

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

August 29, 2024

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape** (except when the key **write** is used). The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 3.1b of **piton**, at the date of 2024/08/29.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by **#>**.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`³;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the native languages supported by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.

³That language `minimal` may be used to format pseudo-codes: cf. p. 30

- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 6.2, p. 12.

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands⁴ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectation }
\piton{c="#" \ \ \ # an affectation }
\piton{MyDict = {'a': 3, 'b': 4 }}
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁵

- **Syntax `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectation +
\piton?MyDict = {'a': 3, 'b': 4}?
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4}
```

⁴That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁵For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁶
These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the five built-in languages (`Python`, `OCaml`, `C`, `SQL` and `minimal`) or the name of the language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 9).

The initial value is `Python`.

- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁷ of the current environment in that file. At the first use of a file by `piton`, it is erased.

This key requires a compilation with `lualatex -shell-escape`.

- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁸
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁹
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.2, p. 12). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.

⁶We remind that a LaTeX environment is, in particular, a TeX group.

⁷In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 22).

⁸For the language Python, the empty lines in the docstrings are taken into account (by design).

⁹When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is `0.7 em`.
- **New 3.1** The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em ,
        line-format = \footnotesize \color{blue}
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 22.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

When the key `split-on-empty-lines` is in force (see the part “Page breaks”, p. 11), the empty lines generated by that key don't have any background color (at least with the initial value of the parameter `split-separation`).

- With the key `prompt-background-color`, piton adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.1.2, p. 11).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special

value `min` requires two compilations with LuaLaTeX¹⁰.

For an example of use of `width=min`, see the section 8.2, p. 23.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹¹ are replaced by the character `\u2423` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹²

Example : `my_string = 'Very\u2423good\u2423answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹³ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton`. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C, line-numbers, auto-gobble, background-color = gray!15]
```

```
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}
```

```
1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 11).

¹⁰The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latexmk` (used by Overleaf) do automatically a sufficient number of compilations.

¹¹With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

¹²The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

¹³cf. 6.1.2 p. 11

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.¹⁴

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luatex` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 26.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁵

For example, with the command

```
\SetPitonStyle[SQL]{Keyword = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of `group` in TeX).¹⁶

¹⁴We remind that a LaTeX environment is, in particular, a TeX group.

¹⁵We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹⁶As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaLaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹⁷

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁸

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{O{} }{\PitonOptions{#1}}{}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

¹⁷We remind that, in `piton`, the name of the informatic languages are case-insensitive.

¹⁸However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

```
\NewPitonEnvironment{Python}{}  
{\begin{tcolorbox}  
{\end{tcolorbox}}
```

With this new environment {Python}, it's possible to write:

```
\begin{Python}  
def square(x):  
    """Compute the square of a number"""  
    return x*x  
end{Python}
```

```
def square(x):  
    """Compute the square of a number"""  
    return x*x
```

5 Definition of new languages with the syntax of listings

New 3.0

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C++, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `1stlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto;if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%  
sensitive,%  
morecomment=[l]//,%  
morecomment=[s]{/*}{*/},%  
morestring=[b]",%  
morestring=[b]',%  
}[keywords,comments,strings]
```

In order to define a language called Java for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols % may be deleted without any problem).

```
\NewPitonLanguage{Java}%  
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%  
const,continue,default,do,double,else,extends,false,final,%  
finally,float,for,goto;if,implements,import,instanceof,int,%  
interface,label,long,native,new,null,package,private,protected,%  
public,return,short,static,super,switch,synchronized,this,throw,%  
throws,transient,true,try,void,volatile,while},%
```

```

sensitive,%
morecomment=[l]//,%
morecomment=[s]{/*}{{},%
morestring=[b]",%
morestring=[b]',%
}

```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁹

```

public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}

```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `\` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

¹⁹We recall that, for `piton`, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

6 Advanced features

6.1 Page breaks and line breaks

6.1.1 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

- The key `split-on-empty-lines` allows breaks on the empty lines²⁰ in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it's possible to put `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.
- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²¹

6.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

²⁰The “empty lines” are the lines which contains only spaces.

²¹With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\\;` (the command `\\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\\hookrightarrow\\;$`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+       ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
            our_dict[name] = [treat_Postscript_line(k) for k in \
+                           ↪ list_letter[1:-1]]
    return dict
```

6.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

6.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

6.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
```

```

u=0
v=1
for i in range(n-1):
    w = u+v
    u = v
    v = w
return v
#<Exercise 1>

```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

6.3 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.²²
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 7).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```

\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

²²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by piton.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

6.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.5 p. 18.

6.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the piton style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 23

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.²³

6.4.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

²³That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

6.4.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `luatex`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape!=!,end-escape!=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character `$` must *not* be protected by a backslash.

However, it's probably more prudent to use `\(`` et `\)``.

```
\PitonOptions{begin-escape-math=\(`,end-escape-math=\)`}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \x < 0\ :
        return \(-\arctan(-x)\)
    elif \x > 1\ :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \0\
        for \k\ in range(\n\): s += \smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\
    return s
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

6.5 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁴

When the package `piton` is used within the class `beamer`²⁵, the behaviour of `piton` is slightly modified, as described now.

6.5.1 `{Piton}` et `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

6.5.2 Commands of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

²⁴Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁵The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

- no mandatory argument : `\pause26`. ;
 - one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- New 3.1**
- It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
 - three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁷ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "`{`" and "`}`" are correctly interpreted (without any escape character).

6.5.3 Environments of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisiblenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

New 3.1

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""

```

²⁶One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁷The short strings of Python are the strings delimited by characters '`'` or the characters "`"` and not '`'''` nor '`"""`'. In Python, the short strings can't extend on several lines.

```

\begin{uncoverenv}<2>
return x*x
\end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command `\alert` and the environment `{alertyenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertyenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertyenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment<>{alertyenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertyenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertyenv}`).

6.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it's also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.4.3, p. 16).

In this document, the package `piton` has been loaded with the option `footnotehyper` and we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}
```

```
\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)28
    elif x > 1:
        return pi/2 - arctan(1/x)29
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emph{\begin{minipage}{\linewidth}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

6.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), piton accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and

²⁸First recursive call.

²⁹Second recursive call.

applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.4.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.4, p. 24.

8 Examples

8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with #>) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```
\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.3 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 7.

We present now an example of tuning of these styles adapted to the documents in black and white.

We use the font *DejaVu Sans Mono*³⁰ specified by the command \setmonofont of fontspec.

That tuning uses the command \highLight of luatex (that package requires itself the package luacolor).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in piton is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.4 Use with pyluatex

The package pyluatex is an extension which allows the execution of some Python code from lualatex (provided that Python is installed on the machine and that the compilation is done with lualatex and --shell-escape).

Here is, for example, an environment {PitonExecute} which formats a Python listing (with piton) but also displays the output of the execution of the code with Python.

³⁰See: <https://dejavu-fonts.github.io>

```
\NewPitonEnvironment{PitonExecute}{!O{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}}
\noignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 22.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.³¹

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }) ; that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }) ; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>in</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .
<code>Identifier</code>	the identifiers.

³¹See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with `\PitonOptions{language = OCaml}`.

It's also possible to set the language OCaml for an individual environment `{Piton}`.

```
\begin{Piton} [language=OCaml]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=OCaml]{...}`

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, done, downto, do, else, exception, for, function , fun, if, lazy, match, mutable, new, of, private, raise, then, to, try , virtual, when, while and with
Keyword.Governing	the following keywords: and, begin, class, constraint, end, external, functor, include, inherit, initializer, in, let, method, module, object, open, rec, sig, struct, type and val.
Identifier	the identifiers.

9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while
Identifier	the identifiers.

9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Identifier</code>	the identifiers.

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.3, p. 14) in order to create, for example, a language for pseudo-code.

9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defines by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)
<code>Identifier</code>	the identifiers.

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³²

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³²Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:\_\_piton\_newline{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_newline:
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

```
1 (*STY)
2 \NeedsTeXFormat{LaTeX2e}
3 \RequirePackage{l3keys2e}

```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
24 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
25 {
26   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
27     { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
28     { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
29 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
30 \cs_new_protected:Npn \@@_error_or_warning:n
31   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use \c_sys_jobname_str because, with Overleaf, the value of \c_sys_jobname_str is always “output”.

```
32 \bool_new:N \g_@@_messages_for_Overleaf_bool
33 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
```

```

139   piton.last_code = ''
140   piton.last_language = ''
141 }
```

10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

142 \str_new:N \l_piton_language_str
143 \str_set:Nn \l_piton_language_str { python }
```

Each time an environment of `piton` is used, the informatic code in the body of that environment will be stored in the following global string.

```
144 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
145 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
146 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

147 \bool_new:N \l_@@_in_PitonOptions_bool
148 \bool_new:N \l_@@_in_PitonInputFile_bool
```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
149 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
150 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

```
151 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation). The technic of the auxiliary file will be used when the key `width` is used with the value `min`.

```
152 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```
153 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments {Piton} are unbreakable.

```
154 \int_set:Nn \l_@@splittable_int { 100 }
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
155 \tl_new:N \l_@@split_separation_tl
156 \tl_set:Nn \l_@@split_separation_tl
157 { \vspace{ \baselineskip } \vspace{ -1.25pt } }
```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
158 \clist_new:N \l_@@bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
159 \tl_new:N \l_@@prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
160 \str_new:N \l_@@begin_range_str
161 \str_new:N \l_@@end_range_str
```

The argument of `\PitonInputFile`.

```
162 \str_new:N \l_@@file_name_str
```

We will count the environments {Piton} (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@env_int`).

```
163 \int_new:N \g_@@env_int
```

The parameter `\l_@@writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@write_seq` (we must not erase a file which has been still been used).

```
164 \str_new:N \l_@@write_str
165 \seq_new:N \g_@@write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
166 \bool_new:N \l_@@show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
167 \bool_new:N \l_@@break_lines_in_Piton_bool
168 \bool_new:N \l_@@indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
169 \tl_new:N \l_@@continuation_symbol_tl
170 \tl_set:Nn \l_@@continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
171 \tl_new:N \l_@@csoi_tl
172 \tl_set:Nn \l_@@csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
173 \tl_new:N \l_@@end_of_broken_line_tl
174 \tl_set:Nn \l_@@end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
175 \bool_new:N \l_@@break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

176 `\dim_new:N \l_@@_width_dim`

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

177 `\dim_new:N \l_@@_line_width_dim`

The following flag will be raised with the key `width` is used with the special value `min`.

178 `\bool_new:N \l_@@_width_min_bool`

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

179 `\dim_new:N \g_@@_tmp_width_dim`

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

180 `\dim_new:N \l_@@_left_margin_dim`

The following boolean will be set when the key `left-margin=auto` is used.

181 `\bool_new:N \l_@@_left_margin_auto_bool`

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

182 `\dim_new:N \l_@@_numbers_sep_dim`

183 `\dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }`

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

184 `\seq_new:N \g_@@_languages_seq`

185 `\int_new:N \l_@@_tab_size_int`

186 `\int_set:Nn \l_@@_tab_size_int { 4 }`

187 `\cs_new_protected:Npn \@@_tab:`

188 `{`

189 `\bool_if:NTF \l_@@_show_spaces_bool`

190 `{`

191 `\hbox_set:Nn \l_tmpa_box`

192 `{ \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

193 `\dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }`

194 `\(\mathcolor{gray}{\l_tmpa_dim}`

195 `{ \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)`

196 `}`

197 `{ \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } } }`

198 `\int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int`

199 `}`

The following integer corresponds to the key `gobble`.

```
200 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
201 \tl_new:N \l_@@_space_tl
202 \tl_set_eq:NN \l_@@_space_tl \nobreakspace
```

At each line, the following counter will count the spaces at the beginning.

```
203 \int_new:N \g_@@_indentation_int
204 \cs_new_protected:Npn \@@_an_indentation_space:
205   { \int_gincr:N \g_@@_indentation_int }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
206 \cs_new_protected:Npn \@@_label:n #1
207   {
208     \bool_if:NTF \l_@@_line_numbers_bool
209       {
210         \bsphack
211         \protected@write \auxout { }
212         {
213           \string \newlabel { #1 }
214         }
215         { \int_eval:n { \g_@@_visual_line_int + 1 } }
216         { \thepage }
217       }
218     \esphack
219   }
220   { \@@_error:n { label-with-lines-numbers } }
221 }
222 }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```
215   { \int_eval:n { \g_@@_visual_line_int + 1 } }
216   { \thepage }
217 }
218 }
219 \esphack
220 }
221 { \@@_error:n { label-with-lines-numbers } }
222 }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
223 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
224 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
225 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
226 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
227 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
228 \cs_new_protected:Npn \@@_prompt:
229   {
230     \tl_gset:Nn \g_@@_begin_line_hook_tl
231     {
232       \tl_if_empty:NF \l_@@_prompt_bg_color_tl
233         { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
234     }
235 }
```

The spaces at the end of a line of code are deleted by `piton`. However, it's not actually true: they are replaced by `\@@_trailing_space`:

```
236 \cs_new_protected:Npn \@@_trailing_space: { }
```

When we have to rescan some pieces of code with `\@@_piton:n`, we will set `\@@_trailing_space`: equal to `\space`.

10.2.3 Treatment of a line of code

```
237 \cs_new_protected:Npn \@@_replace_spaces:n #1
238 {
239     \tl_set:Nn \l_tmpa_tl { #1 }
240     \bool_if:NTF \l_@@_show_spaces_bool
241     {
242         \tl_set:Nn \l_@@_space_t1 { \u2028 }
243         \regex_replace_all:nnN { \x20 } { \u2028 } \l_tmpa_tl % U+2423
244     }
245 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space`:. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
246     \bool_if:NT \l_@@_break_lines_in_Piton_bool
247     {
248         \regex_replace_all:nnN
249             { \x20 }
250             { \c{\@@_breakable_space} }
251         \l_tmpa_tl
252     }
253 }
```

```
254 \l_tmpa_tl
255 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```
256 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
257 {
258     \group_begin:
259     \g_@@_begin_line_hook_t1
260     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```
261 \bool_if:NTF \l_@@_width_min_bool
262     \@@_put_in_coffin_i:i:n
263     \@@_put_in_coffin_i:n
264     {
265         \language = -1
266         \raggedright
267         \strut
268         \@@_replace_spaces:n { #1 }
269         \strut \hfil
270     }
```

Now, we add the potential number of line, the potential left margin and the potential background.

```
271 \hbox_set:Nn \l_tmpa_box
272 {
273     \skip_horizontal:N \l_@@_left_margin_dim
274     \bool_if:NT \l_@@_line_numbers_bool
275     {
```

```

276          \bool_if:nF
277          {
278              \str_if_eq_p:nn { #1 } { \PitonStyle { Prompt } { } }
279              &&
280              \l_@@_skip_empty_lines_bool
281          }
282          { \int_gincr:N \g_@@_visual_line_int }
283      \bool_if:nT
284      {
285          ! \str_if_eq_p:nn { #1 } { \PitonStyle { Prompt } { } }
286          ||
287          ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
288      }
289      \@@_print_number:
290  }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

291      \clist_if_empty:NF \l_@@_bg_color_clist
292      {
293          \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
294          { \skip_horizontal:n { 0.5 em } }
295      }
296      \coffin_typeset:Nnnnn \l_tmpa_coffin T 1 \c_zero_dim \c_zero_dim
297  }
298  \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
299  \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
300  \clist_if_empty:NTF \l_@@_bg_color_clist
301  { \box_use_drop:N \l_tmpa_box }
302  {
303      \vtop
304      {
305          \hbox:n
306          {
307              \@@_color:N \l_@@_bg_color_clist
308              \vrule height \box_ht:N \l_tmpa_box
309                  depth \box_dp:N \l_tmpa_box
310                  width \l_@@_width_dim
311          }
312          \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
313          \box_use_drop:N \l_tmpa_box
314      }
315  }
316  \vspace { - 2.5 pt }
317  \group_end:
318  \tl_gclear:N \g_@@_begin_line_hook_tl
319 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```

320 \cs_set_protected:Npn \@@_put_in_coffin_i:n
321     { \vcoffin_set:Nn \l_tmpa_coffin \l_@@_line_width_dim }

```

The second case is the case when the key `width` is used with the special value `min`.

```

322 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
323     {

```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```

324     \hbox_set:Nn \l_tmpa_box { #1 }

```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```

325 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
326   { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
327 \hcoffin_set:Nn \l_tmpa_coffin
328   {
329     \hbox_to_wd:nn \l_@@_line_width_dim

```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 23).

```

330   { \hbox_unpack:N \l_tmpa_box \hfil }
331 }
332 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

333 \cs_set_protected:Npn \@@_color:N #1
334   {
335     \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
336     \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
337     \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
338     \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

339   { \dim_zero:N \l_@@_width_dim }
340   { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
341 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

342 \cs_set_protected:Npn \@@_color_i:n #1
343   {
344     \tl_if_head_eq_meaning:nNTF { #1 } [
345       {
346         \tl_set:Nn \l_tmpa_tl { #1 }
347         \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
348         \exp_last_unbraced:No \color \l_tmpa_tl
349       }
350       { \color { #1 } }
351   }
```

The command `\@@_newline:` will be inserted by Lua between two lines of the informatic listing.

- In fact, it will be inserted between two commands `\@@_begin_line:... \@@_end_of_line:..`.
- When the key `break-lines-in-Piton` is in force, a line of the informatic code (the *input*) may result in several lines in the PDF (the *output*).
- `\@@_newline:` has a rather complex behaviour because it may close and open `\vtops` and finish and start paragraphs.

```

352 \cs_new_protected:Npn \@@_newline:
353   {
```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```

354   \int_gincr:N \g_@@_line_int
...
... it will be used to allow or disallow page breaks (the final user controls that behaviour with the key splittable).
355   \int_compare:nNnT \g_@@_line_int > { \l_@@_splittable_int - 1 }
356   {
357     \int_compare:nNnT
358       { \l_@@_nb_lines_int - \g_@@_line_int + 1 } > \l_@@_splittable_int
```

Now, we allow a page break after the current line of code.

```
359 {
360     \egroup
361     \bool_if:NT \g_@@_footnote_bool \endsavenotes
362     \par
```

Each non-splittable block of lines is composed in a `\vtop` of TeX inserted in a paragraph of TeX.

- In the previous lines, we have closed a `\vtop` (with `\egroup`) and a paragraph (with `\par`).
- Now, we start a new paragraph (with `\mode_leave_vertical:`) and open a `\vtop` (with `\vtop \bgroup`).

```
363     \mode_leave_vertical:
364     \bool_if:NT \g_@@_footnote_bool \savenotes
365     \vtop \bgroup
```

And, in that `\vtop`, of course, we will put a box for each line of the informatic listing (but a line of the informatic listing may be formatted as a box of several lines when `break-lines-in-Piton` is in force).

```
366 }
367 }
368 }
```

After the command `\@@_newline:`, we will have a command `\@@_begin_line::`.

```
369 \cs_set_protected:Npn \@@_breakable_space:
370 {
371     \discretionary
372     { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }

640   }

641 \cs_new_protected:Npn \@@_in_PitonInputFile:n #1

```

```

642 {
643   \bool_if:NTF \l_@@_in_PitonInputFile_bool
644     { #1 }
645     { \@@_error:n { Invalid-key } }
646 }

647 \NewDocumentCommand \PitonOptions { m }
648 {
649   \bool_set_true:N \l_@@_in_PitonOptions_bool
650   \keys_set:nn { PitonOptions } { #1 }
651   \bool_set_false:N \l_@@_in_PitonOptions_bool
652 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

653 \NewDocumentCommand \@@_fake_PitonOptions { }
654   { \keys_set:nn { PitonOptions } }

```

10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

655 \int_new:N \g_@@_visual_line_int
656 \cs_new_protected:Npn \@@_incr_visual_line:
657 {
658   \bool_if:NF \l_@@_skip_empty_lines_bool
659     { \int_gincr:N \g_@@_visual_line_int }
660 }

661 \cs_new_protected:Npn \@@_print_number:
662 {
663   \hbox_overlap_left:n
664   {
665     \l_@@_line_numbers_format_tl
666   }

```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

667   { \int_to_arabic:n \g_@@_visual_line_int }
668   }
669   \skip_horizontal:N \l_@@_numbers_sep_dim
670 }
671 }

```

10.2.6 The command to write on the aux file

```

672 \cs_new_protected:Npn \@@_write_aux:
673 {
674   \tl_if_empty:NF \g_@@_aux_tl
675   {
676     \iow_now:Nn \mainaux { \ExplSyntaxOn }
677     \iow_now:Nx \mainaux
678     {
679       \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
680       { \exp_not:o \g_@@_aux_tl }
681     }
682     \iow_now:Nn \mainaux { \ExplSyntaxOff }
683   }

```

```

684     \tl_gclear:N \g_@@_aux_tl
685 }

```

The following macro will be used only when the key `width` is used with the special value `min`.

```

686 \cs_new_protected:Npn \@@_width_to_aux:
687 {
688     \tl_gput_right:Nx \g_@@_aux_tl
689     {
690         \dim_set:Nn \l_@@_line_width_dim
691         { \dim_eval:n { \g_@@_tmp_width_dim } }
692     }
693 }

```

10.2.7 The main commands and environments for the final user

```

694 \NewDocumentCommand { \NewPitonLanguage } { O{ } m ! o }
695 {
696     \tl_if_no_value:nTF { #3 }

```

The last argument is provided by currying.

```
697     { \@@_NewPitonLanguage:nnn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```

698     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
699 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```
700 \prop_new:N \g_@@_languages_prop
```

```

701 \keys_define:nn { NewPitonLanguage }
702 {
703     morekeywords .code:n = ,
704     otherkeywords .code:n = ,
705     sensitive .code:n = ,
706     keywordsprefix .code:n = ,
707     moretexcs .code:n = ,
708     morestring .code:n = ,
709     morecomment .code:n = ,
710     moredelim .code:n = ,
711     moredirectives .code:n = ,
712     tag .code:n = ,
713     alsodigit .code:n = ,
714     alsoletter .code:n = ,
715     alsoother .code:n = ,
716     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
717 }
```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

718 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
719 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```

720     \tl_set:Nx \l_tmpa_tl
721     {
722         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
723         \str_lowercase:n { #2 }
724     }
```

The following set of keys is only used to raise an error when a key is unknown!

```
725 \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```
726 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```
727 \exp_args:NV \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
728 }
729 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
730 {
731     \hook_gput_code:nnn { begindocument } { . }
732     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
733 }
```

Now the case when the language is defined upon a base language.

```
734 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
735 {
```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{}{...}`

```
736 \tl_set:Nx \l_tmpa_tl
737 {
738     \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
739     \str_lowercase:n { #4 }
740 }
```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```
741 \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl
```

We can now define the new language by using the previous function.

```
742 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
743 { \@@_error:n { Language-not-defined } }
744 }
```

```
745 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```
746 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
747 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }
```

```
748 \NewDocumentCommand { \piton } { }
749 { \peek_meaning:NTF \bgroup \@@_piton_standard \@@_piton_verbatim }
750 \NewDocumentCommand { \@@_piton_standard } { m }
751 {
752     \group_begin:
```

The following tuning of LaTeX in order to avoid all break of lines on the hyphens.

```
753 \automatichyphenmode = 1
```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Nx` below) and that's why we can provide the following escapes to the final user:

```
754 \cs_set_eq:NN \\ \c_backslash_str
755 \cs_set_eq:NN \% \c_percent_str
756 \cs_set_eq:NN \{ \c_left_brace_str
757 \cs_set_eq:NN \} \c_right_brace_str
758 \cs_set_eq:NN \$ \c_dollar_str
```

The standard command `_` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

759 \cs_set_eq:cN { ~ } \space
760 \cs_set_protected:Npn \l_@@begin_line: { }
761 \cs_set_protected:Npn \l_@@end_line: { }
762 \tl_set:Nx \l_tmpa_tl
763 {
764     \lua_now:e
765         { piton.ParseBis('\l_piton_language_str',token.scan_string()) }
766         { #1 }
767     }
768 \bool_if:NTF \l_@@show_spaces_bool
769     { \regex_replace_all:nnN { \x20 } { \u20 } \l_tmpa_tl } % U+2423

```

The following code replaces the characters U+0020 (spaces) by characters U+0020 of catcode 10: thus, they become breakable by an end of line. Maybe, this programmation is not very efficient but the key `break-lines-in-piton` will be rarely used.

```

770 {
771     \bool_if:NT \l_@@break_lines_in_piton_bool
772         { \regex_replace_all:nnN { \x20 } { \x20 } \l_tmpa_tl }
773 }

```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```

774 \if_mode_math:
775     \text { \ttfamily \l_tmpa_tl }
776 \else:
777     \ttfamily \l_tmpa_tl
778 \fi:
779 \group_end:
780 }

781 \NewDocumentCommand { \l_@@piton_verbatim } { v }
782 {
783     \group_begin:
784     \ttfamily
785     \automatichyphenmode = 1
786     \cs_set_protected:Npn \l_@@begin_line: { }
787     \cs_set_protected:Npn \l_@@end_line: { }
788     \tl_set:Nx \l_tmpa_tl
789     {
790         \lua_now:e
791             { piton.Parse('\l_piton_language_str',token.scan_string()) }
792             { #1 }
793     }
794     \bool_if:NT \l_@@show_spaces_bool
795         { \regex_replace_all:nnN { \x20 } { \u20 } \l_tmpa_tl } % U+2423
796     \l_tmpa_tl
797     \group_end:
798 }

```

The following command is not a user command. It will be used when we will have to “rescan” some chunks of informatic code. For example, it will be the initial value of the Piton style `InitialValues` (the default values of the arguments of a Python function).

```

799 \cs_new_protected:Npn \l_@@piton:n #1
800 {
801     \group_begin:
802     \cs_set_protected:Npn \l_@@begin_line: { }
803     \cs_set_protected:Npn \l_@@end_line: { }
804     \cs_set:cpn { pitonStyle _ \l_piton_language_str _ Prompt } { }
805     \cs_set:cpn { pitonStyle _ Prompt } { }
806     \cs_set_eq:NN \l_@@trailing_space: \space
807     \bool_lazy_or:nnTF
808         { \l_@@break_lines_in_piton_bool }
809         { \l_@@break_lines_in_Piton_bool }
810     {

```

```

811     \tl_set:Nx \l_tmpa_tl
812     {
813         \lua_now:e
814         { piton.ParseTer('l_piton_language_str',token.scan_string()) }
815         { #1 }
816     }
817 }
818 {
819     \tl_set:Nx \l_tmpa_tl
820     {
821         \lua_now:e
822         { piton.Parse('l_piton_language_str',token.scan_string()) }
823         { #1 }
824     }
825 }
826 \bool_if:NT \l_@@_show_spaces_bool
827     { \regex_replace_all:nnN { \x20 } { \u{20} } \l_tmpa_tl } % U+2423
828 \exp_args:No \@@_replace_spaces:n \l_tmpa_tl
829 \group_end:
830 }
```

Despite its name, `\@@_pre_env:` will be used both in `\PitonInputFile` and in the environments such as `{Piton}`.

```

831 \cs_new:Npn \@@_pre_env:
832 {
833     \automatichyphenmode = 1
834     \int_gincr:N \g_@@_env_int
835     \tl_gclear:N \g_@@_aux_tl
836     \dim_compare:nNnT \l_@@_width_dim = \c_zero_dim
837         { \dim_set_eq:NN \l_@@_width_dim \linewidth }
```

We read the information written on the aux file by a previous run (when the key `width` is used with the special value `min`). At this time, the only potential information written on the aux file is the value of `\l_@@_line_width_dim` when the key `width` has been used with the special value `min`).

```

838 \cs_if_exist_use:c { c_@@_ \int_use:N \g_@@_env_int _ tl }
839 \bool_if:NF \l_@@_resume_bool { \int_gzero:N \g_@@_visual_line_int }
840 \dim_gzero:N \g_@@_tmp_width_dim
841 \int_gzero:N \g_@@_line_int
842 \dim_zero:N \parindent
843 \dim_zero:N \lineskip
844 \cs_set_eq:NN \label \@@_label:n
845 }
```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

846 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
847 {
848     \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
849     {

867     { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
868 }
869 }
870 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

871 \cs_new_protected:Npn \@@_compute_width:
872 {
873     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
874     {
875         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
876         \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```
877         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```

878 {
879     \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³³ and we use that value. Elsewhere, we use a value of 0.5 em.

```

880     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
881         { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
882         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
883     }
884 }

```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the aux file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

885 {
886     \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
887     \clist_if_empty:NTF \l_@@_bg_color_clist
888         { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
889     {
890         \dim_add:Nn \l_@@_width_dim { 0.5 em }
891         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
892             { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
893             { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
894     }
895 }
896 }

897 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
898 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

899 \use:x
900 {

```

³³If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

```

901     \cs_set_protected:Npn
902         \use:c { _@@_collect_ #1 :w }

913     \noindent % added 2024/08/07

```

Now, the key `write`.

```

914     \str_if_empty:NTF \l_@@_path_write_str
915         { \lua_now:e { piton.write = "\l_@@_write_str" } }
916         {
917             \lua_now:e
918                 { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
919         }
920     \str_if_empty:NTF \l_@@_write_str
921         { \lua_now:n { piton.write = '' } }
922         {
923             \seq_if_in:NVTF \g_@@_write_seq \l_@@_write_str
924                 { \lua_now:n { piton.write_mode = "a" } }
925                 {
926                     \lua_now:n { piton.write_mode = "w" }
927                     \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
928                 }
929         }

```

Now, the main job.

```

930     \bool_if:NTF \l_@@_split_on_empty_lines_bool
931         \@@_gobble_split_parse:n
932         \@@_gobble_parse:n
933         { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```

934         \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:

```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```

935         \end { #1 }
936         \@@_write_aux:
937     }

```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```

938     \NewDocumentEnvironment { #1 } { #2 }
939     {
940         \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
941         #3
942         \@@_pre_env:
943         \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
944             { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
945         \group_begin:
946         \tl_map_function:nN
947             { \ \\ \{ \} \$ \& \^ \_ \% \~ \^\I }
948             \char_set_catcode_other:N
949             \use:c { _@@_collect_ #1 :w }
950     }

```

```
951 { #4 }
```

The following code is for technical reasons. We want to change the catcode of `^^M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `^^M` is converted to space).

```
952 \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^^M }
953 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```
954 \cs_new_protected:Npn \@@_gobble_parse:n
955 {
956     \lua_now:e
957     {
958         piton.GobbleParse
959         (
960             '\l_piton_language_str' ,
961             \int_use:N \l_@@_gobble_int ,
962             token.scan_argument ( )
963         )
964     }
965 }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```
966 \cs_new_protected:Npn \@@_gobble_split_parse:n
967 {
968     \lua_now:e
969     {
970         piton.GobbleSplitParse
971         (
972             '\l_piton_language_str' ,
973             \int_use:N \l_@@_gobble_int ,
974             token.scan_argument ( )
975         )
976     }
977 }
```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```
978 \bool_if:NTF \g_@@_beamer_bool
979 {
980     \NewPitonEnvironment { Piton } { d < > 0 { } }
981     {
982         \keys_set:nn { PitonOptions } { #2 }
983         \tl_if_no_value:nTF { #1 }
984         {
985             { \begin { uncoverenv } }
986             { \begin { uncoverenv } < #1 > }
987         }
988     }
989     {
990         \NewPitonEnvironment { Piton } { 0 { } }
991         { \keys_set:nn { PitonOptions } { #1 } }
992         { }
993 }
```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```
994 \NewDocumentCommand { \PitonInputFileTF } { d < > O { } m m m }
995 {
996     \group_begin:
```

1220     Name.Module       = \color[HTML]{0060A0} \bfseries ,
1221     Name.Table        = \color[HTML]{309030} ,
1222     Number            = \color[HTML]{FF6600} ,
1223     Operator          = \color[HTML]{555555} ,
1224     Operator.Word     = \bfseries ,
1225     String            = \color[HTML]{CC3300} ,
1226     String.Doc        = \color[HTML]{CC3300} \itshape ,
1227     String.Interpol   = \color[HTML]{AA0000} ,
1228     Comment.LaTeX     = \normalfont \color[rgb]{.468,.532,.6} ,
1229     Name.Type          = \color[HTML]{336666} ,
1230     InitialValues    = \@@_piton:n ,
1231     Interpol.Inside   = \color{black}\@@_piton:n ,
1232     TypeParameter     = \color[HTML]{336666} \itshape ,
1233     Preproc           = \color[HTML]{AA6600} \slshape ,
```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```

1234 Identifier.Internal = \@@_identifier:n ,
1235 Identifier          = ,
1236 Directive           = \color[HTML]{AA6600} ,
1237 Tag                 = \colorbox{gray!10},
1238 UserFunction        = ,
1239 Prompt              = ,
1240 ParseAgain          = \@@_piton_no_cr:n ,
1241 Discard             = \use_none:n
1242 }
```

The styles `ParseAgain.noCR` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document that style for the final user.

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```

1243 \AtBeginDocument
1244 {
1245     \bool_if:NT \g_@@_math_comments_bool
```

```

1246     { \SetPitonStyle { Comment.Math = @@_math_scantokens:n } }
1247 }
```

10.2.10 Highlighting some identifiers

```

1248 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1249 {
1250     \clist_set:Nn \l_tmpa_clist { #2 }
1251     \tl_if_no_value:nTF { #1 }
1252     {
1253         \clist_map_inline:Nn \l_tmpa_clist
1254             { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1255     }
1256     {
1257         \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1258         \str_if_eq:onT \l_tmpa_str { current-language }
1259             { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1260         \clist_map_inline:Nn \l_tmpa_clist
1261             { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1262     }
1263 }
1264 \cs_new_protected:Npn \@@_identifier:n #1
1265 {
1266     \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1267     {
1268         \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1269             { \PitonStyle { Identifier } }
1270     }
1271 { #1 }
1272 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```

1273 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1274 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```

1275 { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```

1276 \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1277 { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```

1278 \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1279 { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1280 \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1281 \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1282 { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1283 }
```

```

1284 \NewDocumentCommand \PitonClearUserFunctions { ! o }
```

```

1285  {
1286    \tl_if_novalue:nTF { #1 }
1287      { \@@_clear_all_functions: }
1288      { \@@_clear_list_functions:n { #1 } }
1289    }
1290

1504         F = space ^ 0 * ( ( alpha ^ 1 ) / "\%0" ) * space ^ 0
1505     }
1506     function piton.addDetectedCommands( key_value )
1507         piton.DetectedCommands = piton.DetectedCommands + my_lpeg : match ( key_value )
1508     end
1509     function piton.addBeamerCommands( key_value )
1510         piton.BeamerCommands
1511             = piton.BeamerCommands + my_lpeg : match ( key_value )
1512     end
1513     local function insert( ... )
1514         local s = piton.beamer_environments
1515         for _ , x in ipairs( { ... } ) do table.insert( s , x ) end
1516         return s
1517     end
1518     local my_lpeg_bis =
1519         P { "E" ,
1520             E = ( V "F" * ( "," * V "F" ) ^ 0 ) / insert ,
1521             F = space ^ 0 * ( alpha ^ 1 ) * space ^ 0
1522         }
1523     function piton.addBeamerEnvironments( key_value )
1524         piton.beamer_environments = my_lpeg_bis : match ( key_value )
1525     end
1526 \end{luacode*}
1527 
```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1528 (*LUA)
1529 if piton.comment_latex == nil then piton.comment_latex = ">" end
1530 piton.comment_latex = "#" .. piton.comment_latex
1531 local function sprintL3 ( s )
1532     tex.sprint ( luatexbase.catcodetables.expl , s )
1533 end

```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1534 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1535 local Cs, Cg, Cmt, Cb = lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1536 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1537 local function Q ( pattern )
1538     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1539 end

```

The function L takes in as argument a pattern and returns a LPEG which does a capture of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```
1540 local function L ( pattern )
1541     return Ct ( C ( pattern ) )
1542 end
```

The function Lc (the c is for *constant*) takes in as argument a string and returns a LPEG with does a constant capture which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of piton). That function, unlike the previous one, will be widely used.

```
1543 local function Lc ( string )
1544     return Cc ( { luatexbase.catcodetables.expl , string } )
1545 end
```

The function K creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a piton style and the second element is a pattern (that is to say a LPEG without capture)

```
1546 e
1547 local function K ( style , pattern )
1548     return
1549         Lc ( "{\\PitonStyle{" .. style .. "}" .. )
1550         * Q ( pattern )
1551         * Lc "}" )
1552 end
```

The formatting commands in a given piton style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function K but should be used for multi-lines elements.

```
1553 local function WithStyle ( style , pattern )
1554     return
1555         Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" .. ) * Cc "}" )
1556         * pattern
1557         * Ct ( Cc "Close" )
1558 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
1559 Escape = P ( false )
1560 EscapeClean = P ( false )
1561 if piton.begin_escape ~= nil
1562 then
1563     Escape =
1564         P ( piton.begin_escape )
1565         * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1566         * P ( piton.end_escape )
```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```
1567 EscapeClean =
1568     P ( piton.begin_escape )
1569     * ( 1 - P ( piton.end_escape ) ) ^ 1
1570     * P ( piton.end_escape )
1571 end
```

```

1572 EscapeMath = P ( false )
1573 if piton.begin_escape_math ~= nil
1574 then
1575   EscapeMath =
1576     P ( piton.begin_escape_math )
1577     * Lc "\ensuremath{"
1578     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1579     * Lc ( "}" )
1580     * P ( piton.end_escape_math )
1581 end

```

The following line is mandatory.

```
1582 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```

1583 local alpha , digit = lpeg.alpha , lpeg.digit
1584 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```

1585 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1586           + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
1587           + "Î" + "Ï" + "Ô" + "Ù" + "Ü"
1588
1589 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1590 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1591 local Identifier = K ( 'Identifier.Internal' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```

1592 local Number =
1593   K ( 'Number' ,
1594     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1595       + digit ^ 0 * P "." * digit ^ 1
1596       + digit ^ 1 )
1597     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1598     + digit ^ 1
1599   )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1600 local Word
1601 if piton.begin_escape then
1602   if piton.begin_escape_math then
1603     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1604                 - piton.begin_escape_math - piton.end_escape_math
1605                 - S "'\"\\r[({})]" - digit ) ^ 1 )

```

```

1606     else
1607         Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1608                     - S "'\"\\r[({})]" - digit ) ^ 1 )
1609     end
1610 else
1611     if piton.begin_escape_math then
1612         Word = Q ( ( 1 - space - piton.begin_escape_math - piton.end_escape_math
1613                     - S "'\"\\r[({})]" - digit ) ^ 1 )
1614     else
1615         Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1616     end
1617 end

1618 local Space = Q " " ^ 1
1619
1620 local SkipSpace = Q " " ^ 0
1621
1622 local Punct = Q ( S ",,:;!" )
1623
1624 local Tab = "\t" * Lc [[\@@_tab:]]

1625 local SpaceIndentation = Lc [[\@@_an_indentation_space:]] * Q " "
1626
1627 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by \l_@@_space_t1. It will be used in the strings. Usually, \l_@@_space_t1 will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, \\l_@@_space_t1 will contain □ (U+2423) in order to visualize the spaces.

```
1627 local VisualSpace = space * Lc [[\l_@@_space_t1]]
```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language).

```

1628 local strict_braces =
1629     P { "E" ,
1630         E = ( "{ " * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
1631         F = ( "{ " * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
1632     }

```

Several tools for the construction of the main LPEG

```

1633 local LPEG0 = { }
1634 local LPEG1 = { }
1635 local LPEG2 = { }
1636 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern which *does no catching*.

```

1637 local function Compute_braces ( lpeg_string ) return
1638     P { "E" ,
1639         E =
1640             (
1641                 "{ " * V "E" * "}"
1642                 +

```

```

1643     lpeg_string
1644     +
1645     ( 1 - S "{}" )
1646     ) ^ 0
1647   }
1648 end

```

The following Lua function will compute the lpeg DetectedCommands which is a LPEG with captures).

```

1649 local function Compute_DetectedCommands ( lang , braces ) return
1650   Ct ( Cc "Open"
1651     * C ( piton.DetectedCommands * P "{" )
1652     * Cc "}"
1653   )
1654   * ( braces
1655     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1656   * P "}"
1657   * Ct ( Cc "Close" )
1658 end

1659 local function Compute_LPEG_cleaner ( lang , braces ) return
1660   Ct ( ( piton.DetectedCommands * "{"
1661     * ( braces
1662       / ( function ( s )
1663         if s ~= '' then return LPEG_cleaner[lang] : match ( s ) end end ) )
1664       * "}"
1665     + EscapeClean
1666     + C ( P ( 1 ) )
1667   ) ^ 0 ) / table.concat
1668 end

```

Constructions for Beamer If the class Beamer is used, some environments and commands of Beamer are automatically detected in the listings of piton.

```

1669 local Beamer = P ( false )
1670 local BeamerBeginEnvironments = P ( true )
1671 local BeamerEndEnvironments = P ( true )

1672 piton.BeamerEnvironments = P ( false )
1673 for _ , x in ipairs ( piton.beamer_environments ) do
1674   piton.BeamerEnvironments = piton.BeamerEnvironments + x
1675 end

1676 BeamerBeginEnvironments =
1677   ( space ^ 0 *
1678     L
1679     (
1680       P "\begin{" * piton.BeamerEnvironments * "}"
1681       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1682     )
1683     * "\r"
1684   ) ^ 0

1685 BeamerEndEnvironments =
1686   ( space ^ 0 *
1687     L ( P "\end{" * piton.BeamerEnvironments * "}" )
1688     * "\r"
1689   ) ^ 0

```

The following Lua function will be used to compute the LPEG Beamer for each informatic language.

```
1690 local function Compute_Beamer ( lang , braces )
```

We will compute in lpeg the LPEG that we will return.

```
1691 local lpeg = L ( P "\\\\" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1692 lpeg = lpeg +
1693   Ct ( Cc "Open"
1694     * C ( piton.BeamerCommands
1695       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1696       * P "{"
1697       )
1698     * Cc "}"
1699   )
1700   * ( braces /
1701     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1702   * "}"
1703   * Ct ( Cc "Close" )
```

For the command \\alt, the specification of the overlays (between angular brackets) is mandatory.

```
1704 lpeg = lpeg +
1705   L ( P "\\\\" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1706   * ( braces /
1707     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1708   * L ( P "}" {")
1709   * ( braces /
1710     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1711   * L ( P "}" )
```

For \\temporal, the specification of the overlays (between angular brackets) is mandatory.

```
1712 lpeg = lpeg +
1713   L ( ( P "\\\\" * temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1714   * ( braces
1715     / ( function ( s )
1716       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1717   * L ( P "}" {")
1718   * ( braces
1719     / ( function ( s )
1720       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1721   * L ( P "}" )
1722   * ( braces
1723     / ( function ( s )
1724       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1725   * L ( P "}" )
```

Now, the environments of Beamer.

```
1726 for _ , x in ipairs ( piton.beamer_environments ) do
1727   lpeg = lpeg +
1728     Ct ( Cc "Open"
1729       * C (
1730         P ( "\\\\"begin{ .. x .. }" )
1731         * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1732       )
1733       * Cc ( "\\\\"end{ .. x .. }" )
1734     )
1735   * (
1736     ( ( 1 - P ( "\\\\"end{ .. x .. }" ) ) ^ 0 )
1737     / ( function ( s )
1738       if s ~= ''
1739       then return LPEG1[lang] : match ( s )
1740       end
1741     )
```

```

1742      )
1743      * P ( "\\\end{.. x .. }" )
1744      * Ct ( Cc "Close" )
1745 end

```

Now, you can return the value we have computed.

```

1746   return lpeg
1747 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1748 local CommentMath =
1749   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

1750 local PromptHastyDetection =
1751   ( # ( P ">>>" + "..." ) * Lc '\\@@_prompt:' ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1752 local Prompt = K ( 'Prompt' , ( ( P ">>>" + "..." ) * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1753 local EOL_without_space_indentation =
1754   P "\r"
1755   *
1756   (
1757     ( space ^ 0 * -1 )
1758     +

```

We recall that each line of the informatic code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁴.

```

1759   Ct (
1760     Cc "EOL"
1761     *
1762     Ct (
1763       Lc [[\@@_end_line:]]
1764       * BeamerEndEnvironments
1765       * BeamerBeginEnvironments
1766       * PromptHastyDetection
1767       * Lc [[\@@_newline:\@@_begin_line:]]
1768       * Prompt
1769     )
1770   )
1771 )
1772 local EOL = EOL_without_space_indentation
1773   * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1

```

³⁴Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

The following LPEG CommentLaTeX is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function C) in a table (by using Ct, which is an alias for lpeg.Ct).

```

1774 local CommentLaTeX =
1775   P(piton.comment_latex)
1776   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
1777   * L ( ( 1 - P "\r" ) ^ 0 )
1778   * Lc "}"}
1779   * ( EOL + -1 )

```

10.3.2 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1780 local Operator =
1781   K ( 'Operator' ,
1782     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
1783     + S "--+/*%=<>&.@|")
1784
1785 local OperatorWord =
1786   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword `in` in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word`.

```

1787 local For = K ( 'Keyword' , P "for" )
1788   * Space
1789   * Identifier
1790   * Space
1791   * K ( 'Keyword' , P "in" )
1792
1793 local Keyword =
1794   K ( 'Keyword' ,
1795     P "as" + "assert" + "break" + "case" + "class" + "continue" + "def" +
1796     "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
1797     "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
1798     "try" + "while" + "with" + "yield" + "yield from" )
1799   + K ( 'Keyword.Constant' , P "True" + "False" + "None" )
1800
1801 local Builtin =
1802   K ( 'Name.Builtin' ,
1803     P "__import__" + "abs" + "all" + "any" + "bin" + "bool" + "bytearray" +
1804     "bytes" + "chr" + "classmethod" + "compile" + "complex" + "delattr" +
1805     "dict" + "dir" + "divmod" + "enumerate" + "eval" + "filter" + "float" +

1837

1838

1839 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1840

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
1841 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

1842 local DefClass =
1843   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

1844 local ImportAs =
1845   K ( 'Keyword' , "import" )
1846   * Space
1847   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1848   *
1849   ( Space * K ( 'Keyword' , "as" ) * Space
1850     * K ( 'Name.Namespace' , identifier ) )
1851   +
1852   ( SkipSpace * Q "," * SkipSpace
1853     * K ( 'Name.Namespace' , identifier ) ) ^ 0
1854 )

```

Be careful: there is no commutativity of + in the previous expression.

The LPEG FromImport is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style Name.Namespace and the following keyword `import` must be formatted with the piton style Keyword and must *not* be caught by the LPEG ImportAs.

Example: `from math import pi`

```

1855 local FromImport =
1856   K ( 'Keyword' , "from" )
1857   * Space * K ( 'Name.Namespace' , identifier )
1858   * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁵ in that interpolation:

```
f'Total price: {total:+.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
1859 local PercentInterpol =
1860   K ( 'String.Interpol' ,
1861     P "%"
1862     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1863     * ( S "-#0 +" ) ^ 0
1864     * ( digit ^ 1 + "*" ) ^ -1
1865     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1866     * ( S "HLL" ) ^ -1
1867     * S "sdfFeExXorgiGauc%""
1868   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.³⁶

```
1869 local SingleShortString =
1870   WithStyle ( 'String.Short' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
1871   Q ( P "f'" + "F'" )
1872   *
1873     K ( 'String.Interpol' , "{}" )
1874     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
1875     * Q ( P ":" * ( 1 - S "};" ) ^ 0 ) ^ -1
1876     * K ( 'String.Interpol' , "}" )
1877     +
1878     VisualSpace
1879     +
1880     Q ( ( P "\\" + "{{" + "}}}" + 1 - S " {" ) ^ 1 )
1881   ) ^ 0
1882   * Q "''"
1883   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1884   Q ( P "''" + "r'" + "R'" )
1885   * ( Q ( ( P "\\" + 1 - S " \r%" ) ^ 1 )
1886     + VisualSpace
1887     + PercentInterpol
1888     + Q "%"
1889   ) ^ 0
1890   * Q "''" )
```

³⁵There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say String.Short or String.Long.

³⁶The interpolations are formatted with the piton style Interpol.Inside. The initial value of that style is \@@_piton:n which means that the interpolations are parsed once again by piton.

```

1893
1894 local DoubleShortString =
1895   WithStyle ( 'String.Short' ,
1896     Q ( P "f\" + "F\" )
1897     *
1898     K ( 'String.Interpol' , "{}" )
1899     * K ( 'Interpol.Inside' , ( 1 - S "}":") ^ 0 )
1900     * ( K ( 'String.Interpol' , ":" ) * Q ( (1 - S "}":") ^ 0 ) ) ^ -1
1901     * K ( 'String.Interpol' , "}" )
1902     +
1903     VisualSpace
1904     +
1905     Q ( ( P "\\\\" + "{}" + "}" ) + 1 - S " {}\" ) ^ 1 )
1906     ) ^ 0
1907     * Q " \""
1908     +
1909     Q ( P "\\" + "r\" + "R\" )
1910     * ( Q ( ( P "\\\\" + 1 - S " \\" ) ^ 1 )
1911       + VisualSpace
1912       + PercentInterpol
1913       + Q "%"
1914       ) ^ 0
1915     * Q " \""
1916
1917 local ShortString = SingleShortString + DoubleShortString

```

Beamer The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

1918 local braces =
1919   Compute_braces
1920   (
1921     ( P "\\" + "r\" + "R\" + "f\" + "F\" )
1922       * ( P "\\\\" + 1 - S " \" ) ^ 0 * " \""
1923     +
1924     ( P '\' + 'r\' + 'R\' + 'f\' + 'F\' )
1925       * ( P '\\\\' + 1 - S '\') ^ 0 * '\'
1926   )
1927 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

Detected commands

```
1928 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
```

LPEG_cleaner

```
1929 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )
```

The long strings

```

1930 local SingleLongString =
1931   WithStyle ( 'String.Long' ,
1932     ( Q ( S "fF" * P "::::" )
1933       *
1934       K ( 'String.Interpol' , "{}" )
1935       * K ( 'Interpol.Inside' , ( 1 - S "}:\r" - "::::" ) ^ 0 )
1936       * Q ( P ":" * (1 - S "}:\r" - "::::" ) ^ 0 ) ^ -1
1937       * K ( 'String.Interpol' , "}" )
1938       +

```

```

1939         Q ( ( 1 - P "****" - S "{}'\r" ) ^ 1 )
1940         +
1941         EOL
1942         ) ^ 0
1943     +
1944     Q ( ( S "rR" ) ^ -1 * "****" )
1945     *
1946     Q ( ( 1 - P "****" - S "\r%" ) ^ 1 )
1947     +
1948     PercentInterpol
1949     +
1950     P "%"
1951     +
1952     EOL
1953     ) ^ 0
1954   )
1955   * Q "****" )
1956
1957 local DoubleLongString =
1958   WithStyle ( 'String.Long' ,
1959   (
1960     Q ( S "fF" * "\"\"\"")
1961     *
1962     (
1963       K ( 'String.Interpol' , "{}" )
1964       * K ( 'Interpol.Inside' , ( 1 - S "}:\r" - "\"\"\"") ^ 0 )
1965       * Q ( ":" * ( 1 - S "}:\r" - "\"\"\"") ^ 0 ) ^ -1
1966       * K ( 'String.Interpol' , "}" )
1967       +
1968       Q ( ( 1 - S "{}\r" - "\"\"\"") ^ 1 )
1969       +
1970       EOL
1971     ) ^ 0
1972   +
1973   Q ( S "rR" ^ -1 * "\"\"\"")
1974   *
1975     Q ( ( 1 - P "\"\"\" - S "%\r" ) ^ 1 )
1976     +
1977     PercentInterpol
1978     +
1979     P "%"
1980     +
1981     EOL
1982     ) ^ 0
1983   )
1984   * Q "\"\"\""
1985 )
1986 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG DefFunction which deals with the whole preamble of a function definition (which begins with `def`).

```

1987 local StringDoc =
1988   K ( 'String.Doc' , P "r" ^ -1 * "\"\"\"")
1989   * ( K ( 'String.Doc' , ( 1 - P "\"\"\" - "\r" ) ^ 0 ) * EOL
1990     * Tab ^ 0
1991     ) ^ 0
1992   * K ( 'String.Doc' , ( 1 - P "\"\"\" - "\r" ) ^ 0 * "\"\"\"")

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

1993 local Comment =
1994   WithStyle ( 'Comment' ,
1995     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
1996     * ( EOL + -1 )

```

DefFunction The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1997 local expression =
1998   P { "E" ,
1999     E = ( ""* ( P "\\" + 1 - S "'\r" ) ^ 0 * //!
2000       + "\\"* ( P "\\\\" + 1 - S "\"\r" ) ^ 0 * "\""
2001       + "{} * V "F" * "}"
2002       + "(" * V "F" * ")"
2003       + "[" * V "F" * "]"
2004       + ( 1 - S "{}()[]\r," ) ) ^ 0 ,
2005     F = (   "{} * V "F" * "}"
2006       + "(" * V "F" * ")"
2007       + "[" * V "F" * "]"
2008       + ( 1 - S "{}()[]\r\\"" ) ) ^ 0
2009   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG **Params** will be used to catch the chunk `a,b,x=10,n:int`.

```

2010 local Params =
2011   P { "E" ,
2012     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2013     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2014     * (
2015       K ( 'InitialValues' , "=" * expression )
2016       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2017     ) ^ -1
2018   }

```

The following LPEG **DefFunction** catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as **Comment**, **CommentLaTeX**, **Params**, **StringDoc**...

```

2019 local DefFunction =
2020   K ( 'Keyword' , "def" )
2021   * Space
2022   * K ( 'Name.Function.Internal' , identifier )
2023   * SkipSpace
2024   * Q "(" * Params * Q ")"
2025   * SkipSpace
2026   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain.noCR` which will be linked to `\@_piton_no_cr:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

2027   * K ( 'ParseAgain.noCR' , ( 1 - S ":\r" ) ^ 0 )
2028   * Q ":" *
2029   * ( SkipSpace
2030     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2031     * Tab ^ 0

```

```

2032     * SkipSpace
2033     * StringDoc ^ 0 -- there may be additional docstrings
2034 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` must appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```

2035 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL

```

The main LPEG for the language Python

```

2036 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2037 local Main =
2038     -- space ^ 1 * -1
2039     -- + space ^ 0 * EOL
2040     Space
2041     + Tab
2042     + Escape + EscapeMath
2043     + CommentLaTeX
2044     + Beamer
2045     + DetectedCommands
2046     + LongString
2047     + Comment
2048     + ExceptionInConsole
2049     + Delim
2050     + Operator
2051     + OperatorWord * EndKeyword
2052     + ShortString
2053     + Punct
2054     + FromImport
2055     + RaiseException
2056     + DefFunction
2057     + DefClass
2058     + For
2059     + Keyword * EndKeyword
2060     + Decorator
2061     + Builtin * EndKeyword
2062     + Identifier
2063     + Number
2064     + Word

```

Here, we must not put `local!`

```

2065 LPEG1['python'] = Main ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³⁷.

```

2066 LPEG2['python'] =
2067     Ct (
2068         ( space ^ 0 * "\r" ) ^ -1
2069         * BeamerBeginEnvironments
2070         * PromptHastyDetection
2071         * Lc [[\@@_begin_line:]]
2072         * Prompt

```

³⁷Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2073     * SpaceIndentation ^ 0
2074     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2075     * -1
2076     * Lc [[\@@_end_line:]]
2077 )

```

10.3.3 The language Ocaml

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write `(1 - S "()")` with outer parenthesis.

```

2078 local balanced_parens =
2079   P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "()" ) ) ^ 0 }
2080 local Delim = Q ( P "[|" + "|]" + S "[()]" )
2081 local Punct = Q ( S ",;:;" )

```

The identifiers caught by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

2082 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2083 local Constructor = K ( 'Name.Constructor' , cap_identifier )
2084 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

2085 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2086 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

2087 local expression_for_fields =
2088   P { "E" ,
2089     E = (   "{" * V "F" * "}"
2090             + "(" * V "F" * ")"
2091             + "[" * V "F" * "]"
2092             + "\\" * ( P "\\\\" + 1 - S "\\" \r" ) ^ 0 * "\\" "
2093             + "''" * ( P "\\'" + 1 - S "''\r" ) ^ 0 * "'''"
2094             + ( 1 - S "{}()[]\r;" ) ) ^ 0 ,
2095     F = (   "{" * V "F" * "}"
2096             + "(" * V "F" * ")"
2097             + "[" * V "F" * "]"
2098             + ( 1 - S "{}()[]\r\'''" ) ) ^ 0
2099   }
2100 local OneFieldDefinition =
2101   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2102   * K ( 'Name.Field' , identifier ) * SkipSpace
2103   * Q ":" * SkipSpace
2104   * K ( 'TypeExpression' , expression_for_fields )
2105   * SkipSpace
2106
2107 local OneField =
2108   K ( 'Name.Field' , identifier ) * SkipSpace
2109   * Q "=" * SkipSpace
2110   * ( expression_for_fields
2111     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2112   )
2113   * SkipSpace
2114
2115 local Record =
2116   Q "{" * SkipSpace
2117   *
2118   (
2119     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2120     +

```

```

2121     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0
2122   )
2123   *
2124   Q "}"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2125 local DotNotation =
2126   (
2127     K ( 'Name.Module' , cap_identifier )
2128     * Q "."
2129     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ ( -1 )
2130   +

2177         * ( digit + R "af" + R "AF" )
2178         * ( digit + R "af" + R "AF" )
2179         + P "o" * R "03" * R "07" * R "07" )
2180     )
2181 * """

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2182 local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2183 if piton.beamer then
2184   Beamer = Compute_Beamer ( 'ocaml' , braces ) -- modified 2024/07/24
2185 end
2186 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

2187 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

The strings en OCaml We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

2188 local ocaml_string =
2189   Q "\""
2190   * (
2191     VisualSpace
2192     +
2193     Q ( ( 1 - S "\r" ) ^ 1 )
2194     +
2195     EOL
2196   ) ^ 0
2197   * Q """
2198 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2199 local ext = ( R "az" + "_" ) ^ 0
2200 local open = "{" * Cg ( ext , 'init' ) * "|"
2201 local close = "|" * C ( ext ) * "}"
2202 local closeeq =
2203   Cmt ( close * Cb ( 'init' ) ,
2204         function ( s , i , a , b ) return a == b end )

```

The `LPEG QuotedStringBis` will do the second analysis.

```

2205 local QuotedStringBis =
2206   WithStyle ( 'String.Long' ,
2207   (
2208     Space
2209     +
2210     Q ( ( 1 - S "\r" ) ^ 1 )
2211     +
2212     EOL
2213   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```
2214 local QuotedString =
2215   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2216   ( function ( s ) return QuotedStringBis : match ( s ) end )
```

The comments in the OCaml listings In OCaml, the delimiters for the comments are (* and *). There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```
2217 local Comment =
2218   WithStyle ( 'Comment' ,
2219     P {
2220       "A" ,
2221       A = Q "(*"
2222         * ( V "A"
2223           + Q ( ( 1 - S "\r$\\" - "(*" - "*)" ) ^ 1 ) -- $
2224           + ocaml_string
2225           + $" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * $" -- $
2226           + EOL
2227         ) ^ 0
2228         * Q "*)"
2229     } )
```

The DefFunction

```
2230 local Argument =
```

For the labels of the labeled arguments. Maybe you will, in the future, create a style for those elements.

```
2231   ( Q "~" * Identifier * Q ":" * SkipSpace ) ^ -1
2232   *
2233   ( K ( 'Identifier.Internal' , identifier )
2234     + Q "(" * SkipSpace
2235     * K ( 'Identifier.Internal' , identifier ) * SkipSpace
2236     * Q ":" * SkipSpace
2237     * K ( 'TypeExpression' , balanced_parens ) * SkipSpace
2238     * Q ")"
2239   )
```

Despite its name, then LPEG DefFunction deals also with let open which opens locally a module.

```
2240 local DefFunction =
2241   K ( 'Keyword.Governing' , "let open" )
2242   * Space
2243   * K ( 'Name.Module' , cap_identifier )
2244   +
2245   K ( 'Keyword.Governing' , P "let rec" + "let" + "and" )
2246   * Space
2247   * K ( 'Name.Function.Internal' , identifier )
2248   * Space
2249   *
2250   Q "=" * SkipSpace * K ( 'Keyword' , "function" )
2251   +
2252   Argument
2253   * ( SkipSpace * Argument ) ^ 0
2254   *
2255   SkipSpace
2256   * Q ":"*
2257   * K ( 'TypeExpression' , ( 1 - P "=" ) ^ 0 )
2258   ) ^ -1
2259   )
```

The DefModule The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2260 local DefModule =
2261   K ( 'Keyword.Governing' , "module" ) * Space
2262   *
2263   (
2264     K ( 'Keyword.Governing' , "type" ) * Space
2265     * K ( 'Name.Type' , cap_identifier )
2266   +
2267     K ( 'Name.Module' , cap_identifier ) * SkipSpace
2268   *
2269   (
2270     Q "(" * SkipSpace
2271       * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2272       * Q ":" * SkipSpace
2273       * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2274       *
2275       (
2276         Q "," * SkipSpace
2277           * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2278           * Q ":" * SkipSpace
2279           * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2280         ) ^ 0
2281       * Q ")"
2282     ) ^ -1
2283   *
2284   (
2285     Q "=" * SkipSpace
2286     * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2287     * Q "("
2288     * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2289     *
2290     (
2291       Q ","
2292       *
2293       K ( 'Name.Module' , cap_identifier ) * SkipSpace
2294     ) ^ 0
2295     * Q ")"
2296   ) ^ -1
2297 )
2298 +
2299 K ( 'Keyword.Governing' , P "include" + "open" )
2300 * Space * K ( 'Name.Module' , cap_identifier )

```

The DefType

```

2301 local TypeParameter =
2302   K ( 'TypeParameter' , """ * alpha * ( # ( 1 - P """ ) + -1 ) )

```

The following LPEG is for the instructions of definitions of types (which begin with type).

```

2303 local DefType =
2304   K ( 'Keyword.Governing' , "type" )
2305   * Space
2306   * WithStyle
2307   (
2308     'TypeExpression' ,
2309     ( Q ( 1 - P ";" - P "\r" ) + EOL_without_space_indentation ) ^ 0
2310   )
2311 * ( # governing_keyword + Q ";" + -1 )

```

The main LPEG for the language OCaml

```
2312 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```
2313 local Main =
2314     Space
2315     + Tab
2316     + Escape + EscapeMath
2317     + Beamer
2318     + DetectedCommands
2319     + TypeParameter
2320     + String + QuotedString + Char
2321     + Comment
2322     + Delim
2323     + Operator
```

For the labels of the labeled arguments. Maybe you will, in the future, create a style for those elements.

```
2324     + Q (~) * Identifier * ( Q ":" ) ^ -1
2325     + Q ":" * # (1 - P ":" ) * SkipSpace
2326         * K ('TypeExpression' , balanced_parens ) * SkipSpace * Q ")"
2327     + Punct
2328     + Exception
2329     + DefFunction
2330     + DefModule
2331     + DefType
2332     + Record
2333     + Keyword * EndKeyword
2334     + OperatorWord * EndKeyword
2335     + Builtin * EndKeyword
2336     + DotNotation
2337     + Constructor
2338     + Identifier
2339     + Number
2340     + Word
2341
2342 LPEG1['ocaml'] = Main ^ 0
```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@_begin_line:` – `\@_end_line:`³⁸.

```
2343 LPEG2['ocaml'] =
2344     Ct (
```

The following lines are in order to allow, in `\piton` (and not in `{Piton}`), judgments of type (such as `f : my_type -> 'a list`) or single expressions of type such as `my_type -> 'a list` (in that case, the argument of `\piton` must begin by a colon).

```
2345     ( P ":" + Identifier * SkipSpace * Q ":" )
2346         * SkipSpace
2347         * K ('TypeExpression' , ( 1 - P "\r" ) ^ 0 )
2348     +
```

Now, the main part.

```
2349     ( space ^ 0 * "\r" ) ^ -1
2350     * BeamerBeginEnvironments
2351     * Lc [[\@_begin_line:]]
2352     * SpaceIndentation ^ 0
2353     * ( ( space * Lc [[\@_trailing_space:]] ) ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2354     * -1
2355     * Lc [[\@_end_line:]]
2356 )
```

³⁸Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

10.3.4 The language C

```
2357 local Delim = Q ( S "{[()]}")  
2358 local Punct = Q ( S ",:;!")
```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```
2359 local identifier = letter * alphanum ^ 0  
2360  
2361 local Operator =  
2362   K ( 'Operator' ,  
2363     P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "||" + "&&"  
2364     + S "--+/*%=<>&.@|!" )  
2365  
2366 local Keyword =  
2367   K ( 'Keyword' ,  
2368     P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +  
2369     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +  
2370     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +  
2371     "register" + "restricted" + "return" + "static" + "static_assert" +  
2372     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +  
2373     "union" + "using" + "virtual" + "volatile" + "while"  
2374   )  
2375   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )  
2376  
2377 local Builtin =  
2378   K ( 'Name.Builtin' ,  
2379     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )  
2380  
2381 local Type =  
2382   K ( 'Name.Type' ,  
2383     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +  
2384     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"  
2385     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0  
2386  
2387 local DefFunction =  
2388   Type  
2389   * Space  
2390   * Q "*" ^ -1  
2391   * K ( 'Name.Function.Internal' , identifier )  
2392   * SkipSpace  
2393   * # P "("
```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
2394 local DefClass =  
2395   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```
2396 String =  
2397   WithStyle ( 'String.Long' ,  
2398     Q "\""  
2399     * ( VisualSpace  
2400       + K ( 'String.Interpol' ,  
2401         "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )  
2402       )
```

```

2403     + Q ( ( P "\\\\" + 1 - S \" \\" ) ^ 1 )
2404     ) ^ 0
2405     * Q \" \"
2406 )

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2407 local braces = Compute_braces ( \" * ( 1 - S \" \\" ) ^ 0 * \" \\" )
2408 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2409 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2410 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```

2411 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

2412 local Comment =
2413   WithStyle ( 'Comment' ,
2414     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2415     * ( EOL + -1 )
2416
2417 local LongComment =
2418   WithStyle ( 'Comment' ,
2419     Q "/*"
2420     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2421     * Q "*/"
2422   ) -- $

```

The main LPEG for the language C

```

2423 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2424 local Main =
2425   Space
2426   + Tab
2427   + Escape + EscapeMath
2428   + CommentLaTeX
2429   + Beamer
2430   + DetectedCommands
2431   + Preproc
2432   + Comment + LongComment
2433   + Delim
2434   + Operator
2435   + String
2436   + Punct
2437   + DefFunction
2438   + DefClass
2439   + Type * ( Q "*" ^ -1 + EndKeyword )
2440   + Keyword * EndKeyword
2441   + Builtin * EndKeyword
2442   + Identifier
2443   + Number
2444   + Word

```

Here, we must not put local!

```
2445 LPEG1['c'] = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁹.

```
2446 LPEG2['c'] =
2447   Ct (
2448     ( space ^ 0 * P "\r" ) ^ -1
2449     * BeamerBeginEnvironments
2450     * Lc [[\@@_begin_line:]]
2451     * SpaceIndentation ^ 0
2452     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2453     * -1
2454     * Lc [[\@@_end_line:]]
2455   )
```

10.3.5 The language SQL

```
2456 local function LuaKeyword ( name )
2457   return
2458   Lc [[{\PitonStyle{Keyword}{}]}
2459   * Q ( Cmt (
2460     C ( identifier ) ,
2461     function ( s , i , a ) return string.upper ( a ) == name end
2462   )
2463   )
2464   * Lc "}"}
2465 end
```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```
2466 local identifier =
2467   letter * ( alphanum + "-" ) ^ 0
2468   + P '""' * ( ( 1 - P '""' ) ^ 1 ) * '""'
2469
2470
2471 local Operator =
2472   K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )
```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```
2473 local function Set ( list )
2474   local set = { }
2475   for _, l in ipairs ( list ) do set[l] = true end
2476   return set
2477 end
2478
2479 local set_keywords = Set
2480 {
2481   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2482   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2483   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,
2484   "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,
2485   "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,
2486   "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2487 }
```

³⁹Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2488
2489 local set_builtins = Set
2490 {
2491   "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2492   "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2493   "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2494 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2495 local Identifier =
2496   C ( identifier ) /
2497   (
2498     function (s)
2499       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL

```

Remind that, in Lua, it's possible to return *several* values.

```

2500       then return { {"\\PitonStyle{Keyword}" } ,
2501                     { luatexbase.catcodetables.other , s } ,
2502                     { "}" } }
2503     else if set_builtins[string.upper(s)]
2504       then return { {"\\PitonStyle{Name.Builtin}" } ,
2505                     { luatexbase.catcodetables.other , s } ,
2506                     { "}" } }
2507     else return { {"\\PitonStyle{Name.Field}" } ,
2508                     { luatexbase.catcodetables.other , s } ,
2509                     { "}" } }
2510   end
2511 end
2512 end
2513 )

```

The strings of SQL

```
2514 local String = K ( 'String.Long' , "" * ( 1 - P "" ) ^ 1 * "" )
```

Beamer The argument of Compute_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

2515 local braces = Compute_braces ( "" * ( 1 - P "" ) ^ 1 * "" )
2516 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2517 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2518 LPEG_cleaner['sql'] = Compute_LPEG_cleaner ( 'sql' , braces )

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

2519 local Comment =
2520   WithStyle ( 'Comment' ,
2521     Q "--" -- syntax of SQL92
2522     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2523     * ( EOL + -1 )
2524
2525 local LongComment =
2526   WithStyle ( 'Comment' ,
2527     Q "/*"
2528     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2529     * Q "*/"
2530   ) -- $

```

The main LPEG for the language SQL

```

2531 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
2532 local TableField =
2533     K ( 'Name.Table' , identifier )

2550 * ( Space * ( LuaKeyword "ASC" + LuaKeyword "DESC" ) ) ^ -1
2551
2552 local OneTable =
2553     K ( 'Name.Table' , identifier )
2554     *
2555         Space
2556         * LuaKeyword "AS"
2557         * Space
2558         * K ( 'Name.Table' , identifier )
2559     ) ^ -1
2560
2561 local WeCatchTableNames =
2562     LuaKeyword "FROM"
2563     * ( Space + EOL )
2564     * OneTable * ( SkipSpace * Q "," * SkipSpace * OneTable ) ^ 0
2565     +
2566         LuaKeyword "JOIN" + LuaKeyword "INTO" + LuaKeyword "UPDATE"
2567         + LuaKeyword "TABLE"
2568     )
2569     * ( Space + EOL ) * OneTable
2570
2571 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2571 local Main =
2572     Space
2573     + Tab
2574     + Escape + EscapeMath
2575     + CommentLaTeX
2576     + Beamer
2577     + DetectedCommands
2578     + Comment + LongComment
2579     + Delim
2580     + Operator
2581     + String
2582     + Punct
2583     + WeCatchTableNames
2584     + ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
2585     + Number
2586     + Word

```

Here, we must not put local!

```
2587 LPEG1['sql'] = Main ^ 0
```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`⁴⁰.

```

2588 LPEG2['sql'] =
2589   Ct (
2590     ( space ^ 0 * "\r" ) ^ -1
2591     * BeamerBeginEnvironments
2592     * Lc [[\@@_begin_line:]]
2593     * SpaceIndentation ^ 0
2594     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2595     * -1
2596     * Lc [[\@@_end_line:]]
2597   )

```

10.3.6 The language “Minimal”

```

2598 local Punct = Q ( S ",,:;!\\\" )
2599
2600 local Comment =
2601   WithStyle ( 'Comment' ,
2602     Q "#"
2603     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
2604   )
2605   * ( EOL + -1 )
2606
2607 local String =
2608   WithStyle ( 'String.Short' ,
2609     Q "\\""
2610     * ( VisualSpace
2611       + Q ( ( P "\\\\" + 1 - S " \\" ) ^ 1 )
2612       ) ^ 0
2613     * Q "\\""
2614   )
2615

```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2616 local braces = Compute_braces ( P "\\" * ( P "\\\\" + 1 - P "\\" ) ^ 1 * "\\" )
2617
2618 if piton.beamer then Beamer = Compute_Beamer ( 'minimal' , braces ) end
2619
2620 DetectedCommands = Compute_DetectedCommands ( 'minimal' , braces )
2621
2622 LPEG_cleaner['minimal'] = Compute_LPEG_cleaner ( 'minimal' , braces )
2623
2624 local identifier = letter * alphanum ^ 0
2625
2626 local Identifier = K ( 'Identifier.Internal' , identifier )
2627
2628 local Delim = Q ( S "[[()]]" )
2629
2630 local Main =
2631   Space
2632   + Tab

2656   )
2657
2658 % \bigskip
2659 % \subsubsection{The function Parse}
2660 %
2661 % \medskip
2662 % The function |Parse| is the main function of the package \pkg{piton}. It
2663 % parses its argument and sends back to LaTeX the code with interlaced
2664 % formatting LaTeX instructions. In fact, everything is done by the
2665 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2666 % which returns as capture a Lua table containing data to send to LaTeX.
2667 %
2668 % \bigskip
2669 % \begin{macrocode}
2670 function piton.Parse ( language , code )
2671   local t = LPEG2[language] : match ( code )
2672   if t == nil
2673     then
2674       sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
2675       return -- to exit in force the function
2676     end
2677   local left_stack = {}
2678   local right_stack = {}
2679   for _ , one_item in ipairs ( t ) do
2680     if one_item[1] == "EOL" then
2681       for _ , s in ipairs ( right_stack ) do
2682         tex.sprint ( s )
2683       end
2684       for _ , s in ipairs ( one_item[2] ) do
2685         tex.tprint ( s )
2686       end
2687       for _ , s in ipairs ( left_stack ) do
2688         tex.sprint ( s )
2689       end
2690     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\uncover` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{uncover}`.

```

2691   if one_item[1] == "Open" then
2692     tex.sprint( one_item[2] )
2693     table.insert ( left_stack , one_item[2] )
2694     table.insert ( right_stack , one_item[3] )
2695   else
2696     if one_item[1] == "Close" then

```

```

2697     tex.sprint ( right_stack[#right_stack] )
2698     left_stack[#left_stack] = nil
2699     right_stack[#right_stack] = nil
2700   else
2701     tex.tprint ( one_item )
2702   end
2703 end
2704 end
2705 end
2706 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2707 function piton.ParseFile ( language , name , first_line , last_line , split )
2708   local s = ''
2709   local i = 0
2710   for line in io.lines ( name ) do
2711     i = i + 1
2712     if i >= first_line then
2713       s = s .. '\r' .. line
2714     end
2715     if i >= last_line then break end
2716   end

```

We extract the BOM of utf-8, if present.

```

2717   if string.byte ( s , 1 ) == 13 then
2718     if string.byte ( s , 2 ) == 239 then
2719       if string.byte ( s , 3 ) == 187 then
2720         if string.byte ( s , 4 ) == 191 then
2721           s = string.sub ( s , 5 , -1 )
2722         end
2723       end
2724     end
2725   end
2726   if split == 1 then
2727     piton.GobbleSplitParse ( language , 0 , s )
2728   else
2729     sprintL3 [[\bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2730     piton.Parse ( language , s )
2731     sprintL3
2732       [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2733   end
2734 end

```

10.3.7 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

2735 function piton.ParseBis ( lang , code )
2736   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2737   return piton.Parse ( lang , s )
2738 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the piton style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2739 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space:`.

```
2740   local s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
```

```

2741         : match ( code )
2742     return piton.Parse ( lang , s )
2743 end

```

10.3.8 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2744 local AutoGobbleLPEG =
2745   (
2746     P " " ^ 0 * "\r"
2747     +
2748     Ct ( C " " ^ 0 ) / table.getn
2749     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2750   ) ^ 0
2751   * ( Ct ( C " " ^ 0 ) / table.getn
2752     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2753 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2754 local TabsAutoGobbleLPEG =
2755   (
2756     (
2757       P "\t" ^ 0 * "\r"
2758       +
2759       Ct ( C "\t" ^ 0 ) / table.getn
2760       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2761     ) ^ 0
2762     * ( Ct ( C "\t" ^ 0 ) / table.getn
2763       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2764   ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2765 local EnvGobbleLPEG =
2766   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2767   * Ct ( C " " ^ 0 * -1 ) / table.getn
2768 local function remove_before_cr ( input_string )
2769   local match_result = ( P "\r" ) : match ( input_string )
2770   if match_result then
2771     return string.sub ( input_string , match_result )
2772   else
2773     return input_string
2774   end
2775 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

2776 local function gobble ( n , code )
2777   code = remove_before_cr ( code )
2778   if n == 0 then
2779     return code
2780   else
2781     if n == -1 then
2782       n = AutoGobbleLPEG : match ( code )

```

```

2783     else
2784         if n == -2 then
2785             n = EnvGobbleLPEG : match ( code )
2786         else
2787             if n == -3 then
2788                 n = TabsAutoGobbleLPEG : match ( code )
2789             end
2790         end
2791     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2792     if n == 0 then
2793         return code
2794     else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of `n`.

```

2795     return
2796     ( Ct (
2797         ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2798             * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2799                 ) ^ 0 )
2800             / table.concat
2801         ) : match ( code )
2802     end
2803 end
2804 end

```

In the following code, `n` is the value of `\l_@@_gobble_int`.

```

2805 function piton.GobbleParse ( lang , n , code )
2806     piton.last_code = gobble ( n , code )
2807     piton.last_language = lang

```

We count the number of lines of the informatic code. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks (when `splittable` is in force).

```

2808     piton.CountLines ( piton.last_code )
2809     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes ]]

```

We begin a `\vtop` for an non-splittable block of lines.

```

2810     sprintL3 [[ \vtop \bgroup ]
2811     piton.Parse ( lang , piton.last_code )

```

We close the latest opened `\vtop` with the following `\egroup`. Be careful: that `\vtop` is *not* necessarily the `\vtop` opened two lines above because the commands `\@@_newline`: inserted by Lua may open and close `\vtops` and start and finish paragraphs (when `splittable` is in force).

```

2812     sprintL3 [[ \vspace{2.5pt} \egroup ]]
2813     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \endsavenotes ]]

```

We finish the paragraph (each block of non-splittable lines of code is composed in a `\vtop` inserted in a paragraph).

```

2814     sprintL3 [[ \par ]]

```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```

2815     if piton.write and piton.write ~= '' then
2816         local file = io.open ( piton.write , piton.write_mode )
2817         if file then
2818             file:write ( piton.get_last_code ( ) )
2819             file:close ( )
2820         else
2821             sprintL3 [[ \@@_error_or_warning:n { FileError } ]]
2822         end
2823     end
2824 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```

2825 function piton.GobbleSplitParse ( lang , n , code )
2826   P { "E" ,
2827     E = ( V "F"
2828       * ( P " " ^ 0 * "\r"
2829         / ( function ( x ) sprintL3 [[ \l@_incr_visual_line: ]] end )
2830         ) ^ 1
2831         / ( function ( x )
2832           sprintL3 ( piton.string_between_chunks )
2833           end )
2834       ) ^ 0 * V "F" ,
2835 
```

The non-terminal F corresponds to a chunk of the informatic code.

```
2835   F = C ( V "G" ^ 0 )
```

The second argument of `piton.GobbleSplitParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```
2836   / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,
```

The non-terminal G corresponds to a non-empty line of code.

```

2837   G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
2838     + ( ( 1 - P "\r" ) ^ 1 * -1 - ( P " " ^ 0 * -1 ) )
2839   } : match ( gobble ( n , code ) )
2840 end
```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibily. The token list `\l@_split_separation_tl` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

2841 piton.string_between_chunks =
2842 [[ \par \l@_split_separation_tl \mode_leave_vertical: ]]
2843 .. [[ \int_gzero:N \g @_line_int ]]
```

The counter `\g @_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

2844 function piton.get_last_code ( )
2845   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2846 end
```

10.3.9 To count the number of lines

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l@_nb_lines_int` and will be used to allow or disallow line breaks (when `splittable` is in force).

```

2847 function piton.CountLines ( code )
2848   local count = 0
2849   for i in code : gmatch ( "\r" ) do count = count + 1 end
2850   sprintL3 ( string.format ( [[ \int_set:Nn \l@_nb_lines_int { % i } ]] , count ) )
2851 end
```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```
2852 function piton.CountNonEmptyLines ( code )
```

```

2853 local count = 0
2854 count =
2855   ( Ct ( ( P " " ^ 0 * "\r"
2856           + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2857           * ( 1 - P "\r" ) ^ 0
2858           * -1
2859         ) / table.getn
2860       ) : match ( code )
2861     sprintL3
2862     ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
2863   end

2864 function piton.CountLinesFile ( name )
2865   local count = 0
2866   for line in io.lines ( name ) do count = count + 1 end
2867   sprintL3
2868   ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count) )
2869 end

2870 function piton.CountNonEmptyLinesFile ( name )
2871   local count = 0
2872   for line in io.lines ( name )
2873     do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2874       count = count + 1
2875     end
2876   end
2877   sprintL3
2878   ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
2879 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2880 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2881   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2882   local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2883   local first_line = -1
2884   local count = 0
2885   local last_found = false
2886   for line in io.lines ( file_name )
2887     do if first_line == -1
2888       then if string.sub ( line , 1 , #s ) == s
2889         then first_line = count
2890         end
2891       else if string.sub ( line , 1 , #t ) == t
2892         then last_found = true
2893         break
2894       end
2895     end
2896     count = count + 1
2897   end
2898   if first_line == -1
2899     then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
2900   else if last_found == false
2901     then sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
2902   end
2903   sprintL3 (
2904     [[ \int_set:Nn \l_@@_first_line_int { }] .. first_line .. ' + 2 ']
2905     .. [[ \int_set:Nn \l_@@_last_line_int { }] .. count .. ' ]')
2906 end

```

10.3.10 To create new languages with the syntax of listings

```

2908 function piton.new_language ( lang , definition )
2909   lang = string.lower ( lang )

2910   local alpha , digit = lpeg.alpha , lpeg.digit
2911   local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `)`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

2912   function add_to_letter ( c )
2913     if c ~= " " then table.insert ( extra_letters , c ) end
2914   end

```

For the digits, it's straightforward.

```

2915   function add_to_digit ( c )
2916     if c ~= " " then digit = digit + c end
2917   end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

2918   local other = S ":_@+-*</>!?:.;()[]~^=#&\\"\\\$" -- $
2919   local extra_others = { }
2920   function add_to_other ( c )
2921     if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

2922     extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

2923   other = other + P ( c )
2924   end
2925 end

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

2926   local cut_definition =
2927     P { "E" ,
2928       E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2929       F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2930                 * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2931     }
2932   local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2933   local tex_braced_arg = "{" * C ( ( 1 - P ")" ) ^ 0 ) * "}"
2934   local tex_arg = tex_braced_arg + C ( 1 )
2935   local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2936   local args_for_tag
2937     = tex_option_arg
2938     * space ^ 0
2939     * tex_arg
2940     * space ^ 0
2941     * tex_arg
2942   local args_for_morekeywords

```

```

2943 = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2944     * space ^ 0
2945     * tex_option_arg
2946     * space ^ 0
2947     * tex_arg
2948     * space ^ 0
2949     * ( tex_braced_arg + Cc ( nil ) )

2950 local args_for_moredelims
2951     = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2952     * args_for_morekeywords

2953 local args_for_morecomment
2954     = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2955     * space ^ 0
2956     * tex_option_arg
2957     * space ^ 0
2958     * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2959 local sensitive = true
2960 local style_tag , left_tag , right_tag
2961 for _ , x in ipairs ( def_table ) do
2962     if x[1] == "sensitive" then
2963         if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2964             sensitive = true
2965         else
2966             if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2967         end
2968     end
2969     if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
2970     if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
2971     if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
2972     if x[1] == "tag" then
2973         style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
2974         style_tag = style_tag or [ \PitonStyle{Tag} ]
2975     end
2976 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

2977 local Number =
2978     K ( 'Number' ,
2979         ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2980             + digit ^ 0 * "." * digit ^ 1
2981             + digit ^ 1 )
2982         * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2983         + digit ^ 1
2984     )
2985 local string_extra_letters = ""
2986 for _ , x in ipairs ( extra_letters ) do
2987     if not ( extra_others[x] ) then
2988         string_extra_letters = string_extra_letters .. x
2989     end
2990 end
2991 local letter = alpha + S ( string_extra_letters )
2992         + P "à" + "â" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
2993         + "ô" + "û" + "ü" + "À" + "Â" + "Ç" + "É" + "È" + "Ê" + "Ë"
2994         + "ï" + "î" + "ô" + "û" + "ü"
2995 local alphanum = letter + digit
2996 local identifier = letter * alphanum ^ 0
2997 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2998 local split_clist =
2999   P { "E" ,
3000     E = ( "[" * ( 1 - P "]") ^ 0 * "]" ) ^ -1
3001     * ( P "{" ) ^ 1
3002     * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
3003     * ( P "}" ) ^ 1 * space ^ 0 ,
3004     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
3005   }

```

The following function will be used if the keywords are not case-sensitive.

```

3006 local function keyword_to_lpeg ( name )
3007   return
3008   Q ( Cmt (
3009     C ( identifier ) ,
3010     function(s,i,a) return string.upper(a) == string.upper(name) end
3011   )
3012   )
3013 end
3014 local Keyword = P ( false )
3015 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

3016 for _ , x in ipairs ( def_table )
3017 do if x[1] == "morekeywords"
3018   or x[1] == "otherkeywords"
3019   or x[1] == "moredirectives"
3020   or x[1] == "moretexcs"
3021 then
3022   local keywords = P ( false )
3023   local style = {[\\PitonStyle{Keyword}]}
3024   if x[1] == "moredirectives" then style = {[\\PitonStyle{Directive}]]} end
3025   style = tex_option_arg : match ( x[2] ) or style
3026   local n = tonumber ( style )
3027   if n then
3028     if n > 1 then style = {[\\PitonStyle{Keyword}]] .. style .. "}" end
3029   end
3030   for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
3031     if x[1] == "moretexcs" then
3032       keywords = Q ( {[[]]] .. word ) + keywords
3033     else
3034       if sensitive

```

The documentation of `lslistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

3035   then keywords = Q ( word ) + keywords
3036   else keywords = keyword_to_lpeg ( word ) + keywords
3037   end
3038   end
3039 end
3040 Keyword = Keyword +
3041   Lc ( "{" .. style .. "{" ) * keywords * Lc "}"}
3042 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that

category (e.g. `:` when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```
3043     if x[1] == "keywordsprefix" then
3044         local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3045         PrefixedKeyword = PrefixedKeyword
3046             + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
3047     end
3048 end
```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```
3049     local long_string = P ( false )
3050     local Long_string = P ( false )
3051     local LongString = P (false )
3052     local central_pattern = P ( false )
3053     for _ , x in ipairs ( def_table ) do
3054         if x[1] == "morestring" then
3055             arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3056             arg2 = arg2 or [[\PitonStyle{String.Long}]]
3057             if arg1 ~= "s" then
3058                 arg4 = arg3
3059             end
3060             central_pattern = 1 - S ( " \r" .. arg4 )
3061             if arg1 : match "b" then
3062                 central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3063             end
```

In fact, the specifier `d` is point-less: when it is not in force, it’s still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```
3064     if arg1 : match "d" or arg1 == "m" then
3065         central_pattern = P ( arg3 .. arg3 ) + central_pattern
3066     end
3067     if arg1 == "m"
3068     then prefix = lpeg.B ( 1 - letter - ")" - "]")
3069     else prefix = P ( true )
3070     end
```

First, a pattern *without captures* (needed to compute braces).

```
3071     long_string = long_string +
3072         prefix
3073         * arg3
3074         * ( space + central_pattern ) ^ 0
3075         * arg4
```

Now a pattern *with captures*.

```
3076     local pattern =
3077         prefix
3078         * Q ( arg3 )
3079         * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3080         * Q ( arg4 )
```

We will need `Long_string` in the nested comments.

```
3081     Long_string = Long_string + pattern
3082     LongString = LongString +
3083         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" ) * Cc "}" )
3084         * pattern
3085         * Ct ( Cc "Close" )
3086     end
3087 end
```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```
3088     local braces = Compute_braces ( long_string )
3089     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3090
```

```

3091 DetectedCommands = Compute_DetectedCommands ( lang , braces )
3092
3093 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

3094 local CommentDelim = P ( false )
3095
3096 for _ , x in ipairs ( def_table ) do
3097   if x[1] == "morecomment" then
3098     local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3099     arg2 = arg2 or {[\\PitonStyle{Comment}]}
3100
3101   if arg1 : match "i" then arg2 = {[\\PitonStyle{Discard}]] end
3102   if arg1 : match "l" then
3103     local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3104     : match ( other_args )
3105     if arg3 == {[\\#]} then arg3 = "#" end -- mandatory
3106     CommentDelim = CommentDelim +
3107       Ct ( Cc "Open"
3108         * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3109         * Q ( arg3 )
3110         * ( CommentMath + Q ( ( 1 - S "$\\r" ) ^ 1 ) ) ^ 0 -- $
3111           * Ct ( Cc "Close" )
3112             * ( EOL + -1 )
3113
3114 else
3115   local arg3 , arg4 =
3116     ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3117   if arg1 : match "s" then
3118     CommentDelim = CommentDelim +
3119       Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3120         * Q ( arg3 )
3121         *
3122           CommentMath
3123             + Q ( ( 1 - P ( arg4 ) - S "$\\r" ) ^ 1 ) -- $
3124               + EOL
3125                 ) ^ 0
3126               * Q ( arg4 )
3127                 * Ct ( Cc "Close" )
3128
3129 end
3130 if arg1 : match "n" then
3131   CommentDelim = CommentDelim +
3132     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3133       * P { "A" ,
3134         A = Q ( arg3 )
3135           * ( V "A"
3136             + Q ( ( 1 - P ( arg3 ) - P ( arg4 )
3137               - S "\\r$\\\" ) ^ 1 ) -- $
3138                 + long_string
3139                   + "$" -- $
3140                     * K ( 'Comment.Math' , ( 1 - S "$\\r" ) ^ 1 ) -- $
3141                       * "$" -- $
3142                         + EOL
3143                           ) ^ 0

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by `piton`.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.

New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.
