

The $\text{\$T}\text{\&E}\text{\$X}$ 3 Package Collection *

Michael Kohlhase, Dennis Müller
FAU Erlangen-Nürnberg
<http://kwarc.info/>

2022-09-14

Abstract

$\text{\$T}\text{\&E}\text{\$X}$ is a collection of \LaTeX packages that allow to markup documents semantically without leaving the document format.

Running ‘pdflatex’ over sTeX -annotated documents formats them into normally-looking PDF. But sTeX also comes with a conversion pipeline into semantically annotated HTML5, which can host semantic added-value services that make the documents active (i.e. interactive and user-adaptive) and essentially turning \LaTeX into a document format for (mathematical) knowledge management (MKM).

$\text{\$T}\text{\&E}\text{\$X}$ augments \LaTeX with

- *semantic macros* that denote and distinguish between mathematical concepts, operators, etc. independent of their notational presentation,
- a powerful *module system* that allows for authoring and importing individual fragments containing document text and/or semantic macros, independent of – and without hard coding – directory paths relative to the current document, and
- a mechanism for exporting $\text{\$T}\text{\&E}\text{\$X}$ documents to (modular) XHTML, preserving all the semantic information for semantically informed knowledge management services.

This is the full documentation of $\text{\$T}\text{\&E}\text{\$X}$. It consists of four parts:

- **Part I** is a general manual for the $\text{\$T}\text{\&E}\text{\$X}$ package and associated software. It is primarily directed at end-users who want to use $\text{\$T}\text{\&E}\text{\$X}$ to author semantically enriched documents.
- **Part II** documents the macros provided by the $\text{\$T}\text{\&E}\text{\$X}$ package. It is primarily directed at package authors who want to build on $\text{\$T}\text{\&E}\text{\$X}$, but can also serve as a reference manual for end-users.
- **Part III** documents additional packages that build on $\text{\$T}\text{\&E}\text{\$X}$, primarily its module system. These are not part of the $\text{\$T}\text{\&E}\text{\$X}$ package itself, but useful additions enabled by $\text{\$T}\text{\&E}\text{\$X}$ package functionality.
- **Part IV** is the detailed documentation of the $\text{\$T}\text{\&E}\text{\$X}$ package implementation.

Part I

Manual

Boxes like this one contain implementation details that are mostly relevant for more advanced use cases, might be useful to know when debugging, or might be good to know to better understand how something works. They can easily be skipped on a first read.

→ Boxes like this one explain how some \LaTeX concept relates to the MMT/OMDoc system, philosophy or language; see [MMT; Koh06] for introductions.

Chapter 1

What is **S_TE_X**?

Formal systems for mathematics (such as interactive theorem provers) have the potential to significantly increase both the accessibility of published knowledge, as well as the confidence in its veracity, by rendering the precise semantics of statements machine actionable. This allows for a plurality of added-value services, from semantic search up to verification and automated theorem proving. Unfortunately, their usefulness is hidden behind severe barriers to accessibility; primarily related to their surface languages reminiscent of programming languages and very unlike informal standards of presentation.

S_TE_X minimizes this gap between informal and formal mathematics by integrating formal methods into established and widespread authoring workflows, primarily **L^AT_EX**, via non-intrusive semantic annotations of arbitrary informal document fragments. That way formal knowledge management services become available for informal documents, accessible via an IDE for authors and via generated *active* documents for readers, while remaining fully compatible with existing authoring workflows and publishing systems.

Additionally, an extensible library of reusable document fragments is being developed, that serve as reference targets for global disambiguation, intermediaries for content exchange between systems and other services.

Every component of the system is designed modularly and extensibly, and thus lay the groundwork for a potential full integration of interactive theorem proving systems into established informal document authoring workflows.

The general **S_TE_X** workflow combines functionalities provided by several pieces of software:

- The **S_TE_X** package collection to use semantic annotations in **L^AT_EX** documents,
- **Rus_TE_X** [RT] to convert **tex** sources to (semantically enriched) **xhtml**,
- The MMT system [MMT], that extracts semantic information from the thus generated **xhtml** and provides semantically informed added value services. Notably, MMT integrates the **Rus_TE_X** system already.

Chapter 2

Setup

There are two ways of using **sTeX**: as a

1. way of writing **L^AT_EX** more modularly (object-oriented Math) for creating PDF documents or
2. foundation for authoring active documents in HTML5 instrumented with knowledge management services.

Both are legitimate and useful. The first requires a significantly smaller tool-chain, so we describe it first. The second requires a much more substantial toolchain of knowledge management systems.

Luckily, the **sTeX-IDE** will take care of much of the setup required for the full toolchain, if you are willing to use it.

2.1 Setting up the **sTeX** Package

2.1.1 Minimal Setup for the **sTeX** Package

In the best of all worlds, there is no setup, as you already have a new version of **TeXLive** on your system as a **L^AT_EX** enthusiast. If not now is the time to install it; see [[TL](#)]. You can usually update **TeXLive** via a package manager or the **TeXLive** manager **tlmgr**. **sTeX** requires a **TeX** kernel newer than February 2022.

Alternatively, you can install **sTeX** from CTAN, the Comprehensive **TeX** Archive Network; see [[ST](#)] for details. We assume you have the **sTeX** package in at least version 3.2 (September 2022).

2.1.2 GIT-based Setup for the **sTeX** Development Version

If you want use the latest and greatest **sTeX** packages that have not even been released to CTAN, then you can directly clone them from the **sTeX** development repository [[sTeX](#)]

by the following command-line instructions:

```
cd <sTeXdir>
git clone https://github.com/slate/sTeX.git
```

and keep it updated by pulling updates via `git pull` in the cloned **sTeX** directory. Make sure to either clone the **sTeX** repository into a local `texmf-tree` or to update your `TEXINPUTS` environment variable, e.g. by placing the following line in your `.bashrc`:

```
export TEXINPUTS="$(TEXINPUTS):<sTeXDIR>//:"
```

2.1.3 Setting your MathHub Directory

One of $\text{\$} \text{TeX}$'s features is a proper *module system* of interconnected document snippets for mathematical content. Analogously to *object-oriented programming*, it allows for “object-oriented mathematics” via individual combinable and, importantly, *reusable* modules, developed collaboratively.

To make use of such modules, the $\text{\$} \text{TeX}$ system needs to be told where to find them. There are several ways to do so (see [subsection 5.2.1](#)), but the most convenient way to do so is via a system variable.

To do so, create a directory **MathHub** somewhere on your local file system and set the environment variable **MATHHUB** to the file path to that directory.

In linux, you can do so by writing

```
export MATHHUB="/path/to/your/MathHub"
```

in your `~/.profile` (for all shells) or `~/.bashrc` (for the bash terminal only) file.

2.2 Setting up the $\text{\$} \text{TeX}$ IDE

The $\text{\$} \text{TeX}$ IDE consists of two components using the *Language Server Protocol (LSP)*: A *client* in the form of a VSCode extension, and a *server* included in the MMT system. Installing the extension will open up a setup routine that will guide you through the rest.

2.2.1 The $\text{\$} \text{TeX}$ VSCode Extension

If you have not already, you should first install the VSCode editor available at <https://code.visualstudio.com/>.

Next, open VSCode and install the $\text{\$} \text{TeX}$ extension by clicking on the *extensions* menu on the very left of the VSCode window and searching for “ $\text{\$} \text{TeX}$ ” in the “*Search Extensions in Marketplace*” field, as in [Figure 1](#), and clicking the *Install*-button of the $\text{\$} \text{TeX}$ extension by KWARC.

2.2.2 Setting up Mmt

Next, open any directory (*File* → *Open Folder...*) that contains a `.tex`-file, and a setup window as in [Figure 2](#) will pop up. Click on the highlighted link ‘here’ and download the latest version of the `MMT.jar` file (at least version 23.0.0) anywhere you like. Then click the “*Browse...*”-button and select your freshly downloaded `MMT.jar`.

If you have already set a system variable for your MathHub-directory, you are now done and can click “*Finish*”. If you have not, you can now also enter a directory path in the lower text field, and the VSCode extension will attempt to globally set one up for you, depending on your operating system.

Once you click “*Finish*”, the client will connect to <https://stexmmt.mathhub.info/:sTeX>, query for available archives, download the core libraries required for all (or most) semantic services (`MMT/urtheories` and `sTeX/meta-inf`) and set up Ru $\text{\$} \text{TeX}$ for you automatically.

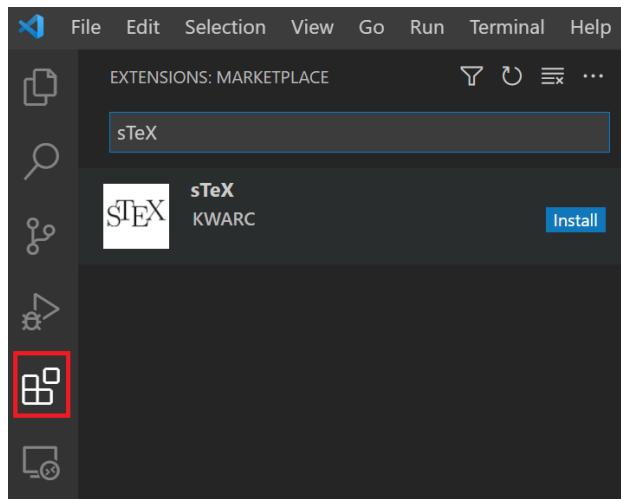

Figure 1: Installing the `sTeX` extension for VSCode

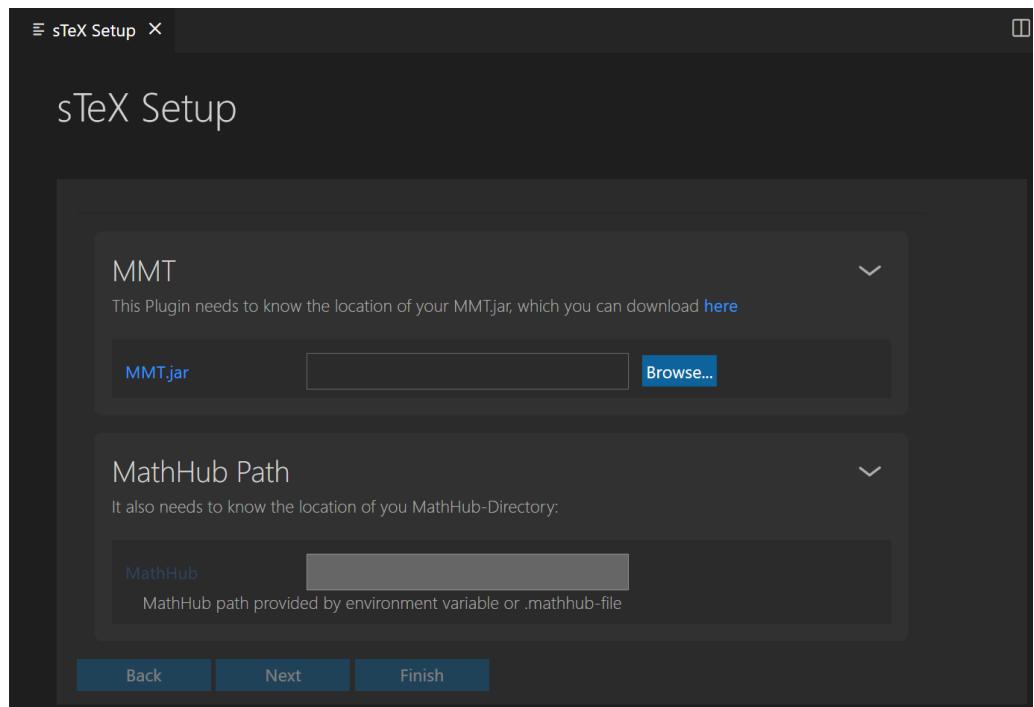

Figure 2: `sTeX` Setup Routine

2.3 Manual Setup

In lieu of using the $\text{S}\text{T}\text{E}\text{X}$ IDE, we can do the following:

2.3.1 $\text{S}\text{T}\text{E}\text{X}$ Archives (Manual Setup)

Writing semantically annotated $\text{S}\text{T}\text{E}\text{X}$ becomes much easier, if we can use well-designed libraries of already annotated content. $\text{S}\text{T}\text{E}\text{X}$ provides such libraries as $\text{S}\text{T}\text{E}\text{X}$ archives – i.e. GIT repositories at <https://gl.mathhub.info> – most prominently the SMGLoM libraries at <https://gl.mathhub.info/smglom>.

To do so, we set up a **local MathHub** by creating a MathHub directory `<mmdir>`. Every $\text{S}\text{T}\text{E}\text{X}$ archive has an **archive path** `<apath>` and a name `<archive>`. We can clone the $\text{S}\text{T}\text{E}\text{X}$ archive by the following command-line instructions:

```
cd <mmdir>/<apath>
git clone https://gl.mathhub.info/smglom/<archive>.git
```

Note that $\text{S}\text{T}\text{E}\text{X}$ archives often depend on other archives, thus you should be prepared to clone these as well – e.g. if `pdflatex` reports missing files. To make sure that $\text{S}\text{T}\text{E}\text{X}$ too knows where to find its archives, we need to set a global system variable `MATHHUB`, that points to your local MathHub-directory (see [section 5.2](#)).

```
export MATHHUB=<mmdir>"
```

2.3.2 Manual Setup for Active Documents and Knowledge Management Services

Foregoing on the $\text{S}\text{T}\text{E}\text{X}$ IDE, we will need several additional (on top of the minimal setup above) pieces of software; namely:

- **The Mmt System** available [here](#). We recommend following the setup routine documented [here](#).

Following the setup routine (Step 3) will entail designating a MathHub-directory on your local file system, where the MMT system will look for $\text{S}\text{T}\text{E}\text{X}$ /MMT content archives.

- **$\text{S}\text{T}\text{E}\text{X}$ Archives** If we only care about $\text{L}\text{A}\text{T}\text{E}\text{X}$ and generating `pdfs`, we do not technically need MMT at all; however, we still need the `MATHHUB` system variable to be set. Furthermore, MMT can make downloading content archives we might want to use significantly easier, since it makes sure that all dependencies of (often highly interrelated) $\text{S}\text{T}\text{E}\text{X}$ archives are cloned as well.

Once set up, we can run `mmt` in a shell and download an archive along with all of its dependencies like this: `lmh install <name-of-repository>`, or a whole *group* of archives; for example, `lmh install smglom` will download all smglom archives.

- **Rus TEX** The MMT system will also set up Rus TEX for you, which is used to generate (semantically annotated) `xhtml` from tex sources. In lieu of using MMT, you can also download and use Rus TEX directly [here](#).

Chapter 3

The **STEX** IDE

Chapter 4

A First **STEX** Document

Having set everything up, we can write a first **STEX** document. As an example, we will use the `smglom/calculus` and `smglom/arithmetics` archives, which should be present in the designated `MathHub`-folder, and write a small fragment defining the *geometric series*:

```
1 \documentclass{article}
2 \usepackage{stex,xcolor,stexthm}
3
4 \begin{document}
5 \begin{smodule}{GeometricSeries}
6   \importmodule[smglom/calculus]{series}
7   \importmodule[smglom/arithmetics]{realarith}
8
9   \symdef{geometricSeries}[name=geometric-series]{\comp{S}}
10
11  \begin{sdefinition}[for=geometricSeries]
12    The \definename{geometricSeries} is the \symname{series}
13    \[\defeq{\geometricSeries}{\definiens{
14      \infinitesum{\svar{n}}{1}{\realdivide{\frac{1}{\realpower{2}{\svar{n}}}}}}}
15    \realdivide{\frac{1}{\realpower{2}{\svar{n}}}}
16    \realpower{2}{\svar{n}}}
17    \}
18  \}.\
19  \end{sdefinition}
20
21  \begin{sassertion}[name=geometricSeriesConverges,type=theorem]
22  The \symname{geometricSeries} \symname{converges} towards $1$.
23  \end{sassertion}
24 \end{smodule}
25 \end{document}
```

Compiling this document with `pdflatex` should yield the output

Definition 0.1. The **geometric series** is the **series**

$$S := \sum_{n=1}^{\infty} \frac{1}{2^n}.$$

Theorem 0.2. The geometric series converges towards 1.

Move your cursor over the various highlighted parts of the document – depending on your pdf viewer, this should yield some interesting (but possibly for now cryptic) information.

Remark 4.0.1:

Note that all of the highlighting, tooltips, coloring and the environment headers come from `stexthm` – by default, the amount of additional packages loaded is kept to a minimum and all the presentations can be customized, see [section 7.3](#).

Let's investigate this document in detail to understand the respective parts of the S^TE_X markup infrastructure:

```
smodule (env.) \begin{smodule}{GeometricSeries}
...
\end{smodule}
```

First, we open a new *module* called `GeometricSeries`. The main purpose of the `smodule` environment is to group the contents and associate it with a *globally unique* identifier (URI), which is computed from the name `GeometricSeries` and the document context.

(Depending on your pdf viewer), the URI should pop up in a tooltip if you hover over the word **geometric series**.

```
\importmodule \importmodule[smglom/calculus]{series}
\importmodule[smglom/arithmetics]{realarith}
```

Next, we *import* two modules – `series` from the S^TE_X archive `smglom/calculus`, and `realarith` from the S^TE_X archive `smglom/arithmetics`. If we investigate these archives, we find the files `series.en.tex` and `realarith.en.tex` (respectively) in their respective `source`-folders, which contain the statements `\begin{smodule}{series}` and `\begin{smodule}{realarith}` (respectively).

The `\importmodule`-statements make all S^TE_X symbols and associated semantic macros (e.g. `\infinitesum`, `\realdivide`, `\realpower`) in the imported module available to the current module `GeometricSeries`. The module `GeometricSeries` “exports” all of these symbols to all modules imports it via an `\importmodule{GeometricSeries}` instruction. Additionally it exports the local symbol `\geometricSeries`.

```
\usemodule
```

If we only want to *use* the content of some module `Foo`, e.g. in remarks or examples, but none of the symbols in our current module actually *depend* on the content of `Foo`, we can use `\usemodule` instead – like `\importmodule`, this will make the module content available, but will *not* export it to other modules.

```
\symdef{GeometricSeries}[name=geometric-series]{\comp{S}}
```

Next, we introduce a new *symbol* with name `geometric-series` and assign it the semantic macro `\geometricSeries`. `\symdef` also immediately assigns this symbol a *notation*, namely `S`.

\comp The macro `\comp` marks the S in the notation as a *notational component*, as opposed to e.g. arguments to `\geometricSeries`. It is the notational components that get highlighted and associated with the corresponding symbol (i.e. in this case `geometricSeries`). Since `\geometricSeries` takes no arguments, we can wrap the whole notation in a `\comp`.

```
\begin{sdefinition}[for=geometricSeries]
...
\end{sdefinition}
\begin{sassertion}[name=geometricSeriesConverges,type=theorem]
...
\end{sassertion}
```

What follows are two *STEX-statements* (e.g. definitions, theorems, examples, proofs, ...). These are semantically marked-up variants of the usual environments, which take additional optional arguments (e.g. `for=`, `type=`, `name=`). Since many L^AT_EX templates predefine environments like `definition` or `theorem` with different syntax, we use `sdefinition`, `sassertion`, `sexample` etc. instead. You can customize these environments to e.g. simply wrap around some predefined `theorem`-environment. That way, we can still use `sassertion` to provide semantic information, while being fully compatible with (and using the document presentation of) predefined environments.

In our case, the `stexthm`-package patches e.g. `\begin{sassertion}[type=theorem]` to use a `theorem`-environment defined (as usual) using the `amsthm` package.

\symname ... is the `\symname{?series}`

The `\symname`-command prints the name of a symbol, highlights it (based on customizable settings) and associates the text printed with the corresponding symbol.

Note that the argument of `\symref` can be an imported symbol (here the `series` symbol is imported from the `series` module). STEX tries to determine the full symbol URI from the argument. If there are name clashes in or with the imported symbols, the name of the exporting module can be prepended to the symbol name before the `?` character.

If you hover over the word `series` in the pdf output, you should see a tooltip showing the full URI of the symbol used.

\symref The `\symname`-command is a special case of the more general `\symref`-command, which allows customizing the precise text associated with a symbol. `\symref` takes two arguments: the first is the symbol name (or macro name), and the second a variant verbalization of the symbol, e.g. an inflection variant, a different language or a synonym. In our example `\symname{?series}` abbreviates `\symref{?series}{series}`.

\definename The `\definename{geometricSeries}` ...

\definiendum The `sdefinition`-environment provides two additional macros, `\definename` and `\definiendum` which behave similarly to `\symname` and `\symref`, but explicitly mark the symbols as *being defined* in this environment, to allow for special highlighting.

```
\[ \defeq{\geometricSeries}{\definiens{
  \infitesum{\svar{n}}{1}{
    \realdivide[frac]{1}[
      \realpower{2}{\svar{n}}
    ]
  }
}\] .\]
```

The next snippet – set in a math environment – uses several semantic macros imported from (or recursively via) `series` and `realarithmetics`, such as `\defeq`, `\infitesum`, etc. In math mode, using a semantic macro inserts its (default) definition. A semantic macro can have several notations – in that case, we can explicitly choose a specific notation by providing its identifier as an optional argument; e.g. `\realdivide[frac]{a}{b}` will use the explicit notation named `frac` of the semantic macro `\realdivide`, which yields $\frac{a}{b}$ instead of a/b .

`\svar` The `\svar{n}` command marks up the `n` as a variable with name `n` and notation `n`.

`\definiens` The `sdefinition`-environment additionally provides the `\definiens`-command, which allows for explicitly marking up its argument as the *definiens* of the symbol currently being defined.

4.1 OMDOC/xhtml Conversion

So, if we run `pdflatex` on our document, then \LaTeX yields pretty colors and tooltips¹. But \LaTeX becomes a lot more powerful if we additionally convert our document to `xhtml` while preserving all the \LaTeX markup in the result.

TODO VSCode Plugin

Using `RuStEX [RT]`, we can convert the document to `xhtml` using the command `rustex -i /path/to/file.tex -o /path/to/outfile.xhtml`. Investigating the resulting file, we notice additional semantic information resulting from our usage of semantic macros, `\symref` etc. Below is the (abbreviated) snippet inside our `\definiens` block:

```
<mrow resource="" property="stex:definiens">
  <mrow resource="...?series?infitesum" property="stex:OMBIND">
    <underover displaystyle="true">
      <mo resource="...?series?infitesum" property="stex:comp">>\Sigma</mo>
      <mrow>
        <mrow resource="1" property="stex:arg">
          <mi resource="var://n" property="stex:OMV">n</mi>
        </mrow>
        <mo resource="...?series?infitesum" property="stex:comp">>=</mo>
        <mi resource="2" property="stex:arg">1</mi>
      </mrow>
      <mi resource="...?series?infitesum" property="stex:comp">>\infty</mi>
    </underover>
    <mrow resource="3" property="stex:arg">
      <frac resource="...?realarith?division#frac#" property="stex:OMA">
        <mi resource="1" property="stex:arg">1</mi>
        <mrow resource="2" property="stex:arg">
          <msup resource="...realarith?exponentiation" property="stex:OMA">
```

¹...and hyperlinks for symbols, and indices, and allows reusing document fragments modularly, and...

```

<mi resource="1" property="stex:arg">2</mi>
<mrow resource="2" property="stex:arg">
  <mi resource="var://n" property="stex:OMV">n</mi>
</mrow>
</msup>
</mrow>
</mfrac>
</mrow>
</mrow>
</mrow>

```

...containing all the semantic information. The MMT system can extract from this the following OPENMATH snippet:

```

<OMBIND>
  <OMID name="...?series?infinitesum"/>
  <OMV name="n"/>
  <OMLIT name="1"/>
  <OMA>
    <OMS name="...?realarith?division"/>
    <OMLIT name="1"/>
    <OMA>
      <OMS name="...realarith?exponentiation"/>
      <OMLIT name="2"/>
      <OMV name="n"/>
    </OMA>
  </OMA>
</OMBIND>

```

...giving us the full semantics of the snippet, allowing for a plurality of knowledge management services – in particular when serving the `xhtml`.

Remark 4.1.1:

Note that the `html` when opened in a browser will look slightly different than the `pdf` when it comes to highlighting semantic content – that is because naturally `html` allows for much more powerful features than `pdf` does. Consequently, the `html` is intended to be served by a system like MMT, which can pick up on the semantic information and offer much more powerful highlighting, linking and similar features, and being customizable by *readers* rather than being prescribed by an author.

Additionally, not all browsers (most notably Chrome) support MATHML natively, and might require additional external JavaScript libraries such as MathJax to render mathematical formulas properly.

4.2 Mmt/OMDoc Conversion

Another way to convert our document to *actual* MMT/OMDOC is to put it in an `STEX archive` (see [section 5.2](#)) and have MMT take care of everything.

Assuming the above file is `source/demo.tex` in an `STEX` archive `MyTest`, you can run MMT and do `build MyTest stex-omdoc demo.tex` to convert the document to both `xhtml` (which you will find in `xhtml/demo.xhtml` in the archive) and formal MMT/OMDoc, which you can subsequently view in the MMT browser (see <https://>

uniformal.github.io//doc/applications/server.html#the-mmt-web-site for details).

Chapter 5

Creating S^TE_X Content

We can use S^TE_X by simply including the package with `\usepackage{stex}`, or – primarily for individual fragments to be included in other documents – by using the S^TE_X document class with `\documentclass{stex}` which combines the `standalone` document class with the `stex` package.

Both the `stex` package and document class offer the following options:

lang (*<language>**) Languages to load with the `babel` package.

mathhub (*<directory>*) MathHub folder to search for repositories – this is not necessary if the `MATHHUB` system variable is set.

writesms (*<boolean>*) with this package option, S^TE_X will write the contents of all external modules imported via `\importmodule` or `\usemodule` into a file `\jobname.sms` (analogously to the table of contents `.toc`-file).

usesms (*<boolean>*) subsequently tells S^TE_X to read the generated sms-file at the beginning of the document. This allows for e.g. collaborating on documents without all authors having to have all used archives and modules available – one author can load the modules with `writesms`, and the rest can use the the modules with `usesms`. Furthermore, the sms file can be submitted alongside a `.tex`-file, effectively making it “standalone”.

image (*<boolean>*) passed on to `tikzinput`.

debug (*<log-prefix>**) Logs debugging information with the given prefixes to the terminal, or all if `all` is given. Largely irrelevant for the majority of users.

5.1 How Knowledge is Organized in S^TE_X

S^TE_X content is organized on multiple levels:

1. S^TE_X **archives** (see [section 5.2](#)) contain individual `.tex`-files.
2. These may contain S^TE_X **modules**, introduced via `\begin{smodule}{ModuleName}`.

3. Modules contain **STEX** symbol declarations, introduced via `\symdecl{symbolname}`, `\symdef{symbolname}` and some other constructions. Most symbols have a *notation* that can be used via a *semantic macro* `\symbolname` generated by symbol declarations.
4. **STEX expressions** finally are built up from usages of semantic macros.

- STEX archives are simultaneously MMT archives, and the same directory structure is consequently used.
- STEX modules correspond to OMDoc/MMT *theories*. `\importmodules` (and similar constructions) induce MMT *includes* and other *theory morphisms*, thus giving rise to a *theory graph* in the OMDoc sense [RK13].
-    Symbol declarations induce OMDoc/MMT *constants*, with optional (formal) *type* and *definiens* components.
- Finally, STEX expressions are converted to OMDOC/MMT terms, which use the abstract syntax (and XML encoding) of OPENMATH [Bus+04].

5.2 STEX Archives

5.2.1 The Local MathHub-Directory

`\usemodule`, `\importmodule`, `\inputref` etc. allow for including content modularly without having to specify absolute paths, which would differ between users and machines. Instead, STEX uses *archives* that determine the global namespaces for symbols and statements and make it possible for STEX to find content referenced via such URIs.

All STEX archives need to exist in the local MathHub-directory. STEX knows where this folder is via one of four means:

1. If the STEX package is loaded with the option `mathhub=/path/to/mathhub`, then STEX will consider `/path/to/mathhub` as the local MathHub-directory.
2. If the `mathhub` package option is *not* set, but the macro `\mathhub` exists when the STEX-package is loaded, then this macro is assumed to point to the local MathHub-directory; i.e. `\def\mathhub{/path/to/mathhub}\usepackage{stex}` will set the MathHub-directory as `path/to/mathhub`.
3. Otherwise, STEX will attempt to retrieve the system variable `MATHHUB`, assuming it will point to the local MathHub-directory. Since this variant needs setting up only *once* and is machine-specific (rather than defined in tex code), it is compatible with collaborating and sharing tex content, and hence recommended.
4. Finally, if all else fails, STEX will look for a file `~/.stex/mathhub.path`. If this file exists, STEX will assume that it contains the path to the local MathHub-directory. This method is recommended on systems where it is difficult to set environment variables.

5.2.2 The Structure of STEX Archives

An STEX archive `group/name` is stored in the directory `/path/to/mathhub/group/name`; e.g. assuming your local MathHub-directory is set as `/user/foo/MathHub`, then in order for the `smglom/calculus`-archive to be found by the STEX system, it needs to be in `/user/foo/MathHub/smglom/calculus`.

Each such archive needs two subdirectories:

- `/source` – this is where all your tex files go.
- `/META-INF` – a directory containing a single file `MANIFEST.MF`, the content of which we will consider shortly

An additional `lib`-directory is optional, and is where STEX will look for files included via `\libinput`.

Additionally a *group* of archives `group/name` may have an additional archive `group/meta-inf`. If this `meta-inf`-archive has a `/lib`-subdirectory, it too will be searched by `\libinput` from all tex files in any archive in the `group/*-group`.

We recommend the following additional directory structure in the `source`-folder of an STEX archive:

- `/source/mod/` – individual STEX modules, containing symbol declarations, notations, and `\begin{sparagraph}[type=symdoc,for=...]` environments for “encyclopaedic” symbol documentations
- `/source/def/` – definitions
- `/source/ex/` – examples
- `/source/thm/` – theorems, lemmata and proofs; preferably proofs in separate files to allow for multiple proofs for the same statement
- `/source/snip/` – individual text snippets such as remarks, explanations etc.
- `/source/frag/` – individual document fragments, ideally only `\inputref`ing snippets, definitions, examples etc. in some desirable order
- `/source/tikz/` – tikz images, as individual `.tex`-files
- `/source/PIC/` – image files.

5.2.3 MANIFEST.MF-Files

The `MANIFEST.MF` in the `META-INF`-directory consists of key-value-pairs, informing STEX (and associated software) of various properties of an archive. For example, the `MANIFEST.MF` of the `smglom/calculus`-archive looks like this:

```
id: smglom/calculus
source-base: http://mathhub.info/smglom/calculus
narration-base: http://mathhub.info/smglom/calculus
dependencies: smglom/arithmetics,smglom/sets,smglom/topology,
               smglom/mv,smglom/linear-algebra,smglom/algebra
responsible: Michael.Kohlhase@FAU.de
title: Elementary Calculus
```

```
teaser: Terminology for the mathematical study of change.  
description: desc.html
```

Many of these are in fact ignored by STEX, but some are important:

id: The name of the archive, including its group (e.g. `smsglom/calculus`),

source-base or

ns: The namespace from which all symbol and module URIs in this repository are formed, see ([TODO](#)),

narration-base: The namespace from which all document URIs in this repository are formed, see ([TODO](#)),

url-base: The URL that is formed as a basis for *external references*, see ([TODO](#)),

dependencies: All archives that this archive depends on. STEX ignores this field, but MMT can pick up on them to resolve dependencies, e.g. for `lmh install`.

5.2.4 Using Files in STEX Archives Directly

Several macros provided by STEX allow for directly including files in repositories. These are:

\mhinput `\mhinput[Some/Archive]{some/file}` directly inputs the file `some/file` in the `source`-folder of `Some/Archive`.

\inputref `\inputref[Some/Archive]{some/file}` behaves like `\mhinput`, but wraps the input in a `\begingroup ... \endgroup`. When converting to `xhtml`, the file is not input at all, and instead an `html`-annotation is inserted that references the file, e.g. for lazy loading.

In the majority of practical cases `\inputref` is likely to be preferred over `\mhinput` because it leads to less duplication in the generated `xhtml`.

\ifinput Both `\mhinput` and `\inputref` set `\ifinput` to “true” during input. This allows for selectively including e.g. bibliographies only if the current file is not being currently included in a larger document.

\addmhbibresource `\addmhbibresource[Some/Archive]{some/file}` searches for a file like `\mhinput` does, but calls `\addbibresource` to the result and looks for the file in the archive root directory directly, rather than the `source` directory. Typical invocations are

- `\addmhbibresource{lib/refs.bib}`, which specifies a bibliography in the `lib` folder in the local archive or
- `\addmhbibresource[HW/meta-inf]{lib/refs.bib}` in another.

\libinput `\libinput{some/file}` searches for a file `some/file` in

- the `lib`-directory of the current archive, and
- the `lib`-directory of a `meta-inf`-archive in (any of) the archive groups containing the current archive

and include all found files in reverse order; e.g. `\libinput{preamble}` in a `.tex`-file in `smglom/calculus` will *first* input `.../smglom/meta-inf/lib/preamble.tex` and then `.../smglom/calculus/lib/preamble.tex`.

`\libinput` will throw an error if *no* candidate for `some/file` is found.

\libusepackage `\libusepackage[package-options]{some/file}` searches for a file `some/file.sty` in the same way that `\libinput` does, but will call `\usepackage[package-options]{path/to/some/file}` instead of `\input`.

`\libusepackage` throws an error if not *exactly one* candidate for `some/file` is found.

Remark 5.2.1:

A good practice is to have individual `STeX` fragments follow basically this document frame:

```

1 \documentclass{stex}
2 \libinput{preamble}
3 \begin{document}
4 ...
5   \ifinputref \else \libinput{postamble} \fi
6 \end{document}

```

Then the `preamble.tex` files can take care of loading the generally required packages, setting presentation customizations etc. (per archive or archive group or both), and `postamble.tex` can e.g. print the bibliography, index etc.

`\libusepackage` is particularly useful in `preamble.tex` when we want to use custom packages that are not part of `TeXLive`. In this case we commit the respective packages in one of the `lib` folders and use `\libusepackage` to load them.

5.3 Module, Symbol and Notation Declarations

5.3.1 The `smodule`-Environment

`smodule (env.)` A new module is declared using the basic syntax

```
\begin{smodule}[options]{ModuleName}...\end{smodule}.
```

A module is required to declare any new formal content such as symbols or notations (but not variables, which may be introduced anywhere).

The `smodule`-environment takes several keyword arguments, all of which are optional:

`title` (*token list*) to display in customizations.

type (*string*)* for use in customizations.
deprecate (*module*) if set, will throw a warning when loaded, urging to use *module* instead.
id (*string*) for cross-referencing.
ns (*URI*) the namespace to use. *Should not be used, unless you know precisely what you're doing.* If not explicitly set, is computed using `\stex_modules_current_namespace`.
lang (*language*) if not set, computed from the current file name (e.g. `foo.en.tex`).
sig (*language*) if the current file is a translation of a file with the same base name but a different language suffix, setting `sig=<lang>` will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.
creators (*string*)* names of the creators.
contributors (*string*)* names of contributors.
srccite (*string*) a source citation for the content of this module.

↙ M → An `\stex` module corresponds to an MMT/OMDOC *theory*. As such it
 ↘ M → gets assigned a module URI (*universal resource identifier*) of the form
 ↗ T ↘ <namespace>?<module-name>.

By default, opening a module will produce no output whatsoever, e.g.:

Example 1

Input:

```
1 \begin{smodule}[title={This is Some Module}]{SomeModule}
2   Hello World
3 \end{smodule}
```

Output:

```
Hello World
```

\stexpatchmodule We can customize this behavior either for all modules or only for modules with a specific type using the command `\stexpatchmodule[optional-type]{begin-code}{end-code}`. Some optional parameters are then available in `\smodule*`-macros, specifically `\smoduledescription`, `\smodulename` and `\smoduledescription`.

For example:

Example 2

Input:

```

1 \stexpatchmodule[display]
2   {\textbf{Module } (\smoduletitle)}\par}
3   {\par\noindent\textbf{End of Module } (\smoduletitle)}}
4
5 \begin{smodule}[type=display,title={Some New Module}]{SomeModule2}
6   Hello World
7 \end{smodule}

```

Output:

```

Module (Some New Module)
Hello World
End of Module (Some New Module)

```

5.3.2 Declaring New Symbols and Notations

Inside an `smodule` environment, we can declare new STEX symbols.

`\symdecl` The most basic command for doing so is using `\symdecl{symbolname}`. This introduces a new symbol with name `symbolname`, arity 0 and semantic macro `\symbolname`.

The starred variant `\symdecl*{symbolname}` will declare a symbol, but not introduce a semantic macro. If we don't want to supply a notation (for example to introduce concepts like "abelian", which is not something that has a notation), the starred variant is likely to be what we want.

←M→ `\symdecl` introduces a new OMDoc/MMT constant in the current module (=OMDoc/MMT theory). Correspondingly, they get assigned the URI ↵T ↵ <module-URI>?<constant-name>.

Without a semantic macro or a notation, the only meaningful way to reference a symbol is via `\symref`, `\symname` etc.

Example 3

Input:

```

1 \symdecl*{foo}
2 Given a \symname{foo}, we can...

```

Output:

```

Given a foo, we can...

```

Obviously, most semantic macros should take actual *arguments*, implying that the symbol we introduce is an *operator* or *function*. We can let `\symdecl` know the *arity* (i.e. number of arguments) of a symbol like this:

Example 4

Input:

```
1 \symdecl{binarysymbol}[args=2]
2 \symref{binarysymbol}{this} is a symbol taking two arguments.
```

Output:

```
this is a symbol taking two arguments.
```

So far we have gained exactly ... nothing by adding the arity information: we cannot do anything with the arguments in the text.

We will now see what we can gain with more machinery.

\notation We probably want to supply a notation as well, in which case we can finally actually use the semantic macro in math mode. We can do so using the **\notation** command, like this:

Example 5

Input:

```
1 \notation{binarysymbol}{\text{First: } #1\text{; Second: } #2}
2 \$\binarysymbol{a}{b}\$
```

Output:

```
First: a; Second: b
```

↳ Applications of semantic macros, such as `\binarysymbol{a}{b}` are translated to
→ MMT/OMDoc as OMA-terms with head `<OMS name="...?binarysymbol"/>`.
→ T Semantic macros with no arguments correspond to OMS directly.

\comp For many semantic services e.g. semantic highlighting or **wikification** (linking user-visible notation components to the definition of the respective symbol they come from), we need to specify the notation components. Unfortunately, there is currently no way the STEX engine can infer this by itself, so we have to specify it manually in the notation specification. We can do so with the **\comp** command.

We can introduce a new notation **highlight** for `\binarysymbol` that fixes this flaw, which we can subsequently use with `\binarysymbol[highlight]`:

Example 6

Input:

```
1 \notation{binarysymbol}[highlight]
2   {\comp{\text{First: }}#1\comp{\text{; Second: }}#2}
3 ${\color{green}binarysymbol}[highlight]{a}{b}$
```

Output:

```
First: a; Second: b
```

Ideally, `\comp` would not be necessary: Everything in a notation that is *not* an argument should be a notation component. Unfortunately, it is computationally expensive to determine where an argument begins and ends, and the argument markers `#n` may themselves be nested in other macro applications or TeX groups, making it ultimately almost impossible to determine them automatically while also remaining compatible with arbitrary highlighting customizations (such as tooltips, hyperlinks, colors) that users might employ, and that are ultimately invoked by `\comp`.

Note that it is required that

1. the argument markers `#n` never occur inside a `\comp`, and
2. no semantic arguments may ever occur inside a notation.

Both criteria are not just required for technical reasons, but conceptionally meaningful:

The underlying principle is that the arguments to a semantic macro represent *arguments to the mathematical operation* represented by a symbol. For example, a semantic macro `\addition{a}{b}` taking two arguments would represent *the actual addition of (mathematical objects) a and b*. It should therefore be impossible for *a* or *b* to be part of a notation component of `\addition`.

Similarly, a semantic macro can not conceptually be part of the notation of `\addition`, since a semantic macro represents a *distinct mathematical concept* with *its own semantics*, whereas notations are syntactic representations of the very symbol to which the notation belongs.

If you want an argument to a semantic macro to be a purely syntactic parameter, then you are likely somewhat confused with respect to the distinction between the precise *syntax* and *semantics* of the symbol you are trying to declare (which happens quite often even to experienced L^AT_EX users), and might want to give those another thought - quite likely, the macro you aim to implement does not actually represent a semantically meaningful mathematical concept, and you will want to use `\def` and similar native L^AT_EX macro definitions rather than semantic macros.

\symdef In the vast majority of cases where a symbol declaration should come with a semantic macro, we will want to supply a notation immediately. For that reason, the `\symdef` command combines the functionality of both `\symdecl` and `\notation` with the optional arguments of both:

Example 7

Input:

```
1 \symdef{newbinarysymbol}[h1,args=2]
2   {\comp{\text{1.: }}}#1\comp{\text{; 2.: }}#2}
3 $newbinarysymbol{a}{b}$
```

Output:

```
1.: a; 2.: b
```

We just declared a new symbol `newbinarysymbol` with `args=2` and immediately provided it with a notation with identifier `h1`. Since `h1` is the *first* (and so far, only) notation supplied for `newbinarysymbol`, using `\newbinarysymbol` without optional argument defaults to this notation.

But one man's meat is another man's poison: it is very subjective what the “default notation” of an operator should be. Different communities have different practices. For instance, the complex unit is written as *i* in Mathematics and as *j* in electrical engineering. So to allow modular specification and facilitate re-use of document fragments S^TE_X allows to re-set notation defaults.

\setnotation The first notation provided will stay the default notation unless explicitly changed – this is enabled by the `\setnotation` command: `\setnotation{symbolname}{notation-id}` sets the default notation of `\symbolname` to `notation-id`, i.e. henceforth, `\symbolname` behaves like `\symbolname[notation-id]` from now on.

Often, a default notation is set right after the corresponding notation is introduced – the starred version `\notation*` for that reason introduces a new notation and immediately sets it to be the new default notation. So expressed differently, the *first* `\notation` for a symbol behaves exactly like `\notation*`, and `\notation*[foo][bar]{...}` behaves exactly like `\notation{foo}[bar]{...}\setnotation{foo}{bar}`.

\textsymdecl In the less mathematical settings where we want a symbol and semantic macro for some concept with a notation *beyond* its mere name, but which should also be available in T_EX's text mode, the command `\textsymdecl` is useful. For example, we can declare a symbol `openmath` with the notation `\textsc{OpenMath}` using `\textsymdecl{openmath}[name=OpenMath]{\textsc{OpenMath}}`. The `\openmath` yields `OPENMATH` both in text and math mode.

Operator Notations

Once we have a semantic macro with arguments, such as `\newbinarysymbol`, the semantic macro represents the *application* of the symbol to a list of arguments. What if we want to refer to the operator *itself*, though?

We can do so by supplying the `\notation` (or `\symdef`) with an *operator notation*, indicated with the optional argument `op=`. We can then invoke the operator notation using `\symbolname!` [notation-identifier]. Since operator notations never take arguments, we do not need to use `\comp` in it, the whole notation is wrapped in a `\comp` automatically:

Example 8

Input:

```
1 \notation{newbinarysymbol}[ab, op={\text{a:}\cdot\text{; b:}\cdot}]\cdot
2 {\comp{\text{a:}}\#1\comp{\text{; b:}}\#2} \symname{newbinarysymbol} is also
3 occasionally written \$\newbinarysymbol![ab]$
```

Output:

```
newbinarysymbol is also occasionally written a:· ; b:·
```

→ M → `\symbolname!` is translated to OMDoc/MMT as `<OMS name="...?symbolname"/>`
→ M → directly.
~ T ~→

5.3.3 Argument Modes

The notations so far used *simple* arguments which we call *mode-i* arguments. Declaring a new symbol with `\symdecl{foo}[args=3]` is equivalent to writing `\symdecl{foo}[args=iii]`, indicating that the semantic macro takes three mode-i arguments. However, there are three more argument modes which we will investigate now, namely mode-b, mode-a and mode-B arguments.

Mode-b Arguments

A mode-b argument represents a *variable* that is *bound* by the symbol in its application, making the symbol a *binding operator*. Typical examples of binding operators are e.g. sums \sum , products \prod , integrals \int , quantifiers like \forall and \exists , that λ -operator, etc.

→ M → Mode-b arguments behave exactly like mode-i arguments within T_EX, but applications of binding operators, i.e. symbols with mode-b arguments, are translated
~ T ~→ to OMBIND-terms in OMDoc/MMT, rather than OMA.

For example, we can implement a summation operator binding an index variable and taking lower and upper index bounds and the expression to sum over like this:

Example 9

Input:

```
1 \symdef{summation}[args=biii]
2   {\mathop{\comp{\sum}}_{\#1\comp{=}\#2}^{\#3\#4}}
3   \$\textcolor{green}{summation}\{\textcolor{violet}{svar}\{x\}\{1\}\{\textcolor{violet}{svar}\{n\}\}\{\textcolor{violet}{svar}\{x\}\}^2\$
```

Output:

```
\sum_{x=1}^n x^2
```

where the variable x is now *bound* by the `\summation`-symbol in the expression.

Mode-a Arguments

Mode-a arguments represent a *flexary argument sequence*, i.e. a sequence of arguments of arbitrary length. Formally, operators that take arbitrarily many arguments don't "exist", but in informal mathematics, they are ubiquitous. Mode-a arguments allow us to write e.g. `\addition{a,b,c,d,e}` rather than having to write something like `\addition{a}{\addition{b}{\addition{c}{\addition{d}{e}}}}`!

`\notation` (and consequently `\symdef`, too) take one additional argument for each mode-a argument that indicates how to "accumulate" a comma-separated sequence of arguments. This is best demonstrated on an example.

Let's say we want an operator representing quantification over an ascending chain of elements in some set, i.e. `\ascendingchain{S}{a,b,c,d,e}{t}` should yield $\forall a <_S b <_S c <_S d <_S e. t$. The "base"-notation for this operator is simply `\comp{\forall} #2\comp{.,}#3`, where #2 represents the full notation fragment *accumulated* from `{a,b,c,d,e}`.

The *additional* argument to `\notation` (or `\symdef`) takes the same arguments as the base notation and two *additional* arguments `##1` and `##2` representing successive pairs in the mode-a argument, and accumulates them into `#2`, i.e. to produce $a <_S b <_S c <_S d <_S e$, we do `##1 \comp{<}_{##1} ##2`:

Example 10

Input:

```
1 \symdef{ascendingchain}[args=iai]
2   {\comp{\forall} #2\comp{.,}#3}
3   {##1 \comp{<}_{##1} ##2}
4
5 Tadaa: \$\textcolor{green}{ascendingchain}\{S\}{a,b,c,d,e}{t}\$
```

Output:

```
Tadaa: \forall a <_S b <_S c <_S d <_S e. t
```

If this seems overkill, keep in mind that you will rarely need the single-hash arguments #1,#2 etc. in the `a`-notation-argument. For a much more representative and simpler example, we can introduce flexary addition via:

Example 11

Input:

```
1 \symdef{addition}[args=a]{#1}{##1 \comp{+} ##2}
2
3 Tadaa: $\addition{a,b,c,d,e}$
```

Output:

```
Tadaa:  $a+b+c+d+e$ 
```

The assoc-key We mentioned earlier that “formally”, flexary arguments don’t really “exist”. Indeed, formally, addition is usually defined as a binary operation, quantifiers bind a single variable etc.

Consequently, we can tell STEX (or, rather, MMT/OMDoc) how to “resolve” flexary arguments by providing `\symdecl` or `\symdef` with an optional `assoc`-argument, as in `\symdecl{addition}[args=a,assoc=bin]`. The possible values for the `assoc`-key are:

`bin`: A binary, associative argument, e.g. as in `\addition`

`binl`: A binary, left-associative argument, e.g. $a^{b^{c^d}}$, which stands for $((a^b)^c)^d$

`binr`: A binary, right-associative argument, e.g. as in $A \rightarrow B \rightarrow C \rightarrow D$, which stands for $A \rightarrow (B \rightarrow (C \rightarrow D))$

`pre`: Successively prefixed, e.g. as in $\forall x, y, z. P$, which stands for $\forall x. \forall y. \forall z. P$

`conj`: Conjunctive, e.g. as in $a = b = c = d$ or $a, b, c, d \in A$, which stand for $a = d \wedge b = d \wedge c = d$ and $a \in A \wedge b \in A \wedge c \in A \wedge d \in A$, respectively

`pwconj`: Pairwise conjunctive, e.g. as in $a \neq b \neq c \neq d$, which stands for $a \neq b \wedge a \neq c \wedge a \neq d \wedge b \neq c \wedge b \neq d \wedge c \neq d$

As before, at the PDF level, this annotation is invisible (and without effect), but at the level of the generated OMDoc/MMT this leads to more semantical expressions.

Mode-B Arguments

Finally, mode-B arguments simply combine the functionality of both `a` and `b` - i.e. they represent an arbitrarily long sequence of variables to be bound, e.g. for implementing quantifiers:

Example 12

Input:

```

1 \symdef{quantforall}[args=Bi]
2   {\comp{\forall}#1\comp{.}#2}
3   {##1\comp,##2}
4
5 \$\quantforall{\svar{x},\svar{y},\svar{z}}{P}$

```

Output:

```
\forall x,y,z.P
```

5.3.4 Type and Definiens Components

`\symdecl` and `\symdef` take two more optional arguments. TeX largely ignores them (except for special situations we will talk about later), but MMT can pick up on them for additional services. These are the `type` and `def` keys, which expect expressions in math-mode (ideally using semantic macros, of course!).

The `type` and `def` keys correspond to the `type` and `definiens` components of
 $\xleftarrow{\text{M}} \text{OMDoc/MMT}$ constants.
 $\xrightarrow{\text{M}}$ Correspondingly, the name “type” should be taken with a grain of salt, since
 $\xrightarrow{\sim T} \text{OMDoc/MMT-}$ being foundation-independent – does not a priori implement a fixed typing system.

The `type`-key allows us to provide additional information (given the necessary STeX symbols), e.g. for addition on natural numbers:

Example 13

Input:

```

1 \symdef{Nat}[type=\set]{\comp{\mathbb{N}}}
2 \symdef{addition}[
3   type=\funtype{\Nat,\Nat}{\Nat},
4   op=+,
5   args=a
6 ]{#1}{##1 \comp+ ##2}
7
8 \symname{addition} is an operation $\funtype{\Nat,\Nat}{\Nat}$

```

Output:

```
addition is an operation  $\mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$ 
```

The `def`-key allows for declaring symbols as abbreviations:

Example 14

Input:

```
1 \symdef{successor}[
2   type=\funtype{\Nat}{\Nat},
3   def=\fun{\svar{x}}{\addition{\svar{x},1}},
4   op=\mathhtt{succ},
5   args=1
6 ]{\comp{\mathhtt{succ}()}{}}
7
8 The \symname{successor} operation $\funtype{\Nat}{\Nat}$
9 is defined as $\fun{\svar{x}}{\addition{\svar{x},1}}$
```

Output:

```
The successor operation  $\mathbb{N} \rightarrow \mathbb{N}$  is defined as  $x \mapsto x + 1$ 
```

5.3.5 Precedences and Automated Bracketing

Having done `\addition`, the obvious next thing to implement is `\multiplication`. This is straight-forward in theory:

Example 15

Input:

```
1 \symdef{multiplication}[
2   type=\funtype{\Nat,\Nat}{\Nat},
3   op=\cdot,
4   args=a
5 ]{\#1}{##1 \comp{\cdot} ##2}
6
7 \symname{multiplication} is an operation $\funtype{\Nat,\Nat}{\Nat}$
```

Output:

```
multiplication is an operation  $\mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$ 
```

However, if we combine `\addition` and `\multiplication`, we notice a problem:

Example 16

Input:

```
1 $\addition{a, \multiplication{b, \addition{c, \multiplication{d,e}}}}$
```

Output:

```
a+b·c+d·e
```

We all know that `.` binds stronger than `+`, so the output $a+b\cdot c+d\cdot e$ does not actually reflect the term we wrote. We can of course insert parentheses manually

Example 17

Input:

```
1 $\backslash addition{a, \multiplication{b, (\backslash addition{c, \multiplication{d, e}})}}$
```

Output:

```
 $a+b\cdot(c+d\cdot e)$ 
```

but we can also do better by supplying *precedences* and have `STEX` insert parentheses automatically.

For that purpose, `\notation` (and hence `\symdef`) take an optional argument `prec=<opprec>;<argprec1>x...x<argprec n>`.

We will investigate the precise meaning of `<opprec>` and the `<argprec>`s shortly – in the vast majority of cases, it is perfectly sufficient to think of `prec=` taking a single number and having that be *the* precedence of the notation, where lower precedences (somewhat counterintuitively) bind stronger than higher precedences. So fixing our notations for `\addition` and `\multiplication`, we get:

Example 18

Input:

```
1 \notation[multiplication][
2   op=\cdot,
3   prec=50
4 ]{#1}{##1 \comp\cdot ##2}
5 \notation[addition][
6   op=+,
7   prec=100
8 ]{#1}{##1 \comp+ ##2}
9
10 $\backslash addition{a, \multiplication{b, \addition{c, \multiplication{d, e}}}}$
```

Output:

```
 $a+b\cdot(c+d\cdot e)$ 
```

Note that the precise numbers used for precedences are pretty arbitrary - what matters is which precedences are higher than which other precedences when used in conjunction.

`\infprec`
`\neginfprec`

It is occasionally useful to have “infinitely” high or low precedences to enforce or forbid automated bracketing entirely, e.g. for bracket-like notations such as intervals – for those purposes, `\infprec` and `\neginfprec` exist (which are implemented as the maximal and minimal integer values accordingly).g

More precisely, each notation takes

1. One *operator precedence* and
2. one *argument precedence* for each argument.

By default, all precedences are 0, unless the symbol takes no argument, in which case the operator precedence is `\neginfpref` (negative infinity). If we only provide a single number, this is taken as both the operator precedence and all argument precedences.

STEX decides whether to insert parentheses by comparing operator precedences to a *downward precedence* p_d with initial value `\infprec`. When encountering a semantic macro, STEX takes the operator precedence p_{op} of the notation used and checks whether $p_{op} > p_d$. If so, STEX insert parentheses.

When STEX steps into an argument of a semantic macro, it sets p_d to the respective argument precedence of the notation used.

In the example above:

1. STEX starts out with $p_d = \infprec$.
2. STEX encounters `\addition` with $p_{op} = 100$. Since $100 \not> \infprec$, it inserts no parentheses.
3. Next, STEX encounters the two arguments for `\addition`. Both have no specifically provided argument precedence, so STEX uses $p_d = p_{op} = 100$ for both and recurses.
4. Next, STEX encounters `\multiplication{b, ...}`, whose notation has $p_{op} = 50$.
5. We compare to the current downward precedence p_d set by `\addition`, arriving at $p_{op} = 50 \not> 100 = p_d$, so STEX again inserts no parentheses.
6. Since the notation of `\multiplication` has no explicitly set argument precedences, STEX uses the operator precedence for all arguments of `\multiplication`, hence sets $p_d = p_{op} = 50$ and recurses.
7. Next, STEX encounters the inner `\addition{c, ...}` whose notation has $p_{op} = 100$.
8. We compare to the current downward precedence p_d set by `\multiplication`, arriving at $p_{op} = 100 > 50 = p_d$ – which finally prompts STEX to insert parentheses, and we proceed as before.

5.3.6 Variables

All symbol and notation declarations require a module with which they are associated, hence the commands `\symdecl`, `\notation`, `\symdef` etc. are disabled outside of `smodule`-environments.

Variables are different – variables are allowed everywhere, are not exported when the current module (if one exists) is imported (via `\importmodule` or `\usemodule`) and (also unlike symbol declarations) “disappear” at the end of the current TEX group.

`\svar` So far, we have always used variables using `\svar{n}`, which marks-up n as a variable with name `n`. More generally, `\svar[foo]{<texcode>}` marks-up the arbitrary `<texcode>` as representing a variable with name `foo`.

Of course, this makes it difficult to reuse variables, or introduce “functional” variables with arities > 0 , or provide them with a type or definitions.

\vardef For that, we can use the `\vardef` command. Its syntax is largely the same as that of `\symdef`, but unlike symbols, variables have only one notation (**TODO: so far?**), hence there is only `\vardef` and no `\vardecl`.

Example 19

Input:

```

1 \vardef{varf}[
2   name=f,
3   type=\funtype{\Nat}{\Nat},
4   op=f,
5   args=1,
6   prec=0;\neginfpref
7 ]{\comp{f}\#1}
8 \vardef{varn}[name=n,type=\Nat]{\comp{n}}
9 \vardef{varx}[name=x,type=\Nat]{\comp{x}}
10
11 Given a function $\varf!: \funtype{\Nat}{\Nat}$,
12 by $\addition{\varf!, \varn}$ we mean the function\rustexBREAK
13 $\fun{\varx}{\varf{\addition{\varx, \varn}}}$
```

Output:

Given a function $f : \mathbb{N} \rightarrow \mathbb{N}$, by $f + n$ we mean the function $x \mapsto f(x + n)$

(of course, “lifting” addition in the way described in the previous example is an operation that deserves its own symbol rather than abusing `\addition`, but... well.)

TODO: bind=forall/exists

5.3.7 Variable Sequences

Variable *sequences* occur quite frequently in informal mathematics, hence they deserve special support. Variable sequences behave like variables in that they disappear at the end of the current TEX group and are not exported from modules, but their declaration is quite different.

\varseq A variable sequence is introduced via the command `\varseq`, which takes the usual optional arguments `name` and `type`. It then takes a starting index, an end index and a *notation* for the individual elements of the sequence parametric in an index. Note that both the starting as well as the ending index may be variables.

This is best shown by example:

Example 20

Input:

```

1 \vardef{varn}[name=n,type=\Nat]{\comp{n}}
2 \varseq{seqa}[name=a,type=\Nat]{1}{\varn}{\comp{a}_{\#1}}
3
4 The $i$th index of $\seqa$ is $\seqa[i]$.

```

Output:

The i th index of a_1, \dots, a_n is a_i .

Note that the syntax `\seqa!` now automatically generates a presentation based on the starting and ending index.

TODO: more notations for invoking sequences.

Notably, variable sequences are nicely compatible with `a`-type arguments, so we can do the following:

Example 21

Input:

```
1 $\mathit{\addition}(\seqa)$
```

Output:

$a_1 + \dots + a_n$

Sequences can be *multidimensional* using the `args`-key, in which case the notation's arity increases and starting and ending indices have to be provided as a comma-separated list:

Example 22

Input:

```

1 \vardef{varm}[name=m,type=\Nat]{\comp{m}}
2 \varseq{seqa}[
3   name=a,
4   args=2,
5   type=\Nat,
6 ]{1,1}{\varn,\varm}{\comp{a}_{\#1}^{\#2}}
7
8 $\seqa$ and $\mathit{\addition}(\seqa)$

```

Output:

a_1^1, \dots, a_n^m and $a_1^1 + \dots + a_n^m$

We can also explicitly provide a “middle” segment to be used, like such:

Example 23

Input:

```
1 \varseq{seqa}[
2   name=a,
3   type=\Nat,
4   args=2,
5   mid={\comp{a}_{\varn}^1, \comp{a}_1^2, \ellipses, \comp{a}_{1}^{\varm}}
6 ]{1,1}{\varn, \varm}{\comp{a}_{\#1}^{\#1}}
7
8 $seqa!$ and $\addition{\seqa}$
```

Output:

```
 $a_1^1, \dots, a_n^1, a_1^2, \dots, a_1^m, \dots, a_n^m$  and  $a_1^1 + \dots + a_n^1 + a_1^2 + \dots + a_1^m + \dots + a_n^m$ 
```

5.4 Module Inheritance and Structures

The $\text{S}\text{T}\text{E}\text{X}$ features for modular document management are inherited from the OMDoc/MMT model that organizes knowledge into a graph, where the nodes are theories (called modules in $\text{S}\text{T}\text{E}\text{X}$) and the edges are truth-preserving mappings (called theory morphisms in MMT). We have already seen modules/theories above.

Before we get into theory morphisms in $\text{S}\text{T}\text{E}\text{X}$ we will see a very simple application of modules: managing multilinguality modularly.

5.4.1 Multilinguality and Translations

If we load the $\text{S}\text{T}\text{E}\text{X}$ document class or package with the option `lang=<lang>`, $\text{S}\text{T}\text{E}\text{X}$ will load the appropriate `babel` language for you – e.g. `lang=de` will load the `babel` language `ngerman`. Additionally, it makes $\text{S}\text{T}\text{E}\text{X}$ aware of the current document being set in (in this example) `german`. This matters for reasons other than mere `babel`-purposes, though:

Every *module* is assigned a language. If no $\text{S}\text{T}\text{E}\text{X}$ package option is set that allows for inferring a language, $\text{S}\text{T}\text{E}\text{X}$ will check whether the current file name ends in e.g. `.en.tex` (or `.de.tex` or `.fr.tex`, or...) and set the language accordingly. Alternatively, a language can be explicitly assigned via `\begin{smodule}[lang=<language>]{Foo}`.

Technically, each `smodule`-environment induces *two* OMDoc/MMT theories:
`\begin{smodule}[lang=<lang>]{Foo}` generates a theory `some/namespace?Foo`
↳ that only contains the “formal” part of the module – i.e. exactly the content
↳ that is exported when using `\importmodule`.
~~T~~ Additionally, MMT generates a *language theory* `some/namespace/Foo?<lang>` that includes `some/namespace?Foo` and contains all the other document content – variable declarations, includes for each `\usemodule`, etc.

Notably, the language suffix in a filename is ignored for `\usemodule`, `\importmodule` and in generating/computing URIs for modules. This however allows for providing *translations* for modules between languages without needing to duplicate content:

If a module `Foo` exists in e.g. `english` in a file `Foo.en.tex`, we can provide a file `Foo.de.tex` right next to it, and write `\begin{smodule}[sig=en]{Foo}`. The `sig`-key then signifies, that the “signature” of the module is contained in the `english` version of the module, which is immediately imported from there, just like `\importmodule` would.

Additionally to translating the informal content of a module file to different languages, it also allows for customizing notations between languages. For example, the *least common multiple* of two numbers is often denoted as `lcm(a,b)` in english, but is called *kleinstes gemeinsames Vielfaches* in german and consequently denoted as `kgV(a,b)` there.

We can therefore imagine a german version of an `lcm`-module looking something like this:

```

1 \begin{smodule}[sig=en]{lcm}
2   \notation*[lcm][de]{\comp{\mathhtt{kgV}}}{#1,#2}
3
4 Das \symref{lcm}{kleinste gemeinsame Vielfache}
5 $lcm{a,b}$ von zwei Zahlen $a,b$ ist...
6 \end{smodule}

```

If we now do `\importmodule{lcm}` (or `\usemodule{lcm}`) within a *german* document, it will also load the content of the german translation, including the `de`-notation for `\lcm`.

5.4.2 Simple Inheritance and Namespaces

`\importmodule` `\importmodule[Some/Archive]{path?ModuleName}` is only allowed within an `smodule`-environment and makes the symbols declared in `ModuleName` available therein. Additionally the symbols of `ModuleName` will be exported if the current module is imported somewhere else via `\importmodule`.

`\usemodule` behaves the same way, but without exporting the content of the used module.

It is worth going into some detail how exactly `\importmodule` and `\usemodule` resolve their arguments to find the desired module – which is closely related to the *namespace* generated for a module, that is used to generate its URI.

Ideally, `STEX` would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, `TEX` only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that `STEX` can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completeness sake, we describe how they are constructed:

- If `\begin{smodule}{Foo}` occurs in a file `/path/to/file/Foo[.(lang)].tex` which does not belong to an archive, the namespace is `file://path/to/file`.
- If the same statement occurs in a file `/path/to/file/bar[.(lang)].tex`, the namespace is `file://path/to/file/bar`.

In other words: outside of archives, the namespace corresponds to the file URI

with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's `source`-folder is replaced by the archive's namespace URI.

Conversely, here is how namespaces/URIs and file paths are computed in import statements, exemplary `\importmodule`:

- `\importmodule{Foo}` outside of an archive refers to module `Foo` in the current namespace. Consequently, `Foo` must have been declared earlier in the same document or, if not, in a file `Foo[.<lang>].tex` in the same directory.
- The same statement *within* an archive refers to either the module `Foo` declared earlier in the same document, or otherwise to the module `Foo` in the archive's top-level namespace. In the latter case, it has to be declared in a file `Foo[.<lang>].tex` directly in the archive's `source`-folder.
- Similarly, in `\importmodule{some/path?Foo}` the path `some/path` refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and `source`-folder, respectively.

The module `Foo` must either be declared in the file `<top-directory>/some/path/Foo[.<lang>].tex`, or in `<top-directory>/some/path[.<lang>].tex` (which are checked in that order).

- Similarly, `\importmodule[Some/Archive]{some/path?Foo}` is resolved like the previous cases, but relative to the archive `Some/Archive` in the `mathhub`-directory.
- Finally, `\importmodule{full://uri?Foo}` naturally refers to the module `Foo` in the namespace `full://uri`. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document.

Since this is less compatible with a modular development, using full URIs directly is strongly discouraged, unless the module is declared in the current file directly.

`\STEXexport`

`\importmodule` and `\usemodule` import all symbols, notations, semantic macros and (recursively) `\importmodules`. If you want to additionally export e.g. convenience macros and other (STEX) code from a module, you can use the command `\STEXexport{<code>}` in your module. Then `<code>` is executed (both immediately and) every time the current module is opened via `\importmodule` or `\usemodule`.

For persistency reasons, everything in an `\STEXexport` is digested by TeXin the LATEX³-category code scheme. This means that the characters `_` and `:` are considered *letters* and valid parts of control sequence names, and space characters are

ignored entirely. For spaces, use the character `~` instead, and keep in mind, that if you want to use subscripts, you should use `\c_math_subscript_token` instead of `_!`

Also note, that `\newcommand` defines macros *globally* and throws an error if the macro already exists, potentially leading to low-level L^AT_EX errors if we put a `\newcommand` in an `\STEXexport` and the `<code>` is executed more than once in a document – which can happen easily.

A safer alternative is to use macro definition principles, that are safe to use even if the macro being defined already exists, and ideally are local to the current T_EX group, such as `\def` or `\let`.

5.4.3 The `mathstructure` Environment

A common occurrence in mathematics is bundling several interrelated “declarations” together into *structures*. For example:

- A *monoid* is a structure $\langle M, \circ, e \rangle$ with $\circ : M \times M \rightarrow M$ and $e \in M$ such that...
- A *topological space* is a structure $\langle X, \mathcal{T} \rangle$ where X is a set and \mathcal{T} is a topology on X
- A *partial order* is a structure $\langle S, \leq \rangle$ where \leq is a binary relation on S such that...

This phenomenon is important and common enough to warrant special support, in particular because it requires being able to *instantiate* such structures (or, rather, structure *signatures*) in order to talk about (concrete or variable) *particular* monoids, topological spaces, partial orders etc.

`mathstructure (env.)` The `mathstructure` environment allows us to do exactly that. It behaves exactly like the `smodule` environment, but is itself only allowed inside an `smodule` environment, and allows for instantiation later on.

How this works is again best demonstrated by example:

Example 24

Input:

```

1 \begin{mathstructure}{monoid}
2   \symdef{universe}[type=\set]{\comp{U}}
3   \symdef{op}[
4     args=2,
5     type=\funtype{\universe,\universe}{\universe},
6     op=\circ
7   ]{#1 \comp{\circ} #2}
8   \symdef{unit}[type=\universe]{\comp{e}}
9 \end{mathstructure}
10
11 A \symname{monoid} is...

```

Output:

```
A monoid is...
```

Note that the `\symname{monoid}` is appropriately highlighted and (depending on your pdf viewer) shows a URI on hovering – implying that the `mathstructure` environment has generated a *symbol* `monoid` for us. It has not generated a semantic macro though, since we can not use the `monoid`-symbol *directly*. Instead, we can instantiate it, for example for integers:

Example 25

Input:

```

1 \symdef{Int}[type=\set]{\comp{\mathbb Z}}
2 \symdef{addition}[
3   type=\funtype{\Int,\Int}{\Int},
4   args=2,
5   op=+
6 ]##1 \comp{+} ##2]
7 \symdef{zero}[type=\Int]{\comp{0}}
8
9 $\mathit{mathstruct}\{\Int,\mathit{addition}!,\mathit{zero}\}$ is a \symname{monoid}.

```

Output:

$\langle \mathbb{Z}, +, 0 \rangle$ is a monoid.

So far, we have not actually instantiated `monoid`, but now that we have all the symbols to do so, we can:

Example 26

Input:

```

1 \instantiate{intmonoid}{monoid}{\mathbb{Z}_{+,0}}[
2   universe = Int ,
3   op = addition ,
4   unit = zero
5 ]
6
7 $\intmonoid{universe}$, $\intmonoid{unit}$ and $\intmonoid{op}{a}{b}$.
8
9 Also: $\intmonoid{!}$

```

Output:

\mathbb{Z} , 0 and $a+b$.
Also: $\mathbb{Z}_{+,0}$

\instantiate So summarizing: `\instantiate` takes four arguments: The (macro-)name of the instance, a key-value pair assigning declarations in the corresponding `mathstructure` to symbols currently in scope, the name of the `mathstructure` to instantiate, and lastly a notation for the instance itself.

It then generates a semantic macro that takes as argument the name of a declaration in the instantiated `mathstructure` and resolves it to the corresponding instance of that particular declaration.

`\instantiate` and `mathstructure` make use of the *Theories-as-Types* paradigm (see [MRK18]):

- `mathstructure{<name>}` simply creates a nested theory with name `<name>-structure`. The constant `<name>` is defined as `Mod(<name>-structure)`
- `M` — a dependent record type with manifest fields, the fields of which are generated from (and correspond to) the constants in `<name>-structure`.
- `\instantiate` generates a constant whose definiens is a record term of type `Mod(<name>-structure)`, with the fields assigned based on the respective key-value-list.

Notably, `\instantiate` throws an error if not *every* declaration in the instantiated `mathstructure` is being assigned.

You might consequently ask what the usefulness of `mathstructure` even is.

\varinstantiate The answer is that we can also instantiate a `mathstructure` with a *variable*. The syntax of `\varinstantiate` is equivalent to that of `\instantiate`, but all of the key-value-pairs are optional, and if not explicitly assigned (to a symbol or a variable declared with `\vardef`) inherit their notation from the one in the `mathstructure` environment.

This allows us to do things like:

Example 27

Input:

```

1 \varinstantiate{varM}{monoid}{M}
2
3 A \symname{monoid} is a structure
4 $ \varM! := \mathstruc{\varM{universe}, \varM{op}!, \varM{unit}} $
5 such that
6 $ \varM{op}! : \funtype{\varM{universe}, \varM{universe}}{\varM{universe}} $ ...

```

Output:

A `monoid` is a structure $M := \langle U, \circ, e \rangle$ such that $\circ : U \times U \rightarrow U$...

and

Example 28

Input:

```
1 \varinstantiate{varMb}{monoid}{M_2}[universe = Int]
2
3 Let $\varMb!:=\mathsf{mathstructure}{\{\varMb{universe},\varMb{op}!,\varMb{unit}\}}$#
4 be a \symname{monoid} on $\mathsf{Int}$ ...
```

Output:

```
Let  $M_2 := \langle \mathbb{Z}, \circ, e \rangle$  be a monoid on  $\mathbb{Z}$  ...
```

We will return to these two example later, when we also know how to handle the *axioms* of a monoid.

usestructure (*env*) The **usestructure{<struct>}** environment is used in multilingual settings as a parallel to the **mathstructure**. It opens a group and then issues a **\usemodule{.../<struct>-structure}** that gives the body access to all the semantic macros in the referenced structure.

5.4.4 The **copymodule** Environment

TODO: explain

Given modules:

Example 29

Input:

```
1 \begin{smodule}{magma}
2   \symdef{universe}{\comp{\mathcal U}}
3   \symdef{operation}[args=2,op=\circ]{\#1 \comp\circ \#2}
4 \end{smodule}
5 \begin{smodule}{monoid}
6   \importmodule{magma}
7   \symdef{unit}{\comp e}
8 \end{smodule}
9 \begin{smodule}{group}
10   \importmodule{monoid}
11   \symdef[inverse][args=1]{{\#1}^{-1}}{\comp{-1}}
12 \end{smodule}
```

Output:

```
.
```

We can form a module for *rings* by “cloning” an instance of **group** (for addition) and **monoid** (for multiplication), respectively, and “glueing them together” to ensure they share the same universe:

Example 30

Input:

```
1 \begin{smodule}{ring}
2   \begin{copymodule}{group}{addition}
3     \renamedecl[name=universe]{universe}{runiverse}
4     \renamedecl[name=plus]{operation}{rplus}
5     \renamedecl[name=zero]{unit}{rzero}
6     \renamedecl[name=uminus]{inverse}{ruminus}
7   \end{copymodule}
8   \notation*[rplus][plus,op=+,prec=60]{#1 \comp+ #2}
9   \notation*[rzero][zero]{\comp0}
10  \notation*[ruminus][uminus,op=-]{\comp- #1}
11  \begin{copymodule}{monoid}{multiplication}
12    \assign{universe}{\runiverse}
13    \renamedecl[name=times]{operation}{rtimes}
14    \renamedecl[name=one]{unit}{rone}
15  \end{copymodule}
16  \notation*[rtimes][cdot,op=\cdot,prec=50]{#1 \comp\cdot #2}
17  \notation*[rone][one]{\comp1}
18  Test: \$\rtimes a{\rplus c{\rtimes de}}\$
19 \end{smodule}
```

Output:

```
Test:  $a \cdot (c + d \cdot e)$ 
```

TODO: explain donotclone

5.4.5 The `interpretmodule` Environment

TODO: explain

Example 31

Input:

```
1 \begin{smodule}{int}
2   \symdef{Integers}{\comp{\mathbb Z}}
3   \symdef{plus}[args=2,op=+]{#1 \comp+ #2}
4   \symdef{zero}{\comp0}
5   \symdef{uminus}[args=1,op=-]{\comp-#1}
6
7   \begin{interpretmodule}{group}{intisgroup}
8     \assign{universe}{\Integers}
9     \assign{operation}{\plus!}
10    \assign{unit}{\zero}
11    \assign{inverse}{\uminus!}
12  \end{interpretmodule}
13 \end{smodule}
```

Output:

5.5 Primitive Symbols (The $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ Metatheory)

The `stex-metatheory` package contains $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ symbols so ubiquitous, that it is virtually impossible to describe any flexiformal content without them, or that are required to annotate even the most primitive symbols with meaningful (foundation-independent) “type”-annotations, or required for basic structuring principles (theorems, definitions). As such, it serves as the default meta theory for any $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ module.

We can also see the `stex-metatheory` as a foundation of mathematics in the sense of [Rab15], albeit an informal one (the ones discussed there are all formal foundations). The state of the `stex-metatheory` is necessarily incomplete, and will stay so for a long while: It arises as a collection of empirically useful symbols that are collected as more and more mathematics are encoded in $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ and are classified as foundational.

Formal foundations should ideally instantiate these symbols with their formal counterparts, e.g. `isa` corresponds to a typing operation in typed setting, or the \in -operator in set-theoretic contexts; `bind` corresponds to a universal quantifier in (n th-order) logic, or a Π in dependent type theories.

We make this theory part of the $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ collection due to the obliquity of the symbols involved. Note however, that the metatheory is for all practical purposes a “normal” $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ module, and the symbols contained “normal” $\text{\texttt{S}\kern-1.6pt\text{\texttt{T}\kern-0.1pt\text{\texttt{E}\kern-0.2pt\text{\texttt{X}}}}$ symbols.

Chapter 6

Using sTeX Symbols

Given a symbol declaration `\symdecl{symbolname}`, we obtain a semantic macro `\symbolname`. We can use this semantic macro in math mode to use its notation(s), and we can use `\symbolname!` in math mode to use its operator notation(s). What else can we do?

6.1 `\symref` and its variants

`\symref`
`\symname`

We have already seen `\symname` and `\symref`, the latter being the more general. `\symref{<symbolname>}{<code>}` marks-up `<code>` as referencing `<symbolname>`. Since quite often, the `<code>` should be (a variant of) the name of the symbol anyway, we also have `\symname{<symbolname>}`.

Note that `\symname` uses the *name* of a symbol, not its macroname. More precisely, `\symname` will insert the name of the symbol with “-” replaced by spaces. If a symbol does not have an explicit `name=` given, the two are equal – but for `\symname` it often makes sense to make the two explicitly distinct. For example:

Example 32

Input:

```
1 \symdef[Nat][
2   name=natural-number,
3   type=\set
4 ]{\comp{\mathbb{N}}}
5
6 A \symname{Nat} is...
```

Output:

```
A natural number is...
```

`\symname` takes two additional optional arguments, `pre=` and `post=` that get prepended or appended respectively to the symbol name.

`\Symname`

Additionally, `\Symname` behaves exactly like `\symname`, but will capitalize the first letter of the name:

Example 33

Input:

```
1 \Symname[post=s]{Nat} are...
```

Output:

```
Natural numbers are...
```

This is as good a place as any other to explain how S^TE_X resolves a string `symbolname` to an actual symbol.

If `\symbolname` is a semantic macro, then S^TE_X has no trouble resolving `symbolname` to the full URI of the symbol that is being invoked.

However, especially in `\symname` (or if a symbol was introduced using `\symdecl*` without generating a semantic macro), we might prefer to use the *name* of a symbol directly for readability – e.g. we would want to write A `\symname{natural-number}` is... rather than A `\symname{Nat}` is.... S^TE_X attempts to handle this case thusly:

If `string` does *not* correspond to a semantic macro `\string` and does *not* contain a ?, then S^TE_X checks all symbols currently in scope until it finds one, whose name is `string`. If `string` is of the form `pre?name`, S^TE_X first looks through all modules currently in scope, whose full URI ends with `pre`, and then looks for a symbol with name `name` in those. This allows for disambiguating more precisely, e.g. by saying `\symname{Integers?addition}` or `\symname{RealNumbers?addition}` in the case where several `additions` are in scope.

6.2 Marking Up Text and On-the-Fly Notations

We can also use semantic macros outside of text mode though, which allows us to annotate arbitrary text fragments.

Let us assume again, that we have `\symdef{addition}[args=2]{#1 \comp+ #2}`. Then we can do

Example 34

Input:

```
1 \addition{\comp{The sum of} \arg{$\$svar{n}$$} \comp{ and } \arg{$\$svar{m}$$}}
2 is...
```

Output:

```
The sum of n and m is...
```

...which marks up the text fragment as representing an *application* of the addition-symbol to two argument n and m .

M → As expected, the above example is translated to OMDoc/MMT as an OMA with `<OMS name="...?addition"/>` as head and `<OMV name="n"/>` and `<OMV name="m"/>` as arguments.

Note the difference in treating “arguments” between math mode and text mode. In math mode the (in this case two) tokens/groups following the `\addition` macro are treated as arguments to the addition function, whereas in text mode the group following `\addition` is taken to be the ad-hoc presentation. We drill in on this now.

\arg In text mode, every semantic macro takes exactly one argument, namely the text-fragment to be annotated. The `\arg` command is only valid within the argument to a semantic macro and marks up the *individual arguments* for the symbol.

We can also use semantic macros in text mode to invoke an operator itself instead of its application, with the usual syntax using !:

Example 35

Input:

```
1 \addition!{Addition} is...
```

Output:

```
Addition is...
```

Indeed, `\symbolname!{<code>}` is exactly equivalent to `\symref{\symbolname}{<code>}` (the latter is in fact implemented in terms of the former).

`\arg` also allows us to switch the order of arguments around and “hide” arguments: For example, `\arg[3]{<code>}` signifies that `<code>` represents the *third* argument to the current operator, and `\arg*[i]{<code>}` signifies that `<code>` represents the *i*th argument, but it should not produce any output (it is exported in the `xhtml` however, so that MMT and other systems can pick up on it).¹

Example 36

Input:

```
1 \addition{\comp{adding}}
2   \arg[2]{$\svar{k}$}
3   \arg*{$\addition{\svar{n}}{\svar{m}}$} yields...
```

¹EDNOTE: MK: I do not understand why we have to/want to give the second `\arg*`; I think this must be elaborated on.

Output:

adding k yields...

Note that since the second `\arg` has no explicit argument number, it automatically represents the first not-yet-given argument – i.e. in this case the first one.²

The same syntax can be used in math mode as well. This allows us to spontaneously introduce new notations on the fly. We can activate it using the starred variants of semantic macros:

Example 37

Input:

```
1 Given $\addition{\svar{n}}{\svar{m}}$, then
2 $\addition*{
3   \arg*\{\addition{\svar{n}}{\svar{m}}\}
4   \comp{+}
5   \arg{\svar{k}}
6 }$ yields...
```

Output:

Given $n+m$, then $+k$ yields...

If we take features like `\inputref` and `\mhinput` (and the `sfragment`-environment, see subsection 9.2.1) seriously, and build large documents modularly from individually compiling documents for sections, chapters and so on, cross-referencing becomes an interesting problem.

Say, we have a document `main.tex`, which `\inputref`s a section `section1.tex`, which references a definition with label `some_definition` in `section2.tex` (subsequently also inputted in `main.tex`). Then the numbering of the definition will depend on the *document context* in which the document fragment `section2.tex` occurs - in `section2.tex` itself (as a standalone document), it might be *Definition 1*, in `main.tex` it might be *Definition 3.1*, and in `section1.tex`, the definition *does not even occur*, so it needs to be referenced by some other text.

What we would want in that instance is an equivalent of `\autoref`, that takes the document context into account to yield something like *Definition 1*, *Definition 3.1* or “*Definition 1 in the section on Foo*” respectively.

The `\sref` command attempts to do precisely that. Unlike plain `\ref`, `\autoref` etc., `\sref` refers to not just a *label*, but instead a pair consisting of a *label* and the *document* in whose context we want to refer to it. Conversely, every *document* (i.e. standalone compilable `.tex`-file) keeps track of the “names” (*Definition 3.1* etc.) for every label as determined in the context of the document, and stores them in a dedicated file `\jobname.sref`. Additionally, every document has a “*reference name*” (e.g. “*the section on Foo*”). This allows us to refer to “label x in document D ” to yield “*Definition 1 in the section on Foo*”. And of course, `STEX` can decide based on the current document

²EDNOTE: MK: I do not understand this at all.

to either refer to the label by its “full name” or directly as e.g. *Definition 3.1* depending on whether the label occurs in the current document anyway (and link to it accordingly).

For that to work, we need to supply (up to) three pieces of information:

- The *label* of the reference target (e.g. `some_definition`),
- (optionally) the *file/document* containing the reference target (e.g. `section2`). This is not strictly necessary, but allows for additional disambiguation between possibly duplicate labels across files, and
- (optionally) the document context, in which we want to refer to the reference target (e.g. `main`).

Additionally, the document in which we want to reference a label needs a title for external references.

```
\sref \sref[archive=<archive1>,file=<file>]
{<label>}[archive=<archive2>,in=<document-context>,title=<title>]
```

This command references *label* (declared in *file* in *archive1*). If the object (section, figure, etc.) with that label occurs ultimately in the same document, `\sref` will ignore the second set of optional arguments and simply defer to `\autoref` if that command exists, or `\ref` if the `hyperref` package is not included.

If the referenced object does *not* occur in the current document however, `\sref` will refer to it by the object’s name as it occurs in the file *document-context* in *archive2*.

For example, the reference to the `sfragment`-environment above will appear as “subsection 7.2.1 (Introduction) in the `STEX3` manual” if you are reading this in the package documentation for `stex-references` directly, but as a linked “subsection 7.2.1” in the full documentation or manual. This is achieved using

```
\sref[file=stex-document-structure]{sec:ds:intro}[in=../stex-manual,title={the \sT
```

For a further example, the following:

Part III

will say “Part III” (and link accordingly) in the full documentation, and “Part III (Extensions) in the full `STEX3` documentation” everywhere else. This is achieved using

```
\sref[file=../stex-doc]{part:extends}[in=../stex-doc,title={the full \sTeX{}3 docu
```

```
\extref \sref[archive=<archive1>,file=<file>]
{<label>}[archive=<archive2>,in=<document-context>,title=<title>]}
```

The `\extref`-command behaves exactly like `\sref`, but takes *required* the document context argument and will always use it for generating the document text, regardless of whether the label occurs in the current document.

Chapter 7

sTeX Statements

7.1 Definitions, Theorems, Examples, Paragraphs

As mentioned earlier, we can semantically mark-up *statements* such as definitions, theorems, lemmata, examples, etc.

The corresponding environments for that are:

- **sdefinition** for definitions,
- **sassertion** for assertions, i.e. propositions that are declared to be *true*, such as theorems, lemmata, axioms,
- **sexample** for examples and counterexamples, and
- **sparagraph** for “other” semantic paragraphs, such as comments, remarks, conjectures, etc.

The *presentation* of these environments can be customized to use e.g. predefined **theorem**-environments, see [section 7.3](#) for details.

All of these environments take optional arguments in the form of **key=value**-pairs. Common to all of them are the keys **id=** (for cross-referencing, see [chapter 8](#)), **type=** for customization (see [section 7.3](#)) and additional information (e.g. definition principles, “difficulty” etc), as well as **title=** (for giving the paragraph a title), and finally **for=**.

The **for=** key expects a comma-separated list of existing symbols, allowing for e.g. things like

Example 38

Input:

```
1 \begin{sexample}[
2   id=additionandmultiplication.ex,
3   for={addition,multiplication},
4   type={trivial,boring},
5   title={An Example}
6 ]
7   $ \addition{2,3} $ is $5$, $ \multiplication{2,3} $ is $6$.
8 \end{sexample}
```

Output:

Example 7.1.1 (An Example). $2+3$ is 5, $2\cdot 3$ is 6.

\definiendum **sdefinition** (and **sparagraph** with `type=symdoc`) introduce three new macros: **definiendum** behaves like **symref** (and **definename/Definename** like **symname/Symname**, respectively), but highlights the referenced symbol as *being defined* in the current definition.

- ↪ M → The special `type=symdoc` for **sparagraph** is intended to be used for “informal definitions”, or encyclopedia-style descriptions for symbols.
- ↪ M → The MMT system can use those (in lieu of an actual **sdefinition** in scope) to present to users, e.g. when hovering over symbols.

\definiens Additionally, **sdefinition** (and **sparagraph** with `type=symdoc`) introduces **\definiens** [`<optional symbolname>`] which marks up `<code>` as being the explicit *definiens* of `<optional symbolname>` (in case `for=` has multiple symbols).

All four statement environments – i.e. **sdefinition**, **sassertion**, **sexample**, and **sparagraph** – also take an optional parameter `name=` – if this one is given a value, the environment will generate a *symbol* by that name (but with no semantic macro). Not only does this allow for **\symref** et al, it allows us to resume our earlier example for monoids much more nicely:³

Example 39

Input:

³EDNOTE: MK: we should reference the example explicitly here.

```

1 \begin{mathstructure}{monoid}
2   \symdef{universe}[type=\set]{\comp{U}}
3   \symdef{op}[
4     args=2,
5     type=\funtype{\universe,\universe}{\universe},
6     op=\circ
7   ]{#1 \comp{\circ} #2}
8   \symdef{unit}[type=\universe]{\comp{e}}
9
10 \begin{spareagraph}[type=symdoc,for=monoid]
11   A \definename{monoid} is a structure
12   $\mathsf{mathstruct}\{\mathbf{universe},\mathbf{op!},\mathbf{unit}\}$
13   where $\mathbf{op!}:\mathsf{funtype}\{\mathbf{universe}\}{\mathbf{universe}}$ and
14   $\mathbf{unit}:\mathsf{inset}\{\mathbf{universe}\}$ such that
15
16   \begin{assertion}[name=associative,
17     type=axiom,
18     title=Associativity]
19     $\mathbf{op!}$ is associative
20   \end{assertion}
21   \begin{assertion}[name=isunit,
22     type=axiom,
23     title=Unit]
24     $\mathsf{equal}\{\mathbf{op}\{\mathbf{svar}\{x\}\}{\mathbf{unit}}\}{\mathbf{svar}\{x\}}$ for all $\mathbf{inset}\{\mathbf{svar}\{x\}\}{\mathbf{universe}}$ 
25   \end{assertion}
26   \end{assertion}
27 \end{spareagraph}
28 \end{mathstructure}
29
30 An example for a \symname{monoid} is...

```

Output:

A **monoid** is a structure $\langle U, o, e \rangle$ where $o : U \rightarrow U$ and $e \in U$ such that

Axiom 7.1.2 (Associativity). o is associative

Axiom 7.1.3 (Unit). $x o e = x$ for all $x \in U$

An example for a **monoid** is...

EdN:4

The main difference to before⁴ is that the two **assertions** now have `name=` attributes. Thus the **mathstructure monoid** now contains two additional symbols, namely the axioms for associativity and that e is a unit. Note that both symbols do not represent the mere *propositions* that e.g. o is associative, but *the assertion that it is actually true* that o is associative.

If we now want to instantiate **monoid** (unless with a variable, of course), we also need to assign **associative** and **neutral** to analogous assertions. So the earlier example

```

1 \instantiate{intmonoid}{monoid}{\mathbb{Z}_{+,0}}[
2   universe = Int ,
3   op = addition ,
4   unit = zero
5 ]

```

⁴EDNOTE: MK: reference

...will not work anymore. We now need to give assertions that `addition` is associative and that `zero` is a unit with respect to addition.²

7.2 Proofs

The `stex-proof` package supplies macros and environment that allow to annotate the structure of mathematical proofs in `STEX` document. This structure can be used by MKM systems for added-value services, either directly from the `STEX` sources, or after translation.

Its central component is the `sproof`-environment, whose body consists of:

- *subproofs* via the `subproof`-environment,
- *proof steps* via the `\spfstep`, `\eqstep` `\assumption`, and `\conclude` macros, and
- *comments*, via normal text without special markup.

`sproof`, `subproof` and the various proof step macros take the following optional arguments:

`id` ($\langle string \rangle$) for referencing,

`method` ($\langle string \rangle$) the proof method (e.g. contradiction, induction,...)

`term` ($\langle token\ list \rangle$) the (ideally semantically-marked up) proposition that is derived/proven by this proof/subproof/proof step.

Additionally, they take one mandatory argument for the document text to be annotated, or (in the case of the environments) as an introductory description of the proof itself. Since the latter often contains the `term` to be derived as text, alternatively to providing it as an optional argument, the mandatory argument can use the `\yield`-macro to mark it up in the text.

The `sproof` and `subproof` environments additionally take two optional arguments:

`for` the symbol identifier/name corresponding to the `sassertion` to be proven. This too subsumes `\yield` and the `term`-argument.

`hide` In the pdf, this only shows the mandatory argument text and hides the body of the environment. In the HTML (as served by MMT), the bodies of all `proof` and `subproof` environments are *collapsible*, and `hide` collapses the body by default.

```

1 \begin{sassertion}[type=theorem,name=sqrt2irr]
2   \conclusion{\irrational{$\arg{\realroot{2}}$} is \comp{irrational}}}.
3 \end{sassertion}
4
5 \begin{sproof}[for=sqrt2irr,method=contradiction]{By contradiction}
6   \assumption{Assume \yield{\rational{$\arg{\realroot{2}}$} is
7     \comp{rational}}}}
8   \begin{subproof}[method=straightforward]{Then
9     \yield{$\eq{\ratfrac{\intpow{\vara}{2}}{\intpow{\varb}{2}}}{2}$}
10    for some $\inset{\vara,\varb}\PosInt$ with
11      \coprime{$\arg{\vara},\arg{\varb}$} \comp{coprime}}}}
```

²Of course, `STEX` can not check that the assertions are the “correct” ones – but if the assertions (both in `monoid` as well as those for `addition` and `zero`) are properly marked up, MMT can. **TODO: should**

```

12  \assumption{By assumption, \yield{there are
13  \$\inset{\vara,\varb}\PosInt $ with
14  \$\realroot{2}=\ratfrac{\vara}{\varb}$$}
15  \spfstep{wlog, we can assume \coprime{$\arg{\vara}$,$\arg{\varb}$}
16  to be \comp{coprime}}}
17  % a comment:
18  If not, reduce the fraction until numerator and denominator
19  are coprime, and let the resulting components be
20  \$\vara $ and \$\varb $
21  \spfstep{Then \yield{$\eq{\intpow{\ratfrac{\vara}{\varb}}{2}}$}}
22  \eqstep{$\ratfrac{\intpow{\vara}{2}}{\intpow{\varb}{2}}$}
23 \end{subproof}
24 \begin{subproof}[term=\divides{2}{\vara},method=straightforward]{}
25  Then \$\vara $ is even}
26  \spfstep{Multiplying the equation by \$\intpow{\varb}{2} yields
27  \$\yield{\eq{\intpow{\vara}{2}}{\inttimes{2}{\intpow{\varb}{2}}}}$}
28  \spfstep[term=\divides{2}{\intpow{\vara}{2}}]{Hence
29  \$\intpow{\vara}{2} $ is even}
30  \conclude[term=\divides{2}{\vara}]{Hence \$\vara $ is even as well}
31  % another comment:
32  Hint: Think about the prime factorizations of \$\vara $ and
33  \$\intpow{\vara}{2}$
34 \end{subproof}
35 \begin{subproof}[term=\divides{2}{\varb},method=straightforward,]{}
36  Then \$\varb $ is also even}
37  \spfstep{Since \$\vara $ is even, we have \yield{some \$\varc $ such that $\eq{\inttimes{2}{\varc}}{\vara}$}}
38  \spfstep{Plugging into the above, we get
39  \yield{$\eq{\intpow{\inttimes{2}{\varc}}{2}}$}}
40  \eqstep{$\inttimes{4}{\intpow{\varb}{2}}$}
41  \spfstep{Dividing both sides by \$2$ yields
42  \yield{$\eq{\intpow{\varb}{2}}{\inttimes{2}{\intpow{\vara}{2}}}$}}
43  \spfstep[term=\divides{2}{\intpow{\varb}{2}}]{Hence
44  \$\intpow{\varb}{2} $ is even}
45  \conclude[term=\divides{2}{\varb}]{Hence \$\varb $ is even}
46  % one more comment:
47  By the same argument as above
48 \end{subproof}
49 \conclude[term=\contradiction]{Contradiction to \$\vara,\varb $ being
50  \symname{coprime}.}
51 \end{sproof}

```

which will produce:

Theorem 7.2.1. $\sqrt{2}$ is *irrational*.

Proof: By contradiction

1. Assume $\sqrt{2}$ is rational
2. Then $(\frac{a^2}{b^2})=2$ for some $a,b \in \mathbb{Z}^+$ with a,b coprime
 - 2.1. By assumption, there are $a,b \in \mathbb{Z}^+$ with $\sqrt{2} = \frac{a}{b}$
 - 2.2. wlog, we can assume a,b to be coprime

If not, reduce the fraction until numerator and denominator are coprime, and let the re-

sulting components be a and b

2.3. Then $(\frac{a}{b})^2 = 2$

$$= \frac{a^2}{b^2}$$

3. Then a is even

3.1. Multiplying the equation by b^2 yields $a^2 = 2b^2$

3.2. Hence a^2 is even

\Rightarrow Hence a is even as well

Hint: Think about the prime factorizations of a and a^2

4. Then b is also even

4.1. Since a is even, we have some c such that $2c = a$

4.2. Plugging into the above, we get $(2c)^2 = 2b^2$

$$= 4c^2$$

4.3. Dividing both sides by 2 yields $2c^2 = b^2$

4.4. Hence b^2 is even

\Rightarrow Hence b is even

By the same argument as above

\Rightarrow Contradiction to a, b being coprime.

□

If we mark all subproofs with `hide`, we will obtain the following instead:

Theorem 7.2.2. $\sqrt{2}$ is irrational.

Proof: By contradiction

1. Assume $\sqrt{2}$ is rational

2. Then $(\frac{a}{b})^2 = 2$ for some $a, b \in \mathbb{Z}^+$ with a, b coprime

3. Then a is even

4. Then b is also even

\Rightarrow Contradiction to a, b being coprime.

□

However, the hidden subproofs will still be shown in the HTML, only in an expandable section which is collapsed by default.

The above style of writing proofs is usually called *structured proofs*. They have a huge advantage over the traditional purely prosaic style, in that (as the name suggests) the actual *structure* of the proof is made explicit, which almost always makes it considerably more comprehensible. We, among many others, encourage the general use of structured proofs.

Alas, most proofs are not written in this style, and we would do users a disservice by insisting on this style. For that reason, the `spfblock` environment turns all subproofs and proof step macros into presentationally neutral *inline* annotations, as in the induction step of the following example:

```
1 \begin{sproof}[id=simple-proof,method=induction]
2   {We prove that  $\sum_{i=1}^n (2i-1) = n^2$  by induction over  $n$ }
```

```

3 For the induction we have to consider three cases: % <- a comment
4 \begin{subproof}{$n=1$}
5 \spfstep*{then we compute $1=1^2$}
6 \end{subproof}
7 \begin{subproof}{$n=2$}
8 This case is not really necessary, but we do it for the
9 fun of it (and to get more intuition).
10 \spfstep*{We compute $1+3=2^2=4$ .}
11 \end{subproof}
12 \begin{subproof}{$n>1$}\begin{spfblock}
13 \assumption[id=ind-hyp]{}
14 Now, we assume that the assertion is true for a certain $k\geq 1$,
15 i.e. \yield{$\sum_{i=1}^k (2i-1)=k^2$}.
16 }
17
18 We have to show that we can derive the assertion for $n=k+1$ from
19 this assumption, i.e. $\sum_{i=1}^{k+1} (2i-1)=(k+1)^2$.
20
21 \spfstep{
22 We obtain $ \yield{\sum_{i=1}^{k+1} (2i-1)=}
23 \sum_{i=1}^k (2i-1) + 2(k+1)-1 $\\
24 \spfjust{by \splitsum{\comp{splitting the sum}}
25 \arg*{$\sum_{i=1}^{k+1} (2i-1)=(k+1)^2$}}.
26 }
27 \spfstep{
28 Thus we have $ \yield{\sum_{i=1}^{k+1} (2i-1)=k^2+2k+1} $\\
29 \spfjust{by \symname{induction-hypothesis}}.
30 }
31 \conclude{
32 We can \spfjust{\simplification{\comp{simplify}} the right-hand side
33 \arg*{$k^2+2k+1$}} to
34 ${k+1}^2$, which proves the assertion.
35 }
36 \end{spfblock}\end{subproof}
37 \conclude{
38 We have considered all the cases, so we have proven the assertion.
39 }
40 \end{sproof}

```

This yields the following result:

Proof: We prove that $\sum_{i=1}^n 2i - 1 = n^2$ by induction over n

For the induction we have to consider three cases:

1. $n = 1$

then we compute $1 = 1^2$

2. $n = 2$

This case is not really necessary, but we do it for the fun of it (and to get more intuition).

We compute $1 + 3 = 2^2 = 4$.

3. $n > 1$

Now, we assume that the assertion is true for a certain $k \geq 1$, i.e. $\sum_{i=1}^k (2i - 1) = k^2$.

We have to show that we can derive the assertion for $n = k + 1$ from this assumption,

i.e. $\sum_{i=1}^{k+1} (2i - 1) = (k + 1)^2$.

We obtain $\sum_{i=1}^{k+1} 2i - 1 = \sum_{i=1}^k 2i - 1 + 2(k + 1) - 1$ by splitting the sum. Thus we have $\sum_{i=1}^{k+1} (2i - 1) = k^2 + 2k + 1$ by induction hypothesis. We can simplify the right-hand side to $k + 1^2$, which proves the assertion.

⇒ We have considered all the cases, so we have proven the assertion. □

sproof (*env.*) The **sproof** environment is the main container for proofs. It takes an optional **KeyVal** argument that allows to specify the **id** (identifier) and **for** (for which assertion is this a proof) keys. The regular argument of the **proof** environment contains an introductory comment, that may be used to announce the proof style. The **proof** environment contains a sequence of **spfstep**, **spfcomment**, and **spfcases** environments that are used to markup the proof steps.

\spfidea The **\spfidea** macro allows to give a one-paragraph description of the proof idea.

\spfsketch For one-line proof sketches, we use the **\spfsketch** macro, which takes the same optional argument as **sproof** and another one: a natural language text that sketches the proof.

\spfstep Regular proof steps are marked up with the **\spfstep** macro, which takes an optional **KeyVal** argument for annotations. A proof step usually contains a local assertion (the text of the step) together with some kind of evidence that this can be derived from already established assertions.

\yield See above

\spfjust This evidence is marked up with the **\spfjust** macro in the **stex-proofs** package. This environment totally invisible to the formatted result; it wraps the text in the proof step that corresponds to the evidence (ideally, a semantically marked-up term).

\assumption The **\assumption** macro allows to mark up a (justified) assumption.

\justarg

subproof (*env.*) The **subproof** environment is used to mark up a subproof. This environment takes an optional **KeyVal** argument for semantic annotations and a second argument that allows to specify an introductory comment (just like in the **proof** environment). The **method** key can be used to give the name of the proof method executed to make this subproof.

`\sproofend` Traditionally, the end of a mathematical proof is marked with a little box at the end of the last line of the proof (if there is space and on the end of the next line if there isn't), like so:

The `stex-proofs` package provides the `\sproofend` macro for this.

`\sProofEndSymbol` If a different symbol for the proof end is to be used (e.g. *q.e.d*), then this can be obtained by specifying it using the `\sProofEndSymbol` configuration macro (e.g. by specifying `\sProofEndSymbol{q.e.d}`).

Some of the proof structuring macros above will insert proof end symbols for sub-proofs, in most cases, this is desirable to make the proof structure explicit, but sometimes this wastes space (especially, if a proof ends in a case analysis which will supply its own proof end marker). To suppress it locally, just set `proofend={}` in them or use `\sProofEndSymbol{}`.

7.3 Highlighting and Presentation Customizations

The environments starting with `s` (i.e. `smodule`, `sassertion`, `sexample`, `sdefinition`, `sparagraph` and `sproof`) by default produce no additional output whatsoever (except for the environment content of course). Instead, the document that uses them (whether directly or e.g. via `\inputref`) can decide how these environments are supposed to look like.

The `stexthm` package defines some default customizations that can be used, but of course many existing L^AT_EX templates come with their own `definition`, `theorem` and similar environments that authors are supposed (or even required) to use. Their concrete syntax however is usually not compatible with all the additional arguments that S^TE_X allows for semantic information.

Therefore we introduced the separate environments `sdefinition` etc. instead of using `definition` directly. We allow authors to specify how these environments should be styled via the commands `stexpatch*`.

`\stexpatchmodule`
`\stexpatchdefinition`
`\stexpatchassertion`
`\stexpatchexample`
`\stexpatchparagraph`
`\stexpatchproof`

All of these commands take one optional and two proper arguments, i.e.

`\stexpatch*[<type>]{<begin-code>}{<end-code>}.`

After S^TE_X reads and processes the optional arguments for these environments, (some of) their values are stored in the macros `\s*<field>` (i.e. `sexampleid`, `sassertionname`, etc.). It then checks for all the values `<type>` in the `type`-list, whether an `\stexpatch*[<type>]` for the current environment has been called. If it finds one, it uses the patches `<begin-code>` and `<end-code>` to mark up the current environment. If no patch for (any of) the type(s) is found, it checks whether and `\stexpatch*` was called without optional argument.

For example, if we want to use a predefined `theorem` environment for `sassertions` with `type=theorem`, we can do

```
1 \stexpatchassertion[theorem]{\begin{theorem}}{\end{theorem}}
```

...or, rather, since e.g. `theorem`-like environments defined using `amsthm` take an optional title as argument, we can do:

```

1 \stexpatchassertion[theorem]
2 {\ifx\sassertiontitle\empty
3   \begin{theorem}
4 \else
5   \begin{theorem}[\sassertiontitle]
6 \fi}
7 {\end{theorem}}

```

Or, if we want *all kinds of **sdefinitions*** to use a predefined **definition**-environment irrespective of their **type=**, then we can issue the following customization patch:

```

1 \stexpatchdefinition
2 {\ifx\sdefinitiontitle\empty
3   \begin{definition}
4 \else
5   \begin{definition}[\sdefinitiontitle]
6 \fi}
7 {\end{definition}}

```

\compemph Apart from the environments, we can control how **STEX** highlights variables, notation components, **\symrefs** and **\definiendum**s, respectively.

\varemph To do so, we simply redefine these four macros. For example, to highlight notation components (i.e. everything in a **\comp**) in blue, as in this document, we can do **\def\compemph#1{\textcolor{blue}{#1}}**. By default, **\compemph** et al do nothing.

\compemph@uri For each of the four macros, there exists an additional macro that takes the full URI of the relevant symbol currently being highlighted as a second argument. That allows us to e.g. use pdf tooltips and links. For example, this document uses⁵

```

1 \protected\def\symrefemph@uri#1#2{
2   \pdftooltip{
3     \symrefemph{#1}
4   }{
5     URI:~\detokenize{#2}
6   }
7 }

```

By default, **\compemph@uri** is simply defined as **\compemph{#1}** (analogously for the other three commands).

Chapter 8

Cross References

If we take features like `\inputref` and `\mhinput` (and the `sfragment`-environment, see subsection 9.2.1) seriously, and build large documents modularly from individually compiling documents for sections, chapters and so on, cross-referencing becomes an interesting problem.

Say, we have a document `main.tex`, which `\inputref`s a section `section1.tex`, which references a definition with label `some_definition` in `section2.tex` (subsequently also inputted in `main.tex`). Then the numbering of the definition will depend on the *document context* in which the document fragment `section2.tex` occurs - in `section2.tex` itself (as a standalone document), it might be *Definition 1*, in `main.tex` it might be *Definition 3.1*, and in `section1.tex`, the definition *does not even occur*, so it needs to be referenced by some other text.

What we would want in that instance is an equivalent of `\autoref`, that takes the document context into account to yield something like *Definition 1*, *Definition 3.1* or “*Definition 1 in the section on Foo*” respectively.

The `\sref` command attempts to do precisely that. Unlike plain `\ref`, `\autoref` etc., `\sref` refers to not just a *label*, but instead a pair consisting of a *label* and the *document* in whose context we want to refer to it. Conversely, every *document* (i.e. standalone compilable `.tex`-file) keeps track of the “names” (*Definition 3.1* etc.) for every label as determined in the context of the document, and stores them in a dedicated file `\jobname.sref`. Additionally, every document has a “*reference name*” (e.g. “*the section on Foo*”). This allows us to refer to “label *x* in document *D*” to yield “*Definition 1 in the section on Foo*”. And of course, `STEX` can decide based on the current document to either refer to the label by its “full name” or directly as e.g. *Definition 3.1* depending on whether the label occurs in the current document anyway (and link to it accordingly).

For that to work, we need to supply (up to) three pieces of information:

- The *label* of the reference target (e.g. `some_definition`),
- (optionally) the *file/document* containing the reference target (e.g. `section2`). This is not strictly necessary, but allows for additional disambiguation between possibly duplicate labels across files, and
- (optionally) the document context, in which we want to refer to the reference target (e.g. `main`).

Additionally, the document in which we want to reference a label needs a title for external references.

```
\sref \sref[archive=<archive1>,file=<file>]
{<label>}[archive=<archive2>,in=<document-context>,title=<title>]
```

This command references *<label>* (declared in *<file>* in *<archive1>*). If the object (section, figure, etc.) with that label occurs ultimately in the same document, `\sref` will ignore the second set of optional arguments and simply defer to `\autoref` if that command exists, or `\ref` if the `hyperref` package is not included.

If the referenced object does *not* occur in the current document however, `\sref` will refer to it by the object's name as it occurs in the file *<document-context>* in *<archive2>*.

For example, the reference to the `sfragment`-environment above will appear as “subsection 7.2.1 (Introduction) in the `sTeX3` manual” if you are reading this in the package documentation for `stex-references` directly, but as a linked “subsection 7.2.1” in the full documentation or manual. This is achieved using

```
\sref[file=stex-document-structure]{sec:ds:intro}[in=../stex-manual,title={the \sT}}
```

For a further example, the following:

Part III

will say “Part III” (and link accordingly) in the full documentation, and “Part III (Extensions) in the full `sTeX3` documentation” everywhere else. This is achieved using

```
\sref[file=../stex-doc]{part:extends}[in=../stex-doc,title={the full \sTeX{}3 docu}
```

```
\extref \sref[archive=<archive1>,file=<file>]
{<label>}[archive=<archive2>,in=<document-context>,title=<title>]
```

The `\extref`-command behaves exactly like `\sref`, but takes *required* the document context argument and will always use it for generating the document text, regardless of whether the label occurs in the current document.

Chapter 9

Additional Packages

9.1 Tikzinput: Treating TIKZ code as images

image The behavior of the `ikzinput` package is determined by whether the `image` option is given. If it is not, then the `tikz` package is loaded, all other options are passed on to it and `\tikzinput{<file>}` inputs the TIKZ file `<file>.tex`; if not, only the `graphicx` package is loaded and `\tikzinput{<file>}` loads an image file `<file>.ext` generated from `<file>.tex`.

The selective input functionality of the `tikzinput` package assumes that the TIKZ pictures are externalized into a standalone picture file, such as the following one

```
1 \documentclass{standalone}
2 \usepackage{tikz}
3 \usetikzpackage{...}
4 \begin{document}
5   \begin{tikzpicture}
6     ...
7   \end{tikzpicture}
8 \end{document}
```

The `standalone` class is a minimal L^AT_EX class that when loaded in a document that uses the `standalone` package: the preamble and the `document` environment are disregarded during loading, so they do not pose any problems. In effect, an `\input` of the file above only sees the `tikzpicture` environment, but the file itself is standalone in the sense that we can run L^AT_EX over it separately, e.g. for generating an image file from it.

\tikzinput This is exactly where the `tikzinput` package comes in: it supplies the `\tikzinput` macro, **\ctikzinput** which – depending on the `image` option – either directly inputs the TIKZ picture (source) or tries to load an image file generated from it.

Concretely, if the `image` option is not set for the `tikzinput` package, then `\tikzinput[<opt>]{<file>}` disregards the optional argument `<opt>` and inputs `<file>.tex` via `\input` and resizes it to as specified in the `width` and `height` keys. If it is, `\tikzinput[<opt>]{<file>}` expands to `\includegraphics[<opt>]{<file>}`.

`\ctikzinput` is a version of `\tikzinput` that is centered.

`\mhtikzinput`
`\cmhtikzinput`

`\mhtikzinput` is a variant of `\tikzinput` that treats its file path argument as a relative path in a math archive in analogy to `\inputref`. To give the archive path, we use the `mrepos=` key. Again, `\cmhtikzinput` is a version of `\mhtikzinput` that is centered.

`\libusetikzlibrary`

Sometimes, we want to supply archive-specific TIKZ libraries in the `lib` folder of the archive or the `meta-inf/lib` of the archive group. Then we need an analogon to `\libinput` for `\usetikzlibrary`. The `stex-tikzinput` package provides the `libusetikzlibrary` for this purpose.

9.2 Modular Document Structuring

9.2.1 Introduction

The `document-structure` package supplies an infrastructure for writing OMDoc documents in L^AT_EX. This includes a simple structure sharing mechanism for S^TE_X that allows to move from a copy-and-paste document development model to a copy-and-reference model, which conserves space and simplifies document management. The augmented structure can be used by MKM systems for added-value services, either directly from the S^TE_X sources, or after translation.

The `document-structure` package supplies macros and environments that allow to label document fragments and to reference them later in the same document or in other documents. In essence, this enhances the document-as-trees model to documents-as-directed-acyclic-graphs (DAG) model. This structure can be used by MKM systems for added-value services, either directly from the S^TE_X sources, or after translation. Currently, trans-document referencing provided by this package can only be used in the S^TE_X collection.

DAG models of documents allow to replace the “Copy and Paste” in the source document with a label-and-reference model where document are shared in the document source and the formatter does the copying during document formatting/presentation.

9.2.2 Package Options

The `document-structure` package accepts the following options:

<code>class=<name></code>	load <code><name>.cls</code> instead of <code>article.cls</code>
<code>topsect=<sect></code>	The top-level sectioning level; the default for <code><sect></code> is <code>section</code>

9.2.3 Document Fragments

`sfragment (env.)`

The structure of the document is given by nested `sfragment` environments. In the L^AT_EX route, the `sfragment` environment is flexibly mapped to sectioning commands, inducing the proper sectioning level from the nesting of `sfragment` environments. Correspondingly, the `sfragment` environment takes an optional key/value argument for metadata followed by a regular argument for the (section) title of the sfragment. The optional metadata argument has the keys `id` for an identifier, `creators` and `contributors` for the Dublin Core metadata [DCM03]. The option `short` allows to give a short title for the generated section. If the title contains semantic macros, we need to give the `loadmodules` key (it needs no value). For instance we would have

```

1 \begin{smodule}{foo}
2   \symdef{bar}{B^a_r}
3   ...
4   \begin{sfragment}[id=sec.barderiv,loadmodules]
5     {Introducing \$\protect\bar\$ Derivations}

```

STEX automatically computes the sectioning level, from the nesting of `sfragment` environments.

But sometimes, we want to skip levels (e.g. to use a `\subsection*` as an introduction for a chapter).

`blindfragment` (*env.*) Therefore the `document-structure` package provides a variant `blindfragment` that does not produce markup, but increments the sectioning level and logically groups document parts that belong together, but where traditional document markup relies on convention rather than explicit markup. The `blindfragment` environment is useful e.g. for creating frontmatter at the correct level. The example below shows a typical setup for the outer document structure of a book with parts and chapters.

```

1 \begin{document}
2 \begin{blindfragment}
3 \begin{blindfragment}
4 \begin{frontmatter}
5 \maketitle\newpage
6 \begin{sfragment}{Preface}
7 ... <<preface>> ...
8 \end{sfragment}
9 \clearpage\setcounter{tocdepth}{4}\tableofcontents\clearpage
10 \end{frontmatter}
11 \end{blindfragment}
12 ... <<introductory remarks>> ...
13 \end{blindfragment}
14 \begin{sfragment}{Introduction}
15 ... <<intro>> ...
16 \end{sfragment}
17 ... <<more chapters>> ...
18 \bibliographystyle{alpha}\bibliography{kwarc}
19 \end{document}

```

Here we use two levels of `blindfragment`:

- The outer one groups the introductory parts of the book (which we assume to have a sectioning hierarchy topping at the part level). This `blindfragment` makes sure that the introductory remarks become a “chapter” instead of a “part”.
- The inner one groups the frontmatter³ and makes the preface of the book a section-level construct. The `frontmatter` environment also suppresses numbering as is traditional for prefaces.

`\skipfragment` The `\skipfragment` “skips an `sfragment`”, i.e. it just steps the respective sectioning counter. This macro is useful, when we want to keep two documents in sync structurally, so that section numbers match up: Any section that is left out in one becomes a `\skipfragment`.

³We shied away from redefining the `frontmatter` to induce a `blindfragment`, but this may be the “right” way to go in the future.

`\currentsectionlevel` The `\currentsectionlevel` macro supplies the name of the current sectioning level, e.g. “chapter”, or “subsection”. `\CurrentSectionLevel` is the capitalized variant. They are useful to write something like “In this `\currentsectionlevel`, we will...” in an `sfragment` environment, where we do not know which sectioning level we will end up.

9.2.4 Ending Documents Prematurely

`\prematurestop`
`\afterprematurestop` For prematurely stopping the formatting of a document, STEX provides the `\prematurestop` macro. It can be used everywhere in a document and ignores all input after that – backing out of the `sfragment` environments as needed. After that – and before the implicit `\end{document}` it calls the internal `\afterprematurestop`, which can be customized to do additional cleanup or e.g. print the bibliography.

`\prematurestop` is useful when one has a driver file, e.g. for a course taught multiple years and wants to generate course notes up to the current point in the lecture. Instead of commenting out the remaining parts, one can just move the `\prematurestop` macro. This is especially useful, if we need the rest of the file for processing, e.g. to generate a theory graph of the whole course with the already-covered parts marked up as an overview over the progress; see `import_graph.py` from the `lmhtools` utilities [LMH].

Text fragments and modules can be made more re-usable by the use of global variables. For instance, the `admin` section of a course can be made course-independent (and therefore re-usable) by using variables (actually token registers) `courseAcronym` and `courseTitle` instead of the text itself. The variables can then be set in the STEX preamble of the course notes file.

9.2.5 Global Document Variables

To make document fragments more reusable, we sometimes want to make the content depend on the context. We use **document variables** for that.

`\setSGvar` `\setSGvar{\<vname>}{\<text>}` to set the global variable `<vname>` to `<text>` and `\useSGvar{\<vname>}`
`\useSGvar` to reference it.

`\ifSGvar` With `\ifSGvar` we can test for the contents of a global variable: the macro call `\ifSGvar{\<vname>}{\<val>}{\<ctext>}` tests the content of the global variable `<vname>`, only if (after expansion) it is equal to `<val>`, the conditional text `<ctext>` is formatted.

9.3 Slides and Course Notes

9.3.1 Introduction

The `notesslides` document class is derived from `beamer.cls` [Tana], it adds a “notes version” for course notes that is more suited to printing than the one supplied by `beamer.cls`.

The `notesslides` class takes the notion of a slide frame from Till Tantau’s excellent `beamer` class and adapts its notion of frames for use in the STEX and OMDoc. To

support semantic course notes, it extends the notion of mixing frames and explanatory text, but rather than treating the frames as images (or integrating their contents into the flowing text), the `notesslides` package displays the slides as such in the course notes to give students a visual anchor into the slide presentation in the course (and to distinguish the different writing styles in slides and course notes).

In practice we want to generate two documents from the same source: the slides for presentation in the lecture and the course notes as a narrative document for home study. To achieve this, the `notesslides` class has two modes: *slides mode* and *notes mode* which are determined by the package option.

9.3.2 Package Options

The `notesslides` class takes a variety of class options:

- slides** The options `slides` and `notes` switch between slides mode and notes mode (see [subsection 9.3.3](#)).
- sectocframes** If the option `sectocframes` is given, then for the `sfragments`, special frames with the `sfragment` title (and number) are generated.
- frameimages** If the option `frameimages` is set, then slide mode also shows the `\frameimage`-generated **fiboxed** frames (see [??](#)). If also the `fiboxed` option is given, the slides are surrounded by a box.

9.3.3 Notes and Slides

- `frame (env.)`** Slides are represented with the `frame` environment just like in the `beamer` class, see [\[Taub\]](#) for details.
- `note (env.)`** The `notesslides` class adds the `note` environment for encapsulating the course note fragments.

Note that it is essential to start and end the `notes` environment at the start of the line – in particular, there may not be leading blanks – else L^AT_EX becomes confused and throws error messages that are difficult to decipher.

By interleaving the `frame` and `note` environments, we can build course notes as shown here:

```

1 \ifnotes\maketitle\else
2 \frame[noframenumbering]\maketitle\fi
3
4 \begin{note}
5   We start this course with ...
6 \end{note}
7
8 \begin{frame}
9   \frametitle{The first slide}
10  ...

```

```

11 \end{frame}
12 \begin{note}
13   ... and more explanatory text
14 \end{note}
15
16 \begin{frame}
17   \frametitle{The second slide}
18 ...
19 \end{frame}
20 ...

```

\ifnotes Note the use of the `\ifnotes` conditional, which allows different treatment between `notes` and `slides` mode – manually setting `\notestrue` or `\notesfalse` is strongly discouraged however.

We need to give the title frame the `noframenumbering` option so that the frame numbering is kept in sync between the slides and the course notes.

The `beamer` class recommends not to use the `allowframebreaks` option on frames (even though it is very convenient). This holds even more in the `notesslides` case: At least in conjunction with `\newpage`, frame numbering behaves funny (we have tried to fix this, but who knows).

\inputref* If we want to transclude the contents of a file as a note, we can use a new variant `\inputref*` of the `\inputref` macro: `\inputref*{foo}` is equivalent to `\begin{note}\inputref{foo}\end{note}`.

`nparagraph (env.)` There are some environments that tend to occur at the top-level of `note` environments.
`nparagraph (env.)` We make convenience versions of these: e.g. the `nparagraph` environment is just an

`ndefinition (env.)` `sparagraph` inside a `note` environment (but looks nicer in the source, since it avoids one
`nexample (env.)` level of source indenting). Similarly, we have the `nfragment`, `ndefinition`, `nexample`,
`nsproof (env.)` `nsproof`, and `nassertion` environments.

`nassertion (env.)`

9.3.4 Customizing Header and Footer Lines

The `notesslides` package and class comes with a simple default theme named `sTeX` that provided by the `beamertemplatex`. It is assumed as the default theme for `sTeX`-based notes and slides. The result in `notes` mode (which is like the `slides` version except that the slide height is variable) is

Test Slide

▷ Some text

©: MiKo
1
sTeX

The footer line can be customized. In particular the logos.

`\setslideLogo` The default logo provided by the `notesslides` package is the `STEX` logo it can be customized using `\setslideLogo{\<logo name>}`.

`\setsource` The default footer line of the `notesslides` package mentions copyright and licensing. In `notesslides` `\source` stores the author's name as the copyright holder. By default it is the author's name as defined in the `\author` macro in the preamble. `\setsource{\<name>}` can change the writer's name.

`\setlicensing` For licensing, we use the Creative Commons Attribution-ShareAlike license by default to strengthen the public domain. If package `hyperref` is loaded, then we can attach a hyperlink to the license logo. `\setlicensing[\<url>]{\<logo name>}` is used for customization, where `\<url>` is optional.

9.3.5 Frame Images

Sometimes, we want to integrate slides as images after all – e.g. because we already have a PowerPoint presentation, to which we want to add `STEX` notes.

`\frameimage` `\mhframeimage` In this case we can use `\frameimage[\<opt>]{\<path>}`, where `\<opt>` are the options of `\includegraphics` from the `graphicx` package [CR99] and `\<path>` is the file path (extension can be left off like in `\includegraphics`). We have added the `label` key that allows to give a frame label that can be referenced like a regular `beamer` frame.

The `\mhframeimage` macro is a variant of `\frameimage` with repository support. Instead of writing

```
1 \frameimage{\MathHub{fooMH/bar/source/baz/foobar}}
```

we can simply write (assuming that `\MathHub` is defined as above)

```
1 \mhframeimage[fooMH/bar]{baz/foobar}
```

Note that the `\mhframeimage` form is more semantic, which allows more advanced document management features in `MathHub`.

If `baz/foobar` is the “current module”, i.e. if we are on the `MathHub` path `...MathHub/fooMH/bar...`, then stating the repository in the first optional argument is redundant, so we can just use

```
1 \mhframeimage{baz/foobar}
```

`\textwarning` The `\textwarning` macro generates a warning sign: 

9.3.6 Excursions

In course notes, we sometimes want to point to an “excursion” – material that is either presupposed or tangential to the course at the moment – e.g. in an appendix. The typical setup is the following:

```
1 \excursion{founif}{../fragments/founif.en}
2 {We will cover first-order unification in}
3 ...
4 \begin{appendix}\printexcursions\end{appendix}
```

It generates a paragraph that references the excursion whose source is in the file `../fragments/founif.en.tex` and automatically books the file for the `\printexcursions` command that is used here to put it into the appendix. We will look at the mechanics now.

`\excursion` The `\excursion{<ref>}{<path>}{{<text>}}` is syntactic sugar for

```
1 \begin{nparagraph}[title=Excursion]
2 \activateexcursion{founif}{../ex/founif}
3 We will cover first-order unification in \sref{founif}.
4 \end{nparagraph}
```

`\activateexcursion` Here `\activateexcursion{<path>}` augments the `\printexcursions` macro by a call `\inputref{<path>}`. In this way, the `\printexcursions` macro (usually in the appendix) will collect up all excursions that are specified in the main text.

Sometimes, we want to reference – in an excursion – part of another. We can use `\excursionref{<label>}` for that.

`\excursiongroup` Finally, we usually want to put the excursions into an `sfragment` environment and add an introduction, therefore we provide the a variant of the `\printexcursions` macro: `\excursiongroup[id=<id>, intro=<path>]` is equivalent to

```
1 \begin{note}
2 \begin{sfragment}[id=<id>]{Excursions}
3 \inputref{<path>}
4 \printexcursions
5 \end{sfragment}
6 \end{note}
```

When option `book` which uses `\pagestyle{headings}` is given and semantic macros are given in the `sfragment` titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made. This is a problem of the underlying document-structure package.

9.4 Representing Problems and Solutions

9.4.1 Introduction

The **problem** package supplies an infrastructure that allows specify problem. Problems are text fragments that come with auxiliary functions: hints, notes, and solutions⁴. Furthermore, we can specify how long the solution to a given problem is estimated to take and how many points will be awarded for a perfect solution.

Finally, the **problem** package facilitates the management of problems in small files, so that problems can be re-used in multiple environment.

9.4.2 Problems and Solutions

solutions The problem package takes the options **solutions** (should solutions be output?), **notes** (should the problem notes be presented?), **hints** (do we give the hints?), **gnotes** (do we show grading notes?), **pts** (do we display the points awarded for solving the problem?), **min** (do we display the estimated minutes for problem soling). If theses are specified, then the corresponding auxiliary parts of the problems are output, otherwise, they remain invisible.

boxed The **boxed** option specifies that problems should be formatted in framed boxes so that they are more visible in the text. Finally, the **test** option signifies that we are in a test situation, so this option does not show the solutions (of course), but leaves space for the students to solve them.

problem (*env.*) The main environment provided by the **problempackage** is (surprise surprise) the **problem** environment. It is used to mark up problems and exercises. The environment takes an optional KeyVal argument with the keys **id** as an identifier that can be reference later, **pts** for the points to be gained from this exercise in homework or quiz situations, **min** for the estimated minutes needed to solve the problem, and finally **title** for an informative title of the problem.

Example 40

Input:

⁴for the moment multiple choice problems are not supported, but may well be in a future version

```

1 \documentclass{article}
2 \usepackage[solutions,hints,pts,min]{problem}
3 \begin{document}
4   \begin{sproblem}[id=elefants,pts=10,min=2,title=Fitting Elefants]
5     How many Elefants can you fit into a Volkswagen beetle?
6     \begin{hint}
7       Think positively, this is simple!
8     \end{hint}
9     \begin{exnote}
10       Justify your answer
11     \end{exnote}
12   \begin{solution}[for=elefants]
13     Four, two in the front seats, and two in the back.
14     \begin{gnote}
15       if they do not give the justification deduct 5 pts
16     \end{gnote}
17   \end{solution}
18 \end{sproblem}
19 \end{document}

```

Output:

Problem 9.4.1 (Fitting Elefants)
How many Elefants can you fit into a Volkswagen beetle?
Hint: Think positively, this is simple!
Note: Justify your answer

Solution: Four, two in the front seats, and two in the back.
Grading: if they do not give the justification deduct 5 pts

solution (env.) The **solution** environment can be used to specify a solution to a problem. If the package option **solutions** is set or **\solutionstrue** is set in the text, then the solution will be presented in the output. The **solution** environment takes an optional KeyVal argument with the keys **id** for an identifier that can be referenced by **for** to specify which problem this is a solution for, and **height** that allows to specify the amount of space to be left in test situations (i.e. if the **test** option is set in the **\usepackage** statement).

hint (env.) The **hint** and **exnote** environments can be used in a **problem** environment to give hints
exnote (env.) and to make notes that elaborate certain aspects of the problem. The **gnote** (grading
gnote (env.) notes) environment can be used to document situations that may arise in grading.

\start solutions Sometimes we would like to locally override the **solutions** option we have given to
\stop solutions the package. To turn on solutions we use the **\start solutions**, to turn them off,
\stop solutions. These two can be used at any point in the documents.

\if solutions Also, sometimes, we want content (e.g. in an exam with master solutions) conditional
on whether solutions are shown. This can be done with the **\if solutions** conditional.

9.4.3 Markup for Added-Value Services

The `problem` package is all about specifying the meaning of the various moving parts of practice/exam problems. The motivation for the additional markup is that we can base added-value services from these, for instance auto-grading and immediate feedback.

The simplest example of this are multiple-choice problems, where the `problem` package allows to annotate answer options with the intended values and possibly feedback that can be delivered to the users in an interactive setting. In this section we will give some infrastructure for these, we expect that this will grow over time.

Multiple Choice Blocks

`mcb (env.)` Multiple choice blocks can be formatted using the `mcb` environment, in which single choices are marked up with `\mcc` macro.

`\mcc` `\mcc[<keyvals>]{<text>}` takes an optional key/value argument `<keyvals>` for choice metadata and a required argument `<text>` for the proposed answer text. The following keys are supported

- `T` for true answers, `F` for false ones,
- `Ttext` the verdict for true answers, `Ftext` for false ones, and
- `feedback` for a short feedback text given to the student.

What we see when this is formatted to PDF depends on the context. In solutions mode (we start the solutions in the code fragment below) we get

Example 41

Input:

```
1 \startsolutions
2 \begin{sproblem}[title=Functions,name=functions1]
3 What is the keyword to introduce a function definition in python?
4 \begin{mcb}
5   \mcc[T]{def}
6   \mcc[F,feedback=that is for C and C++]{function}
7   \mcc[F,feedback=that is for Standard ML]{fun}
8   \mcc[F,Ftext=Nooooooooo,feedback=that is for Java]{public static void}
9 \end{mcb}
10 \end{sproblem}
```

Output:

Problem 9.4.2 (Functions)

What is the keyword to introduce a function definition in python?

- def
Correct!
- function
Wrong! *that is for C and C++*
- fun
Wrong! *that is for Standard ML*
- public static void
Wrong! *that is for Java*

In “exam mode” where disable solutions (here via `\stopsolutions`)

Example 42

Input:

```
1 \stopsolutions
2 \begin{sproblem}[title=Functions,name=functions1]
3 What is the keyword to introduce a function definition in python?
4 \begin{mcb}
5   \mcc[T]{def}
6   \mcc[F,feedback=that is for C and C++]{function}
7   \mcc[F,feedback=that is for Standard ML]{fun}
8   \mcc[F,Ftext=Nooooooooo,feedback=that is for Java]{public static void}
9 \end{mcb}
10 \end{sproblem}
```

Output:

Problem 9.4.3 (Functions)

What is the keyword to introduce a function definition in python?

- def
- function
- fun
- public static void

we get the questions without solutions (that is what the students see during the exam/quiz).

Filling-In Concrete Solutions

The next simplest situation, where we can implement auto-grading is the case where we have fill-in-the-blanks

\fillinsol The `\fillinsol` macro takes⁶ an a single argument, which contains a concrete solution (i.e. a number, a string, ...), which generates a fill-in-box in test mode:

Example 43

Input:

```
1 \stopsolutions
2 \begin{sproblem}[id=elefants.fillin,title=Fitting Elefants]
3 How many Elefants can you fit into a Volkswagen beetle? \fillinsol{4}
\end{sproblem}
```

Problem 9.4.4 (Fitting Elefants)

How many Elefants can you fit into a Volkswagen beetle?
and the actual solution in solutions mode:

Example 44

Input:

```
1 \begin{sproblem}[id=elefants.fillin,title=Fitting Elefants]
2 How many Elefants can you fit into a Volkswagen beetle? \fillinsol{4}
3 \end{sproblem}
```

Output:

Problem 9.4.5 (Fitting Elefants)

How many Elefants can you fit into a Volkswagen beetle? !

If we do not want to leak information about the solution by the size of the blank we can also give `\fillinsol` an optional argument with a size: `\fillinsol[3cm]{12}` makes a box three cm wide.

Obviously, the required argument of `\fillinsol` can be used for auto-grading. For concrete data like numbers, this is immediate, for more complex data like strings “soft comparisons” might be in order.⁷

9.4.4 Including Problems

\includeproblem The `\includeproblem` macro can be used to include a problem from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one problem in the include file). The keys `title`, `min`, and `pts` specify the problem title, the estimated minutes for solving the problem and the points to be gained, and their values (if given) overwrite the ones specified in the `problem` environment in the included file.

The sum of the points and estimated minutes (that we specified in the `pts` and `min` keys to the `problem` environment or the `\includeproblem` macro) to the log file and the

⁷EDNOTE: For the moment we only assume a single concrete value as correct. In the future we will almost certainly want to extend the functionality to multiple answer classes that allow different feedback like in MCQ. This still needs a bit of design. Also we want to make the formatting of the answer in solutions/test mode configurable.

screen after each run. This is useful in preparing exams, where we want to make sure that the students can indeed solve the problems in an allotted time period.

The `\min` and `\pts` macros allow to specify (i.e. to print to the margin) the distribution of time and reward to parts of a problem, if the `pts` and `pts` options are set. This allows to give students hints about the estimated time and the points to be awarded.

9.4.5 Testing and Spacing

The `problem` package is often used by the `hwexam` package, which is used to create homework assignments and exams. Both of these have a “test mode” (invoked by the package option `test`), where certain information –master solutions or feedback – is not shown in the presentation.

`\testspace` `\testspace` takes an argument that expands to a dimension, and leaves vertical space accordingly. Specific instances exist: `\testsmallspace`, `\testmediumspace`, `\testlargepage` give small (1cm), medium (2cm), and big (3cm) vertical space.
`\testsmallspace` `\testnewpage` makes a new page in `test` mode, and `\testemptypage` generates an empty page with the cautionary message that this page was intentionally left empty.
`\testemptypage`

9.5 Homeworks, Quizzes and Exams

9.5.1 Introduction

The `hwexam` package and class supplies an infrastructure that allows to format nice-looking assignment sheets by simply including problems from problem files marked up with the `problem` package. It is designed to be compatible with `problems.sty`, and inherits some of the functionality.

9.5.2 Package Options

`solutions` The `hwexam` package and class take the options `solutions`, `notes`, `hints`, `gnotes`, `pts`, `notes` `min`, and `boxed` that are just passed on to the `problems` package (cf. its documentation for a description of the intended behavior).

`gnotes`

`pts`

`min`

`multiple` Furthermore, the `hwexam` package takes the option `multiple` that allows to combine multiple assignment sheets into a compound document (the assignment sheets are treated as section, there is a table of contents, etc.).

`test` Finally, there is the option `test` that modifies the behavior to facilitate formatting tests. Only in `test` mode, the macros `\testspace`, `\testnewpage`, and `\testemptypage` have an effect: they generate space for the students to solve the given problems. Thus they can be left in the L^AT_EX source.

9.5.3 Assignments

assignment (*env.*) This package supplies the **assignment** environment that groups problems into assignment sheets. It takes an optional KeyVal argument with the keys **number** (for the assignment number; if none is given, 1 is assumed as the default or — in multi-assignment documents **title** — the ordinal of the **assignment** environment), **title** (for the assignment title; this is **type** referenced in the title of the assignment sheet), **type** (for the assignment type; e.g. “quiz”, **given** or “homework”), **given** (for the date the assignment was given), and **due** (for the date **due** the assignment is due).

9.5.4 Including Assignments

\inputassignment The **\inputassignment** macro can be used to input an assignment from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one **assignment** environment in the included file). The keys **number**, **title**, **type**, **given**, and **due** are just as for the **assignment** environment and (if given) overwrite the ones specified in the **assignment** environment in the included file.

9.5.5 Typesetting Exams

testheading (*env.*) The **\testheading** takes an optional keyword argument where the keys **duration** specifies a string that specifies the duration of the test, **min** specifies the equivalent in number **min** of minutes, and **reqpts** the points that are required for a perfect grade.

```
reqpts1 \title{320101 General Computer Science (Fall 2010)}
2 \begin{testheading}[duration=one hour,min=60,reqpts=27]
3 Good luck to all students!
4 \end{testheading}
```

Will result in

Name:

Matriculation Number:

320101 General Computer Science (Fall 2010)

2022-09-14

You have one hour (sharp) for the test;

Write the solutions to the sheet.

The estimated time for solving this exam is 60 minutes, leaving you 0 minutes for revising your exam.

You can reach 40 points if you solve all problems. You will only need 27 points for a perfect score, i.e. 13 points are bonus points.

You have ample time, so take it slow and avoid rushing to mistakes!

Different problems test different skills and knowledge, so do not get stuck on one problem.

prob.	To be used for grading, do not write here												grade	
	9.4.1	9.4.2	9.4.3	9.4.4	9.4.5	1.1	2.1	2.2	2.3	3.1	3.2	3.3		
total	10					4	4	6	6	4	4	2	40

good luck

EdN:8

8

⁸EDNOTE: MK: The first three “problems” come from the stex examples above, how do we get rid of this?

Part II

Documentation

Chapter 10

STEX-Basics

This sub package provides general set up code, auxiliary methods and abstractions for `xhtml` annotations.

10.1 Macros and Environments

\sTeX Both print this STEX logo.
\stex

\stex_debug:nn \stex_debug:nn $\{log-prefix\}$ $\{message\}$
Logs $\langle message \rangle$, if the package option `debug` contains $\langle log-prefix \rangle$.

10.1.1 HTML Annotations

\if@latexml LATEX2e conditional for LATEXML

\latexml_if_p: * LATEX3 conditionals for LATEXML.
\latexml_if:TF *

\stex_if_do_html_p: * Whether to currently produce any HTML annotations (can be false in some advanced
\stex_if_do_html:TF * structuring environments, for example)

\stex_suppress_html:n Temporarily disables HTML annotations in its argument code

We have four macros for annotating generated HTML (via LATEXML or RUSTEX) with attributes:

```
\stex_annotate:nnn          \stex_annotate:nnn {\langle property\rangle} {\langle resource\rangle} {\langle content\rangle}
\stex_annotate_invisible:nnn
\stex_annotate_invisible:n
```

Annotates the HTML generated by *<content>* with

```
property="stex:<property>", resource="<resource>".
```

`\stex_annotate_invisible:n` adds the attributes

```
stex:visible="false", style="display:none".
```

`\stex_annotate_invisible:nnn` combines the functionality of both.

```
stex_annotate_env (env) \begin{stex_annotate_env}{\langle property\rangle}{\langle resource\rangle}
                        {\langle content\rangle}
\end{stex_annotate_env}
behaves like \stex_annotate:nnn {\langle property\rangle} {\langle resource\rangle} {\langle content\rangle}.
```

10.1.2 Babel Languages

```
\c_stex_languages_prop
\c_stex_language_abbrevs_prop
```

Map language abbreviations to their full babel names and vice versa. e.g. `\c_stex_languages_prop{en}` yields `english`, and `\c_stex_language_abbrevs_prop{english}` yields `en`.

10.1.3 Auxiliary Methods

```
\stex_deactivate_macro:Nn \stex_deactivate_macro:Nn<cs>{\langle environments\rangle}
```

```
\stex_reactivate_macro:N
```

Makes the macro *<cs>* throw an error, indicating that it is only allowed in the context of *<environments>*.

`\stex_reactivate_macro:N<cs>` reactivates it again, i.e. this happens ideally in the *<begin>*-code of the associated environments.

```
\ignorespacesandpars
```

`\ignorespacesandpars` ignores white space characters and `\par` control sequences. Expands tokens in the process.

Chapter 11

sT_EX-MathHub

This sub package provides code for handling sT_EX archives, files, file paths and related methods.

11.1 Macros and Environments

\stex_kpsewhich:n \stex_kpsewhich:n executes kpsewhich and stores the return in \l_stex_kpsewhich_return_str. This does not require shell escaping.

11.1.1 Files, Paths, URIs

\stex_path_from_string:Nn \stex_path_from_string:Nn <path-variable> {<string>}
turns the <string> into a path by splitting it at /-characters and stores the result in <path-variable>. Also applies \stex_path_canonicalize:N.

\stex_path_to_string:NN The inverse; turns a path into a string and stores it in the second argument variable, or
\stex_path_to_string:N leaves it in the input stream.

\stex_path_canonicalize:N Canonicalizes the path provided; in particular, resolves . and .. path segments.

\stex_path_if_absolute_p:N *
\stex_path_if_absolute:NTF *

Checks whether the path provided is *absolute*, i.e. starts with an empty segment

\c_stex_pwd_seq Store the current working directory as path-sequence and string, respectively, and the
\c_stex_pwd_str (heuristically guessed) full path to the main file, based on the PWD and \jobname.
\c_stex_mainfile_seq
\c_stex_mainfile_str

`\g_stex_currentfile_seq` The file being currently processed (respecting `\input` etc.)

`\stex_filestack_push:n` Push and pop (respectively) a file path to the file stack, to keep track of the current file.
`\stex_filestack_pop:` Are called in hooks `file/before` and `file/after`, respectively.

11.1.2 MathHub Archives

`\mathhub`
`\c_stex_mathhub_seq`
`\c_stex_mathhub_str` We determine the path to the local MathHub folder via one of four means, in order of precedence:

1. The `mathhub` package option, or
2. the `\mathhub`-macro, if it has been defined before the `\usepackage{stex}`-statement, or
3. the `MATHHUB` system variable, or
4. a path specified in `~/.stex/mathhub.path`.

In all four cases, `\c_stex_mathhub_seq` and `\c_stex_mathhub_str` are set accordingly.

`\l_stex_current_repository_prop`

Always points to the *current* MathHub repository (if we currently are in one). Has the following fields corresponding to the entries in the `MANIFEST.MF`-file:

- `id`: The name of the archive, including its group (e.g. `smglom/calculus`),
- `ns`: The content namespace (for modules and symbols),
- `narr`: the narration namespace (for document references),
- `docurl`: The URL that is used as a basis for *external references*,
- `deps`: All archives that this archive depends on (currently not in use).

`\stex_set_current_repository:n`

Sets the current repository to the one with the provided ID. calls `__stex_mathhub_do_manifest:n`, so works whether this repository's `MANIFEST.MF`-file has already been read or not.

`\stex_require_repository:n` Calls `__stex_mathhub_do_manifest:n` iff the corresponding archive property list does not already exist, and adds a corresponding definition to the `.sms`-file.

`\stex_in_repository:nn \stex_in_repository:nn{\langle repository-name\rangle}{\langle code\rangle}`

Change the current repository to `{\langle repository-name\rangle}` (or not, if `{\langle repository-name\rangle}` is empty), and passes its ID on to `{\langle code\rangle}` as #1. Switches back to the previous repository after executing `{\langle code\rangle}`.

11.1.3 Using Content in Archives

\mhpath $\star \mhpath{\langle archive-ID \rangle}{\langle filename \rangle}$

Expands to the full path of file $\langle filename \rangle$ in repository $\langle archive-ID \rangle$. Does not check whether the file or the repository exist.

\inputref $\inputref{\langle archive-ID \rangle}{\langle filename \rangle}$

\mhinput Both \input the file $\langle filename \rangle$ in archive $\langle archive-ID \rangle$ (relative to the source-subdirectory). \mhinput does so directly. \inputref does so within an $\begin{group}... \end{group}$ -block, and skips it in html-mode, inserting a *reference* to the file instead.

Both also set \ifinputref to true.

\addmhbibresource $\inputref{\langle archive-ID \rangle}{\langle filename \rangle}$

Adds a .bib-file $\langle filename \rangle$ in archive $\langle archive-ID \rangle$ (relative to the top-directory of the archive!).

\libinput $\libinput{\langle filename \rangle}$

Inputs $\langle filename \rangle.tex$ from the lib folders in the current archive and the meta-inf-archive of the current archive group(s) (if existent) in descending order. Throws an error if no file by that name exists in any of the relevant lib-folders.

\libusepackage $\libusepackage[\langle args \rangle]{\langle filename \rangle}$

Like \libinput , but looks for .sty-files and calls $\usepackage[\meta{args}]\Arg{\filename}$ instead of \input .

Throws an error, if none or more than one suitable package file is found.

\mhgraphics If the graphicx package is loaded, these macros are defined at $\begin{document}$.

\cmhgraphics \mhgraphics takes the same arguments as \includegraphics , with the additional optional key mhrepos. It then resolves the file path in $\mhgraphics[mhrepos=Foo/Bar]{foo/bar.png}$ relative to the source-folder of the Foo/Bar-archive.

\cmhgraphics additional wraps the image in a center-environment.

\lstinputmhlisting Like \mhgraphics , but only defined if the listings-package is loaded, and with \lstinputlisting instead of \includegraphics .

Chapter 12

STEX-References

This sub package contains code related to links and cross-references

12.1 Macros and Environments

`\stex_get_document_uri:` Computes the current document uri from the current archive's `narr`-field and its location relative to the archive's `source`-directory. Reference targets are computed from this URI and the reference-id.

`\l_stex_current_docns_str` Stores its result in `\l_stex_current_docns_str`

`\stex_get_document_url:` Computes the current URL from the current archive's `docurl`-field and its location relative to the archive's `source`-directory. Reference targets are computed from this URL and the reference-id, if this document is only included in SMS mode.

`\l_stex_current_docurl_str` Stores its result in `\l_stex_current_docurl_str`

12.1.1 Setting Reference Targets

`\stex_ref_new_doc_target:n \stex_ref_new_doc_target:n{<id>}`
Sets a new reference target with id `<id>`.

`\stex_ref_new_sym_target:n \stex_ref_new_sym_target:n{<uri>}`
Sets a new reference target for the symbol `<uri>`.

12.1.2 Using References

\sref `\sref[<opt-args>]{<id>}`

References the label with if $\langle id \rangle$. Optional arguments: **TODO**

\srefsym `\srefsym[<opt-args>]{<symbol>}`

Like `\sref`, but references the *canonical label* for the provided symbol. The canonical target is the last of the following occurring in the document:

- A `\definiendum` or `\definename` for $\langle symbol \rangle$,
- The `sassertion`, `sexample` or `sparagraph` with `for=<symbol>` that generated $\langle symbol \rangle$ in the first place, or
- A `\sparagraph` with `type=symdoc` and `for=<symbol>`.

\srefsymuri `\srefsymuri{<URI>}{<text>}`

A convenient short-hand for `\srefsym[linktext={text}]{URI}`, but requires the first argument to be a full URI already. Intended to be used in e.g. `\compemph@uri`, `\defemph@uri`, etc.

Chapter 13

sT_EX-Modules

This sub package contains code related to Modules

13.1 Macros and Environments

The content of a module with uri <*URI*> is stored in four macros. All modifications of these macros are global:

`\c_stex_module_<URI>_prop` A property list with the following fields:

`name` The *name* of the module,
`ns` the *namespace* in field `ns`,
`file` the *file* containing the module, as a sequence of path fragments
`lang` the module's *language*,
`sig` the language of the signature module, if the current file is a translation from some other language,
`deprecate` if this module is deprecated, the module that replaces it,
`meta` the metatheory of the module.

`\c_stex_module_<URI>_code` The code to execute when this module is activated (i.e. imported), e.g. to set all the semantic macros, notations, etc.

`\c_stex_module_<URI>_constants`

The names of all constants declared in the module

`\c_stex_module_<URI>_constants`

The full URIs of all modules imported in this module

\l_stex_current_module_str `\l_stex_current_module_str` always contains the URI of the current module (if existent).

\l_stex_all_modules_seq Stores full URIs for all modules currently in scope.

\stex_if_in_module_p: * Conditional for whether we are currently in a module
\stex_if_in_module:T_F *

\stex_if_module_exists_p:n *
\stex_if_module_exists:nTF *

Conditional for whether a module with the provided URI is already known.

\stex_add_to_current_module:n
\STEXexport

Adds the provided tokens to the `_code` control sequence of the current module.

`\stex_add_to_current_module:n` is used internally, `\STEXexport` is intended for users and additionally executes the provided code immediately.

\stex_add_constant_to_current_module:n

Adds the declaration with the provided name to the `_constants` control sequence of the current module.

\stex_add_import_to_current_module:n

Adds the module with the provided full URI to the `_imports` control sequence of the current module.

\stex_collect_imports:n Iterates over all imports of the provided (full URI of a) module and stores them as a topologically sorted list – including the provided module as the last element – in `\l_stex_collect_imports_seq`

\stex_do_up_to_module:n Code that is *exported* from module (such as symbol declarations) should be local *to the current module*. For that reason, ideally all symbol declarations and similar commands should be called directly in the module environment, however, that is not always feasible, e.g. in structural features or `sparapraphs`. `\stex_do_up_to_module` therefore executes the provided code repeatedly in an `\aftergroup` up until the group level is equal to that of the innermost smodule environment.

\stex_modules_current_namespace:

Computes the current namespace as follows:

If the current file is `.../source/sub/file.tex` in some archive with namespace `http://some.namespace/foo`, then the namespace of is `http://some.namespace/foo/sub/file`. Otherwise, the namespace is the absolute file path of the current file (i.e. starting with `file:///`).

The result is stored in `\l_stex_module_ns_str`. Additionally, the sub path relative to the current repository is stored in `\l_stex_module_subpath_str`.

13.1.1 The `smodule` environment

`module (env.) \begin{module}[\langle options \rangle]{\langle name \rangle}`

Opens a new module with name `\langle name \rangle`. Options are:

`title (\langle token list \rangle)` to display in customizations.

`type (\langle string \rangle*)` for use in customizations.

`deprecate (\langle module \rangle)` if set, will throw a warning when loaded, urging to use `\langle module \rangle` instead.

`id (\langle string \rangle)` for cross-referencing.

`ns (\langle URI \rangle)` the namespace to use. *Should not be used, unless you know precisely what you're doing.* If not explicitly set, is computed using `\stex_modules_current_namespace::`.

`lang (\langle language \rangle)` if not set, computed from the current file name (e.g. `foo.en.tex`).

`sig (\langle language \rangle)` if the current file is a translation of a file with the same base name but a different language suffix, setting `sig=<lang>` will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

`creators (\langle string \rangle*)` names of the creators.

`contributors (\langle string \rangle*)` names of contributors.

`srccite (\langle string \rangle)` a source citation for the content of this module.

\stex_module_setup:nn \stex_module_setup:nn{\langle params \rangle}{\langle name \rangle}

Sets up a new module with name `\langle name \rangle` and optional parameters `\langle params \rangle`. In particular, sets `\l_stex_current_module_str` appropriately.

\stexpatchmodule \stexpatchmodule [\langle type \rangle] {\langle beginode \rangle} {\langle endode \rangle}

Customizes the presentation for those `smodule`-environments with `type=\langle type \rangle`, or all others if no `\langle type \rangle` is given.

\STEXModule \STEXModule {\langle fragment \rangle}

Attempts to find a module whose URI ends with `\langle fragment \rangle` in the current scope and passes the full URI on to `\stex_invoke_module:n`.

\stex_invoke_module:n Invoked by `\STEXModule`. Needs to be followed either by `!\macro` or `?{\langle symbolname \rangle}`. In the first case, it stores the full URI in `\macro`; in the second case, it invokes the symbol `\langle symbolname \rangle` in the selected module.

\stex_activate_module:n Activate the module with the provided URI; i.e. executes all macro code of the module's `_code`-macro (does nothing if the module is already activated in the current context) and adds the module to `\l_stex_all_modules_seq`.

Chapter 14

STEX-Module Inheritance

Code related to Module Inheritance, in particular *sms mode*.

14.1 Macros and Environments

14.1.1 SMS Mode

“SMS Mode” is used when loading modules from external tex files. It deactivates any output and ignores all \TeX commands not explicitly allowed via the following lists – all of which either declare module content or are needed in order to declare module content:

`\g_stex_smsmode_allowedmacros_tl`

Macros that are executed as is; i.e. sms mode continues immediately after. These macros may not take any arguments or otherwise gobble tokens.

Initially: `\makeatletter`, `\makeatother`, `\ExplSyntaxOn`, `\ExplSyntaxOff`.

`\g_stex_smsmode_allowedmacros_escape_tl`

Macros that are executed and potentially gobble up further tokens. These macros need to make sure, that the very last token they ultimately expand to is `\stex_smsmode_do`:

Initially: `\symdecl`, `\notation`, `\symdef`, `\importmodule`, `\STEXexport`, `\inlineass`, `\inlinedef`, `\inlineex`, `\endinput`, `\setnotation`, `\copynotation`.

`\g_stex_smsmode_allowedenvs_seq`

The names of environments that should be allowed in SMS mode. The corresponding `\begin`-statements are treated like the macros in `\g_stex_smsmode_allowedmacros_escape_tl`, so `\stex_smsmode_do`: needs to be the last token in the `\begin`-code. Since `\end`-statements take no arguments anyway, those are called directly and sms mode continues afterwards.

Initially: `smodule`, `copymodule`, `interpretmodule`, `sdefinition`, `sexample`, `sassertion`, `sparagraph`.

`\stex_if_smsmode_p`: * Tests whether SMS mode is currently active.
`\stex_if_smsmode:TF` *

`\stex_file_in_smsmode:nn \stex_in_smsmode:nn {filename} {code}`

Executes *code* in SMS mode, followed by the content of *filename*. *code* can be used e.g. to set the current repository, and is executed within a new tex group, and the same group as the file content.

`\stex_smsmode_do:` Starts gobbling tokens until one is encountered that is allowed in SMS mode.

14.1.2 Imports and Inheritance

`\importmodule \importmodule[<archive-ID>]{<module-path>}`

Imports a module by reading it from a file and “activating” it. STEX determines the module and its containing file by passing its arguments on to `\stex_import_module_path:nn`.

`\usemodule \importmodule[<archive-ID>]{<module-path>}`

Like `\importmodule`, but does not export its contents; i.e. including the current module will not activate the used module

```
\stex_import_module_uri:nn \stex_import_module_uri:nn {<archive-ID>} {<module-path>}
```

Determines the URI of a module by splitting $\langle\text{module-path}\rangle$ into $\langle\text{path}\rangle?\langle\text{name}\rangle$. If $\langle\text{module-path}\rangle$ does *not* contain a ?-character, we consider it to be the $\langle\text{name}\rangle$, and $\langle\text{path}\rangle$ to be empty.

If $\langle\text{archive-ID}\rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle\text{archive-ID}\rangle$ is empty:

(a) If $\langle\text{path}\rangle$ is empty, then $\langle\text{name}\rangle$ must have been declared earlier in the same file and retrievable from `\g_stex_modules_in_file_seq`, or a file with name $\langle\text{name}\rangle.\langle\text{lang}\rangle.\text{tex}$ must exist in the same folder, containing a module $\langle\text{name}\rangle$.

That module should have the same namespace as the current one.

(b) If $\langle\text{path}\rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

(a) If $\langle\text{path}\rangle$ is empty, then $\langle\text{name}\rangle$ must have been declared earlier in the same file and retrievable from `\g_stex_modules_in_file_seq`, or a file with name $\langle\text{name}\rangle.\langle\text{lang}\rangle.\text{tex}$ must exist in the top `source` folder of the archive, containing a module $\langle\text{name}\rangle$.

That module should lie directly in the namespace of the archive.

(b) If $\langle\text{path}\rangle$ is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call `\stex_require_module:nn` on the `source` directory of the archive to find the file.

```
\l_stex_import_name_str stores the result in these four variables.
```

```
\l_stex_import_archive_str
```

```
\l_stex_import_path_str
```

```
\l_stex_import_ns_str
```

```
\stex_import_require_module:nnnn {<ns>} {<archive-ID>} {<path>} {<name>}
```

Checks whether a module with URI $\langle\text{ns}\rangle?\langle\text{name}\rangle$ already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its `_code`-macro.

Chapter 15

STEX-Symbols

Code related to symbol declarations and notations

15.1 Macros and Environments

`\symdecl \symdecl{<macroname>}[<args>]`

Declares a new symbol with semantic macro `\macroname`. Optional arguments are:

- **name**: An (OMDOC) name. By default equal to `<macroname>`.
- **type**: An (ideally semantic) term, representing a *type*. Not used by STEX, but passed on to MMT for semantic services.
- **def**: An (ideally semantic) term, representing a *definiens*. Not used by STEX, but passed on to MMT for semantic services.
- **args**: Specifies the “signature” of the semantic macro. Can be either an integer $0 \leq n \leq 9$, or a (more precise) sequence of the following characters:

i a “normal” argument, e.g. `\symdecl{plus}[args=ii]` allows for `\plus{2}{2}`.

a an *associative* argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. `\symdecl{plus}[args=a]` allows for `\plus{2,2,2}`.

b a *variable* argument. Is treated by STEX like an i-argument, but an application is turned into an OMBind in OMDoc, binding the provided variable in the subsequent arguments of the operator; e.g. `\symdecl{forall}[args=bi]` allows for `\forall{x\in\mathbb{N}}{x\geq 0}`.

\stex_symdecl_do:n Implements the core functionality of `\symdecl`, and is called by `\symdecl` and `\symdef`. Ultimately stores the symbol $\langle URI \rangle$ in the property list `\l_stex_symdecl_<URI>_prop` with fields:

- **name** (string),
- **module** (string),
- **notations** (sequence of strings; initially empty),
- **type** (token list),
- **args** (string of `is`, `as` and `bs`),
- **arity** (integer string),
- **assocs** (integer string; number of associative arguments),

\stex_all_symbols:n Iterates over all currently available symbols. Requires two `\seq_map_break:` to break fully.

\stex_get_symbol:n Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...

\notation `\notation[<args>]{<symbol>}{<notations+>}`

Introduces a new notation for $\langle symbol \rangle$, see `\stex_notation_do:nn`

\stex_notation_do:nn `\stex_notation_do:nn{<URI>}{<notations+>}`

Implements the core functionality of `\notation`, and is called by `\notation` and `\symdef`.

Ultimately stores the notation in the property list `\g_stex_notation_<URI>#<variant>#<lang>_prop` with fields:

- **symbol** (URI string),
- **language** (string),
- **variant** (string),
- **opprec** (integer string),
- **argprecs** (sequence of integer strings)

\symdef `\symdef[<args>]{<symbol>}{<notations+>}`

Combines `\symdecl` and `\notation` by introducing a new symbol and assigning a new notation for it.

Chapter 16

STEX-Terms

Code related to symbolic expressions, typesetting notations, notation components, etc.

16.1 Macros and Environments

\STEXsymbol Uses `\stex_get_symbol:n` to find the symbol denoted by the first argument and passes the result on to `\stex_invoke_symbol:n`

\symref `\symref{\langle symbol \rangle}{\langle text \rangle}`
shortcut for `\STEXsymbol{\langle symbol \rangle}![\langle text \rangle]`

\stex_invoke_symbol:n Executes a semantic macro. Outside of math mode or if followed by *, it continues to `\stex_term_custom:nn`. In math mode, it uses the default or optionally provided notation of the associated symbol.

If followed by !, it will invoke the symbol *itself* rather than its application (and continue to `\stex_term_custom:nn`), i.e. it allows to refer to `\plus! [addition]` as an operation, rather than `\plus [addition of] {some} {terms}`.

\STEXInternalTermMathOMSi iii `\langle URI \rangle \langle fragment \rangle \langle precedence \rangle \langle body \rangle`
\STEXInternalTermMathOMAi iii
\STEXInternalTermMathOMBii ii

Annotates `\langle body \rangle` as an OMDoc-term (`OMID`, `OMA` or `OMBIND`, respectively) with head symbol `\langle URI \rangle`, generated by the specific notation `\langle fragment \rangle` with (upwards) operator precedence `\langle precedence \rangle`. Inserts parentheses according to the current downwards precedence and operator precedence.

\STEXInternalTermMathArgiii `\stex_term_arg:nnn \langle int \rangle \langle prec \rangle \langle body \rangle`

Annotates `\langle body \rangle` as the `\langle int \rangle`th argument of the current `OMA` or `OMBIND`, with (downwards) argument precedence `\langle prec \rangle`.

`\STEXInternalTermMathAssocArgiiiiii` `\stex_term_arg:nnn<int><prec><notation><type><body>`

Annotates `<body>` as the `<int>`th (associative) *sequence* argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence `<prec>` and associative notation `<notation>`.

`\infprec` Maximal and minimal notation precedences.
`\neginfprec`

`\dobrackets` `\dobrackets {<body>}`

Puts `<body>` in parentheses; scaled if in display mode unscaled otherwise. Uses the current \TeX brackets (by default (and)), which can be changed temporarily using `\withbrackets`.

`\withbrackets` `\withbrackets {<left>} {<right>} {<body>}`

Temporarily (i.e. within `<body>`) sets the brackets used by \TeX for automated bracketing (by default (and)) to `<left>` and `<right>`.

Note that `<left>` and `<right>` need to be allowed after `\left` and `\right` in display-mode.

`\stex_term_custom:nn` `\stex_term_custom:nn{<URI>}{<args>}`

Implements custom one-time notation. Invoked by `\stex_invoke_symbol:n` in text mode, or if followed by * in math mode, or whenever followed by !.

`\comp` `\comp{<args>}`

Marks `<args>` as a notation component of the current symbol for highlighting, linking, etc.

The precise behavior is governed by `\@comp`, which takes as additional argument the URI of the current symbol. By default, `\@comp` adds the URI as a PDF tooltip and colors the highlighted part in blue.

`\defemph` `\@defemph` behaves like `\@comp`, and can be similarly redefined, but marks an expression as *definiendum* (used by `\definiendum`)

`\STEXinvisible` Exports its argument as OMDoc (invisible), but does not produce PDF output. Useful e.g. for semantic macros that take arguments that are not part of the symbolic notation.

`\ellipses` TODO

Chapter 17

STEX-Structural Features

Code related to structural features

131 }

```

(End definition for `\stex_suppress_html:n`. This function is documented on page 76.)

`\stex_annotation_env:n`

We define four macros for introducing attributes in the HTML output. The definitions depend on the “backend” used (LATEXML, RUSTEX, pdflatex).

The pdflatex-macros largely do nothing; the RUSTEX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

```

132 \ifcsname if@rustex\endcsname\else
133   \expandafter\newif\csname if@rustex\endcsname

27.1 Generic Path Handling

We treat paths as L^AT_EX3-sequences (of the individual path segments, i.e. separated by a /-character) unix-style; i.e. a path is absolute if the sequence starts with an empty entry.

```
\stex_path_from_string:Nn
411   \cs_new_protected:Nn \stex_path_from_string:Nn {
412     \stex_debug:nn{files}{#2}
413     \str_set:Nx \l_tmpa_str { #2 }
414     \str_if_empty:NTF \l_tmpa_str {
415       \seq_clear:N #1
416     }{
417       \exp_args:NNNo \seq_set_split:Nnn #1 / { \l_tmpa_str }
418       \sys_if_platform_windows:T{
```

```

419     \seq_clear:N \l_tmpa_tl
420     \seq_map_inline:Nn #1 {
421         \seq_set_split:Nnn \l_tmpb_tl \c_backslash_str { ##1 }
422         \seq_concat:NNN \l_tmpa_tl \l_tmpa_tl \l_tmpb_tl
423     }
424     \seq_set_eq:NN #1 \l_tmpa_tl
425 }
426 \stex_path_canonicalize:N #1
427 }
428 \stex_debug:nn{files}{Yields: \stex_path_to_string:N#1}
429 }
430

```

(End definition for `\stex_path_from_string:Nn`. This function is documented on page 78.)

`\stex_path_to_string:NN`

`\stex_path_to_string:N`

```

431 \cs_new_protected:Nn \stex_path_to_string:NN {
432     \exp_args:NNe \str_set:Nn #2 { \seq_use:Nn #1 / }
433 }
434
435 \cs_new:Nn \stex_path_to_string:N {
436     \seq_use:Nn #1 /
437 }

```

(End definition for `\stex_path_to_string:NN` and `\stex_path_to_string:N`. These functions are documented on page 78.)

`\c_stex_path_dot_str` . and `\c_stex_path_up_str` .., respectively.

```

438 \str_const:Nn \c_stex_path_dot_str {}
439 \str_const:Nn \c_stex_path_up_str {..}

```

(End definition for `\c_stex_path_dot_str` and `\c_stex_path_up_str`.)

`\stex_path_canonicalize:N` Canonicalizes the path provided; in particular, resolves . and .. path segments.

```

440 \cs_new_protected:Nn \stex_path_canonicalize:N {

```

(End definition for `\c_stex_pwd_seq` and `\c_stex_pwd_str`. These variables are documented on page 78.)

27.3 File Hooks and Tracking

516 `<@@=stex_files>`

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

Note that the absolute paths are only accurate in `\input`-statements for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for `STEX`-purposes.

`\g_stex_files_stack` keeps track of file changes

517 `\seq_gclear_new:N\g_stex_files_stack`

(End definition for `\g_stex_files_stack`.)

`\c_stex_mainfile_seq`
`\c_stex_mainfile_str`

```

518 \str_set:Nx \c_stex_mainfile_str {\c_stex_pwd_str/\jobname.tex}
519 \stex_path_from_string:Nn \c_stex_mainfile_seq
520   \c_stex_mainfile_str

```

(End definition for `\c_stex_mainfile_seq` and `\c_stex_mainfile_str`. These variables are documented on page 78.)

`\g_stex_currentfile_seq`

521 `\seq_gclear_new:N\g_stex_currentfile_seq`

(End definition for `\g_stex_currentfile_seq`. This variable is documented on page 79.)

`\stex_filestack_push:n`

```

522 \cs_new_protected:Nn \stex_filestack_push:n {
523   \stex_path_from_string:Nn\g_stex_currentfile_seq{#1}
524   \stex_path_if_absolute:NF\g_stex_currentfile_seq{
525     \stex_path_from_string:Nn\g_stex_currentfile_seq{
526       \c_stex_pwd_str/#1
527     }

```

```

528   }
529   \seq_gset_eq:NN\g_stex_currentfile_seq\g_stex_currentfile_seq
530   \exp_args:NNo\seq_gpush:Nn\g__stex_files_stack\g_stex_currentfile_seq
531   \stex_get_document_uri:
532 }

```

(End definition for `\stex_filestack_push:n`. This function is documented on page 79.)

`\stex_filestack_pop:`

```

533 \cs_new_protected:Nn \stex_filestack_pop: {
534   \seq_if_empty:NF\g__stex_files_stack{
535     \seq_gpop:NN\g__stex_files_stack\l_tmpa_seq
536   }
537   \seq_if_empty:NTF\g__stex_files_stack{
538     \seq_gset_eq:NN\g_stex_currentfile_seq\c_stex_mainfile_seq
539   }{
540     \seq_get:NN\g__stex_files_stack\l_tmpa_seq
541     \seq_gset_eq:NN\g_stex_currentfile_seq\l_tmpa_seq
542   }
543   \stex_get_document_uri:
544 }

```

(End definition for `\stex_filestack_pop:`. This function is documented on page 79.)

Hooks for the current file:

```

545 \AddToHook{file/before}{
546   \tl_if_empty:NTF\CurrentFilePath{
547     \stex_filestack_push:n{\CurrentFile}
548   }{
549     \stex_filestack_push:n{\CurrentFilePath/\CurrentFile}
550   }
551 }
552 \AddToHook{file/after}{
553   \stex_filestack_pop:
554 }

```

27.4 MathHub Repositories

555 `<@=stex_mathhub>`

`\mathhub`
`\c_stex_mathhub_seq`
`\c_stex_mathhub_str`

The path to the mathhub directory. If the `\mathhub`-macro is not set, we query `kpsewhich` for the MATHHUB system variable.

```

556 \str_if_empty:NTF\mathhub{

29.1 The smodule environment

smodule arguments:

```

1625 \keys_define:nn { stex / module } {
1626   title      .tl_set:N    = \smoduledtitle ,
1627   type       .str_set_x:N = \smodulename ,
1628   id         .str_set_x:N = \smoduledid ,
1629   deprecate  .str_set_x:N = \l_stex_module_deprecate_str ,
1630   ns         .str_set_x:N = \l_stex_module_ns_str ,
1631   lang       .str_set_x:N = \l_stex_module_lang_str ,
1632   sig        .str_set_x:N = \l_stex_module_sig_str ,
1633   creators   .str_set_x:N = \l_stex_module_creators_str ,
1634   contributors .str_set_x:N = \l_stex_module_contributors_str ,
1635   meta       .str_set_x:N = \l_stex_module_meta_str ,
1636   srccite   .str_set_x:N = \l_stex_module_srccite_str
1637 }
1638
1639 \cs_new_protected:Nn \__stex_modules_args:n {
1640   \str_clear:N \smoduledtitle
1641   \str_clear:N \smodulename
1642   \str_clear:N \smoduledid
1643   \str_clear:N \l_stex_module_ns_str
1644   \str_clear:N \l_stex_module_deprecate_str
1645   \str_clear:N \l_stex_module_lang_str
1646   \str_clear:N \l_stex_module_sig_str
1647   \str_clear:N \l_stex_module_creators_str
1648   \str_clear:N \l_stex_module_contributors_str
1649   \str_clear:N \l_stex_module_meta_str
1650   \str_clear:N \l_stex_module_srccite_str
1651   \keys_set:nn { stex / module } { #1 }
1652 }
1653
1654 % module parameters here? In the body?
1655 }
```

`\stex_module_setup:nn` Sets up a new module property list:

```

1656 \cs_new_protected:Nn \stex_module_setup:nn {
1657   \int_set:Nn \l__stex_modules_group_depth_int {\currentgrouplevel}
1658   \str_set:Nx \l_stex_module_name_str { #2 }
1659   \__stex_modules_args:n { #1 }
```

First, we set up the name and namespace of the module.
Are we in a nested module?

```

1660 \stex_if_in_module:TF {
1661   % Nested module
1662   \prop_get:cnN {c_stex_module_\l_stex_current_module_str _prop}
1663   { ns } \l_stex_module_ns_str
1664   \str_set:Nx \l_stex_module_name_str {
1665     \prop_item:cn {c_stex_module_\l_stex_current_module_str _prop}
1666     { name } / \l_stex_module_name_str
1667   }
1668   \str_if_empty:NT \l_stex_module_lang_str {
1669     \str_set:Nx \l_stex_module_lang_str {
1670       \prop_item:cn {c_stex_module_\l_stex_current_module_str _prop}
1671       { lang }
1672     }
1673   }
1674 }{
1675   % not nested:
1676   \str_if_empty:NT \l_stex_module_ns_str {
1677     \stex_modules_current_namespace:
1678     \exp_args:NNNo \seq_set_split:Nnn \l_tmpa_seq
1679     / {\l_stex_module_ns_str}
1680     \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str
1681     \str_if_eq:NNT \l_tmpa_str \l_stex_module_name_str {
1682       \str_set:Nx \l_stex_module_ns_str {
1683         \stex_path_to_string:N \l_tmpa_seq
1684       }
1685     }
1686   }
1687 }
```

Next, we determine the language of the module:

```

1688 \str_if_empty:NT \l_stex_module_lang_str {
1689   \seq_get_right:NN \g_stex_currentfile_seq \l_tmpa_str
1690   \seq_set_split:NnV \l_tmpa_seq . \l_tmpa_str
1691   \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str % .tex
1692   \exp_args:No \str_if_eq:nnF \l_tmpa_str {tex} {
1693     \exp_args:No \str_if_eq:nnF \l_tmpa_str {dtx} {
1694       \exp_args:NNo \seq_put_right:Nn \l_tmpa_seq \l_tmpa_str
1695     }
1696   }
1697   \seq_pop_left:NN \l_tmpa_seq \l_tmpa_str % <filename>
1698   \seq_if_empty:NF \l_tmpa_seq { %remaining element should be [<something>.]language
1699     \seq_pop_right:NN \l_tmpa_seq \l_stex_module_lang_str
1700     \stex_debug:nn{modules} {Language~\l_stex_module_lang_str~
1701       inferred-from~file~name}
1702   }
1703 }
1704
1705 \stex_if_smsmode:F { \str_if_empty:NF \l_stex_module_lang_str {
1706   \exp_args:NNo \stex_set_language:Nn \l_tmpa_str \l_stex_module_lang_str
1707 }}
```

We check if we need to extend a signature module, and set `\l_stex_current_module_prop` accordingly:

```

1708 \str_if_empty:NTF \l_stex_module_sig_str {
1709   \exp_args:Nnx \prop_gset_from_keyval:c {
1710     c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _prop
1711   } {
1712     name      = \l_stex_module_name_str ,
1713     ns        = \l_stex_module_ns_str ,
1714     file      = \exp_not:o { \g_stex_currentfile_seq } ,
1715     lang      = \l_stex_module_lang_str ,
1716     sig       = \l_stex_module_sig_str ,
1717     deprecate = \l_stex_module_deprecate_str ,
1718     meta      = \l_stex_module_meta_str
1719   }
1720 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _imports}
1721 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _constants}
1722 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _copymodules}

6511  %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%% sproof.dtx %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
6512
6513
```

35.1 Proofs

We first define some keys for the proof environment.

```
6514 \keys_define:nn { stex / spf } {
 6515   id      .str_set_x:N = \spfid,
 6516   for     .clist_set:N = \l__stex_sproof_spf_for_clist ,
 6517   from    .tl_set:N   = \l__stex_sproof_spf_from_tl ,
 6518   proofend .tl_set:N   = \l__stex_sproof_spf_proofend_tl,
 6519   type    .str_set_x:N = \spftype,
 6520   title   .tl_set:N   = \spftitle,
 6521   continues .tl_set:N   = \l__stex_sproof_spf_continues_tl,
 6522   functions .tl_set:N   = \l__stex_sproof_spf_functions_tl,
 6523   term    .tl_set:N   = \l__stex_sproof_spf_term_tl,
 6524   method   .tl_set:N   = \l__stex_sproof_spf_method_tl,
 6525   hide     .bool_set:N = \l__stex_sproof_spf_hide_bool
 6526 }
 6527 \cs_new_protected:Nn \__stex_sproof_spf_args:n {
 6528   \str_clear:N \spfid
 6529   \tl_clear:N \l__stex_sproof_spf_for_tl
 6530   \tl_clear:N \l__stex_sproof_spf_from_tl
 6531   \tl_set:Nn \l__stex_sproof_spf_proofend_tl {\sproof@box}
 6532   \str_clear:N \spftype
 6533   \tl_clear:N \spftitle
 6534   \tl_clear:N \l__stex_sproof_spf_continues_tl
 6535   \tl_clear:N \l__stex_sproof_spf_term_tl
 6536   \tl_clear:N \l__stex_sproof_spf_functions_tl
 6537   \tl_clear:N \l__stex_sproof_spf_method_tl
 6538   \bool_set_false:N \l__stex_sproof_spf_hide_bool
 6539   \keys_set:nn { stex / spf }{ #1 }
 6540 }
 6541 \bool_set_true:N \l__stex_sproof_inc_counter_bool
```

```
\c__stex_sproof_flow_str We define this macro, so that we can test whether the display key has the value flow
6542 \str_set:Nn\c__stex_sproof_flow_str{inline}
```

(End definition for `\c__stex_sproof_flow_str`.)

For proofs, we will have to have deeply nested structures of enumerated list-like environments. However, L^AT_EX only allows `enumerate` environments up to nesting depth 4 and general list environments up to listing depth 6. This is not enough for us. Therefore we have decided to go along the route proposed by Leslie Lamport to use a single top-level list with dotted sequences of numbers to identify the position in the proof tree. Unfortunately, we could not use his `pf.sty` package directly, since it does not do automatic numbering, and we have to add keyword arguments all over the place, to accomodate semantic information.

```

7240       \int_set:Nn \l_document_structure_section_level_int {0}
7241     }
7242   }{
7243     \int_set:Nn \l_document_structure_section_level_int {2}
7244   }
7245 }

```

39.2 Document Structure

The structure of the document is given by the `sfragment` environment. The hierarchy is adjusted automatically according to the L^AT_EX class in effect.

`\currentsectionlevel` For the `\currentsectionlevel` and `\Currentsectionlevel` macros we use an internal macro `\current@section@level` that only contains the keyword (no markup). We initialize it with “document” as a default. In the generated OMDoc, we only generate a text element of class `omdoc_currentsectionlevel`, which will be instantiated by CSS later.⁹

```

7246 \def\current@section@level{document}%
7247 \newcommand\currentsectionlevel{\lowercase\expandafter{\current@section@level}\xspace}%
7248 \newcommand\Currentsectionlevel{\expandafter\MakeUppercase\current@section@level\xspace}%

```

(End definition for `\currentsectionlevel`. This function is documented on page 62.)

`\skipfragment`

```

7249 \cs_new_protected:Npn \skipfragment {

```

⁹EdNote: MK: we may have to experiment with the more powerful uppercasing macro from `mfirstuc.sty` once we internationalize.

```

7250 \ifcase\l_document_structure_section_level_int
7251 \or\stepcounter{part}
7252 \or\stepcounter{chapter}
7253 \or\stepcounter{section}
7254 \or\stepcounter{subsection}
7255 \or\stepcounter{subsubsection}
7256 \or\stepcounter{paragraph}
7257 \or\stepcounter{ subparagraph}
7258 \fi
7259 }

```

(End definition for `\skipfragment`. This function is documented on page 61.)

`blindfragment (env.)`

```

7260 \newcommand\at@begin@blindsfragment[1] {}
7261 \newenvironment{blindfragment}
7262 {
7263   \int_incr:N\l_document_structure_section_level_int
7264   \at@begin@blindsfragment\l_document_structure_section_level_int
7265 }{}

```

`\sfragment@nonum` convenience macro: `\sfragment@nonum{<level>}{<title>}` makes an unnumbered sectioning with title `<title>` at level `<level>`.

```

7266 \newcommand\sfragment@nonum[2]{
7267   \ifx\hyper@anchor@\undefined\else\phantomsection\fi
7268   \addcontentsline{toc}{#1}{#2}\@nameuse{#1}*{#2}
7269 }

```

(End definition for `\sfragment@nonum`. This function is documented on page ??.)

`\sfragment@num` convenience macro: `\sfragment@nonum{<level>}{<title>}` makes numbered sectioning with title `<title>` at level `<level>`. We have to check the `short` key was given in the `sfragment` environment and – if it is use it. But how to do that depends on whether the `rdfmeta` package has been loaded. In the end we call `\sref@label@id` to enable crossreferencing.

```

7270 \newcommand\sfragment@num[2]{
7271   \tl_if_empty:NTF \l__document_structure_sfragment_short_t1 {
7272     \@nameuse{#1}{#2}
7273   }{
7274     \cs_if_exist:NTF\rdfmeta@sectioning{
7275       \@nameuse{rdfmeta@old}[\l__document_structure_sfragment_short_t1]{#2}
7276     }{
7277       \@nameuse{#1}[\l__document_structure_sfragment_short_t1]{#2}
7278     }
7279   }
7280 \%sref@label@id@argf\omdoc@sect@name~\@nameuse{the#1}\sfragment@id
7281 }

```

(End definition for `\sfragment@num`. This function is documented on page ??.)

`sfragment (env.)`

```

7282 \keys_define:nn { document-structure / sfragment }{
7283   id           .str_set_x:N = \l__document_structure_sfragment_id_str,
7284   date         .str_set_x:N = \l__document_structure_sfragment_date_str,

```

```

7285   creators      .clist_set:N = \l__document_structure_sfragment_creators_clist,
7286   contributors   .clist_set:N = \l__document_structure_sfragment_contributors_clist,
7287   srccite       .tl_set:N    = \l__document_structure_sfragment_srccite_tl,
7288   type          .tl_set:N    = \l__document_structure_sfragment_type_tl,
7289   short         .tl_set:N    = \l__document_structure_sfragment_short_tl,
7290   intro          .tl_set:N    = \l__document_structure_sfragment_intro_tl,
7291   imports        .tl_set:N    = \l__document_structure_sfragment_imports_tl,
7292   loadmodules    .bool_set:N  = \l__document_structure_sfragment_loadmodules_bool
7293 }
7294 \cs_new_protected:Nn \__document_structure_sfragment_args:n {
7295   \str_clear:N \l__document_structure_sfragment_id_str
7296   \str_clear:N \l__document_structure_sfragment_date_str
7297   \clist_clear:N \l__document_structure_sfragment_creators_clist
7298   \clist_clear:N \l__document_structure_sfragment_contributors_clist
7299   \tl_clear:N \l__document_structure_sfragment_srccite_tl
7300   \tl_clear:N \l__document_structure_sfragment_type_tl
7301   \tl_clear:N \l__document_structure_sfragment_short_tl
7302   \tl_clear:N \l__document_structure_sfragment_imports_tl
7303   \tl_clear:N \l__document_structure_sfragment_intro_tl
7304   \bool_set_false:N \l__document_structure_sfragment_loadmodules_bool
7305   \keys_set:nn { document-structure / sfragment } { #1 }
7306 }

```

we define a switch for numbering lines and a hook for the beginning of groups: The `\at@begin@sfragment` `\at@begin@sfragment` macro allows customization. It is run at the beginning of the `sfragment`, i.e. after the section heading.

```

7307 \newif\if@mainmatter\@mainmattertrue
7308 \newcommand\at@begin@sfragment[3][]{}

```

Then we define a helper macro that takes care of the sectioning magic. It comes with its own key/value interface for customization.

```

7309 \keys_define:nn { document-structure / sectioning }{
7310   name      .str_set_x:N = \l__document_structure_sect_name_str ,
7311   ref       .str_set_x:N = \l__document_structure_sect_ref_str ,
7312   clear     .bool_set:N = \l__document_structure_sect_clear_bool ,
7313   clear     .default:n  = {true} ,
7314   num       .bool_set:N = \l__document_structure_sect_num_bool ,
7315   num       .default:n  = {true}
7316 }
7317 \cs_new_protected:Nn \__document_structure_sect_args:n {
7318   \str_clear:N \l__document_structure_sect_name_str
7319   \str_clear:N \l__document_structure_sect_ref_str
7320   \bool_set_false:N \l__document_structure_sect_clear_bool
7321   \bool_set_false:N \l__document_structure_sect_num_bool
7322   \keys_set:nn { document-structure / sectioning } { #1 }
7323 }
7324 \newcommand\omdoc@sectioning[3][]{%
7325   \__document_structure_sect_args:n {#1}
7326   \let\omdoc@sect@name\l__document_structure_sect_name_str
7327   \bool_if:NT \l__document_structure_sect_clear_bool { \cleardoublepage }
7328   \if@mainmatter% numbering not overridden by frontmatter, etc.
7329     \bool_if:NTF \l__document_structure_sect_num_bool {
7330       \sfragment@num{#2}{#3}
7331     }%

```

```

7332     \sfragment@nonum{#2}{#3}
7333 }
7334 \def\current@section@level{\omdoc@sect@name}
7335 \else
7336     \sfragment@nonum{#2}{#3}
7337 \fi
7338 }% if@mainmatter

```

and another one, if redefines the `\addtocontentsline` macro of L^AT_EX to import the respective macros. It takes as an argument a list of module names.

```

7339 \newcommand\sfragment@redefine@addtocontents[1]{%
7340 \%edef\__document_structureimport{#1}%
7341 \%@for\@I:=\__document_structureimport\do{%
7342 \%edef\@path{\csname module@\@I \path\endcsname}%
7343 \%@ifundefined{tf@toc}\relax%
7344 \% {\protected@write\tf@toc{}{\string\@requiremodules{\@path}}}%
7345 \%ifx\hyper@anchor\@undefined% hyperref.sty loaded?
7346 \%def\addcontentsline##1##2##3{%
7347 \%addtocontents##1{\protect\contentsline##2{\string\withusedmodules{#1}##3}{\thepage}}%
7348 \%else% hyperref.sty not loaded
7349 \%def\addcontentsline##1##2##3{%
7350 \%addtocontents##1{\protect\contentsline##2{\string\withusedmodules{#1}##3}{\thepage}}%
7351 \%fi
7352 }% hypref.sty loaded?

```

now the `sfragment` environment itself. This takes care of the table of contents via the helper macro above and then selects the appropriate sectioning command from `article.cls`. It also registeres the current level of sfragments in the `\sfragment@level` counter.

```

7353 \newenvironment{sfragment}[2][]{% keys, title
7354 {
7355   \__document_structure_sfragment_args:n { #1 }%\sref@target%

```

If the `loadmodules` key is set on `\begin{sfragment}`, we redefine the `\addcontentsline` macro that determines how the sectioning commands below construct the entries for the table of contents.

```

7356 \stex_csl_to_imports:No \usemodule \l__document_structure_sfragment_imports_tl
7357
7358 \bool_if:NT \l__document_structure_sfragment_loadmodules_bool {
7359   \sfragment@redefine@addtocontents{
7360     \%@ifundefined{module@id}\used@modules%
7361     \%{\@ifundefined{module@\module@id \path}{\used@modules}\module@id}
7362   }
7363 }

```

now we only need to construct the right sectioning depending on the value of `\section@level`.

```

7364
7365 \stex_document_title:n { #2 }
7366
7367 \int_incr:N\l__document_structure_section_level_int
7368 \ifcase\l__document_structure_section_level_int
7369   \or\omdoc@sectioning[name=\omdoc@part@kw,clear,num]{part}{#2}
7370   \or\omdoc@sectioning[name=\omdoc@chapter@kw,clear,num]{chapter}{#2}
7371   \or\omdoc@sectioning[name=\omdoc@section@kw,num]{section}{#2}
7372   \or\omdoc@sectioning[name=\omdoc@subsection@kw,num]{subsection}{#2}

```

```

7373     \or\omdoc@sectioning[name=\omdoc@subsubsection@kw,num]{subsubsection}{#2}
7374     \or\omdoc@sectioning[name=\omdoc@paragraph@kw,ref=this \omdoc@paragraph@kw]{paragraph}{#2}
7375     \or\omdoc@sectioning[name=\omdoc@subparagraph@kw,ref=this \omdoc@subparagraph@kw]{subparagraph}{#2}
7376 \fi
7377 \at@begin@sfragment[#1]\l_document_structure_section_level_int{#2}
7378 \str_if_empty:NF \l__document_structure_sfragment_id_str {
7379     \stex_ref_new_doc_target:n\l__document_structure_sfragment_id_str
7380 }
7381 }% for customization
7382 {}

```

and finally, we localize the sections

```

7383 \newcommand\omdoc@part@kw{Part}
7384 \newcommand\omdoc@chapter@kw{Chapter}
7385 \newcommand\omdoc@section@kw{Section}
7386 \newcommand\omdoc@subsection@kw{Subsection}
7387 \newcommand\omdoc@subsubsection@kw{Subsubsection}
7388 \newcommand\omdoc@paragraph@kw{paragraph}
7389 \newcommand\omdoc@subparagraph@kw{subparagraph}

```

39.3 Front and Backmatter

Index markup is provided by the `omtext` package [[Kohlhase:smttf:git](#)], so in the `document-structure` package we only need to supply the corresponding `\printindex` command, if it is not already defined

```

\printindex
7390 \providecommand\printindex{\IfFileExists{\jobname.ind}{\input{\jobname.ind}}{}}
(End definition for \printindex. This function is documented on page ??.)
      some classes (e.g. book.cls) already have \frontmatter, \mainmatter, and
\backmatter macros. As we want to define frontmatter and backmatter environments,
we save their behavior (possibly defining it) in orig@*matter macros and make
them undefined (so that we can define the environments).
7391 \cs_if_exist:NTF\frontmatter{
7392     \let\l__document_structure_orig_frontmatter\frontmatter
7393     \let\frontmatter\relax
7394 }{
7395     \tl_set:Nn\l__document_structure_orig_frontmatter{
7396         \clearpage
7397         \mainmatterfalse
7398         \pagenumbering{roman}
7399     }
7400 }
7401 \cs_if_exist:NTF\backmatter{
7402     \let\l__document_structure_orig_backmatter\backmatter
7403     \let\backmatter\relax
7404 }{
7405     \tl_set:Nn\l__document_structure_orig_backmatter{
7406         \clearpage
7407         \mainmatterfalse
7408         \pagenumbering{roman}
7409     }

```

```
7410 }
```

Using these, we can now define the `frontmatter` and `backmatter` environments

`frontmatter (env.)` we use the `\orig@frontmatter` macro defined above and `\mainmatter` if it exists, otherwise we define it.

```
7411 \newenvironment{frontmatter}{  
7412   \__document_structure_orig_frontmatter  
7413 }{  
7414   \cs_if_exist:NTF\mainmatter{  
7415     \mainmatter  
7416   }{  
7417     \clearpage  
7418     \mainmattertrue  
7419     \pagenumbering{arabic}  
7420   }  
7421 }
```

`backmatter (env.)` As backmatter is at the end of the document, we do nothing for `\endbackmatter`.

```
7422 \newenvironment{backmatter}{  
7423   \__document_structure_orig_backmatter  
7424 }{  
7425   \cs_if_exist:NTF\mainmatter{  
7426     \mainmatter  
7427   }{  
7428     \clearpage  
7429     \mainmattertrue  
7430     \pagenumbering{arabic}  
7431   }  
7432 }
```

finally, we make sure that page numbering is arabic and we have main matter as the default

```
7433 \mainmattertrue\pagenumbering{arabic}
```

`\prematurestop` We initialize `\afterprematurestop`, and provide `\prematurestop@endsfragment` which looks up `\sfragment@level` and recursively ends enough `{sfragment}`s.

```
7434 \def \c__document_structure_document_str{document}  
7435 \newcommand\afterprematurestop{}  
7436 \def\prematurestop@endsfragment{  
7437   \unless\ifx\@currenvir\c__document_structure_document_str  
7438     \expandafter\expandafter\expandafter\end\expandafter\expandafter\expandafter{\expandafter  
7439       \expandafter\prematurestop@endsfragment  
7440     \fi  
7441   }  
7442 \providecommand\prematurestop{  
7443   \message{Stopping~sTeX~processing~prematurely}  
7444   \prematurestop@endsfragment  
7445   \afterprematurestop  
7446   \end{document}  
7447 }
```

(End definition for `\prematurestop`. This function is documented on page 62.)

39.4 Global Variables

\setSGvar set a global variable

```
7448 \RequirePackage{etoolbox}  
7449 \newcommand\setSGvar[1]{\@namedef{sTeX@Gvar@#1}}
```

(End definition for **\setSGvar**. This function is documented on page 62.)

\useSGvar use a global variable

```
7450 \newrobustcmd\useSGvar[1]{%  
7451 \@ifundefined{sTeX@Gvar@#1}{  
7452 {\PackageError{document-structure}{  
7453 {The sTeX Global variable #1 is undefined}}  
7454 {set it with \protect\setSGvar}}}  
7455 \nameuse{sTeX@Gvar@#1}}
```

(End definition for **\useSGvar**. This function is documented on page 62.)

\ifSGvar execute something conditionally based on the state of the global variable.

```
7456 \newrobustcmd\ifSGvar[3]{\def\@test{#2} %  
7457 \@ifundefined{sTeX@Gvar@#1}{  
7458 {\PackageError{document-structure}{  
7459 {The sTeX Global variable #1 is undefined}}  
7460 {set it with \protect\setSGvar}}}  
7461 {\expandafter\ifx\csname sTeX@Gvar@#1\endcsname\@test #3\fi}}
```

(End definition for **\ifSGvar**. This function is documented on page 62.)

Chapter 40

NotesSlides – Implementation

40.1 Class and Package Options

We define some Package Options and switches for the `notesslides` class and activate them by passing them on to `beamer.cls` and `omdoc.cls` and the `notesslides` package. We pass the `nontheorem` option to the `statements` package when we are not in notes mode, since the `beamer` package has its own (overlay-aware) theorem environments.

```
7462 <*cls>
7463 <@=notesslides>
7464 \ProvidesExplClass{notesslides}{2022/09/14}{3.2.0}{notesslides Class}
7465 \RequirePackage{l3keys2e}
7466
7467 \keys_define:nn{notesslides / cls}{
7468   class .str_set_x:N = \c__notesslides_class_str,
7469   notes .bool_set:N = \c__notesslides_notes_bool ,
7470   slides .code:n    = { \bool_set_false:N \c__notesslides_notes_bool },
7471   docopt .str_set_x:N = \c__notesslides_docopt_str,
7472   unknown .code:n   = {
7473     \PassOptionsToPackage{\CurrentOption}{document-structure}
7474     \PassOptionsToClass{\CurrentOption}{beamer}
7475     \PassOptionsToPackage{\CurrentOption}{notesslides}
7476     \PassOptionsToPackage{\CurrentOption}{stex}
7477   }
7478 }
7479 \ProcessKeysOptions{ notesslides / cls }
7480
7481 \str_if_empty:NF \c__notesslides_class_str {
7482   \PassOptionsToPackage{class=\c__notesslides_class_str}{document-structure}
7483 }
7484
7485 \exp_args:No \str_if_eq:nnT \c__notesslides_class_str{book}{
7486   \PassOptionsToPackage{defaulttopsect=part}{notesslides}
7487 }
7488 \exp_args:No \str_if_eq:nnT \c__notesslides_class_str{report}{
7489   \PassOptionsToPackage{defaulttopsect=part}{notesslides}
7490 }
7491
7492 \RequirePackage{stex}
```

```

7493 \stex_html_backend:T {
7494   \bool_set_true:N\c__notesslides_notes_bool
7495 }
7496
7497 \bool_if:NTF \c__notesslides_notes_bool {
7498   \PassOptionsToPackage{notes=true}{notesslides}
7499   \message{notesslides.cls:~Formatting~course~materials~in~notes~mode}
7500 }
7501   \PassOptionsToPackage{notes=false}{notesslides}
7502   \message{notesslides.cls:~Formatting~course~materials~in~slides~mode}
7503 }
7504 
```

now we do the same for the `notesslides` package.

```

7505 <*package>
7506 \ProvidesExplPackage{notesslides}{2022/09/14}{3.2.0}{notesslides Package}
7507 \RequirePackage{l3keys2e}

7528 }
7529
7530 \newif\ifnotes
7531 \bool_if:NTF \c__notesslides_notes_bool {
7532   \notestrue
7533 }{
7534   \notesfalse
7535 }
7536

```

we give ourselves a macro `\@@topsect` that needs only be evaluated once, so that the `\ifdefstring` conditionals work below.

```

7537 \str_if_empty:NTF \c__notesslides_topsect_str {
7538   \str_set_eq:NN \c__notesslides_topsect \c__notesslides_defaulttopsec_str
7539 }{
7540   \str_set_eq:NN \c__notesslides_topsect \c__notesslides_topsect_str
7541 }
7542 \PassOptionsToPackage{topsect=\c__notesslides_topsect}{document-structure}

```

```
7543 </package>
```

Depending on the options, we either load the `article`-based document-structure or the `beamer` class (and set some counters).

```
7544 <*cls>
7545 \bool_if:NTF \c__notesslides_notes_bool {
7546   \str_if_empty:NT \c__notesslides_class_str {
7547     \str_set:Nn \c__notesslides_class_str {article}
7548   }
7549   \exp_after:wN\LoadClass\exp_after:wN[\c__notesslides_docopt_str]
7550   {\c__notesslides_class_str}
7551 }
7552 \LoadClass[10pt,notheorems,xcolor={dvipsnames,svgnames}]{beamer}
7553 \newcounter{Item}
7554 \newcounter{paragraph}
7555 \newcounter{subparagraph}
7556 \newcounter{Hfootnote}
7557 }
7558 \RequirePackage{document-structure}
```

now it only remains to load the `notesslides` package that does all the rest.

```
7559 \RequirePackage{notesslides}
7560 </cls>
```

In `notes` mode, we also have to make the `beamer`-specific things available to `article` via the `beamerarticle` package. We use options to avoid loading theorem-like environments, since we want to use our own from the `STEX` packages. The first batch of packages we want are loaded on `notesslides.sty`. These are the general ones, we will load the `STEX`-specific ones after we have done some work (e.g. defined the counters `m*`). Only the `stex-logo` package is already needed now for the default theme.

```
7561 <*package>
7562 \bool_if:NT \c__notesslides_notes_bool {
7563   \RequirePackage{a4wide}
7564   \RequirePackage{marginnote}
7565   \PassOptionsToPackage{usenames,dvipsnames,svgnames}{xcolor}
7566   \RequirePackage{mdframed}
7567   \RequirePackage[noxcolor,noamsthm]{beamerarticle}
7568   \RequirePackage[bookmarks,bookmarksopen,bookmarksnumbered,breaklinks,hidelinks]{hyperref}
7569 }
7570 \RequirePackage{stex-tikzinput}
7571 \RequirePackage{comment}
7572 \RequirePackage{url}
7573 \RequirePackage{graphicx}
7574 \RequirePackage{pgf}
7575 \RequirePackage{bookmark}
```

40.2 Notes and Slides

For the lecture notes cases, we also provide the `\usetheme` macro that would otherwise come from the the `beamer` class.

```
7576 \bool_if:NT \c__notesslides_notes_bool {
7577   \renewcommand\usetheme[2][]{\usepackage[#1]{beamertHEME#2}}
7578 }
```

```

7579 \NewDocumentCommand \libusetheme {O{} m} {
7580   \libusepackage[#1]{beamertheme#2}
7581 }
7582

```

We define the sizes of slides in the notes. Somehow, we cannot get by with the same here.

```

7583 \newcounter{slide}
7584 \newlength{\slidewidth}\setlength{\slidewidth}{13.5cm}
7585 \newlength{\slideheight}\setlength{\slideheight}{9cm}

```

note (env.) The **note** environment is used to leave out text in the **slides** mode. It does not have a counterpart in OMDoc. So for course notes, we define the **note** environment to be a no-operation otherwise we declare the **note** environment as a comment via the **comment** package.

```

7586 \bool_if:NTF \c__notesslides_notes_bool {
7587   \renewenvironment{note}{\ignorespaces}{}
7588 }{
7589   \excludedcomment{note}
7590 }

```

We first set up the slide boxes in **article** mode. We set up sizes and provide a box register for the frames and a counter for the slides.

```

7591 \bool_if:NT \c__notesslides_notes_bool {
7592   \newlength{\slideframewidth}
7593   \setlength{\slideframewidth}{1.5pt}

```

frame (env.) We first define the keys.

```

7594 \cs_new_protected:Nn \__notesslides_do_yes_param:Nn {
7595   \exp_args:Nx \str_if_eq:nnTF { \str_uppercase:n{ #2 } }{ yes }{
7596     \bool_set_true:N #1
7597   }{
7598     \bool_set_false:N #1
7599   }
7600 }
7601 \keys_define:nn{notesslides / frame}{
7602   label .str_set_x:N = \l__notesslides_frame_label_str,
7603   allowframebreaks .code:n = {
7604     \__notesslides_do_yes_param:Nn \l__notesslides_frame_allowframebreaks_bool { #1 }
7605   },

7626   \bool_set_true:N \l__notesslides_frame_allowdisplaybreaks_bool
7627   \bool_set_true:N \l__notesslides_frame_fragile_bool
7628   \bool_set_true:N \l__notesslides_frame_shrink_bool
7629   \bool_set_true:N \l__notesslides_frame_squeeze_bool
7630   \bool_set_true:N \l__notesslides_frame_t_bool
7631   \keys_set:nn { notesslides / frame }{ #1 }
7632 }

```

We define the environment, read them, and construct the slide number and label.

```

7633 \renewenvironment{frame}{}
7634   \__notesslides_frame_args:n{#1}
7635   \sffamily
7636   \stepcounter{slide}
7637   \def\@currentlabel{\theslide}
7638   \str_if_empty:NF \l__notesslides_frame_label_str {
7639     \label{\l__notesslides_frame_label_str}
7640   }

```

We redefine the `itemize` environment so that it looks more like the one in `beamer`.

```

7641   \def\itemize@level{outer}
7642   \def\itemize@outer{outer}
7643   \def\itemize@inner{inner}
7644   \renewcommand{\newpage}{\addtocounter{framenumber}{1}}
7645   %\newcommand{\metakeys@show@keys}[2]{\marginnote{\scriptsize ##2}}
7646   \renewenvironment{itemize}{%
7647     \ifx\itemize@level\itemize@outer
7648       \def\itemize@label{$\rhd$}
7649     \fi
7650     \ifx\itemize@level\itemize@inner
7651       \def\itemize@label{$\scriptstyle\rhd$}
7652     \fi
7653     \begin{list}
7654       {\itemize@label}
7655       \setlength{\labelsep}{.3em}
7656       \setlength{\labelwidth}{.5em}
7657       \setlength{\leftmargin}{1.5em}
7658     }
7659     \edef\itemize@level{\itemize@inner}
7660   }{%
7661     \end{list}
7662   }

```

We create the box with the `mdframed` environment from the equinymous package.

```

7663 \stex_html_backend:TF {
7664   \begin{stex_annotation_env}{frame}{} \vbox\bgroupt
7665     \mdf@patchamsthm
7666   }{
7667     \begin{mdframed}[linewidth=\slideframewidth,skipabove=1ex,skipbelow=1ex,userdefinedwid

```

```

7668      }
7669  }{
7670      \stex_html_backend:TF {
7671          \miko@slidelabel\egroup\end{stex_annotation_env}
7672      }\medskip\miko@slidelabel\end{mdframed}
7673  }

```

Now, we need to redefine the frametitle (we are still in course notes mode).

```
\frametitle
7674      \renewcommand{\frametitle}[1]{
7675          \stex_document_title:n { #1 }
7676          {\Large\bf\sf\color{blue}{#1}}\medskip
7677      }
7678 }
```

(End definition for `\frametitle`. This function is documented on page ??.)

EdN:10

7720 }

```

(End definition for \inputref*. This function is documented on page 64.)

40.3 Header and Footer Lines

Now, we set up the infrastructure for the footer line of the slides, we use boxes for the logos, so that they are only loaded once, that considerably speeds up processing.

\setslidelogo The default logo is the STEX logo. Customization can be done by \setslidelogo{\langle logo name\rangle}.

```

7721 \newlength{\slidelogoheight}
7722
7723 \RequirePackage{graphicx}
7724
7725 \define@key{Gin}{mhrepos}{\def\Gin@mrepos{\#1}}
7726 \providecommand\mhgraphics[2][]{%
7727   \def\Gin@mrepos[]\setkeys{Gin}{\#1}
7728   \includegraphics[\#1]{\mhp\Gin@mrepos{\#2}}%
7729 }
7730
7731 \bool_if:NTF \c_notesslides_notes_bool {
7732   \setlength{\slidelogoheight}{.4cm}
7733 }{
7734   \setlength{\slidelogoheight}{.25cm}
7735 }

```

```

7736 \ifcsname slideLogo\endcsname\else
7737   \newsavebox{\slideLogo}
7738   \sbox{\slideLogo}{\sTeX}
7739 \fi
7740 \newrobustcmd{\setSlideLogo}[2][]{
7741   \tl_if_empty:nTF{#1}{}{
7742     \sbox{\slideLogo}{\includegraphics[height=\slideLogoHeight]{#2}}
7743   }{
7744     \sbox{\slideLogo}{\mhgraphics[height=\slideLogoHeight,mhrepos=#1]{#2}}
7745   }
7746 }

```

(End definition for `\setSlideLogo`. This function is documented on page 65.)

- \author** In notes mode, we redefine the `\author` macro so that it does not disregard the optional argument (as `beamerarticle` does). We want to use it to set the source later.

```

7747 \bool_if:NT \c__notesslides_notes_bool {
7748   \def\author{\@dblarg\ns@author}
7749   \long\def\ns@author[#1]#2{%
7750     \def\c__notesslides_shortauthor[#1]{%
7751       \def\@author{#2}
7752     }
7753 }

```

(End definition for `\author`. This function is documented on page ??.)

- \setsource** `\source` stores the writer's name. By default it is *Michael Kohlhase* since he is the main user and designer of this package. `\setsource{<name>}` can change the writer's name.

```
7754 \newrobustcmd{\setsource}[1]{\def\source{#1}}
```

(End definition for `\setsource`. This function is documented on page 65.)

- \setlicensing** Now, we set up the copyright and licensing. By default we use the Creative Commons Attribution-ShareAlike license to strengthen the public domain. If package `hyperref` is loaded, then we can attach a hyperlink to the license logo. `\setlicensing[<url>]{<logo name>}` is used for customization, where `<url>` is optional.

```

7755 \def\copyrightnotice{%
7756   \footnotesize\copyright : \hspace{.3ex}%
7757   \ifcsname source\endcsname\source\else%
7758   \ifcsname c__notesslides_shortauthor\endcsname\c__notesslides_shortauthor\else%
7759   \PackageWarning{notesslides}{Author/Source undefined in copyright notice}%
7760   ?source/author?\fi%
7761   \fi}
7762 \newsavebox{\ccLogo}
7763 \sbox{\ccLogo}{\includegraphics[height=\slideLogoHeight]{stex-cc_somerights}}
7764 \newif\ifccchref\ccchreffalse
7765 \AtBeginDocument{
7766   \@ifpackageloaded{hyperref}{\ccchrefture}{\ccchreffalse}

7783         \href{\#1}{\usebox{\cclogo}}
7784       \else
7785         {\usebox{\cclogo}}
7786       \fi
7787     }
7788   \fi
7789 }

```

(End definition for `\setlicensing`. This function is documented on page 65.)

EdN:11

`\slidelabel` Now, we set up the slide label for the `article` mode.¹¹

```

7790 \newrobustcmd\miko@slidelabel{%
7791   \vbox to \slidelogoheight{%
7792     \vss\hbox to \slidewidth{%
7793       {\licensing\hfill\copyrightnotice\hfill\arabic{slide}\hfill\usebox{\slidelogo}}%
7794     }%
7795   }%

```

(End definition for `\slidelabel`. This function is documented on page ??.)

40.4 Frame Images

`\frameimage`

We have to make sure that the width is overwritten, for that we check the `\Gin@ewidth` macro from the `graphicx` package. We also add the `label` key.

```

7796 \def\Gin@mrepos{}%
7797 \define@key{Gin}{mrepos}{\def\Gin@mrepos{\#1}}%
7798 \define@key{Gin}{label}{\def\@currentlabel{\arabic{slide}}\label{\#1}}%
7799 \newrobustcmd\frameimage[2][]{%
7800   \stepcounter{slide}%
7801   \bool_if:NT \c__notesslides_frameimages_bool {%

7803     \bool_if:NF \c__notesslides_notes_bool { \vfill }%
7804     \begin{center}%
7805       \bool_if:NTF \c__notesslides_fiboxed_bool {%
7806         \fbox{%
7807           \ifx\Gin@ewidth\empty%
7808             \ifx\Gin@mrepos\empty%
7809               \mhgraphics[width=\slidewidth,\#1]{\#2}%
7810             \else%
7811               \mhgraphics[width=\slidewidth,\#1,mrepos=\Gin@mrepos]{\#2}%
7812             \fi%
7813           \else% \Gin@ewidth empty%

```

¹¹EDNOTE: see that we can use the themes for the slides some day. This is all fake.

```

7814     \ifx\Gin@mrepos\@empty
7815         \mhgraphics[#1]{#2}
7816     \else
7817         \mhgraphics[#1,mrepos=\Gin@mrepos]{#2}
7818         \fi
7819     \fi% Gin@ewidth empty
7820 }
7821 }{
7822     \ifx\Gin@ewidth\@empty
7823         \ifx\Gin@mrepos\@empty
7824             \mhgraphics[width=\slidewidth,#1]{#2}
7825         \else
7826             \mhgraphics[width=\slidewidth,#1,mrepos=\Gin@mrepos]{#2}
7827         \fi
7828     \ifx\Gin@mrepos\@empty
7829         \mhgraphics[#1]{#2}
7830     \else
7831         \mhgraphics[#1,mrepos=\Gin@mrepos]{#2}
7832     \fi
7833     \fi% Gin@ewidth empty
7834 }
7835 \end{center}
7836 \par\strut\hfill{\footnotesize Slide \arabic{slide}}%
7837 \bool_if:NF \c_notesslides_bool { \vfill }
7838 }
7839 } % ifmks@sty@frameimages

```

(End definition for `\frameimage`. This function is documented on page 65.)

40.5 Sectioning

If the `sectocframes` option is set, then we make section frames. We first define counters for `part` and `chapter`, which `beamer.cls` does not have and we make the `section` counter which it does dependent on `chapter`.

```

7840 \stex_html_backend:F {
7841     \bool_if:NT \c_notesslides_sectocframes_bool {
7842         \str_if_eq:VnTF \c_notesslidestopsect{part} {
7843             \newcounter{chapter}\counterwithin*{section}{chapter}
7844         }{
7845             \str_if_eq:VnT \c_notesslidestopsect{chapter} {
7846                 \newcounter{chapter}\counterwithin*{section}{chapter}
7847             }
7848         }
7849     }
7850 }

```

`\section@level` We set the `\section@level` counter that governs sectioning according to the class options. We also introduce the sectioning counters accordingly.

```

\section@level
7851 \def\part@prefix{}
7852 \ifpackageloaded{document-structure}{}{
7853     \str_case:VnF \c_notesslidestopsect {

```

```

7854 {part}{
7855   \int_set:Nn \l_document_structure_section_level_int {0}
7856   \def\thesection{\arabic{chapter}. \arabic{section}}
7857   \def\part@prefix{\arabic{chapter}.}
7858 }
7859 {chapter} {
7860   \int_set:Nn \l_document_structure_section_level_int {1}
7861   \def\thesection{\arabic{chapter}. \arabic{section}}
7862   \def\part@prefix{\arabic{chapter}.}
7863 }
7864 }{
7865   \int_set:Nn \l_document_structure_section_level_int {2}
7866   \def\part@prefix{}
7867 }
7868 }
7869 \bool_if:NF \c__notesslides_notes_bool { % only in slides

```

(End definition for `\section@level`. This function is documented on page ??.)

The new counters are used in the `sfragment` environment that chooses the L^AT_EX sectioning macros according to `\section@level`.

`sfragment (env.)`

```

7871 \renewenvironment{sfragment}[2][]{%

40.6 Excursions

\excursion The excursion macros are very simple, we define a new internal macro `\excursionref` and use it in `\excursion`, which is just an `\inputref` that checks if the new macro is defined before formatting the file in the argument.

```

7967 \gdef\printexcursions{}
7968 \newcommand\excursionref[2]{% label, text
7969   \bool_if:NT \c_notesslides_notes_bool {
7970     \begin{sparagraph}[title=Excursion]
7971       #2 \sref[fallback=the appendix]{#1}.
7972     \end{sparagraph}
7973   }
7974 }
7975 \newcommand\activate@excursion[2][]{%
7976   \gappto\printexcursions{\inputref[#1]{#2}}
7977 }
7978 \newcommand\excursion[4][]{% repos, label, path, text
7979   \bool_if:NT \c_notesslides_notes_bool {
7980     \activate@excursion[#1]{#3}\excursionref{#2}{#4}
7981   }
7982 }

```

(End definition for `\excursion`. This function is documented on page 66.)

\excursiongroup

```

7983 \keys_define:nn{notesslides / excursiongroup }{
7984   id      .str_set_x:N = \l_notesslides_excursion_id_str,
7985   intro   .tl_set:N    = \l_notesslides_excursion_intro_tl,

(End definition for `\excursiongroup`. This function is documented on page 66.)

Chapter 41

The Implementation

41.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. They all come with their own conditionals that are set by the options.

```
8010 <*package>
8011 <@=problems>
8012 \ProvidesExplPackage{problem}{2022/09/14}{3.2.0}{Semantic Markup for Problems}
8013 \RequirePackage{l3keys2e}
8014 \RequirePackage{amssymb}% for \Box
8015
8016 \keys_define:nn { problem / pkg }{
8017   notes      .default:n    = { true },
8018   notes      .bool_set:N  = \c_problems_notes_bool,
8019   gnotes     .default:n    = { true },
8020   gnotes     .bool_set:N  = \c_problems_gnotes_bool,
8021   hints      .default:n    = { true },
8022   hints      .bool_set:N  = \c_problems_hints_bool,
8023   solutions   .default:n    = { true },
8024   solutions   .bool_set:N  = \c_problems_solutions_bool,
8025   pts        .default:n    = { true },
8026   pts        .bool_set:N  = \c_problems_pts_bool,
8027   min        .default:n    = { true },
8028   min        .bool_set:N  = \c_problems_min_bool,
8029   boxed      .default:n    = { true },
8030   boxed      .bool_set:N  = \c_problems_boxed_bool,
8031   test       .default:n    = { true },
8032   test       .bool_set:N  = \c_problems_test_bool,
8033   unknown     .code:n     = {
8034     \PassOptionsToPackage{\CurrentOption}{stex}
8035   }
8036 }
8037 \newif\ifsolutions
8038
8039 \ProcessKeysOptions{ problem / pkg }
8040 \bool_if:NTF \c_problems_solutions_bool {
8041   \solutionstrue
```

```

8042 }{
8043   \solutionsfalse
8044 }
8045 \RequirePackage{stex}

```

Then we make sure that the necessary packages are loaded (in the right versions).

```
8046 \RequirePackage{comment}
```

The next package relies on the L^AT_EX3 kernel, which L^AT_EXMLonly partially supports. As it is purely presentational, we only load it when the `boxed` option is given and we run L^AT_EXML.

```
8047 \bool_if:NT \c__problems_boxed_bool { \RequirePackage{mdframed} }
```

\prob@*@kw For multilinguality, we define internal macros for keywords that can be specialized in *.ldf files.

```

8048 \def\prob@problem@kw{Problem}
8049 \def\prob@solution@kw{Solution}
8050 \def\prob@hint@kw{Hint}
8051 \def\prob@note@kw{Note}
8052 \def\prob@gnote@kw{Grading}
8053 \def\prob@pt@kw{pt}
8054 \def\prob@min@kw{min}
8055 \def\prob@correct@kw{Correct}
8056 \def\prob@wrong@kw{Wrong}

```

(End definition for \prob@*@kw. This function is documented on page ??.)

For the other languages, we set up triggers

```

8057 \AddToHook{begindocument}{
8058   \ltx@ifpackageloaded{babel}{
8059     \makeatletter
8060     \clist_set:Nx \l_tmpa_clist {\bblobloaded}
8061     \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{ngerman}}{
8062       \input{problem-ngerman.ldf}
8063     }
8064     \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{finnish}}{
8065       \input{problem-finnish.ldf}
8066     }
8067     \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{french}}{
8068       \input{problem-french.ldf}
8069     }
8070     \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{russian}}{
8071       \input{problem-russian.ldf}
8072     }
8073     \makeatother
8074   }{}
8075 }

```

41.2 Problems and Solutions

We now prepare the KeyVal support for problems. The key macros just set appropriate internal macros.

```

8076 \keys_define:nn{ problem / problem }{
8077   id      .str_set_x:N = \l__problems_prob_id_str,

```

```

8078   pts      .tl_set:N      = \l__problems_prob_pts_tl,
8079   min      .tl_set:N      = \l__problems_prob_min_tl,
8080   title    .tl_set:N      = \l__problems_prob_title_tl,
8081   type     .tl_set:N      = \l__problems_prob_type_tl,
8082   imports  .tl_set:N      = \l__problems_prob_imports_tl,
8083   name     .str_set_x:N  = \l__problems_prob_name_str,
8084   refnum   .int_set:N     = \l__problems_prob_refnum_int
8085 }
8086 \cs_new_protected:Nn \__problems_prob_args:n {
8087   \str_clear:N \l__problems_prob_id_str
8088   \str_clear:N \l__problems_prob_name_str
8089   \tl_clear:N \l__problems_prob_pts_tl
8090   \tl_clear:N \l__problems_prob_min_tl
8091   \tl_clear:N \l__problems_prob_title_tl
8092   \tl_clear:N \l__problems_prob_type_tl
8093   \tl_clear:N \l__problems_prob_imports_tl
8094   \int_zero_new:N \l__problems_prob_refnum_int
8095   \keys_set:nn { problem / problem }{ #1 }
8096   \int_compare:nNnT \l__problems_prob_refnum_int = 0 {
8097     \let\l__problems_prob_refnum_int\undefined
8098   }
8099 }

```

Then we set up a counter for problems.

\numberproblemsin

```

8100 \newcounter{sproblem}[section]
8101 \newcommand\numberproblemsin[1]{\@addtoreset{sproblem}{#1}}
8102 \def\theplainsproblem{\arabic{sproblem}}
8103 \def\thesproblem{\thesection.\theplainsproblem}

```

(End definition for `\numberproblemsin`. This function is documented on page ??.)

`\prob@label` We provide the macro `\prob@label` to redefine later to get context involved.

```
8104 \newcommand\prob@label[1]{\thesection.#1}
```

(End definition for `\prob@label`. This function is documented on page ??.)

`\prob@number` We consolidate the problem number into a reusable internal macro

```

8105 \newcommand\prob@number{
8106   \int_if_exist:NTF \l__problems_inclprob_refnum_int {
8107     \prob@label{\int_use:N \l__problems_inclprob_refnum_int }
8108   }{
8109     \int_if_exist:NTF \l__problems_prob_refnum_int {
8110       \prob@label{\int_use:N \l__problems_prob_refnum_int }
8111     }{
8112       \prob@label\theplainsproblem
8113     }
8114   }
8115 }
8116 \def\sproblemautorefname{\prob@problem@kw}

```

(End definition for `\prob@number`. This function is documented on page ??.)

\prob@title We consolidate the problem title into a reusable internal macro as well. \prob@title takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```

8117 \newcommand\prob@title[3]{%
8118   \tl_if_exist:NTF \l__problems_inclprob_title_tl {
8119     #2 \l__problems_inclprob_title_tl #3
8120   }{
8121     \tl_if_empty:NTF \l__problems_prob_title_tl {
8122       #1
8123     }{
8124       #2 \l__problems_prob_title_tl #3
8125     }
8126   }
8127 }
```

(End definition for \prob@title. This function is documented on page ??.)

With these the problem header is a one-liner

\prob@heading We consolidate the problem header line into a separate internal macro that can be reused in various settings.

```

8128 \def\prob@heading{%
8129   {\prob@problem@kw}\ \prob@number\prob@title{\~}{\{}{\}\strut}
8130   \%sref@label@id{\prob@problem@kw\prob@number}{}
8131 }
```

(End definition for \prob@heading. This function is documented on page ??.)

With this in place, we can now define the **problem** environment. It comes in two shapes, depending on whether we are in boxed mode or not. In both cases we increment the problem number and output the points and minutes (depending) on whether the respective options are set.

sproblem (*env.*)

```

8132 \newenvironment{sproblem}[1][]{%

8269 }

```

(End definition for `\record@problem`. This function is documented on page ??.)

`\@problem` This macro acts on a problem's record in the `*.aux` file. It does not have any functionality here, but can be redefined elsewhere (e.g. in the `assignment` package).

```
8270 \def\@problem#1#2#3{}
```

(End definition for `\@problem`. This function is documented on page ??.)

`solution (env.)` The `solution` environment is similar to the `problem` environment, only that it is independent of the boxed mode. It also has its own keys that we need to define first.

```

8271 \keys_define:nn { problem / solution }{
8272   id           .str_set_x:N = \l__problems_solution_id_str ,
8273   for          .str_set_x:N = \l__problems_solution_for_str ,
8274   type         .str_set_x:N = \l__problems_solution_type_str ,
8275   title        .tl_set:N    = \l__problems_solution_title_tl
8276 }
8277 \cs_new_protected:Nn \__problems_solution_args:n {
8278   \str_clear:N \l__problems_solution_id_str
8279   \str_clear:N \l__problems_solution_type_str
8280   \str_clear:N \l__problems_solution_for_str
8281   \tl_clear:N \l__problems_solution_title_tl
8282   \keys_set:nn { problem / solution }{ #1 }
8283 }

```

`\startsolution` for the `\startsolution` macro we use the `\specialcomment` macro from the `comment` package. Note that we use the `\@startsolution` macro in the start codes, that parses the optional argument.

```

41.7 Reporting Metadata

For messages it is OK to have them in English as the whole documentation is, and we can therefore assume authors can deal with it.

```

8494 \AddToHook{enddocument}{
8495   \bool_if:NT \c__problems_pts_bool {
8496     \message{Total:~\arabic{pts}~points}
8497   }
8498   \bool_if:NT \c__problems_min_bool {
8499     \message{Total:~\arabic{min}~minutes}
8500   }
8501 }
```

The margin pars are reader-visible, so we need to translate

```

8502 \def\pts#1{
8503   \bool_if:NT \c__problems_pts_bool {
8504     \marginpar{#1~\prob@pt@kw}
8505   }
8506 }
8507 \def\min#1{
8508   \bool_if:NT \c__problems_min_bool {
8509     \marginpar{#1~\prob@min@kw}
8510   }
8511 }
```

- `\show@pts` The `\show@pts` shows the points: if no points are given from the outside and also no points are given locally do nothing, else show and add. If there are outside points then we show them in the margin.

```

8512 \newcounter{pts}
8513 \def\show@pts{
8514   \tl_if_exist:NTF \l__problems_inclprob_pts_tl {

Chapter 42

Implementation: The `hwexam` Package

42.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. Some come with their own conditionals that are set by the options, the rest is just passed on to the `problems` package.

```
8558 <*package>
8559 \ProvidesExplPackage{hwexam}{2022/09/14}{3.2.0}{homework assignments and exams}
8560 \RequirePackage{l3keys2e}

8561
8562 \newif\iftest\testfalse
8563 \DeclareOption{test}{\testtrue\PassOptionsToPackage{\CurrentOption}{problem}}
8564 \newif\ifmultiple\multiplefalse
8565 \DeclareOption{multiple}{\multipletrue}
8566 \DeclareOption{lang}{\PassOptionsToPackage{\CurrentOption}{problem}}
8567 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{problem}}
8568 \ProcessOptions
```

Then we make sure that the necessary packages are loaded (in the right versions).

```
8569 \RequirePackage[keyval]{1997/11/10}
8570 \RequirePackage{problem}
```

\hwexam@*@kw For multilinguality, we define internal macros for keywords that can be specialized in `*.ldf` files.

```
8571 \newcommand\hwexam@assignment@kw{Assignment}
8572 \newcommand\hwexam@given@kw{Given}
8573 \newcommand\hwexam@due@kw{Due}
8574 \newcommand\hwexam@testemptytype@kw{This~page~was~intentionally~left~blank~for~extra~space}
8575 \newcommand\hwexam@minutes@kw{minutes}
8576 \newcommand\correction@probs@kw{prob.}
8577 \newcommand\correction@pts@kw{total}
8578 \newcommand\correction@reached@kw{reached}
8579 \newcommand\correction@sum@kw{Sum}
8580 \newcommand\correction@grade@kw{grade}
8581 \newcommand\correction@forggrading@kw{To~be~used~for~grading,~do~not~write~here}
```

(End definition for `\hwexam@*@kw`. This function is documented on page ??.)

For the other languages, we set up triggers

```

8582 \AddToHook{begindocument}{
8583 \ltx@ifpackageloaded{babel}{
8584 \makeatletter
8585 \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
8586 \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{ngerman}}{
8587   \input{hwexam-ngerman.ldf}
8588 }
8589 \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{finnish}}{
8590   \input{hwexam-finnish.ldf}
8591 }
8592 \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{french}}{
8593   \input{hwexam-french.ldf}
8594 }
8595 \exp_args:NNx \clist_if_in:NnT \l_tmpa_clist {\detokenize{russian}}{
8596   \input{hwexam-russian.ldf}
8597 }
8598 \makeatother
8599 }{}
8600 }
8601

```

42.2 Assignments

Then we set up a counter for problems and make the problem counter inherited from `problem.sty` depend on it. Furthermore, we specialize the `\prob@label` macro to take the assignment counter into account.

```

8602 \newcounter{assignment}
8603 %\numberproblemsin{assignment}

```

We will prepare the keyval support for the `assignment` environment.

```

8604 \keys_define:nn { hwexam / assignment } {
8605   id .str_set_x:N = \l_@@_assign_id_str,
8606   number .int_set:N = \l_@@_assign_number_int,
8607   title .tl_set:N = \l_@@_assign_title_tl,
8608   type .tl_set:N = \l_@@_assign_type_tl,
8609   given .tl_set:N = \l_@@_assign_given_tl,
8610   due .tl_set:N = \l_@@_assign_due_tl,
8611   loadmodules .code:n = {
8612     \bool_set_true:N \l_@@_assign_loadmodules_bool
8613   }
8614 }
8615 \cs_new_protected:Nn \_@@_assignment_args:n {
8616   \str_clear:N \l_@@_assign_id_str
8617   \int_set:Nn \l_@@_assign_number_int {-1}
8618   \tl_clear:N \l_@@_assign_title_tl
8619   \tl_clear:N \l_@@_assign_type_tl
8620   \tl_clear:N \l_@@_assign_given_tl
8621   \tl_clear:N \l_@@_assign_due_tl
8622   \bool_set_false:N \l_@@_assign_loadmodules_bool
8623   \keys_set:nn { hwexam / assignment }{ #1 }
8624 }

```

The next three macros are intermediate functions that handle the case gracefully, where the respective token registers are undefined.

The \given@due macro prints information about the given and due status of the assignment. Its arguments specify the brackets.

```

8625 \newcommand\given@due[2]{
8626 \bool_lazy_all:nF {
8627 {\tl_if_empty_p:V \l_@@_inclassign_given_tl}
8628 {\tl_if_empty_p:V \l_@@_assign_given_tl}
8629 {\tl_if_empty_p:V \l_@@_inclassign_due_tl}
8630 {\tl_if_empty_p:V \l_@@_assign_due_tl}
8631 }{ #1 }
8632
8633 \tl_if_empty:NTF \l_@@_inclassign_given_tl {
8634 \tl_if_empty:NF \l_@@_assign_given_tl {
8635 \hwexam@given@kw\xspace\l_@@_assign_given_tl
8636 }
8637 }{
8638 \hwexam@given@kw\xspace\l_@@_inclassign_given_tl
8639 }
8640
8641 \bool_lazy_or:nnF {
8642 \bool_lazy_and_p:nn {
8643 \tl_if_empty_p:V \l_@@_inclassign_due_tl
8644 }{
8645 \tl_if_empty_p:V \l_@@_assign_due_tl
8646 }
8647 }{
8648 \bool_lazy_and_p:nn {
8649 \tl_if_empty_p:V \l_@@_inclassign_due_tl
8650 }{
8651 \tl_if_empty_p:V \l_@@_assign_due_tl
8652 }
8653 }{ ,~ }
8654
8655 \tl_if_empty:NTF \l_@@_inclassign_due_tl {
8656 \tl_if_empty:NF \l_@@_assign_due_tl {
8657 \hwexam@due@kw\xspace \l_@@_assign_due_tl
8658 }
8659 }{
8660 \hwexam@due@kw\xspace \l_@@_inclassign_due_tl
8661 }
8662
8663 \bool_lazy_all:nF {
8664 { \tl_if_empty_p:V \l_@@_inclassign_given_tl }
8665 { \tl_if_empty_p:V \l_@@_assign_given_tl }
8666 { \tl_if_empty_p:V \l_@@_inclassign_due_tl }
8667 { \tl_if_empty_p:V \l_@@_assign_due_tl }
8668 }{ #2 }
8669 }
```

\assignment@title This macro prints the title of an assignment, the local title is overwritten, if there is one from the \inputassignment. \assignment@title takes three arguments the first is the

fallback when no title is given at all, the second and third go around the title, if one is given.

```

8670 \newcommand\assignment@title[3]{
8671 \tl_if_empty:NNTF \l_@@_inclassign_title_tl {
8672 \tl_if_empty:NNTF \l_@@_assign_title_tl {
8673 #1
8674 }{
8675 #2\l_@@_assign_title_tl#3
8676 }
8677 }{
8678 #2\l_@@_inclassign_title_tl#3
8679 }
8680 }

```

(End definition for \assignment@title. This function is documented on page ??.)

\assignment@number Like \assignment@title only for the number, and no around part.

```

8681 \newcommand\assignment@number{
8682 \int_compare:nNnTF \l_@@_inclassign_number_int = {-1} {
8683 \int_compare:nNnTF \l_@@_assign_number_int = {-1} {
8684 \arabic{assignment}
8685 } {
8686 \int_use:N \l_@@_assign_number_int
8687 }
8688 }{
8689 \int_use:N \l_@@_inclassign_number_int
8690 }
8691 }

```

(End definition for \assignment@number. This function is documented on page ??.)

With them, we can define the central **assignment** environment. This has two forms (separated by \ifmultiple) in one we make a title block for an assignment sheet, and in the other we make a section heading and add it to the table of contents. We first define an assignment counter

assignment (*env.*) For the **assignment** environment we delegate the work to the @assignment environment that depends on whether **multiple** option is given.

```

8692 \newenvironment{assignment}[1][]{
8693 \l_@@_assignment_args:n {#1}
8694 %\sref@target
8695 \int_compare:nNnTF \l_@@_assign_number_int = {-1} {
8696 \global\stepcounter{assignment}
8697 }{
8698 \global\setcounter{assignment}{\int_use:N\l_@@_assign_number_int}
8699 }
8700 \setcounter{sproblem}{0}
8701 \renewcommand\prob@label[1]{\assignment@number.\#\!#1}
8702 \def\current@section@level{\document@hwexamtype}
8703 %\sref@label@id{\document@hwexamtype \thesection}
8704 \begin{@assignment}
8705 }{
8706 \end{@assignment}
8707 }

```

In the multi-assignment case we just use the `omdoc` environment for suitable sectioning.

```

8708 \def\ass@title{  

8709 {\protect\document@hwexamtype}~\arabic{assignment}  

8710 \assignment@title{\{}{\}} -- \given@due{\{}{\}}  

8711 }  

8712 \ifmultiple  

8713 \newenvironment{@assignment}{  

8714 \bool_if:NTF \l_@@_assign_loadmodules_bool {  

8715 \begin{sfragment}[loadmodules]{\ass@title}  

8716 }{  

8717 \begin{sfragment}{\ass@title}  

8718 }  

8719 }{  

8720 \end{sfragment}  

8721 }

```

for the single-page case we make a title block from the same components.

```

8722 \else  

8723 \newenvironment{@assignment}{  

8724 \begin{center}\bf  

8725 \Large\title\strut\\  

8726 \document@hwexamtype~\arabic{assignment}\assignment@title{\{}{\}}{\}\\  

8727 \large\given@due{--\{}{\}}{--}  

8728 \end{center}  

8729 }{  

8730 \fi% multiple

```

42.3 Including Assignments

`\in*assignment` This macro is essentially a glorified `\include` statement, it just sets some internal macros first that overwrite the local points Importantly, it resets the `inclassig` keys after the input.

```

8731 \keys_define:nn { hwexam / inclassignment } {  

8732 %id .str_set_x:N = \l_@@_assign_id_str,  

8733 number .int_set:N = \l_@@_inclassign_number_int,  

8734 title .tl_set:N = \l_@@_inclassign_title_tl,  

8735 type .tl_set:N = \l_@@_inclassign_type_tl,  

8736 given .tl_set:N = \l_@@_inclassign_given_tl,  

8737 due .tl_set:N = \l_@@_inclassign_due_tl,  

8738 mhrepos .str_set_x:N = \l_@@_inclassign_mrepos_str  

8739 }  

8740 \cs_new_protected:Nn \_@@_inclassignment_args:n {  

8741 \int_set:Nn \l_@@_inclassign_number_int {-1}  

8742 \tl_clear:N \l_@@_inclassign_title_tl  

8743 \tl_clear:N \l_@@_inclassign_type_tl  

8744 \tl_clear:N \l_@@_inclassign_given_tl  

8745 \tl_clear:N \l_@@_inclassign_due_tl  

8746 \str_clear:N \l_@@_inclassign_mrepos_str  

8747 \keys_set:nn { hwexam / inclassignment }{ #1 }  

8748 }  

8749 \_@@_inclassignment_args:n {}  

8750  

8751 \newcommand\inputassignment[2][]{{

```

```

8752 \_@@_inclassignment_args:n { #1 }
8753 \str_if_empty:NTF \l_@@_inclassign_mhrepos_str {
8754 \input{#2}
8755 }
8756 \stex_in_repository:nn{\l_@@_inclassign_mhrepos_str}{%
8757 \input{\mhp{\\l_@@_inclassign_mhrepos_str}{#2}}%
8758 }
8759 }
8760 \_@@_inclassignment_args:n {}
8761 }
8762 \newcommand\includeassignment[2][]{%
8763 \newpage
8764 \inputassignment[#1]{#2}
8765 }

```

(End definition for `\in*assignment`. This function is documented on page ??.)

42.4 Typesetting Exams

`\quizheading`

```

8766 \ExplSyntaxOff
8767 \newcommand\quizheading[1]{%
8768 \def\tas{#1}%
8769 \large\noindent NAME: \hspace{8cm} MAILBOX:\vbox{%
8770 \ifx\tas\empty\else%
8771 \noindent TA:~\@for\@I:=\tas\do{\Large$Box$\@I\hspace*{1em}}\vbox{%
8772 \fi%
8773 }%
8774 \ExplSyntaxOn

```

(End definition for `\quizheading`. This function is documented on page ??.)

`\testheading`

```

8775 \def\hwexamheader{\input{hwexam-default.header}}
8777
8778 \def\hwexamminutes{%
8779 \tl_if_empty:NTF \testheading@duration {%
8780 {\testheading@min}\~\hwexam@minutes@kw
8781 }%
8782 \testheading@duration
8783 }%
8784 }%
8785
8786 \keys_define:nn { hwexam / testheading } {%
8787 min .tl_set:N = \testheading@min,
8788 duration .tl_set:N = \testheading@duration,
8789 reqpts .tl_set:N = \testheading@reqpts,
8790 tools .tl_set:N = \testheading@tools
8791 }%
8792 \cs_new_protected:Nn \_@@_testheading_args:n {%
8793 \tl_clear:N \testheading@min
8794 \tl_clear:N \testheading@duration

```

```

8795 \tl_clear:N \testheading@reqpts
8796 \tl_clear:N \testheading@tools
8797 \keys_set:nn { hwexam / testheading }{ #1 }
8798 }
8799 \newenvironment{testheading}[1][]{%
8800 \_@@_testheading_args:n{ #1 }%
8801 \newcount\check@time\check@time=\testheading@min
8802 \advance\check@time by -\theassignment@totalmin
8803 \newif\if@bonuspoints
8804 \tl_if_empty:NTF \testheading@reqpts {%
8805 \@bonuspointsfalse
8806 }{%
8807 \newcount\bonus@pts
8808 \bonus@pts=\theassignment@totalpts

8810 \edef\bonus@pts{\the\bonus@pts}
8811 \@bonuspointstrue
8812 }%
8813 \edef\check@time{\the\check@time}%
8814
8815 \makeatletter\hwexamheader\makeatother
8816 }{%
8817 \newpage
8818 }

```

(End definition for `\testheading`. This function is documented on page ??.)

\@problem This macro acts on a problem's record in the `*.aux` file. Here we redefine it (it was defined to do nothing in `problem.sty`) to generate the correction table.

```

8819 <@=problems>
8820 \renewcommand{\@problem}[3]{%
8821 \stepcounter{assignment@probs}
8822 \def\__problemspts{\#2}
8823 \ifx\__problemspts\empty\else
8824 \addtocounter{assignment@totalpts}{\#2}
8825 \fi
8826 \def\__problemsmin{\#3}\ifx\__problemsmin\empty\else\addtocounter{assignment@totalmin}{\#3}\fi
8827 \xdef\correction@probs{\correction@probs \& \#1}%
8828 \xdef\correction@pts{\correction@pts \& \#2}%
8829 \xdef\correction@reached{\correction@reached \&}%
8830 }%
8831 <@=hwexam>

```

(End definition for `\@problem`. This function is documented on page ??.)

\correction@table This macro generates the correction table

```

8832 \newcounter{assignment@probs}
8833 \newcounter{assignment@totalpts}
8834 \newcounter{assignment@totalmin}
8835 \def\correction@probs{\correction@probs@kw}
8836 \def\correction@pts{\correction@pts@kw}
8837 \def\correction@reached{\correction@reached@kw}%
8838 \stepcounter{assignment@probs}
8839 \newcommand\correction@table{%

```

```

8840 \resizebox{\textwidth}{!}{%
8841 \begin{tabular}{|l|*{\theassignment@probs}{c}|l|}\hline%
8842 &\multicolumn{\theassignment@probs}{c||}{%
8843 {\footnotesize\correction@forgrading@kw} &\\ \hline
8844 \correction@probs & \correction@sum@kw & \correction@grade@kw\\ \hline
8845 \correction@pts &\theassignment@totalpts & \\ \hline
8846 \correction@reached & & \\ [.7cm]\hline
8847 \end{tabular}}}
8848 \end{package}

```

(End definition for `\correction@table`. This function is documented on page ??.)

42.5 Leftovers

at some point, we may want to reactivate the logos font, then we use

```

here we define the logos that characterize the assignment
\font\bierfont=../assignments/bierglas
\font\denkerfont=../assignments/denker
\font\uhrfont=../assignments/uhr
\font\warnschildfont=../assignments/achtung

\newcommand\bierglas{{\bierfont\char65}}
\newcommand\denker{{\denkerfont\char65}}
\newcommand\uhr{{\uhrfont\char65}}
\newcommand\warnschild{{\warnschildfont\char 65}}
\newcommand\hardA{\warnschild}
\newcommand\longA{\uhr}
\newcommand\thinkA{\denker}
\newcommand\discussA{\bierglas}

```
