1 Initial setup

Start the DocStrip guards.

¹ `<*package>`

Identify the internal prefix (`LATEX3` DocStrip convention).

² `@@=zrefclever`

Taking a stance on backward compatibility of the package. During initial development, we have used freely recent features of the kernel (albeit refraining from `\l3candidates`, even though I'd have loved to have used `\bool_case_true`...). We presume `xparse` (which made to the kernel in the 2020-10-01 release), and `expl3` as well (which made to the kernel in the 2020-02-02 release). We also just use UTF-8 for the language files (which became the default input encoding in the 2018-04-01 release). Finally, a couple of changes came with the 2021-11-15 kernel release, which are important here. First, a fix was made to the new hook management system (`\tcmdhooks`), with implications to the hook we add to `\appendix` (by Phelype Oleinik at <https://tex.stackexchange.com/q/617905> and <https://github.com/latex3/latex2e/pull/699>). Second, the support for `\@currentcounter` has been improved, including `\footnote` and `amsmath` (by Frank Mittelbach and Ulrike Fischer at <https://github.com/latex3/latex2e/issues/687>). Hence, since we would not be able to go much backwards without special handling anyway, we make the cut at the 2021-11-15 kernel release.

13 }%

```

Identify the package.

```

14 \ProvidesExplPackage {zref-clever} {2022-12-27} {0.3.2}
15   {Clever \LaTeX\ cross-references based on zref}

```

2 Dependencies

Required packages. Besides these, `zref-hyperref` may also be loaded depending on user options. `zref-clever` also requires UTF-8 input encoding (see discussion with David Carlisle at <https://chat.stackexchange.com/transcript/message/62644791#62644791>).

```

16 \RequirePackage { zref-base }
17 \RequirePackage { zref-user }
18 \RequirePackage { zref-abspage }
19 \RequirePackage { ifdraft }

```

3 zref setup

For the purposes of the package, we need to store some information with the labels, some of it standard, some of it not so much. So, we have to setup `zref` to do so.

Some basic properties are handled by `zref` itself, or some of its modules. The `default` and `page` properties are provided by `zref-base`, while `zref-abspage` provides the `abspage` property which gives us a safe and easy way to sort labels for page references.

The `counter` property, in most cases, will be just the kernel's `\@currentcounter`, set by `\refstepcounter`. However, not everywhere is it assured that `\@currentcounter` gets updated as it should, so we need to have some means to manually tell `zref-clever` what the current counter actually is. This is done with the `currentcounter` option, and stored in `\l_zrefclever_current_counter_t1`, whose default is `\@currentcounter`.

```

20 \zref@newprop { zc@counter } { \l_zrefclever_current_counter_t1 }
21 \zref@addprop \ZREF@mainlist { zc@counter }

```

The reference itself, stored by `zref-base` in the `default` property, is somewhat a disputed real estate. In particular, the use of `\labelformat` (previously from `variorum`, now in the kernel) will include there the reference “prefix” and complicate the job we are trying to do here. Hence, we isolate `\the<counter>` and store it “clean” in `thecounter` for reserved use. Since `\@currentlabel`, which populates the `default` property, is *more reliable* than `\@currentcounter`, `thecounter` is meant to be kept as an *option* (`ref` option), in case there’s need to use `zref-clever` together with `\labelformat`. Based on the definition of `\@currentlabel` done inside `\refstepcounter` in `texdoc source2e`, section `ltxref.dtx`. We just drop the `\p@...` prefix.

```

22 \zref@newprop { thecounter }
23   {
24     \cs_if_exist:cTF { c@ \l_zrefclever_current_counter_t1 }

```

```

25     { \use:c { the \l_zrefclever_current_counter_tl } }
26     {
27         \cs_if_exist:cT { c@ \currentcounter }
28         { \use:c { the \currentcounter } }
29     }
30 }
31 \zref@addprop \ZREF@mainlist { thecounter }

```

Much of the work of zref-clever relies on the association between a label’s “counter” and its “type” (see the User manual section on “Reference types”). Superficially examined, one might think this relation could just be stored in a global property list, rather than in the label itself. However, there are cases in which we want to distinguish different types for the same counter, depending on the document context. Hence, we need to store the “type” of the “counter” for each “label”. In setting this, the presumption is that the label’s type has the same name as its counter, unless it is specified otherwise by the `countertype` option, as stored in `\l_zrefclever_counter_type_prop`.

```

32 \zref@newprop { zc@type }
33 {
34     \exp_args:NNe \prop_if_in:NnTF \l_zrefclever_counter_type_prop
35         \l_zrefclever_current_counter_tl
36     {
37         \exp_args:NNe \prop_item:Nn \l_zrefclever_counter_type_prop
38             { \l_zrefclever_current_counter_tl }
39     }
40     { \l_zrefclever_current_counter_tl }
41 }
42 \zref@addprop \ZREF@mainlist { zc@type }

```

Since the `default/thecounter` and `page` properties store the “*printed representation*” of their respective counters, for sorting and compressing purposes, we are also interested in their numeric values. So we store them in `zc@cntval` and `zc@pgval`. For this, we use `\c@{counter}`, which contains the counter’s numerical value (see ‘texdoc source2e’, section ‘ltcounts.dtx’).

```

43 \zref@newprop { zc@cntval } [0]
44 {
45     \cs_if_exist:cTF { c@ \l_zrefclever_current_counter_tl }
46     { \int_use:c { c@ \l_zrefclever_current_counter_tl } }
47     {
48         \cs_if_exist:cT { c@ \currentcounter }
49         { \int_use:c { c@ \currentcounter } }
50     }
51 }
52 \zref@addprop \ZREF@mainlist { zc@cntval }
53 \zref@newprop* { zc@pgval } [0] { \int_use:c { c@page } }
54 \zref@addprop \ZREF@mainlist { zc@pgval }

```

However, since many counters (may) get reset along the document, we require more than just their numeric values. We need to know the reset chain of a given counter, in order to sort and compress a group of references. Also here, the “printed representation” is not enough, not only because it is easier to work with the numeric values but, given we occasionally group multiple counters within a single type, sorting this group requires to know the actual counter reset chain.

Furthermore, even if it is true that most of the definitions of counters, and hence of their reset behavior, is likely to be defined in the preamble, this is not necessarily true.

Users can create counters, newtheorems mid-document, and alter their reset behavior along the way. Was that not the case, we could just store the desired information at `\begindocument` in a variable and retrieve it when needed. But since it is, we need to store the information with the label, with the values as current when the label is set.

Though counters can be reset at any time, and in different ways at that, the most important use case is the automatic resetting of counters when some other counter is stepped, as performed by the standard mechanisms of the kernel (optional argument of `\newcounter`, `\@addtoreset`, `\counterwithin`, and related infrastructure). The canonical optional argument of `\newcounter` establishes that the counter being created (the mandatory argument) gets reset every time the “enclosing counter” gets stepped (this is called in the usual sources “within-counter”, “old counter”, “super-counter”, “parent counter” etc.). This information is somewhat tricky to get. For starters, the counters which may reset the current counter are not retrievable from the counter itself, because this information is stored with the counter that does the resetting, not with the one that gets reset (the list is stored in `\c1@⟨counter⟩` with format `\@elt{counterA}\@elt{counterB}\@elt{counterC}`, see `1counts.dtx` in `texdoc source2e`). Besides, there may be a chain of resetting counters, which must be taken into account: if `counterC` gets reset by `counterB`, and `counterB` gets reset by `counterA`, stepping the latter affects all three of them.

The procedure below examines a set of counters, those in `\l_zrefclever_counter_resetters_seq`, and for each of them retrieves the set of counters it resets, as stored in `\c1@⟨counter⟩`, looking for the counter for which we are trying to set a label (`\l_zrefclever_current_counter_t1`, by default `\@currentcounter`, passed as an argument to the functions). There is one relevant caveat to this procedure: `\l_zrefclever_counter_resetters_seq` is populated by hand with the “usual suspects”, there is no way (that I know of) to ensure it is exhaustive. However, it is not that difficult to create a reasonable “usual suspects” list which, of course, should include the counters for the sectioning commands to start with, and it is easy to add more counters to this list if needed, with the option `counterresetters`. Unfortunately, not all counters are created alike, or reset alike. Some counters, even some kernel ones, get reset by other mechanisms (notably, the `enumerate` environment counters do not use the regular counter machinery for resetting on each level, but are nested nevertheless by other means). Therefore, inspecting `\c1@⟨counter⟩` cannot possibly fully account for all of the automatic counter resetting which takes place in the document. And there’s also no other “general rule” we could grab on for this, as far as I know. So we provide a way to manually tell `zref-clever` of these cases, by means of the `counterresetby` option, whose information is stored in `\l_zrefclever_counter_resetby_prop`. This manual specification has precedence over the search through `\l_zrefclever_counter_resetters_seq`, and should be handled with care, since there is no possible verification mechanism for this.

`__zrefclever_get_enclosing_counters_value:n`

Recursively generate a *sequence* of “enclosing counters” values, for a given `⟨counter⟩` and leave it in the input stream. This function must be expandable, since it gets called from `\zref@newprop` and is the one responsible for generating the desired information when the label is being set. Note that the order in which we are getting this information is reversed, since we are navigating the counter reset chain bottom-up. But it is very hard to do otherwise here where we need expandable functions, and easy to handle at the reading side.

```
\__zrefclever_get_enclosing_counters_value:n {⟨counter⟩}
```

⁵⁵ `\cs_new:Npn __zrefclever_get_enclosing_counters_value:n #1`

```

56   {
57     \cs_if_exist:cT { c@ \__zrefclever_counter_reset_by:n {#1} }
58     {
59       { \int_use:c { c@ \__zrefclever_counter_reset_by:n {#1} } }
60       \__zrefclever_get_enclosing_counters_value:e
61       { \__zrefclever_counter_reset_by:n {#1} }
62     }
63   }

```

Both `e` and `f` expansions work for this particular recursive call. I'll stay with the `e` variant, since conceptually it is what I want (`x` itself is not expandable), and this package is anyway not compatible with older kernels for which the performance penalty of the `e` expansion would ensue (helpful comment by Enrico Gregorio, aka ‘egreg’ at https://tex.stackexchange.com/q/611370/#comment1529282_611385).

```
64 \cs_generate_variant:Nn \__zrefclever_get_enclosing_counters_value:n { e }
```

(End definition for `__zrefclever_get_enclosing_counters_value:n`.)

`__zrefclever_counter_reset_by:n` Auxiliary function for `__zrefclever_get_enclosing_counters_value:n`, and useful on its own standing. It is broken in parts to be able to use the expandable mapping functions. `__zrefclever_counter_reset_by:n` leaves in the stream the “enclosing counter” which resets `{counter}`.

```

\__zrefclever_counter_reset_by:n {<counter>}

65 \cs_new:Npn \__zrefclever_counter_reset_by:n #1
66   {
67     \bool_if:nTF
68     { \prop_if_in_p:Nn \l__zrefclever_counter_resetby_prop {#1} }
69     { \prop_item:Nn \l__zrefclever_counter_resetby_prop {#1} }
70     {
71       \seq_map_tokens:Nn \l__zrefclever_counter_resetters_seq
72       { \__zrefclever_counter_reset_by_aux:nn {#1} }
73     }
74   }
75 \cs_new:Npn \__zrefclever_counter_reset_by_aux:nn #1#2
76   {
77     \cs_if_exist:cT { c@ #2 }
78     {
79       \tl_if_empty:cF { c1@ #2 }
80       {
81         \tl_map_tokens:cn { c1@ #2 }
82         { \__zrefclever_counter_reset_by_auxi:nnn {#2} {#1} }
83       }
84     }
85   }
86 \cs_new:Npn \__zrefclever_counter_reset_by_auxi:nnn #1#2#3
87   {
88     \str_if_eq:nnT {#2} {#3}
89     { \tl_map_break:n { \seq_map_break:n {#1} } }
90   }

```

(End definition for `__zrefclever_counter_reset_by:n`.)

Finally, we create the `zc@enclval` property, and add it to the `main` property list.

```

91 \zref@newprop { zc@enclval }
92 {
93     \__zrefclever_get_enclosing_counters_value:e
94     \l__zrefclever_current_counter_t1
95 }
96 \zref@addprop \ZREF@mainlist { zc@enclval }

```

Another piece of information we need is the page numbering format being used by `\thepage`, so that we know when we can (or not) group a set of page references in a range. Unfortunately, `page` is not a typical counter in ways which complicates things. First, it does commonly get reset along the document, not necessarily by the usual counter reset chains, but rather with `\pagenumbering` or variations thereof. Second, the format of the page number commonly changes in the document (roman, arabic, etc.), not necessarily, though usually, together with a reset. Trying to “parse” `\thepage` to retrieve such information is bound to go wrong: we don’t know, and can’t know, what is within that macro, and that’s the business of the user, or of the `documentclass`, or of the loaded packages. The technique used by `cleveref`, which we borrow here, is simple and smart: store with the label what `\thepage` would return, if the counter `\c@page` was “1”. That does not allow us to *sort* the references, luckily however, we have `abspage` which solves this problem. But we can decide whether two labels can be compressed into a range or not based on this format: if they are identical, we can compress them, otherwise, we can’t. To do so, we locally set `\c@page` to “1”, thus avoiding any global spillovers of this trick. Since this operation is not expandable we cannot run it directly from the property definition. Hence, we use a shipout hook, and set `\g__zrefclever_page_format_t1`, which can then be retrieved by the starred definition of `\zref@newprop*{zc@pgfmt}`.

```

97 \tl_new:N \g__zrefclever_page_format_t1
98 \AddToHook { shipout / before }
99 {
100     \group_begin:
101     \int_set:Nn \c@page { 1 }
102     \tl_gset:Nx \g__zrefclever_page_format_t1 { \thepage }
103     \group_end:
104 }
105 \zref@newprop* { zc@pgfmt } { \g__zrefclever_page_format_t1 }
106 \zref@addprop \ZREF@mainlist { zc@pgfmt }

```

Still some other properties which we don’t need to handle at the data provision side, but need to cater for at the retrieval side, are the ones from the `zref-xr` module, which are added to the labels imported from external documents, and needed to construct hyperlinks to them and to distinguish them from the current document ones at sorting and compressing: `urluse`, `url` and `externaldocument`.

4 Plumbing

4.1 Auxiliary

`__zrefclever_if_package_loaded:n`
`__zrefclever_if_class_loaded:n`

Just a convenience, since sometimes we just need one of the branches, and it is particularly easy to miss the empty F branch after a long T one.

```

107 \prg_new_conditional:Npnn \__zrefclever_if_package_loaded:n #1 { T , F , TF }
108   { \IfPackageLoadedTF {#1} { \prg_return_true: } { \prg_return_false: } }
109 \prg_new_conditional:Npnn \__zrefclever_if_class_loaded:n #1 { T , F , TF }
110   { \IfClassLoadedTF {#1} { \prg_return_true: } { \prg_return_false: } }

```

(End definition for `_zrefclever_if_package_loaded:n` and `_zrefclever_if_class_loaded:n`.)

4.3 Data extraction

`_zrefclever_extract_default:Nnnn`

Extract property $\langle prop \rangle$ from $\langle label \rangle$ and sets variable $\langle tl var \rangle$ with extracted value. Ensure `\zref@extractdefault` is expanded exactly twice, but no further to retrieve the proper value. In case the property is not found, set $\langle tl var \rangle$ with $\langle default \rangle$.

```

 $\_zrefclever_extract_default:Nnnn \{ \langle tl var \rangle \}$ 
 $\{ \langle label \rangle \} \{ \langle prop \rangle \} \{ \langle default \rangle \}$ 

266  $\backslash cs\_new\_protected:Npn \_zrefclever_extract_default:Nnnn \#1\#2\#3\#4$ 
267   {
268      $\backslash exp\_args:NNNo \exp\_args:NNo \tl\_set:Nn \#1$ 
269     {  $\zref@extractdefault \{ \#2 \} \{ \#3 \} \{ \#4 \} \#1$ 
270   }
271  $\backslash cs\_generate\_variant:Nn \_zrefclever_extract_default:Nnnn \{ NVnn , Nnvn \}$ 

(End definition for \_zrefclever_extract_default:Nnnn.)

```

`_zrefclever_extract_unexp:nnn`

Extract property $\langle prop \rangle$ from $\langle label \rangle$. Ensure that, in the context of an x expansion, `\zref@extractdefault` is expanded exactly twice, but no further to retrieve the proper value. Thus, this is meant to be used in an x expansion context, not in other situations. In case the property is not found, leave $\langle default \rangle$ in the stream.

```

 $\_zrefclever_extract_unexp:nnn \{ \langle label \rangle \} \{ \langle prop \rangle \} \{ \langle default \rangle \}$ 

272  $\backslash cs\_new:Npn \_zrefclever_extract_unexp:nnn \#1\#2\#3$ 
273   {
274      $\exp\_args:NNNo \exp\_args:No$ 
275      $\exp\_not:n \{ \zref@extractdefault \{ \#1 \} \{ \#2 \} \{ \#3 \} \#1$ 
276   }
277  $\backslash cs\_generate\_variant:Nn \_zrefclever_extract_unexp:nnn \{ Vnn , nvn , Vvn \}$ 

(End definition for \_zrefclever_extract_unexp:nnn.)

```

`_zrefclever_extract:nnn` An internal version for `\zref@extractdefault`.

```

 $\_zrefclever_extract:nnn \{ \langle label \rangle \} \{ \langle prop \rangle \} \{ \langle default \rangle \}$ 

278  $\backslash cs\_new:Npn \_zrefclever_extract:nnn \#1\#2\#3$ 
279   {  $\zref@extractdefault \{ \#1 \} \{ \#2 \} \{ \#3 \} \#1$ 

```

(End definition for `_zrefclever_extract:nnn`.)

4.4 Option infra

This section provides the functions in which the variables naming scheme of the package options is embodied, and some basic general functions to query these option variables.

I had originally implemented the option handling of the package based on property lists, which are definitely very convenient. But as the number of options grew, I started to get concerned about the performance implications. That there was a toll was noticeable, even when we could live with it, of course. Indeed, at the time of writing, the typesetting of a reference queries about 24 different option values, most of them once per type-block, each of these queries can be potentially made in up to 5 option scope levels. Considering the size of the built-in language files is running at the hundreds, the package does have a lot of work to do in querying option values

alone, and thus it is best to smooth things in this area as much as possible. This also gives me some peace of mind that the package will scale well in the long term. For some interesting discussion about alternative methods and their performance implications, see <https://tex.stackexchange.com/q/147966>. Phelype Oleinik also offered some insight on the matter at https://tex.stackexchange.com/questions/629946/#comment1571118_629946. The only real downside of this change is that we can no longer list the whole set of options in place at a given moment, which was useful for the purposes of regression testing, since we don't know what the whole set of active options is.

`_zrefclever_opt_varname_general:nn` Defines, and leaves in the input stream, the csname of the variable used to store the general *<option>*. The data type of the variable must be specified (`tl`, `seq`, `bool`, etc.).

```

\_zrefclever_opt_varname_general:nn {\<option>} {\<data type>}
280 \cs_new:Npn \_zrefclever_opt_varname_general:nn #1#2
281   { l__zrefclever_opt_general_ #1 _ #2 }

```

(End definition for `_zrefclever_opt_varname_general:nn`.)

`_zrefclever_opt_varname_type:nnn` Defines, and leaves in the input stream, the csname of the variable used to store the type-specific *<option>* for *<ref type>*.

```

\_zrefclever_opt_varname_type:nnn {\<ref type>} {\<option>} {\<data type>}
282 \cs_new:Npn \_zrefclever_opt_varname_type:nnn #1#2#3
283   { l__zrefclever_opt_type_ #1 _ #2 _ #3 }
284 \cs_generate_variant:Nn \_zrefclever_opt_varname_type:nnn { enn , een }

```

(End definition for `_zrefclever_opt_varname_type:nnn`.)

`_zrefclever_opt_varname_language:nnn` Defines, and leaves in the input stream, the csname of the variable used to store the language *<option>* for *<lang>* (for general language options, those set with `\zcDeclareLanguage`). The “`lang_unknown`” branch should be guarded against, such as we normally should not get there, but this function *must* return some valid csname. The random part is there so that, in the circumstance this could not be avoided, we (hopefully) don't retrieve the value for an “unknown language” inadvertently.

```

\_zrefclever_opt_varname_language:nnn {\<lang>} {\<option>} {\<data type>}
285 \cs_new:Npn \_zrefclever_opt_varname_language:nnn #1#2#3
286   {

302     _default_ #2 _ #3
303   }
304   { g__zrefclever_opt_lang_unknown_ \int_rand:n { 1000000 } _ #3 }
305 }
306 \cs_generate_variant:Nn \__zrefclever_opt_varname_lang_default:nnn { enn }

(End definition for \__zrefclever_opt_varname_lang_default:nnn.)

```

__zrefclever_opt_varname_lang_type:nnnn
Defines, and leaves in the input stream, the csname of the variable used to store the language- and type-specific reference format *<option>* for *<lang>* and *<ref type>*.

```

\__zrefclever_opt_varname_lang_type:nnnn {\langle lang\rangle} {\langle ref type\rangle}
{\langle option\rangle} {\langle data type\rangle}

307 \cs_new:Npn \__zrefclever_opt_varname_lang_type:nnnn #1#2#3#4
308 {
309   \__zrefclever_language_if_declared:nTF {\#1}
310   {
311     g__zrefclever_opt_lang_
312     \tl_use:c { \__zrefclever_language_varname:n {\#1} }
313     _type_ #2 _ #3 _ #4
314   }
315   { g__zrefclever_opt_lang_unknown_ \int_rand:n { 1000000 } _ #4 }
316 }
317 \cs_generate_variant:Nn
318   \__zrefclever_opt_varname_lang_type:nnnn { eenn , een }

(End definition for \__zrefclever_opt_varname_lang_type:nnnn.)

```

__zrefclever_opt_varname_fallback:nn
Defines, and leaves in the input stream, the csname of the variable used to store the fallback *<option>*.

```

\__zrefclever_opt_varname_fallback:nn {\langle option\rangle} {\langle data type\rangle}

319 \cs_new:Npn \__zrefclever_opt_varname_fallback:nn #1#2
320   { c__zrefclever_opt_fallback_ #1 _ #2 }

(End definition for \__zrefclever_opt_varname_fallback:nn.)

```

__zrefclever_opt_var_set_bool:n
The L^AT_EX3 programming layer does not have the concept of a variable *existing* only locally, it also considers an “error” if an assignment is made to a variable which was not previously declared, but declaration is always global, which means that “setting a local variable at a local scope”, given these requirements, results in it existing, and being empty, globally. Therefore, we need an independent mechanism from the mere existence of a variable to keep track of whether variables are “set” or “unset”, within the logic of the precedence rules for options in different scopes. __zrefclever_opt_var_set_bool:n expands to the name of the boolean variable used to track this state for *<option var>*. See discussion with Phelype Oleinik at https://tex.stackexchange.com/questions/633341/#comment1579825_633347

```

(End definition for `__zrefclever_opt_tl_unset:N`.)

`_zrefclever opt tl if set:NF` This conditional *defines* what means to be unset for a token list option. Note that the “set bool” not existing signals that the variable *is set*, that would be the case of all global option variables (language-specific ones). But this means care should be taken to always define and set the “set bool” for local variables.

4.5 Reference format

For a general discussion on the precedence rules for reference format options, see Section “Reference format” in the User manual. Internally, these precedence rules are handled / enforced in `_zrefclever_get_rf_opt_t1:nnnN`, `_zrefclever_get_rf_opt_seq:nnnN`, `_zrefclever_get_rf_opt_bool:nnnnN`, and `_zrefclever_type_name_setup`: which are the basic functions to retrieve proper values for reference format settings.

The fact that we have multiple scopes to set reference format options has some implications for how we handle these options, and for the resulting UI. Since there is a clear precedence rule between the different levels, setting an option at a high priority level shadows everything below it. Hence, it may be relevant to be able to “unset” these options too, so as to be able go back to the lower precedence level of the language-specific options at any given point. However, since many of these options are token lists, or clists, for which “empty” is a legitimate value, we cannot rely on emptiness to distinguish that particular intention. How to deal with it, depends on the kind of option (its data type, to be precise). For token lists and clists/sequences, we leverage the distinction of an “empty valued key” (`key=` or `key={}`) from a “key with no value” (`key`). This distinction is captured internally by the lower-level key parsing, but must be made explicit in `\keys_define:nn` by means of the `.default:o` property of the key. For the technique, by Jonathan P. Spratte, aka ‘Skillmon’, and some discussion about it, including further insights by Phelype Oleinik, see <https://tex.stackexchange.com/q/614690> and <https://github.com/latex3/latex3/pull/988>. However, Joseph Wright seems to particularly dislike this use and the general idea of a “key with no value” being somehow meaningful for l3keys (e.g. his comments on the previous question, and https://tex.stackexchange.com/q/632157/#comment1576404_632157), which does make it somewhat risky to rely on this. For booleans, the situation is different, since they cannot meaningfully receive an empty value and the “key with no value” is a handy and expected shorthand for `key=true`. Therefore, for reference format option booleans, we use a third value “`unset`” for this purpose. And similarly for “choice” options.

However, “unsetting” options is only supported at the general and reference type levels, that is, at `\zcsetup`, at `\zcref`, and at `\zcRefTypeSetup`. For language-specific options – in the language files or at `\zcLanguageSetup` – there is no unsetting, an option which has been set can there only be changed to another value. This for two reasons. First, these are low precedence levels, so it is less meaningful to be able to unset these options. Second, these settings can only be done in the preamble (or the package itself). They are meant to be global. So, do it once, do it right, and if you need to locally change something along the document, use a higher precedence level.

Store “current” type, language, and declension cases in different places for type-specific and language-specific options handling, notably in `_zrefclever_provide_langfile:n`, `\zcRefTypeSetup`, and `\zcLanguageSetup`, but also for language specific options retrieval.

```
552 \tl_new:N \l_zrefclever_setup_type_t1
553 \tl_new:N \l_zrefclever_setup_language_t1
554 \tl_new:N \l_zrefclever_lang_decl_case_t1
555 \seq_new:N \l_zrefclever_lang_declension_seq
556 \seq_new:N \l_zrefclever_lang_gender_seq
```

(End definition for `\l_zrefclever_setup_type_t1` and others.)

`zrefclever_rf_opts_tl_not_type_specific_seq`
`efclever_rf_opts_tl_maybe_type_specific_seq`
`\g_zrefclever_rf_opts_seq_refbounds_seq`
`\g_zrefclever_rf_opts_bool_maybe_type_specific_seq`
`\g_zrefclever_rf_opts_tl_type_names_seq`
`\g_zrefclever_rf_opts_tl_typesetup_seq`
`\g_zrefclever_rf_opts_tl_reference_seq`

Lists of reference format options in “categories”. Since these options are set in different scopes, and at different places, storing the actual lists in centralized variables makes the job not only easier later on, but also keeps things consistent. These variables are *constants*, but I don’t seem to be able to find a way to concatenate two constants into a third one without triggering L^AT_EX3 debug error “Inconsistent local/global assignment”. And repeating things in a new `\seq_const_from_clist:Nn` defeats the purpose of these variables.

```

557 \seq_new:N \g_zrefclever_rf_opts_tl_not_type_specific_seq
558 \seq_gset_from_clist:Nn
559   \g_zrefclever_rf_opts_tl_not_type_specific_seq
560   {
561     tpairsep ,
562     tlistsep ,
563     tlastsep ,
564     notesep ,
565   }
566 \seq_new:N \g_zrefclever_rf_opts_tl_maybe_type_specific_seq
567 \seq_gset_from_clist:Nn
568   \g_zrefclever_rf_opts_tl_maybe_type_specific_seq
569   {
570     namesep ,
571     pairsep ,

573     lastsep ,
574     rangesep ,
575     namefont ,
576     reffont ,
577   }
578 \seq_new:N \g_zrefclever_rf_opts_seq_refbounds_seq
579 \seq_gset_from_clist:Nn
580   \g_zrefclever_rf_opts_seq_refbounds_seq
581   {
582     refbounds-first ,
583     refbounds-first-sg ,
584     refbounds-first-pb ,
585     refbounds-first-rb ,
586     refbounds-mid ,
587     refbounds-mid-rb ,
588     refbounds-mid-re ,
589     refbounds-last ,
590     refbounds-last-pe ,
591     refbounds-last-re ,
592   }
593 \seq_new:N \g_zrefclever_rf_opts_bool_maybe_type_specific_seq
594 \seq_gset_from_clist:Nn
595   \g_zrefclever_rf_opts_bool_maybe_type_specific_seq
596   {
597     cap ,
598     abbrev ,
599     rangetopair ,
600   }

```

Only “type names” are “necessarily type-specific”, which makes them somewhat special on the retrieval side of things. In short, they don’t have their values queried by

```

\__zrefclever_get_rf_opt_tl:nnN, but by \__zrefclever_type_name_setup::
601 \seq_new:N \g__zrefclever_rf_opts_tl_type_names_seq
602 \seq_gset_from_clist:Nn
603   \g__zrefclever_rf_opts_tl_type_names_seq
604 {
605   Name-sg ,
606   name-sg ,
607   Name-pl ,
608   name-pl ,
609   Name-sg-ab ,
610   name-sg-ab ,
611   Name-pl-ab ,
612   name-pl-ab ,
613 }

```

And, finally, some combined groups of the above variables, for convenience.

```

614 \seq_new:N \g__zrefclever_rf_opts_tl_typesetup_seq
615 \seq_gconcat:NNN \g__zrefclever_rf_opts_tl_typesetup_seq
616   \g__zrefclever_rf_opts_tl_maybe_type_specific_seq
617   \g__zrefclever_rf_opts_tl_type_names_seq
618 \seq_new:N \g__zrefclever_rf_opts_tl_reference_seq
619 \seq_gconcat:NNN \g__zrefclever_rf_opts_tl_reference_seq
620   \g__zrefclever_rf_opts_tl_not_type_specific_seq
621   \g__zrefclever_rf_opts_tl_maybe_type_specific_seq

```

(End definition for \g__zrefclever_rf_opts_tl_not_type_specific_seq and others.)

We set here also the “derived” `refbounds` options, which are (almost) the same for every option scope.

4.6 Languages

`\l__zrefclever_current_language_tl` is an internal alias for babel's `\languagename` or polyglossia's `\mainbabelname` and, if none of them is loaded, we set it to `english`. `\l__zrefclever_main_language_tl` is an internal alias for babel's `\bblob@main@language` or for polyglossia's `\mainbabelname`, as the case may be. Note that for polyglossia we get babel's language names, so that we only need to handle those internally. `\l__zrefclever_ref_language_tl` is the internal variable which stores the language in which the reference is to be made.

```

704 \tl_new:N \l__zrefclever_ref_language_tl
705 \tl_new:N \l__zrefclever_current_language_tl
706 \tl_new:N \l__zrefclever_main_language_tl
```

`\l_zrefclever_ref_language_tl` A public version of `\l__zrefclever_ref_language_tl` for use in `zref-vario`.

```

707 \tl_new:N \l_zrefclever_ref_language_tl
708 \tl_set:Nn \l_zrefclever_ref_language_tl { \l__zrefclever_ref_language_tl }
```

(End definition for `\l_zrefclever_ref_language_tl`. This function is documented on page ??.)

`_zrefclever_language_varname:n` Defines, and leaves in the input stream, the csname of the variable used to store the `\langle base language \rangle` (as the value of this variable) for a `\langle language \rangle` declared for `zref-clever`.

```

\_\_zrefclever_language_varname:n {\langle language \rangle}
709 \cs_new:Npn \_\_zrefclever_language_varname:n #1
710   { g\_\_zrefclever_declared_language_ #1 _tl }
```

(End definition for `_zrefclever_language_varname:n`.)

`\zrefclever_language_varname:n` A public version of `__zrefclever_language_varname:n` for use in `zref-vario`.

```

711 \cs_set_eq:NN \zrefclever_language_varname:n
712   \_\_zrefclever_language_varname:n
```

(End definition for `\zrefclever_language_varname:n`. This function is documented on page ??.)

`__zrefclever_language_if_declared:nTF` A language is considered to be declared for `zref-clever` if it passes this conditional, which requires that a variable with `__zrefclever_language_varname:n{\langle language \rangle}` exists.

```

\_\_zrefclever_language_if_declared:n(TF) {\langle language \rangle}
713 \prg_new_conditional:Npnn \_\_zrefclever_language_if_declared:n #1 { T , F , TF }
714   {
715     \tl_if_exist:cTF { \_\_zrefclever_language_varname:n {#1} }
716     { \prg_return_true: }
717     { \prg_return_false: }
718   }
719 \prg_generate_conditional_variant:Nnn
720   \_\_zrefclever_language_if_declared:n { x } { T , F , TF }
```

(End definition for `__zrefclever_language_if_declared:nTF`.)

\zrefclever_language_if_declared:nTF A public version of __zrefclever_language_if_declared:n for use in zref-vario.

```

721 \prg_set_eq_conditional:NNn \zrefclever_language_if_declared:n
722   \__zrefclever_language_if_declared:n { TF }

```

(End definition for \zrefclever_language_if_declared:nTF. This function is documented on page ??.)

\zcDeclareLanguage Declare a new language for use with zref-clever. *<language>* is taken to be both the “language name” and the “base language name”. A “base language” (loose concept here, meaning just “the name we gave for the language file in that particular language”) is just like any other one, the only difference is that the “language name” happens to be the same as the “base language name”, in other words, it is an “alias to itself”. [*<options>*] receive a **k=v** set of options, with three valid options. The first, **declension**, takes the noun declension cases prefixes for *<language>* as a comma separated list, whose first element is taken to be the default case. The second, **gender**, receives the genders for *<language>* as comma separated list. The third, **allcaps**, is a boolean, and indicates that for *<language>* all nouns must be capitalized for grammatical reasons, in which case, the **cap** option is disregarded for *<language>*. If *<language>* is already known, just warn. This implies a particular restriction regarding [*<options>*], namely that these options, when defined by the package, cannot be redefined by the user. This is deliberate, otherwise the built-in language files would become much too sensitive to this particular user input, and unnecessarily so. \zcDeclareLanguage is preamble only.

```

\zcDeclareLanguage [<options>] {<language>}

```

```

723 \NewDocumentCommand \zcDeclareLanguage { O { } m }
724   {
725     \group_begin:

__zrefclever_process_language_settings:

Auxiliary function for `__zrefclever_zcref:nnn`, responsible for processing language related settings. It is necessary to separate them from the reference options machinery for two reasons. First, because their behavior is language dependent, but the language itself can also be set as an option (`lang`, value stored in `\l__zrefclever_ref_language_t1`). Second, some of its tasks must be done regardless of any option being given (e.g. the default declension case, the `allcaps` option). Hence, we must validate the language settings after the reference options have been set. It is expected to be called right (or soon) after `\keys_set:nn` in `__zrefclever_zcref:nnn`, where current values for `\l__zrefclever_ref_language_t1` and `\l__zrefclever_ref_decl_case_t1` are in place.

```

802 \cs_new_protected:Npn \__zrefclever_process_language_settings:
803   {
804     \__zrefclever_language_if_declared:xTF
805       { \l__zrefclever_ref_language_t1 }
806   }
```

Validate the declension case (d) option against the declared cases for the reference language. If the user value for the latter does not match the declension cases declared for the former, the function sets an appropriate value for `\l__zrefclever_ref_decl_case_t1`, either using the default case, or clearing the variable, depending on the language setup. And also issues a warning about it.

4.7 Language files

Contrary to general options and type options, which are always *local*, language-specific settings are always *global*. Hence, the loading of built-in language files, as well as settings done with `\zcLanguageSetup`, should set the relevant variables globally.

The built-in language files and their related infrastructure are designed to perform “on the fly” loading of the language files, “lazily” as needed. Much like `babel` does for languages not declared in the preamble, but used in the document. This offers some convenience, of course, and that’s one reason to do it. But it also has the purpose of parsimony, of “loading the least possible”. Therefore, we load at `begindocument` one single language (see [lang option](#)), as specified by the user in the preamble with the `lang` option or, failing any specification, the current language of the document, which is the default. Anything else is lazily loaded, on the fly, along the document.

This design decision has also implications to the *form* the language files assumed. As far as my somewhat impressionistic sampling goes, dictionary or localization files of the most common packages in this area of functionality, are usually a set of commands which perform the relevant definitions and assignments in the preamble or at `begindocument`. This includes `translator`, `translations`, but also `babel`’s `.ldf` files, and `biblatex`’s `.lbx` files. I’m not really well acquainted with this machinery, but as far as I grasp, they all rely on some variation of `\ProvidesFile` and `\input`. And they can be safely `\input` without generating spurious content, because they rely on being loaded before the document has actually started. As far as I can tell, `babel`’s “on the fly” functionality is not based on the `.ldf` files, but on the `.ini` files, and on `\babelprovide`. And the `.ini` files are not in this form, but actually resemble “configuration files” of sorts, which means they are read

and processed somehow else than with just `\input`. So we do the more or less the same here. It seems a reasonable way to ensure we can load language files on the fly robustly mid-document, without getting paranoid with the last bit of white-space in them, and without introducing any undue content on the stream when we cannot afford to do it. Hence, zref-clever's built-in language files are a set of *key-value options* which are read from the file, and fed to `\keys_set:nn{zref-clever/langfile}` by `_zrefclever_provide_langfile:n`. And they use the same syntax and options as `\zcLanguageSetup` does. The language file itself is read with `\ExplSyntaxOn` with the usual implications for white-space and catcodes.

`_zrefclever_provide_langfile:n` is only meant to load the built-in language files. For languages declared by the user, or for any settings to a known language made with `\zcLanguageSetup`, values are populated directly to a corresponding variables. Hence, there is no need to "load" anything in this case: definitions and assignments made by the user are performed immediately.

`\g_zrefclever_loaded_langfiles_seq` Used to keep track of whether a language file has already been loaded or not.

```
903 \seq_new:N \g_zrefclever_loaded_langfiles_seq
```

```

It is convenient for a number of language typesetting options (some basic separators) to have some “fallback” value available in case `babel` or `polyglossia` is loaded and sets a

language which `zref-clever` does not know. On the other hand, “type names” are not looked for in “fallback”, since it is indeed impossible to provide any reasonable value for them for a “specified but unknown language”. Other typesetting options, for which it is not a problem being empty, need not be catered for with a fallback value.

```

1513 \cs_new_protected:Npn \__zrefclever_opt_tl_csetFallback:nn #1#2
1514 {
1515   \tl_const:cn
1516   { \__zrefclever_opt_varnameFallback:nn {#1} { tl } } {#2}
1517 }
1518 \keyval_parse:nnn
1519 {
1520   { \__zrefclever_opt_tl_csetFallback:nn }
1521   {
1522     tpairsep = {,~} ,
1523     tlistsep = {,~} ,
1524     tlastsep = {,~} ,
1525     notesep = {~-} ,
1526     namesep = {\nobreakspace} ,
1527     pairsep = {,~} ,
1528     listsep = {,~} ,
1529     lastsep = {,~} ,
1530     rangesep = {\textendash} ,
1531   }

```

4.8 Options

Auxiliary

If $\langle value \rangle$ is empty, remove $\langle key \rangle$ from $\langle property\ list \rangle$. Otherwise, add $\langle key \rangle = \langle value \rangle$ to $\langle property\ list \rangle$.

```

\__zrefclever_prop_put_non_empty:Nnn <property list> {{key}} {{value}}
1532 \cs_new_protected:Npn \__zrefclever_prop_put_non_empty:Nnn #1#2#3
1533 {
1534   \tl_if_empty:nTF {#3}
1535   { \prop_remove:Nn #1 {#2} }
1536   { \prop_put:Nnn #1 {#2} {#3} }
1537 }

```

(End definition for `__zrefclever_prop_put_non_empty:Nnn`.)

`ref` option

`\l__zrefclever_ref_property_tl` stores the property to which the reference is being made. Note that one thing *must* be handled at this point: the existence of the property itself, as far as `zref` is concerned. This because typesetting relies on the check `\zref@ifrefcontainsprop`, which *presumes* the property is defined and silently expands the *true* branch if it is not (insightful comments by Ulrike Fischer at <https://github.com/ho-tex/zref/issues/13>). Therefore, before adding anything to `\l__zrefclever_ref_property_tl`, check if first here with `\zref@ifpropundefined`: close it at the door. We must also control for an empty value, since “empty” passes both `\zref@ifpropundefined` and `\zref@ifrefcontainsprop`.

```

1538 \tl_new:N \l__zrefclever_ref_property_tl
1539 \keys_define:nn { zref-clever/reference }
1540 {

1600 }

```

typesort option

\l__zrefclever_typesort_seq is stored reversed, since the sort priorities are computed in the negative range in \l__zrefclever_sort_default_different_types:nn, so that we can implicitly rely on ‘0’ being the “last value”, and spare creating an integer variable using \seq_map_indexed_inline:Nn.

```

1601 \seq_new:N \l__zrefclever_typesort_seq
1602 \keys_define:nn { zref-clever/reference }

1622     nocomp .meta:n = { comp = false },
1623     nocomp .value_forbidden:n = true ,
1624 }

```

endrange option

The working of endrange option depends on two underlying option values / variables: endrangefunc and endrangeprop. endrangefunc is the more general one,

and `endrangeprop` is used when the first is set to `__zrefclever_get_endrange_property:VNN`, which is the case when the user is setting `endrange` to an arbitrary `zref` property, instead of one of the `\str_case:nn` matches.

`endrangefunc` *must* receive three arguments and, more specifically, its signature *must* be `VVN`. For this reason, `endrangefunc` should be stored without the signature, which is added, and hard-coded, at the calling place. The first argument is `\beg range label`, the second `\end range label`, and the last `\tl var to set`. Of course, `\tl var to set` must be set to a proper value, and that's the main task of the function. `endrangefunc` must also handle the case where `\zref@ifrefcontainsprop` is false, since `__zrefclever_get_ref_endrange:nnN` cannot take care of that. For this purpose, it may set `\tl var to set` to the special value `zc@missingproperty`, to signal a missing property for `__zrefclever_get_ref_endrange:nnN`.

An empty `endrangefunc` signals that no processing is to be made to the end range reference, that is, that it should be treated like any other one, as defined by the `ref` option. This may happen either because `endrange` was never set for the reference type, and empty is the value “returned” by `__zrefclever_get_rf_opt_tl:nnnN` for options not set, or because `endrange` was set to `ref` at some scope which happens to get precedence.

One thing I was divided about in this functionality was whether to (x-)expand the references before processing them, when such processing is required. At first sight, it makes sense to do so, since we are aiming at “removing common parts” as close as possible to the printed representation of the references (`cleveref` does expand them in `\crefstripprefix`). On the other hand, this brings some new challenges: if a fragile command gets there, we are in trouble; also, if a protected one gets there, though things won't break as badly, we may “strip” the macro and stay with different arguments, which will then end up in the input stream. I think `biblatex` is a good reference here, and it offers `\NumCheckSetup`, `\NumsCheckSetup`, and `\PagesCheckSetup` aimed at locally redefining some commands which may interfere with the processing. This is a good idea, thus we offer a similar hook for the same purpose: `endrange-setup`.

```

1625 \NewHook { zref-clever/endrange-setup }
1626 \keys_define:nn { zref-clever/reference }
1627   {
1628     endrange .code:n =
1629     {
1630       \str_case:nnF {#1}
1631       {
1632         { ref }
1633         {

If the range came about by normal compression, we already know the beginning and the end references share the same “form” and “prefix” (this is ensured at `__zrefclever_labels_in_sequence:nn`), but the same is not true if the `range` option is being used, in which case, we have to check the replacement `\l__zrefclever_ref_property_tl` by `\l__zrefclever_endrangeprop_tl` is really granted.

range and rangetopair options

The `rangetopair` option is being handled with other reference format option booleans at `\g__zrefclever_rf_opts_bool_maybe_type_specific_seq`.

```

1968 \bool_new:N \l__zrefclever_typeset_range_bool
1969 \keys_define:nn { zref-clever/reference }
1970 {
1971     range .bool_set:N = \l__zrefclever_typeset_range_bool ,
1972     range .initial:n = false ,
1973     range .default:n = true ,
1974 }

```

cap and capfirst options

The `cap` option is currently being handled with other reference format option booleans at `\g__zrefclever_rf_opts_bool_maybe_type_specific_seq`.

```

1975 \bool_new:N \l__zrefclever_capfirst_bool
1976 \keys_define:nn { zref-clever/reference }
1977 {
1978     capfirst .bool_set:N = \l__zrefclever_capfirst_bool ,
1979     capfirst .initial:n = false ,
1980     capfirst .default:n = true ,
1981 }

```

abbrev and noabbrevfirst options

The `abbrev` option is currently being handled with other reference format option booleans at `\g__zrefclever_rf_opts_bool_maybe_type_specific_seq`.

```

1982 \bool_new:N \l__zrefclever_noabbrev_first_bool
1983 \keys_define:nn { zref-clever/reference }
1984 {
1985     noabbrevfirst .bool_set:N = \l__zrefclever_noabbrev_first_bool ,
1986     noabbrevfirst .initial:n = false ,
1987     noabbrevfirst .default:n = true ,
1988 }

```

S option

```

1989 \keys_define:nn { zref-clever/reference }
1990 {
1991     S .meta:n =

```

```

1992     { capfirst = {#1} , noabbrevfirst = {#1} },
1993     S .default:n = true ,
1994 }

```

hyperref option

```

1995 \bool_new:N \l__zrefclever_hyperlink_bool
1996 \bool_new:N \l__zrefclever_hyperref_warn_bool
1997 \keys_define:nn { zref-clever/reference }
1998 {
1999     hyperref .choice: ,
2000     hyperref / auto .code:n =
2001     {
2002         \bool_set_true:N \l__zrefclever_hyperlink_bool
2003         \bool_set_false:N \l__zrefclever_hyperref_warn_bool
2004     } ,
2005     hyperref / true .code:n =
2006     {
2007         \bool_set_true:N \l__zrefclever_hyperlink_bool
2008         \bool_set_true:N \l__zrefclever_hyperref_warn_bool
2009     } ,
2010     hyperref / false .code:n =
2011     {
2012         \bool_set_false:N \l__zrefclever_hyperlink_bool
2013         \bool_set_false:N \l__zrefclever_hyperref_warn_bool
2014     } ,
2015     hyperref .initial:n = auto ,
2016     hyperref .default:n = true ,

```

`nohyperref` is provided mainly as a means to inhibit hyperlinking locally in `zref-vario`'s commands without the need to be setting `zref-clever`'s internal variables directly. What limits setting `hyperref` out of the preamble is that enabling hyperlinks requires loading packages. But `nohyperref` can only disable them, so we can use it in the document body too.

```

2017     nohyperref .meta:n = { hyperref = false } ,
2018     nohyperref .value_forbidden:n = true ,
2019 }

```

lang option

The overall setup here seems a little roundabout, but this is actually required. In the preamble, we (potentially) don't yet have values for the "current" and "main" document languages, this must be retrieved at a `begindocument` hook. The `begindocument` hook is responsible to get values for `\l__zrefclever_current_language_tl` and `\l__zrefclever_main_language_tl`, and to set the default for `\l__zrefclever_ref_language_tl`. Package options, or preamble calls to `\zcsetup` are also hooked at `begindocument`, but come after the first hook, so that the pertinent variables have been set when they are executed. Finally, we set a third `begindocument` hook, at `begindocument/before`, so that it runs after any options set in the preamble. This hook redefines the `lang` option for immediate execution in the document body, and ensures the `current` language's language file gets loaded, if it hadn't been already.

For the `babel` and `polyglossia` variables which store the "current" and "main" languages, see <https://tex.stackexchange.com/a/233178>, including comments, particularly the one by Javier Bezos. For the `babel` and `polyglossia` variables which store the list of loaded languages, see <https://tex.stackexchange.com/a/281220>, including comments, particularly PLK's. Note, however, that languages loaded by `\babelprovide`, either directly, "on the fly", or with the `provide` option, do not get included in `\bbl@loaded`.

```

2148    },
2149  }
2150 }
2151 }

```

d option

For setting the declension case. Short for convenience and for not polluting the markup too much given that, for languages that need it, it may get to be used frequently.

‘samcarter’ and Alan Munn provided useful comments about declension on the TeX.SX chat. Also, Florent Rougon’s efforts in this area, with the `x cref` package (<https://github.com/frougon/x cref>), have been an insightful source to frame the problem in general terms.

```

2152 \tl_new:N \l_zrefclever_ref_decl_case_tl

2308     }
2309   }
2310 }
```

countertype option

\l__zrefclever_counter_type_prop is used by `zc@type` property, and stores a mapping from “counter” to “reference type”. Only those counters whose type name is different from that of the counter need to be specified, since `zc@type` presumes the counter as the type if the counter is not found in \l__zrefclever_counter_type_prop.

```

2311 \prop_new:N \l__zrefclever_counter_type_prop
2312 \keys_define:nn { zref-clever/label }
2313   {
2314     countertype .code:n =
2315     {
2316       \keyval_parse:nnn
2317       {
2318         \msg_warning:nnnn { zref-clever }
2319           { key-requires-value } { countertype }
2320       }
2321       {
2322         \__zrefclever_prop_put_non_empty:Nnn
2323           \l__zrefclever_counter_type_prop
2324       }
2325     {#1}
2326   },
2327   countertype .value_required:n = true ,
2328   countertype .initial:n =
2329   {
2330     subsection    = section ,
2331     subsubsection = section ,
2332     subparagraph = paragraph ,
2333     enumi        = item ,
2334     enumii       = item ,
2335     enumiii      = item ,
2336     enumiv       = item ,
2337     mfootnote    = footnote ,
2338   },
2339 }
```

One interesting comment I received (by Denis Bitouzé, at issue #1) about the most appropriate type for `paragraph` and `subparagraph` counters was that the reader of the document does not care whether that particular document structure element has been introduced by `\paragraph` or, e.g. by the `\subsubsection` command. This is a difference the author knows, as they’re using L^AT_EX, but to the reader the difference between them

is not really relevant, and it may be just confusing to refer to them by different names. In this case the type for `paragraph` and `subparagraph` should just be `section`. I don't have a strong opinion about this, and the matter was not pursued further. Besides, I presume not many people would set `secnumdepth` so high to start with. But, for the time being, I left the `paragraph` type for them, since there is actually a visual difference to the reader between the `\subsubsection` and `\paragraph` in the standard classes: up to the former, the sectioning commands break a line before the following text, while, from the later on, the sectioning commands and the following text are part of the same line. So, `\paragraph` is actually different from "just a shorter way to write `\subsubsubsection`".

`counterresetters` option

`\l__zrefclever_counter_resetters_seq` is used by `__zrefclever_counter_reset_by:n` to populate the `zc@enclval` property, and stores the list of counters which are potential "enclosing counters" for other counters. This option is constructed such that users can only *add* items to the variable. There would be little gain and some risk in allowing removal, and the syntax of the option would become unnecessarily more complicated. Besides, users can already override, for any particular counter, the search done from the set in `\l__zrefclever_counter_resetters_seq` with the `counterresetby` option.

```

2340 \seq_new:N \l__zrefclever_counter_resetters_seq
2341 \keys_define:nn { zref-clever/label }
2342 {
2343     counterresetters .code:n =
2344     {
2345         \clist_map_inline:nn {#1}
2346         {
2347             \seq_if_in:NnF \l__zrefclever_counter_resetters_seq {##1}
2348             {
2349                 \seq_put_right:Nn
2350                 \l__zrefclever_counter_resetters_seq {##1}
2351             }
2352         }
2353     },
2354     counterresetters .initial:n =
2355     {
2356         part ,
2357         chapter ,
2358         section ,
2359         subsection ,
2360         subsubsection ,
2361         paragraph ,
2362         subparagraph ,
2363     },
2364     counterresetters .value_required:n = true ,
2365 }
```

`counterresetby` option

`\l__zrefclever_counter_resetby_prop` is used by `__zrefclever_counter_reset_by:n` to populate the `zc@enclval` property, and stores a mapping from counters to the

counter which resets each of them. This mapping has precedence in `_zrefclever_counter_reset_by:n` over the search through `\l_zrefclever_counter_resetters_seq`.

```

2366 \prop_new:N \l__zrefclever_counter_resetby_prop
2367 \keys_define:nn { zref-clever/label }
2368 {
2369   counterresetby .code:n =
2370   {
2371     \keyval_parse:nnn
2372     {
2373       \msg_warning:nnn { zref-clever }
2374         { key-requires-value } { counterresetby }
2375     }
2376     {
2377       \_zrefclever_prop_put_non_empty:Nnn
2378         \l__zrefclever_counter_resetby_prop
2379     }
2380     {#1}
2381   },
2382   counterresetby .value_required:n = true ,
2383   counterresetby .initial:n =
2384   {

```

The counters for the `enumerate` environment do not use the regular counter machinery for resetting on each level, but are nested nevertheless by other means, treat them as exception.

```

2385   enumii  = enumi  ,
2386   enumiii = enumii ,
2387   enumiv  = enumiii ,
2388   },
2389 }
```

currentcounter option

`\l__zrefclever_current_counter_tl` is pretty much the starting point of all of the data specification for label setting done by `zref` with our setup for it. It exists because we must provide some “handle” to specify the current counter for packages/features that do not set `\@currentcounter` appropriately.

```

2390 \tl_new:N \l__zrefclever_current_counter_tl
2391 \keys_define:nn { zref-clever/label }
2392 {
2393   currentcounter .tl_set:N = \l__zrefclever_current_counter_tl ,
2394   currentcounter .value_required:n = true ,
2395   currentcounter .initial:n = \@currentcounter ,
2396 }
```

nocompat option

```

2397 \bool_new:N \g__zrefclever_nocompat_bool
2398 \seq_new:N \g__zrefclever_nocompat_modules_seq
2399 \keys_define:nn { zref-clever/reference }
2400 {
2401   nocompat .code:n =
```

```

2402 {
2403     \tl_if_empty:nTF {#1}
2404     { \bool_gset_true:N \g__zrefclever_nocompat_bool }
2405     {

2425         }
2426     }
2427 }
2428 \AtEndOfPackage
2429 {
2430     \AddToHook { begindocument }
2431     {
2432         \seq_map_inline:Nn \g__zrefclever_nocompat_modules_seq
2433         { \msg_warning:nnn { zref-clever } { unknown-compat-module } {#1} }
2434     }
2435 }

```

_zrefclever_compat_module:nn

Function to be used for compatibility modules loading. It should load the module as long as `\l__zrefclever_nocompat_bool` is false and `\langle module \rangle` is not in `\l__zrefclever_nocompat_modules_seq`. The `begindocument` hook is needed so that we can have the option functional along the whole preamble, not just at package load time. This requirement might be relaxed if we made the option only available at load time, but this would not buy us much leeway anyway, since for most compatibility modules, we must test for the presence of packages at `begindocument`, only kernel features and document classes could be checked reliably before that. Besides, since we are using the new hook management system, there is always its functionality to deal with potential loading order issues.

```

\_zrefclever_compat_module:nn {\langle module \rangle} {\langle code \rangle}

2436 \cs_new_protected:Npn \_zrefclever_compat_module:nn #1#2
2437 {
2438     \AddToHook { begindocument }
2439     {
2440         \bool_if:NF \g__zrefclever_nocompat_bool
2441             { \seq_if_in:NnF \g__zrefclever_nocompat_modules_seq {#1} {#2} }

```

```

2442           \seq_gremove_all:Nn \g__zrefclever_nocompat_modules_seq {#1}
2443       }
2444   }

```

(End definition for `_zrefclever_compatible:nn`.)

Reference options

This is a set of options related to reference typesetting which receive equal treatment and, hence, are handled in batch. Since we are dealing with options to be passed to `\zref` or to `\zcsetup` or at load time, only “not necessarily type-specific” options are pertinent here.

```

2445 \seq_map_inline:Nn
2446   \g__zrefclever_rf_opts_tl_reference_seq
2447   {

2551 }
2552 }
```

Package options

The options have been separated in two different groups, so that we can potentially apply them selectively to different contexts: `label` and `reference`. Currently, the only use of this selection is the ability to exclude label related options from `\zref`'s options. Anyway, for package options (`\zcsetup`) we want the whole set, so we aggregate the two into `zref-clever/zcsetup`, and use that here.

```

2553 \keys_define:nn { }
2554   {
2555     zref-clever/zcsetup .inherit:n =
2556     {
2557       zref-clever/label ,
2558       zref-clever/reference ,
2559     }
2560 }
```

`zref-clever` does not accept load-time options. Despite the tradition of so doing, Joseph Wright has a point in recommending otherwise at <https://chat.stackexchange.com/transcript/message/60360822#60360822>: separating “loading the package” from “configuring the package” grants less trouble with “option clashes” and with expansion of options at load-time.

```

2561 \bool_lazy_and:nnT
2562   { \tl_if_exist_p:c { opt@ zref-clever.sty } }
2563   { ! \tl_if_empty_p:c { opt@ zref-clever.sty } }
2564   { \msg_warning:nn { zref-clever } { load-time-options } }
```

5 Configuration

5.1 `\zcsetup`

`\zcsetup` Provide `\zcsetup`.

```

\zcsetup{<options>}

2565 \NewDocumentCommand \zcsetup { m }
2566   { \__zrefclever_zcsetup:n {#1} }

(End definition for \zcsetup.)
```

`__zrefclever_zcsetup:n` A version of `\zcsetup` for internal use with variant.

```

  \__zrefclever_zcsetup:n{options}
2567 \cs_new_protected:Npn \__zrefclever_zcsetup:n #1
2568   { \keys_set:nn { zref-clever/zcsetup } {#1} }
2569 \cs_generate_variant:Nn \__zrefclever_zcsetup:n { x }

(End definition for \__zrefclever_zcsetup:n.)

```

5.2 \zcRefTypeSetup

\zcRefTypeSetup is the main user interface for “type-specific” reference formatting. Settings done by this command have a higher precedence than any language-specific setting, either done at \zcLanguageSetup or by the package’s language files. On the other hand, they have a lower precedence than non type-specific general options. The *<options>* should be given in the usual `key=val` format. The *<type>* does not need to pre-exist, the property list variable to store the properties for the type gets created if need be.

```

\zcRefTypeSetup      \zcRefTypeSetup {<type>} {<options>}
2570 \NewDocumentCommand \zcRefTypeSetup { m m }
2571   {
2572     \tl_set:Nn \l__zrefclever_setup_type_tl {#1}
2573     \keys_set:nn { zref-clever/typesetup } {#2}
2574     \tl_clear:N \l__zrefclever_setup_type_tl
2575   }

(End definition for \zcRefTypeSetup.)

5.3 \zcLanguageSetup

\zcLanguageSetup is the main user interface for “language-specific” reference formatting, be it “type-specific” or not. The difference between the two cases is captured by the `type` key, which works as a sort of a “switch”. Inside the `(options)` argument of \zcLanguageSetup, any options made before the first `type` key declare “default” (non type-specific) language options. When the `type` key is given with a value, the options following it will set “type-specific” language options for that type. The current type can be switched off by an empty `type` key. \zcLanguageSetup is preamble only.

```

\zcLanguageSetup
  \zcLanguageSetup{<language>}{<options>}
  2832 \NewDocumentCommand \zcLanguageSetup { m m }

6 User interface

6.1 \zref

\zref The main user command of the package.

```

\zref(*){}{}
3375 \NewDocumentCommand \zref { s O { } m }
3376   { \zref@wrapper@babel \_zrefclever_zref:nnn {#3} {#1} {#2} }

(End definition for \zref.)

```

_zrefclever_zref:nnnn An intermediate internal function, which does the actual heavy lifting, and places {\labels} as first argument, so that it can be protected by \zref@wrapper@babel in \zref.

```
\_zrefclever_zref:nnnn {\labels} {*} {options}
```

```

3377 \cs_new_protected:Npn \__zrefclever_zcref:nnn #1#2#3
3378   {
3379     \group_begin:

```

Set options.

```

3380       \keys_set:nn { zref-clever/reference } {#3}

```

Store arguments values.

```

3381       \seq_set_from_clist:Nn \l__zrefclever_zcref_labels_seq {#1}
3382       \bool_set:Nn \l__zrefclever_link_star_bool {#2}

```

Ensure language file for reference language is loaded, if available. We cannot rely on `\keys_set:nn` for the task, since if the `lang` option is set for `current`, the actual language may have changed outside our control. `__zrefclever_provide_langfile:x` does nothing if the language file is already loaded.

```

3383     \__zrefclever_provide_langfile:x { \l__zrefclever_ref_language_tl }

```

Process language settings.

```

3384     \__zrefclever_process_language_settings:

```

Integration with zref-check.

```

3385       \bool_lazy_and:nnT

3422 \bool_new:N \l__zrefclever_link_star_bool

```

(End definition for `\l__zrefclever_zcref_labels_seq` and `\l__zrefclever_link_star_bool`.)

6.2 \zcpageref

`\zcpageref` A `\pageref` equivalent of `\zcref`.

```

\zcpageref(*)[<options>]{<labels>}
3423 \NewDocumentCommand \zcpageref { s O{ } m }
3424 {
3425   \group_begin:
3426   \IfBooleanT {#1}
3427     { \bool_set_false:N \l__zrefclever_hyperlink_bool }
3428     \zcref [#2, ref = page] {#3}
3429   \group_end:
3430 }

```

(End definition for `\zcpageref`.)

7 Sorting

Sorting is certainly a “big task” for zref-clever but, in the end, it boils down to “carefully done branching”, and quite some of it. The sorting of “page” references is very much lightened by the availability of `abspage`, from the `zref-abspage` module, which offers “just what we need” for our purposes. The sorting of “default” references falls on two main cases: i) labels of the same type; ii) labels of different types. The first case is sorted according to the priorities set by the `typesort` option or, if that is silent for the case, by the order in which labels were given by the user in `\zcref`. The second case is the most involved one, since it is possible for multiple counters to be bundled together in a single reference type. Because of this, sorting must take into account the whole chain of “enclosing counters” for the counters of the labels at hand.

`\l_zrefclever_label_type_a_tl`
`\l_zrefclever_label_type_b_tl`
`\l_zrefclever_label_enclval_a_tl`
`\l_zrefclever_label_enclval_b_tl`
`\l_zrefclever_label_extdoc_a_tl`
`\l_zrefclever_label_extdoc_b_tl`

Auxiliary variables, for use in sorting, and some also in typesetting. Used to store reference information – label properties – of the “current” (a) and “next” (b) labels.

```

3431 \tl_new:N \l_zrefclever_label_type_a_tl
3432 \tl_new:N \l_zrefclever_label_type_b_tl
3433 \tl_new:N \l_zrefclever_label_enclval_a_tl
3434 \tl_new:N \l_zrefclever_label_enclval_b_tl
3435 \tl_new:N \l_zrefclever_label_extdoc_a_tl
3436 \tl_new:N \l_zrefclever_label_extdoc_b_tl

```

(End definition for `\l_zrefclever_label_type_a_tl` and others.)

`\l_zrefclever_sort_decided_bool`

Auxiliary variable for `__zrefclever_sort_default_same_type:nn`, signals if the sorting between two labels has been decided or not.

```

3437 \bool_new:N \l_zrefclever_sort_decided_bool

```

(End definition for `\l_zrefclever_sort_decided_bool`.)

`\l_zrefclever_sort_prior_a_int`
`\l_zrefclever_sort_prior_b_int`

Auxiliary variables for `__zrefclever_sort_default_different_types:nn`. Store the sort priority of the “current” and “next” labels.

```

3438 \int_new:N \l_zrefclever_sort_prior_a_int
3439 \int_new:N \l_zrefclever_sort_prior_b_int

```

(End definition for `\l_zrefclever_sort_prior_a_int` and `\l_zrefclever_sort_prior_b_int`.)

`\l_zrefclever_label_types_seq`

Stores the order in which reference types appear in the label list supplied by the user in `\zref`. This variable is populated by `__zrefclever_label_type_put_new_right:n` at the start of `__zrefclever_sort_labels::`. This order is required as a “last resort” sort criterion between the reference types, for use in `__zrefclever_sort_default_different_types:nn`.

```

3440 \seq_new:N \l_zrefclever_label_types_seq

```

(End definition for `\l_zrefclever_label_types_seq`.)

`__zrefclever_sort_labels:`

The main sorting function. It does not receive arguments, but it is expected to be run inside `__zrefclever_zref:nnnn` where a number of environment variables are to be set appropriately. In particular, `\l_zrefclever_zref_labels_seq` should contain the labels received as argument to `\zref`, and the function performs its task by sorting this variable.

```

3441 \cs_new_protected:Npn \__zrefclever_sort_labels:
3442 {

```

Store label types sequence.

```

3443     \seq_clear:N \l_zrefclever_label_types_seq
3444     \tl_if_eq:NnF \l_zrefclever_ref_property_tl { page }
3445     {
3446         \seq_map_function:NN \l_zrefclever_zref_labels_seq
3447             \__zrefclever_label_type_put_new_right:n
3448     }

```

Sort.

```

3449   \seq_sort:Nn \l__zrefclever_zcref_labels_seq
350   {
351     \zref@ifrefundefined {##1}
352     {
353       \zref@ifrefundefined {##2}
354       {
355         % Neither label is defined.
356         \sort_return_same:
357       }
358     }
359     % The second label is defined, but the first isn't, leave the
360     % undefined first (to be more visible).
361     \sort_return_same:
362   }
363 }
364 {
365   \zref@ifrefundefined {##2}
366   {
367     % The first label is defined, but the second isn't, bring the
368     % second forward.
369     \sort_return_swapped:
370   }
371   {
372     % The interesting case: both labels are defined. References
373     % to the "default" property or to the "page" are quite
374     % different with regard to sorting, so we branch them here to
375     % specialized functions.
376     \tl_if_eq:NnTF \l__zrefclever_ref_property_tl { page }
377     { \__zrefclever_sort_page:nn {##1} {##2} }
378     { \__zrefclever_sort_default:nn {##1} {##2} }
379   }
380 }
381 }
382 }
```

(End definition for `__zrefclever_sort_labels`.)

`__zrefclever_label_type_put_new_right:n`

Auxiliary function used to store the order in which reference types appear in the label list supplied by the user in `\zcref`. It is expected to be run inside `__zrefclever_sort_labels`, and stores the types sequence in `\l__zrefclever_label_types_seq`. I have tried to handle the same task inside `\seq_sort:Nn` in `__zrefclever_sort_labels`: to spare mapping over `\l__zrefclever_zcref_labels_seq`, but it turned out it not to be easy to rely on the order the labels get processed at that point, since the variable is being sorted there. Besides, the mapping is simple, not a particularly expensive operation. Anyway, this keeps things clean.

```

\__zrefclever_label_type_put_new_right:n {<label>}
3483 \cs_new_protected:Npn \__zrefclever_label_type_put_new_right:n #1
3484 {
3485   \__zrefclever_extract_default:Nnnn
3486   \l__zrefclever_label_type_a_tl {#1} { zc@type } { }
3487   \seq_if_in:NVF \l__zrefclever_label_types_seq
```

```

3488     \l__zrefclever_label_type_a_tl
3489     {
3490         \seq_put_right:NV \l__zrefclever_label_types_seq
3491             \l__zrefclever_label_type_a_tl
3492     }
3493 }
```

(End definition for `__zrefclever_label_type_put_new_right:n`.)

`__zrefclever_sort_default:nn`

The heavy-lifting function for sorting of defined labels for “default” references (that is, a standard reference, not to “page”). This function is expected to be called within the sorting loop of `__zrefclever_sort_labels`: and receives the pair of labels being considered for a change of order or not. It should *always* “return” either `\sort_return_same`: or `\sort_return_swapped`:

```

\__zrefclever_sort_default:nn {\label a} {\label b}

3494 \cs_new_protected:Npn \__zrefclever_sort_default:nn #1#2
3495 {
3496     \__zrefclever_extract_default:Nnnn
3497         \l__zrefclever_label_type_a_tl {#1} {zc@type} {zc@missingtype}
3498     \__zrefclever_extract_default:Nnnn
3499         \l__zrefclever_label_type_b_tl {#2} {zc@type} {zc@missingtype}
3500
3501     \tl_if_eq:NNTF
3502         \l__zrefclever_label_type_a_tl
3503         \l__zrefclever_label_type_b_tl
3504         { \__zrefclever_sort_default_same_type:nn {#1} {#2} }
3505         { \__zrefclever_sort_default_different_types:nn {#1} {#2} }
3506 }
```

(End definition for `__zrefclever_sort_default:nn`.)

`__zrefclever_sort_default_same_type:nn`

```

\__zrefclever_sort_default_same_type:nn {\label a} {\label b}

3507 \cs_new_protected:Npn \__zrefclever_sort_default_same_type:nn #1#2

`__zrefclever_sort_page:nn`

The sorting function for sorting of defined labels for references to “page”. This function is expected to be called within the sorting loop of `__zrefclever_sort_labels:` and receives the pair of labels being considered for a change of order or not. It should *always* “return” either `\sort_return_same:` or `\sort_return_swapped:`. Compared to the sorting of default labels, this is a piece of cake (thanks to `abspage`).

```

\__zrefclever_sort_page:nn {<label a>} {<label b>}
3689 \cs_new_protected:Npn \__zrefclever_sort_page:nn #1#2
3690   {
3691     \int_compare:nNnTF
3692       { \__zrefclever_extract:nnn {#1} { abspage } { -1 } }

3695       { \sort_return_swapped: }
3696       { \sort_return_same: }
3697   }

```

(End definition for `__zrefclever_sort_page:nn`.)

8 Typesetting

“Typesetting” the reference, which here includes the parsing of the labels and eventual compression of labels in sequence into ranges, is definitely the “crux” of `zref-clever`. This because we process the label set as a stack, in a single pass, and hence “parsing”, “compressing”, and “typesetting” must be decided upon at the same time, making it difficult to slice the job into more specific and self-contained tasks. So, do bear this in mind before you curse me for the length of some of the functions below, or before a more orthodox “docstripper” complains about me not sticking to code commenting conventions to keep the code more readable in the `.dtx` file.

While processing the label stack (kept in `\l__zrefclever_typeset_labels_seq`), `__zrefclever_typeset_refs:` “sees” two labels, and two labels only, the “current” one (kept in `\l__zrefclever_label_a_tl`), and the “next” one (kept in `\l__zrefclever_label_b_tl`). However, the typesetting needs (a lot) more information than just these two immediate labels to make a number of critical decisions. Some examples: i) We cannot know if labels “current” and “next” of the same type are a “pair”, or just “elements in a list”, until we examine the label after “next”; ii) If the “next” label is of the same type as the “current”, and it is in immediate sequence to it, it potentially forms a “range”, but we cannot know if “next” is actually the end of the range until we examined an arbitrary number of labels, and found one which is not in sequence from the previous one; iii)

When processing a type block, the “name” comes first, however, we only know if that name should be plural, or if it should be included in the hyperlink, after processing an arbitrary number of labels and find one of a different type. One could naively assume that just examining “next” would be enough for this, since we can know if it is of the same type or not. Alas, “there be ranges”, and a compression operation may boil down to a single element, so we have to process the whole type block to know how its name should be typeset; iv) Similar issues apply to lists of type blocks, each of which is of arbitrary length: we can only know if two type blocks form a “pair” or are “elements in a list” when we finish the block. Etc. etc. etc.

We handle this by storing the reference “pieces” in “queues”, instead of typesetting them immediately upon processing. The “queues” get typeset at the point where all the information needed is available, which usually happens when a type block finishes (we see something of a different type in “next”, signaled by `\l_zrefclever_last_of_type_bool`), or the stack itself finishes (has no more elements, signaled by `\l_zrefclever_typeset_last_bool`). And, in processing a type block, the type “name” gets added last (on the left) of the queue. The very first reference of its type always follows the name, since it may form a hyperlink with it (so we keep it stored separately, in `\l_zrefclever_type_first_label_t1`, with `\l_zrefclever_type_first_label_type_t1` being its type). And, since we may need up to two type blocks in storage before typesetting, we have two of these “queues”: `\l_zrefclever_typeset_queue_curr_t1` and `\l_zrefclever_typeset_queue_prev_t1`.

Some of the relevant cases (e.g., distinguishing “pair” from “list”) are handled by counters, the main ones are: one for the “type” (`\l_zrefclever_type_count_int`) and one for the “label in the current type block” (`\l_zrefclever_label_count_int`).

Range compression, in particular, relies heavily on counting to be able do distinguish relevant cases. `\l_zrefclever_range_count_int` counts the number of elements in the current sequential “streak”, and `\l_zrefclever_range_same_count_int` counts the number of *equal* elements in that same “streak”. The difference between the two allows us to distinguish the cases in which a range actually “skips” a number in the sequence, in which case we should use a range separator, from when they are after all just contiguous, in which case a pair separator is called for. Since, as usual, we can only know this when a arbitrary long “streak” finishes, we have to store the label which (potentially) begins a range (kept in `\l_zrefclever_range_beg_label_t1`). `\l_zrefclever_next_maybe_range_bool` signals when “next” is potentially a range with “current”, and `\l_zrefclever_next_is_same_bool` when their values are actually equal.

One further thing to discuss here – to keep this “on record” – is inhibition of compression for individual labels. It is not difficult to handle it at the infrastructure side, what gets sloppy is the user facing syntax to signal such inhibition. For some possible alternatives for this, suggested by Enrico Gregorio, Phelype Oleinik, and Steven B. Segletes (and good ones at that) see <https://tex.stackexchange.com/q/611370>. Yet another alternative would be an option receiving the label(s) not to be compressed, this would be a repetition, but would keep the syntax clean. All in all, probably the best is simply not to allow individual inhibition of compression. We can already control compression of each `\zref` call with existing options, this should be enough. I don’t think the small extra flexibility individual label control for this would grant is worth the syntax disruption it would entail. Anyway, it would be easy to deal with this in case the need arose, by just adding another condition (coming from whatever the chosen syntax was) when we check for `_zrefclever_labels_in_sequence:nn` in `_zrefclever_typeset_refs_not_last_of_type::`. But I remain unconvinced of the pertinence of doing so.

```

(End definition for `\l_zrefclever_typeset_refs:`)

This is actually the one meaningful “big branching” we can do while processing the label stack: i) the “current” label is the last of its type block; or ii) the “current” label is *not* the last of its type block. Indeed, as mentioned above, quite a number of things can only be decided when the type block ends, and we only know this when we look at the “next” label and find something of a different “type” (loose here, maybe different definition status, maybe end of stack). So, though this is not very strict, `\l_zrefclever_typeset_refs_last_of_type:` is more of a “wrapping up” function, and it is indeed

the one which does the actual typesetting, while `_zrefclever_typeset_refs_not_last_of_type`: is more of an “accumulation” function.

```
\_zrefclever_typeset_refs_last_of_type: Handles typesetting when the current label is the last of its type.

Auxiliary functions

`__zrefclever_get_ref:nN` and `__zrefclever_get_ref_first:` are the two functions which actually build the reference blocks for typesetting. `__zrefclever_get_ref:nN` handles all references but the first of its type, and `__zrefclever_get_ref_first:` deals with the first reference of a type. Saying they do “typesetting” is imprecise though, they actually prepare material to be accumulated in `\l__zrefclever_typeset_queue_curr_tl` inside `__zrefclever_typeset_refs_last_of_type:` and `__zrefclever_typeset_refs_not_last_of_type::`. And this difference results quite crucial for the TeXnical requirements of these functions. This because, as we are processing the label stack and accumulating content in the queue, we are using a number of variables which are transient to the current label, the label properties among them, but not only. Hence, these variables *must* be expanded to their current values to be stored in the queue. Indeed, `__zrefclever_get_ref:nN` and `__zrefclever_get_ref_first:` get called, as they must, in the context of `x` type expansions. But we don’t want to expand the values of the variables themselves, so we need to get current values, but stop expansion after that. In particular, reference options given by the user should reach the stream for its final typesetting (when the queue itself gets typeset) *unmodified* (“no manipulation”, to use the `n` signature jargon). We also need to prevent premature expansion of material that can’t be expanded at this point (e.g. grouping, `\zref@default` or `\hyper@@link`). In a nutshell, the job of these two functions is putting the pieces in place, but with proper expansion control.

`__zrefclever_ref_default:` Default values for undefined references and undefined type names, respectively. We are ultimately using `\zref@default`, but calls to it should be made through these internal functions, according to the case. As a bonus, we don’t need to protect them with `\exp-not:N`, as `\zref@default` would require, since we already define them protected.

```

4677 \cs_new_protected:Npn \__zrefclever_ref_default:
4678   { \zref@default }
4679 \cs_new_protected:Npn \__zrefclever_name_default:
4680   { \zref@default }

```

(End definition for `_zrefclever_ref_default:` and `_zrefclever_name_default::`)

`_zrefclever_get_ref:nN` Handles a complete reference block to be accumulated in the “queue”, including refbounds, and hyperlinking. For use with all labels, except the first of its type, which is done by `_zrefclever_get_ref_first::`, and the last of a range, which is done by `_zrefclever_get_ref_endrange:nnN`.

(End definition for `_zrefclever_get_ref_first:..`)

`_zrefclever_type_name_setup:` Auxiliary function to `_zrefclever_typeset_refs_last_of_type:..`. It is responsible for setting the type name variable `\l_zrefclever_type_name_t1` and `\l_zrefclever_name_in_link_bool`. If a type name can't be found, `\l_zrefclever_type_name_t1` is cleared. The function takes no arguments, but is expected to be called in `_zrefclever_typeset_refs_last_of_type:..` right before `_zrefclever_get_ref_first:..`, which is the main consumer of the variables it sets, though not the only one (and hence this cannot be moved into `_zrefclever_get_ref_first:..` itself). It also expects a number of relevant variables to have been appropriately set, and which it uses, prominently `\l_zrefclever_type_first_label_type_t1`, but also the queue itself in `\l_zrefclever_typeset_queue_curr_t1`, which should be "ready except for the first label", and the type counter `\l_zrefclever_type_count_int`.

(End definition for `__zrefclever_extract_url_unexp:n`.)

`__zrefclever_labels_in_sequence:nn` Auxiliary function to `__zrefclever_typeset_refs_not_last_of_type:`. Sets `\l__zrefclever_next_maybe_range_bool` to true if `\langle label b \rangle` comes in immediate sequence from `\langle label a \rangle`. And sets both `\l__zrefclever_next_maybe_range_bool` and `\l__zrefclever_next_is_same_bool` to true if the two labels are the “same” (that is, have the same counter value). These two boolean variables are the basis for all range and compression handling inside `__zrefclever_typeset_refs_not_last_of_type:`, so this function is expected to be called at its beginning, if compression is enabled.

```

\__zrefclever_labels_in_sequence:nn {\langle label a \rangle} {\langle label b \rangle}

```

If `zc@counters` are equal, `zc@enclvals` are equal, and `zc@enclvals` are equal, but the references themselves are different, this means that `\@currentlabel` has somehow been set manually (e.g. by an `amsmath`'s `\tag`), in which case we have no idea what's in there, and we should not even consider this is still a range. If they are equal, though, of course it is a range, and it is the same.

9 Compatibility

This section is meant to aggregate any “special handling” needed for L^AT_EX kernel features, document classes, and packages, needed for zref-clever to work properly with them.

9.1 appendix

One relevant case of different reference types sharing the same counter is the `\appendix` which in some document classes, including the standard ones, change the sectioning commands looks but, of course, keep using the same counter. `book.cls` and `report.cls` reset counters `chapter` and `section` to 0, change `\@chapapp` to use `\appendixname` and use `\@Alph` for `\thechapter`. `article.cls` resets counters `section` and `subsection` to 0, and uses `\@Alph` for `\thesection`. `memoir.cls`, `scrbook.cls` and `scrarticle.cls` do the same as their corresponding standard classes, and sometimes a little more, but what interests us here is pretty much the same. See also the `appendix` package.

The standard `\appendix` command is a one way switch, in other words, it cannot be reverted (see <https://tex.stackexchange.com/a/444057>). So, even if the fact that it is a “switch” rather than an environment complicates things, because we have to make ungrouped settings to correspond to its effects, in practice this is not a big deal, since these settings are never really reverted (by default, at least). Hence, hooking into `\appendix` is a viable and natural alternative. The `memoir` class and the `appendix` package define the `appendices` and `subappendices` environments, which provide for a way for the appendix to “end”, but in this case, of course, we can hook into the environment instead.

```

5295 \__zrefclever_compat_module:nn { appendix }
5296   {
5297     \AddToHook { cmd / appendix / before }
5298     {
5299       \__zrefclever_zcsetup:n
5300       {
5301         countertype =
5302         {
5303           chapter      = appendix ,
5304           section      = appendix ,
5305           subsection    = appendix ,
5306           subsubsection = appendix ,
5307           paragraph    = appendix ,
5308           subparagraph = appendix ,
5309         }
5310       }
5311     }
5312   }

```

Depending on the definition of `\appendix`, using the hook may lead to trouble with the first released version of `ltcmdhooks` (the one released with the 2021-06-01 kernel). Particularly, if the definition of the command being hooked at contains a double hash mark (##) the patch to add the hook, if it needs to be done with the `\scantokens`

method, may fail noisily (see <https://tex.stackexchange.com/q/617905>, with a detailed explanation and possible workaround by Phelype Oleinik). The 2021-11-15 kernel release already handles this gracefully, thanks to fix by Phelype Oleinik at <https://github.com/latex3/latex2e/pull/699>.

9.2 appendices

This module applies both to the `appendix` package, and to the `memoir` class, since it “emulates” the package.

```

5313 \__zrefclever_compat_module:nn { appendices }
5314   {
5315     \__zrefclever_if_package_loaded:nT { appendix }
5316     {

5366       paragraph    = appendix ,
5367       subparagraph = appendix ,
5368     } ,
5369   }
5370 }
5371 \msg_info:nnn { zref-clever } { compat-package } { appendix }
5372 }
5373 }
```

9.3 memoir

The `memoir` document class has quite a number of cross-referencing related features, mostly dealing with captions, subfloats, and notes. Some of them are implemented in ways which make difficult the use of `zref`, particularly `\zlabel`, short of redefining the whole stuff ourselves. Hopefully, these features are specialized enough to make `zref-clever` useful enough with `memoir` without much friction, but unless some support is added upstream, it is difficult not to be a little intrusive here.

1. Caption functionality which receives $\langle label \rangle$ as optional argument, namely:
 - (a) The `sidecaption` and `sidecontcaption` environments. These environments *store* the label in an internal macro, `\m@mscaplabel`, at the begin environment code (more precisely in `\@sidecaption`), but both the call to `\refstepcounter` and the expansion of `\m@mscaplabel` take place at `\endsidecaption`. For this reason, hooks are not particularly helpful, and there is not any easy way to grab the $\langle label \rangle$ argument to start with. I can see two ways to deal with these environments, none of which I really like. First, map through `\m@mscaplabel` until `\label` is found, then grab the next token which is the $\langle label \rangle$. This can be used to set a `\zlabel` either with a kernel environment hook, or with `\@mem@scap@afterhook` (the former requires running `\refstepcounter` on our own, since the `env/.../end` hook comes before this is done by `\endsidecaption`). Second, locally redefine `\label` to set both labels inside the environments.
 - (b) The bilingual caption commands: `\bitwonumcaption`, `\bionenumcaption`, and `\bicaption`. These commands do not support setting the label in their arguments (the labels do get set, but they end up included in the `title` property of the label too). So we do the same for them as for `sidecaption`, just taking care of grouping, since we can't count on the convenience of the environment hook (luckily for us, they are scoped themselves, so we can add an extra group there).
2. The `\subcaptionref` command, which makes a reference to the subcaption without the number of the main caption (e.g. “(b)”, instead of “2.3(b)”), for labels set inside

the $\langle subtitle \rangle$ argument of the subcaptioning commands, namely: `\subcaption`, `\contsubcaption`, `\subbottom`, `\contsubbottom`, `\subtop`. This functionality is implemented by `memoir` by setting a *second label* with prefix `sub@⟨label⟩`, and storing there just that part of interest. With `zref` this part is easier, since we can just add an extra property and retrieve it later on. The thing is that it is hard to find a place to hook into to add the property to the `main` list, since `memoir` does not really consider the possibility of some other command setting labels. `\@memsubcaption` is the best place to hook I could find. It is used by subcaptioning commands, and only those. And there is no hope for an environment hook in this case anyway.

3. `memoir`'s `\footnote`, `\verbfootnote`, `\sidefootnote` and `\pagenote`, just as the regular `\footnote` until recently in the kernel, do not set `\@currentcounter` alongside `\@currentlabel`, proper referencing to them requires setting the type for it.
4. Note that `memoir`'s appendix features “emulates” the `appendix` package, hence the corresponding compatibility module is loaded for `memoir` even if that package is not itself loaded. The same is true for the `\appendix` command module, since it is also defined.

```
5374 \__zrefclever_compat_module:nn { memoir }
5375   {
5376     \__zrefclever_if_class_loaded:nT { memoir }
5377       {
```

Add subfigure and subtable support out of the box. Technically, this is not “default” behavior for `memoir`, users have to enable it with `\newsubfloat`, but let this be smooth. Still, this does not cover any other floats created with `\newfloat`. Also include setup for `verse`.

```
5378   \__zrefclever_zcsetup:n
5379     {
5380       counterstype =

Add support for `captionbeside` and `captionofbeside` environments. These environments *do* run some variation of `\caption` and hence `\refstepcounter`. However, this happens inside a parbox inside the environment, thus grouped, such that we cannot see the variables set by `\refstepcounter` when we are setting the label. `\@currentlabel` is smuggled out of the group by KOMA, but the same care is not granted for `\@currentcounter`. So we have to rely on `\@capttype`, which the underlying caption infrastructure feeds to `\refstepcounter`. Since we must use `env/.../after` hooks, care should be taken not to set the `currentcounter` option unscoped, which would be quite disastrous. For this reason, though more “invasive”, we set `\@currentcounter` instead, which at least will be set straight the next time `\refstepcounter` runs. It sounds reasonable, it is the same treatment `\@currentlabel` is receiving in this case.

```

5450          \AddToHook { env / captionbeside / after }
5451          {
5452              \tl_if_exist:NT \@capttype

9.5 amsmath

About this, see <https://tex.stackexchange.com/a/402297>.

```

5473 \__zrefclever_compat_module:nn { amsmath }
5474 {
5475     \__zrefclever_if_package_loaded:nT { amsmath }
5476     {

```

First, we define a function for label setting inside `amsmath` math environments, we want it to set both `\zlabel` and `\label`. We may “get a ride”, but not steal the place altogether. This makes for potentially redundant labels, but seems a good compromise. We *must* use the lower level `\zref@label` in this context, and hence also handle protection with `\zref@wrapper@babel`, because `\zlabel` makes itself no-op when `\label` is equal

to `\ltx@gobble`, and that's precisely the case inside the `multiline` environment (and, damn!, I took a beating of this detail...).

```

5477      \cs_set_nopar:Npn \__zrefclever_ltxlabel:n #1
5478      {
5479          \__zrefclever_orig_ltxlabel:n {#1}
5480          \zref@wrapper@babel \zref@label {#1}
5481      }

```

Then we must store the original value of `\ltx@label`, which is the macro actually responsible for setting the labels inside `amsmath`'s math environments. And, after that, redefine it to be `__zrefclever_ltxlabel:n` instead. We must handle `hyperref` here, which comes very late in the preamble, and which loads `nameref` at `begindocument` (though this has changed recently 2022-05-16, see <https://github.com/latex3/hyperref/commit/a011ba9308a1b047dc151796de557da0bb22abaa>), which in turn, lets `\ltx@label` be `\label`. This has to come after `nameref`. Other classes/packages also redefine `\ltx@label`, which may cause some trouble. A grep on `texmf-dist` returns hits for: `thm-restate.sty`, `smartref.sty`, `jmlrbook.cls`, `cleveref.sty`, `cryptocode.sty`, `nameref.sty`, `easyeqn.sty`, `empheq.sty`, `ntheorem.sty`, `nccmath.sty`, `nwejm.cls`, `nwejmath.cls`, `aguplus.sty`, `aguplus.cls`, `agupp.sty`, `amsmath.hyp`, `amsmath.sty` (surprise!), `amsmath.4ht`, `nameref.4ht`, `frenchle.sty`, `french.sty`, plus corresponding documentations and different versions of the same packages. That's not too many, but not "just a few" either. The critical ones are explicitly handled here (`amsmath` itself, and `nameref`). A number of those I'm really not acquainted with. For `cleveref`, in particular, this procedure is not compatible with it. If we happen to come later than it and override its definition, this may be a substantial problem for `cleveref`, since it will find the label, but it won't contain the data it is expecting. However, this should normally not occur, if the user has followed the documented recommendation for `cleveref` to load it last, or at least very late, and besides I don't see much of an use case for using both `cleveref` and `zref-clever` together. I have documented in the user manual that this module may cause potential issues, and how to work around them. And I have made an upstream feature request for a hook, so that this could be made more cleanly at <https://github.com/latex3/hyperref/issues/212>.

```

5482      \__zrefclever_if_package_loaded:nTF { hyperref } 
5483      {
5484          \AddToHook { package / nameref / after } 
5485          {
5486              \cs_new_eq:NN \__zrefclever_orig_ltxlabel:n \ltx@label
5487              \cs_set_eq:NN \ltx@label \__zrefclever_ltxlabel:n
5488          }
5489      }
5490      {
5491          \cs_new_eq:NN \__zrefclever_orig_ltxlabel:n \ltx@label
5492          \cs_set_eq:NN \ltx@label \__zrefclever_ltxlabel:n
5493      }

```

The `subequations` environment uses `parentequation` and `equation` as counters, but only the latter is subject to `\refstepcounter`. What happens is: at the start, `equation` is refstepped, it is then stored in `parentequation` and set to '0' and, at the end of the environment it is restored to the value of `parentequation`. We cannot even set `\@currentcounter` at `env/.../begin`, since the call to `\refstepcounter{equation}` done by `subequations` will override that in sequence. Unfortunately, the suggestion to set `\@currentcounter` to `parentequation` here was not accepted, see <https://github.com/latex3/latex3/issues/100>

github.com/latex3/latex2e/issues/687#issuecomment-951451024 and subsequent discussion. So, for `subequations`, we really must specify manually `currentcounter` and the resetting. Note that, for `subequations`, `\zlabel` works just fine (that is, if given immediately after `\begin{subequations}`, to refer to the parent equation).

```

5494     \bool_new:N \l__zrefclever_amsmath_subequations_bool
5495     \AddToHook { env / subequations / begin }
5496     {
5497         \__zrefclever_zcsetup:x
5498         {
5499             counterresetby =
5500             {
5501                 parentequation =
5502                     \__zrefclever_counter_reset_by:n { equation } ,
5503                     equation = parentequation ,
5504             } ,
5505             currentcounter = parentequation ,
5506             countertype = { parentequation = equation } ,
5507         }
5508         \bool_set_true:N \l__zrefclever_amsmath_subequations_bool
5509     }

```

`amsmath` does use `\refstepcounter` for the `equation` counter throughout and does set `\@currentcounter` for `\tags`. But we still have to manually reset `currentcounter` to default because, since we had to manually set `currentcounter` to `parentequation` in `subequations`, we also have to manually set it to `equation` in environments which may be used within it. The `xxalignat` environment is not included, because it is “starred” by default (i.e. unnumbered), and does not display or accepts labels or tags anyway. The `-ed` (`gathered`, `aligned`, and `alignedat`) and `cases` environments “must appear within an enclosing math environment”. Same logic applies to other environments defined or redefined by the package, like `array`, `matrix` and variations. Finally, `split` too can only be used as part of another environment. We also arrange, at this point, for the provision of the `subeq` property, for the convenience of referring to them directly or to build terse ranges with the `endrange` option.

```

5510     \zref@newprop { subeq } { \alph { equation } }
5511     \clist_map_inline:nn
5512     {
5513         equation ,
5514         equation* ,
5515         align ,
5516         align* ,
5517         alignat ,
5518         alignat* ,
5519         flalign ,
5520         flalign* ,
5521         xalignat ,
5522         xalignat* ,
5523         gather ,
5524         gather* ,

5537 }
5538 }

```

9.6 mathtools

All math environments defined by `mathtools`, extending the `amsmath` set, are meant to be used within enclosing math environments, hence we don't need to handle them specially, since the numbering and the counting is being done on the side of `amsmath`. This includes the new `cases` and `matrix` variants, and also `multlined`.

Hence, as far as I can tell, the only cross-reference related feature to deal with is the `showonlyrefs` option, whose machinery involves writing an extra internal label to the `.aux` file to track for labels which get actually referred to. This is a little more involved, and implies in doing special handling inside `\zref`, but the feature is very cool, so it's worth it.

```

5539 \bool_new:N \l__zrefclever_mathtools_showonlyrefs_bool
5540 \__zrefclever_compat_module:nn { mathtools }

9.7 breqn

From the `breqn` documentation: “Use of the normal `\label` command instead of the `label` option works, I think, most of the time (untested)”. Indeed, light testing suggests it does work for `\zlabel` just as well. However, if it happens not to work, there was no easy alternative handle I could find. In particular, it does not seem viable to leverage the `label=` option without hacking the package internals, even if the case of doing so would not be specially tricky, just “not very civil”.

```

5575 \__zrefclever_compat_module:nn { breqn }
5576 {
5577     \__zrefclever_if_package_loaded:nT { breqn }
5578 }
```

Contrary to the practice in `amsmath`, which prints `\tag` even in unnumbered environments, the starred environments from `breqn` don’t typeset any tag/number at all, even for a manually given `number=` as an option. So, even if one can actually set a label in them, it is not really meaningful to make a reference to them. Also contrary to `amsmath`’s practice, `breqn` uses `\stepcounter` instead of `\refstepcounter` for incrementing the equation counters (see <https://tex.stackexchange.com/a/241150>).

```

5579     \bool_new:N \l__zrefclever_breqn_dgroup_bool

5627         }
5628     }
```

Set (also) a `\zlabel` with the label received in the `label=` option from the `lstlisting` environment. The *only* place to set this label is the `PreInit` hook. This hook, comes right after `\lst@MakeCaption` in `\lst@Init`, which runs `\refstepcounter` on `lstlisting`, so we must come after it. Also `listings` itself sets `\@currentlabel` to `\the\lstnumber` in the `Init` hook, which comes right after the `PreInit` one in `\lst@Init`. Since, if we add to `Init` here, we go to the end of it, we'd be seeing the wrong `\@currentlabel` at that point.

```

5628     \lst@AddToHook { PreInit }
5629     { \tl_if_empty:NF \lst@label { \zlabel { \lst@label } } }
```

Set `currentcounter` to `lstnumber` in the `Init` hook, since `listings` itself sets `\@currentlabel` to `\the\lstnumber` here. Note that `listings` *does use* `\refstepcounter` on `lstnumber`, but does so in the `EveryPar` hook, and there must be some grouping involved such that `\@currentcounter` ends up not being visible to the label. See section “Line numbers” of ‘texdoc listings-devel’ (the `.dtx`), and search for the definition of macro `\c@lstnumber`. Indeed, the fact that `listings` manually sets `\@currentlabel` to `\the\lstnumber` is a signal that the work of `\refstepcounter` is being restrained somehow.

```

5630     \lst@AddToHook { Init }
5631     { \__zrefclever_zcsetup:n { currentcounter = lstnumber } }
5632     \msg_info:nnn { zref-clever } { compat-package } { listings }
5633 }
5634 }
```

9.9 enumitem

The procedure below will “see” any changes made to the `enumerate` environment (made with `enumitem`’s `\renewlist`) as long as it is done in the preamble. Though, technically, `\renewlist` can be issued anywhere in the document, this should be more than enough

for the purpose at hand. Besides, trying to retrieve this information “on the fly” would be much overkill.

The only real reason to “renew” `enumerate` itself is to change $\{\langle max-depth \rangle\}$. `\renewlist` hard-codes `max-depth` in the environment’s definition (well, just as the kernel does), so we cannot retrieve this information from any sort of variable. But `\renewlist` also creates any needed missing counters, so we can use their existence to make the appropriate settings. In the end, the existence of the counters is indeed what matters from `zref-clever`’s perspective. Since the first four are defined by the kernel and already setup for `zref-clever` by default, we start from 5, and stop at the first non-existent `\c@enumN` counter.

```

5635 \__zrefclever_compat_module:nn { enumitem }
5636   {
5637     \__zrefclever_if_package_loaded:nT { enumitem }
5638     {
5639       \int_set:Nn \l_tmpa_int { 5 }
5640       \bool_while_do:nn
5641         {
5642           \cs_if_exist_p:c
5643             { c@ enum \int_to_roman:n { \l_tmpa_int } }
5644         }
5645     {
5646       \__zrefclever_zcsetup:x
5647       {
5648         counterresetby =
5649         {
5650           enum \int_to_roman:n { \l_tmpa_int } =
5651           enum \int_to_roman:n { \l_tmpa_int - 1 }
5652         } ,
5653         countertype =
5654           { enum \int_to_roman:n { \l_tmpa_int } = item } ,
5655         }
5656         \int_incr:N \l_tmpa_int
5657       }
5658       \int_compare:nNnT { \l_tmpa_int } > { 5 }
5659         { \msg_info:nnn { zref-clever } { compat-package } { enumitem } }
5660     }
5661   }

```

9.10 subcaption

```

5662 \__zrefclever_compat_module:nn { subcaption }
5663   {
5664     \__zrefclever_if_package_loaded:nT { subcaption }
5665     {
5666       \__zrefclever_zcsetup:n
5667       {
5668         countertype =
5669         {
5670           subfigure = figure ,
5671           subtable = table ,
5672         } ,
5673         counterresetby =
5674         {

```

```

5675         subfigure = figure ,
5676         subtable = table ,
5677     } ,
5678 }

```

Support for `subref` reference.

```

5679     \zref@newprop { subref }
5680     { \cs_if_exist_use:c { thesub \@capttype } }
5681     \tl_put_right:Nn \caption@subtypehook
5682     { \zref@localaddprop \ZREF@mainlist { subref } }
5683   }
5684 }

```

9.11 subfig

Though `subfig` offers `\subref` (as `\subcaption`), I could not find any reasonable place to add the `subref` property to `zref`'s main list.

```

5685 \__zrefclever_compat_module:nn { subfig }
5686 {
5687   \__zrefclever_if_package_loaded:nT { subfig }
5688   {
5689     \__zrefclever_zcsetup:n
5690     {
5691       counterstype =
5692       {
5693         subfigure = figure ,
5694         subtable = table ,
5695       } ,
5696       counterresetby =
5697       {
5698         subfigure = figure ,
5699         subtable = table ,
5700       } ,
5701     }
5702   }
5703 }
5704 
```

10 Language files

Initial values for the English, German, French, Portuguese, and Spanish language files have been provided by the author. Translations available for document elements' names in other packages have been an useful reference for the purpose, namely: `babel`, `cleveref`, `translator`, and `translations`.

10.1 Localization guidelines

Since the task of localizing `zref-clever` to work in different languages depends on the generous work of contributors, it is a good idea to set some guidelines not only to ease the task itself but also to document what the package expects in this regard.

The first general observation is that, contrary to a common initial reaction of those faced with the task of localizing the reference types, is that the job is not quite one of

“translation”. The reference type names are just the internal names used by the package to refer to them, technically, they could just as well be foobars. Of course, for practical reasons, they were chosen to be semantic. However, what we are searching for is not really the translation to the reference type name itself, but rather for the word / term / expression which is typically used to refer to the document object that the reference type is meant to represent. And terms that should work well in the contexts which cross-references are commonly used.

That said, some comments about the reference types and common pitfalls.

Sectioning: A number of reference types are provided to support referencing to document sectioning commands. Obviously, `part`, `chapter`, `section`, and `paragraph` are meant to refer to the sectioning commands of the standard classes and elsewhere, which anyone reading this is certainly acquainted with. Note that `zref-clever` uses – by default at least, which is what the language files cater for – the `section` reference type to refer to `\subsections` and `\subsubsections` as well, similarly, `paragraph` also refers to `\subparagraph`. The `appendix` reference type is meant to refer to any sectioning command – be them chapters, sections, or paragraphs – issued after `\appendix`, which corresponds to how the standard classes, the KOMA Script classes, and `memoir` deal with appendices. The `book` reference type deserves some explanation. The word “book” has a good number of meanings, and the most common one is not the one which is intended here. The Webster dictionary gives us a couple of definitions of interest: “1. A collection of sheets of paper, or similar material, blank, written, or printed, bound together; commonly, many folded and bound sheets containing continuous printing or writing.” and “3. A part or subdivision of a treatise or literary work; as, the tenth book of ‘Paradise Lost.’” It is this third meaning which the `book` reference type is meant to support: a major subdivision of a work, much like `\part`. Even if it does not exist in the standard classes, it may exist elsewhere, in particular, it is provided by `memoir`.

Common numbered objects: Nothing surprising here, just being explicit. `table` and `figure` refer to the document’s respective floats objects. `page` to the page number. `item` to the item number in `enumerate` environments. Similarly, `line` is meant to refer to line numbers.

Notes: `zref-clever` provides three reference types in this area: `footnote`, `endnote`, and `note`. The first two refer to footnotes and end notes, respectively. The third is meant as a convenience for a general “note” object, either the other two, or something else. By experience, here is one place where that initial observation of not simply translating the reference types names is particularly relevant. There’s a natural temptation, because three different types exist and are somewhat close to each other, to distinguish them clearly. Duty would compel us to do so. But that may lead to less than ideal results. Different terms work well for some languages, like English and German, which have compound words for the purpose. But less so for other languages, like Portuguese, French, or Italian. For example, in a document in French which only contains footnotes, arguably a very common use case, would it be better to refer to a footnote as just “note”, or be very precise with “note infrapaginale”? Of course, in a document which contains both footnotes and end notes, we may need the distinction. But is it really the better default? True, possibly the inclusion of the `note` reference type, with no clear object to refer to, creates more noise than convenience here. If I recall correctly, my intention was to provide an easy way out for users from possible contentious localizations for `footnote` and `endnote`, but I’m not sure if it’s been working like this in practice, and I should probably have refrained from adding it in the first place.

Math & Co.: A good number of reference types provided by the package are meant to cater for document objects commonly used in Mathematics and related areas. They

are either straight math environments, defined by the kernel, `amsmath` or other packages, or environments which are normally not pre-defined by the kernel or the standard classes, but are traditionally defined by users with the kernel's `\newtheorem` or similar constructs available in the L^AT_EX package ecosystem. For most of them, localization should strive as much as possible to use the formal terms, jargon really, typically employed by mathematicians, logicians, and friends. Namely for the reference types: `equation`, `theorem`, `lemma`, `corollary`, `proposition`, `definition`, `proof`, `result`, and `remark`. Regarding `example`, `exercise`, and `solution` being somewhat less formal is admissible. But the chosen terms should still be fit for use in Math related contexts, and should be assumed were created by `\newtheorem` or similar, even if users may well find other uses for these types.

Code: A couple of reference types are provided for code related environments: `algorithm` and `listing`. By experience, the `listing` type has already proven to be a particularly challenging one. Formally, it should be a good default term to encompass anything which may regularly be included in a `lstlisting` environment as provided by the `listings` package. However, it seems that in different languages it is quite difficult to find a satisfying term for it. Though my English is decent, I'm not a native speaker, still I'm not even sure how common the term is used for the purpose even in English. It seems to be traditional enough in the L^AT_EX community at least. In doubt, pend to the jargon side, anglicism if need be. Since we are bound to displease mostly everyone anyway, at least we do so in a consistent manner.

Completeness and abbreviated forms: Ideally, the language file should be as complete as possible. “Complete” meaning it contains: i) the defaults for all basic separators, `namesep`, `pairsep`, `listsep`, `lastsep`, `tpairsep`, `tlistsep`, `tlastsep`, `notesep`, and `rangeseq`; ii) the non-abbreviated forms of names for all the supported reference types, according to the language definitions, that is, usually for `Name-sg`, `name-sg`, `Name-pl`, `name-pl`, but only for the capitalized forms if the language was declared with `allcaps` option, and names for each declension case, if the language was declared with `declension`; iii) genders for each reference type, if the language was declared with `gender`. The language file may include some other things, like some type specific settings for separators or refbounds, and also some abbreviated name forms. In the case of abbreviated name forms, it is usual and desirable to provide some, but they should be used sparingly, only for cases where the abbreviation is a common and well established tradition for the language. The reason is that `abbrev=true` is quite a common use case, and it is easier to provide an occasional wanted abbreviated form, if the language file didn't include it, than it is to disable several unwanted ones, if the language file includes too many of them. What should be aimed at is to provide a good default abbreviations set. Unusual or disputable abbreviations should be avoided. In particular, there is no need at all to provide the same set of abbreviations for each language. It is not because English has them for a given type that some other language has to have them, and it is not because English lacks them for another type, that other languages shouldn't have them. Still, with regard to abbreviated forms, it is better to be conservative than opinionated.

babel names: As is known, `babel` defines a set of captions for different document objects for each supported language. In some cases, they intersect with the objects referred to with cross-references, in which case consistency with `babel` should be maintained as much as possible. This is specially the case for prominent and traditional objects, such as `\chaptername`, `\figurename`, `\tablename`, `\pagename`, `\partname`, and `\appendixname`. This is not set in stone, but there should be good reason to diverge from it. In particular, if a certain term is contentious in a given language, `babel`'s default should be preferred. For example, “table” vs. “tableau” in French, or “cuadro” vs. “tabla” in Spanish.

Input encoding of language files: When zref-clever was released, the L^AT_EX kernel already used UTF-8 as default input encoding. Indeed, zref-clever requires a kernel even newer than the one where the default input encoding was changed. That given, UTF-8 input encoding was made a requirement of the package, and hence the language files should be in UTF-8, since it makes them easier to read and maintain than LICR.

Precedence rule for options in the language files: Any option given twice or more times has to have some precedence rule. Normally, the language files should not contain options in duplicity, but they may happen when setting some “group” `refbounds` options, in which case precedence rules become relevant. For user facing options (those set with `\zcLanguageSetup`), the option is always set, regardless of its previous state. Which means that the last value takes precedence. For the language files, we have to load them at `begindocument` (or later), since that’s the point where we know from `babel` or `polyglossia` the `\languagename`. But we also don’t want to override any options the user has actively set in the preamble. So the language files only set the values if they were not previously set. In other words, for them the precedence order is inverted, the first value takes precedence.

10.2 English

English language file has been initially provided by the author.

10.4 French

French language file has been initially provided by the author, and has been improved thanks to Denis Bitouzé and François Lagarde (at issue #1) and participants of the Groupe francophone des Utilisateurs de T_EX (GUTenberg) (at https://groups.google.com/g/gut_fr/c/rNLm6weGcyg) and the fr.comp.text.tex (at <https://groups.google.com/g/fr.comp.text.tex/c/Fa11Tf6MFFs>) mailing lists.

babel-french also has .ldfs for `francais`, `frenchb`, and `canadien`, but they are deprecated as options and, if used, they fall back to either `french` or `acadian`.
