5960 }

## 43 Localizing catcodes

**for HTML & PRINT:** 5965 \begin{warpall}

 **Misplaced alignment tab character &** Place `\StartDefiningTabulars` and `\StopDefiningTabulars` before and after defining macros or environments which include the tabular & character in their definitions.

The catcode of & must be changed before the definitions begin, and must be restored afterwards. Doing so avoids the error

`\StartDefiningTabulars` Place before defining something with & in it.

```
5966 \newcommand{\StartDefiningTabulars}{%

```

`LWR@mathmacro` (*bool*) True if currently defining math macros. Used to disable SVG math hashing and MATHJAX math contents while defining a macro using inline math. Begin a macro, it is not guaranteed that the contents are static, and so the image must be unique. The contents also almost certainly will not be parsed correctly by MATHJAX.

```
5974 \newbool{LWR@mathmacro}
5975 \boolfalse{LWR@mathmacro}

`\StartDefiningMath` Place before defining something with `$` in it.

5991 }%
5992 \StopDefiningTabulars

5993 \end{warpHTML}
```

## 44 Localizing dynamic math

Inline SVG math usually uses a hash of its contents to generate `lateximages` which are reusable for multiple instances with the same contents. If the contents may change for each use, such as depending on the current value of a counter, then `\inlinemathother` must be used before the inline math expression, and `\inlinemathnormal` must be used after.

For MATHJAX, the inline math expression is usually printed for MATHJAX to interpret. When marked as dynamic math, the following inline math expression will be displayed as an unhashed inline SVG image instead.

For existing code and packages, it may be possible to patch macros after they have been defined, using the `xpatch` package, which is pre-loaded by `lwarp`:

---

```
\xpatchcmd{\macroname}
  {$math expression$}
  {\inlinemathother$math expression$\inlinemathnormal}
  {}
  {\typeout{Error patching macroname.}}
```

---

**for HTML & PRINT:** 5994 `\begin{warpall}`

`LWR@dynamicmath` (*bool*) True to mark inline math which is dynamic in nature, thus should not be hashed for reuse.  
**Default:** `false`

```
5995 \newbool{LWR@dynamicmath}
5996 \boolfalse{LWR@dynamicmath}
```

`\inlinemathother` Place before using `$ ... $` or `\( ... \)` if the contents of the math are not static, depending on counters or dynamic macros.

```
5997 \newcommand{\inlinemathother}{%
5998 \LWR@traceinfo{inlinemathother}%
5999 \booltrue{LWR@dynamicmath}%

```

`\inlinemathnormal` Place after using `$ ... $` or `\( ... \)` with dynamic contents.

```
6001 \newcommand{\inlinemathnormal}{%
6002 \LWR@traceinfo{inlinemathnormal}%
6003 \boolfalse{LWR@dynamicmath}%

## 46 HTML filename generation

The filename of the homepage is set to \HomeHTMLFilename.html. The filenames of additional sections start with \HTMLFilename, to which is appended a section number or a simplified section name, depending on FileSectionNames.

**for HTML & PRINT:** 6048 \begin{warpall}

\BaseJobname The \jobname of the printed version, even if currently compiling the HTML version. I.e. this is the \jobname without \_html appended. This is used to set \HomeHTMLFilename if the user did not provide one.

```
6049 \providecommand*\BaseJobname{\jobname}
```

\HTMLFilename The prefix for all generated HTML files other than the home page, defaulting to empty. See section 7.6.1.

```
6050 \providecommand*\HTMLFilename{}
```

\HomeHTMLFilename The filename of the home page, defaulting to the \BaseJobname. See section 7.6.1.

```
6051 \providecommand*\HomeHTMLFilename{\BaseJobname}
```

\SetHTMLFileNumber {<number>}

Sets the file number for the next file to be generated. 0 is the home page. Use just before the next sectioning command, and set it to one less than the desired number of the next section. May be used to generate numbered groups of nodes such as 100+ for one chapter, 200+ for another chapter, etc.

```
6052 \newcommand*\SetHTMLFileNumber[1]{%
6053   \setcounter{LWR@htmlfilenumber}{#1}%
6054 }
```

FileSectionNames (*bool*) Selects how to create HTML file names.

Defaults to use section names in the filenames.

```
6055 \newbool{FileSectionNames}
6056 \booltrue{FileSectionNames}
```

```
6057 \end{warpall}
```

**for HTML output:** 6058 \begin{warpHTML}

```
6059 \newcounter{LWR@HTMLpagenum}
6060 \setcounter{LWR@HTMLpagenum}{0}
```

**LWR@htmlseqfilenumber** (*Ctr*) A sequential count of the number of each HTML file as it is being created. Number 0 is the home page. Unlike `\LWR@htmlfilenumber`, this one is known to increment by one for each file. This is used to generate previous /next links for each web page, via labels called `\BaseJobname-autofile-*`, and the last page is also labelled `\BaseJobname-autofile-last`.

```
6061 \newcounter{LWR@htmlseqfilenumber}
6062 \setcounter{LWR@htmlseqfilenumber}{0}
```

**LWR@setseqfilelabel** (*bool*) At each new HTML file, this is false until a sectional unit is used, at which point this is set true and a label is placed. In this way, the previous/next labels will point to a named section.

```
6063 \newbool{LWR@setseqfilelabel}
6064 \setbool{LWR@setseqfilelabel}{false}
```

**LWR@htmlfilenumber** (*Ctr*) Records the number of each HTML file as it is being created. Number 0 is the home page. This might not be sequential, as the user may use `\SetHTMLFileNumber` to create groups of numbered nodes.

```
6065 \newcounter{LWR@htmlfilenumber}
6066 \setcounter{LWR@htmlfilenumber}{0}
```

**\LWR@htmlsectionfilename** `{\htmlfilenumber or name}`

Prints the filename for a given section: `\HTMLFilename{ }filenumber/name.html`

For a L<sup>A</sup>T<sub>E</sub>X section named “Index” or “index” without a prefix, create a filename with a trailing `-0` to avoid colliding with the HTML filename `index.html`:

6089 \ifboolexpr{
6090     test{\ifdefvoid{\HTMLFilename}} and

6096 {%
6097 \LWR@traceinfo{Adding a zero to the index filename.}%
6098 \LWR@sanitized-0.html%
6099 }%

```

Otherwise, create a filename with the chosen prefix:

## 52.10 High-level block and inline classes

These are high-level commands which allow the creation of arbitrary block or inline sections which may be formatted with CSS.

Nullified versions are provided for print mode.

For other direct-formatting commands, see section 95.

`BlockClass` (*env.*) [ $\langle style \rangle$ ] ( $\langle aria\ role \rangle$ )  $\langle class \rangle$  High-level interface for `<div>` classes.

Ex: `\begin{BlockClass}{class} text \end{BlockClass}`

**for HTML & PRINT:** 6527 `\begin{warpall}`  
6528 `\NewDocumentEnvironment{BlockClass}{o D(){} m}{}{}`  
6529 `\end{warpall}`

**for HTML output:** 6530 `\begin{warpHTML}`  
6531  
6532 `\NewDocumentEnvironment{LWR@HTML@BlockClass}{o D(){} m}%`  
6533 `{\LWR@htmldivclass[#1](#2){#3}}%`  
6534 `{\LWR@htmldivclassend{#3}}`  
6535  
6536 `\LWR@formattedenv{BlockClass}`  
6537 `\end{warpHTML}`

`\BlockClassSingle`  $\langle class \rangle$   $\langle text \rangle$  A single-line `<div>`, without a paragraph tag for the line of text.

**for HTML & PRINT:** 6538 `\begin{warpall}`  
6539 `\newcommand{\BlockClassSingle}[2]{#2}`  
6540 `\end{warpall}`

**for HTML output:** 6541 `\begin{warpHTML}`  
6542 `\newcommand{\LWR@HTML@BlockClassSingle}[2]{%`  
6543 `\LWR@htmlElementclassline{div}{#1}{#2}%`  
6544 `}`

```
6545
6546 \LWR@formatted{BlockClassSingle}
6547 \end{warpHTML}
```

`\InlineClass (<WP style>) [<style>] {<class>} {<text>}`

High-level interface for inline span classes.

`(<WP style>)` is CSS styling to add when formatting for a word processor import.

`[<style>]` is the CSS styling to add when not formatting for a word processor.

**for HTML & PRINT:** 6548 \begin{warpall}  
6549 \NewDocumentCommand{\InlineClass}{D{()}{ } o m +m}{#4}%  
6550 \end{warpall}

**for HTML output:** 6551 \begin{warpHTML}

`LWR@BlockClassWP (env.) {<WPstyle>} {<HTMLstyle>} (<aria role>) {<class>}` Low-level interface for `<div>` classes with an automatic float ID. These are often used when `\ifbool{FormatWP}`.

The use of `\textquotedbl` instead of `"` provides improved compatibility with `xeCJK`.

## 52.11 Closing HTML tags

for HTML output: 6598 \begin{warpHTML}

Sections H1, H2, etc. do not need a closing HTML tag, but we add a comment for readability:

```

6601 \newcommand*\LWR@printclosepart}

## 53 Paragraph handling

These commands generate the HTML paragraph tags when allowed and required.

Paragraph tags are or are not allowed depending on many conditions. Section 54 has high-level commands which allow paragraph-tag generation to start/stop. Even when allowed (`LWR@doingstartpars`), tags are not generated until a L<sup>A</sup>T<sub>E</sub>X paragraph is being used (`LWR@doingapar`). `LWR@lateximagedepth` is used to prevent nesting tags inside a `lateximage`. `LWR@spandepth` is used to prevent nesting paragraph tags inside a paragraph, which became important inside `\fbox` commands and other spans.

The L<sup>A</sup>T<sub>E</sub>X paragraph hooks are used to manage tag creation.

**for HTML output:** 6626 `\begin{warpHTML}`

`LWR@spandepth` (*Ctrl*) Do not create paragraph tags inside of an HTML span.

```
6627 \newcounter{LWR@spandepth}
6628 \setcounter{LWR@spandepth}{0}
```

`LWR@doingparhooks` (*bool*) Tells whether the `lwarp` paragraph hooks are to be active.

```
6629 \newbool{LWR@doingparhooks}
6630 \boolfalse{LWR@doingparhooks}
```

`LWR@in@multirow@par` (*bool*) Tells whether to generate break instead of paragraph tags inside a `\multirow`.

```
6631 \newbool{LWR@in@multirow@par}
6632 \boolfalse{LWR@in@multirow@par}
```

`LWR@starting@fancybox` (*bool*) Suppresses `<br>` if beginning a `fancybox` environment.

```
6633 \newbool{LWR@starting@fancybox}
6634 \boolfalse{LWR@starting@fancybox}
```

`LWR@doingstartpars` (*bool*) Tells whether paragraphs may be generated.

```
6635 \newbool{LWR@doingstartpars}
6636 \boolfalse{LWR@doingstartpars}
```

`LWR@doingapar` (*bool*) Tells whether have actually generated and are currently processing paragraph text.

```
6637 \newbool{LWR@doingapar}
6638 \global\boolfalse{LWR@doingapar}
```

`LWR@algocf@dopars` (*bool*) Tells whether `algorithm2e` has patched paragraph handling using `\everypar`. If so, the open paragraph tags are generated by `algorithm2e`'s `\algocf@everypar` instead of `\LWR@openparagraph`.

```
6639 \newbool{LWR@algocf@dopars}
6640 \boolfalse{LWR@algocf@dopars}

`\PN@parnotes@auto` Redefined by `parnotes` to print paragraph notes at the end of each paragraph.

```
6641 \def\PN@parnotes@auto{%

## 54 Paragraph start/stop handling

These commands allow/disallow the generation of HTML paragraph tags.

Section 53 has the commands which actually generate the tags.

The L<sup>A</sup>T<sub>E</sub>X paragraph hooks are used to generate the opening and closing paragraph tags.

**for HTML output:** 6727 `\begin{warpHTML}`

`\LWR@startpars` Begin handling HTML paragraphs. This allows an HTML paragraph to start, but one has not yet begun.

```
6728 \newcommand*{\LWR@startpars}%

```
6730   \ifboolexpr{
6731     test {\ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}} or
6732     test {\ifnumcomp{\value{LWR@spandepth}}{>}{0}}
6733   }%
6734   {}% nesting
6735   {% not nesting

The L<sup>A</sup>T<sub>E</sub>X paragraph hook controls tag generation for the start and end of paragraphs.

See if currently handling HTML paragraphs:

```
6736   \ifboolexpr {bool{LWR@doingparhooks} and bool{LWR@doingstartpars}}%
```

If already in paragraph mode, do nothing.

```
6737   {}%

If not currently in paragraph mode:

```
6738   {\par}%
```

Are now handling paragraphs, but have not yet actually started one:

```
6739   \global\booltrue{LWR@doingstartpars}%
```

No `<par>` tag yet to undo:

```
6740   \global\boolfalse{LWR@doingapar}%
6741   }% not nesting
6742 }

`\LWR@stoppars` Stop handling HTML paragraphs. Any currently open HTML paragraph is closed, and no more will be opened.

```
6743 \newcommand*{\LWR@stoppars}%
6744 {%

Disable the special minipage & \hspace interaction until a new minipage is found:

```
6757 \global\boolfalse{LWR@minipagethispar}%
6758 }%
```

If was not in an HTML paragraph:

```
6759     {}%
```

## 55 Indentfirst

`indentfirst (Pkg)` `indentfirst` redefines `\@afterindentfalse` to be `\@afterindenttrue`. This is reversed `\AtBeginDocument` here.

**for HTML output:** `6765 \begin{warpHTML}`

```

6766 \AtBeginDocument{

## 57 CSS

**for HTML output:** 6790 \begin{warpHTML}

`\LWR@currentcss` The css filename to use. This may be changed mid-document using `\CSSFilename`, allowing different css files to be used for different sections of the document.

```
6791 \newcommand*\LWR@currentcss}{lwarp.css}
```

`\CSSFilename`  $\langle new-css-filename.css \rangle$  Assigns the css file to be used by the following HTML pages.

```
6792 \newcommand*\CSSFilename}[1]{%
6793   \renewcommand*\LWR@currentcss}{#1}%
6794   \@onelevel@sanitize\LWR@currentcss%
6795 }
6796
6797 \end{warpHTML}
```

**for PRINT output:** 6798 `\begin{warpprint}`  
6799 `\newcommand*\CSSFilename}[1]{}`  
6800 `\end{warpprint}`

## 58 MATHJAX script

**for HTML output:** 6801 `\begin{warpHTML}`

Default: `lwarp_mathjax.txt`

`\LWR@mathjaxfilename` The MATHJAX script filename to use. This file is copied into the head of each HTML page. This may be changed mid-document using `\MathJaxFilename`, allowing the use of a custom MATHJAX script, such as for a local repository, or different MATHJAX script files to be used for different sections of the document.

```
6802 \newcommand*\LWR@mathjaxfilename}{lwarp_mathjax.txt}
```

`\MathJaxFilename`  $\langle filename \rangle$  Assigns the MATHJAX script file to be used by the following HTML pages.

```
6803 \newcommand*\MathJaxFilename}[1]{%
6804   \renewcommand*\LWR@mathjaxfilename}{#1}%
6805   \@onelevel@sanitize\LWR@mathjaxfilename%
6806 }
6807
6808 \end{warpHTML}
```

**for PRINT output:** 6809 `\begin{warpprint}`  
6810 `\newcommand*\MathJaxFilename}[1]{}`  
6811 `\end{warpprint}`

## 59 Title, HTML meta author, HTML meta description

**for HTML output:** 6812 `\begin{warpHTML}`

`\title`  $\langle title \rangle$  Modified to remember `\thetitle`, which is used to set the HTML page titles.

```
6813 \let\LWR@origtitle\title
6814
6815 \renewcommand*\title[1]{%
6816   \LWR@origtitle{#1}%
6817   \begingroup%

6819       \protected@xdef\thetitle{#1}%
6820     \endgroup%
6821 }

6822 \end{warpHTML}
```

**for HTML & PRINT:** 6823 `\begin{warpall}`

`\HTMLTitle`  $\langle Titlename \rangle$  The Title to place into an HTML meta tag. The default is to use the document `\title`'s setting.

```
6824 \providecommand{\thetitle}{\BaseJobname}
6825
6826 \newcommand{\theHTMLTitle}{\thetitle}
6827
6828 \newcommand{\HTMLTitle}[1]{\renewcommand{\theHTMLTitle}{#1}}
```

`\HTMLAuthor`  $\langle authorname \rangle$  The author to place into an HTML meta tag. If none given, the default is `\theauthor`, which is empty unless the titling package is used.

```
6829 \providecommand{\theauthor}{}
6830
6831 \newcommand{\theHTMLAuthor}{\theauthor}
6832
6833 \newcommand{\HTMLAuthor}[1]{\renewcommand{\theHTMLAuthor}{#1}}
```

This is placed inside an HTML meta tag at the start of each file. This may be changed mid-document using `\HTMLDescription`, allowing different HTML descriptions to be used for different sections of the document.

 **HTML author** Do not use double quotes, and do not exceed 150 characters.

`\HTMLDescription`  $\langle New html meta description. \rangle$  Assigns the HTML file's description meta tag.

```
6834 \newcommand{\LWR@currentHTMLDescription}{}
6835
6836 \newcommand{\HTMLDescription}[1]{%
6837   \LWR@currentHTMLDescription{#1}
6838 }
6839
6840 \end{warpall}
```

## 60 Footnotes

`lwarp` uses native  $\LaTeX$  footnote code, although with its own `\box` to avoid the  $\LaTeX$  output routine. The usual functions mostly work as-is.

**footnote numbering** To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For `bigfoot`, `manyfoot`, or `perpage`:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by `FootnoteDepth`, which is not necessarily by HTML page. This is recommended for `\alph`, `\Alph`, or `\fnsymbol` footnotes, due to the limited number of symbols which are available.

**MATHJAX** Also for `MATHJAX`, `\footnotename` is used for a `\footnotemark` if the actual footnote number is not known. To redefine it, provide it before loading `lwarp`:

```
\providecommand{\footnotename}{something}
\usepackage{lwarp}
```

Similar for sidenotes. For endnotes:

```
\def\endnotename{something}% \def allows name to start with
"end"
```

For the `pagenote` package, there is no `\pagenotename` to define, since there is no `\pagenotemark` command.

**footmisc** The `footmisc` `stable` option is emulated by `lwarp`.

 **sectioning commands** When using footnotes in sectioning commands, to generate consistent results between print and HTML, use the `footmisc` package with the `stable` option, provide a short TOC entry, and `\protect` the `\footnote`:

```
\usepackage[stable]{footmisc}
. . .
\subsection[Subsection Name]
{Subsection Name\protect\footnote{A footnote.}}
```

**memoir with footmisc** If using `memoir` class, with which `lwarp` preloads `footmisc`, the `stable` option must be declared before `lwarp` is loaded:

 **memoir**

```
\PassOptionsToPackage{stable}{footmisc}
\usepackage{lwarp}
. . .
```

Do not use a starred sectioning command. As an alternative, it may be possible to adjust `\secnumdepth` instead.

Several kinds of footnotes are used: in a regular page, in a minipage, or as thanks in the titlepage. Each of these is handle differently.

## 60.1 Regular page footnotes

In HTML documents, footnotes are placed at the bottom of the web page or the section, depending on `FootnoteDepth`, using the L<sup>A</sup>T<sub>E</sub>X box `\LWR@footnotebox`. Using this instead of the original `\footins` box avoids having footnotes be printed

by the output routine, since footnotes should be printed per HTML page instead of per PDF page.

See section 60.4 for the implementation.

## 60.2 Minipage footnotes

See section 60.5 for how minipage footnotes are gathered. See section 94.4 for how minipage footnotes are placed into the document.

## 60.3 Titlepage thanks

See section 69.7 for titlepage footnotes.

## 60.4 Regular page footnote implementation

**for HTML & PRINT:** 6841 `\begin{warpall}`

`FootnoteDepth` (*Ctr*) Determines how deeply to place footnotes in the HTML files, similar to `tocdepth`.  
**Default:** 3 The default of 3 places footnotes before each `\subsubsection` or higher. See table 12 for a table of L<sup>A</sup>T<sub>E</sub>X section headings.

```
6842 \newcounter{FootnoteDepth}
6843 \setcounter{FootnoteDepth}{3}
```

`footnoteReset` (*Ctr*) If non-zero, the footnote counter is reset to this value each time the footnotes are printed, as controlled by `FootnoteDepth`. For the `manyfoot` and `bigfoot` packages, additional counters such as `footnote<suffix>Reset` will be defined as well. These counters may be set non-zero by the user, and are also set if the `perpage`'s `\MakePerPage` or `\MakeSortedPerPage` macros are used for the `footnote` or `footnote<suffix>` counters.

(The name is not capitalized because it is made from the counter's name with "Reset" appended.)

```
6844 \newcounter{footnoteReset}
6845 \setcounter{footnoteReset}{0}
```

```
6846 \end{warpall}
```

**for HTML output:** 6847 `\begin{warpHTML}`

Required for footnotes inside description or `amsthm` square braces:

```
6848 \AtBeginDocument{
6849 \robustify{\footnote}
6850 \robustify{\footnotemark}
6851 }
```

`\LWR@footnotetext` Patch L<sup>A</sup>T<sub>E</sub>X footnotes to use a new `\box` instead of an insert for `lwarp` footnotes. This avoids having the original `\footins` appear at the bottom of a `lateximage`, which is on its own new page.

```
6852 \newbox\LWR@footnotetext
```

`LWR@spewingnotes` (*bool*) Used with the footnote package to suppress paragraph tags before and after `\spewnotes`.

```
6853 \newbool{LWR@spewingnotes}% For the footnote package.
```

Much of the following has unneeded print-mode formatting removed.

```
\@makefnctext {<text>}
```

```
6854 \long\def\@makefnctext#1{\textsuperscript{\@thefnmark}~{#1}}
```

```
\@makefnmark
```

```
6855 \def\@makefnmark{%
6856   \textsuperscript{\@thefnmark}%
6857 }
```

Footnotes may be in regular text, in which case paragraphs are tagged, or in a table data cell or `lateximage`, in which case paragraph tags must be added manually.

In a `lateximage` during HTML output, the `lateximage` is placed inside a print-mode `minipage`, but the footnotes are broken out by:

```
\def\@mpfn{footnote}
\def\@thempfn{\thefootnote}
\let\@footnotetext\LWR@footnotetext
```

```
\LWR@@footnotetext {<text>} {<footnote box name>}
```

Factored to allow multiple footnote boxes for `manyfoot`.

```
6858 \long\def\LWR@@footnotetext#1#2{%
6859 \LWR@traceinfo{LWR@footnotetext}%
```

Perhaps generate an autopage in the text to link a citation backreference closer to its usage.

```
6860 \LWR@newautopagelabel{page}%
6861 \LWR@ensuredoingapar%
```

Locally disable auto page labels inside the footnote text. Footnotes are accumulated in the current page before finally being placed in a potentially later page, so the autopages would be incorrect.

```
6862 \begingroup%
6863 \let\LWR@newautopagelabel\LWR@null@newautopagelabel%
```

Take the existing footnote box and add the new content:

```
6864 \global\setbox\csname #2\endcsname=\vbox{%
6865   \unvbox\csname #2\endcsname%
```

Remember the footnote number for \ref:

```
6866   \protected@edef\@currentlabel{%
6867     \csname p@footnote\endcsname\@thefnmark%
6868   }% @currentlabel
```

Open a group:

```
6869   \color@begingroup%
```

Disable CJK xpinyin while generating footnotes.

```
6870   \LWR@disablepinyin%
```

Use HTML superscripts in the footnote even when the main text is inside a lateximage, because the footnote will be in HTML:

```
6871   \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%
```

Use paragraph tags if in a tabular data cell or a lateximage:

```
6872   \ifbool{LWR@spewingnotes}{}{%
6873     \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
6874   }%
```

Append the footnote to the list:

```
6875   \@makefntext{#1}%
```

Closing paragraph tag:

```
6876   \ifbool{LWR@spewingnotes}{}{%
6877     \LWR@origtilde\LWR@orignewline%
6878     \LWR@htmltagc{/\LWR@tagregularparagraph}%
6879     \LWR@orignewline%
6880   }%
```

Close the group:

```
6881   \color@endgroup%
6882 }% vbox
6883 \endgroup%
6884 }%
```

```
\LWR@footnotetext {<text>}
```

```
6885 \long\def\LWR@footnotetext#1{\LWR@footnotetext{#1}{LWR@footnotebox}}%
```

```
\@footnotetext {<text>}
```

```
6886 \LetLtxMacro\@footnotetext\LWR@footnotetext
```

## 60.5 Minipage footnote implementation

Patch L<sup>A</sup>T<sub>E</sub>X minipage footnotes to use a new `\box` instead of an insert for `lwarp` minipage footnotes. This avoids having the original `\@mpfootins` appear at the bottom of a `lateximage`, which is on its own new page.

```
6887 \newbox\LWR@mpfootnotes
```

```
\@mpfootnotetext {<text>}
```

```
6888 \long\def\@mpfootnotetext#1{%
6889 \LWR@traceinfo{\@mpfootnotetext}%
6890 \LWR@ensuredoingapar%
6891 \global\setbox\LWR@mpfootnotes\vbox{%
6892   \unvbox\LWR@mpfootnotes%
6893   \reset@font\footnotesize%
6894   \hsize\columnwidth%
6895   \@parboxrestore%
6896   \protected@edef\@currentlabel%
6897     {\csname p@mpfootnote\endcsname\@thefnmark}%
6898   \color@begingroup%
```

Add paragraph tag:

```
6899   \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
6900   \@makefnstext{%
6901     \ignorespaces#1%
6902   }%
```

Add the closing paragraph tag:

```
6903   \leavevmode\LWR@orignewline%
6904   \LWR@htmltagc{/\LWR@tagregularparagraph}%
6905   \color@endgroup%
6906 }% vbox
```

Paragraph handling:

```
6907 \LWR@ensuredoingapar%
6908 \LWR@traceinfo{\@mpfootnotetext: done}%
6909 }
```

`\thempfootnote` Redefined to remove the `\itshape`, which caused an obscure compiling error in some situations.

```
6910 \AtBeginDocument{
6911   \def\thempfootnote{\@alph\c@mpfootnote}
6912 }
```

## 60.6 Printing pending footnotes

```
\LWR@@printpendingfootnotes {<footnote counter name>}
```

```

6913 \newcommand*\LWR@printpendingfootnotes}[1]{%
6914 \expandafter\ifvoid\csname LWR@#1box\endcsname\else
6915   \LWR@forcenewpage
6916   \begin{BlockClass}(note){footnotes}%

```

Create a new autopage in case citation back references occur inside the footnotes:

```

6917   \LWR@newautopagelabel{page}%

6918   \null
6919   \unvbox\csuse{LWR@#1box}
6920   \setbox\csuse{LWR@#1box}=\vbox{}
6921   \end{BlockClass}
6922   \ifltxcounter{#1Reset}{%
6923     \ifnumgreater{\value{#1Reset}}{0}{%
6924       \setcounter{#1}{\value{#1Reset}}%
6925       \addtocounter{#1}{-1}%
6926     }{}%
6927   }{}%
6928 \fi
6929 }

```

`\LWR@printpendingfootnotes` Enclose the footnotes in a class, print, then clear. For `manynotes`, new footnotes may be added via `\appto`.

```

6930 \newcommand*\LWR@printpendingfootnotes}{%
6931   \LWR@printpendingfootnotes{footnote}%
6932 }

```

`\LWR@maybeprintpendingfootnotes` `{<depth>}` Used to print footnotes before sections only if formatting for an EPUB or word processor:

```

6933 \newcommand*\LWR@maybeprintpendingfootnotes}[1]{%
6934 \ifboolexpr{
6935   not test{\ifnumcomp{#1}{>}{\value{FootnoteDepth}}} or
6936   bool{FormatEpub} or
6937   bool{FormatWP}
6938 }%
6939 {\LWR@printpendingfootnotes}%
6940 {}%
6941 }

```

`\LWR@printpendingmpfootnotes` Enclose the minipage footnotes in a class, print, then clear.

```

6942 \newcommand*\LWR@printpendingmpfootnotes}{%
6943 \ifvoid\LWR@mpfootnotes\else
6944   \LWR@forcenewpage
6945   \begin{BlockClass}(note){footnotes}%
6946   \null
6947   \unvbox\LWR@mpfootnotes
6948   \setbox\LWR@mpfootnotes=\vbox{}
6949   \end{BlockClass}
6950 \fi
6951 }

```

`\LWR@nullifyfootnotes` Cancels footnotes, such as inside an HTML comment or a `\nameref`.

```

6952 \newcommand*\LWR@nullifyfootnotes}{%
6953   \renewcommand{\footnote}[2][{}]{%
6954     \renewcommand{\footnotemark}[1][{}]{%
6955   }

6956 \end{warpHTML}

```

## 61 Marginpars

`\marginpar` [*left*] [*right*] `\marginpar` may contains paragraphs, but in order to remain inline with the surrounding text `lwarp` nullifies block-related macros inside the `\marginpar`. Paragraph breaks are converted to `<br />` tags.

`\marginparBlock` [*left*] [*right*] To include block-related macros, use `\marginparBlock`, which takes the same arguments but creates a `<div>` instead of a `<span>`. A line break will occur in the text where the `\marginBlock` occurs.

**for HTML output:** 6957 `\begin{warpHTML}`

`\marginpar` [*left*] [*right*]

```

6958 \renewcommand{\marginpar}[2][{}]{%
6959   \ifbool{FormatWP}%

## 62 Tracking internal cross references

Cross references are generated using the PDF file's page number during L<sup>A</sup>T<sub>E</sub>X compilation. Internal labels are generated which include these page numbers in the label.

`*_html.aux` (*file*) A new entry in the `*_html.aux` file is used to help cross-references:

```
\newlabel{autopage-<nnn>}{<x>}{<y>}
```

`LWR@currentautosecpage` (*Ctr*) Records the page number when the section was created. (If a math expression is included in the section name, and `svg math` is used, the corresponding `lateximage` will cause the page number to change by the time the following `autosec` label is created, thus the initial page number is recorded here.) `LWR@currentautosecfloatpage` is updated more often than `LWR@currentautosecpage`.

```
6994 \newcounter{LWR@currentautosecpage}
```

```
6995 \setcounter{LWR@currentautosecpage}{1}
```

`LWR@currentautosecfloatpage` (*Ctr*) The HTML output's PDF page number at the start of a new HTML file, section, or float. Updated more often than `LWR@currentautosecpage`, such as when a new float occurs. Used only for table of contents, list of figures, list of tables, but not for general cross references such as `\label`, citation backlinks, etc.

`\LWRsetnextfloat` is written with this and the `auto` id by the modified `\addcontentsline` just before each float's entry.

```
6996 \newcounter{LWR@currentautosecfloatpage}
6997 \setcounter{LWR@currentautosecfloatpage}{1}
```

`LWR@previousautopagelabel` Remembers which autopage label was most recently generated. Used to avoid (*Ctr*) duplicates.

```
6998 \newcounter{LWR@previousautopagelabel}
6999 \setcounter{LWR@previousautopagelabel}{-1}
```

`\LWR@newautopagelabel`  $\langle$ *pagenumber counter* $\rangle$

`\BaseJobname` is added to the label in case `xr` or `xr-hyper` are used.

```
7000 \newcommand*{\LWR@newautopagelabel}[1]{%
```

No action if this autopage label has already been defined:

```
7001 \ifnumequal{\value{LWR@previousautopagelabel}}{\value{page}}%
7002     {}%
```

If the PDF page has changed, create a label using the desired counter.

If the counter is `LWR@currentautosecpage`, that was the page number when the section generation began, but the current PDF page may be different by now if the section name had an SVG image, such as `SVG math`. To allow the cross-reference to point just after the section heading, the label must be made after the section heading is complete, which may have generated a new PDF page. Thus, the label is made with the given counter, which may be the PDF page number where the section heading began, then if the PDF page number has changed, another label is made for the current page number.

```
7003     {%
7004         \label{\BaseJobname-autopage-\csuse{the#1}}%
```

If there are intervening pages, such as an SVG image, define another label for the new page:

```
7005         \ifnumequal{\value{#1}}{\value{page}}%
7006             {%
7007                 \label{\BaseJobname-autopage-\csuse{thepage}}}%
```

Remember the latest autopage label:

```
7008         \setcounter{LWR@previousautopagelabel}{\value{page}}%
7009     }%
7010 }
```

`\LWR@null@newautopagelabel`  $\langle$ *pagenumber counter* $\rangle$

Inside a footnote, the page numbers will be incorrect, so this is nullified.

```
7011 \newcommand*{\LWR@null@newautopagelabel}[1]{}
```

## 63 Splitting HTML files

- Files are split according to `FileDepth` and `CombineHigherDepths`.
- Filenames are sanitized by `\LWR@filenamoblanks`.
- `\LWR@newhtmlfile` finishes an HTML page, adds a comment to tell where and how to split the file, then starts a new HTML page.

**for HTML & PRINT:** 7012 `\begin{warpall}`

`FileDepth (Ctr)` `{\section depth}` determines how deeply to break into new HTML files, similar to `tocdepth`. The default of `-5` produces one large HTML file.

```
7013 \newcounter{FileDepth}
7014 \setcounter{FileDepth}{-5}
```

`CombineHigherDepths (bool)` Combile higher-level sections together into one file?

```
7015 \newbool{CombineHigherDepths}
7016 \booltrue{CombineHigherDepths}
```

`\FilenameLimit` Maximum length of the generated filenames.

```
7017 \newcommand*\FilenameLimit{80}
7018 \end{warpall}
```

**for HTML output:** 7019 `\begin{warpHTML}`

`\LWR@thisfilename` The currently-active filename or number. At first, this is the homepage.

```

`\LWR@simplifname *` `{\langle expression \rangle}` Simplify `\LWR@thisnewfilename`.

`\LWR@simplifycustom` User-defined filename simplifications. Redefine with `\newcommand`.

```
7037 \newcommand*\LWR@simplifycustom{}

`\FilenameSimplify` \*{<*phrase*>} Assign a user-defined filename simplification. Appends to `\LWR@simplifycustom`.

**defaults** Default customizations:

In the MATHJAX code, footnotes are only referenced. For equations, they are also generated in the HTML when the L<sup>A</sup>T<sub>E</sub>X math is generated inside the HTML comment. For other math environments, the `\footnotemark/\footnotetext` method must be used. See section 8.5.4 regarding `\footnotemark`.

⚠ `\footnotemark`

For footnotes, `\footnotename` is used in most cases, however for equation the footnote is picked up from L<sup>A</sup>T<sub>E</sub>X in `\LWR@doendequation`.

First, `\footnotename` for MATHJAX is copied from L<sup>A</sup>T<sub>E</sub>X.

```

## 64 Sectioning

Sectioning and cross-references have been emulated from scratch, rather than try to patch several layers of existing L<sup>A</sup>T<sub>E</sub>X code and packages. Formatting is handled by css, so the emulated code has much less work to do than the print versions.

**Unicode accents in filenames** Section names and the resulting filenames with accented characters are partially supported, depending on the ability of *pdf<sub>l</sub>atex* to generate characters and *pdf<sub>t</sub>otext* to read them. If extra symbols appear in the text, it may be that *pdf<sub>l</sub>atex* is actually producing a symbol over or under a character, resulting in *pdf<sub>t</sub>otext* picking up the accent symbol separately.

X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X and LuaL<sup>A</sup>T<sub>E</sub>X directly support accented section and file names, but it may be necessary to use L<sup>A</sup>T<sub>E</sub>X accents instead of native Unicode accents. L<sup>A</sup>T<sub>E</sub>X accents will have the accents stripped when creating file names, whereas using Unicode accents will create filenames which include accents, which may cause issues with some operating systems.

**for HTML output:** 7496 \begin{warpHTML}

### 64.1 User-level starred section commands

`\ForceHTMLPage` For HTML output, forces the next section to be on its own HTML page, if `FileDepth` allows, even if starred. For use with `\printindex` and others which generate a starred section which should be on its own HTML page. Also see `\ForceHTMLTOC`.

For print output, no effect.

```
7497 \newbool{LWR@forcinghtmlpage}
7498 \boolfalse{LWR@forcinghtmlpage}
7499
7500 \newcommand*{\ForceHTMLPage}{%
7501 \global\booltrue{LWR@forcinghtmlpage}%
7502 }
```

`\ForceHTMLTOC` For HTML output, forces the next section to have a TOC entry, even if starred. For use with `\printindex` and others which generate a starred section which should be in the TOC so that it may be accessed via HTML. Not necessary if used with `tocbibind`. Also see `\ForceHTMLPage`.

For print output, no effect.

```
7503 \newbool{LWR@forcinghtmltoc}
7504 \boolfalse{LWR@forcinghtmltoc}
7505
7506 \newcommand*{\ForceHTMLTOC}{%
7507 \global\booltrue{LWR@forcinghtmltoc}%

## 64.2 Book class commands

`\mainmatter` Declare the main matter section of the document. Does not reset the page number, which must be consecutive arabic numbers for the HTML conversion.

```
7515 \newbool{LWR@mainmatter}
7516 \DeclareDocumentCommand{\mainmatter}{}{}%
7517 \booltrue{LWR@mainmatter}%
7518 }
```

`\frontmatter` Declare the front matter section of the document, using arabic numbering for the internal numbering. Does not reset the page number.

```
7519 \DeclareDocumentCommand{\frontmatter}{}{}%
7520 \boolfalse{LWR@mainmatter}%
7521 }
```

`\backmatter` Declare the back matter section of the document. Does not reset the page number.

```
7522 \DeclareDocumentCommand{\backmatter}{}{}%
7523 \boolfalse{LWR@mainmatter}
7524 }
```

## 64.3 Sectioning support macros

`\LWR@sectionnumber`  $\langle section\ type \rangle$

Typeset a section number and its trailing space with CSS formatting:

```
7525 \newcommand*{\LWR@sectionnumber}[1]{%
7526 \InlineClass{sectionnumber}{#1}%
7527 }
```

`autosec` A tag used by the TOC and index.

`\LWR@createautosec`  $\{\langle section type \rangle\}$

Create an autosection tag.

The use of `\textquotedbl` instead of `"` provides improved compatibility with `xeCJK`.

```
7528 \newcommand*\LWR@createautosec}[1]{%
7529 \LWR@htmltag{%
7530   #1 % space
7531   id=\textquotedbl\LWR@print@box{autosec-\arabic{page}}\textquotedbl%
7532 }%
7533 }
```

`\LWR@pushoneclose`  $\{\langle sectiontype \rangle\}$  Stacks the new sectioning level's closing tag, to be used when this section is closed some time later.

 `\LWR@stoppars` must be executed first.

```
7534 \NewDocumentCommand{\LWR@pushoneclose}{m}{%
7535 \LWR@traceinfo{\LWR@pushoneclose #1}%
7536   \LWR@pushclose{#1}%
7537 }
```

`\LWR@startnewdepth`  $\{\langle sectiontype \rangle\}$

Closes currently stacked tags of a lesser level, then opens the new nesting level by saving this new sectioning level's closing tag for later use.

 `\LWR@stoppars` must be executed first.

```
7538 \NewDocumentCommand{\LWR@startnewdepth}{m}{%
```

Close any stacked sections up to this new one.

```
7539 \LWR@closeprevious{#1}%
```

Push a new section depth:

```
7540 \LWR@pushoneclose{#1}%
7541 }
```

`LWR@prevFileDepth` (*Ctrl*) Remembers the previous `LWR@FileDepth`.

Initialized to a deep level so that any section will trigger a new HTML page after the home page.

```
7542 \newcounter{LWR@prevFileDepth}
7543 \setcounter{LWR@prevFileDepth}{\LWR@depthsubparagraph}
```

`\@secntformat`  $\{\langle sectiontype \rangle\}$

```
7544 \def\@secntformat#1{\csname the#1\endcsname\quad}
```

`\simplechapterdelim` Used by `tocbibind` and `anonchap`.

```
7545 \newcommand*\simplechapterdelim{}
```

`\@chapcntformat`  $\langle sectiontype \rangle$

`\let` to `\@secntformat` by default, but may be redefined by `\simplechapter` and `\restorechapter` from `tocbibind` or `anonchap`.

```
7546 \let\@chapcntformat\@secntformat
```

`\@partcntformat`  $\langle sectiontype \rangle$

`\let` to `\@secntformat` by default, but may be redefined by `ctex`.

```
7547 \let\@partcntformat\@secntformat
```

`\@partnameformat` Prints “Part” for part sections.

Nullified by `ctex`.

```
7548 \newcommand*\@partnameformat{\LWR@isolate{\partname}~}%
```

`\LWR@printchaptername` Print `\chaptername` in most cases, but this is nullified for `ctexbook`, `komascript`, `ujt*` classes.

```
7549 \newcommand*\LWR@printchaptername{%
7550   \ifdefvoid{\chaptername}{\chaptername~}%
7551 }
```

`\LWR@section` \* [ $\langle TOC name \rangle$ ]  $\langle name \rangle$   $\langle sectiontype \rangle$

The common actions for the high-level sectioning commands.

```
7552 \DeclareDocumentCommand{\LWR@section}{m m m m}{%
7553   \IfValueTF{#2}%
7554     {\LWR@traceinfo{\LWR@section: starting #4 #2}}%

```
7557 \LWR@maybeprintpendingfootnotes{\csuse{\LWR@depth#4}}%
7558 \LWR@stoppars%
7559 \LWR@startnewdepth{#4}%
```

Cancel special minipage horizontal space interaction:

```
7560 \global\boolfalse{\LWR@minipagethispar}%
```

Start a new HTML file unless starred, and if is a shallow sectioning depth.

Exception: Also start a new HTML file for `\part*`, for `appendix`.

Generate a new L<sup>A</sup>T<sub>E</sub>X page so that toc and index page number points to the section:

```

7586   \IfNoValueTF{#2}%

```

If no optional entry

```

```

If yes an optional entry

```

7588     {\LWR@newhtmlfile{#2}}%
7589 }% new file

```

Else: No new HTML file:

```

7590 {% not new file

```

Generate a new L<sup>A</sup>T<sub>E</sub>X page so that toc and index page number points to the section:

```

7592   \LWR@maybe@orignewpage%

Print an opening comment with the level and the name; ex: “section” “Introduction”  
Footnotes may be used in section names, which would also appear in the HTML

opening comment is made if the sectional unit is starred.

Starred, but also forcing a TOC entry, so add unnumbered TOC name or regular name:

Generate a L<sup>A</sup>T<sub>E</sub>X label.

Track the PDF page numbers of the HTML output. A new autopage label may be generated for LWR@currentautosecpage for the start of the section, and

also for the current page if it is different due to an svg image in the section name. Also, the final page after the section has been created is updated in LWR@currentautosecfloatpage.

If not starred, remember the previous depth to possibly trigger a new HTML page.

HOWEVER, allow a \part\* to start a new HTML page. This is used by appendix.

A starred section does not trigger a new HTML page at the beginning of this macro, so it should not affect it here at the end either. This became an issue when a \listoftables was tested in the middle of the document. The \chapter\* for the list was not allowing a new HTML page for the section following it while CombineHigherDepths was true.

## 64.5 `\section` and friends

For `memoir`, a second optional argument is allowed.

For `hypbmsec`, a second optional argument or either parenthesis argument is allowed.

Each of these additional arguments are for headers or PDF bookmarks, and are ignored for HTML output.

## 65 Starting a new file

**for HTML & PRINT:** 7806 `\begin{warpall}`

`\HTMLLanguage` Default language for the HTML lang tag.

```
7807 \newcommand*\LWR@currentHTMLLanguage}{en-US}
7808
7809 \newcommand*\HTMLLanguage}[1]{%

`\theHTMLTitleSeparator` May be used inside `\theHTMLTitleSection` to separate the website's overall HTML title and the particular page's section name.

```
7812 \ifPDFTeX% pdflatex or dvi latex
7813   \ifdefstring{\inputencodingname}{utf8}{%
7814     \newcommand*\theHTMLTitleSeparator}{ -\ }% EMDash

`\HTMLTitleBeforeSection` Sets the HTML page's meta title tag to show the website title before the section name.

```
7825 \newcommand*\HTMLTitleBeforeSection}{%
7826   \def\theHTMLTitleSection{%
7827     \theHTMLTitle\theHTMLTitleSeparator\theHTMLSection%
7828   }%
7829 }
```

`\HTMLTitleAfterSection` Sets the HTML page's meta title tag to show the section name before the website title.

```
7830 \newcommand*\HTMLTitleAfterSection}{%
7831   \def\theHTMLTitleSection{%
7832     \theHTMLSection\theHTMLTitleSeparator\theHTMLTitle%
7833   }%
7834 }
```

`\theHTMLTitleSection` Forms the HTML page's meta title tag. The default is to show the website title before the section name.

```
7835 \HTMLTitleBeforeSection
```

`\theHTMLSection` The section name is passed to `\LWR@filestart`, which then sets `\theHTMLSection` for use inside `\theHTMLTitleSection` to create an HTML meta title tag.

```
7836 \newcommand*{\theHTMLSection}{}
```

```
7837 \end{warpall}
```

**for HTML output:** 7838 \begin{warpHTML}

```
7839 \newcommand*{\LWR@filestart}[1][\%
7840 \LWR@traceinfo{\LWR@filestart !#1!}%
```

Locally temporarily disable direct-formatting commands:

```
7841 \begingroup%
7842 \LWR@nullfonts%
```

Save the section name for use while creating the HTML meta title tag:

```
7843 \edef\theHTMLSection{#1}%
```

Remove extra material:

```
7844 \StrSubstitute{\theHTMLSection}{\protect}{\detokenize{-}}[\theHTMLSection]%
7845 \StrSubstitute{\theHTMLSection}%
7846   {\detokenize{-----}}{\detokenize{-}}[\theHTMLSection]%

7849 \StrSubstitute{\theHTMLSection}%
7850   {\detokenize{---}}{\detokenize{-}}[\theHTMLSection]%
7851 \StrSubstitute{\theHTMLSection}%
7852   {\detokenize{--}}{\detokenize{-}}[\theHTMLSection]%
```

If starts with a dash, remove the leading dash:

```
7853 \IfBeginWith{\theHTMLSection}{\detokenize{-}}{%
7854   \StrGobbleLeft{\theHTMLSection}{1}[\theHTMLSection]%
7855 }{%}
```

Create the page's HTML header:

```
7856 \LWR@htmltag{!DOCTYPE html}\LWR@orignewline
```

The language is user-adjustable:

## 66 Starting HTML output

**for HTML output:** 7940 \begin{warpHTML}

\LWR@LwarpStart Executed at the beginning of the entire document.

The use of \textquotedbl instead of " improves compatibility with xeCJK.

```
7941 \catcode'\$=\active
7942 \newcommand*\LWR@LwarpStart
7943 {%

If formatting for a word processor, force filedepth to single-file only, force HTML debug comments off.

```
7945 \ifbool{FormatWP}{%
7946   \setcounter{FileDepth}{-5}%
7947   \boolfalse{HTMLDebugComments}%

```

Expand and detokenize \HomeHTMLFilename and \HTMLFilename:

```

7950 \edef\HomeHTMLFilename{\detokenize\expandafter{\LWR@strresult}}
7951 \edef\LWR@strresult{\HTMLFilename}
7952 \edef\HTMLFilename{\detokenize\expandafter{\LWR@strresult}}
```

Force onecolumn and empty page style:

```
7953 \LWR@origonecolumn%
7954 \LWR@origpagestyle{empty}%
```

No black box for overfull lines:

```
7955 \overfullrule=0pt
```

Reduce chance of line overflow when HTML tags are added:

```
7956 \LWR@print@footnotesize%
```

In PDF output, don't allow line breaks to interfere with HTML tags:

```
7957 \LWR@print@raggedright%
7958 \LetLtxMacro{\}\LWR@endofline%
```

Spread the lines for *pdftotext* to read them well:

```
7959 \linespread{1.3}%
```

For *pdftotext* to reliably identify paragraph splits:

```
7960 \setlength{\parindent}{0pt}
7961 \setlength{\parskip}{2ex}
```

For the lateximage record file:

```
7962 \immediate\openout\LWR@lateximagesfile=\BaseJobname-images.txt
```

Removes space around the caption in the HTML:

```
7963 \setlength{\belowcaptionskip}{0ex}
```

```
7964 \setlength{\abovecaptionskip}{0ex}
```

Redefine the plain page style to be empty when used by index pages:

```
7965 \renewcommand{\ps@plain}{}
```

Plug in some new actions. This is done just before the document start so that they won't be over-written by some other package.

Float captions:

```
7966 \let\LWR@origcaption\caption
```

Not yet started any paragraph handling:

```
7967 \global\booltrue{LWR@doingparhooks}
```

```
7968 \global\boolfalse{LWR@doingapar}
```

```
7969 \global\boolfalse{LWR@doingstartpars}
```

`\color@endgroup's \endgraf` was conflicting with `lwarp's` paragraph handling.

```
7970 \let\color@endgroup\endgroup
```

Document and page settings:

```
7971 \mainmatter
```

```
7972 \LWR@origpagenumbering{arabic}
```

Start a new HTML file and a header:

```
7973 \LWR@traceinfo{LWR@lwarpStart: Starting new file.}
```

```
7974 \LWR@filestart%
```

Tell *lwarpmk* that the `lwarp` package is in use. This allows *lwarpmk* to warn if `usepackage{lwarp}` was somehow disabled.

```

```

Patch the `itemize`, `enumerate`, and `description` environments and `\item`. This works with the native L<sup>A</sup>T<sub>E</sub>X environments, as well as those provided by `enumitem`, `enumerate`, and `paralist`.

```
7996 \LWR@patchlists
```

Ensure that math mode is active to call `lwarp`'s patches:

```
7997 \catcode'\$=\active
```

```
7998 \immediate\write\@mainaux{\catcode'\string$\active}%
7999 \LetLtxMacro\LWR@syntaxhighlightone% balance for editor syntax highlighting
```

Allow HTML paragraphs to begin:

```
8000 \LWR@startpars
```

If using `MATHJAX`, disable `\ensuremath` by printing a nullified definition at the start of each file, and add further customizations:

```
8001 \ifbool{mathjax}{

8003   \typeout{Package lwarp:}
8004   \typeout{Processing MathJax customizations for the first HTML page.}

```

First autopage label in case a figure occurs early before the first section: A new autopage label may be generated for `LWR@currentautosecpage` for the start of the section, and also for the current page if it is different due to an SVG image in the section name. Also, the final page after the section has been created is updated in `LWR@currentautosecfloatpage`.

```

## 69 Title page

[package support](#) `lwarp` supports the native L<sup>A</sup>T<sub>E</sub>X titling commands, and also supports the packages `authblk` and `titling`. If both are used, `authblk` should be loaded before `titling`.

[load order](#)

[\published and \subtitle](#) If using the `titling` package, additional titlepage fields for `\published` and `\subtitle` may be added by using `\AddSubtitlePublished` in the preamble. See section 69.8.

[affiliation](#) `lwarp` provides for the `\author` macro an additional `\affiliation` macro to pro-

vide an affiliation and other additional information for each author in the title page. The affiliation information is removed when using `titlingpage's \theauthor` in the main text.

### reusing titlepage information

The titling package maintains the definitions of `\thetitle`, `\theauthor`, etc., after the title has been typeset. These commands are to be used to refer to the document's title and author, etc., in the main text. These definitions have the `\thanks` and `\affiliation` removed, and for `\author` the `\and` is replaced to generate a simple inline list of authors separated by commas. Note: `\theauthor` does not work well with `authblk` unless the traditional L<sup>A</sup>T<sub>E</sub>X syntax is used.

⚠ `\theauthor, authblk`

### custom titlepages

`\printtitle`, `\printauthor`, etc., are provided for use inside a custom titlepage or `titlingpage` environment, and these retain the `\thanks` and `\affiliation`.

`\printthanks` `\printthanks` has been added to force the printing of thanks inside a `titlingpage` environment when `\maketitle` is not used.

⚠ `\thanks` Inside a `\titlepage` or `\titlingpage` environment, use `\thanks` instead of `\footnote` for acknowledgements, etc.

## 69.1 Setting the title, etc.

The following provide setting commands for both HTML and print outputs.

`\author` `\and` `{\author}` While using `\maketitle` and print mode, the author is treated as a single-column tabular and the `\and` feature finishes the current tabular then starts a new one for the next author. Each author thus is placed into its own tabular, and an affiliation may be placed on its own line such as

```
\author{Name \ Affiliation \and Second Name \ Second Affiliation}
```

For HTML, the entire author block is placed inside a `<div>` of class `author`, and each individual author is inside a `<div>` of class `oneauthor`.

`\@title` `\@author` `\@date` `\@title`, `\@author`, and `\@date` store the values as originally assigned, including any `\thanks`, `\and`, or `\affiliation`. These are low-level macros intended to be used by other macros only inside a titlepage or `titlingpage`, and are used by `\maketitle`. The author is printed inside a single-column tabular, which becomes multiple single-column tabulars if multiples authors are included. For HTML, these tabulars become side-by-side `<div>`s of class `oneauthor`, all of which are combined into one `<div>` of class `author`.

`\printtitle` `\printauthor` `\printdate` `\printtitle`, etc. are user-level macros intended to be used in custom titlepage or `titlingpage` environments in cases where `\maketitle` is not desired. These commands preserve the `\thanks`, etc., and should not be used in the main text.

`\thetitle` `\theauthor` `\thedata` `\thetitle`, `\theauthor`, and `\thedata` are available if `titling` has been loaded, and are sanitized user-level versions from which have been removed the `\thanks` and `\affiliation`, and `\and` is changed for inline text usage. The author is printed inline without `\affiliation` or `\thanks`, with `\and` placing commas between multiple authors. Thus, these commands are to be used in the main text whenever the user wishes to refer to the document's title and such. One practical use for this is to place the authors at the bottom of each HTML page, such as:

```
\HTMLPageBottom{
  \begin{center}\textcopyright~20xx \theauthor\end{center}
```

```
}

```

△ `\theauthor, authblk` `\theauthor` does not work well if `authblk` is used. If `\theauthor` is important, it is recommended to use the standard L<sup>A</sup>T<sub>E</sub>X syntax for `\author`, optionally with `lwarp`'s `\affiliation` macro as well.

△ `affiliations` After `\maketitle` has completed, `\theauthor` retains the definition of the author, but `\and` is changed to become a comma and a space, intending to print the authors names separated by spaces. This fails when affiliations are included on their own table rows.

`\affiliation` A solution, provide here, is to define a macro `\affiliation` which, during `\maketitle`, starts a new row and adds the affiliation, but after `\maketitle` is finished `\affiliation` is re-defined to discard its argument, thus printing only the author names when `\author` is later used inline.

## 69.2 `\if@titlepage`

**for HTML & PRINT:** 8107 `\begin{warpall}`

`\if@titlepage` Some classes do not provide `\if@titlepage`. In this case, provide it and force it false.

```
8108 \ifcvoid{@titlepagefalse}{
8109   \newif\if@titlepage
8110   \@titlepagefalse
8111 }{}

8112 \end{warpall}
```

## 69.3 Changes for `\affiliation`

`\affiliation` `{<text>}`

Adds the affiliation to the author for use in `\maketitle`.

Inside `titlepage`, this macro prints its argument. Outside, it is null.

**for HTML & PRINT:** 8113 `\begin{warpall}`  
8114 `\providerobustcmd{\affiliation}[1]{}`  
8115 `\end{warpall}`

**for PRINT output:** 8116 `\begin{warpprint}`

```
8117 \AtBeginEnvironment{titlepage}{
8118 \renewrobustcmd{\affiliation}[1]{\ \ \textsc{\small#1}}
8119 }
8120
8121 \AtBeginDocument{
8122 \IfPackageLoadedTF{titling}{
8123 \AtBeginEnvironment{titlingpage}{
8124 \renewrobustcmd{\affiliation}[1]{\ \ \textsc{\small#1}}
8125 }
```

```
8126 }{}% titling loaded
8127 }{}% AtBeginDocument
```

```
8128 \end{warpprint}
```

**for HTML output:** 8129 \begin{warpHTML}

`titlepage` (*enu*) Sets up a <div> of class `titlepage`. Provided even for memoir class, since it is used by `\maketitle`.

```
8130 \DeclareDocumentEnvironment{titlepage}{}
8131 {%
8132   \renewrobustcmd{\affiliation}[1]{\ \InlineClass{affiliation}{##1}}%
8133   \LWR@printpendingfootnotes
8134   \LWR@forcenewpage
8135   \BlockClass{titlepage}
8136 }
8137 {
8138   \endBlockClass
8139   \LWR@printpendingfootnotes
8140 }

8141 \end{warpHTML}
```

## 69.4 Printing the thanks

`\printthanks` Forces the `\thanks` to be printed. This is necessary in a `titlingpage` environment when `\maketitle` was not used.

**for PRINT output:** 8142 \begin{warpprint}  
8143 \newcommand\*{\printthanks}{\@thanks}  
8144 \end{warpprint}

**for HTML output:** 8145 \begin{warpHTML}  
8146 \newcommand\*{\printthanks}{\LWR@stoppars\@thanks\LWR@startpars}  
8147 \end{warpHTML}

## 69.5 Printing the title, etc. in HTML

The following are for printing the title, etc. in a `titlepage` or a `titlingpage` in HTML:

**for HTML output:** 8148 \begin{warpHTML}

`\printtitle`

```
8149 \newcommand*{\printtitle}
8150 {%
8151   \LWR@stoppars%
8152   \LWR@htmltag{\LWR@tagtitle}%
8153   \@title%
8154   \LWR@htmltag{\LWR@tagtitleend}%
8155   \LWR@startpars%
8156 }
```

`\LWR@printthetitle` A private version which prints the title without footnotes, used to title each HTML page.

```
8157 \newcommand*{\LWR@printthetitle}
8158 {%
8159   \LWR@stoppars%
8160   \LWR@htmltag{\LWR@tagtitle}%
8161   \thetitle%
8162   \LWR@htmltag{\LWR@tagtitleend}%
8163   \LWR@startpars%
8164 }
```

`\printauthor` HTML version.

```
8165 \newcommand*{\printauthor}{
```

The entire author block is contained in a <div> named author:

```
8166 \begin{BlockClass}{author}
```

\and finishes one author and starts the next:

```
8167 \renewcommand{\and}{%
8168 \end{BlockClass}
8169 \begin{BlockClass}{oneauthor}
8170 }
```

Individual authors are contained in a <div> named oneauthor:

```
8171 \begin{BlockClass}{oneauthor}
8172 \@author
8173 \end{BlockClass}
8174 \end{BlockClass}
8175 }
```

`\printdate`

```
8176 \newcommand*{\printdate}{%
8177 \begin{BlockClass}{titledate}
8178 \@date
8179 \end{BlockClass}
8180 }
```

```
8181 \end{warphTML}
```

## 69.6 Printing the title, etc. in print form

The following are for printing the title, etc. in a titlepage or a titlingpage in print form:

**for PRINT output:** `8182 \begin{warpprint}`

`\printtitle`

```
8183 \newcommand*{\printtitle}{{\Huge\@title}}
```

`\printauthor` Print mode.

```
8184 \newcommand*\printauthor
8185   {\large\begin{tabular}[t]{c}\@author\end{tabular}}
```

`\printdate`

```
8186 \newcommand*\printdate{\small\textit{\@date}}
8187 \end{warpprint}
```

## 69.7 `\maketitle` for HTML output

An HTML `<div>` of class `titlepage` is used.

`\thanks` are a form of footnotes used in the title page. See section 60 for other kinds of footnotes.

See `\thanksmarkseries{series}`, below, to set the style of the footnote marks.

**for HTML output:** 8188 `\begin{warppHTML}`

```
8189 \IfClassLoadedTF{memoir}
8190 {
8191   \newcommand{\LWR@setfootnoteseries}{%
8192     \renewcommand\thefootnote{\@arabic\c@footnote}%
8193   }
8194 }{% not memoir
8195 \if@titlepage
8196   \newcommand{\LWR@setfootnoteseries}{%
8197     \renewcommand\thefootnote{\@arabic\c@footnote}%
8198   }
8199 \else
8200   \newcommand{\LWR@setfootnoteseries}{%
8201     \renewcommand\thefootnote{\@fnsymbol\c@footnote}%
8202   }
8203 \fi
8204 }{% not memoir
```

`\LWR@maketitlesetup` Patches `\thanks` macros.

```
8205 \newcommand*\LWR@maketitlesetup}{%
```

Redefine the footnote mark:

```
8206 \LWR@setfootnoteseries%
8207 \def\@makefnmark{%
8208   \textsuperscript{\thefootnote}%
8209 }
```

`\thefootnote`  $\Rightarrow$  `\nameuse{arabic}{footnote}`, or  
`\thefootnote`  $\Rightarrow$  `\nameuse{fnsymbol}{footnote}`

Redefine the footnote text:

```
8210 \long\def\@makefntext##1{%
```

Make the footnote mark and some extra horizontal space for the tags:

```
8211 \textsuperscript{\@thefnmark}~%
```

```
\makethanksmark ⇒ \thanksfootmark ⇒ \tmark ⇒
\@thefnmark ⇒ \itshape a (or similar)
```

Print the text:

```
8212 {##1}%
```

```
8213 }%
```

```
8214 }
```

```
\@fnsymbol {<counter>}
```

Re-defined to use an HTML entity for the double vertical bar symbol. The original definition used `\textbar` which was not being seen by *pdftotext*.

```
8215 \def\LWR@HTML@fnsymbol#1{%
8216   \ifcase#1\or * \or

8224   \HTMLentity{Dagger} \HTMLentity{Dagger} \else
8225   \@ctrerr \fi%
8226 }
8227 \LWR@formatted{@fnsymbol}
```

`\maketitle` HTML mode. Creates an HTML titlepage div and typesets the title, etc.

Code from the titling package is adapted, simplified, and modified for HTML output.

The name `\LWR@maketitle` is used to preserve its definition in case a later package overwrites `\maketitle`.

```
8228 \newcommand*{\LWR@maketitle}{%
```

An HTML titlepage `<div>` is used for all classes.

```
8229 \begin{titlepage}

Typeset the title, etc:

```
8231 \@maketitle
```

Immediately generate any `\thanks` footnotes:

```
8232 \LWR@stoppars \@thanks \LWR@startpars
```

Close the HTML titlepage div and cleanup:

```

8233 \end{titlepage}
8234 \setcounter{footnote}{0}%
8235 \global\let\thanks\relax
8236 \global\let\maketitle\relax
8237 \global\let\@maketitle\relax
8238 \global\let\@thanks\@empty
8239 \global\let\@author\@empty
8240 \global\let\@date\@empty
8241 \global\let\@title\@empty

8245 \global\let\and\relax
8246 }
8247
8248 \LetLtxMacro\maketitle\LWR@maketitle

```

`\@maketitle` HTML mode. Typesets the title, etc.:

```

8249 \providecommand*\@maketitle{}
8250 \renewrobustcmd*\@maketitle{%
8251     \LWR@stoppars%
8252     \LWR@htmltag{\LWR@tagtitle}%

8254     \LWR@htmltag{\LWR@tagtitleend}%
8255     \LWR@startpars%
8256     \begin{BlockClass}{author}%

```

For IEEEtran class:

```

8257     \renewcommand*\cr{}%
8258     \renewcommand*\crrc{}%
8259     \renewcommand*\noalign{}%

8260     \renewcommand{\and}{%

8262         \begin{BlockClass}{oneauthor}%
8263     }%
8264     \begin{BlockClass}{oneauthor}%
8265         \@author%
8266     \end{BlockClass}%
8267 \end{BlockClass}%
8268 \begin{BlockClass}{titledate}%
8269     \@date%
8270 \end{BlockClass}%
8271 }

```

`\LWR@titlingmaketitle` `\maketitle` for use inside an HTML titlingpage environment.

```

8272 \newcommand*\LWR@titlingmaketitle{%

```

Keep pending footnotes out of the title block:

```

8273 \LWR@stoppars\@thanks\LWR@startpars

```

Set up special patches:

```
8274 \LWR@maketitlesetup
```

Typeset the title, etc:

```
8275 \@maketitle
```

Immediately generate any \thanks footnotes:

```
8276 \LWR@stoppars\@thanks\LWR@startpars
8277 }
```

```
8278 \end{warphTML}
```

## 69.8 \published and \subtitle

`\subtitle` and `\published` To add `\subtitle` and `\published` to the titlepage, load the titling package and use `\AddSubtitlePublished` in the preamble.

The default `lwarp.css` has definitions for the `published` and `subtitle` classes.

If `titling` is loaded, `\AddSubtitlePublished` creates a number of additional macros, and also assigns some of the `titling` hooks. If `titling` is not loaded, `\AddSubtitlePublished` creates null macros.

 **titling hooks** Do not use `\AddSubtitlePublished` if the user has patched the `titling` hooks for some other reason. Portions are marked `\warpprintonly` to reduce extra tags in HTML. Similarly, `BlockClass` has no effect in print mode. Thus, the following may be marked `warparll`.

**for HTML & PRINT:** 8279 `\begin{warparll}`

`\AddSubtitlePublished` Adds `\published` and `\subtitle`, and related.

```
8280 \newcommand*\AddSubtitlePublished{%
8281 \IfPackageLoadedTF{titling}{% yes titling package
8282   \newcommand{\@published}{}%
8283   \newcommand{\published}[1]{\gdef\@published{##1}}%

8287     \begin{BlockClass}{published}%
8288     \warpprintonly{\large\itshape}%
8289     \@published%
8290     \end{BlockClass}%
8291     \warpprintonly{\end{center}}%
8292   }%
8293   \newcommand{\@subtitle}{}%

## 70 Abstract

The following code replaces the L<sup>A</sup>T<sub>E</sub>X default, and will itself be replaced later if the abstract package is loaded.

**for HTML output:** 8315 \begin{warppHTML}

\abstractname User-redefinable title for the abstract.

Also over-written by the babel package.

```
8316 \providecommand*\abstractname{Abstract}
```

Some classes allow an optional name, so it is allowed here.

## 71 Quote and verse

### 71.1 Attributions

\attribution {<name>}

For use with quote, quotation, verse:

Ex: "A quotation." \attribution{\textsc{Author Name}\textsl{Book Title}}

```
for HTML & PRINT: 8327 \begin{warpall}
8328 \newcommand{\attribution}[1]{
8329   \begin{flushright}
8330   \unskip
8331   #1
8332   \end{flushright}%
8333 }
8334 \end{warpall}
```

```
for HTML output: 8335 \begin{warpHTML}
8336 \newcommand{\LWR@HTML@attribution}[1]{%
8337   \LWR@stoppars%
8338   \begin{BlockClass}{attribution}

8341   \LWR@startpars%
8342 }
8343 \LWR@formatted{attribution}
8344 \end{warpHTML}
```

## 71.2 Quotes, quotations

```
for HTML output: 8345 \begin{warpHTML}
```

```
8346 \newenvironment*{\LWR@HTML@quote}
8347 {
8348   \LWR@forcenewpage

8350 }
8351 {\LWR@htmlblocktag{/blockquote}}
8352
8353 \LWR@formattedenv{quote}
```

8358 }
8359 {\LWR@htmlblocktag{/blockquote}}
8360
8361 \LWR@formattedenv{quotation}

8362 \end{warpHTML}
```

## 71.3 Verse

When using verse or memoir, always place a \\ after each line.

`\attrib` The documentation for the `verse` and `memoir` packages suggest defining an `\attrib` command, which may already exist in current documents, but it will only work for print output. `lwarp` provides `\attribution`, which works for both print and HTML output. To combine the two so that `\attrib` is used for print and `\attribution` is used for HTML:

```
\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}
```

`\leftskip` (*Len*) These lengths are used by `verse` and `memoir` to control the left margin, and they may already be set by the user for print output. New lengths `\HTMLleftskip` and `\HTMLleftmargini` are provided to control the margins in HTML output. These new lengths may be set by the user before any `verse` environment, and persist until they are manually changed again. One reason to change `\HTMLleftmargini` is if there is a wide `\flagverse` in use, such as the word “Chorus”, in which case the value of `\HTMLleftmargini` should be set to a wide enough length to contain “Chorus”. The default is wide enough for a stanza number.

⚠ **spacing** Horizontal spacing relies on *pdftotext*’s ability to discern the layout (`-layout` option) of the text in the HTML-tagged PDF output. For some settings of `\HTMLleftmargini` or `\HTMLleftskip` the horizontal alignment may not work out exactly, in which

⚠ **verse margin** case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

### 71.3.1 L<sup>A</sup>T<sub>E</sub>X core verse environment

**for HTML output:** 8363 `\begin{warpHTML}`

`verse` (*env*)

```
8364 \newenvironment{LWR@HTML@verse}
8365     {\let\\newline% lwarp
8366     \list{}{\itemsep \z@
8367     \itemindent -1.5em%
8368     \listparindent\itemindent
8369     \rightmargin \leftmargin
8370     \advance\leftmargin 1.5em}%
8371     \item\relax}
8372     {\endlist}
8373
8374 \LWR@formattedenv{verse}

8375 \end{warpHTML}
```

**for HTML & PRINT:** 8376 `\begin{warpall}`

### 71.3.2 verse and memoir

The following lengths are used by `verse` and `memoir`. They may be set in either print or HTML output, but are only used in HTML. This allows the user to set `\leftskip` and `\leftmargini` for print output, and optionally select different values for HTML.

`\HTMLvleftskip` (*Len*) Sets `\vleftskip` inside a verse environment in HTML.

```
8377 \newlength{\HTMLvleftskip}
8378 \setlength{\HTMLvleftskip}{1em}
```

`\HTMLleftmargini` (*Len*) Sets `\leftmargini` inside a verse environment in HTML.

```
8379 \newlength{\HTMLleftmargini}
8380 \setlength{\HTMLleftmargini}{4.5em}

8381 \end{warpall}
```

## 72 Verbatim and tabbing

**for HTML & PRINT:** 8382 `\begin{warpall}`

`\VerbatimHTMLWidth` (*Len*) Width to use in HTML Verbatim environment.

This width is used when placing line numbers to the right. Ignored during print output.

```
8383 \newlength{\VerbatimHTMLWidth}

## 73 Theorems

`\newtheorem {<text> [<counter>] — or — [<oldname>] {<text>}`

- The entire theorem is placed into a <div> of class theoremcontents.
- The label for each theorem is placed inside a <span> of class theoremLabel.
- The contents are placed inside a <div> of class theoremcontents.

## 74 Lists

The environments `itemize`, `enumerate`, and `description` are patched when `lwarp` is started. These patches support the standard L<sup>A</sup>T<sub>E</sub>X environments, as well as those of `enumerate`, `enumitem`, and `paralist`, and at least the French version of `babel`. Additional patches are done on a package-specific basis.

The L<sup>A</sup>T<sub>E</sub>X source for `itemize` and `enumerate` are found in `source2e`, but the source for `description` is found in `article.cls`, etc.

**empty item** To have an empty item, use `\mbox{}` or a trailing backslash. This forces a new line in print output, matching the new line which will appear in HTML output. Ex:

---

```

begin{itemize}
item \mbox{}
  \begin{itemize}
...
  \end{itemize}
item \

```

```

\begin{itemize}
...
\end{itemize}

```

`\makelabel` While inside a list environment, `lwarp` nullifies a number of TeX horizontal skip and fill commands, allowing the user to define `\makelabel` for print mode while HTML mode ignores those commands.

 **label font** When defining `\makelabel` in a list environment, use `\textbf` etc. instead of `\bfseries`.

## 74.5 Patching the lists

`\LWR@patchlists` Patches list environments.

`\LWR@patchlists` remembers `\item` as defined by whatever packages have been loaded, then patches the `itemize`, `enumerate`, and `description` environments and `\item`. This works with the native L<sup>A</sup>T<sub>E</sub>X environments, as well as those provided by `enumitem`, `enumerate`, and `paralist`.

```

## 75 Tabular

This is arguably the most complicated part of the entire package. Numerous tricks are employed to handle the syntax of the L<sup>A</sup>T<sub>E</sub>X core and the various tabular-related packages.

### 75.1 Limitations

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, multirows, siunitx S columns, or the packages multirow, longtable, supertabular, or xtab.

#### Defining macros and environments:

- When defining environments or macros which include tabular and instances of the & character, it may be necessary to make & active before the environment or macro is defined, then restore & to its default catcode after, using the following commands. These are ignored in print mode.

```
\StartDefiningTabulars
<define macros or environments using tabular and &
here>
\StopDefiningTabulars
```

This includes before and after defining any macro which used \ttabbox from floatrow.

- When creating a new environment which contains a tabular environment, lwarp's emulation of the tabular does not automatically resume when the containing environment ends, resulting in corrupted HTML rows. To fix this, use \ResumeTabular as follows. This is ignored in print mode.

```
\StartDefiningTabulars % (& is used in a
definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars
```

#### For developers:

- To automate the use of \StartDefiningTabulars and \EndDefiningTabulars, these macros may be embedded inside an HTML environment definition to automatically change the catcode of & before absorbing the arguments. Another environment may be embedded as well.

⚠ Misplaced alignment  
tab character &

⚠ floatrow

⚠ tabular inside another  
environment

```

% Does the work after the catcode has been changed:
\newcommand*{\LWR@HTML@subsomename}[2]{%
  . . .
  \otherenvironmentname [<args>] {<args>} % for
  example
}
% Change catcode before absorbing arguments:
\newcommand*{\LWR@HTML@somename{%
  \StartDefiningTabulars
  \LWR@HTML@subsomename
}
% Change catcode again at the end:
\newcommand*{\LWR@HTML@endsomename}{%
  . . .
  \endotherenvironmentname % for example
  \StopDefiningTabulars
}
% Combine with the existing print definition:
\LWR@formattedenv{somename}

```

**Cell contents:****⚠ macro in a table**

- Using a custom macro inside a tabular data cell may result in an extra HTML data cell tag, corrupting the HTML table. To avoid this, use `\TabularMacro` just before the macro. This is ignored in print mode.

```
\TabularMacro\somemacro & more row contents \
```

**Column specifiers:****⚠ math**

- Due to the way math is gathered for processing, column specifiers such as `>{$}c<{$}` do not work with `lwarp`. Instead, each cell must specify math mode individually.

**@ and !**

- Only one each of `@` and `!` is used at each column, and they are used in that order.

**\multirow**

- In `\multirow` cells, the print version may have extra instances of `<`, `>`, `@`, and `!` cells on the second and later rows in the `\multirow` which do not appear in the HTML version.

**⚠ \newcolumntype**

- If `\newcolumntype` does not work for HTML, add a simplified column type using `\HTMLnewcolumntype`.

**font and alignment**

- `lwarp` detects each of the following, and sets HTML CSS appropriately:
  - `>{\centering\arraybackslash}`
  - `>{\raggedright\arraybackslash}`
  - `>{\raggedleft\arraybackslash}`
  - `>{\itshape}`
  - `>{\bfseries}`
  - `>{\bfseries\itshape}`

These may be used with `\newcolumntype`, such as:

```
\newcolumntype{P}[1]{>{\centering\arraybackslash}p{#1}}
```

**Rules:****vertical rules**

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.
- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

**width and trim**

- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with @ or ! columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

**combined rules**

- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:

```
\cmidrule{2-3} \[-2ex]
```

```
\bottomrule
```

The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warppHTML` environment, if a “Misplaced `\noalign`” error occurs, change

```
This & That \endhead
```

to

```
\warpprintonly{This & That \endhead}
```

and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevant to HTML output.

⚠ `\warpprintonly`

⚠ Misplaced `\noalign`

**Other:**

- `tabularx` ignores the width, but X columns do produce paragraph columns or multicolumns.

**longtable headings**

- For `longtable`, place headings and footings which do not apply to HTML inside `\warpprintonly\{\}`.

⚠ S columns

- For S columns (from the `siunitx` package), while producing print output, anything non-numeric must be placed inside `{ }` braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by `lwarp`'s tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:

```
\warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
```

```
\warppHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
```

- In  $\LaTeX$ , a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

for HTML output: `8747 \begin{warppHTML}`

## 75.2 Temporary package-related macros

These macros are temporary placeholders for macros defined by various packages. If the relevant package is not loaded, these placeholders are used instead.

### 75.2.1 `arydshln`

Emulated by the original  $\LaTeX$  non-dashed versions.

⚠ `tabular` inside a `<span>`

```

8748 \LetLtxMacro\hdashline\hline
8749 \LetLtxMacro\cdashline\cline
8750 \LetLtxMacro\firsthdashline\hline
8751 \LetLtxMacro\lasthdashline\hline

```

### 75.3 Token lookahead

Used by `\LWR@futurenonpacelet` to look at the next token.

`\LWR@mynexttoken`

```
8752 \newcommand\LWR@mynexttoken\relax
```

`\LWR@futurenonpacelet` `\futurelet` copies the next token then executes a function to analyze it.

`\LWR@futurenonpacelet` does the same, but ignores intervening spaces and paragraphs.

Based on the `booktabs` style:

```

8753 \def\LWR@futurenonpacelet#1{\def\LWR@cs{#1}%
8754 \afterassignment\LWR@fnslone\let\nexttoken= }
8755
8756 \def\LWR@fnslone{\expandafter\futurelet\LWR@cs\LWR@fnsltwo}
8757
8758 \def\LWR@fnsltwo{%
8759   \expandafter\ifx\LWR@cs\sptoken%
8760     \let\next=LWR@fnslthree%
8761   \else%
8762     \expandafter\ifx\LWR@cs\par%
8763     \let\next=LWR@fnslthree%
8764   \else%
8765     \let\next=\nexttoken%
8766   \fi%
8767   \fi\next}
8768
8769 \def\LWR@fnslthree{\afterassignment\LWR@fnslone\let\next= }

```

`\LWR@getmynexttoken` Looks ahead and copies the next token into `\LWR@mynexttoken`.

```

8770 \newcommand*\LWR@getmynexttoken){%
8771   \LWR@traceinfo{LWR@getmynexttoken)%

```

Nothing must follow this next line:

```

8772   \LWR@futurenonpacelet\LWR@mynexttoken\LWR@tabledatacolumnntag
8773 }

```

### 75.4 Tabular variables

In order to support nested tabulars, each of these is used locally. For local counters, `etoolbox`'s `\defcounter` and `lwarp`'s new `\defaddtocounter` are used.

`LWR@startedrow` (*bool*) True if should print a row tag before this column.

```
8774 \newbool{LWR@startedrow}
8775 \boolfalse{LWR@startedrow}
```

LWR@tabularcelladded (*bool*) True if have added a data cell for this position.

```
8776 \newbool{LWR@tabularcelladded}
8777 \boolfalse{LWR@tabularcelladded}
```

LWR@hlines (*Ptr*) Number of \hlines or \midrules above the next row.

```
8778 \newcounter{LWR@hlines}
```

LWR@hdashedlines (*Ptr*) Number of \arydshln dashed lines above the next row.

```
8779 \newcounter{LWR@hdashedlines}
```

LWR@doingtbrule (*bool*) True if the next row will have a top/bottom rule above it.

```
8780 \newbool{LWR@doingtbrule}
8781 \boolfalse{LWR@doingtbrule}
```

LWR@doingcmidrule (*bool*) True if the next row will have a cmidrule above it.

This is used by \LWR@tabularfinishrow to force a final empty row to create the border for the \cmidrule.

```
8782 \newbool{LWR@doingcmidrule}
8783 \boolfalse{LWR@doingcmidrule}
```

LWR@tableparcell (*bool*) True if are handling a paragraph inside a table cell, so must close the paragraph tag before moving on.

```
8784 \newbool{LWR@tableparcell}
```

LWR@skippingmrowcell (*bool*) True if are doing an empty \multirow cell, and thus there is no data tag to close.

```
8785 \newbool{LWR@skippingmrowcell}
```

LWR@skippingmcolrowcell (*bool*) True if are doing an empty \multicolumnrow cell, and thus there is no data tag to close, and do not print @ and ! columns.

```
8786 \newbool{LWR@skippingmcolrowcell}
```

LWR@usedmultirow (*bool*) Used to error if used \multirow or \multicolumnrow without using \mrowcell or \mcolrowcell.

```
8787 \newbool{LWR@usedmultirow}
```

LWR@foundmrowcell (*bool*) Used to error if used \multirow or \multicolumnrow without using \mrowcell or \mcolrowcell.

```
8788 \newbool{LWR@foundmrowcell}
```

LWR@skipatbang (*bool*) True if just finished a \multicolumn so should not create the trailing @ or ! columns table data cells.

```
8789 \newbool{LWR@skipatbang}
```

`LWR@emptyatbang` (*bool*) True if finishing a row and should print empty @ or ! column table data cells.

```
8790 \newbool{LWR@emptyatbang}
```

`LWR@intabularmetadata` (*bool*) True if are in a tabular but not in a data cell. Used to prevent extra HTML breaks if not inside table data.

```
8791 \newbool{LWR@intabularmetadata}
8792 \boolfalse{LWR@intabularmetadata}
```

`LWR@exitingtabular` (*bool*) When `\end` is found, turns off the next opening data tag.

```
8793 \newbool{LWR@exitingtabular}
```

`LWR@tabularmutemods` (*bool*) Mutes HTML output for @, !, < and >.

This is used while printing the final row to generate `\bottomrules`.

```
8794 \newbool{LWR@tabularmutemods}
```

`LWR@tabularfinalrow` (*bool*) Used to set `aria-hidden` if adding a final row for the purpose of adding the bottom border.

```
8795 \newbool{LWR@tabularfinalrow}
```

`LWR@validtablecol` (*bool*) True if found a valid table column type.

```
8796 \newbool{LWR@validtablecol}
```

`LWR@opttablecol` (*bool*) True if found a table column optional argument.

```
8797 \newbool{LWR@opttablecol}
```

Used to add a style to a table data cell:

```
8798 \newbool{LWR@tdhavecellstyle}
```

`LWR@tabularDepth` (*Ctr*) Tracks whether & is being used inside a tabular.

```
8799 \newcounter{LWR@tabulardepth}
8800 \setcounter{LWR@tabulardepth}{0}
```

`LWR@tabularpardepth` (*Ctr*) Tracks whether should look ahead at the next token when encountering a `\par` while processing tabular contents.

When `LWR@tabularpardepth` is deeper than `LWR@tabulardepth` then `lwarp` has started looking at the contents of the tabular, and thus any `\pars` encountered must be followed by another token `lookahead`.

```
8801 \newcounter{LWR@tabularpardepth}
8802 \setcounter{LWR@tabularpardepth}{0}
```

```
8803 \newcommand*{\LWR@colsresult}{}%temp storage for column format results
```

```
8804 \newcommand*{\LWR@pposition}{}
```

```
8805 \newcommand*{\LWR@pleft}{}
```

```
8806 \newcommand*{\LWR@pright}{}
```

`LWR@tablecolspec` Holds the parsed column specification, of total width `LWR@tabletotalLaTeXcols`, not counting `@` and `!` columns.

Will contain a string such as `llrrccpc`, exactly one letter per `LATEX` table column, without `@`, `!`, `>`, `<`, or the vertical bar.

`\LWR@strresult` Holds the result of `Str` functions.

```
8807 \providecommand*\LWR@strresult{}
8808 \providecommand*\LWR@strresulttwo{}
```

`\LWR@origcolspec` Holds the original column specs given to `tabular`.

```
8809 \newcommand*\LWR@origcolspec{}
```

`LWR@tablecolspecwidth` (*Ctr*) Holds the number of tokens in the table columns specification.

This includes one for each `@`, `!`, `<`, `>` column, and also one for each of the parameters of `p`, `@`, `!`, `<`, `>` columns, and three for each `D` column.

(This is not the total # of `LATEX` columns in the table.)

```
8810 \newcounter{LWR@tablecolspecwidth}
```

`LWR@tablecolspecindex` (*Ctr*) While parsing the `LATEX` table column specification, starts at 1 and is incremented per token of the specification.

```
8811 \newcounter{LWR@tablecolspecindex}
```

`LWR@tableLaTeXcolindex` (*Ctr*) While producing the table, resets to 1 at the start of the table and also at each end of line, and is incremented by 1 by each ampersand.

```
8812 \newcounter{LWR@tableLaTeXcolindex}
```

`LWR@tabletotalLaTeXcols` (*Ctr*) While parsing a table column specification, begins at 0 and increments by 1 per `LATEX` table column. Eventually holds the final number of `LATEX` table columns in each row, not counting `@` and `!` columns. (In `HTML`, `@` and `!` cells become their own columns, but are not included in `LWR@tabletotalLaTeXcols`.)

```
8813 \newcounter{LWR@tabletotalLaTeXcols}
```

`LWR@tabletotalLaTeXcolsnext` (*Ctr*) Holds the next `LATEX` table column index while parsing, equal to one more than `LWR@tabletotalLaTeXcols`.

```
8814 \newcounter{LWR@tabletotalLaTeXcolsnext}
```

`LWR@colatspec` A data array of specifications for `@` columns. The leftmost's index is `leftedge`, the others are counter values. See section 42.

`LWR@colbangspec` A data array of specifications for `!` columns. The leftmost's index is `leftedge`, the others are counter values. See section 42.

`LWR@colbeforespec` A data array of specifications for `>` columns.

`LWR@colafterspec` A data array of specifications for `<` columns.

LWR@colbarspec A data array of specifications for vertical rules.

LWR@coladdclass A data array of extra css class, as set by >.

LWR@cellcolordepth (*Ctr*) Counts how many cell color <div>s were added to the current tabular data cell.

```
8815 \newcounter{LWR@cellcolordepth}
```

#### 75.4.1 Multicolumn variables

```
8816 \newcounter{LWR@tablemulticolwidth}
```

Indexes into the multicolumn specification:

```
8817 \newcounter{LWR@tablemulticolspos}
```

Remembers multicolumn vertical rules if found in the column spec.

```
8818 \newcounter{LWR@mcolvertbarsl}
8819 \newcounter{LWR@mcolvertbarsr}
8820 \newcounter{LWR@mcolvertbarsldash}
8821 \newcounter{LWR@mcolvertbarsrdash}
8822 \newbool{LWR@mcolvertbaronleft}
```

#### 75.4.2 Longtable variables

LWR@starredlongtable (*bool*) Per the caption package, step the counter if longtable\*.

```
8823 \newbool{LWR@starredlongtable}
8824 \boolfalse{LWR@starredlongtable}
```

#### 75.4.3 Midrule variables

LWR@midrulecounter (*Ctr*) Indexes across the LWR@midrules and LWR@trim<l/r>rules data arrays.

```
8825 \newcounter{LWR@midrulecounter}
```

### 75.5.1 Handling &

**for HTML output:** 8880 \begin{warpHTML}

& Will behave depending on whether it is being used inside tabular.

& is redefined to test whether it is inside a tabular environment, in which case it performs special processing for HTML conversion. If not, it behaves normally.

8881 \newcommand*\LWR@tabularampersand{}%
8882     \LWR@traceinfo{LWR@tabularampersand}%
8883     \ifnumcomp{\value{LWR@tabulardepth}}{>}{0}%

```

Have not yet added data in this column:

```

Look at the next token to decide multi or single column data tag.

```

8889     \LWR@getmynexttoken%

```

If not inside a tabular, performs the original action:

```
8891   {%
8892     \LWR@origampmacro%
8893   }%
8894 }
```

& is left with its original catcode for now.

tikz package seems to require & be left alone until after tikz has been loaded. Also, cleveref uses the ampersand in one of its options.

& is made active inside a tabular.

& is left alone when in math alignments.

## 75.6 Filling an unfinished row

`\LWR@tabularfinishrow` Adds empty table cells if necessary to finish the row.

At the end of the table, if any bottom rules are requested then an empty row must be generated to form the borders which show the rules.

```
8895 \newcommand*{\LWR@tabularfinishrow}{%
```

If not exiting the tabular, or doing a rule, or have already started a row, finish this row:

```
8896   \ifboolexpr{%
8897     not bool {LWR@exitingtabular} or%
8898     bool{LWR@doingtbrule} or%
8899     bool{LWR@doingcmidrule} or%
8900     test{\ifnumcomp{\value{LWR@hlines}}{>}{0}} or%
8901     test{\ifnumcomp{\value{LWR@hdashedlines}}{>}{0}} or%
8902     bool{LWR@startedrow}%
8903   }%
```

Temporarily turn off `LWR@exitingtabular` so that table data tags will still be generated.

If generating a final row for the `\bottomrule` borders, turn off the @, !, <, and > column output:

```
8904   \ifbool{LWR@exitingtabular}{%
8905     \booltrue{LWR@tabularmutemods}%
8906   }{%
8907     \boolfalse{LWR@tabularmutemods}%
8908   }%
```

Locally reenable the table data tags until finished with the final row:

```
8909   \boolfalse{LWR@exitingtabular}%
```

Generate table data tags and ampersands until the right edge:

```
8910   \whileboolexpr{%
```

```

8911     test {
8912         \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
8913             {\value{LWR@tabletotalLaTeXcols}}
8914     } or %
8915     (%
8916         bool{LWR@intabularmetadata} and%
8917         not bool{LWR@tabularcelladded} and%
8918         test {
8919             \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{=}
8920                 {\value{LWR@tabletotalLaTeXcols}}
8921         }%
8922     )%
8923 }%
8924 {%
8925     \LWR@tabulatedatasinglecolumnntag%

```

The following is essentially `\LWR@tabularampersand` with `LWR@emptyatbang` added to empty the following cells:

```

8926     \LWR@closetabledatacell%
8927     \defaddtocounter{LWR@tableLaTeXcolindex}{1}%
8928     \global\boolfalse{LWR@tabularcelladded}%
8929     \booltrue{LWR@emptyatbang}%

```

Starts the next cell:

```

8930     \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
8931         {\value{LWR@tabletotalLaTeXcols}}%
8932         {\LWR@getmynexttoken}%
8933     }%
8934 }%

```

Reenable the original `LWR@exitingtabular` to close the entire table:

```

8935     \ifbool{LWR@tabularmutemods}{%
8936         \booltrue{LWR@exitingtabular}%
8937     }{%
8938         \boolfalse{LWR@exitingtabular}%
8939     }%
8940     \boolfalse{LWR@tabularmutemods}%

8941     \boolfalse{LWR@emptyatbang}%
8942     }{% ifboolexpr
8943 }

```

## 75.7 Handling `\`

Inside `tabular`, `\` is redefined to `\LWR@tabularendofline`

Throws away options `\\[dim]` or `\\*`

```
\LWR@tabularendofline
```

```

### 75.14 Parsing the column specifications

 **tabular baselines** HTML CSS cannot exactly match the L<sup>A</sup>T<sub>E</sub>X concept of a baseline for a table row. Table 13 shows the L<sup>A</sup>T<sub>E</sub>X results for various vertical-alignment choices, with the baseline of the first column drawn across all the columns for comparison. See the p column specification in table 14 for details.

Table 14 describes how each kind of column is converted to HTML.

Table 15 shows the various internal macros generated for each column type.

`\LWR@modifycolumnntype`  $\{\langle 1: column type letter \rangle\} \{\langle 2: number args to ignore \rangle\} \{\langle 3: csname of the cell action \rangle\} \{\langle 4: csname of the multicolumn print type action \rangle\} \{\langle 5: csname of the multicolumn print data action \rangle\}$

Add HTML functionality to an existing print version column type.

Table 14: Tabular HTML column conversions

Each cell is given a css class of `td<column type>`.

---

- l, r, c:** Converted to table cells without paragraph tags.  
Uses css `vertical-align:middle` so that top or bottom-aligned cells may go above or below this cell.
  - p:** Converted to table cells with paragraph tags. Ref: Table 13,  $\LaTeX$  places the top line of a parbox aligned with the rest of the text line, so css `vertical-align:bottom` is used to have the HTML result appear with the paragraph extending below the L, R, C cells at the middle, if possible. This may be confusing as a P cell may not top-align with an L,R,C cell in the HTML conversion, especially in the presence of a B cell, and two P cells side-by-side will be aligned at the bottom instead of the top. Some adjustment of the css may be desired, changing `td.tdp`, `td.tdP`, `td.tdprule`, and `td.tdPrule` to `vertical-align: middle`. Another possibility is to change L,R,C, and P to `vertical-align: top` and not worry about the alignment of B and M cells or trying to approximate  $\LaTeX$  baselines.
  - m:** With paragraph tags, css `vertical-align:middle`.
  - b:** With paragraph tags, css `vertical-align: top` so that the bottom of the text is closest to the middle of the text line.
  - w and W:** Converted to `l`, `c`, or `r`. No paragraph tags.
  - P, M, B:** Horizontally-centered versions.
  - S:** Treated as '`c`'. Ignores optional argument. From the `siunitx` package.
  - D:** Treated as '`c`'. From the `dcolumn` package.
  - @, !, >, <:** One each, in that order.
  - |:** Vertical rule.
  - Unknown:** Converted to '`l`'.
  - \newcolumn type:** Expands to its replacement text.
  - \HTMLnewcolumn type:** Provides simplified replacement text for HTML.
-

`\HTMLnewcolumnntype {<col type>} [<num args>] [<optional arg>] {<replacement text>}`

A user-level macro to creates an HTML version of the replacement text for the column type.

This is the equivalent to:

```

\newcommand*{\LWR@HTML@NC@rewrite@<columnntype>}[<num args>]
  {\NC@find <replacement text>}
\LWR@formatted{NC@rewrite@<columnntype>}

```

**for HTML output:** 9236 \begin{warpHTML}

```
\LWR@parsetablecols {<colspecs>}

Scans the column specification left to right.

Builds \LWR@tablecolspec with the final specification, one L<sup>A</sup>T<sub>E</sub>X column per entry. The final number of L<sup>A</sup>T<sub>E</sub>X columns in each row is stored in LWR@tabletotalLaTeXcols, which is the number of & and \ in each line, but which does not include @, !, <, > specifications in the count.

```
9237 \newcommand*\LWR@parsetablecols}[1]{%
9238   \LWR@traceinfo{\LWR@parsetablecols}%

```

Remember the original supplied column spec:

```
9239   \renewcommand*\LWR@origcolspec}{#1}%

```

Remove spaces:

```
9240   \expandarg%
9241   \StrSubstitute{\LWR@origcolspec}{ }{ }[\LWR@origcolspec]%

```

Expand any star columns:

```
9242   \LWR@expandpreamble{\LWR@origcolspec}%
9243   \edef\LWR@origcolspec{\the\@temptokena}%

```

The parsed column spec data array, LWR@tablecolspec, will be overwritten with new values.

Total number of columns found so far. Also pre-initialize the first several columns of specs:

```
9244   \defcounter{\LWR@tabletotalLaTeXcols}{0}%

```

Starting at the first column specification:

```
9267 \defcounter{LWR@tablecolspecindex}{1}%
```

Place the colspecs string length into `\LWR@strresult`, and remember the number of characters in the column specification:

```

9268 \expandarg%
9269 \StrLen{\LWR@origcolspec}[\LWR@strresult]%
9270 \fullexpandarg%
9271 \LWR@traceinfo{original column spec length: \LWR@strresult}%
9272 \defcounter{LWR@tablecolspecwidth}{\LWR@strresult}%

```

Haven't seen any optional arguments so far

```
9273 \boolfalse{LWR@opttablecol}%
```

Scan through the column specifications:

```

9274 \whileboolexpr{%
9275     not test{%
9276         \ifnumcomp{\value{LWR@tablecolspecindex}}{>}%
9277             {\value{LWR@tablecolspecwidth}}%
9278     }%
9279 }%
9280 {%

```

Place the next single-character column type into `\LWR@strresult`:

```

9281 \expandarg%
9282 \StrChar{\LWR@origcolspec}{\arabic{LWR@tablecolspecindex}}[\LWR@strresult]%
9283 \LWR@traceinfo{position \arabic{LWR@tablecolspecindex}: \LWR@strresult}%
9284 \fullexpandarg%

```

Not yet found a valid column type:

```
9285 \boolfalse{LWR@validtablecol}%
```

Skip over any optional arguments, such as `siunitx S` column:

```
9286 \IfStrEq{\LWR@strresult}[]{\booltrue{LWR@opttablecol}}{%}
```

Throw away anything found inside the optional argument:

```

9287 \ifbool{LWR@opttablecol}%
9288 {}% inside an optional argument
9289 {% not an optional tabular argument

```

Not inside an optional argument, so consider the column type:

```

9290 \ifcsdef{LWR@columnntype@\LWR@strresult}%
9291     {\csuse{LWR@columnntype@\LWR@strresult}}%
9292     {}%

```

If an unknown column type, use l:

```

9293     \ifbool{LWR@validtablecol}{}%
9294         \LWR@traceinfo{invalid column type: \LWR@strresult}%
9295         \LWR@parsenormalcolumn{l}%
9296     }%
9297 }% not an optional column argument

```

If read the closing bracket, no longer inside the optional argument:

```

9298 \IfStrEq{\LWR@strresult}{\boolfalse{LWR@opttablecol}}}%

```

Move to the next character:

```

9299 \defaddtcounter{LWR@tablecolspecindex}{1}%
9300 }% whiledo
9301 }%

```

## 75.15 colortbl and xcolor tabular color support

These macros provide a minimal emulation of some `colortbl` macros which might appear between table cells. If `colortbl` is loaded, these macros will be replaced with functional versions.

For each of the `HTML` colors below, the text for the `HTML` color is set if requested, but the macro is empty if none has been set.

`\rownum` Reserve a counter register.

```

9302 \@ifundefined{rownum}{\newcount\rownum}{}

```

`\@rowcolors` Emulated in case `xcolor` is not used.

```

9303 \newcommand*\@rowcolors{}

```

`\@rowcolrs` Emulated in case `xcolor` is not used.

```

9304 \newcommand*\@rowcolrs{}

```

`\LWR@xcolorrowHTMLcolor` Emulated `xcolor` row color.

```

9305 \newcommand*\LWR@xcolorrowHTMLcolor{}

```

`\LWR@columnHTMLcolor` `HTML`style code for the column color.

```

9306 \def\LWR@columnHTMLcolor{}

```

`\LWR@rowHTMLcolor` `HTML`style code for the row color.

```

9307 \def\LWR@rowHTMLcolor{}

```

`\LWR@cellHTMLcolor` HTMLstyle code for the cell color.

```
9308 \def\LWR@cellHTMLcolor{}
```

`\LWR@ruleHTMLcolor` HTMLstyle code for the rule color.

```
9309 \newcommand*\LWR@ruleHTMLcolor{}
```

`\rowcolor` [*model*] {*color*} [*left overhang*] [*right overhang*] Print version. The HTML version is in `lwarp-colortbl`. Used before starting a tabular data cell, thus `\LWR@getmynexttoken`.

```
9310 \newcommand*\rowcolor{\LWR@getmynexttoken}%
```

`\arrayrulecolor` [*model*] {*color*}

`\arrayrulecolornexttoken` [*model*] {*color*}

Print versions for use outside and inside a tabular:

```
9311 \newcommand{\arrayrulecolor}[2][named]{}
```

```
9312 \newcommand{\arrayrulecolornexttoken}[2][named]{\LWR@getmynexttoken}
```

`\doublerulesepcolor` [*model*] {*color*}

`\doublerulesepcolornexttoken` [*model*] {*color*}

Print versions for use inside and outside a tabular:

```
9313 \newcommand{\doublerulesepcolor}[2][named]{}
```

```
9314 \newcommand{\doublerulesepcolornexttoken}[2][named]{\LWR@getmynexttoken}
```

## 75.16 Starting a new row

`\LWR@maybenewtablerow` If have not yet started a new table row, begin one now. Creates a new row tag, adding a class for `hline` or `tbrule` if necessary.

```
9315 \newcommand*\LWR@maybenewtablerow
```

```
9316 {%
```

```
9317   \ifbool{LWR@startedrow}%
```

```
9318     }% started the row
```

```
9319     {% not started the row
```

Pre-compute the `aria-hidden` attribute, used to hide from screen readers the final row if it is only used to create the bottom border:

```
9320     \ifbool{LWR@tabularfinalrow}%
```

```
9321       {%
```

```
9322         \renewcommand*\LWR@tempone%
```

```
9323           { aria-hidden=\textquotedbl{}true\textquotedbl}%
```

```
9324         }%
```

```
9325       {%
```

```
9326         \renewcommand*\LWR@tempone{}%
```

```
9327       }%
```

Start a new row if doing `\hline`:

```

9328     \ifboolexpr{%
9329         test{\ifnumcomp{\value{LWR@hlines}}{>}{0}} or%
9330         test{\ifnumcomp{\value{LWR@hdashedlines}}{>}{0}}%
9331     }%
9332     {%
9333         \LWR@htmltag{%
9334             tr %
9335                 class=\textquotedbl{}hline\textquotedbl%
9336                 \LWR@tempone% aria-hidden
9337         }%
9338         \LWR@orignewline%

```

Remember that now have started the row, and create the row tag, with a class if necessary.

```

9339         \booltrue{LWR@startedrow}%
9340         \booltrue{LWR@intabularmetadata}%
9341     }%

```

If not doing `\hline`, start a row if doing a top or bottom rule:

```

9342     {% not doing hline
9343         \ifbool{LWR@doingtbrule}%
9344     {%

9349                     \LWR@tempone% aria-hidden
9350             }%
9351         }{%
9352             \LWR@htmltag{%
9353                 tr class=\textquotedbl{}tbrule\textquotedbl\ % space

9356                     \LWR@tempone% aria-hidden
9357             }%
9358         }%
9359         \LWR@orignewline%

```

Remember that now have started the row, and create the row tag, with a class if necessary.

```

9360         \booltrue{LWR@startedrow}%
9361         \booltrue{LWR@intabularmetadata}%
9362     }%
9363     {%

```

If not the final row, start a new row:

```

9364         \ifbool{LWR@tabularfinalrow}%
9365     }%
9366     {%
9367         \LWR@htmltag{tr}\LWR@orignewline%

## 75.17 Printing vertical bar tags

`\LWR@printbartag {<index>}`

Adds to a tabular data cell an HTML class name for a left/right vertical bar.

```

9375 \newcommand*{\LWR@printbartag}[1]{%
9376     \LWR@traceinfo{LWR@printbartag !#1!}%

9382     }% not muting
9383     \LWR@traceinfo{LWR@printbartag done}%
9384 }

```

## 75.18 Printing @ or ! tags

`\LWR@printatbang {<at — or — bang>} {<index>}`

```

9385 \newcommand*{\LWR@printatbang}[2]{%

```

Fetch the column at or bang spec:

## 75.19 Cell opening tag

`\LWR@thiscolspec` Temporary storage.

```

9423 \newcommand*{\LWR@thiscolspec}{}

```

`\LWR@tabledatasinglecolumn` Print a table data opening tag with style for alignment and color.

```

9424 \newcommand*{\LWR@tabledatasinglecolumn}{%
9425     {%
9426         \LWR@traceinfo{LWR@tabledatasinglecolumn}%
9427         \LWR@maybenewtablerow%

```

Don't start a new paragraph tag if have already started one:

```

9428     \ifbool{LWR@intabularmetadata}%
9429     {%

```

If have found the end of tabular command, do not create the next data cell:

```

9430     \ifbool{LWR@exitingtabular}{}%
9431     {% not exiting tabular

```

Print the @ and ! contents before first column:

```

9432     \LWR@tabularleftedge%

```

Fetch the current column's alignment character into \LWR@strresult:

```
9433         \xdef\LWR@strresult{%
9434         \LWR@getexparray{LWR@tablecolspec}{\arabic{LWR@tableLaTeXcolindex}}%
9435         }%
```

Print the start of a new table data cell:

```
9436         \LWR@traceinfo{LWR@tabledatasinglecolumn tag: about to print td tag}%
9437         \LWR@htmltag{%
9438         td class=\textquotedbl{}td%
```

Append this column's spec:

```
9439         \LWR@strresult%
```

If this column has a cmidrule, add "rule" to the end of the HTML class tag. Also add vertical bar tags.

```
9440         \LWR@addcmidruletrim%
9441         \LWR@addleftmostbartag%
9442         \LWR@printbartag{\arabic{LWR@tableLaTeXcolindex}}%
```

Add any tabular > column text alignment or font control css:

```
9443         \LWR@getexparray{LWR@coladdclass}%
9444         {\arabic{LWR@tableLaTeXcolindex}}%
```

Close the class description:

```
9445         \textquotedbl{}%
```

Add styles for rules, alignment:

```
9446         \LWR@tdstartstyles%
9447         \LWR@addcmidrulewidth%
9448         \LWR@addcdashline%

9452         }%
9453         \LWR@addformatwpalignment{\LWR@thiscolspec}%
```

Add styles for cell and rule colors:

```
9454         \LWR@addtabulararrowcolor%
9455         \LWR@addtabularrulecolors%

9456         \LWR@tdendstyles%
9457         }% HTML td
9458         \LWR@traceinfo{LWR@tabledatasinglecolumn tag: done printing td tag}%
```

If this is a p, m, b, or X column, allow paragraphs:

```

## 75.20 Midrules

`LWR@midrules` `LWR@midrules` is a data array (section 42) of columns each containing a non-zero width if a midrule should be created for this column.

`LWR@trimlrules` `LWR@trimlrules` is a data array (section 42) of columns containing `l` if a midrule should be left trimmed for each column.

`LWR@trimrrules` `LWR@trimrrules` is a data array (section 42) of columns containing `r` if a midrule should be right trimmed for each column.

`LWR@cdashlines` `LWR@cdashlines` is a data array (section 42) of columns each containing a `Y` if an `arydshln` package "cdashed line" should be created for this column.

`\LWR@heavyrulewidth` (*Len*) The default width of the rule.

```

9481 \newlength{\LWR@heavyrulewidth}
9482 \setlength{\LWR@heavyrulewidth}{.08em}

```

`\LWR@lightrulewidth` (*Len*) The default width of the rule.

```

9483 \newlength{\LWR@lightrulewidth}

`\LWR@thiscmidrulewidth` (*Len*) The width of the next rule, defaulting to `\LWR@cmidrulewidth`.

If not `\LWR@cmidrulewidth`, a style will be used to generate the custom width.

Assigned from the LWR@midrules array.

```

## 75.22 Multicolumns

### 75.22.1 Parsing multicolumns

`\LWR@printmccoltype@normal` {<col type>}

Prints the column type, and remembers that any vertical bars are no longer on the left edge.

```

9762 \newcommand*{\LWR@printmccoltype@normal}[1]{%
9763   #1%
9764   \boolfalse{\LWR@mcolvertbaronleft}%
9765 }

```

`\LWR@printmccoltype@ignore` {<col type>}

This type does not print a multi-column data cell.

```

9766 \newcommand*{\LWR@printmccoltype@ignore}[1]{%

```

`\LWR@printmccoltype@vertbar` {<col type>}

Adds a left or right vertical bar.

```

9767 \newcommand*{\LWR@printmccoltype@vertbar}[1]{%
9768   \ifbool{\LWR@mcolvertbaronleft}%
9769     {\defaddtocounter{\LWR@mcolvertbarsl}{1}}% left edge
9770     {\defaddtocounter{\LWR@mcolvertbarsr}{1}}% not left edge
9771 }

```

`\LWR@printmccoltype@colon`  $\langle col\ type\rangle$

Adds a left or right vertical bar.

```
9772 \newcommand*\LWR@printmccoltype@colon[1]{%
9773   \ifbool{LWR@mcolvertbaronleft}%
9774     {\defaddtocounter{LWR@mcolvertbarsldash}{1}}% left edge
9775     {\defaddtocounter{LWR@mcolvertbarsrdash}{1}}% not left edge
9776 }
```

`\LWR@printmccoltype@semicolon`  $\langle col\ type\rangle$

Adds a left or right vertical bar.

```
9777 \let\LWR@printmccoltype@semicolon\LWR@printmccoltype@colon
```

`\LWR@printmccoltype`  $\langle colspec\rangle$  Print any valid column type found. Does not print @, !, >, or < columns or their associated tokens.

This is printed as part of the table data tag's class.

`\LWR@columnmtype@mctype@<type>` is defined by `\LWR@modifycolumnmtype`.

```
9778 \newcommand*\LWR@printmccoltype[1]{%
9779   \LWR@traceinfo{lwr@printmccoltype -#1-}%
```

Get one token of the column spec:

```
9780   \StrChar{#1}{\arabic{LWR@tablemulticolspos}}[\LWR@strresult]%
```

Detokenize to avoid problems with special characters:

```
9781   \edef\LWR@strresult{\detokenize\expandafter{\LWR@strresult}}%
```

Add to the HTML tag depending on which column type is found:

```
9782   \ifcdef{LWR@columnmtype@mctype@\LWR@strresult}%
9783     {\csuse{LWR@columnmtype@mctype@\LWR@strresult}}%
9784     {\boolfalse{LWR@mcolvertbaronleft}}%
9785   \LWR@traceinfo{lwr@printmccoltype done}%
9786 }
```

`\LWR@printmccoldata@other`  $\langle num\ args\ to\ skip\rangle$   $\langle entire\ colspec\rangle$

For @, !, >, <, print the next token without paragraph tags:

```
9787 \newcommand*\LWR@printmccoldata@other[2]{%
9788   \defaddtocounter{LWR@tablemulticolspos}{1}%
9789   \StrChar{#2}{\arabic{LWR@tablemulticolspos}}[\LWR@strresult]%
9790   \LWR@strresult%
```

A valid column data type was found:

```
9791   \booltrue{LWR@validtablecol}%
9792 }
```

`\LWR@printmccoldata@skip`  $\langle num\ args\ to\ skip \rangle$   $\langle entire\ colspec \rangle$

Nothing to print for this column type.

```
9793 \newcommand*\LWR@printmccoldata@skip[2]{%
9794   \defaddtocounter{LWR@tablemulticolspos}{#1}%
```

A valid column data type was found:

```
9795   \booltrue{LWR@validtablecol}%
9796 }
```

For `\LWR@printmccoldata@. . .`,  $\langle num\ args\ to\ skip \rangle$  is provided by `\LWR@column@mcdata@<coltype>` when it was defined by `\LWR@modifycolumn@type`. `\entire colspec` is provided by `\LWR@printmccoldata` when it uses `\LWR@column@mcdata@<coltype>`.

`\LWR@printmccoldata@normal`  $\langle num\ args\ to\ skip \rangle$   $\langle entire\ colspec \rangle$

```
9797 \newcommand*\LWR@printmccoldata@normal[2]{%
9798   \LWR@multicoltext%
9799   \defaddtocounter{LWR@tablemulticolspos}{#1}%

```

`\LWR@printmccoldata`  $\langle entire\ colspec \rangle$

Print the data for any valid column type found.

```
9807 \newcommand*\LWR@printmccoldata[1]{%
9808   \LWR@traceinfo{LWR@printmccoldata -#1}%
```

Not yet found a valid column type:

```
9809   \boolfalse{LWR@validtablecol}%

Get one token of the column spec, into a local copy in case nested.

```
9810   \StrChar{#1}{\arabic{LWR@tablemulticolspos}}[\LWR@strresult]%
9811   \edef\LWR@printmccoldata@token{\LWR@strresult}%
```

Print the text depending on which column type is found. Also handles @, >, < as it comes to them.

```
9812   \ifcsdef{LWR@column@mcdata@\LWR@printmccoldata@token}%
9813     {\csuse{LWR@column@mcdata@\LWR@printmccoldata@token}{#1}}%
9814     {}%
```

If an unknown column type, print the text:

```
9815 \ifbool{LWR@validtablecol}{\LWR@multicoltext{}}%
```

Tracing:

```
9816 \LWR@traceinfo{lwr@printmccoldata done}%
9817 }
```

```
\parsemulticolumnalignment {<1: colspec>} {<2: printresults cname>}
```

Scan the multicolumn specification and execute the printfunction for each entry.

Note that the spec for a p{spec} column, or @, >, <, is a token list which will NOT match l, c, r, or p.

```
9818 \newcommand*\LWR@parsemulticolumnalignment}[2]{%

9820 \StrLen{#1}[\LWR@strresult]%

9825 {\value{LWR@tablemulticolwidth}}%

9827 }%
9828 {%
```

Execute the assigned print function for each token in the column spec:

```
9829 \csuse{#2}{#1}%
```

Move to the next token in the column spec:

```
9830 \defaddtocounter{LWR@tablemulticolspos}{1}%

### 75.22.5 Counting HTML tabular columns

The L<sup>A</sup>T<sub>E</sub>X specification for a table includes a number of columns separated by the & character. These columns differ in content from line to line. Additional virtual columns may be specified by the special @ and ! columns. These columns are identical from line to line, but may be skipped during a multicolumn cell.

For HTML output, @ and ! columns are placed into their own tabular columns. Thus, a L<sup>A</sup>T<sub>E</sub>X \multicolumn command may span several additional @ and ! columns in HTML output. These additional columns must be added to the total number of columns spanned by an HTML multi-column data cell.

```

10016 \newcounter{LWR@tabhtmlcolindex}
10017 \newcounter{LWR@tabhtmlcolend}
10018 \newcounter{LWR@tabhtmlcoltotal}

```

\LWR@subtabularhtmlcolumns {<index>}

Factored from \LWR@tabularhtmlcolumns, which follows.

```

10019 \newcommand*{\LWR@subtabularhtmlcolumns}[1]{%

```

Temporarily define a macro equal to the @ specification for this column:

```

10020     \edef\LWR@atbangspec{\LWR@getexparray{LWR@colatspec}{#1}}%

```

If the @ specification is not empty, add to the count:

```

10021     \ifdefempty{\LWR@atbangspec}%
10022     {}%
10023     {\defaddtocounter{LWR@tabhtmlcoltotal}{1}}%

```

Likewise for the ! columns:

```

10024     \edef\LWR@atbangspec{\LWR@getexparray{LWR@colbangspec}{#1}}%
10025     \ifdefempty{\LWR@atbangspec}%
10026     {}%
10027     {\defaddtocounter{LWR@tabhtmlcoltotal}{1}}%
10028 }

```

```
\LWR@tabularhtmlcolumns {<starting LATEX column>} {<number LATEX columns>}
```

Compute the total number of HTML columns being spanned, considering the starting L<sup>A</sup>T<sub>E</sub>X table column and the number of L<sup>A</sup>T<sub>E</sub>X tabular columns being spanned. Any @ and ! columns within this span are included in the total count. The resulting number of HTML columns is returned in the counter LWR@tabhtmlcoltotal.

```
10029 \newcommand*{\LWR@tabularhtmlcolumns}[2]{%
```

Count the starting index, compute ending index, and begin with the count being the L<sup>A</sup>T<sub>E</sub>X span, to which additional @ and ! columns may be added:

```
10030   \defcounter{LWR@tabhtmlcolindex}{#1}%
10031   \defcounter{LWR@tabhtmlcoltotal}{#2}%
10032   \defcounter{LWR@tabhtmlcolend}{#1}%
10033   \defaddtocounter{LWR@tabhtmlcolend}{#2}%
```

If at the left edge, add the at/bang columns for the left edge:

```
10034   \ifnumcomp{\value{LWR@tabhtmlcolindex}}{=}{1}{%
10035     \LWR@subtabularhtmlcolumns{leftedge}%
10036   }{ }%
```

Walk across the L<sup>A</sup>T<sub>E</sub>X columns looking for @ and ! columns:

```
10037   \whileboolexpr{%
10038     test {%
10039     \ifnumcomp{\value{LWR@tabhtmlcolindex}}{<}{\value{LWR@tabhtmlcolend}}}%
10040     }%
10041   }%
10042   {%
10043     \LWR@subtabularhtmlcolumns{\arabic{LWR@tabhtmlcolindex}}%
10044     \defaddtocounter{LWR@tabhtmlcolindex}{1}%
10045   }% whiledo
10046 }
```

```
10047 \end{warpHTML}
```

## 75.23 Multirow if not loaded

A default definition in case multirow is not loaded. This is used during table parsing.

```
10048 \begin{warpHTML}
10049 \newcommand{\multirow}[2][c]{}
10050 \end{warpHTML}
```

## 75.24 Multicolumnrow

A print-mode version is defined here, and is also used during HTML output while inside a lateximage.

See section 429 for the HTML versions.

```
for HTML & PRINT: 10051 \begin{warpall}
```

```
\multicolumnrow {<1:cols>} {<2:halign>} [<3:vpos>] {<4:numrows>} [<5:bigstruts>] {<6:width>} [<7:fixup>]
{<8:text>}
```

For discussion of the use of `\DeclareExpandableDocumentCommand`, see:  
<https://tex.stackexchange.com/questions/168434/problem-with-abbreviation-of-multirow-and-multicolumn-latex>

`\AtBeginDocument` to adjust after the user may have loaded `multirow`, which requires several tests to determine which version is loaded and thus which options are available.

```
10052 \AtBeginDocument{
```

```
\@ifundefined{@xmultirow} determines if multirow was never loaded.
```

Null action if not loaded:

```
10053 \@ifundefined{@xmultirow}
10054 {
10055 \DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
10056   {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
10057   {}%
10058 }% no version of multirow was loaded
10059 {% \@xmultirow defined, so some version of multirow was loaded
```

```
\IfPackageLoadedTF{multirow} determines if v2.0 or later of multirow was used,
which included the \ProvidesPackage macro.
```

The print version:

```
10060 \IfPackageLoadedTF{multirow}{% v2.0 or newer
10061 \IfPackageAtLeastTF{multirow}{2016/09/01}% 2016/09/27 for v2.0
10062 {% v2.0+:
10063 \DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
10064   {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
10065   {\multicolumn{#1}{#2}{\@xmultirow[#3][#4][#5][#6][#7][#8]}}%
10066 }
10067 {% loaded but older, probably not executed:
10068 \DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
10069   {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
10070   {\multicolumn{#1}{#2}{\@xmultirow[#4][#5][#6][#7][#8]}}%
10071 }
10072 }% packageLoaded{multirow}
```

If not `\IfPackageLoadedTF{multirow}` but `\@xmultirow` is defined, then this must be v1.6 or earlier, which did not `\ProvidesPackage{multirow}`, and did not have the `vposn` option.

```
10073 {% v1.6 or older did not \ProvidePackage

## 75.25 Utility macros inside a table

**for HTML output** 10085 \begin{warpHTML}

Used to prevent opening a tabular data cell if the following token is one which does not create tabular data:

```
10086 \newcommand*{\LWR@donothing}{} 
```

In case array is not loaded:

```
10087 \let\firsthline\relax
10088 \let\lasthline\relax
10089 \newcommand*{\firsthline}{}
10090 \newcommand*{\lasthline}{} 
```

In case bigdelim is not loaded:

```
10091 \newcommand*{\ldelim}{}
10092 \newcommand*{\rdelim}{} 
```

```
10093 \end{warpHTML}
```

## 75.26 Special-case tabular markers

**for HTML & PRINT** 10094 \begin{warpall}

`\TabularMacro` Place this just before inserting a custom macro in a table data cell. Doing so tells `lwarp` not to automatically start a new HTML table data cell yet. See section [8.10.1](#).

```
10095 \newcommand*{\TabularMacro}{} 
```

```
10096 \end{warpall}
```

`\ResumeTabular` Used to resume tabular entries after resuming an environment.

 **tabular inside another environment** When creating a new environment which contains a tabular environment, `lwarp`'s emulation of the tabular does not automatically resume when the containing environment ends, resulting in corrupted HTML rows. To fix this, use `\ResumeTabular` as follows. This is ignored in print mode.

```

\StartDefiningTabulars % (& is used in a definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars

```

**for HTML output:** 10097 \begin{warphTML}

```

10098 \newcommand*\ResumeTabular{%
10099   \boolfalse{LWR@exitingtabular}%
10100   \boolfalse{LWR@tabularmutemods}%
10101   \boolfalse{LWR@tabularfinalrow}%
10102   \LWR@getmynexttoken%
10103 }

10104 \end{warphTML}

```

**for PRINT output:** 10105 \begin{warpprint}

```

10106 \newcommand*\ResumeTabular{}

10107 \end{warpprint}

```

## 75.27 Checking for a new table cell

**for HTML output:** 10108 \begin{warphTML}

`\LWR@tabledatacolumnntag` Open a new HTML table cell unless the next token is for a macro which does not create data, such as `\hline`, `\toprule`, etc:

```

10109 \newcommand*\LWR@tabledatacolumnntag%
10110 {%
10111   \LWR@traceinfo{LWR@tabledatacolumnntag}%

```

`\show\LWR@mynexttoken` to see what tokens to look for

If not any of the below, start a new table cell:

```

10112   \global\let\LWR@mynextaction\LWR@tabledatasinglecolumnntag%

```

If find `\end`, exit the tabular:

```

10113   \ifdefequal{\LWR@mynexttoken}{\end}%
10114     {%
10115       \booltrue{LWR@tabularfinalrow}%
10116       \booltrue{LWR@exitingtabular}%
10117     }%

```

longtable can have a caption in a cell

```
10118 \ifdefequal{\LWR@mynexttoken}{\caption}%
10119     {\global\let\LWR@mynextaction\LWR@donothing}{}%

Look for other things which would not start a table cell:

```
10120 \ifdefequal{\LWR@mynexttoken}{\multicolumn}%
10121     {\global\let\LWR@mynextaction\LWR@donothing}{}%
10122 \ifdefequal{\LWR@mynexttoken}{\multirow}%

10126 \ifdefequal{\LWR@mynexttoken}{\noalign}%
10127     {\global\let\LWR@mynextaction\LWR@donothing}{}%
```

If an `\mrowcell`, this is a cell to be skipped over:

```
10128 \ifdefequal{\LWR@mynexttoken}{\mrowcell}%
10129     {\global\let\LWR@mynextaction\LWR@donothing}{}%

 **<table> inside <span>** In `LATEX`, a `tabular` may be placed inside a `minipage`, but in `HTML` a `<table>` may not be inside a `<span>`. Since there may be several nested `<span>`s, with an unknown number of other objects between, it is hard to undo all these `<span>`s before the `<table>` then redo them after. The browser probably compensates for this situation, but formatting may be lost inside the `<table>` because several things are neutralized inside a `<span>`. Furthermore, in the `HTML` output, the entire `<table>` is placed on a single line of `HTML` code, since the line breaking commands are neutralized inside a `<span>`. Since this is such a sloppy situation, a warning is issued here instructing the user to please isolate the `<span>` to print-only.

## 76 Cross-references

Sectioning commands have been emulated from scratch, so the cross-referencing commands are custom-written for them. Emulating both avoids several layers of patches.

\*\_html.aux (*file*) A new entry in \*\_html.aux is used to remember section name, file, and lateximage depth and number for each label:

```

\newlabel{<labelname>@lwarp}{<section name>}{<filename>
    {<limagedepth>}{<limagenumber>}}

```

Table 16 shows the data structures related to cross-referencing.

## 76.2 New lwarp labels.

`*_html.aux` (*file*) A new entry in `*_html.aux` is used to remember section name, file, and lateximage depth and number for each label:

```
\newlabel{<labelname>@lwarp}{<<section name>}{<filename>}

`\LWR@setref`  $\langle args\ list \rangle$   $\langle selector \rangle$   $\langle label \rangle$

`\@setref` without the `\null` (`\hbox`), and without the warning messages. Each caused problems with `lwarp` references. The regular reference will cause the warning.

```

`\LWR@nameref`  $\langle label \rangle$  Returns the section name for this label:

`\LWR@currentautosecpageref`  $\langle\{label}\rangle$  Returns the `LWR@currentautosecpage` for this label:

```
10443 \newcommand*\LWR@currentautosecpageref}[1]{%
10444   \expandafter\LWR@setref\csname r@#1@lwarp\endcsname\LWR@secondoffive{#1}%

`\LWR@write@lwarplabel`  $\langle\{label}\rangle$  Sanitize the name and then creates the label:

### 76.3 Labels

`\LWR@label@subcreatetag` Creates the tag from `\LWR@sanitized`.

Temporarily end the HTML comment, insert the L<sup>A</sup>T<sub>E</sub>X & HTML label, then resume the HTML comment. `\@firstofone` is required to remove extra braces introduced by the `amsmath` package.)

`\LWR@label@createtag {<label>}` Creates an HTML id tag.

Used by `\LWR@new@label` and `\hyperdef`.

`\detokenize` is used to allow underscores in the labels.

```
10493 \newcommand*{\LWR@label@createtag}[1]{%

`\LWR@new@label {<label>}`

`\label` during HTML output when not in SVG math mode, removing extra spaces around the label, as done by a regular L<sup>A</sup>T<sub>E</sub>X `\label`.

This is also used during a `lateximage`, including SVG math, since the special label handling is required, but `\LWR@label@createtag` does not generate HTML tags inside a `lateximage`.

If `memoir` is used, it's `\@mem@old@label` is pointed here.

`cleveref` later encases this to add its own cross-referencing, and also patches `memoir`.

```

10522 \newcommand*{\LWR@new@label}[1]{%

```

Create a special label which holds the section number, section name, `LWR@htmlfilenumber`, `LWR@lateximagedepth`, and `LWR@lateximagenumber`:

```

```

`\LWR@startref {<label>}` (Common code for `\ref` and `\nameref`.)

Open an HTML tag reference to a filename, # character, and a label.

```

10548 \newcommand*\LWR@startref}[1]
10549 {%
10550     \LWR@sanitize{#1}%
10551     \LWR@traceinfo{LWR@startref A: !#1!}%
```

Create the filename part of the link:

```

10552     \LWR@htmltag{a href=\textquotedbl%
10553     \LWR@traceinfo{LWR@startref B}%
10554     \LWR@print@mbbox{\LWR@htmlrefsectionfilename{#1}}%
10555     \LWR@traceinfo{LWR@startref C}%
10556     \LWR@origpound%
```

Create the destination id:

See if `LWR@lateximagedepth` is unknown:

```

10557     \LWR@traceinfo{LWR@startref D: !#1!}%
10558     \ifcsundef{r@#1@lwarp}%
```

“??” if `LWR@lateximagedepth` is unknown, so create a link with an unknown destination:

```

10559     {%
10560         \LWR@traceinfo{LWR@startref D0: ??}%
10561         ??%
10562     }%
```

If `LWR@lateximagedepth` is known. Use a `lateximage` if the depth is greater than zero, or a regular link otherwise:

(Using `xifthen \ifthenelse` here failed in some cases, but `etoolbox \ifnumgreater` works.)

```

10563     {%
10564         \ifnumgreater{\LWR@lateximagedepthref{#1}}{0}%
10565         {%
10566             lateximage-\BaseJobname-\LWR@lateximagenumberref{#1}%
10567         }%
10568     }%
10569     \LWR@traceinfo{LWR@startref D3}%
```

\detokenize is used to allow underscores in the labels:

```
10570             \LWR@print@box{\LWR@sanitized}%
10571             }%
10572     }%
10573     \LWR@traceinfo{LWR@startref E}%
```

Closing quote:

```
10574     \textquotedbl%
```

Maybe add a title:

```
10575     \LWR@addlinktitle%
10576     }%
10577     \LWR@traceinfo{LWR@startref F}%
10578 }
```

`\LWR@subnewref <<label>> <<label or sub@label>>`

Factored for the subfig package. Uses the original label for the hyper-reference, but prints its own text, such as “1 (b)”.

```
10579 \NewDocumentCommand{\LWR@subnewref}{m m}{%
10580     \LWR@traceinfo{LWR@subnewref #1 #2}%
10581     \LWR@startref{#1}%
10582     \LWR@print@ref{#2}%
10583     \LWR@htmltag{/a}%
10584 }
```

`\ref * <<label>>`

\ref is redefined to \LWR@HTML@ref, except inside the text part of a \hyperref, where it is redefined to \LWR@ref@ignorestar.

`\LWR@HTML@ref * <<label>>` Create an internal document reference link, or without a link if starred per hyperref.

The HTML version:

```
10585 \NewDocumentCommand{\LWR@HTML@ref}{s m}{%
10586     \LWR@traceinfo{LWR@HTML@ref !#2!}%
10587     \IfBooleanTF{#1}%
10588         {\LWR@print@ref{#2}}%
10589         {\LWR@subnewref{#2}{#2}}%
10590 }
10591
10592 \LWR@formatted{ref}
10593
10594
10595 \NewDocumentCommand{\LWR@HTML@Ref}{s m}{%
10596     \LWR@traceinfo{LWR@HTML@Ref !#2!}%
10597     \IfBooleanTF{#1}%
10598         {\LWR@print@Ref{#2}}%
10599         {\LWR@subnewref{#2}{#2}}%
10600 }
10601
10602 \LWR@formatted{Ref}
```

```
\LWR@refwithsection * {\langle label \rangle}
```

Creates a reference, using the section number as the text. Used for back references.

```
10603 \NewDocumentCommand{\LWR@refwithsection}{s m}{%
10604   \LWR@traceinfo{\LWR@refwithsection !#2!}%
```

If starred, just use the text without a hyperlink:

```
10605   \IfBooleanTF{#1}%
10606     {\LWR@print@ref{\BaseJobname-autopage-\LWR@currentautosecpageref{#2}}}%
10607     {%
```

Open the reference:

```
10608     \LWR@startref{#2}%
```

Add the text of the link.

Check for and handle an undefined reference:

```
10609     \edef\@tempa{\LWR@currentautosecpageref{#2}}%
10610     \ifdefstring{\@tempa}{??}%
10611     {??}%
```

For a defined reference:

```
10612     {%
```

Set \@tempa to \r@<label>, which is {section number}{page number}.

```
10613     \edef\@tempa{%
10614       \csname
10615         r@\BaseJobname-autopage-\LWR@currentautosecpageref{#2}%
10616       \endcsname%
10617     }%
```

Check the section number alone:

```
10618     \edef\@tempa{\expandafter\@firstoftwo\@tempa}%
```

If the reference has no section number print an asterisk:

```
10619     \expandafter\ifblank\expandafter{\@tempa}%
10620     {*}%
```

If there is a section number, print it:

```
10621     {%
10622       \LWR@print@ref{%
10623         \BaseJobname-autopage-\LWR@currentautosecpageref{#2}%
10624       }%
10625     }%
10626     }%
```

Close the reference:

```

10627         \LWR@htmltag{/a}%
10628     }%
10629 }

```

For MATHJAX:

```

10630 \CustomizeMathJax{\let\LWRref\ref}
10631 \CustomizeMathJax{\renewcommand{\ref}{\ifstar\LWRref\LWRref}}

```

`\pagerefPageFor` Text for page references.

```

10632 \newcommand*{\pagerefPageFor}{see }

```

`\pageref * {<label>}` Create an internal document reference, or just the unlinked number if starred, per `hyperref`.

```

10633 \NewDocumentCommand{\LWR@new@pageref}{s m}{%
10634     \IfBooleanTF{#1}%
10635         {(\pagerefPageFor\LWR@print@ref{#2})}%
10636         {(\cpageref{#2})}%
10637 }

```

`\nameref {<label>}`

```

10638 \newrobustcmd*{\nameref}[1]{%
10639     \LWR@traceinfo{nameref}%
10640     \LWR@startref{#1}%
10641     \LWR@traceinfo{nameref B}%
10642     \LWR@nameref{#1}%

10644     \LWR@htmltag{/a}%
10645     \LWR@traceinfo{nameref: done}%
10646 }

```

`\Nameref {<label>}` In print, adds the page number. In HTML, does not.

```

10647 \LetLtxMacro\Nameref\nameref

```

## 76.5 Hyper-references

Note that the code currently only sanitizes the underscore character. Additional characters should be rendered inert as well. See the `hyperref.sty` definition of `\gdef\hyper@normalise` for an example.

`hyperref (Pkg)`

Do not tell other packages that `hyperref` is emulated. Some packages patch various commands if `hyperref` is present, which will probably break something, and the emulation already handles whatever may be emulated anyhow.

```

10648 % DO NOT TELL OTHER PACKAGES TO ASSUME HYPERREF, lest they attempt to patch it:
10649 % \EmulatesPackage[hyperref][2015/08/01]% Disabled. Do not do this.

```

Emulates hyperref:

`\@currentHref` Added to support backref.

```
10650 \AtBeginDocument{
10651   \def\@currentHref{\BaseJobname-autopage-\theLWR@previousautopagelabel}%
10652 }
```

`\LWR@linkcatcodes` Sets catcodes before processing macros which have hyperlinks as arguments.

```
10653 \newcommand*\LWR@linkcatcodes{%
10654   \catcode'\#=12%
10655   \catcode'\%=12%
10656   \catcode'\&=12%
10657   \catcode'\~=12%
10658   \catcode'\_ =12%
```

For babel-french:

```
10659   \LWR@hook@processingtags%
10660 }
```

`\LWR@linkmediacatcodes` Sets catcodes before processing macros which have hyperlinks as arguments. Modified for multimedia links.

```
10661 \newcommand*\LWR@linkmediacatcodes{%
10662   \catcode'\#=12%
10663   \catcode'\%=12%
10664 %   \catcode'\&=12% left alone for splitting flash variables
10665   \catcode'\~=12%
10666   \catcode'\_ =12%
```

For babel-french:

```
10667   \LWR@hook@processingtags%
10668 }
```

`\LWR@subhyperref` `{\langle URL \rangle}`

Starts a link for `\LWR@hrefb`. A group must have been opened first, with nullified catcodes. The text name is printed afterwards, after the group is closed and catcodes restored.

```
10669 \NewDocumentCommand{\LWR@subhyperref}{m}{%
10670   \LWR@traceinfo{\LWR@subhyperref !#1!}%
10671   \LWR@sanitize{#1}%

10675     target=\textquotedbl\_{ }blank\textquotedbl\ % space
10676   }%
10677 }
```

`\LWR@subhyperreftext` `{\langle text \rangle}`

Finishes the hyperref for `\LWR@hrefb`. Catcodes must have been restored already. To be used after `\LWR@subhyperref`, and after its group has been closed.

```
10678 \newcommand{\LWR@subhyperreftext}[1]{%

10692   \LWR@ensuredoingapar%
10693 }
```

`\LWR@href [ <options> ] { <URL> } { <text> }`

Create a link with accompanying text:

```
10694 \DeclareDocumentCommand{\LWR@hrefb}{O{} m}{%
10695   \LWR@ensuredoingapar%
10696   \LWR@subhyperref{#2}%

```

`\LWR@nolinkurl { <URL> }`

Print the name of the link without creating the link:

```
10706 \newcommand*{\LWR@nolinkurlb}[1]{%
10707   \LWR@ensuredoingapar%
10708   \def\LWR@templink{#1}%

```

`\LWR@url`  $\{\langle URL \rangle\}$

Create a link whose text name is the address of the link.

The `url` package may redefine `\url`, so it is `\let` to `\LWR@url` here and also redefined by `lwarp-url`.

```

10719 \DeclareDocumentCommand{\LWR@urlb}{m}{%

Table 17: Float data structures

---

For each `<type>` of float (figure, table, etc.) there exists the following:

- counter `<type>`:** A counter called `<type>`, such as figure, table.
  - `\<type>name`:** Name. `\figurename` prints “Figure”, etc.
  - `\ext@<type>`:** File extension. `\ext@figure` prints “lof”, etc.
  - `\fps@<type>`:** Placement.
  - `\the<type>`:** Number. `\thetable` prints the number of the table, etc.
  - `\p@<type>`:** Parent’s number. Prints the number of the [within] figure, etc.
  - `\fnum@<type>`:** Prints the figure number for the caption.  
`\<type>name \the<type>`, “Figure 123”.
  - `\<type>`:** Starts the float environment. `\figure` or `\begin{figure}`
  - `\end<type>`:** Ends the float environment. `\endfigure` or `\end{figure}`
  - `\tf@<ext>`:** The L<sup>A</sup>T<sub>E</sub>X file identifier for the output file.
  - `LWR@have<type>`:** A boolean remembering whether a `\listof` was requested for a float of this type.
  - File with extension `lo<f, t, a-z>`:** An output file containing the commands to build the `\listof<type>` “table-of-contents” structure.
  - Cross-referencing names:** For `cleveref`’s `\cref` and related, `\crefname` and `\Crefname` assign human-readable names for references to this float type.
- 

## 77 Floats

Floats are supported, although partially through emulation.

Table 17 shows the data structure associated with each `<type>` of float.

### 77.1 Float environment

for HTML output<sup>10757</sup> `\begin{warpHTML}`

`\LWR@floatbegin {<type>} [<placement>]` Begins a `\newfloat` environment.

<sup>10758</sup> `\NewDocumentCommand{\LWR@floatbegin}{m o}{%`

Warn if starting a float inside a `<span>`:

<sup>10759</sup> `\LWR@spanwarninvalid{float}%`

<sup>10760</sup> `\ifbool{FormatWP}{\newline}{}%`

<sup>10761</sup> `\LWR@stoppars%`

There is a new float, so increment the unique float counter:

```
10762 \addtocounter{LWR@thisautoid}{1}%
10763 \booltrue{LWR@freezethisautoid}%

10764 \begingroup%
```

Settings while inside the environment:

```
10765 \LWR@print@raggedright%
```

Open an HTML figure tag. The figure is assigned a class equal to its type, and another class according to the float package style, if used. Note that `\csuse` returns an empty string if `\LWR@floatstyle@<type>` is not defined.

```
10766 \LWR@htmltag{%
10767     figure id=\textquotedbl%
10768         \LWR@print@ebox{autoid-\arabic{LWR@thisautoid}}%

10773     \LWR@orignewline%
10774     \LWR@BlockClassWP}{\wp#1}%
10775 }{%}
```

Update the caption type:

```
10776 \renewcommand*{\@capttype}{#1}%
```

Mark the float for a word processor conversion:

```
10777 \LWR@startpars%
10778 \ifboolexpr{bool{FormatWP} and bool{WPMarkFloats}}{%
10779
10780     === begin #1 ===
10781
10782     }{%}
```

After each `\LWR@floatbegin`, look for `\centering`, etc next, using `\LWR@floatalignment`.

```
10783 }
```

For koma-script. The following does not work for tables.

```
10784 \AtBeginDocument{
10785
10786 \IfPackageLoadedTF{tocbasic}{
10787
10788 \appto\figure@atbegin{%

10790 }
10791
10792 }{%} tocbasic
10793
10794 }% AtBeginDocument
```

`\@xfloat` Support packages which create floats directly.  
`\@xdblfloat` Look for `\centering`, etc using `\LWR@floatalignment`.

```

10795 \AtBeginDocument{
10796   \def\@xfloat #1[#2]{%
10797     \LWR@floatbegin{#1}[#2]

10802     \LWR@futurenonspacel\WR@mynexttoken\LWR@floatalignment%
10803   }
10804 }
```

`\LWR@floatend` Ends a `\newfloat` environment.

```
10805 \newcommand*\LWR@floatend}{%
```

If saw a `\centering`, finish the center environment:

```
10806   \LWR@endfloatalignment%
```

Mark the float end for a word processor conversion:

```

10807   \ifboolexpr{bool{FormatWP} and bool{WPMarkFloats}}{%

10809   === end ===
10810
10811   }{%

Close an HTML figure tag:

```

10814   \LWR@htmlElementend{figure}%
10815   \endgroup%
10816   \boolfalse{LWR@freezethisautoid}%
10817   \LWR@startpars%
10818   \ifbool{FormatWP}{\newline}{}%
10819 }
```

`\end@float` Support packages which create floats directly.  
`\end@dblfloat`

```

10820 \AtBeginDocument{
10821   \let\end@float\LWR@floatend
10822   \let\end@dblfloat\LWR@floatend
10823 }
```

## 77.2 Float tracking

`LWR@thisautoid` (*Ctr*) A sequential counter for all floats and theorems. This is used to identify the float or theorem then reference it from the List of Figures and List of Tables.

```
10824 \newcounter{LWR@thisautoid}
```

`LWR@thisautoidWP` (*Ctrl*) A sequential counter for all word processor conversion `<div>`s. This is used to convince LIBREOFFICE to form a frame around this element.

```
10825 \newcounter{LWR@thisautoidWP}
```

`LWR@freezethisautoid` (*bool*) Prevents multiple increments of `\LWR@thisautoid` inside a float.

```
10826 \newbool{LWR@freezethisautoid}
10827 \boolfalse{LWR@freezethisautoid}
```

`\LWR@forcenewautoidanchor` Adds a new `<autoid>` anchor.

```
10828 \newcommand*{\LWR@forcenewautoidanchor}{%
10829   \addtocounter{LWR@thisautoid}{1}%
10830   \ifbool{LWR@doingapar}%

```

`\LWR@newautoidanchor` Sometimes adds a new `<autoid>` anchor.

```

## 77.4 Caption and LOF linking and tracking

When a new HTML file is marked in the L<sup>A</sup>T<sub>E</sub>X PDF file, or at the start of a new section, the L<sup>A</sup>T<sub>E</sub>X PDF page number at that point is stored in LWR@currentautosecfloatpage, (and the associated filename is remembered by the special L<sup>A</sup>T<sub>E</sub>X labels). This page number is used to generate an autopage HTML <id> in the HTML output at the start of the new HTML file or section. Meanwhile, there is a float counter used to generate an HTML autoid <id> at the start of the float itself in the HTML file. The autopage and autoid values to use for each float are written to the .lof, etc. files just before each float's entry. These values are used by \l@figure, etc. to create the HTML links in the List of Figures, etc.

LWR@nextautoid (*Ctr*) Tracks autoid for floats. Tracks autopage for floats.

LWR@nextautopage (*Ctr*) These are updated per float as the .lof, .lot file is read.

```

10895 \newcounter{LWR@nextautoid}
10896 \newcounter{LWR@nextautopage}

```

```
\LWRsetnextfloat {<autopage>} {<float autoid>}
```

\*\_html.lof (*file*) This is written to the \*\_html.lof or \*\_html.lot file just before each float's usual entry. The autopage and the float's autoid are remembered for \l@figure to use when creating the HTML links.

\*\_html.lot (*file*)

```

10897 \newcommand*\LWRsetnextfloat}[2]{%
10898     \setcounter{LWR@nextautopage}{#1}%
10899     \setcounter{LWR@nextautoid}{#2}%
10900 }

```

LWR@figcaption (*env*) An HTML <figcaption> is not allowed in places where L<sup>A</sup>T<sub>E</sub>X does allow a figure caption, such as inside a longtable where the tabular has already started, or inside a center environment. Therefore, a <div> of class figurecaption is used instead.

```

10901 \newenvironment*LWR@figcaption}
10902     {%
10903         \ifbool{FormatWP}{%
10904             \BlockClass[font-style:italic]{figurecaption}%

10910     {\endBlockClass}

The print versions are from the `caption` package, if loaded.

```
10911 \newcommand*{\LWR@HTML@caption@begin}[1]

Keep `par` and `minipage` changes local:

```
10914   \begingroup%

10919   \LWR@print@caption@begin{#1}%
10920   \LWR@traceinfo{\LWR@HTML@caption@begin: done}%

`\caption@begin` Low-level patches to create HTML tags for captions. These are assigned `\AtBeginDocument` `\caption@end` so that other packages which modify captions will have already been loaded before saving the print-mode version.

## 78 Table of Contents, LOF, LOT

This section controls the generation of the TOC, LOF, and LOT.

The `.toc`, `.lof`, and `.lot` files are named by the source code `\jobname`.

In HTML, the printed tables are placed inside a `<div>` of class `toc`, `lof`, or `lot`.

A “`sidetoc`” is provided which prints a subset of the TOC on the side of each page other than the homepage.

The regular L<sup>A</sup>T<sub>E</sub>X infrastructure is used for TOC, along with some patches to generate HTML output.

**for HTML output** 10990 `\begin{warpHTML}`

### 78.1 Reading and printing the toc

`\LWR@myshorttoc` `{\langle toc/lof/lot/sidetoc \rangle}`

Reads in and prints the TOC/LOF/LOT at the current position. While doing so, makes the @ character into a normal letter to allow formatting commands in the section names.

Unlike in regular L<sup>A</sup>T<sub>E</sub>X, the file is not reset after being read, since the `sidetoc` may be referred to again in each HTML page.

```

10991 \newcommand*\LWR@myshorttoc[1]{%
10992   \LWR@traceinfo{LWR@myshorttoc: #1}%

```

Only if the file exists:

```

10993   \IfFileExists{\jobname.#1}{%
10994     \LWR@traceinfo{LWR@myshorttoc: loading}%

```

Many of the commands in the file will have @ characters in them, so @ must be

made a regular letter.

```
10995     \begingroup%
10996     \makeatletter%
```

Disable \ref to avoid nested HTML references.

```
10997     \LetLtxMacro\ref\LWR@print@ref%
10998     \LWR@disablepinyin%
```

Read in the toc file:

```
10999     \@input{\jobname.#1}%
11000     \endgroup%
11001     }%
11002     {%
11003     \LWR@traceinfo{LWR@myshorttoc: done}%
11004 }
```

```
\LWR@subtableofcontents {<toc/lof/lot>} {<sectionstarname>}
```

Places a TOC/LOF/LOT at the current position.

```
11005 \NewDocumentCommand{\LWR@subtableofcontents}{m m}{%
```

Closes previous levels:

```
11006     \@ifundefined{chapter}%
11007     {\LWR@closeprevious{section}}%
11008     {\LWR@closeprevious{chapter}}%
```

Prints any pending footnotes so that they appear above the potentially large toc:

```
11009     \LWR@printpendingfootnotes%
```

Place the list into its own chapter (if defined) or section:

```
11010     \@ifundefined{chapter}{\section*{#2}}{\chapter*{#2}}%
```

Create a new HTML nav containing the TOC/LOF/LOT:

```
11011     \LWR@html@elementclass{nav}{#1}%
```

Create the actual list:

```
11012     \LWR@myshorttoc{#1}%
```

Close the nav:

```
11013     \LWR@html@elementclassend{nav}{#1}%
11014 }
```

```
\@starttoc {<ext>}
```

Patch \@starttoc to encapsulate the TOC inside HTML tags:

```

11015 \let\LWR@orig@starttoc \@starttoc
11016
11017 \renewcommand{\@starttoc}[1]{
11018   \LWR@htmlclass{nav}{#1}%
11019   \LWR@orig@starttoc{#1}%
11020   \LWR@htmlclassend{nav}{#1}%
11021 }

```

`LWR@copiedsidetoc` (*bool*) Used to only copy the toc file to the sidetoc a single time.

(listings and perhaps other packages would re-use `\tableofcontents` for their own purposes, causing the sidetoc to be copied more than once, and thus end up empty.)

```

11022 \newbool{LWR@copiedsidetoc}
11023 \boolfalse{LWR@copiedsidetoc}

```

`\tableofcontents` Patch `\tableofcontents`, etc. to print footnotes first. `newfloat` uses `\listoffigures` for all future float types.

```

11024 \AtBeginDocument{
11025
11026 \LetLtxMacro\LWR@origtableofcontents\tableofcontents

### 78.3 Side toc

The “side toc” is a table-of-contents positioned to the side.

It may be renamed by redefining `\sidedocname`, and may contain paragraphs.

Per table 18, CSS may be used to format the sideroc.

Table 18: CSS related to the sideroc

Called by `\l@section`, etc. to create a hyperlink to a section.

The autopage label is always created just after the section opens.

**#1** is depth

**#2** is section, subsection, etc.

**#3** the text of the caption

[how-to-mention-section-number-in-index-created-by-imakeidx](#)

Index links are tracked by the counter `LWR@autoindex`. This counter is used to create a label for each index entry, and a reference to this label for each entry in

the index listing. This method allows each index entry to link directly to its exact position in the document.

`\hyperindexref`  $\{\langle list \text{ of } LWR@autoindex, \text{ commas, and ranges} \rangle\}$

`\hyperindexref{LWR@autoindex}` is inserted into `*.ind` by the *makeindex* style file `lwarp.ist` or the *xindy* style file `lwarp.xdy`. ## 80 Bibliography presentation

**for HTML output:** 11459 `\begin{warpHTML}`

`\bibliography`  $\langle\textit{filenames}\rangle$  At one time this was modified to read `\BaseJobname.bbl`, which meant the HTML version could not resolve until the print version was also present. This also confused `multibib`. It has been reverted to the original to use `\jobname.bbl`.

`\@biblabel`  $\langle\textit{text-refnumber}\rangle$

```
11460 \renewcommand{\@biblabel}[1][#1]\quad
```

`thebibliography` (*enu*) To emphasize document titles in the bibliography, the following redefines `\em` inside `thebibliography` to gather everything until the next closing brace, then display these tokens with `\textit`.

*Adapted from* `embracedef.sty`, which is by TAKAYUKI YATO:

## 81 Restoring original formatting

**for HTML output** `\begin{warpHTML}`

`\LWR@restoreMathJaxformatting` A few macros (ref: `tcolorbox`) must be treated separately while printing the HTML comment for a MATHJAX expression. These are set here, to which other functions may be appended.

```
11485 \newcommand*\LWR@restoreMathJaxformatting){}
```

`\LWR@restoreorigformatting` Used to temporarily restore the print-mode meaning of a number of formatting, graphics, and symbols-related macros while generating SVG math or a `lateximage`.

Must be used inside a group.

Sets `\LWR@formatting` to print until the end of the group.

A number of packages will `\appto` additional actions to this macro.

Various packages add to this macro using `\appto`.

```

11486 \newcommand*\LWR@restoreorigformatting){%
11487   \LWR@traceinfo{\LWR@restoreorigformatting}%

```

Numerous macros change their print/HTML meaning depending on `\LWR@formatting`:

```

11488   \renewcommand*\LWR@formatting}{print}%
11489   \linespread{1}%

```

```

## 82 Nullifying filename formatting

The following are used to nullify certain macros and environments while converting section names to file names.

**for HTML output** 11528 \begin{warpHTML}

Also commonly used are \@empty, \@gobble, and \@firstofone.

```
11529 \newcommand*\LWR@dash}{-}
```

`\LWR@nullfonts` Removes formatting during filename operations, file references, and HTML comments.

 **Use only inside a group.**

The following are *not* made robust, since they must be expanded to their nullified versions.

## 83 Math

### 83.1 Limitations

See [Math](#), section 8.7.

### 83.2 HTML alt tag names

Redefinable names for the HTML alt tags, for translation according to the reader's native language.

**for HTML & PRINT** 11667 \begin{warpall}

`\AltTextOpen` The opening part of HTML alt tag for an image. The default is a left parenthesis.  
Default: (

```
11668 \newcommand*\AltTextOpen}{(}
```

`\AltTextClose` The closing part of HTML alt tag for an image. The default is a right parenthesis.  
Default: )

```
11669 \newcommand*\AltTextClose}{)}
```

`\ImageAltText` The HTML alt tag for an image.  
Default: image

```
11670 \newcommand*\ImageAltText}{image}
```

`\MathImageAltText` The HTML alt tag for an SVG math image.  
Default: "math image"

```
11671 \newcommand*\MathImageAltText}{math image}
```

`\LWR@ThisAltText` The HTML alt tag for the next image. Cleared after use, and also after each `lateximage`, `\LWR@subsingledollar`, and each use of `MATHJAX`.

```
11672 \newcommand*\LWR@ThisAltText}{}
```

`\ThisAltText`  $\{\langle text \rangle\}$

Assigns the HTML alt tag for the next image generated by `lwarp`, such as a `lateximage`, `picture`, or `svg math`.

```
11673 \newcommand*\ThisAltText[1]{%
11674   \renewcommand{\LWR@ThisAltText}{#1}%
11675 }
```

`\PackageDiagramAltText` Appended to the `lateximage` HTML alt tag for the images generated by many packages.  
Default: “`diagram`”

```
11676 \newcommand*\PackageDiagramAltText{diagram}
11677 \end{warppall}
```

### 83.3 Inline and display math

**for HTML output** 11678 `\begin{warppHTML}`

`LWR@externalfilecnt` (*Ctr*) Counter for the external files which are generated and then referenced from the HTML:

```
11679 \newcounter{LWR@externalfilecnt}
```

`LWR@indisplaymathimage` (*bool*) True if processing display math for `svg` output. Inside a `lateximage`, display math is only set to print-mode output if `LWR@indisplaymathimage` is false. Used to avoid nullifying display math before it has been completed.

```
11680 \newbool{LWR@indisplaymathimage}
```

`LWR@insidemathcomment` (*bool*) True while inside an HTML comment which is displaying a math environment. Used to undo the comment for a moment while creating a `\label`, so that the label’s HTML tags will be seen by HTML.

```
11681 \newbool{LWR@insidemathcomment}
11682 \boolfalse{LWR@insidemathcomment}
```

`LWR@xfakebold` (*bool*) True if `xfakebold \setBold` is in use.

```
11683 \newbool{LWR@xfakebold}
11684 \boolfalse{LWR@xfakebold}
```

`\LWR@orig@setBold` Redefined by `lwarp-xfakebold`.

```
11685 \newcommand*\LWR@orig@setBold{}
```

`\LWR@orig@unsetBold` Redefined by `lwarp-xfakebold`.

```
11686 \newcommand*\LWR@orig@unsetBold{}
```

`\LWR@applyxfakebold` Redefined by `lwarp-xfakebold`.

```
11687 \newcommand*\LWR@applyxfakebold{}
```

`\LWR@setcurrentfont` Sets the actual L<sup>A</sup>T<sub>E</sub>X font to that which was selected for HTML output. Ex: In HTML mode, `\bfseries` sets `\LWR@f@series` to “bf”. This sets the PDF output here for use inside a `lateximage`.

```

11688 \newcommand*{\LWR@setcurrentfont}{%
11689   \LWR@traceinfo{Using font family \LWR@f@family}%
11690   \@nameuse{\LWR@print@\LWR@f@family family}%
11691   \LWR@traceinfo{Using font series \LWR@f@series}%
11692   \@nameuse{\LWR@print@\LWR@f@series series}%
11693   \LWR@traceinfo{Using font shape \LWR@f@shape}%
11694   \@nameuse{\LWR@print@\LWR@f@shape shape}%
11695   \LWR@traceinfo{Using font caps shape \LWR@f@shapecaps}%
11696   \@nameuse{\LWR@print@\LWR@f@shapecaps shape}%
11697 }

```

`\$` Plain dollar signs appearing in the HTML output may be interpreted by MATHJAX to be math shifts. For a plain text dollar `\$`, use an HTML entity to avoid it being interpreted by MATHJAX, unless are inside a `lateximage`, in which case it will not be seen by MATHJAX.

```

11698 \let\LWR@origtextdollar\$
11699
11700 \renewcommand*{\$}{%
11701   \ifnumcomp{\value{\LWR@lateximagedepth}}{>}{0}%
11702     {\LWR@origtextdollar}%
11703     {\HTMLUnicode{00024}}%
11704 }

```

`lwarp_baseline_marker.png` A marker to be used to help *pdfcrop* identify the inline math baseline and width.  
*(file)* If either `graphicx` or `graphics` is loaded, this marker is placed at the lower left and lower right corners of the inline math. *pdfcrop* is then able to identify the width of the image, and also the height of an image such as a horizontal dash which does not otherwise touch the baseline.

`lwarp_baseline_marker.eps`  
*(file)* the image, and also the height of an image such as a horizontal dash which does not otherwise touch the baseline.

A marker with alpha or opacity of 0% is not registered by *pdfcrop*, so the marker is a small square block of 1% alpha, which seems to work while still being effectively invisible in the final SVG image.

If `graphicx` is loaded, this marker is sized as a tiny 1 sp square. If `graphics` is loaded, this marker is used at its default size of around .25 pt. If neither `graphics` package is loaded, the marker is replaced by a 10 sp horizontal space, and there is no assistance for determining baseline or width of the inline math image. The best results are obtained when using `graphicx`.

`\LWR@addbaselinemarker` Places a small marker in an SVG inline image. If `graphics` or `graphicx` are loaded, the marker is a mostly transparent image. If neither is loaded, no marker is used.

These markers are seen by *pdfcrop*, and force vertically-centered objects such as a dash to be raised off the baseline in the cropped image, and also force the total width and left/right margins to be correct. **image filename hashing** If starred, a hashed filename is used. If so, the hash is based on the `alt` tag and also the additional hashing argument.

This may be used to provide an expression with a simple `alt` tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated T<sub>E</sub>X expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is used in the additional hashing argument to ensure a unique image.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple `alt` tag is still the same.

## 83.6 `\displaymathnormal` and `\displaymathother`

`\displaymathnormal` By default, or when selecting `\displaymathnormal`, `MATHJAX` math display environments print their contents as text into `HTML` for `MATHJAX` to interpret, and `svg` display math environments render their contents as `svg` images and use their contents as the `alt` tag of `HTML` output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated `TikZ` pictures, compilation will fail.

`\displaymathother` When selecting `\displaymathother`, it is assumed that the contents are more complicated than “pure” math. An example is an elaborate `TikZ` picture, which will not render in `MATHJAX` and will not make sense as an `HTML alt` tag. In this mode, `MATHJAX` is turned off, math display environments become `svg` images, even if `MATHJAX` is selected, and the `HTML alt` tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as `TikZ` pictures are more likely to compile successfully.

`MATHJAX unsupported complicated alt tag`

`\displaymathnormal` Use when display math environments have simple math which is to sent to MATHJAX or included in HTML alt tags.

```

12284 \newcommand*\displaymathnormal{%
12285   \ifbool{LWR@origmathjax}{\booltrue{mathjax}}{\boolfalse{mathjax}}%

12292   \csletcs{equation*}{LWR@equationnormalstar}%
12293   \csletcs{endequation*}{LWR@endequationnormalstar}%
12294 }

```

`\displaymathother` Use when display math environments have complicated objects which will not work with MATHJAX or should not be included in HTML alt tags. Complicated contents are more likely to compile correctly.

```

12295 \newcommand*\displaymathother{%

### 83.7.2 Environment patches

The `amsmath` environments already collect their contents in `\@envbody` for further processing. `eqnarray` is not an  $\mathcal{AMS}$  package, and thus requires special handling.

For `svg math`: Each environment is encapsulated inside a `lateximage` environment, along with a special optional argument of `\LWR@amsmathbody` or `\LWR@amsmathbodynumbered` telling `lateximage` to use as the HTML `<alt>` tag the environment's contents which were automatically captured by the  $\mathcal{AMS}$  environment.

For `MATHJAX`: Each environment is synched with  $\LaTeX$ 's equation numbers, typeset with  $\LaTeX$  inside an HTML comment, then printed to HTML output for `MATHJAX` to process.

`eqnarray` (*enu*) This environment is not an  $\mathcal{AMS}$  environment and thus its body is not automatically captured, so the `environ` package is used to capture the environment into `\BODY`.

```
12335 \let\LWR@origeqnarray\eqnarray
12336 \let\LWR@origendeqnarray\endeqnarray
```

To remember whether the starred environment was used, and thus whether to number the equations:

```
12337 \newbool{LWR@numbereqnarray}
12338 \booltrue{LWR@numbereqnarray}
```

Common code used by eqnarray and Beqnarray (from fancybox):

```
12339 \newcommand{\LWR@eqnarrayfactor}{%
```

If mathjax or FormatWP, print the L<sup>A</sup>T<sub>E</sub>X expression:

```
12340 \ifboolexpr{bool{mathjax} or ( bool{FormatWP} and bool{WPMarkMath} ) }%
12341 {%
```

If MATHJAX, the environment contents (the \BODY) are executed in a HTML comment to trigger the correct equation number increment (if not starred), then are included verbatim in the output for MATHJAX to interpret:

```
12342 \LWR@syncmathjax%
12343 \boolfalse{LWR@amsmultline}%
12344 \ifbool{LWR@numbereqnarray}%
12345 {%
```

If numbering the equations, execute a copy inside an HTML comment block:

```
12346 \LWR@beginhideamsmath%
12347 \LWR@origeqnarray%
12348 \BODY%
12349 \LWR@origendeqnarray%
12350 \LWR@endhideamsmath%
```

Then print the (sanitized) contents to the output for MATHJAX to interpret:

```
12351 \LWR@addmathjax{eqnarray}{\BODY}%
12352 }%
12353 {% not LWR@numbereqnarray
```

If not numbering equations, just create the contents for MATHJAX:

```
12354 \LWR@addmathjax{eqnarray*}{\BODY}%
12355 }% LWR@numbereqnarray
12356 }% mathjax
12357 {% not mathjax
12358 \ifbool{LWR@numbereqnarray}%
12359 {%
```

For numbered svg equations, first create a lateximage with an alt attribute containing sanitized copy of the source code:

```
12360 \begin{BlockClass}{displaymathnumbered}%
12361 \LWR@newautoidanchor%
12362 \booltrue{LWR@indisplaymathimage}%
12363 \begin{lateximage}[{\LWR@startingequationtag\textendash\LWR@equationtag}%
12364 \LWR@addmathjax{eqnarray}{\BODY}]*(\math)%
```

Support for xfakebold:

```
12365          \LWR@applyxfakebold%
```

Create the image contents using an actual eqnarray:

```
12366          \LWR@origeqnarray%
12367          \BODY%
12368          \LWR@origendeqnarray%
12369          \end{lateximage}%
12370          \end{BlockClass}%
12371      }%
12372      {% not LWR@numbereqnarray
```

If not numbered, do the same, but an extra `\nonumber` seems to be required:

```
12373          \begin{BlockClass}{displaymath}%
12374          \LWR@newautoidanchor%
12375          \booltrue{LWR@indisplaymathimage}%
12376          \begin{lateximage}[\LWR@addmathjax{eqnarray*}]{\BODY}*(math)%
```

Support for `xfakebold`:

```
12377          \LWR@applyxfakebold%

12378          \def\@eqnrcr{\nonumber\@seqnrcr}
12379          \csuse{LWR@origeqnarray}%
12380          \BODY%
12381          \nonumber\csuse{LWR@origendeqnarray}%
12382          \end{lateximage}%
12383          \end{BlockClass}%
12384      }% LWR@numbereqnarray
12385      }% not mathjax
```

Default to number equations in the future:

```
12386      \booltrue{LWR@numbereqnarray}%
```

Clear the single-use `alt` text:

```
12387      \gdef\LWR@ThisAltText{}%
12388      }
```

`eqnarray` itself is made with a blank line before and after to force it to be on its own line:

```
12389 \RenewEnviron{eqnarray}
12390 {%
12391
12392 \LWR@eqnarrayfactor
12393
12394 }
```

The starred version is patched to turn off the numbering:

```
12395 \csgpreto{eqnarray*}{\boolfalse{LWR@numbereqnarray}}

12396 \end{warpHTML}
```

## 84 Lateximages

### 84.1 Description

`lateximage (env)` A `lateximage` is a piece of the document which is typeset in L<sup>A</sup>T<sub>E</sub>X then included in the HTML output as an image. This is used for math if `svg math` is chosen, and also for the `picture`, `tikzpicture`, and other environments.

Before typesetting the `lateximage` a large number of formatting, graphics, and symbols-related macros are temporarily restored to their print-mode meaning by `\LWR@restoreorigformatting`. (See section 81.)

A `lateximage` is typeset on its own PDF page inside an HTML comment which starts on the preceding page and ends on following page, and instructions are written to `lateximage.txt` for `lwarpmk` to extract the `lateximage` from the page of the PDF file then generate an accompanying `.svg` file image file. Meanwhile, instructions to show this image are placed into the HTML file after the comment.

An HTML `<span>` is created to hold both the HTML comment, which will have the `pdftotext` conversion, and also the link to the final `.svg` image.

A L<sup>A</sup>T<sub>E</sub>X label is used to remember which PDF page has the image. A label is used because footnotes, endnotes, and pagenotes may cause the image to appear at a later time. The label is declared along with the image, and so it correctly remembers where the image finally ended up.

`HTML alt tag` The HTML `alt` tag is set to the L<sup>A</sup>T<sub>E</sub>X source for `svg math`, some chemistry expressions, and perhaps some other expressions which make sense for text copy/paste. In some other cases, the `alt` tag is set according to the package name.

When creating an `svg math` image, its HTML `alt` tag may be set to the math expression, which may be hashed for image reuse. In the case of `\ensuremath` or after `\inlinemathother`, where the contents require a unique image for each instance of the same expression, the `alt` tag is set to `\MathImageAltText`, along with `\AltTextOpen` and `\AltTextClose`, and the image is not reused.

This `alt` expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is “math image”, and it may be changed according to the document’s language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following `svg math` images.

For many packages, the output is placed inside a `lateximage` with an HTML `alt` tag set to the package name followed by `\PackageDiagramAltText`. For example:

```
(-xy- diagram)
```

This expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is “diagram”, and may it be changed according to the document’s language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following package diagrams.

`svg image font size` For the `lateximage` environment, the size of the math and text used in the `svg` image may be adjusted by setting `\LateximageFontSizeName` to a font size name — *without the backslash*, which defaults to:

```
\renewcommand{\LateximageFontSizeName}{normalsize}
```

For inline svg math, font size is instead controlled by `\LateximageFontScale`, which defaults to:

```
\newcommand*{\LateximageFontScale}{.75}
```

## 84.2 Support counters and macros

**for HTML output** `\begin{warpHTML}`

`LWR@lateximagenumber` (*Ctr*) Sequence the images.

```
12398 \newcounter{LWR@lateximagenumber}
12399 \setcounter{LWR@lateximagenumber}{0}
```

`LWR@lateximagedepth` (*Ctr*) Do not create `\lateximage` inside of `\lateximage`.

```
12400 \newcounter{LWR@lateximagedepth}
12401 \setcounter{LWR@lateximagedepth}{0}
```

A few utility macros to write special characters:

```
12402 \edef\LWR@hashmark{\string#} % for use in \write
12403 \edef\LWR@percent{\@percentchar} % for use in \write
```

`LWR@LIpage` (*Ctr*) Used to reference the PDF page number of a lateximage to be written into `<project>-images.txt`.

```
12404 \newcounter{LWR@LIpage}
```

```
12405 \end{warpHTML}
```

## 84.3 Font size

**for HTML & PRINT** `\begin{warpall}`

`\LateximageFontSizeName` Declares how large to write text in `\lateximages`. The `.svg` file text size should blend well with the surrounding HTML text size.

 **no backslash** Do not include the leading backslash in the name.

```
12407 \newcommand*{\LateximageFontSizeName}{normalsize}
```

`\LateximageFontScale` Declares how large to scale inline svg math images. The `.svg` file text size should blend well with the surrounding HTML text size. The default is 1, but it may be redefined as needed depending on the HTML font.

```
12408 \newcommand*{\LateximageFontScale}{1}
```

```
12409 \end{warpall}
```

## 84.4 Equation numbers

**for HTML output** 12410 `\begin{warpHTML}`

`LWR@startingequation (Ctr)` For use with `lateximage` and multi-line numbered equations. Remembers the next equation number so that it may be printed in the alt tag.

```

12411 \newcounter{LWR@startingequation}
12412
12413 \@ifundefined{chapter}
12414 {
12415 \renewcommand{\theLWR@startingequation}{%
12416   \arabic{LWR@startingequation}%
12417 }
12418 }
12419 {% chapter defined
12420 \renewcommand{\theLWR@startingequation}{%
12421   \ifnumcomp{\value{chapter}}{>}{0}{\arabic{chapter}.}{}}%
12422   \arabic{LWR@startingequation}%
12423 }
12424 }

```

`LWR@isstartingequation (bool)` True for the first equation tag, false for later tags in the same environment.

```
12425 \newbool{LWR@isstartingequation}
```

`\LWR@startingequationtag` Prints the starting equation number or tag.

```
12426 \let\LWR@startingequationtag\theLWR@startingequation
```

`\LWR@equationtag` Prints the ending equation number or tag.

This is reset by `lateximage`, may be temporarily overwritten by `\tag` calling `\LWR@remembertag`.

```
12427 \newcommand*{\LWR@equationtag}{}
```

Only if `svg math`, patch `\tag` after packages have loaded, in case someone else modified `\tag`.

```

12428 \AtBeginDocument{
12429
12430 \ifbool{mathjax}{}{% not mathjax

```

`\LWR@remembertag {<tag>}`

For use inside the math environments while using `svg math`. Sets `\theLWR@startingequation` and `\theequation` to the given tag.

```

12431 \NewDocumentCommand{\LWR@remembertag}{m}{%
12432   \ifbool{LWR@isstartingequation}%
12433   {%
12434     \global\boolfalse{LWR@isstartingequation}%
12435     \xdef\LWR@startingequationtag{#1}%
12436   }{}%

```

```
12437 \xdef\LWR@equationtag{#1}%
12438 }%
```

```
12439 }% not mathjax
12440 }% AtBeginDocument
```

## 84.5 HTML alt tags

`\LWR@amsmathbody`  $\langle\{envname}\rangle$  For use inside the optional argument to a `lateximage` to add the contents of a AMS math environment to the `<alt>` tag.

```
12441 \newcommand*\LWR@amsmathbody[1]
12442 {%
12443 \textbackslash\begin\}\{#1\} % extra space
12444 \LWR@HTMLsanitizeexpanded{\detokenize\expandafter{\the\@envbody}}%
12445 \textbackslash\end\}\{#1\}%
12446 }
```

`\LWR@amsmathbodynumbered`  $\langle\{envname}\rangle$  For use inside the optional argument to a `lateximage` to add the contents of a AMS math environment to the `alt` tag, prefixed by the equation numbers.

```
12447 \newcommand*\LWR@amsmathbodynumbered[1]
12448 {%
12449 \ifnumcomp{\value{LWR@startingequation}}{=}{\value{equation}}%
12450 {(\LWR@equationtag)}%
12451 {(\LWR@startingequationtag\textendash\LWR@equationtag)} % extra space
12452 \LWR@amsmathbody{#1} % extra space
12453 }
```

## 84.6 lateximage environment

`\LWR@lateximage@oneimageb`  $\langle\{1: alt text}\rangle$   $\langle\{2: filename}\rangle$   $\langle\{3: css style}\rangle$   $\langle\{4: aria role}\rangle$  Creates the image for the `lateximage`.

```
12454 \newcommand{\LWR@lateximage@oneimageb}[4]{%
12455 \LWR@subinlineimage{#1}{lateximage}%
12456 {%
12457 \LWR@print@embox{%
12458 \LWR@ImagesDirectory\OSPathSymbol%
12459 #2%
12460 }%
12461 }{svg}{#3}{#4}%
12462 }
```

`\LWR@lateximage@oneimage`  $\langle\{1: alt text}\rangle$   $\langle\{2: filename}\rangle$   $\langle\{3: css style}\rangle$   $\langle\{4: delimit?\rangle$   $\langle\{5: aria role}\rangle$

Creates an image for the `lateximage`, whose `alt` text depends on the circumstances.

```
12463 \newcommand{\LWR@lateximage@oneimage}[5]{%
12464 \LWR@traceinfo{LWR@lateximage@oneimage !#1!#2!#3!#4!#5!}%
12465 \ifdefvoid{\LWR@ThisAltText}{%
```

```

12466     \IfBooleanTF{#4}{%
12467         \LWR@lateximage@oneimageb{#1}{#2}{#3}{#5}%
12468     }{%
12469         \LWR@lateximage@oneimageb%
12470         {\AltTextOpen#1\AltTextClose}%
12471         {#2}{#3}{#5}%
12472     }%
12473 }{%
12474     \LWR@lateximage@oneimageb%
12475     {\AltTextOpen\LWR@ThisAltText\AltTextClose}%
12476     {#2}{#3}{#5}%
12477 }%
12478 }

```

`lateximage (env)` \* [`<2: <alt> tag`] \* [`<4: add'l hashing`] [`<5: css style`] (`<6: aria role`)

Typesets the contents and then renders the result as an SVG file. Star #1 causes the image to be hashed for reuse. Star #3 causes the alt tag to not include `\AltTextOpen` and `\AltTextClose`, for use with math expressions.

The optional `<alt>` tag is included in the HTML code for use with copy/paste.

[image filename hashing](#) If starred, a hashed filename is used. If so, the hash is based on the alt tag and also the additional hashing argument.

This may be used to provide an expression with a simple alt tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated T<sub>E</sub>X expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is used in the additional hashing argument to ensure a unique image.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple alt tag is still the same.

`*_html.aux (file)` A new label is placed into the file `*_html.aux`:

```
\newlabel{LWR@lateximage-<BaseJobname>-<number>}{<x>}{<y>}}
```

This is used to find the image in the PDF file, according to its name.

`*-images.txt (file)` A list of images to generate is created in `<jobname>-images.txt`. Each line has three pipe-delimited fields, containing the PDF page number from `<jobname>_html.pdf`, where the image is located, a boolean indicating whether the image is hashed, and the filename of the image. The last line has “end” in each field, and is used to detect an incomplete compile.

```

12479 \catcode'\$=\active%
12480
12481 \NewDocumentEnvironment{lateximage}{s O{\ImageAltText} s O{} O{} D()}{}%
12482 {%
12483 \LWR@traceinfo{lateximage !#1!#2!#3!#4!#5!#6!}%
12484 \LWR@traceinfo{lateximage: starting on \jobname.pdf page \arabic{page}}%
12485 \LWR@traceinfo{lateximage: entering depth is \arabic{LWR@lateximagedepth}}%

```

Nested lateximages remain one large lateximage:

```
12486 \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
```

If nesting inside an already-existing lateximage, simply record one more level.  $\mathcal{A}\mathcal{M}\mathcal{S}$  packages redefine `\addtocounter` to do nothing if inside a `\text`, so lower-level  $\text{\TeX}$  macros are used for tracking nested lateximages.

```
12487 {%
12488 %   \addtocounter{LWR@lateximagedepth}{1}%
12489 %   \global\advance\c@LWR@lateximagedepth 1\relax% Due to AmS \text macro.
12490 }%
```

Otherwise, this is the outer-most lateximage:

```
12491 {% start of outer-most lateximage
```

Remember the next equation number to be allocated, in case it must be printed in a multi-equation environment:

```
12492   \LWR@traceinfo{lateximage: starting outer-most lateximage}%
12493   \setcounter{LWR@startingequation}{\value{equation}}%
12494   \addtocounter{LWR@startingequation}{1}%
12495   \booltrue{LWR@isstartingequation}%
12496   \let\LWR@startingequationtag\theLWR@startingequation%
```

The default equation tag, unless overwritten by `\tag`:

```
12497   \let\LWR@equationtag\theequation%
```

Starting a new lateximage:

```
12498   \addtocounter{LWR@lateximagenumber}{1}%
12499   \LWR@traceinfo{lateximage: LWR@lateximagenumber is \arabic{LWR@lateximagenumber}}%
```

While inside a lateximage, locally do not use mathjax:

```
12500   \boolfalse{mathjax}%
```

Be sure that are doing a paragraph:

```
12501   \LWR@ensuredoingapar%
```

Inside the lateximage, temporarily prevent underfull hbox warnings.

```
12502   \hbadness=10000\relax%
```

Next file:

```
12503   \addtocounter{LWR@externalfilecnt}{1}%
12504   \LWR@traceinfo{lateximage: LWR@externalfilecnt is \arabic{LWR@externalfilecnt}}%
```

Figure out what the next page number will be. `\setcounterpageref` assigns `LWR@Lpage` to the page number for the reference `LWRlateximage-BaseJobname-XXX`:

```
12505   \setcounterpageref{LWR@Lpage}{%
12506     LWRlateximage-BaseJobname-\arabic{LWR@lateximagenumber}%
```

```

12507   }%
12508   \LWR@traceinfo{lateximage: LWR@LImage is \arabic{LWR@LImage}}%

```

Create an HTML span which will hold the comment which contains the *pdftotext* translation of the image's page, and also will hold the link to the .svg file:

```

12509   \LWR@htmltag{span\LWR@indentHTML%
12510     id=\textquotedbl{}%
12511     lateximage-\BaseJobname-\arabic{LWR@lateximagenumber}%
12512     \textquotedbl\LWR@indentHTML
12513     class=\textquotedbl{}lateximagesource\textquotedbl\LWR@orignewline
12514   }%

```

Write instructions to the <ImagesDirectory>.txt file:

```

12515   \LWR@traceinfo{lateximage: about to write to \BaseJobname-images.txt}%
12516   \IfBooleanTF{#1}% starred
12517   {% hash

```

Compute and save the hashed file name for later use:

```

12518   \ifdefvoid{\LWR@ThisAltText}{%
12519     \IfBooleanTF{#3}{%
12520       \edef\LWR@hashedname{%
12521         \LWR@mdfive{\detokenize\expandafter{#2}-!-#4}%
12522       }%
12523     }{%
12524       \edef\LWR@hashedname{%
12525         \LWR@mdfive{\detokenize\expandafter{\AltTextOpen#2\AltTextClose}-!-#4}%
12526       }%
12527     }%
12528   }{%
12529     \edef\LWR@hashedname{%
12530       \LWR@mdfive{\detokenize\expandafter{\AltTextOpen\LWR@ThisAltText\AltTextClose}-!-#4}%
12531     }%
12532   }%
12533   \LWR@traceinfo{lateximage: hash is \LWR@hashedname}%

```

Write the page, hashing, and hashed name:

```

12534   \immediate\write\LWR@lateximagesfile{%
12535     |\arabic{LWR@LImage}|true|\LWR@hashedname|%
12536   }%
12537   }% hash
12538   {% no hash

```

No hash, so write the page, no hashing, and the image number:

```

12539   \LWR@traceinfo{lateximage: hash false}%
12540   \immediate\write\LWR@lateximagesfile{%
12541     |\arabic{LWR@LImage}|false|\LWR@ImagesName\arabic{LWR@externalfilecnt}|%
12542   }%
12543   }% no hash

```

Place an open comment tag. This will hide any traces of the lateximage PDF page which were picked up by *pdftotext*.

```

12544   \LWR@traceinfo{lateximage: about to create open comment}%
12545   \LWR@htmlopencomment%

```

One level deeper. At this outer-most lateximage, it is known that this is not being used inside an  $\mathcal{AMS}$  \text, since the outer-most level will never be in math mode.

```
12546 \addtocounter{LWR@lateximagedepth}{1}%
```

Start the new PDF page:

```
12547 \LWR@traceinfo{lateximage: about to create a new page}%
12548 \LWR@maybe@orignewpage%
```

If the current page is larger, typeset the image in a “standard” width page and font size:

```
12549 \LWR@traceinfo{lateximage: about to create minipage}%
12550 \setcounter{LWR@mpfootnote@store}{\value{mpfootnote}}
12551 \ifdimless{\linewidth}{6in}{%
12552   \LWR@print@minipage{\linewidth}%
12553 }{%
12554   \LWR@print@minipage{6in}%
12555 }%

12556 \ifnumgreater{\value{LWR@minipage@depth}}{0}%
12557   {\setcounter{mpfootnote}{\value{LWR@mpfootnote@store}}}%
12558   {}%
12559 \@nameuse{LWR@print@LateximageFontSizeName}%
```

Temporarily restore formatting to its PDF definitions: Do not produce HTML tags for \hspace, etc. inside a lateximage.

```
12560 \LWR@traceinfo{lateximage: about to temporarily restore formatting}%
12561 \LWR@restoreorigformatting%
```

If not inside a minipage, use full-page footnotes instead of minipage footnotes. These become HTML footnotes.

```
12562 \ifnumgreater{\value{LWR@minipage@depth}}{0}%

12566     \def\thempfn{\thefootnote}%
12567     \LetLtxMacro\@footnotetext\LWR@footnotetext%
12568   }%
```

Create the LWRlateximage<number> label:

```
12569 \LWR@traceinfo{lateximage: about to create label}%
12570 \LWR@orig@label{LWRlateximage-\BaseJobname-\arabic{LWR@lateximagenumber}}%
12571 \LWR@traceinfo{lateximage: finished creating the label}%
```

Adjust the rule color to match HTML:

```
12572 \ifdefvoid{\LWR@ruleHTMLcolor}{}{%
12573   \LWR@print@arrayrulecolor[HTML]{\LWR@ruleHTMLcolor}%
12574 }%
```

Enable print-mode math functions:

```

12575 \LetLtxMacro$\LWR@origdollar%
12576 \catcode'\$=3% math shift
12577 \LetLtxMacro\(\LWR@origopenparen%
12578 \LetLtxMacro\)\LWR@origcloseparen%

```

Only enable print-mode display math if are not already inside display math:

```

12579 \ifbool{LWR@indisplaymathimage}{}{% not in display math
12580 \LetLtxMacro\[\LWR@origopenbracket%
12581 \LetLtxMacro\]\LWR@origclosebracket%

12583 \let\endequation\LWR@orig@endequation%
12584 \csletcs{equation*}{LWR@orig@equation*}%
12585 \csletcs{endequation*}{LWR@orig@endequation*}%
12586 }% not in display math

```

For chemformula:

```

12587 \LetLtxMacro\LWR@newsingledollar$%
12588 \LetLtxMacro\LWR@newsingledollar$% syntax highlighting

12589 }% end of outer-most lateximage
12590 \LWR@traceinfo{lateximage: finished start of environment}%
12591 }% end of \begin{lateximage}

```

`\endlateximage` When the lateximage environment closes:

```

12592 {% start of \end{lateximage}
12593 \LWR@traceinfo{lateximage: starting end of lateximage}%

```

Nested more than one deep?

```

12594 \LWR@traceinfo{lateximage: internal depth was \arabic{LWR@lateximagedepth}}%
12595 \ifnumcomp{\value{LWR@lateximagedepth}}{>}{1}%

```

If nesting inside an already existing lateximage, simply record one less level. Uses a lower-level TeX macro due to  $\mathcal{A}\mathcal{M}\mathcal{S}$  `\text` change of `\addtocounter`.

```

12596 {%
12597 \LWR@traceinfo{lateximage: unnesting}%
12598 \global\advance\c@LWR@lateximagedepth -1\relax%
12599 }%

```

If this is the outer-most lateximage:

```

12600 {% end of outer-most lateximage

```

Finish the lateximage minipage and start a new PDF page:

```

12601 \LWR@traceinfo{lateximage: ending outer-most lateximage}%
12602 \endLWR@print@minipage%
12603 \LWR@maybe@orignewpage%

```

Close the HTML comment which encapsulated any traces of the lateximage picked up by *pdftotext*:

```

12604 \LWR@print@vspace*{.5\baselineskip}%

```

```
12605 \LWR@htmlclosecomment%
12606 \LWR@traceinfo{lateximage: The page after the image is \arabic{page}}%
```

Create a link to the lateximage, allowing its natural height:

```
12607 \LWR@traceinfo{about to LWR@lateximage@oneimage !#2!}%
12608 \IfBooleanTF{#1}% starred
12609 {% hash
12610 \LWR@lateximage@oneimage{#2}{\LWR@hashedname}{#5}{#3}{#6}%
12611 }% hash
12612 {% no hash
12613 \LWR@lateximage@oneimage{#2}{\LWR@ImagesName\theLWR@externalfilecnt}{#5}{#3}{#6}%
12614 }% no hash
```

Be sure that are doing a paragraph:

```
12615 \LWR@ensuredoingapar%
```

Close the HTML span which has the *pdf<sub>totext</sub>* comment and also the link to the .svg image:

```
12616 \LWR@htmltag{/span}%
12617 \ifbool{HTMLDebugComments}{%
12618 \LWR@htmlcomment{End of lateximage}%
12619 }{}
```

Undo one lateximage level. This is not inside an  $\mathcal{AMS}$   $\text{\textbackslash text}$ , so regular  $\text{\textbackslash addtocounter}$  may be used here.

```
12620 \addtocounter{LWR@lateximagedepth}{-1}%
```

Clear the single-use alt text:

```
12621 \gdef\LWR@ThisAltText{%
12622 }% end of outer-most lateximage
12623 \LWR@traceinfo{lateximage: exiting depth is \arabic{LWR@lateximagedepth}}%
12624 \LWR@traceinfo{lateximage: done}%

## 87 siunitx

`siunitx` (*Pkg*)

A few HTML unit equivalents are defined here.

`siunitx` is well supported by `lwarp`.

**Limitations** Some general limitations:

**fractions** Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

`\cancel` is not currently supported for `siunitx v3`.

Negative values are not automatically colored.

 **tabular** Tabular `S` and `s` columns are rendered as simple `c` columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for `drop-exponent`, without which the value will be shown incorrectly.

 **drop-exponent**

 **table-auto-round** `table-auto-round` is ignored.

**Math rendering** Math may be rendered in several ways in the same document:

**For math mode with `svg display`:** The original `siunitx` code is used while generating the `svg` image.

**For HTML text mode:** `lwarp` uses `siunitx` code patched for `HTML`, and simplified units.

**For math expressions while using MATHJAX:** A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

**Custom units** siunitx allows customized units:

```
\DeclareSIUnit {<name>} {<definition>}
```

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in `svg math` or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

```
\HTMLDeclareSIUnit {<name>} {<definition>}
```

 **v3 only!** Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit` declares a simplified version of the unit for HTML, for example if the print-mode unit uses `TeX` boxes or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MATHJAX:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

**Predefined units** Most units work as-is with HTML. For the following units, `lwarp` has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

 **MathJax**

### Document modifications required for MATHJAX

 `\sisetup`

- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MATHJAX. The MATHJAX emulation also ignores most macro options.

 **complex numbers**

- Complex numbers are displayed as entered, ignoring `output-complex-root`.

**custom units**

- Custom units may be added with `\CustomizeMathJax`. For example, from `lwarp-common-mathjax-siunitx`:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_-\mathrm{h}}}  
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

 **unit spacing**

- Units work better using `~` between units instead of using periods.

 `\square`, `\cubic`

- To square or cube compound units, enclose the following compound units in braces:

```
\cubic{\centimeter}
```

Single units do not require braces.

- For `\numlist`, the argument is printed as text as-is, so use space between semicolons for improved readability.

 **Missing \$ inserted**

- If using `parse-numbers = false`, also use `\num` or `\qty`. `siunitx=siunitx>Missing $ inserted`.

Also see **MATHJAX option**, section 8.7.5.

**for HTML output** 12726 `\begin{warpHTML}`

Options for `siunitx`:

```

12727 \newrobustcmd{\LWR@siunitx@textcelsius}{\HTMLentity{deg}C}
12728 \newrobustcmd{\LWR@siunitx@textdegree}{\HTMLentity{deg}}
12729 \newrobustcmd{\LWR@siunitx@textprime}{\HTMLUnicode{2032}}
12730 \newrobustcmd{\LWR@siunitx@textdblprime}{\HTMLUnicode{2033}}
12731 \newrobustcmd{\LWR@siunitx@textplanckbar}{\text{\textit{\HTMLUnicode{210F}}}}

12736 \renewrobustcmd{\LWR@siunitx@textprime}{\text{\ensuremath{^\prime}}}%
12737 \renewrobustcmd{\LWR@siunitx@textdblprime}{\text{\ensuremath{^\prime\prime}}}%
12738 \renewrobustcmd{\LWR@siunitx@textplanckbar}{\text{\ensuremath{\hbar}}}%
12739 }

12740 \end{warpHTML}

```

**for PRINT output:** The print version of `\HTMLDeclareSIUnit`.

```

12741 \begin{warpprint}
12742 \NewDocumentCommand{\HTMLDeclareSIUnit}{o +m m}{}
12743 \end{warpprint}

## 88 Graphics print-mode modifications

### 88.1 General limitations

Per table 9, image filenames may be specified either with or without an extension. If an extension is given it will be used as-is, for either print or HTML output. If no extension is given, a list of possible extensions is tried, which depends on whether print or HTML is being generated. This allows a PDF file for print and a SVG file for HTML, for example. If no extension is given, the automatic search will only return lowercase extensions, even if the filename actually has an uppercase extension, and `lwarp` cannot get around this problem, so image file extensions must be lowercase to be seen by the HTML browser with `lwarp`. For example, name the image file `image.pdf` instead of `image.PDF`, but refer to it in the source as `image`, without an extension. For images which may be used as-is with either print or HTML, such as JPG or PNG, you may use a capitalized extension if it is specified in the source, such as `image.JPG`.

**file extensions**

**⚠ case sensitive**

**`\includegraphics` file formats** For `\includegraphics` with `.pdf` or `.eps` files, the user must provide a `.pdf` or `.eps` image file for use in print mode, and also a `.svg`, `.png`, or `.jpg` version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, `lwarp` will automatically choose the `.pdf` or `.eps` format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a .pdf or .eps image is referred to with its file extension, the extension will be changed to .svg for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html
\includegraphics{filename.eps} % uses .svg in html
```

`pdftocairo` (*Prog*) To convert a PDF image to SVG, use the utility *pdftocairo*:  
PDF to SVG

Enter ⇒ **pdftocairo -svg filename.pdf**

`lwarpmk pdftosvg` (*Prog*) For a large number of images, use *lwarpmk*:

Enter ⇒ **lwarpmk pdftosvg \*.pdf** (or a list of filenames)

`lwarpmk epstopdf` (*Prog*) For EPS images converted to PDF using the package *epstopdf*, use  
`epstopdf` (*Prog*)  
epstopdf package

Enter ⇒ **lwarpmk pdftosvg \*.PDF**

to convert to SVG images.

`DVI LATEX` When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ **lwarpmk epstopdf \*.eps** (or a list of filenames)

Enter ⇒ **lwarpmk pdftosvg \*.pdf** (or a list of filenames)

`PNG and JPG` For PNG or JPG while using *pdflatex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

`GIF` GIF files may be used for HTML, but another format must also be provided for print output.

`file extension priorities` If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

`duplicate files`

⚠ image not displayed

A complication occurs if a file of the same name exists elsewhere in the T<sub>E</sub>X tree, such as a test image from some L<sup>A</sup>T<sub>E</sub>X package. T<sub>E</sub>X looks in the local document directory before considering the directories specified by `\graphicspath`, but the T<sub>E</sub>X tree is found as “local”, so any file in the tree is found before the directories in `\graphicspath`. To use such an image, it must be copied to the document’s directory to be used for HTML, and furthermore must be in the document’s base directory instead of an images subdirectory.

⚠ graphics vs. graphicx

If using the older `graphics` syntax, use both optional arguments for `\includegraphics`. A single optional parameter is interpreted as the newer `graphicx` syntax. Note that viewports are not supported by *lwarp* — the entire image will be shown.

⚠ viewport

`units` For `\includegraphics`, avoid px and % units for width and height, or enclose them inside `warpHTML` environments. For font-proportional image sizes, use ex or em. For fixed-sized images, use cm, mm, in, pt, or pc. Use the keys `width=.5\linewidth`, or similar for `\textwidth` or `\textheight` to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the `scale` option, since it is not well supported by HTML browsers.

`options` `\includegraphics` accepts `width` and `height`, `origin`, `rotate` and `scale`, plus new `class` and `alt` keys. (`alt` has recently been incorporated into `graphicx` itself.)

`HTML class` With HTML output, `\includegraphics` accepts an optional `class=xyz` keyval com-

ination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

**HTML alt tags** Likewise, the `\includegraphics alt` key adds an HTML alt tag to an image, and is ignored for print output. If not assigned, each image is given an alt tag according to `\ImageAltText`.

**⚠ scale** Avoid using the `\includegraphics scale` option. Change:

```
\includegraphics[scale=<xx>]{...}
```

to:

```
\includegraphics[width=<yy>\linewidth]{...}
```

**\rotatebox** `\rotatebox` accepts the optional origin key.

**⚠ browser support** `\rotatebox`, `\scalebox`, and `\reflectbox` depend on modern browser support. The CSS3 standard declares that when an object is transformed the whitespace which they occupied is preserved, unlike L<sup>A</sup>T<sub>E</sub>X, so expect some ugly results for scaling and rotating.

## 88.2 Print-mode modifications

**for PRINT output:** For print output, accept and then discard the new class key:

```
12744 \begin{warpprint}
12745 \define@key{Gin}{class}{}

```

Print-mode additions for the `overpic` package. See section 460 for the HTML version.

```
12746 \AtBeginDocument{
12747 \IfPackageLoadedTF{overpic}{
12748 \newcommand*\overpicfontsize}{12}
12749 \newcommand*\overpicfontskip}{14}
12750 }{}
12751 }
12752 \end{warpprint}

```

## 89 xcolor boxes

`xcolor (Pkg)` A few new definitions are provided for enhanced HTML colored boxes, and `\fcolorbox` is slightly modified. Print-mode version are also provided.

Print-mode versions of new `xcolor` definitions. These are defined inside `warppall` because they are also used for HTML while inside a `lateximage`. They are defined `\AtBeginDocument` so that the `xcolor` originals may first be loaded and saved for reuse.

The framed versions are modified to allow a background color of none, in which case only the frame is drawn, allowing the background page color to show.

**for HTML & PRINT** 12753 `\begin{warppall}`

After xparse may have been loaded ...

```
12754 \AtBeginDocument{
```

... and *only* if xcolor was loaded:

```
12755 \IfPackageLoadedTF{xcolor}{
12756 \LWR@traceinfo{patching xcolor}
```

The print version:

`\colorboxBlock` `\colorboxBlock` is the same as `\colorbox`:

```
12757 \LetLtxMacro\colorboxBlock\colorbox
```

The original definition is reused by the new versions:

```
12758 \LetLtxMacro\LWR@orig@print@fcolorbox\colorbox
```

```
\colorbox [frame model] [frame color] [box model] [box color] [text]
```

In print mode, `\fcolorbox` is modified to accept a background color of none.

(`\fcolorbox` is particular about its optional arguments, thus the elaborate combinations of `\ifthenelse`.)

```
12759 \newsavebox{\LWR@colorminipagebox}
12760
12761 \NewDocumentCommand{\LWR@print@fcolorbox}{o m o m +m}{%
12762   \LWR@traceinfo{\LWR@print@fcolorbox #2 #4}%
```

Pre-load the contents into an LR box so that they can be used inside a `\fcolorbox`:

```
12763   \begin{lrbox}{\LWR@colorminipagebox}%
12764   #5%
12765   \end{lrbox}%
```

Sort out the various optional arguments and the background color of none. In each case, the LR box is placed inside a `\fcolorbox`.

The current color is remembered, then set to the frame, then the current color is used for the contents.

```
12766   \ifstrequal{#4}{none}%
12767   {% #4 none
12768     \LWR@traceinfo{background is none}%
12769     {% scope the \colorlet

12771       \color{#2}%
12772       \fbox{%
12773         \color{\LWR@currentcolor}%

## 90 chemmacros environments

`\makepolymerdelims` and redox reactions must be enclosed in a `lateximage` during HTML output. These environments are provided here in print mode, and in the `chemmacros` code in HTML mode, as a high-level semantic syntax which automatically embeds the contents in a `lateximage` with an appropriate `alt` tag.

**for PRINT output** 12844 `\begin{warpprint}`

```

12845 \AtBeginDocument{
12846 \IfPackageLoadedTF{chemmacros}{

```

Env polymerdelims

```

12847 \DeclareDocumentEnvironment{polymerdelims}{}
12848     {}{}

```

Env redoxreaction

`{\space above} {\space below}`

For print output, extra space is include above and below the image, and a `lateximage` is not necessary. This extra space must be enforced, even inside a float, so zero-width rules are used.

For the HTML version, see section 193.5.

```
12849 \DeclareDocumentEnvironment{redoxreaction}{m m}
12850   {\rule{0pt}{#1}}{\rule[-#2]{0pt}{#2}}

12851 }{\}% chemmacros
12852 }% AtBeginDocument

12853 \end{warpprint}
```

## 91 cleveref

**loading order** `cleveref` and `lwarp-cleveref` with its associated macro patches are automatically preloaded at the end of the preamble via `\AtEndPreamble` and `\AfterEndPreamble`. This is done because the HTML conversion requires `cleveref`. The user's document may not require `cleveref`, thus the user may never explicitly load it, so during HTML output `lwarp` loads it last. If the user's document preamble uses `cleveref` options, or functions such as `\crefname`, then `cleveref` may be loaded in the user's preamble near the end, and `lwarp`'s additional loading of `cleveref` will have no effect.

`\AtEndPreamble` forces `cleveref` to be loaded last, if it has not yet been loaded by the user.

```
for HTML output12854 \begin{warppHTML}
12855
12856 \AtEndPreamble{

```

## 92 Preexisting label and reference definitions

Remember and patch some label-related definitions. These will be further encased and patched by other packages later.

`\label` and `\pageref` do NOT change their behavior according to print or HTML output, and thus do not use the `\LWR@formatted` system.

## 93 picture environment

`picture (env)` The `picture` environment is enclosed inside a `\lateximage`.

## 94 Minipages and Boxes

A CSS flexbox is used for minipages and parboxes, allowing external and internal vertical positioning.

 **inline** A line of text with an inline minipage or `\parbox` will have the minipage or `\parbox` placed onto its own line, because a paragraph is a block element and cannot be made inline-block.

**placement** minipages and `\parboxes` will be placed side-by-side in HTML unless you place a `\newline` between them.

**side-by-side** Side-by-side minipages may be separated by `\quad`, `\qquad`, `\enskip`, `\hspace`, `\hfill`, or a `\rule`. When inside a center environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side minipages and these spacing commands, but not at the start or end of the paragraph.

 **minipage in a span** There is limited support for minipages inside an HTML `<span>`. An HTML `<div>` cannot appear inside a `<span>`. While in a `<span>`, minipages, and `\parboxes`, and any enclosed lists have limited HTML tags, resulting in an “inline” format, without markup except for HTML breaks. Use `\newline` or `\par` for an HTML break.

 **minipage size** When using minipage, `\parbox`, and `fminipage`, a virtual 6 × 9 inch text area is used for `\linewidth`, `\textwidth`, and `\textheight`, both for sizing the minipage, and also for its contents.

**if width is `\linewidth`** If a minipage or `\parbox` is assigned a width of exactly `\linewidth`, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it appears in print output.

**full-width if HTML** A new macro `\minipagefullwidth` requests that, during HTML output, the next single minipage or `\parbox` be generated without an HTML width attribute, allowing it to be the full width of the display rather than the declared print-output width. This may be useful where the printed version’s width makes no sense in HTML.

 **tabular, multicols** Inside a `tabular` or `multicols` environment, where the width depends on the browser window, `\minipagefullwidth` is effectively used by default for every minipage or `\parbox` inside the environment. `\UseMinipageWidths` may be used to tell lwarp to honor the specified widths of all following minipages and `\parboxes`

```
\UseMinipageWidths
```

```
\IgnoreMinipageWidths
```

until the end of the local scope, and `\IgnoreMinipageWidths` may be used to tell `lwrap` to ignore the specified widths.

 **multicol** Inside a `multicols`, `\linewidth` is divided by the specified number of columns.

 **text alignment** Nested minipages adopt their parent's text alignment in HTML, whereas in regular L<sup>A</sup>T<sub>E</sub>X PDF output they do not. Use a `flushleft` or similar environment in the child minipage to force a text alignment.

**for HTML output** `\begin{warpHTML}`

## 94.1 Computed lengths

`\LWR@minipagewidth` (*Len*) Used to convert the width into printable units.

```
12876 \newlength{\LWR@minipagewidth}
```

`\LWR@minipageheight` (*Len*) Used to convert the height into printable units.

```
12877 \newlength{\LWR@minipageheight}
```

## 94.2 Virtual page size

`LWR@virtualpagedepth` (*Ctr*) Used to only reset the line width at the outermost minipage.

```
12878 \newcounter{LWR@virtualpagedepth}
12879 \setcounter{LWR@virtualpagedepth}{0}
```

`LWR@setvirtualpage` (*env.*) \* [`<columns>`]

If not nesting a minipage, adjust `\linewidth`, `\textwidth`, and `\textheight` for a virtual  $6 \times 9$  page, and start on a new PDF page to help prevent page overflows.

If starred, force a new page in the PDF before generating more HTML. This may be done to reduce the chance of page overflow when starting a new minipage.

The optional number of columns defaults to 1.

```

## 94.4 Minipage handling

`LWR@forceminipagefullwidth` (*bool*) Should the next minipage have no HTML width? Used to force full width for all minipages in an environment such as `tabular` or `multicols`, where the actual width depends on the browser width. Controlled by `\useminipagewidths` and `\ignoreminipagewidths`.

`\LWR@fboxstyle` Prints the HTML attributes for a black border and padding.

`\fbox`  $\langle text \rangle$

Creates a framed inline span enclosing the text.

Create a new HTML version, but don't use it until after `xcolor` may have loaded:

```
13101 \newcommand{\LWR@HTML@fbox}[1]{%
13102   \LWR@traceinfo{HTML fbox}%
13103   \LWR@forceminwidth{\fboxrule}%

13105   \InlineClass[%

13108   ]{fbox}{#1}%
13109   \LWR@traceinfo{HTML fbox: done}%
13110 }
```

`xcolor` lets things to `\fbox` when it is loaded, and this must remain even for HTML output while in a `lateximage`, so `\fbox` is not modified until `\AtBeginDocument`:

```
13111 \AtBeginDocument{\LWR@formatted{fbox}}
```

`\fboxBlock`  $\langle text \rangle$  Creates a framed HTML `<div>` of the text.

First, a print-mode version. This is newly defined for print mode, so it is defined inside `warpall`.

```

13113
13114 \begin{warpall}
13115 \let\fboxBlock\fbox
13116 \end{warpall}
13117
13118 \begin{warpHTML}

**for HTML output:** Next, an HTML version:

```

13128 \LWR@formatted{fboxBlock}
13129
13130 \end{warpHTML}

```

`fminipage (env.)` [*align*] [*height*] [*align*] {*width*}

Creates a framed HTML `<div>` around its contents.

**for HTML & PRINT:** Print version:

```

13131 \begin{warpall}
13132
13133 \newsavebox{\LWR@fminipagebox}
13134
13135 \NewDocumentEnvironment{fminipage}{0{t} o 0{t} m}
13136 {%

```

An outer minipage will be used for vertical alignment. An inner minipage will be framed with `\fbox`.

If the optional inner alignment is not given, use the outer instead:

```

13137 \IfValueTF{#3}%
13138 {\def\LWR@thisalign{#3}}
13139 {\def\LWR@thisalign{#1}}%

```

Form the outer minipage depending on whether a height was given. Make the outer minipage larger to compensate for the frame.

```

13142 {\minipage[#1]{#4+2\fboxsep+2\fboxrule}}%

```

Capture the contents of the environment:

```

13143 \begin{lrbox}{\LWR@fminipagebox}%

```

Nest the contents inside an inner minipage of the desired size:

```

13144 \IfValueTF{#2}%
13145 {\minipage[#1][#2][\LWR@thisalign]{#4}}%
13146 {\minipage[#1]{#4}}%
13147 }
13148 {%

```

Close the inner minipage and the LR box with the contents:

```

13149 \endminipage%
13150 \end{lrbox}%

```

Create a frame around the contents of the environment:

```

13151 \fbox{\usebox{\LWR@fminipagebox}}%

```

The entire thing is placed inside the outer minipage:

```

13152 \endminipage%
13153 }
13154 \end{warpall}

```

HTML version:

**for HTML output**

```

13155 \begin{warpHTML}

13161 \setlength{\LWR@tempwidth}{#4}%
13162 \IfValueT{#2}{\setlength{\LWR@tempheight}{#2}}%

13180 }
13181 {%
13182 \end{BlockClass}%
13183 \end{LWR@setvirtualpage}%

Prevent paragraph tags around horizontal white space until the start of the next paragraph:

```

13194 \end{warpHTML}

```

## 95 Direct formatting

⚠ **\bfseries, etc.** `\textbf`, etc. are supported, but `\bfseries`, etc. work only in some situations.

⚠ **HTML special chars** `&`, `<`, and `>` have special meanings in HTML. If `\&`, `\textless`, and `\textgreater` are used, proper HTML entities will be used, but there may be HTML parsing problems if these special characters occur unescaped in program listings or other verbatim text.

**program listings** For program listings, the `listings` package is supported, and its `literate` option is used to convert `&`, `<`, and `>` to proper HTML entities.

**verbatim** The various verbatim-related environments do not convert `&`, `<`, and `>`, so care must be taken to avoid accidentally including valid HTML code inside these environments. Adding a space on either side may be sufficient.

For high-level block and inline custom CSS classes, see section 52.10.

`\LWR@minipagestartpars` Minipages are often placed side-by-side inside figures, with a bit of horizontal space to separate them. Since HTML does not allow a `<div>` to be inside a `p`, paragraphs must be turned off during the generation of the minipage, then turned on after the minipage is complete. When this occurs between side-by-side minipages, `lwarp` correctly suppresses the paragraph tags between the minipages, unless some other text is between the minipages. Such text forms its own paragraph, resulting in text after a minipage to be on its own line. Since people often place small horizontal space between minipages, it is desirable to maintain this space if possible. `lwarp` tries to do this by remembering that a minipage has been seen, in which case paragraph tags are suppressed around `\hspace`, `\enskip`, `\quad`, and `\qqquad` until the end of the paragraph, when the closing `p` tag is created.

`\hspace`  
`\enskip`  
`\quad`  
`\qqquad`

When a minipage is seen, the boolean `LWR@minipagethispar` is set, telling the following horizontal whitespace commands to try to suppress their surrounding paragraph tags. `LWR@minipagethispar` is cleared at the next end of paragraph, when the HTML paragraph closing tag is generated.

Placed just before `\hspace`, `\quad`, or `\qqquad`'s HTML output.

```
13634 \newcommand*{\LWR@minipagestartpars}{%
13635   \ifbool{LWR@minipagethispar}{\LWR@startpars}{}%
13636 }
```

`\LWR@minipagestoppars` Placed just after `\hspace`, `\quad`, or `\qqquad`'s HTML output.

```
13637 \newcommand*{\LWR@minipagestoppars}{%
13638   \ifbool{LWR@minipagethispar}{\LWR@stoppars}{}%
13639 }
```

`\quad` Handles special minipage & horizontal space interactions. Uses 2003 EM SPACE to pass validation.

```
13640 \newrobustcmd*{\LWR@HTML@quad}{%
13641   \LWR@minipagestoppars%
13642   \HTMLunicode{2003}%
13643   \LWR@minipagestartpars%
13644 }
13645 \LWR@formatted{quad}
```

`\qqad` Handles special minipage & horizontal space interactions.

```
13646 \newrobustcmd*{\LWR@HTML@qqad}{\quad\quad}
13647 \LWR@formatted{qqad}

`\enskip` Handles special minipage & horizontal space interactions.

```
13648 \newrobustcmd*{\LWR@HTML@enskip}{%
13649   \LWR@minipagestoppars%
13650   \HTMLunicode{2002}%
13651   \LWR@minipagestartpars%
13652 }
13653 \LWR@formatted{enskip}
```

`\LWR@tempwidth` (*Len*) Used to compute span width, height, raise for `\hspace` and `\rule`:

```
\LWR@tempheight (Len)
13654 \newlength{\LWR@tempwidth}
\LWR@tempraise (Len)
13655 \newlength{\LWR@tempheight}
13656 \newlength{\LWR@tempraise}
```

`\hspace * {<length>} * {<length>}`

Handles special minipage & horizontal space interactions.

Prints a span of a given width. Ignores the optional star.

`\hspace{\fill}` is converted to `\hspace{2em}`, equal to `\qqad`.

```
13657 \NewDocumentCommand{\LWR@HTML@hspace}{s m}{%
13658 \setlength{\LWR@tempwidth}{#2}%
```

If `\fill`, change to `\qqad`:

```
13659 \ifnum\gluestretchorder\LWR@tempwidth>0%
13660 \setlength{\LWR@tempwidth}{2em}%
13661 \fi%
```

Only if the width is greater than zero:

```
13662 \ifdimcomp{\LWR@tempwidth}{>}{0pt}{%
```

If had a minipage this paragraph, try to inline the white space without generating paragraph tags:

```
13663   \LWR@minipagestoppars%
```

Support the HTML thin wrappable space:

```
13664   \ifdimcomp{\LWR@tempwidth}{=}{.16667em}%
13665   {%
13666     \HTMLunicode{2009}% thin breakable space
13667   }%
```

Print the span with the converted width. Not rounded.

```
13668   {%
```

```

13669     \LWR@htmltagc{%
13670     span style=\textquotedbl{}width:\LWR@printlength{\LWR@tempwidth}; % extra space
13671         display:inline-block\textquotedbl%
13672     }%

```

If formatting for a word processor, approximate with a number of `\quads`, in case a span of a given width is not supported:

```

13673     \ifbool{FormatWP}{%
13674         \setlength{\LWR@templengthone}{\LWR@tempwidth}%
13675         \whiledo{\lengthtest{\LWR@templengthone>1em}}{%
13676             \quad%
13677             \addtolength{\LWR@templengthone}{-1em}%
13678         }%
13679     }%

```

If NOT formatting for a word processor, include an empty comment to avoid an empty span:

```

13680     {\LWR@htmlcomment{}}%

```

Close the span:

```

13681     \LWR@htmltagc{/span}%
13682 }%

```

If had a minipage this paragraph, try to inline the white space without generating paragraph tags:

```

13683     \LWR@minipagestartpars%
13684 }{}% width greater than 0
13685 }%
13686 \LWR@formatted{hspace}

```

`\clearpage`

```
13697 \renewcommand*\clearpage{}

```
13698 \renewcommand*\cleardoublepage{} 
```

`\rule [⟨raise⟩] {⟨width⟩} {⟨height⟩}`

Handles special minipage & horizontal space interactions.

Creates a span of a given width and height. Ignores the optional star.

`\fill` is zero-width, so `\hspace{\fill}` is ignored.

```
13699 \newcommand*\LWR@HTML@rule}[3][{}]{%
```

The width is copied into a temporary L<sup>A</sup>T<sub>E</sub>X length, from which comparisons and conversions may be made:

```
13700 \setlength{\LWR@tempwidth}{#2}% 
```

If it's zero-width then skip the entire rule:

```
13701 \ifthenelse{\lengthtest{\LWR@tempwidth=0pt}}%
```

```
13702 {}% zero- width
```

```
13703 {}% non-zero width
```

If it's non-zero width, set a minimal thickness so that it more reliably shows in the browser:

```
13704 \ifthenelse{%
13705 \lengthtest{\LWR@tempwidth>0pt}\AND%
13706 \lengthtest{\LWR@tempwidth<1pt}}%
13707 }%
13708 {\setlength{\LWR@tempwidth}{1pt}}%
13709 {}%
```

Likewise with height:

```
13710 \setlength{\LWR@tempheight}{#3}%
13711 \ifthenelse{%
13712 \lengthtest{\LWR@tempheight>0pt}\AND%
13713 \lengthtest{\LWR@tempheight<1pt}}%
13714 }%
13715 {\setlength{\LWR@tempheight}{1pt}}%
13716 {}%
```

If had a minipage this paragraph, try to inline the rule without generating paragraph tags:

```
13717 \LWR@minipagestoppar%
```

Print the span with the converted width and height. The width and height are NOT rounded, since a height of less than 1pt is quite common in L<sup>A</sup>T<sub>E</sub>X code.

```
13718   \LWR@findcurrenttextcolor%
13719   \LWR@htmltagc{%
13720   span\LWR@indentHTML%
13721   style=\textquotedbl%
```

The HTML background color is used to draw the filled rule according to the L<sup>A</sup>T<sub>E</sub>X foreground color set by `\textcolor`.

```
13722   \ifbool{FormatWP}{}{background:\LWR@currenttextcolor ; }%
```

The width and height are printed, converted to PT:

```
13723   width:\LWR@printlength{\LWR@tempwidth} ; %
13724   height:\LWR@printlength{\LWR@tempheight} ; %
```

The raise height is converted to a CSS transform. The \*2 raise multiplier is to approximately match HTML output's X height. Conversion to a L<sup>A</sup>T<sub>E</sub>X length allows a typical L<sup>A</sup>T<sub>E</sub>X expression to be used as an argument for the raise, whereas printing the raise argument directly to HTML output without conversion to a L<sup>A</sup>T<sub>E</sub>X length limits the allowable syntax. To do: A superior method would compute a ratio of L<sup>A</sup>T<sub>E</sub>X ex height, then print that to HTML with an ex unit.

Display inline-block to place the span inline with the text:

```
13738   display:inline-block;\textquotedbl\LWR@orignewline%
13739   }%
```

If formatting for a word processor, approximate with a number of underscores, in case a span of a given width is not supported:

```
13740   \ifbool{FormatWP}{%
13741       \setlength{\LWR@templengthone}{\LWR@tempwidth}%
13742       \whiledo{\lengthtest{\LWR@templengthone>1em}}{%
13743           \_{}%
13744           \addtolength{\LWR@templengthone}{-1em}%
13745       }%
13746   }%
```

If NOT formatting for a word processor, add a comment to avoid an empty `<span>`:

```
13747      {\LWR@htmlcomment{}}%
```

Close the span:

```
13748      \LWR@htmltagc{/span}%
```

If had a minipage this paragraph, try to inline the white space without generating paragraph tags:

```
13749      \LWR@minipagestartpars%
```

```
13750 }% non-zero width
```

```
13751 }

## 98 \LaTeX and other logos

Logos for HTML and print modes:

Some of these logos may be redefined in a later package, so after loading other packages, and at the beginning of the document, their definitions are finally set by `\LWR@formatted`.

For CSS conversions, see:

<http://edward.oconnor.cx/2007/08/tex-poshlet>

and the spacing described in the `metafont` package documentation.

## 109 babel and polyglossia warnings

`lwarp` prints a message instructing the user how to avoid the following error.

(These are not `\PackageWarnings` because there may not be a problem.)

`lwarp` uses `cleveref`, which has some limitations when using `polyglossia`, possibly resulting in the error

```
! Undefined control sequence. . . . \_\_hook begindocument
```

To test compatibility, add

```
\usepackage{cleveref}
```

near the end of the preamble (as the last package to be loaded), and try to compile the print version. It may be necessary to set

```
\setdefaultlanguage{english}
```

or some other language supported by `cleveref`, then select other languages using `\setotherlanguages`.

Once the print version works with `cleveref` and `polyglossia`, the HTML version should work as well using `lwarp`.

File 7 **lwarp-abstract.sty**§ 116 Package **abstract**

*(Emulates or patches code by PETER WILSON.)*

`abstract` (*Pkg*) `abstract` is supported and patched by `lwarp`.

 **missing TOC** If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

**for HTML output:** `memoir` provides an abstract environment even though it is not an article or report class. Meanwhile, `lwarp` loads `book` to emulate `memoir`, but `book` does not have an abstract environment, so when the abstract package is loaded for emulation there is no pre-existing abstract to redefine, which would cause an error. Thus, a null abstract is provide here:

File 9 **lwarp-accents.sty**§ 118 Package **accents**

(Emulates or patches code by JAVIER BEZOS.)

accents (*Pkg*) accents is used as-is for SVG math, and is emulated for MATHJAX.

**for HTML output:** 1 \LWR@ProvidesPackagePass{accents}[2006/05/12]

For MATHJAX:

```
2 \begin{warpMathJax}

4
5 \CustomizeMathJax{\newcommand{\ring}[1]{\mathring{#1}}}
6 \CustomizeMathJax{\newcommand{\accentset}[2]{\overset{#1}{#2}}}
```

As of this writing, MATHJAX v3 does not yet support groups for macros, so for `\underaccent`, the originals are remembered here, then they are temporarily redefined and used inside `\underaccent`, then restored to their originals. `\LARGE` gives a reasonable size, and `\raise` is used to adjust vertically without introducing extra line space.

§ 122 Package **acronym**

*(Emulates or patches code by TOBIAS OETIKER.)*

acronym (*Pkg*) acronym is patched for use by lwarp.

 **multiply-defined labels** \acresetall does not work with cleveref, causing multiply-defined labels. lwarp patches acronym for HTML, but not for print mode.

**for HTML output:** 1 \LWR@ProvidesPackagePass{acronym}[2020/04/17]

Simplifies for HTML:

Removes the `mbox` to allow math inside:

```

65 \renewcommand*\AC@acs[1]{%

File 14 **lwarp-adjmulticol.sty**§ 123 Package **adjmulticol**

(Emulates or patches code by BORIS VEYTSMAN.)

adjmulticol (*Pkg*) adjmulticol is emulated.

Emulation similar to multicols is used, with adjusted margins. If the number of columns is specified as 1, it is set so, but if two or greater are used, lwarp allows a variable number of columns up to three.

**for HTML output:** 1 \LWR@ProvidesPackageDrop{adjmulticol}[2012/01/20]

2 \RequirePackage{multicol}

adjmulticols \* {<numcols>} {<left margin>} {<right margin>}

3 \NewDocumentEnvironment{adjmulticols}{s m m m}

4 {%

Compute the margins, and limit to positive only:

5 \setlength{\LWR@templengthone}{#3}%

6 \ifdimcomp{\LWR@templengthone}{<}{0pt}{\setlength{\LWR@templengthone}{0pt}}{ }%

7 \setlength{\LWR@templengthtwo}{#4}

8 \ifdimcomp{\LWR@templengthtwo}{<}{0pt}{\setlength{\LWR@templengthtwo}{0pt}}{ }%

If one column is specified, use a <div> of class singlecolumn, else use multicols:

9 \newcommand\*\LWR@mccolstype{multicols}%

10 \ifnumcomp{#2}{=}{1}{\renewcommand\*\LWR@mccolstype{singlecolumn}}{ }%

Help avoid page overflow:

11 \LWR@forcenewpage%

Create the <div> with the given margin and class:

12 \BlockClass[%

13 \LWR@print@ebox{margin-left:\LWR@printlength{\LWR@templengthone}} ; %

14 \LWR@print@ebox{margin-right:\LWR@printlength{\LWR@templengthtwo}}%

15 ]{\LWR@mccolstype}%

16 }

17 {\endBlockClass}

File 16 **lwarp-afterpage.sty**

§ 125 Package **afterpage**

`afterpage (Pkg)` `afterpage` is emulated.

File 17 **lwarp-algorithm2e.sty**

§ 126 Package **algorithm2e**

*(Emulates or patches code by CHRISTOPHE FIORIO.)*

`algorithm2e (Pkg)` `algorithm2e` is patched for use by `lwarp`.

For print output, captions are placed according to package options, but for HTML output captions are placed where used. Therefore, to have captions appear at the top of the algorithms for both print and HTML, place each captions at the top of each algorithm.

**for HTML output:** 1 \LWR@ProvidesPackagePass{algorithm2e}[2017/07/18]

For the list-of entries:

```

2 \renewcommand{\l@algocf}[2]{\hypertocfloat{1}{algocf}{loa}{#1}{#2}}

```

Select the `lwarp` float style according to the `algorithm2e` style:

```

3 \newcommand*\LWR@floatstyle@algocf{ruled}
4
5 \ifdefstring{\algocf@style}{boxed}{%
6 \renewcommand*\LWR@floatstyle@algocf{boxed}
7 }{}
8

```

```

9 \ifdefstring{\algocf@style}{boxruled}{%
10 \renewcommand*\LWR@floatstyle@algocf}{boxruled}
11 }{}
12
13 \ifdefstring{\algocf@style}{plain}{%
14 \renewcommand*\LWR@floatstyle@algocf}{plain}
15 }{}

```

Paragraph handling to allow line numbers under certain conditions:

```

16 \renewcommand{\algocf@everypar}{%
17   \ifbool{LWR@algocf@dopars}{%
18     \ifbool{LWR@doingstartpars}{%
19       \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}{%
20         }{}%
21       }{}%

```

`algorithm2e` uses `\everypar`, so the open paragraph tag is generated here instead of `\LWR@openparagraph`:

```

22   \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
23
24   \algocf@everyparn\algocf@everyparhanging%
25   }{}%
26 }{}%
27 }

```

lwarp caption handling:

```

28 \renewcommand{\algocf@makecaption}[2]{%
29   \LWR@HTML@caption@begin{algocf}%
30   \LWR@isolate{\algocf@captiontext{#1}{#2}}%
31   \LWR@HTML@caption@end%
32 }

```

Print any caption where it is declared:

```

33 \renewcommand{\algocf@makecaption@plain}[2]{%
34   \LWR@HTML@caption@begin{algocf}%
35   \LWR@isolate{\algocf@captiontext{#1}{#2}}%
36   \LWR@HTML@caption@end%
37 }
38
39 \renewcommand{\algocf@makecaption@boxed}[2]{%
40   \LWR@HTML@caption@begin{algocf}%
41   \LWR@isolate{\algocf@captiontext{#1}{#2}}%
42   \LWR@HTML@caption@end%
43 }
44
45 \renewcommand{\algocf@makecaption@ruled}[2]{%
46   \LWR@HTML@caption@begin{algocf}%
47   \LWR@isolate{\algocf@captiontext{#1}{#2}}%
48   \LWR@HTML@caption@end%
49 }

```

Turn off line numbering while making the caption:

```

50 \long\def\algocf@latexcaption#1[#2]#3{% original definition of caption
51 \boolfalse{LWR@algocf@dopars}%      lwarp
52 \par%
53 \addcontentsline{\csname ext@#1\endcsname}{#1}%
54 {\protect\numberline{\csname the#1\endcsname}{\ignorespaces \LWR@isolate{#2}}}%
55 \begingroup%
56 \@parboxrestore%
57 \if@minipage%
58 \setminipage%
59 \fi%
60 \normalsize%
61 \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par%
62 \endgroup%
63 \booltrue{LWR@algocf@dopars}%      lwarp
64 }

```

Line numbers are printed in a `<span>` of class `alg2elinenumber`:

```

65 \renewcommand{\algocf@printnl}[1]{%
66 \InlineClass{alg2elinenumber}{\NlSty{#1}}~%
67 }%

```

While initializing an algorithm environment, locally declare the style of a regular figure to be the same as the algorithm style, in case the figure option was used.

```

68 \preto\@algocf@init{%
69 \edef\LWR@floatstyle@figure{\LWR@floatstyle@algocf}%
70 }

```

For `lwarp`, the algorithm is not assembled inside a box, since `lateximages` would not work, so the captions are printed where declared.

```

71 \renewcommand{\@algocf@start}{%
72 \let\@mathsemicolon=\; \def\;{\ifmmode\@mathsemicolon\else\endalgoln\fi}%
73 % \raggedright%
74 \ALFnt{}%

```

84 \renewcommand{\BlankLine}{%

§ 129 Package **amscdx**

(Emulates or patches code by MARTIN VERMEER.)

`amscdx` (*Pkg*) `amscdx` is used as-is for SVG math.

 **MATHJAX** For MATHJAX, a warning notes that the CD environment must be enclosed between `\displaymathother` and `\displaymathnormal`.

File 29 **lwarp-arydshln.sty**

§ 138 Package **arydshln**

(Emulates or patches code by HIROSHI NAKASHIMA.)

`arydshln` (*Pkg*) `arydshln` heavily patches tabular code, so the actual package is not used. `arydshln` is emulated for `HTML` tabular, and reverts to solid rules for `SVG` math array and tabular in a `lateximage`.

`css` is not able to display a double-dashed border, so a single-dashed rule is displayed as a single-dashed border, and a double-dashed rule is displayed as a thicker single-dashed border.

For `MATHJAX`, limited emulation is provided for math mode.

**for HTML output:** `array` is required to allow `\newcolumn` below.

```
1 \RequirePackage{array}
2 \LWR@ProvidesPackageDrop{arydshln}[2018/09/26]
```

Ignored, but included for source compatibility:

```
3 \newdimen\dashlinedash \dashlinedash4pt %
4 \newdimen\dashlinegap \dashlinegap4pt %
5 \let\hdashlinewidth\dashlinedash
6 \let\hdashlinegap\dashlinegap
7
8 \def\ADLnullwide{}
9 \def\ADLsomewide{}
10 \def\ADLnullwidehline{}
11 \def\ADLsomewidehline{}
12
13 \def\ADLactivate{}
14 \def\ADLinactivate{}
15 \newcommand*\ADLdrawingmode[1]{}
16 \newcommand*\ADLnoshorthanded{}
17 \newcommand*\dashgapcolor[2][{}]{
18 \newcommand*\nodashgapcolor}
```

In a `lateximage`, revert to solid vertical rules:

```
19 \appto\LWR@restoreorigformatting{%
20 \newcolumnntype{:}{|}%
21 \newcolumnntype{;}[1]{|}%
22 \LetLtxMacro\hdashline\hline%
23 }
```

Some of these macros are already defined as temporary placeholders in the `lwarp` core, so they must be redefined here.

The emulated defaults also work for an emulated print mode inside a `lateximage`:

```
24 \def\hdashline{
```

```

25 % \adl@hdashline\adl@ihdashline
26 \adl@hdashline\adl@inactivehdl

File 34 **lwarp-authblk.sty**

§ 143 Package **authblk**

*(Emulates or patches code by PATRICK W. DALY.)*

`authblk (Pkg)` `authblk` is patched for HTML.

**package support** `lwarp` supports the native L<sup>A</sup>T<sub>E</sub>X titling commands, and also supports the packages `authblk` and `titling`. If both are used, `authblk` should be loaded before `titling`.

 **load order**

**\published and \subtitle** If using the `titling` package, additional titlepage fields for `\published` and `\subtitle` may be added by using `\AddSubtitlePublished` in the preamble. See section 69.8.

*(Emulates or patches code by PATRICK W. DALY.)*

**for HTML output:** Require that `authblk` be loaded before `titling`:

```

1 \IfPackageLoadedTF{titling}{
2   \PackageError{lwarp-authblk}

File 45 **lwarp-biblatex.sty**

§ 154 Package **biblatex**

(Emulates or patches code by PHILIPP LEHMAN.)

`biblatex` (*Pkg*) When `biblatex` is used, modifications from `newfloat` may have to be undone.

**for HTML output:**

1. `lwarp` uses `newfloat`.
2. For classes with chapters which `newfloat` does not know about, such as C<sub>T</sub>E<sub>X</sub>-related classes, `newfloat` may modify `\addtocontents`.

3. `biblatex`, though, wants to patch `\addtocontents`, which causes an error if `\addtocontents` has been changed.
4. Therefore, `\addtocontents` is restored to its original here, since `biblatex` is about to be loaded.
5. This means that the `newfloat`'s `chapterlistsgaps` option may no longer work.

```

1 \ifdef{\newfloat@addtocontents@ORI}{
2   \let\addtocontents\newfloat@addtocontents@ORI
3 }{}

```

`hyperref` emulation is loaded `\AtBeginDocument` to avoid an options clash.

```

4 \AtBeginDocument{\RequirePackage{hyperref}}
5
6 \LWR@ProvidesPackagePass{biblatex}[2018/03/04]

```

The following create hyperlinks to the references. The original code to use `hyperref` is recreated here, because `hyperref` is emulated.

File 46 **lwarp-bibunits.sty**

§ 155 Package **bibunits**

*(Emulates or patches code by THORSTEN HANSEN.)*

bibunits (*Pkg*) bibunits is patched for use by lwarp.

2 \def\bu@bibdata{\BaseJobname}

---

File 47 **lwarp-bigdelim.sty**

§ 156 Package **bigdelim**

*(Emulates or patches code by PIET VAN OOSTRUM, ØYSTEIN BACHE, JERRY LEICHTER.)*

`bigdelim` (*Pkg*) `bigdelim` is used as-is for print or `lateximage`, and patched for HTML.

The delimiters are displayed in HTML by printing the delimiter, the text, and a thick border across the side of the `\multirow` which indicates the actual height of the delimiter. The delimiter character is given a `<span>` class of `ldelim` or `rdelim`, and the default CSS sets this to `font-size:200%`

⚠ **use `\mrowcell`** `\ldelim` and `\rdelim` use `\multirow`, so `\mrowcell` must be used in the proper number of empty cells in the same column below `\ldelim` or `\rdelim`, but not in cells which are above or below the delimiter:

---

```

\begin{tabular}{lll}
<empty> & a & b \\
\ldelim{\}{3}{.25in}[left ] & c & d \\
\mrowcell & e & f \\
\mrowcell & g & h \\
<empty> & i & j \\
\end{tabular}

```

---

```

<->   a   b
      {
left  { c   d
      { e   f
      { g   h
<->   i   j

```

---

For `MATHJAX`, limited emulation is provided which merely prints the delimiter and optional text in the first row.

**for HTML output:** First, remove the temporary definitions of `\ldelim` and `\rdelim`, which were previously defined for tabular scanning in case `bigdelim` was not loaded:

```

1 \let\ldelim\relax
2 \let\rdelim\relax

```

Next, load the package's new definitions:

```

3 \LWR@ProvidesPackagePass{bigdelim}[2021/03/15]

```

```

\ldelim  {\{1:delimiter\}} {\{2:#rows\}} [\{3: vmove\}] {\{4:width\}} [\{5:text\}]
\rdelim

**for HTML output:** If `booktabs` has already been loaded before `lwarp`, such as by `memoir`, use it as-is. If not, the `lwarp` core will have placed some dummy macros which should be removed before loading the actual `booktabs` definitions.

§ 190 Package **chemfig**

*(Emulates or patches code by CHRISTIAN TELLECHEA.)*

chemfig (*Pkg*) chemfig is patched for use by lwarp.

If using `\polymerdelim` to add delimiters to a `\chemfig`, wrap both inside a single `lateximage`:

```
\begin{lateximage}[-chemfig~\PackageDiagramAltText]

The images are not hashed because they depend on external settings which may be changed at any time, and are unlikely to be reused inline anyhow.

File 82 **lwarp-chemformula.sty**

§ 191 Package **chemformula**

(Emulates or patches code by CLEMENS NIEDERBERGER.)

chemformula (*Pkg*) chemformula is patched for use by lwarp.

The SVG images are hashed according to contents and local options. Global options are assumed to be constant document-wide.

 **chemformula with MATHJAX** chemformula works best without MATHJAX. If MATHJAX is used, `\displaymathother` must be used before `array`, and then `\displaymathnormal` may be used after. (The chemformula package adapts to `array`, but does not know about MATHJAX, and MATHJAX does not know about chemformula.)

While using MATHJAX, `\displaymathother` may also be used for other forms of display and inline math which contain chemformula expressions.

**for HTML output:** 1 \LWR@ProvidesPackagePass{chemformula}[2022/01/23]

2 \ExplSyntaxOn

`\ch` Enclose in an inline SVG image or MATHJAX. The `alt` tag is the contents of the `\ch` expression. The filename is hashed, and also has additional hashing information based on the local options.

```

3 \RenewDocumentCommand \ch { O{}m }
4   {%

```

To work inside `align` with `\displaymathother`, a simple version must be used to work with chemformula's adaptation to `align`.

```

5   \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}% lwarp
6   {
7     \chemformula_ch:nn {#1} {#2}% original

If used as the outer level, must temporarily ensure MATHJAX is disabled:

```

9   {

**lwarp** redefines the \$ character, so special handling is required to escape math expressions inside \ch.

This boolean tracks a new kind of escaped math:

```
129 \bool_new:N \l__chemformula_first_last_LWRdollar_bool
```

\chemformula\_input\_escape\_math

Adds additional escaping for the new dollar definition:

```

130 \cs_gset_protected:Npn \l__chemformula_input_escape_math:n #1
131 {
132   \l__chemformula_first_last_math:n {#1}
133   \bool_if:NT \l__chemformula_first_last_dollar_bool
134     {
135       \bool_set_true:N \l__chemformula_first_last_math_bool
136       \__chemformula_read_escape_dollar:w #1 \q_nil
137     }
138   \bool_if:NT \l__chemformula_first_last_mathbraces_bool

141       \__chemformula_read_escape_mathbraces:w #1 \q_nil
142     }

```

Added by lwarp:

```

143   \bool_if:NT \l__chemformula_first_last_LWRdollar_bool% \l__chemformula_read_escape_LWRdollar:w #1 \q_nil%
144   {

146     \__chemformula_read_escape_LWRdollar:w #1 \q_nil%
147   }
148 }

```

\chemformula\_read\_escape\_LWRdollar

The following parses the contents inside the new dollars.

**lwarp** keeps the dollar as its original math shift until the document starts. While **chemmacros** is being patched, the dollar must temporarily be set to its new meaning during the following definition.

```

149 \begingroup
150 \catcode'\$=\active
151
152 \cs_new_protected:Npn \l__chemformula_read_escape_LWRdollar:w $#1$ \q_nil

155 }
156

```

157 \endgroup

\chemformula\_bool\_set\_if\_first\_last

The following looks at the first and last tokens for delimiters to escape math inside \ch. The original definition is modified to look for the control sequences which are used by the new meaning of \$.

```
158 \cs_new_protected:Npn \__chemformula_bool_cs_set_if_first_last:NnNN #1#2#3#4
159 {
160   \int_zero:N \l__chemformula_tmpa_int

163   \tl_map_inline:nn {#2}
164     {
165       \int_incr:N \l__chemformula_tmpb_int
166       \int_compare:nT { \l__chemformula_tmpb_int = 1 }
167         {
```

At the start, the cs\_ version compares control sequences:

```
168     \ifdefstrequal{##1}{#3}% lwarp
169     {
170       \bool_set_true:N #1
171     }% lwarp
172     {}
173   }
```

At the end, compare more control sequences:

```
174   \int_compare:nT { \l__chemformula_tmpb_int = \l__chemformula_tmpa_int }
175   {
176     \ifdefstrequal{##1}{#4}
177     {}
178     {
179       \bool_set_false:N #1
180     }
181   }
182 }
183 }
```

\chemformula\_first\_last\_math

Modified to check for the new meaning of \$ at first/last:

```
184 \cs_gset_protected:Npn \__chemformula_first_last_math:n #1
185 {
186   \bool_set_false:N \l__chemformula_first_last_math_bool

## § 192 Package **chemgreek**

*(Emulates or patches code by CLEMENS NIEDERBERGER.)*

chemgreek (*Pkg*) chemgreek is patched for use by lwarp.

 **package selection** Greek symbols To use text-mode symbols, use packages `textalpha` or `textgreek`. Using the other packages supported by chemgreek will result in math-mode greek characters, which will result in svg images being used. These images will be hashed.

 **X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X, Lua<sup>A</sup>T<sub>E</sub>X** If using X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or Lua<sup>A</sup>T<sub>E</sub>X, select the fontspec mapping:

```
\selectchemgreekmapping{fontspec}
```

**for HTML output:** 1 \LWR@ProvidesPackagePass{chemgreek}[2020/01/16]

```
2 \ExplSyntaxOn

### File 84 **lwarp-chemmacros.sty**

## § 193 Package **chemmacros**

*(Emulates or patches code by CLEMENS NIEDERBERGER.)*

chemmacros (*Pkg*) chemmacros is patched for use by lwarp.

**for HTML output:** 1 \LWR@ProvidesPackagePass{chemmacros}[2022/02/13]

svg file hashing assumes that the relevant options are constant for the entire document.

### § 193.1 **Changes to the user's document**

⚠ `\makepolymerdelims` When using `\makepolymerdelims`, enclose the entire expression inside a `polymerdelims` environment, such as (from the `chemmacros` manual):

```
\begin{polymerdelims}
\chemfig{-[@{op,.75}]CH_2-CH(-[6]Cl)-[@{cl,0.25}]}
\makepolymerdelims{5pt}[27pt]{op}{cl}
\end{polymerdelims}
```

⚠ **redox reactions** Redox reactions must be enclosed inside a `redoxreaction` environment. For print output, extra space must be included above and/or below the result, so they are declared as arguments to the environment, instead of being manually entered as per the `chemmacros` manual. For HTML output, the extra space is ignored and a `lateximage` is used instead.

```
\begin{redoxreaction}{7mm}{7mm}
\OX{a,Na} $\rightarrow$ \OX{b,Na}\pch\redox(a,b){oxidation}
\end{redoxreaction}
```

### § 193.2 **Code**

```
2 \ExplSyntaxOn
```

### § 193.3 **Loading packages**

Also accept the `lwarp` version:

```
3 \prg_set_conditional:Npnn \chemmacros_if_package_loaded:n #1 {p,T,F,TF}
4 {
5   \cs_if_exist:cTF {ver@#1.sty}
6     { \prg_return_true: }
7     {
8       \cs_if_exist:cTF {ver@lwarp-#1.sty}
9         { \prg_return_true: }
10        { \prg_return_false: }
11      }
12 }
```

Nullify `hyperref` detection:

```
13 \hook_gput_code:nnn {begindocument/end} {chemmacros}
14 {
15   \bool_set_false:N \l__chemmacros_hyperref_bool
16 }
```

### § 193.4 Loading modules

Patching chemmacros modules must be done `\AtBeginDocument`, since modules are invoked by the user in the preamble, and each patch is only done if the module is loaded.

### § 193.5 New environments

`\makepolymerdelims` and redox reactions must be enclosed in a `lateximage` during HTML output. These environments are provided here in HTML mode, and in the `lwarp` core in print mode, as a high-level semantic syntax which automatically embeds the contents in a `lateximage` with an appropriate `alt` tag.

Env polymerdelims

```
17 \DeclareDocumentEnvironment{polymerdelims}{}
18 {\begin{lateximage}[-chemmacros- polymer]}
19 {\end{lateximage}}
```

Env redoxreaction

*{<space above>} {<space below>}*

For HTML output, the above and below space is ignored, and a `lateximage` is used instead. For the print output version, see section 90.

```
20 \DeclareDocumentEnvironment{redoxreaction}{m m}
21 {\begin{lateximage}[-chemmacros- redoxreaction]}
22 {\end{lateximage}}
```

File 93 **lwarp-cleveref.sty**

§ 202 Package **cleveref**

(Emulates or patches code by TOBY CUBITT.)

cleveref (*Pkg*) cleveref is patched for HTML, and limited MATHJAX emulation is added.

⚠ **cleveref page numbers** cleveref and varioref are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for `\cpageref` and `\cpagerefrange`. This phrase includes `\cpagerefFor`, which defaults to “for”.

Ex:

```
\cpageref{tab:first,tab:second}
in html becomes:
“pages for table 4.1 and for table 4.2”
```

See `\cpagerefFor` at page 734 to redefine the message which is printed for page number references.

Table 16 on page 495 shows the data structure of the label/reference system as revised by `lwarp` and `cleveref`.

For MATHJAX, each references is printed as an `\eqref`, without `cleveref`’s description text. Page references are also printed as simple `\eqrefs`. Multiple labels in a single `\cref` will print as (???) in MATHJAX.

⚠ **multiple labels**

**for HTML output:** `1 \LWR@ProvidesPackagePass{cleveref}[2018/03/27]`

The following patches are applied. Print-mode versions are not required since they all come down to `\ref` eventually, and `\ref` has a print-mode version.

```
\@@@setcref <<kindofref>> <<label>>
```

`\@templabel` becomes the section number.

`cmbright (Pkg)` `cmbright` is used as-is for SVG math, and is emulated for MATHJAX.

File 132 **lwarp-enumerate.sty**

§ 241 Package **enumerate**

`enumerate (Pkg)` `enumerate` is supported with no changes.

This package is only required because it was used in the past to drop and then emulate the package. It cannot be removed because an older version which dropped the package may still remain, for example in a local vs. distribution directory, but it is now supported directly by `lwarp` and thus must no longer be dropped.

**for HTML output:** `1\LWR@ProvidesPackagePass{enumerate}[2015/07/23]`

File 133 **lwarp-enumitem.sty**

§ 242 Package **enumitem**

```
\newlist {<name>} {<type>} {<maxdepth>}
\renewlist {<name>} {<type>} {<maxdepth>}
```

For enumitem lists, new lists must have the start and end actions assigned to the new environment. Renewed lists already have their actions assigned, and thus need no changes.

 Only the L<sup>A</sup>T<sub>E</sub>X<sub>2</sub>ε syntax is emulated.

**for HTML output:** 1 \LWR@ProvidesPackagePass{epsfig}[2017/06/25]

A few additional keys to capture the filename:

```

File 137 **lwarp-epstopdf.sty**

§ 246 Package **epstopdf**

`epstopdf` (*Pkg*) Previous versions of `lwarp` had a nullified version, but now `epstopdf-base` is supported. `lwarp-epstopdf` becomes a placeholder to overwrite previous versions.

See package `epstopdf-base` for details.

**for HTML output:** `1 \LWR@ProvidesPackagePass{epstopdf}[2020-01-24]`

---

File 138 **lwarp-epstopdf-base.sty**

§ 247 Package **epstopdf-base**

`epstopdf-base` (*Pkg*)

 **convert to .svg** Images with an `.eps` extension will be converted to `.pdf`. The HTML output uses the `.svg` version, so use

```
Enter => lwarpmk pdftosvg <listofPDFfiles>
```

to generate `.svg` versions.

**for HTML output:** `1 \LWR@ProvidesPackagePass{epstopdf-base}[2020-01-24]`

Redefine to remember the image filename, replacing `.pdf` with `.svg`. Use the `epstopdf` print version inside a `lateximage`.

```

2 \newcommand*{\LWR@HTML@ETE@OrgGin@setfile}[3]{%
3   \edef\LWR@tempone{#3}%
4   \StrSubstitute{\LWR@tempone}{.pdf}{.svg}[\LWR@tempone]%

6   \xdef\LWR@parsedfilename{\LWR@tempone}%
7 }
8
9 \LWR@formatted{ETE@OrgGin@setfile}

```

`\includegraphics` in HTML mode redefines `\Gin@setfile` to be `\LWR@HTML@Gin@setfile`, which is now redirected to `epstopdf`'s version:

```

10 \renewcommand*\LWR@HTML@Gin@setfile}[3]{%
11   \ETE@Gin@setfile{#1}{#2}{#3}%
12 }

```

Allow .eps images to be found if a suffix is not provided:

16 }
17 \DeclareGraphicsRule{.svg}{svg}{.svg}{}
18 \DeclareGraphicsRule{.SVG}{svg}{.SVG}{}
19 }

```

Likewise when inside a lateximage:

```

20 \appto\LWR@restoreorigformatting{%
21 \DeclareGraphicsExtensions{%
22   .eps, .EPS, .pdf, .PDF, .gif, .GIF, .png, .PNG, .jpg, .JPG, .jpeg, .JPEG%

File 144 **lwarp-etoc.sty**

§ 253 Package **etoc**

etoc (*Pkg*) etoc is ignored. All commands are nullified.

 **\tableofcontents with \ref** The etoc package uses a non-standard syntax which looks ahead after a `\tableofcontents` for a following `\ref`. These `\refs` appear in the HTML result unless they are removed. Where a `\tableofcontents` is followed by `\ref`, and perhaps also `\label` as well, enclose all of them inside `\warpprintonly`:

```

\warpprintonly{\tableofcontents
\label{toc:def}}
\ref{toc:abc}

```

or place all code related to a local `\tableofcontents` inside a `warpprint` environment.

 **home page** Be sure to keep the initial `\tableofcontents` on the home page, perhaps in its own `\warpHTMLonly` macro or `warpHTML` environment.

File 150 **lwarp-fancybox.sty**

§ 259 Package **fancybox**

(Emulates or patches code by TIMOTHY VAN ZANDT.)

fancybox (*Pkg*) fancybox is supported with some patches.

[framed equation example](#) fancybox's documentation has an example FramedEqn environment which combines math, \Sbox, a minipage, and an \fbox. This combination requires that the entire environment be enclosed inside a lateximage, which is done by adding \lateximage at the very start of FramedEqn's beginning code, and \endlateximage at the very end of the ending code. Unfortunately, the HTML alt attribute is not used here.

```
\newenvironmentFramedEqn
{
\lateximage% NEW
\setlength{\fboxsep}{15pt}
... }{...
\[\fbox{\TheSbox}\]
\endlateximage% NEW
}
```

[framing alternatives](#) \fbox works with fancybox. Also see lwarp's \fboxBlock macro and fminipage environment for alternatives to \fbox for framing environments.

[framed table example](#) The fancybox documentation's example of a framed table using an \fbox containing a tabular does not work with lwarp, but the FramedTable environment does work if \fbox is replaced by \fboxBlock. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a fminipage environment. The caption may be placed either inside or outside the fminipage:

```
\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
...
\end{tabular}
\end{fminipage}
\end{table}
```

 [framed verbatim](#) lwarp does not support the verbatim environment inside a span, box, or fancybox's \Sbox, but a verbatim may be placed inside a fminipage. The fancybox documentation's example FramedVerb may be defined as:

```
\newenvironment{FramedVerb}[1] % width
{
\VerbatimEnvironment
\fminipage{#1}
\beginVerbatim
}{
\endVerbatim
\endfminipage
}
```

framed <code>\VerbBox</code>	<code>fancybox</code> 's <code>\VerbBox</code> may be used inside <code>\fbox</code> .
indented alignment	<code>LVerbatim</code> , <code>\LVerbatimInput</code> , and <code>\LUseVerbatim</code> indent with horizontal space which may not line up exactly with what <i>pdftotext</i> detects. Some lines may be off slightly in their left edge.

Beqarray is adapted for MATHJAX or enclosed inside a lateximage:

```
59 \RenewEnviron{Beqarray}
60 {\LWR@eqnarrayfactor}

\GenericCaption is enclosed in an HTML block:

```
63 \renewcommand{\GenericCaption}[1]{%
64   \LWR@figcaption%
65   \LWR@isolate{#1}%
66   \endLWR@figcaption%
67 }
```

Btrivlist is enclosed in an HTML block. This is a tabular, and does not use \item.

\trivlist

{\l/c/r} [ {\t/c/b} ]

```
68 \RenewDocumentEnvironment{Btrivlist}{m o}
69 {%

73 }
74 {%
75   \endtabular%
76   \end{BlockClass}%
77   \LWR@startpars%

```

Btrivlist is also neutralized when used inside a span:

```
79 \AtBeginEnvironment{LWR@nestspan}{%
80   \RenewDocumentEnvironment{Btrivlist}{m o}{}{}%
81 }
```

lwarp's handling of \item is patched to accept fancybox's optional arguments:

```

92
93 \RenewDocumentCommand{\LWR@descitem}{d()o}{%

```

```

100 \RenewDocumentCommand{\LWR@nestspanitem}{d()}{%

103     \LWR@orignewline%
104   }\fi%
105   \LWR@origitem%
106 }

```

The various boxed lists become regular lists:

```

110     \booltrue{LWR@starting@fancybox}%

132     {\end{description}}

```

`\boxput` simply prints one then the other argument, side-by-side instead of above and behind:

```

133 \RenewDocumentCommand{\boxput}{s d() m m}{%
134   \IfBooleanTF{#1}{#3\quad#4}{#4\quad#3}%

File 152 **lwarp-fancypar.sty**

§ 261 Package **fancypar**

*(Emulates or patches code by GONZALO MEDINA.)*

fancypar (*Pkg*) fancypar is used as-is for print output, and emulated for HTML.

⚠ **css classes** \NotebookPar and related are used as-is inside a lateximage, but for HTML these are emulated as a <div> of class NotebookPar, etc. For HTML, the package options and the macro optional arguments are ignored. The user must provide custom css for each if visual effects are required. See section 7.7.

⚠ **custom styles** If using a custom paragraph style, such as \MyStylePar from the documentation, use the following to generate an HTML <div> of class MyStylePar:

```

... (existing definiton of \MyStylePar, print version) ...
\begin{warpHTML}
\AddFancyparClass{MyStyle}
\end{warpHTML}

```

\MyStylePar is then modified to emulate HTML. An optional argument is allowed, which is ignored.

File 155 **lwarp-fancyvrb.sty**

§ 264 Package **fancyvrb**

*(Emulates or patches code by TIMOTHY VAN ZANDT.)*

fancyvrb (*Pkg*) fancyvrb is supported with some patches.

**HTML classes** The fancy verbatim environment is placed inside a `<div>` of class fancyvrb. The label is placed inside a `<div>` of class fancyvrblabel. The verbatim text itself is placed inside a `<div>` of class verbatim.

**fancybox, fancyvrb** If using fancybox or fancyvrb with `\VerbatimFootnotes`, and using footnotes in a sectioning command or display math, use `\footnotemark` and `\footnotetext`:

`\VerbatimFootnotes`

sectioning or  
displaymath

```

\subsection[Subsection Name]
  {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}

```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when `\VerbatimFootnotes` are selected. The browser usually compensates.

```

1 \AtBeginDocument{\RequirePackage{xcolor}}% for \convertcolorspec
2
3 \LWR@ProvidesPackagePass{fancyvrb}[2008/02/07]

```

Initial default patch for fancyvrb:

```
4 \fvset{frame=none}%
```

After the preamble is loaded, after any patches to Verbatim:

```

5 \AfterEndPreamble{
6 \LWR@traceinfo{Patching fancyvrb.}

```

`\VerbatimFootnotes`

Patched to use the new version.

```

7 \def\VerbatimFootnotes{%
8   \let\@footnotetext\@footnotetext%

```

```

9   \let\footnote\V@footnote%
10  \let\LWR@footnotetext\V@footnotetext% lwarp
11 }

```

\V@@footnotetext

```

12 \def\V@@footnotetext{%
13 \LWR@traceinfo{V@footnotetext}%

```

Place an autopage marker so that back references to citations inside a footnote will link closer to the footnote text, if possible.

```

14 \LWR@newautopagelabel{page}%

```

Take the current footnote box, then append:

```

15 \global\setbox\LWR@footnotebox=\vbox\bgroup%

```

Add to any current footnotes:

```

16 \unvbox\LWR@footnotebox%

```

Remember the footnote number for \ref:

```

17 \protected@edef\@currentlabel{%
18 \csname p@footnote\endcsname\@thefnmark%
19 }% @currentlabel

```

Use HTML superscripts in the footnote even inside a lateximage:

```

20 \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%

```

Use paragraph tags if in a tabular data cell or a lateximage:

```

21 \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewLine%

```

Append the footnote mark to the list:

```

22 \@makefnctext{}%

```

The footnote text will follow after \V@@@footnotetext has completed.

```

23 \bgroup%
24 \aftergroup\V@@@footnotetext%

```

Do not generate autopages inside the footnotes, since they are accumulated at the moment before finally being used perhaps on a later page.

```

25 \let\LWR@newautopagelabel\LWR@null@newautopagelabel%

```

```

§ 265 Package **fbox**

(Emulates or patches code by HERBERT VOSS.)

fbox (*Pkg*) **fbox** is patched for use by lwarp.

**for HTML output:** 1 \LWR@ProvidesPackagePass{fbox}[2022/02/20]

This will be \LWR@formatted when \AtBeginDocument:

```
2 \LetLtxMacro\LWR@HTML@fbox\fbox
```

Instead of using the original, the new version is used with all borders:

```
3 \renewcommand*\orig@fbox{\FBox@i[tblr]}
```

\WR@fboxpkg@border

{\langle 1: top/bottom/left/right \rangle}{\langle 2: t/b/l/r \rangle}{\langle 3: padding, or empty \rangle}

Accumulates HTML styles for border, and padding if given:

```

4 \newcommand*\LWR@fboxpkg@border}[3]{%
5   \colorlet{LWR@border@color}{\csuse{fbox@#2color}}%
6   \protect\convertcolorspec{named}{LWR@border@color}{HTML}\LWR@tempbordercolor\relax%
7   \appto\LWR@tempone{%
8     border-#1: % space
9     \LWR@printlength{\LWR@atleastonept} % space
10    solid \LWR@origpound%
11  }%
12 \expandafter\appto\expandafter\LWR@tempone\expandafter{\LWR@tempbordercolor}%
13 \appto\LWR@tempone{ ;\LWR@indentHTML}%
14 \ifblank{#3}{}%
15   \appto\LWR@tempone{%
16     padding-#1: \LWR@printlength{#3} ;\LWR@indentHTML
17   }%
18 }%
19 }

```

A hack to reuse the same code for inline and blocks:

```

20 \newbool{LWR@fboxpkg@ispar}
21 \boolfalse{LWR@fboxpkg@ispar}

```

Accumulate HTML styles for left and right padding, depending on \if@fbox@space@left, \if@fbox@space@right:

```

22 \newcommand{\LWR@fboxpkg@lrpadding}[1]{%
23   \csuse{if@fbox@space@#1}%
24   \appto\LWR@tempone{%
25     padding-#1: \LWR@printlength{\fbox@@sep};\LWR@indentHTML
26   }
27 \else%
28   \appto\LWR@tempone{%
29     padding-#1: 0pt;\LWR@indentHTML
30   }
31 \fi%
32 }

```

The HTML version, modified to use HTML styles and either an \InlineClass or BlockClass:

```

33 \newcommand{\LWR@HTML@FBox@iii}[1]{%

```

Find and set the text color, rule width, margin:

```

34   \LWR@forceminwidth{\fbox@@rule}%
35   \LWR@findcurrenttextcolor%
36   \def\LWR@tempone{%
37     color: \LWR@origpound\LWR@tempcolor ; \LWR@indentHTML
38     margin: 1ex ; \LWR@indentHTML
39   }%

```

Add left/right padding:

```

40   \LWR@fboxpkg@lrpadding{left}%
41   \LWR@fboxpkg@lrpadding{right}%

```

Per the original to decode the borders, in a new way:

```

42 \ifnum\the\@tempcntb>8\relax
43   \advance\@tempcntb by -8\relax
44   \LWR@fboxpkg@border{top}{t}{\fbox@sep}%
45 \fi
46 \ifnum\@tempcntb>3
47   \advance\@tempcntb by -4\relax
48   \LWR@fboxpkg@border{left}{l}{}%
49 \fi
50 \ifnum\@tempcntb>1\relax
51   \LWR@fboxpkg@border{right}{r}{}%
52 \fi
53 \ifodd\@tempcntb
54   \LWR@fboxpkg@border{bottom}{b}{\fbox@sep}%
55 \fi

```

Generate a BlockClass or \InlineClass with the contents:

```

56 \color@begingroup
57 \ifbool{LWR@fboxpkg@ispar}%
58   {%
59     \begin{BlockClass}[LWR@tempone]{fboxpkg}%
60     #1%
61     \end{BlockClass}%
62   }%
63   {%
64     \InlineClass[LWR@tempone]{fboxpkg}{%
65     #1%
66     }%
67   }%
68 \color@endgroup
69 \boolfalse{LWR@fboxpkg@ispar}% globally
70 }
71 \LWR@formatted{FBox@iii}

```

For \fparbox, set the use of BlockClass, then reuse the above:

```

72 \long\def\LWR@HTML@FParBox@i[#1]#2{%
73   \booltrue{LWR@fboxpkg@ispar}%
74   \FBox@i[#1]{#2}
75 }
76 \LWR@formatted{FParBox@i}
77
78 \long\def\LWR@HTML@FParBox@ii#1{%
79   \booltrue{LWR@fboxpkg@ispar}%
80   \FBox@i[tblr]{#1}%
81 }
82 \LWR@formatted{FParBox@ii}

```

For MATHJAX, absorb and ignore star and optional arguments:

```

83 \CustomizeMathJax{\let\LWRorigfbox\fbox}
84 \CustomizeMathJax{\newcommand{\LWRfboxpkgtwo}[2][\LWRorigfbox{#2}]}

§ 272 Package **fixme**

(Emulates or patches code by DIDIER VERNA.)

`fixme` (*Pkg*) `fixme` is patched for use by `lwarp`.

 **external layouts** External layouts (`\fxloadlayouts`) are not supported.

Customized layouts are overwritten by `lwarp`'s versions `\AtBeginDocument` in order to provide the HTML conversion. If creating a new layout, see `lwarp`'s changes to provide similar for the new layout, inside a `warpHTML` environment.

User control is provided for setting the HTML styling of the “faces”. The defaults are as follows, and may be changed in the preamble after `fixme` is loaded:

```

\def\FXFaceInlineHTMLStyle{font-weight:bold}
\def\FXFaceEnvHTMLStyle{font-weight:bold}
\def\FXFaceSignatureHTMLStyle{font-style:italic}
\def\FXFaceTargetHTMLStyle{font-style:italic}

```

**for HTML output:** `1 \LWR@ProvidesPackagePass{fixme}[2019/01/03]`

Restore `lwarp`'s version of `\@wrindex`, ignoring the `fixme` package's target option:

```
2 \let\@wrindex\LWR@wrindex

Float-related macros required by `lwarp`:

```

7   {\LWR@nameref{\BaseJobname-autopage-\arabic{LWR@nextautopage}} --- #1}%
8   {#2}

```

§ 276 Package **float**

*(Emulates or patches code by ANSELM LINGNAU.)*

`float (Pkg)` float is emulated.

Float styles boxed and ruled are emulated by css and a float class according to style.

The HTML `<figure>` class is set to the float type, so css may also be used to format the float and its caption, according to float type. Furthermore, an additional class is set to the float style: `plain`, `plaintop`, `boxed`, or `ruled`, so css may be used to format by float style as well. Default formatting by css is provided for ruled and boxed styles.

 **not seem to be a floating environment** Always declare a `\newfloat` before modifying it with `\floatname`, etc.

**for HTML output:** 1 \LWR@ProvidesPackageDrop{float}[2001/11/08]

`\LWR@floatstyle` The default float style.

```
2 \newcommand*{\LWR@floatstyle}{plain}
```

`\newfloat``{<1: type>} {<2: placement>} {<3: ext>} [ <4: within >]`Emulates the `\newfloat` command from the `float` package.

“placement” is ignored.

```

3 \NewDocumentCommand{\newfloat}{m m m o}{%
4   \IfValueTF{#4}%
5     {\DeclareFloatingEnvironment[fileext=#3,within=#4]{#1}}%
6     {\DeclareFloatingEnvironment[fileext=#3]{#1}}%

```

Remember the float style:

```
7   \csedef{LWR@floatstyle@#1}{\LWR@floatstyle}%

```

`newfloat` package automatically creates the `\listof` command for new floats, but `float` does not, so remove `\listof` here in case it is manually created later.

```

8   \cslet{listof#1s}\relax%
9   \cslet{listof#1es}\relax%

```

Likesize, `newfloat` also creates `\l@<type>`, but `float` does not, so remove it here:

```

10  \cslet{l@#1}\relax%
11 }

```

`\floatname``{<type>} {<name>}`Sets the text name of the float, such as “Figure”. Avoids trying to set a recursive name, from `trivfloat`.

```

12 \NewDocumentCommand{\floatname}{m +m}{%
13   \def\LWR@tempone{#2}%

§ 279 Package **floatrow**

*(Emulates or patches code by OLGA LAPKO.)*

floatrow (*Pkg*) floatrow is emulated.

**for HTML output:** 1 \LWR@ProvidesPackageDrop{floatrow}[2008/08/02]

⚠ **Misplaced alignment tab character &** Use `\StartDefiningTabulars` and `\StopDefiningTabulars` before and after defining macros using `\ttabbox` with a tabular inside. See section [8.10.1](#).

⚠ **subfig package** When combined with the subfig package, while inside a subfloatrow `\ffigbox` and `\ttabbox` must have the caption in the first of the two of the mandatory arguments.

⚠ **\FBwidth, \FBheight** The emulation of floatrow does not support `\FBwidth` or `\FBheight`. These values are pre-set to `.3\linewidth` and `2in`. Possible solutions include:

- Use fixed lengths. lwarp will scale the HTML lengths appropriately.
- Use `warpprint` and `warpHTML` environments to select appropriate values for each case.
- Inside a `warpHTML` environment, manually change `\FBwidth` or `\FBheight` before the `\ffigbox` or `\ttabbox`. Use `\FBwidth` or `\FBheight` normally afterwards; it will be used as expected in print output, and will use your custom-selected value in HTML output. This custom value will be used repeatedly, until it is manually changed to a new value.

After everything has loaded, remember whether subcaption was loaded. If not, it is assumed that subfig is used instead:

```

2 \newbool{LWR@subcaptionloaded}
3
4 \AtBeginDocument{
5 \IfPackageLoadedTF{subcaption}
6   {\booltrue{LWR@subcaptionloaded}}
7   {\boolfalse{LWR@subcaptionloaded}}

```

\floatbox

```

[⟨1 preamble⟩] {⟨2 captype⟩} [⟨3 width⟩] [⟨4 height⟩] [⟨5 vert pos⟩] {⟨6
caption⟩} {⟨7 object⟩}

```

Only parameters for captype, width, caption, and object are used.

LWR@insubfloatrow is true if inside a subfloatrow environment.

There are two actions, depending on the use of subcaption or subfig.

File 178 **lwarp-fontawesome.sty**

§ 287 Package **fontawesome**

(Emulates or patches code by XAVIER DANAUX.)

fontawesome (*Pkg*) fontawesome is patched for use by lwarp.

Hashed inline images are used, as there may not be Unicode support for all icons.

 **poppler syntax warning** If using PDF L<sup>A</sup>T<sub>E</sub>X, *poppler* may issue a syntax warning regarding parsing a ligature component. X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or LuaL<sup>A</sup>T<sub>E</sub>X may be used to avoid this warning.

In the following, the general strategy is to intercept `\symbol` and embed it inside a `lateximage`. These changes are done inside a local group.

For PDF L<sup>A</sup>T<sub>E</sub>X, the `alt` tag includes the icon (symbol) number. For X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X and LuaL<sup>A</sup>T<sub>E</sub>X, the `alt` tag is generic.

File 205 **lwarp-gindex.sty**

§ 314 Package **gindex**

(Emulates or patches code by JAVIER BEZOS.)

`gindex (Pkg)` `gindex` is patched for use by `lwarp`.

See section [8.6.15](#).

**for HTML output:** 1 \LWR@ProvidesPackagePass{gindex}[2019/10/07]

Set the index page and range separators. These are set `\AtBeginDocument` to allow the user to change them. They are then protected so that the `lwarp` core looks for the tokens instead of their expanded contents, since the `*.ind` files will contain `\indexpagesep` and `\indexrangesep` instead of their literal contents. Finally, `lwarp` is told of the `gindex` macros.

```
2 \AtBeginDocument{
3   \robustify{\indexpagesep}
4   \robustify{\indexrangesep}
5   \renewcommand*\IndexPageSeparator{\indexpagesep}
6   \renewcommand*\IndexRangeSeparator{\indexrangesep}
7 }
```

`\hyperindexref` is added:

```
8 \def\addindexitem#1#2{%
9   \indexflushitem
10  \gix@getspecial#1\indexspecial\indexspecial\@@\indexitem{\hyperindexref{#2}}
11

File 207 **lwarp-glossaries.sty**

§ 316 Package **glossaries**

(Emulates or patches code by NICOLA L.C. TALBOT.)

`glossaries` (*Pkg*) *lwarpmk* has the commands `lwarpmk printglossary` and `lwarpmk htmlglossary`, which process the glossaries created by the `glossaries` package using that package's `makeglossaries` program.

`GlossaryCmd` (*Opt*)

Default: `makeglossaries`

`printglossary` (*Opt*)

`htmlglossary` (*Opt*)

The shell command to execute is set by the `lwarp` option `GlossaryCmd`, which defaults to `makeglossaries`. The print or HTML glossary filename is appended to this command.

⚠ **`makeglossaries` not found** In some situations it may be required to modify the default command, such as to add the `perl` command in front:

```

\usepackage[
  GlossaryCmd={perl makeglossaries},
] {lwarp}

```

*xindy* language To set the language to use for processing glossaries with *xindy*:

```

\usepackage[
  GlossaryCmd={makeglossaries -L english},
] {lwarp}

```

Other options for `makeglossaries` may be set as well.

placement and toc options The glossaries may be placed in a numbered or unnumbered section, given a TOC entry, and placed inline or on their own HTML page:

**Numbered section, on its own HTML page:**

```

\usepackage[xindy,toc,numberedsection=no]{glossaries}
...
\printglossaries

```

**Unnumbered section, inline with the current HTML page:**

```

\usepackage[xindy,toc]{glossaries}
...
\printglossaries

```

**Unnumbered section, on its own HTML page:**

```

\usepackage[xindy,toc]{glossaries}
...
\ForceHTMLPage
\printglossaries

```

△ **glossary style** The default `style=item` option for `glossaries` conflicts with `lwarp`, so the style is forced to `index` instead.

△ **number list** The page number list in the printed form would become `\namerrefs` in HTML, which could become a very long string if many items are referenced. For now, the number list is simply turned off.

**print/HTML versions** The print and HTML versions of the glossary differ in their internal page numbers. Separate commands for generating print and HTML glossaries are used, even though the page number is currently ignored.

**for HTML output:**

```

1 \PassOptionsToPackage{xindy}{glossaries}
2
3 \LWR@ProvidesPackagePass{glossaries}[2018/07/23]
4
5 \setupglossaries{nonumberlist}
6 \setglossarystyle{index}

```

Patched to fix TOC pointing to the previous page:

```

7 \renewcommand*{\p@glossarysection}[2]{%
8   \glsclearpage
9   \LWR@phantomsection
10  \ifdefempty\@glossarysecstar
11  {%
12    \csname\@glossarysec\endcsname{#2}%
13  }%
14  {%

```

In the original, the TOC entry was made before the section, thus linking to the phantomsection in the printed version, but for HTML, this caused the link to point to the page before the glossaries, which could be a different HTML file. Here, the TOC entry is made after the section is created:

```

15    \csname\@glossarysec\endcsname*{#2}%
16    \@gls@toc{#1}{\@glossarysec}% Moved after the previous line.
17  }%
18  \@glossaryseclabel
19 }

```

`lwarp`'s sectioning commands cannot handle robust macros when splitting HTML into named filenames. `glossaries` uses `\translate` in sectioning names, and `\translate` is robust and cannot be expanded. The following pre-expands the translations at this moment, making use of `\translatelet`.

```

20 \newcommand*{\LWR@comp@glossaryname}{\translate{Glossary}}
21
22 \ifdefstrequal{\glossaryname}{\LWR@comp@glossaryname}{
23   \translatelet\LWR@translatetemp{Glossary}
24   \edef\glossaryname{\LWR@translatetemp}
25 }{}
26
27 \newcommand*{\LWR@comp@acronymname}{\translate{Acronym}}
28
29 \ifdefstrequal{\acronymname}{\LWR@comp@acronymname}{
30   \translatelet\LWR@translatetemp{Acronym}
31   \edef\acronymname{\LWR@translatetemp}
32 }{}

```

```

33
34 \newcommand*\LWR@comp@glssymbolsgroupname{\translate{Symbols (glossaries)}}
35
36 \ifdefstrequal{\glssymbolsgroupname}{\LWR@comp@glssymbolsgroupname}{

§ 318.1 **Graphics extensions**

`\DeclareGraphicsExtensions` `{\list}`

`\AtBeginDocument` allow SVG files instead of PDF:

```

4 \DeclareGraphicsRule{.svg}{svg}{.svg}{}
5 \DeclareGraphicsRule{.SVG}{svg}{.SVG}{}

Inside a `lateximage`, allow PDF instead of SVG:

```

## § 318.2 Length conversions and graphics options

**whitespace**

A scaled image in L<sup>A</sup>T<sub>E</sub>X by default takes only as much space on the page as it requires, but HTML browsers use as much space as the original unscaled image would have taken, with the scaled image over- or under-flowing the area.

Used to store the user's selected dimensions and HTML class.

The class defaults to “inlineimage” unless changed by a `class=xyx` option.

```

32 \boolfalse{\LWR@igkeepaspectratio}
33
34 \newcommand*\LWR@igclass{inlineimage}
35 \newcommand*\LWR@igalt{\ImageAltText}

```

Set the actions of each of the key/value combinations for `\includegraphics`. Many are ignored.

If an optional width was given, set an HTML style:

```

36 \define@key{igraph}{width}{%
37 \setlength{\LWR@igwidth}{#1}%
38 \ifthenelse{\lengthtest{\LWR@igwidth > 0pt}}%
39 {%

```

Default to use the converted fixed length given:

```

40 \renewcommand*\LWR@igwidthstyle{width:\LWR@printlength{\LWR@igwidth}}%

```

If ex or em dimensions were given, use those instead:

```

41 \IfEndWith{#1}{ex}%
42 {\renewcommand*\LWR@igwidthstyle{width:#1}}% yes ex
43 {}% not ex
44 \IfEndWith{#1}{em}%
45 {\renewcommand*\LWR@igwidthstyle{width:#1}}% yes em

51   {\renewcommand*\LWR@igwidthstyle}{width:#1}}% yes px
52   }% not px
53 }{}% end of length > 0pt
54 }

```

If an optional height was given, set an HTML style:

```

55 \define@key{igraph}{height}{%
56 \setlength{\LWR@igheight}{#1}%
57 \ifthenelse{\lengthtest{\LWR@igheight > 0pt}}%
58 {%

```

Default to use the converted fixed length given:

```

59   \renewcommand*\LWR@igheightstyle}{%
60   height:\LWR@printlength{\LWR@igheight} % extra space
61   }%

```

If ex or em dimensions were given, use those instead:

It appears that **graphicx** does not have separate keys for `xscale` and `yscale`. `scale` adjusts both at the same time.

```

### § 318.3 Printing HTML styles

`\LWR@rotstyle`

`{\langle prefix \rangle}{\langle degrees \rangle}`

Prints the rotate style with the given prefix.

prefix is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:rotate` style.

```
117 \newcommand*\LWR@rotstyle[2]{%
118   \edef\LWR@tempone{#2}%
119   \setcounter{LWR@tempcountone}{-1*\real{\LWR@tempone}} % space
120   #1transform:rotate(\arabic{LWR@tempcountone}deg); % space
121 }
```

`\LWR@scalestyle`

`{\langle prefix \rangle}{\langle xscale \rangle}{\langle yscale \rangle}`

Prints the scale style with the given prefix.

prefix is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:scale` style.

```
122 \newcommand*\LWR@scalestyle[3]{%
123   #1transform:scale(#2,#3);
124 }
```

### § 318.4 `\includegraphics`

`\LWR@opacity`

For HTML, used only for `\includegraphics`.

`\LWR@opacity` may be set by the `transparent` package.

```
125 \def\LWR@opacity{1}
```

`\LWR@imagesizebox`

Used to determine the actual image size if needed.

```
126 \newsavebox{\LWR@imagesizebox}
```

`\LWR@HTML@Gin@setfile`

`{\langle w \rangle}{\langle h \rangle}{\langle filename \rangle}` Sets the parsed filename for HTML output.

```
127 \newcommand*\LWR@HTML@Gin@setfile[3]{%
128   \xdef\LWR@parsedfilename{#3}%
129 }
```

`class (Key)` css class for the image.

Define the new class `key` for the print-mode version of `\includegraphics`, which is enabled inside a `lateximage`.

```
130 \AtBeginDocument{
131   \define@key{Gin}{class}{}
132 }
```

`\LWR@replaceEPSSVG`

Usually, references to EPS files become SVG files, but if the `epstopdf` package is being used, it automatically converts EPS to PDF, and the following must NOT be done.

```
133 \AtBeginDocument{
134   \IfPackageLoadedTF{epstopdf}
135   {
136     \newcommand*\LWR@replaceEPSSVG{}
137   }{%
```

```

138 \newcommand*\LWR@replaceEPSSVG{%
139     \StrSubstitute{\LWR@tempone}{.eps}{.svg}[\LWR@tempone]%
140     \StrSubstitute{\LWR@tempone}{.EPS}{.SVG}[\LWR@tempone]%
141 }
142 }%
143 }

```

\* [*2: options*] [*3: options*] [*4: filename*]

\LWR@ig@useactualimagesize

If formatting for a word processor, find and set the actual image size, without rotation, using PDF instead of SVG to find the original bounding box:

graphicx syntax is `\includegraphics [key values] {filename}`

If #3 is empty, only one optional argument was given, thus `graphicx` syntax.

If using `\epsfig` or `\psfig` from the `epsfig` package, #4 will be `\LWR@epsfig@filename`, which will have been set by the `file` or `figure` keys. Therefore, #4 must not be used until after the keys have been processed.

`\LWR@rotboxorigin`

`\LWR@originnames``{\langle letters\rangle}`

§ 319 Package **graphicx**

`graphicx` (*Pkg*) `graphicx` is emulated.

`graphicx` loads `graphics`, which also loads `lwarp-graphics`, which remembers the original `graphics` definitions for use inside a `lateximage`, and then patches them `\AtBeginDocument` for HTML output.

`lwarp-graphics` handles the syntax of either `graphics` or `graphicx`.

§ 320 Package **grffile**

`grffile` (*Pkg*) `grffile` is supported as-is. File types known to the browser are displayed, and unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

**matching PDF and SVG**

`lwarp-grffile` now exists as a placeholder since `grffile` used to be emulated by `lwarp`, and thus older versions of `lwarp-grffile` may exist and should be overwritten by this newer version.

File 229 **lwarp-imakeidx.sty**

§ 338 Package **imakeidx**

(Emulates or patches code by ENRICO GREGORIO.)

`imakeidx` (*Pkg*) `imakeidx` is patched for use by `lwarp`.

**letter headings** When using `makeindex`, to match the print and HTML output's display of index letter headings, specify the `lwarp.ist` style:

```
\makeindex[options={-s lwarp.ist}]
```

(For HTML the `lwarp.ist` style is used automatically, which displays letter headings. When using `xindy` the default style also displays letter headings.)

**index setup** See section 8.6.18 for how to setup `lwarpmk` to process the indexes with `imakeidx`, both with and without shell escape.

**for HTML output:** 1 \LWR@ProvidesPackagePass{imakeidx}[2016/10/15]

Use the new HTML suffix:

```
2 \catcode'\_ =12%
3 \define@key{imki}{name}{\def\imki@name{#1_html}}

`\LWR@imki@setdefopts`

`{\langle user options \rangle}`

Sets the HTML options, added to the user's settings, depending on whether *makeindex* or *xindy* are used.

For *makeindex*, the user's choice is ignored, and only the `lwarp` version is used. (Only one style at a time is possible.)

For *xindy*, multiple modules may be specified, and the `lwarp` version is appended.

```

97 \newcommand*\LWR@imki@setdefopts[1]{%

theindex was already defined \AtBeginDocument by the lwarp core, so it must be redefined here similarly, but patched for imakeidx:

Env theindex

```
118 \AtBeginDocument{
119 \renewenvironment*{theindex}{%

§ 346 Package **karnaugh-map**

*(Emulates or patches code by MATTIAS JACOBSSON.)*

karnaugh-map (*Pkg*) karnaugh-map is patched for use by lwarp.

**for HTML output:** 1 \LWR@ProvidesPackagePass{karnaugh-map}[2017/02/20]

This patch is needed only because lwarp changes the definition of `\&`, and the original uses `\ifnum` to compare 0 with `\&`. It is hard to patch this environment, so the entire thing is redefined here, with the lwarp modifications identified in comments.

§ 347 Package **keyfloat**

*(Emulates or patches code by BRIAN DUNN.)*

keyfloat (*Pkg*) keyfloat is supported with a considerable amount of hacking. (It's a mashup of lwarp, keyfloat, and tocdata.)

 **keywrap** If placing a `\keyfig[H]` inside a keywrap, use an absolute width for `\keyfig`, instead of lw-proportional widths. (The [H] option forces the use of a minipage, which internally adjusts for a virtual 6-inch wide minipage, which then corrupts the lw option.)

For wrapped figures, overhang and number of lines are ignored.

§ 349 Package **kpfonts**

*(Emulates or patches code by CHRISTOPHE CAIGNAERT.)*

kpfonts (*Pkg*) kpfonts is used as-is for SVG math, and is emulated for MATHJAX.

- ⚠ **limitations** The MATHJAX emulation honors the options `uprightRoman` for `\D` only, `classicReIm`, `frenchstyle` for Greek only, `upright` for Greek only, `uprightgreeks`, `slantedGreeks`, and `mathcalasscript`.

The dedicated macros for Greek work correctly.

svg math should appear the same as the printed output.

§ 350 Package **kpfonts-otf**

*(Emulates or patches code by DANIEL FLIPO.)*

kpfonts-otf (*Pkg*) kpfonts-otf is used as-is for SVG math, and is emulated for MATHJAX.

 **limitations** The MATHJAX emulation honors the options fancyReIm, mathcal, frenchstyle for Greek only, and mathcalasscript.

Also see the options for unicode-math, which is loaded by kpfonts-otf.

The unicode-math dedicated macros for Greek work correctly.

File 249 **lwarp-libertinust1math.sty**

§ 358 Package **libertinust1math**

*(Emulates or patches code by MICHAEL SHARPE.)*

**libertinust1math** (*Pkg*) **libertinust1math** is used as-is for SVG math, and is emulated for MATHJAX.

The MATHJAX emulation honors frenchmath for Greek but not Latin characters, and slantedGreek, uprightGreek, and ISO also adjust Greek characters. MATHJAX cannot yet honor options for adjusting Latin characters.

The dedicated macros for upright and italic Greek letters do work correctly.

Some of the symbol font macros such as `\mathsfbf` do not use a sans font because MATHJAX does not yet have sans Greek.

SVG math honors all font choices, and should appear the same as the printed output.

§ 362 Package **listings**

*(Emulates or patches code by CARSTEN HEINZ, BROOKS MOSES, JOBST HOFFMANN.)*

`listings (Pkg)` listings is supported with some limitations. Text formatting and escape characters are not yet supported.

1 \LWR@ProvidesPackagePass{listings}[2018/09/02]

Force flexible columns. Fixed columns inserts spaces in the PDF output.

```

```

\lstset

*{<options>}*Use the listings `literate` option to replace HTML entities:

```

9 \def\lstset@#1{\endgroup%
10% \ifx\@empty#1%
11%     \@empty%
12%     \else%
13%         \setkeys{lst}{%
14%             #1%
15%             ,literate=%
16%             {<}\HTMLentity{lt}}{4}%
17%             {>}\HTMLentity{gt}}{4}%
18%             {'}\HTMLentity{apos}}{6}%
19%             {'}\HTMLentity{grave}}{7}%

```

The ampersand is not treated here, as the result is inconsistent spacing. It is nevertheless converted to `&amp;`; elsewhere. Sanitizing the double quote interferes with listings' conversion of visible spaces inside strings.

```

File 258 **lwarp-longtable.sty**

§ 367 Package **longtable**

(Emulates or patches code by DAVID CARLISLE.)

longtable (*Pkg*) longtable is emulated.

**for HTML output:** 1 \LWR@ProvidesPackageDrop{longtable}[2014/10/28]

Use one of either `\endhead` or `\endfirsthead` for both print and HTML, and use a `\warpprintonly` macro to disable the other head phrase, and also the `\endfoot` and `\endfirstfoot` phrases. (See section 8.10.4 if using `threeparttablex`.)

```

\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead % or \endhead, for print and HTML
\warpprintonly{ % not used in HTML
[ . . . ] \endhead % or \endfirsthead
[ . . . ] \endfoot
[ <lastfoot macros> ] \endlastfoot
}
. . . table contents . . .
\warphTMLonly{
[ <lastfoot macros> ] % HTML last footer, without \endfoot
% or \endlastfoot.
}
\end{longtable}

```

⚠ **Misplaced `\noalign`** Use the `\warpprintonly` macro instead of the `warpprint` environment. Doing so helps avoid “Misplaced `\noalign`.” when using `\begin{warpprint}`.

⚠ **`\kill`** `\kill` is ignored, place a `\kill` line inside

```
\begin{warpprint} . . . \end{warpprint}
```

or place it inside `\warpprintonly`.

⚠ **`lateximage`** `longtable` is not supported inside a `lateximage`.

See:

<http://tex.stackexchange.com/questions/43006/why-is-input-not-expandable>

Used to detect more than one of `\endhead` and `\endfirsthead` in use for HTML at the same time.

```

3 \boolfalse{LWR@longtable@havehead}

`longtable (env)` \* [`<horizontalignment>`] [`<colspec>`] Emulates the `longtable` environment.

Per the `caption` package, the starred version steps the counter per caption. The unstarred version steps the counter once at the beginning, but not at each caption.

Options `[c]`, `[l]`, and `[r]` are ignored.

File 272 **lwarp-lyluatex.sty**

§ 381 Package **lyluatex**

(Emulates or patches code by FR. JACQUES PERON, URS LISKA, BR. SAMUEL SPRINGUEL.)

lyluatex (*Pkg*) lyluatex is patched for use by lwarp.

For the first compile, to set *lwarpmk*'s configuration, use:

```
lualatex --shell-escape <filename>
```

 **images** After compiling the document with **lwarpmk html**, use **lwarpmk limages** to convert the Lilypond images for HTML.

**css** The option `insert=systems` results in an image per system. Each music image “system” is placed inside a `<span>` of class `lyluatex`, which defaults to `display: inline-block`.

 **insert=fullpage** The option `insert=fullpage` results in a single image per page of printed output. Each music “fullpage” image is placed inside a `<div>` of class `lyluatex`. To

match the number of measures per line with the printed version, use the `geometry` package to select the page geometry, or use the `lyluatex` options for page and staff sizes.

- ⚠ **options** To use `\linewidth` or `\textwidth` inside the package options for `lyluatex`, use the `kvoptions-patch` package first:

```
\usepackage{kvoptions-patch}
\usepackage[... ,line-width=0.8\linewidth,...]{lyluatex}
```

- ⚠ **raw-pdf** If using `raw-pdf`, the resulting PDF images must be converted to `svg`:

```
Enter ⇒ lwarpmk pdftosvg tmp-ly/*.pdf
```

**for HTML output:**

```
1 \LWR@origRequirePackage{luacode}
2
3 \LWR@ProvidesPackagePass{lyluatex}[2022/11/07]
```

User-redefinable ALT tag:

```
4 \newcommand*{\LyluatexImageAltText}{-lilypond--\PackageDiagramAltText}
```

`\ly@compilescore`

`{(Lilypond object)}`

```
5 \LetLtxMacro\LWR@orig@ly@compilescore\ly@compilescore
6
7 \renewcommand*{\ly@compilescore}[1]{%
```

A local group holds a number of changes:

```
8 \begingroup%
```

The user's original geometry and font size are restored to match the print version. This allows for correct spacing in the musical score.

```
9 \LWR@maybe@orignewpage%
10 \LWR@origloadgeometry{LWR@usergeometry}%
11 \LWR@print@normalsize%
```

A local group holds a redefined `\includegraphics` which is used by `lyluatex.lua` to insert the *Lilypond* score if `insert=systems` is used. This is now placed inside a `lateximage`, which itself is placed inside a `<span>` of class `lyluatex`.

`\LWR@addbaselinemarker` preserves the left margins.

```
12 \renewcommand{\includegraphics}[2][1]{%
13 \InlineClass{lyluatex}{%
14 \begin{lateximage}[\LyluatexImageAltText]%
15 \LWR@addbaselinemarker%
16 \LWR@originincludegraphics{##2}%
17 \end{lateximage}%
18 }%
19 }%
```

From the original:

```
20 \ly@setunits%
21 \setluaoption{ly}{currfiledir}{\currfiledir}
22 \setluaoption{ly}{twoside}{\ly@istwosided}
23 \directlua{
24 #1
25 ly.newpage_if_fullpage()}
```

```

26   }%
27   \ly@resetunits%
28   \ly@currentfonts%

```

The fullpage version is set inside an HTML <div>:

```

29   \directlua{
30       if (ly.score.insert == 'fullpage') then
31           tex.print{[[\string\begin{BlockClass}{lyluatex}]]}
32       end
33   }%

```

Generate the score:

```

34   \directlua{ly.score:process()}%

```

Close the <div>:

```

35   \directlua{
36       if (ly.score.insert == 'fullpage') then
37           tex.print{[[\string\end{BlockClass}]]}
38       end
39   }%

```

Move to a new page and renew the regular page geometry:

```

40   \LWR@maybe@orignewpage%
41   \LWR@origrestoregeometry%

```

End of the local group.

```

42   \endgroup%
43 }

```

In HTML the following generates an error, so is removed:

```

44 \xpatchcmd{\endly@bufferenv}
45   {\hspace{0pt}\}
46   {}
47   {}
48   {\LWR@patcherror{lyluatex}{endly@bufferenv}}

File 275 **lwarp-manyfoot.sty**

§ 384 Package **manyfoot**

manyfoot (*Pkg*) manyfoot is emulated.

**bigfoot, manyfoot** Verbatim footnotes are not yet supported.

 **verbatim**

If using the **bigfoot** package, and possibly also **manyfoot**, problems may occur with counter allocation because **lwarp** uses many counters, and there is a difference in how counters numbered 256 and up are handled in PDF L<sup>A</sup>T<sub>E</sub>X. With **bigfoot** this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining **bigfoot** or **manyfoot** footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X or LuaL<sup>A</sup>T<sub>E</sub>X instead of PDF L<sup>A</sup>T<sub>E</sub>X.

**lwarp**'s emulation of **bigfoot** uses **manyfoot**, so some of the **bigfoot** enhancements are included here.

The **bigfoot** “default” footnote is ignored, using the **lwarp** version instead.

File 288 **lwarp-mathptmx.sty**

§ 397 Package **mathptmx**

(Emulates or patches code by WALTER SCHMIDT.)

`mathptmx` (*Pkg*) `mathptmx` is used as-is for SVG math, and is emulated for MATHJAX.

 **limitations** The MATHJAX emulation ignores all package options. The dedicated macros for upright greek letters do work correctly.

SVG math should appear the same as the printed output.

**for HTML output:** `1 \LWR@ProvidesPackagePass{mathptmx}[2020/03/25]`

For MATHJAX:

```
2 \LWR@origRequirePackage{lwarp-common-mathjax-letters}
3
4 \begin{warpMathJax}
5 \LWR@infoProcessingmathjax{mathptmx}
6
7 \IfPackageLoadedWithOptionsTF{mathptmx}{slantedGreek}
8   {\LWR@mathjax@addgreek@u@it*{}{}}
9   {}
10
11 \LWR@mathjax@addgreek@u@up*{up}{}
12 \end{warpMathJax}
```

File 289 **lwarp-mathspec.sty**

§ 398 Package **mathspec**

(Emulates or patches code by ANDREW GILBERT MOSCHOU.)

`mathspec` (*Pkg*) `mathspec` is used as-is with SVG math, and is emulated for MATHJAX.

 **quotes** Double quotes (`\` and the `"` character) are removed during MATHJAX emulation, but this also includes inside `\text`.

**for HTML output:** `1 \LWR@ProvidesPackagePass{mathspec}[2016/12/22]`

```
2 \LWR@origRequirePackage{lwarp-common-mathjax-letters}
3
4 \begin{warpMathJax}
```

Neutralize double quotes (`"` and `\`):

```
5 \booltrue{LWR@MathJax@silentquotes}
```

Sort options for out Greek emulation:

```

6 \AtBeginDocument{
7 \ifcase\eu@GreekUppercase@@value %% If Greek Uppercase Regular
8   \LWR@mathjax@addgreek@u@up*{}{}
9 \or %% If Greek Uppercase Italic
10  \LWR@mathjax@addgreek@u@it*{}{}
11 \or %% If Greek Uppercase Plain
12  \LWR@mathjax@addgreek@u@up*{}{}
13 \fi
14 \ifcase\eu@GreekLowercase@@value %% If Greek Lowercase Regular
15   \LWR@mathjax@addgreek@l@up{}{}
16 \or %% If Greek Lowercase Italic

18 \or %% If Greek Lowercase Plain
19   \LWR@mathjax@addgreek@l@it{}{}

Swap definitions according the mathspec conditionals:

## File 290 `lwarp-mathtools.sty`

### § 399 Package **mathtools**

*(Emulates or patches code by MORTEN HØGHOLM, LARS MADSEN.)*

`mathtools` (*Pkg*) `mathtools` is patched for use by `lwarp`. Emulation macros are provided for MATHJAX.

#### ⚠ equation numbering

`showonlyrefs` is disabled, as it conflicts with `cleveref`, which is used by `lwarp`. Equation numbers may not match the print version.

⚠ **italic correction** `mathic` is not emulated for HTML.

⚠ **MATHJAX** If using MATHJAX:

- `mathtools disallowspaces` does not work for MATHJAX. Protect brackets which are not optional arguments, such as:

```

\begin{gathered}{}
[p]=1 . . .
\end{gathered}

```

- `showonlyrefs` does not work in MATHJAX, and will result in a difference in equation numbering compared to the print version.
- `alignat` in MATHJAX requires math mode, but in L<sup>A</sup>T<sub>E</sub>X it doesn't. It may be required to use `warpHTML` and `warpprint` to isolate a version for each mode.
- `\DeclarePairedDelimiter` and related must be in the preamble before `\begin{document}`.

**for HTML output:** 1 `\LWR@ProvidesPackagePass{mathtools}[2018/01/08]`

2 `\RequirePackage{graphicx}`

3 `\MHInternalSyntaxOn`

Forces `showonlyrefs` off because `lwarp` uses `cleveref`, which is not compatible with `showonlyrefs`.

```

4 \renewcommand*{\MT_showonlyrefs_true:}{%
5   \PackageWarningNoLine{lwarp}
6   {%
7     Mathtools \space showonlyrefs \space conflicts \space
8     with \space cleveref,\MessageBreak
9     which \space is \space used \space by \space lwarp, \space
10    so \space showonlyrefs \space is\MessageBreak
11    forced \space off. \space\space

13  }
14  \MT_showonlyrefs_false:
15 }
16 \mathtoolsset{showonlyrefs=false}

```

Forces math italic correction off. Not patched for lwarp.

```

17 \renewcommand*{\MT_mathic_true:}{\MT_mathic_false:}
18 \mathtoolsset{mathic=false}

```

```

19 \MHInternalSyntaxOff

```

For MATHJAX.

The MATHJAX package is used, and improvements are added.

---

File 294 **lwarp-mdframed.sty**

§ 403 Package **mdframed**

*(Emulates or patches code by MARCO DANIEL, ELKE SCHUBERT.)*

mdframed (*Pkg*) mdframed is loaded with options forced to framemethod=none.

§ 403.1 **Limitations**

**support** Most basic functionality is supported, including frame background colors and single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for mdframed environments and frame titles.

 **loading** When used, lwarp loads mdframed in HTML with framemethod=none.

**font** For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the mdframed source). Since lwarp does not support `\bfseries` and friends, only one font selection may be made at a time.

**theoremtitlefont** theoremtitlefont is not supported, since the following text is not in braces in the mdframed source.

**ignored options** userdefinedwidth and align are currently ignored.

**css classes** Environments created or encapsulated by mdframed are enclosed in a `<div>` of class mdframed, and also class md<environmentname> for new environments.

Frame titles are placed in a `<div>` of class `[mdframedtitle]`. Subtitles are in a `<div>` of class `[mdframedsubtitle]`, and likewise for subsubtitles.

Pre-existing hooks are used to patch extra functions before and after the frames.

### § 403.2 Package loading

**for HTML output:**

```
1 \RequirePackage{xcolor}% for \convertcolorspec
2
3 \LWR@ProvidesPackageDrop{mdframed}[2013/07/01]
```

Do not require TikZ or pstricks:

```
4 \LWR@origRequirePackage[framemethod=none]{mdframed}
```

### § 403.3 Patches

Patch to remove PDF formatting and add HTML tags:

```
5 \AtBeginDocument{

8 \topsep=\the\topsep\relax%

31 }% AtBeginDocument
```

### § 403.4 Initial setup

To handle CSS and paragraphs, patch code at start and end of environment and contents. `\LWR@print@raggedright` helps avoid hyphenation.

```
32 \mdfsetup{
33 startcode={\LWR@mdframedstart\LWR@print@raggedright},
34 endcode={\LWR@mdframedend},
35 startinnercode={\LWR@startpars\LWR@print@raggedright},
36 endinnercode={\LWR@stoppars},
37 }
```

### § 403.5 **Color and length HTML conversion**

`\LWR@mdfprintcolor`

`{\mdfcolorkey}`

Given the `mdframed` key, print the color.

```
38 \newcommand*\LWR@mdfprintcolor[1]{%
39 \convertcolorspec{named}{\@nameuse{mdf@#1}}{HTML}\LWR@tempcolor%
40 \LWR@origpound\LWR@tempcolor
41 }
```

`\LWR@mdfprintlength`

`{\mdflengthkey}`

Given the `mdframed` key, print the length.

```
42 \newcommand*\LWR@mdfprintlength[1]{%
43 \LWR@forceminwidth{\@nameuse{mdf@#1@length}}%
44 \LWR@printlength{\LWR@atleastonept}%
45 }
```

### § 403.6 **Environment encapsulation**

`\LWR@mdframedstart`

Actions before an `mdframe` starts.

Encapsulate a frame inside a `<div>` of the desired class.

```
46 \newcommand*\LWR@mdframedstart{%
47 \LWR@traceinfo{\LWR@mdframedstart start}%
```

Warn if starting a frame inside a `<span>`:

```
48 \LWR@spanwarninvalid{mdframe}%
```

Turn off paragraph handling during the generation of the encapsulating tags:

```
49 \LWR@stoppars%
```

Open a `<div>` and with custom class and custom style. A `BlockClass` environment is not used because this `<div>` is created by the `mdframed` startcode and encode settings, which do not properly nest the `<div>` inside the `mdframed` environment.

```
50 \LWR@htmltagc{div class=\textquotedbl%

Convert and print the background color:

```
55 background: \LWR@mdfprintcolor{backgroundcolor} ; \LWR@orignewline
```

Convert and print the border color and width:

```
56 border: \LWR@mdfprintlength{linewidth} solid
57 \LWR@mdfprintcolor{linecolor} ; \LWR@orignewline
```

Convert and print the border radius:

```
58 border-radius: \LWR@mdfprintlength{roundcorner} ; \LWR@orignewline

Convert and print the shadow:

```
59 \ifbool{mdf@shadow}{%

mdframed environment may not work with the HTML versions of the following, so restore them to their originals while inside mdframed:

```

70 \let\hspace\LWR@print@hspace%
71 \renewcommand*\rule{\LWR@print@rule}
72 \LetLtxMacro\makebox\LWR@print@makebox%

73 \LWR@startpars%
74 \LWR@traceinfo{LWR@mdframedstart done}%
75 }

```

\LWR@mdframedend

Actions after an mdframe ends.

After closing the <div>, globally restore to the default environment type:

```

76 \newcommand*\LWR@mdframedend{}
77 \LWR@traceinfo{LWR@mdframedend start}%

```

Close the custom <div>:

```
78 \LWR@htmldivclassend{\LWR@mdthisenv}
```

Reset future custom class to the default:

```
79 \gdef\LWR@mdthisenv{mdframed}
```

Resume paragraph handling:

```

80 \LWR@startpars%
81 \LWR@traceinfo{LWR@mdframedend done}%
82 }

```

File 296 **lwarp-media9.sty**

§ 405 Package **media9**

*media9 (Pkg)* **media9** is emulated.

The packages `multimedia`, `movie15`, and `media9` are supported.

HTML5 `<audio>` and `<video>` objects are created for `.mp3` and `.mp4` files.

HTML5 `<embed>` objects are created for `http` and `ftp` links.

`\href` links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For `media9`, a `multimedia` object is inserted for each `addressource=`, as well as each `flashvars source=` and `src=`. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside `\warpprintonly` or the `warpprint` environment.

Each HTML `multimedia` object includes the `poster` text, except for `<embed>` objects. For `movie15`, the `text` option is supported to specify the poster text.

The `width`, `height`, and `totalheight` options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

`media9 \addmediapath` is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each `<audio>` and `<video>` object.

`media9` slideshows are not supported.

`\hyperlinkmovie`, `\movieref`, and `\mediabutton` are not supported.

3D objects are not supported.

If using a YOUTUBE™ video, use an “embedded” URL with `.../embed/...` instead of `.../v/...`

 **& in a URL** Many special characters are converted to regular catcode 12 characters for use inside a URL. `&` is used in the flash variables fields, which are split with `xparse \SplitList`, which does not seem to work with a catcode 12 divider token, so `&` is not converted to catcode 12, and will not work in a URL with `media9`. Using `&` in a URL in a `flashvars` field may also cause parsing problems with print output, as well.

File 301 **lwarp-mhchem.sty**

§ 410 Package **mhchem**

(Emulates or patches code by MARTIN HENSEL.)

mhchem (*Pkg*) mhchem is patched for use by lwarp.

**without MATHJAX** Without MATHJAX, mhchem expressions are converted to svg math. Inline expressions use hashed filenames to allow reuse, and assume that any mhchem options are global.

**MATHJAX with mhchem extension** For MATHJAX, the mhchem extension is used if the mhchem expression is used inside a math expression:

```
\ce{C6H5-CHO}
```

To force the use of svg math for an expression which does not work with MATHJAX, place the expression between `\displaymathother` and `\displaymathnormal`:

```
\displaymathother
\[ \ce{ . . . } \] . . . $ \ce { . . . } $
\displaymathnormal
```

not inside math

If *not* used inside a math expression, lwarp converts standalone mhchem expressions into svg math images.

 **nested math** When producing HTML output without the MATHJAX mhchem extension, lwarp does not support the use of nested dollar signs in mhchem expressions.

For some examples from the mhchem manual, change as follows:

<code>\ce{NaOH(aq,\infty)}</code>	% old
<code>\ce{NaOH(aq,\infty)}</code>	% new
<code>\ce{Fe(CN)_{\frac{6}{2}}}</code>	% old
<code>\ce{Fe(CN)_{\frac{6}{2}}}</code>	% new
<code>\ce{NO_x}</code>	% old
<code>\ce{NO_x}</code>	% new
<code>\ce{NO_x}</code>	% old
<code>\ce{NO_x}</code>	% new
<code>\ce{\mathit{cis}[PtCl2(NH3)2]}</code>	% old
<code>\ce{\mathit{cis}[PtCl2(NH3)2]}</code>	% new

File 308 **lwarp-mismath.sty**

§ 417 Package **mismath**

*(Emulates or patches code by ANTOINE MISSIER.)*

`mismath` (*Pkg*) `mismath` is patched for SVG math, and emulated for MATHJAX.

 **MATHJAX** `\enumber`, `\inumber`, `\jnumber`, and `\pinumber` are ignored for MATHJAX, except that `\itpi` is made available as a clone of `\pi`.

For MATHJAX, `\boldvect` and `\arrowvect` are honored if in the preamble.

If `\boldvectcommand` is set to `\mathbf` in the preamble, it will be used for MATHJAX, otherwise it will default to `\mathit`. `\boldvectcommand` may also be set with `\CustomizeMathJax` in the preamble. See section 8.7.7. Note that as of this writing there is not a bold italic font across all MATHJAX fonts.

If `\probastyle` is set to `\mathbb` in the preamble, it will be used for MATHJAX, otherwise it will default to `\mathrm`. `\probastyle` may be set with `\CustomizeMathJax` in the preamble.

If `\mathset` is set to `\mathbb` in the preamble, it will be used for MATHJAX, otherwise it will default to `\mathbf`. `\mathset` may be set with `\CustomizeMathJax` in the preamble.

**for HTML output:** 1 \LWR@ProvidesPackagePass{mismath}[2022/11/11]

File 312 **lwarp-movie15.sty**

§ 421 Package **movie15**

`movie15 (Pkg)` **movie15** is emulated.

The packages `multimedia`, `movie15`, and `media9` are supported.

HTML5 `<audio>` and `<video>` objects are created for `.mp3` and `.mp4` files.

HTML5 `<embed>` objects are created for `http` and `ftp` links.

`\href` links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For `media9`, a multimedia object is inserted for each `addressource=`, as well as each `flashvars source=` and `src=`. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside `\warpprintonly` or the `warpprint` environment.

Each HTML multimedia object includes the poster text, except for `<embed>` objects. For `movie15`, the `text` option is supported to specify the poster text.

The `width`, `height`, and `totalheight` options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

`media9 \addmediapath` is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each `<audio>` and `<video>` object.

`media9` slideshows are not supported.

`\hyperlinkmovie`, `\movieref`, and `\mediabutton` are not supported.

3D objects are not supported.

If using a YouTube™ video, use an “embedded” URL with `.../embed/...` instead of `.../v/...`

File 320 **lwarp-multirow.sty**

§ 429 Package **multirow**

(Emulates or patches code by PIET VAN OOSTRUM, ØYSTEIN BACHE, JERRY LEICHTER.)

`multirow` (*Pkg*) `multirow` is emulated during HTML output, and used as-is while inside a `LatexImage`.

- `vposn` • Note that recent versions of `multirow` include a new optional `vposn` argument.

**multirow cells**

- For `multirow`, insert `\mrowcell` into any empty multi-row cells. This will be a null function for the print output, and is a placeholder for parsing the table for HTML output. An error is generated if this is missed.

```
... & \multirow{2}{.5in}{text} & ...
... & \mrowcell & ...
```

**colored cells**

- The `multirow` documentation regarding colored cells recommends using a negative number of rows. This will not work with `lwarp`, so `\warpprintonly` and `\warpHTMLonly` must be used to make versions for print and HTML.

**with `\multicolumn`**

⚠ `\multicolumn & \multirow`

- See section 429.2 for `\multicolumnrow`.

`lwarp` does not support directly combining `\multicolumn` and `\multirow`. Use `\multicolumnrow` instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for `\multicolumn` come first, followed by the five arguments for `\multirow`, many of which are optional, followed by the contents.

⚠ **skipped cells**

As per `\multirow`, skipped cells to the right of the `\multicolumnrow` statement are not included in the source code on the same line. On the following lines, `\mcolrowcell` must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

⚠ **empty cells**

```
... & \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text} & ...
... & \mcolrowcell & \mcolrowcell & ...
... & \mcolrowcell & \mcolrowcell & ...
```

⚠ **MathJax**

- `MATHJAX` does not support `multirow`, so it is emulated to only print its text on the first row. `\multirow` works as expected in text tabulars or SVG math.

In a `lateximage`, the print versions are restored.

See section 75.24 for the print-mode versions.

**for HTML output:**

Remove the placeholder macro which was used if `multirow` was not loaded:

```
1 \LetLtxMacro\multirow\relax
```

```
2 \LWR@ProvidesPackagePass{multirow}[2021/03/15]
```

`\LWR@multirowborder` Set to left or right to create a thick border for the cell, for use by `bigdelim`:

29     }%

```

```
30     \LWR@addcmidrulewidth%
31     \LWR@addcdashline%
32     \LWR@addtabularrulecolors%

While printing the text, redefine `\` to generate a new line. If a nested tabular occurs, `\` is redefined to `\LWR@tabularendofline` at the start of the tabular, then `\LWR@endofline` before again printing any `\multirow` contents inside the nested tabular.

`\par` is redefined to insert an HTML break, and if tabular is nested, it is redefined at the start of tabular.

File 322 **lwarp-musicography.sty**

§ 431 Package **musicography**

(Emulates or patches code by ANDREW A. CASHNER.)

musicography (*Pkg*) musicography is patched for use by lwarp.

Images are used for the meter symbols and fingered bass, since the HTML fonts tend not to be the correct size and HTML cannot stack items. The HTML alt tag copies C and 3/2, etc. Hashes are used for the meter images, which are then reused as necessary.

Note that browser support for musical symbols may be buggy. ALT text and copy/paste into a text editor work well.

File 338 **lwarp-nicematrix.sty**§ 447 Package **nicematrix**

(Emulates or patches code by F. PANTIGNY.)

nicematrix (*Pkg*) nicematrix is used as-is for SVG math, and is emulated for MATHJAX.

 **MATHJAX** Keys/values are ignored in MATHJAX. \Cdots, etc. do not span multiple cells. AutoNiceMatrix, etc. are not supported for MATHJAX. SVG math output preserves all nicematrix features. To force SVG output for one or more consecutive math expressions, for inline math use \inlinemathother and \inlinemathnormal, or for display math use \displaymathother and \displaymathnormal.

**for HTML output:** Skip the test for array, which does not work with lwarp:

```

1 \PassOptionsToPackage{no-test-for-array}{nicematrix}
2 \LWR@ProvidesPackagePass{nicematrix}[2022/10/06]
```

NiceTabular must be converted to SVG to support the various nicematrix options:

```

3 \begin{warpHTML}
4 \BeforeBeginEnvironment{NiceTabular}{%
5   \begin{lateximage}[-nicematrix--\PackageDiagramAltText]%
6 }
7 \AfterEndEnvironment{NiceTabular}{\end{lateximage}}
8 \BeforeBeginEnvironment{NiceTabular*}{%
```

```

9   \begin{lateximage}[-nicematrix--\PackageDiagramAltText]%
10  }
11  \AfterEndEnvironment{NiceTabular*}{\end{lateximage}}
12  \end{warpHTML}

```

Special handling for the optional arguments, and the lack of a delimiter:

```

13  \begin{warpMathJax}
14  \CustomizeMathJax{\newcommand{\LWRnicearrayarray}[1]{\begin{array}{#1}}}
15  \CustomizeMathJax{\def\LWRnicearrayarrayopt#1[#2] {\begin{array}{#1}}}
16
17  \CustomizeMathJax{%
18    \newenvironment{NiceArray}[2][[%
19      {\ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}}%
20      {\end{array}}}%
21  }
22
23  \CustomizeMathJax{%
24    \newcommand{\LWRnicearraywithdelimitwo}[2][[%
25      \ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}}%
26      ]%
27  }

```

General case with left / right delimiters:

```

28  \CustomizeMathJax{%
29    \newenvironment{NiceArrayWithDelims}[2]%
30      {%
31        \def\LWRnicearrayrightdelim{\right#2}%
32        \left#1%
33        \LWRnicearraywithdelimitwo%
34      }%
35    {\end{array}\LWRnicearrayrightdelim}%
36  }

```

Instances of specific delimiters:

```

37  \CustomizeMathJax{%
38    \newenvironment{pNiceArray}
39      {\begin{NiceArrayWithDelims}{(}{)}%
40      {\end{NiceArrayWithDelims}}
41  }
42
43  \CustomizeMathJax{%
44    \newenvironment{bNiceArray}
45      {\begin{NiceArrayWithDelims}{[}{]}%
46      {\end{NiceArrayWithDelims}}
47  }
48
49  \CustomizeMathJax{%
50    \newenvironment{BNiceArray}
51      {\begin{NiceArrayWithDelims}{\{}{\}}%
52      {\end{NiceArrayWithDelims}}
53  }
54
55  \CustomizeMathJax{%
56    \newenvironment{vNiceArray}
57      {\begin{NiceArrayWithDelims}{\vert}{\vert}}
58      {\end{NiceArrayWithDelims}}
59  }

```

```

60
61 \CustomizeMathJax{%
62   \newenvironment{VNiceArray}
63     {\begin{NiceArrayWithDelims}{\Vert}{\Vert}}
64     {\end{NiceArrayWithDelims}}
65 }

```

Ignore optional arg and use standard environments:

```

66 \CustomizeMathJax{\newenvironment{NiceMatrix}[1][\begin{matrix}]{\end{matrix}}}
67 \CustomizeMathJax{\newenvironment{pNiceMatrix}[1][\begin{pmatrix}]{\end{pmatrix}}}
68 \CustomizeMathJax{\newenvironment{BNiceMatrix}[1][\begin{Bmatrix}]{\end{Bmatrix}}}
69 \CustomizeMathJax{\newenvironment{vNiceMatrix}[1][\begin{vmatrix}]{\end{vmatrix}}}
70 \CustomizeMathJax{\newenvironment{VNiceMatrix}[1][\begin{Vmatrix}]{\end{Vmatrix}}}
71 \CustomizeMathJax{\newenvironment{VNiceMatrix}[1][\begin{Vmatrix}]{\end{Vmatrix}}}

```

Ignore optional argument and size. Print contents.

```

72 \CustomizeMathJax{\newcommand{\LWRnicematrixBlock}[1]{#1}}
73 \CustomizeMathJax{\def\LWRnicematrixBlockopt<#1>#2{#2}}
74
75 \CustomizeMathJax{%
76   \newcommand{\Block}[2][\ifnextchar<\LWRnicematrixBlockopt\LWRnicematrixBlock}%
77 }

```

Form an approximation:

```

78 \CustomizeMathJax{%
79   \newcommand{\diagbox}[2]{%
80     \begin{array}{l}\hfill\quad#2\\\hline#1\quad\hfill\end{array}%
81   }%
82 }

```

**Theorem:** `<div> of class theorembody<theoremstyle>`

**Theorem Header:** `<span> of class theoremheader<style>`

---

### § 457.1 Limitations

 **Font control** This conversion is not total. Font control is via css, and the custom L<sup>A</sup>T<sub>E</sub>X font settings are ignored.

 **Equation numbering** ntheorem has a bug with equation numbering in  $\mathcal{A}\mathcal{M}\mathcal{S}$  environments when the option `thref` is used. lwarp does not share this bug, so equations with `\split`, etc, are numbered correctly with lwarp's HTML output, but not with the print output. It is recommended to use `cleveref` instead of ntheorem's `thref` option.

## § 457.2 Options

Options `amsthm` or `standard` choose which set of theorems and proofs to initialize.

 **Disabled options** The options `thmmarks` and `amsmath` are disabled, since they heavily modify the underlying math code. Theorem marks are emulated. The AMS-math modifications are not done.

Option `thref` is disabled because `cleveref` functions are used instead. `\thref` is emulated.

Option `hyperref` is disabled because `lwarp` emulated `hyperref`.

**for HTML output:** Some disabled options:

```

1 \DeclareOption{thref}{
2   \AtEndDocument{
3     \PackageWarningNoLine{lwarp}{%
4       Lwarp uses cleveref, which takes over ntheorem's\MessageBreak
5       referencing, including
6         \protect\label \space and \protect\thref.\MessageBreak
7       Cleveref does not accept ntheorem's optional\MessageBreak
8       argument for \protect\label, so it will appear\MessageBreak
9       in the text. It is recommended to remove the\MessageBreak
10      thref option, \protect\usepackage{cleveref} instead,\MessageBreak

```

### § 457.11 **\NoEndMark**

```
464 \gdef\NoEndMark{\global\setendmarkfalse}
```

### § 457.12 **List-of**

Redefined to reuse the float mechanism to add list-of-theorem links:

```

\thm@thmline {\langle 1: printed type \rangle} {\langle 2: # \rangle} {\langle 3: optional \rangle} {\langle 4: page \rangle}

465 \renewcommand{\thm@thmline@noname}[4]{%
466 \hypertocfloat{1}{theorem}{thm}{#2 #3}{}%
467 }
468
469 \renewcommand{\thm@thmline@name}[4]{%
470 \hypertocfloat{1}{theorem}{thm}{#1 #2 #3}{}%
471 }
```

This was redefined by `ntheorem` when loaded, so it is now redefined for `lwarp`:

```
472 \def\thm@thmline{\thm@thmline@name}
```

Patch for css:

```

473 \def\listtheorems#1{

File 351 **lwarp-overpic.sty**

§ 460 Package **overpic**

*(Emulates or patches code by ROLF NIEPRASCHK.)*

overpic (*Pkg*) overpic is patched for use by lwarp.

 **scaling** The macros `\overpicfontsize` and `\overpicfontskip` are used during HTML generation. These are sent to `\fontsize` to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the `overpic` and `Overpic` environments.

See section 88.2 for the print-mode version of `\overpicfontsize` and `\overpicfontskip`.

File 357 **lwarp-parcolumns.sty**

§ 466 Package **parcolumns**

*(Emulates or patches code by JONATHAN SAUER.)*

parcolumns (*Pkg*) parcolumns is emulated.

rulebetween is honored. The other keys are ignored, including colwidths.

Each column is placed inside a <div> of class minipage, each of whose width is fixed at 85% divided by the number of columns. In most cases, this results in side-by-side minipages adapting to the browser width. Inside each minipage, \linewidth, \textwidth, and \textheight are set for a virtual 6 × 9 inch page, with \linewidth divided by the number of columns.

§ 482 Package **pdfrenderer**

`pdfrenderer (Pkg)` pdfrenderer is allowed during HTML, but it has no effect on HTML text output. pdfrenderer is enabled for use with `xfakebold`, and it is enabled during HTML so

that it may be in use when an SVG math image is started. I.e. `xfakebold's \setBold` may be used outside of a math expression and still be detected when the math begins.

The `lwarp-pdfrender` package is present because it used to disable `pdfrender`, so this newer version is to overwrite older versions.

 **convert image files** The `pdftricks` image files `<jobname>-fig*.pdf` must be converted to `.svg`, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

File 377 **lwarp-perpage.sty**

§ 486 Package **perpage**

*(Emulates or patches code by DAVID KASTRUP.)*

perpage (*Pkg*) **perpage** is mostly ignored, but support is added for footnote counters.

There is no page number in HTML, so most counters are not reset. If the document redefines `\the<countername>` to include `\theperpage`, it is necessary to place that redefinition inside a `warpprint` environment to avoid modifying the HTML definitions.

`\AddAbsoluteCounter` must not be inside `warpprint`, as the counter must be added for HTML also, although it is not incremented.

[footnote numbering](#) To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For `bigfoot`, `manyfoot`, or `perpage`:

```
\MakePerPage{footnoteX}
```

— or —

```
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by `FootnoteDepth`, which is not necessarily by HTML page. This is recommended for `\alph`, `\Alph`, or `\fnsymbol` footnotes, due to the limited number of symbols which are available.

**for HTML output:** 1 \LWR@ProvidesPackageDrop{perpage}[2014/10/25]

File 410 **lwarp-reysize.sty**

§ 519 Package **reysize**

*(Emulates or patches code by DONALD ARSENEAU, BERNIE COSELL, MATT SWIFT.)*

`relsize` (*Pkg*) `relsize` is patched for use by `lwarp`, and emulated for `MATHJAX`.

For `HTML`, only the inline macros are supported: `\textlarger`, `\textsmaller`, and `\textscale`. Each becomes an inline span of a modified font-size.

`\relsize`, `\larger`, `\smaller`, and `\relscale` are ignored.

While creating `SVG` math for `HTML`, the original definitions are temporarily restored, and so should work as expected.

 **not small** The `HTML` browser's setting for minimum font size may limit how small the output will be displayed.

**for HTML output:**

```

File 438 **lwarp-seqspl.it.sty**

§ 547 Package **seqsplit**

(Emulates or patches code by BORIS VEYTSMAN.)

`seqsplit` (*Pkg*) `seqsplit` is patched for use by `lwarp`.

For HTML output, the results are similar to print mode, and respond to window size.

 **svg math results** For SVG math, the output differs from print mode in that the contents are formatted in a minipage, which is then inline with the surrounding math.

For MATHJAX, the contents are used as-is.

**for HTML output:** `1 \LWR@ProvidesPackagePass{seqsplit}[2006/08/07]`

Special handling because `lwarp` uses a box for SVG math, which does not normally allow line breaks, so a print-mode minipage must be used to allow line breaks. The minipage will not be wrapped inline with any surrounding math.

```

Borrowed from the lwarp version of keyfloat:

```

36
37 \RenewDocumentEnvironment{margintable}{o}
38   {\begin{KFLTsidenotes@marginfloat}{table}}
39   {\end{KFLTsidenotes@marginfloat}}

```

The following were changed by `sidenotes`, and now are reset back to their `lwarp`-supported originals:

Restoring the definition from the  $\text{\LaTeX}2_{\epsilon}$  `article.cls` source:

```

40 \renewenvironment{figure*}
41     {\@dblfloat{figure}}
42     {\end@dblfloat}
43
44 \renewenvironment{table*}
45     {\@dblfloat{table}}
46     {\end@dblfloat}

```

For `MATHJAX`:

Note that `sidenotes` does not support `\sidenote` inside math in print mode. Use `\sidenotemark` and `\sidenotetext` instead.

```

47 \begin{warpMathJax}
48 \providecommand{\sidenotename}{sidenote}
49 \appto\LWR@syncnotenumbers{\LWR@synconotenummer{\LWRsidenote}{\thesidenote}}

51 \CustomizeMathJax{\def\LWRsidenote{1}}
52 \CustomizeMathJax{\newcommand{\sidenotemark}[1][\LWRsidenote]{{}^{\mathrm{#1}}}}
53 \end{warpMathJax}

```

The following is not defined since is not allowed inside math in print mode, and also would have to be modified to parse the optional offset argument:

```
\CustomizeMathJax{\newcommand{\sidenote}[2][\LWRsidenote]{{}^{\mathrm{#1}}}}
```

File 451 **lwarp-SIunits.sty**

§ 560 Package **Slunits**

*(Emulates or patches code by MARCEL HELDOORN.)*

SIunits (*Pkg*) **Slunits** is patched for use by **lwarp**.

For SVG math, it is recommended to use `\unit` where possible, which combines the entire expression into a single `lateximage`, and adds the `alt` tag containing the L<sup>A</sup>T<sub>E</sub>X code, allowing for copy/paste. When units are used outside of the `\unit` macro, each unit macro will have its own `lateximage`, and each will have the `alt` tag set according to `\MathImageAltText`, which defaults to `(math image)`.

For MATHJAX, individual units used in text will appear as SVG images, since `\ensuremath` is used in the original definitions, and `\ensuremath` often has expressions which do not work well in MATHJAX, so it is always forced to an SVG image. If, however, `\unit` is used, the result is expressed with MATHJAX instead of an SVG image.

**for HTML output:** 1 \LWR@ProvidesPackagePass{SIunits}[2007/12/02]

Patched for copy/paste with the HTML `alt` tag:

File 453 **lwarp-siunitx-v2.sty**

§ 562 Package **siunitx-v2**

(Emulates or patches code by JOSEPH WRIGHT.)

siunitx-v2 (*Pkg*) siunitx-v2 is patched for use by lwarp, and is emulated for MATHJAX.

siunitx is well supported by lwarp.

**Limitations** Some general limitations:

**fractions** Due to *pdftotext* limitations, fraction output is replaced by symbol output for per-mode and quotient-mode.

`\cancel` is not currently supported for siunitx v3.

Negative values are not automatically colored.

 **tabular**

Tabular S and s columns are rendered as simple c columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for `drop-exponent`, without which the value will be shown incorrectly.

 **drop-exponent**

 **table-auto-round**

`table-auto-round` is ignored.

**Math rendering** Math may be rendered in several ways in the same document:

**For math mode with `svg display`:** The original siunitx code is used while generating the SVG image.

**For HTML text mode:** lwarp uses siunitx code patched for HTML, and simplified units.

**For math expressions while using MATHJAX:** A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

**Custom units** siunitx allows customized units:

```
\DeclareSIUnit {<name>} {<definition>}
```

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in `svg math` or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

```
\HTMLDeclareSIUnit {<name>} {<definition>}
```

 **v3 only!** Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit`

declares a simplified version of the unit for HTML, for example if the print-mode unit uses TEX boxes or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MATHJAX:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

**Predefined units** Most units work as-is with HTML. For the following units, `lwarp` has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

### ⚠ MathJax

#### Document modifications required for MATHJAX

#### ⚠ `\sisetup`

- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MATHJAX. The MATHJAX emulation also ignores most macro options.

#### ⚠ complex numbers

- Complex numbers are displayed as entered, ignoring `output-complex-root`.

#### custom units

- Custom units may be added with `\CustomizeMathJax`. For example, from `lwarp-common-mathjax-siunitx`:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_{\mathrm{h}}}}
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

#### ⚠ unit spacing

- Units work better using `~` between units instead of using periods.

#### ⚠ `\square`, `\cubic`

- To square or cube compound units, enclose the following compound units in braces:

```
\cubic{\centi\meter}
```

Single units do not require braces.

- For `\numlist`, the argument is printed as text as-is, so use space between semicolons for improved readability.

#### ⚠ Missing \$ inserted

- If using `parse-numbers = false`, also use `\num` or `\qty`. `siunitx=siunitx>Missing $ inserted`.

Also see [MATHJAX option](#), section 8.7.5.

#### for HTML output:

```
1 \RequirePackage{xcolor}% for \convertcolorspec
2
3 \LWR@ProvidesPackagePass{siunitx}[=v2]% 2021-04-17

4 \AtBeginDocument{% in case textcomp was not loaded

6   \DeclareSIUnit\clight{\textit{c}\textsubscript{0}}
7   \DeclareSIUnit\elementarycharge{\textit{e}}
8   \DeclareSIUnit\electronmass{\textit{m}\textsubscript{e}}
9   \DeclareSIUnit\hartree{\textit{E}\textsubscript{h}}
10  \DeclareSIUnit\planckbar{\LWR@siunitx@textplanckbar}
11 }% AtBeginDocument
```

Support the S and s column types:

```

12 \AtBeginDocument{
13 \HTMLnewcolumnntype{S}[1][>{\begingroup\sisetup{#1}}c<{\endgroup}}
14 \HTMLnewcolumnntype{s}[1][>{\begingroup\sisetup{#1}}c<{\endgroup}}
15 }

```

`\@ensuredmath` is not supported inside an `\hbox`, so it must temporarily be restored to its original. Similar for `\mbox`. SVG math is created explicitly when necessary, using `\LWR@subsingledollar`.

```

16
17 \ExplSyntaxOn

```

Modified to use the print version of `\@ensuredmath` to avoid having a `lateximage` each time.

§ 563 Package **common-mathjax-siunitx**

*(Emulates or patches code by JOSEPH WRIGHT.)*

`common-mathjax-siunitx` (*Pkg*) `common-mathjax-siunitx` adds `MATHJAX` for `siunitx` and `siunitx-v2`.

for HTML output:  
`MATHJAX`

For `MATHJAX`.

The following runs much faster as separate `\CusomizeMathJax` calls instead of one single call.

```
1 \begin{warpMathJax}
2 \LWR@infoprocessingmathjax{siunitx}

3 \CustomizeMathJax{\newcommand{\tothe}[1]{^{#1}}}
4 \CustomizeMathJax{\newcommand{\raiseto}[2]{^{#2}^{#1}}}
```

Used as an end marker when parsing values:

```
5 \CustomizeMathJax{\newcommand{\LWRsiunitxEND}{}}
```

`\ang`

`[<options>] {<value>}`

```
6 \CustomizeMathJax{\def\LWRsiunitxang#1;#2;#3;#4\LWRsiunitxEND{%
7   \ifblank{#1}{}{\num{#1}\degree}%
8   \ifblank{#2}{}{\num{#2}^{\unicode{x2032}}}% \prime
9   \ifblank{#3}{}{\num{#3}^{\unicode{x2033}}}% \dblprime
10 }}
11 \CustomizeMathJax{\newcommand{\ang}[2][\LWRsiunitxang#2; ; \LWRsiunitxEND]}
```

`\num`

`[<options>] {<value>}`

`\num` handles optional powers (e, E, d, D), multiples (x), plus and minus, and period or comma decimal output.

To split the string, `\def` is used with parameter delimiters. When each of the following macros is used, extra delimiters are padded to the end of the arguments of each macro when used, and the final argument of each collects any extra unused delimiters.

The number is split by dimensions (x), then by powers (E, e, D, d), then by plus/minus (+-, `\pm`), then by plus and minus (+, -), then into pieces before and after the decimal point or decimal comma.

Determine if the number is output with a decimal period or a decimal comma. The enclosing braces tell MATHJAX to not add extra space after the punctuation.

```

Any units which must be distributed across multiple dimensions:

```

siunitx accepts either commas or periods as decimal points. `\LWRsiunitxprintdecimal` splits its input by periods then commas, parsing out before and after sections to print on either side of the decimal point.

`\LWRsiunitxENDTWO` is used only by `\LWRsiunitxprintdecimalsubtwo`, to avoid a parsing conflict with the more widely-used `\LWRsiunitxEND`.

The following splits by decimal commas:

File 455 **lwarp-skmath.sty**

§ 564 Package **skmath**

*(Emulates or patches code by SIMON SIGURDHSSON.)*

skmath (*Pkg*) **skmath** is used as-is for SVG math, and is emulated for MATHJAX.

**for HTML output:** 1 \LWR@ProvidesPackagePass{skmath}[2019/10/15]

Only defined if package option requested:

```

2 \begin{warpMathJax}
3 \ExplSyntaxOn
4 \bool_if:NT\g__skmath_define_common_sets_bool{
5 \CustomizeMathJax{\newcommand{\N}{\mathbb{N}}}
6 \CustomizeMathJax{\newcommand{\Z}{\mathbb{Z}}}
7 \CustomizeMathJax{\newcommand{\Q}{\mathbb{Q}}}
8 \CustomizeMathJax{\newcommand{\R}{\mathbb{R}}}
9 \CustomizeMathJax{\newcommand{\C}{\mathbb{C}}}
10 }

```

`skmath` is using `l3keys`, which does not seem to have an equivalent to `\@ifpackagewith`. To detect package options, comparisons with the following are made to see if various macros have been defined as follows:

```
11 \cs_gset_nopar:Npn\LWR__skmath_imaginary_unit:n#1{#{#1}}
12 \cs_gset_nopar:Npn\LWR__skmath_natural_log_e:{{e}}
13 \cs_gset_nopar:Npn\LWR__skmath_integral_d:{{d}}
14 \cs_gset_nopar:Npn\LWR__skmath_total_derivative_d:{{d}}
```

If `notation=iso`, use upright, else italic:

```
15 \cs_if_eq:NNTF \__skmath_imaginary_unit:n \LWR__skmath_imaginary_unit:n
16   {
17     \CustomizeMathJax{\newcommand{ii}{\mathit{i}}}
18     \CustomizeMathJax{\newcommand{jj}{\mathit{j}}}
19   }
20   {
21     \CustomizeMathJax{\newcommand{ii}{\mathrm{i}}}
22     \CustomizeMathJax{\newcommand{jj}{\mathrm{j}}}
23   }
```

If `notation=iso`, use upright, else italic:

```
24 \cs_if_eq:NNTF \__skmath_natural_log_e: \LWR__skmath_natural_log_e:
25   { \CustomizeMathJax{\newcommand{ee}{\mathit{e}}} }
26   { \CustomizeMathJax{\newcommand{ee}{\mathrm{e}}} }
```

`skmath` uses `\DeclarePairedDelimiter` from `mathtools` for `\abs` and `\norm`, and `lwarp` uses this to automatically define `MATHJAX` definitions for each.

If `notation=english`, use slanted, else upright:

```
27 \cs_if_eq:NNTF \__skmath_integral_d: \LWR__skmath_integral_d:
28   { \CustomizeMathJax{\newcommand{d}{\mathit{d}}} }
29   { \CustomizeMathJax{\newcommand{d}{\mathrm{d}}} }
```

Used to parse comma and caret arguments for `\pd` and `\td`:

```
30 \CustomizeMathJax{\def\LWRskmathEND{}}
```

Parse the arguments with up to four commas. Argument 6 contains any leftover commas.

```
31 \CustomizeMathJax{\def\LWRskmathpdstarsub#1#2,#3,#4,#5,#6\LWRskmathEND{
32   #1_{#2#3#4#5}%
33 }}
34
35 \CustomizeMathJax{\newcommand{\LWRskmathpdstar}[2]{%
36   \LWRskmathpdstarsub{#1}#2,,,\LWRskmathEND%
37 }}
```

Parse the arguments with up to two carets. Argument 3 contains any leftover carets. `\LWRskmathpdplus` is used to only place a plus sign starting after the first term. `\LWRskmathpdone` is used to only place a 1 digit if a second or later term does not have a power.

```
38 \CustomizeMathJax{\def\LWRskmathpdnumerator#1^#2^#3\LWRskmathEND{%
39   \ifblank{#1}{}
```

```

40     \ifblank{#2}{\LWRskmathpdplus\LWRskmathpdone}{\LWRskmathpdplus#2}
41   }
42 }}

```

Parse the arguments with up to two carets. Argument 3 contains any leftover carets.

```

43 \CustomizeMathJax{\def\LWRskmathpd denominator#1^#2^#3\LWRskmathEND{%
44   \ifblank{#1}{}%
45     \ifblank{#2}%
46       {\partial{#1}}%
47       {\partial{#1}^{#2}}%
48   }%
49 }}

```

Factored from `\LWRskmathpdnostarsub`, following:

The phrase `^{}` appears to be required while parsing the carets. `\LWRskmathpdplus` is used to only place a plus sign starting after the first term. `\LWRskmathpdone` is used to only place a 1 digit if a second or later term does not have a power.

This may not be recursion-safe. (Is there really such a thing as nested differentials?)

```

File 462 **lwarp-splitidx.sty**

§ 571 Package **splitidx**

(Emulates or patches code by MARKUS KOHM.)

splitidx (*Pkg*) splitidx is patched for use by lwarp.

If the `latexmk` option is selected for `lwarp`, `latexmk` will compile the document but will *not* compile the indexes. `lwarpmk printindex` and `lwarpmk htmlindex` will still be required.

 `\thepage` When using `\AtWriteToIndex` or `\AtNextWriteToIndex`, the user must not refer to `\thepage` during HTML output, as the concept of a page number is meaningless. Instead, do

```

\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the `\index`-like action occurs, and then refer to `\arabic{LWR@autoindex}` instead of `\thepage` where the reference should occur.

See section 695.17 in the `lwarp-patch-memoir` package for the `\@wrsindexhyp` macro as an example.

**for HTML output:** `1 \LWR@ProvidesPackagePass{splitidx}[2016/02/18]`

```
2 \catcode'\_ =12%
3 \xpatchcmd{\newindex}
4   {\jobname-#2.idx}
5   {\jobname-#2_html.idx}
6   {}
7   {\LWR@patcherror{splitidx}{@newindex}}
8 \catcode'\_ =8%
```

Patched to use `lwarp`'s automatic indexing counter instead of `\thepage`:

```
9 \renewcommand*{\@wrsindex}[2][\%
10 \ifx\relax#1\relax
11   \if@splitidx
12     \@wrsindex[idx]{#2}%
13   \else
14     \def\@tempa{#2}%
15     \if@verbinde\@onelevel@sanitize\@tempa\fi
16     \@wrsindex{\@tempa}%
17   \fi
18 \else
19   \def\@tempa{#2}%
20   \csname index@#1@hook\endcsname
21%   \expandafter\ifx\csname @wrsindex\endcsname\relax
22   \addtocounter{LWR@autoindex}{1}%           lwarp
23%   \@wrsindex{#1}{\@tempa}{\thepage}%
24   \@wrsindex{#1}{\@tempa}{\arabic{LWR@autoindex}}%
25%   \else
26%     \def\@tempb{\@wrsindex{#1}}%
27%     \expandafter\@tempb\@tempa||\%
28%   \fi
```

The label is assigned after the file write to avoid conflict with `cleveref`.

```
29   \label{LWRindex-\arabic{LWR@autoindex}}%   lwarp
30   \endgroup
31   \@esphack
32 \fi
33 }
```

`lwarp` defines sectioning commands with `xparse`, so the below patches are done as temporary redefinitions instead of being `\let`.

```
34 \xpatchcmd{\printsubindex}
35   {\let\section\subsection}
36   {\renewcommand*{\section}{\subsection}}

File 466 **lwarp-stackengine.sty**

§ 575 Package **stackengine**

*(Emulates or patches code by STEVEN B. SEGLETES.)*

`stackengine` (*Pkg*) `stackengine` is patched for use by `lwarp`.

**for HTML output:** 1 \LWR@ProvidesPackagePass{stackengine}[2017/02/13]

The original version is necessary for the patched `\@stack` and `\stackanchor`, where nesting `lateximages` does not work:

```

2 \LetLtxMacro\LWR@orig@stackengine\stackengine
3 \renewcommand*\stackengine[8]{%
4   \ifstrequal{#4}{0}%
5     {\begin{lateximage}[\ImageAltText]}%
6     {\begin{lateximage}[\ImageAltText][vertical-align:top]}%
7   \LWR@orig@stackengine{#1}{#2}{#3}{#4}{#5}{#6}{#7}{#8}%
8   \end{lateximage}%
9 }

```

`\@stack` uses a `lateximage` with a vertical alignment:

```

10 \LetLtxMacro\LWR@orig@@stack\@stack
11
12 \xpatchcmd{\LWR@orig@@stack}{\stackengine}{\LWR@orig@stackengine}
13   {}
14   {\LWR@patcherror{stackengine}{\LWR@orig@@stack}}
15
16 \renewcommand*\@stack[4]{%
17   \ifstrequal{#3}{0}%
18     {\begin{lateximage}[\ImageAltText]}%
19     {\begin{lateximage}[\ImageAltText][vertical-align:top]}%
20   \LWR@orig@@stack{#1}{#2}{#3}{#4}%
21   \end{lateximage}%
22 }

```

The lapping macros are disabled for HTML:

```

23 \newcommand*\LWR@HTML@@stacklap[4]{#3}
24 \LWR@formatted{@stacklap}

```

`\stackanchor` is patched for two instances of `\stackengine`. A `lateximage` with vertical alignment is used.

```

25 \xpatchcmd{\stackanchor}{\stackengine}{\LWR@orig@stackengine}
26   {}
27   {\LWR@patcherror{stackengine}{stackanchor patch 1}}
28
29 \xpatchcmd{\stackanchor}{\stackengine}{\LWR@orig@stackengine}
30   {}
31   {\LWR@patcherror{stackengine}{stackanchor patch 2}}
32
33 \xpretocmd{\stackanchor}
34   {\begin{lateximage}[\ImageAltText][vertical-align:middle]}
35   {}
36   {\LWR@patcherror{stackengine}{stackanchor pre}}
37
38 \xapptocmd{\stackanchor}{\end{lateximage}}
39   {}
40   {\LWR@patcherror{stackengine}{stackanchor app}}

```

`\Centerstack` is simply placed inside a `lateximage` with a vertical alignment:

```

41 \xpretocmd{\Centerstack}
42   {\begin{lateximage}[\ImageAltText][vertical-align:middle]}
43   {}
44   {\LWR@patcherror{stackengine}{Centerstack pre}}
45
46 \xapptocmd{\Centerstack}{\end{lateximage}}
47   {}
48   {\LWR@patcherror{stackengine}{Centerstack app}}

```

`\savestack` reverts to print mode while saving the box, then places it inside a `lateximage` when used:

```

49 \renewcommand*\savestack[2]{%
50   \xdef\sv@name{\stack@macro@name{#1}}%
51   \ifundefined{\sv@name content}{%
52     \expandafter\newsavebox\expandafter{\csname\sv@name content\endcsname}%

File 468 **lwarp-stalex2.sty**

§ 577 Package **stalex2**

(Emulates or patches code by RODNEY A SPARAPANI.)

`stalex2` (*Pkg*) `stalex2` is patched for use by `lwarp`, and emulated for MATHJAX.

⚠ As of this version, option `autobold` does not appear to work for PDF output.

⚠ For MATHJAX, the tilde character `~` does not create `\sim`. Use `\sim` directly.

⚠ Because MATHJAX has limited conditional processing:

- `\wrap` only creates square braces, no matter what its optional arguments.
- `\P`, `\pCau`, `\pN`, and `\pU` do not handle special cases.

⚠ `\and` To have `\and` work if using `\maketitle`, place the following after the start of the document:

```
\newcommand*{\and}{%
  \relax\ifmmode
    \expandafter\;\mb{\mathrm{and}}\;%
  \else%
    \expandafter\STATEXand%

§ 578 Package **statistics**

(Emulates or patches code by JULIEN RIVAUD.)

statistics (*Pkg*) statistics is patched for use by lwarp.

 **\color** The statistics documentation examples include the use of the `\color` macro. Use `\textcolor` instead.

 **math** The statistics package uses math arrays, but the HTML version uses text tabulars to allow text copy/paste. If math is required, use `\ensuremath` or `\(` and `\)` as needed.

Pre/postline is ignored, and `\hline` is used instead. Each table will have an `\hline` above and below as a frame.

**for HTML output:** 1 \LWR@ProvidesPackagePass{statistics}[2019/09/29]

2 \ExplSyntaxOn

To use text tabular instead of math array. This allows text copy/paste of the results.

In the following, all changes for the Lwarp package are labelled "lwarp".

Redefined using the lwarp version of &:

With `lwarp`, `\ensuremath` creates an SVG image, but its `alt` tag does not contain the text of the contents for copy/paste, since these expressions are usually not simple text. For the `statistics` package, copy/paste is restored by using text instead of math output.

For the leftmost column. Redefined to use text output:

```

161 \cs_set_protected_nopar:Nn \l__statistics_table_start: {

§ 583 Package **subcaption**

*(Emulates or patches code by AXEL SOMMERFELDT.)*

subcaption (*Pkg*) subcaption is patched for use by lwarp.

**for HTML output:** 1 \LWR@ProvidesPackagePass{subcaption}[2018/05/01]

Tells **lwarp** to ignore minipage widths inside a subfigure or subtable. In print mode the minipages are used to place the items next to each other. In HTML they are placed side-by-side automatically.

```

2 \xpretocmd{\subcaption@iiminipage}
3   {\minipagefullwidth}
4   {}
5   {\LWR@patcherror{subcaption}{subcaption@iiminipage}}

```

Likewise for a `\subcaptionbox`:

```

6 \xpretocmd{\subcaptionbox}
7   {\minipagefullwidth}
8   {}
9   {\LWR@patcherror{subcaption}{subcaptionbox}}

File 475 **lwarp-subfig.sty**

§ 584 Package **subfig**

*(Emulates or patches code by STEVEN DOUGLAS COCHRAN.)*

subfig (*Pkg*) subfig is supported and patched by lwarp.

 **table numbering** To have correct sub table numbers:

```

\usepackage{caption}
\captionsetup[table]{position=top}

```

 **lof/lotdepth** At present, the package options for `lofdepth` and `lotdepth` are not working. These counters must be set separately after the package has been loaded.

 **horizontal spacing** In the document source, use `\hfill` and `\hspace*` between subfigures to spread them apart horizontally. The use of other forms of whitespace may cause paragraph tags to be generated, resulting in subfigures appearing on the following lines instead of all on a single line.

for HTML output: Accept all options for lwarp-subfig:

```
1 \LWR@ProvidesPackagePass{subfig}[2005/06/28]
```

\sf@@@subfloat

```
{\langle 1 type \rangle} [\langle 2 lof entry \rangle] [\langle 3 caption \rangle] {\langle 4 contents \rangle}
```

The outer minipage allows side-by-side subfloats with \hfill between.

§ 603 Package **tensor**

(Emulates or patches code by PHILIP G. RATCLIFFE.)

tensor (*Pkg*) **tensor** is used as-is for SVG math, and is emulated for MATHJAX.

 **spacing** Compressed spacing and left justification are not possible with MATHJAX.

**for HTML output:** 1 \LWR@ProvidesPackagePass{tensor}[2004/12/20]

For MATHJAX. Special handling is required to parse the superscript and subscript arguments.

When a superscript or subscript is seen, it is processed and then the remainder is processed recursively.

```

2 \begin{warpMathJax}
3 \CustomizeMathJax{\def\LWRtensorindicesub#1#2{\_{\#2}}\LWRtensorindicesubthree}}

File 508 **lwarp-threeparttablex.sty**

§ 617 Package **threeparttablex**

`threeparttablex` (*pkg*) `threeparttablex` is patched for use by `lwarp`.

`threeparttablex` is used with `longtable` and `booktabs` as follows:

```

\begin{longtable}[column specifiers] }
[ . . . ] \endfirsthead % or \endhead, for print and HTML
\warpprintonly{ % not used in HTML
[ . . . ] \endhead % or \endfirsthead
[ . . . ] \endfoot
\bottomrule \insertTableNotes \endlastfoot
}
. . . table contents . . .
\warppHTMLonly{ % HTML last footer
\bottomrule
\UseMinipageWidths % optional
\insertTableNotes
\endlastfoot
}
\end{longtable}

```

**table width** The table notes are created using a `\multicolumn`. By default the width is not specified to the browser, so long table notes can cause the table to be spread out horizontally. For HTML output, `lwarp` guesses the width of the table depending on the number of columns, then restricts its guess to a min/max range. To use this guess for the width of the table notes, use `\UseMinipageWidths` before `\insertTableNotes`. The width is then specified, and in many cases the result is an improvement in overall table layout.

**for HTML output:** 1 `\LWR@ProvidesPackagePass{threeparttablex}[2013/07/23]`

The width is guessed depending on the number of columns, then limited to a min/max.

```

File 511 **lwarp-tikz.sty**

§ 620 Package **tikz**

*(Emulates or patches code by TILL TANTAU.)*

`tikz` (*Pkg*) `tikz` is supported.

 **displaymath and matrices** If using display math with `tikzpicture` or `\tikz`, along with matrices with the `&` character, the document must be modified as follows:

```
\usepackage{tikz}
\tikzset{every picture/.style={ampersand replacement=\&}}
```

and each instance of `&` in the `tikz` expression must be replaced with `\&`.

Accept all options for `lwarp-tikz`:

```
1 \LWR@ProvidesPackagePass{tikz}[2015/08/07]
```

**catcodes** `lwarp` changes the catcode of `$` for its own use. The TikZ babel library temporarily changes catcodes back to normal for TikZ's use. `tikz` v3.0.0 introduced the babel library which handles catcode changes. For older versions, `lwarp` must change `$`'s catcode itself.

§ 626 Package **titling**

(Emulates or patches code by PETER WILSON.)

titling (*Pkg*)

**package support** lwarp supports the native L<sup>A</sup>T<sub>E</sub>X titling commands, and also supports the packages  
 **load order** authblk and titling. If both are used, authblk should be loaded before titling.

**\published and \subtitle** If using the titling package, additional titlepage fields for \published and \subtitle may be added by using \AddSubtitlePublished in the preamble. See section 69.8.

The various titling footnote restyling commands have no effect.

Pass all options to lwarp-titling:

**for HTML output:** 1 \LWR@ProvidesPackagePass{titling}[2009/09/04]

**\@bsmtitleempty** Patch \@bsmtitleempty:

21 {
```

At the end of the environment, end the HTML titlepage div:

```

tocbibind (*Pkg*) **Inline, with an automatic toc entry:**

The tocbibind package may be used to automatically place an entry in the TOC.

```

\usepackage[nottoc]{tocbibind}

File 527 **lwarp-tram.sty**

§ 636 Package **tram**

tram (*Pkg*) tram is emulated.

 **block only** The HTML emulation uses a `<div>`, which must not appear inside an HTML `<span>` or an HTML paragraph. For this reason, the `tram` environment should only be used to contain paragraphs inside a `\parbox` or `minipage`. `tram` should not be used to mark up inline text.

To disable `tram`, allowing source compatibility with inline uses:

```

File 530 **lwarp-trivfloat.sty**

§ 639 Package **trivfloat**

*(Emulates or patches code by JOSEPH WRIGHT.)*

`trivfloat (Pkg)` `trivfloat` is forced to use the built-in `lwarp` emulation for floats.

To create a new float type and change its name:

---

```

\trivfloat{example}
\renewcommand{\examplename}{Example Name}
\crefname{example}{example}{examples}
\Crefname{example}{Example}{Examples}

```

---

Discard all options for `lwarp-trivfloat`. This tells `trivfloat` not to use `floatrow` or `memoir`.

```

1 \LWR@ProvidesPackageDrop{trivfloat}[2009/04/23]
2 \LWR@origRequirePackage{trivfloat}

```

`\tfl@chapter@fix` Nullified at the beginning of the document. Is used by `trivfloat` to correct float chapter numbers, but is not needed for `lwarp`.

```

3 \AtBeginDocument{\DeclareDocumentCommand{\tfl@chapter@fix}{m m}{}

### § 639.1 **Combining `\newfloat`, `\trivfloat`, and `algorithmicx`**

**For both print and HTML output:**

- ⚠ When using `float`, `trivfloat`, or `algorithmicx` at the same time, be aware of conflicting file usage. `algorithmicx` uses `.loa`. `trivfloat` by default starts with `.loa` and goes up for additional floats, skipping `.lof` and `.lot`.
- ⚠ When using `\newfloat`, be sure to manually assign higher letters to the `\newfloat` files to avoid `.loa` used by `algorithmicx`, and any files used by `trivfloat`. Also avoid using `.lof` and `.lot`.
- ⚠ When using `\trivfloat`, you may force it to avoid conflicting with `algorithmicx` by starting `trivfloat`'s file extensions with `.lob`:

---

```
\makeatletter
\setcounter{tfl@float@cnt}{1} % start trivfloats with .lob
\makeatletter
```

File 541 **lwarp-unicode-math.sty**

§ 650 Package **unicode-math**

(Emulates or patches code by WILL ROBERTSON.)

unicode-math (*Pkg*) unicode-math is supported as-is for HTML with SVGmath.

 **MATHJAX** If the document source includes embedded Unicode characters, these may not be reproduced correctly for *pdftotext*, and thus not display correctly in MATHJAX.

Symbol font commands are emulated, but not all combinations are supported by MATHJAX, especially with the dedicated Greek macros. Symbol macros such as `\symbfsf` may not be sans or bold. For Greek, use the Unicode equivalent, if necessary.

 **\mathversion** The MATHJAX emulation does not change with the use of `\mathversion`. Whatever emulation is established at the begin of the document will remain.

The option `sans-style` honors upright and italic, but italic will not be sans, in order to support Greek macros.

Greek macros such as `\alpha` respond to the `math-style` option. Latin symbols does not, per MATHJAX limitations, unless placed inside `\symbit` or similar.

Macros from the categories `\mathopen`, `\mathclose`, and `\mathfence` are emulated. Due to current MATHJAX limitations, not all stretch to the correct height.

Also emulated are macros from the categories `\mathpunct`, `\mathover`, `\mathunder`, `\mathaccent`, `\mathbotaccent`, and `\mathop`.

The individual `unicode-math` macros of categories `\mathbin`, `\mathord`, and `\mathrel` are not emulated for MATHJAX, as there are more than two thousand of them, but they may be added as needed. Place the following in the document preamble after loading `unicode-math`, including a definition for each macro which is used in the document but undefined in MATHJAX:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\uplus}{\mathbin{\unicode{x0228E}}}}
...
\end{warpMathJax}
```

Use `\mathrel`, `\mathbin`, etc. depending on the category of each macro. For a list of macro names and symbols, see **texdoc unimath-symbols**.

File 550 **lwarp-verse.sty**

§ 659 Package **verse**

(Emulates or patches code by PETER WILSON.)

verse (*Pkg*) verse is supported and patched by lwarp.

**for HTML output:** Pass all options for lwarp-verse:

```
1 \LWR@ProvidesPackagePass{verse}[2009/09/04]
```

When using verse or memoir, always place a `\\` after each line.

`\attrib` The documentation for the `verse` and `memoir` packages suggest defining an `\attrib` command, which may already exist in current documents, but it will only work for print output. `lwarp` provides `\attribution`, which works for both print and HTML output. To combine the two so that `\attrib` is used for print and `\attribution` is used for HTML:

```
\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}
```

`\leftskip` (*Len*) These lengths are used by `verse` and `memoir` to control the left margin, and they may already be set by the user for print output. New lengths `\HTMLleftskip` and `\HTMLleftmargini` are provided to control the margins in HTML output. These new lengths may be set by the user before any `verse` environment, and persist until they are manually changed again. One reason to change `\HTMLleftmargini` is if there is a wide `\flagverse` in use, such as the word “Chorus”, in which case the value of `\HTMLleftmargini` should be set to a wide enough length to contain “Chorus”. The default is wide enough for a stanza number.

⚠ **spacing** Horizontal spacing relies on *pdftotext*'s ability to discern the layout (`-layout` option) of the text in the HTML-tagged PDF output. For some settings of `\HTMLleftmargini` or `\HTMLleftskip` the horizontal alignment may not work out exactly, in which

⚠ **verse margin** case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

verse (*env.*) The verse environment will be placed inside a HTML `<pre>`.

```
2 \AfterEndPreamble{
3 \LWR@traceinfo{Patching verse.}
```

At the beginning of the verse environment:

```
4 \AtBeginEnvironment{verse}
5 {%
```

Use the original `list` environment inside a `<pre>` to attempt to preserve formatting.

```
6 \LWR@restoreoriglists%
```

`verse` (*Pkg*) The `verse` or `memoir` packages can place stanza numbers to the left with their `\flagverse` command. The following does not allow them to go into the left margin, which would cause *pdfcrop* to crop the entire page further to the left.

```
\leftskip (Len) 7 \ifdef{\vleftskip}{%
8 \setlength{\vleftskip}{\HTMLvleftskip}
9 \setlength{\leftmargini}{\HTMLleftmargini}
10 }{}
11 \LWR@forcenewpage
12 \LWR@atbeginverbatim{verse}%
13 }
```

After the end of the `verse` environment, which places the `<pre>` tag at the regular left margin:

```
14 \AtEndEnvironment{verse}{%
15 \leavevmode%
16 \LWR@afterendverbatim%
17 }
```

Patch to place `poemtitle` inside an HTML `<span>` of class `poemtitle`:

```
18 \ifdef{\poemtitle}{
19 \DeclareDocumentCommand{\vstypeptitle}{m}{%
20 \vspace{\beforepoemtitleskip}%
21 {\InlineClass{poemtitle}{\poemtitlefont #1}\par}%
22 \vspace{\afterpoemtitleskip}%
23 }
24 }{}
25
26 \LWR@traceinfo{Finished patching verse.}
27 }% AfterEndPreamble

§ 674 Package **xcolor**

*(Emulates or patches code by DR. UWE KERN.)*

`xcolor (Pkg)` `xcolor` is supported by `lwarp`.

### § 674.1 **Limitations**

<code>\colorboxBlock</code> and <code>\fcolorboxBlock</code>	<code>\colorboxBlock</code> and <code>\fcolorboxBlock</code> are provided for increased HTML compatibility, and they are identical to <code>\colorbox</code> and <code>\fcolorbox</code> in print mode. In HTML mode they place their contents into a <code>&lt;div&gt;</code> instead of a <code>&lt;span&gt;</code> . These <code>&lt;div&gt;</code> s are set to display: <code>inline-block</code> so adjacent <code>\colorboxBlock</code> s appear side-by-side in HTML, although text is placed before or after each.
	Print-mode definitions for <code>\colorboxBlock</code> and <code>\fcolorboxBlock</code> are created by <code>lwarp</code> 's core if <code>xcolor</code> is loaded.
<code>background: none</code>	<code>\fcolorbox</code> and <code>\fcolorboxBlock</code> allow a background color of none, in which case only the frame is drawn, which can be useful for HTML.
<code>color support</code>	Color definitions, models, and mixing are fully supported without any changes required.
<code>colored tables</code>	<code>\rowcolors</code> is supported, except that the optional argument is ignored so far.
<code>colored text and boxes</code>	<code>\textcolor</code> , <code>\colorbox</code> , and <code>\fcolorbox</code> are supported.
<code>\color</code> and <code>\pagecolor</code>	<code>\color</code> and <code>\pagecolor</code> are ignored. Use CSS or <code>\textcolor</code> where possible.

### § 674.2 **xcolor definitions: location and timing**

The `lwarp` core and its `lwarp-xcolor` package are tightly integrated to allow comparable results for print, HTML, and print inside an HTML `lateximage`. This requires a number of definitions and redefinitions depending on whether each of `xcolor` and `lateximage` is being used, and whether print or HTML is being generated. Some of these actions are one-time when `xcolor` is loaded, and others are temporary as `lateximage` is used.

**When `xcolor` is loaded in print mode:** No special actions are taken at the time that `xcolor` is loaded in print mode, but see `\AtBeginDocument` below.

**When `lwarp-xcolor` is loaded in HTML mode:** `xcolor`'s original definitions are saved for later restoration. `\LWR@restoreorigformatting` is appended to restore these definitions for use inside a `lateximage`. New HTML-mode definitions are created for `\textcolor`, `\pagecolor`, `\nopagecolor`, `\colorbox`, `\colorboxBlock`, `\fcolorbox`, `\fcolorboxBlock`, and `fcolorminipage`.

**`\AtBeginDocument` in print or HTML mode:** See Section 89. If `xcolor` has been loaded, the print-mode `\fcolorbox` is modified to accept a background color of none, and additional definitions are created for `lwarp`'s new macros print-mode macros `\colorboxBlock`, `\fcolorboxBlock`, and `fcolorminipage`. The HTML versions of these macros will already have been created by `lwarp-xcolor` if it has been loaded.

For use inside an HTML `lateximage`, `\LWR@restoreorigformatting` is appended to temporarily set these functions to their print-mode versions.

**In a `lateximage` in HTML mode:** `\LWR@restoreorigformatting` temporarily restores the print-mode definitions of `xcolor`'s functions. See `\LWR@restoreorigformatting` on page 532.

**`\color`:**

**Print:** Used as-is.

**HTML:** Ignored by *pdftotext*, and will not appear.

**HTML lateximage:** Colors will appear in a lateximage.

**\textcolor:**

**Print:** Used as-is.

**HTML:** Redefined by lwarp-xcolor, page 1222.

**HTML lateximage:** Remembers and reuses the print version.

**\pagecolor:**

**Print:** Used as-is.

**HTML:** Ignored.

**HTML lateximage:** Colors will be picked up in a lateximage.

**\nopagecolor:**

**Print:** Used as-is.

**HTML:** Ignored.

**HTML lateximage:** Colors will be picked up in a lateximage.

**\colorbox:**

**Print:** Used as-is.

**HTML:** Redefined by lwarp-xcolor, page 1222.

**HTML lateximage:** Remembers and reuses the print version.

**\colorboxBlock:**

**Print:** Becomes \colorbox.

**HTML:** Newly defined by lwarp-xcolor to use a <div>, page 1223.

**HTML lateximage:** Remembers and reuses the print version \colorbox.

**\fcolorbox:**

**Print:** Modified to allow a background of none.

**HTML:** Redefined by lwarp-xcolor, page 1223.

**HTML lateximage:** Remembers and reuses the print version.

**\fcolorboxBlock:**

**Print:** Becomes \fcolorbox. Section 89

**HTML:** Newly defined by lwarp-xcolor to use a <div>, page 1224.

**HTML lateximage:** Remembers and reuses the print version \fcolorbox.

**fcolorminipage:**

**Print:** Newly defined in the lwarp core.

File 571 **lwarp-xfrac.sty**

§ 680 Package **xfrac**

(Emulates or patches code by THE L<sup>A</sup>T<sub>E</sub>X3 PROJECT.)

`xfrac` (*Pkg*) Supported by adding `xfrac` instances, and emulated for `MATHJAX`.

**for HTML output:** 1 \LWR@ProvidesPackagePass{xfrac}[2018-08-23]

 **font size** In the user's document preamble, `lwarp` should be loaded after font-related setup. During `HTML` conversion, this font is used by `lwarp` to generate its initial `PDF` output containing `HTML` tags, later to be converted by `pdftotext` to a plain text file. While the text may be in any font which `pdftotext` can read, the math is directly converted into `svg` images using this same user-selected font. `xfrac` below is set for the Latin Modern (`lmr`) font. If another font is used, it may be desirable to redefine `\xfracHTMLfontsize` with a different `em` size.

`\sfrac` [*instance*] {*num*} [*sep*] {*denom*}

A text-mode instance for the default font is provided below. The numerator and denominator formats are adjusted to encase everything in `HTML` tags. `\scalebox`

is made null inside the numerator and denominator, since the HTML tags should not be scaled, and we do not want to introduce additional HTML tags for scaling.

In math mode, which will appear inside a `lateximage`, no adjustments are necessary.

`\xfracHTMLfontsize` User-redefinable macro which controls the font size of the fraction.

```
2 \newcommand*\xfracHTMLfontsize{.6em}
```

**instances** Instances of `xfrac` for various font choices:

Produce CSS for a small raised numerator and a small denominator.

Scaling is turned off so that *pdftotext* correctly reads the result.

```
3 \DeclareInstance{xfrac}{default}{text}{

File 586 **lwarp-patch-memoir.sty**

§ 695 Package **patch-memoir**

*(Emulates or patches code by PETER WILSON.)*

lwarp-patch-memoir (*Pkg*) Patches for memoir class.

- ⚠ **Not fully tested!** [Please send bug reports!](#)
- lwarp loads this package when the memoir class is detected.
- ⚠ **captions** lwarp uses caption, which causes a warning from memoir. This is normal. Adjust captions via caption, instead of memoir.
- ⚠ **options clash** While emulating memoir, lwarp pre-loads a number of packages (section 695.1). This can cause an options clash when the user's document later loads the same packages with options. To fix this problem, specify the options before loading lwarp:
- ```

\documentclass{memoir}
...
\PassOptionsToPackage{options_list}{package_name}
...
\usepackage\{lwarp\}
...
\usepackage\{package\_name\}

```
- ⚠ **version numbers** memoir emulates a number of packages, and declares a version date for each which often does not match the date of the corresponding freestanding package. This can cause warnings about incorrect version numbers. Since lwarp is intended to support the freestanding packages, which are often newer than the date declared by memoir, it is hoped that memoir will update and change its emulated version numbers to match.
- [\label\(bookmark\){tag}](#) \label accepts an optional (bookmark) argument, but this is ignored in HTML.
- ⚠ **comment** The comment environment is from the comment package, and thus requires that the \begin and \end each be on its own line:
- ```

\begin{comment}
This is a comment.
\end{comment}

```
- [\newcomment](#) Comments defined with \newcomment use memoir's definitions, and behave as expected, where the \begin and \end do have to each be on its own line.
- ⚠ **verbatim footnotes** \verbfootnote is not supported.
- ⚠ **\newfootnoteseries** \newfootnoteseries, etc. are not supported.
- ⚠ **page notes** lwarp loads pagenote to perform memoir's pagenote functions, but there are minor differences in \pagenotesubhead and related macros.
- [page notes with cleveref](#) To add support for pagenotes with cleveref, add:
- ```

\crefname{pagenote}{page note}{page notes}
\Crefname{pagenote}{Page note}{Page notes}

```
- [page note \nameref](#) Note that for print mode, \nameref print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.
- ⚠ **poems** Poem numbering is not supported.
- ⚠ **verbatim** The verbatim environment does not yet support the memoir enhancements. It is currently recommended to load and use fancyvrb instead.

 **glossaries** The memoir glossary system is not yet supported by *lwarpmk*. The *glossaries* package may be used instead, but does require the glossary entries be changed from the memoir syntax to the *glossaries* syntax.

**for HTML output:** `1 \ProvidesPackage{lwarp-patch-memoir}`

## § 695.1 Packages

These are pre-loaded to provide emulation for many of memoir's functions. memoir pretends that `abstract`, etc. are already loaded, via its "emulated" package mechanism, but *lwarp* is directly loading the "lwarp-" version of each, which happens to avoid memoir's emulation system.

## § 695.2 Label handling

Insert the `lwarp` label mechanism into the memoir package mechanism:

- `\@mem@old@label` is the L<sup>A</sup>T<sub>E</sub>X definition of `\label`.
- `\LWR@orig@label` becomes the memoir definition.
- `lwarp`'s `\LWR@new@label` uses `\LWR@orig@label`.
- Want memoir's `\label` to use `lwarp`'s `\label`, which then would use L<sup>A</sup>T<sub>E</sub>X's `\label`.
- So:
  - `\@mem@old@label` is set to `\LWR@new@label`.
  - `\LWR@orig@label` is set to `\@mem@old@label`.
- `cleveref` then encapsulates all the above with `\cref@old@label`.
- For a subcaption, `cleveref` modifies memoir's `\sf@memsub@label`, but that change is undone by `lwarp`.

```
36 \LetLtxMacro\LWR@orig@label\@mem@old@label
37 \LetLtxMacro\@mem@old@label\LWR@new@label
```

Patches for subfloats to support additional `lwarp` labels. This is the non-hyperref version from memoir.

```
38 \AtBeginDocument{
39   \renewcommand*\sf@memsub@label}[1]{%
40     \@bsphack
41     \sf@memsub@label@hook{#1}%
42 %     \@memoldlabel{#1}%
43     \cref@label{#1}%                lwarp
44     \LWR@label@createtag{sub#1}%    lwarp
45     \protected@write\@auxout{}{%
46       \string\newlabel{sub#1}%
47       {{\@nameuse{@@thesub\@capttype}}%
48       {\thepage}}}%
49     \LWR@write@lwarplabel{sub#1}%    lwarp
50     \@esphack
51   }
52 }
```

## § 695.3 Page layout

memoir already set the page size to a default, so it must be forced large for `lwarp`'s use, to avoid tag overflows off the page.

```
53 \setstocksize{190in}{20in}
54 \setlrmarginsandblock{2in}{2in}{*}
55 \setulmarginsandblock{1in}{1in}{*}

## § 695.11 Floats and captions

\@xfloat

\@xdblfloat

Reestablish lwarp's takeover the float handing, which memoir tried to grab:

```

721       {\DeclareFloatingEnvironment[fileext=#3,name={#4}]{#2}}%
722   }%

```

`newfloat` package automatically creates the `\listof` command for new floats, but `float` does not, so remove `\listof` here in case it is manually created later.

```
723 \cslet{listof#2s}\relax%
724 \cslet{listof#2es}\relax%
725 }
```

`\newlistof`

[<*within*>] {<*type*>} {<*ext*>} {<*listofname*>}

Emulated through the `\newfloat` mechanism. Note that `memoir` uses a different syntax than `tocloft` for the name.

```

To have `cleveref` work with page note labels, the following patch writes `\thepagenote` and also adds `\arabic{pagenote}` to the first argument written to the `.ent` file:

```
\startnoteentry{\thepagenote}{\arabic{pagenote}} . . .
```

The arabic value is required for `cleveref`. `\thepagenote` becomes `\@firstoftwo#1` and the arabic value becomes `\@secondoftwo#1`.

 `\nameref` Note that for print mode, `\nameref` print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

## § 695.17 Back matter

\@@wrindexhyp

Redefined to write the LWR@autoindex counter instead of page. Note that memoir has two versions, depending on the use of hyperref.

```

1051   \endgroup
1052   \@esphack}%

```

The label is assigned after the file write to avoid conflict with cleveref.

\@@wrspindexhyp

\specialindex behaves like a regular \index, pointing to where \specialindex is used. If \specialindex is used inside a figure or table after the \caption, then the hyperlink will be given the name of that particular figure or table.

File 587 **lwarp-common-multimedia.sty**

§ 696 Package **common-multimedia**

lwarp-common-multimedia (*Pkg*) Common code for multimedia, movie15, and media9.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addressource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each `<audio>` and `<video>` object.

media9 slideshows are not supported.

`\hyperlinkmovie`, `\movieref`, and `\mediabutton` are not supported.

3D objects are not supported.

If using a YouTube™ video, use an “embedded” URL with `.../embed/...` instead of `.../v/...`

**for HTML output:**

§ 698 Package **common-mathjax-newpctxmath**

*(Emulates or patches code by MICHAEL SHARPE.)*

lwarp-common-mathjax-newpctxmath Common code used by newpctxmath, newtxmath, and newtxsf for MATHJAX.

*(Pkg)*

**for HTML output:** 1 \ProvidesPackage{lwarp-common-mathjax-newpctxmath}[2020/09/20]

For MATHJAX:

```

2 \LWR@origRequirePackage{lwarp-common-mathjax-nonunicode}

§ 699 Package **common-mathjax-nonunicode**

*(Emulates or patches code by DANIEL FLIPO, MICHAEL SHARPE.)*

lwarp-common-mathjax-nonunicode Common code used by newpxmath, newtxmath, newtxsf, kpfonts-otf for MATH-  
(Pkg) JAX. These are symbols not found in UNICODE.

Factored from lwarp-common-mathjax-newpctxmath.

§ 700 Package **common-mathjax-overlaysymbols**

lwarp-common-mathjax-overlaysymbols Common code used by a number of packages to overlay two symbols for MATHJAX.

(Pkg)

**for HTML output:** 1 \ProvidesPackage{lwarp-common-mathjax-overlaysymbols}[2020/08/17]

`\LWROverlaysymbols`

`{\langle symbol \rangle} {\langle symbol \rangle}`

Overlays one symbol over another.

# Index of Objects

This is an index of macros, environments, booleans, counters, lengths, packages, classes, options, keys, files, and various other programming objects. Each is listed by itself, and also by category. In some cases, they are further subdivided by [class].

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition.

# Troubleshooting Index

This index is a sorted reference of problems and solutions. In order to make it easier to locate a solution, the same issue may be addressed by more than one entry.

Entries starting with page 202 are often duplicates of entries with lower page numbers, as the same warning may occur within the user manual and again within the source code.
