

A L^AT_EX Package of utility macros ^{*†}

Arthur Ogawa [‡]

October 3, 2020

This file embodies the `ltxutil` package, the implementation and its user documentation.

The distribution point for this work is journals.aps.org/revtex, which contains prebuilt runtime files, documentation, and full source, ready to add to a TDS-compliant TeX installation.

The `ltxutil` package was commissioned by the American Physical Society and is distributed under the terms of the L^AT_EX Project Public License 1.3c, the same license under which all the portions of L^AT_EX itself are distributed. Please see <http://ctan.tug.org/macros/latex/base/lppl.txt> for details.

To use this document class, you must have a working TeX installation equipped with L^AT_EX 2_ε and possibly pdftex and Adobe Acrobat Reader or equivalent.

To install, retrieve the distribution, unpack it into a directory on the target computer, and move the file `ltxutil.sty` into a location in your filesystem where it will be found by L^AT_EX.

To use, read the user documentation `ltxutil.pdf`.

1 Processing Instructions

The package file `ltxutil.sty` is generated from this file, `ltxutil.dtx`, using the `DOCSTRIP` facility of L^AT_EX via `tex ltxutil.dtx` (Note: do *not* use L^AT_EX for this

task). The typeset documentation that you are now reading is generated from the same file by typesetting it with L^AT_EX or pdftex via `latex ltxutil.dtx` or `pdflatex ltxutil.dtx`.

1.1 Build Instructions

You may bootstrap this suite of files solely from `ltxutil.dtx`. Prepare by installing L^AT_EX 2_E (and either tex or pdftex) on your computer, then carry out the following steps:

1. Within an otherwise empty directory, typeset `ltxutil.dtx` with L^AT_EX or pdflatex; you will obtain the typeset documentation you are now reading, along with the file `README-LTXUTIL`.

Note: you will have to run L^AT_EX, then `makeindex -s gind.ist ltxutil.idx`, then `makeindex -s gglo.ist -o ltxutil.gls ltxutil.glo`, then L^AT_EX again in order to obtain a valid index and table of contents.

2. Now typeset `ltxutil.dtx` with T_EX(not L^AT_EX), thereby generating the package file `ltxutil.sty`.
3. Install the following files into indicated locations within your TDS-compliant `texmf` tree (you may need root access):

- `$TEXMF/tex/latex/revtex/ltxutil.sty`
- `$TEXMF/source/latex/revtex/ltxutil.dtx`
- `$TEXMF/doc/latex/revtex/ltxutil.pdf`

where `$TEXMF/` stands for `texmf-local/`, or some other `texmf` tree in your installation.

4. Run `mktexlsr` on `$TEXMF/` (you may need root access).
5. Build and installation are now complete; now put a `\usepackage{ltxutil}` in your document preamble!

1.2 Change Log

1.3 Bill of Materials

Following is a list of the files in this distribution arranged according to provenance.

1.3.1 Primary Source

One single file generates all.

```
%ltxutil.dtx
%
```

1.3.2 Generated by `latex ltxutil.dtx`

Typesetting the source file under pdflatex generates the readme and the documentation.

```
%README-LTXUTIL ltxutil.pdf  
%
```

1.3.3 Generated by `tex ltxutil.dtx`

Typesetting this file with `TEX` generates the package file.

```
%ltxutil.sty  
%
```

1.3.4 Auxiliary

The following are auxiliary files generated in the course of running `LATEX`:

```
%ltxutil.aux ltxutil.idx ltxutil.ind ltxutil.log ltxutil.toc  
%
```

2 Code common to all modules

We want to require only one place in this file where the version number is stated, and we also want to ensure that the version number is embedded into every generated file.

Now we declare that these files can only be used with `LATEX 2E`. An appropriate message is displayed if a different `TEX` format is used.

```
1 %<*doc|package>  
2 \NeedsTeXFormat{LaTeX2e}[1995/12/01]  
3 %</doc|package>
```

As desired, the following modules all take common version information:

```
4 %<kernel&!package&!doc>\typeout{  
5 %<*package|doc>  
6 \ProvidesFile{  
7 %</package|doc>  
8 %<*kernel|package|doc>  
9 ltxutil%  
10 %</kernel|package|doc>  
11 %<*doc>  
12 .dtx%  
13 %</doc>  
14 %<package>.sty%  
15 %<*package|doc>  
16 }%  
17 %</package|doc>
```

The following line contains, for once and for all, the version and date information. By various means, this information is reproduced consistently in all generated files and in the typeset documentation. Give credit where due.

```
18 %<*doc|package|kernel>
19 %<version>
20 [2020/10/03 4.2e utilities package (portions licensed from W. E. Baxter web at superscript.com)
21 %</doc|package|kernel>
22 %<kernel&!package&!doc>}%
```

3 The driver module doc

This module, consisting of the present section, typesets the programmer's documentation, generating the `README-LTXUTIL` as required.

Because the only uncommented-out lines of code at the beginning of this file constitute the `doc` module itself, we can simply typeset the `.dtx` file directly, and there is thus rarely any need to generate the "doc" DOCSTRIP module. Module delimiters are nonetheless required so that this code does not find its way into the other modules.

The `\end{document}` command concludes the typesetting run.

```
23 %<*doc>
```

3.1 The Preamble

The programmers documentation is formatted with the `ltxdoc` class with local customizations, and with the usual code line indexing.

```
24 \documentclass{ltxdoc}
25 \RequirePackage{ltxdocext}%
26 \let\url\undefined
27 \RequirePackage[colorlinks=true,linkcolor=blue]{hyperref}%
28 \pdfstringdefDisableCommands{%
29   \let\file\relax
30   \let\sc\relax
31 }
32 \%expandafter\ifx\csname package@font\endcsname\@undefined\else
33 \%expandafter\RequirePackage\expandafter{\csname package@font\endcsname}%
34 \%fi
35 \CodelineIndex\EnableCrossrefs % makeindex -s gind.ist ltxutil
36 \RecordChanges % makeindex -s gglo.ist -o ltxutil.gls ltxutil.glo
```

3.1.1 Docstrip and info directives

We use so many DOCSTRIP modules that we set the `StandardModuleDepth` counter to 1.

```
37 \setcounter{StandardModuleDepth}{1}
```

The following command retrieves the date and version information from this file.

```
38 \expandafter\GetFileInfo\expandafter{\jobname.dtx}%
```

3.2 The “Read Me” File

As promised above, here is the contents of the “Read Me” file. That file serves a double purpose, since it also constitutes the beginning of the programmer’s documentation. What better thing, after all, to have appear at the beginning of the typeset documentation?

A good discussion of how to write a ReadMe file can be found in Engst, Tonya, “Writing a ReadMe File? Read This” *MacTech* October 1998, p. 58.

Note the appearance of the `\StopEventually` command, which marks the dividing line between the user documentation and the programmer documentation.

The usual user will not be asked to do a full build, not to speak of the bootstrap. Instructions for carrying out these procedures begin the programmer’s manual.

84
85 \tableofcontents
86
87 \section{Processing Instructions}
88
89 The package file \file{ltxutil.sty}
90 is generated from this file, \file{ltxutil.dtx},
91 using the {\sc docstrip} facility of \LaTeX
92 via |tex ltxutil.dtx| (Note: do \emph{not} use \LaTeX\ for this task).
93 The typeset documentation that you are now reading is generated from
94 the same file by typesetting it with \LaTeX\ or pdftex
95 via |latex ltxutil.dtx| or |pdflatex ltxutil.dtx|.
96
97 \subsection{Build Instructions}
98
99 You may bootstrap this suite of files solely from \file{ltxutil.dtx}.
100 Prepare by installing \LaTeXe\ (and either tex or pdftex) on your computer,
101 then carry out the following steps:
102 \begin{enumerate}
103 \item
104 Within an otherwise empty directory,
105 typeset \file{ltxutil.dtx} with \LaTeX\ or pdflatex;
106 you will obtain the typeset documentation you are now reading,
107 along with the file \file{README-LTXUTIL}.
108
109 Note: you will have to run \LaTeX, then
110 \file{makeindex} \texttt{-s gind.ist ltxutil.idx}, then
111 \file{makeindex} \texttt{-s gglo.ist -o ltxutil.gls ltxutil.glo}, then
112 \LaTeX\ again in order to obtain a valid index and table of contents.
113 \item
114 Now typeset \file{ltxutil.dtx} with \TeX\ (not \LaTeX),
115 thereby generating the package file \file{ltxutil.sty}.
116 \item
117 Install the following files into indicated locations within your
118 TDS-compliant \texttt{texmf} tree (you may need root access):
119 \begin{itemize}
120 \item
121 \file{$TEXMF/}\file{tex/}\file{latex/}\file{revtex/}\classname{ltxutil.sty}
122 \item
123 \file{$TEXMF/}\file{source/}\file{latex/}\file{revtex/}\classname{ltxutil.dtx}
124 \item
125 \file{$TEXMF/}\file{doc/}\file{latex/}\file{revtex/}\classname{ltxutil.pdf}

```

```

126 \end{itemize}
127 where \file{$TEXMF} stands for \file{texmf-local/}, or some other \texttt{texmf} tree
128 in your installation.
129 \item
130 Run \texttt{mktexlsr} on \file{$TEXMF} (you may need root access).
131 \item
132 Build and installation are now complete;
133 now put a \cmd{\usepackage}{\texttt{\{ltxutil\}}} in your document preamble!
134 \end{enumerate}
135

```

3.3 The Document Body

Here is the document body, containing only a `\DocInput` directive—referring to this very file. This very cute self-reference is a common `ltxdoc` idiom.

```

191 \begin{document}%
192 \expandafter\DocInput\expandafter{\jobname.dtx}%
193 \end{document}%
194 %</doc>

```

4 Using this package

Once this package is installed on your filesystem, you can employ it in adding functionality to L^AT_EX by invoking it in your document or document class.

4.1 Invoking the package

In your document, you can simply call it up in your preamble:

```

%\documentclass{book}%
%\usepackage{ltxutil}%
%\begin{document}%
%<your document here>
%\end{document}

```

However, the preferred way is to invoke this package from within your customized document class:

```

%\NeedsTeXFormat{LaTeX2e}[1995/12/01]%
%\ProvidesClass{myclass}%
%\RequirePackage{ltxutil}%
%\LoadClass{book}%
%<class customization commands>
%\endinput

```

Once loaded, the package gives you access to certain procedures, usually to be invoked by a L^AT_EX command or environment, but not at the document level.

5 Compatibility with L^AT_EX's Required Packages

Certain packages, usually ones written by members of the L^AT_EX Project itself, have been designated “required” and are distributed as part of standard L^AT_EX. These packages have been placed in a privileged position vis à vis the L^AT_EX kernel in that they override the definitions of certain kernel macros.

The `ltxutil` package will be incompatible with any package that redefines any of the kernel macros that `ltxutil` patches—if that package is loaded *after* `ltxutil`. This means that for greatest compatibility, `ltxutil` should be loaded *after*, say, `ftnright`, which overwrites L^AT_EX's kernel procedures `\@outputdblcol`, `\@startcolumn`, and `\@makecol`.

Hereinafter follows some notes on specific L^AT_EX packages.

5.1 array

This package alters the way tabular environments are done, therefore it could run afoul of the L^AT_EX “required” package `array` or any package that calls for it to be loaded. However, this package has provisions for remaining compatible with `array`. So long as the version of `array` that is used with this package has the appropriate meanings for the procedures it overwrites, all should be well.

5.2 longtable

David Carlisle's `longtable` package modifies both the L^AT_EX kernel and the `array` package. This package must therefore alter `\LT@array`. For now, that job is handled by `ltxgrid`.

6 Implementation of package

Special acknowledgment: this package uses concepts pioneered and first realized by William Baxter (<mailto:web at superscript.com>) in his SuperScript line of commercial typesetting tools, and which are used here with his permission.

6.1 Beginning of the package DOCSTRIP module

```
195 %<*package>
196 \def\package@name{ltxutil}%
197 \expandafter\PackageInfo\expandafter{\package@name}{%
198   Utility macros for \protect\LaTeXe,
199   by A. Ogawa (arthur_ogawa at sbcglobal.net)%
200 }%
201 %</package>

6.5 Boolean Control

We introduce just enough of the Boolean calculus for TeX. Alan Jeffrey was the pioneer here, with an article in TUGboat (Vol. 11, No. 2, page 237). This implementation owes a debt to William Baxter (web at superscript.com). See articles by Baxter and Ogawa in the proceedings of the 1994 TUG meeting, TUGboat Vol. 15, No. 3.

\prepdef \appdef \gapdef	Provide the capability of performing head- and tail patches. The procedure \prepdef prepends to the given macro the tokens specified in its second argument. Likewise for \appdef , except that it appends. Note that the first 10 toks registers are utility registers, and we simply make a control sequence name, \toks@ii , for one of them.
---	--

```

269 \long\def\prepdef#1#2{%

302 \def\@ifxundefined#1{\expandafter\@ifx\expandafter{\csname#1\endcsname\relax}}%
```

`\rvtx@iffomat@geq` Some changes in the L^AT_EX kernel requires us to conditionally define some macros depending on the version of the kernel. `\rvtx@iffomat@geq` will check if the release date of the currently-running L^AT_EX 2_E kernel is greater or equal to the argument (the argument should be in the format yyyy-mm-dd).

```
303 \ifx\IfFormatAtLeastTF\undefined
304   \def\rvtx@iffomat@geq{\ifl@t@r\fmtversion}%
305 \else
306   \let\rvtx@iffomat@geq\IfFormatAtLeastTF
307 \fi
```

`\@boolean` In order to define `\@ifx`, we first must create the “defining word” (term taken from our Forth vocabulary) `\@boole@def`, which employs `\@boolean` to do its job.

```
308 \def\@boolean#1#2{%
309   \long\def#1{%
310     #2% \if<something>
311       \expandafter\true@sw
312     \else
313       \expandafter\false@sw
314     \fi
315   }%
316 }%
317 \def\@boole@def#1{\@boolean{#1}}% Implicit #2
```

`\@booleantrue` The procedures `\@booleantrue` and `\@booleanfalse` are assignment operators
`\@booleanfalse` for Boolean flags.

```
318 \def\@booleantrue#1{\let#1\true@sw}%
319 \def\@booleanfalse#1{\let#1\false@sw}%
```

`\@ifx` We can now invoke the defining word to create the procedures `\@ifx` and friends.
`\@ifx@empty` Compatibility Note: earlier versions of this package defined a procedure
`\@ifempty`. However, for compatibility with AMSL^AT_EX, we must avoid the fol-
`\@ifcat` lowing three names: `\@ifempty`, `\@xifempty`, and `\@ifnotempty`.

```
320 \@boole@def\@ifx#1{\ifx#1}%
321 \@boole@def\@ifx@empty#1{\ifx\@empty#1}%
322 \@boole@def\@ifempty#1{\if!#1!}%

6.6 Begin Document Structure

The standard L^AT_EX mechanism **\AtBeginDocument** is inadequate because the **\vsize** is bound much too early. We supply here a mechanism whereby decisions about the page layout can be deferred until **\AtBeginDocument** time.

The problem we are working around is that the **\AtBeginDocument** hook in **\document** appears long after the calculation of **\vsize** and **\hsize**, that is, L^AT_EX provides no mechanism for deferring the decision about the page grid until **\AtBeginDocument** time. We fix things by prepending a hook at the very beginning of **\document**.

As it turns out, though, it appears feasible to simply invoke the desired column grid command at **\AtBeginDocument** time, since the MVL has nothing in it at that time that would be problematical.

\document We begin by installing hooks into **\document** that we will manage ourselves.

The 2020-10-01 L^AT_EX release got a new hook management system and several new hooks (several previously provided by **etoolbox**). The one we want here is **begindocument/before**, the first thing executed by **\document**, right after ending the group started by **\begin**.

Thus, if the L^AT_EX kernel date is 2020-10-01 we just add to that hook, otherwise resort to the old method, patching **\document**: end the group started by **\begin**,

apply our hook, and conclude our shenanigans by absorbing the first token of the expansion of `\document`, which we assume to be `\endgroup` (true until the aforementioned release).

```
344 \rvtx@iff{format@geq{2020-10-01}}%
345   {%
346     \AddToHook{begindocument/before}{\document@inithook}%
347   }{%
348     \prepdef{\document}{%
349       \endgroup
350       \document@inithook
351       \true@sw{}%
352     }%
353   }%
```

`\document@inithook` To use, simply `\appdef{\document@inithook}{<your tokens here>}`.

```
354 \let{\document@inithook}{\empty}
```

`\class@documenthook` We install the last `\AtBeginDocument` hook, namely the procedure `\class@documenthook`.
`\class@enddocumenthook` Within the document class, we will use this hook exclusively, so as to avoid interference from other packages. Similarly with `\class@enddocumenthook`, installed via `\AtEndDocument`.

A document class using this package should do as this package does and just say, `\appdef{\class@documenthook}` instead of `\AtBeginDocument`, and `\appdef{\class@enddocumenthook}` instead of `\AtEndDocument`.

```
355 \appdef{\document@inithook}{%
356   \AtBeginDocument{\class@documenthook}%
357 }%
358 \AtEndDocument{%
359   \class@enddocumenthook
360 }%
361 \let{\class@documenthook}{\empty}
362 \let{\class@enddocumenthook}{\empty}
```

`\enddocument` The standard L^AT_EX `\end{document}` processing is a potential problem, particularly when the output routine has been changed by `ltxgrid`. We separate out the `\check@aux` procedure that checks the auxiliary file at the end of the job so that later it can be called from the safety of the output routine. We will do this to ensure that the `\mainaux` stream is not closed until the last page of the job is shipped out, and that can only be done by coordinating with the output routine.

This approach, however, will only be done for older versions of the L^AT_EX kernel:

```
363 \rvtx@iff{format@geq{2020-10-01}}{%
364   % <definitions for newer LaTeX later>
365 }{%
366   % <definitions for older LaTeX>
367 \def{\enddocument}{%
```

The following line from `ltxutil.dtxlstmiscen.dtx` ‘resets `\AtEndDocument` for latex/3060’.

```
368 \let{\AtEndDocument}{\firstofone}
```

```

369  \enddocumenthook
370  \checkend{document}%

```

The `\clear@document` statement ends the current page (we must guarantee no further shipouts), then executes all cleanup procedures that must occur only after the last shipout. Clients will queue up their procedures via `\AfterLastShipout`, if it exists, otherwise by doing `\appdef\clear@document`.

```

371  \clear@document

```

We are very close to ending the T_EX run, now.

```

372  \check@aux
373  \deadcycles\z@
374  \@@end
375 }%

402  }{}%
403 }{}%
404  \multiplelabels
405 }%
406 }{}%
407 }%
408 }

```

`\rvtx@enddocument@patch` For newer L^AT_EX we'll try to be a bit more future-proof (no miracle though). The code for `\enddocument` (in pre-2020-10-01 L^AT_EX) is roughly:

```

% \def\enddocument{%
%   <hooks and bookkeeping>
%   \clearpage
%   <read main .aux and final checks>
%   \@@end
% }
%
```

and the patches above replace the `\clearpage` by its own `\clear@document`, and `<read main .aux and final checks>` by `\do@check@aux`, which it can later control the timing.

Now we will apply the same changes, but this time without redefining `\enddocument`: we will instead replace tokens on-the-fly, when `\enddocument` is expanded. This will grant us a slightly safer approach that won't depend so much on the internals of `\enddocument`.

This entire patch should work with the previous definition of `\enddocument` as well (except it cannot be used in the hook), but for now leave previous versions untouched.

The entire patching will reside in the `enddocument` hook:

```

409 \rvtx@ifformat@geq{2020-10-01}{%
410   \AddToHook{enddocument}{\rvtx@enddocument@patch{}}
411 }{}
```

This macro will be executed after `\enddocument` has expanded, so all its tokens are now exposed. Here we will assume that `\enddocument` contains the tokens `\@checkend{document}` and `\endgroup`, and use them as delimiters:

```

412 \protected\long\def\rvtx@enddocument@patch#1#2\@checkend#3{%
413   \begingroup
414     \edef\x{\detokenize{#3}}%
415     \edef\y{\detokenize{document}}%
416     \expandafter\endgroup
417     \ifx\x\y
418       \expandafter\rvtx@enddocument@patch@end
419     \else
420       \expandafter\rvtx@enddocument@patch@more
421     \fi
422     {#1#2}{#3}}
423 \def\rvtx@enddocument@patch@more#1#2{%
424   \rvtx@enddocument@patch{#1\@checkend{#2}}}
```

When the `\@checkend{document}` is reached, use `\clearpage` and `\enddocument` as delimiters for the `<read main .aux and final checks>` part, and save it in `\do@check@aux`:

```

425 \long\def\rvtx@enddocument@patch@end#1#2\clearpage#3\endgroup{%
426   \def\do@check@aux{#3\endgroup}}
```

Then execute the code consumed in the previous step:

```

427   #1%
428   \@checkend{#2}%
```

Do `\clear@document` instead of `\clearpage` and `\check@aux` instead of the code grabbed.

```
429 \clear@document
430 \check@aux}
431 \def\check@aux{\do@check@aux}%
```

- `\clear@document` The procedure `\clear@document` is responsible for flushing out the last page of the document, if not already done. The procedure then executes those procedures that must wait for execution until after the last page is shipped out. Clients of `ltxutil`, such as `ltxgrid` and `revtex4` will queue these procedures up via `\AfterLastShipout`, if it exists, otherwise by doing `\appdef\clear@document`.

The command `\Call@AfterLastShipout` is provided by Heiko Oberdiek's `atveryend` package. This package is compatible with `ltxutil`.

Note on compatibility with `atveryend`: we arrange for `\Call@AfterLastShipout` to be called from the safety of the output routine, thereby ensuring that all of the procedures queued up by that package's `\AfterLastShipout` are executed at the right time. We also ensure that `\Call@AfterLastShipout` has a default definition, in case the package was never loaded.

```
432 \def\clear@document{%
433 \clearpage
434 \do@output@cclvf%
435 \Call@AfterLastShipout
436 }%
437 }%
438 \appdef\class@documenthook{%
439 \providecommand\Call@AfterLastShipout{}%
440 }%
```

6.7 Class Extensions

The L^AT_EX procedure `\@onefilewithoptions` is the vehicle for reading in a L^AT_EX class or package. The APS RevTeX class implements the use of what are called “substyles”, actually extensions to the class itself. Any document class can do likewise.

- `\class@extension` A procedure similar to L^AT_EX's `\@onefilewithoptions`, but as an extension to the current document class.
`\class@extensionfile` Read in the given file as if it were a document class file. Usage: `\class@extensionfile {\langle class \rangle} \@extension`, where `\langle class \rangle` is a file (similar to `aps.rtx`) and where `\@extension` is the file extension for `\langle class \rangle`. For instance, to read in the file `aps.rtx`, do `\class@extensionfile {aps} \substyle@ext`, where the latter has been define to expand to `.rtx`.

Features supported include passing existing class options on to the class extension, `\AtEndOfClass` processing, a stack that restores `\@currname`, `\@currentt`, `\@clsextension`, and the `\catcode` of ‘@’, fall-back to a control sequence name (with leading ‘rtx@’) if no file exists.

Note that `\LoadClass` gives one the ability to write a class that calls in another class as a (sort of) module: this scheme is like `\LoadClass`, but turned inside out.

```

441 \def\class@extension#1#2{%
442   \IfFileExists{#1.#2}{%
443     \expandafter\class@extensionfile\csname ver@\currname.\@currext\endcsname{#1}#2%
444   }%
445   \csname rtx@#1\endcsname
446 }%
447 }%
448 \def\class@extensionfile#1#2#3{%
449   @pass@ptions#3\@unusedoptionlist{#2}%
450   \global\let\@unusedoptionlist\empty
451   \expandafter\class@ext@hook\csname#2.#3-h00k\endcsname{#2}#3%
452 }%
453 \def\class@ext@hook#1#2#3#4{%
454   @pushfilename@ltx
455   \makeatletter
456   \let\CurrentOption\empty
457   @reset@ptions
458   \let#1\empty
459   \xdef\currname{#3}%
460   \global\let\@currext#4%
461   \global\let\@clsextension\currext
462   \input{#3.#4}%
463   @ifl@ter#4{#3}#2{%
464     \class@info{Class extension later than: #2}%
465   }%
466   \class@info{Class extension earlier: #2}%
467   @@end
468 }%
469 #1%
470 \let#1\undefined
471 \expandafter@p@filename@ltx@\currnamestack@ltx@nil
472 @reset@ptions
473 }%

```

`\@pushfilename` But! L^AT_EX does not provide for a class extension other than `.cls`, therefore we must extend L^AT_EX's file name stack with the file extension of a class extension. This way, procedures like `\ProvidesPackage`, `\OptionNotUsed`, `\ProcessOptions`, `\@reset@ptions` will still work properly.

```

474 \def@pushfilename@ltx{%
475   \xdef\currnamestack@ltx{%
476     {\currname}%
477     {\currext}%
478     {\clsextension}%
479     {\the\catcode`\@}%
480   }\currnamestack@ltx
481 }%
482 }%

```

```

483 \def\@p@filename@ltx#1#2#3#4#5@nil{%
484   \gdef\@currname{#1}%
485   \gdef\@currext{#2}%
486   \gdef\@clsextension{#3}%
487   \catcode`\@#4\relax
488   \gdef\@currnamestack@ltx{#5}%
489 }%
490 \global\let\@currnamestack@ltx\@empty

```

We carefully patch L^AT_EX so that the current value of \@clsextension can be restored after reading in a class file.

6.8 Type Tools

\flushing Undoes \centering. Should also undo \raggedleft and \raggedright.

```

491 \def\flushing{%
492   \let\\@normalcr
493   \leftskip\z@skip
494   \rightskip\z@skip
495   \rightskip\z@skip
496   \parfillskip\@flushglue
497 }%

```

\@centercr The \@centercr command is the replacement for \@normalcr when setting type centered or ragged. Normally, the meaning of \\ is \@normalcr, which L^AT_EX defines via \DeclareRobustCommand. In centered or ragged typesetting, the meaning of \\ is \@centercr, therefore it ought to be defined via \DeclareRobustCommand (but unfortunately is not). The fact that it is not is yet another of L^AT_EX's early failures that will never get fixed.

The following exemplar fails under L^AT_EX version 2005/12/01, package `textcase` 2004/10/07 v0.07:

```

% \documentclass{article}%
% \usepackage[overload]{textcase}
% \begin{document}
% \centering
% \section{\MakeTextUppercase{Section\\title}}
% Text
% \end{document}
%

```

The solution is to promote \@centercr to a robust command, just the same as \\ . We do that here without needing to know the meaning of the command.

```
498 \expandafter\DeclareRobustCommand\expandafter\@centercr\expandafter{\@centercr}%
```

6.9 Display Math

\eqnarray@LaTeX Team L^AT_EX has stated they will never repair Leslie's broken definition of \eqnarray@fleqn@fixed . Let us be bold....

Note on `hyperref` package compatibility: that package overrides `\eqnarray` by wrapping it up in a larger procedure, so its changes are compatible with this package's changes.

```
499 \def\eqnarray@LaTeX{%

The macro `\ltx@mathindent` is assigned to the `\tabskip` glue just before the alignment preamble is expanded, the value therefore applying at the left of the first column.

The below value specifies the display math to be set centered, as is common practice. Alternatively, `\tabskip` can be set to a different glue value, accomplishing flush-left display math.

Note that the `ltxutil.dtxfleqn.clo` package provides its own meaning for the `eqnarray` environment, which is also broken. We do not patch that package, however.

Bug note: The `ltxutil.dtxlineno.sty` package detects `ltxutil.dtxfleqn.clo` by testing whether `\mathindent` is defined, instead of using correct L^AT_EX 2 _{ε} means. Even though our `eqnarray` environment is modelled after `ltxutil.dtxfleqn.clo`, we must program defensively here.

```

549 \def\ltx@mathindent{@centering}%
550 \def\set@eqnarray@skips{}%

```

`\prep@math` If we are in vertical mode when display math mode is entered (via `$$`), TeX will first enter horizontal mode, then display math mode; this results in a phantom paragraph containing a single `\hbox` consisting of the `\parindent` box followed by the `\parskipfillskip` glue. Of course, that `\hbox` is accompanied by `\parskip` glue and `\baselineskip` glue.

The `\prep@math` procedure removes the `\parindent` box, thereby (magically) eliminating the phantom paragraph. The `\prep@math@patch` procedure head-patches the `equation` and `eqnarray` environments to accomplish this removal of the phantom paragraph.

Note that there are three remaining ways to enter display math mode that we do not treat: the `displaymath` environment (equivalent to `\[/\]`), and the primitive the `$$` markup. I refrain from treating the first case because `displaymath` already detects the case where it is entered from vertical mode: I do not wish to engage in the dubious enterprise of attempting to correct a procedure that is ill conceived from the outset. As to the primitive `$$`, there is no help for users who insist upon employing procedural markup in their documents. in their documents.

```

551 \def\prep@math{%
552   \@ifvmode{\everypar{{\setbox\z@\lastbox}}}{%
553 }%
554 \def\prep@math@patch{%
555   \prepdef\equation{\prep@math}%
556   \prepdef\eqnarray{\prep@math}%
557 }%

```

A document class may invoke `\prep@math@patch` at any point it wishes to prevent the appearance of the phantom paragraph: it may be a global declaration or a local one.

We fail to patch `\[`, `\equation`, however.

6.10 Footnotes

<code>\footnotemark</code> <code>\footnotetext</code> <code>\ltx@xfootnote</code> <code>\ltx@footmark</code> <code>\ltx@foottext</code> <code>\ltx@make@current@footnote</code>	We repair an error in the L ^A T _E X kernel (see <code>ltffloat.dtx</code>) involving footnotes. The symptom is that the <code>\footnotemark</code> command does not work properly within a <code>minipage</code> environment. The source of the problem is in the way the <code>\footnotemark</code> and <code>\@xfootnotemark</code> procedures are defined: they do not share the method, used by <code>\footnote</code> and other procedures, that allows a context switch to change the way footnotes behave within a <code>minipage</code> environment. This is a L ^A T _E X bug of long standing; our fix dates to 1987.
--	--

While we are at it, we rewrite both the `\footnote`, `\footnotemark` and `\footnotetext` procedures, achieving a cleaner separation of syntax and semantics. Note that the `\@footnotetext` procedure is not involved in context switching; `hyperref` will take over that procedure, substituting its own processing around its argument and passing this to `\H@@footnotetext`. We anticipate this, and do our context switching on `\H@@footnotetext`.

The `\@makefnmark` continues as the method of formatting the footnote mark.

A note about the context switch mentioned above: the `minipage` environment executes the following in order to alter the way footnotes behave:

```
%\def\@mpfn{\mpfootnote}%
%\def\thempfn{\thempfootnote}%
%\let\@footnotetext\@mpfootnotetext
%\let\@makefnmark\@mpmakefnmark
%\c@mpfootnote\z@
```

This code changes the counter used in autonumbered footnotes, the choice of footnote marker, and the procedure used on the footnote text. Changing the counter is needed because `minipage` footnotes are in their own sequence, and the footnote marker is customarily different within a `minipage`. The procedure that works on the footnote text must be different because the footnotes are placed at the bottom of the `minipage`, not the bottom of the text column.

Note that L^AT_EX initially defines `\@mpfn` as `footnote` and `\thempfn` as `\thefootnote`, so we are initially doing general footnotes.

Any procedure that establishes a `minipage`-like context (e.g., floats) can do the same as the `minipage` context switch illustrated above.

Three user-level command, `\footnote`, `\footnotemark`, and `\footnotetext` are defined (see the L^AT_EX manual for user-level details).

<code>\footnote</code>	The first user-level command is <code>\footnote</code> . A simple way to look at this command is to think of it as <code>\footnotemark [⟨number⟩] \footnotetext [⟨number⟩] {⟨text⟩}</code> , where the optional argument is the same in both calls. We also define a syntactical helper procedure <code>\ltx@xfootnote</code> .
------------------------	---

We employ the procedures `\ltx@stp@footproc` and `\ltx@def@footproc`, passing in the procedure to execute, in this case `\ltx@footmark`, which sets the footnote mark. In any case, we end on the procedure `\ltx@foottext`, which sets the footnote text.

```

558 \def\footnote{\@ifnextchar[\ltx@xfootnote\ltx@yfootnote}%
559 \def\ltx@xfootnote[#1]{%
560   \ltx@def@footproc\ltx@footmark[#1]%
561   \expandafter\ltx@foottext\expandafter{\the\csname c@\@mpfn\endcsname}%
562 }%
563 \def\ltx@yfootnote{%
564   \ltx@stp@footproc\ltx@footmark
565   \expandafter\ltx@foottext\expandafter{\the\csname c@\@mpfn\endcsname}%
566 }%

```

The `\footmark` user-level command is next. Here we use the procedures `\ltx@stp@footproc` and `\ltx@def@footproc` again, but unlike `\footnote`, we do not set the footnote text.

```

567 \def\footnotemark{\@ifnextchar[\ltx@xfootmark\ltx@yfootmark}%
568 \def\ltx@xfootmark{\ltx@def@footproc\ltx@footmark}%
569 \def\ltx@yfootmark{\ltx@stp@footproc\ltx@footmark}%
570 \def\ltx@footmark#1{%
571   \leavevemode
572   \ifhmode\edef\@x@sf{\the\spacefactor}\nobreak\fi
573   \begingroup
574   \expandafter\ltx@make@current@footnote\expandafter{\@mpfn}{#1}%
575   \expandafter\@argswap@val\expandafter{\Hy@footnote@currentHref}{\hyper@linkstart {link}}%
576   \makefnmark
577   \hyper@linkend
578   \endgroup
579   \ifhmode\spacefactor\@x@sf\fi
580   \relax
581 }%

```

The third user-level command is `\footnotetext`. As with `\footnotemark`, we use the procedures `\ltx@stp@footproc` and `\ltx@def@footproc`, this time passing in the procedure `\ltx@foottext`, which sets the footnote text.

```

582 \def\footnotetext{\@ifnextchar[\ltx@xfoottext\ltx@yfoottext}%
583 \def\ltx@xfoottext{\ltx@def@footproc\ltx@foottext}%
584 \def\ltx@yfoottext{\ltx@stp@footproc\ltx@foottext}%
585 \long\def\ltx@foottext#1#2{%
586   \begingroup
587   \expandafter\ltx@make@current@footnote\expandafter{\@mpfn}{#1}%
588   \footnotetext{#2}%
589   \endgroup
590 }%

```

Here are the definitions of the procedures `\ltx@stp@footproc` and `\ltx@def@footproc`. The require argument is the procedure to execute afterwards, and `\ltx@def@footproc` parses a bracket-delimited argument (it is not optional). In each case the given

procedure is executed with an argument prepared for it: the value of the footnote counter.

```

591 \def\ltx@def@footproc#1[#2]{%
592   \begingroup
593     \csname c@\@mpfn\endcsname #2\relax
594   \unrestored@protected@xdef\@thefnmark{\thempfn}%
595   \expandafter\endgroup
596   \expandafter#1%
597   \expandafter{\the\csname c@\@mpfn\endcsname}%
598 }%
599 \def\ltx@stp@footproc#1{%
600   \expandafter\stepcounter\expandafter{\@mpfn}%
601   \protected@xdef\@thefnmark{\thempfn}%
602   \expandafter#1%
603   \expandafter{\the\csname c@\@mpfn\endcsname}%
604 }%

```

Here we provide for our good friend `hyperref` to enter in like a bull in a china shop. If it is not loaded, we do what it would have done, but gentlier and without hypertext functionality.

```

605 \appdef\class@documenthook{%
606   \let\footnote@latex\footnote
607   \@ifpackageloaded{hyperref}{}{%
608     \let\H@@footnotetext\footnotetext
609     \def\@footnotetext{\H@@footnotetext}%
610     \let\H@@mpfootnotetext\mpfootnotetext
611     \def\@mpfootnotetext{\H@@mpfootnotetext}%
612   }%
613 }%

```

In the following, we must use L^AT_EX's rococco equipment in the form of `\protected@edef`, because of the presence of a font switch in the meaning of `\thempfootnote`. But, really, isn't this a sloppy conflation of semantics and presentation?

```

614 \def\ltx@make@current@footnote#1#2{%
615   \csname c@#1\endcsname#2\relax
616   \protected@edef\Hy@footnote@currentHref{\@currentHref-#1.\csname the#1\endcsname}%
617 }%
618 \def\thempfootnote@latex{\itshape \alph \c@mpfootnote }}%
619 \def\ltx@thempfootnote{\alph\c@mpfootnote}%
620 \c@ifx{\thempfootnote}{\thempfootnote@latex}{%
621   \class@info{Repairing hyperref-unfriendly LATEX definition of \string\mpfootnote}%
622   \let\thempfootnote\ltx@thempfootnote
623 }{}%

```

Note on `hyperref` compatibility: In its “Automated L^AT_EX hypertext cross-references”, the `hyperref` package alters footnote processing, but it does nothing to address the several issues of concern to us.

The `hyperref` package takes over the `\@mpfootnotetext` and `\@footnotetext` procedures, wrapping the argument in its own code. It also rewrites `\@footnotemark`,

making it a hyperlink, and `\@xfootnotenext`, removing from it all hypertext capabilities.

However, if the `\footnotemark` command has been supplied with an optional argument, `hyperref`'s changes do not apply: it punts in this case.

At the same time, it attempts to turn off its changes during `\maketitle` processing, destroying one of the capabilities we desire.

We make ourself `hyperref` savvy: we re-implement footnote processing, using `hyperref` capabilities if that package has been loaded.

Any other package that rewrites L^AT_EX's footnote macros will be incompatible with this package.

Two thoughts about `hyperref`: what for does it define `\realfootnote`? Apparently even SR himself cannot remember.

Also: a document class that desires high hypertext capabilities might well wish to reimplement `\maketitle` so that footnotes called out from there are hypertext links: the `hyperref` package's "Automated L^AT_EX hypertext cross-references" does not do any of this:

But the special footnotes in `\maketitle` are much too hard to deal with properly. Let them revert to plain behaviour.

Note that the document class, in reimplementing `\maketitle`, must ensure that the `hyperref` package does not clobber its own definition!

<code>\@footnotetext</code> <code>\@mpfootnotetext</code> <code>\@tpfootnotetext</code> <code>\make@footnotetext</code> <code>\set@footnotewidth</code>	<p>The two procedures <code>\@footnotetext</code> and <code>\@mpfootnotetext</code> share code. We make that explicit here.</p> <p>Note that the procedure calling <code>\make@footnotetext</code> will open a group with <code>\bgroup</code> which is then closed by <code>\minipagefootnote@drop</code>.</p>
---	---

Difference from L^AT_EX: here we do not set `\floatingpenalty` to infinity. Doing this must date back to a time when L^AT_EX could not accomodate split insertions (footnotes). I cannot think of any other reason to do have done this. At any rate, with the `ltxgrid` package, split insertions are properly taken care of, so we allow it.

We provide the hook `\set@footnotewidth` that sets the footnote on a particular measure. Some page grids are such as to set a footnote in a context where `\columnwidth` is not the right parameter to use for the set width of a footnote. In such a case, for the applicable scope, you should define `\set@footnotewidth` to perform this job correctly.

If we are setting type on multiple page grids, we must still ensure that all footnotes that find their way into the `\footins` insert register are set on the same width. This implies the need for a document to have an "overall" page grid, which determines the set width of all footnotes with the exception of minipage footnotes.

In general, remember that footnotes, like all insertions (including floats), are a step outside of the galley context, and all aspects of insertions need to be properly handled, including the set width.

```
624 \def\@makefnmark{%
625   \hbox{%
626     \@textsuperscript{%
```

```

627     \normalfont\itshape\@thefnmark
628 }%
629 }%
630 }%
631 \long\def\@footnotetext{%
632   \insert\footins\bgroup
633   \make@footnotetext
634 }%
635 \long\def\@mpfootnotetext{%
636   \minipage{footnote@pick}
637   \make@footnotetext
638 }%

```

Procedure `\make@footnotetext` sets the footnote #1 into type, with the proper font, color, leading, width, and label in effect. It also establishes a strut and null glue at the end of the last paragraph of the footnote; The strut helps compensate for the lack of `\interlineskip` glue between `\inserts`; the glue establishes a feasible `\vsplit` point between footnotes.

Note that in the title block (`ltxfront`), the alternative definition, under the name `\frontmatter@footnotetext`, is used. The only material difference there is the reference to `\frontmatter@makefntext` instead of `\makefntext`.

Dependency note: the `\makefntext` procedure is used to further process the footnote text and to execute the `\makefnmark` procedure to produce the footnote mark. The definition of the former is customarily found in the document class (hereunder that of `ltxutil.dtxarticle.cls`), the latter in `ltxutil.dtxlatex.ltx`. They are as follows:

```

% \newcommand{\makefntext}[1]{%
%   \parindent 1em\noindent
%   \hbox{\@textsuperscript{\normalfont\@thefnmark}}%
%   #1%
% }%
% \def{\makefnmark}{%
%   \hbox{\@textsuperscript{\normalfont\@thefnmark}}%
% }%
% 

639 \long\def\make@footnotetext#1{%
640   \set@footnotefont

```

As noted above, we do *not* do `\floatingpenalty\@MM`, as in standard L^AT_EX.

```

641   \set@footnotewidth
642   \parboxrestore
643   \protected@edef{\currentlabel}{%

```

Note that we employ `\mpfn` as a level of redirection for the footnote counter.

```

644   \csname p@\mpfn\endcsname\@thefnmark
645 }%
646 \color@begingroup

```

```

647     \makefntext{%
648         \rule{z}{\footnotesep}\ignorespaces#1%
649         \finalstrut\strutbox\vadjust{\vskip\z@skip}%
650     }%
651     \color@endgroup
652     \minipage{footnote@drop}
653 }%

```

The following strut and glue are for spacing and splitting, as mentioned above.

```

654 \def\set@footnotefont{%
655     \reset@font\footnotesize
656     \interlinepenalty\interfootnotelinepenalty
657     \splittopskip\footnotesep
658     \splitmaxdepth\dp\strutbox
659 }%

```

`\set@footnotefont` is the procedure for setting the font of a footnote. Other aspects of the environment may be set using this hook.

```

660 \def\set@footnotewidth{\set@footnotewidth@one}%

```

6.11 Floats

6.11.1 Usage notes

We extend the L^AT_EX kernel for three purposes:

1. When the `\footnote` command is used within the scope of a float, we do as `minipage` does.
2. We provide a mechanism to write floats out to an external stream for temporary storage (deferred floats).
3. We provide mechanism for placing a float `here` invariably, that is, floats are unfloated. This mechanism is used to read the external stream mentioned above.

To use these mechanisms, the document class should define a float, say, `figure` as per usual, and in addition:

1. Optionally define an alternative, say `figure@write` as follows:

```

\newenvironment{figure@write}{%
% \write@float{figure}%
% }{%
% \endwrite@float
% }

```

That is, the alternative environment executes `\write@float` instead of `\@float`. Note that this step is not needed if the float environment is defined in the simple way of `classes.dtx`. However, an environment like `longtable` will require it.

2. Install into `\AtBeginDocument` a call to `\do@if@floats`, with the float name and an appropriate file extension as its arguments.

```
\appdef\class@documenthook{\do@if@floats{figure}{.fgx}}
```

3. Optionally define a text entity `\figuresname` that will be the text of the head that is set over the deferred floats. If not defined, there will be no head.
4. Optionally define a user-level command to allow the document to determine where the figures are printed out (default is to print at end of document). E.g.,

```
\newcommand\printfigures{\print@float{figure}}
```

5. Install into `\appdef\class@enddocumenthook` a call to `\printfigures`, or, if the latter is not defined, as follows:

```
\appdef\class@enddocumenthook{\print@float{figure}}
```

Note that installing this command into `\AtBeginDocument` is best done earlier than calls that assume the last page of the document is at hand.

6.11.2 Robustifying fragile commands

Certain of L^AT_EX's commands cannot be written out to a file or appear within a `\mark` command argument because they do calculations during expansion. We provide for a little help, but without changing the meanings of these commands.

```
\addtocontents
\robustify@contents 661 \def\robustify@contents{%
 662   \let \label \@gobble
 663   \let \index \@gobble
 664   \let \glossary \@gobble
 665   \let\footnote \@gobble
 666   \def(\{\string\{%
 667     \def)\{\string\}%
 668     \def\\{\string\\}%
 669 }%
 670 \long\def\addtocontents#1#2{%
 671   \protected@write\@auxout{\robustify@contents}{\string \@writefile {#1}{#2}}%
 672 }}
```

6.11.3 Preparing for the hyperref package

\addcontentsline \label The `hyperref` package assumes that the `\contentsline` command will be given four arguments. Therefore it cannot successfully process a `ltxutil.dtx.toc` file that had been written by standard L^AT_EX. We fix things up by always writing that fourth argument and by supplying a `\contentsline` command that can read them.

We also give the `\newlabel` command's second argument five tokens.

Finally, we wrap L^AT_EX's `\contentsline` command with code to detect the case where the expected procedure is not defined, and we give it a syntax with no semantics.

We switch over to this new definition only after `hyperref` has loaded.

```

673 \def\addcontentsline#1#2#3{%
674   \addtocontents{#1}{%
675     \protect\contentsline{#2}{#3}{\thepage}{}{}}%
676   }%
677 }%
678 \def\label#1{%
679   \@bsphack
680   \protected@write\auxout{}{%
681     \string\newlabel{#1}{{\@currentlabel}{\thepage}{}{}{}}%
682   }%
683   \@esphack
684 }%
685 \def\ltx@contentsline#1{%
686   \expandafter\@ifnotrelax\csname l@#1\endcsname{}{%
687     \expandafter\let\csname l@#1\endcsname\@gobbletwo
688   }%
689   \contentsline@latex{#1}%
690 }%
691 \appdef\document@inithook{%
692   \let\contentsline@latex\contentsline
693   \let\contentsline\ltx@contentsline
694 }%

```

6.11.4 Footnotes within floats, unfloating floats, float font

\caption DPC: Er a bit of a hack, but seems best way of supporting normal L^AT_EX syntax at this point: If a caption is used below a table, then put out the footnotes before the caption.

```

695 \appdef\class@documenthook{%
696   \prepdef\caption{\minipagefootnote@here}%
697 }%

```

Note on `hyperref` compatibility: this change to the `\caption` command is compatible with the “Automated L^AT_EX hypertext cross-references” patches of that package.

All the same, I think Sebastian's changes to `\caption` and `\@caption` could bear with some improvement. The following implementation requires knowing only the pattern part of the `\@caption` macro:

```

% \def\caption{%
%   \H@refstepcounter{@captive}
%   \hyper@makecurrent{@captive}%
%   \Odblarg{\H@caption{@captive}}%
% }%
% \def\H@caption#1[#2]#3{%
%   \Ocaption{#1}[#2]{%
%     \ifHy@nesting
%       \hyper@@anchor{\@currentHref}{#3}%
%     \else
%       \hyper@@anchor{\@currentHref}{\relax}#3%
%     \fi
%   }%
% }
% }

6.11.5 Writing floats out to a file

\do@if@floats The procedure `\do@if@floats` should be executed at `\class@documenthook` time: it arranges to write out the floats of the given class to a temporary file, to be read back later (deferred floats), given that `\floats@sw` is false. Note that, to protect against the Boolean being undefined at this late hour, we default it globally to true.

```

773 \def\do@if@floats#1#2{%
774 \floats@sw{}{%

```

Open the stream to save out the document's floats of this class.

```

775 \expandafter\newwrite
776         \csname#1write\endcsname
777 \expandafter\def
778         \csname#1@stream\endcsname{\jobname#2}%
779 \expandafter\immediate
780 \expandafter\openout
781         \csname#1write\endcsname
782         \csname#1@stream\endcsname\relax

```

Swap environments. If the class writer has defined, e.g., `figure@write`, then we use this as the procedure to execute for writing the float out to the external stream. Otherwise, the replacement of `\@float` by `\write@float` should do the right thing for float environments defined in the simple way of `classes.dtx`.

```

783 \@ifxundefined\@float@LaTeX{%

```

6.13 Customization of Sections

Patch the standard L^AT_EX sectioning procedure to:

- Allow a sectioning command to trigger the title page, or more generally to recognize that it is the first object in the document, so we headpatch `\@startsection`.
- Allow a tail command in #6 to uppercase the title, so we retain DPC's braces.
- Allow each type of sectioning command to format its number differently, so we generalize `\@secntformat`.
- Allow each type of sectioning command to format its argument differently, so we generalize `\@hangfrom`.
- Allow the starred form of the command to mark (the running head) and make an entry in the TOC, so we put `\@ssect` on the same footing as `\@sect`.

Note that the tokens passed to the TOC now are *not* the optional argument of the command, but the required. This means that the user can no longer use the former to put variant content in to the TOC as the Manual says.

Instead, the optional argument is used to put an alternative title into the running headers, a better choice.

`\@startsection` Patch a head hook into the basic sectioning command. Treat `\@sect` and `\@ssect` on an equal footing: now their pattern parts are identical.

```
926 \def\@startsection#1#2#3#4#5#6{%

944 \def\@startsection{hook}{}%

```

\@sect When defining `\@svsec`, do not expand `\@seccntformat`. Put brace characters back where they were before David Carlisle got at them (i.e., as if `\@hangfrom` had two arguments). Protect the mark mechanism from an undefined meaning. Pass #8 to the TOC instead of #7. Remove `\relax` from the replacement part of `\@svsec`.

The procedure `\@hangfrom` and `\@runin@to` can be used to process the argument of the head. The head can define, e.g., `\@hangfrom@section`, to do its own processing.

In using `\H@refstepcounter` in place of `\refstepcounter` we rely on either loading before any package that patches the latter, or the convention that the former is the original L^AT_EX procedure.

```

\@ssect Put brace characters back where they were before David Carlisle got at them (as if `\@hangfrom` has two arguments). Possibly set a mark. Make a TOC entry.

Note that, for compatibility with the `hyperref` package, we need to provide the interface required by that package (actually required by `pdfmark.def` and `nameref.sty`), namely the definition of `\@currentlabelname` (but now removed), the insertion of the procedure `\Sectionformat` (but why is this needed?), and the call to `\phantomsection` (which must precede the call to `\addcontentsline`). We also have to sidestep the patch to `\@ssect` in that same file, therefore we use a different control sequence name in the call from `\startsection`.

```

`\init@hyperref` Document classes that incorporate this package will be `hyperref`-savvy. (To accomplish this, we ensure that `\hyperanchor` and `\hyper@last` are both defined.) Being `hyperref`-savvy levels some requirements on us, but the benefits are many.

One is that the TOC will not get amnesia and require a full set of three typesetting runs before its formatting is stable. Instead, only two runs are required: the first updates the auxiliary file, the second the TOC. However, the formatting of the document does not change.

Another aspect of being `hyperref`-savvy is that the syntax of commands in the `.aux` file will not change if `hyperref` is turned on or off.

Note that `\hyper@anchorstart` and `\hyper@anchorend` constitute the programming interface for a hypertext anchor (the target of a hypertext link); `\hyper@linkstart` and `\hyper@linkend` are the interface for a hypertext link.

```

1030 \def\init@hyperref{%

1041 \appdef\document@inithook{%
1042   \init@hyperref
1043 }%

```

`\sec@upcase` Upper case for sections (optional upper case items). These are created so that some headings can be toggled between mixed case and upper case readily. Headings that might be changed can be wrapped in the style file in `\sec@upcase{<text>}` constructs; the expansion of `\sec@upcase` is controlled here. It is `\relax` by default (mixed case heads), and can easily be changed to `\uppercase` if desired. If mixed-case headings are wanted by the editor, authors *must* supply mixed case text, although this is what authors should be doing anyway. (Mixed can be converted to upper, but the reverse transformation cannot be automated.)

The following setting gives the L^AT_EX default.

```
1044 \def\sec@upcase#1{\relax{#1}}%
```

6.14 Patch the tabular and array Environments

`\endtabular` We headpatch the begin processing and tailpatch the end processing of the `\endarray` `tabular` and `array` environments. A document class can define these hooks as needed.

We proceed with care to make further patches to support tabulars that break over pages. Our patches will not necessarily be effective for other packages that replace the L^AT_EX `array` and `tabular` environments. I know of none that do so.

```
1045 \appdef\document@inithook{%
1046   \@ifpackageloaded{array}{\switch@array}{\switch@tabular}%
1047   \prepdef\endtabular{\endtabular@hook}%
1048   \@provide\endtabular@hook{}%
1049   \prepdef\endarray{\endarray@hook}%
1050   \@provide\endarray@hook{}%
1051   \providetcommand\array@hook{}%
```

Install, effectively, a head patch to `\tabular`. In order to avoid interference from, e.g., the `array` package, we must perform this patch only *after* packages load.

```
1052 \prepdef\@tabular{\tabular@hook}%
1053 \@provide\tabular@hook{}%
1054 }%
```

`\switch@tabular` The two procedures `\switch@tabular` and `\switch@array` apply needed patches
`\switch@array` to the various tabular procedures, the former applying to the L^AT_EX kernel, the latter to the required `array` package (and to the number of other required packages that load it).

```
1055 \def\switch@tabular{%
1056   \let\@array@sw\@array@sw@array

\@tabular We provide the old versions of `\@tabular` along with the respective new versions. The change here is to avoid committing to LR mode. That will be done later (as late as possible, naturally).

Compatibility note: I had done `\let \col@sep \undefined` here, but this was not compatible with `colortbl`. I have removed that statement.

\@tabarray Here we provide old and new versions of the `\@tabarray` procedure. The change here is to parametrize the default vertical alignment, which is 'c' in standard L^AT_EX. Under some circumstances, we want to change this to, say, 'v'.

FIXME: must decouple `array` and `tabular`. Done (it seems).

Note on `colortbl`: this package head-patches `\@tabarray` with its own command `\CT@start`, and tails onto `\endarray` with `\CT@end`. It fortuitously does the former at `\AtBeginDocument` time, and, fortuitously, we do not patch `\endarray`, which it overwrites.

```

\@tabularcr We provide for the \\ command within tabular to provide control over page breaking, just the same as that of eqnarray.

\@tabularcr The count register \intertabularlinepenalty is similar to \interdisplaylinepenalty: it is the penalty associated with each row of a tabular. When it is set to \OM, the tabular will cleave together.

\@xargarraycr The count register \@tbpen is similar to \eqopen: it memorizes the penalty to use after the current tabular row. If the \\ command is in its star form, then \eqopen is set to \OM.

We append code to \samepage so that a tabular within its scope will cleave together.

We keep the standard definition of \@tabularcr in \@tabularcr@LaTeX for reference, and provide a new definition that works like \eqncr: it sets \@tbpen to \OM if the star was given.

We also provide new versions of \@xtabularcr, \@xargarraycr, and \@yargarraycr, all of which invoke \@tbpen.

The \switch@tabular procedure switches in the new definitions.

```

\array We provide old and new versions of the `\array` procedure for both L^AT_EX and the `array` package. The change here is to accomodate the new procedures that will be called for the array boundaries, even though at present they are not special. A thought: here is where matrices can be readily accomodated.

\@array Here we provide old and new versions of `\@array`. The change here is to provide a convenient, flexible, and extensible mechanism for new vertical alignment options.

Instead of testing the optional argument with `\if`, we use a dispatcher based on `\csname`.

We also refrain from using `\ialign`, which would set the `\tabskip` to the wrong value.

Finally, the procedure to set the `\carstrutbox` is broken out so that it can be patched.

```

\@array@align@ Here are the various procedures for the vertical alignment options. The change from standard L^AT_EX is that we do not go into math mode in every case: only when required by `\vcenter`. Also, we use `\aftergroup` to close out the boxes and modes we have started. It requires only that each procedure issue exactly one unmatched `\bgroup`.

We establish here the default vertical alignment.

\array@row@pre The procedure `\array@row@rst` reestablishes a default context for an alignment, **\array@row@pst** so that they can be nested. Any environment or procedure that alters the way **\array@row@rst** alignments are formatted must patch this procedure to restore from that alteration. To start things off, we equate `\@array@align@v` to `\@array@align@c`, because it does not make sense to do the former in any context other than the MVL or in a list that will be unboxed onto the MVL.

\@mkpream@relax The procedure \@mkpream@relax participates in a strange and wonderful method of binding the alignment procedure—but only certain parts thereof.

Here is how it works: in L^AT_EX, the **array** package, and in the **longtable** package alike, there is a need to create an alignment preamble (using \@mkpream) for use by the upcoming \halign. Then, in both **array** and **longtable**, T_EX’s \edef is used to ‘compile in place’ that alignment preamble.

In the case of **array**, the operation is done in order to pre-expand the use of *; in **longtable**, it is to set the widths of the columns.

Now, during this \edef, certain control sequence names must *not* be expanded, and those are robustified by \@mkpream@relax.

```

1707 \def\@mkpream@relax{%
1708   \let\tableftsep \relax
1709   \let\tabmidsep \relax
1710   \let\tabrightsep \relax
1711   \let\array@row@rst\relax
1712   \let\cell@font \relax
1713   \let\@startpbox \relax
1714 }%

```

\@mkpream We insert \@mkpream@relax at the head of the procedure. The robustifying of \@startpbox and \@endpbox is taken over by this mechanism. We also invoke \@acolr instead of \@acol when a right-hand column is at hand.

Note on **colortbl**: this package head-patches \@mkpream to robustify a number of its commands during the construction of the alignment preamble. The best we can do is to supplement the \@mkpream@relax procedure to perform this action.

6.16 Syntax

\@gobble@opt@one The \@gobble@opt@one command eats up an optional argument and one required argument.

```
1986 \newcommand*\@gobble@opt@one[2] [] {}%
```

6.17 Auto-indented Contents

Facility to automatically determine the proper indentation of the TOC entries.

Note on `hyperref` compatibility: We must respect that `\contentsline` now has a fourth argument. So, instead of trying to override the meaning of

\contentsline, we use the aux file to remember max values from one run to the next.

In this respect, this package retains compatibility with `hyperref`.

\@starttoc Install hooks at beginning and end of the TOC processing.

```

```

\toc@@font Interface for setting the formatting characteristics of this part of the TOC.

Note: \toc@@font is the common font for all auto-sizing toc commands, although this, too, could become a dispatcher.

```
2002 \def\toc@@font{}%
2003 \def\ltxu@dotsep{\z@}%
```

\l@section Interface for determining which TOC elements are automatically indented.

All of the \l@... commands simply go through the utility procedure \l@sections. The calling convention is to pass the name of self and the name of parent. If you want to exclude any of these from the indentation scheme, simply leave the \l@... command undefined.

Note that the parent of “section” is nil, so we have to define a stub.

```
\def\l@section{\l@sections{}{section}}% Implicit #3#4
\def\tocleft{\z@}%
\def\l@subsection{\l@sections{section}{subsection}}% Implicit #3#4
\def\l@subsubsection{\l@sections{subsection}{subsubsection}}% Implicit #3#4
\def\l@paragraph{\l@sections{subsubsection}{paragraph}}% Implicit #3#4
\def\l@subparagraph{\l@sections{paragraph}{subparagraph}}% Implicit #3#4
```

Glom some \dimen registers.

```
2004 \let\tocdim@section \leftmargini
2005 \let\tocdim@subsection \leftmarginii
2006 \let\tocdim@subsubsection \leftmarginiii
```

```

2007 \let\tocdim@paragraph      \leftmarginiv
2008 \let\tocdim@appendix       \leftmarginv
2009 \let\tocdim@pagenum        \leftmarginvi

\toc@pre@auto We patch \starttoc to: 1) before TOC processing, initialize the max registers
\toc@post@auto and set the needed dimensions from the values stored in the auxiliary file, and 2)
after TOC processing, store out those max register values into the auxiliary file.

Note that the font is set here: all other TOC entries must override these font
settings.

To activate this override of the standard LATEX processing, the substyle does:
\let\toc@pre\toc@pre@auto and \let\toc@post\toc@post@auto.

```

\l@@sections The procedure for formatting the indented TOC entries. We use control sequence names such as `\tocmax@section` and `\topleft@section`, the former being written to the auxiliary file and the latter only defined for the duration of the TOC processing.

Note that the assignment of `\box@tempboxa` by `\set@tocdim@pagenum` must endure over the invocation of #3: it contains the page number which will be set just before the `\par`.

The arguments:

- #1 superior section
- #2 this section
- #3 content, including possible `\numberline`
- #4 page number

```

2050 \def\l@@sections#1#2#3#4{%
2051   \begingroup
2052   \everypar{}%
2053   \set@tocdim@pagenum\@tempboxa{#4}%
2054   \global\@tempdima\csname tocdim@\#2\endcsname
2055   \leftskip\csname toclft@\#2\endcsname\relax
2056   \dimen@\csname toclft@\#1\endcsname\relax
2057   \parindent-\leftskip\advance\parindent\dimen@
2058   \rightskip\tocleft@pagenum plus 1fil\relax
2059   \skip@\parfillskip\parfillskip\z@
2060   \let\numberline\numberline@\sections
2061   \nameuse{l@f@\#2}%
2062   \ignorespaces#3\unskip\nobreak\hskip\skip@
2063   \hbox@\rightskip{\hfil\unhbox\@tempboxa}\hskip-\rightskip\hskip\z@skip

```

By side effect, set the value of, e.g., `\tocdim@section`.

Note that the `\par` must not be executed before the value of `\@tempdima` is expanded (outside the current group). Otherwise, the `lineno.sty` package may interfere (it unfortunately does a global assignment of `\@tempdima`).

```

2064   \expandafter\par
2065   \expandafter\aftergroup\csname tocdim@\#2%
2066   \expandafter\endcsname
2067   \expandafter\endgroup
2068   \the\@tempdima\relax
2069 }%

```

In the call to `\set@tocdim@pagenum`, I am now exposing the use of the particular box register.

```
2070 \def\set@tocdim@pagenum#1#2{%
2071   \setbox#1\hbox{\ignorespaces#2}%
2072   \ifdim{\tocdim@pagenum<\wd#1}{\global\tocdim@pagenum\wd#1}{}%
2073 }%
```

`\numberline@@sections` The utility procedure for all `\numberline` processing in indented TOC entries. The first argument is self.

We use `\tempdima` to pass a value around (via global assignment) because `\numberline` executes inside a group if the `hyperref` package is loaded. Would that it were not so!

```
2074 \def\numberline@@sections#1{%
2075   \leavevmode\hb@xt@-\parindent{%
2076     \hfil
2077     \if@empty{#1}{}{%
2078       \setbox\z@\hbox{\#1.\kern\ltxu@dotsep}%
2079       \ifdim{\@tempdima<\wd\z@}{\global\@tempdima\wd\z@}{}%
2080       \unhbox\z@
2081     }%
2082   }%
2083   \ignorespaces
2084 }%
2085 \def\tocdim@min{\z@}%
```

6.18 Lists

`\list` Using `\parshape` to implement lists was always suspect (can you get behind `\parshape\@ne?`) and we now see that it was a mistake all along. Why? Because `\parshape`, like `\hangindent`, achieves its effect via “shifting” the `\hboxes` in a paragraph instead of using `\leftskip` and `\parindent`, which is robust during column balancing.

We introduce the alternative method with a hook into the L^AT_EX kernel procedure `\list`, which is the implementation of all lists.

```
2086 \def\list#1#2{%
2087   \ifnum \@listdepth >5\relax
2088     \toodeep
2089   \else
2090     \global\advance\@listdepth\@ne

2117 }%
2118 \let\set@listindent\set@listindent@parshape

```

6.19 Hypertext capabilities

`\href` We provide support for the `\href`, `\url`, and `\doi` commands. Packages, like `\url` `hyperref`, may override these definitions and provide better semantics.

```

\URL@prefix 2119 \providecommand\href[0]{\begingroup\@sanitize@url\@href}%
\doi 2120 \def\@href#1{\@startlink{#1}\endgroup\@endlink}%
\doibase 2121 \def\@href#1{#1\@endlink}%
2122 \providecommand\url[0]{\begingroup\@sanitize@url \@url }%
2123 \def\@url #1{\endgroup\@href {#1}{\URL@prefix#1}}%

2128 \providecommand\doibase [0]{https://doi.org/}%
2129 \providecommand\@sanitize@url[0]{\chardef\cat@space\the\catcode`\ \@sanitize\catcode`\ \cat@sp}

```

`\@startlink` How we define `\@startlink` and `\@endlink` will depend on whether we are running under PDFLATEX. If so, and if PDF output is requested, then we

`\pdfstartlink@attr` use its primitives to implement hypertext, breaking out the link attributes in
`\hypertext@enable@ltx` `\pdfstartlink@attr` and using the `hyperref` defaults; `\pdfstartlink@attr` can be redefined by a client package. Otherwise we fall back the HyperTEX standard and leave things to the DVI translator.

A class or package that wishes to employ hypertext capabilities should execute the `\hypertext@enable@ltx` procedure.

```

2130 \def\@startlink#1{%

\href The `\href` command of `hyperref` was extend somewhere between versions 6.75r and 6.80e. We apply a repair to the earlier version (if present) so that it works like the later version.

The issue is the presence of whitespace, either following the `\href` token or following the first argument's closing brace character.

```

Change History

4.0b		
\@mpmakefntext:	AO: Removed superfluous \defs, changed to using \floats@sw as the flag. Also stopped using DPC's \if@twocolumn flag; using \floats@sw instead. Also added \par\vskip\z@skip after the \minipagefootnotes so that the float box would have zero depth like the kernel one.	33
\caption:	Support the hack with \predef, and delay until \AtBeginDocument time, since hyperref clobbers \caption.	31
\print@float:	only execute if there really were floats of the given type	34
\write@@float:	AO: Fixed spurious CR and (return) characters in output file. Also, if the document did not have the \endfigure on a line of its own, the macro wouldn't work. Fixed.	37
General:	AO: Fixed spurious CR and (return) characters in output file. Also, if the document did not have the \endfigure on a line of its own, the macro wouldn't work. Fixed.	3
AO:	Removed superfluous \defs, changed to using \floats@sw as the flag. Also stopped using DPC's \if@twocolumn flag; using \floats@sw instead. Also added \par\vskip\z@skip after the \minipagefootnotes so that the float box would have zero depth like the kernel one.	3
	only execute if there really were floats of the given type	3
	Support the hack with \predef, and delay until \AtBeginDocument time, since hyperref clobbers \caption.	3
4.0c		
\@mpmakefntext:	(AO, 110) Install hooks for endfloats processing	33
\@sect:	(AO, 116) Hyperref compatibility	40
\endarray:	(AO, 130) Interference from array package	42
\print@float:	*-form mandates pagebreak at each float; only print section head if there is something there.	34
General:	(AO, 110) Install hooks for endfloats processing	3
	(AO, 116) Hyperref compatibility	3
	(AO, 130) Interference from array package	3
	*-form mandates pagebreak at each float; only print section head if there is something there.	3
4.0d		
\@mpmakefntext:	(AO, 127) Floats placed [h] to allow page breaks	33
\@sect:	(AO, 224) Hyperref compatibility	33
\print@float:	Allow things to break over pages by setting array@default.	34
General:	(AO, 127) Floats placed [h] to allow page breaks	3
	(AO, 174) kernel fix	3, 24
	(AO, 224) Hyperref compatibility.	3
	Allow things to break over pages by setting array@default.	3
4.0e		
\@mpmakefntext:	(AO, 221) Remove samepage command from @xfloat@prep: If the float can break over pages, we want better control.	33
General:	(AO, 221) Remove samepage command from @xfloat@prep: If the float can	

break over pages, we want better control.	3	understood in mu. (What we wanted was a dimension.)	65
4.0f		General: (AO) Make	
\@ssect: (AO, 404) Hyperref compatibility	40	\addtocontents a \long \def; gobble up \footnote	3
General: (AO, 404) Hyperref compatibility	3	(AO) Remove code that avoided changes to \@xfootnotemark	3
4.1a		(AO, 438) Complete rewrite of footnote macros.	3
\@mpmakefntext: \@xfloat@prep calls \ltx@footnote@pop to restore the original \ltx@footmark and \ltx@foottext procedures, in case footnote processing has switched.	33	(AO, 459) do not assume \class@name is defined	3, 11
\@p@filename: Class extension mechanism \@pushfilename@ltx and \@p@filename@ltx.	20	(AO, 461) Change the csname from \@dotsep to \ltxu@dotsep . The former is understood in mu. (What we wanted was a dimension.)	3
\class@enddocumenthook: \class@documenthook is the last \AtBeginDocument token now	16	(AO, 475) I had not properly reproduced the LaTeX macro \eqnarray	3
\document: Get rid of \set@typesize@hook \set@pica@hook and the \normalsize directive	16	\@xfloat@prep calls \ltx@footnote@pop to restore the original \ltx@footmark and \ltx@foottext procedures, in case footnote processing has switched.	3
