

# The package **nicematrix**<sup>\*</sup>

F. Pantigny  
fpantigny@wanadoo.fr

August 24, 2022

## Abstract

The LaTeX package **nicematrix** provides new environments similar to the classical environments **{tabular}**, **{array}** and **{matrix}** of **array** and **amsmath** but with extended features.

$$\begin{array}{c|ccc} & \textcolor{blue}{C_1} & \textcolor{blue}{C_2} & \cdots \cdots \cdots \textcolor{blue}{C_n} \\ \textcolor{blue}{L_1} & a_{11} & a_{12} & \cdots \cdots \cdots a_{1n} \\ \textcolor{blue}{L_2} & a_{21} & a_{22} & \cdots \cdots \cdots a_{2n} \\ \vdots & \vdots & \vdots & \ddots \cdots \cdots \vdots \\ \textcolor{blue}{L_n} & a_{n1} & a_{n2} & \cdots \cdots \cdots a_{nn} \end{array}$$

Product	dimensions (cm)			Price
	L	l	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

The package **nicematrix** is entirely contained in the file **nicematrix.sty**. This file may be put in the current directory or in a **texmf** tree. However, the best is to install **nicematrix** with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

*Remark:* If you use LaTeX via Internet with, for example, Overleaf, you can upload the file **nicematrix.sty** in the repertory of your project in order to take full advantage of the latest version de **nicematrix**.<sup>1</sup>

This package can be used with **xelatex**, **lualatex**, **pdflatex** but also by the classical workflow **latex-dvips-ps2pdf** (or Adobe Distiller). However, the file **nicematrix.dtx** of the present documentation should be compiled with XeLaTeX.

This package requires and **loads** the packages **l3keys2e**, **array**, **amsmath**, **pgfcore** and the module **shapes** of PGF (tikz, which is a layer over PGF, is *not* loaded). The final user only has to load the package with **\usepackage{nicematrix}**.

The idea of **nicematrix** is to create PGF nodes under the cells and the positions of the rules of the tabular created by **array** and to use these nodes to develop new features. As usual with PGF, the coordinates of these nodes are written in the **aux** to be used on the next compilation and that's why **nicematrix** may need **several compilations**.<sup>2</sup>

Most features of **nicematrix** may be used without explicit use of PGF or Tikz (which, in fact, is not loaded by default).

A command **\NiceMatrixOptions** is provided to fix the options (the scope of the options fixed by this command is the current TeX group: they are semi-global).

<sup>\*</sup>This document corresponds to the version 6.13 of **nicematrix**, at the date of 2022/08/24.

<sup>1</sup>The latest version of the file **nicematrix.sty** may be downloaded from the SVN server of TeXLive:  
<https://www.tug.org/svn/texlive/trunk/Master/texmf-dist/tex/latex/nicematrix/nicematrix.sty>

<sup>2</sup>If you use Overleaf, Overleaf will do automatically the right number of compilations.

# 1 The environments of this package

The package `nicematrix` defines the following new environments.

{NiceTabular}	{NiceArray}	{NiceMatrix}
{NiceTabular*}	{pNiceArray}	{pNiceMatrix}
{NiceTabularX}	{bNiceArray}	{bNiceMatrix}
	{BNiceArray}	{BNiceMatrix}
	{vNiceArray}	{vNiceMatrix}
	{VNiceArray}	{VNiceMatrix}

The environments `{NiceArray}`, `{NiceTabular}` and `{NiceTabular*}` are similar to the environments `{array}`, `{tabular}` and `{tabular*}` of the package `array` (which is loaded by `nicematrix`).

The environments `{pNiceArray}`, `{bNiceArray}`, etc. have no equivalent in `array`.

The environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. are similar to the corresponding environments of `amsmath` (which is loaded by `nicematrix`): `{matrix}`, `{pmatrix}`, etc.

The environment `{NiceTabularX}` is similar to the environment `{tabularx}` from the eponymous package.<sup>3</sup>

**It's recommended to use primarily the classical environments and to use the environments of `nicematrix` only when some feature provided by these environments is used (this will save memory).**

All the environments of the package `nicematrix` accept, between square brackets, an optional list of `key=value` pairs. **There must be no space before the opening bracket (`[`) of this list of options.**

## 2 The vertical space between the rows

It's well known that some rows of the arrays created by default with LaTeX are, by default, too close to each other. Here is a classical example.

```
$\begin{pmatrix} \frac{1}{2} & -\frac{1}{2} \\ \frac{1}{3} & \frac{1}{4} \end{pmatrix}
```

Inspired by the package `cellspace` which deals with that problem, the package `nicematrix` provides two keys `cell-space-top-limit` and `cell-space-bottom-limit` similar to the parameters `\cellspacetoplimit` and `\cellspacebottomlimit` of `cellspace`.

There is also a key `cell-space-limits` to set both parameters at once.

The initial value of these parameters is 0 pt in order to have for the environments of `nicematrix` the same behaviour as those of `array` and `amsmath`. However, a value of 1 pt would probably be a good choice and we suggest to set them with `\NiceMatrixOptions`.<sup>4</sup>

```
\NiceMatrixOptions{cell-space-limits = 1pt}

$\begin{pmatrix} \frac{1}{2} & -\frac{1}{2} \\ \frac{1}{3} & \frac{1}{4} \end{pmatrix}
```

---

<sup>3</sup>In fact, it's possible to use directly the `X` columns in the environment `{NiceTabular}` (and the required width for the tabular is fixed by the key `width`): cf. p. 21

<sup>4</sup>One should remark that these parameters apply also to the columns of type `S` of `siunitx` whereas the package `cellspace` is not able to act on such columns of type `S`.

### 3 The vertical position of the arrays

The package `nicematrix` provides a option `baseline` for the vertical position of the arrays. This option takes in as value an integer which is the number of the row on which the array will be aligned.

```
$A = \begin{pNiceMatrix} [baseline=2]
\frac{1}{\sqrt{1+p^2}} & p & 1-p \\
1 & 1 & 1 \\
1 & p & 1+p
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} \frac{1}{\sqrt{1+p^2}} & p & 1-p \\ 1 & 1 & 1 \\ 1 & p & 1+p \end{pmatrix}$$

It's also possible to use the option `baseline` with one of the special values `t`, `c` or `b`. These letters may also be used absolutely like the option of the environments `{tabular}` and `{array}` of `array`. The initial value of `baseline` is `c`.

In the following example, we use the option `t` (equivalent to `baseline=t`) immediately after an `\item` of list. One should remark that the presence of a `\hline` at the beginning of the array doesn't prevent the alignment of the baseline with the baseline of the first row (with `{tabular}` or `{array}` of `array`, one must use `\firsthline`).

```
\begin{enumerate}
\item an item
\smallskip
\item \renewcommand{\arraystretch}{1.2}
\begin{NiceArray}[t]{lcccccc}
\hline
n & 0 & 1 & 2 & 3 & 4 & 5 \\
u_n & 1 & 2 & 4 & 8 & 16 & 32
\hline
\end{NiceArray}
\end{enumerate}
```

1. an item

$$\begin{array}{ccccccc} n & 0 & 1 & 2 & 3 & 4 & 5 \\ u_n & 1 & 2 & 4 & 8 & 16 & 32 \end{array}$$

However, it's also possible to use the tools of `booktabs`<sup>5</sup>: `\toprule`, `\bottomrule`, `\midrule`, etc.

```
\begin{enumerate}
\item an item
\smallskip
\item \begin{NiceArray}[t]{lcccccc}
\toprule
n & 0 & 1 & 2 & 3 & 4 & 5 \\
\midrule
u_n & 1 & 2 & 4 & 8 & 16 & 32
\bottomrule
\end{NiceArray}
\end{enumerate}
```

1. an item

$$\begin{array}{ccccccc} n & 0 & 1 & 2 & 3 & 4 & 5 \\ u_n & 1 & 2 & 4 & 8 & 16 & 32 \end{array}$$

It's also possible to use the key `baseline` to align a matrix on an horizontal rule (drawn by `\hline`). In this aim, one should give the value `line-i` where *i* is the number of the row *following* the horizontal rule.

```
\NiceMatrixOptions{cell-space-limits=1pt}

$A=\begin{pNiceArray}{cc|cc} [baseline=line-3]
\dfrac{1}{A} & \dfrac{1}{B} & 0 & 0 \\
\dfrac{1}{C} & \dfrac{1}{D} & 0 & 0 \\
\hline
0 & 0 & A & B \\
0 & 0 & D & D \\
\end{pNiceArray}$
```

$$A = \begin{array}{c|cc} \begin{array}{cc} \frac{1}{A} & \frac{1}{B} \\ \frac{1}{C} & \frac{1}{D} \end{array} & \begin{array}{cc} 0 & 0 \\ 0 & 0 \end{array} \\ \hline \begin{array}{cc} 0 & 0 \\ 0 & 0 \end{array} & \begin{array}{cc} A & B \\ D & D \end{array} \end{array}$$

---

<sup>5</sup>The extension `booktabs` is *not* loaded by `nicematrix`.

## 4 The blocks

### 4.1 General case

In the environments of `nicematrix`, it's possible to use the command `\Block` in order to place an element in the center of a rectangle of merged cells of the array.<sup>6</sup>

The command `\Block` must be used in the upper leftmost cell of the array with two arguments.

- The first argument is the size of the block with the syntax  $i-j$  where  $i$  is the number of rows of the block and  $j$  its number of columns.  
If this argument is empty, its default value is  $1-1$ . If the number of rows is not specified, or equal to  $*$ , the block extends until the last row (idem for the columns).
- The second argument is the content of the block. It's possible to use `\backslash\backslash` in that content to have a content on several lines. In `{NiceTabular}`, `{NiceTabular*}` and `{NiceTabularX}`, the content of the block is composed in text mode whereas, in the other environments, it is composed in math mode.

Here is an example of utilisation of the command `\Block` in mathematical matrices.

```
$\begin{bNiceArray}{c|c}[margin]
\Block{3-3}{A} & & 0 \\
& \Vdots \\
& & 0 \\
\hline
0 & \Cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[ \begin{array}{c|c} A & \begin{matrix} 0 \\ \vdots \\ 0 \end{matrix} \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

One may wish to raise the size of the “ $A$ ” placed in the block of the previous example. Since this element is composed in math mode, it's not possible to use directly a command like `\large`, `\Large` and `\LARGE`. That's why the command `\Block` provides an option between angle brackets to specify some TeX code which will be inserted before the beginning of the math mode.<sup>7</sup>

```
$\begin{bNiceArray}{c|c}[margin]
\Block{3-3}<\Large>{A} & & 0 \\
0 & \Vdots \\
& & 0 \\
\hline
0 & \Cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[ \begin{array}{c|c} A & \begin{matrix} 0 \\ \vdots \\ 0 \end{matrix} \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

It's possible to set the horizontal position of the block with one of the keys `l`, `c` and `r`.

```
$\begin{bNiceArray}{c|c}[margin]
\Block[r]{3-3}<\LARGE>{A} & & 0 \\
& \Vdots \\
& & 0 \\
\hline
0 & \Cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[ \begin{array}{c|c} A & \begin{matrix} 0 \\ \vdots \\ 0 \end{matrix} \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

In fact, the command `\Block` accepts as first optional argument (between square brackets) a list of couples `key=value`. The available keys are as follows:

<sup>6</sup>The spaces after a command `\Block` are deleted.

<sup>7</sup>This argument between angular brackets may also be used to insert a command of font such as `\bfseries` when the command `\backslash\backslash` is used in the content of the block.

- the keys **l**, **c** and **r** are used to fix the horizontal position of the content of the block, as explained previously;
- the key **fill** takes in as value a color and fills the block with that color;
- the key **draw** takes in as value a color and strokes the frame of the block with that color (the default value of that key is the current color of the rules of the array);
- the key **color** takes in as value a color and apply that color the content of the block but draws also the frame of the block with that color;
- the keys **hlines**, **vlines** and **hvlines** draw all the corresponding rules in the block;<sup>8</sup>
- the key **line-width** is the width of the rules (this key is meaningful only when one of the keys **draw**, **hvlines**, **vlines** and **hlines** is used);
- the key **rounded-corners** requires rounded corners (for the frame drawn by **draw** and the shape drawn by **fill**) with a radius equal to the value of that key (the default value is 4 pt<sup>9</sup>);
- the keys **t** and **b** fix the base line that will be given to the block when it has a multi-line content (the lines are separated by **\\"**);
- when the key **tikz** is used, the Tikz path corresponding of the rectangle which delimits the block is executed with Tikz<sup>10</sup> by using as options the value of that key **tikz** (which must be a list of keys allowed for a Tikz path). For examples, cf. p. 48;
- the key **name** provides a name to the rectangular Tikz node corresponding to the block; it's possible to use that name with Tikz in the **\CodeAfter** of the environment (cf. p. 28);
- the key **respect-arraystretch** prevents the setting of **\arraystretch** to 1 at the beginning of the block (which is the behaviour by default) ;
- the key **borders** provides the ability to draw only some borders of the blocks; the value of that key is a (comma-separated) list of elements covered by **left**, **right**, **top** and **bottom**; it's possible, in fact, in the list which is the value of the key **borders**, to add an entry of the form **tikz={list}** where **list** is a list of couples **key=value** of Tikz specifying the graphical characteristics of the lines that will be drawn (for an example, see p. 51).

**One must remark that, by default, the commands \Blocks don't create space.** There is exception only for the blocks mono-row and the blocks mono-column as explained just below.

In the following example, we have had to enlarge by hand the columns 2 and 3 (with the construction **wc{...}** of **array**).

```
\begin{NiceTabular}{cwc{2cm}wc{3cm}c}
rose      & tulip & daisy & dahlia \\
violet
& \Block[draw=red,fill=[RGB]{204,204,255},rounded-corners]{2-2}
  {\LARGE Some beautiful flowers}
  & & marigold \\
iris & & lis \\
arum & periwinkle & forget-me-not & hyacinth
\end{NiceTabular}
```

rose	tulip	daisy	dahlia
violet	<b>Some beautiful flowers</b>		
iris	periwinkle	forget-me-not	hyacinth
arum			

<sup>8</sup>However, the rules are not drawn in the sub-blocks of the block, as always with **nicematrix**: the rules are not drawn in the blocks (cf. section 5 p. 7).

<sup>9</sup>This value is the initial value of the *rounded corners* of Tikz.

<sup>10</sup>Tikz should be loaded (by default, **nicematrix** only loads PGF) and, if it's not, an error will be raised.

## 4.2 The mono-column blocks

The mono-column blocks have a special behaviour.

- The natural width of the contents of these blocks is taken into account for the width of the current column.

In the columns with a fixed width (columns `w{...}{...}`, `p{...}`, `b{...}`, `m{...}` and `X`), the content of the block is formatted as a paragraph of that width.

- The specification of the horizontal position provided by the type of column (`c`, `r` or `l`) is taken into account for the blocks.
- The specifications of font specified for the column by a construction `>{...}` in the preamble of the array are taken into account for the mono-column blocks of that column (this behaviour is probably expected).

<code>\begin{NiceTabular}{@{}&gt;{\bfseries}lr@{}} \hline</code>		
<code>\Block{2-1}{John} &amp; 12 \\</code>	<b>John</b>	12
<code>             &amp; 13 \\ \hline</code>		13
<code>Steph &amp; 8 \\ \hline</code>	<b>Steph</b>	8
<code>\Block{3-1}{Sarah} &amp; 18 \\</code>		18
<code>             &amp; 17 \\</code>	<b>Sarah</b>	17
<code>             &amp; 15 \\ \hline</code>		15
<code>Ashley &amp; 20 \\ \hline</code>	<b>Ashley</b>	20
<code>Henry &amp; 14 \\ \hline</code>	<b>Henry</b>	14
<code>\Block{2-1}{Madison} &amp; 15 \\</code>		15
<code>             &amp; 19 \\ \hline</code>	<b>Madison</b>	19
<code>\end{NiceTabular}</code>		

## 4.3 The mono-row blocks

For the mono-row blocks, the natural height and depth are taken into account for the height and depth of the current row (as does a standard `\multicolumn` of LaTeX).

## 4.4 The mono-cell blocks

A mono-cell block inherits all the properties of the mono-row blocks and mono-column blocks.

At first sight, one may think that there is no point using a mono-cell block. However, there are some good reasons to use such a block.

- It's possible to use the command `\\"\\` in a (mono-cell) block.
- It's possible to use the option of horizontal alignment of the block in derogation of the type of column given in the preamble of the array.
- It's possible do draw a frame around the cell with the key `draw` of the command `\Block` and to fill the background with rounded corners with the keys `fill` and `rounded-corners`.<sup>11</sup>
- It's possible to draw one or several borders of the cell with the key `borders`.

---

<sup>11</sup>If one simply wishes to color the background of a unique cell, there is no point using the command `\Block`: it's possible to use the command `\cellcolor` (when the key `colortbl-like` is used).

```
\begin{NiceTabular}{cc}
\toprule
Writer & \Block[1]{}{year\\ of birth} \\
\midrule
Hugo & 1802 \\
Balzac & 1799 \\
\bottomrule
\end{NiceTabular}
```

Writer	year of birth
Hugo	1802
Balzac	1799

We recall that if the first mandatory argument of `\Block` is left blank, the block is mono-cell.<sup>12</sup>

## 4.5 Horizontal position of the content of the block

By default, the horizontal position of the content of a block is computed by using the positions of the *contents* of the columns implied in that block. That's why, in the following example, the header "First group" is correctly centered despite the instruction `!{\quad}` in the preamble which has been used to increase the space between the columns (this is not the behaviour of `\multicolumn`).

```
\begin{NiceTabular}{@{}ccc!{\quad}ccc@{}}
\toprule
Rank & \Block{1-3}{First group} & & & \Block{1-3}{Second group} \\
& 1A & 1B & 1C & 2A & 2B & 2C \\
\midrule
1 & 0.657 & 0.913 & 0.733 & 0.830 & 0.387 & 0.893 \\
2 & 0.343 & 0.537 & 0.655 & 0.690 & 0.471 & 0.333 \\
3 & 0.783 & 0.885 & 0.015 & 0.306 & 0.643 & 0.263 \\
4 & 0.161 & 0.708 & 0.386 & 0.257 & 0.074 & 0.336 \\
\bottomrule
\end{NiceTabular}
```

Rank	First group			Second group		
	1A	1B	1C	2A	2B	2C
1	0.657	0.913	0.733	0.830	0.387	0.893
2	0.343	0.537	0.655	0.690	0.471	0.333
3	0.783	0.885	0.015	0.306	0.643	0.263
4	0.161	0.708	0.386	0.257	0.074	0.336

In order to have an horizontal positionning of the content of the block computed with the limits of the columns of the LaTeX array (and not with the contents of those columns), one may use the key `L`, `R` and `C` of the command `\Block`.

## 5 The rules

The usual techniques for the rules may be used in the environments of `nicematrix` (excepted `\vline`). However, there is some small differences with the classical environments.

---

<sup>12</sup>One may consider that the default value of the first mandatory argument of `\Block` is `1-1`.

## 5.1 Some differences with the classical environments

### 5.1.1 The vertical rules

In the environments of `nicematrix`, the vertical rules specified by `|` in the preambles of the environments are never broken, even by an incomplete row or by a double horizontal rule specified by `\hline\hline` (there is no need to use the package `hhline`).

```
\begin{NiceTabular}{|c|c|} \hline
First & Second \\ \hline\hline
Peter \\ \hline
Mary & George\\ \hline
\end{NiceTabular}
```

First	Second
Peter	
Mary	George

However, the vertical rules are not drawn in the blocks (created by `\Block`: cf. p. 4) nor in the corners (created by the key `corner`: cf. p. 10) nor in the potential exterior rows (created by the keys `first-row` and `last-row`: cf. p. 21).

If you use `booktabs` (which provides `\toprule`, `\midrule`, `\bottomrule`, etc.) and if you really want to add vertical rules (which is not in the spirit of `booktabs`), you should notice that the vertical rules drawn by `nicematrix` are compatible with `booktabs`.

```
$\begin{NiceArray}{|cccc|} \toprule
a & b & c & d \\ \midrule
1 & 2 & 3 & 4 \\
1 & 2 & 3 & 4 \\ \bottomrule
\end{NiceArray}$
```

a	b	c	d
1	2	3	4
1	2	3	4

However, it's still possible to define a specifier (named, for instance, `I`) to draw vertical rules with the standard behaviour of `array`.

```
\newcolumntype{I}{!{\vrule}}
```

### 5.1.2 The command `\cline`

The horizontal and vertical rules drawn by `\hline` and the specifier “`|`” make the array larger or wider by a quantity equal to the width of the rule (with `array` and also with `nicematrix`).

For historical reasons, this is not the case with the command `\cline`, as shown by the following example.

```
\setlength{\arrayrulewidth}{2pt}
\begin{tabular}{cccc} \hline
A&B&C&D \\ \cline{2-2}
A&B&C&D \\ \hline
\end{tabular}
```

A	B	C	D
A	<u>B</u>	C	D

In the environments of `nicematrix`, this situation is corrected (it's still possible to go to the standard behaviour of `\cline` with the key `standard-cline`).

```
\setlength{\arrayrulewidth}{2pt}
\begin{NiceTabular}{cccc} \hline
A&B&C&D \\ \cline{2}
A&B&C&D \\ \hline
\end{NiceTabular}
```

A	B	C	D
A	<u>B</u>	C	D

In the environments of `nicematrix`, an instruction `\cline{i}` is equivalent to `\cline{i-i}`.

## 5.2 The thickness and the color of the rules

The environments of `nicematrix` provide a key `rules/width` to set the width (in fact the thickness) of the rules in the current environment. In fact, this key merely sets the value of the length `\arrayrulewidth`.

It's well known that `colortbl` provides the command `\arrayrulecolor` in order to specify the color of the rules.

With `nicematrix`, it's possible to specify the color of the rules even when `colortbl` is not loaded. For sake of compatibility, the command is also named `\arrayrulecolor`. The environments of `nicematrix` also provide a key `rules/color` to fix the color of the rules in the current environment. This key sets the value locally (whereas `\arrayrulecolor` acts globally).

```
\begin{NiceTabular}{|ccc|}[rules/color=[gray]{0.9},rules/width=1pt]
\hline
rose & tulipe & lys \\
arum & iris & violette \\
muguet & dahlia & souci \\
\hline
\end{NiceTabular}
```

rose	tulipe	lys
arum	iris	violette
muguet	dahlia	souci

## 5.3 The tools of `nicematrix` for the rules

Here are the tools provided by `nicematrix` for the rules.

- the keys `hlines`, `vlines`, `hvlines` and `hvlines-except-borders`;
- the specifier “|” in the preamble (for the environments with preamble);
- the command `\Hline`.

All these tools don't draw the rules in the blocks nor in the empty corners (when the key `corners` is used), nor in the exterior rows and columns.

- These blocks are:
  - the blocks created by the command `\Block`<sup>13</sup> presented p. 4;
  - the blocks implicitly delimited by the continuous dotted lines created by `\Cdots`, `\Vdots`, etc. (cf. p. 23).
- The corners are created by the key `corners` explained below (see p. 10).
- For the exterior rows and columns, see p. 21.

In particular, this remark explains the difference between the standard command `\hline` and the command `\Hline` provided by `nicematrix`.

**New 6.13** The key `\Hline` takes in an optional argument (between square brackets) which is a list of `key=value` pairs. For the description of those keys, see `custom-line` on p. 11.

### 5.3.1 The keys `hlines` and `vlines`

The keys `hlines` and `vlines` (which draw, of course, horizontal and vertical rules) take in as value a list of numbers which are the numbers of the rules to draw.<sup>14</sup>

In fact, for the environments with delimiters (such as `{pNiceMatrix}` or `{bNiceArray}`), the key `vlines` don't draw the exterior rules (this is certainly the expected behaviour).

```
$\begin{pNiceMatrix}[\vlines, rules/width=0.2pt]
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6
\end{pNiceMatrix}$
```

$$\left( \begin{array}{c|c|c|c|c|c} 1 & 2 & 3 & 4 & 5 & 6 \\ 1 & 2 & 3 & 4 & 5 & 6 \\ 1 & 2 & 3 & 4 & 5 & 6 \end{array} \right)$$

<sup>13</sup> And also the command `\multicolumn` but it's recommended to use instead `\Block` in the environments of `nicematrix`.

<sup>14</sup> It's possible to put in that list some intervals of integers with the syntax  $i-j$ .

### 5.3.2 The keys `hvlines` and `hvlines-except-borders`

The key `hvlines` (no value) is the conjunction of the keys `hlines` and `vlines`.

```
\setlength{\arrayrulewidth}{1pt}
\begin{NiceTabular}{cccc}[hvlines, rules/color=blue]
rose & tulipe & marguerite & dahlia \\
violette & \Block[draw=red]{2-2}{\LARGE fleurs} & & souci \\
pervenche & & lys \\
arum & iris & jacinthe & muguet
\end{NiceTabular}
```

rose	tulipe	marguerite	dahlia
violette	fleurs		souci
pervenche			lys
arum	iris	jacinthe	muguet

The key `hvlines-except-borders` is similar to the key `hvlines` but does not draw the rules on the horizontal and vertical borders of the array.

### 5.3.3 The (empty) corners

The four `corners` of an array will be designed by `NW`, `SW`, `NE` and `SE` (*north west*, *south west*, *north east* and *south east*).

For each of these corners, we will call *empty corner* (or simply *corner*) the reunion of all the empty rectangles starting from the cell actually in the corner of the array.<sup>15</sup>  
However, it's possible, for a cell without content, to require `nicematrix` to consider that cell as not empty with the key `\NotEmpty`.

In the example on the right (where `B` is in the center of a block of size  $2 \times 2$ ), we have colored in blue the four (empty) corners of the array.

When the key `corners` is used, `nicematrix` computes the (empty) corners and these corners will be taken into account by the tools for drawing the rules (the rules won't be drawn in the corners).

```
\NiceMatrixOptions{cell-space-top-limit=3pt}
\begin{NiceTabular}{*{6}{c}}[corners,hvlines]
& & & A \\
& & A & A & A \\
& & A & & A \\
& & A & A & A & A \\
A & A & A & A & A & A \\
A & A & A & A & A & A \\
& A & A & A & A & A \\
& \Block{2-2}{B} & & A \\
& & & A \\
\end{NiceTabular}
```

<sup>15</sup>For sake of completeness, we should also say that a cell contained in a block (even an empty cell) is not taken into account for the determination of the corners. That behaviour is natural. The precise definition of a “non-empty cell” is given below (cf. p. 47).

It's also possible to provide to the key `corners` a (comma-separated) list of corners (designed by `NW`, `SW`, `NE` and `SE`).

```
\NiceMatrixOptions{cell-space-top-limit=3pt}
\begin{NiceTabular}{*{6}{c}}[corners=NE,hvlines]
1 \\
1&1\\
1&2&1\\
1&3&3&1\\
1&4&6&4&1\\
&&&&1
\end{NiceTabular}
```

1					
1	1				
1	2	1			
1	3	3	1		
1	4	6	4	1	
					1

► The corners are also taken into account by the tools provided by `nicematrix` to color cells, rows and columns. These tools don't color the cells which are in the corners (cf. p. 14).

## 5.4 The command `\diagbox`

The command `\diagbox` (inspired by the package `diagbox`), allows, when it is used in a cell, to slash that cell diagonally downwards.

```
$\begin{NiceArray}{*{5}{c}}[hvlines]
\diagbox{x}{y} & e & a & b & c \\
e & e & a & b & c \\
a & a & e & c & b \\
b & b & c & e & a \\
c & c & b & a & e
\end{NiceArray}$
```

<i>x</i>	<i>y</i>	<i>e</i>	<i>a</i>	<i>b</i>	<i>c</i>
<i>e</i>		<i>e</i>	<i>a</i>	<i>b</i>	<i>c</i>
<i>a</i>		<i>a</i>	<i>e</i>	<i>c</i>	<i>b</i>
<i>b</i>		<i>b</i>	<i>c</i>	<i>e</i>	<i>a</i>
<i>c</i>		<i>c</i>	<i>b</i>	<i>a</i>	<i>e</i>

It's possible to use the command `\diagbox` in a `\Block`.

## 5.5 Commands for customized rules

It's also possible to define commands and letters for customized rules with the key `custom-line` available in `\NiceMatrixOptions` and in the options of individual environments. That key takes in as argument a list of `key=value` pairs. First, there are two keys to define the tools which will be used to use that new type of rule.

- the key `command` is the name (without the backslash) of a command that will be created by `nicematrix` and that will be available for the final user in order to draw horizontal rules (similarly to `\hline`);
- **New 6.11** the key `cccommand` is the name (without the backslash) of a command that will be created by `nicematrix` and that will be available for the final user to order to draw partial horizontal rules (similarly to `\cline`, hence the name `cccommand`): the argument of that command is a list of intervals of columns specified by the syntax `i` or `i-j`.<sup>16</sup>
- the key `letter` takes in as argument a letter<sup>17</sup> that the user will use in the preamble of an environment with preamble (such as `\NiceTabular`) in order to specify a vertical rule.

We will now speak of the keys which describe the rule itself. Those keys may also be used in the (optional) argument of an individual command `\Hline`.

There are three possibilities.

- *First possibility*

It's possible to specify composite rules, with a color and a color for the inter-rule space (as possible with `colortbl` for instance).

<sup>16</sup>It's recommended to use such commands only once in a row because each use will create space between the rows corresponding to the total width of the rule.

<sup>17</sup>The following letters are forbidden: `lcrpmbVX|()` !@<>

- the key `multiplicity` is the number to consecutive rules that will be drawn: for instance, a value of 2 will create double rules such those created by `\hline\hline` or `||` in the preamble of an environment;
- the key `color` sets the color of the rule ;
- the key `sep-color` sets the color between two successive rules (should be used only in conjunction with `multiplicity`).

That system may be used, in particular, for the definition of commands and letters to draw rules with a specific color (and those rules will respect the blocks and corners as do all the rules of `nicematrix`).

```
\begin{NiceTabular}{lcIcIc}[custom-line = {letter=I, color=blue}]
\hline
& \Block{1-3}{dimensions} \\
& L & 1 & H \\
\hline
Product A & 3 & 1 & 2 \\
Product B & 1 & 3 & 4 \\
Product C & 5 & 4 & 1 \\
\hline
\end{NiceTabular}
```

- *Second possibility*

It's possible to use the key `tikz` (if Tikz is loaded). In that case, the rule is drawn directly with Tikz by using as parameters the value of the key `tikz` which must be a list of `key=value` pairs which may be applied to a Tikz path.

By default, no space is reserved for the rule that will be drawn with Tikz. It is possible to specify a reservation (horizontal for a vertical rule and vertical for an horizontal one) with the key `total-width`. That value of that key, is, in some ways, the width of the rule that will be drawn (`nicematrix` does not compute that width from the characteristics of the rule specified in `tikz`).

dimensions			
	L	1	H
Product A	3	1	2
Product B	1	3	4
Product C	5	4	1

Here is an example with the key `dotted` of Tikz.

```
\NiceMatrixOptions
{
  custom-line =
  {
    letter = I ,
    tikz = dotted ,
    total-width = \pgflinewidth
  }
}

\begin{NiceTabular}{cIcIc}
one & two & three \\
four & five & six \\
seven & eight & nine \\
\end{NiceTabular}
```

one	two	three
four	five	six
seven	eight	nine

- *Third possibility* : the key `dotted`

As one can see, the dots of a dotted line of Tikz have the shape of a square, and not a circle. That's why the extension `nicematrix` provides in the key `custom-line` a key `dotted` which will draw rounded dots. The initial value of the key `total-width` is, in this case, equal to the diameter of the dots (but the user may change the value with the key `total-width` if needed). Those dotted rules are also used by `nicematrix` to draw continuous dotted rules between cells of the matrix with `\Cdots`, `\Vdots`, etc. (cf. p. 23).

In fact, `nicematrix` defines by default the commands `\hdottedline` and `\cdottedline` and the letter ":" for those dotted rules.<sup>18</sup>

```
\NiceMatrixOptions % present in nicematrix.sty
{
  custom-line =
  {
    letter = : ,
    command = hdottedline ,
    ccommand = cdottedline ,
    dotted
  }
}
```

Thus, it's possible to use the commands `\hdottedline` and `\cdottedline` to draw horizontal dotted rules.

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
\hdottedline
6 & 7 & 8 & 9 & 10 \\
\cdottedline{1,4-5}
11 & 12 & 13 & 14 & 15
\end{pNiceMatrix}
```

$$\left( \begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ \hdots & \hdots & \hdots & \hdots & \hdots \\ 6 & 7 & 8 & 9 & 10 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ 11 & 12 & 13 & 14 & 15 \end{array} \right)$$

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to draw a vertical dotted line with the specifier ":".

```
\left(\begin{NiceArray}{cccc:c}
1 & 2 & 3 & 4 & 5 \\
6 & 7 & 8 & 9 & 10 \\
11 & 12 & 13 & 14 & 15
\end{NiceArray}\right)
```

$$\left( \begin{array}{ccccc} 1 & 2 & 3 & 4 & : 5 \\ 6 & 7 & 8 & 9 & : 10 \\ 11 & 12 & 13 & 14 & : 15 \end{array} \right)$$

## 6 The color of the rows and columns

### 6.1 Use of `colortbl`

We recall that the package `colortbl` can be loaded directly with `\usepackage{colortbl}` or by loading `xcolor` with the key `table`: `\usepackage[table]{xcolor}`.

Since the package `nicematrix` is based on `array`, it's possible to use `colortbl` with `nicematrix`.

However, there is two drawbacks:

- The package `colortbl` patches `array`, leading to some incompatibilities (for instance with the command `\hdotsfor`).

---

<sup>18</sup>However, it's possible to overwrite those definitions with a `custom-line` (in order, for example, to switch to dashed lines).

- The package `colortbl` constructs the array row by row, alternating colored rectangles, rules and contents of the cells. The resulting PDF is difficult to interpret by some PDF viewers and may lead to artefacts on the screen.
    - Some rules seem to disappear. This is because many PDF viewers give priority to graphical element drawn posteriorly (which is in the spirit of the “painting model” of PostScript and PDF). Concerning this problem, MuPDF (which is used, for instance, by SumatraPDF) gives better results than Adobe Reader).
    - A thin white line may appear between two cells of the same color. This phenomenon occurs when each cell is colored with its own instruction `fill` (the PostScript operator `fill` noted `f` in PDF). This is the case with `colortbl`: each cell is colored on its own, even when `\columncolor` or `\rowcolor` is used.
- As for this phenomenon, Adobe Reader gives better results than MuPDF.

The package `nicematrix` provides tools to avoid those problems.

## 6.2 The tools of `nicematrix` in the `\CodeBefore`

The package `nicematrix` provides some tools (independent of `colortbl`) to draw the colored panels first, and, then, the content of the cells and the rules. This strategy is more conform to the “painting model” of the formats PostScript and PDF and is more suitable for the PDF viewers. However, it requires several compilations.<sup>19</sup>

The extension `nicematrix` provides a key `code-before` for some code that will be executed before the drawing of the tabular.

An alternative syntax is provided: it’s possible to put the content of that `code-before` between the keywords `\CodeBefore` and `\Body` at the beginning of the environment.

```
\begin{pNiceArray}{preamble}
\CodeBefore
  instructions of the code-before
\Body
  contents of the environment
\end{pNiceArray}
```

New commands are available in that `\CodeBefore`: `\cellcolor`, `\rectanglecolor`, `\rowcolor`, `\columncolor`, `\rowcolors`, `\rowlistcolors`, `\chessboardcolors` and `\arraycolor`.<sup>20</sup>

All these commands accept an optional argument (between square brackets and in first position) which is the color model for the specification of the colors.

These commands don’t color the cells which are in the “corners” if the key `corners` is used. This key has been described p. 10.

- The command `\cellcolor` takes its name from the command `\cellcolor` of `colortbl`. This command takes in as mandatory arguments a color and a list of cells, each of which with the format  $i-j$  where  $i$  is the number of the row and  $j$  the number of the column of the cell. In fact, despite its name, this command may be used to color a whole row (with the syntax  $i-$ ) or a whole column (with the syntax  $-j$ ).

```
\begin{NiceTabular}{ccc}[hvlines]
\CodeBefore
  \cellcolor[HTML]{FFFF88}{3-1,2-2,-3}
\Body
a & b & c \\
e & f & g \\
h & i & j \\
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

<sup>19</sup>If you use Overleaf, Overleaf will do automatically the right number of compilations.

<sup>20</sup>Remark that, in the `\CodeBefore`, PGF/Tikz nodes of the form “ $(i-|j)$ ” are also available to indicate the position to the potential rules: cf. p. 44.

- The command `\rectanglecolor` takes three mandatory arguments. The first is the color. The second is the upper-left cell of the rectangle and the third is the lower-right cell of the rectangle.

```
\begin{NiceTabular}{ccc}[hvlines]
\CodeBefore
    \rectanglecolor{blue!15}{2-2}{3-3}
\Body
a & b & c \\
e & f & g \\
h & i & j \\
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

- The command `\arraycolor` takes in as mandatory argument a color and color the whole tabular with that color (excepted the potential exterior rows and columns: cf. p. 21). It's only a particular case of `\rectanglecolor`.
- The command `\chessboardcolors` takes in as mandatory arguments two colors and it colors the cells of the tabular in quincunx with these colors.

```
$\begin{pNiceMatrix}[r,margin]
\CodeBefore
    \chessboardcolors{red!15}{blue!15}
\Body
1 & -1 & 1 \\
-1 & 1 & -1 \\
1 & -1 & 1 \\
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & -1 & 1 \\ -1 & 1 & -1 \\ 1 & -1 & 1 \end{pmatrix}$$

We have used the key `r` which aligns all the columns rightwards (cf. p. 37).

- The command `\rowcolor` takes its name from the command `\rowcolor` of `colortbl`. Its first mandatory argument is the color and the second is a comma-separated list of rows or interval of rows with the form  $a-b$  (an interval of the form  $a-$  represent all the rows from the row  $a$  until the end).

```
$\begin{NiceArray}{lll}[hvlines]
\CodeBefore
    \rowcolor{red!15}{1,3-5,8-}
\Body
a_1 & b_1 & c_1 \\
a_2 & b_2 & c_2 \\
a_3 & b_3 & c_3 \\
a_4 & b_4 & c_4 \\
a_5 & b_5 & c_5 \\
a_6 & b_6 & c_6 \\
a_7 & b_7 & c_7 \\
a_8 & b_8 & c_8 \\
a_9 & b_9 & c_9 \\
a_{10} & b_{10} & c_{10} \\
\end{NiceArray}$
```

$a_1$	$b_1$	$c_1$
$a_2$	$b_2$	$c_2$
$a_3$	$b_3$	$c_3$
$a_4$	$b_4$	$c_4$
$a_5$	$b_5$	$c_5$
$a_6$	$b_6$	$c_6$
$a_7$	$b_7$	$c_7$
$a_8$	$b_8$	$c_8$
$a_9$	$b_9$	$c_9$
$a_{10}$	$b_{10}$	$c_{10}$

- The command `\columncolor` takes its name from the command `\columncolor` of `colortbl`. Its syntax is similar to the syntax of `\rowcolor`.
- The command `\rowcolors` (with a  $s$ ) takes its name from the command `\rowcolors` of `colortbl`. The  $s$  emphasizes the fact that there is *two* colors. This command colors alternately the rows

of the tabular with the two colors (provided in second and third argument), beginning with the row whose number is given in first (mandatory) argument.

In fact, the first (mandatory) argument is, more generally, a comma separated list of intervals describing the rows involved in the action of `\rowcolors` (an interval of the form  $i\text{-}j$  describes in fact the interval of all the rows of the tabular, beginning with the row  $i$ ).

The last argument of `\rowcolors` is an optional list of pairs `key=value` (the optional argument in the first position corresponds to the colorimetric space). The available keys are `cols`, `restart` and `respect-blocks`.

- The key `cols` describes a set of columns. The command `\rowcolors` will color only the cells of these columns. The value is a comma-separated list of intervals of the form  $i\text{-}j$  (where  $i$  or  $j$  may be replaced by  $*$ ).
- With the key `restart`, each interval of rows (specified by the first mandatory argument) begins with the same color.<sup>21</sup>
- With the key `respect-blocks` the “rows” alternately colored may extend over several rows if they have to incorporate blocks (created with the command `\Block`: cf. p. 4).

```
\begin{NiceTabular}{clr}[hvlines]
\CodeBefore
    \rowcolors[gray]{2}{0.8}{}[cols=2-3,restart]
\Body
\Block{1-*}{Results} \\
John & 12 \\
Stephen & 8 \\
Sarah & 18 \\
Ashley & 20 \\
Henry & 14 \\
Madison & 15
\end{NiceTabular}
```

Results		
A	John	12
B	Stephen	8
	Sarah	18
	Ashley	20
	Henry	14
	Madison	15

```
\begin{NiceTabular}{lr}[hvlines]
\CodeBefore
    \rowcolors{1}{blue!10}{}[respect-blocks]
\Body
\Block{2-1}{John}    & 12 \\
& 13 \\
Steph                & 8 \\
\Block{3-1}{Sarah}   & 18 \\
& 17 \\
& 15 \\
Ashley               & 20 \\
Henry                & 14 \\
\Block{2-1}{Madison} & 15 \\
& 19
\end{NiceTabular}
```

John	12
	13
Steph	8
	18
Sarah	17
	15
Ashley	20
Henry	14
Madison	15
	19

- The extension `nicematrix` provides also a command `\rowlistcolors`. This command generalises the command `\rowcolors`: instead of two successive arguments for the colors, this command takes in an argument which is a (comma-separated) list of colors. In that list, the symbol `=` represent a color identical to the previous one.

---

<sup>21</sup>Otherwise, the color of a given row relies only upon the parity of its absolute number.

```
\begin{NiceTabular}{c}
\CodeBefore
    \rowlistcolors{1}{red!15,blue!15,green!15}
\Body
Peter \\
James \\
Abigail \\
Elisabeth \\
Claudius \\
Jane \\
Alexandra \\
\end{NiceTabular}
```

Peter
James
Abigail
Elisabeth
Claudius
Jane
Alexandra

We recall that all the color commands we have described don't color the cells which are in the "corners". In the following example, we use the key `corners` to require the determination of the corner *north east* (NE).

```
\begin{NiceTabular}{ccccccc} [corners=NE,margin,hvlines,first-row,first-col]
\CodeBefore
    \rowlistcolors{1}{blue!15, }
\Body
& 0 & 1 & 2 & 3 & 4 & 5 & 6 \\
0 & 1 & \\
1 & 1 & 1 \\
2 & 1 & 2 & 1 \\
3 & 1 & 3 & 3 & 1 \\
4 & 1 & 4 & 6 & 4 & 1 \\
5 & 1 & 5 & 10 & 10 & 5 & 1 \\
6 & 1 & 6 & 15 & 20 & 15 & 6 & 1 \\
\end{NiceTabular}
```

0	1						
1	1						
2	1	2	1				
3	1	3	3	1			
4	1	4	6	4	1		
5	1	5	10	10	5	1	
6	1	6	15	20	15	6	1

One should remark that all the previous commands are compatible with the commands of `booktabs` (`\toprule`, `\midrule`, `\bottomrule`, etc). However, `booktabs` is not loaded by `nicematrix`.

```
\begin{NiceTabular}{c}[lSSSS]
\CodeBefore
    \rowcolor{red!15}{1-2}
    \rowcolors{3}{blue!15}{}
\Body
\toprule
\Block{2-1}{Product} &
\Block{1-3}{dimensions (cm)} & & &
\Block{2-1}{\rotate Price} \\
\cmidrule(r1){2-4}
& L & 1 & h & \\
\midrule
small & 3 & 5.5 & 1 & 30 \\
standard & 5.5 & 8 & 1.5 & 50.5 \\
premium & 8.5 & 10.5 & 2 & 80 \\
extra & 8.5 & 10 & 1.5 & 85.5 \\
special & 12 & 12 & 0.5 & 70 \\
\bottomrule
\end{NiceTabular}
```

Product	dimensions (cm)			Price
	L	1	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

We have used the type of column `S` of `siunitx`.

### 6.3 Color tools with the syntax of colortbl

It's possible to access the preceding tools with a syntax close to the syntax of `colortbl`. For that, one must use the key `colortbl-like` in the current environment.<sup>22</sup>

There are three commands available (they are inspired by `colortbl` but are *independent* of `colortbl`):

- `\cellcolor` which colorizes a cell;<sup>23</sup>
- `\rowcolor` which must be used in a cell and which colorizes the end of the row;
- `\columncolor` which must be used in the preamble of the environment with the same syntax as the corresponding command of `colortbl` (however, unlike the command `\columncolor` of `colortbl`, this command `\columncolor` can appear within another command, itself used in the preamble of the array).

```
\NewDocumentCommand { \Blue } { } { \columncolor{blue!15} }
\begin{NiceTabular}[colortbl-like]{>{\Blue}c>{\Blue}cc}
\toprule
\rowcolor{red!15}
Last name & First name & Birth day \\
\midrule
Achard & Jacques & 5 juin 1962 \\
Lefebvre & Mathilde & 23 mai 1988 \\
Vanesse & Stephany & 30 octobre 1994 \\
Dupont & Chantal & 15 janvier 1998 \\
\bottomrule
\end{NiceTabular}
```

Last name	First name	Birth day
Achard	Jacques	5 juin 1962
Lefebvre	Mathilde	23 mai 1988
Vanesse	Stephany	30 octobre 1994
Dupont	Chantal	15 janvier 1998

## 7 The command `\RowStyle`

The command `\RowStyle` takes in as argument some formatting instructions that will be applied to each cell on the rest of the current row.

That command also takes in as optional argument (between square brackets) a list of `key=value` pairs.

- The key `nb-rows` sets the number of rows to which the specifications of the current command will apply (with the special value `*`, it will apply to all the following rows).
- The keys `cell-space-top-limit`, `cell-space-bottom-limit` and `cell-space-limits` are available with the same meaning that the corresponding global keys (cf. p. 2).
- The key `rowcolor` sets the color of the background and the key `color` sets the color of the text.<sup>24</sup>

<sup>22</sup>Up to now, this key is *not* available in `\NiceMatrixOptions`.

<sup>23</sup>However, this command `\cellcolor` will delete the following spaces, which does not the command `\cellcolor` of `colortbl`.

<sup>24</sup>The key `color` uses the command `\color` but inserts also an instruction `\leavevmode` before. This instruction prevents a extra vertical space in the cells which belong to columns of type `p`, `b`, `m` and `X` (which start in vertical mode).

- The key `bold` enforces bold characters for the cells of the row, both in math and text mode.

```
\begin{NiceTabular}{cccc}
\hline
\RowStyle[cell-space-limits=3pt]{\rotate}
first & second & third & fourth \\
\RowStyle[nb-rows=2, rowcolor=blue!50, color=white]{\sffamily}
1 & 2 & 3 & 4 \\
I & II & III & IV
\end{NiceTabular}
```

first	second	third	fourth
1	2	3	4
I	II	III	IV

The command `\rotate` is described p. 38.

## 8 The width of the columns

### 8.1 Basic tools

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to fix the width of a given column with the standard letters `w`, `W`, `p`, `b` and `m` of the package `array`.

```
\begin{NiceTabular}{Wc{2cm}cc}[hvlines]
Paris & New York & Madrid \\
Berlin & London & Roma \\
Rio & Tokyo & Oslo
\end{NiceTabular}
```

Paris	New York	Madrid
Berlin	London	Roma
Rio	Tokyo	Oslo

In the environments of `nicematrix`, it's also possible to fix the *minimal* width of all the columns (excepted the potential exterior columns: cf. p. 21) directly with the key `columns-width`.

```
$\begin{pNiceMatrix}[\text{columns-width} = 1cm]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

Note that the space inserted between two columns (equal to `2 \tabcolsep` in `{NiceTabular}` and to `2 \arraycolsep` in the other environments) is not suppressed (of course, it's possible to suppress this space by setting `\tabcolsep` or `\arraycolsep` equal to 0 pt before the environment).

It's possible to give the special value `auto` to the option `columns-width`: all the columns of the array will have a width equal to the widest cell of the array.<sup>25</sup>

```
$\begin{pNiceMatrix}[\text{columns-width} = \text{auto}]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

Without surprise, it's possible to fix the minimal width of the columns of all the arrays of a current scope with the command `\NiceMatrixOptions`.

```
\NiceMatrixOptions[columns-width=10mm]
$\begin{pNiceMatrix}
a & b \\
c & d
\end{pNiceMatrix}
=
\begin{pNiceMatrix}
1 & 1245 \\
345 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} 1 & 1245 \\ 345 & 2 \end{pmatrix}$$

---

<sup>25</sup>The result is achieved with only one compilation (but PGF/Tikz will have written informations in the aux file and a message requiring a second compilation will appear).

But it's also possible to fix a zone where all the matrices will have their columns of the same width, equal to the widest cell of all the matrices. This construction uses the environment `{NiceMatrixBlock}` with the option `auto-columns-width26`. The environment `{NiceMatrixBlock}` has no direct link with the command `\Block` presented previously in this document (cf. p. 4).

```
\begin{NiceMatrixBlock}[auto-columns-width]
$\begin{array}{c}
\begin{bNiceMatrix}
9 & 17 \\ -2 & 5
\end{bNiceMatrix} \\
\begin{bNiceMatrix}
1 & 1245345 \\ 345 & 2
\end{bNiceMatrix}
\end{array}$
\end{NiceMatrixBlock}
```

$$\begin{bmatrix} 9 & 17 \\ -2 & 5 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1245345 \\ 345 & 2 \end{bmatrix}$$

## 8.2 The columns V of varwidth

Let's recall first the behaviour of the environment `{varwidth}` of the eponymous package `varwidth`. That environment is similar to the classical environment `{minipage}` but the width provided in the argument is only the *maximal* width of the created box. In the general case, the width of the box constructed by an environment `{varwidth}` is the natural width of its contents.

That point is illustrated on the following examples.

```
\fbox{%
\begin{varwidth}{8cm}
\begin{itemize}
\item first item
\item second item
\end{itemize}
\end{varwidth}}}
```

- first item
- second item

  

```
\fbox{%
\begin{minipage}{8cm}
\begin{itemize}
\item first item
\item second item
\end{itemize}
\end{minipage}}}
```

- first item
- second item

The package `varwidth` provides also the column type `V`. A column of type `V{<dim>}` encapsulates all its cells in a `{varwidth}` with the argument `<dim>` (and does also some tuning).

When the package `varwidth` is loaded, the columns `V` of `varwidth` are supported by `nicematrix`. Concerning `nicematrix`, one of the interests of this type of columns is that, for a cell of a column of type `V`, the PGF/Tikz node created by `nicematrix` for the content of that cell has a width adjusted to the content of the cell : cf. p. 41.

```
\begin{NiceTabular}[corners=NW,hvlines]{V{3cm}V{3cm}V{3cm}}
& some very very very long text & some very very very long text \\
some very very very long text \\
some very very very long text
\end{NiceTabular}
```

---

<sup>26</sup>At this time, this is the only usage of the environment `{NiceMatrixBlock}` but it may have other usages in the future.

	some very very very long text	some very very very long text
some very very very long text		
some very very very long text		

One should remark that the extension `varwidth` (at least in its version 0.92) has some problems: for instance, with LuaLaTeX, it does not work when the content begins with `\color`.

### 8.3 The columns X

The environment `{NiceTabular}` provides X columns similar to those provided by the environment `{tabularx}` of the eponymous package.

The required width of the tabular may be specified with the key `width` (in `{NiceTabular}` or in `\NiceMatrixOptions`). The initial value of this parameter is `\linewidth` (and not `\textwidth`).

For sake of similarity with the environment `{tabularx}`, `nicematrix` also provides an environment `{NiceTabularX}` with a first mandatory argument which is the width of the tabular.<sup>27</sup>

As with the packages `tabu`<sup>28</sup> and `tabulararray`, the specifier X takes in an optional argument (between square brackets) which is a list of keys.

- It's possible to give a weight for the column by providing a positive integer directly as argument of the specifier X. For example, a column X[2] will have a width double of the width of a column X (which has a weight equal to 1).<sup>29</sup>
- It's possible to specify an horizontal alignment with one of the letters l, c and r (which insert respectively `\raggedright`, `\centering` and `\raggedleft` followed by `\arraybackslash`).
- It's possible to specify a vertical alignment with one of the keys t (alias p), m and b (which construct respectively columns of type p, m and b). The default value is t.

```
\begin{NiceTabular}[width=9cm]{X[2,1]X[1]}[hvlines]
a rather long text which fits on several lines
& a rather long text which fits on several lines \\
a shorter text & a shorter text
\end{NiceTabular}
```

a rather long text which fits on several lines	a rather long text which fits on several lines
a shorter text	a shorter text

## 9 The exterior rows and columns

The options `first-row`, `last-row`, `first-col` and `last-col` allow the composition of exterior rows and columns in the environments of `nicematrix`. It's particularly interesting for the (methematical) matrices.

A potential “first row” (exterior) has the number 0 (and not 1). Idem for the potential “first column”.

---

<sup>27</sup>If `tabularx` is loaded, one must use `{NiceTabularX}` (and not `{NiceTabular}`) in order to use the columns X (this point comes from a conflict in the definitions of the specifier X).

<sup>28</sup>The extension `tabu` is now considered as deprecated.

<sup>29</sup>The negative values of the weight, as provided by `tabu` (which is now obsolete), are *not* supported by `nicematrix`. If such a value is used, an error will be raised.

```
$\begin{pNiceMatrix}[\first-row,\last-row,\first-col,\last-col,nullify-dots]
    & C_1 & \cdots & C_4 &
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 & \\
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots & \\
& a_{31} & a_{32} & a_{33} & a_{34} & & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 & \\
    & C_1 & \cdots & C_4 &
\end{pNiceMatrix}$
```

$$\begin{array}{c} C_1 \dots \dots \dots C_4 \\ L_1 \left( \begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right) L_1 \\ \vdots \qquad \qquad \qquad \vdots \\ L_4 \end{array}$$

The dotted lines have been drawn with the tools presented p. 23.

We have several remarks to do.

- For the environments with an explicit preamble (i.e. `{NiceTabular}`, `{NiceArray}` and its variants), no letter must be given in that preamble for the potential first column and the potential last column: they will automatically (and necessarily) be of type `r` for the first column and `l` for the last one.<sup>30</sup>
- One may wonder how `nicematrix` determines the number of rows and columns which are needed for the composition of the “last row” and “last column”.
  - For the environments with explicit preamble, like `{NiceTabular}` and `{pNiceArray}`, the number of columns can obviously be computed from the preamble.
  - When the option `light-syntax` (cf. p. 39) is used, `nicematrix` has, in any case, to load the whole body of the environment (and that’s why it’s not possible to put verbatim material in the array with the option `light-syntax`). The analysis of this whole body gives the number of rows and the number of columns.
  - In the other cases, `nicematrix` compute the number of rows and columns during the first compilation and write the result in the `aux` file for the next run.

*However, it’s possible to provide the number of the last row and the number of the last column as values of the options `last-row` and `last-col`, tending to an acceleration of the whole compilation of the document.* That’s what we will do throughout the rest of the document.

It’s possible to control the appearance of these rows and columns with options `code-for-first-row`, `code-for-last-row`, `code-for-first-col` and `code-for-last-col`. These options specify tokens that will be inserted before each cell of the corresponding row or column.

```
\NiceMatrixOptions{code-for-first-row = \color{red},
                  code-for-first-col = \color{blue},
                  code-for-last-row = \color{green},
                  code-for-last-col = \color{magenta}}
$\begin{pNiceArray}{cc|cc}[\first-row,\last-row=5,\first-col,\last-col,nullify-dots]
    & C_1 & \cdots & C_4 &
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 & \\
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots & \\
& a_{31} & a_{32} & a_{33} & a_{34} & & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 & \\
    & C_1 & \cdots & C_4 &
\end{pNiceArray}
```

---

<sup>30</sup>The users wishing exterior columns with another type of alignment should consider the command `\SubMatrix` available in the `\CodeAfter` (cf. p. 29).

```

& a_{31} & a_{32} & a_{33} & a_{34} & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 \\
& C_1 & \cdots & C_4 & \\
\end{pNiceArray}
```

$$\begin{array}{c|cc|cc} & \color{red}C_1\cdots\cdots\color{black} & & \color{red}C_4\cdots\cdots\color{black} & \\ \color{blue}L_1\left(\begin{array}{cc|cc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \end{array}\right) & \color{blue}L_1\cdots\cdots\color{black} & & \color{blue}L_4\cdots\cdots\color{black} & \\ \vdots & & & \vdots & \\ \color{blue}L_4\left(\begin{array}{cc|cc} a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array}\right) & \color{blue}L_4\cdots\cdots\color{black} & & \color{blue}L_4\cdots\cdots\color{black} & \\ & \color{green}C_1\cdots\cdots\color{black} & & \color{green}C_4\cdots\cdots\color{black} & \end{array}$$

### Remarks

- As shown in the previous example, the horizontal and vertical rules don't extend in the exterior rows and columns. This remark also applies to the customized rules created by the key `custom-line` (cf. p. 11).
- A specification of color present in `code-for-first-row` also applies to a dotted line drawn in that exterior "first row" (excepted if a value has been given to `xdots/color`). Idem for the other exterior rows and columns.
- Logically, the potential option `columns-width` (described p. 19) doesn't apply to the "first column" and "last column".
- For technical reasons, it's not possible to use the option of the command `\\\` after the "first row" or before the "last row". The placement of the delimiters would be wrong. If you are looking for a workaround, consider the command `\SubMatrix` in the `\CodeAfter` described p. 29.

## 10 The continuous dotted lines

Inside the environments of the package `nicematrix`, new commands are defined: `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Idots`. These commands are intended to be used in place of `\dots`, `\cdots`, `\vdots`, `\ddots` and `\iddots`.<sup>31</sup>

Each of them must be used alone in the cell of the array and it draws a dotted line between the first non-empty cells<sup>32</sup> on both sides of the current cell. Of course, for `\Ldots` and `\Cdots`, it's an horizontal line; for `\Vdots`, it's a vertical line and for `\Ddots` and `\Idots` diagonal ones. It's possible to change the color of these lines with the option `color`.<sup>33</sup>

```

\begin{bNiceMatrix}
a_1 & \Cdots & a_1 & \\
\Vdots & a_2 & \Cdots & a_2 & \\
& \Vdots & \Ddots[\color=red] & \\
& a_1 & a_2 & & a_n
\end{bNiceMatrix}
```

$$\begin{bmatrix} a_1 & \cdots & a_1 \\ \vdots & a_2 & \cdots & a_2 \\ \vdots & \vdots & \vdots & \vdots \\ a_1 & a_2 & & a_n \end{bmatrix}$$

In order to represent the null matrix, one can use the following codage:

```

\begin{bNiceMatrix}
0 & \Cdots & 0 & \\
\Vdots & & \Vdots & \\
0 & \Cdots & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ \vdots & \vdots & \vdots \\ 0 & \cdots & 0 \end{bmatrix}$$

<sup>31</sup>The command `\idots`, defined in `nicematrix`, is a variant of `\ddots` with dots going forward. If `mathdots` is loaded, the version of `mathdots` is used. It corresponds to the command `\adots` of `unicode-math`.

<sup>32</sup>The precise definition of a "non-empty cell" is given below (cf. p. 47).

<sup>33</sup>It's also possible to change the color of all these dotted lines with the option `xdots/color` (`xdots` to remind that it works for `\Cdots`, `\Ldots`, `\Vdots`, etc.): cf. p. 27.

However, one may want a larger matrix. Usually, in such a case, the users of LaTeX add a new row and a new column. It's possible to use the same method with `nicematrix`:

```
\begin{bNiceMatrix}
0 & \Cdots & \Cdots & 0 \\
\Vdots & & & \Vdots \\
\Vdots & & & \Vdots \\
0 & \Cdots & \Cdots & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & \cdots & 0 \\ \vdots & & & \vdots \\ \vdots & & & \vdots \\ 0 & \cdots & \cdots & 0 \end{bmatrix}$$

In the first column of this exemple, there are two instructions `\Vdots` but, of course, only one dotted line is drawn.

In fact, in this example, it would be possible to draw the same matrix more easily with the following code:

```
\begin{bNiceMatrix}
0 & \Cdots & 0 \\
\Vdots & & \Vdots \\
& & \Vdots \\
0 & \Cdots & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ \vdots & & \vdots \\ & & \vdots \\ 0 & \cdots & 0 \end{bmatrix}$$

There are also other means to change the size of the matrix. Someone might want to use the optional argument of the command `\Vdots` for the vertical dimension and a command `\hspace*` in a cell for the horizontal dimension.<sup>34</sup>

However, a command `\hspace*` might interfer with the construction of the dotted lines. That's why the package `nicematrix` provides a command `\Hspace` which is a variant of `\hspace` transparent for the dotted lines of `nicematrix`.

```
\begin{bNiceMatrix}
0 & \Cdots & \Hspace*[1cm] & 0 \\
\Vdots & & & \Vdots \\[1cm]
0 & \Cdots & & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & & 0 \\ \vdots & & & \vdots \\ 0 & \cdots & & 0 \end{bmatrix}$$

## 10.1 The option `nullify-dots`

Consider the following matrix composed classically with the environment `{pmatrix}` of `amsmath`.

```
$A = \begin{pmatrix} h & i & j & k & l & m \\ x & & & & & x \end{pmatrix}
```

If we add `\ldots` instructions in the second row, the geometry of the matrix is modified.

```
$B = \begin{pmatrix} h & i & j & k & l & m \\ x & \ldots & \ldots & \ldots & \ldots & x \end{pmatrix}
```

By default, with `nicematrix`, if we replace `{pmatrix}` by `{pNiceMatrix}` and `\ldots` by `\Ldots`, the geometry of the matrix is not changed.

```
$C = \begin{pNiceMatrix} h & i & j & k & l & m \\ x & \Ldots & \Ldots & \Ldots & \Ldots & x \end{pNiceMatrix}
```

---

<sup>34</sup>In `nicematrix`, one should use `\hspace*` and not `\hspace` for such an usage because `nicematrix` loads `array`. One may also remark that it's possible to fix the width of a column by using the environment `{NiceArray}` (or one of its variants) with a column of type `w` or `W`: see p. 19

However, one may prefer the geometry of the first matrix  $A$  and would like to have such a geometry with a dotted line in the second row. It's possible by using the option `nullify-dots` (and only one instruction `\Ldots` is necessary).

```
$D = \begin{pNiceMatrix} [nullify-dots]
h & i & j & k & l & m \\
x & \Ldots & & & x
\end{pNiceMatrix}$
```

$$D = \begin{pmatrix} h & i & j & k & l & m \\ x & \dots & & & & x \end{pmatrix}$$

The option `nullify-dots` smashes the instructions `\Ldots` (and the variants) horizontally but also vertically.

## 10.2 The commands `\Hdotsfor` and `\Vdotsfor`

Some people commonly use the command `\hdotsfor` of `amsmath` in order to draw horizontal dotted lines in a matrix. In the environments of `nicematrix`, one should use instead `\Hdotsfor` in order to draw dotted lines similar to the other dotted lines drawn by the package `nicematrix`.

As with the other commands of `nicematrix` (like `\Cdots`, `\Ldots`, `\Vdots`, etc.), the dotted line drawn with `\Hdotsfor` extends until the contents of the cells on both sides.

```
$\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
1 & \Hdotsfor{3} & 5 \\
1 & 2 & 3 & 4 & 5 \\
1 & 2 & 3 & 4 & 5
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & \dots & & & 5 \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

However, if these cells are empty, the dotted line extends only in the cells specified by the argument of `\Hdotsfor` (by design).

```
$\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
& \Hdotsfor{3} \\
1 & 2 & 3 & 4 & 5 \\
1 & 2 & 3 & 4 & 5
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ & \dots & & & \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

Remark: Unlike the command `\hdotsfor` of `amsmath`, the command `\Hdotsfor` may be used even when the package `colortbl`<sup>35</sup> is loaded (but you might have problem if you use `\rowcolor` on the same row as `\Hdotsfor`).

The package `nicematrix` also provides a command `\Vdotsfor` similar to `\Hdotsfor` but for the vertical dotted lines. The following example uses both `\Hdotsfor` and `\Vdotsfor`:

```
\begin{bNiceMatrix}
C[a_1,a_1] & \Cdots & C[a_1,a_n]
& \hspace*{20mm} & C[a_1,a_1^{(p)}] & \Cdots & C[a_1,a_n^{(p)}] \\
\Vdots & \Ddots & \Vdots
& \Hdotsfor{1} & \Vdots & \Ddots & \Vdots \\
C[a_n,a_1] & \Cdots & C[a_n,a_n]
& & C[a_n,a_1^{(p)}] & \Cdots & C[a_n,a_n^{(p)}] \\
\rule{0pt}{15mm}\NotEmpty & \Vdotsfor{1} & \Ddots & \Vdotsfor{1} \\
C[a_1^{(p)},a_1] & \Cdots & C[a_1^{(p)},a_n]
& & C[a_1^{(p)},a_1^{(p)}] & \Cdots & C[a_1^{(p)},a_n^{(p)}] \\
\Vdots & \Ddots & \Vdots
& \Hdotsfor{1} & \Vdots & \Ddots & \Vdots \\
C[a_n^{(p)},a_1] & \Cdots & C[a_n^{(p)},a_n]
& & C[a_n^{(p)},a_1^{(p)}] & \Cdots & C[a_n^{(p)},a_n^{(p)}]
\end{bNiceMatrix}
```

---

<sup>35</sup>We recall that when `xcolor` is loaded with the option `table`, the package `colortbl` is loaded.

$$\left[ \begin{array}{cccc} C[a_1, a_1] & \cdots & \cdots & C[a_1, a_n] \\ \vdots & & & \vdots \\ C[a_n, a_1] & \cdots & \cdots & C[a_n, a_n] \\ \vdots & & & \vdots \\ C[a_1^{(p)}, a_1] & \cdots & \cdots & C[a_1^{(p)}, a_n] \\ \vdots & & & \vdots \\ C[a_n^{(p)}, a_1] & \cdots & \cdots & C[a_n^{(p)}, a_n] \end{array} \right]$$

$$\left[ \begin{array}{cccc} C[a_1, a_1^{(p)}] & \cdots & \cdots & C[a_1, a_n^{(p)}] \\ \vdots & & & \vdots \\ C[a_n, a_1^{(p)}] & \cdots & \cdots & C[a_n, a_n^{(p)}] \\ \vdots & & & \vdots \\ C[a_1^{(p)}, a_1^{(p)}] & \cdots & \cdots & C[a_1^{(p)}, a_n^{(p)}] \\ \vdots & & & \vdots \\ C[a_n^{(p)}, a_1^{(p)}] & \cdots & \cdots & C[a_n^{(p)}, a_n^{(p)}] \end{array} \right]$$

### 10.3 How to generate the continuous dotted lines transparently

Imagine you have a document with a great number of mathematical matrices with ellipsis. You may wish to use the dotted lines of `nicematrix` without having to modify the code of each matrix. It's possible with the keys `renew-dots` and `renew-matrix`.<sup>36</sup>

- The option `renew-dots`

With this option, the commands `\ldots`, `\cdots`, `\vdots`, `\ddots`, `\iddots`<sup>31</sup> and `\hdotsfor` are redefined within the environments provided by `nicematrix` and behave like `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Idots` and `\Hdotsfor`; the command `\dots` ("automatic dots" of `amsmath`) is also redefined to behave like `\Ldots`.

- The option `renew-matrix`

With this option, the environment `{matrix}` is redefined and behave like `{NiceMatrix}`, and so on for the five variants.

Therefore, with the keys `renew-dots` and `renew-matrix`, a classical code gives directly the output of `nicematrix`.

```
\NiceMatrixOptions{renew-dots,renew-matrix}
\begin{pmatrix}
1 & \cdots & \cdots & 1 \\
0 & \ddots & & \vdots \\
\vdots & \ddots & \ddots & \vdots \\
0 & \cdots & 0 & 1
\end{pmatrix}
```

$$\begin{pmatrix} 1 & \cdots & \cdots & 1 \\ 0 & \ddots & & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ 0 & \cdots & 0 & 1 \end{pmatrix}$$

### 10.4 The labels of the dotted lines

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Idots` and `\Hdotsfor` (and the command `\line` in the `\CodeAfter` which is described p. 29) accept two optional arguments specified by the tokens `_` and `^` for labels positionned below and above the line. The arguments are composed in math mode with `\scriptstyle`.

```
$\begin{bNiceMatrix}
1 & \hspace*{1cm} & & 0 \\ 
& \Ddots^{\text{n times}} & & \\ 
0 & & & 1
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & \cdots & & 0 \\ & \ddots & \cdots & \vdots \\ & & n \text{ times} & \cdots & 1 \\ 0 & & & & 1 \end{bmatrix}$$

---

<sup>36</sup>The options `renew-dots`, `renew-matrix` can be fixed with the command `\NiceMatrixOptions` like the other options. However, they can also be fixed as options of the command `\usepackage`.

## 10.5 Customisation of the dotted lines

The dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots`, `\Hdotsfor` and `\Vdotsfor` (and by the command `\line` in the `\CodeAfter` which is described p. 29) may be customized by the following options (specified between square brackets after the command):

- `color`;
- `radius`;
- `shorten-start`, `shorten-end` and `shorten`;
- `inter`;
- `line-style`.

These options may also be fixed with `\NiceMatrixOptions`, as options of `\CodeAfter` or at the level of a given environment but, in those cases, they must be prefixed by `xdots` (`xdots` to remind that it works for `\Cdots`, `\Ldots`, `\Vdots`, etc.), and, thus have for names:

- `xdots/color`;
- `xdots/radius`;
- `xdots/shorten-start`, `xdots/shorten-end` and `xdots/shorten`;
- `xdots/inter`;
- `xdots/line-style`.

For the clarity of the explanations, we will use those names.

### The option `xdots/color`

The option `xdots/color` fixes the color of the dotted line. However, one should remark that the dotted lines drawn in the exterior rows and columns have a special treatment: cf. p. 21.

### The option `xdots/radius`

The option `radius` fixes the radius of the dots. The initial value is 0.53 pt.

### The option `xdots/shorten`

The keys `xdots/shorten-start` and `xdots/shorten-end` fix the margin at the extremities of the line. The key `xdots/shorten` fixes both parameters. The initial value is 0.3 em (it is recommended to use a unit of length dependent of the current font).

**New 6.10** The keys `xdots/shorten-start` and `xdots/shorten-end` have been introduced in version 6.10. In the previous versions, there was only `xdots/shorten`.

### The option `xdots/inter`

The option `xdots/inter` fixes the length between the dots. The initial value is 0.45 em (it is recommended to use a unit of length dependent of the current font).

### The option `xdots/line-style`

It should be pointed that, by default, the lines drawn by Tikz with the parameter `dotted` are composed of square dots (and not rounded ones).<sup>37</sup>

```
\tikz \draw [dotted] (0,0) -- (5,0) ;
```

In order to provide lines with rounded dots in the style of those provided by `\ldots` (at least with the *Computer Modern* fonts), the package `nicematrix` embeds its own system to draw a dotted line

<sup>37</sup>The first reason of this behaviour is that the PDF format includes a description for dashed lines. The lines specified with this descriptor are displayed very efficiently by the PDF readers. It's easy, starting from these dashed lines, to create a line composed by square dots whereas a line of rounded dots needs a specification of each dot in the PDF file. Nevertheless, you can have a look at the following page to see how to have dotted rules with rounded dots in Tikz:  
<https://tex.stackexchange.com/questions/52848/tikz-line-with-large-dots>

(and this system uses PGF and not Tikz). This style is called `standard` and that's the initial value of the parameter `xdots/line-style`.

However (when Tikz is loaded) it's possible to use for `xdots/line-style` any style provided by Tikz, that is to say any sequence of options provided by Tikz for the Tizk pathes (with the exception of “`color`”, “`shorten >`” and “`shorten <`”).

Here is for example a tridiagonal matrix with the style `loosely dotted`:

```
$\begin{pNiceMatrix} [nullify-dots, xdots/line-style=loosely dotted]
a & b & 0 & & \Cdots & 0 & \\
b & a & b & \Ddots & & \Vdots & \\
0 & b & a & \Ddots & & & \\
& \Ddots & \Ddots & \Ddots & & 0 & \\
& \Vdots & & & & b & \\
0 & & \Cdots & 0 & b & a &
\end{pNiceMatrix}$
```

$$\begin{pmatrix} a & b & 0 & \cdots & 0 \\ b & a & b & & \vdots \\ 0 & b & a & & \vdots \\ \vdots & & & & 0 \\ \vdots & & & & b \\ 0 & \cdots & 0 & b & a \end{pmatrix}$$

## 10.6 The dotted lines and the rules

The dotted lines determine virtual blocks which have the same behaviour regarding the rules (the rules specified by the specifier `|` in the preamble, by the command `\Hline`, by the keys `hlines`, `vlines`, `hvlines` and `hvlines-except-borders` and by the tools created by `custom-line` are not drawn within the blocks).<sup>38</sup>

```
$\begin{bNiceMatrix} [margin, hvlines]
\Block{3-3}<\text{LARGE}>\{A} & & & 0 & \\
& \hspace*{1cm} & & \Vdots & \\
& & & 0 & \\
0 & \Cdots & 0 & 0 &
\end{bNiceMatrix}$
```

$$\left[ \begin{array}{c|c} A & \begin{matrix} 0 \\ \vdots \\ 0 \end{matrix} \\ \hline 0 & \begin{matrix} \dots & 0 \end{matrix} \end{array} \right]$$

## 11 The `\CodeAfter`

The option `code-after` may be used to give some code that will be executed *after* the construction of the matrix.<sup>39</sup>

For the legibility of the code, an alternative syntax is provided: it's possible to give the instructions of the `code-after` at the end of the environment, after the keyword `\CodeAfter`. Although `\CodeAfter` is a keyword, it takes in an optional argument (between square brackets).<sup>40</sup>

The experienced users may, for instance, use the PGF/Tikz nodes created by `nicematrix` in the `\CodeAfter`. These nodes are described further beginning on p. 40.

Moreover, several special commands are available in the `\CodeAfter`: `line`, `\SubMatrix`, `\OverBrace` and `\UnderBrace`. We will now present these commands.

<sup>38</sup>On the other side, the command `\line` in the `\CodeAfter` (cf. p. 29) does *not* create block.

<sup>39</sup>There is also a key `code-before` described p. 14.

<sup>40</sup>Here are the keys accepted in that argument: `delimiters/color`, `rules` and its sub-keys and `sub-matrix` (linked to the command `\SubMatrix`) and its sub-keys.

## 11.1 The command \line in the \CodeAfter

The command `\line` draws directly dotted lines between cells or blocks. It takes in two arguments for the cells or blocks to link. Both argument may be:

- a specification of cell of the form  $i-j$  where  $i$  is the number of the row and  $j$  is the number of the column;
- **New 6.10** the name of a block (created by the command `\Block` with the key `name` of that command).

The options available for the customisation of the dotted lines created by `\Cdots`, `\Vdots`, etc. are also available for this command (cf. p. 27).

This command may be used, for example, to draw a dotted line between two adjacent cells.

```
\NiceMatrixOptions{xdots/shorten = 0.6 em}
\begin{pNiceMatrix}
I & 0 & \Cdots & 0 & \\
0 & I & \Ddots & \Vdots & \\
\Vdots & \Ddots & I & 0 & \\
0 & \Cdots & 0 & I & \\
\CodeAfter \line{2-2}{3-3}
\end{pNiceMatrix}
```

$$\begin{pmatrix} I & 0 & \cdots & 0 \\ 0 & I & \ddots & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ \vdots & \ddots & I & 0 \\ 0 & \cdots & 0 & I \end{pmatrix}$$

It can also be used to draw a diagonal line not parallel to the other diagonal lines (by default, the dotted lines drawn by `\Ddots` are “parallelized”: cf. p. 46).

```
\begin{bNiceMatrix}
1 & \Cdots & 1 & 2 & \Cdots & 2 & \\
0 & \Ddots & & \Vdots & \Vdots & \hspace*{2.5cm} & \Vdots \\
\Vdots & \Ddots & & & & & \\
0 & \Cdots & 0 & 1 & 2 & \Cdots & 2
\CodeAfter \line[shorten=6pt]{1-5}{4-7}
\end{bNiceMatrix}
```

$$\begin{bmatrix} 1 & \cdots & 1 & 2 & \cdots & 2 \\ 0 & \ddots & \ddots & \ddots & \ddots & \vdots \\ \vdots & & \ddots & \ddots & \ddots & \vdots \\ 0 & \cdots & 0 & 1 & 2 & \cdots & 2 \end{bmatrix}$$

## 11.2 The command \SubMatrix in the \CodeAfter

The command `\SubMatrix` provides a way to put delimiters on a portion of the array considered as a submatrix. The command `\SubMatrix` takes in five arguments:

- the first argument is the left delimiter, which may be any extensible delimiter provided by LaTeX : `(`, `[`, `\{`, `\langle`, `\lgroup`, `\lfloor`, etc. but also the null delimiter `.`;
- the second argument is the upper-left corner of the submatrix with the syntax  $i-j$  where  $i$  the number of row and  $j$  the number of column;
- the third argument is the lower-right corner with the same syntax;
- the fourth argument is the right delimiter;
- the last argument, which is optional, is a list of `key=value` pairs.<sup>41</sup>

---

<sup>41</sup>There is no optional argument between square brackets in first position because a square bracket just after `\SubMatrix` must be interpreted as the first (mandatory) argument of the command `\SubMatrix`: that bracket is the left delimiter of the sub-matrix to construct (eg.: `\SubMatrix[{2-2}{4-7}]`).

One should remark that the command `\SubMatrix` draws the delimiters after the construction of the array: no space is inserted by the command `\SubMatrix` itself. That's why, in the following example, we have used the key `margin` and you have added by hand some space between the third and fourth column with `\hspace{1.5em}` in the preamble of the array.

```
\begin{NiceArray}{ccc@{\hspace{1.5em}}c}[cell-space-limits=2pt,margin]
 1 & 1 & 1 & x \\
 \dfrac{1}{4} & \dfrac{1}{2} & \dfrac{1}{4} & y \\
 1 & 2 & 3 & z
\CodeAfter
  \SubMatrix({1-1}{3-3})
  \SubMatrix({1-4}{3-4})
\end{NiceArray}
```

$$\begin{pmatrix} 1 & 1 & 1 \\ \frac{1}{4} & \frac{1}{2} & \frac{1}{4} \\ 1 & 2 & 3 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

In fact, the command `\SubMatrix` also takes in two optional arguments specified by the traditional symbols `^` and `_` for material in superscript and subscript.

```
$\begin{bNiceMatrix}[right-margin=1em]
 1 & 1 & 1 \\
 1 & a & b \\
 1 & c & d
\CodeAfter
  \SubMatrix[{2-2}{3-3}]^T
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & a & b \\ 1 & c & d \end{bmatrix}^T$$

The options of the command `\SubMatrix` are as follows:

- `left-xshift` and `right-xshift` shift horizontally the delimiters (there exists also the key `xshift` which fixes both parameters);
- `extra-height` adds a quantity to the total height of the delimiters (height `\ht` + depth `\dp`);
- `delimiters/color` fixes the color of the delimiters (also available in `\NiceMatrixOptions`, in the environments with delimiters and as option of the keyword `\CodeAfter`);
- `slim` is a boolean key: when that key is in force, the horizontal position of the delimiters is computed by using only the contents of the cells of the submatrix whereas, in the general case, the position is computed by taking into account the cells of the whole columns implied in the submatrix (see example below). ;
- `vlines` contains a list of numbers of vertical rules that will be drawn in the sub-matrix (if this key is used without value, all the vertical rules of the sub-matrix are drawn);
- `hlines` is similar to `vlines` but for the horizontal rules;
- `hvlines`, which must be used without value, draws all the vertical and horizontal rules.

One should remark that these keys add their rules after the construction of the main matrix: no space is added between the rows and the columns of the array for these rules.

All these keys are also available in `\NiceMatrixOptions`, at the level of the environments of `nicematrix` or as option of the command `\CodeAfter` with the prefix `sub-matrix` which means that their names are therefore `sub-matrix/left-xshift`, `sub-matrix/right-xshift`, `sub-matrix/xshift`, etc.

```
$\begin{NiceArray}{cc@{\hspace{5mm}}l}[cell-space-limits=2pt]
  & & \frac{1}{2} \\
  & & \frac{1}{4}
a & b & \frac{1}{2}a+\frac{1}{4}b \\
c & d & \frac{1}{2}c+\frac{1}{4}d
\CodeAfter
  \SubMatrix({1-3}{2-3})
  \SubMatrix({3-1}{4-2})
  \SubMatrix({3-3}{4-3})
\end{NiceArray}$
```

$$\begin{pmatrix} & & \frac{1}{2} \\ & & \frac{1}{4} \\ a & b & \frac{1}{2}a+\frac{1}{4}b \\ c & d & \frac{1}{2}c+\frac{1}{4}d \end{pmatrix}$$

Here is the same example with the key `slim` used for one of the submatrices.

```
$\begin{NiceArray}{cc@{\hspace{5mm}}l}[cell-space-limits=2pt]
& & \frac{1}{2} \\
& & \frac{1}{4} \\
a & b & \frac{1}{2}a + \frac{1}{4}b \\
c & d & \frac{1}{2}c + \frac{1}{4}d \\
\CodeAfter
\SubMatrix({1-3}{2-3}) [slim]
\SubMatrix({3-1}{4-2})
\SubMatrix({3-3}{4-3})
\end{NiceArray}
```

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} \frac{1}{2} \\ \frac{1}{4} \end{pmatrix} = \begin{pmatrix} \frac{1}{2}a + \frac{1}{4}b \\ \frac{1}{2}c + \frac{1}{4}d \end{pmatrix}$$

There is also a key `name` which gives a name to the submatrix created by `\SubMatrix`. That name is used to create PGF/Tikz nodes: cf p. 44.

It's also possible to specify some delimiters<sup>42</sup> by placing them in the preamble of the environment (for the environments with a preamble: `{NiceArray}`, `{pNiceArray}`, etc.). This syntax is inspired by the extension `blkarray`.

When there are two successive delimiters (necessarily a closing one following by an opening one for another submatrix), a space equal to `\enskip` is automatically inserted.

```
$\begin{pNiceArray}{(c)(c)(c)}
a_{11} & a_{12} & a_{13} \\
a_{21} & \displaystyle \int_0^1 \frac{1}{x^2+1} dx & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{pNiceArray}
```

$$\begin{pmatrix} a_{11} \\ a_{21} \\ a_{31} \end{pmatrix} \left( \int_0^1 \frac{1}{x^2+1} dx \right) \begin{pmatrix} a_{13} \\ a_{23} \\ a_{33} \end{pmatrix}$$

### 11.3 The commands `\OverBrace` and `\UnderBrace` in the `\CodeAfter`

The commands `\OverBrace` and `\UnderBrace` provide a way to put horizontal braces on a part of the array. These commands take in three arguments:

- the first argument is the upper-left corner of the submatrix with the syntax  $i-j$  where  $i$  the number of row and  $j$  the number of column;
- the second argument is the lower-right corner with the same syntax;
- the third argument is the label of the brace that will be put by `nicematrix` (with PGF) above the brace (for the command `\OverBrace`) or under the brace (for `\UnderBrace`).

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 & 6 \\
11 & 12 & 13 & 14 & 15 & 16
\CodeAfter
\OverBrace{1-1}{2-3}{A}
\OverBrace{1-4}{2-6}{B}
\end{pNiceMatrix}
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 \\ 11 & 12 & 13 & 14 & 15 & 16 \end{pmatrix} \quad \text{A} \quad \text{B}$$

In fact, the commands `\OverBrace` and `\UnderBrace` take in an optional argument (in first position and between square brackets) for a list of `key=value` pairs. The available keys are:

---

<sup>42</sup>Those delimiters are `(`, `[`, `\{` and the closing ones. Of course, it's also possible to put `|` and `||` in the preamble of the environment.

- `left-shorten` and `right-shorten` which do not take in value; when the key `left-shorten` is used, the abscissa of the left extremity of the brace is computed with the contents of the cells of the involved sub-array, otherwise, the position of the potential vertical rule is used (idem for `right-shorten`).
- `shorten`, which is the conjunction of the keys `left-shorten` and `right-shorten`;
- `yshift`, which shifts vertically the brace (and its label) ;
- `color`, which sets the color of the brace (and its label).

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 & 6 \\
11 & 12 & 13 & 14 & 15 & 16 \\
\CodeAfter
    \OverBrace[shorten,yshift=3pt]{1-1}{2-3}{A}
    \OverBrace[shorten,yshift=3pt]{1-4}{2-6}{B}
\end{pNiceMatrix}
```

$$\left( \begin{array}{cccccc} & & & A & & B \\ 1 & 2 & 3 & & 4 & 5 & 6 \\ 11 & 12 & 13 & 14 & 15 & 16 \end{array} \right)$$

## 12 Captions and notes in the tabulars

### 12.1 Caption of a tabular

**New 6.12** The environment `{NiceTabular}` provides the keys `caption`, `short-caption` and `label` which may be used when the tabular is inserted in a floating environment (typically the environment `{table}`).

With the key `caption`, the caption, when it is long, is wrapped at the width of the tabular (excepted the potential exterior columns specified by `first-col` and `last-col`), without the use of the package `threeparttable` or the package `floatrow`.

By default, the caption is composed below the tabular. With the key `caption-above`, available in `\NiceMatrixOptions`, the caption will be composed above de tabular.

The key `short-caption` corresponds to the optional argument of the clasical command `\caption` and the key `label` corresponds, of course, to the command `\label`.

See table 1, p. 34 for an example of use the keys `caption` and `label`.

### 12.2 The footnotes

The package `nicematrix` allows, by using `footnote` or `footnotehyper`, the extraction of the notes inserted by `\footnote` in the environments of `nicematrix` and their composition in the footpage with the other notes of the document.

If `nicematrix` is loaded with the option `footnote` (with `\usepackage[footnote]{nicematrix}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `nicematrix` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) ant it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferently. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

### 12.3 The notes of tabular

The package `nicematrix` also provides a command `\tabularnote` which gives the ability to specify notes that will be composed at the end of the array with a width of line equal to the width of the array (excepted the potential exterior columns specified by `first-col` and `last-col`). With no surprise, that command is available only in the environments `{NiceTabular}`, `{NiceTabular*}` and `{NiceTabularX}`.

In fact, this command is available only if the extension `enumitem` has been loaded (before or after `nicematrix`). Indeed, the notes are composed at the end of the array with a type of list provided by the package `enumitem`.

```
\begin{NiceTabular}{@{}llr@{}}
\toprule \RowStyle{\bfseries}
Last name & First name & Birth day \\
\midrule
Achard\tabularnote{Achard is an old family of the Poitou.} \\
& Jacques & 5 juin 1962 \\
Lefebvre\tabularnote{The name Lefebvre is an alteration of the name Lefebure.} \\
& Mathilde & 23 mai 1988 \\
Vanesse & Stephany & 30 octobre 1994 \\
Dupont & Chantal & 15 janvier 1998 \\
\bottomrule
\end{NiceTabular}
```

Last name	First name	Birth day
Achard <sup>a</sup>	Jacques	June 5, 2005
Lefebvre <sup>b</sup>	Mathilde	January 23, 1975
Vanesse	Stephany	October 30, 1994
Dupont	Chantal	January 15, 1998

<sup>a</sup> Achard is an old family of the Poitou.

<sup>b</sup> The name Lefebvre is an alteration of the name Lefebure.

- If you have several successive commands `\tabularnote{...}` with no space at all between them, the labels of the corresponding notes are composed together, separated by commas (this is similar to the option `multiple` of `footmisc` for the footnotes).
- If a command `\tabularnote{...}` is exactly at the end of a cell (with no space at all after), the label of the note is composed in an overlapping position (towards the right). This structure may provide a better alignment of the cells of a given column.
- If the key `notes/para` is used, the notes are composed at the end of the array in a single paragraph (as with the key `para` of `threeparttable`).
- There is a key `tabularnote` which provides a way to insert some text in the zone of the notes before the numbered tabular notes.

**New 6.13** An alternative syntaxe is available with the environment `{TabularNote}`. That environment should be used at the end of the environment `{NiceTabular}` (but before a potential instruction `\CodeAfter`).

- If the package `booktabs` has been loaded (before or after `nicematrix`), the key `notes/bottomrule` draws a `\bottomrule` of `booktabs` after the notes.
- The command `\tabularnote` may be used before the environment of `nicematrix`. Thus, it's possible to use it on the title inserted by `\caption` in an environment `{table}` of LaTeX (or in a command `\captionof` of the package `caption`). It's also possible, as expected, to use the command `\tabularnote` in the caption provided by the *key* `caption` of the environment `{NiceTabular}`.

If several commands `\tabularnote` are used in a tabular with the same argument, only one note is inserted at the end of the tabular (but all the labels are composed, of course). It's possible to control that feature with the key `notes/detect-duplicates`.<sup>43</sup>

- It's possible to create a reference to a tabular note created by `\tabularnote` (with the usual command `\label` used after the `\tabularnote`).

For an illustration of some of those remarks, see table 1, p. 34. This table has been composed with the following code (the package `caption` has been loaded in this document).

```
\begin{table}
\centering
\niceMatrixOptions[caption-above]
\begin{NiceTabular}{@{}llc@{}}
[
    caption = A tabular whose caption has been specified by the key
    \texttt{\caption}\tabularnote{It's possible to put a tabular note in the caption} ,
    label = t:tabularnote ,
    tabularnote = Some text before the notes. ,
    notes/bottomrule
]
\toprule
Last name & First name & Length of life \\
\midrule
Churchill & Wiston & 91\\
Nightingale\tabularnote{Considered as the first nurse of history}
\tabularnote{Nicknamed ``the Lady with the Lamp''.}
& Florence\tabularnote{This note is shared by two references.} & 90 \\
Schoelcher & Victor & 89\tabularnote{The label of the note is overlapping.}\\
Touchet & Marie\tabularnote{This note is shared by two references.} & 89 \\
Wallis & John & 87 \\
\bottomrule
\end{NiceTabular}
\end{table}
```

Table 1: A tabular whose caption has been specified by the key `caption`<sup>a</sup>

Last name	First name	Length of life
Churchill	Wiston	91
Nightingale <sup>b,c</sup>	Florence <sup>d</sup>	90
Schoelcher	Victor	89 <sup>e</sup>
Touchet	Marie <sup>d</sup>	89
Wallis	John	87

Some text before the notes.

<sup>a</sup> It's possible to put a tabular note in the caption

<sup>b</sup> Considered as the first nurse of history.

<sup>c</sup> Nicknamed “the Lady with the Lamp”.

<sup>d</sup> This note is shared by two references.

<sup>e</sup> The label of the note is overlapping.

---

<sup>43</sup>For technical reasons, the final user is not allowed to put several commands `\tabularnote` with exactly the same argument in the caption of the tabular.

## 12.4 Customisation of the tabular notes

The tabular notes can be customized with a set of keys available in `\NiceMatrixOptions`. The name of these keys is prefixed by `notes`.

- `notes/para`
- `notes/bottomrule`
- `notes/style`
- `notes/label-in-tabular`
- `notes/label-in-list`
- `notes/enumitem-keys`
- `notes/enumitem-keys-para`
- `notes/code-before`

For sake of commodity, it is also possible to set these keys in `\NiceMatrixOptions` via a key `notes` which takes in as value a list of pairs `key=value` where the name of the keys need no longer be prefixed by `notes`:

```
\NiceMatrixOptions
{
    notes =
    {
        bottomrule ,
        style = ... ,
        label-in-tabular = ... ,
        enumitem-keys =
        {
            labelsep = ... ,
            align = ... ,
            ...
        }
    }
}
```

We detail these keys.

- The key `notes/para` requires the composition of the notes (at the end of the tabular) in a single paragraph.

Initial value: `false`

That key is also available within a given environment.

- The key `notes/bottomrule` adds a `\bottomrule` of `booktabs` after the notes. Of course, that rule is drawn only if there is really notes in the tabular. The package `booktabs` must have been loaded (before or after the package `nicematrix`). If it is not, an error is raised.

Initial value: `false`

That key is also available within a given environment.

- The key `notes/style` is a command whose argument is specified by `#1` and which gives the style of numerotation of the notes. That style will be used by `\ref` when referencing a tabular note marked with a command `\label`. The labels formatted by that style are used, separated by commas, when the user puts several consecutive commands `\tabularnote`. The marker `#1` is meant to be the name of a LaTeX counter.

Initial value: `\textit{\alph{#1}}`

Another possible value should be a mere `\arabic{#1}`

- The key **notes/label-in-tabular** is a command whose argument is specified by #1 which is used when formatting the label of a note in the tabular. Internally, this number of note has already been formatted by **notes/style** before sent to that command.

Initial value: `\textsuperscript{#1}`

In French, it's a tradition of putting a small space before the label of note. That tuning could be achieved by the following code:

```
\NiceMatrixOptions{notes/label-in-tabular = \,\textsuperscript{#1}}
```

- The key **notes/label-in-list** is a command whose argument is specified by #1 which is used when formatting the label in the list of notes at the end of the tabular. Internally, this number of note has already been formatted by **notes/style** before sent to that command.

Initial value: `\textsuperscript{#1}`

In French, the labels of notes are not composed in upper position when composing the notes. Such behaviour could be achieved by:

```
\NiceMatrixOptions{notes/label-in-list = #1.\nobreak\hspace{0.25em}}
```

The command `\nobreak` is for the event that the option `para` is used.

- The notes are composed at the end of the tabular by using internally a style of list of `enumitem`. This style of list is defined as follows (with, of course, keys of `enumitem`):

```
noitemsep , leftmargin = * , align = left , labelsep = 0pt
```

The specification `align = left` in that style requires a composition of the label leftwards in the box affected to that label. With that tuning, the notes are composed flush left, which is pleasant when composing tabulars in the spirit of `booktabs` (see for example the table 1, p. 34).

The key **notes/enumitem-keys** specifies a list of pairs `key=value` (following the specifications of `enumitem`) to customize that style of list (it uses internally the command `\setlist*` of `enumitem`).

- The key **notes/enumitem-keys-para** is similar to the previous one but corresponds to the type of list used when the option `para` is in force. Of course, when the option `para` is used, a list of type `inline` (as called by `enumitem`) is used and the pairs `key=value` should correspond to such a list of type `inline`.

Initially, the style of list is defined by: `afterlabel = \nobreak, itemjoin = \quad`

- The key **notes/code-before** is a token list inserted by `nicematrix` just before the composition of the notes at the end of the tabular.

Initial value: `empty`

For example, if one wishes to compose all the notes in gray and `\footnotesize`, he should use that key:

```
\NiceMatrixOptions{notes/code-before = \footnotesize \color{gray}}
```

It's also possible to add `\raggedright` or `\RaggedRight` in that key (`\RaggedRight` is a command of `ragged2e`).

- The key **notes/detect-duplicates** activates the detection of the commands `\tabularnotes` with the same argument.

Initial value : `true`

For an example of customisation of the tabular notes, see p. 48.

## 12.5 Use of {NiceTabular} with threeparttable

If you wish to use the environment `{NiceTabular}`, `{NiceTabular*}` `{NiceTabularX}` in an environment `{threeparttable}` of the eponymous package, you have to patch the environment `{threeparttable}` with the following code (with a version of LaTeX at least 2020/10/01).

```
\makeatletter
\AddToHook{env/threeparttable/begin}
  {\TPT@hookin{NiceTabular}\TPT@hookin{NiceTabular*}\TPT@hookin{NiceTabularX}}
\makeatother
```

## 13 Other features

### 14 Autres fonctionnalités

#### 14.1 Command \ShowCellNames

The command `\ShowCellNames`, which may be used in the `\CodeBefore` and in the `\CodeAfter` display the name (with the form  $i-j$ ) of each cell. When used in the `\CodeAfter`, that command applies a semi-transparent white rectangle to fade the array (caution: some PDF readers don't support transparency).

```
\begin{NiceTabular}{ccc}[hvlines,cell-space-limits=3pt]
\Block{2-2}{} & & test \\
& & blabla \\
& some text & nothing
\CodeAfter \ShowCellNames
\end{NiceTabular}
```

1-1	1-2	1-3
2-1	2-2	2-3
3-1	3-2	3-3

#### 14.2 Use of the column type S of siunitx

If the package `siunitx` is loaded (before or after `nicematrix`), it's possible to use the `S` column type of `siunitx` in the environments of `nicematrix`. The implementation doesn't use explicitly any private macro of `siunitx`.

```
$\begin{pNiceArray}{ScW{c}{1cm}c}[nullify-dots,first-row]
{C_1} & \cdots & C_n \\
2.3 & 0 & 0 \\
12.4 & \vdots & \vdots \\
1.45 & \vdots & \vdots \\
7.2 & 0 & 0
\end{pNiceArray}$
```

$$\begin{pmatrix} C_1 & \cdots & C_n \\ 2.3 & 0 & 0 \\ 12.4 & \vdots & \vdots \\ 1.45 & \vdots & \vdots \\ 7.2 & 0 & 0 \end{pmatrix}$$

On the other hand, the `d` columns of the package `dcolumn` are not supported by `nicematrix`.

#### 14.3 Default column type in {NiceMatrix}

**New 6.11** The environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.) and the commande `\pAutoNiceMatrix` (and its variants) provide an option `columns-type` to specify the type of column which will be used (the initial value is, of course, `c`).

The keys `l` and `r` are shortcuts for `columns-type=l` and `columns-type=r`.

```
$\begin{bNiceMatrix}[r]
\cos x & -\sin x \\
\sin x & \cos x
\end{bNiceMatrix}$
```

$$\begin{bmatrix} \cos x & -\sin x \\ \sin x & \cos x \end{bmatrix}$$

The key `columns-type` is available in `\NiceMatrixOptions` but with the prefix `matrix`, which means that its name is, within `\NiceMatrixOptions : matrix/columns-type`.

## 14.4 The command `\rotate`

The package `nicematrix` provides a command `\rotate`. When used in the beginning of a cell, this command composes the contents of the cell after a rotation of  $90^\circ$  in the direct sens.

In the following command, we use that command in the `code-for-first-row`.<sup>44</sup>

```
\NiceMatrixOptions%
{code-for-first-row = \scriptstyle \rotate \text{image of },
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[first-row,last-col=4]
e_1 & e_2 & e_3 & \\
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \atop e_2 \atop e_3}^{\text{image of } e_1 \atop \text{image of } e_2 \atop \text{image of } e_3}$$

If the command `\rotate` is used in the “last row” (exterior to the matrix), the corresponding elements are aligned upwards as shown below.

```
\NiceMatrixOptions%
{code-for-last-row = \scriptstyle \rotate ,
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[last-row=4,last-col=4]
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3 \\
\text{image of } e_1 & e_2 & e_3 &
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \atop e_2 \atop e_3}^{\text{image of } e_1 \atop \text{image of } e_2 \atop \text{image of } e_3}$$

## 14.5 The option `small`

With the option `small`, the environments of the package `nicematrix` are composed in a way similar to the environment `{smallmatrix}` of the package `amsmath` (and the environments `{psmallmatrix}`, `{bsmallmatrix}`, etc. of the package `mathtools`).

```
$\begin{bNiceArray}{cccc|c} [small,
 last-col,
 code-for-last-col = \scriptscriptstyle,
 columns-width = 3mm ]
1 & -2 & 3 & 4 & 5 \\
0 & 3 & 2 & 1 & 2 \gets 2L_1 - L_2 \\
0 & 1 & 1 & 2 & 3 \gets L_1 + L_3
\end{bNiceArray}$
```

$$\left[ \begin{array}{ccccc} 1 & -2 & 3 & 4 & 5 \\ 0 & 3 & 2 & 1 & 2 \\ 0 & 1 & 1 & 2 & 3 \end{array} \right]_{L_2 \leftarrow -2L_1 - L_2 \atop L_3 \leftarrow L_1 + L_3}$$

One should note that the environment `{NiceMatrix}` with the option `small` is not composed *exactly* as the environment `{smallmatrix}`. Indeed, all the environments of `nicematrix` are constructed upon `{array}` (of the package `array`) whereas the environment `{smallmatrix}` is constructed directly with an `\halign` of TeX.

In fact, the option `small` corresponds to the following tuning:

- the cells of the array are composed with `\scriptstyle`;

---

<sup>44</sup>It can also be used in `\RowStyle` (cf. p. 18).

- `\arraystretch` is set to 0.47;
- `\arraycolsep` is set to 1.45 pt;
- the characteristics of the dotted lines are also modified.

## 14.6 The counters `iRow` and `jCol`

In the cells of the array, it's possible to use the LaTeX counters `iRow` and `jCol` which represent the number of the current row and the number of the current column<sup>45</sup>. Of course, the user must not change the value of these counters which are used internally by `nicematrix`.

In the `\CodeBefore` (cf. p. 14) and in the `\CodeAfter` (cf. p. 28), `iRow` represents the total number of rows (excepted the potential exterior rows) and `jCol` represents the total number of columns (excepted the potential exterior columns).

```
$\begin{pNiceMatrix}%
  % don't forget the %
  [first-row,
   first-col,
   code-for-first-row = \mathbf{\alpha{jCol}} ,
   code-for-first-col = \mathbf{\arabic{iRow}} ]
   & & & \\
   & 1 & 2 & 3 & 4 \\
   & 5 & 6 & 7 & 8 \\
   & 9 & 10 & 11 & 12 \\
  \end{pNiceMatrix}$
```

$$\begin{matrix} & \mathbf{a} & \mathbf{b} & \mathbf{c} & \mathbf{d} \\ \mathbf{1} & \left( \begin{matrix} 1 & 2 & 3 & 4 \end{matrix} \right) \\ \mathbf{2} & \left( \begin{matrix} 5 & 6 & 7 & 8 \end{matrix} \right) \\ \mathbf{3} & \left( \begin{matrix} 9 & 10 & 11 & 12 \end{matrix} \right) \end{matrix}$$

If LaTeX counters called `iRow` and `jCol` are defined in the document by packages other than `nicematrix` (or by the final user), they are shadowed in the environments of `nicematrix`.

The package `nicematrix` also provides commands in order to compose automatically matrices from a general pattern. These commands are `\AutoNiceMatrix`, `\pAutoNiceMatrix`, `\bAutoNiceMatrix`, `\vAutoNiceMatrix`, `\VAutoNiceMatrix` and `\BAutoNiceMatrix`.

These commands take in two mandatory arguments. The first is the format of the matrix, with the syntax  $n-p$  where  $n$  is the number of rows and  $p$  the number of columns. The second argument is the pattern (it's a list of tokens which are inserted in each cell of the constructed matrix).

```
$C = \pAutoNiceMatrix{3-3}{C_{\arabic{iRow},\arabic{jCol}}} $
```

$$C = \begin{pmatrix} C_{1,1} & C_{1,2} & C_{1,3} \\ C_{2,1} & C_{2,2} & C_{2,3} \\ C_{3,1} & C_{3,2} & C_{3,3} \end{pmatrix}$$

## 14.7 The key `light-syntax`

The option `light-syntax` (inspired by the package `spalign`) allows the user to compose the arrays with a lighter syntax, which gives a better legibility of the TeX source.

When this option is used, one should use the semicolon for the end of a row and spaces or tabulations to separate the columns. However, as usual in the TeX world, the spaces after a control sequence are discarded and the elements between curly braces are considered as a whole.

```
$\begin{bNiceMatrix}[\light-syntax,first-row,first-col]
{} a & b & ; & a & b \\
a & 2\cos a & \{\cos a + \cos b\} & ; & a & 2\cos a & \cos a + \cos b \\
b & \cos a + \cos b & \{ 2 \cos b \} & ; & b & \cos a + \cos b & 2\cos b \\
\end{bNiceMatrix}$
```

---

<sup>45</sup>We recall that the exterior “first row” (if it exists) has the number 0 and that the exterior “first column” (if it exists) has also the number 0.

It's possible to change the character used to mark the end of rows with the option `end-of-row`. As said before, the initial value is a semicolon.

When the option `light-syntax` is used, it is not possible to put verbatim material (for example with the command `\verb!`) in the cells of the array.<sup>46</sup>

## 14.8 Color of the delimiters

For the environments with delimiters (`{pNiceArray}`, `{pNiceMatrix}`, etc.), it's possible to change the color of the delimiters with the key `delimiters/color`.

```
$\begin{bNiceMatrix} [delimiters/color=red]
1 & 2 \\
3 & 4
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

This colour also applies to the delimiters drawn by the command `\SubMatrix` (cf. p. 29).

## 14.9 The environment `{NiceArrayWithDelims}`

In fact, the environment `{pNiceArray}` and its variants are based upon a more general environment, called `{NiceArrayWithDelims}`. The first two mandatory arguments of this environment are the left and right delimiters used in the construction of the matrix. It's possible to use `{NiceArrayWithDelims}` if we want to use atypical or asymmetrical delimiters.

```
$\begin{NiceArrayWithDelims}{\downarrow}{\uparrow}{ccc}[margin]
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{NiceArrayWithDelims}$
```

$$\left| \begin{array}{ccc} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{array} \right|$$

## 14.10 The command `\OnlyMainNiceMatrix`

The command `\OnlyMainNiceMatrix` executes its argument only when it is in the main part of the array, that is to say it is not in one of the exterior rows. If it is used outside an environment of `nicematrix`, that command is no-op.

For an example of utilisation, see [tex.stackexchange.com/questions/488566](https://tex.stackexchange.com/questions/488566)

# 15 Use of Tikz with `nicematrix`

## 15.1 The nodes corresponding to the contents of the cells

The package `nicematrix` creates a PGF/Tikz node for each (non-empty) cell of the considered array. These nodes are used to draw the dotted lines between the cells of the matrix (inter alia).

**Caution :** By default, no node is created in a empty cell.

However, it's possible to impose the creation of a node with the command `\NotEmpty`.<sup>47</sup>

The nodes of a document must have distinct names. That's why the names of the nodes created by `nicematrix` contains the number of the current environment. Indeed, the environments of `nicematrix` are numbered by a internal global counter.

---

<sup>46</sup>The reason is that, when the option `light-syntax` is used, the whole content of the environment is loaded as a TeX argument to be analyzed. The environment doesn't behave in that case as a standard environment of LaTeX which only put TeX commands before and after the content.

<sup>47</sup>One should note that, with that command, the cell is considered as non-empty, which has consequences for the continuous dotted lines (cf. p. 23) and the computation of the “corners” (cf. p. 10).

In the environment with the number  $n$ , the node of the row  $i$  and column  $j$  has for name `nm-n-i-j`. The command `\NiceMatrixLastEnv` provides the number of the last environment of `nicematrix` (for LaTeX, it's a “fully expandable” command and not a counter).

However, it's advisable to use instead the key `name`. This key gives a name to the current environment. When the environment has a name, the nodes are accessible with the name “`name-i-j`” where `name` is the name given to the array and  $i$  and  $j$  the numbers of row and column. It's possible to use these nodes with PGF but the final user will probably prefer to use Tikz (which is a convenient layer upon PGF). However, one should remind that `nicematrix` doesn't load Tikz by default. In the following examples, we assume that Tikz has been loaded.

```
$\begin{pNiceMatrix} [name=mymatrix]
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{pNiceMatrix}$
\tikz[remember picture,overlay]
\draw (mymatrix-2-2) circle (2mm) ;
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

Don't forget the options `remember picture` and `overlay`.

In the `\CodeAfter`, the things are easier : one must refer to the nodes with the form  $i-j$  (we don't have to indicate the environment which is of course the current environment).

```
$\begin{pNiceMatrix}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\CodeAfter
\tikz \draw (2-2) circle (2mm) ;
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

In the following example, we have underlined all the nodes of the matrix (we explain below the technic used : cf. p. 55).

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

The nodes of the last column (excepted the potential «last column» specified by `last-col`) may also be indicated by `i-last`. Similarly, the nodes of the last row may be indicated by `last-j`.

### 15.1.1 The columns V of `varwidth`

When the extension `varwidth` is loaded, the columns of the type `V` defined by `varwidth` are supported by `nicematrix`. It may be interessant to notice that, for a cell of a column of type `V`, the PGF/Tikz node created by `nicematrix` for the content of that cell has a width adjusted to the content of the cell. This is in contrast to the case of the columns of type `p`, `m` or `b` for which the nodes have always a width equal to the width of the column. In the following example, the command `\lipsum` is provided by the eponymous package.

```
\begin{NiceTabular}{V{10cm}}
\bfseries \large
Titre \\
\lipsum[1] [1-4]
\CodeAfter
\tikz \draw [rounded corners] (1-1) -| (last-|2) -- (last-|1) |- (1-1) ;
\end{NiceTabular}
```

## Titre

  Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna.

We have used the nodes corresponding to the position of the potential rules, which are described below (cf. p. 44).

### 15.2 The “medium nodes” and the “large nodes”

In fact, the package `nicematrix` can create “extra nodes”: the “medium nodes” and the “large nodes”. The first ones are created with the option `create-medium-nodes` and the second ones with the option `create-large-nodes`.<sup>48</sup>

These nodes are not used by `nicematrix` by default, and that’s why they are not created by default.

The names of the “medium nodes” are constructed by adding the suffix “`-medium`” to the names of the “normal nodes”. In the following example, we have underlined the “medium nodes”. We consider that this example is self-explanatory.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & \underline{a} & \underline{a+b} \\ a & \underline{a} & \underline{a} \end{pmatrix}$$

The names of the “large nodes” are constructed by adding the suffix “`-large`” to the names of the “normal nodes”. In the following example, we have underlined the “large nodes”. We consider that this example is self-explanatory.<sup>49</sup>

$$\begin{pmatrix} a & a+b & a+b+c \\ a & \underline{a} & \underline{a+b} \\ a & \underline{a} & \underline{a} \end{pmatrix}$$

The “large nodes” of the first column and last column may appear too small for some usage. That’s why it’s possible to use the options `left-margin` and `right-margin` to add space on both sides of the array and also space in the “large nodes” of the first column and last column. In the following example, we have used the options `left-margin` and `right-margin`.<sup>50</sup>

$$\begin{pmatrix} a & a+b & a+b+c \\ a & \underline{a} & \underline{a+b} \\ a & \underline{a} & \underline{a} \end{pmatrix}$$

It’s also possible to add more space on both side of the array with the options `extra-left-margin` and `extra-right-margin`. These margins are not incorporated in the “large nodes”. It’s possible to fix both values with the option `extra-margin` and, in the following example, we use `extra-margin` with the value 3 pt.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & \underline{a} & \underline{a+b} \\ a & \underline{a} & \underline{a} \end{pmatrix}$$

**Be careful :** These nodes are reconstructed from the contents of the contents cells of the array. Usually, they do not correspond to the cells delimited by the rules (if we consider that these rules are drawn).

---

<sup>48</sup>There is also an option `create-extra-nodes` which is an alias for the conjunction of `create-medium-nodes` and `create-large-nodes`.

<sup>49</sup>There is no “large nodes” created in the exterior rows and columns (for these rows and columns, cf. p. 21).

<sup>50</sup>The options `left-margin` and `right-margin` take dimensions as values but, if no value is given, the default value is used, which is `\arraycolsep` (by default: 5 pt). There is also an option `margin` to fix both `left-margin` and `right-margin` to the same value.

Here is an array composed with the following code:

```
\large
\begin{NiceTabular}{wl{2cm}ll}[hvlines]
fraise & amande & abricot \\
prune & pêche & poire \\
noix & noisette & brugnon
\end{NiceTabular}
```

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here, we have colored all the cells of the array with `\chessboardcolors`.

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here are the “large nodes” of this array (without use of `margin` nor `extra-margin`).

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

The nodes we have described are not available by default in the `\CodeBefore` (described p. 14). It’s possible to have these nodes available in the `\CodeBefore` by using the key `create-cell-nodes` of the keyword `\CodeBefore` (in that case, the nodes are created first before the construction of the array by using informations written on the aux file and created a second time during the construction of the array itself).

Here is an example which uses these nodes in the `\CodeAfter`.

```
\begin{NiceArray}{c@{\;}c@{\;}c@{\;}c@{\;}c}[create-medium-nodes]
u_1 &-& u_0 &=& r \\
u_2 &-& u_1 &=& r \\
u_3 &-& u_2 &=& r \\
u_4 &-& u_3 &=& r \\
\phantom{u_5} && \phantom{u_4} && \&\smash{\vdots} & \\
u_n &-& u_{n-1} &=& r \\[3pt]
\hline
u_n &-& u_0 &=& nr \\
\CodeAfter
\tikz[very thick, red, opacity=0.4, name suffix = -medium]
\draw (1-1.north west) -- (2-3.south east)
(2-1.north west) -- (3-3.south east)
(3-1.north west) -- (4-3.south east)
(4-1.north west) -- (5-3.south east)
(5-1.north west) -- (6-3.south east) ;
\end{NiceArray}
```

$$\begin{array}{rcl}
u_1 - u_0 &=& r \\
u_2 - u_1 &=& r \\
u_3 - u_2 &=& r \\
u_4 - u_3 &=& r \\
&\vdots& \\
u_n - u_{n-1} &=& r \\
\hline
u_n - u_0 &=& nr
\end{array}$$

### 15.3 The nodes which indicate the position of the rules

The package `nicematrix` creates a PGF/Tikz node merely called  $i$  (with the classical prefix) at the intersection of the horizontal rule of number  $i$  and the vertical rule of number  $i$  (more specifically the potential position of those rules because maybe there are not actually drawn). The last node has also an alias called `last`. There is also a node called  $i.5$  midway between the node  $i$  and the node  $i+1$ . These nodes are available in the `\CodeBefore` and the `\CodeAfter`.

	<sup>1</sup> • <sub>1.5</sub>	tulipe	lys	
arum		• <sub>2.5</sub>	violette mauve	
muguet	dahlia		• <sub>3.5</sub>	<sub>4</sub>

If we use Tikz (we remind that `nicematrix` does not load Tikz by default, by only PGF, which is a sub-layer of Tikz), we can access, in the `\CodeAfter` but also in the `\CodeBefore`, to the intersection of the (potential) horizontal rule  $i$  and the (potential) vertical rule  $j$  with the syntax  $(i|-j)$ .

```
\begin{NiceMatrix}
\CodeBefore
    \tikz \draw [fill=red!15] (7-|4) |- (8-|5) |- (9-|6) |- cycle ;
\Body
1 \\
1 & 1 \\
1 & 2 & 1 \\
1 & 3 & 3 & 1 \\
1 & 4 & 6 & 4 & 1 \\
1 & 5 & 10 & 10 & 5 & 1 \\
1 & 6 & 15 & 20 & 15 & 6 & 1 \\
1 & 7 & 21 & 35 & 35 & 21 & 7 & 1 \\
1 & 8 & 28 & 56 & 70 & 56 & 28 & 8 & 1
\end{NiceMatrix}
```

1
1 1
1 2 1
1 3 3 1
1 4 6 4 1
1 5 10 10 5 1
1 6 15 20 15 6 1
1 7 21 35 35 21 7 1
1 8 28 56 70 56 28 8 1

The nodes of the form  $i.5$  may be used, for example to cross a row of a matrix (if Tikz is loaded).

```
$\begin{pNiceArray}{ccc|c}
2 & 1 & 3 & 0 \\
3 & 3 & 1 & 0 \\
3 & 3 & 1 & 0
\CodeAfter
    \tikz \draw [red] (3.5-|1) -- (3.5-|last) ;
\end{pNiceArray}$
```

$$\left( \begin{array}{ccc|c} 2 & 1 & 3 & 0 \\ 3 & 3 & 1 & 0 \\ 3 & 3 & 1 & 0 \end{array} \right)$$

### 15.4 The nodes corresponding to the command `\SubMatrix`

The command `\SubMatrix` available in the `\CodeAfter` has been described p. 29.

If a command `\SubMatrix` has been used with the key `name` with an expression such as `name=MyName` three PGF/Tikz nodes are created with the names `MyName-left`, `MyName` and `MyName-right`.

The nodes `MyName-left` and `MyName-right` correspond to the delimiters left and right and the node `MyName` correspond to the submatrix itself.

In the following example, we have highlighted these nodes (the submatrix itself has been created with `\SubMatrix\{{2-2}\{3-3}\}`).

$$\begin{pmatrix} 121 & 23 & 345 & 345 \\ 45 & \left\{ \begin{array}{cc} 346 & 863 \end{array} \right\} 444 \\ 3462 & \left\{ \begin{array}{c} 38458 \\ 34 \end{array} \right\} 294 \\ 34 & 7 & 78 & 309 \end{pmatrix}$$

## 16 API for the developpers

The package `nicematrix` provides two variables which are internal but public<sup>51</sup>:

- `\g_nicematrix_code_before_tl` ;
- `\g_nicematrix_code_after_tl`.

These variables contain the code of what we have called the “code-before” (usually specified at the beginning of the environment with the syntax using the keywords `\CodeBefore` and `\Body`) and the “code-after” (usually specified at the end of the environment after the keyword `\CodeAfter`). The developper can use them to add code from a cell of the array (the affectation must be global, allowing to exit the cell, which is a TeX group).

One should remark that the use of `\g_nicematrix_code_before_tl` needs one compilation more (because the instructions are written on the `aux` file to be used during the next run).

*Example* : We want to write a command `\crossbox` to draw a cross in the current cell. This command will take in an optional argument between square brackets for a list of pairs `key-value` which will be given to Tikz before the drawing.

It's possible to program such command `\crossbox` as follows, explicitely using the public variable `\g_nicematrix_code_before_tl`.

```
\ExplSyntaxOn
\cs_new_protected:Nn \__pantigny_crossbox:n
{
    \tikz \draw [ #3 ]
        ( #1 -| \int_eval:n { #2 + 1 } ) -- ( \int_eval:n { #1 + 1 } -| #2 )
        ( #1 -| #2 ) -- ( \int_eval:n { #1 + 1 } -| \int_eval:n { #2 + 1 } ) ;
}

\NewDocumentCommand \crossbox { ! O { } }
{
    \tl_gput_right:Nx \g_nicematrix_code_before_tl
    {
        \__pantigny_crossbox:n
        { \int_use:c { c@iRow } }
        { \int_use:c { c@jCol } }
        { \exp_not:n { #1 } }
    }
}
\ExplSyntaxOff
```

---

<sup>51</sup> According to the LaTeX3 conventions, each variable with name beginning with `\g_nicematrix` ou `\l_nicematrix` is public and each variable with name beginning with `\g_nicematrix` or `\l_nicematrix` is private.

Here is an example of utilisation:

```
\begin{NiceTabular}{ccc}[hvlines]
\CodeBefore
    \arraycolor{gray!10}
\Body
merlan & requin & cabillaud \\
baleine & \crossbox[red] & morue \\
mante & raie & poule
\end{NiceTabular}
```

merlan	requin	cabillaud
baleine	X	morue
mante	raie	poule

## 17 Technical remarks

First remark: the package `underscore` must be loaded before `nicematrix`.

### 17.1 Diagonal lines

By default, all the diagonal lines<sup>52</sup> of a same array are “parallelized”. That means that the first diagonal line is drawn and, then, the other lines are drawn parallel to the first one (by rotation around the left-most extremity of the line). That’s why the position of the instructions `\Ddots` in the array can have a marked effect on the final result.

In the following examples, the first `\Ddots` instruction is written in color:

Example with parallelization (default):

```
$A = \begin{pNiceMatrix}
1 & \Cdots & & 1 & \\
a+b & \Ddots & & \Vdots & \\
\Vdots & \Ddots & & & \\
a+b & \Cdots & a+b & & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & \cdots & \cdots & 1 \\ a+b & \cdots & \cdots & \cdots & \vdots \\ \vdots & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & \cdots & a+b & 1 \end{pmatrix}$$

```
$A = \begin{pNiceMatrix}
1 & \Cdots & & 1 & \\
a+b & & & \Vdots & \\
\Vdots & \Ddots & \Ddots & & \\
a+b & \Cdots & a+b & & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & \cdots & \cdots & 1 \\ a+b & \cdots & \cdots & \cdots & \vdots \\ \vdots & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & \cdots & a+b & 1 \end{pmatrix}$$

It’s possible to turn off the parallelization with the option `parallelize-diags` set to `false`:

The same example without parallelization:

$$A = \begin{pmatrix} 1 & \cdots & \cdots & \cdots & 1 \\ a+b & \cdots & \cdots & \cdots & \vdots \\ \vdots & \cdots & \cdots & \cdots & \vdots \\ a+b & \cdots & \cdots & a+b & 1 \end{pmatrix}$$

It’s possible to specify the instruction `\Ddots` which will be drawn first (and which will be used to draw the other diagonal dotted lines when the parallelization is in force) with the key `draw-first: \Ddots[draw-first]`.

---

<sup>52</sup>We speak of the lines created by `\Ddots` and not the lines created by a command `\line` in the `\CodeAfter`.

## 17.2 The “empty” cells

An instruction like `\Ldots`, `\Cdots`, etc. tries to determine the first non-empty cell on both sides. When the key `corners` is used (cf. p. 10), `nicematrix` computes corners consisting of empty cells. However, an “empty cell” is not necessarily a cell with no TeX content (that is to say a cell with no token between the two ampersands `&`). The precise rules are as follow.

- An implicit cell is empty. For example, in the following matrix:

```
\begin{pmatrix}
a & b \\
c \\
\end{pmatrix}
```

the last cell (second row and second column) is empty.

- For the columns of type `p`, `m`, `b`, `V`<sup>53</sup> and `X`<sup>54</sup>, the cell is empty if (and only if) its content in the TeX code is empty (there is only spaces between the ampersands `&`).
- For the columns of type `c`, `l`, `r` and `w{...}{...}`, the cell is empty if (and only if) its TeX output has a width equal to zero.
- A cell containing the command `\NotEmpty` is not empty (and a PGF/Tikz node is created in that cell).
- A cell with only a command `\Hspace` (or `\Hspace*`) is empty. This command `\Hspace` is a command defined by the package `nicematrix` with the same meaning as `\hspace` except that the cell where it is used is considered as empty. This command can be used to fix the width of some columns of the matrix without interfering with `nicematrix`.

## 17.3 The option `exterior-arraycolsep`

The environment `{array}` inserts an horizontal space equal to `\arraycolsep` before and after each column. In particular, there is a space equal to `\arraycolsep` before and after the array. This feature of the environment `{array}` was probably not a good idea<sup>55</sup>. The environment `{matrix}` of `amsmath` and its variants (`{pmatrix}`, `{vmatrix}`, etc.) of `amsmath` prefer to delete these spaces with explicit instructions `\hskip -\arraycolsep`<sup>56</sup>. The package `nicematrix` does the same in all its environments, `{NiceArray}` included. However, if the user wants the environment `{NiceArray}` behaving by default like the environment `{array}` of `array` (for example, when adapting an existing document) it's possible to control this behaviour with the option `exterior-arraycolsep`, set by the command `\NiceMatrixOptions`. With this option, exterior spaces of length `\arraycolsep` will be inserted in the environments `{NiceArray}` (the other environments of `nicematrix` are not affected).

## 17.4 Incompatibilities

The package `nicematrix` is not compatible with the class `ieeaccess` (because that class is not compatible with PGF/Tikz).<sup>57</sup>

In order to use `nicematrix` with the class `aastex631`, you have to add the following lines in the preamble of your document :

<sup>53</sup>The columns of type `V` are provided by `varwidth`: cf. p. 20.

<sup>54</sup>See p. 21

<sup>55</sup>In the documentation of `{amsmath}`, we can read: *The extra space of `\arraycolsep` that `array` adds on each side is a waste so we remove it [in `{matrix}`] (perhaps we should instead remove it from `array` in general, but that's a harder task).*

<sup>56</sup>And not by inserting `@{}` on both sides of the preamble of the array. As a consequence, the length of the `\hline` is not modified and may appear too long, in particular when using square brackets.

<sup>57</sup>See <https://tex.stackexchange.com/questions/528975/error-loading-tikz-in-ieeeaccess-class>

```
\BeforeBegin{NiceTabular}{\let\begin\BeginEnvironment\let\end\EndEnvironment}
\BeforeBegin{NiceArray}{\let\begin\BeginEnvironment}
\BeforeBegin{NiceMatrix}{\let\begin\BeginEnvironment}
```

In order to use `nicematrix` with the class `sn-jnl`, `pgf` must be loaded before the `\documentclass`:

```
\RequirePackage{pgf}
\documentclass{sn-jnl}
```

The package `nicematrix` is not fully compatible with the package `arydshln` (because this package redefines many internal of `array`). By any means, in the context of `nicematrix`, it's recommended to draw dashed rules with the tools provided by `nicematrix`, by creating a customized line style with `custom-line`: cf. p. 11.

## 18 Examples

### 18.1 Utilisation of the key “tikz” of the command `\Block`

The key `tikz` of the command `\Block` is available only when `Tikz` is loaded.<sup>58</sup>  
For the following example, we need also the `Tikz` library `patterns`.

```
\usetikzlibrary{patterns}

\ttfamily \small
\begin{NiceTabular}{X[m] X[m] X[m]}[hvlines,cell-space-limits=3pt]
\Block[tikz={pattern=grid,pattern color=lightgray}]{}
  {pattern = grid,\ pattern color = lightgray}
& \Block[tikz={pattern = north west lines,pattern color=blue}]{}
  {pattern = north west lines,\ pattern color = blue}
& \Block[tikz={outer color = red!50, inner color=white }]{2-1}
  {outer color = red!50,\ inner color = white} \\
\Block[tikz={pattern = sixpointed stars, pattern color = blue!15}]{}
  {pattern = sixpointed stars,\ pattern color = blue!15}
& \Block[tikz={left color = blue!50}]{}
  {left color = blue!50} \\
\end{NiceTabular}
```

pattern = grid, pattern color = lightgray	pattern = north west lines, pattern color = blue	outer color = red!50, inner color = white
pattern = sixpointed stars, pattern color = blue!15	left color = blue!50	

### 18.2 Notes in the tabulars

The tools provided by `nicematrix` for the composition of the tabular notes have been presented in the section 12 p. 32.

Let's consider that we wish to number the notes of a tabular with stars.<sup>59</sup>

First, we write a command `\stars` similar the well-known commands `\arabic`, `\alph`, `\Alpha`, etc. which produces a number of stars equal to its argument<sup>60</sup>

<sup>58</sup>By default, `nicematrix` only loads `PGF`, which is a sub-layer of `Tikz`.

<sup>59</sup>Of course, it's realistic only when there is very few notes in the tabular.

<sup>60</sup>In fact: the value of its argument.

```
\ExplSyntaxOn
\NewDocumentCommand \stars { m }
  { \prg_replicate:nn { \value{#1} } { $ \star $ } }
\ExplSyntaxOff
```

Of course, we change the style of the labels with the key `notes/style`. However, it would be interesting to change also some parameters in the type of list used to compose the notes at the end of the tabular. First, we required a composition flush right for the labels with the setting `align=right`. Moreover, we want the labels to be composed on a width equal to the width of the widest label. The widest label is, of course, the label with the greatest number of stars. We know that number: it is equal to `\value{tabularnote}` (because `tabularnote` is the LaTeX counter used by `\tabularnote` and, therefore, at the end of the tabular, its value is equal to the total number of tabular notes). We use the key `widest*` of `enumitem` in order to require a width equal to that value: `widest*=\value{tabularnote}`.

```
\NiceMatrixOptions
{
  notes =
  {
    style = \stars{#1} ,
    enumitem-keys =
    {
      widest* = \value{tabularnote} ,
      align = right
    }
  }
}

\begin{NiceTabular}{|c|c|c|}{}&llr{}}
```

\toprule \RowStyle{\bfseries}  
 Last name & First name & Birth day \\

\midrule  
 Achard\tabularnote{Achard is an old family of the Poitou.}  
 & Jacques & 5 juin 1962 \\

Lefebvre\tabularnote{The name Lefebvre is an alteration of the name Lefebure.}  
 & Mathilde & 23 mai 1975 \\

Vanesse & Stephany & 30 octobre 1994 \\

Dupont & Chantal & 15 janvier 1998 \\

\bottomrule

\end{NiceTabular}

Last name	First name	Birth day
Achard*	Jacques	June 5, 2005
Lefebvre**	Mathilde	January 23, 1975
Vanesse	Stephany	October 30, 1994
Dupont	Chantal	January 15, 1998

\*Achard is an old family of the Poitou.

\*\*The name Lefebvre is an alteration of the name Lefebure.

### 18.3 Dotted lines

An example with the resultant of two polynomials:

```

\setlength{\extrarowheight}{1mm}
\begin{vNiceArray}{cccc:ccc}[columns-width=6mm]
a_0 & & & b_0 & & & \\
a_1 & \Ddots & & b_1 & \Ddots & & \\
\vdots & \vdots & & \vdots & \vdots & & \\
a_p & & a_0 & & & b_1 & \\
& \Ddots & a_1 & b_q & & \vdots & \\
& & \vdots & & \Ddots & & \\
& & a_p & & & b_q & \\
\end{vNiceArray}

```

An example for a linear system:

```

\$\\begin{pNiceArray}{*6c|c}[nullify-dots,last-col,code-for-last-col=\\scriptstyle]
1      & 1 & 1 & \\Cdots &   & 1      & 0      & \\
0      & 1 & 0 & \\Cdots &   & 0      &       & L_2 \\gets L_2-L_1 \\
0      & 0 & 1 & \\Ddots &   & \\Vdots &       & L_3 \\gets L_3-L_1 \\
&     & & \\Ddots &   &       & \\Vdots & \\Vdots \\
\\Vdots &   & & \\Ddots &   & 0      & \\
0      &   & & \\Cdots & 0 & 1      & 0      & L_n \\gets L_n-L_1
\\end{pNiceArray}$

```

$$\left( \begin{array}{cccccc|c} 1 & 1 & 1 & \dots & 1 & 0 \\ 0 & 1 & 0 & \dots & 0 & \vdots \\ 0 & 0 & 1 & \ddots & & L_2 \leftarrow L_2 - L_1 \\ \vdots & \ddots & & \ddots & & L_3 \leftarrow L_3 - L_1 \\ \vdots & & & & 0 & \vdots \\ 0 & \dots & \dots & \dots & 0 & L_n \leftarrow L_n - L_1 \\ 0 & \dots & \dots & \dots & 1 & 0 \end{array} \right)$$

#### 18.4 Dotted lines which are no longer dotted

The option `line-style` controls the style of the lines drawn by `\Ldots`, `\Cdots`, etc. Thus, it's possible with these commands to draw lines which are not longer dotted.

```
\NiceMatrixOptions{code-for-first-row = \scriptstyle,code-for-first-col = \scriptstyle }
\setcounter{MaxMatrixCols}{12}
\newcommand{\blue}{\color{blue}}
\begin{pNiceMatrix}[last-row,last-col,nullify-dots,xdots/line-style={dashed,blue}]
1 & & \Vdots & & & & \Vdots \\

```

```

& \Ddots[line-style=standard] \\
& & 1 \\
\cdots [color=blue, line-style=dashed] & & \blue 0 &
\cdots & & \blue 1 & & \cdots & \blue \leftarrow i \\
& & & & 1 \\
& & & \vdots & & \Ddots [line-style=standard] & & \vdots \\
& & & & & 1 \\
\cdots & & \blue 1 & \cdots & \cdots & \blue 0 & & & \cdots & \blue \leftarrow j \\
& & & & & 1 \\
& & & & & & \Ddots [line-style=standard] \\
& & & & \vdots & & \Ddots & & & 1 \\
& & & & \blue \overrightarrow{i} & & \blue \overrightarrow{j} \\
\end{pmatrix}

```

In fact, it's even possible to draw solid lines with the commands `\Cdots`, `\Vdots`, etc.<sup>61</sup>

```
\NiceMatrixOptions
  {nullify-dots,code-for-first-col = \color{blue},code-for-first-row=\color{blue}}
$\begin{pNiceMatrix}[first-row,first-col]
    & & \Ldots [line-style={solid,<->},shorten=0pt]^{\text{ columns}} \\
& 1 & 1 & 1 & \Ldots & 1 \\
& 1 & 1 & 1 & & 1 \\
\Vdots [line-style={solid,<->}]_{\text{ rows}} & 1 & 1 & 1 & & 1 \\
& 1 & 1 & 1 & & 1 \\
& 1 & 1 & 1 & \Ldots & 1
\end{pNiceMatrix}$
```

<i>n</i> columns					
<i>n</i> rows	1	1	1	1	1
	1	1	1	1	1
	1	1	1	1	1
	1	1	1	1	1
	1	1	1	1	1
	1	1	1	1	1

## 18.5 Dashed rules

In the following example, we use the command `\Block` to draw dashed rules. For that example, Tikz should be loaded (by `\usepackage{tikz}`).

<sup>61</sup>In this document, the Tikz library arrows.meta has been loaded, which impacts the shape of the arrow tips.

```

\begin{pNiceMatrix}
\Block[borders={bottom,right,tikz=dashed}]{2-2}{}
1 & 2 & 0 & 0 & 0 & 0 \\
4 & 5 & 0 & 0 & 0 & 0 \\
0 & 0 & \Block[borders={bottom,top,right,left,tikz=dashed}]{2-2}{}
    7 & 1 & 0 & 0 \\
0 & 0 & -1 & 2 & 0 & 0 \\
0 & 0 & 0 & 0 & \Block[borders={left,top,tikz=dashed}]{2-2}{}
    3 & 4 \\
0 & 0 & 0 & 0 & 1 & 4
\end{pNiceMatrix}

```

$$\left( \begin{array}{cc|cccc} 1 & 2 & 0 & 0 & 0 & 0 \\ 4 & 5 & 0 & 0 & 0 & 0 \\ \hline 0 & 0 & 7 & 1 & 0 & 0 \\ 0 & 0 & -1 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 & 3 & 4 \\ \hline 0 & 0 & 0 & 0 & 1 & 4 \end{array} \right)$$

## 18.6 Stacks of matrices

We often need to compose mathematical matrices on top on each other (for example for the resolution of linear systems).

In order to have the columns aligned one above the other, it's possible to fix a width for all the columns. That's what is done in the following example with the environment `{NiceMatrixBlock}` and its option `auto-columns-width`.

```

\begin{NiceMatrixBlock}[auto-columns-width]
\niceMatrixOptions
{
    light-syntax,
    last-col, code-for-last-col = \color{blue} \scriptstyle,
}
\setlength{\extrarowheight}{1mm}

$\begin{pNiceArray}{rrrr|r}
12 & -8 & 7 & 5 & 3 {} ; \\
3 & -18 & 12 & 1 & 4 ; \\
-3 & -46 & 29 & -2 & -15 ; \\
9 & 10 & -5 & 4 & 7
\end{pNiceArray}$

\smallskip
$\begin{pNiceArray}{rrrr|r}
12 & -8 & 7 & 5 & 3 ; \\
0 & 64 & -41 & 1 & 19 \{ L_2 \gets L_1 - 4L_2 \} ; \\
0 & -192 & 123 & -3 & -57 \{ L_3 \gets L_1 + 4L_3 \} ; \\
0 & -64 & 41 & -1 & -19 \{ L_4 \gets 3L_1 - 4L_4 \} ;
\end{pNiceArray}$

\smallskip
$\begin{pNiceArray}{rrrr|r}
12 & -8 & 7 & 5 & 3 ; \\
0 & 64 & -41 & 1 & 19 ; \\
0 & 0 & 0 & 0 & \{ L_3 \gets 3L_2 + L_3 \}
\end{pNiceArray}$

\smallskip
$\begin{pNiceArray}{rrrr|r}
12 & -8 & 7 & 5 & 3 {} ;

```

```

0 64 -41 1 19      ;
\end{pNiceArray}$
\end{NiceMatrixBlock}

```

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 3 & -18 & 12 & 1 & 4 \\ -3 & -46 & 29 & -2 & -15 \\ 9 & 10 & -5 & 4 & 7 \end{array} \right)$$

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & -192 & 123 & -3 & -57 \\ 0 & -64 & 41 & -1 & -19 \end{array} \right) \begin{matrix} L_2 \leftarrow L_1 - 4L_2 \\ L_3 \leftarrow L_1 + 4L_3 \\ L_4 \leftarrow 3L_1 - 4L_4 \end{matrix}$$

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right) \begin{matrix} L_3 \leftarrow 3L_2 + L_3 \end{matrix}$$

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \end{array} \right)$$

However, one can see that the last matrix is not perfectly aligned with others. That's why, in LaTeX, the parenthesis have not exactly the same width (smaller parenthesis are a bit slimmer).

In order to solve that problem, it's possible to require the delimiters to be composed with the maximal width, thanks to the boolean key `delimiters/max-width`.

```

\begin{NiceMatrixBlock}[auto-columns-width]
\niceMatrixOptions
{
    delimiters/max-width,
    light-syntax,
    last-col, code-for-last-col = \color{blue}\scriptstyle,
}
\setlength{\extrarowheight}{1mm}

$\begin{pNiceArray}{rrrr|r}
12 & -8 & 7 & 5 & 3 {} ; \\
3 & -18 & 12 & 1 & 4 {} ; \\
-3 & -46 & 29 & -2 & -15 {} ; \\
9 & 10 & -5 & 4 & 7 {} ;
\end{pNiceArray}$

```

...

```

\end{NiceMatrixBlock}

```

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 3 & -18 & 12 & 1 & 4 \\ -3 & -46 & 29 & -2 & -15 \\ 9 & 10 & -5 & 4 & 7 \end{array} \right)$$

$$\left( \begin{array}{rrrr|r} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & -192 & 123 & -3 & -57 \\ 0 & -64 & 41 & -1 & -19 \end{array} \right) \begin{matrix} L_2 \leftarrow L_1 - 4L_2 \\ L_3 \leftarrow L_1 + 4L_3 \\ L_4 \leftarrow 3L_1 - 4L_4 \end{matrix}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right) \xrightarrow{L_3 \leftarrow 3L_2 + L_3}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \end{array} \right)$$

If you wish an alignment of the different matrices without the same width for all the columns, you can construct a unique array and place the parenthesis with commands `\SubMatrix` in the `\CodeAfter`. Of course, that array can't be broken by a page break.

```
\setlength{\extrarowheight}{1mm}
\[\begin{NiceMatrix}[ r, last-col=6, code-for-last-col = \scriptstyle \color{blue} ]
```

$$\begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & 0 & 0 & 0 & 0 \end{array}$$

$$\xrightarrow{L_3 \leftarrow 3L_2 + L_3}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \end{array} \right)$$

```
\CodeAfter [sub-matrix/vlines=4]
\SubMatrix({1-1}{4-5})
\SubMatrix({5-1}{8-5})
\SubMatrix({9-1}{11-5})
\SubMatrix({12-1}{13-5})
\end{NiceMatrix}\]
```

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 3 & -18 & 12 & 1 & 4 \\ -3 & -46 & 29 & -2 & -15 \\ 9 & 10 & -5 & 4 & 7 \end{array} \right)$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & -192 & 123 & -3 & -57 \\ 0 & -64 & 41 & -1 & -19 \end{array} \right) \xrightarrow{L_2 \leftarrow L_1 - 4L_2}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & -192 & 123 & -3 & -57 \\ 0 & -64 & 41 & -1 & -19 \end{array} \right) \xrightarrow{L_3 \leftarrow L_1 + 4L_3}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right) \xrightarrow{L_4 \leftarrow 3L_1 - 4L_4}$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \end{array} \right)$$

$$\left( \begin{array}{cccc|c} 12 & -8 & 7 & 5 & 3 \\ 0 & 64 & -41 & 1 & 19 \end{array} \right) \xrightarrow{L_3 \leftarrow 3L_2 + L_3}$$

In this tabular, the instructions `\SubMatrix` are executed after the composition of the tabular and, thus, the vertical rules are drawn without adding space between the columns.

In fact, it's possible, with the key `vlines-in-sub-matrix`, to choice a letter in the preamble of the array to specify vertical rules which will be drawn in the `\SubMatrix` only (by adding space between the columns).

```

\setlength{\extrarowheight}{1mm}
\begin{NiceArray}

## 18.7 How to highlight cells of a matrix

In order to highlight a cell of a matrix, it's possible to "draw" that cell with the key `draw` of the command `\Block` (this is one of the uses of a mono-cell block<sup>62</sup>).

```

$\begin{pNiceArray}{>{\strut}cccc}[margin,rules/color=blue]
\Block[draw]{}{a_{11}} & a_{12} & a_{13} & a_{14} \\

```

---

<sup>62</sup>We recall that, if the first mandatory argument of the command `\Block` is left empty, that means that the block is a mono-cell block

```
a_{21} & \Block[draw]{}{a_{22}} & a_{23} & a_{24} \\
a_{31} & a_{32} & \Block[draw]{}{a_{33}} & a_{34} \\
a_{41} & a_{42} & a_{43} & \Block[draw]{}{a_{44}} \\
\end{pNiceArray}
```

$$\left( \begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right)$$

We should remark that the rules we have drawn are drawn *after* the construction of the array and thus, they don't spread the cells of the array. We recall that, on the other side, the commands `\hline` and `\Hline`, the specifier “|” and the options `hlines`, `vlines`, `hvlines` and `hvlines-except-borders` spread the cells.<sup>63</sup>

It's possible to color a row with `\rowcolor` in the `code-before` (or with `\rowcolor` in the first cell of the row if the key `colortbl-like` is used—even when `colortbl` is not loaded).

```
\begin{pNiceArray}{>{\strut}cccc}[margin, extra-margin=2pt,colortbl-like]
\rowcolor{red!15}A_{11} & A_{12} & A_{13} & A_{14} \\
A_{21} & \rowcolor{red!15}A_{22} & A_{23} & A_{24} \\
A_{31} & A_{32} & \rowcolor{red!15}A_{33} & A_{34} \\
A_{41} & A_{42} & A_{43} & \rowcolor{red!15}A_{44}
\end{pNiceArray}
```

$$\left( \begin{array}{cccc} A_{11} & A_{12} & A_{13} & A_{14} \\ A_{21} & A_{22} & A_{23} & A_{24} \\ A_{31} & A_{32} & A_{33} & A_{34} \\ A_{41} & A_{42} & A_{43} & A_{44} \end{array} \right)$$

However, it's not possible to do a fine tuning. That's why we describe now a method to highlight a row of the matrix.

That example and the following ones require Tikz (by default, `nicematrix` only loads PGF, which is a sub-layer of Tikz) and the Tikz library `fit`. The following lines in the preamble of your document do the job:

```
\usepackage{tikz}
\usetikzlibrary{fit}
```

We create a rectangular Tikz node which encompasses the nodes of the second row by using the tools of the Tikz library `fit`. Those nodes are not available by default in the `\CodeBefore` (for efficiency). We have to require their creation with the key `create-cell-nodes` of the keyword `\CodeBefore`.

```
\tikzset{highlight/.style={rectangle,
                           fill=red!15,
                           rounded corners = 0.5 mm,
                           inner sep=1pt,
                           fit=#1}}

$\begin{bNiceMatrix}
\CodeBefore [create-cell-nodes]
\tikz \node [highlight = (2-1) (2-3)] {} ;
\Body

```

---

<sup>63</sup>For the command `\cline`, see the remark p. 8.

```

0 & \Cdots & 0 \\
1 & \Cdots & 1 \\
0 & \Cdots & 0 \\
\end{bNiceMatrix}$

```

$$\begin{bmatrix} 0 & \cdots & 0 \\ 1 & \cdots & 1 \\ 0 & \cdots & 0 \end{bmatrix}$$

We consider now the following matrix. If we want to highlight each row of this matrix, we can use the previous technique three times.

```

\[\begin{pNiceArray}{ccc}[last-col]
\CodeBefore [create-cell-nodes]
\begin{tikzpicture}
\node [highlight = (1-1) (1-3)] {};
\node [highlight = (2-1) (2-3)] {};
\node [highlight = (3-1) (3-3)] {};
\end{tikzpicture}
\Body
a & a + b & a + b + c & L_1 \\
a & a & a + b & L_2 \\
a & a & a & L_3
\end{pNiceArray}\]

```

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

The result may seem disappointing. We can improve it by using the “medium nodes” instead of the “normal nodes”.

```

\[\begin{pNiceArray}{ccc}[last-col,create-medium-nodes]
\CodeBefore [create-cell-nodes]
\begin{tikzpicture} [name suffix = -medium]
\node [highlight = (1-1) (1-3)] {};
\node [highlight = (2-1) (2-3)] {};
\node [highlight = (3-1) (3-3)] {};
\end{tikzpicture}
\Body
a & a + b & a + b + c & L_1 \\
a & a & a + b & L_2 \\
a & a & a & L_3
\end{pNiceArray}\]

```

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

## 18.8 Utilisation of \SubMatrix in the \CodeBefore

In the following example, we illustrate the mathematical product of two matrices. The whole figure is an environment `{NiceArray}` and the three pairs of parenthesis have been added with `\SubMatrix` in the `\CodeBefore`.

$$L_i \begin{pmatrix} a_{11} & \dots & a_{1n} \\ \vdots & & \vdots \\ a_{i1} & \dots & a_{ik} & \dots & a_{in} \\ \vdots & & & & \vdots \\ a_{n1} & \dots & a_{nn} \end{pmatrix} \begin{pmatrix} b_{11} & \dots & b_{1j} & \dots & b_{1n} \\ \vdots & & \vdots & & \vdots \\ b_{kj} & & & & \vdots \\ \vdots & & & & \vdots \\ b_{n1} & \dots & b_{nj} & \dots & b_{nn} \end{pmatrix} = C_{ij}$$

```
\tikzset{highlight/.style={rectangle,
                           fill=red!15,
                           rounded corners = 0.5 mm,
                           inner sep=1pt,
                           fit=#1}}

\[\begin{NiceArray}{*{6}{c}} @{} & @{} & @{} & @{} & @{} & @{} \\ \CodeBefore [create-cell-nodes] \\ \SubMatrix({2-7}{6-last}) \\ \SubMatrix({7-2}{last-6}) \\ \SubMatrix({7-7}{last-last}) \\ \begin{tikzpicture} \\ \node [highlight = (9-2) (9-6)] {} ; \\ \node [highlight = (2-9) (6-9)] {} ; \\ \end{tikzpicture} \\ \Body \\ & & & & & & \color{blue}\scriptstyle C_j \\ & & & & & & \& b_{11} & \cdots & b_{1j} & \cdots & b_{1n} \\ & & & & & & \& \vdots & & \vdots & & \vdots \\ & & & & & & \& & & & & \vdots \\ & & & & & & \& & & & & \vdots \\ & & & & & & \& & & & & \vdots \\ & & & & & & \& & & & & \vdots \\ & a_{11} & \cdots & a_{1n} & & & \& a_{1n} & \cdots & a_{nj} & \cdots & a_{nn} \\ & \vdots & & \vdots & & & \& \vdots & & \vdots & & \vdots \\ & a_{i1} & \cdots & a_{ik} & \cdots & a_{in} & \& a_{in} & & \vdots & & \vdots \\ & \vdots & & \vdots & & & \& \vdots & & \vdots & & \vdots \\ & a_{n1} & \cdots & a_{nn} & & & \& a_{nn} & & \vdots & & \vdots \\ \color{blue}\scriptstyle L_i \\ & a_{i1} & \cdots & a_{ik} & \cdots & a_{in} & \& a_{in} & \cdots & a_{nj} & \cdots & a_{nn} \\ & \vdots & & \vdots & & & \& \vdots & & \vdots & & \vdots \\ & a_{n1} & \cdots & a_{nn} & & & \& a_{nn} & & \vdots & & \vdots \\ \CodeAfter \\ \tikz \draw [gray,shorten > = 1mm, shorten < = 1mm] (9-4.north) to [bend left] (4-9.west) ; \\ \end{NiceArray}\]
```

## 19 Implementation

By default, the package `nicematrix` doesn't patch any existing code.

However, when the option `renew-dots` is used, the commands `\cdots`, `\ldots`, `\dots`, `\vdots`, `\ddots` and `\iddots` are redefined in the environments provided by `nicematrix` as explained previously. In the same way, if the option `renew-matrix` is used, the environment `{matrix}` of `amsmath` is redefined.

On the other hand, the environment `{array}` is never redefined.

Of course, the package `nicematrix` uses the features of the package `array`. It tries to be independent of its implementation. Unfortunately, it was not possible to be strictly independent. For example, the package `nicematrix` relies upon the fact that the package `{array}` uses `\ialign` to begin the `\halign`.

## Declaration of the package and packages loaded

The prefix `nicematrix` has been registered for this package.

See: [<http://mirrors.ctan.org/macros/latex/contrib/13kernel/13prefixes.pdf>](http://mirrors.ctan.org/macros/latex/contrib/13kernel/13prefixes.pdf)

First, we load `pgfcore` and the module `shapes`. We do so because it's not possible to use `\usepgfmodule` in `\ExplSyntaxOn`.

```
1 \RequirePackage{pgfcore}
2 \usepgfmodule{shapes}
```

We give the traditional declaration of a package written with the L3 programming layer.

```
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
  {nicematrix}
  {\myfiledate}
  {\myfileversion}
  {Enhanced arrays with the help of PGF/TikZ}
```

The command for the treatment of the options of `\usepackage` is at the end of this package for technical reasons.

We load some packages.

```
9 \RequirePackage { array }
10 \RequirePackage { amsmath }

11 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { nicematrix } }
12 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { nicematrix } }
13 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { nicematrix } }
14 \cs_generate_variant:Nn \@@_error:nn { n x }
15 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { nicematrix } }
16 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { nicematrix } }
17 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { nicematrix } }
18 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { nicematrix } }
```

With Overleaf, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
19 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
20 {
21   \bool_if:NTF \c_@@_messages_for_Overleaf_bool
22     { \msg_new:nnn { nicematrix } { #1 } { #2 \\ #3 } }
23     { \msg_new:nnnn { nicematrix } { #1 } { #2 } { #3 } }
24 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currfication.

```
25 \cs_new_protected:Npn \@@_error_or_warning:n
26   { \bool_if:NTF \c_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```

27 \bool_set:Nn \c_@@_messages_for_Overleaf_bool
28 {
29     \str_if_eq_p:Vn \c_sys_jobname_str { _region_ } % for Emacs
30     || \str_if_eq_p:Vn \c_sys_jobname_str { output } % for Overleaf
31 }

32 \cs_new_protected:Npn \@@_msg_redirect_name:nn
33 { \msg_redirect_name:nnn { nicematrix } }
34 \cs_new_protected:Npn \@@_gredirect_none:n #1
35 {
36     \group_begin:
37     \globaldefs = 1
38     \@@_msg_redirect_name:nn { #1 } { none }
39     \group_end:
40 }
41 \cs_new_protected:Npn \@@_err_gredirect_none:n #1
42 {
43     \@@_error:n { #1 }
44     \@@_gredirect_none:n { #1 }
45 }
46 \cs_new_protected:Npn \@@_warning_gredirect_none:n #1
47 {
48     \@@_warning:n { #1 }
49     \@@_gredirect_none:n { #1 }
50 }
```

## Technical definitions

```

51 \tl_new:N \l_@@_argspec_tl
52 \cs_generate_variant:Nn \seq_set_split:Nnn { N V n }
53 \cs_generate_variant:Nn \keys_define:nn { n x }
54 \cs_generate_variant:Nn \str_lowercase:n { V }

55 \hook_gput_code:nmm { begindocument } { . }
56 {
57     @ifpackageloaded { varwidth }
58     { \bool_const:Nn \c_@@_varwidth_loaded_bool { \c_true_bool } }
59     { \bool_const:Nn \c_@@_varwidth_loaded_bool { \c_false_bool } }
60     @ifpackageloaded { booktabs }
61     { \bool_const:Nn \c_@@_booktabs_loaded_bool { \c_true_bool } }
62     { \bool_const:Nn \c_@@_booktabs_loaded_bool { \c_false_bool } }
63     @ifpackageloaded { enumitem }
64     { \bool_const:Nn \c_@@_enumitem_loaded_bool { \c_true_bool } }

66     @ifpackageloaded { tabularx }
67     { \bool_const:Nn \c_@@_tabularx_loaded_bool { \c_true_bool } }
68     { \bool_const:Nn \c_@@_tabularx_loaded_bool { \c_false_bool } }
69     @ifpackageloaded { floatrow }
70     { \bool_const:Nn \c_@@_floatrow_loaded_bool { \c_true_bool } }
71     { \bool_const:Nn \c_@@_floatrow_loaded_bool { \c_false_bool } }
72     @ifpackageloaded { tikz }
73 }
```

In some constructions, we will have to use a `{pgfpicture}` which *must* be replaced by a `{tikzpicture}` if Tikz is loaded. However, this switch between `{pgfpicture}` and `{tikzpicture}` can't be done dynamically with a conditional because, when the Tikz library `external` is loaded by the user, the pair `\tikzpicture-\endtikzpicture` (or `\begin{tikzpicture}-\end{tikzpicture}`) must be statically “visible” (even when externalization is not activated).

That's why we create `\c_@@_pgfortikzpicture_tl` and `\c_@@_endpgfortikzpicture_tl` which will be used to construct in a `\AtBeginDocument` the correct version of some commands. The tokens `\exp_not:N` are mandatory.

```

74     \bool_const:Nn \c_@@_tikz_loaded_bool \c_true_bool
75     \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \tikzpicture }
76     \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endtikzpicture }
77   }
78   {
79     \bool_const:Nn \c_@@_tikz_loaded_bool \c_false_bool
80     \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \pgfpicture }
81     \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endpgfpicture }
82   }
83 }
```

We test whether the current class is `revtex4-1` (deprecated) or `revtex4-2` because these classes redefines `\array` (of `array`) in a way incompatible with our programmation. At the date January 2022, the current version `revtex4-2` is 4.2e (compatible with `booktabs`).

```

84 \@ifclassloaded { revtex4-1 }
85   { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
86   {
87     \@ifclassloaded { revtex4-2 }
88       { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
89     }
```

Maybe one of the previous classes will be loaded inside another class... We try to detect that situation.

```

90   \cs_if_exist:NT \rvtx@iffORMAT@geq
91     { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
92     { \bool_const:Nn \c_@@_revtex_bool \c_false_bool }
93   }
94 }
```

  

```

95 \cs_generate_variant:Nn \tl_if_single_token_p:n { V }
```

The following regex will be used to modify the preamble of the array when the key `colortbl-like` is used.

```
96 \regex_const:Nn \c_@@_columncolor_regex { \c { columncolor } }
```

If the final user uses `nicematrix`, PGF/Tikz will write instruction `\pgfsyspdfmark` in the `aux` file. If he changes its mind and no longer loads `nicematrix`, an error may occur at the next compilation because of remanent instructions `\pgfsyspdfmark` in the `aux` file. With the following code, we try to avoid that situation.

```

97 \cs_new_protected:Npn \@@_provide_pgfsyspdfmark:
98   {
99     \iow_now:Nn \mainaux
100    {
101      \ExplSyntaxOn
102      \cs_if_free:NT \pgfsyspdfmark
103        { \cs_set_eq:NN \pgfsyspdfmark \gobblethree }
104      \ExplSyntaxOff
105    }
106    \cs_gset_eq:NN \@@_provide_pgfsyspdfmark: \prg_do_nothing:
107  }
```

We define a command `\iddots` similar to `\ddots` ( $\cdots$ ) but with dots going forward ( $\cdot\cdot$ ). We use `\ProvideDocumentCommand` and so, if the command `\iddots` has already been defined (for example by the package `mathdots`), we don't define it again.

```

108 \ProvideDocumentCommand \iddots { }
109   {
110     \mathinner
111     {
112       \tex_mkern:D 1 mu
113       \box_move_up:nn { 1 pt } { \hbox:n { . } }
```

```

114     \tex_mkern:D 2 mu
115     \box_move_up:nn { 4 pt } { \hbox:n { . } }
116     \tex_mkern:D 2 mu
117     \box_move_up:nn { 7 pt }
118     { \vbox:n { \kern 7 pt \hbox:n { . } } }
119     \tex_mkern:D 1 mu
120   }
121 }

```

This definition is a variant of the standard definition of `\ddots`.

In the `aux` file, we will have the references of the PGF/Tikz nodes created by `nicematrix`. However, when `booktabs` is used, some nodes (more precisely, some `row` nodes) will be defined twice because their position will be modified. In order to avoid an error message in this case, we will redefine `\pgfutil@check@rerun` in the `aux` file.

```

122 \hook_gput_code:nnn { begindocument } { . }
123 {
124   @ifpackageloaded { booktabs }
125   { \iow_now:Nn \mainaux \nicematrix@redefine@check@rerun }
126   { }
127 }
128 \cs_set_protected:Npn \nicematrix@redefine@check@rerun
129 {
130   \cs_set_eq:NN \@@_old_pgfutil@check@rerun \pgfutil@check@rerun

```

The new version of `\pgfutil@check@rerun` will not check the PGF nodes whose names start with `nm-` (which is the prefix for the nodes created by `nicematrix`).

```

131 \cs_set_protected:Npn \pgfutil@check@rerun ##1 ##2
132 {
133   \str_if_eq:eeF { nm- } { \tl_range:nnn { ##1 } 1 3 }
134   { \@@_old_pgfutil@check@rerun { ##1 } { ##2 } }
135 }
136 }

```

We have to know whether `colortbl` is loaded in particular for the redefinition of `\everycr`.

```

137 \bool_new:N \l_@@_colortbl_loaded_bool
138 \hook_gput_code:nnn { begindocument } { . }
139 {
140   @ifpackageloaded { colortbl }
141   { \bool_set_true:N \l_@@_colortbl_loaded_bool }
142   {

```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. We will use it to store the instruction of color for the rules even if `colortbl` is not loaded.

```

143 \cs_set_protected:Npn \CT@arc@ {}
144 \cs_set:Npn \arrayrulecolor #1 # { \CT@arc { #1 } }
145 \cs_set:Npn \CT@arc #1 #2
146 {
147   \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
148   { \cs_gset:Npn \CT@arc@ { \color #1 { #2 } } }
149 }

```

Idem for `\CT@drs@`.

```

150   \cs_set:Npn \doublerulesepcolor #1 # { \CT@drs { #1 } }
151   \cs_set:Npn \CT@drs #1 #2
152   {
153     \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
154     { \cs_gset:Npn \CT@drsc@ { \color #1 { #2 } } }
155   }
156   \cs_set:Npn \hline
157   {
158     \noalign { \ifnum 0 = ` } \fi
159     \cs_set_eq:NN \hskip \vskip
160     \cs_set_eq:NN \vrule \hrule
161     \cs_set_eq:NN \width \height

```

```

162      { \CT@arc@ \vline }
163      \futurelet \reserved@a
164      \xhline
165    }
166  }
167 }
```

We have to redefine `\cline` for several reasons. The command `\@@_cline` will be linked to `\cline` in the beginning of `{NiceArrayWithDelims}`. The following commands must *not* be protected.

```

168 \cs_set:Npn \@@_standard_cline #1 { \@@_standard_cline:w #1 \q_stop }
169 \cs_set:Npn \@@_standard_cline:w #1-#2 \q_stop
170 {
171   \int_compare:nNnT \l_@@_first_col_int = 0 { \omit & }
172   \int_compare:nNnT { #1 } > 1 { \multispan { \int_eval:n { #1 - 1 } } & }
173   \multispan { \int_eval:n { #2 - #1 + 1 } }
174 {
175   \CT@arc@
176   \leaders \hrule \height \arrayrulewidth \hfill
```

The following `\skip_horizontal:N \c_zero_dim` is to prevent a potential `\unskip` to delete the `\leaders`<sup>64</sup>

```

177   \skip_horizontal:N \c_zero_dim
178 }
```

Our `\everycr` has been modified. In particular, the creation of the `row` node is in the `\everycr` (maybe we should put it with the incrementation of `\c@iRow`). Since the following `\cr` correspond to a “false row”, we have to nullify `\everycr`.

```

179 \everycr { }
180 \cr
181 \noalign { \skip_vertical:N -\arrayrulewidth }
182 }
```

The following version of `\cline` spreads the array of a quantity equal to `\arrayrulewidth` as does `\hline`. It will be loaded excepted if the key `standard-cline` has been used.

```
183 \cs_set:Npn \@@_cline
```

We have to act in a fully expandable way since there may be `\noalign` (in the `\multispan`) to detect. That’s why we use `\@@_cline_i:en`.

```
184 { \@@_cline_i:en \l_@@_first_col_int }
```

The command `\cline_i:nn` has two arguments. The first is the number of the current column (it *must* be used in that column). The second is a standard argument of `\cline` of the form *i-j* or the form *i*.

```

185 \cs_set:Npn \@@_cline_i:nn #1 #2 { \@@_cline_i:w #1|#2- \q_stop }
186 \cs_set:Npn \@@_cline_i:w #1|#2-#3 \q_stop
187 {
188   \tl_if_empty:nTF { #3 }
189   { \@@_cline_iii:w #1|#2-#2 \q_stop }
190   { \@@_cline_ii:w #1|#2-#3 \q_stop }
191 }
192 \cs_set:Npn \@@_cline_ii:w #1|#2-#3-\q_stop
193 { \@@_cline_iii:w #1|#2-#3 \q_stop }
194 \cs_set:Npn \@@_cline_iii:w #1|#2-#3 \q_stop
195 }
```

Now, `#1` is the number of the current column and we have to draw a line from the column `#2` to the column `#3` (both included).

```

196   \int_compare:nNnT { #1 } < { #2 }
197   { \multispan { \int_eval:n { #2 - #1 } } & }
198   \multispan { \int_eval:n { #3 - #2 + 1 } }
199   {
200     \CT@arc@
```

---

<sup>64</sup>See question 99041 on TeX StackExchange.

```

201     \leaders \hrule \@height \arrayrulewidth \hfill
202     \skip_horizontal:N \c_zero_dim
203 }

```

You look whether there is another `\cline` to draw (the final user may put several `\cline`).

```

204 \peek_meaning_remove_ignore_spaces:NTF \cline
205 { & \@@_cline_i:en { \int_eval:n { #3 + 1 } } }
206 { \everycr { } \cr }
207 }
208 \cs_generate_variant:Nn \@@_cline_i:nn { e n }

```

The following command is a small shortcut.

```

209 \cs_new:Npn \@@_math_toggle_token:
210 { \bool_if:NF \l_@@_NiceTabular_bool \c_math_toggle_token }

211 \cs_new_protected:Npn \@@_set_Carc@:n #1
212 {
213     \tl_if_blank:nF { #1 }
214     {
215         \tl_if_head_eq_meaning:nNTF { #1 } [
216             { \cs_set:Npn \CT@arc@ { \color #1 } }
217             { \cs_set:Npn \CT@arc@ { \color { #1 } } }
218         ]
219     }
220 \cs_generate_variant:Nn \@@_set_Carc@:n { V }

221 \cs_new_protected:Npn \@@_set_Cdrsc@:n #1
222 {
223     \tl_if_head_eq_meaning:nNTF { #1 } [
224         { \cs_set:Npn \CT@drsc@ { \color #1 } }
225         { \cs_set:Npn \CT@drsc@ { \color { #1 } } }
226     ]
227 \cs_generate_variant:Nn \@@_set_Cdrsc@:n { V }

```

The following command must *not* be protected since it will be used to write instructions in the (internal) `\CodeBefore`.

```

228 \cs_new:Npn \@@_exp_color_arg:Nn #1 #2
229 {
230     \tl_if_head_eq_meaning:nNTF { #2 } [
231         { #1 #2 }
232         { #1 { #2 } }
233     ]
234 \cs_generate_variant:Nn \@@_exp_color_arg:Nn { N V }

```

The following command must be protected because of its use of the command `\color`.

```

235 \cs_new_protected:Npn \@@_color:n #1
236 {
237     \tl_if_blank:nF { #1 }
238     { \@@_exp_color_arg:Nn \color { #1 } }
239 }
240 \cs_generate_variant:Nn \@@_color:n { V }

241 \cs_set_eq:NN \@@_old_pgfpointanchor \pgfpointanchor

```

## The column S of siunitx

We want to know whether the package `siunitx` is loaded and, if it is loaded, we redefine the `S` columns of `siunitx`.

```

242 \bool_new:N \l_@@_siunitx_loaded_bool
243 \hook_gput_code:nnn { begindocument } { . }
244 {
245     \ifpackageloaded { siunitx }
246     { \bool_set_true:N \l_@@_siunitx_loaded_bool }

```

```

247     { }
248 }

The command \@@_renew_NC@rewrite@S: will be used in each environment of nicematrix in order to
“rewrite” the S column in each environment.
249 \hook_gput_code:nnn { begindocument } { . }
250 {
251   \bool_if:nTF { ! \l_@@_siunitx_loaded_bool }
252   { \cs_set_eq:NN \@@_renew_NC@rewrite@S: \prg_do_nothing: }
253   {
254     \cs_new_protected:Npn \@@_renew_NC@rewrite@S:
255     {
256       \renewcommand*\{\NC@rewrite@S\}[1] []
257     }
258   }
259   \@@temptokena is a toks (not supported by the L3 programming layer).
260   \tl_if_empty:nTF { ##1 }
261   {
262     \@@temptokena \exp_after:wN
263     { \tex_the:D \@@temptokena \@@_S: }
264   }
265   {
266     \@@temptokena \exp_after:wN
267     { \tex_the:D \@@temptokena \@@_S: [ ##1 ] }
268   }
269   \NC@find
270 }
271 }

272 \cs_new_protected:Npn \@@_rescan_for_spanish:N #1
273 {
274   \tl_set_rescan:Nno
275   #1
276   {
277     \char_set_catcode_other:N >
278     \char_set_catcode_other:N <
279   }
280   #1
281 }

```

## Parameters

The following counter will count the environments `{NiceArray}`. The value of this counter will be used to prefix the names of the Tikz nodes created in the array.

```
282 \int_new:N \g_@@_env_int
```

The following command is only a syntactic shortcut. It must *not* be protected (it will be used in names of PGF nodes).

```
283 \cs_new:Npn \@@_env: { nm - \int_use:N \g_@@_env_int }
```

The command `\NiceMatrixLastEnv` is not used by the package `nicematrix`. It's only a facility given to the final user. It gives the number of the last environment (in fact the number of the current environment but it's meant to be used after the environment in order to refer to that environment — and its nodes — without having to give it a name). This command *must* be expandable since it will be used in pgf nodes.

```
284 \NewExpandableDocumentCommand \NiceMatrixLastEnv { }
285   { \int_use:N \g_@@_env_int }
```

The following command is only a syntactic shortcut. The `q` in `qpoint` means *quick*.

```
286 \cs_new_protected:Npn \@@_qpoint:n #1
287   { \pgfpointanchor { \@@_env: - #1 } { center } }
```

The following counter will count the environments `{NiceMatrixBlock}`.

```
288 \int_new:N \g_@@_NiceMatrixBlock_int
```

If, in a tabular, there is a tabular note in a caption that must be composed *above* the tabular, we will store in `\l_@@_note_in_caption_int` the number of notes in that caption. It will be stored in the `aux` file.

```
289 \int_new:N \l_@@_note_in_caption_int
```

The dimension `\l_@@_columns_width_dim` will be used when the options specify that all the columns must have the same width (but, if the key `columns-width` is used with the special value `auto`, the boolean `\l_@@_auto_columns_width_bool` also will be raised).

```
290 \dim_new:N \l_@@_columns_width_dim
```

The dimension `\l_@@_col_width_dim` will be available in each cell which belongs to a column of fixed width: `w{...}{...}`, `W{...}{...}`, `p{}`, `m{}`, `b{}` but also `X` (when the actual width of that column is known, that is to say after the first compilation). It's the width of that column. It will be used by some commands `\Block`. A non positive value means that the column has no fixed width (it's a column of type `c`, `r`, `l`, etc.).

```
291 \dim_new:N \l_@@_col_width_dim
292 \dim_set:Nn \l_@@_col_width_dim { -1 cm }
```

The following counters will be used to count the numbers of rows and columns of the array.

```
293 \int_new:N \g_@@_row_total_int
294 \int_new:N \g_@@_col_total_int
```

The following parameter will be used by `\@@_create_row_node`: to avoid to create the same row-node twice (at the end of the array).

```
295 \int_new:N \g_@@_last_row_node_int
```

The following counter corresponds to the key `nb-rows` of the command `\RowStyle`.

```
296 \int_new:N \l_@@_key_nb_rows_int
```

The following token list will contain the type of horizontal alignment of the current cell as provided by the corresponding column. The possible values are `r`, `l`, `c`. For exemple, a column `p[1]{3cm}` will provide the value `l` for all the cells of the column.

```
297 \str_new:N \l_@@_hpos_cell_str
298 \str_set:Nn \l_@@_hpos_cell_str { c }
```

When there is a mono-column block (created by the command `\Block`), we want to take into account the width of that block for the width of the column. That's why we compute the width of that block in the `\g_@@_blocks_wd_dim` and, after the construction of the box `\l_@@_cell_box`, we change the width of that box to take into account the length `\g_@@_blocks_wd_dim`.

```
299 \dim_new:N \g_@@_blocks_wd_dim
```

Idem for the mono-row blocks.

```
300 \dim_new:N \g_@@_blocks_ht_dim
301 \dim_new:N \g_@@_blocks_dp_dim
```

The following dimension correspond to the key `width` (which may be fixed in `\NiceMatrixOptions` but also in an environment `{NiceTabular}`).

```
302 \dim_new:N \l_@@_width_dim
```

The sequence `\g_@@_names_seq` will be the list of all the names of environments used (via the option `name`) in the document: two environments must not have the same name. However, it's possible to use the option `allow-duplicate-names`.

```
303 \seq_new:N \g_@@_names_seq
```

We want to know whether we are in an environment of `nicematrix` because we will raise an error if the user tries to use nested environments.

```
304 \bool_new:N \l_@@_in_env_bool
```

The following key corresponds to the key `notes/detect_duplicates`.

```
305 \bool_new:N \l_@@_notes_detect_duplicates_bool
306 \bool_set_true:N \l_@@_notes_detect_duplicates_bool
```

If the user uses `{NiceArray}` or `{NiceTabular}` the flag `\g_@@_NiceArray_bool` will be raised.

```
307 \bool_new:N \g_@@_NiceArray_bool
```

In fact, if there is delimiters in the preamble of `{NiceArray}` (eg: `[cccc]`), this boolean will be set to false.

If the user uses `{NiceTabular}`, `{NiceTabular*}` or `{NiceTabularX}`, we will raise the following flag.

```
308 \bool_new:N \l_@@_NiceTabular_bool
```

If the user uses `{NiceTabular*}`, the width of the tabular (in the first argument of the environment `{NiceTabular*}`) will be stored in the following dimension.

```
309 \dim_new:N \l_@@_tabular_width_dim
```

The following dimension will be used for the total width of composite rules (*total* means that the spaces on both sides are included).

```
310 \dim_new:N \l_@@_rule_width_dim
```

If the user uses an environment without preamble, we will raise the following flag.

```
311 \bool_new:N \l_@@_Matrix_bool
```

The following boolean will be raised when the command `\rotate` is used.

```
312 \bool_new:N \g_@@_rotate_bool
```

In a cell, it will be possible to know whether we are in a cell of a column of type `X` thanks to that flag.

```
313 \bool_new:N \l_@@_X_column_bool
```

```
314 \bool_new:N \g_@@_caption_finished_bool
```

We will write in `\g_@@_aux_t1` all the instructions that we have to write on the `aux` file for the current environment. The contain of that token list will be written on the `aux` file at the end of the environment (in an instruction `\tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ t1 }`).

```
315 \tl_new:N \g_@@_aux_t1
```

The following parameter corresponds to the key `columns-type` of the environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. and also the key `matrix / columns-type` of `\NiceMatrixOptions`. However, it does *not* contain the value provided by the final user. Indeed, a transformation is done in order to have a preamble (for the package `array`) which is nicematrix-aware. That transformation is done with the command `\@@_set_preamble:Nn`.

```
316 \tl_new:N \l_@@_columns_type_t1
```

```
317 \hook_gput_code:nnn { begindocument } { . }
```

```
318 { \@@_set_preamble:Nn \l_@@_columns_type_t1 { c } }
```

```

319 \cs_new_protected:Npn \@@_test_if_math_mode:
320 {
321     \if_mode_math: \else:
322         \@@_fatal:n { Outside~math~mode }
323     \fi:
324 }

```

The letter used for the vlines which will be drawn only in the sub-matrices. `vlism` stands for *vertical lines in sub-matrices*.

```
325 \tl_new:N \l_@@_letter_vlism_tl
```

The list of the columns where vertical lines in sub-matrices (`vlism`) must be drawn. Of course, the actual value of this sequence will be known after the analyse of the preamble of the array.

```
326 \seq_new:N \g_@@_cols_vlism_seq
```

The following colors will be used to memorize the color of the potential “first col” and the potential “first row”.

```

327 \colorlet{nicematrix-last-col}{.}
328 \colorlet{nicematrix-last-row}{.}

```

The following string is the name of the current environment or the current command of `nicematrix` (despite its name which contains `env`).

```
329 \str_new:N \g_@@_name_env_str
```

The following string will contain the word *command* or *environment* whether we are in a command of `nicematrix` or in an environment of `nicematrix`. The default value is *environment*.

```

330 \tl_new:N \g_@@_com_or_env_str
331 \tl_gset:Nn \g_@@_com_or_env_str { environment }

```

The following command will be able to reconstruct the full name of the current command or environment (despite its name which contains `env`). This command must *not* be protected since it will be used in error messages and we have to use `\str_if_eq:VnTF` and not `\tl_if_eq:NnTF` because we need to be fully expandable).

```

332 \cs_new:Npn \@@_full_name_env:
333 {
334     \str_if_eq:VnTF \g_@@_com_or_env_str { command }
335     { command \space \c_backslash_str \g_@@_name_env_str }
336     { environment \space \{ \g_@@_name_env_str \} }
337 }

```

The following token list corresponds to the option `code-after` (it's also possible to set the value of that parameter with the keyword `\CodeAfter`). That parameter is *public*.

```

338 \tl_new:N \g_nicematrix_code_after_tl
339 \bool_new:N \l_@@_in_code_after_bool

```

For the key `code` of the command `\SubMatrix` (itself in the main `\CodeAfter`), we will use the following token list.

```
340 \tl_new:N \l_@@_code_tl
```

The following token list has a function similar to `\g_nicematrix_code_after_tl` but it is used internally by `nicematrix`. In fact, we have to distinguish between `\g_nicematrix_code_after_tl` and `\g_@@_pre_code_after_tl` because we must take care of the order in which instructions stored in that parameters are executed.

```
341 \tl_new:N \g_@@_pre_code_after_tl
```

```

342 \tl_new:N \g_nicematrix_code_before_tl
343 \tl_new:N \g_@@_pre_code_before_tl

```

The counters `\l_@@_old_iRow_int` and `\l_@@_old_jCol_int` will be used to save the values of the potential LaTeX counters `iRow` and `jCol`. These LaTeX counters will be restored at the end of the environment.

```
344 \int_new:N \l_@@_old_iRow_int
345 \int_new:N \l_@@_old_jCol_int
```

The TeX counters `\c@iRow` and `\c@jCol` will be created in the beginning of `{NiceArrayWithDelims}` (if they don't exist previously).

The following sequence will contain the names (without backslash) of the commands created by `custom-line` by the key `command` or `ccommand` (commands used by the final user in order to draw horizontal rules).

```
346 \seq_new:N \l_@@_custom_line_commands_seq
```

The following token list corresponds to the key `rules/color` available in the environments.

```
347 \tl_new:N \l_@@_rules_color_tl
```

The sum of the weights of all the X-columns in the preamble. The weight of a X-column is given as an optional argument between square brackets. The default value, of course, is 1.

```
348 \int_new:N \g_@@_total_X_weight_int
```

If there is at least one X-column in the preamble of the array, the following flag will be raised via the `aux` file. The length `\l_@@_x_columns_dim` will be the width of X-columns of weight 1 (the width of a column of weight  $n$  will be that dimension multiplied by  $n$ ). That value is computed after the construction of the array during the first compilation in order to be used in the following run.

```
349 \bool_new:N \l_@@_X_columns_aux_bool
350 \dim_new:N \l_@@_X_columns_dim
```

This boolean will be used only to detect in an expandable way whether we are at the beginning of the (potential) column zero, in order to raise an error if `\Hdotsfor` is used in that column.

```
351 \bool_new:N \g_@@_after_col_zero_bool
```

A kind of false row will be inserted at the end of the array for the construction of the `col` nodes (and also to fix the width of the columns when `columns-width` is used). When this special row will be created, we will raise the flag `\g_@@_row_of_col_done_bool` in order to avoid some actions set in the redefinition of `\everycr` when the last `\cr` of the `\halign` will occur (after that row of `col` nodes).

```
352 \bool_new:N \g_@@_row_of_col_done_bool
```

It's possible to use the command `\NotEmpty` to specify explicitly that a cell must be considered as non empty by `nicematrix` (the Tikz nodes are constructed only in the non empty cells).

```
353 \bool_new:N \g_@@_not_empty_cell_bool
```

`\l_@@_code_before_tl` may contain two types of informations:

- A `code-before` written in the `aux` file by a previous run. When the `aux` file is read, this `code-before` is stored in `\g_@@_code_before_i_tl` (where  $i$  is the number of the environment) and, at the beginning of the environment, it will be put in `\l_@@_code_before_tl`.
- The final user can explicitly add material in `\l_@@_code_before_tl` by using the key `code-before` or the keyword `\CodeBefore` (with the keyword `\Body`).

```
354 \tl_new:N \l_@@_code_before_tl
355 \bool_new:N \l_@@_code_before_bool
```

The following token list will contain the code inserted in each cell of the current row (this token list will be cleared at the beginning of each row).

```
356 \tl_new:N \g_@@_row_style_tl
```

The following dimensions will be used when drawing the dotted lines.

```
357 \dim_new:N \l_@@_x_initial_dim  
358 \dim_new:N \l_@@_y_initial_dim  
359 \dim_new:N \l_@@_x_final_dim  
360 \dim_new:N \l_@@_y_final_dim
```

The L3 programming layer provides scratch dimensions `\l_tmpa_dim` and `\l_tmpb_dim`. We creates two more in the same spirit.

```
361 \dim_zero_new:N \l_@@_tmpc_dim  
362 \dim_zero_new:N \l_@@_tmpd_dim
```

Some cells will be declared as “empty” (for example a cell with an instruction `\Cdots`).

```
363 \bool_new:N \g_@@_empty_cell_bool
```

The following boolean will be used to deal with the commands `\tabularnote` in the caption (command `\caption` or key `caption`).

```
364 \bool_new:N \g_@@_second_composition_bool
```

The following dimensions will be used internally to compute the width of the potential “first column” and “last column”.

```
365 \dim_new:N \g_@@_width_last_col_dim  
366 \dim_new:N \g_@@_width_first_col_dim
```

The following sequence will contain the characteristics of the blocks of the array, specified by the command `\Block`. Each block is represented by 6 components surrounded by curly braces:  
`{imin}{jmin}{imax}{jmax}{options}{contents}`.

The variable is global because it will be modified in the cells of the array.

```
367 \seq_new:N \g_@@_blocks_seq
```

We also manage a sequence of the *positions* of the blocks. In that sequence, each block is represented by only five components: `{imin}{jmin}{imax}{jmax}{name}`. A block with the key `hvlines` won’t appear in that sequence (otherwise, the lines in that block would not be drawn!).

```
368 \seq_new:N \g_@@_pos_of_blocks_seq
```

In fact, this sequence will also contain the positions of the cells with a `\diagbox`. The sequence `\g_@@_pos_of_blocks_seq` will be used when we will draw the rules (which respect the blocks).

We will also manage a sequence for the positions of the dotted lines. These dotted lines are created in the array by `\Cdots`, `\Vdots`, `\Ddots`, etc. However, their positions, that is to say, their extremities, will be determined only after the construction of the array. In this sequence, each item contains five components: `{imin}{jmin}{imax}{jmax}{name}`.

```
369 \seq_new:N \g_@@_pos_of_xdots_seq
```

The sequence `\g_@@_pos_of_xdots_seq` will be used when we will draw the rules required by the key `hvlines` (these rules won’t be drawn within the virtual blocks corresponding to the dotted lines).

The final user may decide to “stroke” a block (using, for example, the key `draw=red!15` when using the command `\Block`). In that case, the rules specified, for instance, by `hvlines` must not be drawn around the block. That’s why we keep the information of all that stroken blocks in the following sequence.

```
370 \seq_new:N \g_@@_pos_of_stroken_blocks_seq
```

If the user has used the key `corners`, all the cells which are in an (empty) corner will be stored in the following sequence.

```
371 \seq_new:N \l_@@_corners_cells_seq
```

The list of the names of the potential `\SubMatrix` in the `\CodeAfter` of an environment. Unfortunately, that list has to be global (we have to use it inside the group for the options of a given `\SubMatrix`).

```
372 \seq_new:N \g_@@_submatrix_names_seq
```

The following flag will be raised if the key `width` is used in an environment `{NiceTabular}` (not in a command `\NiceMatrixOptions`). You use it to raise an error when this key is used while no column `X` is used.

```
373 \bool_new:N \l_@@_width_used_bool
```

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with  $n > 1$  is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of  $n$ ) correspondant will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

```
374 \seq_new:N \g_@@_multicolumn_cells_seq
375 \seq_new:N \g_@@_multicolumn_sizes_seq
```

The following counters will be used when searching the extremities of a dotted line (we need these counters because of the potential “open” lines in the `\SubMatrix`—the `\SubMatrix` in the `code-before`).

```
376 \int_new:N \l_@@_row_min_int
377 \int_new:N \l_@@_row_max_int
378 \int_new:N \l_@@_col_min_int
379 \int_new:N \l_@@_col_max_int
```

The following sequence will be used when the command `\SubMatrix` is used in the `\CodeBefore` (and not in the `\CodeAfter`). It will contain the position of all the sub-matrices specified in the `\CodeBefore`. Each sub-matrix is represented by an “object” of the form  $\{i\}\{j\}\{k\}\{l\}$  where  $i$  and  $j$  are the number of row and column of the upper-left cell and  $k$  and  $l$  the number of row and column of the lower-right cell.

```
380 \seq_new:N \g_@@_submatrix_seq
```

We are able to determine the number of columns specified in the preamble (for the environments with explicit preamble of course and without the potential exterior columns).

```
381 \int_new:N \g_@@_static_num_of_col_int
```

The following parameters correspond to the keys `fill`, `draw`, `tikz`, `borders`, and `rounded-corners` of the command `\Block`.

```
382 \tl_new:N \l_@@_fill_tl
383 \tl_new:N \l_@@_draw_tl
384 \seq_new:N \l_@@_tikz_seq
385 \clist_new:N \l_@@_borders_clist
386 \dim_new:N \l_@@_rounded_corners_dim
```

The last parameter has no direct link with the [empty] corners of the array (which are computed and taken into account by `nicematrix` when the key `corners` is used).

The following token list correspond to the key `color` of the command `\Block` and also the key `color` of the command `\RowStyle`.

```
387 \tl_new:N \l_@@_color_tl
```

Here is the dimension for the width of the rule when a block (created by `\Block`) is stroked.

```
388 \dim_new:N \l_@@_line_width_dim
```

The parameters of the horizontal position of the label of a block. If the user uses the key `c` or `C`, the value is `c`. If the user uses the key `l` or `L`, the value is `l`. If the user uses the key `r` or `R`, the value is `r`. If the user has used a capital letter, the boolean `\l_@@_hpos_of_block_cap_bool` will be raised (in the second pass of the analyze of the keys of the command `\Block`).

```
389 \str_new:N \l_@@_hpos_block_str
390 \str_set:Nn \l_@@_hpos_block_str { c }
391 \bool_new:N \l_@@_hpos_of_block_cap_bool
```

For the vertical position, the possible values are `c`, `t` and `b`. Of course, it would be interesting to program a key `T` and a key `B`.

```
392 \tl_new:N \l_@@_vpos_of_block_tl
393 \tl_set:Nn \l_@@_vpos_of_block_tl { c }
```

Used when the key `draw-first` is used for `\Ddots` or `\Idots`.

```
394 \bool_new:N \l_@@_draw_first_bool
```

The following flag corresponds to the keys `vlines` and `hlines` of the command `\Block` (the key `hvlines` is the conjunction of both).

```
395 \bool_new:N \l_@@_vlines_block_bool  
396 \bool_new:N \l_@@_hlines_block_bool
```

The blocks which use the key – will store their content in a box. These boxes are numbered with the following counter.

```
397 \int_new:N \g_@@_block_box_int
```

```
398 \dim_new:N \l_@@_submatrix_extra_height_dim  
399 \dim_new:N \l_@@_submatrix_left_xshift_dim  
400 \dim_new:N \l_@@_submatrix_right_xshift_dim  
401 \clist_new:N \l_@@_hlines_clist  
402 \clist_new:N \l_@@_vlines_clist  
403 \clist_new:N \l_@@_submatrix_hlines_clist  
404 \clist_new:N \l_@@_submatrix_vlines_clist
```

The following flag will be used by (for instance) `\@@_vline_ii`. When `\l_@@_dotted_bool` is true, a dotted line (with our system) will be drawn.

```
405 \bool_new:N \l_@@_dotted_bool
```

The following flag will be set to true during the composition of a caption specified (by the key `caption`).

```
406 \bool_new:N \l_@@_in_caption_bool
```

## Variables for the exterior rows and columns

The keys for the exterior rows and columns are `first-row`, `first-col`, `last-row` and `last-col`. However, internally, these keys are not coded in a similar way.

- **First row**

The integer `\l_@@_first_row_int` is the number of the first row of the array. The default value is 1, but, if the option `first-row` is used, the value will be 0.

```
407 \int_new:N \l_@@_first_row_int  
408 \int_set:Nn \l_@@_first_row_int 1
```

- **First column**

The integer `\l_@@_first_col_int` is the number of the first column of the array. The default value is 1, but, if the option `first-col` is used, the value will be 0.

```
409 \int_new:N \l_@@_first_col_int  
410 \int_set:Nn \l_@@_first_col_int 1
```

- **Last row**

The counter `\l_@@_last_row_int` is the number of the potential “last row”, as specified by the key `last-row`. A value of `-2` means that there is no “last row”. A value of `-1` means that there is a “last row” but we don’t know the number of that row (the key `last-row` has been used without value and the actual value has not still been read in the aux file).

```
411 \int_new:N \l_@@_last_row_int  
412 \int_set:Nn \l_@@_last_row_int { -2 }
```

If, in an environment like `{pNiceArray}`, the option `last-row` is used without value, we will globally raise the following flag. It will be used to know if we have, after the construction of the array, to write in the `aux` file the number of the “last row”.<sup>65</sup>

```
413 \bool_new:N \l_@@_last_row_without_value_bool
```

Idem for `\l_@@_last_col_without_value_bool`

```
414 \bool_new:N \l_@@_last_col_without_value_bool
```

- **Last column**

For the potential “last column”, we use an integer. A value of `-2` means that there is no last column. A value of `-1` means that we are in an environment without preamble (e.g. `{bNiceMatrix}`) and there is a last column but we don’t know its value because the user has used the option `last-col` without value. A value of `0` means that the option `last-col` has been used in an environment with preamble (like `{pNiceArray}`): in this case, the key was necessary without argument.

```
415 \int_new:N \l_@@_last_col_int
416 \int_set:Nn \l_@@_last_col_int { -2 }
```

However, we have also a boolean. Consider the following code:

```
\begin{pNiceArray}{cc}[last-col]
 1 & 2 \\
 3 & 4
\end{pNiceArray}
```

In such a code, the “last column” specified by the key `last-col` is not used. We want to be able to detect such a situation and we create a boolean for that job.

```
417 \bool_new:N \g_@@_last_col_found_bool
```

This boolean is set to `false` at the end of `\@@_pre_array_ii::`.

## Some utilities

```
418 \cs_set_protected:Npn \@@_cut_on_hyphen:w #1-#2\q_stop
419 {
420   \tl_set:Nn \l_tmpa_tl { #1 }
421   \tl_set:Nn \l_tmpb_tl { #2 }
422 }
```

The following takes as argument the name of a `clist` and which should be a list of intervals of integers. It *expands* that list, that is to say, it replaces (by a sort of `mapcan` or `flat_map`) the interval by the explicit list of the integers.

```
423 \cs_new_protected:Npn \@@_expand_clist:N #1
424 {
425   \clist_if_in:NnF #1 { all }
426   {
427     \clist_clear:N \l_tmpa_clist
428     \clist_map_inline:Nn #1
429     {
430       \tl_if_in:nnTF { ##1 } { - }
431       { \@@_cut_on_hyphen:w ##1 \q_stop }
432     }
```

---

<sup>65</sup>We can’t use `\l_@@_last_row_int` for this usage because, if `nicematrix` has read its value from the `aux` file, the value of the counter won’t be `-1` any longer.

```

433     \tl_set:Nn \l_tmpa_tl { ##1 }
434     \tl_set:Nn \l_tmpb_tl { ##1 }
435   }
436   \int_step_inline:nnn { \l_tmpa_tl } { \l_tmpb_tl }
437   { \clist_put_right:Nn \l_tmpa_clist { #####1 } }
438 }
439   \tl_set_eq:NN #1 \l_tmpa_clist
440 }
441 }
```

## The command `\tabularnote`

Of course, it's possible to use `\tabularnote` in the main tabular. But there is also the possibility to use that command in the caption of the tabular. And the caption may be specified by two means:

- The caption may of course be provided by the command `\caption` in a floating environment. Of course, a command `\tabularnote` in that `\caption` makes sens only if the `\caption` is *before* the `{tabular}`.
- It's also possible to use `\tabularnote` in the value of the key `caption` of the `{NiceTabular}` when the key `caption-above` is in force. However, in that case, one must remind that the caption is composed *after* the composition of the box which contains the main tabular (that's mandatory since that caption must be wrapped with a line width equal to the width of the tabular). However, we want the labels of the successive tabular notes in the logical order. That's why:
  - The number of tabular notes present in the caption will be written on the `aux` file and available in `\l_@@_note_in_caption_int`.
  - During the composition of the main tabular, the tabular notes will be numbered from `\l_@@_note_in_caption_int+1` and the notes will be stored in `\g_@@_notes_seq`.
  - During the composition of the caption (value of `\l_@@_caption_t1`), the tabular notes will be numbered from 1 to `\l_@@_note_in_caption_int` and the notes themselves will be stored in `\g_@@_notes_in_caption_seq`.
  - After the composition of the main tabular and after the composition of the caption, the sequences `\g_@@_notes_in_caption_seq` and `\g_@@_notes_seq` will be merged (in that order) and the notes will be composed.

The LaTeX counter `tabularnote` will be used to count the tabular notes during the construction of the array (this counter won't be used during the composition of the notes at the end of the array). You use a LaTeX counter because we will use `\refstepcounter` in order to have the tabular notes referenceable.

```

442 \newcounter{tabularnote}
443 \seq_new:N \g_@@_notes_seq
444 \seq_new:N \g_@@_notes_in_caption_seq
```

Before the actual tabular notes, it's possible to put a text specified by the key `tabularnote` of the environment. The token list `\l_@@_tabularnote_t1` corresponds to the value of that key.

```
445 \tl_new:N \g_@@_tabularnote_t1
```

We prepare the tools for the formatting of the references of the footnotes (in the tabular itself). There may have several references of footnote at the same point and we have to take into account that point.

```

446 \seq_new:N \l_@@_notes_labels_seq
447 \newcounter{nicematrix_draft}
448 \cs_new_protected:Npn \@@_notes_format:n #1
449 {
450   \setcounter{nicematrix_draft}{#1}
451   \@@_notes_style:n {nicematrix_draft}
452 }
```

The following function can be redefined by using the key `notes/style`.

```
453 \cs_new:Npn \@@_notes_style:n #1 { \textit { \alph { #1 } } }
```

The following fonction can be redefined by using the key `notes/label-in-tabular`.

```
454 \cs_new:Npn \@@_notes_label_in_tabular:n #1 { \textsuperscript { #1 } }
```

The following function can be redefined by using the key `notes/label-in-list`.

```
455 \cs_new:Npn \@@_notes_label_in_list:n #1 { \textsuperscript { #1 } }
```

We define `\thetabularnote` because it will be used by LaTeX if the user want to reference a tabular which has been marked by a `\label`. The TeX group is for the case where the user has put an instruction such as `\color{red}` in `\@@_notes_style:n`.

```
456 \cs_set:Npn \thetabularnote { \@@_notes_style:n { tabularnote } }
```

The tabular notes will be available for the final user only when `enumitem` is loaded. Indeed, the tabular notes will be composed at the end of the array with a list customized by `enumitem` (a list `tabularnotes` in the general case and a list `tabularnotes*` if the key `para` is in force). However, we can test whether `enumitem` has been loaded only at the beginning of the document (we want to allow the user to load `enumitem` after `nicematrix`).

```
457 \hook_gput_code:nnn { begindocument } { . }
458 {
459   \bool_if:nTF { ! \c_@@_enumitem_loaded_bool }
460   {
461     \NewDocumentCommand \thetabularnote { m }
462     {
463       \@@_error_or_warning:n { enumitem-not-loaded }
464       \@@_gredirect_none:n { enumitem-not-loaded }
465     }
466   }
467 }
```

The type of list `tabularnotes` will be used to format the tabular notes at the end of the array in the general case and `tabularnotes*` will be used if the key `para` is in force.

```
468   \newlist { tabularnotes } { enumerate } { 1 }
469   \setlist [ tabularnotes ]
470   {
471     topsep = 0pt ,
472     noitemsep ,
473     leftmargin = * ,
474     align = left ,
475     labelsep = 0pt ,
476     label =
477       \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotesi } } ,
478   }
479   \newlist { tabularnotes* } { enumerate* } { 1 }
480   \setlist [ tabularnotes* ]
481   {
482     afterlabel = \nobreak ,
483     itemjoin = \quad ,
484     label =
485       \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotes*i } }
486   }
```

One must remind that we have allowed a `\tabular` in the caption and that caption may also be found in the list of tables (`\listoftables`). We want the command `\tabularnote` be no-op during the composition of that list. That's why we program `\tabularnote` to be no-op excepted in a floating environment or in an environment of `nicematrix`.

```
487   \NewDocumentCommand \thetabularnote { m }
488   {
489     \bool_if:nT { \cs_if_exist_p:N \capttype || \l_@@_in_env_bool }
```

```

490      {
491          \bool_if:nTF { ! \l_@@_NiceTabular_bool && \l_@@_in_env_bool }
492              { \@@_error:n { tabularnote-forbidden } }
493              {
494                  \bool_if:NTF \l_@@_in_caption_bool
495                      { \@@_tabularnote_i:n { #1 } }
496                      { \@@_tabularnote_i:n { #1 } }
497              }
498      }
499  }

```

For the version in normal conditions, that is to say not in the key `caption`.

```

500      \cs_new_protected:Npn \@@_tabularnote_i:n #1
501          {

```

You have to see whether the argument of `\tabularnote` has yet been used as argument of another `\tabularnote` in the same tabular. In that case, there will be only one note (for both commands `\tabularnote`) at the end of the tabular. We search the argument of our command `\tabularnote` in the `\g_@@_notes_seq`. The position in the sequence will be stored in `\l_tmpa_int` (0 if the text is not in the sequence yet).

```

502          \int_zero:N \l_tmpa_int
503          \bool_if:NT \l_@@_notes_detect_duplicates_bool
504              {
505                  \seq_map_indexed_inline:Nn \g_@@_notes_seq
506                      {
507                          \tl_if_eq:nnT { #1 } { ##2 }
508                              { \int_set:Nn \l_tmpa_int { ##1 } \seq_map_break: }
509                      }
510                  \int_compare:nNnf \l_tmpa_int = 0
511                      { \int_add:Nn \l_tmpa_int \l_@@_note_in_caption_int }
512              }
513          \int_compare:nNnTF \l_tmpa_int = 0
514              {
515                  \int_gincr:N \c@tabularnote
516                  \seq_put_right:Nx \l_@@_notes_labels_seq
517                      { \@@_notes_format:n { \int_use:c { c @ tabularnote } } }
518                  \seq_gput_right:Nn \g_@@_notes_seq { #1 }
519              }
520              {
521                  \seq_put_right:Nx \l_@@_notes_labels_seq
522                      { \@@_notes_format:n { \int_use:N \l_tmpa_int } }
523              }
524          \peek_meaning:NF \tabularnote
525              {

```

If the following token is *not* a `\tabularnote`, we have finished the sequence of successive commands `\tabularnote` and we have to format the labels of these tabular notes (in the array). We compose those labels in a box `\l_tmpa_box` because we will do a special construction in order to have this box in an overlapping position if we are at the end of a cell.

```

526          \hbox_set:Nn \l_tmpa_box
527              {

```

We remind that it is the command `\@@_notes_label_in_tabular:n` that will put the labels in a `\textsuperscript`.

```

528          \@@_notes_label_in_tabular:n
529              {
530                  \seq_use:Nnnn
531                      \l_@@_notes_labels_seq { , } { , } { , }
532              }
533          }

```

We want the (last) tabular note referenceable (with the standard command `\label`).

```

534          \int_gsub:Nn \c@tabularnote { 1 }
535          \int_set_eq:NN \l_tmpa_int \c@tabularnote

```

```

536     \refstepcounter { tabularnote }
537     \int_compare:nNnT \l_tmpa_int = \c@tabularnote
538         { \int_gincr:N \c@tabularnote }
539     \seq_clear:N \l_@@_notes_labels_seq
540     \hbox_overlap_right:n { \box_use:N \l_tmpa_box }

```

If the command `\tabularnote` is used exactly at the end of the cell, the `\unskip` (inserted by `array?`) will delete the skip we insert now and the label of the footnote will be composed in an overlapping position (by design).

```

541     \skip_horizontal:n { \box_wd:N \l_tmpa_box }
542     }
543 }

```

Now the version when the command is used in the key `caption`. The main difficulty is that the argument of the command `\caption` is composed several times. In order to know the number of commands `\tabularnote` in the caption, we will consider that there should not be the same tabular note twice in the caption (in the main tabular, it's possible). Once we have found a tabular note which has yet been encountered, we consider that you are in a new composition of the argument of `\caption`. At that time, we store in `\g_@@_nb_of_notes_int` the number of notes in the `\caption`.

```

544 \cs_new_protected:Npn \@@_tabularnote_i:n #1
545 {
546     \int_gincr:N \c@tabularnote
547     \bool_if:NTF \g_@@_caption_finished_bool
548     {
549         \int_compare:nNnTF
550             { \tl_count:N \g_@@_notes_in_caption_seq } > 1
551             { \int_gset:Nn \c@tabularnote { 1 } }
552         \seq_if_in:NnTF \g_@@_notes_in_caption_seq { #1 }

```

## Command for creation of rectangle nodes

The following command should be used in a `{pgfpicture}`. It creates a rectangle (empty but with a name).

#1 is the name of the node which will be created; #2 and #3 are the coordinates of one of the corner of the rectangle; #4 and #5 are the coordinates of the opposite corner.

```

582 \cs_new_protected:Npn \@@_pgf_rect_node:nnnn #1 #2 #3 #4 #5
583 {
584     \begin { pgfscope }
585     \pgfset
586     {
587         outer~sep = \c_zero_dim ,
588         inner~sep = \c_zero_dim ,
589         minimum~size = \c_zero_dim
590     }
591     \pgftransformshift { \pgfpoint { 0.5 * ( #2 + #4 ) } { 0.5 * ( #3 + #5 ) } }
592     \pgfnode
593     { rectangle }
594     { center }
595     {
596         \vbox_to_ht:nn
597         { \dim_abs:n { #5 - #3 } }
598         {
599             \vfill
600             \hbox_to_wd:nn { \dim_abs:n { #4 - #2 } } { }
601         }
602     }
603     { #1 }
604     { }
605     \end { pgfscope }
606 }
```

The command `\@@_pgf_rect_node:nnn` is a variant of `\@@_pgf_rect_node:nnnn`: it takes two PGF points as arguments instead of the four dimensions which are the coordinates.

```

607 \cs_new_protected:Npn \@@_pgf_rect_node:nnn #1 #2 #3
608 {
609     \begin { pgfscope }
610     \pgfset
611     {
612         outer~sep = \c_zero_dim ,
613         inner~sep = \c_zero_dim ,
614         minimum~size = \c_zero_dim
615     }
616     \pgftransformshift { \pgfpointscale { 0.5 } { \pgfpointadd { #2 } { #3 } } }
617     \pgfpointdiff { #3 } { #2 }
618     \pgfgetlastxy \l_tmpa_dim \l_tmpb_dim
619     \pgfnode
620     { rectangle }
621     { center }
622     {
623         \vbox_to_ht:nn
624         { \dim_abs:n \l_tmpb_dim }
625         { \vfill \hbox_to_wd:nn { \dim_abs:n \l_tmpa_dim } { } }
626     }
627     { #1 }
628     { }
629     \end { pgfscope }
630 }
```

## The options

The following parameter corresponds to the keys `caption`, `short-caption` and `label` of the environment `{NiceTabular}`.

```
631 \tl_new:N \l_@@_caption_tl
```

```

632 \tl_new:N \l_@@_short_caption_tl
633 \tl_new:N \l_@@_label_tl

```

The following parameter corresponds to the key `caption-above` of `\NiceMatrixOptions`. When this parameter is `true`, the captions of the environments `{NiceTabular}`, specified with the key `caption` are put above the tabular (and below elsewhere).

```

634 \bool_new:N \l_@@_caption_above_bool

```

By default, the commands `\cellcolor` and `\rowcolor` are available for the user in the cells of the tabular (the user may use the commands provided by `\colortbl`). However, if the key `colortbl-like` is used, these commands are available.

```

635 \bool_new:N \l_@@_colortbl_like_bool

```

By default, the behaviour of `\cline` is changed in the environments of `nicematrix`: a `\cline` spreads the array by an amount equal to `\arrayrulewidth`. It's possible to disable this feature with the key `\l_@@_standard_cline_bool`.

```

636 \bool_new:N \l_@@_standard_cline_bool

```

The following dimensions correspond to the options `cell-space-top-limit` and co (these parameters are inspired by the package `cellspace`).

```

637 \dim_new:N \l_@@_cell_space_top_limit_dim
638 \dim_new:N \l_@@_cell_space_bottom_limit_dim

```

The following dimension is the distance between two dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.45 em but it will be changed if the option `small` is used.

```

639 \dim_new:N \l_@@_xdots_inter_dim
640 \hook_gput_code:nnn { begindocument } { . }
641   { \dim_set:Nn \l_@@_xdots_inter_dim { 0.45 em } }

```

We use a hook only by security in case `revtex4-1` is used (even though it is obsolete).

The following dimension is the minimal distance between a node (in fact an anchor of that node) and a dotted line (we say “minimal” because, by definition, a dotted line is not a continuous line and, therefore, this distance may vary a little).

```

642 \dim_new:N \l_@@_xdots_shorten_start_dim
643 \dim_new:N \l_@@_xdots_shorten_end_dim
644 \hook_gput_code:nnn { begindocument } { . }
645   {
646     \dim_set:Nn \l_@@_xdots_shorten_start_dim { 0.3 em }
647     \dim_set:Nn \l_@@_xdots_shorten_end_dim { 0.3 em }
648   }

```

We use a hook only by security in case `revtex4-1` is used (even though it is obsolete).

The following dimension is the radius of the dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.53 pt but it will be changed if the option `small` is used.

```

649 \dim_new:N \l_@@_xdots_radius_dim
650 \hook_gput_code:nnn { begindocument } { . }
651   { \dim_set:Nn \l_@@_xdots_radius_dim { 0.53 pt } }

```

We use a hook only by security in case `revtex4-1` is used (even though it is obsolete).

The token list `\l_@@_xdots_line_style_tl` corresponds to the option `tikz` of the commands `\Cdots`, `\Ldots`, etc. and of the options `line-style` for the environments and `\NiceMatrixOptions`. The constant `\c_@@_standard_tl` will be used in some tests.

```

652 \tl_new:N \l_@@_xdots_line_style_tl
653 \tl_const:Nn \c_@@_standard_tl { standard }
654 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl

```

The boolean `\l_@@_light_syntax_bool` corresponds to the option `light-syntax`.

```
655 \bool_new:N \l_@@_light_syntax_bool
```

The string `\l_@@_baseline_tl` may contain one of the three values `t`, `c` or `b` as in the option of the environment `{array}`. However, it may also contain an integer (which represents the number of the row to which align the array).

```
656 \tl_new:N \l_@@_baseline_tl  
657 \tl_set:Nn \l_@@_baseline_tl c
```

The flag `\l_@@_exterior_arraycolsep_bool` corresponds to the option `exterior-arraycolsep`. If this option is set, a space equal to `\arraycolsep` will be put on both sides of an environment `{NiceArray}` (as it is done in `{array}` of `array`).

```
658 \bool_new:N \l_@@_exterior_arraycolsep_bool
```

The flag `\l_@@_parallelize_diags_bool` controls whether the diagonals are parallelized. The initial value is `true`.

```
659 \bool_new:N \l_@@_parallelize_diags_bool  
660 \bool_set_true:N \l_@@_parallelize_diags_bool
```

The following parameter correspond to the key `corners`. The elements of that `clist` must be in NW, SW, NE and SE.

```
661 \clist_new:N \l_@@_corners_clist
```

```
662 \dim_new:N \l_@@_notes_above_space_dim  
663 \hook_gput_code:nnn { begindocument } { . }  
664 { \dim_set:Nn \l_@@_notes_above_space_dim { 1 mm } }
```

We use a hook only by security in case `revtex4-1` is used (even though it is obsolete).

The flag `\l_@@_nullify_dots_bool` corresponds to the option `nullify-dots`. When the flag is down, the instructions like `\vdots` are inserted within a `\phantom` (and so the constructed matrix has exactly the same size as a matrix constructed with the classical `{matrix}` and `\ldots`, `\vdots`, etc.).

```
665 \bool_new:N \l_@@_nullify_dots_bool
```

The following flag corresponds to the key `respect-arraystretch` (that key has an effect on the blocks).

```
666 \bool_new:N \l_@@_respect_arraystretch_bool
```

The following flag will be used when the current options specify that all the columns of the array must have the same width equal to the largest width of a cell of the array (except the cells of the potential exterior columns).

```
667 \bool_new:N \l_@@_auto_columns_width_bool
```

The following boolean corresponds to the key `create-cell-nodes` of the keyword `\CodeBefore`.

```
668 \bool_new:N \g_@@_recreate_cell_nodes_bool
```

The string `\l_@@_name_str` will contain the optional name of the environment: this name can be used to access to the Tikz nodes created in the array from outside the environment.

```
669 \str_new:N \l_@@_name_str
```

The boolean `\l_@@_medium_nodes_bool` will be used to indicate whether the “medium nodes” are created in the array. Idem for the “large nodes”.

```
670 \bool_new:N \l_@@_medium_nodes_bool  
671 \bool_new:N \l_@@_large_nodes_bool
```

The boolean `\l_@@_except_borders_bool` will be raised when the key `hvlines-except-borders` will be used (but that key has also other effects).

```
672 \bool_new:N \l_@@_except_borders_bool
```

The dimension `\l_@@_left_margin_dim` correspond to the option `left-margin`. Idem for the right margin. These parameters are involved in the creation of the “medium nodes” but also in the placement of the delimiters and the drawing of the horizontal dotted lines (`\hdottedline`).

```
673 \dim_new:N \l_@@_left_margin_dim
674 \dim_new:N \l_@@_right_margin_dim
```

The dimensions `\l_@@_extra_left_margin_dim` and `\l_@@_extra_right_margin_dim` correspond to the options `extra-left-margin` and `extra-right-margin`.

```
675 \dim_new:N \l_@@_extra_left_margin_dim
676 \dim_new:N \l_@@_extra_right_margin_dim
```

The token list `\l_@@_end_of_row_tl` corresponds to the option `end-of-row`. It specifies the symbol used to mark the ends of rows when the light syntax is used.

```
677 \tl_new:N \l_@@_end_of_row_tl
678 \tl_set:Nn \l_@@_end_of_row_tl { ; }
```

The following parameter is for the color the dotted lines drawn by `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` but *not* the dotted lines drawn by `\hdottedline` and “:”.

```
679 \tl_new:N \l_@@_xdots_color_tl
```

The following token list corresponds to the key `delimiters/color`.

```
680 \tl_new:N \l_@@_delimiters_color_tl
```

Sometimes, we want to have several arrays vertically juxtaposed in order to have an alignment of the columns of these arrays. To achieve this goal, one may wish to use the same width for all the columns (for example with the option `columns-width` or the option `auto-columns-width` of the environment `{NiceMatrixBlock}`). However, even if we use the same type of delimiters, the width of the delimiters may be different from an array to another because the width of the delimiter is function of its size. That’s why we create an option called `delimiters/max-width` which will give to the delimiters the width of a delimiter (of the same type) of big size. The following boolean corresponds to this option.

```
681 \bool_new:N \l_@@_delimiters_max_width_bool
```

```
682 \keys_define:nn { NiceMatrix / xdots }
683 {
684   line-style .code:n =
685   {
686     \bool_lazy_or:nnTF
```

We can’t use `\c_@@_tikz_loaded_bool` to test whether tikz is loaded because `\NiceMatrixOptions` may be used in the preamble of the document.

```
687   { \cs_if_exist_p:N \tikzpicture }
688   { \str_if_eq_p:nn { #1 } { standard } }
689   { \tl_set:Nn \l_@@_xdots_line_style_tl { #1 } }
690   { \@@_error:n { bad-option-for-line-style } }
691   ,
692   line-style .value_required:n = true ,

## Important code used by {NiceArrayWithDelims}

The pseudo-environment \@@\_cell\_begin:w-\@@\_cell\_end: will be used to format the cells of the array. In the code, the affectations are global because this pseudo-environment will be used in the cells of a \halign (via an environment {array}).

```

1049 \cs_new_protected:Npn \@@_cell_begin:w
1050 {

```

\g\_@@\_cell\_after\_hook\_tl will be set during the composition of the box \l\_@@\_cell\_box and will be used *after* the composition in order to modify that box.

```

1051 \tl_gclear:N \g_@@_cell_after_hook_tl

```

At the beginning of the cell, we link \CodeAfter to a command which do begin with \\ (whereas the standard version of \CodeAfter does not).

```

1052 \cs_set_eq:NN \CodeAfter \@@_CodeAfter_i:

```

We increment \c@jCol, which is the counter of the columns.

```

1053 \int_gincr:N \c@jCol

```

Now, we increment the counter of the rows. We don't do this incrementation in the \everycr because some packages, like arydshln, create special rows in the \halign that we don't want to take into account.

```

1054 \int_compare:nNnT \c@jCol = 1
1055   { \int_compare:nNnT \l_@@_first_col_int = 1 \@@_begin_of_row: }

```

The content of the cell is composed in the box `\l_@@_cell_box`. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the `\@@_cell_end:` (and the potential `\c_math_toggle_token` also).

```
1056     \hbox_set:Nw \l_@@_cell_box
1057     \bool_if:NF \l_@@_NiceTabular_bool
1058     {
1059         \c_math_toggle_token
1060         \bool_if:NT \l_@@_small_bool \scriptstyle
1061     }
```

For unexplained reason, with XeTeX (and not with the other engines), the environments of `nicematrix` were all composed in black and do not take into account the color of the encompassing text. As a workaround, you peek the color in force at the beginning of the environment and we use it now (in each cell of the array).

```
1062     \color { nicematrix }
1063     \g_@@_row_style_tl
```

We will call *corners* of the matrix the cases which are at the intersection of the exterior rows and exterior columns (of course, the four corners doesn't always exist simultaneously).

The codes `\l_@@_code_for_first_row_tl` and `al` don't apply in the corners of the matrix.

```
1064     \int_compare:nNnTF \c@iRow = 0
1065     {
1066         \int_compare:nNnT \c@jCol > 0
1067         {
1068             \l_@@_code_for_first_row_tl
1069             \xglobal \colorlet { nicematrix-first-row } { . }
1070         }
1071     }
1072     {
1073         \int_compare:nNnT \c@iRow = \l_@@_last_row_int
1074         {
1075             \l_@@_code_for_last_row_tl
1076             \xglobal \colorlet { nicematrix-last-row } { . }
1077         }
1078     }
1079 }
```

The following macro `\@@_begin_of_row` is usually used in the cell number 1 of the row. However, when the key `first-col` is used, `\@@_begin_of_row` is executed in the cell number 0 of the row.

```
1080 \cs_new_protected:Npn \@@_begin_of_row:
1081 {
1082     \int_gincr:N \c@iRow
1083     \dim_gset_eq:NN \g_@@_dp_ante_last_row_dim \g_@@_dp_last_row_dim
1084     \dim_gset:Nn \g_@@_dp_last_row_dim { \box_dp:N \carstrutbox }
1085     \dim_gset:Nn \g_@@_ht_last_row_dim { \box_ht:N \carstrutbox }
1086     \pgfpicture
1087     \pgfrememberpicturepositiononpagetrue
1088     \pgfcoordinate
1089     { \c@env: - row - \int_use:N \c@iRow - base }
1090     { \pgfpoint \c_zero_dim { 0.5 \arrayrulewidth } }
1091     \str_if_empty:NF \l_@@_name_str
1092     {
1093         \pgfnodealias
1094         { \l_@@_name_str - row - \int_use:N \c@iRow - base }
1095         { \c@env: - row - \int_use:N \c@iRow - base }
1096     }
1097     \endpgfpicture
1098 }
```

Remark: If the key `recreate-cell-nodes` of the `\CodeBefore` is used, then we will add some lines to that command.

The following code is used in each cell of the array. It actualises quantities that, at the end of the array, will give informations about the vertical dimension of the two first rows and the two last rows. If the user uses the `last-row`, some lines of code will be dynamically added to this command.

```

```

1164 \@@_update_for_first_and_last_row:

```

If the cell is empty, or may be considered as if, we must not create the PGF node, for two reasons:

- it’s a waste of time since such a node would be rather pointless;
- we test the existence of these nodes in order to determine whether a cell is empty when we search the extremities of a dotted line.

However, it’s very difficult to determine whether a cell is empty. Up to now we use the following technic:

- for the columns of type p, m, b, V (of `varwidth`) or X, we test whether the cell is syntactically empty with `\@@_test_if_empty:` and `\@@_test_if_empty_for_S:`
- if the width of the box `\l_@@_cell_box` (created with the content of the cell) is equal to zero, we consider the cell as empty (however, this is not perfect since the user may have used a `\rlap`, `\llap` or a `\mathclap` of `mathtools`).
- the cells with a command `\Ldots` or `\Cdots`, `\Vdots`, etc., should also be considered as empty; if `nullify-dots` is in force, there would be nothing to do (in this case the previous commands only write an instruction in a kind of `\CodeAfter`); however, if `nullify-dots` is not in force, a phantom of `\ldots`, `\cdots`, `\vdots` is inserted and its width is not equal to zero; that’s why these commands raise a boolean `\g_@@_empty_cell_bool` and we begin by testing this boolean.

```

1165 \bool_if:NTF \g_@@_empty_cell_bool

1231 { \@@_patch_node_for_cell:n { } }

```

The second argument of the following command `\@@_instruction_of_type:nnn` defined below is the type of the instruction (`Cdots`, `Vdots`, `Ddots`, etc.). The third argument is the list of options. This command writes in the corresponding `\g_@@_type_lines_tl` the instruction which will actually draw the line after the construction of the matrix.

For example, for the following matrix,

```

\begin{pNiceMatrix}
1 & 2 & 3 & 4 \\
5 & \Cdots & & 6 \\
7 & \Cdots [color=red]
\end{pNiceMatrix}

```

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & \cdots & & 6 \\ 7 & \cdots & & \end{pmatrix}$$

the content of `\g_@@_Cdots_lines_tl` will be:

```

\@@_draw_Cdots:nnn {2}{2}{}
\@@_draw_Cdots:nnn {3}{2}{color=red}

```

The first argument is a boolean which indicates whether you must put the instruction on the left or on the right on the list of instructions.

```

```

If `booktabs` is loaded, we have to patch the macro `\@BTnormal` which is a macro of `booktabs`. The macro `\@BTnormal` draws an horizontal rule but it occurs after a vertical skip done by a low level TeX command. When this macro `\@BTnormal` occurs, the `row` node has yet been inserted by `nicematrix` before the vertical skip (and thus, at a wrong place). That why we decide to create a new `row` node (for the same row). We patch the macro `\@BTnormal` to create this `row` node. This new `row` node will overwrite the previous definition of that `row` node and we have managed to avoid the error messages of that redefinition <sup>66</sup>.

```

1347 \bool_if:NT \c_@@_booktabs_loaded_bool
1348   { \tl_put_left:Nn \@BTnormal \@@_create_row_node_i: } % modified in 6.10a

1361     { \@@_env: - row - \int_use:N \c@iRow - base }
1362   }
1363 }
```

The environment `{array}` uses internally the command `\ialign`. We change the definition of `\ialign` for several reasons. In particular, `\ialign` sets `\everycr` to `{ }` and we *need* to have to change the value of `\everycr`.

```

1364 \cs_set_nopar:Npn \ialign
1365 {
1366   \bool_if:NTF \l_@@_colortbl_loaded_bool
1367   {
1368     \CT@everycr
1369     {
1370       \noalign { \cs_gset_eq:NN \CT@row@color \prg_do_nothing: }
1371       \@@_everycr:
1372     }
1373   }
1374   { \everycr { \@@_everycr: } }
1375 \tabskip = \c_zero_skip
```

The box `\@arstrutbox` is a box constructed in the beginning of the environment `{array}`. The construction of that box takes into account the current value of `\arraystretch`<sup>67</sup> and `\extrarowheight` (of `array`). That box is inserted (via `\@arstrut`) in the beginning of each row of the array. That's why we use the dimensions of that box to initialize the variables which will be the dimensions of the potential first and last row of the environment. This initialization must be done after the creation of `\@arstrutbox` and that's why we do it in the `\ialign`.

```

```

We redefine `\multicolumn` and, since we want `\multicolumn` to be available in the potential environments `{tabular}` nested in the environments of `nicematrix`, we patch `{tabular}` to go back to the original definition.

```

1419  \cs_set_eq:NN \multicolumn \@@_multicolumn:nnn
1420  \hook_gput_code:nnn { env / tabular / begin } { . }
1421      { \cs_set_eq:NN \multicolumn \@@_old_multicolumn }

```

If there is one or several commands `\tabularnote` in the caption specified by the key `caption` and if that caption has to be composed above the tabular, we have now that information because it has been written in the `aux` file at a previous run. We use that information to start couting the tabular notes in the main array at the right value (that remember that the caption will be composed *after* the array!).

```

1422  \tl_if_exist:NT \l_@@_note_in_caption_tl
1423      {
1424          \tl_if_empty:NF \l_@@_note_in_caption_tl
1425              {
1426                  \int_set_eq:NN \l_@@_note_in_caption_int
1427                      { \l_@@_note_in_caption_tl }
1428                  \int_gset:Nn \c@tabularnote { \l_@@_note_in_caption_tl }
1429              }
1430      }

```

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with  $n > 1$  is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of  $n$ ) correspondant will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

```

1431  \seq_gclear:N \g_@@_multicolumn_cells_seq
1432  \seq_gclear:N \g_@@_multicolumn_sizes_seq

```

The counter `\c@iRow` will be used to count the rows of the array (its incrementation will be in the first cell of the row).

```
1433 \int_gset:Nn \c@iRow { \l_@@_first_row_int - 1 }
```

At the end of the environment `{array}`, `\c@iRow` will be the total number de rows.

`\g_@@_row_total_int` will be the number or rows excepted the last row (if `\l_@@_last_row_bool` has been raised with the option `last-row`).

```
1434 \int_gzero_new:N \g_@@_row_total_int
```

The counter `\c@jCol` will be used to count the columns of the array. Since we want to know the total number of columns of the matrix, we also create a counter `\g_@@_col_total_int`. These counters are updated in the command `\@@_cell_begin:w` executed at the beginning of each cell.

```
1435 \int_gzero_new:N \g_@@_col_total_int
1436 \cs_set_eq:NN \c@ifnextchar \new@ifnextchar
1437 \@@_renew_NC@rewrite@S:
1438 \bool_gset_false:N \g_@@_last_col_found_bool
```

During the construction of the array, the instructions `\Cdots`, `\Ldots`, etc. will be written in token lists `\g_@@_Cdots_lines_tl`, etc. which will be executed after the construction of the array.

```
1439 \tl_gclear_new:N \g_@@_Cdots_lines_tl
1440 \tl_gclear_new:N \g_@@_Ldots_lines_tl
1441 \tl_gclear_new:N \g_@@_Vdots_lines_tl
1442 \tl_gclear_new:N \g_@@_Ddots_lines_tl
1443 \tl_gclear_new:N \g_@@_Iddots_lines_tl
1444 \tl_gclear_new:N \g_@@_HVdotsfor_lines_tl

1445 \tl_gclear:N \g_nicematrix_code_before_tl
1446 \tl_gclear:N \g_@@_pre_code_before_tl
1447 }
```

This is the end of `\@@_pre_array_ii::`.

The command `\@@_pre_array:` will be executed after analyse of the keys of the environment.

```
1448 \cs_new_protected:Npn \@@_pre_array:
1449 {
1450   \cs_if_exist:NT \theiRow { \int_set_eq:NN \l_@@_old_iRow_int \c@iRow }
1451   \int_gzero_new:N \c@iRow
1452   \cs_if_exist:NT \thejCol { \int_set_eq:NN \l_@@_old_jCol_int \c@jCol }
1453   \int_gzero_new:N \c@jCol
```

We recall that `\l_@@_last_row_int` and `\l_@@_last_column_int` are *not* the numbers of the last row and last column of the array. There are only the values of the keys `last-row` and `last-column` (maybe the user has provided erroneous values). The meaning of that counters does not change during the environment of `nicematrix`. There is only a slight adjustment: if the user have used one of those keys without value, we provide now the right value as read on the `aux` file (of course, it's possible only after the first compilation).

```
1454 \int_compare:nNnT \l_@@_last_row_int = { -1 }
1455 {
1456   \bool_set_true:N \l_@@_last_row_without_value_bool
1457   \bool_if:NT \g_@@_aux_found_bool
1458     { \int_set:Nn \l_@@_last_row_int { \seq_item:Nn \g_@@_size_seq 3 } }
1459 }
1460 \int_compare:nNnT \l_@@_last_col_int = { -1 }
1461 {
1462   \bool_if:NT \g_@@_aux_found_bool
1463     { \int_set:Nn \l_@@_last_col_int { \seq_item:Nn \g_@@_size_seq 6 } }
1464 }
```

If there is an exterior row, we patch a command used in `\@@_cell_begin:w` in order to keep track of some dimensions needed to the construction of that “last row”.

```

1465 \int_compare:nNnT \l_@@_last_row_int > { -2 }
1466 {
1467     \tl_put_right:Nn \@@_update_for_first_and_last_row:
1468     {
1469         \dim_gset:Nn \g_@@_ht_last_row_dim
1470         { \dim_max:nn \g_@@_ht_last_row_dim { \box_ht:N \l_@@_cell_box } }
1471         \dim_gset:Nn \g_@@_dp_last_row_dim
1472         { \dim_max:nn \g_@@_dp_last_row_dim { \box_dp:N \l_@@_cell_box } }
1473     }
1474 }
1475 \seq_gclear:N \g_@@_cols_vlism_seq
1476 \seq_gclear:N \g_@@_submatrix_seq

```

Now the `\CodeBefore`.

```
1477 \bool_if:NT \l_@@_code_before_bool \@@_exec_code_before:
```

The value of `\g_@@_pos_of_blocks_seq` has been written on the aux file and loaded before the (potential) execution of the `\CodeBefore`. Now, we clear that variable because it will be reconstructed during the creation of the array.

```
1478 \seq_gclear:N \g_@@_pos_of_blocks_seq
```

Idem for other sequences written on the aux file.

```

1479 \seq_gclear_new:N \g_@@_multicolumn_cells_seq
1480 \seq_gclear_new:N \g_@@_multicolumn_sizes_seq

```

The command `\create_row_node:` will create a row-node (and not a row of nodes!). However, at the end of the array we construct a “false row” (for the col-nodes) and it interferes with the construction of the last row-node of the array. We don’t want to create such row-node twice (to avoid warnings or, maybe, errors). That’s why the command `\@@_create_row_node:` will use the following counter to avoid such construction.

```
1481 \int_gset:Nn \g_@@_last_row_node_int { -2 }
```

The value  $-2$  is important.

The code in `\@@_pre_array_ii:` is used only here.

```
1482 \@@_pre_array_ii:
```

The array will be composed in a box (named `\l_@@_the_array_box`) because we have to do manipulations concerning the potential exterior rows.

```
1483 \box_clear_new:N \l_@@_the_array_box
```

We compute the width of both delimiters. We remind that, when the environment `{NiceArray}` is used, it’s possible to specify the delimiters in the preamble (eg `[ccc]`).

```

1484 \dim_zero_new:N \l_@@_left_delim_dim
1485 \dim_zero_new:N \l_@@_right_delim_dim
1486 \bool_if:NTF \g_@@_NiceArray_bool
1487 {
1488     \dim_gset:Nn \l_@@_left_delim_dim { 2 \arraycolsep }
1489     \dim_gset:Nn \l_@@_right_delim_dim { 2 \arraycolsep }
1490 }
1491 {

```

The command `\bBigg@` is a command of `amsmath`.

```

1492 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_left_delim_tl $ }
1493 \dim_set:Nn \l_@@_left_delim_dim { \box_wd:N \l_tmpa_box }
1494 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_right_delim_tl $ }
1495 \dim_set:Nn \l_@@_right_delim_dim { \box_wd:N \l_tmpa_box }
1496 }

```

Here is the beginning of the box which will contain the array. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the second part of the environment (and the closing `\c_math_toggle_token` also).

```

1497 \hbox_set:Nw \l_@@_the_array_box
1498 \skip_horizontal:N \l_@@_left_margin_dim
1499 \skip_horizontal:N \l_@@_extra_left_margin_dim
1500 \c_math_toggle_token
1501 \bool_if:NTF \l_@@_light_syntax_bool
1502   { \use:c { @@-light-syntax } }
1503   { \use:c { @@-normal-syntax } }
1504 }
```

The following command `\@@_CodeBefore_Body:w` will be used when the keyword `\CodeBefore` is present at the beginning of the environment.

```

1505 \cs_new_protected:nopar:Npn \@@_CodeBefore_Body:w #1 \Body
1506 {
1507   \tl_gput_left:Nn \g_@@_pre_code_before_tl { #1 }
1508   \bool_set_true:N \l_@@_code_before_bool
```

We go on with `\@@_pre_array:` which will (among other) execute the `\CodeBefore` (specified in the key `code-before` or after the keyword `\CodeBefore`). By definition, the `\CodeBefore` must be executed before the body of the array...

```

1509 \@@_pre_array:
1510 }
```

## The `\CodeBefore`

The following command will be executed if the `\CodeBefore` has to be actually executed.

```

1511 \cs_new_protected:Npn \@@_pre_code_before:
1512 {
```

First, we give values to the LaTeX counters `iRow` and `jCol`. We remind that, in the `\CodeBefore` (and in the `\CodeAfter`) they represent the numbers of rows and columns of the array (without the potential last row and last column). The value of `\g_@@_row_total_int` is the number of the last row (with potentially a last exterior row) and `\g_@@_col_total_int` is the number of the last column (with potentially a last exterior column).

```

1513 \int_set:Nn \c@iRow { \seq_item:Nn \g_@@_size_seq 2 }
1514 \int_set:Nn \c@jCol { \seq_item:Nn \g_@@_size_seq 5 }
1515 \int_set_eq:NN \g_@@_row_total_int { \seq_item:Nn \g_@@_size_seq 3 }
1516 \int_set_eq:NN \g_@@_col_total_int { \seq_item:Nn \g_@@_size_seq 6 }
```

Now, we will create all the `col` nodes and `row` nodes with the informations written in the `aux` file. You use the technique described in the page 1229 of `pgfmanual.pdf`, version 3.1.4b.

```

1517 \pgfsys@markposition { \@@_env: - position }
1518 \pgfsys@getposition { \@@_env: - position } \@@_picture_position:
1519 \pgfpicture
1520 \pgf@relevantforpicturesizefalse
```

First, the recreation of the `row` nodes.

```

1521 \int_step_inline:nnn \l_@@_first_row_int { \g_@@_row_total_int + 1 }
1522 {
1523   \pgfsys@getposition { \@@_env: - row - ##1 } \@@_node_position:
1524   \pgfcoordinate { \@@_env: - row - ##1 }
1525     { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1526 }
```

Now, the recreation of the `col` nodes.

```

1527 \int_step_inline:nnn \l_@@_first_col_int { \g_@@_col_total_int + 1 }
1528 {
1529     \pgfsys@getposition { \@@_env: - col - ##1 } \@@_node_position:
1530     \pgfcoordinate { \@@_env: - col - ##1 }
1531         { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1532 }
```

Now, you recreate the diagonal nodes by using the `row` nodes and the `col` nodes.

```
1533 \@@_create_diag_nodes:
```

Now, the creation of the cell nodes ( $i-j$ ), and, maybe also the “medium nodes” and the “large nodes”.

```

1534 \bool_if:NT \g_@@_recreate_cell_nodes_bool \@@_recreate_cell_nodes:
1535 \endpgfpicture
```

Now, the recreation of the nodes of the blocks *which have a name*.

```

1536 \@@_create_blocks_nodes:
1537 \bool_if:NT \c_@@_tikz_loaded_bool
1538 {
1539     \tikzset
1540     {
1541         every~picture / .style =
1542             { overlay , name~prefix = \@@_env: - }
1543     }
1544 }
1545 \cs_set_eq:NN \cellcolor \@@_cellcolor
1546 \cs_set_eq:NN \rectanglecolor \@@_rectanglecolor
1547 \cs_set_eq:NN \roundedrectanglecolor \@@_roundedrectanglecolor
1548 \cs_set_eq:NN \rowcolor \@@_rowcolor
1549 \cs_set_eq:NN \rowcolors \@@_rowcolors
1550 \cs_set_eq:NN \rowlistcolors \@@_rowlistcolors
1551 \cs_set_eq:NN \arraycolor \@@_arraycolor
1552 \cs_set_eq:NN \columncolor \@@_columncolor
1553 \cs_set_eq:NN \chessboardcolors \@@_chessboardcolors
1554 \cs_set_eq:NN \SubMatrix \@@_SubMatrix_in_code_before
1555 \cs_set_eq:NN \ShowCellNames \@@_ShowCellNames
1556 }
```

  

```

1557 \cs_new_protected:Npn \@@_exec_code_before:
1558 {
1559     \seq_gclear_new:N \g_@@_colors_seq
1560     \bool_gset_false:N \g_@@_recreate_cell_nodes_bool
1561     \group_begin:
```

We compose the `\CodeBefore` in math mode in order to nullify the spaces put by the user between instructions in the `\CodeBefore`.

```
1562 \bool_if:NT \l_@@_NiceTabular_bool \c_math_toggle_token
```

The following code is a security for the case the user has used `babel` with the option `spanish`: in that case, the characters < (de code ASCII 60) and > are activated and Tikz is not able to solve the problem (even with the `Tikz` library `babel`).

```

1563 \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
1564 {
1565     \@@_rescan_for_spanish:N \g_@@_pre_code_before_tl
1566     \@@_rescan_for_spanish:N \l_@@_code_before_tl
1567 }
```

Here is the `\CodeBefore`. The construction is a bit complicated because `\g_@@_pre_code_before_tl` may begin with keys between square brackets. Moreover, after the analyze of those keys, we sometimes have to decide to do *not* execute the rest of `\g_@@_pre_code_before_tl` (when it is asked for the creation of cell nodes in the `\CodeBefore`). That's why we use a `\q_stop`: it will be used to discard the rest of `\g_@@_pre_code_before_tl`.

```
1568 \exp_last_unbraced:NV \@@_CodeBefore_keys:
1569   \g_@@_pre_code_before_tl
```

Now, all the cells which are specified to be colored by instructions in the `\CodeBefore` will actually be colored. It's a two-stages mechanism because we want to draw all the cells with the same color at the same time to absolutely avoid thin white lines in some PDF viewers.

```
1570   \@@_actually_color:
1571     \l_@@_code_before_tl
1572     \q_stop
1573   \bool_if:NT \l_@@_NiceTabular_bool \c_math_toggle_token
1574   \group_end:
1575   \bool_if:NT \g_@@_recreate_cell_nodes_bool
1576     { \tl_put_left:Nn \@@_node_for_cell: \@@_patch_node_for_cell: }
1577 }

1578 \keys_define:nn { NiceMatrix / CodeBefore }
1579 {
1580   create-cell-nodes .bool_gset:N = \g_@@_recreate_cell_nodes_bool ,
1581   create-cell-nodes .default:n = true ,
1582   sub-matrix .code:n = \keys_set:nn { NiceMatrix / sub-matrix } { #1 } ,
1583   sub-matrix .value_required:n = true ,
1584   delimiters / color .tl_set:N = \l_@@_delimiters_color_tl ,
1585   delimiters / color .value_required:n = true ,
1586   unknown .code:n = \@@_error:n { Unknown-key-for-CodeBefore }
1587 }

1588 \NewDocumentCommand \@@_CodeBefore_keys: { O { } }
1589 {
1590   \keys_set:nn { NiceMatrix / CodeBefore } { #1 }
1591   \@@_CodeBefore:w
1592 }
```

We have extracted the options of the keyword `\CodeBefore` in order to see whether the key `create-cell-nodes` has been used. Now, you can execute the rest of the `\CodeAfter`, excepted, of course, if we are in the first compilation.

```
1593 \cs_new_protected:Npn \@@_CodeBefore:w #1 \q_stop
1594 {
1595   \bool_if:NT \g_@@_aux_found_bool
1596   {
1597     \@@_pre_code_before:
1598     #1
1599   }
1600 }
```

By default, if the user uses the `\CodeBefore`, only the `col` nodes, `row` nodes and `diag` nodes are available in that `\CodeBefore`. With the key `create-cell-nodes`, the cell nodes, that is to say the nodes of the form  $(i-j)$  (but not the extra nodes) are also available because those nodes also are recreated and that recreation is done by the following command.

```
1601 \cs_new_protected:Npn \@@_recreate_cell_nodes:
1602 {
1603   \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int

1739 { #3 , #5 }

1740 \@@_set_CT@arc@:V \l_@@_rules_color_tl

```

The argument `#6` is the last argument of `{NiceArrayWithDelims}`. With that argument of type “`t \CodeBefore`”, we test whether there is the keyword `\CodeBefore` at the beginning of the body of the environment. If that keyword is present, we have now to extract all the content between that keyword `\CodeBefore` and the (other) keyword `\Body`. It’s the job that will do the command

\@@\_CodeBefore\_Body:w. After that job, the command \@@\_CodeBefore\_Body:w will go on with \@@\_pre\_array::

```
1741     \IfBooleanTF { #6 } \@@_CodeBefore_Body:w \@@_pre_array:
1742 }
```

Now, the second part of the environment {NiceArrayWithDelims}.

```
1743 {
1744     \bool_if:NTF \l_@@_light_syntax_bool
1745         { \use:c { end @@-light-syntax } }
1746         { \use:c { end @@-normal-syntax } }
1747     \c_math_toggle_token
1748     \skip_horizontal:N \l_@@_right_margin_dim
1749     \skip_horizontal:N \l_@@_extra_right_margin_dim
1750     \hbox_set_end:
```

End of the construction of the array (in the box \l\_@@\_the\_array\_box).

If the user has used the key width without any column X, we raise an error.

```
1751 \bool_if:NT \l_@@_width_used_bool
1752 {
1753     \int_compare:nNnT \g_@@_total_X_weight_int = 0
1754         { \@@_error_or_warning:n { width-without-X-columns } }
1755 }
```

Now, if there is at least one X-column in the environment, we compute the width that those columns will have (in the next compilation). In fact, \l\_@@\_X\_columns\_dim will be the width of a column of weight 1. For a X-column of weight n, the width will be \l\_@@\_X\_columns\_dim multiplied by n.

```
1756 \int_compare:nNnT \g_@@_total_X_weight_int > 0
1757 {
1758     \tl_gput_right:Nx \g_@@_aux_tl
1759     {
1760         \bool_set_true:N \l_@@_X_columns_aux_bool
1761         \dim_set:Nn \l_@@_X_columns_dim

1767                 }
1768                 <
1769                 { 0.001 pt }
1770                 { \dim_use:N \l_@@_X_columns_dim }
1771                 {
1772                     \dim_eval:n
1773                     {
1774                         ( \l_@@_width_dim - \box_wd:N \l_@@_the_array_box )
1775                         / \int_use:N \g_@@_total_X_weight_int
1776                         + \l_@@_X_columns_dim
1777                     }
1778                 }
1779             }
1780         }
1781     }
```

If the user has used the key last-row with a value, we control that the given value is correct (since we have just constructed the array, we know the actual number of rows of the array).

```
1782 \int_compare:nNnT \l_@@_last_row_int > { -2 }
1783 {
1784     \bool_if:NF \l_@@_last_row_without_value_bool
1785     {
1786         \int_compare:nNnF \l_@@_last_row_int = \c@iRow
1787         {
1788             \@@_error:n { Wrong-last-row }
1789             \int_gset_eq:NN \l_@@_last_row_int \c@iRow
```

```

1790         }
1791     }
1792 }
```

Now, the definition of `\c@jCol` and `\g_@@_col_total_int` change: `\c@jCol` will be the number of columns without the “last column”; `\g_@@_col_total_int` will be the number of columns with this “last column”.<sup>70</sup>

```

1793 \int_gset_eq:NN \c@jCol \g_@@_col_total_int
1794 \bool_if:nTF \g_@@_last_col_found_bool
1795   { \int_gdecr:N \c@jCol }
1796   {
1797     \int_compare:nNnT \l_@@_last_col_int > { -1 }
1798     { \@@_error:n { last-col-not-used } }
1799   }
```

We fix also the value of `\c@iRow` and `\g_@@_row_total_int` with the same principle.

```

1800 \int_gset_eq:NN \g_@@_row_total_int \c@iRow
1801 \int_compare:nNnT \l_@@_last_row_int > { -1 } { \int_gdecr:N \c@iRow }
```

**Now, we begin the real construction in the output flow of TeX.** First, we take into account a potential “first column” (we remind that this “first column” has been constructed in an overlapping position and that we have computed its width in `\g_@@_width_first_col_dim`: see p. 137).

```

1802 \int_compare:nNnT \l_@@_first_col_int = 0
1803   {
1804     \skip_horizontal:N \col@sep
1805     \skip_horizontal:N \g_@@_width_first_col_dim
1806   }
```

The construction of the real box is different when `\g_@@_NiceArray_bool` is true (`{NiceArray}` or `{NiceTabular}`) and in the other environments because, in `{NiceArray}` or `{NiceTabular}`, we have no delimiter to put (but we have tabular notes to put). We begin with this case.

```

1807 \bool_if:NTF \g_@@_NiceArray_bool
1808   {
1809     \str_case:VnF \l_@@_baseline_tl
1810     {
1811       b \@@_use_arraybox_with_notes_b:
1812       c \@@_use_arraybox_with_notes_c:
1813     }
1814     \@@_use_arraybox_with_notes:
1815   }
```

Now, in the case of an environment `{pNiceArray}`, `{bNiceArray}`, etc. We compute `\l_tmpa_dim` which is the total height of the “first row” above the array (when the key `first-row` is used).

```

1816   {
1817     \int_compare:nNnTF \l_@@_first_row_int = 0
1818     {
1819       \dim_set_eq:NN \l_tmpa_dim \g_@@_dp_row_zero_dim
1820       \dim_add:Nn \l_tmpa_dim \g_@@_ht_row_zero_dim
1821     }
1822     { \dim_zero:N \l_tmpa_dim }
```

We compute `\l_tmpb_dim` which is the total height of the “last row” below the array (when the key `last-row` is used). A value of `-2` for `\l_@@_last_row_int` means that there is no “last row”.<sup>71</sup>

```

1823 \int_compare:nNnTF \l_@@_last_row_int > { -2 }
1824   {
1825     \dim_set_eq:NN \l_tmpb_dim \g_@@_ht_last_row_dim
1826     \dim_add:Nn \l_tmpb_dim \g_@@_dp_last_row_dim
1827   }
1828   { \dim_zero:N \l_tmpb_dim }
1829 \hbox_set:Nn \l_tmpa_box
```

---

<sup>70</sup>We remind that the potential “first column” (exterior) has the number 0.

<sup>71</sup>A value of `-1` for `\l_@@_last_row_int` means that there is a “last row” but the user have not set the value with the option `last row` (and we are in the first compilation).

```

1830      {
1831          \c_math_toggle_token
1832          \@@_color:V \l_@@_delimiters_color_tl
1833          \exp_after:wN \left \g_@@_left_delim_tl
1834          \vcenter
1835          {

```

We take into account the “first row” (we have previously computed its total height in `\l_tmpa_dim`). The `\hbox:n` (or `\hbox`) is necessary here.

```

1836          \skip_vertical:n { -\l_tmpa_dim - \arrayrulewidth }
1837          \hbox
1838          {
1839              \bool_if:NTF \l_@@_NiceTabular_bool
1840                  { \skip_horizontal:N -\tabcolsep }
1841                  { \skip_horizontal:N -\arraycolsep }
1842              \@@_use_arraybox_with_notes_c:
1843              \bool_if:NTF \l_@@_NiceTabular_bool
1844                  { \skip_horizontal:N -\tabcolsep }
1845                  { \skip_horizontal:N -\arraycolsep }
1846          }

```

We take into account the “last row” (we have previously computed its total height in `\l_tmpb_dim`).

```

1847          \skip_vertical:n { -\l_tmpb_dim + \arrayrulewidth }
1848      }

```

Curiously, we have to put again the following specification of color. Otherwise, with XeLaTeX (and not with the other engines), the closing delimiter is not colored.

```

1849          \@@_color:V \l_@@_delimiters_color_tl
1850          \exp_after:wN \right \g_@@_right_delim_tl
1851          \c_math_toggle_token
1852      }

```

Now, the box `\l_tmpa_box` is created with the correct delimiters.

We will put the box in the TeX flow. However, we have a small work to do when the option `delimiters/max-width` is used.

```

1853          \bool_if:NTF \l_@@_delimiters_max_width_bool
1854          {
1855              \@@_put_box_in_flow_bis:nn
1856                  \g_@@_left_delim_tl \g_@@_right_delim_tl
1857          }
1858          \@@_put_box_in_flow:
1859      }

```

We take into account a potential “last column” (this “last column” has been constructed in an overlapping position and we have computed its width in `\g_@@_width_last_col_dim`: see p. 138).

```

1860          \bool_if:NT \g_@@_last_col_found_bool
1861          {
1862              \skip_horizontal:N \g_@@_width_last_col_dim
1863              \skip_horizontal:N \col@sep
1864          }
1865          \bool_if:NF \l_@@_Matrix_bool
1866          {
1867              \int_compare:nNnT \c@jCol < \g_@@_static_num_of_col_int
1868                  { \@@_warning_gredirect_none:n { columns-not-used } }
1869          }
1870          \@@_after_array:

```

The aim of the following `\egroup` (the corresponding `\bgroup` is, of course, at the beginning of the environment) is to be able to put an exposant to a matrix in a mathematical formula.

```

1871          \egroup

```

We want to write on the aux file all the informations corresponding to the current environment.

```

1872          \iow_now:Nn \mainaux { \ExplSyntaxOn }
1873          \iow_now:Nn \mainaux { \char_set_catcode_space:n { 32 } }
1874          \iow_now:Nx \mainaux
1875          {

```

```

1876     \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
1877     { \exp_not:V \g_@@_aux_tl }
1878   }
1879   \iow_now:Nn \mainaux { \ExplSyntaxOff }

1880   \bool_if:NT \c_@@_footnote_bool \endsavenotes
1881 }
```

This is the end of the environment `{NiceArrayWithDelims}`.

## We construct the preamble of the array

The transformation of the preamble is an operation in several steps.<sup>72</sup>

The preamble given by the final user is in `\g_@@_preamble_tl` and the modified version will be stored in `\g_@@_preamble_t1` also.

```

1882 \cs_new_protected:Npn \@@_transform_preamble:
1883 {
```

First, we will do an “expansion” of the preamble with the tools of the package `array` itself. This “expansion” will expand all the constructions with `*` and all column types (defined by the user or by various packages using `\newcolumntype`).

Since we use the tools of `array` to do this expansion, we will have a programmation which is not in the style of the L3 programming layer.

We redefine the column types `w` and `W`. We use `\@@_newcolumntype` instead of `\newcolumntype` because we don’t want warnings for column types already defined. These redefinitions are in fact *protections* of the letters `w` and `W`. We don’t want these columns type expanded because we will do the patch ourselves after. We want to be able to use the standard column types `w` and `W` in potential `{tabular}` of `array` in some cells of our array. That’s why we do those redefinitions in a TeX group.

```
1884 \group_begin:
```

If we are in an environment without explicit preamble, we have nothing to do (excepted the treatment on both sides of the preamble which will be done at the end).

```

1885 \bool_if:NF \l_@@_Matrix_bool
1886 {
1887   \@@_newcolumntype w [ 2 ] { \@@_w: { ##1 } { ##2 } }
1888   \@@_newcolumntype W [ 2 ] { \@@_W: { ##1 } { ##2 } }
```

If the package `varwidth` has defined the column type `V`, we protect from expansion by redefining it to `\@@_V:` (which will be catched by our system).

```
1889 \cs_if_exist:NT \NC@find@V { \@@_newcolumntype V { \@@_V: } }
```

First, we have to store our preamble in the token register `\@temptokena` (those “token registers” are *not* supported by the L3 programming layer).

```
1890 \exp_args:NV \@temptokena \g_@@_preamble_t1
```

Initialisation of a flag used by `array` to detect the end of the expansion.

```
1891 \@tempswattrue
```

The following line actually does the expansion (it’s has been copied from `array.sty`). The expanded version is still in `\@temptokena`.

```
1892 \@whilsw \if@tempswa \fi { \@tempswafalse \the \NC@list }
```

---

<sup>72</sup>Be careful: the transformation of the preamble may also have by-side effects, for example, the boolean `\g_@@_NiceArray_bool` will be set to `false` if we detect in the preamble a delimiter at the beginning or at the end.

Now, we have to “patch” that preamble by transforming some columns. We will insert in the TeX flow the preamble in its actual form (that is to say after the “expansion”) following by a marker `\q_stop` and we will consume these tokens constructing the (new form of the) preamble in `\g_@@_preamble_tl`. This is done recursively with the command `\@_patch_preamble:n`. In the same time, we will count the columns with the counter `\c@jCol`.

```
1893     \int_gzero:N \c@jCol
1894     \tl_gclear:N \g_@@_preamble_tl
```

`\g_tmpb_bool` will be raised if you have a `|` at the end of the preamble.

```
1895     \bool_gset_false:N \g_tmpb_bool
1896     \tl_if_eq:NnTF \l_@@_vlines_clist { all }
1897     {
1898         \tl_gset:Nn \g_@@_preamble_tl
1899         { ! { \skip_horizontal:N \arrayrulewidth } }
1900     }
1901     {
1902         \clist_if_in:NnT \l_@@_vlines_clist 1
1903         {
1904             \tl_gset:Nn \g_@@_preamble_tl
1905             { ! { \skip_horizontal:N \arrayrulewidth } }
1906         }
1907     }
```

The sequence `\g_@@_cols_vlism_seq` will contain the numbers of the columns where you will have to draw vertical lines in the potential sub-matrices (hence the name `vlism`).

```
1908     \seq_clear:N \g_@@_cols_vlism_seq
```

The following sequence will store the arguments of the successive `>` in the preamble.

```
1909     \tl_gclear_new:N \g_@@_pre_cell_tl
```

The counter `\l_tmpa_int` will count the number of consecutive occurrences of the symbol `|`.

```
1910     \int_zero:N \l_tmpa_int
```

Now, we actually patch the preamble (and it is constructed in `\g_@@_preamble_tl`).

```
1911     \exp_after:wn \@_patch_preamble:n \the \c@temptokena \q_stop
1912     \int_gset_eq:NN \g_@@_static_num_of_col_int \c@jCol
1913 }
```

Now, we replace `\columncolor` by `\@@_columncolor_preamble`.

```
1914     \bool_if:NT \l_@@_colortbl_like_bool
1915     {
1916         \regex_replace_all:NnN
1917             \c_@@_columncolor_regex
1918             { \c { @@_columncolor_preamble } }
1919             \g_@@_preamble_tl
1920     }
```

Now, we can close the TeX group which was opened for the redefinition of the columns of type `w` and `W`.

```
1921     \group_end:
```

If there was delimiters at the beginning or at the end of the preamble, the environment `{NiceArray}` is transformed into an environment `{xNiceMatrix}`.

```
1922     \bool_lazy_or:nnT
1923     { ! \str_if_eq_p:Vn \g_@@_left_delim_tl { . } }
1924     { ! \str_if_eq_p:Vn \g_@@_right_delim_tl { . } }
1925     { \bool_gset_false:N \g_@@_NiceArray_bool }
```

We want to remind whether there is a specifier `|` at the end of the preamble.

```
1926     \bool_if:NT \g_tmpb_bool { \bool_set_true:N \l_@@_bar_at_end_of_pream_bool }
```

We complete the preamble with the potential “exterior columns” (on both sides).

```

1927 \int_compare:nNnTF \l_@@_first_col_int = 0
1928   { \tl_gput_left:NV \g_@@_preamble_tl \c_@@_preamble_first_col_tl }

1993       \@@_patch_preamble:n
1994     }

```

Now the case of a letter set by the final user for a customized rule. Such customized rule is defined by using the key `custom-line` in `\NiceMatrixOptions`. That key takes in as value a list of `key=value` pairs. Among the keys available in that list, there is the key `letter`. All the letters defined by this way by the final user for such customized rules are added in the set of keys `{NiceMatrix/ColumnTypes}`. That set of keys is used to store the characteristics of those types of rules for convenience: the keys of that set of keys won't never be used as keys by the final user (he will use, instead, letters in the preamble of its array).

```

1995   {
1996     \keys_if_exist:nnTF { NiceMatrix / ColumnTypes } { #1 }
1997     {
1998       \keys_set:nn { NiceMatrix / ColumnTypes } { #1 }
1999       \@@_patch_preamble:n
2000     }
2001     { \@@_fatal:nn { unknown~column~type } { #1 } }
2002   }
2003 }
2004

```

Now, we will list all the auxiliary functions for the different types of entries in the preamble of the array.

For `c`, `l` and `r`

```

2005 \cs_new_protected:Npn \@@_patch_preamble_i:n #1
2006   {
2007     \tl_gput_right:NV \g_@@_preamble_tl \g_@@_pre_cell_tl

```

2497 \cs_new:Npn \@@_multicolumn:nnn #1 #2 #3
2498 {
```

The following lines are from the definition of `\multicolumn` in `array` (and *not* in standard LaTeX). The first line aims to raise an error if the user has put more than one column specifier in the preamble of `\multicolumn`.

```

2499   \multispan { #1 }
2500   \begingroup
2501   \cs_set:Npn \caddamp { \if@firstamp \firstampfalse \else \preamerr 5 \fi }
2502   \@@_newcolumntype w [ 2 ] { \@@_w: { ##1 } { ##2 } }
2503   \@@_newcolumntype W [ 2 ] { \@@_W: { ##1 } { ##2 } }
```

You do the expansion of the (small) preamble with the tools of `array`.

```
2504 \@temptokena = { #2 }
2505 \@tempsw@true
2506 \@whilesw \if@tempswa \fi { \@tempswafalse \the \NC@list }
```

Now, we patch the (small) preamble as we have done with the main preamble of the array.

```
2507 \t1_gclear:N \g_@@_preamble_t1
2508 \exp_after:wN \@@_patch_m_preamble:n \the \@temptokena \q_stop
```

The following lines are an adaptation of the definition of `\multicolumn` in `array`.

```
2509 \exp_args:NV \mkpream \g_@@_preamble_t1
2510 \@addtopreamble \empty
2511 \endgroup
```

Now, you do a treatment specific to `nicematrix` which has no equivalent in the original definition of `\multicolumn`.

```
2512 \int_compare:nNnT { #1 } > 1
2513 {
2514     \seq_gput_left:Nx \g_@@_multicolumn_cells_seq
2515         { \int_use:N \c@iRow - \int_eval:n { \c@jCol + 1 } }
2516     \seq_gput_left:Nn \g_@@_multicolumn_sizes_seq { #1 }
2517     \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
2518         {
2519             {
2520                 \int_compare:nNnTF \c@jCol = 0
2521                     { \int_eval:n { \c@iRow + 1 } }
2522                     { \int_use:N \c@iRow }
2523             }
2524             { \int_eval:n { \c@jCol + 1 } }
2525             {
2526                 \int_compare:nNnTF \c@jCol = 0
2527                     { \int_eval:n { \c@iRow + 1 } }
2528                     { \int_use:N \c@iRow }
2529             }
2530             { \int_eval:n { \c@jCol + #1 } }
2531             { } % for the name of the block
2532         }
2533     }
```

The following lines were in the original definition of `\multicolumn`.

```
2534 \cs_set:Npn \sharp { #3 }
2535 \carstrut
2536 \preamble
2537 \null
```

We add some lines.

```
2538 \int_gadd:Nn \c@jCol { #1 - 1 }
2539 \int_compare:nNnT \c@jCol > \g_@@_col_total_int
2540     { \int_gset_eq:NN \g_@@_col_total_int \c@jCol }
2541 \ignorespaces
2542 }
```

The following commands will patch the (small) preamble of the `\multicolumn`. All those commands have a `m` in their name to recall that they deal with the redefinition of `\multicolumn`.

```
2543 \cs_new_protected:Npn \@@_patch_m_preamble:n #1
2544 {
2545     \str_case:nnF { #1 }

2634     \@@_patch_m_preamble_x:n
2635 }

```

The command `\@@_put_box_in_flow:` puts the box `\l_tmpa_box` (which contains the array) in the flow. It is used for the environments with delimiters. First, we have to modify the height and the depth to take back into account the potential exterior rows (the total height of the first row has been computed in `\l_tmpa_dim` and the total height of the potential last row in `\l_tmpb_dim`).

```

2636 \cs_new_protected:Npn \@@_put_box_in_flow:
2637 {
2638     \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + \l_tmpa_dim }
2639     \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + \l_tmpb_dim }
2640     \tl_if_eq:NnTF \l_@@_baseline_tl { c }
2641     { \box_use_drop:N \l_tmpa_box }
2642     \@@_put_box_in_flow_i:
2643 }

```

The command `\@@_put_box_in_flow_i:` is used when the value of `\l_@@_baseline_tl` is different of c (which is the initial value and the most used).

```

2644 \cs_new_protected:Npn \@@_put_box_in_flow_i:
2645 {
2646     \pgfpicture
2647     \@@_qpoint:n { row - 1 }
2648     \dim_gset_eq:NN \g_tmpa_dim \pgf@y

```

Now, we can put the box in the TeX flow with the horizontal adjustments on both sides.

```

2884 \skip_horizontal:N \l_@@_left_delim_dim
2885 \skip_horizontal:N -\l_@@_real_left_delim_dim
2886 \@@_put_box_in_flow:
2887 \skip_horizontal:N \l_@@_right_delim_dim
2888 \skip_horizontal:N -\l_@@_real_right_delim_dim
2889 }

```

The construction of the array in the environment `{NiceArrayWithDelims}` is, in fact, done by the environment `{@@-light-syntax}` or by the environment `{@@-normal-syntax}` (whether the option `light-syntax` is in force or not). When the key `light-syntax` is not used, the construction is a standard environment (and, thus, it's possible to use verbatim in the array).

```

2890 \NewDocumentEnvironment { @@-normal-syntax } { }

```

First, we test whether the environment is empty. If it is empty, we raise a fatal error (it's only a security). In order to detect whether it is empty, we test whether the next token is `\end` and, if it's the case, we test if this is the end of the environment (if it is not, an standard error will be raised by LaTeX for incorrect nested environments).

```

2891 {
2892   \peek_remove_spaces:n
2893   {
2894     \peek_meaning:NTF \end
2895     \@@_analyze_end:Nn
2896     {
2897       \@@_transform_preamble:

```

Here is the call to `\array` (we have a dedicated macro `\@@_array:n` because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

2898       \@@_array:V \g_@@_preamble_tl
2899     }
2900   }
2901 }
2902 {
2903   \@@_create_col_nodes:
2904   \endarray
2905 }
```

When the key `light-syntax` is in force, we use an environment which takes its whole body as an argument (with the specifier `b`).

```

2906 \NewDocumentEnvironment { @@-light-syntax } { b }
2907 {
```

First, we test whether the environment is empty. It's only a security. Of course, this test is more easy than the similar test for the “normal syntax” because we have the whole body of the environment in `#1`.

```

2908 \tl_if_empty:nT { #1 } { \@@_fatal:n { empty~environment } }
2909 \tl_map_inline:nn { #1 }
2910 {
2911   \str_if_eq:nnT { ##1 } { & }
2912   { \@@_fatal:n { ampersand-in-light-syntax } }
2913   \str_if_eq:nnT { ##1 } { \\ }
2914   { \@@_fatal:n { double-backslash-in-light-syntax } }
2915 }
```

Now, you extract the `\CodeAfter` of the body of the environment. Maybe, there is no command `\CodeAfter` in the body. That's why you put a marker `\CodeAfter` after `#1`. If there is yet a `\CodeAfter` in `#1`, this second (or third...) `\CodeAfter` will be catched in the value of `\g_nicematrix_code_after_tl`. That doesn't matter because `\CodeAfter` will be set to `no-op` before the execution of `\g_nicematrix_code_after_tl`.

```
2916   \@@_light_syntax_i:w #1 \CodeAfter \q_stop
```

The command `\array` is hidden somewhere in `\@@_light_syntax_i:w`.

```
2917 }
```

Now, the second part of the environment. We must leave these lines in the second part (and not put them in the first part even though we caught the whole body of the environment with an argument of type `b`) in order to have the columns `S` of `siunitx` working fine.

```

2918 {
2919   \@@_create_col_nodes:
2920   \endarray
2921 }

2922 \cs_new_protected:Npn \@@_light_syntax_i:w #1\CodeAfter #2\q_stop
2923 {
2924   \tl_gput_right:Nn \g_nicematrix_code_after_tl { #2 }
```

The body of the array, which is stored in the argument `#1`, is now splitted into items (and *not* tokens).

```
2925   \seq_clear_new:N \l_@@_rows_seq
```

We rescan the character of end of line in order to have the correct catcode.

```
2926 \tl_set_rescan:Nno \l_@@_end_of_row_tl { } \l_@@_end_of_row_tl
2927 \seq_set_split:NVn \l_@@_rows_seq \l_@@_end_of_row_tl { #1 }
```

We delete the last row if it is empty.

```
2928 \seq_pop_right:NN \l_@@_rows_seq \l_tmpa_tl
2929 \tl_if_empty:NF \l_tmpa_tl
2930 { \seq_put_right:NV \l_@@_rows_seq \l_tmpa_tl }
```

If the environment uses the option `last-row` without value (i.e. without saying the number of the rows), we have now the opportunity to compute that value. We do it, and so, if the token list `\l_@@_code_for_last_row_tl` is not empty, we will use directly where it should be.

```
2931 \int_compare:nNnT \l_@@_last_row_int = { -1 }
2932 { \int_set:Nn \l_@@_last_row_int { \seq_count:N \l_@@_rows_seq } }
```

The new value of the body (that is to say after replacement of the separators of rows and columns by `\backslash` and `&`) of the environment will be stored in `\l_@@_new_body_tl` (that part of the implementation has been changed in the version 6.11 of `nicematrix` in order to allow the use of commands such as `\hline` or `\hdottedline` with the key `light-syntax`).

```
2933 \tl_clear_new:N \l_@@_new_body_tl
2934 \int_zero_new:N \l_@@_nb_cols_int
```

First, we treat the first row.

```
2935 \seq_pop_left:NN \l_@@_rows_seq \l_tmpa_tl
2936 \@@_line_with_light_syntax:V \l_tmpa_tl
```

Now, the other rows (with the same treatment, excepted that we have to insert `\backslash\backslash` between the rows).

```
2937 \seq_map_inline:Nn \l_@@_rows_seq
2938 {
2939     \tl_put_right:Nn \l_@@_new_body_tl { \backslash\backslash }
2940     \@@_line_with_light_syntax:n { ##1 }
2941 }
2942 \int_compare:nNnT \l_@@_last_col_int = { -1 }
2943 {
2944     \int_set:Nn \l_@@_last_col_int
2945     { \l_@@_nb_cols_int - 1 + \l_@@_first_col_int }
2946 }
```

Now, we can construct the preamble: if the user has used the key `last-col`, we have the correct number of columns even though the user has used `last-col` without value.

```
2947 \@@_transform_preamble:
```

The call to `\array` is in the following command (we have a dedicated macro `\@@_array:n` because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```
2948 \@@_array:V \g_@@_preamble_tl \l_@@_new_body_tl
2949 }
2950 \cs_new_protected:Npn \@@_line_with_light_syntax:n #1

3093     }

3094     &
3095     \omit

```

The two following lines have been added on 2021-12-15 to solve a bug mentionned by Joao Luis Soares by mail.

```

3096     \int_compare:nNnT \g_@@_col_total_int = 1
3097         { \skip_gset:Nn \g_tmpa_skip { 0 pt plus 1 fill } }
3098     \skip_horizontal:N \g_tmpa_skip
3099     \int_gincr:N \g_tmpa_int
3100     \bool_lazy_all:nT
3101     {
3102         \g_@@_NiceArray_bool
3103         { \bool_not_p:n \l_@@_NiceTabular_bool }
3104         { \clist_if_empty_p:N \l_@@_vlines_clist }
3105         { \bool_not_p:n \l_@@_exterior_arraycolsep_bool }
3106         { ! \l_@@_bar_at_end_of_pream_bool }
3107     }
3108     { \skip_horizontal:N -\col@sep }
3109     \bool_if:NT \l_@@_code_before_bool
3110     {
3111         \hbox
3112         {
3113             \skip_horizontal:N -0.5\arrayrulewidth

```

With an environment `{Matrix}`, you want to remove the exterior `\arraycolsep` but we don't know the number of columns (since there is no preamble) and that's why we can't put `@{}` at the end of the preamble. That's why we remove a `\arraycolsep` now.

```

3453   }
3454 }
3455 \endpgfpicture

```

By default, the diagonal lines will be parallelized<sup>73</sup>. There are two types of diagonals: the `\Ddots` diagonals and the `\Iddots` diagonals. We have to count both types in order to know whether a diagonal is the first of its type in the current `{NiceArray}` environment.

```

3456 \bool_if:NT \l_@@_parallelize_diags_bool
3457 {
3458   \int_gzero_new:N \g_@@_ddots_int
3459   \int_gzero_new:N \g_@@_iddots_int

```

The dimensions `\g_@@_delta_x_one_dim` and `\g_@@_delta_y_one_dim` will contain the  $\Delta_x$  and  $\Delta_y$  of the first `\Ddots` diagonal. We have to store these values in order to draw the others `\Ddots`

---

<sup>73</sup>It's possible to use the option `parallelize-diags` to disable this parallelization.

diagonals parallel to the first one. Similarly `\g_@@_delta_x_two_dim` and `\g_@@_delta_y_two_dim` are the  $\Delta_x$  and  $\Delta_y$  of the first \Idots diagonal.

```

3460     \dim_gzero_new:N \g_@@_delta_x_one_dim
3461     \dim_gzero_new:N \g_@@_delta_y_one_dim
3462     \dim_gzero_new:N \g_@@_delta_x_two_dim
3463     \dim_gzero_new:N \g_@@_delta_y_two_dim
3464 }
3465 \int_zero_new:N \l_@@_initial_i_int
3466 \int_zero_new:N \l_@@_initial_j_int
3467 \int_zero_new:N \l_@@_final_i_int
3468 \int_zero_new:N \l_@@_final_j_int
3469 \bool_set_false:N \l_@@_initial_open_bool
3470 \bool_set_false:N \l_@@_final_open_bool

```

If the option `small` is used, the values `\l_@@_xdots_radius_dim` and `\l_@@_xdots_inter_dim` (used to draw the dotted lines created by `\hdottedline` and `\vdottedline` and also for all the other dotted lines when `line-style` is equal to `standard`, which is the initial value) are changed.

```

3471 \bool_if:NT \l_@@_small_bool
3472 {
3473     \dim_set:Nn \l_@@_xdots_radius_dim { 0.7 \l_@@_xdots_radius_dim }
3474     \dim_set:Nn \l_@@_xdots_inter_dim { 0.55 \l_@@_xdots_inter_dim }

```

The dimensions `\l_@@_xdots_shorten_start_dim` and `\l_@@_xdots_shorten_end_dim` correspond to the options `xdots/shorten-start` and `xdots/shorten-end` available to the user.

```

3475 \dim_set:Nn \l_@@_xdots_shorten_start_dim
3476     { 0.6 \l_@@_xdots_shorten_start_dim }
3477 \dim_set:Nn \l_@@_xdots_shorten_end_dim
3478     { 0.6 \l_@@_xdots_shorten_end_dim }
3479 }

```

Now, we actually draw the dotted lines (specified by `\Cdots`, `\Vdots`, etc.).

```
3480 \@@_draw_dotted_lines:
```

The following computes the “corners” (made up of empty cells) but if there is no corner to compute, it won’t do anything. The corners are computed in `\l_@@_corners_cells_seq` which will contain all the cells which are empty (and not in a block) considered in the corners of the array.

```
3481 \@@_compute_corners:
```

The sequence `\g_@@_pos_of_blocks_seq` must be “adjusted” (for the case where the user have written something like `\Block{1-*}`).

```

3482 \@@_adjust_pos_of_blocks_seq:
3483 \tl_if_empty:NF \l_@@_hlines_clist \@@_draw_hlines:
3484 \tl_if_empty:NF \l_@@_vlines_clist \@@_draw_vlines:

```

Now, the pre-code-after and then, the `\CodeAfter`.

```

3485 \bool_if:NT \c_@@_tikz_loaded_bool
3486 {
3487     \tikzset
3488     {
3489         every~picture / .style =
3490         {
3491             overlay ,
3492             remember~picture ,
3493             name~prefix = \@@_env: -
3494         }
3495     }
3496 }
3497 \cs_set_eq:NN \ialign \@@_old_ialign:
3498 \cs_set_eq:NN \SubMatrix \@@_SubMatrix
3499 \cs_set_eq:NN \UnderBrace \@@_UnderBrace
3500 \cs_set_eq:NN \OverBrace \@@_OverBrace
3501 \cs_set_eq:NN \ShowCellNames \@@_ShowCellNames

```

```

3502   \cs_set_eq:NN \line \@@_line
3503   \g_@@_pre_code_after_tl
3504   \tl_gclear:N \g_@@_pre_code_after_tl

```

When `light-syntax` is used, we insert systematically a `\CodeAfter` in the flow. Thus, it's possible to have two instructions `\CodeAfter` and the second may be in `\g_nicematrix_code_after_tl`. That's why we set `\Code-after` to be *no-op* now.

```
3505   \cs_set_eq:NN \CodeAfter \prg_do_nothing:
```

We clear the list of the names of the potential `\SubMatrix` that will appear in the `\CodeAfter` (unfortunately, that list has to be global).

```
3506   \seq_gclear:N \g_@@_submatrix_names_seq
```

The following code is a security for the case the user has used `babel` with the option `spanish`: in that case, the characters `>` and `<` are activated and Tikz is not able to solve the problem (even with the Tikz library `babel`).

```

3507   \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
3508     { \@@_rescan_for_spanish:N \g_nicematrix_code_after_tl }

```

And here's the `\CodeAfter`. Since the `\CodeAfter` may begin with an “argument” between square brackets of the options, we extract and treat that potential “argument” with the command `\@@_CodeAfter_keys`:

```

3509   \bool_set_true:N \l_@@_in_code_after_bool
3510   \exp_last_unbraced:NV \@@_CodeAfter_keys: \g_nicematrix_code_after_tl
3511   \scan_stop:
3512   \tl_gclear:N \g_nicematrix_code_after_tl
3513   \group_end:

```

`\g_@@_pre_code_before_tl` is for instructions in the cells of the array such as `\rowcolor` and `\cellcolor` (when the key `colortbl-like` is in force). These instructions will be written on the `aux` file to be added to the `code-before` in the next run.

```

3514   \tl_if_empty:NF \g_@@_pre_code_before_tl
3515   {
3516     \tl_gput_right:Nx \g_@@_aux_tl
3517     {
3518       \tl_gset:Nn \exp_not:N \g_@@_pre_code_before_tl
3519         { \exp_not:V \g_@@_pre_code_before_tl }
3520     }
3521     \tl_gclear:N \g_@@_pre_code_before_tl
3522   }
3523   \tl_if_empty:NF \g_nicematrix_code_before_tl

3528         { \exp_not:V \g_nicematrix_code_before_tl }
3529     }
3530     \tl_gclear:N \g_nicematrix_code_before_tl
3531   }

3532   \str_gclear:N \g_@@_name_env_str
3533   \@@_restore_iRow_jCol:

```

The command `\CT@arc@` contains the instruction of color for the rules of the array<sup>74</sup>. This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That's why we do the following instruction which is in the patch of the end of arrays done by `colortbl`.

```

3534   \cs_gset_eq:NN \CT@arc@ \@@_old_CT@arc@
3535 }

```

---

<sup>74</sup>e.g. `\color[rgb]{0.5,0.5,0}`

The following command will extract the potential options (between square brackets) at the beginning of the `\CodeAfter` (that is to say, when `\CodeAfter` is used, the options of that “command” `\CodeAfter`). Idem for the `\CodeBefore`.

```
3536 \NewDocumentCommand \@@_CodeAfter_keys: { 0 { } }
3537   { \keys_set:nn { NiceMatrix / CodeAfter } { #1 } }
```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format  $i-j$ . However, the user is allowed to omit  $i$  or  $j$  (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_pos_of_blocks_seq` (and `\g_@@_blocks_seq`) as a number of rows (resp. columns) for the block equal to 100. It’s possible, after the construction of the array, to replace these values by the correct ones (since we know the number of rows and columns of the array).

```
3538 \cs_new_protected:Npn \@@_adjust_pos_of_blocks_seq:
3539   {
3540     \seq_gset_map_x:NNn \g_@@_pos_of_blocks_seq \g_@@_pos_of_blocks_seq
3541       { \@@_adjust_pos_of_blocks_seq_i:nnnnn ##1 }
3542   }
```

The following command must *not* be protected.

```
3543 \cs_new:Npn \@@_adjust_pos_of_blocks_seq_i:nnnnn #1 #2 #3 #4 #5
3544   {
3545     { #1 }
3546     { #2 }
3547     {
3548       \int_compare:nNnTF { #3 } > { 99 }
3549         { \int_use:N \c@iRow }
3550         { #3 }
3551     }
3552     {
3553       \int_compare:nNnTF { #4 } > { 99 }
3554         { \int_use:N \c@jCol }
3555         { #4 }
3556     }
3557     { #5 }
3558 }
```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible”. That’s why we have to define the adequate version of `\@@_draw_dotted_lines`: whether Tikz is loaded or not (in that case, only PGF is loaded).

```
3559 \hook_gput_code:nnn { begindocument } { . }
3560   {
3561     \cs_new_protected:Npx \@@_draw_dotted_lines:
3562       {
3563         \c_@@_pgfortikzpicture_tl
3564         \@@_draw_dotted_lines_i:
3565         \c_@@_endpgfortikzpicture_tl
3566       }
3567   }
```

The following command *must* be protected because it will appear in the construction of the command `\@@_draw_dotted_lines`:

```
3568 \cs_new_protected:Npn \@@_draw_dotted_lines_i:
3569   {
3570     \pgfrememberpicturepositiononpagetrue
3571     \pgf@relevantforpicturesizefalse
3572     \g_@@_Hdotsfor_lines_tl
3573     \g_@@_Vdots_lines_tl
3574     \g_@@_Ddots_lines_tl
3575     \g_@@_Iddots_lines_tl
3576     \g_@@_Cdots_lines_tl
3577     \g_@@_Ldots_lines_tl
3578 }
```

```

3579 \cs_new_protected:Npn \@@_restore_iRow_jCol:
360 {
3581   \cs_if_exist:NT \theiRow { \int_gset_eq:NN \c@iRow \l_@@_old_iRow_int }
3582   \cs_if_exist:NT \thejCol { \int_gset_eq:NN \c@jCol \l_@@_old_jCol_int }
3583 }

```

We define a new PGF shape for the diag nodes because we want to provide a anchor called .5 for those nodes.

```

3584 \pgfdeclareshape {\@@_diag_node}
3585 {
3586   \savedanchor{\five}{%
3587     \dim_gset_eq:NN \pgf@x \l_tmpa_dim
3588     \dim_gset_eq:NN \pgf@y \l_tmpb_dim
3589   }
3590   \anchor{5}{\five}
3591   \anchor{center}{\pgfpointorigin}
3592 }
3593

```

The following command creates the diagonal nodes (in fact, if the matrix is not a square matrix, not all the nodes are on the diagonal).

```

3594 \cs_new_protected:Npn \@@_create_diag_nodes:
3595 {
3596   \pgfpicture
3597   \pgfrememberpicturepositiononpagetrue
3598   \int_step_inline:nn { \int_max:nn \c@iRow \c@jCol } {
3599     \@@_qpoint:n { col - \int_min:nn { ##1 } { \c@jCol + 1 } }
3600     \dim_set_eq:NN \l_tmpa_dim \pgf@x
3601     \@@_qpoint:n { row - \int_min:nn { ##1 } { \c@iRow + 1 } }
3602     \dim_set_eq:NN \l_tmpb_dim \pgf@y
3603     \@@_qpoint:n { col - \int_min:nn { ##1 + 1 } { \c@jCol + 1 } }
3604     \dim_set_eq:NN \l_@@_tmpc_dim \pgf@x
3605     \@@_qpoint:n { row - \int_min:nn { ##1 + 1 } { \c@iRow + 1 } }
3606     \dim_set_eq:NN \l_@@_tmpd_dim \pgf@y
3607     \pgftransformshift { \pgfpoint \l_tmpa_dim \l_tmpb_dim }
3608   }

```

Now, `\l_tmpa_dim` and `\l_tmpb_dim` become the width and the height of the node (of shape `\@@_diag_node`) that we will construct.

```

3609   \dim_set:Nn \l_tmpa_dim { ( \l_@@_tmpc_dim - \l_tmpa_dim ) / 2 }
3610   \dim_set:Nn \l_tmpb_dim { ( \l_@@_tmpd_dim - \l_tmpb_dim ) / 2 }
3611   \pgfnode {\@@_diag_node} { center } { } { \@@_env: - ##1 } { }
3612   \str_if_empty:NF \l_@@_name_str
3613     { \pgfnodealias { \l_@@_name_str - ##1 } { \@@_env: - ##1 } }
3614 }

```

Now, the last node. Of course, that is only a coordinate because there is not .5 anchor for that node.

```

3615   \int_set:Nn \l_tmpa_int { \int_max:nn \c@iRow \c@jCol + 1 }
3616   \@@_qpoint:n { row - \int_min:nn { \l_tmpa_int } { \c@iRow + 1 } }
3617   \dim_set_eq:NN \l_tmpa_dim \pgf@y
3618   \@@_qpoint:n { col - \int_min:nn { \l_tmpa_int } { \c@jCol + 1 } }
3619   \pgfcoordinate
3620     { \@@_env: - \int_use:N \l_tmpa_int } { \pgfpoint \pgf@x \l_tmpa_dim }
3621   \pgfnodealias
3622     { \@@_env: - last }
3623     { \@@_env: - \int_eval:n { \int_max:nn \c@iRow \c@jCol + 1 } }
3624   \str_if_empty:NF \l_@@_name_str
3625     {
3626       \pgfnodealias
3627         { \l_@@_name_str - \int_use:N \l_tmpa_int }
3628         { \@@_env: - \int_use:N \l_tmpa_int }
3629       \pgfnodealias
3630         { \l_@@_name_str - last }

```

```

3631      { \@@_env: - last }
3632    }
3633  \endpgfpicture
3634 }

```

## We draw the dotted lines

A dotted line will be said *open* in one of its extremities when it stops on the edge of the matrix and *closed* otherwise. In the following matrix, the dotted line is closed on its left extremity and open on its right.

$$\begin{pmatrix} a+b+c & a+b & a \\ a & \dots & a \\ a & a+b & a+b+c \end{pmatrix}$$

The command `\@@_find_extremities_of_line:nnnn` takes four arguments:

- the first argument is the row of the cell where the command was issued;
- the second argument is the column of the cell where the command was issued;
- the third argument is the  $x$ -value of the orientation vector of the line;
- the fourth argument is the  $y$ -value of the orientation vector of the line.

This command computes:

- `\l_@@_initial_i_int` and `\l_@@_initial_j_int` which are the coordinates of one extremity of the line;
- `\l_@@_final_i_int` and `\l_@@_final_j_int` which are the coordinates of the other extremity of the line;
- `\l_@@_initial_open_bool` and `\l_@@_final_open_bool` to indicate whether the extremities are open or not.

```

3635 \cs_new_protected:Npn \@@_find_extremities_of_line:nnnn #1 #2 #3 #4
3636 {

```

First, we declare the current cell as “dotted” because we forbide intersections of dotted lines.

```
3637   \cs_set:cpn { @@ _ dotted _ #1 - #2 } { }
```

Initialization of variables.

```

3638   \int_set:Nn \l_@@_initial_i_int { #1 }
3639   \int_set:Nn \l_@@_initial_j_int { #2 }
3640   \int_set:Nn \l_@@_final_i_int { #1 }
3641   \int_set:Nn \l_@@_final_j_int { #2 }

```

We will do two loops: one when determinating the initial cell and the other when determinating the final cell. The boolean `\l_@@_stop_loop_bool` will be used to control these loops. In the first loop, we search the “final” extremity of the line.

```

3642   \bool_set_false:N \l_@@_stop_loop_bool
3643   \bool_do_until:Nn \l_@@_stop_loop_bool
3644   {
3645     \int_add:Nn \l_@@_final_i_int { #3 }
3646     \int_add:Nn \l_@@_final_j_int { #4 }

```

We test if we are still in the matrix.

If the case is empty, we declare that the cell as non-empty. Indeed, we will draw a dotted line and the cell will be on that dotted line. All the cells of a dotted line have to be marked as "dotted" because we don't want intersections between dotted lines. We recall that the research of the extremities of the lines are all done in the same TeX group (the group of the environment), even though, when the extremities are found, each line is drawn in a TeX group that we will open for the options of the line.

4025             \group_end:
4026         }
4027     }

```

The command `\@@_actually_draw_Vdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool`.

The following function is also used by `\Vdotsfor`.

```

4028 \cs_new_protected:Npn \@@_actually_draw_Vdots:
4029 {

```

The boolean `\l_tmpa_bool` indicates whether the column is of type l or may be considered as if.

```
4030     \bool_set_false:N \l_tmpa_bool
```

First the case when the line is closed on both ends.

```

4031     \bool_lazy_or:nnF \l_@@_initial_open_bool \l_@@_final_open_bool
4032     {
4033         \@@_set_initial_coords_from_anchor:n { south-west }
4034         \@@_set_final_coords_from_anchor:n { north-west }
4035         \bool_set:Nn \l_tmpa_bool
4036             { \dim_compare_p:nNn \l_@@_x_initial_dim = \l_@@_x_final_dim }
4037     }

```

Now, we try to determine whether the column is of type c or may be considered as if.

```

4038     \bool_if:NTF \l_@@_initial_open_bool
4039         \@@_open_y_initial_dim:
4040             { \@@_set_initial_coords_from_anchor:n { south } }
4041     \bool_if:NTF \l_@@_final_open_bool
4042         \@@_open_y_final_dim:
4043             { \@@_set_final_coords_from_anchor:n { north } }
4044     \bool_if:NTF \l_@@_initial_open_bool
4045         {
4046             \bool_if:NTF \l_@@_final_open_bool
4047                 {

```

```

4048     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4049     \dim_set_eq:NN \l_tmpa_dim \pgf@x
4050     \@@_qpoint:n { col - \int_eval:n { \l_@@_initial_j_int + 1 } }
4051     \dim_set:Nn \l_@@_x_initial_dim { ( \pgf@x + \l_tmpa_dim ) / 2 }
4052     \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim

```

We may think that the final user won't use a "last column" which contains only a command `\Vdots`. However, if the `\Vdots` is in fact used to draw, not a dotted line, but an arrow (to indicate the number of rows of the matrix), it may be really encountered.

```

4053     \int_compare:nNnT \l_@@_last_col_int > { -2 }
4054     {
4055         \int_compare:nNnT \l_@@_initial_j_int = \g_@@_col_total_int
4056         {
4057             \dim_set_eq:NN \l_tmpa_dim \l_@@_right_margin_dim
4058             \dim_add:Nn \l_tmpa_dim \l_@@_extra_right_margin_dim
4059             \dim_add:Nn \l_@@_x_initial_dim \l_tmpa_dim
4060             \dim_add:Nn \l_@@_x_final_dim \l_tmpa_dim
4061         }
4062     }
4063     { \dim_set_eq:NN \l_@@_x_initial_dim \l_@@_x_final_dim }
4064 }
4065 }
4066 {
4067     \bool_if:NTF \l_@@_final_open_bool
4068     { \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim }
4069     {

```

Now the case where both extremities are closed. The first conditional tests whether the column is of type `c` or may be considered as if.

```

4070     \dim_compare:nNnF \l_@@_x_initial_dim = \l_@@_x_final_dim
4071     {
4072         \dim_set:Nn \l_@@_x_initial_dim
4073         {
4074             \bool_if:NTF \l_tmpa_bool \dim_min:nn \dim_max:nn
4075                 \l_@@_x_initial_dim \l_@@_x_final_dim
4076             }
4077             \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
4078         }
4079     }
4080 }
4081 \@@_draw_line:
4082 }

```

For the diagonal lines, the situation is a bit more complicated because, by default, we parallelize the diagonals lines. The first diagonal line is drawn and then, all the other diagonal lines are drawn parallel to the first one.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4083 \cs_new_protected:Npn \@@_draw_Ddots:nnn #1 #2 #3
4084 {
4085     \@@_adjust_to_submatrix:nn { #1 } { #2 }
4086     \cs_if_free:cT { @_ dotted _ #1 - #2 }
4087     {
4088         \@@_find_extremities_of_line:nnnn { #1 } { #2 } 1 1

```

The previous command may have changed the current environment by marking some cells as "dotted", but, fortunately, it is outside the group for the options of the line.

```

4089     \group_begin:
4090         \keys_set:nn { NiceMatrix / xdots } { #3 }
4091         \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
4092         \@@_actually_draw_Ddots:
4093         \group_end:
4094     }
4095 }

```

The command `\@@_actually_draw_Ddots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

```

4096 \cs_new_protected:Npn \@@_actually_draw_Ddots:
4097 {
4098     \bool_if:NTF \l_@@_initial_open_bool
4099     {
4100         \@@_open_y_initial_dim:
4101         \@@_open_x_initial_dim:
4102     }
4103     { \@@_set_initial_coords_from_anchor:n { south-east } }
4104     \bool_if:NTF \l_@@_final_open_bool
4105     {
4106         \@@_open_x_final_dim:
4107         \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
4108     }
4109     { \@@_set_final_coords_from_anchor:n { north-west } }

```

We have retrieved the coordinates in the usual way (they are stored in `\l_@@_x_initial_dim`, etc.). If the parallelization of the diagonals is set, we will have (maybe) to adjust the fourth coordinate.

```

4110     \bool_if:NT \l_@@_parallelize_diags_bool
4111     {
4112         \int_gincr:N \g_@@_ddots_int

```

We test if the diagonal line is the first one (the counter `\g_@@_ddots_int` is created for this usage).

```
4113     \int_compare:nNnTF \g_@@_ddots_int = 1
```

If the diagonal line is the first one, we have no adjustment of the line to do but we store the  $\Delta_x$  and the  $\Delta_y$  of the line because these values will be used to draw the others diagonal lines parallels to the first one.

```

4114     {
4115         \dim_gset:Nn \g_@@_delta_x_one_dim
4116         { \l_@@_x_final_dim - \l_@@_x_initial_dim }
4117         \dim_gset:Nn \g_@@_delta_y_one_dim
4118         { \l_@@_y_final_dim - \l_@@_y_initial_dim }
4119     }

```

If the diagonal line is not the first one, we have to adjust the second extremity of the line by modifying the coordinate `\l_@@_x_initial_dim`.

```

4120     {
4121         \dim_set:Nn \l_@@_y_final_dim
4122         {
4123             \l_@@_y_initial_dim +
4124             ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) *
4125             \dim_ratio:nn \g_@@_delta_y_one_dim \g_@@_delta_x_one_dim
4126         }
4127     }
4128 }
4129 \@@_draw_line:
4130 }
```

We draw the `\Idots` diagonals in the same way.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4131 \cs_new_protected:Npn \@@_draw_Iddots:nnn #1 #2 #3

4184     { \tl_if_eq_p:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl }
4185     \l_@@_dotted_bool
4186         \@@_draw_standard_dotted_line:
4187         \@@_draw_unstandard_dotted_line:
4188 }
```

We have to do a special construction with `\exp_args:N` to be able to put in the list of options in the correct place in the Tikz instruction.

```

4189 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:
4190 {
4191     \begin{scope}
4192         \@@_draw_unstandard_dotted_line:o
4193             { \l_@@_xdots_line_style_tl , \l_@@_xdots_color_tl }
4194 }
```

We have used the fact that, in PGF, un color name can be put directly in a list of options (that's why we have put directly `\l_@@_xdots_color_tl`).

The argument of `\@@_draw_unstandard_dotted_line:n` is, in fact, the list of options.

```

4195 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:n #1
4196 {
4197     \@@_draw_unstandard_dotted_line:nVV
4198     { #1 }
4199     \l_@@_xdots_up_tl
4200     \l_@@_xdots_down_tl
4201 }
4202 \cs_generate_variant:Nn \@@_draw_unstandard_dotted_line:n { o }
4203 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:nnn #1 #2 #3
4204 {
4205     \draw
4206     [
4207         #1 ,
4208         shorten~> = \l_@@_xdots_shorten_end_dim ,
4209         shorten~< = \l_@@_xdots_shorten_start_dim ,
4210     ]
4211     ( \l_@@_x_initial_dim , \l_@@_y_initial_dim )
```

Be careful: We can't put `\c_math_toggle_token` instead of \$ in the following lines because we are in the contents of Tikz nodes (and they will be *rescanned* if the Tikz library `babel` is loaded).

```

4212     -- node [ sloped , above ] { $ \scriptstyle #2 $ }
4213     node [ sloped , below ] { $ \scriptstyle #3 $ }
4214     ( \l_@@_x_final_dim , \l_@@_y_final_dim ) ;
4215     \end { scope }
4216 }
4217 \cs_generate_variant:Nn \@@_draw_unstandard_dotted_line:nnn { n V V }
```

The command `\@@_draw_standard_dotted_line:` draws the line with our system of dots (which gives a dotted line with real round dots).

```

4218 \cs_new_protected:Npn \@@_draw_standard_dotted_line:
4219 {

4262     \endpgfscope
4263 }
4264 }
```

`\group_begin:`

The dimension `\l_@@_l_dim` is the length  $\ell$  of the line to draw. We use the floating point reals of the L3 programming layer to compute this length.

```

4265 \dim_zero_new:N \l_@@_l_dim
4266 \dim_set:Nn \l_@@_l_dim
4267 {
4268     \fp_to_dim:n
4269     {
4270         sqrt
4271         (
4272             ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) ^ 2
4273             +
4274             ( \l_@@_y_final_dim - \l_@@_y_initial_dim ) ^ 2
4275         )
4276     }
```

```
4277 }
```

It seems that, during the first compilations, the value of  $\l_@@_l\_dim$  may be erroneous (equal to zero or very large). We must detect these cases because they would cause errors during the drawing of the dotted line. Maybe we should also write something in the aux file to say that one more compilation should be done.

```
4278 \bool_lazy_or:nnF
4279   { \dim_compare_p:nNn { \dim_abs:n \l_@@_l_dim } > \c_@@_max_l_dim }

4363 }
4364 \pgfusepathqfill
4365 }

```

## User commands available in the new environments

The commands  $\text{\Oo\_Ldots}$ ,  $\text{\Oo\_Cdots}$ ,  $\text{\Oo\_Vdots}$ ,  $\text{\Oo\_Ddots}$  and  $\text{\Oo\_Iddots}$  will be linked to  $\text{\Ldots}$ ,  $\text{\Cdots}$ ,  $\text{\Vdots}$ ,  $\text{\Ddots}$  and  $\text{\Iddots}$  in the environments  $\{NiceArray\}$  (the other environments of `nicematrix` rely upon  $\{NiceArray\}$ ).

The syntax of these commands uses the character  $_$  as embellishment and that's why we have to insert a character  $_$  in the *arg spec* of these commands. However, we don't know the future catcode of  $_$  in the main document (maybe the user will use `underscore`, and, in that case, the catcode is 13 because `underscore` activates  $_$ ). That's why these commands will be defined in a  $\text{\hook_gput_code:nnn \{ begindocument \} \{ . \}}$  and the *arg spec* will be rescanned.

```

4366 \hook_gput_code:nnn \{ begindocument \} \{ . \}
4367 {
4368   \tl_set:Nn \l_@@_argspec_tl { 0 { } E { _ ^ } { { } { } } }
4369   \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl

4460     }
4461 \bool_if:NF \l_@@_nullify_dots_bool
4462     { \phantom { \ensuremath { \oldiddots } } }
4463 \bool_gset_true:N \g_@@_empty_cell_bool
4464
4465 }

```

End of the `\AddToHook`.

Despite its name, the following set of keys will be used for `\Ddots` but also for `\Iddots`.

```

4466 \keys_define:nn { NiceMatrix / Ddots }
4467 {
4468     draw-first .bool_set:N = \l_@@_draw_first_bool ,
4469     draw-first .default:n = true ,
4470     draw-first .value_forbidden:n = true
4471 }

```

The command `\@@_Hspace:` will be linked to `\hspace` in `{NiceArray}`.

```

4472 \cs_new_protected:Npn \@@_Hspace:
4473 {
4474     \bool_gset_true:N \g_@@_empty_cell_bool
4475     \hspace
4476 }

```

In the environments of `nicematrix`, the command `\multicolumn` is redefined. We will patch the environment `{tabular}` to go back to the previous value of `\multicolumn`.

```
4477 \cs_set_eq:NN \oldmulticolumn \multicolumn
```

The command `\@@_Hdotsfor` will be linked to `\Hdotsfor` in `{NiceArrayWithDelims}`. Tikz nodes are created also in the implicit cells of the `\Hdotsfor` (maybe we should modify that point).

This command must *not* be protected since it begins with `\multicolumn`.

```

4478 \cs_new:Npn \@@_Hdotsfor:
4479 {
4480     \bool_lazy_and:nnTF
4481     { \int_compare_p:nNn \c@jCol = 0 }
4482     { \int_compare_p:nNn \l_@@_first_col_int = 0 }
4483     {
4484         \bool_if:NTF \g_@@_after_col_zero_bool
4485         {
4486             \multicolumn { 1 } { c } { }
4487             \@@_Hdotsfor_i
4488         }
4489         { \@@_fatal:n { Hdotsfor-in-col-0 } }
4490     }
4491     {
4492         \multicolumn { 1 } { c } { }
4493         \@@_Hdotsfor_i
4494     }
4495 }

```

The command `\@@_Hdotsfor_i` is defined with `\NewDocumentCommand` because it has an optional argument. Note that such a command defined by `\NewDocumentCommand` is protected and that's why we have put the `\multicolumn` before (in the definition of `\@@_Hdotsfor:`).

```

4496 \hook_gput_code:nnn { begindocument } { . }
4497 {
4498     \tl_set:Nn \l_@@_argspec_tl { 0 { } m 0 { } E { _ ^ } { { } { } } }
4499     \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl

```

We don't put ! before the last optionnal argument for homogeneity with `\Cdots`, etc. which have only one optional argument.

```

4500 \exp_args:NNV \NewDocumentCommand \@@_Hdotsfor_i \l_@@_argspec_tl

```

## The command `\line` accessible in code-after

In the `\CodeAfter`, the command `\@@_line:nn` will be linked to `\line`. This command takes two arguments which are the specifications of two cells in the array (in the format  $i-j$ ) and draws a dotted line between these cells.

First, we write a command with the following behaviour:

- If the argument is of the format  $i-j$ , our command applies the command `\int_eval:n` to  $i$  and  $j$  ;
- If not (that is to say, when it’s a name of a `\Block`), the argument is left unchanged.

This must *not* be protected (and is, of course fully expandable).<sup>75</sup>

```
4649 \cs_new:Npn \@@_double_int_eval:n #1-#2 \q_stop
4650 {
4651   \tl_if_empty:nTF { #2 }
4652   { #1 }
4653   { \@@_double_int_eval_i:n #1-#2 \q_stop }
4654 }
4655 \cs_new:Npn \@@_double_int_eval_i:n #1-#2- \q_stop
4656 { \int_eval:n { #1 } - \int_eval:n { #2 } }
```

With the following construction, the command `\@@_double_int_eval:n` is applied to both arguments before the application of `\@@_line_i:nn` (the construction uses the fact the `\@@_line_i:nn` is protected and that `\@@_double_int_eval:n` is fully expandable).

```
4657 \hook_gput_code:nnn { begindocument } { . }
4658 {
4659   \tl_set:Nn \l_@@_argspec_tl { 0 { } m m ! 0 { } E { _ ^ } { { } { } } }

4687     }
4688     { \@@_draw_line_ii:nn { #1 } { #2 } }
4689 }
4690 \hook_gput_code:nnn { begindocument } { . }
4691 {
4692     \cs_new_protected:Npx \@@_draw_line_ii:nn #1 #2
4693     {

```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible” and that why we do this static construction of the command `\@@_draw_line_ii:`.

```

4694     \c_@@_pgfortikzpicture_tl
4695     \@@_draw_line_iii:nn { #1 } { #2 }
4696     \c_@@_endpgfortikzpicture_tl
4697 }
4698 }
```

The following command *must* be protected (it’s used in the construction of `\@@_draw_line_ii:nn`).

```

4699 \cs_new_protected:Npn \@@_draw_line_iii:nn #1 #2
4700 {
4701     \pgfrememberpicturepositiononpagetrue
4702     \pgfpointshapeborder { \@@_env: - #1 } { \@@_qpoint:n { #2 } }
4703     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4704     \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
4705     \pgfpointshapeborder { \@@_env: - #2 } { \@@_qpoint:n { #1 } }
4706     \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
4707     \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
4708     \@@_draw_line:
4709 }
```

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Iddots` don’t use this command because they have to do other settings (for example, the diagonal lines must be parallelized).

## The command `\RowStyle`

```

## Colors of cells, rows and columns

We want to avoid the thin white lines that are shown in some PDF viewers (eg: with the engine MuPDF used by SumatraPDF). That's why we try to draw rectangles of the same color in the same instruction `\pgfusepath { fill }` (and they will be in the same instruction `fill`—coded `f`—in the resulting PDF).

The commands `\@@_rowcolor`, `\@@_columncolor`, `\@@_rectanglecolor` and `\@@_rowlistcolors` don't directly draw the corresponding rectangles. Instead, they store their instructions color by color:

- A sequence `\g_@@_colors_seq` will be built containing all the colors used by at least one of these instructions. Each *color* may be prefixed by its color model (eg: `[gray]{0.5}`).
- For the color whose index in `\g_@@_colors_seq` is equal to *i*, a list of instructions which use that color will be constructed in the token list `\g_@@_color_i_tl`. In that token list, the instructions will be written using `\@@_cartesian_color:nn` and `\@@_rectanglecolor:nn`.

#1 is the color and #2 is an instruction using that color. Despite its name, the command `\@@_add_to_colors_seq:nn` doesn't only add a color to `\g_@@_colors_seq`: it also updates the

corresponding token list `\g_@@_color_i_tl`. We add in a global way because the final user may use the instructions such as `\cellcolor` in a loop of `pgffor` in the `\CodeBefore` (and we recall that a loop of `pgffor` is encapsulated in a group).

```
4817 \cs_new_protected:Npn \@@_add_to_colors_seq:nn #1 #2
4818 {
```

Firt, we look for the number of the color and, if it's found, we store it in `\l_tmpa_int`. If the color is not present in `\l_@@_colors_seq`, `\l_tmpa_int` will remain equal to 0.

```
4819 \int_zero:N \l_tmpa_int
```

We don't take into account the colors like `myserie!!+` because those colors are special color from a `\definecolorseries` of `xcolor`.

```
4820 \str_if_in:nnF { #1 } { !! }
4821 {
4822     \seq_map_indexed_inline:Nn \g_@@_colors_seq
4823         { \tl_if_eq:nnT { #1 } { ##2 } { \int_set:Nn \l_tmpa_int { ##1 } } }
4824     }
4825 \int_compare:nNnTF \l_tmpa_int = \c_zero_int
```

First, the case where the color is a *new* color (not in the sequence).

```
4826 {
4827     \seq_gput_right:Nn \g_@@_colors_seq { #1 }
4828     \tl_gset:cx { g_@@_color _ \seq_count:N \g_@@_colors_seq _ tl } { #2 }
4829 }
```

Now, the case where the color is *not* a new color (the color is in the sequence at the position `\l_tmpa_int`).

```
4830 { \tl_gput_right:cx { g_@@_color _ \int_use:N \l_tmpa_int _ tl } { #2 } }
4831 }

4832 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { x n }
4833 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { x x }
```

The macro `\@@_actually_color:` will actually fill all the rectangles, color by color (using the sequence `\l_@@_colors_seq` and all the token lists of the form `\l_@@_color_i_tl`).

```
4834 \cs_new_protected:Npn \@@_actually_color:
4835 {
4836     \pgfpicture
4837     \pgf@relevantforpicturesizefalse

4894     \tl_set_eq:NN \l_@@_tmpc_t1 \l_tmpa_t1
4895     \tl_set_eq:NN \l_@@_tmpd_t1 \l_tmpb_t1
4896     \@@_cut_on_hyphen:w #2 \q_stop
4897     \tl_set:Nx \l_@@_rows_t1 { \l_@@_tmpc_t1 - \l_tmpa_t1 }
4898     \tl_set:Nx \l_@@_cols_t1 { \l_@@_tmpd_t1 - \l_tmpb_t1 }

```

The command \@@\_cartesian\_path:n takes in two implicit arguments: \l\_@@\_cols\_t1 and \l\_@@\_rows\_t1.

```

4899     \@@_cartesian_path:n { #3 }
4900 }

```

Here is an example : \@@\_cellcolor[rgb]{0.5,0.5,0}{2-3,3-4,4-5,5-6}

```

4901 \NewDocumentCommand \@@_cellcolor { 0 { } m m }
4902 {
4903     \clist_map_inline:nn { #3 }
4904     { \@@_rectanglecolor [ #1 ] { #2 } { ##1 } { ##1 } }
4905 }

```

```

4906 \NewDocumentCommand \@@_chessboardcolors { 0 { } m m }
4907 {
4908   \int_step_inline:nn { \int_use:N \c@iRow }
4909   {
4910     \int_step_inline:nn { \int_use:N \c@jCol }
4911     {
4912       \int_if_even:nTF { #####1 + ##1 }
4913       { \@@_cellcolor [ #1 ] { #2 } }
4914       { \@@_cellcolor [ #1 ] { #3 } }
4915       { ##1 - #####1 }
4916     }
4917   }
4918 }

```

The command `\@@_arraycolor` (linked to `\arraycolor` at the beginning of the `\CodeBefore`) will color the whole tabular (excepted the potential exterior rows and columns) and the cells in the “corners”.

```

4919 \NewDocumentCommand \@@_arraycolor { 0 { } m }
4920 {
4921   \@@_rectanglecolor [ #1 ] { #2 }
4922   { 1 - 1 }
4923   { \int_use:N \c@iRow - \int_use:N \c@jCol }
4924 }

4925 \keys_define:nn { NiceMatrix / rowcolors }
4926 {
4927   respect-blocks .bool_set:N = \l_@@_respect_blocks_bool ,
4928   respect-blocks .default:n = true ,
4929   cols .tl_set:N = \l_@@_cols_tl ,
4930   restart .bool_set:N = \l_@@_rowcolors_restart_bool ,
4931   restart .default:n = true ,
4932   unknown .code:n = \@@_error:n { Unknown-key-for-rowcolors }
4933 }

```

The command `\rowcolors` (accessible in the `code-before`) is inspired by the command `\rowcolors` of the package `xcolor` (with the option `table`). However, the command `\rowcolors` of `nicematrix` has *not* the optional argument of the command `\rowcolors` of `xcolor`. Here is an example: `\rowcolors{1}{blue!10}{}[respect-blocks]`.

#1 (optional) is the color space ; #2 is a list of intervals of rows ; #3 is the list of colors ; #4 is for the optional list of pairs `key=value`.

```

4934 \NewDocumentCommand \@@_rowlistcolors { 0 { } m m 0 { } }
4935 {

```

The group is for the options. `\l_@@_colors_seq` will be the list of colors.

```

4936 \group_begin:
4937 \seq_clear_new:N \l_@@_colors_seq
4938 \seq_set_split:Nnn \l_@@_colors_seq { , } { #3 }
4939 \tl_clear_new:N \l_@@_cols_tl
4940 \tl_set:Nn \l_@@_cols_tl { - }
4941 \keys_set:nn { NiceMatrix / rowcolors } { #4 }

```

The counter `\l_@@_color_int` will be the rank of the current color in the list of colors (modulo the length of the list).

```

4942 \int_zero_new:N \l_@@_color_int
4943 \int_set:Nn \l_@@_color_int 1
4944 \bool_if:NT \l_@@_respect_blocks_bool
4945 {

```

We don't want to take into account a block which is completely in the “first column” of (number 0) or in the “last column” and that's why we filter the sequence of the blocks (in a the sequence `\l_tmpa_seq`).

```

4946 \seq_set_eq:NN \l_tmpb_seq \g_@@_pos_of_blocks_seq

```

```

4947   \seq_set_filter:NNn \l_tmpa_seq \l_tmpb_seq
4948     { \@@_not_in_exterior_p:nnnn ##1 }
4949   }
4950 \pgfpicture
4951 \pgf@relevantforpicturesizefalse

```

#2 is the list of intervals of rows.

```

4952 \clist_map_inline:nn { #2 }
4953 {
4954   \tl_set:Nn \l_tmpa_tl { ##1 }
4955   \tl_if_in:NnTF \l_tmpa_tl { - }
4956     { \@@_cut_on_hyphen:w ##1 \q_stop }
4957     { \tl_set:Nx \l_tmpb_tl { \int_use:N \c@iRow } }

```

Now, `\l_tmpa_tl` and `\l_tmpb_tl` are the first row and the last row of the interval of rows that we have to treat. The counter `\l_tmpa_int` will be the index of the loop over the rows.

```

4958 \int_set:Nn \l_tmpa_int \l_tmpa_tl
4959 \bool_if:NTF \l_@@_rowcolors_restart_bool
4960   { \int_set:Nn \l_@@_color_int 1 }
4961   { \int_set:Nn \l_@@_color_int \l_tmpa_tl }
4962 \int_zero_new:N \l_@@_tmpc_int
4963 \int_set:Nn \l_@@_tmpc_int \l_tmpb_tl
4964 \int_do_until:nNnn \l_tmpa_int > \l_@@_tmpc_int
4965   {

```

We will compute in `\l_tmpb_int` the last row of the “block”.

```
4966 \int_set_eq:NN \l_tmpb_int \l_tmpa_int
```

If the key `respect-blocks` is in force, we have to adjust that value (of course).

```

4967 \bool_if:NT \l_@@_respect_blocks_bool
4968   {

5011 }
```

  

```

5012 \prg_new_conditional:Nnn \@@_not_in_exterior:nnnnn p
5013 {
5014     \bool_lazy_or:nnTF
5015         { \int_compare_p:nNn { #4 } = \c_zero_int }
5016         { \int_compare_p:nNn { #2 } = { \int_eval:n { \c@jCol + 1 } } }
5017     \prg_return_false:
5018     \prg_return_true:
5019 }
```

The following command return `true` when the block intersects the row `\l_tmpa_int`.

```

5020 \prg_new_conditional:Nnn \@@_intersect_our_row:nnnnn p
5021 {
5022     \bool_if:nTF
5023     {
5024         \int_compare_p:n { #1 <= \l_tmpa_int }
5025         &&
5026         \int_compare_p:n { \l_tmpa_int <= #3 }
5027     }
5028     \prg_return_true:
5029     \prg_return_false:
5030 }
```

The following command uses two implicit arguments: `\l_@@_rows_tl` and `\l_@@_cols_tl` which are specifications for a set of rows and a set of columns. It creates a path but does *not* fill it. It must be filled by another command after. The argument is the radius of the corners. We define below a command `\@@_cartesian_path:` which corresponds to a value 0 pt for the radius of the corners. This command is in particular used in `\@@_rectanglecolor:nnn` (used in `\@@_rectanglecolor`, itself used in `\@@_cellcolor`).

```

5031 \cs_new_protected:Npn \@@_cartesian_path:n #1
5032 {
5033     \bool_lazy_and:nnT
5034         { ! \seq_if_empty_p:N \l_@@_corners_cells_seq }
5035         { \dim_compare_p:nNn { #1 } = \c_zero_dim }
5036     {
5037         \@@_expand_clist:NN \l_@@_cols_tl \c@jCol
5038         \@@_expand_clist:NN \l_@@_rows_tl \c@iRow
5039     }
```

We begin the loop over the columns.

```

5040 \clist_map_inline:Nn \l_@@_cols_tl
5041 {
5042     \tl_set:Nn \l_tmpa_tl { ##1 }
5043     \tl_if_in:NnTF \l_tmpa_tl { - }
5044         { \@@_cut_on_hyphen:w ##1 \q_stop }
5045         { \@@_cut_on_hyphen:w ##1 - ##1 \q_stop }
5046     \bool_lazy_or:nnT
5047         { \tl_if_blank_p:V \l_tmpa_tl }
5048         { \str_if_eq_p:Vn \l_tmpa_tl { * } }
5049         { \tl_set:Nn \l_tmpa_tl { 1 } }
5050     \bool_lazy_or:nnT
5051         { \tl_if_blank_p:V \l_tmpb_tl }
5052         { \str_if_eq_p:Vn \l_tmpb_tl { * } }
5053         { \tl_set:Nx \l_tmpb_tl { \int_use:N \c@jCol } }
5054     \int_compare:nNnT \l_tmpb_tl > \c@jCol
5055         { \tl_set:Nx \l_tmpb_tl { \int_use:N \c@jCol } }

\l_@@_tmpc_tl will contain the number of column.

5056 \tl_set_eq:NN \l_@@_tmpc_tl \l_tmpa_tl

```

If we decide to provide the commands `\cellcolor`, `\rectanglecolor`, `\rowcolor`, `\columncolor`, `\rowcolors` and `\chessboardcolors` in the code-before of a `\SubMatrix`, we will have to modify the following line, by adding a kind of offset. We will have also some other lines to modify.

```

5057 \@@_qpoint:n { col - \l_tmpa_tl }
5058 \int_compare:nNnTF \l_@@_first_col_int = \l_tmpa_tl
5059     { \dim_set:Nn \l_@@_tmpc_dim { \pgf@x - 0.5 \arrayrulewidth } }
5060     { \dim_set:Nn \l_@@_tmpc_dim { \pgf@x + 0.5 \arrayrulewidth } }
5061 \@@_qpoint:n { col - \int_eval:n { \l_tmpb_tl + 1 } }
5062 \dim_set:Nn \l_tmpa_dim { \pgf@x + 0.5 \arrayrulewidth }

```

We begin the loop over the rows.

```

5063 \clist_map_inline:Nn \l_@@_rows_tl
5064 {
5065     \tl_set:Nn \l_tmpa_tl { #####1 }
5066     \tl_if_in:NnTF \l_tmpa_tl { - }
5067         { \@@_cut_on_hyphen:w #####1 \q_stop }
5068         { \@@_cut_on_hyphen:w #####1 - #####1 \q_stop }
5069     \tl_if_empty:NT \l_tmpa_tl { \tl_set:Nn \l_tmpa_tl { 1 } }
5070     \tl_if_empty:NT \l_tmpb_tl
5071         { \tl_set:Nx \l_tmpb_tl { \int_use:N \c@iRow } }
5072     \int_compare:nNnT \l_tmpb_tl > \c@iRow
5073         { \tl_set:Nx \l_tmpb_tl { \int_use:N \c@iRow } }

```

Now, the numbers of both rows are in `\l_tmpa_tl` and `\l_tmpb_tl`.

```

5074 \seq_if_in:NxF \l_@@_corners_cells_seq
5075     { \l_tmpa_tl - \l_@@_tmpc_tl }
5076     {
5077         \@@_qpoint:n { row - \int_eval:n { \l_tmpb_tl + 1 } }
5078         \dim_set:Nn \l_tmpb_dim { \pgf@y + 0.5 \arrayrulewidth }
5079         \@@_qpoint:n { row - \l_tmpa_tl }
5080         \dim_set:Nn \l_@@_tmpd_dim { \pgf@y + 0.5 \arrayrulewidth }
5081         \pgfsetcornersarced { \pgfpoint { #1 } { #1 } }
5082         \pgfpathrectanglecorners
5083             { \pgfpoint \l_@@_tmpc_dim \l_@@_tmpd_dim }
5084             { \pgfpoint \l_tmpa_dim \l_tmpb_dim }
5085     }
5086 }
5087 }
5088 }

```

The following command corresponds to a radius of the corners equal to 0 pt. This command is used by the commands `\@@_rowcolors`, `\@@_columncolor` and `\@@_rowcolor:n` (used in `\@@_rowcolor`).

```

5089 \cs_new_protected:Npn \@@_cartesian_path: { \@@_cartesian_path:n { 0 pt } }

```

The following command will be used only with `\l_@@_cols_t1` and `\c@jCol` (first case) or with `\l_@@_rows_t1` and `\c@iRow` (second case). For instance, with `\l_@@_cols_t1` equal to `2,4-6,8-*` and `\c@jCol` equal to `10`, the list `\l_@@_cols_t1` will be replaced by `2,4,5,6,8,9,10`.

```

5111             { \clist_put_right:Nn #1 { #####1 } }
5112     }
5113 }
```

When the user uses the key `colortbl-like`, the following command will be linked to `\cellcolor` in the tabular.

```

5114 \NewDocumentCommand \@@_cellcolor_tabular { O { } m }
5115 {
5116     \tl_gput_right:Nx \g_@@_pre_code_before_tl
5117 }
```

We must not expand the color (#2) because the color may contain the token ! which may be activated by some packages (ex.: babel with the option french on latex and pdflatex).

```

5118     \@@_cellcolor [ #1 ] { \exp_not:n { #2 } }
5119         { \int_use:N \c@iRow - \int_use:N \c@jCol }
5120     }
5121     \ignorespaces
5122 }
```

When the user uses the key `colortbl-like`, the following command will be linked to `\rowcolor` in the tabular.

```

5123 \NewDocumentCommand \@@_rowcolor_tabular { O { } m }
5124 {
5125     \tl_gput_right:Nx \g_@@_pre_code_before_tl
5126     {
5127         \@@_rectanglecolor [ #1 ] { \exp_not:n { #2 } }
5128             { \int_use:N \c@iRow - \int_use:N \c@jCol }
5129             { \int_use:N \c@iRow - \exp_not:n { \int_use:N \c@jCol } }
5130     }
5131     \ignorespaces
5132 }
```

  

```

5133 \NewDocumentCommand \@@_columncolor_preamble { O { } m }
5134 {
```

With the following line, we test whether the cell is the first one we encounter in its column (don't forget that some rows may be incomplete).

```

5135     \int_compare:nNnT \c@jCol > \g_@@_col_total_int
5136     {
```

You use `gput_left` because we want the specification of colors for the columns drawn before the specifications of color for the rows (and the cells). Be careful: maybe this is not effective since we have an analyze of the instructions in the `\CodeBefore` in order to fill color by color (to avoid the thin white lines).

```

5137 \tl_gput_left:Nx \g_@@_pre_code_before_tl
5138 {
5139     \exp_not:N \columncolor [ #1 ]
5140     { \exp_not:n { #2 } } { \int_use:N \c@jCol }
5141 }
5142 }
5143 }
```

## The vertical and horizontal rules

### OnlyMainNiceMatrix

We give to the user the possibility to define new types of columns (with `\newcolumntype` of `array`) for special vertical rules (*e.g.* rules thicker than the standard ones) which will not extend in the potential exterior rows of the array.

We provide the command `\OnlyMainNiceMatrix` in that goal. However, that command must be no-op outside the environments of `nicematrix` (and so the user will be allowed to use the same new type of column in the environments of `nicematrix` and in the standard environments of `array`).

That's why we provide first a global definition of `\OnlyMainNiceMatrix`.

```
5144 \cs_set_eq:NN \OnlyMainNiceMatrix \use:n
```

Another definition of `\OnlyMainNiceMatrix` will be linked to the command in the environments of `nicematrix`. Here is that definition, called `\@@_OnlyMainNiceMatrix:n`.

```

5145 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix:n #1
5146 {
5147     \int_compare:nNnTF \l_@@_first_col_int = 0
5148     { \@@_OnlyMainNiceMatrix_i:n { #1 } }
5149     {
5150         \int_compare:nNnTF \c@jCol = 0
5151         {
5152             \int_compare:nNnF \c@iRow = { -1 }
5153             { \int_compare:nNnF \c@iRow = { \l_@@_last_row_int - 1 } { #1 } }
5154         }
5155         { \@@_OnlyMainNiceMatrix_i:n { #1 } }
5156     }
5157 }
```

This definition may seem complicated but we must remind that the number of row `\c@iRow` is incremented in the first cell of the row, *after* a potential vertical rule on the left side of the first cell.

The command `\@@_OnlyMainNiceMatrix_i:n` is only a short-cut which is used twice in the above command. This command must *not* be protected.

```

5158 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix_i:n #1
5159 {
5160     \int_compare:nNnF \c@iRow = 0
5161     { \int_compare:nNnF \c@iRow = \l_@@_last_row_int { #1 } }
5162 }
```

Remember that `\c@iRow` is not always inferior to `\l_@@_last_row_int` because `\l_@@_last_row_int` may be equal to  $-2$  or  $-1$  (we can't write `\int_compare:nNnT \c@iRow < \l_@@_last_row_int`).

## General system for drawing rules

When a command, environment or “subsystem” of nicematrix wants to draw a rule, it will write in the internal \CodeAfter a command \@@\_vline:n or \@@\_hline:n. Both commands take in as argument a list of key=value pairs. That list will first be analyzed with the following set of keys. However, unknown keys will be analyzed further with another set of keys.

```

5163 \keys_define:nn { NiceMatrix / Rules }
5164 {
5165   position .int_set:N = \l_@@_position_int ,
5166   position .value_required:n = true ,
5167   start .int_set:N = \l_@@_start_int ,
5168   start .initial:n = 1 ,
5169   end .code:n =
5170     \bool_lazy_or:nnTF
5171       { \tl_if_empty_p:n { #1 } }
5172       { \str_if_eq_p:nn { #1 } { last } }
5173       { \int_set_eq:NN \l_@@_end_int \c@jCol }
5174       { \int_set:Nn \l_@@_end_int { #1 } }
5175 }
```

It's possible that the rule won't be drawn continuously from `start` ot `end` because of the blocks (created with the command `\Block`), the virtual blocks (created by `\Cdots`, etc.), etc. That's why an analyse is done and the rule is cut in small rules which will actually be drawn. The small continuous rules will be drawn by `\@@_vline_ii:` and `\@@_hline_ii::`. Those commands use the following set of keys.

```

5176 \keys_define:nn { NiceMatrix / RulesBis }
5177 {
5178   multiplicity .int_set:N = \l_@@_multiplicity_int ,
5179   multiplicity .initial:n = 1 ,
5180   dotted .bool_set:N = \l_@@_dotted_bool ,
5181   dotted .initial:n = false ,
5182   dotted .default:n = true ,
5183   color .code:n = \@@_set_Carc:n { #1 } ,
5184   color .value_required:n = true ,
5185   sep-color .code:n = \@@_set_Cdrsc:n { #1 } ,
5186   sep-color .value_required:n = true ,
```

If the user uses the key `tikz`, the rule (or more precisely: the different sub-rules since a rule may be broken by blocks or others) will be drawn with Tikz.

```

5187   tikz .tl_set:N = \l_@@_tikz_rule_tl ,
5188   tikz .value_required:n = true ,
5189   tikz .initial:n = ,
5190   total-width .dim_set:N = \l_@@_rule_width_dim ,
5191   total-width .value_required:n = true ,
5192   width .meta:n = { total-width = #1 } ,
5193   unknown .code:n = \@@_error:n { Unknown-key-for-RulesBis }
5194 }
```

## The vertical rules

The following command will be executed in the internal \CodeAfter. The argument #1 is a list of key=value pairs.

```

5195 \cs_new_protected:Npn \@@_vline:n #1
5196 {
```

The group is for the options.

```

5197   \group_begin:
5198   \int_zero_new:N \l_@@_end_int
5199   \int_set_eq:NN \l_@@_end_int \c@iRow
5200   \keys_set_known:nnN { NiceMatrix / Rules } { #1 } \l_@@_other_keys_tl
```

The following test is for the case where the user does not use all the columns specified in the preamble of the environment (for instance, a preamble of `|c|c|c|` but only two columns used).

```

5201 \int_compare:nNnT \l_@@_position_int < { \c@jCol + 2 }
5202   \@@_vline_i:
5203   \group_end:
5204 }

5205 \cs_new_protected:Npn \@@_vline_i:
5206 {
5207   \int_zero_new:N \l_@@_local_start_int
5208   \int_zero_new:N \l_@@_local_end_int

```

`\l_tmpa_t1` is the number of row and `\l_tmpb_t1` the number of column. When we have found a row corresponding to a rule to draw, we note its number in `\l_@@_tmpc_t1`.

```

5209 \tl_set:Nx \l_tmpb_t1 { \int_eval:n \l_@@_position_int }
5210 \int_step_variable:nnNn \l_@@_start_int \l_@@_end_int
5211   \l_tmpa_t1
5212 }

```

The boolean `\g_tmpa_bool` indicates whether the small vertical rule will be drawn. If we find that it is in a block (a real block, created by `\Block` or a virtual block corresponding to a dotted line, created by `\Cdots`, `\Vdots`, etc.), we will set `\g_tmpa_bool` to `false` and the small vertical rule won't be drawn.

```

5382 }
```

## The horizontal rules

The following command will be executed in the internal `\CodeAfter`. The argument #1 is a list of `key=value` pairs of the form `{NiceMatrix/Rules}`.

```

5383 \cs_new_protected:Npn \@_hline:n #1
5384 {
```

The group is for the options.

```

5385 \group_begin:
5386 \int_zero_new:N \l_@@_end_int
5387 \int_set_eq:NN \l_@@_end_int \c@jCol
5388 \keys_set_known:nnN { NiceMatrix / Rules } { #1 } \l_@@_other_keys_tl
5389 \@_hline_i:
5390 \group_end:
5391 }

5392 \cs_new_protected:Npn \@_hline_i:
5393 {
5394     \int_zero_new:N \l_@@_local_start_int
5395     \int_zero_new:N \l_@@_local_end_int
```

`\l_tmpa_tl` is the number of row and `\l_tmpb_tl` the number of column. When we have found a column corresponding to a rule to draw, we note its number in `\l_@@_tmpc_tl`.

```

5396 \tl_set:Nx \l_tmpa_tl { \int_use:N \l_@@_position_int }
5397 \int_step_variable:nnNn \l_@@_start_int \l_@@_end_int
5398     \l_tmpb_tl
5399 }
```

The boolean `\g_tmpa_bool` indicates whether the small horizontal rule will be drawn. If we find that it is in a block (a real block, created by `\Block` or a virtual block corresponding to a dotted line, created by `\Cdots`, `\Vdots`, etc.), we will set `\g_tmpa_bool` to false and the small horizontal rule won't be drawn.

```

The following code is for the case of a dotted rule (with our system of rounded dots). The aim is that, by standard the dotted line fits between square brackets (`\hline` doesn't).

```

\begin{bNiceMatrix}
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

```

$$\left[ \begin{matrix} 1 & 2 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ \vdots & \ddots & \ddots & \ddots \end{matrix} \right]$$

But, if the user uses `margin`, the dotted line extends to have the same width as a `\hline`.

```

\begin{bNiceMatrix}[margin]
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

5518 \cs_new_protected:Npn \@@_hline_iv:

## Customized rules defined by the final user

The final user can define a customized rule by using the key `custom-line` in `\NiceMatrixOptions`. That key takes in as value a list of `key=value` pairs.

Among the keys available in that list, there is the key `letter` to specify a letter that the final user will use in the preamble of the array. All the letters defined by this way by the final user for such customized rules are added in the set of keys `{NiceMatrix / ColumnTypes}`. That set of keys is used to store the characteristics of those types of rules for convenience: the keys of that set of keys won't never be used as keys by the final user (he will use, instead, letters in the preamble of its array).

```
5618 \keys_define:nn { NiceMatrix / ColumnTypes } { }
```

The following command will create the customized rule (it is executed when the final user uses the key `custom-line`, for example in `\NiceMatrixOptions`).

```
5619 \cs_new_protected:Npn \@@_custom_line:n #1
5620 {
  \str_clear_new:N \l_@@_command_str
  \str_clear_new:N \l_@@_ccommand_str
  \str_clear_new:N \l_@@_letter_str
  \keys_set_known:nnN { NiceMatrix / custom-line } { #1 } \l_@@_other_keys_tl
```

If the final user only wants to draw horizontal rules, he does not need to specify a letter (for the vertical rules in the preamble of the array). On the other hand, if he only wants to draw vertical rules, he does not need to define a command (which is the tool to draw horizontal rules in the array). Of course, a definition of custom lines with no letter and no command would be point-less.

```
5625 \bool_lazy_all:nTF
5626 {
  { \str_if_empty_p:N \l_@@_letter_str }
  { \str_if_empty_p:N \l_@@_command_str }

## The key corners

When the key `corners` is raised, the rules are not drawn in the corners. Of course, we have to compute the corners before we begin to draw the rules.

```
5862 \cs_new_protected:Npn \@@_compute_corners:
5863 {
```

The sequence `\l_@@_corners_cells_seq` will be the sequence of all the empty cells (and not in a block) considered in the corners of the array.

```
5864 \seq_clear_new:N \l_@@_corners_cells_seq
5865 \clist_map_inline:Nn \l_@@_corners_clist
5866 {
5867     \str_case:nnF { ##1 }
5868     {
5869         { NW }
5870         { \@@_compute_a_corner:nnnnnn 1 1 1 1 \c@iRow \c@jCol }
5871         { NE }
5872         { \@@_compute_a_corner:nnnnnn 1 \c@jCol 1 { -1 } \c@iRow 1 }
5873         { SW }
5874         { \@@_compute_a_corner:nnnnnn \c@iRow 1 { -1 } 1 1 \c@jCol }
5875         { SE }
5876         { \@@_compute_a_corner:nnnnnn \c@iRow \c@jCol { -1 } { -1 } 1 1 }
5877     }
5878     { \@@_error:nn { bad-corner } { ##1 } }
5879 }
```

Even if the user has used the key `corners` the list of cells in the corners may be empty.

```
5880 \seq_if_empty:NF \l_@@_corners_cells_seq
5881 {
```

You write on the `aux` file the list of the cells which are in the (empty) corners because you need that information in the `\CodeBefore` since the commands which color the `rows`, `columns` and `cells` must not color the cells in the corners.

```
5882 \tl_gput_right:Nx \g_@@_aux_tl
5883 {
5884     \seq_set_from_clist:Nn \exp_not:N \l_@@_corners_cells_seq
5885     { \seq_use:Nnnn \l_@@_corners_cells_seq , , , }
5886 }
5887 }
5888 }
```

“Computing a corner” is determining all the empty cells (which are not in a block) that belong to that corner. These cells will be added to the sequence `\l_@@_corners_cells_seq`.

The six arguments of `\@@_compute_a_corner:nnnnnn` are as follow:

- #1 and #2 are the number of row and column of the cell which is actually in the corner;
- #3 and #4 are the steps in rows and the step in columns when moving from the corner;
- #5 is the number of the final row when scanning the rows from the corner;
- #6 is the number of the final column when scanning the columns from the corner.

```
5889 \cs_new_protected:Npn \@@_compute_a_corner:nnnnnn #1 #2 #3 #4 #5 #6
5890 {
```

For the explanations and the name of the variables, we consider that we are computing the left-upper corner.

First, we try to determine which is the last empty cell (and not in a block: we won’t add that precision any longer) in the column of number 1. The flag `\l_tmpa_bool` will be raised when a non-empty cell is found.

```
5891 \bool_set_false:N \l_tmpa_bool
5892 \int_zero_new:N \l_@@_last_empty_row_int
5893 \int_set:Nn \l_@@_last_empty_row_int { #1 }
```

```

5894 \int_step_inline:nnnn { #1 } { #3 } { #5 }
5895 {
5896     \@@_test_if_cell_in_a_block:nn { ##1 } { \int_eval:n { #2 } }
5897     \bool_lazy_or:nnTF
5898     {
5899         \cs_if_exist_p:c
5900         { pgf @ sh @ ns @ \@@_env: - ##1 - \int_eval:n { #2 } }
5901     }
5902     \l_tmpb_bool
5903     { \bool_set_true:N \l_tmpa_bool }
5904     {
5905         \bool_if:NF \l_tmpa_bool
5906         { \int_set:Nn \l_@@_last_empty_row_int { ##1 } }
5907     }
5908 }

```

Now, you determine the last empty cell in the row of number 1.

```

5909 \bool_set_false:N \l_tmpa_bool
5910 \int_zero_new:N \l_@@_last_empty_column_int
5911 \int_set:Nn \l_@@_last_empty_column_int { #2 }
5912 \int_step_inline:nnnn { #2 } { #4 } { #6 }
5913 {
5914     \@@_test_if_cell_in_a_block:nn { \int_eval:n { #1 } } { ##1 }
5915     \bool_lazy_or:nnTF
5916     \l_tmpb_bool
5917     {
5918         \cs_if_exist_p:c
5919         { pgf @ sh @ ns @ \@@_env: - \int_eval:n { #1 } - ##1 }
5920     }
5921     { \bool_set_true:N \l_tmpa_bool }
5922     {
5923         \bool_if:NF \l_tmpa_bool
5924         { \int_set:Nn \l_@@_last_empty_column_int { ##1 } }
5925     }
5926 }

```

Now, we loop over the rows.

```

5927 \int_step_inline:nnnn { #1 } { #3 } \l_@@_last_empty_row_int
5928 {

```

We treat the row number ##1 with another loop.

```

5929 \bool_set_false:N \l_tmpa_bool
5930 \int_step_inline:nnnn { #2 } { #4 } \l_@@_last_empty_column_int
5931 {
5932     \@@_test_if_cell_in_a_block:nn { ##1 } { #####1 }

5970             }
5971         }
5972     }
5973 }
```

## The environment {NiceMatrixBlock}

The following flag will be raised when all the columns of the environments of the block must have the same width in “auto” mode.

```
5974 \bool_new:N \l_@@_block_auto_columns_width_bool
```

Up to now, there is only one option available for the environment {NiceMatrixBlock}.

```

5975 \keys_define:nn { NiceMatrix / NiceMatrixBlock }
5976 {
5977     auto-columns-width .code:n =
5978     {
5979         \bool_set_true:N \l_@@_block_auto_columns_width_bool
5980         \dim_gzero_new:N \g_@@_max_cell_width_dim
5981         \bool_set_true:N \l_@@_auto_columns_width_bool
5982     }
5983 }
```

  

```

5984 \NewDocumentEnvironment { NiceMatrixBlock } { ! O { } }
5985 {
5986     \int_gincr:N \g_@@_NiceMatrixBlock_int
5987     \dim_zero:N \l_@@_columns_width_dim
5988     \keys_set:nn { NiceMatrix / NiceMatrixBlock } { #1 }
5989     \bool_if:NT \l_@@_block_auto_columns_width_bool
5990     {
5991         \cs_if_exist:cT { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
5992         {
5993             \exp_args:NNo \dim_set:Nn \l_@@_columns_width_dim
5994                 { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
5995         }
5996     }
5997 }
```

At the end of the environment `{NiceMatrixBlock}`, we write in the main `aux` file instructions for the column width of all the environments of the block (that's why we have stored the number of the first environment of the block in the counter `\l_@@_first_env_block_int`).

```

5998   {
5999     \bool_if:NT \l_@@_block_auto_columns_width_bool
6000     {
6001       \iow_shipout:Nn \@mainaux \ExplSyntaxOn
6002       \iow_shipout:Nx \@mainaux
6003       {
6004         \cs_gset:cpn
6005           { @@ _ max _ cell _ width _ \int_use:N \g_@@_NiceMatrixBlock_int }
6006       { \dim_eval:n { \g_@@_max_cell_width_dim + \arrayrulewidth } }
6007     }
6008     \iow_shipout:Nn \@mainaux \ExplSyntaxOff
6009   }
6010 }
```

## The extra nodes

First, two variants of the functions `\dim_min:nn` and `\dim_max:nn`.

```

6011 \cs_generate_variant:Nn \dim_min:nn { v n }
6012 \cs_generate_variant:Nn \dim_max:nn { v n }
```

The following command is called in `\@@_use_arraybox_with_notes_c`: just before the construction of the blocks (if the creation of medium nodes is required, medium nodes are also created for the blocks and that construction uses the standard medium nodes).

```

6013 \cs_new_protected:Npn \@@_create_extra_nodes:
6014   {
6015     \bool_if:nTF \l_@@_medium_nodes_bool
6016     {
6017       \bool_if:NTF \l_@@_large_nodes_bool
6018         \@@_create_medium_and_large_nodes:
6019         \@@_create_medium_nodes:
6020     }
6021   { \bool_if:NT \l_@@_large_nodes_bool \@@_create_large_nodes: }
6022 }
```

We have three macros of creation of nodes: `\@@_create_medium_nodes:`, `\@@_create_large_nodes:` and `\@@_create_medium_and_large_nodes:`.

We have to compute the mathematical coordinates of the “medium nodes”. These mathematical coordinates are also used to compute the mathematical coordinates of the “large nodes”. That's why we write a command `\@@_computations_for_medium_nodes:` to do these computations.

The command `\@@_computations_for_medium_nodes:` must be used in a `{pgfpicture}`.

For each row  $i$ , we compute two dimensions `\l_@@_row_i_min_dim` and `\l_@@_row_i_max_dim`. The dimension `\l_@@_row_i_min_dim` is the minimal  $y$ -value of all the cells of the row  $i$ . The dimension `\l_@@_row_i_max_dim` is the maximal  $y$ -value of all the cells of the row  $i$ .

Similarly, for each column  $j$ , we compute two dimensions `\l_@@_column_j_min_dim` and `\l_@@_column_j_max_dim`. The dimension `\l_@@_column_j_min_dim` is the minimal  $x$ -value of all the cells of the column  $j$ . The dimension `\l_@@_column_j_max_dim` is the maximal  $x$ -value of all the cells of the column  $j$ .

Since these dimensions will be computed as maximum or minimum, we initialize them to `\c_max_dim` or `-\c_max_dim`.

```

6023 \cs_new_protected:Npn \@@_computations_for_medium_nodes:
6024   {
6025     \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
```

```

6026    {
6027        \dim_zero_new:c { l_@@_row_\@@_i: _min_dim }
6028        \dim_set_eq:cN { l_@@_row_\@@_i: _min_dim } \c_max_dim
6029        \dim_zero_new:c { l_@@_row_\@@_i: _max_dim }
6030        \dim_set:cn { l_@@_row_\@@_i: _max_dim } { - \c_max_dim }
6031    }
6032    \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
6033    {
6034        \dim_zero_new:c { l_@@_column_\@@_j: _min_dim }
6035        \dim_set_eq:cN { l_@@_column_\@@_j: _min_dim } \c_max_dim
6036        \dim_zero_new:c { l_@@_column_\@@_j: _max_dim }
6037        \dim_set:cn { l_@@_column_\@@_j: _max_dim } { - \c_max_dim }
6038    }

```

We begin the two nested loops over the rows and the columns of the array.

```

6039    \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6040    {
6041        \int_step_variable:nnNn
6042            \l_@@_first_col_int \g_@@_col_total_int \@@_j:

```

If the cell  $(i-j)$  is empty or an implicit cell (that is to say a cell after implicit ampersands &) we don't update the dimensions we want to compute.

```

6043    {
6044        \cs_if_exist:cT
6045            { pgf @ sh @ ns @ \@@_env: - \@@_i: - \@@_j: }

```

We retrieve the coordinates of the anchor `south west` of the (normal) node of the cell  $(i-j)$ . They will be stored in `\pgf@x` and `\pgf@y`.

```

6046    {
6047        \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { south-west }
6048        \dim_set:cn { l_@@_row_\@@_i: _min_dim }
6049            { \dim_min:vn { l_@@_row_\@@_i: _min_dim } \pgf@y }
6050        \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
6051        {
6052            \dim_set:cn { l_@@_column_\@@_j: _min_dim }
6053                { \dim_min:vn { l_@@_column_\@@_j: _min_dim } \pgf@x }
6054        }

```

We retrieve the coordinates of the anchor `north east` of the (normal) node of the cell  $(i-j)$ . They will be stored in `\pgf@x` and `\pgf@y`.

```

6055        \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { north-east }
6056        \dim_set:cn { l_@@_row_\@@_i: _max_dim }
6057            { \dim_max:vn { l_@@_row_\@@_i: _max_dim } \pgf@y }
6058        \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
6059        {
6060            \dim_set:cn { l_@@_column_\@@_j: _max_dim }
6061                { \dim_max:vn { l_@@_column_\@@_j: _max_dim } \pgf@x }
6062        }
6063    }
6064}
6065

```

Now, we have to deal with empty rows or empty columns since we don't have created nodes in such rows and columns.

```

6066    \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6067    {
6068        \dim_compare:nNt
6069            { \dim_use:c { l_@@_row_\@@_i: _min_dim } } = \c_max_dim
6070        {
6071            \@@_qpoint:n { row - \@@_i: - base }
6072            \dim_set:cn { l_@@_row_\@@_i: _max_dim } \pgf@y
6073            \dim_set:cn { l_@@_row_\@@_i: _min_dim } \pgf@y
6074        }
6075    }
6076    \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:

```

```

6077     {
6078         \dim_compare:nNnT
6079             { \dim_use:c { l_@@_column _ \@@_j: _ min _ dim } } = \c_max_dim
6080             {
6081                 \@@_qpoint:n { col - \@@_j: }
6082                 \dim_set:cn { l_@@_column _ \@@_j: _ max _ dim } \pgf@y
6083                 \dim_set:cn { l_@@_column _ \@@_j: _ min _ dim } \pgf@y
6084             }
6085     }
6086 }
```

Here is the command `\@@_create_medium_nodes:`. When this command is used, the “medium nodes” are created.

```

6087 \cs_new_protected:Npn \@@_create_medium_nodes:
6088 {
6089     \pgfpicture
6090         \pgfrememberpicturepositiononpagetrue
6091         \pgf@relevantforpicturesizefalse
6092         \@@_computations_for_medium_nodes:
```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

6093     \tl_set:Nn \l_@@_suffix_tl { -medium }
6094     \@@_create_nodes:
6095     \endpgfpicture
6096 }
```

The command `\@@_create_large_nodes:` must be used when we want to create only the “large nodes” and not the medium ones<sup>76</sup>. However, the computation of the mathematical coordinates of the “large nodes” needs the computation of the mathematical coordinates of the “medium nodes”. Hence, we use first `\@@_computations_for_medium_nodes:` and then the command `\@@_computations_for_large_nodes:`.

```

6097 \cs_new_protected:Npn \@@_create_large_nodes:
6098 {
6099     \pgfpicture
6100         \pgfrememberpicturepositiononpagetrue
6101         \pgf@relevantforpicturesizefalse
6102         \@@_computations_for_medium_nodes:
6103         \@@_computations_for_large_nodes:
6104         \tl_set:Nn \l_@@_suffix_tl { - large }
6105         \@@_create_nodes:
6106     \endpgfpicture
6107 }

6108 \cs_new_protected:Npn \@@_create_medium_and_large_nodes:
6109 {
6110     \pgfpicture
6111         \pgfrememberpicturepositiononpagetrue
6112         \pgf@relevantforpicturesizefalse
6113         \@@_computations_for_medium_nodes:
```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

6114     \tl_set:Nn \l_@@_suffix_tl { - medium }
6115     \@@_create_nodes:
6116     \@@_computations_for_large_nodes:
6117     \tl_set:Nn \l_@@_suffix_tl { - large }
6118     \@@_create_nodes:
6119     \endpgfpicture
6120 }
```

---

<sup>76</sup>If we want to create both, we have to use `\@@_create_medium_and_large_nodes:`

For “large nodes”, the exterior rows and columns don’t interfere. That’s why the loop over the columns will start at 1 and stop at  $\backslash c@jCol$  (and not  $\backslash g_{@@\_col\_total\_int}$ ). Idem for the rows.

```

6121 \cs_new_protected:Npn \@@_computations_for_large_nodes:
6122 {
6123     \int_set:Nn \l_@@_first_row_int 1
6124     \int_set:Nn \l_@@_first_col_int 1

We have to change the values of all the dimensions  $\l_@@_row_i\_min\_dim$ ,  $\l_@@_row_i\_max\_dim$ ,  $\l_@@_column_j\_min\_dim$  and  $\l_@@_column_j\_max\_dim$ .
6125     \int_step_variable:nNn { \c@iRow - 1 } \@@_i:

6139     {
6140         \dim_set:cn { \l_@@_column _ \@@_j: _ max _ dim }
6141         {
6142             (
6143                 \dim_use:c { \l_@@_column _ \@@_j: _ max _ dim } +
6144                 \dim_use:c
6145                     { \l_@@_column _ \int_eval:n { \@@_j: + 1 } _ min _ dim }
6146             )
6147             / 2
6148         }
6149         \dim_set_eq:cc { \l_@@_column _ \int_eval:n { \@@_j: + 1 } _ min _ dim }
6150         { \l_@@_column _ \@@_j: _ max _ dim }
6151     }
}

```

Here, we have to use  $\dim_sub:cn$  because of the number 1 in the name.

```

6152 \dim_sub:cn
6153 { \l_@@_column _ 1 _ min _ dim }
6154 \l_@@_left_margin_dim
6155 \dim_add:cn
6156 { \l_@@_column _ \int_use:N \c@jCol _ max _ dim }
6157 \l_@@_right_margin_dim
6158 }

```

The command  $\backslash @@_create\_nodes:$  is used twice: for the construction of the “medium nodes” and for the construction of the “large nodes”. The nodes are constructed with the value of all the dimensions  $\l_@@_row_i\_min\_dim$ ,  $\l_@@_row_i\_max\_dim$ ,  $\l_@@_column_j\_min\_dim$  and  $\l_@@_column_j\_max\_dim$ . Between the construction of the “medium nodes” and the “large nodes”, the values of these dimensions are changed.

The function also uses  $\l_@@_suffix_tl$  (-medium or -large).

```

6159 \cs_new_protected:Npn \@@_create_nodes:
6160 {
6161     \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6162     {
6163         \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
6164         {

```

We draw the rectangular node for the cell ( $\backslash @@_i$ - $\backslash @@_j$ ).

```

6165     \@@_pgf_rect_node:nnnn
6166     { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6167     { \dim_use:c { \l_@@_column_ \@@_j: _min_dim } }

```

```

6168     { \dim_use:c { l_@@_row_ \@@_i: _min_dim } }
6169     { \dim_use:c { l_@@_column_ \@@_j: _max_dim } }
6170     { \dim_use:c { l_@@_row_ \@@_i: _max_dim } }
6171     \str_if_empty:NF \l_@@_name_str
6172     {
6173         \pgfnodealias
6174             { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
6175             { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6176     }
6177 }
6178 }
```

Now, we create the nodes for the cells of the `\multicolumn`. We recall that we have stored in `\g_@@_multicolumn_cells_seq` the list of the cells where a `\multicolumn{n}{...}{...}` with  $n > 1$  was issued and in `\g_@@_multicolumn_sizes_seq` the correspondant values of  $n$ .

```

6179 \seq_mapthread_function:NNN
6180     \g_@@_multicolumn_cells_seq
6181     \g_@@_multicolumn_sizes_seq
6182     \@@_node_for_multicolumn:nn
6183 }

6184 \cs_new_protected:Npn \@@_extract_coords_values: #1 - #2 \q_stop
6185 {
6186     \cs_set_nopar:Npn \@@_i: { #1 }
6187     \cs_set_nopar:Npn \@@_j: { #2 }
6188 }
```

The command `\@@_node_for_multicolumn:nn` takes two arguments. The first is the position of the cell where the command `\multicolumn{n}{...}{...}` was issued in the format  $i-j$  and the second is the value of  $n$  (the length of the “multi-cell”).

```

6189 \cs_new_protected:Npn \@@_node_for_multicolumn:nn #1 #2
6190 {
6191     \@@_extract_coords_values: #1 \q_stop
6192     \@@_pgf_rect_node:nnnnn
6193         { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6194         { \dim_use:c { l_@@_column_ \@@_j: _ min _ dim } }
6195         { \dim_use:c { l_@@_row_ \@@_i: _ min _ dim } }
6196         { \dim_use:c { l_@@_column_ \int_eval:n { \@@_j: +#2-1 } _ max _ dim } }
6197         { \dim_use:c { l_@@_row_ \@@_i: _ max _ dim } }
6198     \str_if_empty:NF \l_@@_name_str
6199     {
6200         \pgfnodealias
6201             { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
6202             { \int_use:N \g_@@_env_int - \@@_i: - \@@_j: \l_@@_suffix_tl }
6203     }
6204 }
```

## The blocks

The code deals with the command `\Block`. This command has no direct link with the environment `{NiceMatrixBlock}`.

The options of the command `\Block` will be analyzed first in the cell of the array (and once again when the block will be put in the array). Here is the set of keys for the first pass.

```

6205 \keys_define:nn { NiceMatrix / Block / FirstPass }
6206 {
6207     l .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
6208     l .value_forbidden:n = true ,
6209     r .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
6210     r .value_forbidden:n = true ,
```

```

6211 c .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
6212 c .value_forbidden:n = true ,
6213 L .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
6214 L .value_forbidden:n = true ,
6215 R .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
6216 R .value_forbidden:n = true ,
6217 C .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
6218 C .value_forbidden:n = true ,
6219 t .code:n = \str_set:Nn \l_@@_vpos_of_block_tl t ,
6220 t .value_forbidden:n = true ,
6221 b .code:n = \str_set:Nn \l_@@_vpos_of_block_tl b ,
6222 b .value_forbidden:n = true ,
6223 color .tl_set:N = \l_@@_color_tl ,
6224 color .value_required:n = true ,
6225 respect-arraystretch .bool_set:N = \l_@@_respect_arraystretch_bool ,
6226 respect-arraystretch .default:n = true ,
6227 }

```

The following command `\@@_Block:` will be linked to `\Block` in the environments of `nicematrix`. We define it with `\NewExpandableDocumentCommand` because it has an optional argument between `<` and `>`. It's mandatory to use an expandable command.

```

6228 \NewExpandableDocumentCommand \@@_Block: { O { } m D < > { } +m }
6229 {

```

If the first mandatory argument of the command (which is the size of the block with the syntax  $i-j$ ) has not be provided by the user, you use `1-1` (that is to say a block of only one cell).

```

6230 \peek_remove_spaces:n
6231 {
6232     \tl_if_blank:nTF { #2 }
6233         { \@@_Block_i 1-1 \q_stop }
6234         { \@@_Block_i #2 \q_stop }
6235     { #1 } { #3 } { #4 }
6236 }
6237 }

```

With the following construction, we extract the values of  $i$  and  $j$  in the first mandatory argument of the command.

```

6238 \cs_new:Npn \@@_Block_i #1-#2 \q_stop { \@@_Block_ii:nnnn { #1 } { #2 } }

```

Now, the arguments have been extracted: `#1` is  $i$  (the number of rows of the block), `#2` is  $j$  (the number of columns of the block), `#3` is the list of `key=values` pairs, `#4` are the tokens to put before the math mode and the beginning of the small array of the block and `#5` is the label of the block.

```

6239 \cs_new_protected:Npn \@@_Block_ii:nnnn #1 #2 #3 #4 #5
6240 {

```

We recall that `#1` and `#2` have been extracted from the first mandatory argument of `\Block` (which is of the syntax  $i-j$ ). However, the user is allowed to omit  $i$  or  $j$  (or both). We detect that situation by replacing a missing value by 100 (it's a convention: when the block will actually be drawn these values will be detected and interpreted as *maximal possible value* according to the actual size of the array).

```

6241 \bool_lazy_or:nnTF
6242     { \tl_if_blank_p:n { #1 } }
6243     { \str_if_eq_p:nn { #1 } { * } }
6244     { \int_set:Nn \l_tmpa_int { 100 } }
6245     { \int_set:Nn \l_tmpa_int { #1 } }
6246 \bool_lazy_or:nnTF
6247     { \tl_if_blank_p:n { #2 } }
6248     { \str_if_eq_p:nn { #2 } { * } }
6249     { \int_set:Nn \l_tmpb_int { 100 } }
6250     { \int_set:Nn \l_tmpb_int { #2 } }

```

If the block is mono-column.

```

6251 \int_compare:nNnTF \l_tmpb_int = 1
6252 {
6253     \str_if_empty:NTF \l_@@_hpos_cell_str
6254     { \str_set:Nn \l_@@_hpos_block_str c }
6255     { \str_set_eq:NN \l_@@_hpos_block_str \l_@@_hpos_cell_str }
6256 }
6257 { \str_set:Nn \l_@@_hpos_block_str c }
```

The value of `\l_@@_hpos_block_str` may be modified by the keys of the command `\Block` that we will analyze now.

```

6258 \keys_set_known:nn { NiceMatrix / Block / FirstPass } { #3 }
6259 \tl_set:Nx \l_tmpa_tl
6260 {
6261     { \int_use:N \c@iRow }
6262     { \int_use:N \c@jCol }
6263     { \int_eval:n { \c@iRow + \l_tmpa_int - 1 } }
6264     { \int_eval:n { \c@jCol + \l_tmpb_int - 1 } }
6265 }
```

Now, `\l_tmpa_tl` contains an “object” corresponding to the position of the block with four components, each of them surrounded by curly brackets:

`{imin}{jmin}{imax}{jmax}`.

If the block is mono-column or mono-row, we have a special treatment. That’s why we have two macros: `\@@_Block_iv:nnnnn` and `\@@_Block_v:nnnnn` (the five arguments of those macros are provided by curryfication).

```

6266 \bool_if:nTF
6267 {
6268     (
6269         \int_compare_p:nNn { \l_tmpa_int } = 1
6270         ||
6271         \int_compare_p:nNn { \l_tmpb_int } = 1
6272     )
6273     && ! \tl_if_empty_p:n { #5 }
```

For the blocks mono-column, we will compose right now in a box in order to compute its width and take that width into account for the width of the column. However, if the column is a `X` column, we should not do that since the width is determined by another way. This should be the same for the `p`, `m` and `b` columns and we should modify that point. However, for the `X` column, it’s imperative. Otherwise, the process for the determination of the widths of the columns will be wrong.

```

6274     && ! \l_@@_X_column_bool
6275 }
6276 { \exp_args:Nxx \@@_Block_iv:nnnnn }
6277 { \exp_args:Nxx \@@_Block_v:nnnnn }
6278 { \l_tmpa_int } { \l_tmpb_int } { #3 } { #4 } { #5 }
6279 }
```

The following macro is for the case of a `\Block` which is mono-row or mono-column (or both). In that case, the content of the block is composed right now in a box (because we have to take into account the dimensions of that box for the width of the current column or the height and the depth of the current row). However, that box will be put in the array *after the construction of the array* (by using PGF).

```

6280 \cs_new_protected:Npn \@@_Block_iv:nnnnn #1 #2 #3 #4 #5
6281 {
6282     \int_gincr:N \g_@@_block_box_int
6283     \cs_set_protected_nopar:Npn \diagbox ##1 ##2
6284     {
6285         \tl_gput_right:Nx \g_@@_pre_code_after_tl
6286         {
6287             \@@_actually_diagbox:nnnnn
6288             { \int_use:N \c@iRow }
```

```

6289     { \int_use:N \c@jCol }
6290     { \int_eval:n { \c@iRow + #1 - 1 } }
6291     { \int_eval:n { \c@jCol + #2 - 1 } }
6292     { \exp_not:n { ##1 } } { \exp_not:n { ##2 } }
6293   }
6294 }
6295 \box_gclear_new:c
6296   { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
6297 \hbox_gset:cn
6298   { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
6299   {

```

For a mono-column block, if the user has specified a color for the column in the preamble of the array, we want to fix that color in the box we construct. We do that with `\set@color` and not `\color_ensure_current:` (in order to use `\color_ensure_current:` safely, you should load l3backend before the `\documentclass` with `\RequirePackage{exp13}`).

```

6300 \tl_if_empty:NTF \l_@@_color_tl
6301   { \int_compare:nNnT { #2 } = 1 \set@color }
6302   { \@@_color:V \l_@@_color_tl }

```

If the block is mono-row, we use `\g_@@_row_style_tl` even if it has yet been used in the beginning of the cell where the command `\Block` has been issued because we want to be able to take into account a potential instruction of color of the font in `\g_@@_row_style_tl`.

```

6303 \int_compare:nNnT { #1 } = 1 \g_@@_row_style_tl
6304 \group_begin:
6305 \bool_if:NF \l_@@_respect_arraystretch_bool
6306   { \cs_set:Npn \arraystretch { 1 } }
6307 \dim_zero:N \extrarowheight
6308 #4

```

If the box is rotated (the key `\rotate` may be in the previous `#4`), the tabular used for the content of the cell will be constructed with a format `c`. In the other cases, the tabular will be constructed with a format equal to the key of position of the box. In other words: the alignment internal to the tabular is the same as the external alignment of the tabular (that is to say the position of the block in its zone of merged cells).

```

6309 \bool_if:NT \g_@@_rotate_bool { \str_set:Nn \l_@@_hpos_block_str c }
6310 \bool_if:NTF \l_@@_NiceTabular_bool
6311   {
6312     \bool_lazy_all:nTF
6313     {
6314       { \int_compare_p:nNn { #2 } = 1 }
6315       { \dim_compare_p:n { \l_@@_col_width_dim } >= \c_zero_dim }
6316       { ! \l_@@_respect_arraystretch_bool }
6317     }

```

When the block is mono-column in a column with a fixed width (eg `p{3cm}`).

```

```

The command `\@@_draw_blocks:` will draw all the blocks. This command is used after the construction of the array. We have to revert to a clean version of `\ialign` because there may be tabulars in the `\Block` instructions that will be composed now.

```

6514 \cs_new_protected:Npn \@@_draw_blocks:
6515 {
6516   \cs_set_eq:NN \ialign \@@_old_ialign:
6517   \seq_map_inline:Nn \g_@@_blocks_seq { \@@_Block_iv:nnnnn ##1 }
6518 }
6519 \cs_new_protected:Npn \@@_Block_iv:nnnnn #1 #2 #3 #4 #5 #6
6520 {

```

The integer `\l_@@_last_row_int` will be the last row of the block and `\l_@@_last_col_int` its last column.

```

6521   \int_zero_new:N \l_@@_last_row_int
6522   \int_zero_new:N \l_@@_last_col_int

```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format  $i-j$ . However, the user is allowed to omit  $i$  or  $j$  (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_blocks_seq` as a number of rows (resp. columns) for the block equal to 100. That's what we detect now.

```

Let's consider the following `\begin{NiceTabular}`. Because of the instruction `!{\hspace{1cm}}` in the preamble which increases the space between the columns (by adding, in fact, that space to the previous column, that is to say the second column of the tabular), we will create *two* nodes relative to the block: the node `1-1-block` and the node `1-1-block-short`.

```

\begin{NiceTabular}{cc!{\hspace{1cm}}c}
\Block{2-2}{our block} & one & \\
& two & \\
three & four & five \\

```

```

six          & seven & eight \\
\end{NiceTabular}

```

We highlight the node 1-1-block

our block	
one	two
three	four
six	seven

We highlight the node 1-1-block-short

our block	
one	two
three	four
six	seven

The construction of the node corresponding to the merged cells.

```

6652 \pgfpicture
6653   \pgfrememberpicturepositiononpagetrue
6654   \pgf@relevantforpicturesizefalse
6655   \@@_qpoint:n { row - #1 }
6656   \dim_set_eq:NN \l_tmpa_dim \pgf@y

6658   \dim_set_eq:NN \l_tmpb_dim \pgf@x
6659   \@@_qpoint:n { row - \int_eval:n { \l_@@_last_row_int + 1 } }
6660   \dim_set_eq:NN \l_@@_tmpc_dim \pgf@y
6661   \@@_qpoint:n { col - \int_eval:n { \l_@@_last_col_int + 1 } }
6662   \dim_set_eq:NN \l_@@_tmpd_dim \pgf@x

```

We construct the node for the block with the name (#1-#2-block).

The function \@@\_pgf\_rect\_node:nnnn takes in as arguments the name of the node and the four coordinates of two opposite corner points of the rectangle.

```

6663 \@@_pgf_rect_node:nnnn
6664   { \@@_env: - #1 - #2 - block }
6665   \l_tmpb_dim \l_tmpa_dim \l_@@_tmpd_dim \l_@@_tmpc_dim
6666   \str_if_empty:NF \l_@@_block_name_str
6667   {
6668     \pgfnodealias
6669     { \@@_env: - \l_@@_block_name_str }
6670     { \@@_env: - #1 - #2 - block }
6671     \str_if_empty:NF \l_@@_name_str
6672     {
6673       \pgfnodealias
6674       { \l_@@_name_str - \l_@@_block_name_str }
6675       { \@@_env: - #1 - #2 - block }
6676     }
6677   }

```

Now, we create the “short node” which, in general, will be used to put the label (that is to say the content of the node). However, if one the keys L, C or R is used (that information is provided by the boolean \l\_@@\_hpos\_of\_block\_cap\_bool), we don’t need to create that node since the normal node is used to put the label.

```

6678 \bool_if:NF \l_@@_hpos_of_block_cap_bool
6679   {
6680     \dim_set_eq:NN \l_tmpb_dim \c_max_dim

```

The short node is constructed by taking into account the *contents* of the columns involved in at least one cell of the block. That’s why we have to do a loop over the rows of the array.

```

6681 \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
6682   {

```

We recall that, when a cell is empty, no (normal) node is created in that cell. That’s why we test the existence of the node before using it.

```

6683 \cs_if_exist:cT
6684   { pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
6685   {
6686     \seq_if_in:NnF \g_@@_multicolumn_cells_seq { ##1 - #2 }
6687     {
6688       \pgfpointanchor { \@@_env: - ##1 - #2 } { west }

```

```

6689             \dim_set:Nn \l_tmpb_dim { \dim_min:nn \l_tmpb_dim \pgf@x }
6690         }
6691     }
6692 }

```

If all the cells of the column were empty, `\l_tmpb_dim` has still the same value `\c_max_dim`. In that case, you use for `\l_tmpb_dim` the value of the position of the vertical rule.

```

6693     \dim_compare:nNnT \l_tmpb_dim = \c_max_dim
6694     {
6695         \@@_qpoint:n { col - #2 }

6721 }

```

If the creation of the “medium nodes” is required, we create a “medium node” for the block. The function `\@@_pgf_rect_node:nnn` takes in as arguments the name of the node and two PGF points.

```

6722     \bool_if:NT \l_@@_medium_nodes_bool
6723     {
6724         \@@_pgf_rect_node:nnn
6725         { \@@_env: - #1 - #2 - block - medium }
6726         { \pgfpointanchor { \@@_env: - #1 - #2 - medium } { north-west } }
6727         {
6728             \pgfpointanchor
6729                 { \@@_env:
6730                     - \int_use:N \l_@@_last_row_int
6731                     - \int_use:N \l_@@_last_col_int - medium
6732                 }
6733                 { south-east }
6734         }
6735     }

```

Now, we will put the label of the block beginning with the case of a `\Block` of one row.

```

6736     \bool_if:nTF
6737     { \int_compare_p:nNn { #1 } = { #3 } && ! \l_@@_v_center_bool }
6738     {

```

We take into account the case of a block of one row in the “first row” or the “last row”.

```

6739     \int_compare:nNnTF { #1 } = 0
6740     { \l_@@_code_for_first_row_tl }
6741     {
6742         \int_compare:nNnT { #1 } = \l_@@_last_row_int

```

```

6743           \l_@@_code_for_last_row_tl
6744       }

```

If the block has only one row, we want the label of the block perfectly aligned on the baseline of the row. That's why we have constructed a `\pgfcoordinate` on the baseline of the row, in the first column of the array. Now, we retrieve the *y*-value of that node and we store it in `\l_tmpa_dim`.

```
6745     \pgfextracty \l_tmpa_dim { \l_@@_qpoint:n { row - #1 - base } }
```

We retrieve (in `\pgf@x`) the *x*-value of the center of the block.

```

6746     \pgfpointanchor
6747     {
6748         \l_@@_env: - #1 - #2 - block
6749         \bool_if:NF \l_@@_hpos_of_block_cap_bool { - short }
6750     }
6751     {
6752         \str_case:Vn \l_@@_hpos_block_str
6753         {
6754             c { center }
6755             l { west }
6756             r { east }
6757         }
6758     }

```

We put the label of the block which has been composed in `\l_@@_cell_box`.

```

6759     \pgftransformshift { \pgfpoint \pgf@x \l_tmpa_dim }
6760     \pgfset { inner-sep = \c_zero_dim }
6761     \pgfnode
6762     { rectangle }
6763     {
6764         \str_case:Vn \l_@@_hpos_block_str
6765         {
6766             c { base }
6767             l { base-west }
6768             r { base-east }
6769         }
6770     }
6771     { \box_use_drop:N \l_@@_cell_box } { } { }
6772 }

```

If the number of rows is different of 1, we will put the label of the block by using the short node (the label of the block has been composed in `\l_@@_cell_box`).

```
6773     {
```

If we are in the first column, we must put the block as if it was with the key `r`.

7087 \prg_replicate:nn {#3}
7088 {
7089     \int_compare:nNnT \l_@@_first_col_int = 0 { & }

```

We put `{ }` before `#6` to avoid a hasty expansion of a potential `\arabic{iRow}` at the beginning of the row which would result in an incorrect value of that `iRow` (since `iRow` is incremented in the first cell of the row of the `\halign`).

```

7090     \prg_replicate:nn {#4 - 1} { { } #5 & } #5
7091     \int_compare:nNnT \l_@@_last_col_int > { -1 } { & } \\
7092 }
7093 \int_compare:nNnT \l_@@_last_row_int > { -2 }
7094 {
7095     \int_compare:nNnT \l_@@_first_col_int = 0 { & }
7096     \prg_replicate:nn {#4 - 1} { & }
7097     \int_compare:nNnT \l_@@_last_col_int > { -1 } { & } \\
7098 }
7099 \end {NiceArrayWithDelims}
7100 \group_end:
7101 }

7102 \cs_set_protected:Npn \@@_define_com:nnn #1 #2 #3
7103 {
7104     \cs_set_protected:cpx {#1 AutoNiceMatrix}
7105     {
7106         \bool_gset_false:N \g_@@_NiceArray_bool
7107         \str_gset:Nx \g_@@_name_env_str {#1 AutoNiceMatrix}
7108         \AutoNiceMatrixWithDelims {#2} {#3}
7109     }
7110 }

7111 \@@_define_com:nnn p ()
7112 \@@_define_com:nnn b []
7113 \@@_define_com:nnn v ||
7114 \@@_define_com:nnn V ||
7115 \@@_define_com:nnn B \{ \}
```

We define also a command `\AutoNiceMatrix` similar to the environment `{NiceMatrix}`.

```

7116 \NewDocumentCommand \AutoNiceMatrix { O {} m O {} m ! O {} }
7117 {
7118     \group_begin:
7119     \bool_gset_true:N \g_@@_NiceArray_bool

```

```

7120 \AutoNiceMatrixWithDelims . . { #2 } { #4 } [ #1 , #3 , #5 ]
7121 \group_end:
7122 }

```

## The redefinition of the command \dotfill

```

7123 \cs_set_eq:NN \@@_old_dotfill \dotfill
7124 \cs_new_protected:Npn \@@_dotfill:
7125 {

```

First, we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in case of use of `\dotfill` “internally” in the cell (e.g. `\hbox to 1cm {\dotfill}`).

```

7126   \@@_old_dotfill
7127   \bool_if:NT \l_@@_NiceTabular_bool
7128     { \group_insert_after:N \@@_dotfill_ii: }
7129     { \group_insert_after:N \@@_dotfill_i: }
7130   }
7131 \cs_new_protected:Npn \@@_dotfill_i: { \group_insert_after:N \@@_dotfill_ii: }
7132 \cs_new_protected:Npn \@@_dotfill_ii: { \group_insert_after:N \@@_dotfill_iii: }

```

Now, if the box if not empty (unfortunately, we can't actually test whether the box is empty and that's why we only consider it's width), we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in the cell of the array, and it will extend, since it is no longer in `\l_@@_cell_box`.

```

7133 \cs_new_protected:Npn \@@_dotfill_iii:
7134   { \dim_compare:nNnT { \box_wd:N \l_@@_cell_box } = \c_zero_dim \@@_old_dotfill }

```

## The command \diagbox

The command `\diagbox` will be linked to `\diagbox:nn` in the environments of `nicematrix`. However, there are also redefinitions of `\diagbox` in other circumstances.

```

7135 \cs_new_protected:Npn \@@_diagbox:nn #1 #2
7136   {
7137     \tl_gput_right:Nx \g_@@_pre_code_after_tl
7138     {
7139       \@@_actually_diagbox:nnnnnn
7140         { \int_use:N \c@iRow }
7141         { \int_use:N \c@jCol }
7142         { \int_use:N \c@iRow }
7143         { \int_use:N \c@jCol }
7144         { \exp_not:n { #1 } }
7145         { \exp_not:n { #2 } }
7146     }

```

We put the cell with `\diagbox` in the sequence `\g_@@_pos_of_blocks_seq` because a cell with `\diagbox` must be considered as non empty by the key `corners`.

```

7147 \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
7148   {
7149     { \int_use:N \c@iRow }
7150     { \int_use:N \c@jCol }
7151     { \int_use:N \c@iRow }
7152     { \int_use:N \c@jCol }

```

The last argument is for the name of the block.

```

7153   { }
7154 }
7155 }

```

The command `\diagbox` is also redefined locally when we draw a block.

The first four arguments of `\@@_actually_diagbox:nnnnnn` correspond to the rectangle (=block) to slash (we recall that it's possible to use `\diagbox` in a `\Block`). The other two are the elements to draw below and above the diagonal line.

```

7156 \cs_new_protected:Npn \@@_actually_diagbox:nnnnnn #1 #2 #3 #4 #5 #6
7157 {
7158   \pgfpicture
7159   \pgf@relevantforpicturesizefalse
7160   \pgfrememberpicturepositiononpagetrue
7161   \@@_qpoint:n { row - #1 }
7162   \dim_set_eq:NN \l_tmpa_dim \pgf@y
7163   \@@_qpoint:n { col - #2 }
7164   \dim_set_eq:NN \l_tmpb_dim \pgf@x
7165   \pgfpathmoveto { \pgfpoint \l_tmpb_dim \l_tmpa_dim }
7166   \@@_qpoint:n { row - \int_eval:n { #3 + 1 } }
7167   \dim_set_eq:NN \l_@@_tmpc_dim \pgf@y
7168   \@@_qpoint:n { col - \int_eval:n { #4 + 1 } }

7182   \@@_math_toggle_token: #5 \@@_math_toggle_token:
7183   \end { minipage }
7184 }
7185 {
7186 }
7187 \endpgfscope
7188 \pgftransformshift { \pgfpoint \l_@@_tmpd_dim \l_tmpa_dim }
7189 \pgfnode { rectangle } { north~east }
7190 {
7191   \begin { minipage } { 20 cm }
7192   \raggedleft
7193   \@@_math_toggle_token: #6 \@@_math_toggle_token:
7194   \end { minipage }
7195 }
7196 {
7197 }
7198 \endpgfpicture
7199 }
```

## The keyword `\CodeAfter`

The `\CodeAfter` (inserted with the key `code-after` or after the keyword `\CodeAfter`) may always begin with a list of pairs `key=value` between square brackets. Here is the corresponding set of keys.

```

7200 \keys_define:nn { NiceMatrix }
7201 {
7202   CodeAfter / rules .inherit:n = NiceMatrix / rules ,
7203   CodeAfter / sub-matrix .inherit:n = NiceMatrix / sub-matrix
7204 }
7205 \keys_define:nn { NiceMatrix / CodeAfter }
7206 {
7207   sub-matrix .code:n = \keys_set:nn { NiceMatrix / sub-matrix } { #1 } ,
7208   sub-matrix .value_required:n = true ,
```

```

7209   delimiters / color .tl_set:N = \l_@@_delimiters_color_tl ,
7210   delimiters / color .value_required:n = true ,
7211   rules .code:n = \keys_set:nn { NiceMatrix / rules } { #1 } ,
7212   rules .value_required:n = true ,
7213   unknown .code:n = \@@_error:n { Unknown-key-for-CodeAfter }
7214 }

```

In fact, in this subsection, we define the user command `\CodeAfter` for the case of the “normal syntax”. For the case of “light-syntax”, see the definition of the environment `{@@-light-syntax}` on p. 131.

In the environments of `nicematrix`, `\CodeAfter` will be linked to `\@@_CodeAfter::`. That macro must *not* be protected since it begins with `\omit`.

```
7215 \cs_new:Npn \@@_CodeAfter: { \omit \@@_CodeAfter_i:n }
```

However, in each cell of the environment, the command `\CodeAfter` will be linked to the following command `\@@_CodeAfter_i:n` which begins with `\``.

```
7216 \cs_new_protected:Npn \@@_CodeAfter_i: { `` \omit \@@_CodeAfter_i:n }
```

We have to catch everything until the end of the current environment (of `nicematrix`). First, we go until the next command `\end`.

```

7217 \cs_new_protected:Npn \@@_CodeAfter_i:n #1 \end
7218 {
7219   \tl_gput_right:Nn \g_nicematrix_code_after_tl { #1 }
7220   \@@_CodeAfter_iv:n
7221 }

```

We catch the argument of the command `\end` (in `#1`).

```
7222 \cs_new_protected:Npn \@@_CodeAfter_iv:n #1
7223 {
```

If this is really the end of the current environment (of `nicematrix`), we put back the command `\end` and its argument in the TeX flow.

```
7224 \str_if_eq:eeTF \currenvir { #1 }
7225   { \end { #1 } }
```

If this is not the `\end` we are looking for, we put those tokens in `\g_nicematrix_code_after_tl` and we go on searching for the next command `\end` with a recursive call to the command `\@@_CodeAfter:n`.

```

7226 {
7227   \tl_gput_right:Nn \g_nicematrix_code_after_tl { \end { #1 } }
7228   \@@_CodeAfter_i:n
7229 }
7230 }
```

## The delimiters in the preamble

The command `\@@_delimiter:nnn` will be used to draw delimiters inside the matrix when delimiters are specified in the preamble of the array. It does *not* concern the exterior delimiters added by `{NiceArrayWithDelims}` (and `{pNiceArray}`, `{pNiceMatrix}`, etc.).

A delimiter in the preamble of the array will write an instruction `\@@_delimiter:nnn` in the `\g_@@_pre_code_after_tl` (and also potentially add instructions in the preamble provided to `\array` in order to add space between columns).

The first argument is the type of delimiter ((, [, \{, ), ] or \}). The second argument is the number of columnn. The third argument is a boolean equal to `\c_true_bool` (resp. `\c_false_true`) when the delimiter must be put on the left (resp. right) side.

```

7231 \cs_new_protected:Npn \@@_delimiter:nnn #1 #2 #3
7232 {
7233   \pgfpicture
7234   \pgfrememberpicturepositiononpagetrue
7235   \pgf@relevantforpicturesizefalse
```

`\l_@@y_initial_dim` and `\l_@@y_final_dim` will be the  $y$ -values of the extremities of the delimiter we will have to construct.

```
7236 \@@_qpoint:n { row - 1 }
7237 \dim_set_eq:NN \l_@@y_initial_dim \pgf@y
7238 \@@_qpoint:n { row - \int_eval:n { \c@iRow + 1 } }
7239 \dim_set_eq:NN \l_@@y_final_dim \pgf@y
```

We will compute in `\l_tmpa_dim` the  $x$ -value where we will have to put our delimiter (on the left side or on the right side).

```
7240 \bool_if:nTF { #3 }
7241   { \dim_set_eq:NN \l_tmpa_dim \c_max_dim }
7242   { \dim_set:Nn \l_tmpa_dim { - \c_max_dim } }
7243 \int_step_inline:nnn \l_@@first_row_int \g_@@row_total_int
7244   {
7245     \cs_if_exist:cT
7246       { pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
7247     {
7248       \pgfpointanchor
7249         { \@@_env: - ##1 - #2 }
7250         { \bool_if:nTF { #3 } { west } { east } }
7251       \dim_set:Nn \l_tmpa_dim
7252         { \bool_if:nTF { #3 } \dim_min:nn \dim_max:nn \l_tmpa_dim \pgf@x }
7253     }
7254 }
```

Now we can put the delimiter with a node of PGF.

```
7255 \pgfset { inner_sep = \c_zero_dim }
7256 \dim_zero:N \nulldelimiterspace
7257 \pgftransformshift
7258   {
7259     \pgfpoint
7260       { \l_tmpa_dim }
7261       { ( \l_@@y_initial_dim + \l_@@y_final_dim + \arrayrulewidth ) / 2 }
7262   }
7263 \pgfnode
7264   { rectangle }
7265   { \bool_if:nTF { #3 } { east } { west } }
7266 }
```

Here is the content of the PGF node, that is to say the delimiter, constructed with its right size.

```
7267   \nullfont
7268   \c_math_toggle_token
7269   \color:V \l_@@delimiters_color_tl
7270   \bool_if:nTF { #3 } { \left #1 } { \left . }
7271   \vcenter
7272   {
7273     \nullfont
7274     \hrule \height
7275       \dim_eval:n { \l_@@y_initial_dim - \l_@@y_final_dim }
7276       \depth \c_zero_dim
7277       \width \c_zero_dim
7278   }
7279   \bool_if:nTF { #3 } { \right . } { \right #1 }
7280   \c_math_toggle_token
7281 }
7282 {
7283 }
```

```
\endpgfpicture
```

## The command \SubMatrix

```
7286 \keys_define:nn { NiceMatrix / sub-matrix }
```

```

7287 {
7288   extra-height .dim_set:N = \l_@@_submatrix_extra_height_dim ,
7289   extra-height .value_required:n = true ,

```

We use a group to protect `\l_tmpa_dim` and `\l_tmpb_dim`.

```
7537 \group_begin:
```

We compute in `\l_tmpa_dim` the *x*-value of the left end of the rule.

```
7538   \dim_set:Nn \l_tmpa_dim
7539     { \l_@@_x_initial_dim - \l_@@_submatrix_left_xshift_dim }
7540   \str_case:nn { #1 }
7541   {
7542     ( { \dim_sub:Nn \l_tmpa_dim { 0.9 mm } }
7543     [ { \dim_sub:Nn \l_tmpa_dim { 0.2 mm } }
7544     \{ { \dim_sub:Nn \l_tmpa_dim { 0.9 mm } }
7545   }
7546   \pgfpathmoveto { \pgfpoint \l_tmpa_dim \pgf@y }
```

We compute in `\l_tmpb_dim` the *x*-value of the right end of the rule.

```
7547   \dim_set:Nn \l_tmpb_dim
7548     { \l_@@_x_final_dim + \l_@@_submatrix_right_xshift_dim }
7549   \str_case:nn { #2 }
7550   {
7551     ) { \dim_add:Nn \l_tmpb_dim { 0.9 mm } }
```

```

7552     ] { \dim_add:Nn \l_tmpb_dim { 0.2 mm } }
7553     \} { \dim_add:Nn \l_tmpb_dim { 0.9 mm } }
7554   }
7555   \pgfpathlineto { \pgfpoint \l_tmpb_dim \pgf@y }
7556   \pgfusepathqstroke
7557   \group_end:
7558 }
7559 { \@@_error:n { Wrong-line-in-SubMatrix } { horizontal } { ##1 } }
760 }
```

If the key `name` has been used for the command `\SubMatrix`, we create a PGF node with that name for the submatrix (this node does not encompass the delimiters that we will put after).

```

7561 \str_if_empty:NF \l_@@_submatrix_name_str
7562 {
7563   \@@_pgf_rect_node:nnnn \l_@@_submatrix_name_str
7564   \l_@@_x_initial_dim \l_@@_y_initial_dim
7565   \l_@@_x_final_dim \l_@@_y_final_dim
7566 }
7567 \group_end:
```

The group was for `\CT@arc@` (the color of the rules).

Now, we deal with the left delimiter. Of course, the environment `{pgfscope}` is for the `\pgftransformshift`.

```

7568 \begin{pgfscope}
7569 \pgftransformshift
7570 {
7571   \pgfpoint
7572   { \l_@@_x_initial_dim - \l_@@_submatrix_left_xshift_dim }
7573   { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
7574 }
7575 \str_if_empty:NTF \l_@@_submatrix_name_str
7576 { \@@_node_left:nn #1 { } }
7577 { \@@_node_left:nn #1 { \@@_env: - \l_@@_submatrix_name_str - left } }
7578 \end{pgfscope}
```

Now, we deal with the right delimiter.

```

7579 \pgftransformshift
7600 {
7601   \pgfpoint
7602   { \l_@@_x_final_dim + \l_@@_submatrix_right_xshift_dim }
7603   { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
7604 }
7605 \str_if_empty:NTF \l_@@_submatrix_name_str
7606 { \@@_node_right:nnnn #2 { } { #3 } { #4 } }
7607 {
7608   \@@_node_right:nnnn #2
7609   { \@@_env: - \l_@@_submatrix_name_str - right } { #3 } { #4 }
7610 }
7611 \cs_set_eq:NN \pgfpointanchor \@@_pgfpointanchor:n
7612 \flag_clear_new:n { nicematrix }
7613 \l_@@_code_t1
7614 }
```

In the key `code` of the command `\SubMatrix` there may be Tikz instructions. We want that, in these instructions, the  $i$  and  $j$  in specifications of nodes of the forms  $i-j$ , `row-i`, `col-j` and  $i-|j$  refer to the number of row and column *relative* of the current `\SubMatrix`. That's why we will patch (locally in the `\SubMatrix`) the command `\pgfpointanchor`

```
7595 \cs_set_eq:NN \@@_old_pgfpoinanchor \pgfpointanchor
```

The following command will be linked to `\pgfpointanchor` just before the execution of the option `code` of the command `\SubMatrix`. In this command, we catch the argument #1 of `\pgfpointanchor` and we apply to it the command `\@@_pgfpointanchor_i:nn` before passing it to the original `\pgfpointanchor`. We have to act in an expandable way because the command `\pgfpointanchor` is used in names of Tikz nodes which are computed in an expandable way.

```
7596 \cs_new_protected:Npn \@@_pgfpointanchor:n #1
7597 {
7598     \use:e
7599     { \exp_not:N \@@_old_pgfpointanchor { \@@_pgfpointanchor_i:nn #1 } }
7600 }
```

In fact, the argument of `\pgfpointanchor` is always of the form `\a_command { name_of_node }` where “`name_of_node`” is the name of the Tikz node without the potential prefix and suffix. That’s why we catch two arguments and work only on the second by trying (first) to extract an hyphen -.

```
7601 \cs_new:Npn \@@_pgfpointanchor_i:nn #1 #
7602     { #1 { \@@_pgfpointanchor_ii:w #2 - \q_stop } }
```

Since `\seq_if_in:NnTF` and `\clist_if_in:NnTF` are not expandable, we will use the following token list and `\str_case:nVT` to test whether we have an integer or not.

```
7603 \tl_const:Nn \c_@@_integers alist_tl
7604 {
7605     { 1 } { } { 2 } { } { 3 } { } { 4 } { } { 5 } { }
7606     { 6 } { } { 7 } { } { 8 } { } { 9 } { } { 10 } { }
7607     { 11 } { } { 12 } { } { 13 } { } { 14 } { } { 15 } { }
7608     { 16 } { } { 17 } { } { 18 } { } { 19 } { } { 20 } { }
7609 }
7610 \cs_new:Npn \@@_pgfpointanchor_ii:w #1-#2\q_stop
7611 {
```

If there is no hyphen, that means that the node is of the form of a single number (ex.: 5 or 11). In that case, we are in an analysis which result from a specification of node of the form  $i-j$ . In that case, the  $i$  of the number of row arrives first (and alone) in a `\pgfpointanchor` and, the, the  $j$  arrives (alone) in the following `\pgfpointanchor`. In order to know whether we have a number of row or a number of column, we keep track of the number of such treatments by the expandable flag called `nicematrix`.

```
7612 \tl_if_empty:nTF { #2 }
7613 {
7614     \str_case:nVT { #1 } \c_@@_integers alist_tl
7615     {
7616         \flag_raise:n { nicematrix }
7617         \int_if_even:nTF { \flag_height:n { nicematrix } }
7618         { \int_eval:n { #1 + \l_@@_first_i_tl - 1 } }
7619         { \int_eval:n { #1 + \l_@@_first_j_tl - 1 } }
7620     }
7621     { #1 }
7622 }
```

If there is an hyphen, we have to see whether we have a node of the form  $i-j$ , `row-i` or `col-j`.

```
7623 { \@@_pgfpointanchor_iii:w { #1 } #2 }
7624 }
```

There was an hyphen in the name of the node and that’s why we have to retrieve the extra hyphen we have put (cf. `\@@_pgfpointanchor_i:nn`).

```
7625 \cs_new:Npn \@@_pgfpointanchor_iii:w #1 #2 -
7626 {
7627     \str_case:nnF { #1 }
7628     {
7629         { row } { row - \int_eval:n { #2 + \l_@@_first_i_tl - 1 } }
7630         { col } { col - \int_eval:n { #2 + \l_@@_first_j_tl - 1 } }
7631     }
```

Now the case of a node of the form  $i-j$ .

```

7632 {
7633   \int_eval:n { #1 + \l_@@_first_i_tl - 1 }
7634   - \int_eval:n { #2 + \l_@@_first_j_tl - 1 }
7635 }
7636 }
```

The command `\@@_node_left:nn` puts the left delimiter with the correct size. The argument `#1` is the delimiter to put. The argument `#2` is the name we will give to this PGF node (if the key `name` has been used in `\SubMatrix`).

```

7637 \cs_new_protected:Npn \@@_node_left:nn #1 #2
7638 {

```

The command `\@@_node_right:nn` puts the right delimiter with the correct size. The argument `#1` is the delimiter to put. The argument `#2` is the name we will give to this PGF node (if the key `name` has been used in `\SubMatrix`). The argument `#3` is the subscript and `#4` is the superscript.

## We process the options at package loading

We process the options when the package is loaded (with `\usepackage`) but we recommend to use `\NiceMatrixOptions` instead.

We must process these options after the definition of the environment `{NiceMatrix}` because the option `renew-matrix` executes the code `\cs_set_eq:NN \env@matrix \NiceMatrix`.

Of course, the command `\NiceMatrix` must be defined before such an instruction is executed.

The boolean `\g_@@_footnotehyper_bool` will indicate if the option `footnotehyper` is used.

```
8001 \bool_new:N \c_@@_footnotehyper_bool
```

The boolean `\c_@@_footnote_bool` will indicate if the option `footnote` is used, but quickly, it will also be set to true if the option `footnotehyper` is used.

```

8002 \bool_new:N \c_@@_footnote_bool
8003 \msg_new:nnnn { nicematrix } { Unknown-key-for-package }

```

If the user uses too much columns, the command `\@@_error_too_much_cols:` is triggered. This command raises an error but also tries to give the best information to the user in the error message. The command `\seq_if_in:NVT` is not expandable and that's why we can't put it in the error message itself. We have to do the test before the `\@@_fatal:n`.

```

## 20 History

The successive versions of the file `nicematrix.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://www.tug.org/svn/texlive/trunk/Master/texmf-dist/tex/latex/nicematrix/nicematrix.sty>

### Changes between versions 1.0 and 1.1

The dotted lines are no longer drawn with Tikz nodes but with Tikz circles (for efficiency).  
Modification of the code which is now twice faster.

### Changes between versions 1.1 and 1.2

New environment `{NiceArray}` with column types L, C and R.

### Changes between version 1.2 and 1.3

New environment `{pNiceArrayC}` and its variants.  
Correction of a bug in the definition of `{BNiceMatrix}`, `{vNiceMatrix}` and `{VNiceMatrix}` (in fact, it was a typo).  
Options are now available locally in `{pNiceMatrix}` and its variants.  
The names of the options are changed. The old names were names in “camel style”.

### Changes between version 1.3 and 1.4

The column types w and W can now be used in the environments `{NiceArray}`, `{pNiceArrayC}` and its variants with the same meaning as in the package `array`.  
New option `columns-width` to fix the same width for all the columns of the array.

### Changes between version 1.4 and 2.0

The versions 1.0 to 1.4 of `nicematrix` were focused on the continuous dotted lines whereas the version 2.0 of `nicematrix` provides different features to improve the typesetting of mathematical matrices.

### Changes between version 2.0 and 2.1

New implementation of the environment `{pNiceArrayRC}`. With this new implementation, there is no restriction on the width of the columns.  
The package `nicematrix` no longer loads `mathtools` but only `amsmath`.  
Creation of “medium nodes” and “large nodes”.

### Changes between version 2.1 and 2.1.1

Small corrections: for example, the option `code-for-first-row` is now available in the command `\NiceMatrixOptions`.  
Following a discussion on TeX StackExchange<sup>77</sup>, Tikz externalization is now deactivated in the environments of the package `nicematrix`.<sup>78</sup>

<sup>77</sup>cf. [tex.stackexchange.com/questions/450841/tikz-externalize-and-nicematrix-package](https://tex.stackexchange.com/questions/450841/tikz-externalize-and-nicematrix-package)

<sup>78</sup>Before this version, there was an error when using `nicematrix` with Tikz externalization. In any case, it's not possible to externalize the Tikz elements constructed by `nicematrix` because they use the options `overlay` and `remember picture`.

## **Changes between version 2.1.2 and 2.1.3**

When searching the end of a dotted line from a command like `\Cdots` issued in the “main matrix” (not in the exterior column), the cells in the exterior column are considered as outside the matrix. That means that it’s possible to do the following matrix with only a `\Cdots` command (and a single `\Vdots`).

$$\begin{pmatrix} & C_j \\ 0 & \vdots & 0 \\ 0 & \ddots & \dots \\ & & 0 \end{pmatrix}_{L_i}$$

## **Changes between version 2.1.3 and 2.1.4**

Replacement of some options `0 { }` in commands and environments defined with `xparse` by `! 0 { }` (because a recent version of `xparse` introduced the specifier `!` and modified the default behaviour of the last optional arguments).

See [www.texdev.net/2018/04/21/xparse-optional-arguments-at-the-end](http://www.texdev.net/2018/04/21/xparse-optional-arguments-at-the-end)

## **Changes between version 2.1.4 and 2.1.5**

Compatibility with the classes `revtex4-1` and `revtex4-2`.  
Option `allow-duplicate-names`.

## **Changes between version 2.1.5 and 2.2**

Possibility to draw horizontal dotted lines to separate rows with the command `\hdottedline` (similar to the classical command `\hline` and the command `\hdashline` of `arydshln`).  
Possibility to draw vertical dotted lines to separate columns with the specifier “`:`” in the preamble (similar to the classical specifier “`|`” and the specifier “`:`” of `arydshln`).

## **Changes between version 2.2 and 2.2.1**

Improvement of the vertical dotted lines drawn by the specifier “`:`” in the preamble.  
Modification of the position of the dotted lines drawn by `\hdottedline`.

## **Changes between version 2.2.1 and 2.3**

Compatibility with the column type `S` of `siunitx`.  
Option `hlines`.

## **Changes between version 2.3 and 3.0**

Modification of `\Hdotsfor`. Now `\Hdotsfor` erases the `\vlines` (of “`|`”) as `\hdotsfor` does.  
Composition of exterior rows and columns on the four sides of the matrix (and not only on two sides) with the options `first-row`, `last-row`, `first-col` and `last-col`.

## Changes between version 3.0 and 3.1

Command `\Block` to draw block matrices.

Error message when the user gives an incorrect value for `last-row`.

A dotted line can no longer cross another dotted line (excepted the dotted lines drawn by `\cdottedline`, the symbol ":" (in the preamble of the array) and `\line` in `code-after`).

The starred versions of `\Cdots`, `\Ldots`, etc. are now deprecated because, with the new implementation, they become pointless. These starred versions are no longer documented.

The vertical rules in the matrices (drawn by "|") are now compatible with the color fixed by `colortbl`. Correction of a bug: it was not possible to use the colon ":" in the preamble of an array when `pdflatex` was used with `french-babel` (because `french-babel` activates the colon in the beginning of the document).

## Changes between version 3.1 and 3.2 (and 3.2a)

Option `small`.

## Changes between version 3.2 and 3.3

The options `first-row`, `last-row`, `first-col` and `last-col` are now available in the environments `{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.

The option `columns-width=auto` doesn't need any more a second compilation.

The previous version of `nicematrix` was incompatible with a recent version of `expl3` (released 2019/09/30). This version is compatible.

## Changes between version 3.3 and 3.4

Following a discussion on TeX StackExchange<sup>79</sup>, optimization of Tikz externalization is disabled in the environments of `nicematrix` when the class `standalone` or the package `standalone` is used.

## Changes between version 3.4 and 3.5

Correction on a bug on the two previous versions where the `code-after` was not executed.

## Changes between version 3.5 and 3.6

LaTeX counters `iRow` and `jCol` available in the cells of the array.

Addition of `\normalbaselines` before the construction of the array: in environments like `{align}` of `amsmath` the value of `\baselineskip` is changed and if the options `first-row` and `last-row` were used in an environment of `nicematrix`, the position of the delimiters was wrong.

A warning is written in the `.log` file if an obsolete environment is used.

There is no longer artificial errors `Duplicate~name` in the environments of `amsmath`.

## Changes between version 3.6 and 3.7

The four "corners" of the matrix are correctly protected against the four codes: `code-for-first-col`, `code-for-last-col`, `code-for-first-row` and `code-for-last-row`.

New command `\pAutoNiceMatrix` and its variants (suggestion of Christophe Bal).

---

<sup>79</sup>cf. [tex.stackexchange.com/questions/510841/nicematrix-and-tikz-external-optimize](https://tex.stackexchange.com/questions/510841/nicematrix-and-tikz-external-optimize)

## Changes between version 3.7 and 3.8

New programmation for the command `\Block` when the block has only one row. With this programmation, the vertical rules drawn by the specifier “|” at the end of the block is actually drawn. In previous versions, they were not because the block of one row was constructed with `\multicolumn`. An error is raised when an obsolete environment is used.

## Changes between version 3.8 and 3.9

New commands `\NiceMatrixLastEnv` and `\OnlyMainNiceMatrix`.  
New options `create-medium-nodes` and `create-large-nodes`.

## Changes between version 3.9 and 3.10

New option `light-syntax` (and `end-of-row`).  
New option `dotted-lines-margin` for fine tuning of the dotted lines.

## Changes between versions 3.10 and 3.11

Correction of a bug linked to `first-row` and `last-row`.

## Changes between versions 3.11 and 3.12

Command `\rotate` in the cells of the array.  
Options `vlines`, `hlines` and `hvlines`.  
Option `baseline` pour `{NiceArray}` (not for the other environments).  
The name of the Tikz nodes created by the command `\Block` has changed: when the command has been issued in the cell  $i-j$ , the name is  `$i-j$ -block` and, if the creation of the “medium nodes” is required, a node  `$i-j$ -block-medium` is created.  
If the user tries to use more columns than allowed by its environment, an error is raised by `nicematrix` (instead of a low-level error).  
The package must be loaded with the option `obsolete-environments` if we want to use the deprecated environments.

## Changes between versions 3.12 and 3.13

The behaviour of the command `\rotate` is improved when used in the “last row”.  
The option `dotted-lines-margin` has been renamed in `xdots/shorten` and the options `xdots/color` and `xdots/line-style` have been added for a complete customisation of the dotted lines.  
In the environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, etc.), it’s possible to use the options `l` (=L) or `r` (=R) to specify the type of the columns.  
The starred versions of the commands `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots` and `\Iddots` are deprecated since the version 3.1 of `nicematrix`. Now, one should load `nicematrix` with the option `starred-commands` to avoid an error at the compilation.  
The code of `nicematrix` no longer uses Tikz but only PGF. By default, Tikz is *not* loaded by `nicematrix`.

## Changes between versions 3.13 and 3.14

Correction of a bug (question 60761504 on `stackoverflow`).  
Better error messages when the user uses & or `\\"` when `light-syntax` is in force.

## **Changes between versions 3.14 and 3.15**

It's possible to put labels on the dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots`, `\Hdotsfor` and the command `\line` in the `code-after` with the tokens `_` and `^`.

The option `baseline` is now available in all the environments of `nicematrix`. Before, it was available only in `{NiceArray}`.

New keyword `\CodeAfter` (in the environments of `nicematrix`).

## **Changes between versions 3.15 and 4.0**

New environment `{NiceTabular}`

Commands to color cells, rows and columns with a perfect result in the PDF.

## **Changes between versions 4.0 and 4.1**

New keys `cell-space-top-limit` and `cell-space-bottom-limit`

New command `\diagbox`

The key `hvline` don't draw rules in the blocks (commands `\Block`) and in the virtual blocks corresponding to the dotted lines.

## **Changes between versions 4.1 and 4.2**

It's now possible to write `\begin{pNiceMatrix}a&b\\c&d\end{pNiceMatrix}^2` with the expected result.

## **Changes between versions 4.2 and 4.3**

The horizontal centering of the content of a `\Block` is correct even when an instruction such as `!{\quad}` is used in the preamble of the array.

It's now possible to use the command `\Block` in the "last row".

## **Changes between versions 4.3 and 4.4**

New key `hvlines-except-corners` (now deprecated).

## **Changes between versions 4.4 and 5.0**

Use of the standard column types `l`, `c` and `r` instead of `L`, `C` and `R`.

It's now possible to use the command `\diagbox` in a `\Block`.

Command `\tabularnote`

## **Changes between versions 5.0 and 5.1**

The vertical rules specified by `|` in the preamble are not broken by `\hline\hline` (and other).

Environment `{NiceTabular*}`

Command `\Vdotsfor` similar to `\Hdotsfor`

The variable `\g_nicematrix_code_after_t1` is now public.

## Changes between versions 5.1 and 5.2

The vertical rules specified by `|` or `||` in the preamble respect the blocks.

Key `respect-blocks` for `\rowcolors` (with a *s*) in the `code-before`.

The variable `\g_nicematrix_code_before_t1` is now public.

The key `baseline` may take in as value an expression of the form `line-i` to align the `\hline` in the row *i*.

The key `hvlines-except-corners` may take in as value a list of corners (eg: NW,SE).

## Changes between versions 5.2 and 5.3

Keys `c`, `r` and `l` for the command `\Block`.

It's possible to use the key `draw-first` with `\Ddots` and `\Iddots` to specify which dotted line will be drawn first (the other lines will be drawn parallel to that one if parallelization is activated).

## Changes between versions 5.3 and 5.4

Key `tabularnote`.

Different behaviour for the mono-column blocks.

## Changes between versions 5.4 and 5.5

The user must never put `\omit` before `\CodeAfter`.

Correction of a bug: the tabular notes `\tabularnotes` were not composed when present in a block (except a mono-column block).

## Changes between versions 5.5 and 5.6

Different behaviour for the mono-row blocks.

New command `\NotEmpty`.

## Changes between versions 5.6 and 5.7

New key `delimiters-color`

Keys `fill`, `draw` and `line-width` for the command `\Block`.

## Changes between versions 5.7 and 5.8

Keys `cols` and `restart` of the command `\rowcolors` in the `code-before`.

Modification of the behaviour of `\backslash` in the columns of type `p`, `m` or `b` (for a behaviour similar to the environments of `array`).

Better error messages for the command `\Block`.

## Changes between versions 5.8 and 5.9

Correction of a bug: in the previous versions, it was not possible to use the key `line-style` for the continuous dotted lines when the Tikz library `babel` was loaded.

New key `cell-space-limits`.

## Changes between versions 5.9 and 5.10

New command `\SubMatrix` available in the `\CodeAfter`.

It's possible to provide options (between brackets) to the keyword `\CodeAfter`.

## Changes between versions 5.10 and 5.11

It's now possible, in the `code-before` and in the `\CodeAfter`, to use the syntax `| $(i-|j)$`  for the Tikz node at the intersection of the (potential) horizontal rule number  $i$  and the (potential) vertical rule number  $j$ .

## Changes between versions 5.11 and 5.12

Keywords `\CodeBefore` and `\Body` (alternative syntax to the key `code-before`).

New key `delimiters/max-width`.

New keys `hlines`, `vlines` and `hvlines` for the command `\SubMatrix` in the `\CodeAfter`.

New key `rounded-corners` for the command `\Block`.

## Changes between versions 5.12 and 5.13

New command `\arraycolor` in the `\CodeBefore` (with its key `except-corners`).

New key `borders` for the command `\Block`.

New command `\Hline` (for horizontal rules not drawn in the blocks).

The keys `vlines` and `hlines` takes in as value a (comma-separated) list of numbers (for the rules to draw).

## Changes between versions 5.13 and 5.14

Nodes of the form `(1.5)`, `(2.5)`, `(3.5)`, etc.

Keys `t` and `b` for the command `\Block`.

Key `corners`.

## Changes between versions 5.14 and 5.15

Key `hvlines` for the command `\Block`.

The commands provided by `nicematrix` to color cells, rows and columns don't color the cells which are in the "corners" (when the key `corner` is used).

It's now possible to specify delimiters for submatrices in the preamble of an environment.

The version 5.15b is compatible with the version 3.0+ of `siunitx` (previous versions were not).

## Changes between versions 5.15 and 5.16

It's now possible to use the cells corresponding to the contents of the nodes (of the form `i-j`) in the `\CodeBefore` when the key `create-cell-nodes` of that `\CodeBefore` is used. The medium and the large nodes are also available if the corresponding keys are used.

## Changes between versions 5.16 and 5.17

The key `define-L-C-R` (only available at load-time) now raises a (non fatal) error.

Keys `L`, `C` and `R` for the command `\Block`.

Key `hvlines-except-borders`.

It's now possible to use a key `l`, `r` or `c` with the command `\pAutoNiceMatrix` (and the similar ones).

## Changes between versions 5.17 and 5.18

New command `\RowStyle`

## Changes between versions 5.18 and 5.19

New key `tikz` for the command `\Block`.

## **Changes between versions 5.19 and 6.0**

Columns X and environment `{NiceTabularX}`.

Command `\rowlistcolors` available in the `\CodeBefore`.

In columns with fixed width, the blocks are composed as paragraphs (wrapping of the lines).  
The key `define-L-C-R` has been deleted.

## **Changes between versions 6.0 and 6.1**

Better computation of the widths of the X columns.

Key `\color` for the command `\RowStyle`.

## **Changes between versions 6.1 and 6.2**

Better compatibility with the classes `revtex4-1` and `revtex4-2`.

Key `vlines-in-sub-matrix`.

## **Changes between versions 6.2 and 6.3**

Keys `nb-rows`, `rowcolor` and `bold` for the command `\RowStyle`

Key `name` for the command `\Block`.

Support for the columns V of `varwidth`.

## **Changes between versions 6.3 and 6.4**

New commands `\UnderBrace` and `\OverBrace` in the `\CodeAfter`.

Correction of a bug of the key `baseline` (cf. question 623258 on TeX StackExchange).

Correction of a bug with the columns V of `varwidth`.

Correction of a bug: the use of `\hdottedline` and `:` in the preamble of the array (of another letter specified by `letter-for-dotted-lines`) was incompatible with the key `xdots/line-style`.

## **Changes between versions 6.4 and 6.5**

Key `custom-line` in `\NiceMatrixOptions`.

Key `respect-arraystretch`.

## **Changes between version 6.5 and 6.6**

Keys `tikz` and `width` in `custom-line`.

## **Changes between version 6.6 and 6.7**

Key `color` for `\OverBrace` and `\UnderBrace` in the `\CodeAfter`

Key `tikz` in the key `borders` of a command `\Block`

## **Changes between version 6.7 and 6.8**

In the notes of a tabular (with the command `\tabularnote`), the duplicates are now detected: when several commands `\tabularnote` are used with the same argument, only one note is created at the end of the tabular (but all the labels are present, of course).

## **Changes between version 6.8 and 6.9**

New keys `xdots/radius` and `xdots/inter` for customisation of the continuous dotted lines.  
New command `\ShowCellNames` available in the `\CodeBefore` and in the `\CodeAfter`.

## **Changes between version 6.9 and 6.10**

New keys `xdots/shorten-start` and `xdots/shorten-end`.  
It's possible to use `\line` in the `\CodeAfter` between two blocks (and not only two cells).

## **Changes between version 6.10 and 6.11**

New key `matrix/columns-type` to specify the type of columns of the matrices.  
New key `ccommand` in `custom-line` and new command `\cdottedline`.

## **Changes between version 6.11 and 6.12**

New keys `caption`, `short-caption` and `label` in the environment `{NiceTabular}`.  
In `{NiceTabular}`, a caption specified by the key `caption` is wrapped to the width of the tabular.  
Correction of a bug: it's now possible to use `\OverBrace` and `\UnderBrace` with `unicode-math` (with XeLaTeX or LuaLaTeX).

## **Changes between version 6.12 and 6.13**

New environment `{TabularNote}` in `{NiceTabular}` with the same semantic as the key `tabularnote` (for legibility).  
The command `\Hline` nows accepts options (between square brackets).

# Contents

<b>1</b>	<b>The environments of this package</b>	<b>2</b>
