

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

January 6, 2024

Abstract

The package **piton** provides tools to typeset computer listings in Python, OCaml, C and SQL with syntactic highlighting by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing Python, OCaml, C or SQL listings and typesets them with syntactic highlighting. Since it uses Lua code, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape`. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

2 Installation

The package **piton** is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install **piton** with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

^{*}This document corresponds to the version 2.3 of **piton**, at the date of 2024/01/06.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by `#>`.

3 Use of the package

3.1 Loading the package

The package `piton` should be loaded with the classical command `\usepackage{piton}`. Nevertheless, we have two remarks:

- the package `piton` uses the package `xcolor` (but `piton` does *not* load `xcolor`: if `xcolor` is not loaded before the `\begin{document}`, a fatal error will be raised).
- the package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`, ...) is used, a fatal error will be raised.

3.2 Choice of the computer language

In current version, the package `piton` supports four computer languages: Python, OCaml, SQL and C (in fact C++).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language: \PitonOptions{language = C}`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python code: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}      def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.
- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 5.2, p. 9.

New 2.2 The key `path` of the command `\PitonOptions` specifies a path where the files included by `\PitonInputFile` will be searched.

3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use % inside the argument,
but the command `\%` is provided to insert a %;

- the braces must appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands³ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

<pre>\piton{MyString = '\\n'} \piton{def even(n): return n%2==0} \piton{c="#" # an affectation } \piton{c="#" \ \ \ # an affectation } \piton{MyDict = {'a': 3, 'b': 4 }}</pre>	<pre>MyString = '\\n' def even(n): return n%2==0 c="#" # an affectation c="#" # an affectation MyDict = {'a': 3, 'b': 4 }</pre>
--	---

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁴

- **Syntaxe `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

<pre>\piton MyString = '\n' \piton!def even(n): return n%2==0! \piton+c="#" # an affectation + \piton?MyDict = {'a': 3, 'b': 4}?</pre>	<pre>MyString = '\n' def even(n): return n%2==0 c="#" # an affectation MyDict = {'a': 3, 'b': 4}</pre>
--	---

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁵
These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Four values are allowed : `Python`, `OCaml`, `C` and `SQL`. The initial value is `Python`.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer `n`: the first `n` characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value `n` of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of `n`.

³That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁴For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

⁵We remind that a LaTeX environment is, in particular, a TeX group.

- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of gobble is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- **New 2.3** The key `write` takes in argument a name of file (with its extension) and write the content of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

New 2.1 In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines are considered as non-existent for the line numbering (if the key `/absolute` is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁶
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the key `/label-empty-lines` is no-op. The initial value of that key is `true`.
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 5.2, p. 9). The key `/absolute` is no-op in the environments `{Piton}`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
  line-numbers =
  {
    skip-empty-lines = false ,
    label-empty-lines = false ,
    sep = 1 em
  }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 6.1 on page 18.

⁶For the language Python, the empty lines in the docstrings are taken into account (by design).

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, piton adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with `REPL` (*read-eval-print loop*).

- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 5.1.2, p. 9).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with `LuaLaTeX`⁷.

For an example of use of `width=min`, see the section 6.2, p. 18.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters⁸ are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.⁹

Example : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹⁰ is in force).

```
\begin{Piton}[language=C,line-numbers,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
```

⁷The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `ltxmk` (used by Overleaf) do automatically a sufficient number of compilations.

⁸With the language Python that feature applies only to the short strings (delimited by `'` or `"`). In OCaml, that feature does not apply to the *quoted strings*.

⁹The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

¹⁰cf. 5.1.2 p. 9

```

5     swapped = 0;
6     for (int j = 0; j < n - i - 1; j++) {
7         if (arr[j] > arr[j + 1]) {
8             temp = arr[j];
9             arr[j] = arr[j + 1];
10            arr[j + 1] = temp;
11            swapped = 1;
12        }
13    }
14    if (!swapped) break;
15 }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 8).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.¹¹

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luacolor` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C and SQL), are described in the part 7, starting at the page 22.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

¹¹We remind that a LaTeX environment is, in particular, a TeX group.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc.).

New 2.2 But it's also possible to define a style locally for a given informatic langage by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹²

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we fix as value for that style `UserFunction` the initial value of the style `Name.Function` (which applies to the name of the functions, *at the moment of their definition*).

```
\SetPitonStyle{UserFunction = \color[HTML]{CC00FF}}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

As one see, the name `transpose` has been highlighted because it's the name of a Python function previously defined by the user (hence the name `UserFunction` for that style).

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaLaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹³

¹²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹³We remind that, in `piton`, the name of the informatic languages are case-insensitive.

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why piton provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{\begin{PitonOptions}{#1}}{}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
{\begin{tcolorbox}}
{\end{tcolorbox}}
```

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

5 Advanced features

5.1 Page breaks and line breaks

5.1.1 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the key `splittable` to allow such breaks.

- If the key `splittable` is used without any value, the listings are breakable everywhere.
- If the key `splittable` is used with a numeric value n (which must be a non-negative integer number), the listings are breakable but no break will occur within the first n lines and within the last n lines. Therefore, `splittable=1` is equivalent to `splittable`.

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `splittable` is in force.¹⁴

¹⁴With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

5.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+ \;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\hookrightarrow \; $`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+     a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
        our_dict[name] = [treat_Postscript_line(k) for k in \
+                     list_letter[1:-1]]
    return dict
```

5.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formating) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- New 2.1** It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

5.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

5.2.2 With textual markers

New 2.1

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-line` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

5.3 Highlighting some identifiers

It's possible to require a changement of formating for some identifiers with the key `identifiers` of `\PitonOptions`.¹⁵

That key takes in as argument a value of the following format:

```
{ names = names, style = instructions }
```

- `names` is a (comma-separated) list of identifier names;
- `instructions` is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won't be affected, even if their name is in the list `names`.

```
\PitonOptions
{
    identifiers =
    {
        names = { 11 , 12 } ,
        style = \color{red}
    }
}

\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}
```

¹⁵This feature is not available for the language SQL because, in SQL, there is no identifiers : there are only names of fields and names of tables.

```

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [x for x in l[1:] if x < a ]
        l2 = [x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

By using the key `identifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```

\PitonOptions
{
    identifiers =
    {
        names = { cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial } ,
        style = \PitonStyle{Name.Builtin}
    }
}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)

```

5.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should aslo remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `\{Piton\}` many commands and environments of Beamer: cf. 5.5 p. 15.

5.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntatic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntatic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It’s possible to change the formatting of the LaTeX comment itself by changing the `piton` style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part [6.2 p. 18](#)

If the user has required line numbers (with the key `line-numbers`), it’s possible to refer to a number of line with the command `\label` used in a LaTeX comment.¹⁶

5.4.2 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, *which is available only in the preamble of the document*.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute x^2
```

5.4.3 The mechanism “escape”

It’s also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it’s necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

In the following example, we assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!,end-escape=!}
```

In the following code, which is a recursive programmation of the mathematical factorial, we decide to highlight in yellow the instruction which contains the recursive call. That example uses the command `\highLight` of `lua-ul` (that package requires itself the package `luacolor`).

¹⁶That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

```

\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight{!return n*fact(n-1)!}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

In fact, in that case, it's probably easier to use the command `\@highLight` of `lua-ul`: that command sets a yellow background until the end of the current TeX group. Since the name of that command contains the character `@`, it's necessary to define a synonym without `@` in order to be able to use it directly in `{Piton}`.

```

\makeatletter
\NewCommandCopy{\Yellow}{\@highLight}
\makeatother

\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\Yellow!return n*fact(n-1)
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

5.4.4 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the langages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character `$` must *not* be protected by a backslash.

However, it's probably more prudent to use `\(` et \)``.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \x < 0\ :
        return \(-\arctan(-x)\)
    elif \x > 1\ :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \0\
        for \k\ in range(\n\): s += \(\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\)
    return s
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

5.5 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.¹⁷

When the package `piton` is used within the class `beamer`¹⁸, the behaviour of `piton` is slightly modified, as described now.

5.5.1 {Piton} et \PitonInputFile are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

¹⁷Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

¹⁸The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

5.5.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class beamer , the following commands of beamer (classified upon their number of arguments) are automatically detected in the environments {Piton} (and in the listings processed by \PitonInputFile):

- no mandatory argument : \pause¹⁹ . ;
- one mandatory argument : \action, \alert, \invisible, \only, \uncover and \visible ;
- two mandatory arguments : \alt ;
- three mandatory arguments : \temporal.

In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁰ of Python are not considered.

Regarding the functions \alt and \temporal there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

5.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class beamer, the following environments of Beamer are directly detected in the environments {Piton} (and in the listings processed by \PitonInputFile): {actionenv}, {alertenv}, {invisibleref}, {onlyenv}, {uncoverenv} and {visibleenv}.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
\begin{uncoverenv}<2>

```

¹⁹One should remark that it's also possible to use the command \pause in a “LaTeX comment”, that is to say by writing #> \pause. By this way, if the Python code is copied, it's still executable by Python

²⁰The short strings of Python are the strings delimited by characters ' or the characters " and not ''' nor """. In Python, the short strings can't extend on several lines.

```

    return x*x
  \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

5.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. [6.3](#), p. [19](#).

5.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces).

6 Examples

6.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

6.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`.

```
\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

6.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension piton must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 5.6 p. 17. In this document, the extension piton has been loaded with the key `footnotehyper`. Of course, in an environment `{Piton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```
\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)21
    elif x > 1:
        return pi/2 - arctan(1/x)22
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

²¹First recursive call.

²²Second recursive call.

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emphase\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

adef arctan(x,n=10):
a    if x < 0:
a        return -arctan(-x)a
b    elif x > 1:
b        return pi/2 - arctan(1/x)b
c    else:
c        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

6.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. We use the font *DejaVu Sans Mono*²³ specified by the command `\setmonofont` of `fontspec`.

That tuning uses the command `\highLight` of `luatex` (that package requires itself the package `luacolor`).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formating instruction (the element will be composed in the standard color, usually

²³See: <https://dejavu-fonts.github.io>

in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that  $\arctan(x) + \arctan(1/x) = \pi/2$  for  $x > 0$ )
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s
```

6.5 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but display also the output of the execution of the code with Python (for technical reasons, the `!` is mandatory in the signature of the environment).

```
\ExplSyntaxOn
\NewDocumentEnvironment { PitonExecute } { ! O { } } % the ! is mandatory
{
    \PyLTVerbatimEnv
    \begin{pythonq}
}
{
    \end{pythonq}
    \directlua
    {
        tex.print("\\\\PitonOptions{#1}")
        tex.print("\\\\begin{Piton}")
        tex.print(pylumatex.get_last_code())
        tex.print("\\\\end{Piton}")
        tex.print("")
    }
    \begin{center}
        \directlua{tex.print(pylumatex.get_last_output())}
    \end{center}
}
\ExplSyntaxOff
```

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

7 The styles for the different computer languages

7.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.²⁴

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

²⁴See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

7.2 The language OCaml

It's possible to switch to the language OCaml with `\PitonOptions{language = OCaml}`.

It's also possible to set the language OCaml for an individual environment `{Piton}`.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=OCaml]{...}`

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : and, asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, begin, class, constraint, done, downto, do, else, end, exception, external, for, function, functor, fun , if include, inherit, initializer, in , lazy, let, match, method, module, mutable, new, object, of, open, private, raise, rec, sig, struct, then, to, try, type, value, val, virtual, when, while and with

7.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

7.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

8 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

8.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.²⁵

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

²⁵Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_piton_begin_line:{\PitonStyle{Keyword}{def}}
\{\PitonStyle{Name.Function}{parity}\}(x):\_piton_end_line:\_piton_newline:
\_piton_begin_line:\_piton_{\PitonStyle{Keyword}{return}}
\{x\}\PitonStyle{Operator}{%}\{\PitonStyle{Number}{2}\}\_piton_end_line:
```

8.2 The L3 part of the implementation

8.2.1 Declaration of the package

```
1 (*STY)
2 \NeedsTeXFormat{LaTeX2e}
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {piton}
6   {\PitonFileVersion}
7   {\PitonFileDate}
8   {Highlight Python codes with LPEG on LuaLaTeX}

101 \bool_if:NT \g_@@_footnote_bool
102 {

```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```

103 \@ifclassloaded { beamer }
104   { \bool_gset_false:N \g_@@_footnote_bool }
105   {
106     \@ifpackageloaded { footnotehyper }
107       { \@@_error:n { footnote~with~footnotehyper~package } }
108       { \usepackage { footnote } }
109   }
110 }
111 \bool_if:NT \g_@@_footnotehyper_bool
112 {

```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```

113 \@ifclassloaded { beamer }
114   { \bool_gset_false:N \g_@@_footnote_bool }
115   {
116     \@ifpackageloaded { footnote }
117       { \@@_error:n { footnotehyper~with~footnote~package } }
118       { \usepackage { footnotehyper } }
119     \bool_gset_true:N \g_@@_footnote_bool
120   }
121 }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

```
122 \lua_now:n { piton = piton~or { } }
```

8.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

123 \str_new:N \l_@@_language_str
124 \str_set:Nn \l_@@_language_str { python }

125 \str_new:N \l_@@_path_str

```

In order to have a better control over the keys.

```

126 \bool_new:N \l_@@_in_PitonOptions_bool
127 \bool_new:N \l_@@_in_PitonInputFile_bool

```

The following flag will be raised in the `\AtBeginDocument`.

```
128 \bool_new:N \g_@@_in_document_bool
```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```
129 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the Python codes.

```
130 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```
131 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) informations to write on the `aux` (to be used in the next compilation).

```
132 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to n , then no line break can occur within the first n lines or the last n lines of the listings.

```
133 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
134 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
135 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
136 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
137 \str_new:N \l_@@_begin_range_str
```

```
138 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
139 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
140 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
141 \str_new:N \l_@@_write_str
```

```
142 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
143 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
144 \bool_new:N \l_@@_break_lines_in_Piton_bool
```

```
145 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
146 \tl_new:N \l_@@_continuation_symbol_tl
```

```
147 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
148 \tl_new:N \l_@@_csoi_tl  
149 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
150 \tl_new:N \l_@@_end_of_broken_line_tl  
151 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
152 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```
153 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
154 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```
155 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the spacial value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```
156 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
157 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
158 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
159 \dim_new:N \l_@@_numbers_sep_dim  
160 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

The tabulators will be replaced by the content of the following token list.

```
161 \tl_new:N \l_@@_tab_tl
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```
162 \seq_new:N \g_@@_languages_seq
```

```

163 \cs_new_protected:Npn \@@_set_tab_tl:n #1
164 {
165   \tl_clear:N \l_@@_tab_tl
166   \prg_replicate:nn { #1 }
167   { \tl_put_right:Nn \l_@@_tab_tl { ~ } }
168 }
169 \@@_set_tab_tl:n { 4 }

```

The following integer corresponds to the key `gobble`.

```

170 \int_new:N \l_@@_gobble_int

171 \tl_new:N \l_@@_space_tl
172 \tl_set:Nn \l_@@_space_tl { ~ }

```

At each line, the following counter will count the spaces at the beginning.

```

173 \int_new:N \g_@@_indentation_int

174 \cs_new_protected:Npn \@@_an_indentation_space:
175   { \int_gincr:N \g_@@_indentation_int }

```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```

176 \cs_new_protected:Npn \@@_beamer_command:n #1
177 {
178   \str_set:Nn \l_@@_beamer_command_str { #1 }
179   \use:c { #1 }
180 }

```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

181 \cs_new_protected:Npn \@@_label:n #1
182 {
183   \bool_if:NTF \l_@@_line_numbers_bool
184   {
185     \bphack
186     \protected@write \auxout { }
187     {
188       \string \newlabel { #1 }
189     }

```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

190           { \int_eval:n { \g_@@_visual_line_int + 1 } }
191           { \thepage }
192         }
193       }
194     \esphack
195   }
196   { \@@_error:n { label-with-lines-numbers } }
197 }

```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “`range`” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by piton the part which must be included (and formatted).

```

198 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
199 \cs_new_protected:Npn \@@_marker_end:n #1 { }

```

The following commands are a easy way to insert safely braces ({} and }) in the TeX flow.

```
200 \cs_new_protected:Npn \@@_open_brace: { \directlua { piton.open_brace() } }
201 \cs_new_protected:Npn \@@_close_brace: { \directlua { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of \@@_begin_line:... \@@_end_line: and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
202 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook \g_@@_begin_line_hook to specify that a background must be inserted to the current line of code.

```
203 \cs_new_protected:Npn \@@_prompt:
204 {
205     \tl_gset:Nn \g_@@_begin_line_hook_tl
206     {
207         \tl_if_empty:NF \l_@@_prompt_bg_color_tl % added 2023-04-24
208         { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
209     }
210 }
```

8.2.3 Treatment of a line of code

```
211 \cs_new_protected:Npn \@@_replace_spaces:n #1
212 {
213     \tl_set:Nn \l_tmpa_tl { #1 }
214     \bool_if:NTF \l_@@_show_spaces_bool
215     { \regex_replace_all:nnN { \x20 } { \l_tmpa_tl } } % U+2423
216     { }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by \@@_breakable_space:. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
217     \bool_if:NT \l_@@_break_lines_in_Piton_bool
218     {
219         \regex_replace_all:nnN
220         { \x20 }
221         { \c{@@_breakable_space}: }
222         \l_tmpa_tl
223     }
224 }
225 \l_tmpa_tl
226 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by \@@_begin_line: and \@@_end_line:. \@@_begin_line: is a LaTeX command that we will define now but \@@_end_line: is only a syntactic marker that has no definition.

```
227 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
228 {
229     \group_begin:
230     \g_@@_begin_line_hook_tl
231     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin \l_tmpa_coffin the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```
232 \bool_if:NTF \l_@@_width_min_bool
233     \@@_put_in_coffin_i:i:n
234     \@@_put_in_coffin_i:n
235     { }
```

```

236   \language = -1
237   \raggedright
238   \strut
239   \@@_replace_spaces:n { #1 }
240   \strut \hfil
241 }

Now, we add the potential number of line, the potential left margin and the potential background.
242 \hbox_set:Nn \l_tmpa_box
243 {
244   \skip_horizontal:N \l_@@_left_margin_dim
245   \bool_if:NT \l_@@_line_numbers_bool
246   {
247     \bool_if:nF
248     {
249       \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{}{} }
250       &&
251       \l_@@_skip_empty_lines_bool
252     }
253   { \int_gincr:N \g_@@_visual_line_int}

255   \bool_if:nT
256   {
257     ! \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{}{} }
258     ||
259     ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
260   }
261   \@@_print_number:
262
263 }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

264   \clist_if_empty:NF \l_@@_bg_color_clist
265   {
... but if only if the key left-margin is not used !
266     \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
267     { \skip_horizontal:n { 0.5 em } }
268   }
269   \coffin_typeset:Nnnnn \l_tmpa_coffin T 1 \c_zero_dim \c_zero_dim
270 }
271 \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
272 \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
273 \clist_if_empty:NTF \l_@@_bg_color_clist
274   { \box_use_drop:N \l_tmpa_box }
275   {
276     \vtop
277     {
278       \hbox:n
279       {
280         \@@_color:N \l_@@_bg_color_clist
281         \vrule height \box_ht:N \l_tmpa_box
282           depth \box_dp:N \l_tmpa_box
283           width \l_@@_width_dim
284       }
285       \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
286       \box_use_drop:N \l_tmpa_box
287     }
288   }
289   \vspace { - 2.5 pt }
290   \group_end:
291   \tl_gclear:N \g_@@_begin_line_hook_tl
292 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin

with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```
293 \cs_set_protected:Npn \@@_put_in_coffin_i:n
294   { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```
295 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
296   {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
297   \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```
298 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
299   { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
300 \hcoffin_set:Nn \l_tmpa_coffin
301   {
302     \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 6.2, p. 18).

```
303   { \hbox_unpack:N \l_tmpa_box \hfil }
304   }
305 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```
306 \cs_set_protected:Npn \@@_color:N #1
307   {
308     \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
309     \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
310     \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
311     \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```
312   { \dim_zero:N \l_@@_width_dim }
313   { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
314 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```
315 \cs_set_protected:Npn \@@_color_i:n #1
316   {
317     \tl_if_head_eq_meaning:nNTF { #1 } [
318       {
319         \tl_set:Nn \l_tmpa_tl { #1 }
320         \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
321         \exp_last_unbraced:No \color \l_tmpa_tl
322       }
323     { \color { #1 } }
324   }

325 \cs_new_protected:Npn \@@_newline:
326   {
327     \int_gincr:N \g_@@_line_int
328     \int_compare:nNnT \g_@@_line_int > { \l_@@_splittable_int - 1 }
329     {
330       \int_compare:nNnT
331         { \l_@@_nb_lines_int - \g_@@_line_int } > \l_@@_splittable_int
```

```

332     {
333         \egroup
334         \bool_if:NT \g_@@_footnote_bool { \end { savenotes } }

```

Despite its name, `\@@_pre_env:` will be used both in `\PitonInputFile` and in the environments such as `{Piton}`.

```

747 \cs_new:Npn \@@_pre_env:
748   {
749     \automatichyphenmode = 1
750     \int_gincr:N \g_@@_env_int
751     \tl_gclear:N \g_@@_aux_tl
752     \dim_compare:nNnT \l_@@_width_dim = \c_zero_dim
753       { \dim_set_eq:NN \l_@@_width_dim \linewidth }

```

We read the information written on the `aux` file by a previous run (when the key `width` is used with the special value `min`). At this time, the only potential information written on the `aux` file is the value of `\l_@@_line_width_dim` when the key `width` has been used with the special value `min`).

```

754 \cs_if_exist_use:c { c_@@_ \int_use:N \g_@@_env_int _ tl }
755 \bool_if:NF \l_@@_resume_bool { \int_gzero:N \g_@@_visual_line_int }
756 \dim_gzero:N \g_@@_tmp_width_dim
757 \int_gzero:N \g_@@_line_int
758 \dim_zero:N \parindent
759 \dim_zero:N \lineskip
760 \cs_set_eq:NN \label \@@_label:n
761 }

```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

762 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
763   {
764     \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
765     {
766       \hbox_set:Nn \l_tmpa_box
767       {
768         \footnotesize
769         \bool_if:NTF \l_@@_skip_empty_lines_bool
770         {
771           \lua_now:n
772             { piton.#1(token.scan_argument()) }

```

```

773     { #2 }
774     \int_to_arabic:n
775     { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
776   }
777   {
778     \int_to_arabic:n
779     { \g_@@_visual_line_int + \l_@@_nb_lines_int }
780   }
781 }
782 \dim_set:Nn \l_@@_left_margin_dim
783   { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
784 }
785 }
786 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

787 \cs_new_protected:Npn \@@_compute_width:
788   {
789     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
790     {
791       \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
792       \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```
    { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```

794   {
795     \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value²⁶ and we use that value. Elsewhere, we use a value of 0.5 em.

```

796   \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
797   { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
798   { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
799 }
800 }

```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the `.aux` file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

801   {

814 {

```

²⁶If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

815   \use:x
816   {
817     \cs_set_protected:Npn
818       \use:c { _@@_collect_ #1 :w }
819       #####1
820       \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
821   }
822   {
823     \group_end:
824     \mode_if_vertical:TF \mode_leave_vertical: \newline

```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks.

```
825   \lua_now:n { piton.CountLines(token.scan_argument()) } { ##1 }
```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

826   \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
827   \@@_compute_width:
828   \ttfamily
829   \dim_zero:N \parskip

```

`\g_@@_footnote_bool` is raised when the package piton has been loaded with the key `footnote` or the key `footnotehyper`.

```
830   \bool_if:NT \g_@@_footnote_bool { \begin { savenotes } }
```

Now, the key `write`.

```

831   \lua_now:e { piton.write = "\l_@@_write_str" }
832   \str_if_empty:NF \l_@@_write_str
833   {
834     \seq_if_in:NVT \g_@@_write_seq \l_@@_write_str
835     { \lua_now:n { piton.write_mode = "a" } }
836     {
837       \lua_now:n { piton.write_mode = "w" }
838       \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
839     }
840   }
841   \vtop \bgroup
842   \lua_now:e
843   {
844     piton.GobbleParse
845     (
846       '\l_@@_language_str' ,
847       \int_use:N \l_@@_gobble_int ,
848       token.scan_argument()
849     )
850   }
851   { ##1 }
852   \vspace { 2.5 pt }
853   \egroup
854   \bool_if:NT \g_@@_footnote_bool { \end { savenotes } }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
855   \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```

856   \end { #1 }
857   \@@_write_aux:
858 }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```

859 \NewDocumentEnvironment { #1 } { #2 }
860 {
861     \cs_set_eq:NNT \PitonOptions \@@_fake_PitonOptions
862     #3
863     \@@_pre_env:
864     \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
865         { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
866     \group_begin:
867     \tl_map_function:nN
868         { \ \\ \{ \} \$ \# \^ \_ \% \~ \^\I }
869         \char_set_catcode_other:N
870     \use:c { _@@_collect_ #1 :w }
871 }
872 { #4 }

```

The following code is for technical reasons. We want to change the catcode of $\wedge\wedge M$ before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the $\wedge\wedge M$ is converted to space).

```

873     \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^\wedgeM }
874 }

```

This is the end of the definition of the command `\NewPitonEnvironment`.

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

875 \bool_if:NTF \g_@@_beamer_bool
876 {
877     \NewPitonEnvironment { Piton } { d < > 0 { } }
878     {
879         \keys_set:nn { PitonOptions } { #2 }
880         \IfValueTF { #1 }
881             { \begin { uncoverenv } < #1 > }
882             { \begin { uncoverenv } }
883         }
884         { \end { uncoverenv } }
885     }
886     {
887         \NewPitonEnvironment { Piton } { 0 { } }
888         { \keys_set:nn { PitonOptions } { #1 } }
889         { }
890     }
}

```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

891 \NewDocumentCommand { \PitonInputFile } { d < > 0 { } m }
892 {
893     \group_begin:

1109     Prompt        = ,
1110     ParseAgain.noCR = \@@_piton_no_cr:n ,
1111     ParseAgain    = \@@_piton:n ,
1112 }
```

The last styles `ParseAgain.noCR` and `ParseAgain` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document these styles for the final user (why not?).

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```
1113 \bool_if:NT \g_@@_math_comments_bool { \SetPitonStyle { Comment.Math } }
```

8.2.10 Highlighting some identifiers

```
1114 \cs_new_protected:Npn \@@_identifier:n #1
1115   { \cs_if_exist_use:c { PitonIdentifier _ \l_@@_language_str _ #1 } { #1 } }

1116 \keys_define:nn { PitonOptions }
1117   { identifiers .code:n = \@@_set_identifiers:n { #1 } }

1118 \keys_define:nn { Piton / identifiers }
1119   {
1120     names .clist_set:N = \l_@@_identifiers_names_tl ,
1121     style .tl_set:N     = \l_@@_style_tl ,
1122   }

1123 \cs_new_protected:Npn \@@_set_identifiers:n #1
1124   {
1125     \clist_clear_new:N \l_@@_identifiers_names_tl
1126     \tl_clear_new:N \l_@@_style_tl
1127     \keys_set:nn { Piton / identifiers } { #1 }
1128     \clist_map_inline:Nn \l_@@_identifiers_names_tl
1129     {
1130       \tl_set_eq:cN
1131         { PitonIdentifier _ \l_@@_language_str _ ##1 }
1132         \l_@@_style_tl
1133     }
1134 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1135 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1136 { }
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1137 { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formated with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1138 \cs_gset_protected:cpn { PitonIdentifier _ \l_@@_language_str _ #1 }
1139 { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1140 \seq_if_exist:cF { g_@@_functions _ \l_@@_language_str _ seq }
1141   { \seq_new:c { g_@@_functions _ \l_@@_language_str _ seq } }
1142 \seq_gput_right:cn { g_@@_functions _ \l_@@_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```
1143 \seq_if_in:NVF \g_@@_languages_seq \l_@@_language_str
1144   { \seq_gput_left:NV \g_@@_languages_seq \l_@@_language_str }
1145 }
```

```

1146 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1147   {
1148     \tl_if_no_value:nTF { #1 }

```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```

1149   { \@@_clear_all_functions: }
1150   { \@@_clear_list_functions:n { #1 } }
1151 }

1152 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1153   {
1154     \clist_set:Nn \l_tmpa_clist { #1 }
1155     \clist_map_function:NN \l_tmpa_clist \@@_clear_functions_i:n
1156     \clist_map_inline:nn { #1 }
1157     { \seq_gremove_all:Nn \g_@@_languages_seq { ##1 } }
1158 }

1159 \cs_new_protected:Npn \@@_clear_functions_i:n #1
1160   { \exp_args:Ne \@@_clear_functions_ii:n { \str_lowercase:n { #1 } } }

```

The following command clears the list of the user-defined functions for the language provided in argument (mandatory in lower case).

```

1161 \cs_new_protected:Npn \@@_clear_functions_ii:n #1
1162   {
1163     \seq_if_exist:cT { g_@@_functions _ #1 _ seq }
1164     {
1165       \seq_map_inline:cn { g_@@_functions _ #1 _ seq }
1166       { \cs_undefine:c { PitonIdentifier _ #1 _ ##1 } }
1167       \seq_gclear:c { g_@@_functions _ #1 _ seq }
1168     }
1169 }

1170 \cs_new_protected:Npn \@@_clear_functions:n #1
1171   {
1172     \@@_clear_functions_i:n { #1 }
1173     \seq_gremove_all:Nn \g_@@_languages_seq { #1 }
1174 }

```

The following command clears all the user-defined functions for all the informatic languages.

```

1175 \cs_new_protected:Npn \@@_clear_all_functions:
1176   {
1177     \seq_map_function:NN \g_@@_languages_seq \@@_clear_functions_i:n
1178     \seq_gclear:N \g_@@_languages_seq
1179 }

```

8.2.13 We load piton.lua

```

1320 \hook_gput_code:nnn { begindocument } { . }
1321   { \lua_now:e { require("piton.lua") } }
1322 
```

8.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1323 (*LUA)
1324 if piton.comment_latex == nil then piton.comment_latex = ">" end
1325 piton.comment_latex = "#" .. piton.comment_latex

```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```

1326 function piton.open_brace ()
1327   tex.sprint("{")
1328 end
1329 function piton.close_brace ()
1330   tex.sprint("}")
1331 end

```

8.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1332 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1333 local Cf, Cs, Cg, Cmt, Cb = lpeg.Cf, lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1334 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1335 local function Q(pattern)
1336   return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1337 end

```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```

1338 local function L(pattern)
1339   return Ct ( C ( pattern ) )
1340 end

```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function will be widely used.

```
1341 local function Lc(string)
1342     return Cc ( { luatexbase.catcodetables.expl , string } )
1343 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1344 local function K(style, pattern)
1345     return
1346         Lc ( {"\\PitonStyle{" .. style .. "}" })
1347         * Q ( pattern )
1348         * Lc ( "}" )
1349 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
1350 local function WithStyle(style,pattern)
1351     return
1352         Ct ( Cc "Open" * Cc ( {"\\PitonStyle{" .. style .. "}" } ) * Cc "}" )
1353         * pattern
1354         * Ct ( Cc "Close" )
1355 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions). Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`) without number of catcode table at the first component of the table.

```
1356 Escape = P ( false )
1357 if piton.begin_escape == nil
1358 then
1359     Escape =
1360     P(piton.begin_escape)
1361     * L ( ( 1 - P(piton.end_escape) ) ^ 1 )
1362     * P(piton.end_escape)
1363 end
1364 EscapeMath = P ( false )
1365 if piton.begin_escape_math == nil
1366 then
1367     EscapeMath =
1368     P(piton.begin_escape_math)
1369     * Lc ( "\\ensuremath{" )
1370     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1371     * Lc ( "}" )
1372     * P(piton.end_escape_math)
1373 end
```

The following line is mandatory.

```
1374 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```
1375 local alpha, digit = lpeg.alpha, lpeg.digit
1376 local space = P " "
```

Remember that, for LPEG, the Unicode characters such as à, á, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```
1377 local letter = alpha + P "-"
1378   + P "â" + P "à" + P "ç" + P "é" + P "è" + P "ê" + P "ë" + P "í" + P "î"
1379   + P "ô" + P "û" + P "â" + P "À" + P "Ç" + P "É" + P "È" + P "Ê"
1380   + P "Ë" + P "Ï" + P "Î" + P "Ô" + P "Ü" + P "Û"
1381
1382 local alphanum = letter + digit
```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1383 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1384 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated piton style. For example, for the numbers, piton provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of piton styles (but this is only a convention).

```
1385 local Number =
1386   K ( 'Number' ,
1387     ( digit^1 * P "." * digit^0 + digit^0 * P "." * digit^1 + digit^1 )
1388     * ( S "eE" * S "+-" ^ -1 * digit^1 ) ^ -1
1389     + digit^1
1390   )
```

We recall that `piton.begin_espce` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```
1391 local Word
1392 if piton.begin_escape ~= nil -- before : ''
1393 then Word = Q ( ( 1 - space - P(piton.begin_escape) - P(piton.end_escape) )
1394   - S "'\"\\r[()]" - digit ) ^ 1 )
1395 else Word = Q ( ( ( 1 - space ) - S "'\"\\r[()]" - digit ) ^ 1 )
1396 end

1397 local Space = ( Q " " ) ^ 1
1398
1399 local SkipSpace = ( Q " " ) ^ 0
1400
1401 local Punct = Q ( S ",;:;" )
1402
1403 local Tab = P "\t" * Lc ( '\\"l_@@_tab_t1' )

1404 local SpaceIndentation = Lc ( '\\"@_an_indentation_space:' ) * ( Q " " )

1405 local Delim = Q ( S "[()]" )
```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1406 local VisualSpace = space * Lc "\l_@@_space_t1"
```

If the classe Beamer is used, some environemnts and commands of Beamer are automatically detected in the listings of piton.

```
1407 local Beamer = P ( false )
1408 local BeamerBeginEnvironments = P ( true )
1409 local BeamerEndEnvironments = P ( true )
1410 if piton_beamer
1411 then
1412 % \bigskip
1413 % The following function will return a \textsc{lpeg} which will catch an
1414 % environment of Beamer (supported by \pkg{piton}), that is to say \{uncover\},
1415 % \{only\}, etc.
1416 % \begin{macrocode}
1417 local BeamerNamesEnvironments =
1418   P "uncoverenv" + P "onlyenv" + P "visibleenv" + P "invisibleenv"
1419   + P "alertenv" + P "actionenv"
1420 BeamerBeginEnvironments =
1421   ( space ^ 0 *
1422     L
1423     (
1424       P "\begin{" * BeamerNamesEnvironments * "}"

1507
1508
1509 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q ( P "(" )

```

In Python, a “decorator” is a statement whose begins by `@` which patches the function defined in the following statement.

```
1511 local Decorator = K ( 'Name.Decorator' , P "@" * letter^1 )
```

The following LPEG `DefClass` will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```
1512 local DefClass =
1513   K ( 'Keyword' , P "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be catched as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
1514 local ImportAs =
1515   K ( 'Keyword' , P "import" )
1516   * Space
1517   * K ( 'Name.Namespace' ,
1518     identifier * ( P "." * identifier ) ^ 0 )
1519   *
1520   ( Space * K ( 'Keyword' , P "as" ) * Space
1521     * K ( 'Name.Namespace' , identifier ) )
1522   +
1523   ( SkipSpace * Q ( P "," ) * SkipSpace
1524     * K ( 'Name.Namespace' , identifier ) ) ^ 0
1525   )
```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be catched by the LPEG `ImportAs`.

Example: `from math import pi`

```
1526 local FromImport =
1527   K ( 'Keyword' , P "from" )
1528   * Space * K ( 'Name.Namespace' , identifier )
1529   * Space * K ( 'Keyword' , P "import" )
```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction²⁷ in that interpolation:

```
f'Total price: {total:+1:.2f} €'
```

The interpolations beginning by % (even though there is more modern technics now in Python).

```
1530 local PercentInterpol =
1531     K ( 'String.Interpol' ,
1532         P "%"
1533         * ( P "(" * alphanum ^ 1 * P ")" ) ^ -1
1534         * ( S "-#0 +" ) ^ 0
1535         * ( digit ^ 1 + P "*" ) ^ -1
1536         * ( P "." * ( digit ^ 1 + P "*" ) ) ^ -1
1537         * ( S "HLL" ) ^ -1
1538         * S "sdfFeExXorgiGauc%"
1539     )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.²⁸

```
1540 local SingleShortString =
1541     WithStyle ( 'String.Short' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
1542     Q ( P "f'" + P "F'" )
1543     *
1544         K ( 'String.Interpol' , P "{")
1545         * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
1546         * Q ( P ":" * ( 1 - S "}:;" ) ^ 0 ) ^ -1
1547         * K ( 'String.Interpol' , P "}" )
1548         +
1549         VisualSpace
1550         +
1551             Q ( ( P "\\"' + P "{{" + P "}" }" + 1 - S " {}}'" ) ^ 1 )
1552         ) ^ 0
1553         * Q ( P "''' )
1554     +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
1555     Q ( P "''' + P "r'" + P "R'" )
1556     * ( Q ( ( P "\\"' + 1 - S " '\r%" ) ^ 1 )
1557         + VisualSpace
1558         + PercentInterpol
1559         + Q ( P "%" )
1560         ) ^ 0
1561     * Q ( P "''' ) )
1562
1563
1564 local DoubleShortString =
1565     WithStyle ( 'String.Short' ,
1566         Q ( P "f\\"" + P "F\\"" )
1567     *
1568         K ( 'String.Interpol' , P "{")
1569         * Q ( ( 1 - S "}:;" ) ^ 0 , 'Interpol.Inside' )
1570         * ( K ( 'String.Interpol' , P ":" ) * Q ( ( 1 - S "}:\"") ^ 0 ) ) ^ -1
1571         * K ( 'String.Interpol' , P "}" )
1572         +
1573         VisualSpace
```

²⁷There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

²⁸The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

```

1574     +
1575     Q ( ( P "\\\\" + P "{{" + P "}}}" + 1 - S " {}\" ) ^ 1 )
1576     ) ^ 0
1577     * Q ( P "\" )
1578 +
1579     Q ( P "\"" + P "r\"" + P "R\"")
1580     * ( Q ( ( P "\\\\" + 1 - S " \"\r%" ) ^ 1 )
1581         + VisualSpace
1582         + PercentInterpol
1583         + Q ( P "%" )
1584     ) ^ 0
1585     * Q ( P "\" ) )
1586
1587 local ShortString = SingleShortString + DoubleShortString

```

Beamer The following pattern `balanced_braces` will be used for the (mandatory) argument of the commands `\only` and `al.` of Beamer. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1644     * L ( P "}" )  
1645 end

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```
1646 local PromptHastyDetection = ( # ( P "">>>>" + P "...") * Lc ( '\@@_prompt:' ) ) ^ -1
```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```
1647 local Prompt = K ( 'Prompt' , ( ( P "">>>>" + P "...") * P " " ^ -1 ) ^ -1 )
```

The following LPEG EOL is for the end of lines.

```

1648 local EOL =  
1649     P "\r"  
1650     *  
1651     (  
1652     ( space^0 * -1 )  
1653     +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`²⁹.

```

1654 Ct (  
1655     Cc "EOL"  
1656     *  
1657     Ct (  
1658         Lc "\@@_end_line:"  
1659         * BeamerEndEnvironments  
1660         * BeamerBeginEnvironments  
1661         * PromptHastyDetection  
1662         * Lc "\@@_newline: \@@_begin_line:"  
1663         * Prompt  
1664     )

```

²⁹Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1665      )

1730   ) ^ 0
1731   * K ( 'String.Doc' , ( 1 - P "\"\"\" - P "\r" ) ^ 0 * P "\"\"\"")
```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```
1732 local CommentMath =
1733   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$"
1734
1735 local Comment =
1736   WithStyle ( 'Comment' ,
1737     Q ( P "#" )
1738     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 )
1739   * ( EOL + -1 )
```

The following LPEG `CommentLaTeX` is for what is called in that document the “*LaTeX comments*”. Since the elements that will be catched must be sent to *LaTeX* with standard *LaTeX* catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```
1740 local CommentLaTeX =
1741   P(piton.comment_latex)
1742   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
1743   * L ( ( 1 - P "\r" ) ^ 0 )
1744   * Lc "}"}
1745   * ( EOL + -1 )
```

DefFunction The following LPEG `expression` will be used for the parameters in the `argspec` of a Python function. It’s necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it’s known in the theory of formal languages that this can’t be done with regular expressions *stricto sensu* only).

```
1746 local expression =
1747   P { "E" ,
1748     E = ( P ""'' * ( P "\\\\'" + 1 - S "'\r" ) ^ 0 * P """
1749       + P "\"" * ( P "\\\\" + 1 - S "\"\r" ) ^ 0 * P """
1750       + P "{" * V "F" * P "}"
1751       + P "(" * V "F" * P ")"
1752       + P "[" * V "F" * P "]"
1753       + ( 1 - S "{}()[]\r," ) ^ 0 ,
1754     F = ( P "{" * V "F" * P "}"
1755       + P "(" * V "F" * P ")"
1756       + P "[" * V "F" * P "]"
1757       + ( 1 - S "{}()[]\r""") ) ^ 0
1758   }
```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the `argspec`) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int`.
 Of course, a `Params` is simply a comma-separated list of `Param`, and that's why we define first the LPEG `Param`.

```

1759 local Param =
1760   SkipSpace * Identifier * SkipSpace
1761   *
1762     K ( 'InitialValues' , P "=" * expression )
1763     + Q ( P ":" ) * SkipSpace * K ( 'Name.Type' , letter ^ 1 )
1764   ) ^ -1

1765 local Params = ( Param * ( Q "," * Param ) ^ 0 ) ^ -1

```

The following LPEG `DefFunction` catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

1766 local DefFunction =
1767   K ( 'Keyword' , P "def" )
1768   * Space
1769   * K ( 'Name.Function.Internal' , identifier )
1770   * SkipSpace
1771   * Q ( P "(" ) * Params * Q ( P ")" )
1772   * SkipSpace
1773   * ( Q ( P "->" ) * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain` which will be linked to `\@_piton:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

1774   * K ( 'ParseAgain' , ( 1 - S ":" \r" ) ^ 0 )
1775   * Q ( P ":" )
1776   * ( SkipSpace
1777     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
1778     * Tab ^ 0
1779     * SkipSpace
1780     * StringDoc ^ 0 -- there may be additionnal docstrings
1781   ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be catched as keyword by the LPEG `Keyword` (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```
1782 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL
```

The main LPEG for the language Python

First, the main loop :

```

1783 local MainPython =
1784   EOL
1785   + Space
1786   + Tab
1787   + Escape + EscapeMath
1788   + CommentLaTeX
1789   + Beamer
1790   + LongString
1791   + Comment
1792   + ExceptionInConsole
1793   + Delim
1794   + Operator
1795   + OperatorWord * ( Space + Punct + Delim + EOL + -1 )

```

```

1796     + ShortString
1797     + Punct
1798     + FromImport
1799     + RaiseException
1800     + DefFunction
1801     + DefClass
1802     + Keyword * ( Space + Punct + Delim + EOL + -1 )
1803     + Decorator
1804     + Builtin * ( Space + Punct + Delim + EOL + -1 )
1805     + Identifier
1806     + Number
1807     + Word

```

Here, we must not put local!

```

1808 MainLoopPython =
1809   ( ( space^1 * -1 )
1810     + MainPython
1811   ) ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁰.

```

1812 local python = P ( true )
1813
1814 python =
1815   Ct (
1816     ( ( space - P "\r" ) ^0 * P "\r" ) ^ -1
1817     * BeamerBeginEnvironments
1818     * PromptHastyDetection
1819     * Lc '\@@_begin_line:'
1820     * Prompt
1821     * SpaceIndentation ^ 0
1822     * MainLoopPython
1823     * -1
1824     * Lc '\@@_end_line:'
1825   )
1826 languages['python'] = python

```

8.3.3 The LPEG ocaml

```

1827 local Delim = Q ( P "[|" + P "|]" + S "[()]" )
1828 local Punct = Q ( S ",;:;" )

```

The identifiers catched by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

1829 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
1830 local Constructor = K ( 'Name.Constructor' , cap_identifier )
1831 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

1832 local identifier =
1833   ( R "az" + P "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
1834 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

1835 local expression_for_fields =
1836   P { "E" ,
1837     E = ( P "{" * V "F" * P "}" )

```

³⁰Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1838     + P "(" * V "F" * P ")"
1839     + P "[" * V "F" * P "]"
1840     + P "\\" * (P "\\\\" + 1 - S "\\r")^0 * P "\\"
1841     + P '\"' * (P "\\" + 1 - S '\"r')^0 * P '\"'
1842     + (1 - S "{}[]\r;") ) ^ 0 ,
1843 F = ( P "{" * V "F" * P "}"
1844     + P "(" * V "F" * P ")"
1845     + P "[" * V "F" * P "]"
1846     + (1 - S "{}[]\r\"") ) ^ 0
1847 }

1848 local OneFieldDefinition =
1849   ( K ( 'KeyWord' , P "mutable" ) * SkipSpace ) ^ -1
1850   * K ( 'Name.Field' , identifier ) * SkipSpace
1851   * Q ":" * SkipSpace
1852   * K ( 'Name.Type' , expression_for_fields )
1853   * SkipSpace

1854
1855 local OneField =
1856   K ( 'Name.Field' , identifier ) * SkipSpace
1857   * Q "=" * SkipSpace
1858   * ( C ( expression_for_fields ) / ( function (s) return LoopOCaml:match(s) end ) )
1859   * SkipSpace

1860
1861 local Record =
1862   Q "{" * SkipSpace
1863   *
1864   (
1865     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
1866     +
1867     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0
1868   )
1869   *
1870   Q "}"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

1871 local DotNotation =
1872   (
1873     K ( 'Name.Module' , cap_identifier )
1874     * Q "."
1875     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{"
1876
1877     +
1878     Identifier
1879     * Q "."
1880     * K ( 'Name.Field' , identifier )
1881   )
1882   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0

1992         * Prompt
1993       )
1994     )
1995   )
1996   *
1997 SpaceIndentation ^ 0

```

The strings en OCaml We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

1998 local ocaml_string =
1999   Q ( P "\"" )
2000   * (
2001     VisualSpace
2002     +
2003     Q ( ( 1 - S " \r" ) ^ 1 )

```

```

2004     +
2005     EOL
2006     ) ^ 0
2007     * Q ( P "\" )
2008 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua’s long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2009 local ext = ( R "az" + P "_" ) ^ 0
2010 local open = "{" * Cg(ext, 'init') * "|"
2011 local close = "|" * C(ext) * "}"
2012 local closeeq =
2013   Cmt ( close * Cb('init'),
2014         function (s, i, a, b) return a==b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

2015 local QuotedStringBis =
2016   WithStyle ( 'String.Long' ,
2017   (
2018     Space
2019     +
2020     Q ( ( 1 - S " \r" ) ^ 1 )
2021     +
2022     EOL
2023   ) ^ 0 )
2024

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2025 local QuotedString =
2026   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2027   ( function (s) return QuotedStringBis : match(s) end )

```

The comments in the OCaml listings In OCaml, the delimiters for the comments are `(* and *)`. There are unsymmetrical and OCaml allow those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2028 local Comment =
2029   WithStyle ( 'Comment' ,
2030   P {
2031     "A" ,
2032     A = Q "(*"
2033     * ( V "A"
2034       + Q ( ( 1 - P "(*" - P "*") - S "\r$\\" ) ^ 1 ) -- $
2035       + ocaml_string
2036       + P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $
2037       + EOL
2038     ) ^ 0
2039     * Q "*)"
2040   } )

```

The DefFunction

```

2041 local balanced_parens =
2042   P { "E" ,
2043     E =
2044     (
2045       P "(" * V "E" * P ")"
2046       +
2047       ( 1 - S "()")
2048     ) ^ 0
2049   }
2050 local Argument =
2051   K ( 'Identifier' , identifier )
2052   + Q "(" * SkipSpace
2053     * K ( 'Identifier' , identifier ) * SkipSpace
2054     * Q ":" * SkipSpace
2055     * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2056     * Q ")"

```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```

2057 local DefFunction =
2058   K ( 'Keyword' , P "let open" )
2059   * Space
2060   * K ( 'Name.Module' , cap_identifier )
2061   +
2062   K ( 'Keyword' , P "let rec" + P "let" + P "and" )
2063   * Space
2064   * K ( 'Name.Function.Internal' , identifier )
2065   * Space
2066   * (
2067     Q "=" * SkipSpace * K ( 'Keyword' , P "function" )
2068     +
2069     Argument
2070     * ( SkipSpace * Argument ) ^ 0
2071     * (
2072       SkipSpace
2073       * Q ":" *
2074       * K ( 'Name.Type' , ( 1 - P "=" ) ^ 0 )
2075     ) ^ -1
2076   )

```

The DefModule The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2077 local DefModule =
2078   K ( 'Keyword' , P "module" ) * Space
2079   *
2080   (
2081     K ( 'Keyword' , P "type" ) * Space
2082     * K ( 'Name.Type' , cap_identifier )
2083   +
2084     K ( 'Name.Module' , cap_identifier ) * SkipSpace
2085   *
2086   (
2087     Q "(" * SkipSpace
2088       * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2089       * Q ":" * SkipSpace
2090       * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2091     *
2092     (
2093       Q "," * SkipSpace
2094         * K ( 'Name.Module' , cap_identifier ) * SkipSpace

³¹Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2199     + P "void" + P "wchar_t"
2200 )
2201
2202 local DefFunction =
2203   Type
2204   * Space
2205   * Q ( "*" ) ^ -1
2206   * K ( 'Name.Function.Internal' , identifier )
2207   * SkipSpace
2208   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

2209 local DefClass =
2210   K ( 'Keyword' , P "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be catched as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```

2211 local String =
2212   WithStyle ( 'String.Long' ,
2213     Q "\""
2214     * ( VisualSpace
2215       + K ( 'String.Interpol' ,
2216         P "%" * ( S "difcspxYou" + P "ld" + P "li" + P "hd" + P "hi" )
2217       )
2218       + Q ( ( P "\\\\" + 1 - S " \"\\"" ) ^ 1 )
2219     ) ^ 0
2220     * Q "\""
2221   )

```

Beamer The following LPEG `balanced_braces` will be used for the (mandatory) argument of the commands `\only` and `al.` of Beamer. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2222 local balanced_braces =

```

The directives of the preprocessor

```

2301 local Preproc =
2302   K ( 'Preproc' , P "#" * (1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

2303 local CommentMath =
2304   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$"
2305
2306 local Comment =
2307   WithStyle ( 'Comment' ,
2308     Q ( P("//")
2309     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 )
2310   * ( EOL + -1 )
2311
2312 local LongComment =
2313   WithStyle ( 'Comment' ,
2314     Q ( P ("/*")
2315     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2316     * Q ( P "*/" )
2317   ) -- $

```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be catched must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

2318 local CommentLaTeX =
2319   P(piton.comment_latex)
2320   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
2321   * L ( ( 1 - P "\r" ) ^ 0 )
2322   * Lc "}"}
2323   * ( EOL + -1 )

```

The main LPEG for the language C

First, the main loop :

```

2324 local MainC =
2325   EOL
2326   + Space
2327   + Tab
2328   + Escape + EscapeMath
2329   + CommentLaTeX
2330   + Beamer
2331   + Preproc
2332   + Comment + LongComment
2333   + Delim
2334   + Operator
2335   + String
2336   + Punct
2337   + DefFunction

```

```

2338     + DefClass
2339     + Type * ( Q ( "*" ) ^ -1 + Space + Punct + Delim + EOL + -1 )
2340     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2341     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2342     + Identifier
2343     + Number
2344     + Word

```

Here, we must not put local!

```

2345 MainLoopC =
2346   ( ( space^1 * -1 )
2347     + MainC
2348   ) ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³³.

```

2349 languageC =
2350   Ct (
2351     ( ( space - P "\r" ) ^0 * P "\r" ) ^ -1
2352     * BeamerBeginEnvironments
2353     * Lc '\\@@_begin_line:'
2354     * SpaceIndentation ^ 0
2355     * MainLoopC
2356     * -1
2357     * Lc '\\@@_end_line:'
2358   )
2359 languages['c'] = languageC

```

8.3.5 The LPEG language SQL

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```

2360 local identifier =
2361   letter * ( alphanum + P "-" ) ^ 0
2362   + P "'" * ( ( alphanum + space - P "'" ) ^ 1 ) * P "'"
2363
2364
2365 local Operator =
2366   K ( 'Operator' ,
2367     P "=" + P "!=" + P "<>" + P ">=" + P ">" + P "<=" + P "<" + S "*+/"
2368   )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```

2369 local function Set (list)
2370   local set = {}
2371   for _, l in ipairs(list) do set[l] = true end
2372   return set
2373 end
2374
2375 local set_keywords = Set
2376 {
2377   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2378   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2379   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,

```

³³Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2380     "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,
2381     "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,
2382     "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2383 }
2384
2385 local set_builtins = Set
2386 {
2387     "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2388     "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2389     "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2390 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2391 local Identifier =
2392   C ( identifier ) /
2393   (
2394     function (s)
2395       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL
2396         then return { "\\\PitonStyle{Keyword}" } ,
2397             { luatexbase.catcodetables.other , s } ,
2398             { "}" }
2399       else if set_builtins[string.upper(s)]
2400         then return { "\\\PitonStyle{Name.Builtin}" } ,
2401             { luatexbase.catcodetables.other , s } ,
2402             { "}" }
2403       else return { "\\\PitonStyle{Name.Field}" } ,
2404             { luatexbase.catcodetables.other , s } ,
2405             { "}" }
2406     end
2407   end
2408 end
2409 )

```

The strings of SQL

```

2464         * L ( P "}{")
2465         * K ( 'ParseAgain.noCR' , balanced_braces )
2466         * L ( P "}{")
2467         * K ( 'ParseAgain.noCR' , balanced_braces )
2468         * L ( P "}" )
2469 end

```

EOL The following LPEG EOL is for the end of lines.

```

2470 local EOL =
2471     P "\r"
2472     *
2473     (
2474         ( space^0 * -1 )
2475     +

```

We recall that each line in the SQL code we have to parse will be sent back to LaTeX between a pair \\@@_begin_line: - \\@@_end_line:³⁴.

³⁴Remember that the \\@@_end_line: must be explicit because it will be used as marker in order to delimit the argument of the command \\@@_begin_line:

```

2476 Ct (
2477   Cc "EOL"
2478   *
2479   Ct (
2480     Lc "\\@@_end_line:"
2481     * BeamerEndEnvironments
2482     * BeamerBeginEnvironments
2483     * Lc "\\@@_newline: \\@@_begin_line:"
2484   )
2485 )
2486 )
2487 *
2488 SpaceIndentation ^ 0

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

2489 local CommentMath =
2490   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$"
2491
2492 local Comment =
2493   WithStyle ( 'Comment' ,
2494     Q ( P "--" ) -- syntax of SQL92
2495     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 )
2496   * ( EOL + -1 )
2497
2498 local LongComment =
2499   WithStyle ( 'Comment' ,
2500     Q ( P "/*" )
2501     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2502     * Q ( P "*/" )
2503   ) -- $

```

The following LPEG `CommentLaTeX` is for what is called in that document the “*LaTeX comments*”. Since the elements that will be caught must be sent to *LaTeX* with standard *LaTeX* catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

2504 local CommentLaTeX =
2505   P(piton.comment_latex)
2506   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
2507   * L ( ( 1 - P "\r" ) ^ 0 )
2508   * Lc "}"}
2509   * ( EOL + -1 )

```

The main LPEG for the language SQL

```

2510 local function LuaKeyword ( name )
2511 return
2512   Lc ( "{\\PitonStyle{Keyword}{"
2513   * Q ( Cmt (
2514     C ( identifier ) ,
2515     function(s,i,a) return string.upper(a) == name end
2516   )
2517   )
2518   * Lc ( "}" ) )
2519 end
2520 local TableField =
2521   K ( 'Name.Table' , identifier )
2522   * Q ( P "." )
2523   * K ( 'Name.Field' , identifier )
2524

```

```

2525 local OneField =
2526 (
2527   Q ( P "(" * ( 1 - P ")" ) ^ 0 * P ")" )
2528   +
2529   K ( 'Name.Table' , identifier )
2530   * Q ( P ".")
2531   * K ( 'Name.Field' , identifier )
2532   +
2533   K ( 'Name.Field' , identifier )
2534 )
2535 *
2536   Space * LuaKeyword ( "AS" ) * Space * K ( 'Name.Field' , identifier )
2537 ) ^ -1
2538 * ( Space * ( LuaKeyword ( "ASC" ) + LuaKeyword ( "DESC" ) ) ) ^ -1
2539
2540 local OneTable =
2541   K ( 'Name.Table' , identifier )
2542 *
2543   Space
2544   * LuaKeyword ( "AS" )
2545   * Space
2546   * K ( 'Name.Table' , identifier )
2547 ) ^ -1
2548
2549 local WeCatchTableNames =
2550   LuaKeyword ( "FROM" )
2551   * ( Space + EOL )
2552   * OneTable * ( SkipSpace * Q ( P "," ) * SkipSpace * OneTable ) ^ 0
2553 +
2554   LuaKeyword ( "JOIN" ) + LuaKeyword ( "INTO" ) + LuaKeyword ( "UPDATE" )
2555   + LuaKeyword ( "TABLE" )
2556 )
2557 * ( Space + EOL ) * OneTable

```

First, the main loop :

```

2558 local MainSQL =
2559   EOL
2560   + Space
2561   + Tab
2562   + Escape + EscapeMath
2563   + CommentLaTeX
2564   + Beamer
2565   + Comment + LongComment
2566   + Delim
2567   + Operator
2568   + String
2569   + Punct
2570   + WeCatchTableNames
2571   + ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
2572   + Number
2573   + Word

```

Here, we must not put local!

```

2574 MainLoopSQL =
2575   ( ( space^1 * -1 )
2576     + MainSQL
2577   ) ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair \@@_begin_line: – \@@_end_line:³⁵.

³⁵Remember that the \@@_end_line: must be explicit because it will be used as marker in order to delimit the argument of the command \@@_begin_line:

```

2578 languageSQL =
2579   Ct (
2580     ( ( space - P "\r" ) ^ 0 * P "\r" ) ^ -1
2581     * BeamerBeginEnvironments
2582     * Lc '\\@_begin_line:'
2583     * SpaceIndentation ^ 0
2584     * MainLoopSQL
2585     * -1
2586     * Lc '\\@_end_line:'
2587   )
2588 languages['sql'] = languageSQL

```

8.3.6 The function Parse

The function `Parse` is the main function of the package `piton`. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`languages[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```

2589 function piton.Parse(language,code)
2590   local t = languages[language] : match ( code )
2591   if t == nil
2592     then
2593       tex.sprint("\\PitonSyntaxError")
2594       return -- to exit in force the function
2595     end
2596   local left_stack = {}
2597   local right_stack = {}
2598   for _ , one_item in ipairs(t)
2599     do
2600       if one_item[1] == "EOL"
2601         then
2602           for _ , s in ipairs(right_stack)
2603             do tex.sprint(s)
2604             end
2605           for _ , s in ipairs(one_item[2])
2606             do tex.tprint(s)
2607             end
2608           for _ , s in ipairs(left_stack)
2609             do tex.sprint(s)
2610             end
2611         else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}{2}" , "\end{cover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\{cover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}{2}` and `right_stack` will be for the elements like `\end{cover}`.

```

2612     if one_item[1] == "Open"
2613       then
2614         tex.print( one_item[2] )
2615         table.insert(left_stack,one_item[2])
2616         table.insert(right_stack,one_item[3])
2617       else
2618         if one_item[1] == "Close"
2619           then
2620             tex.print( right_stack[#right_stack] )
2621             left_stack[#left_stack] = nil
2622             right_stack[#right_stack] = nil
2623           else

```

```

2624         tex.tprint(one_item)
2625     end
2626   end
2627 end
2628 end
2629 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the whole file (that is to say all its lines) and then apply the function `Parse` to the resulting Lua string.

```

2630 function piton.ParseFile(language,name,first_line,last_line)
2631   local s = ''
2632   local i = 0
2633   for line in io.lines(name)
2634     do i = i + 1
2635       if i >= first_line
2636         then s = s .. '\r' .. line
2637       end
2638       if i >= last_line then break end
2639   end

```

We extract the BOM of utf-8, if present.

```

2640   if string.byte(s,1) == 13
2641     then if string.byte(s,2) == 239
2642       then if string.byte(s,3) == 187
2643         then if string.byte(s,4) == 191
2644           then s = string.sub(s,5,-1)
2645         end
2646       end
2647     end
2648   end
2649   piton.Parse(language,s)
2650 end

```

8.3.7 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```

2651 function piton.ParseBis(language,code)
2652   local s = ( Cs( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2653   return piton.Parse(language,s)
2654 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the piton style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```

2655 function piton.ParseTer(language,code)
2656   local s = ( Cs( ( P '\\@@_breakable_space:' / ' ' + 1 ) ^ 0 ) ) :
2657     match ( code )
2658   return piton.Parse(language,s)
2659 end

```

8.3.8 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The function `gobble` gobbles n characters on the left of the code. It uses a LPEG that we have to compute dynamically because it depends on the value of n .

```

2660 local function gobble(n,code)
2661     function concat(acc,new_value)
2662         return acc .. new_value
2663     end
2664     if n==0
2665     then return code
2666     else
2667         return Cf (
2668             Cc ( "" ) *
2669             ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2670             * ( C ( P "\r" )
2671             * ( 1 - P "\r" ) ^ (-n)
2672             * C ( ( 1 - P "\r" ) ^ 0 )
2673             ) ^ 0 ,
2674             concat
2675         ) : match ( code )
2676     end
2677 end

```

The following function `add` will be used in the following LPEG `AutoGobbleLPEG`, `TabsAutoGobbleLPEG` and `EnvGobbleLPEG`.

```

2678 local function add(acc,new_value)
2679     return acc + new_value
2680 end

```

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code. The main work is done by two *fold captures* (`lpeg.Cf`), one using `add` and the other (encompassing the previous one) using `math.min` as folding operator.

```

2681 local AutoGobbleLPEG =
2682     ( space ^ 0 * P "\r" ) ^ -1
2683     * Cf (
2684         (

```

We don't take into account the empty lines (with only spaces).

```

2685         ( P " " ) ^ 0 * P "\r"
2686         +
2687         Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add )
2688         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * P "\r"
2689     ) ^ 0

```

Now for the last line of the Python code...

```

2690     *
2691     ( Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add )
2692     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1 ,
2693     math.min
2694 )

```

The following LPEG is similar but works with the indentations.

```

2695 local TabsAutoGobbleLPEG =
2696     ( space ^ 0 * P "\r" ) ^ -1
2697     * Cf (
2698         (
2699             ( P "\t" ) ^ 0 * P "\r"
2700             +
2701             Cf ( Cc(0) * ( P "\t" * Cc(1) ) ^ 0 , add )

```

```

2702         * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * P "\r"
2703     ) ^ 0
2704     *
2705     ( Cf ( Cc(0) * ( P "\t" * Cc(1) ) ^ 0 , add )
2706     * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1 ,
2707     math.min
2708   )

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditionnal way to indent in LaTeX). The main work is done by a *fold capture* (`lpeg.Cf`) using the function `add` as folding operator.

```

2709 local EnvGobbleLPEG =
2710   ( ( 1 - P "\r" ) ^ 0 * P "\r" ) ^ 0
2711   * Cf ( Cc(0) * ( P " " * Cc(1) ) ^ 0 , add ) * -1

2712 function piton.GobbleParse(language,n,code)
2713   if n== -1
2714     then n = AutoGobbleLPEG : match(code)
2715   else if n== -2
2716     then n = EnvGobbleLPEG : match(code)
2717   else if n== -3
2718     then n = TabsAutoGobbleLPEG : match(code)
2719   end
2720 end
2721 piton.Parse(language,gobble(n,code))
2722 if piton.write ~= ''
2723 then local file = assert(io.open(piton.write,piton.write_mode))
2724   file:write(code)
2725   file:close()
2726 end
2727 end
2728 end

```

8.3.9 To count the number of lines

```

2729 function piton.CountLines(code)
2730   local count = 0
2731   for i in code : gmatch ( "\r" ) do count = count + 1 end
2732   tex.sprint(
2733     luatexbase.catcodetables.expl ,
2734     '\int_set:Nn \\l_@@_nb_lines_int {' .. count .. '}')
2735 end

2736 function piton.CountNonEmptyLines(code)
2737   local count = 0
2738   count =
2739   ( Cf ( Cc(0) *
2740     (
2741       ( P " " ) ^ 0 * P "\r"
2742       + ( 1 - P "\r" ) ^ 0 * P "\r" * Cc(1)
2743     ) ^ 0
2744     * ( 1 - P "\r" ) ^ 0 ,
2745     add
2746   ) * -1 ) : match (code)
2747   tex.sprint(
2748     luatexbase.catcodetables.expl ,
2749     '\int_set:Nn \\l_@@_nb_non_empty_lines_int {' .. count .. '}')
2750 end

```

```

2751 function piton.CountLinesFile(name)
2752     local count = 0
2753     io.open(name) -- added
2754     for line in io.lines(name) do count = count + 1 end
2755     tex.sprint(
2756         luatexbase.catcodetables.expl ,
2757         '\int_set:Nn \\l_@@_nb_lines_int {' .. count .. '}')
2758 end

2759 function piton.CountNonEmptyLinesFile(name)
2760     local count = 0
2761     for line in io.lines(name)
2762     do if not ( ( P " " ) ^ 0 * -1 ) : match ( line ) )
2763         then count = count + 1
2764     end
2765     end
2766     tex.sprint(
2767         luatexbase.catcodetables.expl ,
2768         '\int_set:Nn \\l_@@_non_empty_lines_int {' .. count .. '}')
2769 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2770 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2771     local s = ( Cs (( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2772     local t = ( Cs (( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2773     local first_line = -1
2774     local count = 0
2775     local last_found = false
2776     for line in io.lines(file_name)
2777     do if first_line == -1
2778         then if string.sub(line,1,#s) == s
2779             then first_line = count
2780             end
2781         else if string.sub(line,1,#t) == t
2782             then last_found = true
2783             break
2784             end
2785         end
2786         count = count + 1
2787     end
2788     if first_line == -1
2789     then tex.sprint("\PitonBeginMarkerNotFound")
2790     else if last_found == false
2791         then tex.sprint("\PitonEndMarkerNotFound")
2792         end
2793     end
2794     tex.sprint(
2795         luatexbase.catcodetables.expl ,
2796         '\int_set:Nn \\l_@@_first_line_int {' .. first_line .. ' + 2 }
2797         .. '\int_set:Nn \\l_@@_last_line_int {' .. count .. '}')
2798 end
2799 (/LUA)

```

9 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension piton is done on the following GitHub repository:
<https://github.com/fpantigny/piton>

Changes between versions 2.2 and 2.3

New key `write`.

Changes between versions 2.1 and 2.2

New key path for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

Changes between versions 1.6 and 2.0

The extension piton now supports the computer languages OCaml and C (and, of course, Python).

Changes between versions 1.5 and 1.6

New key `width` (for the total width of the listing).

New style `UserFunction` to format the names of the Python functions previously defined by the user.

Command `\PitonClearUserFunctions` to clear the list of such functions names.

Changes between versions 1.4 and 1.5

New key `numbers-sep`.

Changes between versions 1.3 and 1.4

New key `identifiers` in `\PitonOptions`.

New command `\PitonStyle`.

`background-color` now accepts as value a *list* of colors.

Changes between versions 1.2 and 1.3

When the class Beamer is used, the environment `{Piton}` and the command `\PitonInputFile` are “overlay-aware” (that is to say, they accept a specification of overlays between angular brackets).

New key `prompt-background-color`

It's now possible to use the command `\label` to reference a line of code in an environment `{Piton}`.

A new command `_` is available in the argument of the command `\piton{...}` to insert a space (otherwise, several spaces are replaced by a single space).

Changes between versions 1.1 and 1.2

New keys `break-lines-in-piton` and `break-lines-in-Piton`.

New key `show-spaces-in-string` and modification of the key `show-spaces`.

When the class beamer is used, the environements `{uncoverenv}`, `{onlyenv}`, `{visibleenv}` and `{invisibleenv}`

Changes between versions 1.0 and 1.1

The extension piton detects the class beamer and activates the commands \action, \alert, \invisible, \only, \uncover and \visible in the environments {Piton} when the class beamer is used.

Changes between versions 0.99 and 1.0

New key tabs-auto-gobble.

Changes between versions 0.95 and 0.99

New key break-lines to allow breaks of the lines of code (and other keys to customize the appearance).

Changes between versions 0.9 and 0.95

New key show-spaces.

The key left-margin now accepts the special value auto.

New key latex-comment at load-time and replacement of ## by #>

New key math-comments at load-time.

New keys first-line and last-line for the command \InputPitonFile.

Changes between versions 0.8 and 0.9

New key tab-size.

Integer value for the key splittable.

Changes between versions 0.7 and 0.8

New keys footnote and footnotehyper at load-time.

New key left-margin.

Changes between versions 0.6 and 0.7

New keys resume, splittable and background-color in \PitonOptions.

The file piton.lua has been embedded in the file piton.sty. That means that the extension piton is now entirely contained in the file piton.sty.
