

The package **nicematrix**^{*}

F. Pantigny
fpantigny@wanadoo.fr

June 12, 2020

Abstract

The LaTeX package **nicematrix** provides new environments similar to the classical environments **{tabular}**, **{array}** and **{matrix}** of **array** and **amsmath** but with extended features.

$$\begin{array}{c|cccc} & \color{blue}C_1 & \color{blue}C_2 & \cdots & \color{blue}C_n \\ \color{blue}L_1 & a_{11} & a_{12} & \cdots & a_{1n} \\ \color{blue}L_2 & a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \color{blue}L_n & a_{n1} & a_{n2} & \cdots & a_{nn} \end{array}$$

Product	dimensions (cm)			Price
	L	l	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

The package **nicematrix** is entirely contained in the file **nicematrix.sty**. This file may be put in the current directory or in a **texmf** tree. However, the best is to install **nicematrix** with a TeX distribution as MiKTeX or TeXlive.

This package can be used with **xelatex**, **lualatex**, **pdflatex** but also by the classical workflow **latex-dvips-ps2pdf** (or Adobe Distiller).

This package requires and **loads** the packages **l3keys2e**, **xparse**, **array**, **amsmath**, **pgfcore** and the module **shapes** of **PGF** (**tikz**, which is a layer over **PGF** is *not* loaded). The final user only has to load the package with **\usepackage{nicematrix}**.

The idea of **nicematrix** is to create PGF nodes under the cells and the positions of the rules of the tabular created by **array** and to use these nodes to develop new features. As usual with PGF, the coordinates of these nodes are written in the **.aux** to be used on the next compilation and that's why **nicematrix** may need **several compilations**.

Most features of **nicematrix** may be used without explicit use of PGF or Tikz (which, in fact, is not loaded by default).

A command **\NiceMatrixOptions** is provided to fix the options (the scope of the options fixed by this command is the current TeX group: they are semi-global).

^{*}This document corresponds to the version 4.3 of **nicematrix**, at the date of 2020/06/12.

1 The environments of this package

The package `nicematrix` defines the following new environments.

```
{NiceTabular} {NiceArray} {NiceMatrix}
{pNiceArray} {pNiceMatrix}
{bNiceArray} {bNiceMatrix}
{BNiceArray} {BNiceMatrix}
{vNiceArray} {vNiceMatrix}
{VNiceArray} {VNiceMatrix}
```

The environments `{NiceArray}` and `{NiceTabular}` are similar to the environments `{array}` and `{tabular}` of the package `array` (which is loaded by `nicematrix`).

However, there are some small differences:

- For technical reasons, in the preamble of these environments, the user must use the letters `L`, `C` and `R`¹ instead of `l`, `c` and `r`, included in the commands `\multicolumn` and in the types of columns defined by `\newcolumntype`.
- * In `{NiceArray}` (and its variants), the columns of type `w` (ex. : `wc{1cm}`) are composed in math mode whereas, in `{array}` of `array`, they are composed in text mode.

The environments `{pNiceArray}`, `{bNiceArray}`, etc. have no equivalent in `array`.

The environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. are similar to the corresponding environments of `amsmath` (which is loaded by `nicematrix`): `{matrix}`, `{pmatrix}`, etc.

All the environments of the package `nicematrix` accept, between square brackets, an optional list of `key=value` pairs. **There must be no space before the opening bracket (`[`) of this list of options.**

2 The vertical space between the rows

It's well known that some rows of the arrays created by default with LaTeX are, by default, too close to each other. Here is a classical example.

```
$\begin{pmatrix}
\frac{1}{2} & -\frac{1}{2} \\
\frac{1}{3} & \frac{1}{4}
\end{pmatrix}
```

Inspired by the package `cellspace` which deals with that problem, the package `nicematrix` provides two keys `cell-space-top-limit` and `cell-space-bottom-limit` similar to the parameters `\cellspacetoplimit` and `\cellspacebottomlimit` of `cellspace`. The initial value of these parameters is 0 pt in order to have for the environments of `nicematrix` the same behaviour as those of `array` and `amsmath`. However, a value of 1 pt would probably be a good choice and we suggest to set them with `\NiceMatrixOptions`.

```
\NiceMatrixOptions{cell-space-top-limit = 1pt,cell-space-bottom-limit = 1pt}

$\begin{pmatrix}
\frac{1}{2} & -\frac{1}{2} \\
\frac{1}{3} & \frac{1}{4}
\end{pmatrix}
```

¹The column types `L`, `C` and `R` are defined locally inside `{NiceTabular}` or `{NiceArray}` with `\newcolumntype` of `array`. This definition overrides an eventual previous definition.

3 The vertical position of the arrays

The package `nicematrix` provides a option `baseline` for the vertical position of the arrays. This option takes as value an integer which is the number of the row on which the array will be aligned.

```
$A = \begin{pNiceMatrix} [baseline=2]
\frac{1}{\sqrt{1+p^2}} & p & 1-p \\
1 & 1 & 1 \\
1 & p & 1+p
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} \frac{1}{\sqrt{1+p^2}} & p & 1-p \\ 1 & 1 & 1 \\ 1 & p & 1+p \end{pmatrix}$$

It's also possible to use the option `baseline` with one of the special values `t`, `c` or `b`. These letters may also be used absolutely like the option of the environments `{tabular}` and `{array}` of `array`. The initial value of `baseline` is `c`.

In the following example, we use the option `t` (equivalent to `baseline=t`) immediately after an `\item` of list. One should remark that the presence of a `\hline` at the beginning of the array doesn't prevent the alignment of the baseline with the baseline of the first row (with `{tabular}` or `{array}` of `array`, one must use `\firsthline`²).

```
\begin{enumerate}
\item an item
\smallskip
\item \renewcommand{\arraystretch}{1.2}
\begin{NiceArray}[t]{LCCCCCC}
\hline
n & 0 & 1 & 2 & 3 & 4 & 5 \\
u_n & 1 & 2 & 4 & 8 & 16 & 32
\hline
\end{NiceArray}
\end{enumerate}
```

1. an item

2.	n	0	1	2	3	4	5
	u_n	1	2	4	8	16	32

However, it's also possible to use the tools of `booktabs`: `\toprule`, `\bottomrule`, `\midrule`, etc.

```
\begin{enumerate}
\item an item
\smallskip
\item
\begin{NiceArray}[t]{LCCCCCC}
\toprule
n & 0 & 1 & 2 & 3 & 4 & 5 \\
\midrule
u_n & 1 & 2 & 4 & 8 & 16 & 32
\bottomrule
\end{NiceArray}
\end{enumerate}
```

1. an item

2.	n	0	1	2	3	4	5
	u_n	1	2	4	8	16	32

4 The blocks

In the environments of `nicematrix`, it's possible to use the command `\Block` in order to place an element in the center of a rectangle of merged cells of the array. The command `\Block` don't create space by itself.

The command `\Block` must be used in the upper leftmost cell of the array with two arguments. The first argument is the size of the block with the syntax $i-j$ where i is the number of rows of the block and j its number of columns. The second argument is the content of the block.

In `{NiceTabular}` the content of the block is composed in text mode. In the other environments, it is composed in math mode.

²It's also possible to use `\firsthline` in the environments of `nicematrix`.

```
\begin{NiceTabular}{CCCC}
rose      & tulipe & marguerite & dahlia \\
violette & \Block{2-2}{\LARGE\color{blue} fleurs} & & souci \\
pervenche & & & lys \\
arum      & iris   & jacinthe & muguet
\end{NiceTabular}
```

rose	tulipe	marguerite	dahlia
violette			souci
pervenche		fleurs	lys
arum	iris	jacinthe	muguet

One should remark that the horizontal centering of the contents of the blocks is correct even when an instruction such as `!{\qquad}` has been used in the preamble of the array in order to increase the space between two columns (this is not the case with `\multicolumn`). In the following example, the header “First group” is correctly centered.

```
\begin{NiceTabular}{C!{\qquad}CCC!{\qquad}CCC}
\toprule
& \Block{1-3}{First group} & & & \Block{1-3}{Second group} \\
Rank & 1A & 1B & 1C & 2A & 2B & 2C \\
\midrule
1 & 0.657 & 0.913 & 0.733 & 0.830 & 0.387 & 0.893 \\
2 & 0.343 & 0.537 & 0.655 & 0.690 & 0.471 & 0.333 \\
3 & 0.783 & 0.885 & 0.015 & 0.306 & 0.643 & 0.263 \\
4 & 0.161 & 0.708 & 0.386 & 0.257 & 0.074 & 0.336 \\
\bottomrule
\end{NiceTabular}
```

Rank	First group			Second group		
	1A	1B	1C	2A	2B	2C
1	0.657	0.913	0.733	0.830	0.387	0.893
2	0.343	0.537	0.655	0.690	0.471	0.333
3	0.783	0.885	0.015	0.306	0.643	0.263
4	0.161	0.708	0.386	0.257	0.074	0.336

It's also possible to use the command `\Block` in mathematical matrices.

```
$\begin{bNiceArray}{CCC|C}[margin]
\Block{3-3}{A} & & & 0 \\
& \hspace*{1cm} & & \Vdots \\
& & 0 & \\
\hline
0 & \cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ & A & & \vdots \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

One may wish to raise the size of the “ A ” placed in the block of the previous example. Since this element is composed in math mode, it's not possible to use directly a command like `\large`, `\Large` and `\LARGE`. That's why the command `\Block` provides an option between angle brackets to specify some TeX code which will be inserted before the beginning of the math mode.

```
$\begin{bNiceArray}{CCC|C}[margin]
\Block{3-3}{<\Large>A} & & & 0 \\
& \hspace*{1cm} & & \Vdots \\
& & 0 & \\
\hline
0 & \cdots & 0 & 0
\end{bNiceArray}$
```

$$\left[\begin{array}{ccc|c} & & & 0 \\ & A & & \vdots \\ \hline 0 & \cdots & 0 & 0 \end{array} \right]$$

5 The rules

The usual techniques for the rules may be used in the environments of `nicematrix` (excepted `\vline`).

5.1 The thickness and the color of the rules

The environments of `nicematrix` provide a key `rules/width` to set the width (in fact the thickness) of the rules in the current environment. In fact, this key merely sets the value of the length `\arrayrulewidth`.

It's well known that `colortbl` provides the command `\arrayrulecolor` in order to specify the color of the rules.

With `nicematrix`, it's possible to specify the color of the rules even when `colortbl` is not loaded. For sake of compatibility, the command is also named `\arrayrulecolor`. The environments of `nicematrix` also provide a key `rules/color` to fix the color of the rules in the current environment.

```
\begin{NiceTabular}{|CCC|} [rules/color=[gray]{0.9},rules/width=1pt]
\hline
rose & tulipe & lys \\
arum & iris & violette \\
muguet & dahlia & souci \\
\hline
\end{NiceTabular}
```

rose	tulipe	lys
arum	iris	violette
muguet	dahlia	souci

If one wishes to define new specifiers for columns in order to draw vertical rules (for example with a specific color or thicker than the standard rules), he should consider the command `\OnlyMainNiceMatrix` described on page 22.

5.2 A remark about `\cline`

The horizontal and vertical rules drawn by `\hline` and the specifier “|” make the array larger or wider by a quantity equal to the width of the rule.

For historical reasons, this is not the case with the command `\cline`, as shown by the following example.

```
\setlength{\arrayrulewidth}{2pt}
\begin{tabular}{cccc} \hline
A&B&C&D \\ \cline{2-2}
A&B&C&D \\ \hline
\end{tabular}
```

A	B	C	D
A	<u>B</u>	C	D

In the environments of `nicematrix`, this situation is corrected (it's still possible to go to the standard behaviour of `\cline` with the key `standard-cline`).

```
\setlength{\arrayrulewidth}{2pt}
\begin{NiceTabular}{CCCC} \hline
A&B&C&D \\ \cline{2-2}
A&B&C&D \\ \hline
\end{NiceTabular}
```

A	B	C	D
A	<u>B</u>	C	D

5.3 The keys `hlines` and `vlines`

The key `hlines` draws all the horizontal rules and the key `vlines` draws all the vertical rules. In fact, in the environments with delimiters (as `{pNiceMatrix}` or `{bNiceArray}`) the exteriors rules are not drawn (as expected).

```
$\begin{pNiceMatrix} [vlines, rules/width=0.2pt]
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6 \\
1 & 2 & 3 & 4 & 5 & 6
\end{pNiceMatrix}$
```

$$\left(\begin{array}{c|c|c|c|c|c} 1 & 2 & 3 & 4 & 5 & 6 \\ 1 & 2 & 3 & 4 & 5 & 6 \\ 1 & 2 & 3 & 4 & 5 & 6 \end{array} \right)$$

However, there is a difference between the key `vlines` and the use of the specifier “|” in the preamble of the environment: the rules drawn by `vlines` completely cross the double-rules drawn by `\hline\hline` (you don’t need `hhline`).

```
$\begin{NiceMatrix}[\vlines] \hline
a & b & c & d \\ \hline
1 & 2 & 3 & 4 \\
1 & 2 & 3 & 4 \\ \hline
\end{NiceMatrix}$
```

a	b	c	d
1	2	3	4
1	2	3	4

If you use `booktabs` (which provides `\toprule`, `\midrule`, `\bottomrule`, etc.) and you really want to draw vertical rules (something opposed to the spirit of `booktabs`), you should remark that the key `vlines` is compatible with `booktabs`.

```
$\begin{NiceMatrix}[\vlines] \toprule
a & b & c & d \\ \midrule
1 & 2 & 3 & 4 \\
1 & 2 & 3 & 4 \\ \bottomrule
\end{NiceMatrix}$
```

a	b	c	d
1	2	3	4
1	2	3	4

5.4 The key `hvlines`

The key `hvlines` draws all the vertical and horizontal rules *excepted in the blocks*.³

```
\setlength{\arrayrulewidth}{1pt}
\begin{NiceTabular}{cccc}[\hvlines, rules/color=blue]
rose      & tulipe & marguerite & dahlia \\
violette   & \Block{2-2}{\LARGE\color{blue} fleurs} & & souci \\
pervenche  & & & lys \\
arum       & iris    & jacinthe & muguet
\end{NiceTabular}
```

rose	tulipe	marguerite	dahlia
violette	fleurs		souci
pervenche			lys
arum	iris	jacinthe	muguet

5.5 La commande `\diagbox`

The command `\diagbox` (inspired by the package `diagbox`), allows, when it is used in a cell, to slash that cell diagonally downwards.⁴

```
$\begin{NiceArray}{*{5}{C}}[\hvlines]
\diagbox{x}{y} & e & a & b & c \\
e & e & a & b & c \\
a & a & e & c & b \\
b & b & c & e & a \\
c & c & b & a & e
\end{NiceArray}$
```

x	y	e	a	b	c
e		e	a	b	c
a		a	e	c	b
b		b	c	e	a
c		c	b	a	e

³In fact, when the key `hvlines` is in force, the rules are also not drawn in the virtual blocks delimited by cells relied par dotted lines (cf. p. 16).

⁴The author of this document considers that type of construction as graphically poor.

5.6 Dotted rules

In the environments of the package `nicematrix`, it's possible to use the command `\hdottedline` (provided by `nicematrix`) which is a counterpart of the classical commands `\hline` and `\hdashline` (the latter is a command of `arydshln`).

```
\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
\hdottedline
6 & 7 & 8 & 9 & 10 \\
11 & 12 & 13 & 14 & 15
\end{pNiceMatrix}
```

$$\left(\begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ 6 & 7 & 8 & 9 & 10 \\ 11 & 12 & 13 & 14 & 15 \end{array} \right)$$

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to draw a vertical dotted line with the specifier “`:`”.

```
\left(\begin{NiceArray}{CCCC:C}
1 & 2 & 3 & 4 & 5 \\
6 & 7 & 8 & 9 & 10 \\
11 & 12 & 13 & 14 & 15
\end{NiceArray}\right)
```

$$\left(\begin{array}{ccccc} 1 & 2 & 3 & 4 & : & 5 \\ 6 & 7 & 8 & 9 & : & 10 \\ 11 & 12 & 13 & 14 & : & 15 \end{array} \right)$$

It's possible to change in `nicematrix` the letter used to specify a vertical dotted line with the option `letter-for-dotted-lines` available in `\NiceMatrixOptions`.

Remark : In the package `array` (on which the package `nicematrix` relies), horizontal and vertical rules make the array larger or wider by a quantity equal to the width of the rule⁵. In `nicematrix`, the dotted lines drawn by `\hdottedline` and “`:`” do likewise.

6 The color of the rows and columns

With the classical package `colortbl`, it's possible to color the cells, rows and columns of a tabular. However, the resulting PDF is not always perfectly displayed by the PDF viewers, in particular in conjunction with rules. With some PDF viewers, some vertical rules seem to vanish. On the other side, some thin horizontal white lines may appear in some circumstances.

The package `nicematrix` provides similar tools which do not present these drawbacks. It provides a key `code-before`⁶ for some code which will be executed *before* the drawing of the tabular. In this `code-before`, new commands are available: `\cellcolor`, `\rectanglecolor`, `\rowcolor`, `\columncolor`, `\rowcolors` and `\chessboardcolors`.

These commands are independent of `colortbl`.⁷

All these commands accept an optional argument (between square brackets and in first position) which is the color model for the specification of the colors.

- The command `\cellcolor` takes its name from the command `\cellcolor` of `colortbl`. This command takes in mandatory arguments a color and a list of cells, each of which with the format $i-j$ where i is the number of row and j the number of columnn of the cell.

```
\begin{NiceTabular}{|C|C|C|}[code-before =
\cellcolor{red!15}{3-1,2-2,1-3}]
\hline
a & b & c \\
e & f & g \\
h & i & j \\
\hline
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

⁵In fact, this is true only for `\hline` and “`|`” but not for `\cline`.

⁶There is also a key `code-after` : see p. 16.

⁷Thus, it's possible to coloror the rules, the cells, the rows, the columns, etc. without loading `colortbl`.

- The command `\rectanglecolor` takes three mandatory arguments. The first is the color. The second is the upper-left cell of the rectangle and the third is the lower-right cell of the rectangle.

```
\begin{NiceTabular}{|C|C|C|}[code-before =
\rectanglecolor{blue!15}{2-2}{3-3}]
\hline
a & b & c \\
e & f & g \\
h & i & j \\
\end{NiceTabular}
```

a	b	c
e	f	g
h	i	j

- The command `\rowcolor` takes its name from the command `\rowcolor` of `colortbl`. Its first mandatory argument is the color and the second is a comma-separated list of rows or interval of rows with the form $a-b$ (an interval of the form $a-$ represent all the rows from the row a until the end).

```
$\begin{NiceArray}{LLL}[hvlines, code-before = \rowcolor{red!15}{1,3-5,8-}]
a_1 & b_1 & c_1 \\
a_2 & b_2 & c_2 \\
a_3 & b_3 & c_3 \\
a_4 & b_4 & c_4 \\
a_5 & b_5 & c_5 \\
a_6 & b_6 & c_6 \\
a_7 & b_7 & c_7 \\
a_8 & b_8 & c_8 \\
a_9 & b_9 & c_9 \\
a_{10} & b_{10} & c_{10} \\
\end{NiceArray}$
```

a_1	b_1	c_1
a_2	b_2	c_2
a_3	b_3	c_3
a_4	b_4	c_4
a_5	b_5	c_5
a_6	b_6	c_6
a_7	b_7	c_7
a_8	b_8	c_8
a_9	b_9	c_9
a_{10}	b_{10}	c_{10}

- The command `\columncolor` takes its name from the command `\columncolor` of `colortbl`. Its syntax is similar to the syntax of `\rowcolor`.
- The command `\rowcolors` (with a s) takes its name from the command `\rowcolors` of `xcolor`⁸. The s emphasizes the fact that there is *two* colors. This command colors alternately the rows of the tabular, beginning with the row whose number is given in first (mandatory) argument. The two other (mandatory) arguments are the colors.

```
\begin{NiceTabular}{LR}[hlines,code-before = \rowcolors{1}{blue!10}{}]
John & 12 \\
Stephen & 8 \\
Sarah & 18 \\
Ashley & 20 \\
Henry & 14 \\
Madison & 15
\end{NiceTabular}
```

John	12
Stephen	8
Sarah	18
Ashley	20
Henry	14
Madison	15

- The command `\chessboardcolors` takes in mandatory arguments two colors and colors the cells of the tabular in quincunx with these colors.

```
$\begin{pNiceMatrix}[R,margin, code-before=\chessboardcolors{red!15}{blue!15}]
1 & -1 & 1 \\
-1 & 1 & -1 \\
1 & -1 & 1
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & -1 & 1 \\ -1 & 1 & -1 \\ 1 & -1 & 1 \end{pmatrix}$$

We have used the key `R` which aligns all the columns rightwards (cf. p. 17).

⁸The command `\rowcolors` of `color` is available when `xcolor` is loaded with the option `table`.

One should remark that these commands are compatible with the commands de `booktabs` (`\toprule`, `\midrule`, `\bottomrule`, etc.).

```
\begin{NiceTabular}[c]{LSSSS}%
[code-before = \rowcolor{red!15}{1-2} \rowcolors{3}{blue!15}{[]}]
\toprule
\Block{2-1}{Product} \\
\Block{1-3}{dimensions (cm)} & & & \\
\Block{2-1}{\rotate Price} \\
\cmidrule(r1){2-4}
& L & l & h \\
\midrule
small & 3 & 5.5 & 1 & 30 \\
standard & 5.5 & 8 & 1.5 & 50.5 \\
premium & 8.5 & 10.5 & 2 & 80 \\
extra & 8.5 & 10 & 1.5 & 85.5 \\
special & 12 & 12 & 0.5 & 70 \\
\bottomrule
\end{NiceTabular}
```

We have used the type of column `S` of `siunitx`.

Product	dimensions (cm)			Price
	L	l	h	
small	3	5.5	1	30
standard	5.5	8	1.5	50.5
premium	8.5	10.5	2	80
extra	8.5	10	1.5	85.5
special	12	12	0.5	70

7 The width of the columns

In the environments with an explicit preamble (like `{NiceTabular}`, `{NiceArray}`, etc.), it's possible to fix the width of a given column with the standard letters `w` and `W` of the package `array`. In `{NiceTabular}`, the cells of such columns are composed in `texte` mode but, in `{NiceArray}`, `{pNiceArray}`, etc., they are composed in `math` mode (whereas, in `{array}` of `array`, they are composed in `text` mode).

```
\begin{NiceTabular}{Wc{2cm}CC}[hvlines]
Paris & New York & Madrid \\
Berlin & London & Roma \\
Rio & Tokyo & Oslo
\end{NiceTabular}
```

Paris	New York	Madrid
Berlin	London	Roma
Rio	Tokyo	Oslo

In the environments of `nicematrix`, it's also possible to fix the *minimal* width of all the columns of an array directly with the key `columns-width`.

```
$\begin{pNiceMatrix}[\text{columns-width} = 1cm]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

Note that the space inserted between two columns (equal to `2 \tabcolsep` in `{NiceTabular}` and to `2 \arraycolsep` in the other environments) is not suppressed (of course, it's possible to suppress this space by setting `\tabcolsep` or `\arraycolsep` equal to 0 pt before the environment).

It's possible to give the special value `auto` to the option `columns-width`: all the columns of the array will have a width equal to the widest cell of the array.⁹

```
$\begin{pNiceMatrix}[\text{columns-width} = \text{auto}]
1 & 12 & -123 \\
12 & 0 & 0 \\
4 & 1 & 2
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 12 & -123 \\ 12 & 0 & 0 \\ 4 & 1 & 2 \end{pmatrix}$$

⁹The result is achieved with only one compilation (but Tikz will have written informations in the `.aux` file and a message requiring a second compilation will appear).

Without surprise, it's possible to fix the minimal width of the columns of all the matrices of a current scope with the command `\NiceMatrixOptions`.

```
\NiceMatrixOptions{columns-width=10mm}
$\begin{pNiceMatrix}
a & b \\ c & d
\end{pNiceMatrix}
=
\begin{pNiceMatrix}
1 & 1245 \\ 345 & 2
\end{pNiceMatrix}$
```

$$\left(\begin{array}{cc} a & b \\ c & d \end{array} \right) = \left(\begin{array}{cc} 1 & 1245 \\ 345 & 2 \end{array} \right)$$

But it's also possible to fix a zone where all the matrices will have their columns of the same width, equal to the widest cell of all the matrices. This construction uses the environment `{NiceMatrixBlock}` with the option `auto-columns-width`¹⁰. The environment `{NiceMatrixBlock}` has no direct link with the command `\Block` presented previously in this document (cf. p. 3).

```
\begin{NiceMatrixBlock}[auto-columns-width]
$\begin{array}{c}
\begin{bNiceMatrix}
9 & 17 \\ -2 & 5
\end{bNiceMatrix} \\
\begin{bNiceMatrix}
1 & 1245345 \\ 345 & 2
\end{bNiceMatrix}
\end{array}$
```

$$\left[\begin{array}{cc} 9 & 17 \\ -2 & 5 \end{array} \right] \quad \left[\begin{array}{cc} 1 & 1245345 \\ 345 & 2 \end{array} \right]$$

Several compilations may be necessary to achieve the job.

8 The exterior rows and columns

The options `first-row`, `last-row`, `first-col` and `last-col` allow the composition of exterior rows and columns in the environments of `nicematrix`.

A potential “first row” (exterior) has the number 0 (and not 1). Idem for the potential “first column”.

```
$\begin{pNiceMatrix}[first-row,last-row,first-col,last-col]
$\begin{pNiceMatrix}[first-row,last-row,first-col,last-col,nullify-dots]
& C_1 & \cdots & C_4 & \\
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 \\
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots \\
& a_{31} & a_{32} & a_{33} & a_{34} & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 \\
& C_1 & \cdots & C_4 & \\
\end{pNiceMatrix}$
\end{pNiceMatrix}$
```

$$L_1 \left(\begin{array}{cccc} C_1 & \cdots & \cdots & C_4 \\ a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right) L_4$$

$$\vdots \qquad \qquad \qquad \vdots$$

$$C_1 \cdots \cdots C_4$$

The dotted lines have been drawn with the tools presented p. 12.

We have several remarks to do.

¹⁰At this time, this is the only usage of the environment `{NiceMatrixBlock}` but it may have other usages in the future.

- For the environments with an explicit preamble (i.e. `{NiceArray}` and its variants), no letter must be given in that preamble for the potential first column and the potential last column: they will automatically (and necessarily) be of type `R` for the first column and `L` for the last one.
- One may wonder how `nicematrix` determines the number of rows and columns which are needed for the composition of the “last row” and “last column”.
 - For the environments with explicit preamble, like `{NiceTabular}` and `{pNiceArray}`, the number of columns can obviously be computed from the preamble.
 - When the option `light-syntax` (cf. p. 19) is used, `nicematrix` has, in any case, to load the whole body of the environment (and that’s why it’s not possible to put verbatim material in the array with the option `light-syntax`). The analysis of this whole body gives the number of rows (but not the number of columns).
 - In the other cases, `nicematrix` compute the number of rows and columns during the first compilation and write the result in the `aux` file for the next run.

However, it’s possible to provide the number of the last row and the number of the last column as values of the options `last-row` and `last-col`, tending to an acceleration of the whole compilation of the document. That’s what we will do throughout the rest of the document.

It’s possible to control the appearance of these rows and columns with options `code-for-first-row`, `code-for-last-row`, `code-for-first-col` and `code-for-last-col`. These options specify tokens that will be inserted before each cell of the corresponding row or column.

```
\NiceMatrixOptions{code-for-first-row = \color{red},
                  code-for-first-col = \color{blue},
                  code-for-last-row = \color{green},
                  code-for-last-col = \color{magenta}}
$\begin{pNiceArray}{CC|CC}[first-row,last-row=5,first-col,last-col,nullify-dots]
& C_1 & \Cdots & & C_4 & \\
L_1 & a_{11} & a_{12} & a_{13} & a_{14} & L_1 \\
\vdots & a_{21} & a_{22} & a_{23} & a_{24} & \vdots \\
\hline
& a_{31} & a_{32} & a_{33} & a_{34} & \\
L_4 & a_{41} & a_{42} & a_{43} & a_{44} & L_4 \\
& C_1 & \Cdots & & C_4 & \\
\end{pNiceArray}$
```

$$\begin{array}{c|ccccc}
& \color{red}C_1 \cdots \cdots \cdots \color{red}C_4 & & & & \\
\color{blue}L_1 & \left(\begin{array}{cc|cc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \end{array} \right) & \color{magenta}L_1 & \vdots & & \\
\vdots & & & & & \vdots \\
\color{blue}L_4 & \left(\begin{array}{cc|cc} a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right) & \color{magenta}L_4 & \vdots & & \vdots \\
& \color{green}C_1 \cdots \cdots \cdots \color{green}C_4 & & & &
\end{array}$$

Remarks

- As shown in the previous example, the horizontal and rules doesn’t extend in the exterior rows and columns.

However, if one wishes to define new specifiers for columns in order to draw vertical rules (for example thicker than the standard rules), he should consider the command `\OnlyMainNiceMatrix` described on page 22.

- A specification of color present in `code-for-first-row` also applies to a dotted line draw in this exterior “first row” (excepted if a value has been given to `xdots/color`). Idem for the other exterior rows and columns.

- Logically, the potential option `columns-width` (described p. 9) doesn't apply to the "first column" and "last column".
- For technical reasons, it's not possible to use the option of the command `\\"\\` after the "first row" or before the "last row" (the placement of the delimiters would be wrong).

9 The continuous dotted lines

Inside the environments of the package `nicematrix`, new commands are defined: `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Idots`. These commands are intended to be used in place of `\dots`, `\cdots`, `\vdots`, `\ddots` and `\iddots`.¹¹

Each of them must be used alone in the cell of the array and it draws a dotted line between the first non-empty cells¹² on both sides of the current cell. Of course, for `\Ldots` and `\Cdots`, it's an horizontal line; for `\Vdots`, it's a vertical line and for `\Ddots` and `\Idots` diagonal ones. It's possible to change the color of these lines with the option `color`.¹³

```
\begin{bNiceMatrix}
a_1 & \Cdots & & a_1 & \\
\Vdots & a_2 & \Cdots & a_2 & \\
& \Vdots & \Ddots[color=red] & \\
& a_1 & a_2 & & a_n
\end{bNiceMatrix}
```

$$\begin{bmatrix} a_1 & \cdots & a_1 \\ \vdots & & \vdots \\ a_2 & \cdots & a_2 \\ \vdots & & \vdots \\ a_1 & a_2 & & a_n \end{bmatrix}$$

In order to represent the null matrix, one can use the following codage:

```
\begin{bNiceMatrix}
0 & \Cdots & 0 & \\
\Vdots & & \Vdots & \\
0 & \Cdots & 0 &
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ \vdots & & \vdots \\ 0 & \cdots & 0 \end{bmatrix}$$

However, one may want a larger matrix. Usually, in such a case, the users of LaTeX add a new row and a new column. It's possible to use the same method with `nicematrix`:

```
\begin{bNiceMatrix}
0 & \Cdots & \Cdots & 0 & \\
\Vdots & & & \Vdots & \\
\Vdots & & & \Vdots & \\
0 & \Cdots & \Cdots & 0 &
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & \cdots & 0 \\ \vdots & & & \vdots \\ \vdots & & & \vdots \\ 0 & \cdots & \cdots & 0 \end{bmatrix}$$

In the first column of this exemple, there are two instructions `\Vdots` but only one dotted line is drawn (there is no overlapping graphic objects in the resulting PDF¹⁴).

In fact, in this example, it would be possible to draw the same matrix more easily with the following code:

```
\begin{bNiceMatrix}
0 & \Cdots & & 0 & \\
\Vdots & & & & \\
& & & \Vdots & \\
0 & & & \Cdots & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & & 0 \\ \vdots & & & \vdots \\ & & & \vdots \\ 0 & \cdots & & 0 \end{bmatrix}$$

¹¹The command `\idots`, defined in `nicematrix`, is a variant of `\ddots` with dots going forward. If `mathdots` is loaded, the version of `mathdots` is used. It corresponds to the command `\adots` of `unicode-math`.

¹²The precise definition of a "non-empty cell" is given below (cf. p. 23).

¹³It's also possible to change the color of all theses dotted lines with the option `xdots/color` (`xdots` to remind that it works for `\Cdots`, `\Ldots`, `\Vdots`, etc.): cf. p. 15.

¹⁴And it's not possible to draw a `\Ldots` and a `\Cdots` line between the same cells.

There are also other means to change the size of the matrix. Someone might want to use the optional argument of the command `\backslash\backslash` for the vertical dimension and a command `\hspace*` in a cell for the horizontal dimension.¹⁵

However, a command `\hspace*` might interfere with the construction of the dotted lines. That's why the package `nicematrix` provides a command `\Hspace` which is a variant of `\hspace` transparent for the dotted lines of `nicematrix`.

```
\begin{bNiceMatrix}
0 & \Cdots & \Hspace*[1cm] & 0 & \\
\Vdots & & & \Vdots & \\[1cm]
0 & \Cdots & & 0
\end{bNiceMatrix}
```

$$\begin{bmatrix} 0 & \cdots & & 0 \\ \vdots & & & \vdots \\ \vdots & & & \vdots \\ 0 & \cdots & & 0 \end{bmatrix}$$

9.1 The option `nullify-dots`

Consider the following matrix composed classically with the environment `{pmatrix}` of `amsmath`.

```
$A = \begin{pmatrix}
h & i & j & k & l & m \\
x & & & & & x
\end{pmatrix}
```

If we add `\ldots` instructions in the second row, the geometry of the matrix is modified.

```
$B = \begin{pmatrix}
h & i & j & k & l & m \\
x & \ldots & \ldots & \ldots & \ldots & x
\end{pmatrix}
```

By default, with `nicematrix`, if we replace `{pmatrix}` by `{pNiceMatrix}` and `\ldots` by `\Ldots`, the geometry of the matrix is not changed.

```
$C = \begin{pNiceMatrix}
h & i & j & k & l & m \\
x & \Ldots & \Ldots & \Ldots & \Ldots & x
\end{pNiceMatrix}
```

However, one may prefer the geometry of the first matrix A and would like to have such a geometry with a dotted line in the second row. It's possible by using the option `nullify-dots` (and only one instruction `\Ldots` is necessary).

```
$D = \begin{pNiceMatrix}[nullify-dots]
h & i & j & k & l & m \\
x & \Ldots & & & & x
\end{pNiceMatrix}
```

The option `nullify-dots` smashes the instructions `\Ldots` (and the variants) horizontally but also vertically.

9.2 The command `\Hdotsfor`

Some people commonly use the command `\hdotsfor` of `amsmath` in order to draw horizontal dotted lines in a matrix. In the environments of `nicematrix`, one should use instead `\Hdotsfor` in order to draw dotted lines similar to the other dotted lines drawn by the package `nicematrix`.

As with the other commands of `nicematrix` (like `\Cdots`, `\Ldots`, `\Vdots`, etc.), the dotted line drawn with `\Hdotsfor` extends until the contents of the cells on both sides.

¹⁵In `nicematrix`, one should use `\hspace*` and not `\hspace` for such an usage because `nicematrix` loads `array`. One may also remark that it's possible to fix the width of a column by using the environment `{NiceArray}` (or one of its variants) with a column of type `w` or `W`: see p. 9

```
$\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
1 & \Hdotsfor{3} & 5 \\
1 & 2 & 3 & 4 & 5 \\
1 & 2 & 3 & 4 & 5
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & \dots & & & 5 \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

However, if these cells are empty, the dotted line extends only in the cells specified by the argument of `\Hdotsfor` (by design).

```
$\begin{pNiceMatrix}
1 & 2 & 3 & 4 & 5 \\
& \Hdotsfor{3} \\
1 & 2 & 3 & 4 & 5 \\
1 & 2 & 3 & 4 & 5
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ & \dots & & & \\ 1 & 2 & 3 & 4 & 5 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix}$$

Remark: Unlike the command `\hdotsfor` of `amsmath`, the command `\Hdotsfor` may be used when the package `colortbl` is loaded (but you might have problem if you use `\rowcolor` on the same row as `\Hdotsfor`).

9.3 How to generate the continuous dotted lines transparently

The package `nicematrix` provides an option called `transparent` for using existing code transparently in the environments of the `amsmath` : `{matrix}`, `{pmatrix}`, `{bmatrix}`, etc. In fact, this option is an alias for the conjunction of two options: `renew-dots` and `renew-matrix`.¹⁶

- The option `renew-dots`

With this option, the commands `\ldots`, `\cdots`, `\vdots`, `\ddots`, `\iddots`¹¹ and `\hdotsfor` are redefined within the environments provided by `nicematrix` and behave like `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Idots` and `\Hdotsfor`; the command `\dots` (“automatic dots” of `amsmath`) is also redefined to behave like `\Ldots`.

- The option `renew-matrix`

With this option, the environment `{matrix}` is redefined and behave like `{NiceMatrix}`, and so on for the five variants.

Therefore, with the option `transparent`, a classical code gives directly the ouput of `nicematrix`.

```
\NiceMatrixOptions{transparent}
\begin{pmatrix}
1 & \cdots & \cdots & 1 \\
0 & \ddots & & \vdots \\
\vdots & \ddots & \ddots & \vdots \\
0 & \cdots & 0 & 1
\end{pmatrix}
```

9.4 The labels of the dotted lines

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Idots` and `\Hdotsfor` (and the command `\line` in the `code-after` which is described p. 16) accept two optional arguments specified by the tokens `_` and `^` for labels positionned below and above the line. The arguments are composed in math mode with `\scriptstyle`.

```
$\begin{bNiceMatrix}
1 & \hspace*{1cm} & & 0 \\ 
& \Ddots^{n \text{ text{ times}}} & & \\
0 & & & 1
\end{bNiceMatrix}$
```

$$\begin{bmatrix} 1 & & & 0 \\ & \dots & \dots & \\ & n \text{ text{ times}} & \dots & \\ 0 & & & 1 \end{bmatrix}$$

¹⁶The options `renew-dots`, `renew-matrix` and `transparent` can be fixed with the command `\NiceMatrixOptions` like the other options. However, they can also be fixed as options of the command `\usepackage` (it's an exception for these three specific options.)

9.5 Customization of the dotted lines

The dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` (and by the command `\line` in the `code-after` which is described p. 16) may be customized by three options (specified between square brackets after the command):

- `color`;
- `shorten`;
- `line-style`.

These options may also be fixed with `\NiceMatrixOptions` or at the level of a given environment but, in those cases, they must be prefixed by `xdots`, and, thus have for names:

- `xdots/color`;
- `xdots/shorten`;
- `xdots/line-style`.

For the clarity of the explanations, we will use those names.

The option `xdots/color`

The option `xdots/color` fixes the color of the dotted line. However, one should remark that the dotted lines drawn in the exterior rows and columns have a special treatment: cf. p. 10.

The option `xdots/shorten`

The option `xdots/shorten` fixes the margin of both extremities of the line. The name is derived from the options “`shorten >`” and “`shorten <`” of Tikz but one should notice that `nicematrix` only provides `xdots/shorten`. The initial value of this parameter is 0.3 em (it is recommended to use a unit of length dependent of the current font).

The option `xdots/line-style`

It should be pointed that, by default, the lines drawn by Tikz with the parameter `dotted` are composed of square dots (and not rounded ones).¹⁷

```
\tikz \draw [dotted] (0,0) -- (5,0) ;
```

In order to provide lines with rounded dots in the style of those provided by `\ldots` (at least with the *Computer Modern* fonts), the package `nicematrix` embeds its own system to draw a dotted line (and this system uses PGF and not Tikz). This style is called `standard` and that's the initial value of the parameter `xdots/line-style`.

However (when Tikz is loaded) it's possible to use for `xdots/line-style` any style provided by Tikz, that is to say any sequence of options provided by Tikz for the Tikz pathes (with the exception of “`color`”, “`shorten >`” and “`shorten <`”).

Here is for example a tridiagonal matrix with the style `loosely dotted`:

```
$\begin{pNiceMatrix} [nullify-dots, xdots/line-style=loosely dotted]
a & b & 0 & & \Cdots & 0 & \\
b & a & b & & \Ddots & & \Vdots \\
0 & b & a & & \Ddots & & \\
& \Ddots & \Ddots & \Ddots & & 0 & \\
& \Vdots & & & & & \\
0 & & \Cdots & 0 & b & a
\end{pNiceMatrix}$
```

$$\begin{pmatrix} a & b & 0 & \cdots & 0 \\ b & a & b & \ddots & \vdots \\ 0 & b & a & \ddots & \vdots \\ \vdots & \ddots & \ddots & \ddots & 0 \\ 0 & \cdots & 0 & b & a \end{pmatrix}$$

¹⁷The first reason of this behaviour is that the PDF format includes a description for dashed lines. The lines specified with this descriptor are displayed very efficiently by the PDF readers. It's easy, starting from these dashed lines, to create a line composed by square dots whereas a line of rounded dots needs a specification of each dot in the PDF file.

9.6 The dotted lines and the key `hvlines`

We have said (cf. p. 6) that the key `hvlines` draws all the horizontal and vertical rules, excepted in the blocks. In fact, when this key is in force, the rules are also not drawn in the virtual blocks delimited by cells relied par dotted lines.

```
\NiceMatrixOptions{nullify-dots}
$\begin{pNiceMatrix}[rules/color=gray,hvlines,margin]
0 & \Cdots & & & 0 & \\
1 & \Cdots & & 1 & 2 & \\
0 & \Ddots & & \Vdots & \Vdots & \\
\Vdots & \Ddots & & & & \\
& & & & & \\
0 & \Cdots & 0 & 1 & 2 & \\
\end{pNiceMatrix}$
```

$$\left(\begin{array}{cc|c} 0 & \cdots & 0 \\ 1 & \cdots & 1 & 2 \\ 0 & & \cdots & \cdots \\ \vdots & & \ddots & \ddots & \ddots \\ 0 & \cdots & 0 & 1 & 2 \end{array} \right)$$

10 The code-after

The option `code-after` may be used to give some code that will be excuted after the construction of the matrix.¹⁸

A special command, called `\line`, is available to draw directly dotted lines between nodes. It takes two arguments for the two cells to rely, both of the form $i-j$ where i is the number of row and j is the number of column. It may be used, for example, to draw a dotted line between two adjacents cells.

```
\NiceMatrixOptions{xdots/shorten = 0.6 em}
$\begin{pNiceMatrix}[code-after=\line{2-2}{3-3}]
I & 0 & \Cdots & 0 & \\
0 & I & \Ddots & \Vdots & \\
\Vdots & \Ddots & I & 0 & \\
0 & \Cdots & 0 & I & \\
\end{pNiceMatrix}$
```

$$\left(\begin{array}{ccccc} I & 0 & \cdots & \cdots & 0 \\ 0 & I & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & I & 0 \\ 0 & \cdots & 0 & I & \\ \end{array} \right)$$

For the readability of the code, an alternative syntax is provided: it's possible to give the instructions of the `\code-after` at the end of the environment, after the keyword `\CodeAfter`. For an example, cf. p. 27.

11 Other features

11.1 Use of the column type S of siunitx

If the package `siunitx` is loaded (before or after `nicematrix`), it's possible to use the `S` column type of `siunitx` in the environments of `nicematrix`. The implementation doesn't use explicitly any private macro of `siunitx`.

```
$\begin{pNiceArray}{SCWc{1cm}C}[nullify-dots,first-row]
{C_1} & \Cdots & C_n \\
2.3 & 0 & \Cdots & 0 \\
12.4 & \Vdots & \Vdots & \\
1.45 & \\
7.2 & 0 & \Cdots & 0 \\
\end{pNiceArray}$
```

$$\left(\begin{array}{cccc} C_1 & \cdots & C_n \\ 2.3 & 0 & \cdots & 0 \\ 12.4 & \vdots & \vdots & \vdots \\ 1.45 & \vdots & \vdots & \vdots \\ 7.2 & 0 & \cdots & 0 \end{array} \right)$$

On the other hand, the `d` columns of the package `dcolumn` are not supported by `nicematrix`.

¹⁸There is also a key `code-before` described p. 7.

11.2 Alignement option in {NiceMatrix}

The environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.) provide two options `l` and `r` (equivalent at `L` and `R`) which generate all the columns aligned leftwards (or rightwards).

```
$\begin{bNiceMatrix}[R]
\cos x & - \sin x \\
\sin x & \cos x
\end{bNiceMatrix}$
```

$$\begin{bmatrix} \cos x & - \sin x \\ \sin x & \cos x \end{bmatrix}$$

There is also a key `S` which sets all the columns all type `S` of `siunitx` (if this package is loaded).¹⁹

11.3 The command `\rotate`

The package `nicematrix` provides a command `\rotate`. When used in the beginning of a cell, this command composes the contents of the cell after a rotation of 90° in the direct sens.

In the following command, we use that command in the `code-for-first-row`.

```
\NiceMatrixOptions%
{code-for-first-row = \scriptstyle \rotate \text{image of },
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[first-row,last-col=4]
e_1 & e_2 & e_3 \\
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \atop e_2 \atop e_3}^{\text{image of } e_1 \atop \text{image of } e_2 \atop \text{image of } e_3}$$

If the command `\rotate` is used in the “last row” (exterior to the matrix), the corresponding elements are aligned upwards as shown below.

```
\NiceMatrixOptions%
{code-for-last-row = \scriptstyle \rotate ,
 code-for-last-col = \scriptstyle }
$A = \begin{pNiceMatrix}[last-row=4,last-col=4]
1 & 2 & 3 & e_1 \\
4 & 5 & 6 & e_2 \\
7 & 8 & 9 & e_3 \\
\text{image of } e_1 & e_2 & e_3 &
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}_{e_1 \atop e_2 \atop e_3}^{\text{image of } e_1 \atop \text{image of } e_2 \atop \text{image of } e_3}$$

11.4 The option `small`

With the option `small`, the environments of the package `nicematrix` are composed in a way similar to the environment `{smallmatrix}` of the package `amsmath` (and the environments `{psmallmatrix}`, `{bsmallmatrix}`, etc. of the package `mathtools`).

```
$\begin{bNiceArray}{CCCC|C} [small,
last-col,
code-for-last-col = \scriptscriptstyle,
columns-width = 3mm ]
1 & -2 & 3 & 4 & 5 \\
0 & 3 & 2 & 1 & 2 & L_2 \gets 2 L_1 - L_2 \\
0 & 1 & 1 & 2 & 3 & L_3 \gets L_1 + L_3
\end{bNiceArray}$
```

¹⁹This is a part of the functionality provided by the environments `{pmatrix*}`, `{bmatrix*}`, etc. of `mathtools`.

$$\left[\begin{array}{cccc|c} 1 & -2 & 3 & 4 & 5 \\ 0 & 3 & 2 & 1 & 2 \\ 0 & 1 & 1 & 2 & 3 \end{array} \right] \xrightarrow[L_2 \leftarrow 2L_1 - L_2]{L_3 \leftarrow L_1 + L_3}$$

One should note that the environment `{NiceMatrix}` with the option `small` is not composed *exactly* as the environment `{smallmatrix}`. Indeed, all the environments of `nicematrix` are constructed upon `{array}` (of the package `array`) whereas the environment `{smallmatrix}` is constructed directly with an `\halign` of TeX.

In fact, the option `small` corresponds to the following tuning:

- the cells of the array are composed with `\scriptstyle`;
- `\arraystretch` is set to 0.47;
- `\arraycolsep` is set to 1.45 pt;
- the characteristics of the dotted lines are also modified.

11.5 The counters `iRow` and `jCol`

In the cells of the array, it's possible to use the LaTeX counters `iRow` and `jCol` which represent the number of the current row and the number of the current column²⁰. Of course, the user must not change the value of these counters which are used internally by `nicematrix`.

In the `code-before` (cf. p. 7) and in the `code-after` (cf. p. 16), `iRow` represents the total number of rows (excepted the potential exterior rows) and `jCol` represents the total number of columns (excepted the potential exterior columns).

```
$\begin{pNiceMatrix}% don't forget the %
  [first-row,
   first-col,
   code-for-first-row = \mathbf{\{alph\{jCol\}\}} ,
   code-for-first-col = \mathbf{\{arabic\{iRow\}\}} ]
   & & & \\
& 1 & 2 & 3 & 4 \\
& 5 & 6 & 7 & 8 \\
& 9 & 10 & 11 & 12
\end{pNiceMatrix}$
```

a	b	c	d
1	1	2	3
2	5	6	7
3	9	10	11
			12

If LaTeX counters called `iRow` and `jCol` are defined in the document by packages other than `nicematrix` (or by the final user), they are shadowed in the environments of `nicematrix`.

The package `nicematrix` also provides commands in order to compose automatically matrices from a general pattern. These commands are `\AutoNiceMatrix`, `\pAutoNiceMatrix`, `\bAutoNiceMatrix`, `\vAutoNiceMatrix`, `\VAutoNiceMatrix` and `\BAutoNiceMatrix`.

These commands take two mandatory arguments. The first is the format of the matrix, with the syntax $n-p$ where n is the number of rows and p the number of columns. The second argument is the pattern (it's a list of tokens which are inserted in each cell of the constructed matrix, excepted in the cells of the eventual exterior rows and columns).

```
$C = \pAutoNiceMatrix{3-3}{C_{\arabic{iRow},\arabic{jCol}}} $
```

$$C = \begin{pmatrix} C_{1,1} & C_{1,2} & C_{1,3} \\ C_{2,1} & C_{2,2} & C_{2,3} \\ C_{3,1} & C_{3,2} & C_{3,3} \end{pmatrix}$$

²⁰We recall that the exterior “first row” (if it exists) has the number 0 and that the exterior “first column” (if it exists) has also the number 0.

11.6 The option `light-syntax`

The option `light-syntax` (inspired by the package `spalign`) allows the user to compose the arrays with a lighter syntax, which gives a better legibility of the TeX source.

When this option is used, one should use the semicolon for the end of a row and spaces or tabulations to separate the columns. However, as usual in the TeX world, the spaces after a control sequence are discarded and the elements between curly braces are considered as a whole.

The following example has been composed with XeLaTeX with `unicode-math`, which allows the use of greek letters directly in the TeX source.

```
$\begin{bNiceMatrix}[\textcolor{blue}{light-syntax},\textit{first-row},\textit{first-col}]\\
{} a & b & ; \\
a \cos a & \{\cos a + \cos b\} & \\
b \cos a + \cos b & \{ 2 \cos b \} \\
\end{bNiceMatrix}$
```

$$\begin{array}{cc} a & b \\ a \left[\begin{array}{cc} 2 \cos a & \cos a + \cos b \\ \cos a + \cos b & 2 \cos b \end{array} \right] \end{array}$$

It's possible to change the character used to mark the end of rows with the option `end-of-row`. As said before, the initial value is a semicolon.

When the option `light-syntax` is used, it is not possible to put verbatim material (for example with the command `\verb`) in the cells of the array.²¹

11.7 The environment `{NiceArrayWithDelims}`

In fact, the environment `{pNiceArray}` and its variants are based upon a more general environment, called `{NiceArrayWithDelims}`. The first two mandatory arguments of this environment are the left and right delimiters used in the construction of the matrix. It's possible to use `{NiceArrayWithDelims}` if we want to use atypical or asymmetrical delimiters.

```
$\begin{NiceArrayWithDelims}[\textit{CCC}][\textit{margin}]\\
\downarrow\!\!\! \uparrow & \downarrow\!\!\! \uparrow & \downarrow\!\!\! \uparrow \\
1 & 2 & 3 \\ 
4 & 5 & 6 \\ 
7 & 8 & 9 \\
\end{NiceArrayWithDelims}$
```

12 Utilisation of Tikz with `nicematrix`

12.1 The nodes corresponding to the contents of the cells

The package `nicematrix` creates a PGF/Tikz node for each (non-empty) cell of the considered array. These nodes are used to draw the dotted lines between the cells of the matrix (inter alia).

The nodes of a document must have distinct names. That's why the names of the nodes created by `nicematrix` contains the number of the current environment. Indeed, the environments of `nicematrix` are numbered by a internal global counter.

In the environment with the number n , the node of the row i and column j has for name `nm-n-i-j`.

The command `\NiceMatrixLastEnv` provides the number of the last environment of `nicematrix` (for LaTeX, it's a “fully expandable” command and not a counter).

However, it's advisable to use instead the key `name`. This key gives a name to the current environment. When the environment has a name, the nodes are accessible with the name “`name-i-j`” where `name` is the name given to the array and i and j the numbers of row and column. It's possible to use these nodes with PGF but the final user will probably prefer to use Tikz (which is a convenient layer upon PGF). However, one should remind that `nicematrix` doesn't load Tikz by default.

²¹The reason is that, when the option `light-syntax` is used, the whole content of the environment is loaded as a TeX argument to be analyzed. The environment doesn't behave in that case as a standard environment of LaTeX which only put TeX commands before and after the content.

```
$\begin{pNiceMatrix} [name=mymatrix]
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{pNiceMatrix}$
\tikz[remember picture,overlay]
\draw (mymatrix-2-2) circle (2mm) ;
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

Don't forget the options `remember picture` and `overlay`.

In the `code-after`, and if Tikz is loaded, the things are easier. One may design the nodes with the form $i-j$: there is no need to indicate the environment which is of course the current environment.

```
$\begin{pNiceMatrix}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\CodeAfter
\tikz \draw (2-2) circle (2mm) ;
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & 2 & 3 \\ 4 & \textcircled{5} & 6 \\ 7 & 8 & 9 \end{pmatrix}$$

In the following example, we have underlined all the nodes of the matrix (we explain below the technic used : cf. p. 27).

$$\begin{pmatrix} a & a+b & a+b+c \\ \underline{a} & a & \underline{a+b} \\ a & a & a \end{pmatrix}$$

12.2 The “medium nodes” and the “large nodes”

In fact, the package `nicematrix` can create “extra nodes”: the “medium nodes” and the “large nodes”. The first ones are created with the option `create-medium-nodes` and the second ones with the option `create-large-nodes`.²²

These nodes are not used by `nicematrix` by default, and that's why they are not created by default.

The names of the “medium nodes” are constructed by adding the suffix “-medium” to the names of the “normal nodes”. In the following example, we have underlined the “medium nodes”. We consider that this example is self-explanatory.

$$\begin{pmatrix} a & a+b & a+b+c \\ \underline{a} & \underline{a} & \underline{a+b} \\ a & a & a \end{pmatrix}$$

The names of the “large nodes” are constructed by adding the suffix “-large” to the names of the “normal nodes”. In the following example, we have underlined the “large nodes”. We consider that this example is self-explanatory.²³

$$\begin{pmatrix} a & a+b & a+b+c \\ \underline{a} & a & \underline{a+b} \\ a & a & a \end{pmatrix}$$

The “large nodes” of the first column and last column may appear too small for some usage. That's why it's possible to use the options `left-margin` and `right-margin` to add space on both sides of

²²There is also an option `create-extra-nodes` which is an alias for the conjunction of `create-medium-nodes` and `create-large-nodes`.

²³There is no “large nodes” created in the exterior rows and columns (for these rows and columns, cf. p. 10).

the array and also space in the “large nodes” of the first column and last column. In the following example, we have used the options `left-margin` and `right-margin`.²⁴

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

It’s also possible to add more space on both side of the array with the options `extra-left-margin` and `extra-right-margin`. These margins are not incorporated in the “large nodes”. It’s possible to fix both values with the option `extra-margin` and, in the following example, we use `extra-margin` with the value 3 pt.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix}$$

Be careful : These nodes are reconstructed from the contents cells of the array. Usually, they do not correspond to the cells delimited by the rules (if we consider that these rules are drawn).

Here is an array composed with the following code:

```
\large
\begin{NiceTabular}{wl{2cm}LL}[hvlines]
fraise & amande & abricot \\
prune & pêche & poire \\
noix & noisette & brugnon
\end{NiceTabular}
```

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here, we have colored all the cells of the array with `\chessboardcolors`.

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

Here are the “large nodes” of this array (without utilisation of `margin` nor `extra-margin`).

fraise	amande	abricot
prune	pêche	poire
noix	noisette	brugnon

12.3 The “row-nodes” and the “col-nodes”

The package `nicematrix` creates a PGF/Tikz node indicating the potential position of each horizontal rule (with the names `row-i`) and each vertical rule (with the names `col-j`), as described in the following figure. These nodes are available in the `code-before` and the `code-after`.

row-1	rose	tulipe	lys
row-2	arum	iris	violette
row-3	muguet	dahlia	souci
row-4	col-1	col-2	col-3

If we use Tikz (we remind that `nicematrix` does not load Tikz by default), we can access (in the `code-before` and the `code-after`) to the intersection of the horizontal rule *i* and the vertical rule *j* with the syntax `(row-i-|col-j)`.

²⁴The options `left-margin` and `right-margin` take dimensions as values but, if no value is given, the default value is used, which is `\arraycolsep` (by default: 5 pt). There is also an option `margin` to fix both `left-margin` and `right-margin` to the same value.

```
\[\begin{NiceMatrix}[  
code-before =  
{  
    \tikz \draw [fill = red!15]  
        (row-7-|col-4) -- (row-8-|col-4) -- (row-8-|col-5) --  
        (row-9-|col-5) -- (row-9-|col-6) |- cycle ;  
}  
]  
1 \\  
1 & 1 \\  
1 & 2 & 1 \\  
1 & 3 & 3 & 1 \\  
1 & 4 & 6 & 4 & 1 \\  
1 & 5 & 10 & 10 & 5 & 1 \\  
1 & 6 & 15 & 20 & 15 & 6 & 1 \\  
1 & 7 & 21 & 35 & 35 & 21 & 7 & 1 \\  
1 & 8 & 28 & 56 & 70 & 56 & 28 & 8 & 1  
\end{NiceMatrix}]
```

$$\begin{array}{ccccccccc} 1 & & & & & & & & \\ 1 & 1 & & & & & & & \\ 1 & 2 & 1 & & & & & & \\ 1 & 3 & 3 & 1 & & & & & \\ 1 & 4 & 6 & 4 & 1 & & & & \\ 1 & 5 & 10 & 10 & 5 & 1 & & & \\ 1 & 6 & 15 & 20 & 15 & 6 & 1 & & \\ 1 & 7 & 21 & 35 & 35 & 21 & 7 & 1 & \\ 1 & 8 & 28 & 56 & 70 & 56 & 28 & 8 & 1 \end{array}$$

13 Technical remarks

13.1 Definition of new column types

The package `nicematrix` provides the command `\OnlyMainNiceMatrix` which is meant to be used in definitions of new column types. Its argument is evaluated if and only if we are in the main part of the array, that is to say not in an eventual exterior row.

For example, one may wish to define a new column type `?` in order to draw a (black) heavy rule of width 1 pt. The following definition will do the job²⁵:

```
\newcolumntype{?}{!{\OnlyMainNiceMatrix{\vrule width 1 pt}}}
```

The heavy vertical rule won't extend in the exterior rows:

```
$\begin{pNiceArray}{CC?CC}[first-row,last-row=3]  
C_1 & C_2 & C_3 & C_4 \\  
a & b & c & d \\  
e & f & g & h \\  
C_1 & C_2 & C_3 & C_4  
\end{pNiceArray}$
```

$$\left(\begin{array}{cc|cc} C_1 & C_2 & C_3 & C_4 \\ a & b & c & d \\ e & f & g & h \\ \hline C_1 & C_2 & C_3 & C_4 \end{array} \right)$$

This specifier `?` may be used in the standard environments `{tabular}` and `{array}` (of the package `array`) and, in this case, the command `\OnlyMainNiceMatrix` is no-op.

²⁵The command `\vrule` is a TeX (and not LaTeX) command.

13.2 Diagonal lines

By default, all the diagonal lines²⁶ of a same array are “parallelized”. That means that the first diagonal line is drawn and, then, the other lines are drawn parallel to the first one (by rotation around the left-most extremity of the line). That’s why the position of the instructions `\Ddots` in the array can have a marked effect on the final result.

In the following examples, the first `\Ddots` instruction is written in color:

Example with parallelization (default):

```
$A = \begin{pNiceMatrix}
1 & \Cdots & & 1 & \\
a+b & \textcolor{violet}{\Ddots} & & \Vdots & \\
\Vdots & \Ddots & & & \\
a+b & \Cdots & a+b & & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ a+b & \cdots & \cdots & \cdots & \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ a+b & \cdots & a+b & & 1 \end{pmatrix}$$

```
$A = \begin{pNiceMatrix}
1 & \Cdots & & 1 & \\
a+b & & & \Vdots & \\
\Vdots & \textcolor{violet}{\Ddots} & \Ddots & & \\
a+b & \Cdots & a+b & & 1
\end{pNiceMatrix}$
```

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ a+b & \cdots & \cdots & \cdots & \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ a+b & \cdots & a+b & & 1 \end{pmatrix}$$

It’s possible to turn off the parallelization with the option `parallelize-diags` set to `false`:

The same example without parallelization:

$$A = \begin{pmatrix} 1 & \cdots & & & 1 \\ a+b & \cdots & \cdots & \cdots & \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ a+b & \cdots & a+b & & 1 \end{pmatrix}$$

13.3 The “empty” cells

An instruction like `\Ldots`, `\Cdots`, etc. tries to determine the first non-empty cells on both sides. However, an empty cell is not necessarily a cell with no TeX content (that is to say a cell with no token between the two ampersands `&`). Indeed, a cell which only contains `\hspace*{1cm}` may be considered as empty.

For `nicematrix`, the precise rules are as follow.

- An implicit cell is empty. For example, in the following matrix:

```
\begin{pmatrix}
a & b \\
c
\end{pmatrix}
```

the last cell (second row and second column) is empty.

- Each cell whose TeX output has a width equal to zero is empty.
- A cell with a command `\Hspace` (or `\Hspace*`) is empty. This command `\Hspace` is a command defined by the package `nicematrix` with the same meaning as `\hspace` except that the cell where it is used is considered as empty. This command can be used to fix the width of some columns of the matrix without interfering with `nicematrix`.

²⁶We speak of the lines created by `\Ddots` and not the lines created by a command `\line` in `code-after`.

13.4 The option `exterior-arraycolsep`

The environment `{array}` inserts an horizontal space equal to `\arraycolsep` before and after each column. In particular, there is a space equal to `\arraycolsep` before and after the array. This feature of the environment `{array}` was probably not a good idea²⁷. The environment `{matrix}` of `amsmath` and its variants (`{pmatrix}`, `{vmatrix}`, etc.) of `amsmath` prefer to delete these spaces with explicit instructions `\hskip -\arraycolsep`²⁸. The package `nicematrix` does the same in all its environments, `{NiceArray}` included. However, if the user wants the environment `{NiceArray}` behaving by default like the environment `{array}` of `array` (for example, when adapting an existing document) it's possible to control this behaviour with the option `exterior-arraycolsep`, set by the command `\NiceMatrixOptions`. With this option, exterior spaces of length `\arraycolsep` will be inserted in the environments `{NiceArray}` (the other environments of `nicematrix` are not affected).

13.5 Incompatibilities

The package `nicematrix` is not compatible with `threeparttable`.

The package `nicematrix` is not fully compatible with the package `arydshln` (because this package redefines many internal of `array`).

14 Examples

14.1 Dotted lines

A permutation matrix (as an example, we have raised the value of `xdots/shorten`).

```
$\begin{pNiceMatrix} [xdots/shorten=0.6em]
0 & 1 & 0 & & \Cdots & 0 \\
\Vdots & & & \Ddots & & \Vdots \\
& & & \Ddots & & \\
& & & \Ddots & & \\
0 & & 0 & & & 1 \\
1 & & 0 & & \Cdots & 0
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 0 & 1 & 0 & \cdots & 0 \\ \vdots & \ddots & \ddots & \ddots & \vdots \\ \vdots & & \ddots & \ddots & \vdots \\ 0 & 0 & & & 1 \\ 1 & 0 & \cdots & & 0 \end{pmatrix}$$

An example with `\Iddots` (we have raised again the value of `xdots/shorten`).

```
$\begin{pNiceMatrix} [xdots/shorten=0.9em]
1 & & \Cdots & 1 \\
\Vdots & & & 0 \\
& \Iddots & \Iddots & \Vdots \\
1 & & 0 & \Cdots & 0
\end{pNiceMatrix}$
```

$$\begin{pmatrix} 1 & & \cdots & 1 \\ \vdots & & & 0 \\ 1 & 0 & \cdots & 0 \end{pmatrix}$$

²⁷In the documentation of `{amsmath}`, we can read: *The extra space of `\arraycolsep` that `array` adds on each side is a waste so we remove it [in `{matrix}`] (perhaps we should instead remove it from `array` in general, but that's a harder task).*

²⁸And not by inserting `\hskip -\arraycolsep` on both sides of the preamble of the array. As a consequence, the length of the `\hline` is not modified and may appear too long, in particular when using square brackets

An example with `\multicolumn`:

```
\begin{BNiceMatrix}[nullify-dots]
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\
\cdots & \multicolumn{6}{C}{10 \text{ other rows}} & \cdots \\
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10
\end{BNiceMatrix}
```

$$\left\{ \begin{array}{cccccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ \dots & & & & & & & & & \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \end{array} \right\}$$

An example with `\Hdotsfor`:

```
\begin{pNiceMatrix}[nullify-dots]
0 & 1 & 1 & 1 & 1 & 0 \\
0 & 1 & 1 & 1 & 1 & 0 \\
\Vdots & \Hdotsfor{4} & \Vdots \\
& \Hdotsfor{4} & \\
& \Hdotsfor{4} & \\
& \Hdotsfor{4} & \\
0 & 1 & 1 & 1 & 1 & 0
\end{pNiceMatrix}
```

$$\left(\begin{array}{cccccc} 0 & 1 & 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 1 & 1 & 1 & 0 \end{array} \right)$$

An example for the resultant of two polynomials:

```
\setlength{\extrarowheight}{1mm}
\begin{vNiceArray}{CCCC:CCC}[columns-width=6mm]
a_0 & & b_0 & & & & \\
a_1 & \& b_1 & \& & & \\
\Vdots & \Ddots & \Vdots & \Ddots & b_0 & & \\
a_p & \& a_0 & & b_1 & & \\
& \& \& b_q & & \Vdots & \\
& \& \Vdots & & \Ddots & & \\
& \& a_p & & b_q & &
\end{vNiceArray}]
```

An example for a linear system:

```
$\begin{pNiceArray}{*6C|C}[nullify-dots,last-col,code-for-last-col=\scriptstyle]
1 & 1 & 1 &\cdots& 1 & 0 & \\
0 & 1 & 0 &\cdots& 0 & & L_2 \gets L_2 - L_1 \\
0 & 0 & 1 &\ddots& & & L_3 \gets L_3 - L_1 \\
& & &\ddots& & & \\
\Vdots & & &\ddots& & & \\
0 & & &\ddots& 0 & & L_n \gets L_n - L_1
\end{pNiceArray}$
```

$$\left(\begin{array}{cccc|c} 1 & 1 & 1 & \cdots & 1 & 0 \\ 0 & 1 & 0 & \cdots & 0 & \vdots \\ 0 & 0 & 1 & \ddots & \vdots & L_2 \leftarrow L_2 - L_1 \\ \vdots & & & \ddots & \vdots & L_3 \leftarrow L_3 - L_1 \\ 0 & \cdots & 0 & 1 & 0 & \vdots \\ 0 & \cdots & 0 & 1 & 0 & L_n \leftarrow L_n - L_1 \end{array} \right)$$

14.2 Dotted lines which are no longer dotted

The option `line-style` controls the style of the lines drawn by `\Ldots`, `\Cdots`, etc. Thus, it's possible with these commands to draw lines which are not longer dotted.

```
\NiceMatrixOptions
  {nullify-dots,code-for-first-col = \color{blue},code-for-first-col=\color{blue}}
$\begin{pNiceMatrix}[first-row,first-col]
  & & \Ldots[\text{line-style}=\{solid,<->\},shorten=0pt]^{\text{n columns}} \\
  & 1 & 1 & \Ldots & 1 \\
  & 1 & 1 & & 1 \\
\Vdots[\text{line-style}=\{solid,<->\}]_{\text{n rows}} & 1 & 1 & 1 & 1 \\
  & 1 & 1 & & 1 \\
  & 1 & 1 & 1 & 1
\end{pNiceMatrix}$
```

$$\left(\begin{array}{ccccc} 1 & 1 & 1 & \cdots & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & & 1 \\ 1 & 1 & 1 & \cdots & 1 \end{array} \right)$$

14.3 Width of the columns

In the following example, we use `{NiceMatrixBlock}` with the option `auto-columns-width` because we want the same automatic width for all the columns of the matrices.

```

\begin{NiceMatrixBlock}[auto-columns-width]
\niceMatrixOptions
{ last-col,code-for-last-col = \color{blue}\scriptstyle,\lightSyntax}
\setlength{\extrarowheight}{1mm}
$\begin{pNiceArray}{CCCC:C}
1 1 1 1 1 ;
2 4 8 16 9 ;
3 9 27 81 36 ;
4 16 64 256 100
\end{pNiceArray}$
\medskip
$\begin{pNiceArray}{CCCC:C}
1 1 1 1 1 ;
0 2 6 14 7      \{ L_2 \gets -2 L_1 + L_2 \} ;
0 6 24 78 33    \{ L_3 \gets -3 L_1 + L_3 \} ;
0 12 60 252 96   \{ L_4 \gets -4 L_1 + L_4 \}
\end{pNiceArray}$
\end{pNiceArray}$
...
\end{NiceMatrixBlock}

```

$$\left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 2 & 4 & 8 & 16 & 9 \\ 3 & 9 & 27 & 81 & 36 \\ 4 & 16 & 64 & 256 & 100 \end{array} \right) \quad \left| \quad \left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 3 & 18 & 6 \\ 0 & 0 & -2 & -14 & -\frac{9}{2} \end{array} \right) \begin{array}{l} L_3 \leftarrow -3L_2 + L_3 \\ L_4 \leftarrow L_2 - L_4 \end{array} \right. \\[10pt]
\left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 0 & 2 & 6 & 14 & 7 \\ 0 & 6 & 24 & 78 & 33 \\ 0 & 12 & 60 & 252 & 96 \end{array} \right) \begin{array}{l} L_2 \leftarrow -2L_1 + L_2 \\ L_3 \leftarrow -3L_1 + L_3 \\ L_4 \leftarrow -4L_1 + L_4 \end{array} \quad \left| \quad \left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 1 & 6 & 2 \\ 0 & 0 & -2 & -14 & -\frac{9}{2} \end{array} \right) \begin{array}{l} L_3 \leftarrow \frac{1}{3}L_3 \\ L_4 \leftarrow L_2 - L_3 \end{array} \right. \\[10pt]
\left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 3 & 12 & 39 & \frac{33}{2} \\ 0 & 1 & 5 & 21 & 8 \end{array} \right) \begin{array}{l} L_2 \leftarrow \frac{1}{2}L_2 \\ L_3 \leftarrow \frac{1}{2}L_3 \\ L_4 \leftarrow \frac{1}{12}L_4 \end{array} \quad \left| \quad \left(\begin{array}{ccccc|c} 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 3 & 7 & \frac{7}{2} \\ 0 & 0 & 1 & 6 & 2 \\ 0 & 0 & 0 & -2 & -\frac{1}{2} \end{array} \right) \begin{array}{l} L_4 \leftarrow L_3 + L_4 \end{array} \right.
\end{array}$$

14.4 How to highlight cells of the matrix

The following examples require Tikz (by default, `nicematrix` only loads PGF) and the Tikz library `fit`. The following lines in the preamble of your document do the job:

```
\usepackage{tikz}
\usetikzlibrary{fit}
```

In order to highlight a cell of a matrix, it's possible to "draw" one of the correspondant nodes (the "normal node", the "medium node" or the "large node"). In the following example, we use the "large nodes" of the diagonal of the matrix (with the Tikz key "name suffix", it's easy to use the "large nodes").

We redraw the nodes with other nodes by using the Tikz library `fit`. Since we want to redraw the nodes exactly, we have to set `inner sep = 0 pt` (if we don't do that, the new nodes will be larger than the nodes created by `nicematrix`).

```
$\begin{pNiceArray}{>{\strut}CCCC}[create-large-nodes,margin,extra-margin = 2pt]
a_{11} & a_{12} & a_{13} & a_{14} \\
a_{21} & a_{22} & a_{23} & a_{24} \\
a_{31} & a_{32} & a_{33} & a_{34} \\
a_{41} & a_{42} & a_{43} & a_{44}

```

```
\CodeAfter
\begin{tikzpicture}[name suffix = -large,
                    every node/.style = {draw, inner sep = 0 pt}]
\node [fit = (1-1)] {};
\node [fit = (2-2)] {};
\node [fit = (3-3)] {};
\node [fit = (4-4)] {};
\end{tikzpicture}
\end{pNiceArray}
```

$$\left(\begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{array} \right)$$

We should remark that the rules we have drawn are drawn *after* the construction of the array and thus, they don't spread the cells of the array. We recall that, on the other side, the command `\hline`, the specifier “|” and the options `hlines`, `vlines` and `hvlines` spread the cells.²⁹

It's possible to color a row with `\rowcolor` in the `code-before` (or with `\rowcolor` of `colortbl` in the first cell of the row). However, it's not possible to do a fine tuning. That's why we describe now method to highlight a row of the matrix. We create a rectangular Tikz node which encompasses the nodes of the second row with the Tikz library `fit`. This Tikz node is filled after the construction of the matrix. In order to see the text *under* this node, we have to use transparency with the `blend mode` equal to `multiply`.

```
\tikzset{highlight/.style={rectangle,
                           fill=red!15,
                           blend mode = multiply,
                           rounded corners = 0.5 mm,
                           inner sep=1pt,
                           fit = #1}}

$\begin{bNiceMatrix}[code-after = {\tikz \node [highlight] = (2-1) (2-3) {} ;}] 0 & \cdots & 0 \\ 1 & \cdots & 1 \\ 0 & \cdots & 0 \end{bNiceMatrix}$
```

$$\begin{bmatrix} 0 & \cdots & 0 \\ 1 & \cdots & 1 \\ 0 & \cdots & 0 \end{bmatrix}$$

This code fails with `latex-dvips-ps2pdf` because Tikz for `dvips`, as for now, doesn't support blend modes. However, the following code, in the preamble, should activate blend modes in this way of compilation.

```
\ExplSyntaxOn
\makeatletter
\tl_set:Nn \l_tmpa_tl {pgfsys-dvips.def}
\tl_if_eq:NNT \l_tmpa_tl \pgfsysdriver
  {\cs_set:Npn \pgfsys@blend@mode{\special{ps:~/\tl_upper_case:n #1~.setblendmode}}}
\makeatother
\ExplSyntaxOff
```

²⁹For the command `\cline`, see the remark p. 5.

We recall that, for a rectangle of merged cells (with the command `\Block`), a Tikz node is created for the set of merged cells with the name *i-j-block* where *i* and *j* are the number of the row and the number of the column of the upper left cell (where the command `\Block` has been issued). If the user has required the creation of the `medium` nodes, a node of this type is also created with a name suffixed by `-medium`.

```
$\begin{pNiceMatrix} [margin,create-medium-nodes]
\Block{3-3}<\Large>{A} & & & 0 \\
& \hspace*{1cm} & & \Vdots \\
& & & 0 \\
0 & \cdots & 0 & 0
\CodeAfter
\tikz \node [highlight = (1-1-block-medium)] {} ;
\end{pNiceMatrix}$
```

$$\begin{pmatrix} A & 0 \\ \vdots & 0 \\ 0 & \ddots & 0 \end{pmatrix}$$

Consider now the following matrix which we have named `example`.

```
$\begin{pNiceArray} [CCC] [name=example, last-col, create-medium-nodes]
a & a + b & a + b + c & L_1 \\
a & a & a + b & L_2 \\
a & a & a & L_3
\end{pNiceArray}$
```

$$\begin{pmatrix} a & a + b & a + b + c \\ a & a & a + b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

If we want to highlight each row of this matrix, we can use the previous technique three times.

```
\tikzset{mes-options/.style={remember picture,
    overlay,
    name prefix = exemple-,
    highlight/.style = {fill = red!15,
        blend mode = multiply,
        inner sep = 0pt,
        fit = #1}}}

\begin{tikzpicture}[mes-options]
\node [highlight = (1-1) (1-3)] {} ;
\node [highlight = (2-1) (2-3)] {} ;
\node [highlight = (3-1) (3-3)] {} ;
\end{tikzpicture}
```

We obtain the following matrix.

$$\begin{pmatrix} a & a + b & a + b + c \\ a & a & a + b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

The result may seem disappointing. We can improve it by using the “medium nodes” instead of the “normal nodes”.

```
\begin{tikzpicture}[mes-options, name suffix = -medium]
\node [highlight = (1-1) (1-3)] {} ;
\node [highlight = (2-1) (2-3)] {} ;
\node [highlight = (3-1) (3-3)] {} ;
\end{tikzpicture}
```

We obtain the following matrix.

$$\begin{pmatrix} a & a+b & a+b+c \\ a & a & a+b \\ a & a & a \end{pmatrix} \begin{matrix} L_1 \\ L_2 \\ L_3 \end{matrix}$$

In the following example, we use the “large nodes” to highlight a zone of the matrix.

```

\begin{pNiceArray}{>{\strut}CCCC}[create-large-nodes,margin,extra-margin=2pt]
  A_{11} & A_{12} & A_{13} & A_{14} \\
  A_{21} & A_{22} & A_{23} & A_{24} \\
  A_{31} & A_{32} & A_{33} & A_{34} \\
  A_{41} & A_{42} & A_{43} & A_{44}
\CodeAfter
  \tikz \path [name suffix = -large,fill = red!15, blend mode = multiply]
    (1-1.north west)
    |- (2-2.north west)
    |- (3-3.north west)
    |- (4-4.north west)
    |- (4-4.south east)
    |- (1-1.north west) ;
\end{pNiceArray}

```

$$\begin{pmatrix} A_{11} & A_{12} & A_{13} & A_{14} \\ A_{21} & A_{22} & A_{23} & A_{24} \\ A_{31} & A_{32} & A_{33} & A_{34} \\ A_{41} & A_{42} & A_{43} & A_{44} \end{pmatrix}$$

14.5 Direct use of the Tikz nodes

In the following example, we illustrate the mathematical product of two matrices.

The use of `{NiceMatrixBlock}` with the option `auto-columns-width` gives the same width for all the columns and, therefore, a perfect alignment of the two superposed matrices.

```
\begin{NiceMatrixBlock}[auto-columns-width]
```

```
\NiceMatrixOptions{nullify-dots}
```

The three matrices will be displayed using an environment `{array}` (an environment `{tabular}` may also be possible).

```
$\begin{array}{cc}\\&
```

The matrix B has a “first row” (for C_j) and that’s why we use the key `first-row`.

```
\begin{bNiceArray}{C>\strut CCCC} [name=B,first-row]
    & & C_j & \\
b_{11} & \cdots & b_{1j} & \cdots & b_{1n} \\
\vdots & & \vdots & & \vdots \\
& & b_{kj} & & \\
& & \vdots & & \\
b_{n1} & \cdots & b_{nj} & \cdots & b_{nn}
\end{bNiceArray} \\ \\
```

The matrix A has a “first column” (for L_i) and that’s why we use the key `first-col`.

```

\begin{bNiceArray}{CC>{\strut}CCC}[name=A,first-col]
& a_{11} & \cdots & & a_{1n} \\
& \vdots & & & \vdots \\
L_i & a_{i1} & \cdots & a_{ik} & \cdots & a_{in} \\
& \vdots & & & & \vdots \\
& a_{n1} & \cdots & a_{nn} & & a_{nn}
\end{bNiceArray}
&

```

In the matrix product, the two dotted lines have an open extremity.

```

\begin{bNiceArray}{CC>{\strut}CCC}
& & & & \\
& & \vdots & & \\
\cdots & & c_{ij} & & \\
\\
\\
\end{bNiceArray}
\end{array}$

```

```
\end{NiceMatrixBlock}
```

```

\begin{tikzpicture}[remember picture, overlay]
\node [highlight = (A-3-1) (A-3-5) ] {};
\node [highlight = (B-1-3) (B-5-3) ] {};
\draw [color = gray] (A-3-3) to [bend left] (B-3-3) ;
\end{tikzpicture}

```

$$A_i \begin{bmatrix} a_{11} & \cdots & a_{1n} \\ \vdots & & \vdots \\ a_{i1} & \cdots & a_{ik} & \cdots & a_{in} \\ \vdots & & & & \vdots \\ a_{n1} & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} C_j \\ b_{11} & \cdots & b_{1j} & \cdots & b_{1n} \\ \vdots & & \vdots & & \vdots \\ b_{n1} & \cdots & b_{nj} & \cdots & b_{nn} \end{bmatrix} = \begin{bmatrix} c_{ij} \end{bmatrix}$$

15 Implementation

By default, the package `nicematrix` doesn't patch any existing code.

However, when the option `renew-dots` is used, the commands `\cdots`, `\ldots`, `\dots`, `\vdots`, `\ddots` and `\iddots` are redefined in the environments provided by `nicematrix` as explained previously. In the same way, if the option `renew-matrix` is used, the environment `{matrix}` of `amsmath` is redefined.

On the other hand, the environment `{array}` is never redefined.

Of course, the package `nicematrix` uses the features of the package `array`. It tries to be independent of its implementation. Unfortunately, it was not possible to be strictly independent: the package `nicematrix` relies upon the fact that the package `{array}` uses `\ialign` to begin the `\halign`.

Declaration of the package and packages loaded

The prefix `nicematrix` has been registered for this package.

See: <http://mirrors.ctan.org/macros/latex/contrib/13kernel/13prefixes.pdf>
`<@@=nicematrix>`

First, we load `pgfcore` and the module `shapes`. We do so because it's not possible to use `\usepgfmodule` in `\ExplSyntaxOn`.

```
1 \RequirePackage{pgfcore}
2 \usepgfmodule{shapes}
```

We give the traditional declaration of a package written with `expl3`:

```
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {nicematrix}
6   {myfiledate}
7   {\myfileversion}
8   {Mathematical matrices with PGF/TikZ}
```

The command for the treatment of the options of `\usepackage` is at the end of this package for technical reasons.

We load some packages.

```
9 \RequirePackage { array }
10 \RequirePackage { amsmath }
11 \RequirePackage { xparse }

12 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { nicematrix } }
13 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { nicematrix } }
14 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { nicematrix } }
15 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { nicematrix } }
16 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { nicematrix } }
17 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { nicematrix } }
18 \cs_new_protected:Npn \@@_msg_new:nnn { \msg_new:nnnn { nicematrix } }

19 \cs_new_protected:Npn \@@_msg_redirect_name:nn
20   { \msg_redirect_name:nnn { nicematrix } }
```

Technical definitions

```
21 \bool_new:N \c_@@_booktabs_loaded_bool
22 \bool_new:N \c_@@_tikz_loaded_bool
23 \AtBeginDocument
24 {
25   \ifpackageloaded { booktabs }
26     { \bool_set_true:N \c_@@_booktabs_loaded_bool }
27   { }
28   \ifpackageloaded { tikz }
29   { }
```

In some constructions, we will have to use a `{pgfpicture}` which *must* be replaced by a `{tikzpicture}` if Tikz is loaded. However, this switch between `{pgfpicture}` and `{tikzpicture}` can't be done dynamically with a conditional because, when the Tikz library `external` is loaded by the user, the pair `\tikzpicture-\endtikzpicture` (or `\begin{tikzpicture}-\end{tikzpicture}`) must be statically “visible” (even when externalization is not activated).

That's why we create `\c_@@_pgfortikzpicture_tl` and `\c_@@_endpgfortikzpicture_tl` which will be used to construct in a `\AtBeginDocument` the correct version of some commands.

```
30   \bool_set_true:N \c_@@_tikz_loaded_bool
31   \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \tikzpicture }
32   \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endtikzpicture }
```

```

33     }
34     {
35         \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \pgfpicture }
36         \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endpgfpicture }
37     }
38 }
```

We test whether the current class is `revtex4-1` or `revtex4-2` because these classes redefines `\array` (of `array`) in a way incompatible with our programmation.

```

39 \bool_new:N \c_@@_revtex_bool
40 \@ifclassloaded { revtex4-1 }
41   { \bool_set_true:N \c_@@_revtex_bool }
42   { }
43 \@ifclassloaded { revtex4-2 }
44   { \bool_set_true:N \c_@@_revtex_bool }
45   { }
```

We define a command `\iddots` similar to `\ddots` (\cdots) but with dots going forward ($\cdot\cdot\cdot$). We use `\ProvideDocumentCommand` of `xparse`, and so, if the command `\iddots` has already been defined (for example by the package `mathdots`), we don't define it again.

```

46 \ProvideDocumentCommand \iddots { }
47   {
48     \mathinner
49     {
50       \tex_mkern:D 1 mu
51       \box_move_up:nn { 1 pt } { \hbox:n { . } }
52       \tex_mkern:D 2 mu
53       \box_move_up:nn { 4 pt } { \hbox:n { . } }
54       \tex_mkern:D 2 mu
55       \box_move_up:nn { 7 pt }
56       { \vbox:n { \kern 7 pt \hbox:n { . } } }
57       \tex_mkern:D 1 mu
58     }
59 }
```

This definition is a variant of the standard definition of `\ddots`.

In the `aux` file, we will have the references of the PGF/Tikz nodes created by `nicematrix`. However, when `booktabs` is used, some nodes (more precisely, some `row` nodes) will be defined twice because their position will be modified. In order to avoid an error message in this case, we will redefine `\pgfutil@check@rerun` in the `aux` file.

```

60 \AtBeginDocument
61   {
62     \@ifpackageloaded { booktabs }
63     { \iow_now:Nn \mainaux \nicematrix@redefine@check@rerun }
64     { }
65   }
66 \cs_set_protected:Npn \nicematrix@redefine@check@rerun
67   {
68     \cs_set_eq:NN \c_@@_old_pgfutil@check@rerun \pgfutil@check@rerun
```

The new version of `\pgfutil@check@rerun` will not check the PGF nodes whose names start with `nm-` (which is the prefix for the nodes creates by `nicematrix`).

```

69 \cs_set_protected:Npn \pgfutil@check@rerun ##1 ##2
70   {
71     \str_if_eq:eeF { nm- } { \tl_range:nnn { ##1 } 1 3 }
72     { \c_@@_old_pgfutil@check@rerun { ##1 } { ##2 } }
73   }
74 }
```

We have to know whether `colortbl` is loaded in particular for the redefinition of `\everycr`.

```

75 \bool_new:N \c_@@_colortbl_loaded_bool
76 \AtBeginDocument
```

```

77   {
78     \@ifpackageloaded { colortbl }
79     { \bool_set_true:N \c_@@_colortbl_loaded_bool }
80   }

The command \CT@arc@ is a command of colortbl which sets the color of the rules in the array. We will use it to store the instruction of color for the rules even if colortbl is not loaded.

81   \cs_set_protected:Npn \CT@arc@ { }
82   \cs_set:Npn \arrayrulecolor #1 # { \CT@arc { #1 } }
83   \cs_set:Npn \CT@arc #1 #2
84   {
85     \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
86     { \cs_gset:Npn \CT@arc@ { \color #1 { #2 } } }
87   }
88   \cs_set:Npn \hline
89   {
90     \noalign { \ifnum 0 = `} \fi
91     \cs_set_eq:NN \hskip \vskip
92     \cs_set_eq:NN \vrule \hrule
93     \cs_set_eq:NN \cwidth \cheight
94     { \CT@arc@ \vline }
95     \futurelet \reserved@a
96     \xhline
97   }
98 }
99 }
```

We have to redefine \cline for several reasons. The command \@@_cline will be linked to \cline in the beginning of {NiceArrayWithDelims}. The following commands must *not* be protected.

```

100 \cs_set:Npn \@@_standard_cline #1 { \@@_standard_cline:w #1 \q_stop }
101 \cs_set:Npn \@@_standard_cline:w #1-#2 \q_stop
102 {
103   \int_compare:nNnT \l_@@_first_col_int = 0 { \omit & }
104   \int_compare:nNnT { #1 } > 1 { \multispan { \@@_pred:n { #1 } } & }
105   \multispan { \int_eval:n { #2 - #1 + 1 } }
106   { \CT@arc@ \leaders \hrule \cheight \arrayrulewidth \hfill }
```

Our \everycr has been modified. In particular, the creation of the row node is in the \everycr (maybe we should put it with the incrementation of \c@iRow). Since the following \cr correspond to a “false row”, we have to nullify \everycr.

```

107 \everycr { }
108 \cr
109 \noalign { \skip_vertical:N -\arrayrulewidth }
110 }
```

The following version of \cline spreads the array of a quantity equal to \arrayrulewidth as does \hline. It will be loaded except if the key standard-cline has been used.

```
111 \cs_set:Npn \@@_cline
```

We have to act in a fully expandable way since there may be \noalign (in the \multispan) to detect. That's why we use \@@_cline_i:en.

```
112 { \@@_cline_i:en \l_@@_first_col_int }
```

The command \cline_i:nn has two arguments. The first is the number of the current column (it *must* be used in that column). The second is a standard argument of \cline of the form *i-j*.

```

113 \cs_set:Npn \@@_cline_i:nn #1 #2 { \@@_cline_i:w #1-#2 \q_stop }
114 \cs_set:Npn \@@_cline_i:w #1-#2-#3 \q_stop
115 {
```

Now, #1 is the number of the current column and we have to draw a line from the column #2 to the column #3 (both included).

```

116 \int_compare:nNnT { #1 } < { #2 }
117 { \multispan { \int_eval:n { #2 - #1 } } & }
118 \multispan { \int_eval:n { #3 - #2 + 1 } }
119 { \CT@arc@ \leaders \hrule \cheight \arrayrulewidth \hfill }
```

You look whether there is another `\cline` to draw (the final user may put several `\cline`).

```

120 \peek_meaning_remove_ignore_spaces:NTF \cline
121   { & \@@_cline_i:en { \@@_succ:n { #3 } } }
122   { \everycr { } \cr }
123 }
124 \cs_generate_variant:Nn \@@_cline_i:nn { e n }
```

The following commands are only for efficiency. They must *not* be protected because it will be used (for instance) in names of PGF nodes.

```

125 \cs_new:Npn \@@_succ:n #1 { \the \numexpr #1 + 1 \relax }
126 \cs_new:Npn \@@_pred:n #1 { \the \numexpr #1 - 1 \relax }
```

The following command is a small shortcut.

```

127 \cs_new:Npn \@@_math_toggle_token:
128   { \bool_if:NF \l_@@_NiceTabular_bool \c_math_toggle_token }

129 \cs_new_protected:Npn \@@_set_Carc@:
130   { \peek_meaning:NTF [ \@@_set_Carc@_i: \@@_set_Carc@_ii: ]
131 \cs_new_protected:Npn \@@_set_Carc@_i: [ #1 ] #2 \q_stop
132   { \cs_set:Npn \Carc@ { \color [ #1 ] [ #2 ] } }
133 \cs_new_protected:Npn \@@_set_Carc@_ii: #1 \q_stop
134   { \cs_set:Npn \Carc@ { \color { #1 } } }
```

The column S of siunitx

We want to know whether the package `siunitx` is loaded and, if it is loaded, we redefine the `S` columns of `siunitx`.

```

135 \bool_new:N \c_@@_siunitx_loaded_bool
136 \AtBeginDocument
137 {
138   \ifpackageloaded { siunitx }
139     { \bool_set_true:N \c_@@_siunitx_loaded_bool }
140   { }
141 }
```

The command `\NC@rewrite@S` is a LaTeX command created by `siunitx` in connection with the `S` column. In the code of `siunitx`, this command is defined by:

```

\renewcommand*{\NC@rewrite@S}[1] []
{
  \temptokena \exp_after:wN
  {
    \tex_the:D \temptokena
    > { \__siunitx_table_collect_begin: S {#1} }
    c
    < { \__siunitx_table_print: }
  }
  \NC@find
}
```

We want to patch this command (in the environments of `nicematrix`) in order to have:

```

\renewcommand*{\NC@rewrite@S}[1] []
{
  \temptokena \exp_after:wN
  {
    \tex_the:D \temptokena
    > { \@@_Cell: \__siunitx_table_collect_begin: S {#1} }
    c
    < { \__siunitx_table_print: \@@_end_Cell: }
  }
  \NC@find
}
```

However, we don't want to use explicitly any private command of `siunitx`. That's why we will extract the name of the two `__siunitx...` commands by their position in the code of `\NC@rewrite@S`. Since the command `\NC@rewrite@S` appends some tokens to the `toks` list `\@temptokena`, we use the LaTeX command `\NC@rewrite@S` in a group (`\group_begin:-\group_end:`) and we extract the two command names which are in the `toks` `\@temptokena`. However, this extraction can be done only when `siunitx` is loaded (and it may be loaded after `nicematrix`) and, in fact, after the beginning of the document — because some instructions of `siunitx` are executed in a `\AtBeginDocument`). That's why this extraction will be done only at the first use of an environment of `nicematrix` with the command `\@@_adapt_S_column:`.

```

142 \cs_set_protected:Npn \@@_adapt_S_column:
143 {
144     \bool_if:NT \c_@@_siunitx_loaded_bool
145     {
146         \group_begin:
147         \@temptokena = { }
148     }
149 }
```

We protect `\NC@find` which is at the end of `\NC@rewrite@S`.

```

148     \cs_set_eq:NN \NC@find \prg_do_nothing:
149     \NC@rewrite@S { }
```

Conversion of the `toks` `\@temptokena` in a token list of `expl3` (the `toks` are not supported by `expl3` but we can, nevertheless, use the option `V` for `\tl_gset:NV`).

```

150     \tl_gset:NV \g_tmpa_tl \@temptokena
151     \group_end:
152     \tl_new:N \c_@@_table_collect_begin_tl
153     \tl_set:Nx \l_tmpa_tl { \tl_item:Nn \g_tmpa_tl 2 }
154     \tl_gset:Nx \c_@@_table_collect_begin_tl { \tl_item:Nn \l_tmpa_tl 1 }
155     \tl_new:N \c_@@_table_print_tl
156     \tl_gset:Nx \c_@@_table_print_tl { \tl_item:Nn \g_tmpa_tl { -1 } }
```

The token lists `\c_@@_table_collect_begin_tl` and `\c_@@_table_print_tl` contain now the two commands of `siunitx`.

If the adaptation has been done, the command `\@@_adapt_S_column:` becomes no-op (globally).

```

157     \cs_gset_eq:NN \@@_adapt_S_column: \prg_do_nothing:
158     }
159 }
```

The command `\@@_renew_NC@rewrite@S:` will be used in each environment of `nicematrix` in order to “rewrite” the `S` column in each environment (only if the boolean `\c_@@_siunitx_loaded_bool` is raised, of course).

```

160 \cs_new_protected:Npn \@@_renew_NC@rewrite@S:
161 {
162     \renewcommand*{\NC@rewrite@S}[1] []
163     {
164         \@temptokena \exp_after:wN
165         {
166             \tex_the:D \@temptokena
167             > { \@@_Cell: \c_@@_table_collect_begin_tl S {##1} }
168             c
169             < { \c_@@_table_print_tl \@@_end_Cell: }
170         }
171         \NC@find
172     }
173 }
```

Parameters

The following counter will count the environments `{NiceArray}`. The value of this counter will be used to prefix the names of the Tikz nodes created in the array.

```

174 \int_new:N \g_@@_env_int
```

The following command is only a syntactic shortcut. It must *not* be protected (it will be used in names of PGF nodes).

```
175 \cs_new:Npn \@@_env: { nm - \int_use:N \g_@@_env_int }
```

The command `\NiceMatrixLastEnv` is not used by the package `nicematrix`. It's only a facility given to the final user. It gives the number of the last environment (in fact the number of the current environment but it's meant to be used after the environment in order to refer to that environment — and its nodes — without having to give it a name). This command *must* be expandable since it will be used in pgf nodes.

```
176 \NewExpandableDocumentCommand \NiceMatrixLastEnv { }
177   { \int_use:N \g_@@_env_int }
```

The following command is only a syntactic shortcut. The `q` in `qpoint` means *quick*.

```
178 \cs_new_protected:Npn \@@_qpoint:n #1
179   { \pgfpointanchor { \@@_env: - #1 } { center } }
```

the following counter will count the environments `{NiceMatrixBlock}`.

```
180 \int_new:N \g_@@_NiceMatrixBlock_int
```

The dimension `\l_@@_columns_width_dim` will be used when the options specify that all the columns must have the same width (but, if the key `columns-width` is used with the special value `auto`, the boolean `\l_@@_auto_columns_width_bool` also will be raised).

```
181 \dim_new:N \l_@@_columns_width_dim
```

The sequence `\g_@@_names_seq` will be the list of all the names of environments used (via the option `name`) in the document: two environments must not have the same name. However, it's possible to use the option `allow-duplicate-names`.

```
182 \seq_new:N \g_@@_names_seq
```

We want to know if we are in an environment of `nicematrix` because we will raise an error if the user tries to use nested environments.

```
183 \bool_new:N \l_@@_in_env_bool
```

If the user uses `{NiceArray}` or `{NiceTabular}` the flag `\l_@@_NiceArray_bool` will be raised.

```
184 \bool_new:N \l_@@_NiceArray_bool
```

If the user uses `{NiceTabular}`, we will raise the following flag.

```
185 \bool_new:N \l_@@_NiceTabular_bool
```

```
186 \cs_new_protected:Npn \@@_test_if_math_mode:
187   {
188     \if_mode_math: \else:
189       \@@_fatal:n { Outside~math-mode }
190     \fi:
191   }
```

The following colors will be used to memorize le color of the potential “first col” and the potential “first row”.

```
192 \colorlet { nicematrix-last-col } { . }
193 \colorlet { nicematrix-last-row } { . }
```

The following string is the name of the current environment or the current command of `nicematrix` (despite its name which contains `env`).

```
194 \str_new:N \g_@@_name_env_str
```

The following string will contain the word *command* or *environment* whether we are in a command of `nicematrix` or in an environment of `nicematrix`. The default value is *environment*.

```
195 \str_new:N \g_@@_com_or_env_str
196 \str_set:Nn \g_@@_com_or_env_str { environment }
```

The following command will be able to reconstruct the full name of the current command or environment (despite its name which contains `env`). This command must *not* be protected since it will be used in error messages.

```
197 \cs_new:Npn \g_@@_full_name_env:
198 {
199   \str_if_eq:VnTF \g_@@_com_or_env_str { command }
200     { command \space \c_backslash_str \g_@@_name_env_str }
201     { environment \space \{ \g_@@_name_env_str \} }
202 }
```

The following token list corresponds to the option `code-after` (it's also possible to set the value of that parameter with the command `\CodeAfter`).

```
203 \tl_new:N \g_@@_code_after_tl
```

The following token list has a function similar to `\g_@@_code_after_tl` but it is used internally by `nicematrix`. In fact, we have to distinguish between `\g_@@_code_after_tl` and `\g_@@_internal_code_after_tl` because we must take care of the order in which instructions stored in that parameters are executed.

```
204 \tl_new:N \g_@@_internal_code_after_tl
```

The counters `\l_@@_old_iRow_int` and `\l_@@_old_jCol_int` will be used to save the values of the potential LaTeX counters `iRow` and `jCol`. These LaTeX counters will be restored at the end of the environment.

```
205 \int_new:N \l_@@_old_iRow_int
206 \int_new:N \l_@@_old_jCol_int
```

The TeX counters `\c@iRow` and `\c@jCol` will be created in the beginning of `{NiceArrayWithDelims}` (if they don't exist previously).

The following token list corresponds to the key `rules/color` available in the environments.

```
207 \tl_new:N \l_@@_rules_color_tl
```

A kind of false row will be inserted at the end of the array for the construction of the `col` nodes (and also to fix the width of the columns when `columns-width` is used). When this special row will be created, we will raise the flag `\g_@@_row_of_col_done_bool` in order to avoid some actions set in the redefinition of `\everycr` when the last `\cr` of the `\halign` will occur (after that row of `col` nodes).

```
208 \bool_new:N \g_@@_row_of_col_done_bool
```

The following flag will be raised when the key `code-before` is used in the environment. Indeed, if there is a `code-before` in the environment, we will manage to have the `row` nodes and the `col` nodes available *before* the creation of the array.

```
209 \bool_new:N \l_@@_code_before_bool
```

The following dimensions will be used when drawing the dotted lines.

```
210 \dim_new:N \l_@@_x_initial_dim
211 \dim_new:N \l_@@_y_initial_dim
212 \dim_new:N \l_@@_x_final_dim
213 \dim_new:N \l_@@_y_final_dim
```

`\expl3` provides scratch dimension `\l_tmpa_dim` and `\l_tmpd_dim`. We creates two other in the same spirit (if they don't exist yet : that's why we use `\dim_zero_new:N`).

```
214 \dim_zero_new:N \l_tmpc_dim
215 \dim_zero_new:N \l_tmpd_dim
```

Some cells will be declared as “empty” (for example a cell with the instruction `\Cdot`).

```
216 \bool_new:N \g_@@_empty_cell_bool
```

The following dimension will be used to save the current value of `\arraycolsep`.

```
217 \dim_new:N \c@_old_arraycolsep_dim
```

The following dimensions will be used internally to compute the width of the potential “first column” and “last column”.

```
218 \dim_new:N \g_@@_width_last_col_dim
219 \dim_new:N \g_@@_width_first_col_dim
```

The following sequence will contain the characteristics of the blocks of the array, specified by the command `\Block`. Each block is represented by 6 components surrounded by braces:

`{imin}{jmin}{imax}{jmax}{options}{contents}`.

The variable is global because it will be modified in the cells of the array.

```
220 \seq_new:N \g_@@_blocks_seq
```

We also manage a sequence of the *positions* of the blocks. Of course, it's redundant with the previous sequence, but it's for efficiency. In that sequence, each block is represented by only the four first components: `{imin}{jmin}{imax}{jmax}`.

```
221 \seq_new:N \g_@@_pos_of_blocks_seq
```

The sequence `\g_@@_pos_of_blocks_seq` when we will draw the rules required by the key `hvlines` (these rules won't be drawn within the blocks).

We will also manage a sequence for the positions of the dotted lines. These dotted lines are created in the array by `\Cdots`, `\Vdots`, `\Ddots`, etc. However, their positions, that is to say, their extremities, will be determined only after the construction of the array. In this sequence, each item contains four components: `{imin}{jmin}{imax}{jmax}`.

```
222 \seq_new:N \g_@@_pos_of_xdots_seq
```

The sequence `\g_@@_pos_of_xdots_seq` will be used when we will draw the rules required by the key `hvlines` (these rules won't be drawn within the virtual blocks corresponding to the dotted lines).

Variables for the exterior rows and columns

The keys for the exterior rows and columns are `first-row`, `first-col`, `last-row` and `last-col`. However, internally, these keys are not coded in a similar way.

- **First row**

The integer `\l_@@_first_row_int` is the number of the first row of the array. The default value is 1, but, if the option `first-row` is used, the value will be 0.

```
223 \int_new:N \l_@@_first_row_int
224 \int_set:Nn \l_@@_first_row_int 1
```

- **First column**

The integer `\l_@@_first_col_int` is the number of the first column of the array. The default value is 1, but, if the option `first-col` is used, the value will be 0.

```
225 \int_new:N \l_@@_first_col_int
226 \int_set:Nn \l_@@_first_col_int 1
```

- **Last row**

The counter `\l_@@_last_row_int` is the number of the eventual “last row”, as specified by the key `last-row`. A value of `-2` means that there is no “last row”. A value of `-1` means that there is a “last row” but we don’t know the number of that row (the key `last-row` has been used without value and the actual value has not still been read in the `aux` file).

```
227 \int_new:N \l_@@_last_row_int
228 \int_set:Nn \l_@@_last_row_int { -2 }
```

If, in an environment like `{pNiceArray}`, the option `last-row` is used without value, we will globally raise the following flag. It will be used to know if we have, after the construction of the array, to write in the `aux` file the number of the “last row”.³⁰

```
229 \bool_new:N \l_@@_last_row_without_value_bool
```

Idem for `\l_@@_last_col_without_value_bool`

```
230 \bool_new:N \l_@@_last_col_without_value_bool
```

- **Last column**

For the potential “last column”, we use an integer. A value of `-2` means that there is no last column. A value of `-1` means that there is a last column but we don’t know its value because the user has used the option `last-col` without value (it’s possible in an environment without preamble like `{pNiceMatrix}`). A value of `0` means that the option `last-col` has been used in an environment with preamble (like `{pNiceArray}`).

```
231 \int_new:N \l_@@_last_col_int
232 \int_set:Nn \l_@@_last_col_int { -2 }
```

However, we have also a boolean. Consider the following code:

```
\begin{pNiceArray}{CC}[last-col]
1 & 2 \\
3 & 4
\end{pNiceArray}
```

In such a code, the “last column” specified by the key `last-col` is not used. We want to be able to detect such a situation and we create a boolean for that job.

```
233 \bool_new:N \g_@@_last_col_found_bool
```

This boolean is set to `false` at the end of `\@_pre_array::`.

Command for creation of rectangle nodes

The following command should be used in a `{pgfpicture}`. It creates a rectangle (empty but with a name).

#1 is the name of the node which will be created; #2 and #3 are the coordinates of one of the corner of the rectangle; #4 and #5 are the coordinates of the opposite corner.

```
234 \cs_new_protected:Npn \@_pgf_rect_node:nnnnn #1 #2 #3 #4 #5
235 {
236   \begin{pgfscope}
237   \pgfset
238   {
239     outer sep = \c_zero_dim ,
```

³⁰We can’t use `\l_@@_last_row_int` for this usage because, if `nicematrix` has read its value from the `aux` file, the value of the counter won’t be `-1` any longer.

```

240     inner-sep = \c_zero_dim ,
241     minimum-size = \c_zero_dim
242 }
243 \pgftransformshift { \pgfpoint { 0.5 * ( #2 + #4 ) } { 0.5 * ( #3 + #5 ) } }
244 \pgfnode
245   { rectangle }
246   { center }
247   {
248     \vbox_to_ht:nn
249       { \dim_abs:n { #5 - #3 } }
250     {
251       \vfill
252       \hbox_to_wd:nn { \dim_abs:n { #4 - #2 } } { }
253     }
254   }
255   { #1 }
256   { }
257 \end { pgfscope }
258 }
```

The command `\@@_pgf_rect_node:nnn` is a variant of `\@@_pgr_rect_node:nnnn`: it takes two PGF points as arguments instead of the four dimensions which are the coordinates.

```

259 \cs_new_protected:Npn \@@_pgf_rect_node:nnn #1 #2 #3
260 {
261   \begin { pgfscope }
262   \pgfset
263   {
264     outer-sep = \c_zero_dim ,
265     inner-sep = \c_zero_dim ,
266     minimum-size = \c_zero_dim
267   }
268   \pgftransformshift { \pgfpointscale { 0.5 } { \pgfpointadd { #2 } { #3 } } }
269   \pgfpointdiff { #3 } { #2 }
270   \pgfgetlastxy \l_tmpa_dim \l_tmpb_dim
271   \pgfnode
272   { rectangle }
273   { center }
274   {
275     \vbox_to_ht:nn
276       { \dim_abs:n \l_tmpb_dim }
277       { \vfill \hbox_to_wd:nn { \dim_abs:n \l_tmpa_dim } { } }
278   }
279   { #1 }
280   { }
281 \end { pgfscope }
282 }
```

The options

By default, the behaviour of `\cline` is changed in the environments of `nicematrix`: a `\cline` spreads the array by an amount equal to `\arrayrulewidth`. It's possible to disable this feature with the key `\l_@@_standard_cline_bool`.

```
283 \bool_new:N \l_@@_standard_cline_bool
```

The following dimensions correspond to the options `cell-space-top-limit` and `co` (these parameters are inspired by the package `cellspace`).

```

284 \dim_new:N \l_@@_cell_space_top_limit_dim
285 \dim_new:N \l_@@_cell_space_bottom_limit_dim
```

The following dimension is the distance between two dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.45 em but it will be changed if the option `small` is used.

```
286 \dim_new:N \l_@@_inter_dots_dim
287 \dim_set:Nn \l_@@_inter_dots_dim { 0.45 em }
```

The following dimension is the minimal distance between a node (in fact an anchor of that node) and a dotted line (we say “minimal” because, by definition, a dotted line is not a continuous line and, therefore, this distance may vary a little).

```
288 \dim_new:N \l_@@_xdots_shorten_dim
289 \dim_set:Nn \l_@@_xdots_shorten_dim { 0.3 em }
```

The following dimension is the radius of the dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.53 pt but it will be changed if the option `small` is used.

```
290 \dim_new:N \l_@@_radius_dim
291 \dim_set:Nn \l_@@_radius_dim { 0.53 pt }
```

The token list `\l_@@_xdots_line_style_tl` corresponds to the option `tikz` of the commands `\Cdots`, `\Ldots`, etc. and of the options `line-style` for the environments and `\NiceMatrixOptions`. The constant `\c_@@_standard_tl` will be used in some tests.

```
292 \tl_new:N \l_@@_xdots_line_style_tl
293 \tl_const:Nn \c_@@_standard_tl { standard }
294 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl
```

The boolean `\l_@@_light_syntax_bool` corresponds to the option `light-syntax`.

```
295 \bool_new:N \l_@@_light_syntax_bool
```

The string `\l_@@_baseline_str` may contain one of the three values `t`, `c` or `b` as in the option of the environment `{array}`. However, it may also contain an integer (which represents the number of the row to which align the array).

```
296 \str_new:N \l_@@_baseline_str
297 \str_set:Nn \l_@@_baseline_str c
```

The flag `\l_@@_exterior_arraycolsep_bool` corresponds to the option `exterior-arraycolsep`. If this option is set, a space equal to `\arraycolsep` will be put on both sides of an environment `{NiceArray}` (as it is done in `{array}` of `array`).

```
298 \bool_new:N \l_@@_exterior_arraycolsep_bool
```

The flag `\l_@@_parallelize_diags_bool` controls whether the diagonals are parallelized. The initial value is `true`.

```
299 \bool_new:N \l_@@_parallelize_diags_bool
300 \bool_set_true:N \l_@@_parallelize_diags_bool
```

The flag `\l_@@_hlines_bool` corresponds to the key `hlines`, the flag `\l_@@_vlines_bool` to the key `vlines` and the flag `hvlines` to the key `hvlines`. Since version 4.1, the key `hvlines` is no longer a mere alias for the conjunction of `hlines` and `vlines`. Indeed, with `hvlines`, the vertical and horizontal rules are *not* drawn within the blocks (created by `\Block`).

```
301 \bool_new:N \l_@@_hlines_bool
302 \bool_new:N \l_@@_vlines_bool
303 \bool_new:N \l_@@_hvlines_bool
```

The flag `\l_@@_nullify_dots_bool` corresponds to the option `nullify-dots`. When the flag is down, the instructions like `\vdots` are inserted within a `\hphantom` (and so the constructed matrix has exactly the same size as a matrix constructed with the classical `{matrix}` and `\ldots`, `\vdots`, etc.).

```
304 \bool_new:N \l_@@_nullify_dots_bool
```

The following flag will be used when the current options specify that all the columns of the array must have the same width equal to the largest width of a cell of the array (except the cells of the potential exterior columns).

```
305 \bool_new:N \l_@@_auto_columns_width_bool
```

The string `\l_@@_name_str` will contain the optional name of the environment: this name can be used to access to the Tikz nodes created in the array from outside the environment.

```
306 \str_new:N \l_@@_name_str
```

The boolean `\l_@@_medium_nodes_bool` will be used to indicate whether the “medium nodes” are created in the array. Idem for the “large nodes”.

```
307 \bool_new:N \l_@@_medium_nodes_bool
308 \bool_new:N \l_@@_large_nodes_bool
```

The dimension `\l_@@_left_margin_dim` correspond to the option `left-margin`. Idem for the right margin. These parameters are involved in the creation of the “medium nodes” but also in the placement of the delimiters and the drawing of the horizontal dotted lines (`\hdottedline`).

```
309 \dim_new:N \l_@@_left_margin_dim
310 \dim_new:N \l_@@_right_margin_dim
```

The dimensions `\l_@@_extra_left_margin_dim` and `\l_@@_extra_right_margin_dim` correspond to the options `extra-left-margin` and `extra-right-margin`.

```
311 \dim_new:N \l_@@_extra_left_margin_dim
312 \dim_new:N \l_@@_extra_right_margin_dim
```

The token list `\l_@@_end_of_row_tl` corresponds to the option `end-of-row`. It specifies the symbol used to mark the ends of rows when the light syntax is used.

```
313 \tl_new:N \l_@@_end_of_row_tl
314 \tl_set:Nn \l_@@_end_of_row_tl { ; }
```

The following parameter is for the color the dotted lines drawn by `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` but *not* the dotted lines drawn by `\hdottedline` and “:”.

```
315 \tl_new:N \l_@@_xdots_color_tl
```

Sometimes, we want to have several arrays vertically juxtaposed in order to have an alignment of the columns of these arrays. To achieve this goal, one may wish to use the same width for all the columns (for example with the option `columns-width` or the option `auto-columns-width` of the environment `{NiceMatrixBlock}`). However, even if we use the same type of delimiters, the width of the delimiters may be different from an array to another because the width of the delimiter is function of its size. That's why we create an option called `max-delimiter-width` which will give to the delimiters the width of a delimiter (of the same type) of big size. The following boolean corresponds to this option.

```
316 \bool_new:N \l_@@_max_delimiter_width_bool
```

First, we define a set of keys “`NiceMatrix / Global`” which will be used (with the mechanism of `.inherit:n`) by other sets of keys.

```
317 \keys_define:nn { NiceMatrix / xdots }
318 {
319   line-style .code:n =
320   {
321     \bool_lazy_or:nnTF
```

We can't use `\c_@@_tikz_loaded_bool` to test whether tikz is loaded because `\NiceMatrixOptions` may be used in the preamble of the document.

```
322   { \cs_if_exist_p:N \tikzpicture }
323   { \str_if_eq_p:nn { #1 } { standard } }
324   { \tl_set:Nn \l_@@_xdots_line_style_tl { #1 } }
325   { \@@_error:n { bad-option-for-line-style } }
326 },
327   line-style .value_required:n = true ,
```

```

```

Important code used by `{NiceArrayWithDelims}`

The pseudo-environment `\@@_Cell:-\@@_end_Cell:` will be used to format the cells of the array. In the code, the affectations are global because this pseudo-environment will be used in the cells of a `\halign` (via an environment `{array}`).

```

544 \cs_new_protected:Npn \@@_Cell:
545 {

```

We increment `\c@jCol`, which is the counter of the columns.

```

546     \int_gincr:N \c@jCol

```

Now, we increment the counter of the rows. We don't do this incrementation in the `\everycr` because some packages, like `arydshln`, create special rows in the `\halign` that we don't want to take into account.

```

547     \int_compare:nNnT \c@jCol = 1
548         { \int_compare:nNnT \l_@@_first_col_int = 1 \@@_begin_of_row: }
549         \int_gset:Nn \g_@@_col_total_int { \int_max:nn \g_@@_col_total_int \c@jCol }

```

The content of the cell is composed in the box `\l_@@_cell_box` because we want to compute some dimensions of the box. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the `\@@_end_Cell:` (and the potential `\c_math_toggle_token` also).

```

550     \hbox_set:Nw \l_@@_cell_box
551     \bool_if:NF \l_@@_NiceTabular_bool
552     {
553         \c_math_toggle_token
554         \bool_if:NT \l_@@_small_bool \scriptstyle
555     }

```

We will call *corners* of the matrix the cases which are at the intersection of the exterior rows and exterior columns (of course, the four corners doesn't always exist simultaneously).

The codes `\l_@@_code_for_first_row_tl` and `al` don't apply in the corners of the matrix.

```

556     \int_compare:nNnTF \c@iRow = 0
557     {

```

```

558     \int_compare:nNnT \c@jCol > 0
559     {
560         \l_@@_code_for_first_row_tl
561         \xglobal \colorlet{nicematrix-first-row}{.}
562     }
563 }
564 {
565     \int_compare:nNnT \c@iRow = \l_@@_last_row_int
566     {
567         \l_@@_code_for_last_row_tl
568         \xglobal \colorlet{nicematrix-last-row}{.}
569     }
570 }
571 }
```

The following macro `\@@_begin_of_row` is usually used in the cell number 1 of the row. However, when the key `first-col` is used, `\@@_begin_of_row` is executed in the cell number 0 of the row.

```

572 \cs_new_protected:Npn \@@_begin_of_row:

```

The following computations are for the “first row” and the “last row”.

```

618 \@@_update_for_first_and_last_row:

```

If the cell is empty, or may be considered as if, we must not create the PGF node, for two reasons:

- it’s a waste of time since such a node would be rather pointless;
- we test the existence of these nodes in order to determine whether a cell is empty when we search the extremities of a dotted line.

However, it’s very difficult to determine whether a cell is empty. As of now, we use the following technic:

- if the width of the box `\l_@@_cell_box` (created with the content of the cell) is equal to zero, we consider the cell as empty (however, this is not perfect since the user may have use a `\rlap`, a `\llap` or a `\mathclap` of `mathtools`).
- the cells with a command `\Ldots` or `\Cdots`, `\Vdots`, etc., should also be considered as empty; if `nullify-dots` is in force, there would be nothing to do (in this case the previous commands only write an instruction in a kind of `code-after`); however, if `nullify-dots` is not in force, a phantom of `\ldots`, `\cdots`, `\vdots` is inserted and its width is not equal to zero; that’s why these commands raise a boolean `\g_@@_empty_cell_bool` and we begin by testing this boolean.

```

619 \bool_if:NTF \g_@@_empty_cell_bool
620   { \box_use_drop:N \l_@@_cell_box }
621   {
622     \dim_compare:nNnTF { \box_wd:N \l_@@_cell_box } > \c_zero_dim

649    }
650  \endpgfpicture
651 }

```

The first argument of the following command `\@@_instruction_of_type:nn` defined below is the type of the instruction (`Cdots`, `Vdots`, `Ddots`, etc.). The second argument is the list of options. This command writes in the corresponding `\g_@@_type_lines_tl` the instruction which will actually draw the line after the construction of the matrix.

For example, for the following matrix,

```

\begin{pNiceMatrix}
1 & 2 & 3 & 4 \\
5 & \Cdots & & 6 \\
7 & \Cdots [color=red]
\end{pNiceMatrix}

```

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & \cdots & & 6 \\ 7 & \cdots & & \end{pmatrix}$$

the content of `\g_@@_Cdots_lines_tl` will be:

```

\@@_draw_Cdots:nnn {2}{2}{}
\@@_draw_Cdots:nnn {3}{2}{color=red}

```

```

652 \cs_new_protected:Npn \@@_instruction_of_type:nn #1 #2
653 {

```

It's important to use a `\tl_gput_right:cx` and not a `\tl_gput_left:cx` because we want the `\Ddots` lines to be drawn in the order of appearance in the array (for parallelisation).

```

654 \tl_gput_right:cx
655   { g_@@_ #1 _ lines _ tl }
656   {
657     \use:c { @@ _ draw _ #1 : nnn }
658     { \int_use:N \c@iRow }
659     { \int_use:N \c@jCol }
660     { \exp_not:n { #2 } }
661   }
662 }

```

We want to use `\array` of `array`. However, if the class used is `revtex4-1` or `revtex4-2`, we have to do some tuning and use the command `\@array@array` instead of `\array` because these classes do a redefinition of `\array` incompatible with our use of `\array`.

```

663 \cs_new_protected:Npn \@@_array:
664 {
665   \bool_if:NTF \c_@@_revtex_bool
666   {
667     \cs_set_eq:NN \acoll \arrayacol
668     \cs_set_eq:NN \acolr \arrayacol
669     \cs_set_eq:NN \acol \arrayacol
670     \cs_set:Npn \halignto { }
671     \@array@array
672   }
673   \array

```

`\l_@@_baseline_str` may have the value `t`, `c` or `b`. However, if the value is `b`, we compose the `\array` (of `array`) with the option `t` and the right translation will be done further.

```

674   [ \str_if_eq:VnTF \l_@@_baseline_str c c t ]
675 }

```

We keep in memory the standard version of `\ialign` because we will redefine `\ialign` in the environment `{NiceArrayWithDelims}` but restore the standard version for use in the cells of the array.

```

676 \cs_set_eq:NN \@@_old_ialign: \ialign

```

The following command creates a `row` node (and not a row of nodes!).

```
677 \cs_new_protected:Npn \@@_create_row_node:
678 {
```

The `\hbox:n` (or `\hbox`) is mandatory.

```
679 \hbox

```

Here, we put `c` but we would have the result with `l` or `r`.

```

738   c
739   < { \box_use:N \carstrutbox \end { minipage } \@@_end_Cell: }
740   }
741 }

```

The following code `\@@_pre_array:` is used in `{NiceArrayWithDelims}`. It exists as a standalone macro only for lisibility.

```

742 \cs_new_protected:Npn \@@_pre_array:
743   {

```

If `booktabs` is loaded, we have to patch the macro `\@BTnormal` which is a macro of `booktabs`. The macro `\@BTnormal` draws an horizontal rule but it occurs after a vertical skip done by a low level TeX command. When this macro `\@BTnormal` occurs, the `row` node has yet been inserted by `nicematrix` before the vertical skip (and thus, at a wrong place). That why we decide to create a new `row` node (for the same row). We patch the macro `\@BTnormal` to create this `row` node. This new `row` node will overwrite the previous definition of that `row` node and we have managed to avoid the error messages of that redefinition ³¹.

```

744 \bool_if:NT \c_@@_booktabs_loaded_bool
745   { \tl_put_left:Nn \@BTnormal \@@_create_row_node: }

862   }
863 }
```

By default, the letter used to specify a dotted line in the preamble of an environment of `nicematrix` (for example in `\{pNiceArray\}`) is the letter `:`. However, this letter is used by some packages, for example `arydshln`. That's why it's possible to change the letter used by `nicematrix` with the option `letter-for-dotted-lines` which changes the value of `\l_@@_letter_for_dotted_lines_str`. We rescan this string (which is always of length 1) in particular for the case where `pdflatex` is used with `french-babel` (the colon is activated by `french-babel` at the beginning of the document).

```

864 \tl_set_rescan:Nno
865   \l_@@_letter_for_dotted_lines_str { } \l_@@_letter_for_dotted_lines_str
866 \exp_args:NV \newcolumntype \l_@@_letter_for_dotted_lines_str
867 {
868   !
869 }
```

The following code because we want the dotted line to have exactly the same position as a vertical rule drawn by “`|`” (considering the rule having a width equal to the diameter of the dots).

```

870 \int_compare:nNnf \c@iRow = 0
871 {
872   \int_compare:nNnf \c@iRow = \l_@@_last_row_int
873   { \skip_horizontal:N 2\l_@@_radius_dim }
874 }
```

Consider the following code:

```

870 \begin{NiceArray}{C:CC:C}
871   a & b
872   c & d \\
873   e & f & g & h \\
874   i & j & k & l
875 \end{NiceArray}
```

The first “:” in the preamble will be encountered during the first row of the environment `{NiceArray}` but the second one will be encountered only in the third row. We have to issue a command `\vdottedline:n` in the `code-after` only one time for each “:” in the preamble. That’s why we keep a counter `\g_@@_last_vdotted_col_int` and with this counter, we know whether a letter “:” encountered during the parsing has already been taken into account in the `code-after`.

```
875     \int_compare:nNnT \c@jCol > \g_@@_last_vdotted_col_int
876     {
877         \int_gset_eq:NN \g_@@_last_vdotted_col_int \c@jCol
878         \tl_gput_right:Nx \g_@@_internal_code_after_tl
```

The command `\@@_vdottedline:n` is protected, and, therefore, won’t be expanded before writing on `\g_@@_internal_code_after_tl`.

```
879             { \@@_vdottedline:n { \int_use:N \c@jCol } }
880         }
881     }
882 }
883 \int_gzero_new:N \g_@@_last_vdotted_col_int

907 \bool_set_true:N \l_@@_in_env_bool
```

The command `\CT@arc@` contains the instruction of color for the rules of the array³⁴. This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That’s why we do the following instruction which is in the patch of the beginning of arrays done by `colortbl`. Of course, we restore the value of `\CT@arc@` at the end of our environment.

```
908 \cs_gset_eq:NN \g_@@_old_CT@arc@ \CT@arc@
```

We deactivate Tikz externalization because we will use PGF pictures with the options `overlay` and `remember picture` (or equivalent forms).

³⁴e.g. `\color[rgb]{0.5,0.5,0}`

```

909 \cs_if_exist:NT \tikz@library@external@loaded
910 {
911     \tikzset { external / export = false }
912     \cs_if_exist:NT \ifstandalone
913         { \tikzset { external / optimize = false } }
914 }

```

We increment the counter `\g_@@_env_int` which counts the environments of the package.

```

915 \int_gincr:N \g_@@_env_int
916 \bool_if:NF \l_@@_block_auto_columns_width_bool
917     { \dim_gzero_new:N \g_@@_max_cell_width_dim }

```

We do a redefinition of `\arrayrule` because we want that the vertical rules drawn by `|` in the preamble of the array don't extend in the potential exterior rows.

```

918 \cs_set_protected:Npn \arrayrule { \addtopreamble \@@_vline: }

```

The sequence `\g_@@_blocks_seq` will contain the characteristics of the blocks (specified by `\Block`) of the array. The sequence `\g_@@_pos_of_blocks_seq` will contain only the position of the blocks. Of course, this is redundant but it's for efficiency.

```

919 \seq_clear:N \g_@@_blocks_seq
920 \seq_clear:N \g_@@_pos_of_blocks_seq

```

The set of keys is not exactly the same for `{NiceArray}` and for the variants of `{NiceArray}` (`{pNiceArray}`, `{bNiceArray}`, etc.) because, for `{NiceArray}`, we have the options `t`, `c`, `b` and `baseline`.

```

921 \bool_if:NTF \l_@@_NiceArray_bool
922     { \keys_set:nn { NiceMatrix / NiceArray } }
923     { \keys_set:nn { NiceMatrix / pNiceArray } }
924 { #3 , #5 }

925 \tl_if_empty:NF \l_@@_rules_color_tl
926     { \exp_after:wN \@@_set_Carc@: \l_@@_rules_color_tl \q_stop }

```

If the key `code-before` is used, we have to create the `col` nodes and the `row` nodes before the creation of the array. First, we have to test whether the size of the array has been written in the `aux` file in a previous run. In this case, a command `\@@_size_nb_of_env:` has been created.

```

927 \bool_if:NT \l_@@_code_before_bool
928 {
929     \seq_if_exist:cT { @@_size_ \int_use:N \g_@@_env_int _ seq }
930     {

```

First, we give values to the LaTeX counters `iRow` and `jCol`. We remind that, in the `code-before` (and in the `code-after`) they represent the numbers of rows and columns of the array (without the potential last row and last column).

```

931 \int_zero_new:N \c@iRow
932 \int_set:Nn \c@iRow
933     { \seq_item:cn { @@_size_ \int_use:N \g_@@_env_int _ seq } 2 }
934 \int_zero_new:N \c@jCol
935 \int_set:Nn \c@jCol
936     { \seq_item:cn { @@_size_ \int_use:N \g_@@_env_int _ seq } 4 }

```

We have to adjust the values of `\c@iRow` and `\c@jCol` to take into account the potential last row and last column. A value of `-2` for `\l_@@_last_row_int` means that there is no last row. Idem for the columns.

```

937 \int_compare:nNnF \l_@@_last_row_int = { -2 }
938     { \int_decr:N \c@iRow }
939 \int_compare:nNnF \l_@@_last_col_int = { -2 }
940     { \int_decr:N \c@jCol }

```

Now, we will create all the `col` nodes and `row` nodes with the informations written in the `aux` file. You use the technique described in the page 1229 of `pgfmanual.pdf`, version 3.1.4b.

```

941 \pgfsys@markposition { \@@_env: - position }
942 \pgfsys@getposition { \@@_env: - position } \@@_picture_position:
943 \pgfpicture

```

First, the creation of the `row` nodes.

```

944 \int_step_inline:nnn

```

```

945 { \seq_item:cn { @0_size_ \int_use:N \g_@@_env_int _ seq } 1 }
946 { \seq_item:cn { @0_size_ \int_use:N \g_@@_env_int _ seq } 2 + 1 }
947 {
948     \pgfsys@getposition { \@@_env: - row - ##1 } \@@_node_position:

```

Here is the beginning of the box which will contain the array. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the second part of the environment (and the closing `\c_math_toggle_token` also).

```
1070 \hbox_set:Nw \l_@@_the_array_box
```

Here is a trick. We will call `\array` and, at the beginning, `\array` will set `\col@sep` equal to the current value of `\arraycolsep`. In we are in an environment `{NiceTabular}`, we would like that `\array` sets `\col@sep` equal to the current value of `\tabcolsep`. That's why we set `\arraycolsep` equal to `\tabcolsep`. However, the value of `\tabcolsep` in each cell of the array should be equal to the current value of `\tabcolsep` outside `{NiceTabular}`. That's why we save the current value of `\arraycolsep` and we will restore the value just before the `\halign`. It's possible because we do a redefinition of `\ialign` (see just below).

```

1071 \bool_if:NT \l_@@_NiceTabular_bool
1072 {
1073     \dim_set_eq:NN \@@_old_arraycolsep_dim \arraycolsep
1074     \dim_set_eq:NN \arraycolsep \tabcolsep
1075 }
```

If the key `\vlines` is used, we increase `\arraycolsep` by `0.5\arrayrulewidth` in order to reserve space for the width of the vertical rules drawn with Tikz after the end of the array. However, the first `\arraycolsep` is used once (between columns, `\arraycolsep` is used twice). That's why we add a `0.5\arrayrulewidth` more.

```

1076 \bool_if:NT \l_@@_vlines_bool
1077 {
1078     \dim_add:Nn \arraycolsep { 0.5 \arrayrulewidth }
1079     \skip_horizontal:N 0.5\arrayrulewidth
1080 }
1081 \skip_horizontal:N \l_@@_left_margin_dim
1082 \skip_horizontal:N \l_@@_extra_left_margin_dim
1083 \c_math_toggle_token
1084 \bool_if:NTF \l_@@_light_syntax_bool
1085 { \use:c { @@-light-syntax } }
1086 { \use:c { @@-normal-syntax } }
1087 }
1088 {
1089 \bool_if:NTF \l_@@_light_syntax_bool
1090 { \use:c { end @@-light-syntax } }
1091 { \use:c { end @@-normal-syntax } }
1092 \c_math_toggle_token
1093 \skip_horizontal:N \l_@@_right_margin_dim
1094 \skip_horizontal:N \l_@@_extra_right_margin_dim
```

If the key `\vlines` is used, we have increased `\arraycolsep` by $0.5\arrayrulewidth$ in order to reserve space for the width of the vertical rules drawn with Tikz after the end of the array. However, the last `\arraycolsep` is used once (between columns, `\arraycolsep` is used twice). That's we add a $0.5 \arrayrulewidth$ more.

```
1095   \bool_if:NT \l_@@_vlines_bool { \skip_horizontal:N 0.5\arrayrulewidth }
1096   \hbox_set_end:
```

End of the construction of the array (in the box `\l_@@_the_array_box`).

If the user has used the key `last-row` with a value, we control that the given value is correct (since we have just constructed the array, we know the real number of rows of the array).

```
1097   \int_compare:nNnT \l_@@_last_row_int > { -2 }
1098   {
1099     \bool_if:NF \l_@@_last_row_without_value_bool

1103         \@@_error:n { Wrong~last~row }
1104         \int_gset_eq:NN \l_@@_last_row_int \c@iRow
1105       }
1106     }
1107   }
```

Now, the definition of `\c@jCol` and `\g_@@_col_total_int` change: `\c@jCol` will be the number of columns without the “last column”; `\g_@@_col_total_int` will be the number of columns with this “last column”.³⁵

```
1108   \int_gset_eq:NN \c@jCol \g_@@_col_total_int
1109   \bool_if:nT \g_@@_last_col_found_bool { \int_gdecr:N \c@jCol }
```

We fix also the value of `\c@iRow` and `\g_@@_row_total_int` with the same principle.

```
1110   \int_gset_eq:NN \g_@@_row_total_int \c@iRow
1111   \int_compare:nNnT \l_@@_last_row_int > { -1 } { \int_gdecr:N \c@iRow }
```

Now, we begin the real construction in the output flow of TeX. First, we take into account a potential “first column” (we remind that this “first column” has been constructed in an overlapping position and that we have computed its width in `\g_@@_width_first_col_dim`: see p. 70).

```
1112   \int_compare:nNnT \l_@@_first_col_int = 0
1113   {
1114     \skip_horizontal:N \arraycolsep
1115     \skip_horizontal:N \g_@@_width_first_col_dim
1116   }
```

The construction of the real box is different in `{NiceArray}` and in the other environments because, in `{NiceArray}`, we have to take into account the value of `baseline` and we have no delimiter to put. We begin with `{NiceArray}`.

```
1117   \bool_if:NTF \l_@@_NiceArray_bool
1118   {
```

Remember that, when the key `b` is used, the `\array` (of `array`) is constructed with the option `t` (and not `b`). Now, we do the translation to take into account the option `b`.

```
1119   \str_if_eq:VnTF \l_@@_baseline_str { b }
1120   {
1121     \pgfpicture
1122       \@@_qpoint:n { row - 1 }
1123       \dim_gset_eq:NN \g_tmpa_dim \pgf@y
1124       \@@_qpoint:n { row - \int_use:N \c@iRow - base }
1125       \dim_gsub:Nn \g_tmpa_dim \pgf@y
1126     \endpgfpicture
1127     \int_compare:nNnT \l_@@_first_row_int = 0
1128     {
1129       \dim_gadd:Nn \g_tmpa_dim
1130       { \g_@@_ht_row_zero_dim + \g_@@_dp_row_zero_dim }
1131     }
1132     \box_move_up:nn \g_tmpa_dim { \box_use_drop:N \l_@@_the_array_box }
```

³⁵We remind that the potential “first column” (exterior) has the number 0.

```

1133     }
1134 {
1135     \str_if_eq:VnTF \l_@@_baseline_str { c }
1136     { \box_use_drop:N \l_@@_the_array_box }
1137     {

```

We convert a value of t to a value of 1.

```

1138     \str_if_eq:VnT \l_@@_baseline_str { t }
1139     { \str_set:Nn \l_@@_baseline_str { 1 } }

```

Now, we convert the value of $\l_@@_baseline_str$ (which should represent an integer) to an integer stored in \l_tmpa_int .

```

1140     \int_set:Nn \l_tmpa_int \l_@@_baseline_str
1141     \bool_if:nT
1142     {
1143         \int_compare_p:nNn \l_tmpa_int < \l_@@_first_row_int
1144         || \int_compare_p:nNn \l_tmpa_int > \g_@@_row_total_int
1145     }
1146     {
1147         \@@_error:n { bad-value-for-baseline }
1148         \int_set:Nn \l_tmpa_int 1
1149     }
1150     \pgfpicture
1151     \@@_qpoint:n { row - 1 }
1152     \dim_gset_eq:NN \g_tmpa_dim \pgf@y
1153     \@@_qpoint:n { row - \int_use:N \l_tmpa_int - base }
1154     \dim_gsub:Nn \g_tmpa_dim \pgf@y
1155     \endpgfpicture
1156     \int_compare:nNnT \l_@@_first_row_int = 0
1157     {
1158         \dim_gadd:Nn \g_tmpa_dim
1159         { \g_@@_ht_row_zero_dim + \g_@@_dp_row_zero_dim }
1160     }
1161     \box_move_up:nn \g_tmpa_dim
1162     { \box_use_drop:N \l_@@_the_array_box }
1163 }
1164 }
1165 }

```

Now, in the case of an environment $\{pNiceArray\}$, $\{bNiceArray\}$, etc. We compute \l_tmpa_dim which is the total height of the “first row” above the array (when the key `first-row` is used).

```

1166 {
1167     \int_compare:nNnTF \l_@@_first_row_int = 0
1168     {
1169         \dim_set_eq:NN \l_tmpa_dim \g_@@_dp_row_zero_dim
1170         \dim_add:Nn \l_tmpa_dim \g_@@_ht_row_zero_dim
1171     }
1172     { \dim_zero:N \l_tmpa_dim }

```

We compute \l_tmpb_dim which is the total height of the “last row” below the array (when the key `last-row` is used). A value of -2 for $\l_@@_last_row_int$ means that there is no “last row”.³⁶

```

1173     \int_compare:nNnTF \l_@@_last_row_int > { -2 }
1174     {
1175         \dim_set_eq:NN \l_tmpb_dim \g_@@_ht_last_row_dim
1176         \dim_add:Nn \l_tmpb_dim \g_@@_dp_last_row_dim
1177     }
1178     { \dim_zero:N \l_tmpb_dim }

1179     \hbox_set:Nn \l_tmpa_box
1180     {
1181         \c_math_toggle_token
1182         \left #1
1183         \vcenter
1184         {

```

³⁶A value of -1 for $\l_@@_last_row_int$ means that there is a “last row” but the user have not set the value with the option `last row` (and we are in the first compilation).

We take into account the “first row” (we have previously computed its total height in `\l_tmpa_dim`). The `\hbox:n` (or `\hbox`) is necessary here.

```

1185      \skip_vertical:N -\l_tmpa_dim
1186      \hbox
1187      {
1188          \bool_if:NTF \l_@@_NiceTabular_bool
1189              { \skip_horizontal:N -\tabcolsep }
1190              { \skip_horizontal:N -\arraycolsep }
1191          \box_use_drop:N \l_@@_the_array_box
1192          \bool_if:NTF \l_@@_NiceTabular_bool
1193              { \skip_horizontal:N -\tabcolsep }
1194              { \skip_horizontal:N -\arraycolsep }
1195      }

```

We take into account the “last row” (we have previously computed its total height in `\l_tmpb_dim`).

```

1196      \skip_vertical:N -\l_tmpb_dim
1197      }
1198      \right #2
1199      \c_math_toggle_token
1200  }

```

Now, the box `\l_tmpa_box` is created with the correct delimiters.

We will put the box in the TeX flow. However, we have a small work to do when the option `max-delimiter-width` is used.

```

1201      \bool_if:NTF \l_@@_max_delimiter_width_bool
1202          { \@@_put_box_in_flow_bis:nn { #1 } { #2 } }
1203          \@@_put_box_in_flow:
1204      }

```

We take into account a potential “last column” (this “last column” has been constructed in an overlapping position and we have computed its width in `\g_@@_width_last_col_dim`: see p. 71).

```

1205      \bool_if:NT \g_@@_last_col_found_bool
1206      {
1207          \skip_horizontal:N \g_@@_width_last_col_dim
1208          \skip_horizontal:N \arraycolsep
1209      }
1210      \@@_after_array:
1211      \egroup
1212  }

```

This is the end of the environment `{NiceArrayWithDelims}`.

The command `\@@_put_box_in_flow:` puts the box `\l_tmpa_box` (which contains the array) in the flow. It is used for the environments with delimiters. First, we have to modify the height and the depth to take back into account the potential exterior rows (the total height of the first row has been computed in `\l_tmpa_dim` and the total height of the potential last row in `\l_tmpb_dim`).

```

1213 \cs_new_protected:Npn \@@_put_box_in_flow:
1214 {
1215     \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + \l_tmpa_dim }
1216     \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + \l_tmpb_dim }
1217     \str_if_eq:VnTF \l_@@_baseline_str { c }
1218         { \box_use_drop:N \l_tmpa_box }
1219         \@@_put_box_in_flow_i:
1220     }

```

The command `\@@_put_box_in_flow_i:` is used when the value of `\l_@@_baseline_str` is different of `c` (which is the initial value and the most used).

```

1221 \cs_new_protected:Npn \@@_put_box_in_flow_i:
1222 {
1223     \str_case:VnF \l_@@_baseline_str
1224     {
1225         { t } { \int_set:Nn \l_tmpa_int 1 }
1226         { b } { \int_set_eq:NN \l_tmpa_int \c@iRow }
1227     }
1228     { \int_set:Nn \l_tmpa_int \l_@@_baseline_str }

```

```

1229 \bool_if:nT
130 {
131     \int_compare_p:nNn \l_tmpa_int < \l_@@_first_row_int
132     || \int_compare_p:nNn \l_tmpa_int > \g_@@_row_total_int
133 }
134 {
135     \@@_error:n { bad~value~for~baseline }
136     \int_set:Nn \l_tmpa_int 1
137 }
138 \pgfpicture
139     \@@_qpoint:n { row - 1 }
140     \dim_gset_eq:NN \g_tmpa_dim \pgf@y
141     \@@_qpoint:n { row - \@@_succ:n \c@iRow }
142     \dim_gadd:Nn \g_tmpa_dim \pgf@y
143     \dim_gset:Nn \g_tmpa_dim { 0.5 \g_tmpa_dim }

```

Now, `\g_tmpa_dim` contains the y -value of the center of the array (the delimiters are centered in relation with this value).

```

1244 \@@_qpoint:n { row - \int_use:N \l_tmpa_int - base }
1245 \dim_gsub:Nn \g_tmpa_dim \pgf@y

```

We take into account the position of the mathematical axis.

```

1246 \dim_gsub:Nn \g_tmpa_dim { \fontdimen22 \textfont2 }

```

Now, `\g_tmpa_dim` contains the value of the y translation we have to do.

```

1247 \endpgfpicture
1248 \box_move_up:nn \g_tmpa_dim { \box_use_drop:N \l_tmpa_box }
1249 \box_use_drop:N \l_tmpa_box
1250 }

```

The command `\@@_put_box_in_flow_bis:` is used when the option `max-delimiter-width` is used because, in this case, we have to adjust the widths of the delimiters. The arguments #1 and #2 are the delimiters specified by the user.

```

1251 \cs_new_protected:Npn \@@_put_box_in_flow_bis:nn #1 #2
1252 {

```

We will compute the real width of both delimiters used.

```

1253 \dim_zero_new:N \l_@@_real_left_delim_dim
1254 \dim_zero_new:N \l_@@_real_right_delim_dim
1255 \hbox_set:Nn \l_tmpb_box
1256 {
1257     \c_math_toggle_token
1258     \left #1
1259     \vcenter
1260     {
1261         \vbox_to_ht:nn
1262         { \box_ht:N \l_tmpa_box + \box_dp:N \l_tmpa_box }
1263         { }
1264     }
1265     \right .
1266     \c_math_toggle_token
1267 }
1268 \dim_set:Nn \l_@@_real_left_delim_dim
1269 { \box_wd:N \l_tmpb_box - \nulldelimiterspace }
1270 \hbox_set:Nn \l_tmpb_box
1271 {
1272     \c_math_toggle_token
1273     \left .
1274     \vbox_to_ht:nn
1275     { \box_ht:N \l_tmpa_box + \box_dp:N \l_tmpa_box }
1276     { }
1277     \right #
1278     \c_math_toggle_token
1279 }
1280 \dim_set:Nn \l_@@_real_right_delim_dim
1281 { \box_wd:N \l_tmpb_box - \nulldelimiterspace }

```

Now, we can put the box in the TeX flow with the horizontal adjustments on both sides.

```

1282 \skip_horizontal:N \l_@@_left_delim_dim
1283 \skip_horizontal:N -\l_@@_real_left_delim_dim
1284 \@@_put_box_in_flow:
1285 \skip_horizontal:N \l_@@_right_delim_dim
1286 \skip_horizontal:N -\l_@@_real_right_delim_dim
1287 }
```

The construction of the array in the environment `{NiceArrayWithDelims}` is, in fact, done by the environment `{@@-light-syntax}` or by the environment `{@@-normal-syntax}` (whether the option `light-syntax` is used or not). When the key `light-syntax` is not used, the construction is a standard environment (and, thus, it's possible to use verbatim in the array).

```
1288 \NewDocumentEnvironment { @@-normal-syntax } { }
```

First, we test whether the environment is empty. If it is empty, we raise a fatal error (it's only a security). In order to detect whether it is empty, we test whether the next token is `\end` and, if it's the case, we test if this is the end of the environment (if it is not, an standard error will be raised by LaTeX for incorrect nested environments).

```

1289 {
1290   \peek_meaning_ignore_spaces:NTF \end
1291   { \@@_analyze_end:Nn }
```

Here is the call to `\array` (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

1292   { \exp_args:NV \@@_array: \l_tmpa_t1 }
1293 }
1294 {
1295   \@@_create_col_nodes:
1296   \endarray
1297 }
```

When the key `light-syntax` is used, we use an environment which takes its whole body as an argument (with the specifier `b` of `xparse`).

```
1298 \NewDocumentEnvironment { @@-light-syntax } { b }
1299 {
```

First, we test whether the environment is empty. It's only a security. Of course, this test is more easy than the similar test for the "normal syntax" because we have the whole body of the environment in `#1`.

```

1300 \tl_if_empty:nT { #1 } { \@@_fatal:n { empty~environment } }
1301 \tl_map_inline:nn { #1 }
1302 {
1303   \tl_if_eq:nnT { ##1 } { & }
1304   { \@@_fatal:n { ampersand-in-light-syntax } }
1305   \tl_if_eq:nnT { ##1 } { \\ }
1306   { \@@_fatal:n { double-backslash-in-light-syntax } }
1307 }
```

Now, you extract the `code-after` or the body of the environment. Maybe, there is no command `\CodeAfter` in the body. That's why you put a marker `\CodeAfter` after `#1`. If there is yet a `\CodeAfter` in `#1`, this second (or third...) `\CodeAfter` will be catched in the value of `\g_@@_code_after_t1`. That doesn't matter because `\CodeAfter` will be set to `no-op` before the execution of `\g_@@_code_after_t1`.

```

1308   \@@_light_syntax_i #1 \CodeAfter \q_stop
1309 }
```

Now, the second part of the environment. It is empty. That's not surprising because we have caught the whole body of the environment with the specifier `b` provided by `xparse`.

```

1310 { }
1311 \cs_new_protected:Npn \@@_light_syntax_i #1\CodeAfter #2\q_stop
1312 {
1313   \tl_gput_right:Nn \g_@@_code_after_t1 { #2 }
```

The body of the array, which is stored in the argument `#1`, is now splitted into items (and *not* tokens).

```

1314 \seq_gclear_new:N \g_@@_rows_seq
1315 \tl_set_rescan:Nno \l_@@_end_of_row_tl { } \l_@@_end_of_row_tl
1316 \exp_args:NNV \seq_gset_split:Nnn \g_@@_rows_seq \l_@@_end_of_row_tl { #1 }

```

If the environment uses the option `last-row` without value (i.e. without saying the number of the rows), we have now the opportunity to know that value. We do it, and so, if the token list `\l_@@_code_for_last_row_tl` is not empty, we will use directly where it should be.

```

1317 \int_compare:nNnT \l_@@_last_row_int = { -1 }
1318 { \int_set:Nn \l_@@_last_row_int { \seq_count:N \g_@@_rows_seq } }

```

Here is the call to `\array` (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

1319 \exp_args:NV \@@_array: \l_tmpa_tl

```

We need a global affectation because, when executing `\l_tmpa_tl`, we will exit the first cell of the array.

```

1320 \seq_gpop_left>NN \g_@@_rows_seq \l_tmpa_tl
1321 \exp_args:NV \@@_line_with_light_syntax_i:n \l_tmpa_tl
1322 \seq_map_function:NN \g_@@_rows_seq \@@_line_with_light_syntax:n
1323 \@@_create_col_nodes:
1324 \endarray
1325 }
1326 \cs_new_protected:Npn \@@_line_with_light_syntax:n #1
1327 { \tl_if_empty:nF { #1 } { \\\@@_line_with_light_syntax_i:n { #1 } } }
1328 \cs_new_protected:Npn \@@_line_with_light_syntax_i:n #1
1329 {
1330 \seq_gclear_new:N \g_@@_cells_seq
1331 \seq_gset_split:Nnn \g_@@_cells_seq { ~ } { #1 }
1332 \seq_gpop_left>NN \g_@@_cells_seq \l_tmpa_tl
1333 \l_tmpa_tl
1334 \seq_map_inline:Nn \g_@@_cells_seq { & ##1 }
1335 }

```

The following command is used by the code which detects whether the environment is empty (we raise a fatal error in this case: it's only a security).

```

1336 \cs_new_protected:Npn \@@_analyze_end:Nn #1 #2
1337 {
1338 \str_if_eq:VnT \g_@@_name_env_str { #2 }
1339 { \@@_fatal:n { empty~environment } }

```

We reput in the stream the `\end{...}` we have extracted and the user will have an error for incorrect nested environments.

```

1340 \end { #2 }
1341 }

```

The command `\@@_create_col_nodes:` will construct a special last row. That last row is a false row used to create the col nodes and to fix the width of the columns (when the array is constructed with an option which specify the width of the columns).

```

1342 \cs_new:Npn \@@_create_col_nodes:
1343 {
1344 \crrcr

We compute in \g_tmpa_skip the common width of the columns (it's a skip and not a dimension). We use a global variable because we are in a cell of an \halign and because we have to use this variable in other cells (of the same row). The affectation of \g_tmpa_skip, like all the affectations, must be done after the \omit of the cell.

We give a default value for \g_tmpa_skip (0 pt plus 1 fill) but it will just after erased by a fixed value in the concerned cases.

```

```

³⁸e.g. `\color[rgb]{0.5,0.5,0}`

```

1801   \cs_if_exist:NT \thejCol { \int_gset_eq:NN \c@jCol \l_@@old_jCol_int }
1802 }
```

We draw the dotted lines

A dotted line will be said *open* in one of its extremities when it stops on the edge of the matrix and *closed* otherwise. In the following matrix, the dotted line is closed on its left extremity and open on its right.

$$\begin{pmatrix} a+b+c & a+b & a \\ a & \dots & \\ a & a+b & a+b+c \end{pmatrix}$$

The command `\@@_find_extremities_of_line:nnnn` takes four arguments:

- the first argument is the row of the cell where the command was issued;
- the second argument is the column of the cell where the command was issued;
- the third argument is the x -value of the orientation vector of the line;
- the fourth argument is the y -value of the orientation vector of the line.

This command computes:

- `\l_@@initial_i_int` and `\l_@@initial_j_int` which are the coordinates of one extremity of the line;
- `\l_@@final_i_int` and `\l_@@final_j_int` which are the coordinates of the other extremity of the line;
- `\l_@@initial_open_bool` and `\l_@@final_open_bool` to indicate whether the extremities are open or not.

```

1803 \cs_new_protected:Npn \@@_find_extremities_of_line:nnnn #1 #2 #3 #4
1804 {
```

First, we declare the current cell as “dotted” because we forbide intersections of dotted lines.

```
1805   \cs_set:cpn { @@ _ dotted _ #1 - #2 } { }
```

Initialization of variables.

```

1806   \int_set:Nn \l_@@initial_i_int { #1 }

2002     \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2003     \@@_actually_draw_Ldots:
2004     \group_end:
2005 }
2006 }

```

The command `\@@_actually_draw_Ldots:` has the following implicit arguments:

- $\l_@@_initial_i_int$
- $\l_@@_initial_j_int$
- $\l_@@_initial_open_bool$
- $\l_@@_final_i_int$
- $\l_@@_final_j_int$
- $\l_@@_final_open_bool$.

The following function is also used by `\Hdotsfor`.

```

2007 \cs_new_protected:Npn \@@_actually_draw_Ldots:
2008 {
2009     \bool_if:NTF \l_@@_initial_open_bool
2010     {
2011         \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
2012         \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
2013         \dim_add:Nn \l_@@_x_initial_dim
2014             { \bool_if:NTF \l_@@_NiceTabular_bool \tabcolsep \arraycolsep }
2015         \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int - base }
2016         \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2017     }
2018     { \@@_set_initial_coords_from_anchor:n { base-east } }
2019     \bool_if:NTF \l_@@_final_open_bool
2020     {
2021         \@@_qpoint:n { col - \@@_succ:n \l_@@_final_j_int }
2022         \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
2023         \dim_sub:Nn \l_@@_x_final_dim
2024             { \bool_if:NTF \l_@@_NiceTabular_bool \tabcolsep \arraycolsep }
2025         \@@_qpoint:n { row - \int_use:N \l_@@_final_i_int - base }
2026         \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
2027     }
2028     { \@@_set_final_coords_from_anchor:n { base-west } }

```

We raise the line of a quantity equal to the radius of the dots because we want the dots really “on” the line of text. Of course, maybe we should not do that when the option `line-style` is used (?).

```
2029 \dim_add:Nn \l_@@_y_initial_dim \l_@@_radius_dim
2030 \dim_add:Nn \l_@@_y_final_dim \l_@@_radius_dim
2031 \@@_draw_line:
2032 }
```

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```
2033 \cs_new_protected:Npn \@@_draw_Cdots:nnn #1 #2 #3
2034 {
2035     \cs_if_free:cT { @_ dotted _ #1 - #2 }
2036     {
2037         \@@_find_extremities_of_line:nnnn { #1 } { #2 } 0 1
2038 }
```

The previous command may have changed the current environment by marking some cells as “dotted”, but, fortunately, it is outside the group for the options of the line.

```
2038 \group_begin:
2039     \int_compare:nNnTF { #1 } = 0
2040     {
2041         \color { nicematrix-first-row }
2042     }
```

We remind that, when there is a “last row” `\l_@@_last_row_int` will always be (after the construction of the array) the number of that “last row” even if the option `last-row` has been used without value.

```
2042     \int_compare:nNnT { #1 } = \l_@@_last_row_int
2043     {
2044         \color { nicematrix-last-row }
2045     }
2046     \keys_set:nn { NiceMatrix / xdots } { #3 }
2047     \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2048     \@@_actually_draw_Cdots:
2049     \group_end:
2050 }
```

The command `\@@_actually_draw_Cdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool`.

```
2051 \cs_new_protected:Npn \@@_actually_draw_Cdots:
2052 {
2053     \bool_if:NTF \l_@@_initial_open_bool

2082     \bool_if:NT \l_@@_final_open_bool
2083       { \dim_set_eq:NN \l_@@_y_final_dim \l_@@_y_initial_dim }
2084   }
2085 \@@_draw_line:
2086 }

```

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

2087 \cs_new_protected:Npn \@@_draw_Vdots:nnn #1 #2 #3
2088 {
2089   \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2090   \cs_if_free:cT { @ _ dotted _ #1 - #2 }
2091   {
2092     \@@_find_extremities_of_line:nnnn { #1 } { #2 } 1 0

```

The previous command may have changed the current environment by marking some cells as “dotted”, but, fortunately, it is outside the group for the options of the line.

```

2093 \group_begin:
2094   \int_compare:nNnT { #2 } = 0
2095     { \color { nicematrix-first-col } }
2096     {
2097       \int_compare:nNnT { #2 } = \l_@@_last_col_int
2098         { \color { nicematrix-last-col } }
2099     }
2100   \keys_set:nn { NiceMatrix / xdots } { #3 }
2101   \@@_actually_draw_Vdots:
2102 \group_end:
2103 }
2104 }

```

The command `\@@_actually_draw_Vdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool`.

The following function is also used by `\Vdotsfor`.

```

2105 \cs_new_protected:Npn \@@_actually_draw_Vdots:
2106   {

```

The boolean `\l_tmpa_bool` indicates whether the column is of type l (L of {NiceArray}) or may be considered as if.

```

2107  \bool_set_false:N \l_tmpa_bool
2108  \bool_lazy_or:nnF \l_@@_initial_open_bool \l_@@_final_open_bool
2109  {
2110      \@@_set_initial_coords_from_anchor:n { south-west }
2111      \@@_set_final_coords_from_anchor:n { north-west }
2112      \bool_set:Nn \l_tmpa_bool
2113          { \dim_compare_p:nNn \l_@@_x_initial_dim = \l_@@_x_final_dim }
2114  }
```

Now, we try to determine whether the column is of type c (C of {NiceArray}) or may be considered as if.

```

2115  \bool_if:NTF \l_@@_initial_open_bool
2116  {
2117      \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int }
2118      \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2119  }
2120  { \@@_set_initial_coords_from_anchor:n { south } }
2121 \bool_if:NTF \l_@@_final_open_bool
2122  {
2123      \@@_qpoint:n { row - \@@_succ:n \l_@@_final_i_int }
2124      \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
2125  }
2126  { \@@_set_final_coords_from_anchor:n { north } }
2127 \bool_if:NTF \l_@@_initial_open_bool
2128  {
2129      \bool_if:NTF \l_@@_final_open_bool
2130  {
2131      \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
2132      \dim_set_eq:NN \l_tmpa_dim \pgf@x
2133      \@@_qpoint:n { col - \@@_succ:n \l_@@_initial_j_int }
2134      \dim_set:Nn \l_@@_x_initial_dim { ( \pgf@x + \l_tmpa_dim ) / 2 }
2135      \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
2136 }
```

We may think that the final user won't use a "last column" which contains only a command `\Vdots`. However, if the `\Vdots` is in fact used to draw, not a dotted line, but an arrow (to indicate the number of rows of the matrix), it may be really encountered.

```

2136  \int_compare:nNnT \l_@@_last_col_int > { -2 }
2137  {
2138      \int_compare:nNnT \l_@@_initial_j_int = \g_@@_col_total_int
2139  {
2140      \dim_set_eq:NN \l_tmpa_dim \l_@@_right_margin_dim
2141      \dim_add:Nn \l_tmpa_dim \l_@@_extra_right_margin_dim
2142      \dim_add:Nn \l_@@_x_initial_dim \l_tmpa_dim
2143      \dim_add:Nn \l_@@_x_final_dim \l_tmpa_dim
2144  }
2145  }
2146  { \dim_set_eq:NN \l_@@_x_initial_dim \l_@@_x_final_dim }
2147  }
2148  }
2149  {
2150      \bool_if:NTF \l_@@_final_open_bool
2151          { \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim }
2152          { }
```

Now the case where both extremities are closed. The first conditional tests whether the column is of type c (C of {NiceArray}) or may be considered as if.

```

2153  \dim_compare:nNnF \l_@@_x_initial_dim = \l_@@_x_final_dim
2154  {
2155      \dim_set:Nn \l_@@_x_initial_dim
2156  {
2157      \bool_if:NTF \l_tmpa_bool \dim_min:nn \dim_max:nn
2158          \l_@@_x_initial_dim \l_@@_x_final_dim
```

```

2159         }
2160         \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
2161     }
2162   }
2163 }
2164 \@@_draw_line:
2165 }
```

For the diagonal lines, the situation is a bit more complicated because, by default, we parallelize the diagonals lines. The first diagonal line is drawn and then, all the other diagonal lines are drawn parallel to the first one.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

2166 \cs_new_protected:Npn \@@_draw_Ddots:nnn #1 #2 #3
2167 {
2168   \cs_if_free:cT { @@ _ dotted _ #1 - #2 }
2169   {
2170     \@@_find_extremities_of_line:nnnn { #1 } { #2 } 1 1
```

The previous command may have changed the current environment by marking some cells as “dotted”, but, fortunately, it is outside the group for the options of the line.

```

2171   \group_begin:
2172     \keys_set:nn { NiceMatrix / xdots } { #3 }
2173     \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2174     \@@_actually_draw_Ddots:
2175   \group_end:
2176 }
2177 }
```

The command `\@@_actually_draw_Ddots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

```

2178 \cs_new_protected:Npn \@@_actually_draw_Ddots:
2179 {
2180   \bool_if:NTF \l_@@_initial_open_bool
2181   {
2182     \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int }
2183     \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2184     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
2185     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
2186   }
2187   { \@@_set_initial_coords_from_anchor:n { south-east } }
2188   \bool_if:NTF \l_@@_final_open_bool
2189   {

2193     \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
2194   }
2195   { \@@_set_final_coords_from_anchor:n { north-west } }
```

We have retrieved the coordinates in the usual way (they are stored in `\l_@@_x_initial_dim`, etc.). If the parallelization of the diagonals is set, we will have (maybe) to adjust the fourth coordinate.

```
2196 \bool_if:NT \l_@@_parallelize_diags_bool
2197 {
2198   \int_gincr:N \g_@@_ddots_int
```

We test if the diagonal line is the first one (the counter `\g_@@_ddots_int` is created for this usage).

```
2199 \int_compare:nNnTF \g_@@_ddots_int = 1
```

If the diagonal line is the first one, we have no adjustment of the line to do but we store the Δ_x and the Δ_y of the line because these values will be used to draw the others diagonal lines parallels to the first one.

```
2200 {
2201   \dim_gset:Nn \g_@@_delta_x_one_dim
2202   { \l_@@_x_final_dim - \l_@@_x_initial_dim }
2203   \dim_gset:Nn \g_@@_delta_y_one_dim
2204   { \l_@@_y_final_dim - \l_@@_y_initial_dim }
2205 }
```

If the diagonal line is not the first one, we have to adjust the second extremity of the line by modifying the coordinate `\l_@@_x_initial_dim`.

```
2206 {
2207   \dim_set:Nn \l_@@_y_final_dim
2208   {
2209     \l_@@_y_initial_dim +
2210     ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) *
2211     \dim_ratio:nn \g_@@_delta_y_one_dim \g_@@_delta_x_one_dim
2212   }
2213 }
2214 \@@_draw_line:
2215 }
2216 }
```

We draw the `\Iddots` diagonals in the same way.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```
2217 \cs_new_protected:Npn \@@_draw_Iddots:nnn #1 #2 #3

```

The actual instructions for drawing the dotted line with Tikz

The command `\@@_draw_line:` should be used in a `{pgfpicture}`. It has six implicit arguments:

- `\l_@@_x_initial_dim`
- `\l_@@_y_initial_dim`
- `\l_@@_x_final_dim`
- `\l_@@_y_final_dim`
- `\l_@@_initial_open_bool`
- `\l_@@_final_open_bool`

```

2339 \cs_new_protected:Npn \@@_draw_line:
2340 {
2341     \pgfrememberpicturepositiononpage true
2342     \pgf@relevantforpicturesize false
2343     \tl_if_eq:NNTF \l_@@_xdots_line_style_tl \c_@@_standard_tl
```

```

2273     \@@_draw_standard_dotted_line:
2274     \@@_draw_non_standard_dotted_line:
2275 }

```

We have to do a special construction with `\exp_args:N` to be able to put in the list of options in the correct place in the Tikz instruction.

```

2276 \cs_new_protected:Npn \@@_draw_non_standard_dotted_line:
2277 {
2278     \begin{scope}
2279         \exp_args:No \@@_draw_non_standard_dotted_line:n
2280             { \l_@@_xdots_line_style_tl , \l_@@_xdots_color_tl }
2281     }

```

We have used the fact that, in PGF, un color name can be put directly in a list of options (that's why we have put directly `\l_@@_xdots_color_tl`).

The argument of `\@@_draw_non_standard_dotted_line:n` is, in fact, the list of options.

```

2282 \cs_new_protected:Npn \@@_draw_non_standard_dotted_line:n #1
2283 {
2284     \draw
2285     [
2286         #1 ,
2287         shorten~> = \l_@@_xdots_shorten_dim ,
2288         shorten~< = \l_@@_xdots_shorten_dim ,
2289     ]
2290     ( \l_@@_x_initial_dim , \l_@@_y_initial_dim )
2291     -- node [ sloped , above ]
2292         { \c_math_toggle_token \scriptstyle \l_@@_xdots_up_tl \c_math_toggle_token }
2293     node [ sloped , below ]
2294         {
2295             \c_math_toggle_token
2296             \scriptstyle \l_@@_xdots_down_tl
2297             \c_math_toggle_token
2298         }
2299     ( \l_@@_x_final_dim , \l_@@_y_final_dim ) ;
2300 \end{scope}
2301 }

```

The command `\@@_draw_standard_dotted_line:` draws the line with our system of points (which give a dotted line with real round points).

```

2302 \cs_new_protected:Npn \@@_draw_standard_dotted_line:
2303 {

```

First, we put the labels.

```

2362         }
2363     }

```

It seems that, during the first compilations, the value of $\l_@@_l_dim$ may be erroneous (equal to zero or very large). We must detect these cases because they would cause errors during the drawing of the dotted line. Maybe we should also write something in the aux file to say that one more compilation should be done.

```

2416   \dim_ratio:nn \l_@@_inter_dots_dim \l_@@_l_dim
2417 }

```

The length ℓ is the length of the dotted line. We note Δ the length between two dots and n the number of intervals between dots. We note $\delta = \frac{1}{2}(\ell - n\Delta)$. The distance between the initial extremity of the line and the first dot will be equal to $k \cdot \delta$ where $k = 0, 1$ or 2 . We first compute this number k in `\l_tmpb_int`.

```

2418 \int_set:Nn \l_tmpb_int
2419 {
2420   \bool_if:NTF \l_@@_initial_open_bool

User commands available in the new environments

The commands `\@@_Ldots`, `\@@_Cdots`, `\@@_Vdots`, `\@@_Ddots` and `\@@_Idots` will be linked to `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots` and `\Idots` in the environments `{NiceArray}` (the other environments of `nicematrix` rely upon `{NiceArray}`).

The starred versions of these commands are deprecated since version 3.1 but, as for now, they are still available with an error.

The syntax of these commands uses the character `_` as embellishment and that's why we have to insert a character `_` in the *arg spec* of these commands. However, we don't know the future catcode of `_` in the main document (maybe the user will use `underscore`, and, in that case, the catcode is 13 because `underscore` activates `_`). That's why these commands will be defined in a `\AtBeginDocument` and the *arg spec* will be rescanned.

```

2451 \AtBeginDocument
2452 {
2453     \tl_set:Nn \l_@@_argspec_tl { 0 { } E { _ ^ } { { } { } } }

2542     \bool_gset_true:N \g_@@_empty_cell_bool
2543 }
2544 }
```

End of the `\AtBeginDocument`.

The command `\@@_Hspace:` will be linked to `\hspace` in `{NiceArray}`.

```

2545 \cs_new_protected:Npn \@@_Hspace:
2546 {
2547     \bool_gset_true:N \g_@@_empty_cell_bool
2548     \hspace
2549 }
```

In the environment `{NiceArray}`, the command `\multicolumn` will be linked to the following command `\@@_multicolumn:nnn`.

```

2550 \cs_set_eq:NN \@@_old_multicolumn \multicolumn
2551 \cs_new:Npn \@@_multicolumn:nnn #1 #2 #3
2552 {
2553     \@@_old_multicolumn { #1 } { #2 } { #3 }
```

The `\peek_remove_spaces:n` is mandatory.

```

2554 \peek_remove_spaces:n
2555 {
2556     \int_compare:nNnT #1 > 1
2557     {
2558         \seq_gput_left:Nx \g_@@_multicolumn_cells_seq
2559         { \int_use:N \c@iRow - \int_use:N \c@jCol }
2560         \seq_gput_left:Nn \g_@@_multicolumn_sizes_seq { #1 }
2561         \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
2562         {
2563             { \int_use:N \c@iRow }
2564             { \int_use:N \c@jCol }
2565             { \int_use:N \c@iRow }
2566             { \int_eval:n { \c@jCol + #1 - 1 } }
2567         }
2568     }
2569     \int_gadd:Nn \c@jCol { #1 - 1 }
2570 }
2571 }
```

The command `\@@_Hdotsfor` will be linked to `\Hdotsfor` in `{NiceArrayWithDelims}`. Tikz nodes are created also in the implicit cells of the `\Hdotsfor` (maybe we should modify that point).

This command must *not* be protected since it begins with `\multicolumn`.

```

2572 \cs_new:Npn \@@_Hdotsfor:
2573 {
2574     \multicolumn { 1 } { C } { }
2575     \@@_Hdotsfor_i
2576 }
```

The command `\@@_Hdotsfor_i` is defined with the tools of `xparse` because it has an optional argument. Note that such a command defined by `\NewDocumentCommand` is protected and that's why we have put the `\multicolumn` before (in the definition of `\@@_Hdotsfor:`).

```

2577 \AtBeginDocument
2578 {
2579   \tl_set:Nn \l_@@_argspec_tl { 0 { } m 0 { } E { _ ^ } { { } { } } }
2580   \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl

```

We don't put ! before the last optionnal argument for homogeneity with `\Cdots`, etc. which have only one optional argument.

```

2581 \exp_args:NNV \NewDocumentCommand \@@_Hdotsfor_i \l_@@_argspec_tl
2582 {

2737   {
2738     \box_rotate:Nn \l_@@_cell_box { 90 }

```

If we are in the last row, we want all the boxes composed with the command `\rotate` aligned upwards.

```

2739 \int_compare:nNnT \c@iRow = \l_@@_last_row_int
2740   {
2741     \vbox_set_top:Nn \l_@@_cell_box
2742     {
2743       \vbox_to_zero:n { }
2744       \skip_vertical:n { - \box_ht:N \arstrutbox + 0.8 ex }
2745       \box_use:N \l_@@_cell_box
2746     }
2747   }
2748 }

```

The command `\line` accessible in code-after

In the `code-after`, the command `\@@_line:nn` will be linked to `\line`. This command takes two arguments which are the specifications of two cells in the array (in the format $i-j$) and draws a dotted line between these cells.

First, we write a command with an argument of the format $i-j$ and applies the command `\int_eval:n` to i and j ; this must *not* be protected (and is, of course fully expandable).³⁹

```

2749 \cs_new:Npn \@@_double_int_eval:n #1-#2 \q_stop
2750   { \int_eval:n { #1 } - \int_eval:n { #2 } }

```

With the following construction, the command `\@@_double_int_eval:n` is applied to both arguments before the application of `\@@_line_i:nn` (the construction uses the fact the `\@@_line_i:nn` is protected and that `\@@_double_int_eval:n` is fully expandable).

```

2751 \AtBeginDocument
2752   {
2753     \tl_set:Nn \l_@@_argspec_tl { 0 { } m m ! 0 { } E { _ ^ } { { } { } } }
2754     \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl
2755     \exp_args:NNV \NewDocumentCommand \@@_line \l_@@_argspec_tl
2756     {
2757       \group_begin:
2758       \keys_set:nn { NiceMatrix / xdots } { #1 , #4 , down = #5 , up = #6 }
2759       \tl_if_empty:VF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
2760       \use:x
2761       {
2762         \@@_line_i:nn
2763         { \@@_double_int_eval:n #2 \q_stop }
2764         { \@@_double_int_eval:n #3 \q_stop }
2765       }
2766       \group_end:
2767     }
2768 }

```

³⁹Indeed, we want that the user may use the command `\line` in `code-after` with LaTeX counters in the arguments — with the command `\value`.

```

2769 \cs_new_protected:Npn \@@_line_i:nn #1 #2
2770 {
2771     \bool_set_false:N \l_@@_initial_open_bool
2772     \bool_set_false:N \l_@@_final_open_bool
2773     \bool_if:nTF
2774     {
2775         \cs_if_free_p:c { pgf @ sh @ ns @ \@@_env: - #1 }
2776         ||
2777         \cs_if_free_p:c { pgf @ sh @ ns @ \@@_env: - #2 }
2778     }
2779     {
2780         \@@_error:nnn { unknown-cell-for-line-in-code-after } { #1 } { #2 }
2781     }
2782     { \@@_draw_line_ii:nn { #1 } { #2 } }
2783 }
2784 \AtBeginDocument
2785 {
2786     \cs_new_protected:Npx \@@_draw_line_ii:nn #1 #2
2787     {

```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible” and that why we do this static construction of the command `\@@_draw_line_ii`:

```

2788     \c_@@_pgfortikzpicture_tl
2789     \@@_draw_line_iii:nn { #1 } { #2 }
2790     \c_@@_endpgfortikzpicture_tl
2791 }
2792 }
```

The following command *must* be protected (it’s used in the construction of `\@@_draw_line_ii:nn`).

```

2793 \cs_new_protected:Npn \@@_draw_line_iii:nn #1 #2
2794 {
2795     \pgfrememberpicturepositiononpagetrue
2796     \pgfpointshapeborder { \@@_env: - #1 } { \@@_qpoint:n { #2 } }
2797     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
2798     \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
2799     \pgfpointshapeborder { \@@_env: - #2 } { \@@_qpoint:n { #1 } }
2800     \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
2801     \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
2802     \@@_draw_line:
2803 }
```

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Iddots` don’t use this command because they have to do other settings (for example, the diagonal lines must be parallelized).

Commands available in the code-before

In the beginning of the `code-before`, the command `\@@_rowcolor:nn` will be linked to `\rowcolor` and the command `\@@_columncolor:nn` to `\columncolor`.

```

2804 \cs_set_protected:Npn \@@_cut_on_hyphen:w #1-#2\q_stop
2805 {
2806     \tl_set:Nn \l_tmpa_tl { #1 }

The command `\rowcolors` (accessible in the `code-before`) is inspired by the command `\rowcolors` of the package `xcolor` (with the option `table`). However, the command `\rowcolors` of `nicematrix` has *not* the optional argument of the command `\rowcolors` of `xcolor`.

```

2949 \NewDocumentCommand \qrowcolors { O{ } m m m }
2950 {
2951     \int_step_inline:nnn { #2 } { \int_use:N \c@iRow }

2969         }
2970     }
2971 }
```

The vertical rules

We give to the user the possibility to define new types of columns (with `\newcolumntype` of `array`) for special vertical rules (*e.g.* rules thicker than the standard ones) which will not extend in the potential exterior rows of the array.

We provide the command `\OnlyMainNiceMatrix` in that goal. However, that command must be no-op outside the environments of `nicematrix` (and so the user will be allowed to use the same new type of column in the environments of `nicematrix` and in the standard environments of `array`). That's why we provide first a global definition of `\OnlyMainNiceMatrix`.

```
2972 \cs_set_eq:NN \OnlyMainNiceMatrix \use:n
```

Another definition of `\OnlyMainNiceMatrix` will be linked to the command in the environments of `nicematrix`. Here is that definition, called `\@@_OnlyMainNiceMatrix:n`.

```
2973 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix:n #1
2974 {
2975     \int_compare:nNnTF \l_@@_first_col_int = 0
2976     { \@@_OnlyMainNiceMatrix_i:n { #1 } }
2977     {
2978         \int_compare:nNnTF \c@jCol = 0
2979         {
2980             \int_compare:nNnF \c@iRow = { -1 }
2981             { \int_compare:nNnF \c@iRow = { \l_@@_last_row_int - 1 } { #1 } }
2982         }
2983         { \@@_OnlyMainNiceMatrix_i:n { #1 } }
2984     }
2985 }
```

This definition may seem complicated by we must remind that the number of row `\c@iRow` is incremented in the first cell of the row, *after* an potential vertical rule on the left side of the first cell.

The command `\@@_OnlyMainNiceMatrix_i:n` is only a short-cut which is used twice in the above command. This command must *not* be protected.

```
2986 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix_i:n #1
2987 {
2988     \int_compare:nNnF \c@iRow = 0
2989     { \int_compare:nNnF \c@iRow = \l_@@_last_row_int { #1 } }
2990 }
```

Remember that `\c@iRow` is not always inferior to `\l_@@_last_row_int` because `\l_@@_last_row_int` may be equal to -2 or -1 (we can't write `\int_compare:nNnT \c@iRow < \l_@@_last_row_int`).

In fact, independently of `\OnlyMainNiceMatrix`, which is a convenience given to the user, we have to modify the behaviour of the standard specifier “`|`”.

Remark first that the natural way to do that would be to redefine the specifier “`|`” with `\newcolumntype`:

```
\newcolumntype { | } { ! { \OnlyMainNiceMatrix \vline } }
```

However, this code fails if the user uses `\DefineShortVerb{\|}` of `fancyvrb`. Moreover, it would not be able to deal correctly with two consecutive specifiers “`|`” (in a preamble like `ccc||ccc`).

That's why we have done a redefinition of the macro `\arrayrule` of `array` and this redefinition will add `\@@_vline`: instead of `\vline` in the preamble (that definition is in the beginning of `{NiceArrayWithDelims}`).

Here is the definition of `\@@_vline`. This definition *must* be protected because you don't want that macro expanded during the construction of the preamble (the tests in `\@@_OnlyMainNiceMatrix:n` must be effective in each row and not once for all when the preamble is constructed). The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. The package `nicematrix` uses it even if `colortbl` is not loaded.

```
2991 \cs_new_protected:Npn \@@_vline:
2992     { \@@_OnlyMainNiceMatrix:n { { \CT@arc@ \vline } } }
```

The command `\@@_draw_vlines` will be executed when the user uses the option `vlines` (which draws all the vlines of the array).

```
2993 \cs_new_protected:Npn \@@_draw_vlines:
2994 {
2995     \group_begin:
```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. The package `nicematrix` uses it even when `colortbl` is not loaded.

```

2996 \CT@arc@
2997 \pgfpicture
2998 \pgfrememberpicturepositiononpagetrue
2999 \pgf@relevantforpicturesizefalse
3000 \pgfsetlinewidth \arrayrulewidth
3001 \pgfsetrectcap
3002 \@@_qpoint:n { row - 1 }

3034       \dim_set:Nn \l_tmpb_dim { \pgf@x + 0.5 \arrayrulewidth }
3035       \pgfpathlineto { \pgfpoint \l_tmpb_dim \l_tmpa_dim }
3036     }
3037 \pgfusepathqstroke
3038 \endpgfpicture
3039 }

```

Since version 4.1, the key `hvlines` is no longer a mere alias for the conjunction of `hlines` and `vlines`. Indeed, with `hvlines`, the vertical and horizontal rules are *not* drawn within the blocks (created by `\Block`) nor within the “virtual blocks” (corresponding to the dotted lines drawn by `\Cdots`, `\Vdots`, etc.).

```

3040 \cs_new_protected:Npn \@@_draw_hvlines:
3041 {
3042   \bool_lazy_and:nnTF
3043   { \seq_if_empty_p:N \g_@@_pos_of_blocks_seq }

3162       }
3163     }
3164   }
3165 }

```

The commands to draw dotted lines to separate columns and rows

These commands don't use the normal nodes, the medium nor the large nodes. They only use the `col` nodes and the `row` nodes.

Horizontal dotted lines

The following command must *not* be protected because it's meant to be expanded in a `\noalign`.

```

3166 \cs_new:Npn \@@_hdottedline:
3167 {
3168   \noalign { \skip_vertical:N 2\l_@@_radius_dim }
3169   \@@_hdottedline_i:
3170 }

```

On the other side, the following command should be protected.

```

3171 \cs_new_protected:Npn \@@_hdottedline_i:
3172 {

```

We write in the code-after the instruction that will eventually draw the dotted line. It's not possible to draw this dotted line now because we don't know the length of the line (we don't even know the number of columns).

```

3173 \tl_gput_right:Nx \g_@@_internal_code_after_tl
3174   { \@@_hdottedline:n { \int_use:N \c@iRow } }
3175 }

```

The command `\@@_hdottedline:n` is the command written in the `code-after` that will actually draw the dotted line. Its argument is the number of the row *before* which we will draw the row.

```

3176 \AtBeginDocument
3177 {

```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible”.

```

3178 \cs_new_protected:Npx \@@_hdottedline:n #1
3179 {
3180   \bool_set_true:N \exp_not:N \l_@@_initial_open_bool
3181   \bool_set_true:N \exp_not:N \l_@@_final_open_bool
3182   \c_@@_pgfortikzpicture_tl
3183   \@@_hdottedline_i:n { #1 }
3184   \c_@@_endpgfortikzpicture_tl
3185 }
3186 }

```

The following command *must* be protected since it is used in the construction of \@@_hdottedline:n.

```
3187 \cs_new_protected:Npn \@@_hdottedline_i:n #1
3188 {
3189     \pgfrememberpicturepositiononpagetrue
3190     \@@_qpoint:n { row - #1 }
```

We do a translation par -\l_@@_radius_dim because we want the dotted line to have exactly the same position as a vertical rule drawn by “|” (considering the rule having a width equal to the diameter of the dots).

```
3191 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
3192 \dim_sub:Nn \l_@@_y_initial_dim \l_@@_radius_dim
3193 \dim_set_eq:NN \l_@@_y_final_dim \l_@@_y_initial_dim
```

The dotted line will be extended if the user uses `margin` (or `left-margin` and `right-margin`).

The aim is that, by standard the dotted line fits between square brackets (\hline doesn't).

```
\begin{bNiceMatrix}
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}
```

$$\begin{array}{cccc} 1 & 2 & 3 & 4 \\ \hline 1 & 2 & 3 & 4 \\ \vdots & \vdots & \vdots & \vdots \\ 1 & 2 & 3 & 4 \end{array}$$

But, if the user uses `margin`, the dotted line extends to have the same width as a \hline.

```
\begin{bNiceMatrix}[margin]
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}
```

$$\begin{array}{cccc} 1 & 2 & 3 & 4 \\ \hline 1 & 2 & 3 & 4 \\ \cdot & \cdot & \cdot & \cdot \\ 1 & 2 & 3 & 4 \end{array}$$

```
3194 \@@_qpoint:n { col - 1 }
3195 \dim_set:Nn \l_@@_x_initial_dim
3196 {
3197     \pgf@x +
3198     \bool_if:NTF \l_@@_NiceTabular_bool \tabcolsep \arraycolsep
3199     - \l_@@_left_margin_dim
3200 }
3201 \@@_qpoint:n { col - \@@_succ:n \c@jCol }
3202 \dim_set:Nn \l_@@_x_final_dim
3203 {

3268     }
3269   }
3270 }

At the end of the environment {NiceMatrixBlock}, we write in the main .aux file instructions for the column width of all the environments of the block (that's why we have stored the number of the first environment of the block in the counter \l_@@_first_env_block_int).

```

```

3271 {
3272   \bool_if:NT \l_@@_block_auto_columns_width_bool
3273   {
3274     \iow_shipout:Nn \@mainaux \ExplSyntaxOn
3275     \iow_shipout:Nx \@mainaux
3276     {
3277       \cs_gset:cprn
3278       { @@ _ max _ cell _ width _ \int_use:N \g_@@_NiceMatrixBlock_int }
3279     \dim_eval:n { \g_@@_max_cell_width_dim + \arrayrulewidth } }
3280   }
3281   \iow_shipout:Nn \@mainaux \ExplSyntaxOff
3282 }
3283 }

For technical reasons, we have to include the width of an eventual rule on the right side of the cells.

```

The extra nodes

First, two variants of the functions \dim_min:nn and \dim_max:nn.

```

3284 \cs_generate_variant:Nn \dim_min:nn { v n }
3285 \cs_generate_variant:Nn \dim_max:nn { v n }

```

We have three macros of creation of nodes: \@@_create_medium_nodes:, \@@_create_large_nodes: and \@@_create_medium_and_large_nodes:.

We have to compute the mathematical coordinates of the “medium nodes”. These mathematical coordinates are also used to compute the mathematical coordinates of the “large nodes”. That's why we write a command \@@_computations_for_medium_nodes: to do these computations.

The command \@@_computations_for_medium_nodes: must be used in a {pgfpicture}.

For each row i , we compute two dimensions $l_{\text{@}\text{@}_\text{row}_i\text{_min_dim}}$ and $l_{\text{@}\text{@}_\text{row}_i\text{_max_dim}}$. The dimension $l_{\text{@}\text{@}_\text{row}_i\text{_min_dim}}$ is the minimal y -value of all the cells of the row i . The dimension $l_{\text{@}\text{@}_\text{row}_i\text{_max_dim}}$ is the maximal y -value of all the cells of the row i .

Similarly, for each column j , we compute two dimensions $l_{\text{@}\text{@}_\text{column}_j\text{_min_dim}}$ and $l_{\text{@}\text{@}_\text{column}_j\text{_max_dim}}$. The dimension $l_{\text{@}\text{@}_\text{column}_j\text{_min_dim}}$ is the minimal x -value of all the cells

of the column j . The dimension `l_@_column_j_max_dim` is the maximal x -value of all the cells of the column j .

Since these dimensions will be computed as maximum or minimum, we initialize them to `\c_max_dim` or `-\c_max_dim`.

```

3286 \cs_new_protected:Npn \@@_computations_for_medium_nodes:
3287 {
3288     \int_step_variable:nnNn \l_@_first_row_int \g_@_row_total_int \@@_i:

3317     }
}

```

We retrieve the coordinates of the anchor `north east` of the (normal) node of the cell $(i-j)$. They will be stored in `\pgf@x` and `\pgf@y`.

```

3318 \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { north-east }
3319 \dim_set:cn { l_@_row_\@@_i: _max_dim }
3320 { \dim_max:vn { l_@_row_\@@_i: _max_dim } \pgf@y }
3321 \seq_if_in:NxF \g_@_multicolumn_cells_seq { \@@_i: - \@@_j: }
3322 {
3323     \dim_set:cn { l_@_column_\@@_j: _max_dim }
3324     { \dim_max:vn { l_@_column_\@@_j: _max_dim } \pgf@x }
3325 }
3326 }
3327 }
3328 }

```

Now, we have to deal with empty rows or empty columns since we don't have created nodes in such rows and columns.

```

3329 \int_step_variable:nnNn \l_@_first_row_int \g_@_row_total_int \@@_i:
3330 {
3331     \dim_compare:nNnT
3332     { \dim_use:c { l_@_row_\@@_i: _min_dim } } = \c_max_dim
}

```

```

3333     {
3334         \@@_qpoint:n { row - \@@_i: - base }
3335         \dim_set:cn { l_@@_row - \@@_i: _ max _ dim } \pgf@y
3336         \dim_set:cn { l_@@_row - \@@_i: _ min _ dim } \pgf@y
3337     }
3338 }
3339 \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
3340 {
3341     \dim_compare:nNnT
3342     { \dim_use:c { l_@@_column - \@@_j: _ min _ dim } } = \c_max_dim
3343     {
3344         \@@_qpoint:n { col - \@@_j: }
3345         \dim_set:cn { l_@@_column - \@@_j: _ max _ dim } \pgf@y
3346         \dim_set:cn { l_@@_column - \@@_j: _ min _ dim } \pgf@y
3347     }
3348 }
3349 }

```

Here is the command `\@@_create_medium_nodes:`. When this command is used, the “medium nodes” are created.

```

3350 \cs_new_protected:Npn \@@_create_medium_nodes:
3351 {
3352     \pgfpicture
3353     \pgfrememberpicturepositiononpagetrue
3354     \pgf@relevantforpicturesizefalse
3355     \@@_computations_for_medium_nodes:

```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

3356     \tl_set:Nn \l_@@_suffix_tl { -medium }
3357     \@@_create_nodes:
3358     \endpgfpicture
3359 }

```

The command `\@@_create_large_nodes:` must be used when we want to create only the “large nodes” and not the medium ones⁴⁰. However, the computation of the mathematical coordinates of the “large nodes” needs the computation of the mathematical coordinates of the “medium nodes”. Hence, we use first `\@@_computations_for_medium_nodes:` and then the command `\@@_computations_for_large_nodes:`.

```

3360 \cs_new_protected:Npn \@@_create_large_nodes:
3361 {
3362     \pgfpicture
3363     \pgfrememberpicturepositiononpagetrue

3411     }
3412     \dim_set_eq:cc { \l_@@_column _ \@@_succ:n \@@_j: _ min _ dim }
3413     { \l_@@_column _ \@@_j: _ max _ dim }
3414 }
```

Here, we have to use $\dim_{\text{sub}}:\text{cn}$ because of the number 1 in the name.

```

3415 \dim_sub:cn
3416   { \l_@@_column _ 1 _ min _ dim }
3417   \l_@@_left_margin_dim
3418 \dim_add:cn
3419   { \l_@@_column _ \int_use:N \c@jCol _ max _ dim }
3420   \l_@@_right_margin_dim
3421 }
```

The command \@@_create_nodes: is used twice: for the construction of the “medium nodes” and for the construction of the “large nodes”. The nodes are constructed with the value of all the dimensions $\text{l_@@_row_i_min_dim}$, $\text{l_@@_row_i_max_dim}$, $\text{l_@@_column_j_min_dim}$ and $\text{l_@@_column_j_max_dim}$. Between the construction of the “medium nodes” and the “large nodes”, the values of these dimensions are changed.

The function also uses \l_@@_suffix_tl (-medium or -large).

```

3422 \cs_new_protected:Npn \@@_create_nodes:
3423 {
3424   \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
```

```

3425      {
3426          \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
3427          {

```

We draw the rectangular node for the cell ($\text{\@}_i - \text{\@}_j$).

```

3428          \@@_pgf_rect_node:nnnn
3429              { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
3430              { \dim_use:c { l_@@_column_ \@@_j: _min_dim } }
3431              { \dim_use:c { l_@@_row_ \@@_i: _min_dim } }
3432              { \dim_use:c { l_@@_column_ \@@_j: _max_dim } }
3433              { \dim_use:c { l_@@_row_ \@@_i: _max_dim } }
3434          \str_if_empty:NF \l_@@_name_str
3435          {
3436              \pgfnodealias
3437                  { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
3438                  { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
3439          }
3440      }
3441  }

```

Now, we create the nodes for the cells of the `\multicolumn`. We recall that we have stored in `\g_@@_multicolumn_cells_seq` the list of the cells where a `\multicolumn{n}{...}{...}` with $n > 1$ was issued and in `\g_@@_multicolumn_sizes_seq` the correspondant values of n .

```

3442  \seq_mapthread_function:NNN
3443      \g_@@_multicolumn_cells_seq
3444      \g_@@_multicolumn_sizes_seq
3445      \@@_node_for_multicolumn:nn
3446  }

3447 \cs_new_protected:Npn \@@_extract_coords_values: #1 - #2 \q_stop
3448  {
3449      \cs_set:Npn \@@_i: { #1 }
3450      \cs_set:Npn \@@_j: { #2 }
3451  }

```

The command `\@@_node_for_multicolumn:nn` takes two arguments. The first is the position of the cell where the command `\multicolumn{n}{...}{...}` was issued in the format $i-j$ and the second is the value of n (the length of the “multi-cell”).

```

3452 \cs_new_protected:Npn \@@_node_for_multicolumn:nn #1 #2
3453  {
3454      \@@_extract_coords_values: #1 \q_stop
3455      \@@_pgf_rect_node:nnnn
3456          { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
3457          { \dim_use:c { l_@@_column_ \@@_j: _min_dim } }
3458          { \dim_use:c { l_@@_row_ \@@_i: _min_dim } }
3459          { \dim_use:c { l_@@_column_ \int_eval:n { \@@_j: +#2-1 } _max_dim } }
3460          { \dim_use:c { l_@@_row_ \@@_i: _max_dim } }
3461      \str_if_empty:NF \l_@@_name_str
3462      {
3463          \pgfnodealias
3464              { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
3465              { \int_use:N \g_@@_env_int - \@@_i: - \@@_j: \l_@@_suffix_tl }
3466      }
3467  }

```

The blocks

The code deals with the command `\Block`. This command has no direct link with the environment `{NiceMatrixBlock}`.

The following command will be linked to `\Block` in the environments of `nicematrix`. We define it with `\NewDocumentCommand` of `xparse` because it has an optional argument between `<` and `>` (for TeX instructions put before the math mode of the label)

It's mandatory to use a expandable command (probably because of the first optional argument ?).

```
3468 \NewExpandableDocumentCommand \@@_Block: { 0 { } m D < > { } m }
3469   { \@@_Block_i #2 \q_stop { #1 } { #3 } { #4 } }
```

The first mandatory argument of `\@@_Block:` has a special syntax. It must be of the form $i-j$ where i and j are the size (in rows and columns) of the block.

```
3470 \cs_new:Npn \@@_Block_i #1-#2 \q_stop { \@@_Block_ii:nnnn { #1 } { #2 } }
```

Now, the arguments have been extracted: `#1` is i (the number of rows of the block), `#2` is j (the number of columns of the block), `#3` is the list of key-values, `#4` are the tokens to put before the math mode and `#5` is the label of the block.

```
3471 \cs_new_protected:Npn \@@_Block_ii:nnnn { #1 } { #2 } { #3 } { #4 } { #5 }
```

```
3472 {
```

```
3473   \tl_set:Nx \l_tmpa_tl
3474   {
3475     { \int_use:N \c@iRow }
3476     { \int_use:N \c@jCol }
3477     { \int_eval:n { \c@iRow + #1 - 1 } }
3478     { \int_eval:n { \c@jCol + #2 - 1 } }
3479   }
```

Now, `\l_tmpa_tl` contains a “object” corresponding to the position of the block whith four components surrounded by brackets:

`{imin}-{jmin}-{imax}-{jmax}`.

We store this information in the sequence `\g_@@_pos_of_blocks_seq`.

```
3480 \seq_gput_left:NV \g_@@_pos_of_blocks_seq \l_tmpa_tl
```

We also store a complete description of the block in the sequence `\g_@@_blocks_seq`. Of course, the sequences `\g_@@_pos_of_blocks_seq` and `\g_@@_blocks_seq` are redundant, but it's for efficiency. In `\g_@@_blocks_seq`, each block is represented by an “objet” with six components:
`{imin}-{jmin}-{imax}-{jmax}-{options}-{contents}`.

```
3481 \seq_gput_left:Nx \g_@@_blocks_seq
3482 {
3483   \l_tmpa_tl
3484   { #3 }
3485   \exp_not:n { { #4 \@@_math_toggle_token: #5 \@@_math_toggle_token: } }
3486 }
3487 }
```

The key `tikz` is for Tikz options used when the PGF node of the block is created (the “normal” block node and not the “short” one nor the “medium” one). **In fact, as for now, it is *not* documented.** Is it really a good idea to provide such a key?

```
3488 \keys_define:nn { NiceMatrix / Block }
3489 {
3490   tikz .tl_set:N = \l_@@_tikz_tl ,
3491   tikz .value_required:n = true ,
3492 }
```

The command `\@@_draw_blocks:` will draw all the blocks. This command is used after the construction of the array.

```
3493 \cs_new_protected:Npn \@@_draw_blocks:
3494   { \seq_map_inline:Nn \g_@@_blocks_seq { \@@_Block_iii:nnnnn ##1 } }
3495 \cs_new_protected:Npn \@@_Block_iii:nnnnn { #1 } { #2 } { #3 } { #4 } { #5 } { #6 }
3496 {
```

The group is for the keys (even if, as for new, there is only one key, called `tikz` and not documented).

```

3497 \group_begin:
3498 \keys_set:nn { NiceMatrix / Block } { #5 }

3499 \bool_lazy_or:nnTF
3500 { \int_compare_p:nNn { #3 } > \g_@@_row_total_int }
3501 { \int_compare_p:nNn { #4 } > \c@jCol }
3502 { \msg_error:nnnn { nicematrix } { Block-too-large } { #1 } { #2 } }
3503 {

```

We put the contents of the cell in the box `\l_@@_cell_box` because we want the command `\rotate` used in the content to be able to rotate the box.

```
3504 \hbox_set:Nn \l_@@_cell_box { #6 }
```

Let's consider the following `{NiceTabular}`. Because of the instruction `!{\hspace{1cm}}` in the preamble which increases the space between the columns (by adding, in fact, that space to the previous column, that is to say the second column of the tabular), we will create *two* nodes relative to the block: the node `1-1-block` and the node `1-1-block-short`. The latter will be used by `nicematrix` to put the label of the node. The first one won't be used explicitly.

```

\begin{NiceTabular}{CC!{\hspace{1cm}}C}
\Block{2-2}{our block} & & one \\
& & two \\
three & four & five \\
six & seven & eight \\
\end{NiceTabular}

```

We highlight the node `1-1-block`

our block	one
	two
three	four
six	seven

We highlight the node `1-1-block-short`

our block	one
	two
three	four
six	seven

The construction of the node corresponding to the merged cells.

```

3505 \pgfpicture
3506   \pgfrememberpicturepositiononpagetrue
3507   \pgf@relevantforpicturesizefalse
3508   \qpoint:n { row - #1 }
3509   \dim_set_eq:NN \l_tmpa_dim \pgf@y
3510   \qpoint:n { col - #2 }
3511   \dim_set_eq:NN \l_tmpb_dim \pgf@x
3512   \qpoint:n { row - \qpoint:n { #3 } }
3513   \dim_set_eq:NN \l_tmpc_dim \pgf@y
3514   \qpoint:n { col - \qpoint:n { #4 } }
3515   \dim_set_eq:NN \l_tmpd_dim \pgf@x

```

We construct the node for the block with the name `(#1-#2-block)`.

The function `\@@_pgf_rect_node:nnnnn` takes as arguments the name of the node and the four coordinates of two opposite corner points of the rectangle.

```

3516   \begin { pgfscope }
3517     \exp_args:Nx \pgfset { \l_@@_tikz_tl }
3518     \@@_pgf_rect_node:nnnnn
3519       { \@@_env: - #1 - #2 - block }
3520       \l_tmpb_dim \l_tmpa_dim \l_tmpd_dim \l_tmpc_dim
3521   \end { pgfscope }

```

We construct the `short` node.

```

3522   \dim_set_eq:NN \l_tmpb_dim \c_max_dim
3523   \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
3524   {

```

We recall that, when a cell is empty, no (normal) node is created in that cell. That's why we test the existence of the node before using it.

```

3525     \cs_if_exist:cT
3526         { pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
3527     {
3528         \pgfpointanchor { \@@_env: - ##1 - #2 } { west }
3529         \dim_set:Nn \l_tmpb_dim { \dim_min:nn \l_tmpb_dim \pgf@x }
3530     }
3531 }
```

If all the cells of the column were empty, \l_tmpb_dim has still the same value \c_max_dim . In that case, you use for \l_tmpb_dim the value of the position of the vertical rule.

```

3532     \dim_compare:nNnT \l_tmpb_dim = \c_max_dim
3533     {
3534         \@@_qpoint:n { col - #2 }
3535         \dim_set_eq:NN \l_tmpb_dim \pgf@x
3536     }
3537     \dim_set:Nn \l_tmpd_dim { - \c_max_dim }
3538     \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
3539     {
3540         \cs_if_exist:cT
3541             { pgf @ sh @ ns @ \@@_env: - ##1 - #4 }
3542             {
3543                 \pgfpointanchor { \@@_env: - ##1 - #4 } { east }
3544                 \dim_set:Nn \l_tmpd_dim { \dim_max:nn \l_tmpd_dim \pgf@x }
3545             }
3546     }
3547     \dim_compare:nNnT \l_tmpd_dim = { - \c_max_dim }
3548     {
3549         \@@_qpoint:n { col - \@@_succ:n { #4 } }
3550         \dim_set_eq:NN \l_tmpd_dim \pgf@x
3551     }
3552     \@@_pgf_rect_node:nnnnn
3553     { \@@_env: - #1 - #2 - block - short }
3554     \l_tmpb_dim \l_tmpa_dim \l_tmpd_dim \l_tmpc_dim
```

If the creation of the “medium nodes” is required, we create a “medium node” for the block. The function $\@@_pgf_rect_node:nnnnn$ takes as arguments the name of the node and two PGF points.

```

3555     \bool_if:NT \l_@@_medium_nodes_bool
3556     {
3557         \@@_pgf_rect_node:nnn
3558             { \@@_env: - #1 - #2 - block - medium }
3559             { \pgfpointanchor { \@@_env: - #1 - #2 - medium } { north-west } }
3560             { \pgfpointanchor { \@@_env: - #3 - #4 - medium } { south-east } }
3561     }
```

Now, we will put the label of the block.

```

3562     \int_compare:nNnTF { #1 } = { #3 }
3563     { }
```

We take into account the case of a block of one row in the “first row” or the “end row”.

```

3564     \int_compare:nNnTF { #1 } = 0
3565         { \l_@@_code_for_first_row_tl }
3566         {
3567             \int_compare:nNnT { #1 } = \l_@@_last_row_int
3568                 \l_@@_code_for_last_row_tl
3569         }
```

If the block has only one row, we want the label of the block perfectly aligned on the baseline of the row. That's why we have constructed a \pgfcoordinate on the baseline of the row, in the first column of the array. Now, we retrieve the y -value of that node and we store it in \l_tmpa_dim .

```

3570     \pgfextracty \l_tmpa_dim { \@@_qpoint:n { row - #1 - base } }
```

We retrieve (in \pgf@x) the x -value of the center of the block.

```

3571     \@@_qpoint:n { #1 - #2 - block - short }
```

We put the label of the block which has been composed in `\l_@@_cell_box`.

```

3572     \pgftransformshift { \pgfpoint \pgf@x \l_tmpa_dim }
3573     \pgfnode { rectangle } { base }
3574     { \box_use_drop:N \l_@@_cell_box } { } { }
3575 }
```

If the number of rows is different of 1, we put the label of the block in the center of the (short) node (the label of the block has been composed in `\l_@@_cell_box`).

```

3576     {
3577         \pgftransformshift { \Q_@_qpoint:n { #1 - #2 - block - short } }
3578         \pgfnode { rectangle } { center }
3579         { \box_use_drop:N \l_@@_cell_box } { } { }
3580     }
3581     \endpgfpicture
3582 }
3583 \group_end:
3584 }
```

3633 \end { NiceArrayWithDelims }
3634 }
3635 \cs_set_protected:Npn \@@_define_com:nnn #1 #2 #3
3636 {
3637     \cs_set_protected:cpx { #1 AutoNiceMatrix }
3638     {
3639         \str_gset:Nx \g_@@_name_env_str { #1 AutoNiceMatrix }
3640         \AutoNiceMatrixWithDelims { #2 } { #3 }
3641     }
3642 }
3643 \@@_define_com:nnn p ( )
3644 \@@_define_com:nnn b [ ]
3645 \@@_define_com:nnn v | |
3646 \@@_define_com:nnn V \| \|
3647 \@@_define_com:nnn B \{ \}

```

We define also an command \AutoNiceMatrix similar to the environment {NiceMatrix}.

```

3648 \NewDocumentCommand \AutoNiceMatrix { O { } m O { } m ! O { } }
3649 {
3650     \group_begin:
3651         \bool_set_true:N \l_@@_NiceArray_bool
3652         \AutoNiceMatrixWithDelims . . { #2 } { #4 } [ #1 , #3 , #5 ]
3653     \group_end:
3654 }

```

The redefinition of the command \dotfill

```

3655 \cs_set_eq:NN \@@_dotfill \dotfill
3656 \cs_new_protected:Npn \@@_dotfill:
3657 {

```

First, we insert \@@_dotfill (which is the saved version of \dotfill) in case of use of \dotfill “internally” in the cell (e.g. \hbox to 1cm {\dotfill}).

```

3658 \@@_dotfill
3659 \bool_if:NT \l_@@_NiceTabular_bool
3660     { \group_insert_after:N \@@_dotfill_ii: }
3661     { \group_insert_after:N \@@_dotfill_i: }
3662 }
3663 \cs_new_protected:Npn \@@_dotfill_i: { \group_insert_after:N \@@_dotfill_ii: }
3664 \cs_new_protected:Npn \@@_dotfill_ii: { \group_insert_after:N \@@_dotfill_iii: }

```

Now, if the box if not empty (unfortunately, we can't actually test whether the box is empty and that's why we only consider it's width), we insert \@@_dotfill (which is the saved version of \dotfill) in the cell of the array, and it will extend, since it is no longer in \l_@@_cell_box.

```

3665 \cs_new_protected:Npn \@@_dotfill_iii:
3666     { \dim_compare:nNnT { \box_wd:N \l_@@_cell_box } = \c_zero_dim \@@_dotfill }

```

The command \diagbox

```

3667 \cs_new_protected:Npn \@@_diagbox:nn #1 #2
3668 {
3669     \tl_gput_right:Nx \g_@@_internal_code_after_tl
3670     {
3671         \@@_actually_diagbox:nnnn
3672         { \int_use:N \c@iRow } { \int_use:N \c@jCol } { #1 } { #2 }
3673     }
3674 }
```

The two arguments of `\@@_actually_diagbox:nn` are the number of row and the number of column of the cell to slash. The two other are the elements to draw below and above the diagonal line.

```

3675 \cs_new_protected:Npn \@@_actually_diagbox:nnnn #1 #2 #3 #4
3676 {
3677     \pgfpicture
3678     \pgf@relevantforpicturesizefalse

3680     \@@_qpoint:n { row - #1 }
3681     \dim_set_eq:NN \l_tmpa_dim \pgf@y
3682     \@@_qpoint:n { col - #2 }
3683     \dim_set_eq:NN \l_tmpb_dim \pgf@x
3684     \pgfpathmoveto { \pgfpoint \l_tmpb_dim \l_tmpa_dim }
3685     \@@_qpoint:n { row - \@@_succ:n { #1 } }
3686     \dim_set_eq:NN \l_tmpc_dim \pgf@y
3687     \@@_qpoint:n { col - \@@_succ:n { #2 } }
3688     \dim_set_eq:NN \l_tmpd_dim \pgf@x
3689     \pgfpathlineto { \pgfpoint \l_tmpd_dim \l_tmpc_dim }
3690 }
```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. The package `nicematrix` uses it even if `colortbl` is not loaded.

```

3691     \CT@arc@
3692     \pgfsetroundcap
3693     \pgfusepathqstroke
3694 }
3695 \pgfset { inner~sep = 1 pt }
3696 \pgfscope
3697 \pgftransformshift { \pgfpoint \l_tmpb_dim \l_tmpc_dim }
3698 \pgfnode { rectangle } { south-west }
3699 { \@@_math_toggle_token: #3 \@@_math_toggle_token: } { } { }
3700 \endpgfscope
3701 \pgftransformshift { \pgfpoint \l_tmpd_dim \l_tmpa_dim }
3702 \pgfnode { rectangle } { north-east }
3703 { \@@_math_toggle_token: #4 \@@_math_toggle_token: } { } { }
3704 \endpgfpicture
3705 }
```

The keyword \CodeAfter

In fact, in this subsection, we define the user command `\CodeAfter` for the case of the “normal syntax”. For the case of “light-syntax”, see the definition of the environment `{@@-light-syntax}` on p. 66.

The command `\CodeAfter` catches everything until the end of the current environment (of `nicematrix`). First, we go until the next command `\end`.

```

3706 \cs_new_protected:Npn \@@_CodeAfter:n #1 \end
3707 {
3708     \tl_gput_right:Nn \g_@@_code_after_tl { #1 }
3709     \@@_CodeAfter_i:n
3710 }
```

We catch the argument of the command `\end` (in #1).

```

3711 \cs_new_protected:Npn \@@_CodeAfter_i:n #1
3712 {
```

If this is really the `\end` of the current environment (of `nicematrix`), we put back the command `\end` and its argument in the TeX flow.

```
3713 \str_if_eq:eeTF \currenvir { #1 }
3714   { \end { #1 } }
```

If this is not the `\end` we are looking for, we put those tokens in `\g_@@_code_after_tl` and we go on searching for the next command `\end` with a recursive call to the command `\@@_CodeAfter:n`.

```
3715   {
3716     \tl_gput_right:Nn \g_@@_code_after_tl { \end { #1 } }
3717     \@@_CodeAfter:n
3718   }
3719 }
```

We process the options at package loading

We process the options when the package is loaded (with `\usepackage`) but we recommend to use `\NiceMatrixOptions` instead.

We must process these options after the definition of the environment `{NiceMatrix}` because the option `renew-matrix` executes the code `\cs_set_eq:NN \env@matrix \NiceMatrix`.

Of course, the command `\NiceMatrix` must be defined before such an instruction is executed.

```
3720 \keys_define:nn { NiceMatrix / Package }
3721   {
3722     renew-dots .bool_set:N = \l_@@_renew_dots_bool ,
3723     renew-dots .value_forbidden:n = true ,
3724     renew-matrix .code:n = \@@_renew_matrix: ,
3725     renew-matrix .value_forbidden:n = true ,
3726     transparent .meta:n = { renew-dots , renew-matrix } ,
3727     transparent .value_forbidden:n = true ,
3728   }
3729 \ProcessKeysOptions { NiceMatrix / Package }
```

Error messages of the package

The following command converts all the elements of a sequence (which are token lists) into strings.

```
3730 \cs_new_protected:Npn \@@_convert_to_str_seq:N #1
3731   {
3732     \seq_clear:N \l_tmpa_seq
3733     \seq_map_inline:Nn #1
3734       {
3735         \seq_put_left:Nx \l_tmpa_seq { \tl_to_str:n { ##1 } }
3736       }
3737     \seq_set_eq:NN #1 \l_tmpa_seq
3738 }
```

The following command creates a sequence of strings (`str`) from a `clist`.

```
3739 \cs_new_protected:Npn \@@_set_seq_of_str_from_clist:Nn #1 #2
3740   {
3741     \seq_set_from_clist:Nn #1 { #2 }
3742     \@@_convert_to_str_seq:N #1
3743   }
3744 \@@_set_seq_of_str_from_clist:Nn \c_@@_types_of_matrix_seq
3745   {
3746     NiceMatrix ,
3747     pNiceMatrix , bNiceMatrix , vNiceMatrix, BNiceMatrix, VNiceMatrix
3748 }
```

If the user uses too much columns, the command `\@@_error_too_much_cols:` is executed. This command raises an error but try to give the best information to the user in the error message. The command `\seq_if_in:NVT` is not expandable and that's why we can't put it in the error message itself. We have to do the test before the `\@@_fatal:n`.

```

3749 \cs_new_protected:Npn \@@_error_too_much_cols:
3750 {
3751     \seq_if_in:NVT \c_@@_types_of_matrix_seq \g_@@_name_env_str

16 History

Changes between versions 1.0 and 1.1

The dotted lines are no longer drawn with Tikz nodes but with Tikz circles (for efficiency). Modification of the code which is now twice faster.

Changes between versions 1.1 and 1.2

New environment `{NiceArray}` with column types L, C and R.

Changes between version 1.2 and 1.3

New environment `{pNiceArrayC}` and its variants.

Correction of a bug in the definition of `{BNiceMatrix}`, `{vNiceMatrix}` and `{VNiceMatrix}` (in fact, it was a typo).

Options are now available locally in `{pNiceMatrix}` and its variants.

The names of the options are changed. The old names were names in “camel style”.

Changes between version 1.3 and 1.4

The column types w and W can now be used in the environments `{NiceArray}`, `{pNiceArrayC}` and its variants with the same meaning as in the package `array`.

New option `columns-width` to fix the same width for all the columns of the array.

Changes between version 1.4 and 2.0

The versions 1.0 to 1.4 of `nicematrix` were focused on the continuous dotted lines whereas the version 2.0 of `nicematrix` provides different features to improve the typesetting of mathematical matrices.

Changes between version 2.0 and 2.1

New implementation of the environment `{pNiceArrayRC}`. With this new implementation, there is no restriction on the width of the columns.

The package `nicematrix` no longer loads `mathtools` but only `amsmath`.

Creation of “medium nodes” and “large nodes”.

Changes between version 2.1 and 2.1.1

Small corrections: for example, the option `code-for-first-row` is now available in the command `\VNiceMatrixOptions`.

Following a discussion on TeX StackExchange⁴¹, Tikz externalization is now deactivated in the environments of the package `nicematrix`.⁴²

⁴¹cf. tex.stackexchange.com/questions/450841/tikz-externalize-and-nicematrix-package

⁴²Before this version, there was an error when using `nicematrix` with Tikz externalization. In any case, it's not possible to externalize the Tikz elements constructed by `nicematrix` because they use the options `overlay` and `remember picture`.

Changes between version 2.1.2 and 2.1.3

When searching the end of a dotted line from a command like `\Cdots` issued in the “main matrix” (not in the exterior column), the cells in the exterior column are considered as outside the matrix. That means that it’s possible to do the following matrix with only a `\Cdots` command (and a single `\Vdots`).

$$\begin{pmatrix} 0 & \overset{C_j}{\vdots} & 0 \\ 0 & a & \dots \\ 0 & & 0 \end{pmatrix}_{L_i}$$

Changes between version 2.1.3 and 2.1.4

Replacement of some options `0 { }` in commands and environments defined with `xparse` by `! 0 { }` (because a recent version of `xparse` introduced the specifier `!` and modified the default behaviour of the last optional arguments).

See www.texdev.net/2018/04/21/xparse-optional-arguments-at-the-end

Changes between version 2.1.4 and 2.1.5

Compatibility with the classes `revtex4-1` and `revtex4-2`.
Option `allow-duplicate-names`.

Changes between version 2.1.5 and 2.2

Possibility to draw horizontal dotted lines to separate rows with the command `\hdottedline` (similar to the classical command `\hline` and the command `\hdashline` of `arydshln`).
Possibility to draw vertical dotted lines to separate columns with the specifier “`:`” in the preamble (similar to the classical specifier “`|`” and the specifier “`:`” of `arydshln`).

Changes between version 2.2 and 2.2.1

Improvement of the vertical dotted lines drawn by the specifier “`:`” in the preamble.
Modification of the position of the dotted lines drawn by `\hdottedline`.

Changes between version 2.2.1 and 2.3

Compatibility with the column type `S` of `siunitx`.
Option `hlines`.

Changes between version 2.3 and 3.0

Modification of `\Hdotsfor`. Now `\Hdotsfor` erases the `\vlines` (of “`|`”) as `\hdotsfor` does.
Composition of exterior rows and columns on the four sides of the matrix (and not only on two sides) with the options `first-row`, `last-row`, `first-col` and `last-col`.

Changes between version 3.0 and 3.1

Command `\Block` to draw block matrices.

Error message when the user gives an incorrect value for `last-row`.

A dotted line can no longer cross another dotted line (excepted the dotted lines drawn by `\cdottedline`, the symbol ":" (in the preamble of the array) and `\line` in `code-after`).

The starred versions of `\Cdots`, `\Ldots`, etc. are now deprecated because, with the new implementation, they become pointless. These starred versions are no longer documented.

The vertical rules in the matrices (drawn by "|") are now compatible with the color fixed by `colortbl`. Correction of a bug: it was not possible to use the colon ":" in the preamble of an array when `pdflatex` was used with `french-babel` (because `french-babel` activates the colon in the beginning of the document).

Changes between version 3.1 and 3.2 (and 3.2a)

Option `small`.

Changes between version 3.2 and 3.3

The options `first-row`, `last-row`, `first-col` and `last-col` are now available in the environments `{NiceMatrix}`, `{pNiceMatrix}`, `{bNiceMatrix}`, etc.

The option `columns-width=auto` doesn't need any more a second compilation.

The options `renew-dots`, `renew-matrix` and `transparent` are now available as package options (as said in the documentation).

The previous version of `nicematrix` was incompatible with a recent version of `expl3` (released 2019/09/30). This version is compatible.

Changes between version 3.3 and 3.4

Following a discussion on TeX StackExchange⁴³, optimization of Tikz externalization is disabled in the environments of `nicematrix` when the class `standalone` or the package `standalone` is used.

Changes between version 3.4 and 3.5

Correction on a bug on the two previous versions where the `code-after` was not executed.

Changes between version 3.5 and 3.6

LaTeX counters `iRow` and `jCol` available in the cells of the array.

Addition of `\normalbaselines` before the construction of the array: in environments like `{align}` of `amsmath` the value of `\baselineskip` is changed and if the options `first-row` and `last-row` were used in an environment of `nicematrix`, the position of the delimiters was wrong.

A warning is written in the `.log` file if an obsolete environment is used.

There is no longer artificial errors `Duplicate~name` in the environments of `amsmath`.

Changes between version 3.6 and 3.7

The four "corners" of the matrix are correctly protected against the four codes: `code-for-first-col`, `code-for-last-col`, `code-for-first-row` and `code-for-last-row`.

New command `\pAutoNiceMatrix` and its variants (suggestion of Christophe Bal).

⁴³cf. tex.stackexchange.com/questions/510841/nicematrix-and-tikz-external-optimize

Changes between version 3.7 and 3.8

New programmation for the command `\Block` when the block has only one row. With this programmation, the vertical rules drawn by the specifier “|” at the end of the block is actually drawn. In previous versions, they were not because the block of one row was constructed with `\multicolumn`. An error is raised when an obsolete environment is used.

Changes between version 3.8 and 3.9

New commands `\NiceMatrixLastEnv` and `\OnlyMainNiceMatrix`.
New options `create-medium-nodes` and `create-large-nodes`.

Changes between version 3.9 and 3.10

New option `light-syntax` (and `end-of-row`).
New option `dotted-lines-margin` for fine tuning of the dotted lines.

Changes between versions 3.10 and 3.11

Correction of a bug linked to `first-row` and `last-row`.

Changes between versions 3.11 and 3.12

Command `\rotate` in the cells of the array.
Options `vlines`, `hlines` and `hvlines`.
Option `baseline` pour `{NiceArray}` (not for the other environments).
The name of the Tikz nodes created by the command `\Block` has changed: when the command has been issued in the cell $i-j$, the name is `$i-j$ -block` and, if the creation of the “medium nodes” is required, a node `$i-j$ -block-medium` is created.
If the user try to use more columns than allowed by its environment, an error is raised by `nicematrix` (instead of a low-level error).
The package must be loaded with the option `obsolete-environments` if we want to use the deprecated environments.

Changes between versions 3.12 and 3.13

The behaviour of the command `\rotate` is improved when used in the “last row”.
The option `dotted-lines-margin` has been renamed in `xdots/shorten` and the options `xdots/color` and `xdots/line-style` have been added for a complete customization of the dotted lines.
In the environments without preamble (`{NiceMatrix}`, `{pNiceMatrix}`, etc.), it’s possible to use the options `l` (=L) or `r` (=R) to specify the type of the columns.
The starred versions of the commands `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots` and `\Iddots` are deprecated since the version 3.1 of `nicematrix`. Now, one should load `nicematrix` with the option `starred-commands` to avoid an error at the compilation.
The code of `nicematrix` no longer uses Tikz but only PGF. By default, Tikz is *not* loaded by `nicematrix`.

Changes between versions 3.13 and 3.14

Correction of a bug (question 60761504 on `stackoverflow`).
Better error messages when the user uses & or `\\"` when `light-syntax` is in force.

Changes between versions 3.14 and 3.15

It's possible to put labels on the dotted lines drawn by `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, `\Iddots`, `\Hdotsfor` and the command `\line` in the `code-after` with the tokens `_` and `^`.
The option `baseline` is now available in all the environments of `nicematrix`. Before, it was available only in `{NiceArray}`.
New command `\CodeAfter` (in the environments of `nicematrix`).

Changes between versions 3.15 and 4.0

New environment `{NiceTabular}`
Commands to color cells, row and columns with a perfect result in the PDF.

Changes between versions 4.0 and 4.1

New keys `cell-space-top-limit` and `cell-space-bottom-limit`
New command `\diagbox`
The key `hvline` don't draw rules in the blocks (commands `\Block`) and in the virtual blocks corresponding to the dotted lines.

Changes between versions 4.1 and 4.2

It's now possible to write `\begin{pNiceMatrix}a&b\c&d\end{pNiceMatrix}^2` with the expected result.

Changes between versions 4.2 and 4.3

The horizontal centering of the content of a `\Block` is correct even when an instruction such as `!{\quad}` is used in the preamble of the array.
It's now possible to use the command `\Block` in the “last row”.

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.

10	The code-after	16
11	Other features	16
11.1	Use of the column type S of siunitx	16
11.2	Alignement option in {NiceMatrix}	17
11.3	The command \rotate	17
11.4	The option small	17
11.5	The counters iRow and jCol	18
11.6	The option light-syntax	19
11.7	The environment {NiceArrayWithDelims}	19

12	Utilisation of Tikz with nicematrix	19
12.1	The nodes corresponding to the contents of the cells	19
12.2	The “medium nodes” and the “large nodes”	20
12.3	The “row-nodes” and the “col-nodes”	21
13	Technical remarks	22
13.1	Definition of new column types	22
13.2	Diagonal lines	23
13.3	The “empty” cells	23
13.4	The option exterior-arraycolsep	24
13.5	Incompatibilities	24
14	Examples	24
14.1	Dotted lines	24
14.2	Dotted lines which are no longer dotted	26
14.3	Width of the columns	26
14.4	How to highlight cells of the matrix	27
14.5	Direct use of the Tikz nodes	30
15	Implementation	31
16	History	127
