

# The **secnum** package

Gau, Syu

*Last Update:* 2020/01/01

## Abstract

The package **secnum** provides a macro `\setsecnum` which allows user to format section numbering intuitively.

	Formatting . . . . .	5

## A Usage

Before using the macro, load the package in preamble.

```
\usepackage{secnum}
```

Then, one can format the section numbering by using the macro `\setsecnum` in preamble.

---

```
\setsecnum \setsecnum <num format>
```

A typical `<num format>` is like this:

1.1.1

It consists of some syntax abbrs of numbering formats, reffering the follows,

A	a	I	i	1
\Alpha	\alpha	\Roman	\roman	\arabic

and some separators, which can be any character except the abbrs and special characters such as braces “{}”, comma “,”, space “ ”, etc.

## B Process

The process of the macro `\setsecnum` can be explained as follows.

- Step 1. The main function eats the input, saying `I.1.a`, and stores it in a token list.
- Step 2. Replace abbrs by macros. In our example, it results “`\Roman.\arabic.\alph`”
- Step 3. Split this token list into a sequence by macros. In our example, it results “`\Roman`”, “`.arabic`” and “`.alph`”.
- Step 4. Store those codes in individual containers.
- Step 5. Use them to renew `\thesection`, `\thesubsection`, `\thesubsubsection` etc. provided there is no `\chapter`.

## C Implementation

The following is the implementation. Users can ignore.

### Preparations

This document class uses L<sup>A</sup>T<sub>E</sub>X3. Therefore, the packages `expl3`, `xparse` and `l3keys2e` are needed and should use `\ProvidesExplClass` rather than `\ProvidesClass`.

```
1  {*package}
2  <@=syu>
3  \NeedsTeXFormat{LaTeX2e}
4  \RequirePackage{expl3}
5  \ProvidesExplPackage{secnum}{2020/01/01}{}%
6  { An intuitive way to format section numbering }
7  \RequirePackage{xparse}
```

`\l_syu_secnum_tl` The two variables are used to store the formatting information.

```
8  \tl_new:N \l_syu_secnum_tl
9  \seq_new:N \l_syu_secnum_seq
```

`\g_syu_chapter_tl` The following variables are used to store the individual formatting codes.

```
10 \tl_new:N \g_syu_chapter_tl
11 \tl_new:N \g_syu_section_tl
12 \tl_new:N \g_syu_subsection_tl
13 \tl_new:N \g_syu_subsubsection_tl
14 \tl_new:N \g_syu_paragraph_tl
15 \tl_new:N \g_syu_subparagraph_tl
```

`\g_syu_if_thechapter_int` This `<integer>` encodes if `\thechapter` is defined.

```
16 \int_new:N \g_syu_if_thechapter_int
```

If `\thechapter` is defined, it is 1.

```
17 \if_cs_exist:N \thechapter
18   \int_gset:Nn \g_syu_if_thechapter_int 1
```

Otherwise, it is 0.

```
19 \else:
20   \int_gset:Nn \g_syu_if_thechapter_int 0
21 \fi:
```

## Main function

\setsecnum Here is the definition of the main function \setsecnum.

```
22 \DeclareDocumentCommand{\setsecnum}{m}
23 {
```

Store the input in.

```
24   \tl_set:Nn \l_syu_secnum_tl {#1}
```

Replace syntax abbrs by corresponding macros.

```
25   \syu_secnum_unabbr:N \l_syu_secnum_tl
```

Split into a sequence by macros.

```
26   \syu_split_by_macros:NN \l_syu_secnum_tl \l_syu_secnum_seq
```

Read formatting information.

```
27   \syu_secnum_from_seq:N \l_syu_secnum_seq
```

Set the secnumdepth.

```
28   \setcounter{secnumdepth}{\seq_count:N \l_syu_secnum_seq }
```

Format numberings.

```
29   \syu_secnum:
30 }
```

## Unabrvation

\syu\_secnum\_unabbr:N This function replace the abbrs in a  $\langle tl var \rangle$  by expansions.

```
31 \cs_new_protected:Npn \syu_secnum_unabbr:N #1
32 {
33   \regex_replace_all:nnN {A} {\c{Alpha}} #1
34   \regex_replace_all:nnN {a} {\c{alpha}} #1
35   \regex_replace_all:nnN {I} {\c{Roman}} #1
36   \regex_replace_all:nnN {i} {\c{roman}} #1
37   \regex_replace_all:nnN {1} {\c{arabic}} #1
38 }
```

## Split to sequence

\syu\_split\_by\_macros:NN This function split a  $\langle tl var \rangle$  into a  $\langle sequence \rangle$  by macros.

```
39 \cs_new_protected:Npn \syu_split_by_macros:NN #1 #2
40 {
41   \tl_clear:N \l_tmpa_tl
42   \seq_clear:N #2
43   \tl_map_inline:Nn #1
44   {
45     \tl_put_right:Nn \l_tmpa_tl ##1
46     \__syu_if_macro:nT ##1
47     {
48       \seq_put_right:NV #2 \l_tmpa_tl
49       \tl_clear:N \l_tmpa_tl
50     }
51   }
52 }
```

But how to see if an  $\langle item \rangle$  in the token list is a macro?

\g\_syu\_macro\_tl This  $\langle tl\ var \rangle$  stores the first five characters of the meaning of any macro, i.e. `macro` (watch out its catcode). The idea is to creat a  $\langle tl\ var \rangle$  and then set its value to be the first five characters of its meaning.

```

53 \tl_new:N \g_syu_macro_tl
54 \tl_set:Nx \g_syu_macro_tl { \meaning \g_syu_macro_tl }
55 \tl_gset:Nx \g_syu_macro_tl { \tl_range:Nnn \g_syu_macro_tl {1}{5} }
```

\\_syu\_if\_macro:nT \\_syu\_if\_macro:nF \\_syu\_if\_macro:nTF Then, define a conditional testing if the input is a macro. Note that I use `\if_meaning` rather than `\tl_if_eq:NNTF`.

```

56 \prg_new_protected_conditional:Npnn \_syu_if_macro:n #1 { T , F , TF }
57 {
58     \group_begin:
59         \tl_set:Nx \l_tmpa_tl { \meaning #1 }
60         \tl_set:Nx \l_tmpa_tl { \tl_range:Nnn \l_tmpa_tl {1} {5} }
```

This is a trick to keep `\l_tmpa_tl` in the current local group

```

61     \exp_after:wN
62     \group_end:
```

while throwing the comparison result out.

```

63     \if_meaning:w \l_tmpa_tl \g_syu_macro_tl
64         \prg_return_true:
65     \else:
66         \prg_return_false:
67     \fi:
68 }
```

## Read formatting info

\syu\_secnum\_from\_seq:N Read the formatting info from given  $\langle sequence \rangle$ .

```

69 \cs_new_protected:Npn \syu_secnum_from_seq:N #1
70 {
```

Use `\tl_gset:Nx` since: 1, these data are global and 2: I need them eating the fully expanded results.

```

71     \tl_gset:Nx \g_syu_chapter_tl
72         { \seq_item:Nn #1 { \g_syu_if_thechapter_int } }
73     \tl_gset:Nx \g_syu_section_tl
74         { \seq_item:Nn #1 { 1 + \g_syu_if_thechapter_int } }
75     \tl_gset:Nx \g_syu_subsection_tl
76         { \seq_item:Nn #1 { 2 + \g_syu_if_thechapter_int } }
77     \tl_gset:Nx \g_syu_subsubsection_tl
78         { \seq_item:Nn #1 { 3 + \g_syu_if_thechapter_int } }
79     \tl_gset:Nx \g_syu_paragraph_tl
80         { \seq_item:Nn #1 { 4 + \g_syu_if_thechapter_int } }
81     \tl_gset:Nx \g_syu_subparagraph_tl
82         { \seq_item:Nn #1 { 5 + \g_syu_if_thechapter_int } }
83 }
```

## Formatting

\syu\_secnum: Formatting section numbering.

```
84 \cs_new:Nn \syu_secnum:  
85 {
```

When \thechapter is defined, start from it.

```
86 \if_cs_exist:N \thechapter  
87   \renewcommand*\{\thechapter}  
88   { \g_syu_chapter_tl {chapter} }  
89   \renewcommand*\{\thesection}  
90   { \thechapter  
91     \g_syu_section_tl {section} }
```

Otherwise start from \thesection.

```
92 \else:  
93   \renewcommand*\{\thesection}  
94   { \g_syu_section_tl {section} }  
95 \fi:
```

The rest levels.

```
96 \renewcommand*\{\thesubsection}  
97 { \thesection  
98   \g_syu_subsection_tl {subsection} }  
99 \renewcommand*\{\thesubsubsection}  
100 { \thesubsection  
101   \g_syu_subsubsection_tl {subsubsection} }  
102 \renewcommand*\{\theparagraph}  
103 { \thesubsubsection  
104   \g_syu_paragraph_tl {paragraph} }  
105 \renewcommand*\{\thesubparagraph}  
106 { \theparagraph  
107   \g_syu_subparagraph_tl {subparagraph} }  
108 }
```

```
109 </package>
```
