

The `l3pdfxform` module

Commands for form XObjects

L^AT_EX PDF management testphase bundle

1 `l3pdfxform` documentation

This module contains a number of commands to create “form XObjects”, for which pdf_TE_X introduced the short name “xforms”.

The status is still beta, so the style itself is currently named `l3pdfxform-beta`. Missing is for example code for the dvips route. Probably some of the function will also need to be enhanced by hooks.

`\pdfxform_new:nnn` `\pdfxform_new:nnn` $\langle name \rangle$ $\langle attributes \rangle$ $\langle content \rangle$

New: 2019-08-05
Updated: 2021-02-14

This command create a new form XObject that can be used as appearance or directly later. If the $\langle content \rangle$ contains BDC-marks it should *not* be given as a previously typeset box, but directly so that the names of the BDC-marks can be added to the resources of the xform. The xform will automatically include the resources of the current page. The content will be typeset in a hbox. With pdf_lat_ex and lua_te_x the surrounding color is *not* stored in the form XObject but should be if wanted added e.g. with `\color_select:n{.}`. This keeps the option of color injection open.

`\pdfxform_use:n` `\pdfxform_use:n` $\langle name \rangle$

New: 2019-08-05

This command uses (typesets) a previously created form XObject. If the surrounding color is different, it is injected in the form XObject with the engines pdf_te_x or lua_te_x.

`\pdfxform_ref:n` \star `\pdfxform_ref:n` $\langle name \rangle$

New: 2019-08-05

Inserts the appropriate information to reference the xform $\langle name \rangle$ in for example appearance dictionaries.

`\pdfxform_wd:n` \star `\pdfxform_wd:n` $\langle name \rangle$

`\pdfxform_ht:n` \star

`\pdfxform_dp:n` \star

New: 2019-08-05

These command give back the sizes of the form XObject. The values are stored in t_l-variables with the unit pt and not in dimensions!

```

\pdfxform_if_exist_p:n * \pdfxform_if_exist_p:n {<name>}
\pdfxform_if_exist:nTF * \pdfxform_if_exist:NTF <name> {(true code)} {(false code)}

```

New: 2020-04-29 These command tests if an xform with name {<name>} has been already defined.
