7	Code	5

1 Introduction

Repeating of math operator at the broken line and the new line in inline equations is used in Cyrillic mathematical typography (Russian for example), but unfortunately, \LaTeX doesn't provide such an option. There was an attempt to do it many years ago [see M.I. Grinchuk "TeX and Russian Traditions of Typesetting", TUGboat 17(4) (1996) 385], but there was no ready to use package.

This package extends ideas described in the "TeX and Russian Traditions of Typesetting" and supports most of \LaTeX 's mathematical packages (some known issues are listed in the "Known issues" section below).

2 Usage

Just include the package using `\usepackage{rmathbr}` command.

$$\begin{aligned} (a+b)^2 &= a^2 + 2ab + b^2, & a^3 \pm b^3 &= (a \pm b)(a^2 \mp ab + b^2), & \int x \sin ax \, dx &= -\frac{x}{a} \cos ax - \frac{1}{a^2} \sin ax, & x &= 12 \times 10^3, \\ a^2 - b^2 &= (a + b)(a - b), & \sin^2 \alpha &+ \cos^2 \alpha &= 1, & t_1 t_2 \cos \theta &= t_1 t_2 \end{aligned}$$

It's recommended to load `rmathbr` after other packages because `rmathbr` has special support of many math-related packages: `amsfonts`, `amssymb`, `amstex`, `bm`,

boisik, euler, eulervm, fourier, icomma, latexsym, lucbmath, lucidabr, lucmin, lucmtime, luctime, mathbbol, mathtools, mdwmath, program, sbbm, stmaryrd, wasysym, xy.

Please, submit any found bugs to <https://github.com/dryabov/rmathbr/issues>.

3 Options

Some aspects of the `rmathbr` can be altered using package options. In most cases, it should be sufficient to load the package without extra options, but sometimes it may be necessary to change default options for compatibility with other packages.

The “key=value” scheme is used with the following possible options (default value is printed in italics):

<code>script</code>	noactive <i>mathactive</i> active	This option declares what way <code>rmathbr</code> will affect <code>_</code> and <code>^</code> commands (sub- and superscripts). In the “noactive” mode, they have default \TeX behavior, but it may be necessary to manually wrap some indices into curly brackets, e.g. $A^{\{\star\}}$ instead of just a A^{\star} . In the “mathactive” mode, both <code>_</code> and <code>^</code> become commands in math mode that process arguments properly, and extra wrapping is unnecessary. And in the “active” mode these commands can be used for scripts even in the text mode (e.g. H_{20}).
<code>run</code>	atload atbegindocument <i>auto</i>	This option declares when to affect math commands for hyphenation, directly at package loading time, or later at the <code>\begin{document}</code> . The latter is necessary to deal with packages that declare math symbols at the <code>\begin{document}</code> . The “auto” value allows to switch to the “atbegindocument” mode automatically (currently, if <code>unicode-math</code> or <code>mathtools</code> packages are loaded).
<code>cdottimes</code>	true <i>false</i>	Re-declare <code>\cdot</code> command as <code>\cdott</code> (see <code>\cdott</code> description below) to hyphenate it using the <code>\times</code> character. By default, it is disabled because <code>\cdot</code> is also used for scalar products (e.g. $\vec{a} \cdot \vec{b}$), and in this case, it is wrong to replace it with <code>\times</code> on break, because <code>\times</code> is usually used for cross products.
<code>brokencolon</code>	true <i>false</i>	According to Russian typography traditions, math expression shouldn’t be broken on the division character (<code>:</code>). But if you like to allow it, just set this option to true.

<code>brokenminus</code>	<code>true</code> <code>false</code>	Usually, it's allowed to break math expression on the “minus” character, but it's possible to disable it.
<code>brokenbin</code>	<code>true</code> <code>false</code>	This option disables breaks on binary operations (keeping relations only). See also <code>\BrokenBinOff</code> and <code>\BrokenBinOn</code> macros.

Internally, `scripts=mathactive` assigns the `mathactive` (12) category to `^` and `_` characters, `scripts=active` assigns the `active` (13) category, and `scripts=noactive` keeps default categories to `^` and `_` characters (7 and 8, correspondingly).

For backward compatibility, `rmathbr` supports the `noactivechars` option as an alias for `scripts=noactive`, the `mathactivechars` option as an alias for `scripts=mathactive`, and the `activechars` option as an alias for `scripts=active`. These options are deprecated, and it's recommended to switch to the corresponding `script` option.

4 Macros

<code>*</code>	Macro <code>*</code> is used to mark multiplication point that is invisible and changed to \times at the break only. E.g. $(a+b)*(a-b)$.
<code>\cdott</code>	This command displays <code>\cdot</code> (\cdot) that is changed to <code>\times</code> (\times) at the break.
<code>\nobr</code>	This command is used to prevent break expression on the following math operator. E.g. $a\nobr-b$.
<code>\SetBreakableRel</code>	Declares breakable relation operator, e.g. <code>\SetBreakableRel{\MyEqual}</code> .
<code>\SetBreakableBin</code>	Declares breakable binary operator, e.g. <code>\SetBreakableBin{\MyPlus}</code> .
<code>\SetBreakableInner</code>	Declares breakable “inner” expression, e.g. <code>\SetBreakableInner{\ldots}</code> .
<code>\SetOpenBracket</code>	Declares opening bracket (<code>rmathbr</code> disables break directly after brackets), e.g. <code>\SetOpenBracket{\MyOpenBracket}</code> .
<code>\SetMathOperator</code>	Declares math operator (<code>rmathbr</code> disables break directly after operators), e.g. <code>\SetMathOperator{\MySum}</code> .
<code>\SetPunctuation</code>	Declares punctuation command (<code>rmathbr</code> disables break directly after punctuation to prevent break and duplication in the case like $\$1,-1\$$), e.g. <code>\SetPunctuation{\MyColon}</code> .
<code>\UnsetBrokenCmd</code>	Restores original command, e.g. to avoid potential issues or conflicts with other packages. Usage example: <code>\UnsetBrokenCmd{\cdot}</code> to disable break on <code>\cdot</code> . Note that in the case of <code>run=atbegindocument</code> (or <code>auto</code>) this command should be used after <code>\begin{document}</code> .

`\BrokenBinOff`

Disables break on binary operations, see also `brokenbin=false` option.

`\BrokenBinOn`

Enables break on binary operations.

5 Known issues

- `breqn` package: cannot work together with `rmathbr` (as `breqn` redefines all the math in \TeX)

6 Changelog

1.1 (11-December-2020)

- add support of XeTeX/LuaTeX and `unicode-math` package
- add new key-value options (`script`, `run`, `cdottimes`, `brokenminus`, `brokencolon`, `brokenbin`)
- add new commands (`\UnsetBrokenCmd`, `\BrokenBinOff` and `\BrokenBinOn`)
- add support of `mathtools` package
- add a patch for `bm` package
- add a patch for `xy` package
- remove dependence on `mathstyle` package
- fix math class for `=`, `<`, `>` (`\mathrel` instead of `\mathbin`)
- fix math class for `:` (`\mathbin` instead of `\mathrel`)
- fix processing of colon-related commands (e.g. `\coloneq` from `mathtools`, etc.)
- performance optimizations

1.0.3 (10-April-2016)

- fix issue with sub-/superscripts in `\Biggl`, `\biggl`, `\Bigl`, `\bigl`

1.0.2 (23-June-2015)

- fix issue with expanding of math operators

1.0.1 (14-June-2015)

- fix `\cdott`-related issues (thanks to Bruno Le Floch)
- fix some `\SetBreakableRel` and `\SetBreakableBin` declarations
- fix mathematical operators with `\limits` or `\nolimits`

1.0 (02-June-2015)

- fix break after math operators (`\sum`, `\int`, etc.)
- add documentation

0.99 (15-November-2010)

- don't hyphenate trailing mathsign (e.g. in $\$2+2=\$$)
- don't change redefined symbols (`\le`, `\ge`, `\to`, etc.)

0.98 (31-January-2010)

- fix hyphenation on `:=`
- correct work with `icomma` package and option `[icomma]` of `eulervm` package
- correct work with `program` package
- symbols have been added from `boisik`, `euler`, `fourier`, `lucbmath`, `lucidabr`, `lucmin`, `lucmtime`, `luctime`, `mathbbol`, `mdwmath`, `sbbm`, `stmaryrd`, and `wasysym` packages.
- remove shrinking of space in math (broke `url` package)
- don't hyphenate after punctuation ("`,`", "`;`", "`\colon`" etc.)
- create broken commands as robust ones
- some fixes of redeclaring of AMS commands
- commented hyphenation on `\ldots` and `\cdots`, as \TeX doesn't break here

0.97 (08-October-2009)

- fix problem with operators like "`+^\leq`"

0.96 (29-September-2009)

- fix problem with "`-`" in AMS's `\DeclareMathOperator`
- fix problem with `\ldots` in text mode

0.95 (28-September-2009)

- fix problem with sub/sup-scripts after relations
- fix hyphenation on `\ldots`
- AMS/Lucida left brackets (`\lvert`, `\lVert`, `\ulcorner`, `\llcorner`) support
- `mathbbol` left bracket (`\Lbrack`) support
- huge code refactoring

0.91 (21-September-2009)

- fix problem with problem with space after brackets

0.90 (20-September-2009)

- first public release

7 Code**Initialization**

Load required packages.

```
1 \RequirePackage{ifetex}
2 \RequirePackage{ifluatex}
```

```

3 \RequirePackage{xkeyval}

\mathbr@kv
4 \edef\mathbr@kv{\@currname.\@currentx}

\DeclareBoolOptionX The macro to declare boolean option.
5 \def\DeclareBoolOptionX#1#2{%
6   \define@boolkey{\mathbr@kv}[mathbr@kv@]{#1}[true]{#2}%
7 }

\DeclareChoiceOptionX The macro to declare multi-choice option.
8 \def\DeclareChoiceOptionX#1[#2]#3[#4]#5{%
9   \define@choicekey{\mathbr@kv}{#1}[#2]{#3}[#4]{#5}%
10 }

    Warn about known issues.
11 \ifpackageloaded{breqn}{%
12   \PackageError{mathbr}{'mathbr' package cannot be used together with 'breqn' package!}{}%
13 }{}
```

Interface

```

\nobr Makes next symbol nonbreakable.
14 \def\nobr{\penalty\relpenalty}

\SetBreakableRel Makes breakable relation sign.
15 \def\SetBreakableRel#1{\mathbr@setbreakable{#1}{\brokenrel}}

\SetBreakableBin Makes breakable binary operation.
16 \def\SetBreakableBin#1{\mathbr@setbreakable{#1}{\brokenbin}}

\SetBreakableInner Makes breakable inner (like \ldots).
17 \def\SetBreakableInner#1{\mathbr@setbreakable{#1}{\brokeninner}}

\SetOpenBracket Disables breaks after open bracket.
18 \def\SetOpenBracket#1{\mathbr@nobrafter{#1}}

\SetPunctuation Disables breaks after punctuation sign.
19 \def\SetPunctuation#1{\mathbr@nobrafter{#1}}

\SetMathOperator Disables breaks after math operator.
20 \def\SetMathOperator#1{\mathbr@setbreakable{#1}{\mathbr@mathop}}

\UnsetBrokenCmd Restores original command.
21 \def\UnsetBrokenCmd#1{\mathbr@unsetbroken{#1}}

\BrokenBinOff Disables break on binary operations.
22 \def\BrokenBinOff{\mathbr@brokenbinoff}

\BrokenBinOn Enables break on binary operations.
23 \def\BrokenBinOn{\mathbr@brokenbinon}
```

`\brokenrel` Makes argument as breakable relation sign.
 24 `\DeclareRobustCommand{\brokenrel}[1]{\rmathbr@brokenrel{#1}}`

`\brokenbin` Makes argument as breakable binary operation.
 25 `\DeclareRobustCommand{\brokenbin}[1]{\rmathbr@brokenbin{#1}}`

`\brokeninner` Makes argument as breakable inner.
 26 `\DeclareRobustCommand{\brokeninner}[1]{\rmathbr@brokeninner{#1}}`

Options

Start to process options.

First of all, warn about deprecated options:

```

27 \xDeclareBoolOptionX{noactivechars}{
28   \ifmathbr@kv@noactivechars
29     \PackageWarning{rmathbr}{^^J Option 'noactivechars' is deprecated.^^J
30                           Use 'scripts=noactive' instead.^^J}
31   \ExecuteOptionsX{scripts=noactive}
32   \fi
33 }

34 \xDeclareBoolOptionX{mathactivechars}{
35   \ifmathbr@kv@mathactivechars
36     \PackageWarning{rmathbr}{^^J Option 'mathactivechars' is deprecated.^^J
37                           Use 'scripts=mathactive' instead.^^J}
38   \ExecuteOptionsX{scripts=mathactive}
39   \fi
40 }

41 \xDeclareBoolOptionX{activechars}{
42   \ifmathbr@kv@activechars
43     \PackageWarning{rmathbr}{^^J Option 'activechars' is deprecated.^^J
44                           Use 'scripts=active' instead.^^J}
45   \ExecuteOptionsX{scripts=active}
46   \fi
47 }

```

Process script option:

```

48 \let\rmathbr@scriptsmode=\@ne
49 \xDeclareChoiceOptionX{scripts}[\val\nr]{noactive,mathactive,active}[mathactive]{
50   \ifcase\nr\relax
51     \let\rmathbr@scriptsmode=\z@
52   \or
53     \let\rmathbr@scriptsmode=\@ne
54   \or
55     \let\rmathbr@scriptsmode=\tw@
56   \fi
57 }

```

Set when to patch math commands, at the package loading or at the `\begin{document}` (i.e. after other packages are loaded and set its macros):

```

58 \newif\ifmathbr@patch@begindocument

```

Note that by default 'atload' is used unless 'unicode-math' or 'mathtools' are loaded.

```

59 \xDeclareChoiceOptionX{run}[\val\nr]{atload,atbegindocument,auto}[auto]{
60   \ifcase\nr\relax
61     \rmathbr@patch@begindocumentfalse
62   \or
63     \rmathbr@patch@begindocumenttrue
64   \or
65     \@ifpackageloaded{unicode-math}{\rmathbr@patch@begindocumenttrue}{-}
66     \@ifpackageloaded{mathtools}{\rmathbr@patch@begindocumenttrue}{-}
67   \fi
68 }

```

The option to make `\cdot` works like `\cdott`:

```

69 \xDeclareBoolOptionX{cdottimes}{-}
    Other options (see documentation):
70 \xDeclareBoolOptionX{brokenminus}{-}
71 \xDeclareBoolOptionX{brokencolon}{-}
72 \xDeclareBoolOptionX{brokenbin}{-%
73   \ifrmathbr@kv@brokenbin
74   \else
75     \AtBeginDocument{\BrokenBinOff}
76   \fi
77 }

```

Default values:

```

78 \ExecuteOptionsX{scripts=mathactive}
79 \ExecuteOptionsX{run=auto}
80 \ExecuteOptionsX{cdottimes=false}
81 \ExecuteOptionsX{brokenminus=true}
82 \ExecuteOptionsX{brokencolon=false}
83 \ExecuteOptionsX{brokenbin=true}

```

Execute options:

```

84 \ProcessOptionsX

```

Implementation

Switch to scripts mode

```

85 \ifcase\rmathbr@scriptsmode
86   % nop
87 \or
88   \AtBeginDocument{\catcode'\^=12\mathcode'\^=32768\catcode'\_ =12\mathcode'\_ =32768}
89 \or
90   \AtBeginDocument{\catcode'\^ \active\catcode'\_ \active}
91 \fi

```

Store original penalty values (via `mathchardef` trick).

```

92 \mathchardef\rmathbr@orig@relpenalty=\relpenalty
93 \mathchardef\rmathbr@orig@binoppenalty=\binoppenalty

```

Independent hyphen penalties are supported by LuaTeX only. That's why we save default penalty to `\exhyphenpenalty` (as `\exhyphenpenalty` will be actual penalty for math breaks in TeX and XeTeX).

```

94 \ifluatex\else
95   \exhyphenpenalty=\relpenalty
96 \fi

```

Disable default breaks.

```

97 \relpenalty=13131
98 \binoppenalty=14141

```

`\everymath` First symbol/command in equation is nonbreakable.

```

99 \expandafter\everymath\expandafter{\the\everymath\nobr }

```

Save some characters definitions.

`\rmathbr@superscript@std`

```

100 \begingroup\catcode'\^=7 \global\let\rmathbr@superscript@std=\^ \endgroup

```

`\rmathbr@superscript@other`

```

101 \begingroup\catcode'\^=12\global\let\rmathbr@superscript@other=\^ \endgroup

```

`\rmathbr@subscript@std`

```
