

# OpT<sub>E</sub>X

## Format Based on Plain T<sub>E</sub>X and OPmac<sup>1</sup>

Version 0.16

Petr Olsák, 2020

<http://petr.olsak.net/optex>

OpT<sub>E</sub>X is LuaT<sub>E</sub>X format with Plain T<sub>E</sub>X and OPmac. Only LuaT<sub>E</sub>X engine is supported.

OpT<sub>E</sub>X should be a modern Plain T<sub>E</sub>X with power from OPmac (Fonts Selection System, colors, graphics, references, hyperlinks, indexing, bibliography, ...) with preferred Unicode fonts.

The main goal of OpT<sub>E</sub>X is:

- OpT<sub>E</sub>X keeps the simplicity (like in Plain T<sub>E</sub>X and OPmac macros).
- There is no old obscurities concerning with various 8-bit encodings and various engines.
- OpT<sub>E</sub>X provides a powerful Fonts Selection System (for Unicode font families, of course).
- OpT<sub>E</sub>X supports hyphenations of all languages installed in your T<sub>E</sub>X system.
- All features from OPmac macros are copied. For example sorting words in the Index<sup>2</sup>, reading .bib files directly<sup>2</sup>, syntax highlighting<sup>2</sup>, colors, graphics, hyperlinks, references).
- Macros are documented in the same place where code is.
- User name space of control sequences is separated from internal name space of OpT<sub>E</sub>X and primitives (\foo versus \\_foo). The name spaces for macro writers are designed too.

If you need to customize your document or you need to use something very specific, then you can copy relevant parts of OpT<sub>E</sub>X macros into your macro file and do changes of these macros here. This is significant difference from L<sub>A</sub>T<sub>E</sub>X or ConTeXt, which are an attempt to create a new user level with a plenty of non-primitive parameters and syntax hiding T<sub>E</sub>X internals. The macros from OpT<sub>E</sub>X are simple and straightforward because they solve only what is explicitly needed, they does not create a new user level for controlling your document. We have T<sub>E</sub>X. You can use OpT<sub>E</sub>X macros, understand them and modify them.

OpT<sub>E</sub>X offers a markup language for authors of texts (like L<sub>A</sub>T<sub>E</sub>X), i. e. the fixed set of tags to define the structure of the document. This markup is different from the L<sub>A</sub>T<sub>E</sub>X markup. It may offer to write the source text of the document somewhat clearer and more attractive.

The manual includes two parts: user documentation and technical documentation. The second part is generated directly from the sources of OpT<sub>E</sub>X. There are many hyperlinks from one part to second and vice versa.

This manual describes OpT<sub>E</sub>X features only. We suppose that user knows T<sub>E</sub>X basics. They are described in many books. You can see a short document [T<sub>E</sub>X in nutshell](#) too.

---

<sup>1</sup> The OPmac package is a set of simple additional macros to Plain T<sub>E</sub>X. It enables users to take advantage of L<sub>A</sub>T<sub>E</sub>X functionality but keeps Plain T<sub>E</sub>X simplicity. See <http://petr.olsak.net/opmac-e.html> for more information about it.

<sup>2</sup> All these features are implemented by T<sub>E</sub>X macros, no external program is needed.

# Chapter 1

## User documentation

### 1.1 Starting with OpTeX

OpTeX is compiled as a format for LuaTeX. Maybe there is a command `optex` in your TeX distribution. Then you can write into command line

```
optex document
```

You can try to process `optex op-demo` or `optex optex-doc`.

If there is no `optex` command, see more information about installation OpTeX at <http://petr.olsak.net/optex>.

A minimal document should be

```
\fontfam[LMfonts]  
Hello World! \bye
```

The first line `\fontfam[LMfonts]` tells that Unicode Latin Modern fonts (derived from Computer Modern) are used. If you omit this line then preloaded Latin Modern fonts are used but preloaded fonts cannot be in Unicode<sup>1</sup>. So the sentence `Hello World` will be OK without the first line, but you cannot print such sentence in another languages (for example `Ahoj světe!`) where Unicode fonts are needed because of the characters like ě are not mapped correctly in preloaded fonts.

A somewhat larger example with common settings should be:

```
\fontfam[Termes] % selecting Unicode font family Termes (section 1.3.1)  
\typothesize[11/13] % setting default font size and baselineskip (sec. 1.3.2)  
\margins/1 a4 (1,1,1,1)in % setting A4 paper, 1 in margins (section 1.2.1)  
\cslang % Czech hyphenation patterns (section 1.7.1)
```

```
Tady je zkušební textík v českém jazyce.  
\bye
```

You can look at `op-demo.tex` file for more complex, but still simple example.

### 1.2 Page layout

#### 1.2.1 Setting the margins

The `\margins` command declares margins of the document. This command have the following parameters:

```
\margins/{pg} {fmt} ({left},{right},{top},{bot}){unit}  
example:  
\margins/1 a4 (2.5,2.5,2,2)cm
```

Parameters are:

- `{pg}` ... 1 or 2 specifies one-page or two-pages design.
- `{fmt}` ... paper format (a4, a4l, a5, letter, etc. or user defined).
- `{left}, {right}, {top}, {bot}` ... gives the amount of left, right, top and bottom margins.
- `{unit}` ... unit used for values `{left}, {right}, {top}, {bot}`.

---

<sup>1</sup> This is a technical limitation of LuaTeX for fonts downloaded in formats: only 8bit fonts can be preloaded.

Each of the parameters  $\langle left \rangle$ ,  $\langle right \rangle$ ,  $\langle top \rangle$ ,  $\langle bot \rangle$  can be empty. If both  $\langle left \rangle$  and  $\langle right \rangle$  are nonempty then  $\text{\hspace}$  is set. Else  $\text{\hspace}$  is unchanged. If both  $\langle left \rangle$  and  $\langle right \rangle$  are empty then typesetting area is centered in the paper format. The analogical rule works when  $\langle top \rangle$  or  $\langle bot \rangle$  parameter is empty ( $\text{\vsize}$  instead  $\text{\hspace}$  is used). Examples:

```
\margins/1 a4 (,,,)mm % \hspace, \vsize untouched,
                      % typesetting area centered
\margins/1 a4 (,2,,)cm % right margin set to 2cm
                      % \hspace, \vsize untouched, vertically centered
```

If  $\langle pg \rangle=1$  then all pages have the same margins. If  $\langle pg \rangle=2$  then the declared margins are true for odd pages. The margins at the even pages are automatically mirrored in such case, it means that  $\langle left \rangle$  is replaced by  $\langle right \rangle$  and vice versa.

OpTeX declares following paper formats: a4, a4l (landscape a4), a5, a5l, b5, letter and user can declare another own format by  $\text{\sdef}$ :

```
\sdef{_pgs:b5l}{(250,176)mm}
\sdef{_pgs:letterl}{(11,8.5)in}
```

The  $\langle fmt \rangle$  can be also in the form  $(\langle width \rangle, \langle height \rangle) \langle unit \rangle$  where  $\langle unit \rangle$  is optional. If it is missing then  $\langle unit \rangle$  after margins specification is used. For example:

```
\margins/1 (100,200) (7,7,7,7)mm
```

declares the paper  $100 \times 200$  mm with all four margins 7 mm. The spaces before and after  $\langle fmt \rangle$  parameter are necessary.

The command  $\text{\magscale}[\langle factor \rangle]$  scales the whole typesetting area. The fixed point of such scaling is the upper left corner of the paper sheet. Typesetting (breakpoints etc.) is unchanged. All units are relative after such scaling. Only paper formats dimensions stays unscaled. Example:

```
\margins/2 a5 (22,17,19,21)mm
\magscale[1414] \margins/1 a4 (,,,)mm
```

The first line sets the  $\text{\hspace}$  and  $\text{\vsize}$  and margins for final printing at a5 format. The setting on the second line centers the scaled typesetting area to the true a4 paper while breaking points for paragraphs and pages are unchanged. It may be usable for review printing. After review is done, the second line can be commented out.

### 1.2.2 Concept of default page

OpTeX uses “output routine” for page design. It is very similar to Plain TeX output routine. There is  $\text{\headline}$  followed by “page body” followed by  $\text{\footline}$ . The  $\text{\headline}$  is empty by default and it can be used for running headers repeated on each page. The  $\text{\footline}$  prints centered page number by default. You can set the  $\text{\footline}$  to empty using  $\text{\nopagenumbers}$  macro.

The margins declared by  $\text{\margins}$  macro (documented in the previous section 1.2.1) is concerned to the page body, i.e. the  $\text{\headline}$  and  $\text{\footline}$  are placed to the top and bottom margins.

The distance between the  $\text{\headline}$  and the top of the page body is given by the  $\text{\headlinedist}$  register. The distance between bottom of the page body and the  $\text{\footline}$  is given by  $\text{\footlinedist}$ . The default values are:

```
\headline = {}
\footline = {\_hss\_rmfixed \_folio \_hss} % \folio expands to page number
\headlinedist = 14pt % from baseline of \headline to top of page body
\footlinedist = 24pt % from last line in pagebody to baseline of footline
```

The page body should be divided to top insertions (floating tables and figures) followed by a real text and followed by footnotes. Typically, only real text is here.

The `\pgbackground` tokens list is empty by default but it can be used for creating background of each page (colors, picture, watermark for example). The macro `\draft` uses this register and puts big text DRAFT as watermark to each page. You can try it.

More about the page layout is documented in sections [2.7.4](#) and [2.17](#).

### 1.2.3 Footnotes and marginal notes

The Plain TeX's macro `\footnote` can be used as usual. But a new macro `\fnote{<text>}` is defined. The footnote mark is added automatically and it is numbered on each chapter from one<sup>2</sup>. The `<text>` is scaled to 80 %. User can redefine footnote mark or scaling, as shown in the section [2.33](#).

The `\fnote` macro is fully applicable only in "normal outer" paragraph. It doesn't work inside boxes (tables, for example). If you are solving such case then you can use the command `\fnotemark<numeric-label>` inside the box: only the footnote mark is generated here. When the box is finished you can use `\fnotetext{<text>}`. This macro puts the `<text>` to the footnote. The `<numeric-label>` have to be 1 if only one such command is in the box. Second `\fnotemark` inside the same box have to have the parameter 2 etc. The same number of `\fnotetexts` have to be written after the box as the number of `\fnotemarks` inserted inside the box. Example:

```
Text in a paragraph\fnote{First notice}...      % a "normal" footnote
\table{...}{...}\fnotemark1...\fnotemark2...}  % two footnotes in a box
\fnotetext{Second notice}
\fnotetext{Third notice}
...
\table{...}{...}\fnotemark1...}                  % one footnote in a box
\fnotetext{Fourth notice}
```

The marginal note can be printed by the `\mnote{<text>}` macro. The `<text>` is placed to the right margin on the odd pages and it is placed to the left margin on the even pages. This is done after second TeX run because the relevant information is stored in an external file and read from it again. If you need to place the notes only to the fixed margin write `\fixmnotes\right` or `\fixmnotes\left`.

The `<text>` is formatted as a little paragraph with the maximal width `\mnotesize` ragged left on the left margins or ragged right on the right margins. The first line of this little paragraph has its vertical position given by the position of `\mnote` in the text. The exceptions are possible by using the `up` keyword: `\mnote up<dimen>{<text>}`. You can set such `<dimen>` to each `\mnote` manually in final printing in order to margin notes do not overlap. The positive value of `<dimen>` shifts the note up and negative value shifts it down. For example `\mnote up 2\badselineskip{<text>}` shifts this marginal note two lines up.

## 1.3 Fonts

### 1.3.1 Font families

You can select the font family by `\fontfam[<Family-name>]`. The argument `<Family-name>` is case insensitive and spaces are ignored in it. For example, `\fontfam[LM Fonts]` is equal to `\fontfam[LMfonts]` and it is equal to `\fontfam[lmfonts]`. Several aliases are prepared, thus `\fontfam[Latin Modern]` can be used for loading Latin Modern family too.

If you write `\fontfam[?]` then all font families registered in OptEX are listed on the terminal and in the log file. If you write `\fontfam[catalog]` then a catalog of all fonts registered in

---

<sup>2</sup> You can declare `\fnotenumglobal` if you want footnotes numbered in whole document from one or `\fnotenumpages` if you want footnotes numbered at each page from one. Default setting is `\fnotenumchapters`

OpTeX and available in your TeX system is printed. The instructions how to register your own font family is appended in such catalog.

If the family is loaded then *font modifiers* applicable in such font family are listed on the terminal: (\caps, \cond for example). And there are four basic *variant selectors* (\rm, \bf, \it, \bi). The usage of variant selectors is the same as in Plain TeX: {\it italics text}, {\bf bold text} etc.

The font modifiers (\caps, \cond for example) can be used before a variant selector and they can be (independently) combined: \caps\it or \cond\caps\bf. The modifiers keeps their internal setting until group ends or until another modifier which negates the previous feature is used. So {\caps \rm First text \it Second text} gives FIRST TEXT SECOND TEXT.

There is one special variant selector \currvar which does not change the selected variant but reloads the font due to (maybe newly specified) font modifier(s).

The context between variants \rm ↔ \it and \bf ↔ \bi is kept by the \em macro (emphasize text). It switches from current \rm to \it, from current \it to \rm, from current \bf to \bi and from current \bi to \bf. The italics correction \v/ is inserted automatically, if needed. Example:

```
This is {\em important} text.    % = This is {\it important\}/} text.
\it This is {\em important} text. % = This is\v/ {\rm important} text.
\bf This is {\em important} text. % = This is {\bi important\}/} text.
\bi This is {\em important} text. % = This is\v/ {\bf important} text.
```

More about the OpTeX Font Selection System is written in the technical documentation in the section 2.12. You can mix more font families in your document, you can declare your own variant selectors or modifiers etc.

### 1.3.2 Font sizes

The command \typosize[⟨fontsize⟩/⟨baselineskip⟩] sets the font size of text and math fonts and baselineskip. If one of these two parameters is empty, the corresponding feature stays unchanged. Don't write the unit of these parameters. The unit is internally set to \ptunit which is 1pt by default. You can change the unit by the command \ptunit=⟨something-else⟩, for instance \ptunit=1mm enlarges all font sizes declared by \typosize. Examples:

```
\typosize[10/12]    % default of Plain TeX
\typosize[11/12.5] % font 11pt, baseline 12.5pt
\typosize[8/]       % font 8pt, baseline unchanged
```

The commands for font size setting described in this section have local validity. If you put them into a group, the settings are lost when the group is finished. If you set something relevant with paragraph shape (baselineskip given by \typosize for example) then you must first finalize the paragraph before closing the group: {\typosize[12/14] ...⟨text of paragraph⟩... \par}.

The command \typoscale[⟨font-factor⟩/⟨baselineskip-factor⟩] sets the text and math fonts size and baselineskip as a multiple of the current fonts size and baselineskip. The factor is written in "scaled"-like way, it means that 1000 means factor one. The empty parameter is equal to the parameter 1000, i.e. the value stays unchanged. Examples:

```
\typoscale[800/800]    % fonts and baselineskip re-size to 80 %
\typoscale[\magstep2/] % fonts bigger 1,44times (\magstep2 expands to 1440)
```

First usage of \typosize or \typoscale macro in your document sets so called *main values*, i.e. main font size and main baselineskip. They are internally saved in registers \mainfsize and \mainbskip.

The \typoscale command does scaling in respect to current values by default. If you want to do it in respect to main values, type \scalemain immediately before \typoscale command.

```
\typothesize[12/14.4] % first usage in document, sets main values internally
\typothesize[15/18]   % bigger font
\scalemain \typoscale[800/800] % reduces from main values, no from current.
```

The size of the current font can be changed by the command `\thefontsize[⟨font-size⟩]` or can be rescaled by `\thescale[⟨factor⟩]`. These macros don't change math fonts sizes nor baselineskip.

There is "low level" `\setfontsize{⟨size-spec⟩}` command which behaves like a font modifier and sets given font size used by next variant selectors. It doesn't change the font size immediately, but following variant selector does it. For example `\setfontsize{at15pt}\currvar` sets current variant to 15pt.

If you are using a font family with "optical sizes feature" (i.e. there are more recommended sizes of the same font which are not scaled linearly; good example is Computer Modern aka Latin Modern fonts) then the recommended size is selected by all mentioned commands automatically.

More information about resizing of fonts is documented in the section [2.11](#).

### 1.3.3 Typesetting math

See the additional document [Typesetting Math with OpTeX](#) for more details about this issue.

OpTeX preloads a collection of 7bit Computer Modern math fonts and AMS fonts in its format for math typesetting. You can use them in any size and in the `\boldmath` variant. Most declared text font families (see `\fontfam` in the section [1.3.1](#)) are configured with recommended Unicode math font. This font is automatically loaded unless you specify `\noloadmath` before first `\fontfam` command. See log file for more information about loading text font family and Unicode math fonts. If you prefer another Unicode math font, specify it by `\loadmath{[⟨font-file⟩]}` or `\loadmath{⟨font-name⟩}` before first `\fontfam` command.

Hundreds math symbols and operators like in AMSTeX are accessible. For example `\alpha`, `\geq`  $\geq$ , `\sum`  $\sum$ , `\sphericalangle`  $\sphericalangle$ , `\bumpeq`,  $\bumpeq$ . See AMSTeX manual or [Typesetting Math with OpTeX](#) for complete list of math symbols.

The following math alphabets are available:

<code>\mit</code>	% mathematical variables	<i>abc–xyz, ABC–XYZ</i>
<code>\it</code>	% text italics	<i>abc–xyz, ABC–XYZ</i>
<code>\rm</code>	% text roman	<i>abc–xyz, ABC–XYZ</i>
<code>\cal</code>	% normal calligraphics	<i>ABC–XYZ</i>
<code>\script</code>	% script	<i>A<small>B</small>C–X<small>Y</small>Z</i>
<code>\frak</code>	% fracture	<i>abc–xyz, A<small>B</small>C–X<small>Y</small>Z</i>
<code>\bbchar</code>	% double stroked letters	<i>ABC–XYZ</i>
<code>\bf</code>	% sans serif bold	<b><i>abc–xyz, ABC–XYZ</i></b>
<code>\bi</code>	% sans serif bold slanted	<b><i>abc–xyz, ABC–XYZ</i></b>

The last two selectors `\bf` and `\bi` select the sans serif fonts in math regardless the current text font family. This is common notation for vectors and matrices. You can re-declare them, see section [2.15.2](#) where definitions of Unicode math variants of `\bf` and `\bi` selectors are documented.

The math fonts can be scaled by `\typothesize` and `\typoscale` macros. Two math fonts collections are prepared: `\normalmath` for normal weight and `\boldmath` for bold. The first one is set by default, the second one is usable for math formulae in titles typeset in bold, for example.

You can use `\mathbox{⟨text⟩}` inside math mode. It behaves as `{\hbox{⟨text⟩}}` (i.e. the `⟨text⟩` is printed in horizontal non-math mode) but the size of the `⟨text⟩` is adapted to the context of math size (text or script or scriptscript). Moreover, there is the macro `\mathstyles{⟨math list⟩}` which depends on the current math style. It is documented at the end of the section [2.14](#).

## 1.4 Typical elements of document

### 1.4.1 Chapters and sections

The documents can be divided into chapters (`\chap`), sections (`\sec`), subsections (`\secc`) and they can be titled by `\tit` command. The parameters are separated by the end of current line (no braces are used):

```
\tit Document title <end of line>
\chap Chapter title <end of line>
\sec Section title <end of line>
\secc Subsection title <end of line>
```

The chapters are automatically numbered by one number, sections by two numbers (chapter.section) and subsections by three numbers. If there are no chapters then section have only one number and subsection two.

The implicit design of the titles of chapter etc. are implemented in the macros `\_printchap`, `\_printsec` and `\_printsecc`. A designer can simply change these macros if he/she needs another behavior.

The first paragraph after the title of chapter, section and subsection is not indented but you can type `\let\firstnoindent=\relax` if you need all paragraphs indented.

If a title is so long then it breaks to more lines in the output. It is better to hint the breakpoints because TeX does not interpret the meaning of the title. User can put the `\nl` (it means newline) macro to the breakpoints.

If you want to arrange a title to more lines in your source file then you can use `^J` at the end of each line (except the last one). When `^J` is used, then reading of the title continues at the next line. The “normal” comment character `%` doesn’t work in titles. You can use `\nl^J` if you want to have corresponding lines in the source and in the output.

The chapter, section or subsection isn’t numbered if the `\nonum` precedes. And the chapter, section or subsection isn’t delivered to the table of contents if `\notoc` precedes. You can combine both prefixes.

### 1.4.2 Another numbered objects

Apart from chapters, sections and subsections, there are another automatically numbered objects: equations, captions for tables and figures. The user can declare more numbered objects.

If the user writes the `\eqmark` as the last element of the display mode then this equation is numbered. The equation number is printed in brackets. This number resets in each section by default.

If the `\eqalignno` is used, then user can put `\eqmark` to the last column before `\cr`. For example:

```
\eqalignno{
  a^2+b^2 &= c^2 \cr
  c &= \sqrt{a^2+b^2} & \eqmark \cr}
```

Another automatically numbered object is a caption which is tagged by `\caption/t` for tables and `\caption/f` for figures. The caption text follows. The `\cskip` can be used between `\caption` text and the real object (table or figure). You can use two orders: `<caption>\cskip <object>` or `<object>\cskip <caption>`. The `\cskip` creates appropriate vertical space between them. Example:

```
\caption/t The dependency of the computer-dependency on the age.
\cskip
\noindent\hfil\table{r1}{
```

```

age   & value \crl\noalign{\smallskip}
0--1 & unmeasured \cr
1--6 & observable \cr
6--12 & significant \cr
12--20 & extremal \cr
20--40 & normal \cr
40--60 & various \cr
60--$\infty$ & moderate}

```

This example produces:

**Table 1.4.1** The dependency of the computer-dependency on the age.

age	value
0--1	unmeasured
1--6	observable
6--12	significant
12--20	extremal
20--40	normal
40--60	various
60--\$\infty\$	moderate

You can see that the word “Table” followed by a number is added by the macro `\caption/t`. The caption text is centered. If it occupies more lines then the last line is centered.

The macro `\caption/f` behaves like `\caption/t` but it is intended for figure captions with independent numbering. The word (Table, Figure) depends on the actual selected language (see section 1.7.1 about languages).

If you wish to make the table or figure as floating object, you need to use Plain TEX macros `\midinsert` or `\topinsert` terminated by `\endinsert`. Example:

```

\topinsert % table and its caption printed at the top of the current page
<caption and table>
\endinsert

```

The pair `\midinsert... \endinsert` prefers to put the enclosed object to the current place. Only if this is unable due to page breaking, it behaves like `\topinsert... \endinsert`.

There are five prepared counters A, B, C, D and E. They are reset in each chapter and section<sup>3</sup>. They can be used in context of `\numberedpar {letter}{text}` macro. For example:

```

\def\theorem {\numberedpar A{Theorem}}
\def\corollary {\numberedpar A{Corollary}}
\def\definition {\numberedpar B{Definition}}
\def\example {\numberedpar C{Example}}

```

Three independent numbers are used in this example. One for Theorems and Corollaries second for Definitions and third for Examples. The user can write `\theorem Let $M$ be...` and the new paragraph is started with the text: **Theorem 1.4.1.** Let  $M$  be... You can add an optional parameter in brackets. For example, `\theorem [(L'Hôpital's rule)] Let $f$, $g$ be...` is printed like **Theorem 1.4.2 (L'Hôpital's rule).** Let  $f, g$  be...

### 1.4.3 References

Each automatically numbered object documented in sections 1.4.1 and 1.4.2 can be referenced if optional parameter [`<label>`] is appended to `\chap`, `\sec`, `\secc`, `\caption/t`, `\caption/f`

---

<sup>3</sup> This feature can be changed, see the section 2.25 in the technical documentation.

or `\eqmark`. The alternative syntax is to use `\label[label]` before mentioned commands (not necessarily directly before). The reference is realized by `\ref[label]` or `\pgref[label]`. Example:

```
\sec[beatle] About Beatles

\noindent\hfil\table{rl}{...} % the table
\cskip
\caption/t [comp-depend] The dependency of the comp-dependency on the age.

\label[pythagoras]
$$ a^2 + b^2 = c^2 \eqmark $$
```

Now we can point to the section~`\ref[beatle]` on the page~`\pgref[beatle]` or write something about the equation~`\ref[pythagoras]`. Finally there is an interesting Table~`\ref[comp-depend]`.

If there are forward referenced objects then user have to run  $\text{\TeX}$  twice. During each pass, the working `*.ref` file (with references data) is created and this file is used (if it exists) at the beginning of the document.

You can use the `\label[label]` before the `\theorem`, `\definition` etc. (macros defined with `\numberedpar`) if you want to reference these numbered objects. You can't use `\theorem[label]` because the optional parameter is reserved to another purpose here.

You can create a reference to whatever else by commands `\label[label] \wlabel[text]`. The connection between *label* and *text* is established. The `\ref[label]` will print *text*.

By default, labels are not printed, of course. But if you are preparing a draft version of your document then you can declare `\showlabels`. The labels are printed at their destination places after such declaration.

#### 1.4.4 Hyperlinks, outlines

If the command `\hyperlinks` *color-in* *color-out* is used at the beginning of the document, then the following objects are hyperlinked in the PDF output:

- numbers generated by `\ref` or `\pgref`,
- numbers of chapters, sections and subsections in the table of contents,
- numbers or marks generated by `\cite` command (bibliography references),
- texts printed by `\url` or `\ulink` commands.

The last object is an external link and it is colored by *color-out*. Others links are internal and they are colored by *color-in*. Example:

```
\hyperlinks \Blue \Green % internal links blue, URLs green.
```

You can use another marking of active links: by frames which are visible in the PDF viewer but invisible when the document is printed. The way to do it is to define the macros `\_pgborder`, `\_tocborder`, `\_citeborder`, `\_refborder` and `\_urlborder` as the triple of RGB components of the used color. Example:

```
\def\_tocborder {1 0 0} % links in table of contents: red frame
\def\_pgborder {0 1 0} % links to pages: green frame
\def\_citeborder {0 0 1} % links to references: blue frame
```

By default these macros are not defined. It means that no frames are created.

The hyperlinked footnotes can be activated by `\fnotelinks` *color-fnt* *color-fnf* where footnote marks in text have *color-fnt* and the same footnote marks in footnotes have

*(color-fnf)*. You can define relevant borders `\_fntborder` and `\_fnfborder` analogically as `\_pgborder` (for example).

There are “low level” commands to create the links. You can specify the destination of the internal link by `\dest[<type>:<label>]`. The active text linked to the `\dest` can be created by `\ilink[<type>:<label>]{<text>}`. The `<type>` parameter is one of the `toc`, `pg`, `cite`, `ref` or another special for your purpose. These commands create internal links only when `\hyperlinks` is declared.

The `\url` macro prints its parameter in `\tt` font and creates a potential breakpoints in it (after slash or dot, for example). If `\hyperlinks` declaration is used then the parameter of `\url` is treated as an external URL link. An example: `\url{http://www.olsak.net}` creates `http://www.olsak.net`. The characters %, \, #, { and } have to be protected by backslash in the `\url` argument, the other special characters ~, ^, & can be written as single character<sup>4</sup>. You can insert the `\|` command in the `\url` argument as a potential breakpoint.

If the linked text have to be different than the URL, you can use `\ulink[<url>]{<text>}` macro. For example: `\ulink[http://petr.olsak.net/optex]{\OpTeX/ page}` outputs to the text `OpTeX page`.

The PDF format provides *outlines* which are notes placed in the special frame of the PDF viewer. These notes can be managed as structured and hyperlinked table of contents of the document. The command `\outlines{<level>}` creates such outlines from data used for table of contents in the document. The `<level>` parameter gives the level of opened sub-outlines in the default view. The deeper levels can be opened by mouse click on the triangle symbol after that.

If you are using a special unprotected macro in section titles then `\outlines` macro may crash. You must declare variant of the macro for outlines case which is expandable. Use `\regmacro` in such case. See the section 1.5.1 for more information about `\regmacro`.

The command `\insertoutline{<text>}` inserts next entry into PDF outlines at the main level 0. These entries can be placed before table of contents (created by `\outlines`) or after it. Theirs hyperlink destination is in the place where the `\insertoutline` macro is used.

#### 1.4.5 Lists

The list of items is surrounded by `\begitems` and `\enditems` commands. The asterisk (\*) is active within this environment and it starts one item. The item style can be chosen by the `\style` parameter written after `\begitems`:

```
\style o % small bullet
\style O % big bullet (default)
\style - % hyphen char
\style n % numbered items 1., 2., 3., ...
\style N % numbered items 1), 2), 3), ...
\style i % numbered items (i), (ii), (iii), ...
\style I % numbered items I, II, III, IV, ...
\style a % items of type a), b), c), ...
\style A % items of type A), B), C), ...
\style x % small rectangle
\style X % big rectangle
```

For example:

```
\begitems
* First idea
* Second idea in subitems:
\begitems \style i
```

---

<sup>4</sup> More exactly, there are the same rules as for `\code` command, see section 1.4.7.

```

    * First sub-idea
    * Second sub-idea
    * Last sub-idea
\end{items}
* Finito
\end{items}

```

produces:

- First idea
- Second idea in subitems:
  - (i) First sub-idea
  - (ii) Second sub-idea
  - (iii) Last sub-idea
- Finito

Another style can be defined by the command `\sdef{_item:<style>}{<text>}`. Default item can be set by `\defaultitem=<text>`. The list environments can be nested. Each new level of items is indented by next multiple of `\iindent` value which is set to `\parindent` by default. The `\ilevel` register says what level of items is currently processed. Each `\begitems` starts `\everylist` tokens register. You can set, for example:

```
\everylist={\ifcase\ilevel\or \style X \or \style x \else \style - \fi}
```

You can say `\begitems \novspaces` if you don't want vertical spaces above and below the list. The nested item list are without vertical spaces automatically. More information about design of lists of items should be found in the section [2.26](#).

#### 1.4.6 Tables

The macro `\table{<declaration>}{<data>}` provides similar `<declaration>` of tables as in L<sup>A</sup>T<sub>E</sub>X: you can use letters `l`, `r`, `c`, each letter declares one column (aligned to left, right, center, respectively). These letters can be combined by the `|` character (vertical line). Example

```
\table{||lc|r||}{\cr
Month & commodity & price \crl \tskip2pt
January & notebook & \$ 700 \cr
February & skateboard & \$ 100 \cr
July & yacht & k\$ 170 \crl}
```

generates the following result:

Month	commodity	price
January	notebook	\\$ 700
February	skateboard	\\$ 100
July	yacht	k\\$ 170

Apart from `l`, `r`, `c` declarators, you can use the `p{<size>}` declarator which declares the column with paragraphs of given width. More precisely, a long text in the table cell is printed as a multiline paragraph with given width. By default, the paragraph is left-right justified. But there are alternatives:

- `p{<size>}\fL` fit left, i.e. left justified, ragged right,
- `p{<size>}\fR` fit right, i.e. right justified, ragged left,
- `p{<size>}\fC` fit center, i.e. ragged left plus right,
- `p{<size>}\fS` fit special, short one-line paragraph centered, long paragraph normal,
- `p{<size>}\fX` fit extra, left-right justified but last line centered.

You can use (*text*) in the *declaration*. Then this text is applied in each line of the table. For example `r(\kern10pt)1` adds more 10pt space between `r` and 1 rows.

An arbitrary part of the *declaration* can be repeated by a *number* prefixed. For example `3c` means `ccc` or `c 3{|c|}` means `c|c|c|c`. Note that spaces in the *declaration* are ignored and you can use them in order to more legibility.

The command `\crl` used in the *data* part of the table is generally known from Plain TeX. It marks the end of each row in the table. Moreover OpTeX defines following similar commands:

- `\crl` ... the end of the row with a horizontal line after it.
- `\crl1` ... the end of the row with a double horizontal line after it.
- `\crl1i` ... like `\crl` but the horizontal line doesn't intersect the vertical double lines.
- `\crl1li` ... like `\crl1i` but horizontal line is doubled.
- `\crlp{<list>}` ... like `\crl1i` but the lines are drawn only in the columns mentioned in comma separated *list* of their numbers. The *list* can include *from*-*to* declarators, for example `\crlp{1-3,5}` is equal to `\crlp{1,2,3,5}`.

The `\tskip{dimen}` command works like the `\noalign{\vskip{dimen}}` immediately after `\cr*` commands but it doesn't interrupt the vertical lines.

You can use following parameters for the `\table` macro. Default values are listed too.

```
\everytable={}           % code used in \vbox before table processing
\thistable={}          % code used in \vbox, it is removed after using it
\tabiteml={\enspace}    % left material in each column
\tabitemr={\enspace}    % right material in each column
\tabstrut={\strut}     % strut which declares lines distance in the table
\tablinespace=2pt       % additional vert. space before/after horizontal lines
\vvkern=1pt            % space between lines in double vertical line
\hhkern=1pt            % space between lines in double horizontal line
\tabskip=0pt           % space between columns
\tabskipl=0pt \tabskipr=0pt % space before first and after last column
```

Example: if you do `\tabiteml={$\enspace$}\tabitemr={$\enspace$}` then the `\table` acts like LATEX's array environment.

If there is an item which spans to more than one column in the table then the macro `\multispan{<number>}` (from Plain TeX) can help you. Another alternative is the command `\mspan{<number>}[<declaration>]{<text>}` which spans *number* columns and formats the *text* by the *declaration*. The *declaration* must include a declaration of only one column with the same syntax as common `\table` *declaration*. If your table includes vertical rules and you want to create continuous vertical rules by `\mspan`, then use rule declarators `|` after `c`, `l` or `r` letter in `\mspan` *declaration*. The exception is only in the case when `\mspan` includes first column and the table have rules on the left side. The example of `\mspan` usage is below.

The `\frame{<text>}` makes a frame around *text*. You can put the whole `\table` into `\frame` if you need double-ruled border of the table. Example:

```
\frame{\table{|c||l||r|}{ \crl
\mspan3[|c|]{\bf Title} \crl \noalign{\kern\hhkern}\crl1i
first & second & third \crl1li
seven & eight & nine \crl1i}}
```

creates the following result:

Title		
first	second	third
seven	eight	nine

The `\vspan{number}{text}` shifts the `<text>` down in order it looks like to be in the center of the `<number>` lines (current line is first). You can use this for creating tables like in the following example:

```
\thistable{\tabstrut={\vrule height 20pt depth10pt width0pt}
          \baselineskip=20pt \tablinespace=0pt \rulewidth=.8pt}
\table{|8{c|}}{\crlp{3-8}}
  \mspan2[c|]{} & \mspan3[c|]{Singular} & \mspan3[c|]{Plural} \crlp{3-8}
  \mspan2[c|]{} & Neuter & Masculine & Feminine & Masculine & Feminine & Neuter \crl
  \vspan2{I} & Inclusive & \mspan3[c|]{\vspan2{0}} & \mspan3[c|]{X} \crlp{2,6-8}
              & Exclusive & \mspan3[c|]{} & \mspan3[c|]{X} \crl
  \vspan2{II} & Informal & \mspan3[c|]{X} & \mspan3[c|]{X} \crlp{2-8}
              & Formal & \mspan6[c|]{X} \crl
  \vspan2{III} & Informal & \vspan2{0} & X & X & \mspan2[c|]{X} & \vspan2{0} \crlp{2,4-7}
              & Formal & & & & \mspan4[c|]{X} & \crl
}

```

The `<number>` parameter of `\vspan` must be one-digit number. If you want to set more digits then use braces. You can use non-integer values too if you feel that the result is better, for example `\vspan{2.1}{text}`.

The rule width of tables and implicit width of all `\vrules` and `\hrules` can be set by the command `\rulewidth=<dimen>`. The default value given by TeX is 0.4 pt.

The `c`, `l`, `r` and `p` are default “declaration letters” but you can define more such letters by `\def\_tabdeclare<letter>{<left>##<right>}`. More about it is in technical documentation in section 2.29.5. See the definition of the `\tabdeclarec` macro, for example.

The `:` columns boundary declarator is described in section 2.29.1. The tables with given width can be declared by `to<size>` or `pxto<size>`. More about it is in section 2.29.3 Many tips about tables can be seen on the site <http://petr.olsak.net/optex/optex-tricks.html>.

#### 1.4.7 Verbatim

The display verbatim text have to be surrounded by the `\begtt` and `\endtt` couple. The in-line verbatim have to be tagged (before and after) by a character which is declared by `\activettchar<char>`. For example `\activettchar`` declares the character ` for in-line verbatim markup. And you can use ``\relax`` for verbatim `\relax` (for example). Another alternative of printing in-line verbatim text is `\code{<text>}` (see below).

If the numerical register `\ttline` is set to the non-negative value then display verbatim will number the lines. The first line has the number `\ttline+1` and when the verbatim ends then the `\ttline` value is equal to the number of last line printed. Next `\begtt... \endtt` environment will follow the line numbering. OptEX sets `\ttline=-1` by default.

The indentation of each line in display verbatim is controlled by `\ttindent` register. This register is set to the `\parindent` by default. User can change values of the `\parindent` and `\ttindent` independently.

The `\begtt` command starts internal group in which the catcodes are changed. Then the `\everytt` tokens register is run. It is empty by default and user can control fine behavior by it. For example the catcodes can be re-declared here. If you need to define active character in the `\everytt`, use `\adef` as in the following example:

```
\everytt=\adef!{?}\adef?{!}
\begtt
Each occurrence of the exclamation mark will be changed to
the question mark and vice versa. Really? You can try it!
\endtt
```

		Singular			Plural		
		Neuter	Masculine	Feminine	Masculine	Feminine	Neuter
I	Inclusive	o			x		
	Exclusive	o			x		
II	Informal	x			x		
	Formal	x			x		
III	Informal	o	x	x	x		
	Formal	x			o		

The `\adef` command sets its parameter as active *after* the parameter of `\everytt` is read. So you don't have to worry about active categories in this parameter.

There is an alternative to `\everytt` named `\everyintt` which is used for in-line verbatim surrounded by an `\activettchar` or processed by the `\code` command.

The `\everytt` is applied to all `\begtt... \endtt` environments (if it is not declared in a group). There are tips for such global `\everytt` definitions here:

```
\everytt={\typo{9/11}} % setting font size for verbatim
\everytt={\ttline=0}    % each listing will be numbered from one
\everytt={\visiblesp}   % visualization of spaces
```

If you want to apply a special code only for one `\begtt... \endtt` environment then don't set any `\everytt` but put desired material at the same line where `\begtt` is. For example:

```
\begtt  \adef!{?}\adef?{!}
Each occurrence of ? will be changed to ! and vice versa.
\endtt
```

The in-line verbatim surrounded by an `\activettchar` doesn't work in parameter of macros and macro definitions. (It works in titles declared by `\chap`, `\sec` etc. and in `\fnotes`, because these macros are specially defined in O<sub>P</sub>T<sub>E</sub>X). You can use more robust command `\code{\text}` in problematic situations, but you have to escape following characters in the `\text`: \, #, %, braces (if the braces are unmatched in the `\text`), and space or ^ (if there are more than one subsequent spaces or ^ in the `\text`). Examples:

```
\code{\text, \%#} ... prints \text, %
\code{@{..}*^$ $} ... prints @{..}*^$ $ without escaping, but you can
                   escape these characters too, if you want.
\code{a \ b}       ... two spaces between a b, second one must be escaped
\code{xy\{z}       ... xy{z ... unbalanced brace must be escaped
\code{^`^M}         ... prints ^`^M, the second ^ must be escaped
```

You can print verbatim listing from external files by the `\verbinput` command. Examples:

```
\verbinput (12-42) program.c % listing from program.c, only lines 12-42
\verbinput (-60) program.c  % print from begin to the line 60
\verbinput (61-) program.c % from line 61 to the end
\verbinput (-) program.c  % whole file is printed
\verbinput (70+10) program.c % from line 70, only 10 lines printed
\verbinput (+10) program.c % from the last line read, print 10 lines
\verbinput (-5+7) program.c % from the last line read, skip 5, print 7
\verbinput (+) program.c   % from the last line read to the end
```

You can insert additional commands for the `\verbinput` before first opening bracket. They are processed in the local group. For example, `\verbinput \hspace=20cm (-) program.c`.

The `\ttline` influences the line numbering by the same way as in `\begtt... \endtt` environment. If `\ttline=-1` then real line numbers are printed (this is default). If `\ttline<-1` then no line numbers are printed.

The `\verbinput` can be controlled by `\everytt`, `\ttindent` just like in `\begtt... \endtt`.

The `\begtt... \endtt` pair or `\verbinput` can be used for listings of codes. Automatic syntax highlighting is possible, for example `\begtt \hisp{C}` activates colors for C programs. Or `\verbinput \hisp{HTML} (-) file.html` can be used for HTML or XML codes. O<sub>P</sub>T<sub>E</sub>X implements C, Python, T<sub>E</sub>X, HTML and XML syntax highlighting. More languages can be declared, see the section [2.27.2](#).

## 1.5 Autogenerated lists

### 1.5.1 Table of contents

The `\maketoc` command prints the table of contents of all `\chap`, `\sec` and `\secc` used in the document. These data are read from external `*.ref` file, so you have to run TeX more than once (typically three times if the table of contents is at the beginning of the document).

Typically, we don't want to repeat the name of the section "table of contents" in the table of contents again. The direct usage of `\chap` or `\sec` isn't recommended here because the table of contents is typically not referenced to itself. You can print the unnumbered and unreferenced title of the section like this:

```
\nonum\notoc\sec Table of Contents
```

If you need a customization of the design of the TOC, read the section [2.23](#).

If you are using a special macro in section or chapter titles and you need different behavior of such macro in other cases then use `\regmacro{<case-toc>}{<case-mark>}{<case-outline>}`. The parameters are applied locally in given cases. The `\regmacro` can be used repeatedly: then the parameters are accumulated (for more macros). If a parameter is empty then original definition is used in given case. For example:

```
% default value of \mylogo macro used in text and in the titles:  
\def\mylogo{\leavevmode\hbox{{\Red\it My}\setfontsize{mag1.5}\rm Lo}Go}  
% another variants:  
\regmacro {\def\mylogo{\hbox{\Red My\Black LoGo}}}% used in TOC  
{\def\mylogo{\hbox{{\it My}\rm LoGo}}}% used in running heads  
\def\mylogo{MyLoGo}% used in outlines
```

### 1.5.2 Making the index

The index can be included into document by the `\makeindex` macro. No external program is needed, the alphabetical sorting are done inside TeX at macro level.

The `\ii` command (insert to index) declares the word separated by the space as the index item. This declaration is represented as invisible item on the page connected to the next visible word. The page number of the page where this item occurs is listed in the index entry. So you can type:

```
The \ii resistor resistor is a passive electrical component ...
```

You cannot double the word if you use the `\iid` instead `\ii`:

```
The \iid resistor is a passive electrical component ...
```

or:

```
Now we'll deal with the \iid resistor .
```

Note that the dot or comma have to be separated by space when `\iid` is used. This space (before dot or comma) is removed by the macro in the current text.

The multiple-words entries are commonly arranged in the index as follows:

```
linear dependency 11, 40–50  
— independency 12, 42–53  
— space 57, 76  
— subspace 58
```

To do this you have to declare the parts of the index entries by the / separator. Example:

```
{\bf Definition.}  
\ii linear/space, vector/space  
\em Linear space} (or {\em vector space}) is a nonempty set of...
```

The number of the parts of one index entry is unlimited. Note, that you can spare your typing by the comma in the `\ii` parameter. The previous example is equivalent to `\ii linear/space \ii vector/space`.

Maybe you need to propagate to the index the similar entry to the linear/space in the form space/linear. You can do this by the shorthand `,@` at the end of the `\ii` parameter. Example:

```
\ii linear/space, vector/space,@  
is equivalent to:  
\ii linear/space, vector/space \ii space/linear, space/vector
```

If you really need to insert the space into the index entry, write `~`.

The `\ii` or `\iid` commands can be preceded by `\iitype {letter}`, then such reference (or more references generated by one `\ii`) has specified type. The page numbers of such references should be formatted specially in the index. OptEX implements only `\iitype b`, `\iitype i` and `\iitype u`: the page number in bold or in italics or underlined is printed in the index when these types are used. Default index type is empty, which prints page numbers in normal font. The TeXbook index is good example.

The `\makeindex` creates the list of alphabetically sorted index entries without the title of the section and without creating more columns. OptEX provides another macros `\begmulti` and `\endmulti` for more columns:

```
\begmulti <number of columns>  
<text>  
\endmulti
```

The columns will be balanced. The Index can be printed by the following code:

```
\sec Index  
\begmulti 3 \makeindex \endmulti
```

Only “pure words” can be propagated to the index by the `\ii` command. It means that there cannot be any macro, TeX primitive, math selector etc. But there is another possibility to create such complex index entry. Use “pure equivalent” in the `\ii` parameter and map this equivalent to the real word which is printed in the index by the `\iis` command. Example:

```
The \ii chiquadrat $\chi$-quadrat method is  
...  
If the \ii relax `relax` command is used then \TeX/ is relaxing.  
...  
\iis chiquadrat {$\chi$-quadrat}  
\iis relax {\code{\relax}}
```

The `\iis {equivalent} {\text}` creates one entry in the “dictionary of the exceptions”. The sorting is done by the `{equivalent}` but the `\text` is printed in the index entry list.

The sorting rules when `\makeindex` runs depends on the current language. See section 1.7.1 about languages selection.

### 1.5.3 BibTeXing

The command `\cite[<label>]` (or `\cite[<label-1>, <label-2>, ..., <label-n>]`) creates the citation in the form [42] (or [15, 19, 26]). If `\shortcitations` is declared at the beginning of the document then continuous sequences of numbers are re-printed like this: [3–5, 7, 9–11]. If `\sortcitations` is declared then numbers generated by one `\cite` command are sorted upward.

If `\nonumcitations` is declared then the marks instead numbers are generated depending on the used bib-style. For example the citations look like [Now08] or [Nowak, 2008].

The `\rcite[<labels>]` creates the same list as `\cite[<labels>]` but without the outer brackets. Example: `[\rcite[tbn], pg.~13]` creates [4, pg. 13].

The `\ecite[⟨label⟩]{⟨text⟩}` prints the `⟨text⟩` only, but the entry labeled `⟨label⟩` is decided as to be cited. If `\hyperlinks` is used then `⟨text⟩` is linked to the references list.

You can define alternative formating of `\cite` command. Example:

```
\def\cite[#1]{(\rcite[#1])} % \cite[⟨label⟩] creates (27)
\def\cite[#1]{$^{\circ}\{\rcite[#1]\}$} % \cite[⟨label⟩] creates^{27}
```

The numbers printed by `\cite` correspond to the same numbers generated in the list of references. There are two possibilities to generate this references list:

- Manually using `\bib[⟨label⟩]` commands.
- By `\usebib/⟨type⟩ ⟨style⟩ ⟨bib-base⟩` command which reads `*.bib` files directly.

Note that another two possibilities documented in OPmac (using external Bib<sub>TEX</sub> program) isn't supported because Bib<sub>TEX</sub> is old program which does not support Unicode. And Biber seems to be not compliant with Plain <sub>TEX</sub>.

### References created manually using `\bib[⟨label⟩]` command.

```
\bib [tbn] P. Olšák. {\it\TeX{}book naruby.} 468~s. Brno: Konvoj, 1997.
\bib [tst] P. Olšák. {\it Typografický systém \TeX.}
            269~s. Praha: CSTUG, 1995.
```

If you are using `\nonumcitations` then you need to declare the `⟨marks⟩` used by `\cite` command. To do it you must use long form of the `\bib` command in the format `\bib[⟨label⟩] = {⟨mark⟩}`. The spaces around equal sign are mandatory. Example:

```
\bib [tbn] = {Olšák, 2001}
P. Olšák. {\it\TeX{}book naruby.} 468~s. Brno: Konvoj, 2001.
```

**Direct reading of .bib files** is possible by `\usebib` macro. This macro reads and uses macro package `librarian.tex` by Paul Isambert. The usage is:

```
\usebib/c (<style>) <bib-base> % sorted by \cite-order (c=cite),
\usebib/s (<style>) <bib-base> % sorted by style (s=style).
% example:
\usebib/s (simple) op-example
```

The `⟨bib-base⟩` is one or more `*.bib` database source files (separated by spaces and without extension) and the `⟨style⟩` is the part of the filename `bib-⟨style⟩.opm` where the formatting of the references list is defined. Op<sub>TEX</sub> supports `simple` or `iso690` styles. The features of the `iso690` style is documented in the section 2.31.4 in detail.

Not all records are printed from `⟨bib-base⟩` files: the command `\usebib` selects only such bib-records which were used in `\cite` or `\nocite` commands in your document. The `\nocite` behaves as `\cite` but prints nothing. It only tells that mentioned bib-record should be printed in the reference list. If `\nocite[*]` is used then all records from `⟨bib-base⟩` are printed.

## 1.6 Graphics

### 1.6.1 Colors

Op<sub>TEX</sub> provides a small number of color selectors: `\Blue`, `\Red`, `\Brown`, `\Green`, `\Yellow`, `\Cyan`, `\Magenta`, `\White`, `\Grey`, `\LightGrey` and `\Black`. User can define more such selectors by setting four CMYK components or three RGB components. For example

```
\def \Orange {\setcmykcolor{0 0.5 1 0}}
\def \Purple {\setrgbcolor{1 0 1}}
```

The command `\morecolors` reads more definitions of color selectors. There is about 300 color names like `\DeepPink`, `\Chocolate` etc. If there are numbered variants of the same name, then the letters B, C, etc. are appended to the name in  $\text{\TeX}$ . For example `\Chocolate` is Chocolate1, `\ChocolateB` is Chocolate2 etc.

The color selectors work locally in groups by default but with limitations. See the technical documentation, section 2.19 for more information.

The basic colors `\Blue`, `\Red`, `\Cyan`, `\Yellow` etc. are defined with CMYK components using `\setcmykcolor`. On the other hand, you can define a color with three RGB components and `\morecolors` defines such RGB colors. By default, the color model isn't converted but only stored to PDF output for each used color. Thus, there may be a mix of color models in the PDF output which is not good idea. You can overcome this problem by declaration `\onlyrgb` or `\onlycmyk`. Then only selected color model is used for PDF output and if a used color is declared by another color model then it is converted. The `\onlyrgb` creates colors more bright (usable for computer presentations). On the other hand CMYK makes colors more true<sup>5</sup> for printing.

You can define your color by a linear combination of previously defined colors using `\colordef`. For example:

```
\colordef \myCyan {.3\Green + .5\Blue} % 30 % green, 50 % blue, 20% white
\colordef \DarkBlue {\Blue + .4\Black} % Blue mixed with 40 % of black
\colordef \myGreen{\Cyan+\Yellow}      % exact the same as \Green
\colordef \MyColor {.3\Orange+.5\Green+.2\Yellow}
```

The linear combination is done in CMYK subtractive color space by default (RGB colors used in `\colordef` argument are converted first). If the resulting component is greater than 1 then it is truncated to 1. If a convex linear combination (as in the last example above) is used then it emulates color behavior on a painter's palette. You can use `\rgbcolordef` instead `\colordef` if you want to mix colors in the additive RGB color space.

The following example defines the macro for the colored text on the colored background.  
Usage: `\coloron<background><foreground>\{<text>\}`

The `\coloron` can be defined as follows:

```
\def\coloron#1#2#3{%
  \setbox0=\hbox{{#2#3}}%
  \leavevmode \rlap{\#1\strut \vrule width\wd0}\box0
}
\coloron\Yellow\Brown{The brown text on the yellow background}
```

## 1.6.2 Images

The `\inspic \{<filename>\.<extension>\}` or `\inspic <filename>\.<extension>\<space>` inserts the picture stored in the graphics file with the name `<filename>\.<extension>` to the document. You can set the picture width by `\picw=<dimen>` before `\inspic` command which declares the width of the picture. The image files can be in the PNG, JPG, JBIG2 or PDF format.

The `\picwidth` is an equivalent register to `\picw`. Moreover there is an `\picheight` register which denotes the height of the picture. If both registers are set then the picture will be (probably) deformed.

The image files are searched in `\picdir`. This token list is empty by default, this means that the image files are searched in the current directory. Example: `\picdir={img/}` supposes that image files are in `img` subdirectory. Note: the directory name must end by / in the `\picdir` declaration.

---

<sup>5</sup> Printed output is more equal to the monitor preview specially if you are using ICC profile for your printer.

Inkscape<sup>6</sup> is able to save a picture to PDF and labels of the picture to another file<sup>7</sup>. This second file should be read by TeX in order to print labels in the same font as document font. OptEX supports this feature by `\inkinspic {<filename>.pdf}` command. It reads and displays both: PDF image and labels generated by Inkscape.

If you want to create a vector graphics (diagrams, schema, geometry skicing) then you can do it by Wysiwyg graphics editor (Inkscape, Geogebra for example), export the result to PDF and include it by `\inspic`. If you want to “programm” such pictures then Tikz package is recommended. It works in Plain TeX.

### 1.6.3 PDF transformations

All typesetting elements are transformed by linear transformation given by the current transformation matrix. The `\pdfsetmatrix {<a> <b> <c> <d>}` command makes the internal multiplication with the current matrix so linear transformations can be composed. One linear transformation given by the `\pdfsetmatrix` above transforms the vector  $[0, 1]$  to  $[\langle a \rangle, \langle b \rangle]$  and  $[1, 0]$  to  $[\langle c \rangle, \langle d \rangle]$ . The stack-oriented commands `\pdfsave` and `\pdfrestore` gives a possibility of storing and restoring the current transformation matrix and the position of the current point. This position have to be the same from TeX’s point of view as from transformation point of view when `\pdfrestore` is processed. Due to this fact the `\pdfsave\rlap{<transformed text>}\pdfrestore` or something similar is recommended.

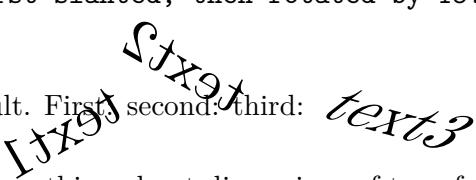

OptEX provides two special transformation macros `\pdfscale` and `\pdfrotate`:

```
\pdfscale{<horizontal-factor>}{<vertical-factor>}
\pdfrotate{<angle-in-degrees>}
```

These macros simply calls the properly `\pdfsetmatrix` command.

It is known that the composition of transformations is not commutative. It means that the order is important. You have to read the transformation matrices from right to left. Example:

```
First: \pdfsave \pdfrotate{30}\pdfscale{-2}{2}\rlap{text1}\pdfrestore
      % text1 is scaled two times and it is reflected about vertical axis
      % and next it is rotated by 30 degrees left.
second: \pdfsave \pdfscale{-2}{2}\pdfrotate{30}\rlap{text2}\pdfrestore
      % text2 is rotated by 30 degrees left then it is scaled two times
      % and reflected about vertical axis.
third: \pdfsave \pdfrotate{-15.3}\pdfsetmatrix{2 0 1.5 2}\rlap{text3}%
      \pdfrestore % first slanted, then rotated by 15.3 degrees right
```

This gives the following result. First second third: 

You can see that TeX knows nothing about dimensions of transformed material, it treats it as with a zero dimension object. The `\transformbox{<transformation>}{<text>}` macro solves the problem. This macro puts the transformed material to a box with relevant dimension. The `<transfromation>` parameter includes one or more transfromation commands `\pdfsetmatrix`, `\pdfscale`, `\pdfrotate` with their parameters. The `<text>` is transformed text.

Example: `\frame{\transformbox{\pdfscale{1}{1.5}\pdfrotate{-10}}{moj}}` creates

The `\rotbox{<deg>}{<text>}` is shortcut for `\transformbox{\pdfrotate{<deg>}}{<text>}`.

<sup>6</sup> A powerfull and free wysiwyg editor for creating vector graphics.

<sup>7</sup> Chose “Omit text in PDF and create LaTeX file” option.

#### 1.6.4 Ovals, circles

The `\inoval{\text{}}` creates a box like this: `\text`. Multiline text can be put in an oval by the command `\inoval{\vbox{\text{}}}`. Local settings can be set by `\inoval[<settings>]{\text{}}` or you can re-declare global settings by `\ovalparams={<settings>}`. The default settings are:

```
\ovalparams={\roundness=2pt          % diameter of circles in the corners
            \fcolor=\Yellow        % color used for filling oval
            \lcolor=\Red           % line color used in the border
            \lwidth=0.5bp          % line width in the border
            \shadow=N              % use a shadow effect
            \overlapmargins=N      % ignore margins by surrounding text
            \hhkern=0pt \vvkern=0pt} % left-right margin, top-bottom margin
```

The total distance from text to oval boundary is `\hhkern+\roundness` at the left and right sides and `\vvkern+\roundness` at the top and bottom sides of the text.

If you need to set a parameters for the `\text` (color, size, font etc.), put such setting right in front of the `\text`: `\inoval[<text settings>]{\text{}}`.

The `\incircle[\ratio=1.8]{\text{}}` creates a box like this `\text`. The `\ratio` parameter means width/height. The usage is analogical like for oval. The default parameters are

```
\circleparams={\ratio=1 \fcolor=\Yellow \lcolor=\Red \lwidth=0.5bp
               \shadow=N \ignoremargins=N \hhkern=2pt \vvkern=2pt}
```

The macros `\clipinoval {x} {y} {width} {height} {\text{}}` and `\clipincircle` (with the same parameters) print the `\text` when a clipping path (oval or circle with given `<with>` and `<height>` shifted its center by `<x>` to right and by `<y>` to up) is used. The `\roundness=5mm` is default for `\clipinoval` and user can change it. Example:

```
\clipincircle 3cm 3.5cm 6cm 7cm {\picw=6cm \inspic{myphoto.jpg}}
```

#### 1.6.5 Putting images and texts wherever

The `\puttext {x} {y} {\text{}}` puts the `\text` shifted by `<x>` right and by `<y>` up from current point of typesetting and does'n not change the position of the current point. Assume coordinate system with origin in the current point. Then `\puttext {x} {y} {\text{}}` puts the text at the coordinates `<x>, <y>`. More exactly the left edge of its baseline is at that position.

The `\putpic {x} {y} {width} {height} {\image{}}` puts the `\image` of given `<width>` and `<height>` at given position (its left-bottom corner). You can write `\nospec` instead `<width>` or `<height>` if this parameter is not given.

### 1.7 Others

#### 1.7.1 Using more languages

OpTeX prepares hyphenation patterns for all languages if such patterns are available in your TeX system. Only USenglish patterns (original from Plain TeX) are preloaded. Hyphenation patterns of all another languages are loaded on demand when you first use the `\{iso-code\}lang` command in your document. For example `\delang` for German, `\cslang` for Czech, `\pllang` for Polish. The `<iso-code>` is a shortcut of the language (mostly from ISO 639-1). You can list all available languages by `\langlist` macro. This macro prints now:

en(USenglish) enus(USenglishmax) engb(UKenglish) it(Italian) ia(Interlingua) id(Indonesian) cs(Czech) sk(Slovak)  
de(nGerman) fr(French) pl(Polish) cy(Welsh) da(Danish) es(Spanish) sl(Slovenian) fi(Finnish) hu(Hungarian) tr(Turkish)  
et(Estonian) eu(Basque) ga(Irish) nb(Bokmal) nn(Nynorsk) nl(Dutch) pt(Portuguese) ro(Romanian) hr(Croatian)  
zh(Pinyin) is(Icelandic) hsb(Uppersorbian) af(Afrikaans) gl(Galician) kmr(Kurmanji) tk(Turkmen) la(Latin) lac(classicLatin)  
lal(liturgicalLatin) elm(monoGreek) elp(Greek) grc(ancientGreek) ca(Catalan) cop(Coptic) mn(Mongolian)

sa(Sanskrit) ru(Russian) uk(Ukrainian) hy(Armenian) as(Assamese) hi(Hindi) kn(Kannada) lv(Latvian) lt(Lithuanian)  
ml(Malayalam) mr(Marathi) or(Oriya) pa(Punjabi) ta(Tamil) te(Telugu)

For compatibility with e-plain macros, there is the command `\uselanguage{⟨language⟩}`. The parameter `⟨language⟩` is long form of language name, i.e. `\uselanguage{Czech}` works the same as `\cslang`. The `\uselanguage` parameter is case insensitive.

For compatibility with C<sub>S</sub>plain, there are macros `\ehyph`, `\chyp`, `\shyp` which are equivalent to `\enlang`, `\cslang` and `\sklang`.

You can switch between language patterns by `\⟨iso-code⟩lang` commands mentioned above. Default is `\enlang`.

OpTeX generates three phrases used for captions and titles in technical articles or books: “Chapter”, “Table” and “Figure”. These phrases need to be known in used language and it depends on the previously used language selectors `\⟨iso-code⟩lang`. OpTeX declares these words only for few languages: Czech, German, Spanish, French, Greek, Italian, Polish, Russian, Slovak and English, If you need to use these words in another languages or you want to auto-generate more words in your macros, then you can declare it by `\sdef` or `\_langw` commands as shown in the section 2.36.3.

The `\makeindex` command needs to know the sorting rules used in your language. OpTeX defines only few language rules for sorting: Czech, Slovak and English. How to declare sorting rules for more languages are described in the section 2.32.

If you declare `\⟨iso-code⟩quotes`, then the control sequences `\"` and `\'` should be used like this: `\"⟨quoted text⟩"` or `\'⟨quoted text⟩'` (note that the terminating character is the same but it isn't escaped). This prints language dependent normal or alternative quotes around `⟨quoted text⟩`. The language is specified by `⟨iso-code⟩`. OpTeX declares quotes only for Czech, German, Spanish, French, Greek, Italian, Polish, Russian, Slovak and English (`\csquotes`, `\dequotes`, ..., `\enquotes`). You can simply define your own quotes as shown in `languages.opm` file. The `\"` is used for quotes visually more similar to the `"` character which can be primary quotes or secondary quotes depending on the language rules. May be you want to alternate meaning of these two types of quotes. Use `\⟨isocode⟩quotes\altquotes` in such case.

### 1.7.2 Pre-defined styles

OpTeX defines three style-declaration macros `\report`, `\letter` and `\slides`. You can use them at the beginning of your document if you are preparing these types of document and you don't need to create your own macros.

The `\report` declaration is intended to create reports. It sets default font size to 11pt and `\parindent` (paragraph indentation) to 1.2em. The `\tit` macro uses smaller font because we assume that “chapter level” will be not used in reports. The first page has no page number, but next pages are numbered (from number 2). Footnotes are numbered from one in whole document. The macro `\author{⟨authors⟩}{⟨end-line⟩}` can be used when `\report` is declared. It prints `⟨authors⟩` in italics at center of the line. You can separate authors by `\nl` to more lines.

The `\letter` declaration is intended to create letters. See the files `op-letter-*.tex` for examples. The `\letter` style sets default font size to 11pt and `\parindent` to 0pt. It sets half-line space between paragraphs. The page numbers are not printed. The `\subject` macro can be used, it prints the word “Subject:” or “Věc” (or something else depending on current language) in bold. Moreover, the `\address` macro can be used when `\letter` is declared. The usage of the `\address` macro looks like:

```
\address
  ⟨first line of address⟩
  ⟨second line of address⟩
  ⟨etc.⟩
  ⟨empty line⟩
```

It means that you need not to use any special mark at the end of lines: end of lines in the source file are the same as in printed output. The `\address` macro creates `\vtop` with address lines. The width of such `\vtop` is equal to the most wide line used in it. So, you can use `\hfill\address...` in order to put the address box to the right side of the document. Or you can use `\{prefixed text\}\address...` to put `\{prefixed text\}` before first line of the address.

The `\slides` style creates a simple presentation slides. See an example in the file `op-slides.tex`. Run `optex op-slides.tex` and see the documentation of `\slides` style in the file `op-slides.pdf`.

Analogical declaration macro `\book` is not prepared. Each book needs an individual typographical care. You need to create specific macros for design.

### 1.7.3 Loading other macro packages

You can load more macro packages by `\input{\langle file-name \rangle}` or by `\load[\langle file-names \rangle]`. The first case (`\input`) is TeX primitive command, it can be used in the alternative old syntax `\input \filename\langle space \rangle` too. The second case (`\load`) allows to specify a comma separated list of included files. Moreover, it loads each macro file only once, it sets temporarily standard category codes during loading and it tries to load `\filename.opm` or `\filename.tex` or `\filename`, first occurrence wins. Example:

```
\load [qrcode, tikz]
```

does `\input qrcode.opm` and `\input tikz.tex` and it saves local information about the fact that these file names `qrcode` and `tikz` were already used, i.e. next `\load` will skip them.

It is strongly recommended to use the `\load` macro for loading external macros, if you need them. On the other hand, if your source document is structured to more files (with individual chapters or sections), use simply the `\input` primitive.

### 1.7.4 Lorem ipsum dolor sit

A designer needs to concentrate to the design of the output and maybe he/she needs a material for testing macros. There is the possibility to generate a neutral text for such experiments. Use `\lorem[\langle number \rangle]` or `\lorem[\langle from \rangle-\langle to \rangle]`. It prints a paragraph (or paragraphs) with neutral text. The numbers `\langle number \rangle` or `\langle from \rangle`, `\langle to \rangle` must be in the range 1 to 150 because there are 150 paragraphs with neutral text prepared for you. The `\lipsum` macro is equivalent to `\lorem`. Example: `\lipsum[1-150]` prints all prepared paragraphs.

### 1.7.5 Logos

The control sequences for typical logos can be terminated by optional / which is ignored when printing. This makes logos more legible in source file:

```
We are using \TeX/ because it is cool. \OoTeX/ is better than \LaTeX.
```

### 1.7.6 The last page

The number of the last page (it may be different from number of pages) is expanded by `\lastpage` macro. It expands to ? in first TeX run and to the last page in next TeX runs.

There is an example for footlines in the format “current page / last page”:

```
\footline={\hss \fixedrm \folio/\lastpage \hss}
```

The `\lastpage` expands to the last `\folio` which is a decimal number or Roman numeral (when `\pageno` is negative). If you need to know total pages used in the document, use `\totalpages` macro. It expands to zero (in first TeX run) or to the number of all pages in the document (in next TeX runs).

### 1.7.7 Use OpTeX

The command `\useOpTeX` (or `\useoptex`) does nothing in OpTeX but it causes an error (undefined control sequence) when another format is used. You can put it as the first command in your document:

```
\useOpTeX % we are using OpTeX format, no LaTeX :)
```

## 1.8 Summary

```
\tit Title (terminated by end of line)
\chap Chapter Title (terminated by end of line)
\sec Section Title (terminated by end of line)
\secc Subsection Title (terminated by end of line)

\maketoc      % table of contents generation
\ii item1,item2 % insertion the items to the index
\makeindex     % the index is generated

\label [labname] % link target location
\ref [labname]   % link to the chapter, section, subsection, equation
\pgref [labname] % link to the page of the chapter, section, ...

\caption/t % a numbered table caption
\caption/f % a numbered caption for the picture
\eqmark    % a numbered equation

\begin{items} % start list of the items
\end{items}   % end of list of the items
\begin{ttt}    % start verbatim text
\end{ttt}      % end verbatim text
\activettchar X % initialization character X for in-text verbatim
\code        % another alternative for in-text verbatim
\verbinput    % verbatim extract from the external file
\begin{multi} num % start multicolumn text (num columns)
\end{multi}    % end multicolumn text

\cite [labnames] % refers to the item in the lists of references
\rcite [labnames] % similar to \cite but [] are not printed.
\sortcitations \shortcitations \nonumcitations % cite format
\bib [labname] % an item in the list of references
\usebib/? (style) bib-base % direct using of .bib file, ? in {s,c}

\load [<filenames>] % loading macro files
\fontfam [FamilyName] % selection of font family
\typosize [font-size/baselineskip] % size setting of typesetting
\typoscale [factor-font/factor-baselineskip] % size scaling
\thefontsize [size] \thefontscale [factor] % current font size

## 1.9 Compatibility with Plain $\text{\TeX}$

All macros of Plain  $\text{\TeX}$  are re-written in Op $\text{\TeX}$ . Common macros should work in the same sense as in original Plain  $\text{\TeX}$ . Internal control sequences like  $\backslash p@$  or  $\backslash f@t$  are removed and mostly replaced by control sequences prefixed by  $_$  (like  $\_this$ ). If you need to use basic set of such Plain  $\text{\TeX}$  control sequences (for example you are reading an old macro file), use  $\backslash load[plain-at]$ .

All primitives and common macros have two control sequences with the same meaning: in prefixed and unprefixed form. For example  $\backslash hbox$  is equal to  $\_hbox$ . Internal macros of Op $\text{\TeX}$  have and use only prefixed form. User should use unprefixed forms, but prefixed forms are accessible too, because the  $_$  is set as a letter category code globally (in macro files and in users document too). User should re-define unprefixed forms of control sequences without worries that something internal will be broken (only the sequence  $\backslash par$  cannot be re-defined without change of internal  $\text{\TeX}$  behavior because it is hard-coded in  $\text{\TeX}$ , unfortunately).

The Latin Modern 8bit fonts instead Computer Modern 7bit fonts are preloaded in the format, but only few ones. The full family set is ready to use after the command  $\backslash fontfam[LMfonts]$  which reads the fonts in OTF format.

Plain  $\text{\TeX}$  defines  $\backslash newcount$ ,  $\backslash bye$  etc. as  $\backslash outer$  macros. Op $\text{\TeX}$  doesn't set any macro as  $\backslash outer$ . Macros like  $\backslash TeX$ ,  $\backslash rm$  are defined as  $\backslash protected$ .

The text accents macros  $\backslash", \backslash', \backslash v, \backslash u, \backslash=, \backslash^, \backslash., \backslash H, \backslash~, \backslash`$ ,  $\backslash t$  are undefined<sup>8</sup> in Op $\text{\TeX}$ . Use real letters like á, ũ, ž in your source document instead of these old accents macros. If you really want to use them, you can initialize them by the  $\backslash oldaccents$  command. But we don't recommend it.

The default paper size is not set as letter with 1 in margins but as A4 with 2.5 cm margins. You can change it, for example by  $\backslash margins/1\ letter\ (1,1,1,1)\ in$ . This example sets the classical Plain  $\text{\TeX}$  page layout.

The origin for typographical area is not at top left 1 in 1 in coordinates but at top left paper corner exactly. For example,  $\backslash hoffset$  includes directly left margin.

The  $\backslash sec$  macro is reserved to sections but original Plain  $\text{\TeX}$  declares this control sequence for math secans.

---

<sup>8</sup> The math accents macros like  $\backslash acute$ ,  $\backslash bar$ ,  $\backslash dot$ ,  $\backslash hat$  still work.

# Chapter 2

## Technical documentation

This documentation is written in the source files `*.opm` between the `\_doc` and `\_cod` pairs or after the `\_endcode` command. When the format is generated by

```
luatex -ini optex.ini
```

then the text of the documentation is ignored and the format `optex fmt` is generated. On the other hand, if you run

```
optex optex-doc.tex
```

then the same `*.opm` files are read when the second chapter of this documentation is printed.

A knowledge about  $\text{\TeX}$  is expected from the reader. You can see a short document [TeX in a Nutshell](#) or more detail [TeX by topic](#).

Notices about hyperlinks. If a control sequence is printed in red color in this documentation then this denotes its “main documentation point”. Typically, the listing where the control sequence is declared follows immediately. If a control sequence is printed in the blue color in the listing or in the text then it is active link which points (usually) to the main documentation point. The main documentation point can be active link which points to a previous text where the control sequence was mentioned. Such occurrences are active links to the main documentation point.

### 2.1 The main initialization file

The `optex.ini` file is read as main file when the format is generated.

```
optex.ini  
1 %% This is part of OpTeX project, see http://petr.olsak.net/optex  
2  
3 %% OpTeX ini file  
4 %% Petr Olsak <project started from: Jan. 2020>
```

Category codes are set first. Note that the `_` is set to category code “letter”, it can be used as a part of control sequence names. Other category codes are set as in the plain  $\text{\TeX}$ .

```
optex.ini  
6 % Catcodes:  
7  
8 \catcode `{\=1 % left brace is begin-group character  
9 \catcode `}=2 % right brace is end-group character  
10 \catcode `\$=3 % dollar sign is math shift  
11 \catcode `&=4 % ampersand is alignment tab  
12 \catcode `#=6 % hash mark is macro parameter character  
13 \catcode `^=7 %  
14 \catcode `~\K=7 % circumflex and uparrow are for superscripts  
15 \catcode `~\A=8 % downarrow is for subscripts  
16 \catcode `~\I=10 % ascii tab is a blank space  
17 \catcode `~\_=11 % underline can be used in control sequences  
18 \catcode `~\~=13 % tilde is active  
19 \catcode `~\a0=13 % non breaking space in Unicode  
20 \catcode 127=12 % normal character
```

The `\optexversion` and `\fmtname` are defined.

```
optex.ini  
22 % OpTeX version  
23  
24 \def\optexversion{Beta 0.16 Oct.2020}  
25 \def\fmtname{OpTeX}
```

We check if  $\text{\LaTeX}$  engine is used at `-ini` state. And the `^\^J` character is set as `\newlinechar`.

```
optex.ini  
27 % Engine testing:  
28  
29 \newlinechar=`^\^J  
30 \ifx\directlua\undefined
```

```

31   \message{This format is based only on LuaTeX, use luatex -ini optex.ini^^J}
32   \endinput \fi
33
34 \ifx\bgroup\undefined \else
35   \message{This file can be used only for format initialisation, use luatex -ini^^J}
36   \endinput \fi

```

The basic macros for macro file syntax is defined, i.e. `\_endcode`, `\_doc` and `\_cod`. The `\_codedecl` will be re-defined later.

```

38 % Basic .opm syntax:
39
40 \let\_endcode =\endinput
41 \def \_codedecl #1#2{\message{#2^^J}}% information about .opm file
42 \long\def\_\_doc#1\_\_cod#2 {} % skip documentation

```

Individual \*.opm macro files are read.

```

44 % Initialization:
45
46 \message{OpTeX (Olsak's Plain TeX) initialization <\optexversion>^^J}
47

91   \_mathchardef\_fnotestack=\_pdfcolorstackinit page {0 g 0 G}%
92   \_directlua {callback.register_x = callback.register}%
93   \_mathsbon % replaces \int _a^b to \int _a`^b

```

```

94   \_inputref % inputs \jobname.ref if exists
95 }
96
97 \_dump

```

## 2.2 Concept of name spaces of control sequences

### 2.2.1 Prefixing internal control sequences

All control sequences used in OptEX are used and defined with `_` prefix. The user can be sure that when he/she does `\def\foo` then internal macros of OptEX nor TeX primitives will be not damaged. For example `\def\if{...}` will not damage macros because OptEX's macros are using `\_if` instead of `\if`.

All TeX primitives are initialized with two representative control sequences: `\word` and `\_word`, for example `\hbox` and `\_hbox`. The first alternative is reserved for users or such control sequences can be re-defined by user.

OptEX sets the character `_` as letter, so it can be used in control sequences. When a control sequence begins with this character then it means that it is a primitive or it is used in OptEX macros as internal. User can redefine such prefixed control sequence only if he/she explicitly know what happens.

We never change catcode of `_`, so internal macros can be redefined by user without problems if it is desired. We need not something like `\makealetter` from LATEX.

OptEX defines all new macros as prefixed. For public usage of such macros we need to set non-prefixed version. This is done by

```
\public <list of control sequences> ;
```

For example `\public \foo \bar` ; does `\let\foo=\_foo, \let\bar=\_bar`.

At the end of each code segment in OptEX, the `\_public` macro is used. You can see, what macros are defined for public usage in such code segment.

The macro `\private` does a reverse job to `\public` with the same syntax. For example `\private \foo \bar` ; does `\let\_foo=\foo, \let\_bar=\bar`. This should be used when unprefixed variant of control sequence is declared already but we need the prefixed variant too.

In this documentation: if both variants of a control sequence are declared (prefixed and unprefixed), then the accompanying text mentions only unprefixed variant. The code typically defines prefixed variant and then the `\public` (or `\_public`) macro is used.

### 2.2.2 Name space of control sequences for users

User can define or declare any control sequence with a name without any `_`. This does not make any problem. Only one exception is the reserved control sequence `\par`. It is generated by tokenizer (at empty lines) and used as internal in TeX.

User can define or declare control sequences with `_` character, for example `\my_control_sequence`, but with the following exceptions:

- Control sequences which begin with `_` are reserved for TeX primitives, OptEX internal macros and macro package writers.
- Control sequences (terminated by non-letter) in the form `\langle word \rangle _` or `\langle word \rangle _ \langle one-letter \rangle`, where `\langle word \rangle` is a sequence of letters, are inaccessible, because they are interpreted as `\langle word \rangle` followed by `_` or as `\langle word \rangle` followed by `_ \langle one-letter \rangle`. This is important for writing math, for example:

```

\int_a^b      ... is interpreted as \int _a^b
\max_M        ... is interpreted as \max _M
\alpha_{ij}     ... is interpreted as \alpha _{ij}

```

This feature is implemented using lua code at input processor level, see the section 2.14 for more details. You can deactivate this feature by `\mathsboff`. After this, you can still write `$\int_a^b$` (Unicode) or `\int_a^b` without problems but `\int_a^b` yields to undefined control sequence `\int_a`. You can activate this feature again by `\mathsbon`. The effect will take shape from next line read from input file.

- Control sequences in the form `\_ \langle pkg \rangle _ \langle word \rangle` is intended for package writers as internal macros for a package with `\langle pkg \rangle` identifier, see section 2.2.4.

The single letter control sequences like `\%`, `\$`, `\^` etc. are not used in internal macros. User can redefine them, but (of course) some classical features can be lost (printing percent character by `\%` for example).

### 2.2.3 Macro files syntax

Each segment of OpTeX macros is stored in one file with `.opm` extension (means OPtex Macros). Your local macros should be in normal `*.tex` file.

The code in macro files starts by `\_codedecl` and ends by `\_endcode`. The `\_endcode` is equivalent for `\endinput`, so documentation can follow. The `\_codedecl` has syntax:

```
\_codedecl \sequence {Name <version>}
```

If the mentioned `\sequence` is defined, then `\_codedecl` does the same as `\endinput`: this protect from reading the file twice. We suppose, that `\sequence` is defined in the macro file.

It is possible to use the `\_doc ... \cod` pair between the macro lines. The documentation text should be here. It is ignored when macros are read but it can be printed using `doc.opm` macros like in this documentation.

### 2.2.4 Name spaces for package writers

Package writer should use internal names in the form `\_(pkg)_<sequence>`, where `<pkg>` is a package label. For example: `\qr_ushort` from `qrcode.opm` package.

The package writer needs not write repeatedly `\_pkg_foo \_pkg_bar` etc. again and again in the macro file.<sup>1</sup> When the `\_namespace {<pkg>}` is declared at the beginning of the macro file then all occurrences of `\.foo` will be replaced by `\_(pkg)_foo` at the input processor level. The macro writer can write (and backward can read his/her code) simply with `\.foo`, `\.bar` control sequences and `\_(pkg)_foo`, `\_(pkg)_bar` control sequences are processed internally. The scope of the `\_namespace` command ends at the `\_endnamespace` command or when another `\_namespace` is used. This command checks if the same package label is not declared by the `\_namespace` twice.

The `\_nspublic` macro does `\let\foo = \_(pkg)_foo` when `\_namespace{<pkg>}` is declared. And the `\_nsprivate` macro does reverse operation to it. Example: you can define `\def\macro{...}` and then set it to the user name space by `\_nspublic \macro;`.

Don't load another packages (which are using their own name space) inside your name space. Do load them before your `\_namespace {<pkg>}` is initialized. Or close your name space by `\_endnamespace` and open it again (after other packages are loaded) by `\_resetnamespace {<pkg>}`.

If the package writer needs to declare a control sequence by `\newif`, then there is an exception of the rule described above. Use `\_newifi\_if{<pkg>}_bar`, for example `\_newifi\_ifqr_incorner`. Then the control sequences `\qr_incornertrue` and `\qr_incornerfalse` can be used (or the sequences `\.incornertrue` and `\.incornerfalse` when `\_namespace{qr}` is used).

### 2.2.5 Summary about rules for external macro files published for OpTeX

If you are writing a macro file which is intended to be published for OpTeX, then you are greatly welcome. You should follow these rules:

- Don't use a control sequences from user name space in the macro bodies if there is not explicit and documented reason to do this.
- Don't declare control sequences in the user name space if there is not explicit and documented reason to do this.
- Use control sequences from OpTeX and primitive name space in read only mode if there is not explicit and documented reason to redefine them.
- Use `\_(pkg)_<name>` for your internal macros or `\.<name>` if the `\_namespace{<pkg>}` is declared. See section 2.2.4.
- Use `\load` (or better: `\_load`) for loading more external macros if you need them. Don't use `\input` explicitly in such cases. The reason is: the external macro file is not loaded twice if another macro or the user needs it explicitly too.
- Use `\_codedecl` as your first command in the macro file and `\_endcode` to close the text of macros.
- Use `\_doc ... \cod` pairs for documenting the code pieces and/or write more documentation after the `\_endcode` command.

---

<sup>1</sup> We have not adapted the idea from expl3 language:

If the macro file accepts these recommendations then it should be named by `<filename>.opm` where `<filename>` differs from file names used directly in OptEX and from other published macros. This extension `.opm` has a precedence before `.tex` when the `\load` macro is used.

The `qrcode.opm` is first example how an external macro file for OptEX can look like.

## 2.2.6 The implementation of the name spaces

```
3 \codedecl \public {Prefixing and code syntax <2020-02-14>} % preloaded in format
```

`prefixed.opm`

All T<sub>E</sub>X primitives have alternative control sequence `\_hbox \_string`, ...

```
9 \let\directlua = \directlua
10 \directlua {
11     % enable all TeX primitives with _ prefix
12     tex.enableprimitives('_', tex.extraprimitives('tex'))
13     % enable all primitives without prefixing
14     tex.enableprimitives('', tex.extraprimitives())
15     % enable all primitives with _ prefix
16     tex.enableprimitives('_', tex.extraprimitives())
17 }
```

`prefixed.opm`

`\ea` is useful shortcut for `\expandafter`. We recommend to use always the private form of `\_ea` because there is high probability that `\ea` will be redefined by the user.

`\public <sequence> <sequence> ... ; does \let \<sequence> = \_<sequence> for all sequences.`

`\private <sequence> <sequence> ... ; does \let \_<sequence> = \<sequence> for all sequences.`

`\xargs <what> <sequence> <sequence> ... ; does <what>\<sequence> for each sequences.`

```
34 \let\ea =\expandafter % usefull shortcut
35
36 \long\def \xargs #1#2{\_ifx #2;\_else \ea#1\ea#2\xargs \ea #1\_fi}
37
38 \def \pkglabel{%
39 \def \public {\_xargs \publicA}
40 \def \publicA #1{\_ea\let \ea#1\_csname \_csstring #1\_endcsname}
41
42 \def \private {\_xargs \privateA}
43 \def \privateA #1{\_ea\let \csname \_csstring #1\_endcsname =#1}
44
45 \public \public \private \xargs \ea ;
```

`prefixed.opm`

Each macro file should begin with `\codedecl \macro {<info>}`. If the `\macro` is defined already then the `\endinput` protects to read such file more than one times. Else the `<info>` is printed to the terminal and the file is read.

The `\endcode` is defined as `\endinput` in the `optex.ini` file. `\wterm {<text>}` prints `<text>` to the terminal and to the `.log` file (as in plain T<sub>E</sub>X).

```
57 \def \codedecl #1#2{%
58     \_ifx #1\_undefined \wterm{#2}%
59     \_else \expandafter \endinput \_fi
60 }
61 \def \wterm {\immediate \write16 }
62
63 \public \wterm ;
```

`prefixed.opm`

The `\optexversion` and `\fmtname` are defined in the `optex.ini` file. Maybe, somebody will need a private version of these macros.

```
70 \private \optexversion \fmtname ;
```

`prefixed.opm`

The `\mathsbon` and `\mathsboff` are defined in `math-macros.opm` file. Now, we define the macros `\_namespace {<pkg label>}`, `\_resetnamespace {<pkg label>}`, `\_endnamespace`, `\_nspublic` and `\_nsprivate` for package writers, see section 2.2.4.

```
80 \def \pkglabel{%
81 \def \namespace #1{%
82     \_ifcsname namesp:#1\_endcsname \errmessage
83         {The name space "#1" is used already, it cannot be used twice}%
84 }
```

`prefixed.opm`

```

84     \_endinput
85     \_else \_resetnamespace{#1}\_fi
86   }
87 \_def\_resetnamespace #1{%
88   \_ea \_gdef \_csname namesp:#1\_endcsname {}%
89   \_gdef \_pkglabel{_#1}%
90   \_directlua{
91     callback.register_x("process_input_buffer",
92       function (str)
93         return string.gsub(str, "\_nbb[.]( [a-zA-Z])", "\_nbb _#1\_pcent 1")
94       end )
95   }%
96 }
97 \_def\_endnamespace {%
98   \_ifmathsb \_mathsbon \_else \_mathsboff \_fi
99   \_gdef \_pkglabel{}%
100 }
101
102 \_def \_nspublic {\_xargs \_nspublicA}
103 \_def \_nspublicA #1{\_ea\_\_let \_ea#1\_csname \_pkglabel _\_csstring #1\_endcsname}
104
105 \_def \_nsprivate {\_xargs \_nsprivateA}
106 \_def \_nsprivateA #1{\_ea\_\_let \_csname \_pkglabel _\_csstring #1\_endcsname =#1}

```

## 2.3 pdfTeX initialization

Common pdfTeX primitives equivalents are declared here. Initial values are set.

`luatex-ini.omp`

```

3 \_codedecl \pdfprimitive {LuaTeX initialization code <2020-02-21>} % preloaded in format
4
5 \_let\pdfpagewidth      \pagewidth

## 2.4 Basic macros

We define first bundle of basic macros.

```

basic-macros.opm
3 \_codedecl \sdef {Basic macros for OpTeX <2020-02-14>} % loaded in format
4
5 \bgroup, \egroup, \empty, \space, \null and \wlog are classical macros from plain TEX.
6
7
8
9
10
11
12
13
14
15
16 \_public \bgroup \egroup \empty \space \null \wlog ;

```

\bslash is “normal backslash” with category code 12. \nbb and \pcent are double backslash and normal %, they should be used in lua codes, for example.

```

basic-macros.opm
24 \_edef \_bslash {\_csstring\\}
25 \_edef \_nbb {\_bslash\_bslash}
26 \_edef \_pcent{\_csstring\%}
27
28 \_public \bslash \nbb \pcent ;

```

\sdef {<text>} is equivalent to \def\<text>, where \<text> is a control sequence. You can use arbitrary parameter mask after \sdef{<text>}, don’t put the (unwanted) space immediately after closing brace }.

\sxdef {<text>} is equivalent to \xdef\<text>.

\slet {<textA>}{<textB>} is equivalent to \let \<textA> = \<textB>.

```

basic-macros.opm
40 \_def \_sdef #1{\_ea\_def \_csname#1\_endcsname}
41 \_def \_sxdef #1{\_ea\_xdef \_csname#1\_endcsname}
42 \_def \_slet #1#2{\_ea\_let \_csname#1\_ea\_endcsname \_csname#2\_endcsname}
43
44 \_public \sdef \sxdef \slet ;

```

\adef {<char>}{<body>} puts the <char> as active character and defines it as {<body>}. You can declare a macro with parameters too. For example \adef @#1{...\$1...}.

```

basic-macros.opm
52 \_def \_adef #1{\_catcode`#1=13 \_begingroup \_lccode`\~=\#1\_lowercase{\_endgroup\_def~}}
53 \_public \adef ;

```

\cs {<text>} is only a shortcut to \csname <text>\endcsname, but you need one more \ea if you need to get the real control sequence \<text>.

\trycs {<csname>}{<text>} expands to \<csname> if it is defined else to the <text>.

```

63 \_def \_cs #1{\_csname#1\_endcsname}
64 \_def \trycs#1#2{\_ifcsname #1\_endcsname \_csname #1\_endcsname \_else #2\_fi}
65 \_public \cs \trycs ;

```

\addto {\macro{<text>}} adds <text> to your \macro, which must be defined.

```

71 \long\def \addto #1#2{\_ea\def \ea#1\ea{#1#2}}
72 \public \addto ;

```

\opwarning {<text>} prints warning on the terminal and to the log file.

```

78 \_def \opwarning #1{\_wterm{WARNING: #1.}}
79 \public \opwarning ;

```

\loggingall and \tracingall are defined similarly as in plain T<sub>E</sub>X, but they print more logging information to the log file and to the terminal.

```

87 \_def \loggingall{\_tracingcommands=3 \_tracingstats=2 \_tracingpages=1
88 \_tracingoutput=1 \_tracinglostchars=1 \_tracingmacros=2
89 \_tracingparagraphs=1 \_tracingrestores=1 \_tracingscantokens=1
90 \_tracingifs=1 \_tracinggroups=1 \_tracingassigns=1 }
91 \_def \tracingall{\_tracingonline=1 \_loggingall}
92
93 \public \loggingall \tracingall ;

```

Write a warning if the user did not to load a Unicode Font or if there were unresolved references. \byehook is used in the \bye macro.

```

100 \_def \byehook{%
101   \ifx \initunifonts \relax \relax \else \opwarning{Unicode font was not loaded}\fi
102   \ifnum \unresolvedrefs>0 \opwarning{Rerun to get references right}\fi
103 }

```

## 2.5 Allocators for T<sub>E</sub>X registers

Like plainT<sub>E</sub>X, the allocators \newcount, \newwrite, etc. are defined. The registers are allocated from 256 to the \mai{type} which is 65535 in LuaT<sub>E</sub>X.

Unlike in PlainT<sub>E</sub>X, the mentioned allocators are not \outer.

User can use \dimen0 to \dimen200 and similarly for \skip, \muskip, \box and \toks directly. User can use \count20 to \count200 directly too. This is the same philosophy like in old plainT<sub>E</sub>X, but the range of directly used registers is wider.

Inserts are allocated form 254 to 201 using \newinsert.

You can define your own allocation concept (for example for allocation of arrays) from top of registers array. The example shows a definition of the array-like declarator of counters.

```

\newcount \maicount    % redefine maximal allocation index as variable
\maicount = \maicount % first value is top of the array

\def \newcountarray #1[#2]{% \newcountarray \foo[100]
  \global \advance \maicount by -#2\relax
  \ifnum \countalloc > \maicount
    \errmessage{No room for a new array of \string\count}%
  \else
    \global \chardef #1=\maicount
  \fi
}
\def \usecount #1[#2]{% \usecount \foo[2]
  \count \numexpr #1 + #2 \relax
}

3 \codedecl \newdimen {Allocators for registers <2020-05-12>} % loaded in format

```

The limits are set first.

```

9  \chardef\maicount = 65535    % Max Allocation Index for counts registers in LaTeX
10 \let\maidimen = \maicount
11 \let\maiskip = \maicount
12 \let\mainuskip = \maicount
13 \let\maibox = \maicount
14 \let\maitoks = \maicount
15 \chardef\mairead = 15
16 \chardef\maiwrite = 15
17 \chardef\maifam = 255

```

Each allocation macro needs its own counter.

```

23 \countdef\countalloc=10 \countalloc=255
24 \countdef\dimenalloc=11 \dimenalloc=255
25 \countdef\skipalloc=12 \skipalloc=255
26 \countdef\muskipalloc=13 \muskipalloc=255
27 \countdef\boxalloc=14 \boxalloc=255
28 \countdef\toksalloc=15 \toksalloc=255
29 \countdef\readalloc=16 \readalloc=-1
30 \countdef\writealloc=17 \writealloc=-1
31 \countdef\famalloc=18 \famalloc=3

```

The common allocation macro `\allocator` `\<sequence>` `{<type>}` `\<primitive declarator>` is defined. This idea was used in classical plain TeX by Donald Knuth too but the macro from plain TeX seems to be more complicated:).

```

41 \def\allocator #1#2#3{%
42   \global\advance\cs{#2alloc}by1
43   \ifnum\cs{#2alloc}>\cs{mai#2}%
44     \errmessage{No room for a new \ea\string\csname #2\_endcsname}%
45   \else
46     \global#3#1=\cs{#2alloc}%
47     \wlog{\string#1=\ea\string\csname #2\_endcsname\_the\cs{#2alloc}}%
48   \fi
49 }

```

The allocation macros `\newcount`, `\newdimen`, `\newskip`, `\newmuskip`, `\newbox`, `\newtoks`, `\newread`, `\newwrite` and `\newfam` are defined here.

```

58 \def\newcount #1{\allocator #1{count}\countdef}
59 \def\newdimen #1{\allocator #1{dimen}\dimendef}
60 \def\newskip #1{\allocator #1{skip}\skipdef}
61 \def\newmuskip #1{\allocator #1{muskip}\muskipdef}
62 \def\newbox #1{\allocator #1{box}\chardef}
63 \def\newtoks #1{\allocator #1{toks}\toksdef}
64 \def\newread #1{\allocator #1{read}\chardef}
65 \def\newwrite #1{\allocator #1{write}\chardef}
66 \def\newfam #1{\allocator #1{fam}\chardef}
67
68 \public \newcount \newdimen \newskip \newmuskip \newbox \newtoks \newread \newwrite \newfam ;

```

The `\newinsert` macro is defined differently than others.

```

74 \newcount\insertalloc \insertalloc=255
75 \chardef\insertmin = 201
76
77 \def\newinsert #1{%
78   \global\advance\insertalloc by-1
79   \ifnum\insertalloc <\insertmin
80     \errmessage{No room for a new \string\insert}%
81   \else
82     \global\chardef#1=\insertalloc
83     \wlog{\string#1=\string\insert\_the\insertalloc}%
84   \fi
85 }
86 \public \newinsert ;

```

Other allocation macros `\newattribute` and `\newcatodetable` have their counter allocated by the `\newcount` macro.

```

93 \_newcount \_attributealloc \_attributealloc=0
94 \_chardef\maiaattribute=\maicount
95 \_def\_newattribute #1{\_allocator #1{attribute}\_attributedef}
96
97 \_newcount \_catcodetablealloc \_catcodetablealloc=10
98 \_chardef\maicatcodetable=32767
99 \_def\_newcatcodetable #1{\_allocator #1{catcodetable}\_chardef}
100
101 \_public \newattribute \newcatcodetable ;

```

We declare public and private versions of \tmpnum and \tmpdim registers separately. They are independent registers.

```

108 \_newcount \tmpnum \_newcount \tmpnum
109 \_newdimen \tmpdim \_newdimen \tmpdim

```

A few registers are initialized like in plainTeX. Note that \z@skip from plainTeX is \zoskip here because we absolutely don't support the @ category dance. The \z@ and \p@ is not defined because we can write 0pt or 1pt which is more legible in source code. You can see plain-at.opm file.

```

119 \_newdimen\maxdimen \_maxdimen=16383.99999pt % the largest legal <dimen>
120 \_newskip\hideskip \_hideskip=-1000pt plus 1fill % negative but can grow
121 \_newskip\centering \_centering=0pt plus 1000pt minus 1000pt
122 \_newskip\zoskip \_zoskip=0pt plus0pt minus0pt
123 \_newbox\voidbox % permanently void box register
124
125 \_public \maxdimen \hideskip \centering \zoskip \voidbox ;

```

## 2.6 If-macros, loops, is-macros

```

3 \codedecl \newif {Special if-macros, is-macros and loops <2020-05-22>} % preloaded in format

```

### 2.6.1 Classical \newif

The \newif macro implements boolean value. It works as in plain TeX. It means that after \newif\ifxxx you can use \xxxtrue or \xxxfalse to set the boolean value and use \ifxxx true\else false\fi to test this value. The default value is false.

The macro \newifi enables to declare \ifxxx and to use \xxxtrue and \xxxfalse. This means that it is usable for internal name space (\_prefixed macros).

```

18 \_def\_newif #1{\_ea\_newifA \_string #1\_relax#1}
19 \_ea\def \_ea\_newifA \_string\if #1\_relax#2{%
20   \_sdef{#1true}{\_let#2=\_iftrue}%
21   \_sdef{#1false}{\_let#2=\_iffalse}%
22   \_let#2=\_iffalse
23 }
24 \_def\_newifi #1{\_ea\_newifiA \_string#1\_relax#1}
25 \_ea\def \_ea\_newifiA \_string\if #1\_relax#2{%
26   \_sdef{#1true}{\_let#2=\_iftrue}%
27   \_sdef{#1false}{\_let#2=\_iffalse}%
28   \_let#2=\_iffalse
29 }
30 \_public \newif ;

```

### 2.6.2 Loops

The \loop<codeA>\ifsomething<codeB>\repeat loops <codeA><codeB> until \ifsomething is false. Then <codeB> is not executed and loop is finished. This works like in plain TeX, but implementation is somewhat better (you can use \else clause after the \ifsomething).

There are public version \loop...\repeat and private version \loop...\repeat. You cannot mix both versions in one loop.

The \loop macro keeps its original plain TeX meaning. It is not expandable and nested \loops are possible only in a TeX group.

```
if-macros.opp
46 \_long\_def \_loop #1\_repeat{\_def\_body{#1}\_iterate}
47 \_def \_loop #1\repeat{\_def\_body{#1}\_iterate}
48 \_let \_repeat=\_fi % this makes \loop...if...\repeat skipable
49 \_let \repeat=\_fi
50 \_def \_iterate {\_body \_ea \_iterate \_fi}
```

`\foreach {list} \do {{what}}` repeats `{what}` for each element of the `{list}`. The `{what}` can include `#1` which is substituted by each element of the `{list}`. The macro is expandable.

`\fornum {from}..{to} \do {{what}}` or `\fornumstep {num}: {from}..{to} \do {{what}}` repeats `{what}` for each number from `{from}` to `{to}` (with step `{num}` or with step one). The `{what}` can include `#1` which is substituted by current number. The sequence `{from}..{to}` can be decreasing too. The macro is expandable.

Recommendation: it is better to use private variants of `\foreach` and `\fornum`. When the user writes `\input tikz` then `\foreach` macro is redefined! The private variants use `\_do` separator instead `\do` separator.

```
if-macros.opp
71 \_newcount\_frnum      % the numeric variable used in \fornum
72 \_def\_\do{\_dounDEFINED} % we need to ask \_ifx#1\_\do ...
73
74 \_long\_def\_\foreach #1\_\do#2{\_putforstack
75   \_immediateassignment\gdef\_\fbody##1{#2}%
76   \_foreachA #1\_\do}
77 \_long\_def\_\foreachA #1{\_ifx\_\do#1\_\getforstack\_\else\_\fbody{#1}\_\ea\_\foreachA\_\fi}
78
79 \_def\_\fornum#1..#2\_\do{\_fornumstep 1:#1..#2\_\do}
80 \_long\_def\_\fornumstep#1:#2..#3\_\do#4{\_putforstack
81   \_immediateassigned{%
82     \_gdef\_\fbody##1{#4}%
83     \_gdef\_\fornumsgn{}%
84     \_gdef\_\fornumrel{<}%
85     \_global\_\frnum=\_numexpr#2\_\relax
86     \_ifnum\_\numexpr#3<\_\frnum \_gdef\_\fornumrel{>}\_\fi %decreasing sequence
87     \_ifnum\_\numexpr#1\_\fornumrel0 \_gdef\_\fornumsgn{-}\_\fi % correction
88   }%
89   \_fornumB{#3}{#1}%
90 }
91 \_def\_\fornumB #1#2{\_ifnum\_\numexpr#1\_\fornumrel\_\frnum \_getforstack \_\else
92   \_\ea\_\fbody\_\ea{\_the\_\frnum}%
93   \_immediateassignment\global\_\advance\_\frnum by\_\numexpr\_\fornumsgn#2\_\relax
94   \_afterfi{\_fornumB{#1}{#2}}\_\fi
95 }
96 \_def\_\afterfi#1#2\_\fi{\_fi#1}
97
98 \_def\_\foreach #1\do{\_foreach #1\_\do}
99 \_def\_\fornum#1..#2\do{\_fornumstep 1:#1..#2\_\do}
100 \_def\_\fornumstep#1:#2..#3\do{\_fornumstep #1:#2..#3\_\do}
```

The `\foreach` and `\fornum` macros can be nested and arbitrary combined. When they are nested then use `##1` for the variable of nested level, `####1` for the variable of second nested level etc. Example:

```
\foreach ABC \do {\fornum 1..5 \do {letter:#1, number: ##1. }}
```

Implementation note: we cannot use TeX-groups for nesting levels because we want to do the macros expandable. We must implement a special for-stack which saves the data needed by `\foreach` and `\fornum`. The `\_putforstack` is used when `\for*` is initialized and `\_getforstack` is used when the `\for*` macro ends. The `\_forlevel` variable keeps the current nesting level. If it is zero, then we need not save nor restore any data.

```
if-macros.opp
118 \_newcount\_forlevel
119 \_def\_\putforstack{\_immediateassigned{%
120   \_ifnum\_\forlevel>0
121     \_sxdef{\_frnum:\_the\_\forlevel\_ea}{\_the\_\frnum}%
122     \_global\_\slet{\_fbody:\_the\_\forlevel}{\_fbody}%
123   \_\fi
124   \_global\_\advance\_\forlevel by1
125 }%
126 \_def\_\getforstack{\_immediateassigned{%
127   \_global\_\advance\_\forlevel by-1
```

```

128     \_ifnum\_\_forlevel>0
129         \_global\_\_slet{_fbody}{_fbody:\_the\_\_forlevel}%
130         \_global\_\_frnum=\_csf\_\_frnum:\_the\_\_forlevel}\_\_space
131     \_fi
132 }

```

### 2.6.3 Is-macros

There are a collection of macros `\isempty`, `\istoksempy`, `\isequal`, `\ismacro`, `\isdefined`, `\isinlist` and `\isfile` with common syntax:

```

\issomething <params> \iftrue <codeA> \else <codeB> \fi
or
\issomething <params> \iffalse <codeB> \else <codeA> \fi

```

The `\else` part is optional. The `<codeA>` is processed if `\issomething<params>` generates true condition. The `<codeB>` is processed if `\issomething<params>` generates false condition.

The `\iftrue` or `\iffalse` is an integral part of this syntax because we need to keep skippable nested `\if` conditions.

Implementation note: we read this `\iftrue` or `\iffalse` into unseparated parameter and repeat it because we need to remove an optional space before this command.

`\isempty {<text>} \iftrue` is true if the `<text>` is empty. This macro is expandable.

`\istoksempy {tokens variable} \iftrue` is true if the `<tokens variable>` is empty. It is expandable.

```

if-macros.opm
163 \_long\_\def \_isempty #1#2{\_if\_\relax\_detokenize{#1}\_\relax \_else \_ea\_\unless \_fi#2}
164 \_def \_istoksempy #1#2{\_ea\_\isempty\_ea{\_the#1}#2}
165 \_public \isempty \istoksempy ;

```

`\isequal {<textA>} {<textB>} \iftrue` is true if the `<textA>` and `<textB>` are equal, only from strings point of view, category codes are ignored. The macro is expandable.

```

if-macros.opm
174 \_def\_\isequal#1#2#3{\_directlua{%
175     if "\_luaescapestring{\_detokenize{#1}}"=="\_luaescapestring{\_detokenize{#2}}"
176     then else tex.print("\_nbb unless") end}#3}
177 \_public \isequal ;

```

`\ismacro {macro{text}} \iftrue` is true if macro is defined as `<text>`. Category codes are ignored in this testing. The macro is expandable.

```

if-macros.opm
184 \_def\_\ismacro#1{\_ea\_\isequal\_\ea{#1}}
185 \_public \ismacro ;

```

`\isdefined {<csname>} \iftrue` is true if `\<csname>` is defined. The macro is expandable.

```

if-macros.opm

249 \def\_isnextcharA{\the\toks\ifx\tmp\_\next0\else1\fi\space}
250
251 \public \isnextchar ;
```

## 2.7 Setting parameters

The behavior of document processing by OpTeX is controlled by *parameters*. The parameters are

- primitive registers used in build-in algorithms of TeX,
- registers declared and used by OpTeX macros.

Both groups of registers have their type: number, dimension, skip, token list.

The registers are represented by their names (control sequences). If the user re-defines such control sequence then the appropriate register exists steadily and build-in algorithms are using it without change. But user cannot access its value in such case. OpTeX declares two control sequences for each register: prefixed and unprefixed. OpTeX macros use only prefixed variants of control sequences. The user should use unprefixed variant with the same meaning and set or read values of registers using the unprefixed variant. If the user re-defines the unprefixed control sequence of a register then OpTeX macros still work without change.

```
parameters.opm
3 \codedecl \normalbaselineskip {Parameter settings <2020-03-17>} % preloaded in format
```

### 2.7.1 Primitive registers

The primitive registers with the same default value as in plain TeX follow:

```
parameters.opm
10 \parindent=20pt      % indentation of paragraphs
11 \pretolerance=100    % parameters used in paragraph breaking algorithm
12 \tolerance=200
13 \hbadness=1000
14 \vbadness=1000
15 \doublehyphendemerits=10000
16 \finalhyphendemerits=5000
17 \adjdemerits=10000
18 \uchyph=1
19 \defaulthyphenchar=-\
20 \defaultskewchar=-1
21 \hfuzz=0.1pt
22 \vfuzz=0.1pt
23 \overfullrule=5pt
24 \linepenalty=10        % penalty between lines inside the paragraph
25 \hyphenpenalty=50      % when a word is broken
26 \exhyphenpenalty=50    % when the hyphenmark is used explicitly
27 \binoppenalty=700      % between binary operators in math
28 \relpenalty=500        % between relations in math
```

```

29 \brokenpenalty=100 % after lines if they end by a broken word.
30 \displaywidowpenalty=50 % before last line of paragraph if display math follows
31 \predisplaypenalty=10000 % above display math
32 \postdisplaypenalty=0 % below display math
33 \delimiterfactor=901 % parameter for scaling delimiters
34 \delimitershortfall=5pt
35 \nulldelimiterspace=1.2pt
36 \scriptspace=0.5pt
37 \maxdepth=4pt
38 \splitmaxdepth=\maxdimen
39 \boxmaxdepth=\maxdimen
40 \parskip=0pt plus 1pt
41 \abovedisplayskip=12pt plus 3pt minus 9pt
42 \abovedisplayshortskip=0pt plus 3pt
43 \belowdisplayskip=12pt plus 3pt minus 9pt
44 \belowdisplayshortskip=7pt plus 3pt minus 4pt
45 \parfillskip=0pt plus 1fil
46 \thinmuskip=3mu
47 \medmuskip=4mu plus 2mu minus 4mu
48 \thickmuskip=5mu plus 5mu

```

Note that `\topskip` and `\splittopskip` are changed when first `\typo` sets the main values (default font size and default `\baselineskip`).

```

56 \topskip=10pt      % top edge of page-box to first baseline distance
57 \splittopskip=10pt

```

`parameters.opm`

## 2.7.2 Plain T<sub>E</sub>X registers

Declared registers used in plain T<sub>E</sub>X

```

64 % We also define special registers that function like parameters:
65 \newskip\smallskipamount \smallskipamount=3pt plus 1pt minus 1pt
66 \newskip\medskipamount \medskipamount=6pt plus 2pt minus 2pt
67 \newskip\bigskipamount \bigskipamount=12pt plus 4pt minus 4pt
68 \newskip\normalbaselineskip \normalbaselineskip=12pt
69 \newskip\normallineskip \normallineskip=1pt
70 \newdimen\normallineskiplimit \normallineskiplimit=0pt
71 \newdimen\jot \jot=3pt
72 \newcount\interdisplaylinepenalty \interdisplaylinepenalty=100
73 \newcount\interfootnotelinepenalty \interfootnotelinepenalty=100
74
75 \def\normalbaselines{\lineskip=\normallineskip
76   \baselineskip=\normalbaselineskip \lineskiplimit=\normallineskiplimit}
77
78 \def\frenchspacing{\sfcode`.=1000 \sfcode`?=1000 \sfcode`!=1000
79   \sfcode`\:=1000 \sfcode`\;=1000 \sfcode`\,=1000 }
80 \def\nonfrenchspacing{\sfcode`.=3000 \sfcode`?=3000 \sfcode`!=3000
81   \sfcode`\:=2000 \sfcode`\;=1500 \sfcode`\,=1250 }
82
83 \public \normalbaselines \frenchspacing \nonfrenchspacing
84   \smallskipamount \medskipamount \bigskipamount
85   \normalbaselineskip \normallineskip \normallineskiplimit
86   \jot \interdisplaylinepenalty \interfootnotelinepenalty ;

```

`parameters.opm`

## 2.7.3 Different settings than in plain T<sub>E</sub>X

Default “baseline setting” is for 10 pt fonts (like in plain T<sub>E</sub>X). But `\typo` and `\typoscale` macros re-declare it if another font size is used.

The `\nonfrenchspacing` is not set by default because the author of OpT<sub>E</sub>X is living in the Europe. If you set `\enlang` hyphenation patterns then `\nonfrenchspacing` is set.

```

100 \normalbaselines % baseline setting, 10 pt font size

```

`parameters.opm`

Different values than in plain T<sub>E</sub>X have following primitive registers. We prohibit orphans, set more information for tracing boxes, set page origin to upper left corner of the paper (no at 1 in, 1 in coordinates) and set default page dimensions as A4, no letter.

```

109 \emergencystretch=20pt % we want to use third pass of aparagraph building algoritmh
110             % we need not to keep the compatibility with old documents
111
112 \clubpenalty=10000    % after first line of paragraph
113 \widowpenalty=10000   % before last line of paragraph
114
115 \showboxbreadth=150   % for tracing boxes
116 \showboxdepth=7
117 \errorcontextlines=15
118 \tracinglostchars=2   % missing chracter warnings on terminal too
119
120 \outputmode=1          % PDF ouput
121 \pdfvorigin=0pt        % origin is exatly at left upper corner
122 \pdfhorigin=0pt
123 \hoffset=25mm          % margins are 2.5cm, no 1in
124 \voffset=25mm
125 \hsize=160mm           % 210mm (from A4 size) - 2*25mm (default margins)
126 \vsize=244mm            % 297mm (from A4 size) - 2*25mm (default margins) -3mm baseline correction
127 \pagewidth=210 true mm
128 \pageheight=297 true mm

```

If you insist on plain  $\text{\TeX}$  values of these parameters then you can call the `\plaintexsetting` macro.

```

135 \def\plaintexsetting{%
136     \emergencystretch=0pt
137     \clubpenalty=150
138     \widowpenalty=150
139     \pdfvorigin=1in
140     \pdfhorigin=1in
141     \hoffset=0pt
142     \voffset=0pt
143     \hsize=6.5in
144     \vsize=8.9in
145     \pagewidth=8.5 true in
146     \pageheight=11 true in
147     \nonfrenchspacing
148 }
149 \public \plaintexsetting ;

```

## 2.7.4 Op $\text{\TeX}$ parameters

The main principle how to configure Op $\text{\TeX}$  is not to use only parameters. A designer can copy macros from Op $\text{\TeX}$  and re-define them as required. This is a reason why we don't implement dozens of parameters, but we keep Op $\text{\TeX}$  macros relatively simple. Example: do you want another design of section titles? Copy macros `\printsec` and `\printsecc` from `sections.opm` file to your macro file and re-define them.

Notice for OPmac users: there is important difference: all "string-like" parameters are token lists in Op $\text{\TeX}$  (OPmac uses macros for them). The reason of this difference: if user sets parameter by unprotected control sequence, an Op $\text{\TeX}$  macro can read *the same data* using protected control sequence. If user re-defines such unprotected control sequence (because he/she does know about it) then nothing bad happens.

The `\picdir` tokens list can include a directory where image files (loaded by `\inspic`) are saved. Empty `\picdir` (default value) means that image files are in the current directory (or somewhere in the  $\text{\TeX}$  system where Lua $\text{\TeX}$  is able to find them). If you set non-empty value to the `\picdir`, then it must end by / character, for example `\picdir={img/}` means that there exists a directory `img` in your current directory and the image files are stored here.

```

177 \newtoks\picdir
178 \public \picdir ;

```

You can control the dimensions of included images by the parameters `\picwidth` (which is equivalent to `\picw`) and `\picheight`. By default these parameters are set to zero: the native dimension of the image is used. If only `\picwidth` has a nonzero value, then this is the width of the image (height is calculated automatically in order to respect the aspect of the image). If only `\picheight` has a nonzero value then height is given, width is calculated. If both parameters are non-zero, the height and width are given and the aspect ratio of the image is (probably) broken. We recommend to set these parameters locally in the

group where `\inspic` is used in order to not influence the dimensions of another images. But there exist many situations you need to put the same dimensions to more images, so you can set this parameter only once before more `\inspic` macros.

```
parameters.opm
196 \_newdimen\_picwidth  \_picwidth=0pt  \_let\picw=\_picwidth
197 \_newdimen\_picheight  \_picheight=0pt
198 \_public \picwidth \picheight ;
```

The `\everytt` is token list used in `\begtt...\\endtt` environment and in the verbatim group opened by `\verbinput` macro. You can include a code which is processed inside the group after basic settings were done. On the other hand, it is processed before scanner of verbatim text is started. Your macros should influence scanner (catcode settings) or printing process of the verbatim code or both.

The code from the line immediately after `\begtt` is processed after the `\everytt`. This code should overwrite `\everytt` settings. Use `\everytt` for all verbatim environments in your document and use a code after `\begtt` locally only for this environment.

The `\everyintt` token list does similar work but acts in the in-line verbatim text processed by a pair of `\activettchar` characters or by `\code{<text>}`. You can set `\everyintt={\Red}` for example if you want in-line verbatim in red color.

```
parameters.opm
221 \_newtoks\_everytt
222 \_newtoks\_everyintt
223 \_public \everytt \everyintt ;
```

The `\ttline` is used in `\begtt...\\endtt` environment or in the code printed by `\verbinput`. If `\ttline` is positive or zero, then the verbatim code have numbered lines from `\ttline+1`. The `\ttline` register is re-set to new value after a code piece is printed, so next code pieces have numbered lines continuously. If `\ttline=-1`, then `\begtt...\\endtt` lines are without numbers and `\verbinput` lines shows the line numbers of inputted file. If `\ttline<-1` then no line numbers are printed.

```
parameters.opm
237 \_newcount\_ttline  \_ttline=-1 % last line number in \begtt...\\endtt
238 \_public \ttline ;
```

The `\ttindent` gives default indentation of verbatim lines printed by `\begtt...\\endtt` pair or by `\verbinput`.

The `\ttshift` gives the amount of shift of all verbatim lines to right. Despite to the `\ttindent`, it does not shift the line numbers, only the text.

The `\iindent` gives default indentations used in table of contents, captions, lists, bib references, It is strongly recommended to re-set this value if you set `\parindent` to another value than plain TeX default 20pt. A well typeset document should have the same dimension for all indentations, so you should say `\ttindent=\parindent` and `\iindent=\parindent`.

```
parameters.opm
258 \_newdimen\_ttindent \_ttindent=\_parindent % indentation in verbatim
259 \_newdimen\_ttshift
260 \_newdimen\_iindent \_iindent=\_parindent
261 \_public \ttindent \ttshift \iindent ;
```

The tabelator `^I` has its category code like space: it behaves as a space in normal text. This is normal plain TeX setting. But in the multiline verbatim environment it is active and expands to the `\hskip<dimen>` where `<dimen>` is the width of `\tabspaces` spaces. Default `\tabspaces=3` means that tabelator behaves like three spaces in multiline verbatim.

```
parameters.opm
273 \_newcount \_tabspaces  \_tabspaces=3
274 \_public \tabspaces ;
```

If `\hicolors` is non-empty then its contents is used instead `\hicolors<name>` declared in the file `hisyntax-<name>.opm`. The user can give his/her preferences about colors for syntax highlighting by this tokens list. Full color set must be declared here.

```
parameters.opm
284 \_newtoks\_hicolors
285 \_public \hicolors ;
```

The default item mark used between `\begin{items}` and `\end{items}` is bullet. The `\defaultitem` tokens list declare this default item mark.

The `\everyitem` tokens list is applied in vertical mode at the start of each item.

The `\everylist` tokens list is applied after group is opened by

The `\ilevel` keeps the value of current nesting level of the items list.

The `\listskipamount` gives vertical skip above and below the items list if `\ilevel=1`.

```
parameters.opm
302 \_newtoks\_defaultitem \_defaultitem={\$\_bullet$\_enspace}
303 \_newtoks\_everyitem
304 \_newtoks\_everylist
305 \_newskip \listskipamount \listskipamount=\_medskipamount
306 \_newcount \ilevel
307 \_public \defaultitem \everyitem \everylist \listskipamount \ilevel ;
```

The `\tit` macro includes `\vglue\titskip` above the title of the document.

```
parameters.opm
313 \_newskip\_titskip \_titskip=40pt \_relax % \vglue above title printed by \tit
314 \_public \titskip ;
```

The `\begmulti \endmulti` pair creates more columns. The parameter `\colsep` declares the space between columns. If  $n$  columns are specified then we have  $n - 1$  `\colseps` and  $n$  columns in total `\hsize`. This gives definite result of columns width.

```
parameters.opm
323 \_newdimen\_colsep \_colsep=20pt % space between columns
324 \_public \colsep ;
```

Each line in the Table of contents is printed in a group. The `\everytocline` tokens list is processed here before the internal `\_tocl:(num)` macro which starts printing the line.

```
parameters.opm
332 \_newtoks \_everytocline
333 \_public \everytocline ;
```

The `\bibtexhook` tokens list is used inside the group when `\usebib` command is processed after style file is loaded and before printing bib-entries. You can re-define a behavior of style file here or you can modify the more declaration for printing (fonts, baselineskip, etc.) or you can define a specific macros used in your `.bib` file.

```
parameters.opm
343 \_newtoks\_bibtexhook
344 \_public \bibtexhook ;
345
346 \_newtoks\_everycaptiont \_newtoks\_everycaptionf
347 \_public \everycaptiont \everycaptionf ;
```

The `\everyii` tokens list is used before `\noindent` for each Index item when printing the Index.

```
parameters.opm
354 \_newtoks\_everyii
355 \_public \everyii ;
```

The `\everymnote` is used in the `\mnote` group before `\noindent` which immediately precedes marginal note text.

The `\mnotesize` is horizontal size of the marginal notes.

The `\mnoteindent` is horizontal space between body-text and marginal note.

```
parameters.opm
366 \_newtoks\_everymnote
367 \_newdimen\_mnotesize \_mnotesize=20mm % the width of the mnote paragraph
368 \_newdimen\_mnoteindent \_mnoteindent=10pt % distance between mnote and text
369 \_public \everymnote \mnotesize \mnoteindent ;
```

The `\table` parameters follows. The `\thistable` tokens list register should be used for giving an exception for only one `\table` which follows. It should change locally other parameters of the `\table`. It is reset to empty list after the table is printed.

The `\everytable` tokens list register is applied in every table. There is another difference between these two registers. The `\thistable` is used first, then strut and baselineskip settings are done, then `\everytable` is applied and then the table is printed.

`\tabstrut` configures the height and depth of lines in the table. You can declare `\tabstrut={} ,` then normal baselineskip is used in the table. This can be used when you don't use horizontal nor vertical lines in tables.

`\tabiteml` is applied before each item, `\tabitemr` is applied after each item of the table.

`\tablinespace` is additional vertical space between horizontal rules and the lines of the table.

`\hhkern` gives the space between horizontal lines if they are doubled and `\vvkern` gives the space between such vertical lines.

\tabskip<sub>1</sub> is \tabskip used before first column, \tabskip<sub>r</sub> is \tabskip used after the last column.

\tsize is virtual unit of the width of paragraph-like table items when \table pxt<sub>o</sub>(size) is used.

parameters.opm

```
403 \_newtoks\_everytable \_newtoks\_thistable
404 \_newtoks\_tabiteml \_newtoks\_tabitemr \_newtoks\_tabstrut
405 \_newdimen\_tablinespace \_newdimen\_vvkern \_newdimen\_hkern \_newdimen\_tsize
406 \_newskip\_\tabskip1 \_newskip\_\tabskipr
407 \_everytable={} % code used after settings in \vbox before table processing
408 \_thistable={} % code used when \vbox starts, is removed after using it
409 \_tabstrut=\_strut
410 \_tabiteml=\_enspace % left material in each column
411 \_tabitemr=\_enspace % right material in each column
412 \_tablinespace=2pt % additional vertical space before/after horizontal rules
413 \_vvkern=1pt % space between double vertical line and used in \frame
414 \_hkern=1pt % space between double horizontal line and used in \frame
415 \_tabskip1=0pt\relax % \tabskip used before first column
416 \_tabskipr=0pt\relax % \tabskip used after the last column
417 \_public \_everytable \thistable \tabiteml \tabitemr \tabstrut \tablinespace
418 \_vvkern \_hkern \tsize \tabskip1 \tabskipr ;
```

The \eqalign macro can be configured by \eqlines and \eqstyle tokens lists. The default values are set in order this macro behaves like in Plain TeX. The \eqspace is horizontal space put between equation systems if more columns in \eqalign is used.

parameters.opm

```
427 \_newtoks \_eqlines \_eqlines=\{_openup\_\jot}
428 \_newtoks \_eqstyle \_eqstyle=\{_strut\_\displaystyle}
429 \_newdimen \_eqspace \_eqspace=20pt
430 \_public \eqlines \eqstyle \eqspace ;
```

\lmfil is “left matrix filler” (for \matrix columns). The default value does centering because right matrix filler is directly set to \hfil.

parameters.opm

```
437 \_newtoks \_lmfil \_lmfil=\_hfil
438 \_public \lmfil ;
```

The output routine uses token list \headline and \footline in the same sense as in plain TeX. If they are non-empty then \hfil or \hss must be here because they are used inside \hbox to\hsize.

Assume that page-body text can be typeset in different sizes and different fonts and we don't know in what font context the output routine is invoked. So, it is strongly recommended to declare fixed variants of fonts at the beginning of your document. For example \fontdef\rmfixed{\rm}, \fontdef\itfixed{\it}. Then use them in headline and footline:

```
\headline=\{ \itfixed Text of headline, section: \fistmark \hss}
\footline=\{ \rmfixed \ifodd\pageno \hfill\fi \folio \hfill}
```

parameters.opm

```
456 \_newtoks\_headline \_headline={}
457 \_newtoks\_footline \_footline=\{_hss\_\rmfixed \_folio \_hss}
458 \_public \headline \footline ;
```

The distance between the \headline and the top of the page-text is controlled by the \headlinedist register. The distance between bottom of page-text and \footline is \footlinedist. More precisely: baseline of headline and baseline of first line in page-text have distance \headlinedist+\topskip. The baseline of the last line in page-text and the baseline of the footline have distance \footlinedist. Default values are inspired from plain TeX.

parameters.opm

```
472 \_newdimen \_headlinedist \_headlinedist=14pt
473 \_newdimen \_footlinedist \_footlinedist=24pt
474 \_public \headlinedist \footlinedist ;
```

The \pgbottomskip is inserted to the page bottom in the output routine. You can set a less tolerance here than \raggedbottom does. By default, no tolerance is given.

parameters.opm

```
482 \_newskip \_pgbottomskip \_pgbottomskip=0pt \relax
483 \_public \pgbottomskip ;
```

The \nextpages tokens list can include settings which will be used at next pages. It is processed at the end of output routine with \globaldefs=1 prefix. The \nextpages is reset to empty after processing. Example of usage:

```
\headline={} \nexptpages={\headline={\fixedrm \firstmark \hfil}}
```

This example sets current page with empty headline, but next pages have non-empty headlines.

```
497 \_newtoks \_nextpages
498 \_public \nextpages ;
```

parameters.opm

The `\pgbackground` token list can include macros which generate a vertical list. It is used as page background. The top-left corner of such `\vbox` is at the top-left corner of the paper. Example creates the background of all pages yellow:

```
\pgbackground={\Yellow \hrule height Opt depth\pdfpageheight width\pdfpagewidth}
```

```
510 \_newtoks \_pgbackground \_pgbackground={} % for page background
511 \_public \pgbackground ;
```

parameters.opm

The parameters used in `\inoval` and `\incircle` macros. The default values (documented in user manual) are set in the macros. The user can re-set these values using tokens `\ovalparams`, `\circleparams`.

```
519 \_newtoks \_ovalparams
520 \_newtoks \_circleparams
521 \%_ovalparams={\_roundness=2pt \_fcolor=\Yellow \_lcolor=\Red \_lwidth=.5bp
522 \% \_shadow=N \_overlapmargins=N \_hhkern=Opt \_vvkern=Opt }
523 \%_circleparams={\_ratio=1 \_fcolor=\Yellow \_lcolor=\Red \_lwidth=.5bp
524 \% \_shadow=N \_overlapmargins=N \_hhkern=3pt \_vvkern=3pt}
525
526 \_newdimen \_roundness \_roundness=5mm % used in \clippingoval macro
527
528 \_public \ovalparams \circleparams \roundness ;
```

parameters.opm

## 2.8 More OpTeX macros

The second bundle of OpTeX macros is here.

```
3 \_codedecl \eoldef {OpTeX useful macros <2020-05-22>} % preloaded in format
```

more-macros.opm

We define `\opinput`  $\{\langle file \ name \rangle\}$  macro which does `\input`  $\{\langle file \ name \rangle\}$  but the catcodes are set to normal catcodes (like OpTeX initializes them) and the catcodes setting are returned back to the current values when the file is read. You can use `\optinput` in any situation inside the document and you will be sure that the file is read correctly with correct catcode settings.

In order to achieve this, we declare `\optexcatcodes` catcode table and `\plaintexcatcodes`. They save the commonly used catcode tables. Note that `\catcodetable` is a part of LuaTeX extension. The catcodetable stack is implemented by OpTeX macros. The `\setctable`  $\langle catcode \ table \rangle$  pushes current catcode table to the stack and activates catcodes from the  $\langle catcode \ table \rangle$ . The `\restorectable` returns to the saved catcodes from the catcode table stack. So, the `\opinput` macro can be implemented simply:

```
23 \_def\opinput #1{\_setctable\_optexcatcodes \_input {\#1}\_relax\_restorectable}
24
25 \_newcatcodetable \_optexcatcodes
26 \_newcatcodetable \_plaintexcatcodes
27
28 \_public \optexcatcodes \plaintexcatcodes \opinput ;
29
30 \_savecatcodetable\_optexcatcodes
31 {\_catcode`^=8 \_savecatcodetable\plaintexcatcodes}
```

more-macros.opm

The implementation of the catcodetable stack follows.

The current catcodes are managed in the `\catcodetable0`. If the `\setctable` is used first (or at the outer level of the stack), then the `\catcodetable0` is pushed to the stack and the current table is re-set to the given  $\langle catcode \ table \rangle$ . The numbers of these tables are stacked to the `\_ctablelist` macro. The `\restorectable` reads the last saved catcode table number from the `\_ctablelist` and uses it.

```
45 \_newcount\_currctable \_currctable=0
46 \_catcodetable0
47
48 \_def\setctable#1{\_edef\_ctablelist{{\_the\_currctable}\_ctablelist}%
%
```

more-macros.opm

```

49   \_catcodetable#1\_relax \_currctable=#1\_relax
50 }
51 \_def\_restorectable{\_ea\_\_restorectableA\_\_ctablelist\_\_relax}
52 \_def\_\_restorectableA#1#2\_\_relax{%
53   \_ifx^#2^{\_opwarning
54     {You can't use \_noindent\restoretabcle without previous \_string\setctable}%
55   \_else \_def\_\_ctablelist{#2}\_catcodetable#1\_relax \_currctable=#1\_relax \_fi
56 }
57 \_def\_\_ctablelist{.}
58
59 \_public \setctable \restoretabcle ;

```

When a special macro is defined with different catcodes then `\normalcatcodes` can be used at the end of such definition. The normal catcodes are restored. The macro reads catcodes from `\optecatodes` table and sets it to the main catcode table 0.

```
more-macros.opm
```

```

69 \_def\_\_normalcatcodes {\_catcodetable\_\_optexcatcodes \_savecatcodetable0 \_catcodetable0 }
70 \_public \normalcatodes ;

```

The `\load` [*<filename-list>*] loads files specified in comma separated *<filename-list>*. The first space (after comma) is ignored using the trick #1#2,: first parameter is unseparated. The `\load` macro saves the information about loaded files by setting `\_load:<filename>` as a defined macro.

If the `\_afterload` macro is defined then it is run after `\opinput`. The catcode setting should be here. Note that catcode setting done in the loaded file is forgotten after the `\opinput`.

```
more-macros.opm
```

```

84 \_def \_load [#1]{\_loadA #1,,, \_end}
85 \_def \_loadA #1#2,{\_ifx,#1 \_ea \_loadE \_else \_loadB{#1#2}\_ea\_\_loadA\_\_fi}
86 \_def \_loadB #1{%

89   \_sxdef{\_load:#1}{}
90   \_trycs{\_afterload}{\_let\_\_afterload=\_undefined
91   \_fi
92 }
93 \_def \_loadE #1\_\_end{}}
94 \_public \load ;

```

The declarator `\optdef\macro [⟨opt default⟩] ⟨params⟩{⟨replacement text⟩}` defines the `\macro` with the optional parameter followed by normal parameters declared in *⟨params⟩*. The optional parameter must be used as the first first parameter in brackets [...]. If it isn't used then *⟨opt default⟩* is taken into account. The *⟨replacement text⟩* can use `\the\opt` because optional parameter is saved to the `\opt` tokens register. Note the difference from L<sup>A</sup>T<sub>E</sub>X concept where the optional parameter is in #1. Op<sup>T</sup>EX uses #1 as the first normal parameter (if declared).

The `\_nospaceafter` ignores the following optional space at expand processor level using the negative `\romannumeral` trick.

```
more-macros.opm
```

```

110 \_def\_\_optdef#1[#2]{%
111   \_def#1{\_opt={#2}\_isnextchar[{\_cs{_oA:\_string#1}}{\_cs{_oB:\_string#1}}]}%
112   \_sdef{_oA:\_string#1}[##1]{\_opt={##1}\_cs{_oB:\_string#1\_\_nospaceafter}}%{%
113   \_sdef{_oB:\_string#1\_\_nospaceafter}}%{%
114 }
115 \_def\_\_nospaceafter#1{\_ea#1\_\_romannumeral-`\_.
116 \_newtoks\_\_opt
117
118 \_public \opt \optdef ;

```

The declarator `\eoldef\macro #1{⟨replacement text⟩}` defines a `\macro` which scans its parameter to the end of the current line. This is the parameter #1 which can be used in the *⟨replacement text⟩*. The catcode of the `\endlinechar` is reset temporarily when the parameter is scanned.

The macro defined by `\eoldef` cannot be used with its parameter inside other macros because the catcode dancing is not possible here. But the `\bracedparam\macro{⟨parameter⟩}` can be used here. The `\bracedparam` is a prefix which re-sets temporarily the `\macro` to a `\macro` with normal one parameter.

The `\skiptoeol` macro reads the text to the end of the current line and ignores it.

```
more-macros.opm
```

```

136 \_def\_\_eoldef #1{\_def #1{\_begingroup \_catcode`^\^M=12 \_eoldefA #1}%
137   \_ea\_\_def\_\_csname _\_\_csstring #1:M\_\_endcsname}

```

```

145     \_else \_csname _in_\csstring #1:M\_ea \_endcsname \_fi
146 }
147 \_public \eoldef \skiptoeol \bracedparam ;

```

**\scantoeol** macro (*text to end of line*) scans the *(text to end of line)* in verbatim mode and runs the **\macro{<text to end of line>}**. The **\macro** can be defined **\def\macro#1{... \scantextokens{#1} ...}**. The new tokenization of the parameter is processed when the parameter is used, no when the parameter is scanned. This principle is used in definition of **\chap**, **\sec**, **\secc** and **\Xtoc** macros. It means that user can write **\sec text`&` text** for example. Inline verbatim works in title sections.

The verbatim scanner of **\scantoeol** keeps category 7 for ^ in order to be able to use ^^J as comment character which means that the next line continues.

```

more-macros.opm
165 \_def\_scantoeol#1{\def\_tmp{#1}\_begingroup \_setscancatcodes \_scantoeolA}
166 \_def\_setscancatcodes{\_setverb \_catcode`\^^M=12\_catcode`\^=7\_catcode`\ =10\_catcode`\^^J=14 }

168 \_def\_scantoeolA#1^^M{\_endgroup \_tmp{#1}}%
169 \_normalcatcodes %
170
171 \_public \scantoeol ;

```

The **\replstring\macro{<textA>}{<textB>}** replaces all occurrences of *<textA>* by *<textB>* in the **\macro** body. The **\macro** must be defined without parameters. The occurrences of *<textA>* are not replaced if they are “hidden” in braces, for example ...{...<textA>...}.... The category codes in the *<textA>* must exactly match.

```

more-macros.opm
182 \_catcode`!=3 \_catcode`?=3
183 \_def\_replstring #1#2#3{%
184     \_replstring #1{stringA}{stringB}
185     \_long\def\_replacestringsA##1#2{\_def #1{##1}\_replacestringsB}%
186     \_long\def\_replacestringsB##1#2{\_ifx!##1\relax \_else \_addto #1{#3##1}%
187         \_ea\_replacestringsB\_fi}%
188         \_ea\_replacestringsA #1?#2!#2%
189     \_long\def\_replacestringsA##1?{\_def #1{##1}}\_ea\_replacestringsA #1}
190 \_normalcatcodes
191 \_public \replstring ;

```

The **\catcode** primitive is redefined here. Why? There is very common cases like **\catcode`<something>** or **\catcode"<number>** but these characters ` or " can be set as active (typically by **\activettchar** macro). Nothing problematic happens if re-defined **\catcode** is used in this case.

If you really need primitive **\catcode** then you can use **\\_catcode**.

```

more-macros.opm
203 \_def\catcode#1{\_catcode \_if`\_noexpand#1\_ea`\_else\_if`\_noexpand#1"\_else
204     \_if'`\_noexpand#1'\_else \_ea\_ea\_ea\_ea\_ea#\_fi\_fi\_fi}%

```

The **\removespaces** *<text with spaces>{}* expands to *<textwithoutspaces>*.

The **\ea\ignorept\the<dimen>** expands to a decimal number **\the<dimen>** but without pt unit.

The **\ignoreit<token>** just ignores the *<token>*.

```

more-macros.opm
215 \_def\_removespaces #1 {\_isempty{#1}\_iffalse #1\_ea\_removespaces\_fi}
216 \_ea\_def \_ea\_ignorept \_ea#\_ea1\detokenize{pt}{#1}
217 \_def\_ignoreit#1{%
218
219 \_public \removespaces \ignorept \ignoreit ;

```

You can use expandable **\bp{<dimen>}** convertor from T<sub>E</sub>X *<dimen>* (or from an expression accepted by **\dimexpr** primitive) to a decimal value in big points (used as natural unit in the PDF format). So, you can write, for example:

```
\pdfliteral{q \_bp{.3\hsize-2mm} \_bp{2mm} m 0 \_bp{-4mm} l S Q}
```

You can use expandable `\expr{\langle expression \rangle}` for analogical purposes. It expands to the value of the `\langle expression \rangle` at expand processor level with `\_decdigits` digits after decimal point. The `\langle expression \rangle` can include `+-*/()` and decimal numbers in common syntax.

The usage of prefixed versions `\_expr` or `\_bp` is more recommended because user can re-define the control sequences `\expr` or `\bp`.

```
238 \_def\_decdigits{3} % digits after decimal point in \_bp and \_expr outputs.  
239 \_def\_pttopb{  
240   \_directlua{tex.print(string.format('\'_pcent.\_decdigits f',  
241     token.scan_dimen()/65781.76))}% pt to bp conversion  
242 }  
243 \def\_bp#1{\_ea\_pttopb\_dimexpr#1\_relax}  
244 \def\_expr#1{\_directlua{tex.print(string.format('\'_pcent.\_decdigits f',#1))}}  
245  
246 \_public \expr \bp ;
```

The pair `\_doc ... \_cod` is used for documenting macros and to printing the technical documentation of the OpTeX. The syntax is:

```
\_doc <ignored text>  
<documentation>  
\_cod <ignored text>
```

The `<documentation>` (and `<ignored text>` too) must be `<balanced text>`. It means that you cannot document only the `{` but you must document the `}` too.

261 \long\def\doc #1\cod {\\_skiptoeol}

## 2.9 Plain T<sub>E</sub>X macros

All macros from plain TeX are rewritten here. Differences are mentioned in the documentation below.

plain-macros.omp

The `\dospecials` works like in plain TeX but does nothing with `_`. If you need to do the same with this character, you can re-define:

```
\addto \dospecials{\do\ }
```

```
plain-macros.opp
13 \_def\_dospecials {\do\ \do\\do{\do\}\do$\do\&%
14   \do#\do`\do`^K\do`^A\do`\%\do`~}
15 \_chardef\_active = 13
16
17 \_public \dospecials \active ;
```

The shortcuts `\chardef\cone` is not defined in OptTeX. Use normal numbers instead of such obscurities. The `\magstep` and `\magstephalf` are defined with `\space`, (no `\relax`), in order to be expandable.

```
plain-macros.omp
27 \_def \magstephalf{1095 }
28 \_def \magstep#1{\_ifcase#1 1000\_or 1200\_or 1440\_or 1728\_or 2074\_or 2488\_fi\_space}
29 \_public \magstephalf \magstep ;
```

Plain **TEX** basic macros and control sequences. `\endgraf`, `\endline`. The `^L` is not defined in **OpTEX** because it is obsolete.

```
37 \_def\^\^M{\ } % control <return> = control <space>
38 \_def\^\^I{\ } % same for <tab>
39
40 \_def\lq{\`}\_def\rq{`}
41 \_def\lbrack{[} \_def\rbrack{]} % They are only public versions.
42 % \catcode`\^\^L=active \outer\def\^\^L{\par} % ascii form-feed is "\outer\par" % obsolete
43
44 \_let\_endgraf=\_par \_let\_endline=\_cr
45 \_public \endgraf \endline ;
```

Plain T<sub>E</sub>X classical \obeylines and \obeyspaces.

```

51 % In \obeylines, we say `let^M=par' instead of `def^M{\par}'           plain-macros.opm
52 % since this allows, for example, `let\par=\cr \obeylines \halign{...}'
53 {\_catcode`^M=13 % these lines must end with %
54   \gdef\obeylines{\_catcode`^M=13\_let^M\_par}%
55   \global\_let^M=par% this is in case ^M appears in a \write
56 \def\obeyspaces{\_catcode`^ =13 }
57 {\_obeyspaces\global\_let =\_space}
58 \public \obeylines \obeyspaces ;

```

Spaces. `\thinspace`, `\negthinspace`, `\enspace`, `\enskip`, `\quad`, `\qquad`, `\smallskip`, `\medskip`,  
`\bigskip`, `\nointerlineskip`, `\offinterlineskip`, `\topglue`, `\vglue`, `\hglue`, `\slash`.

```

68 \protected\def\thinspace {\kern .16667em }
69 \protected\def\negthinspace {\kern-.16667em }
70 \protected\def\enspace {\kern.5em }

116 \def\bigbreak {\par\ifdim\lastskip<\bigskipamount
117   \removelastskip \penalty-200 \bigskip \fi}
118
119 \public \break \nobreak \allowbreak \filbreak \goodbreak \eject \supereject \dosupereject
120   \removelastskip \smallbreak \medbreak \bigbreak ;

```

Boxes. `\line`, `\leftline`, `\rightline`, `\centerline`, `\rlap`, `\llap`, `\underline`.

```

128 \def\line {\hbox to\hsize}
129 \def\leftline #1{\line{\hss#1\hss}}
130 \def\rightline #1{\line{\hss#1\hss}}
131 \def\centerline #1{\line{\hss#1\hss}}
132 \def\rlap #1{\hbox to0pt{\hss#1\hss}}
133 \def\llap #1{\hbox to0pt{\hss#1\hss}}

```

```

134 \_def\_\underline #1{$\_setbox0=\_hbox{#1}\_dp0=0pt \_math \_underline{\_box0}$}
135
136 \_public \line \leftline \rightline \centerline \rlap \llap \underline ;

```

The `\strutbox` is declared as 10pt size dependent (like in plain TeX), but the macro `\setbaselineskip` (from `fonts-opmac.opm`) redefines it.

```

143 \_newbox\_\strutbox
144 \_setbox\_\strutbox=\_hbox{\_vrule height8.5pt depth3.5pt width0pt}
145 \_def \_\strut {\_relax\_\ifmmode\_\copy\_\strutbox\_\else\_\unhcopy\_\strutbox\_\fi}
146
147 \_public \strutbox \strut ;

```

plain-macros.opm

Alignment. `\hidewidth \ialign \multispan`.

```

153 \_def \_\hidewidth {\_hskip\_\hideskip} % for alignment entries that can stick out
154 \_def \_\ialign{\_everycr={}\_tabskip=\_zskip \_halign} % initialized \halign
155 \_newcount\_\mscount
156 \_def \_\multispan #1{\_omit \_\mscount=#1\_\relax
157   \_loop \_\ifnum\_\mscount>1 \_\spanA \_\repeat}
158 \_def \_\spanA {\_span\_\omit \_\advance\_\mscount by-1 }
159
160 \_public \hidewidth \ialign \multispan ;

```

plain-macros.opm

Tabbing macros are omitted because they are obsolete.

Indentation and others. `\textindent`, `\item`, `\itemitem`, `\narrower`, `\raggedright`, `\ttraggedright`, `\leavevmode`.

```

169 \_def \_\hang {\_hangindent\_\parindent}
170 \_def \_\textindent #1{\_indent\_\llap{#1\_\enspace}\_\ignorespaces}
171 \_def \_\item {\_par\_\hang\_\textindent}
172 \_def \_\itemitem {\_par\_\indent \_\hangindent2\_\parindent \_\textindent}
173 \_def \_\narrower {\_advance\_\leftskip\_\parindent
174   \_\advance\_\rightskip\_\parindent}

341
342 \_def \bye {\_par \vfill \supereject \byehook \end}
343 \public \bye ;

```

## 2.10 Preloaded fonts for text mode

Format in luaTeX can download only non-Unicode fonts. Latin Modern EC is loaded here. These fonts are totally unusable in LuaTeX when languages with out of ASCII or ISO-8859-1 alphabets are used (for example Czech). We load only few 8bit fonts here especially for simple testing the format. But, if the user needs to do a more serious work, he/she can use `\fontfam` macro in order to load a selected font family of Unicode fonts.

We have a dilemma: when the Unicode fonts cannot be preloaded in format then basic font set can be loaded by `\everyjob`. But why to load a set of fonts ta the beginning of every job when there is highly likely that the user will load something completely different. Our decision is: there is a basic 8bit font set and user will load the font at beginning of the document.

The fonts selectors `\tenrm`, `\tenbf`, `\tenit`, `\tenbi`, `\tentt` are declared as `\public` here but only for backward compatibility. We don't use them in the Font Selection System. But the protected versions of these control sequences are used in the Font Selection System.

fonts-preload.opm

```

3 \codedecl \tenrm {Latin Modern fonts (EC) preloaded <2020-01-23>} % loaded in format
4
5 % Only few text fonts are preloaded:
6
7 \font\tenrm=ec-lmr10 % roman text

```

```

8 \_font\tenbf=ec-lmbx10 % boldface extended
9 \_font\tenit=ec-lmri10 % text italic
10 \_font\tenbi=ec-lmbxi10 % bold italic
11 \_font\tentt=ec-lmtt10 % typewriter
12 \tenrm
13
14 \public \tenrm \tenbf \tenit \tenbi \tentt ;

```

## 2.11 Scaling fonts in text mode (low-level macros)

The `\setfontsize {<size spec>}` saves the information about `<size spec>`. This information is taken into account when a variant selector (for example `\rm`, `\bf`, `\it`, `\bi`) or `\resizethefont` is used. The `<size spec>` can be:

- `at<dimen>`, for example `\setfontsize{at12pt}`. It gives the desired font size directly.
- `scaled<scale factor>`, for example `\setfontsize{scaled1200}`. The font is scaled in respect to its native size (which is typically 10 pt). It behaves like `\font\... scaled<number>`.
- `mag<decimal number>`, for example `\setfontsize{mag1.2}`. The font is scaled in respect to the current size of the fonts given by the previous `\setfontsize` command.

The initialization value in `OptTeX` is given by `\setfontsize{at10pt}`.

The `\resizethefont` resizes the current font to the size given by previous `\setfontsize`. For example

```

Here is 10 pt text,
\setfontsize{at12pt} 10 pt text here unchanged...
\resizethefont      and 12 pt text is here.

```

The `\setfontsize` command acts like *font modifier*. It means that it saves information about fonts but does not change the font actually until variant selector or `\resizethefont` is used.

The following example demonstrates the `mag` format of `\setfontsize` parameter. It is only a curious example probably not used in practical typography.

```

\def\smaller{\setfontsize{mag .9}\resizethefont}
Text \smaller text \smaller text \smaller text.

```

If you load a font directly by `\font` primitive and you want to create a size-dependent selector for such font then you can use `\resizethefont`:

```

\font\tencomfortaa=Comfortaa-Regular-T1 at10pt
\def\comfortaa{\tencomfortaa\resizethefont}

\comfortaa Here is 10 pt text
\setfontsize{at12pt}
\comfortaa Here is 12 pt text

```

The example above uses the 8 bit `tfm` font. You can use Unicode font too, of course. The `\fontfam` macro initializes the extended `\font` primitive features for `Luatex`. If you didn't use this command, you must to initialize these features by the `\initunifonts` command explicitly, for example:

```

\initunifonts
\font\tencyklop=[cyklop-regular] at10pt % the font cyklop-regular.otf is loaded
\def\cyklop{\tencyklop\resizethefont}

\cyklop Here is 10 pt text
\setfontsize{at12pt}
\cyklop Here is 12 pt text

```

### 2.11.1 The `\fontdef` declarator

You can declare `\<newfont>` by the `\fontdef` command.

```

\fontdef \<newfont> {\<font modifiers>} {\<variant-selector>}
example:
\fontdef \bigfont {\setfontsize{at15pt}\bf}

```

This command runs  $\langle font\ modifiers \rangle$   $\backslash\langle variant\text{-}selector \rangle$  in a group and sets the resulting current font as  $\backslash\langle newfont \rangle$ .

The resulting  $\backslash\langle newfont \rangle$  declared by  $\backslash\text{fontdef}$  is “fixed font switch” independent of  $\backslash\text{setfontsize}$  and other font modifiers. More exactly, it is fixed font switch when it is used but it can depend on the current font modifiers and font family and given font modifiers when it is declared.

The parameter of the  $\backslash\text{fontdef}$  macro must be exactly finished by the variant selector. More information about font modifiers and variant selectors are in the section 2.12.

## 2.11.2 The $\backslash\text{fontlet}$ declarator

We have another command for scaling:  $\backslash\text{fontlet}$  which is able to resize arbitrary font given by its font switch. This font switch was declared it by the  $\backslash\text{font}$  primitive or the  $\backslash\text{fontdef}$  macro.

```
 $\backslash\text{fontlet } \backslash\langle newfont \rangle = \backslash\langle fontswitch \rangle \langle sizespec \rangle$ 
example:
 $\backslash\text{fontlet } \backslash\text{bigfont} = \backslash\text{tenbf at}15pt$ 
```

The resulted  $\backslash\text{bigfont}$  is the same as in previous example where  $\backslash\text{fontdef}$  was used. The advantage of  $\backslash\text{fontdef}$  macro will be more clear when you load font families by  $\backslash\text{fontfam}$  and you are using more font modifiers declared in such families.

Summary: you can declare font switches:

- by the  $\backslash\text{font}$  primitive if you know the font file,
- by the  $\backslash\text{fontlet}$  command if you know the font switch and the size, or
- by the  $\backslash\text{fontdef}$  command if you know the variant and modifiers.

## 2.11.3 Optical sizes

There are font families with more font files where almost the same font is implemented in various design sizes: `cmr5`, `cmr6`, `cmr7`, `cmr8`, `cmr9`, `cmr10`, `cmr12`, `cmr17` for example. This feature is called “optical sizes”. OptEX chooses a font with an optical size closest to desired size specified by the  $\backslash\text{setfontsize}$ , when  $\text{at}\langle dimen \rangle$  or  $\text{mag}\langle coefficient \rangle$  is used. When  $\text{scaled}\langle scale\ factor \rangle$  is used then optical size is chosen using the value of the  $\backslash\text{defaultoptsizes}$  register and such font is scaled by the specified  $\langle scale\ factor \rangle$ . There is  $\backslash\text{defaultoptsizes}=10pt$  by default.

Font collections with optical sizes must be registered by the  $\backslash\text{regtfm}$  for `tfm` files or  $\backslash\text{regoptsizes}$  for Unicode fonts. OptEX registers 8bit Latin Modern fonts in the format (`fonts-resize.opm` file) and OTF Latin Modern fonts in the `f-lmfonts.opm` file.

## 2.11.4 Implementation notes

```
fonts-resize.opm
3  \_codedecl \setfontsize {Font resizing macros <2020-04-17>} % preloaded in format
```

The  $\backslash\text{setfontsize}$   $\{\langle sizespec \rangle\}$  saves the  $\langle sizespec \rangle$  to the  $\backslash\text{_sizespec}$  macro. The  $\backslash\text{_optsizes}$  value is calculated from the  $\langle sizespec \rangle$ . If the  $\langle sizespec \rangle$  is in the  $\text{mag}\langle number \rangle$  format then the contents of the  $\backslash\text{_sizespec}$  macro is re-calculated to the  $\text{at}\langle dimen \rangle$  format using previous  $\backslash\text{_optsizes}$  value.

```
fonts-resize.opm
14 \_newdimen \_optsizes          \_optsizes=10pt

32 }
```

```

32 }
33 \_public \setfontsize \defaultoptsized ;

```

`\_resizelfont` {*variant-name*}\\{*font switch*}, for example `\resizelfont{bf}\_tenbf` resizes the font given by the variant. The variant `XX` have its font switch `\_tenXX`. The `\_doresizelfont\fontswitch` is used. It works in TFM mode (`\_doresizetfmfont`) or OTF mode (`\_doresizeunifont`). In both modes, it does

```
\_font \_tenXX = <fontname> \_sizespec
```

The *<fontname>* is generated by the `\fontname` TeX primitive where `\_rfontskipat` removes the `at(dimen)` part of the `\_fontname` output. The *<fontname>* is generated differently in OTF mode, see `\_doresizeunifont` macro.

The `\_whatresize` is defined as *<variant-name>*.

```
fonts-resize.opm
```

```

52 \_def \_resizelfont#1#2{%
53   \_edef \_whatresize{#1}%
54   \_ifx \_fontselector \_undefined \_doresizelfont#2%
55   \_else \_ea \_doresizelfont \_fontselector \_fi
56   \_lastmag=0pt
57   \_slet \_tryload#1 \_relax}%
58 }
59 \_def \_doresizetfmfont#1{\_logfont{#1}%
60   \_ea \_font \_ea#1 \_ea \_rfontskipat
61   \_fontname \_cs \_ten \_whatresize} \_relax \_space \_sizespec \_relax
62 }
63 \_let \_doresizelfont=\_doresizetfmfont
64 \_def \_logfont#1{} % default is no logging of used fonts
65
66 \_def \_rfontskipat#1{\_ifx#1"\_ea\_\rfskipatX \_else \_ea\_\rfskipatN \_ea#1\_\fi}
67 \_def \_rfskipatX #1" #2 \_relax{"\_whichtfm{#1}"}
68 \_def \_rfskipatN #1 #2 \_relax{\_whichtfm{#1}}

```

`\fontdef` {*font switch*} {*modifiers*} {*variant selector*} opens group, runs *modifiers* {*variant selector*} (i.e. it runs #2 parameter). The font switch #1 saved in the `\_fontselector` macro is re-declared because the variant selector runs the `\_resizelfont`. Now, we need to keep the current meaning of the font switch #1 but we must leave the opened group. This is done by the `\_keepmeaning` macro.

`\fontlet` {*font switch A*} {*font switch B*} {*size spec*} does

```
\font {font switch A} = <fontname> \_sizespec
```

The *<fontname>* is extracted using the primitive command `\_fontname` {*font switch B*}.

```
fonts-resize.opm
```

```

85 \_def \_fontdef #1#2{\_begingroup
86   \_ifx \_fontselector \_undefined \_def \_fontselector{#1} \_fi
87   \_reloading #2%
88   \_ea \_keepmeaning \_fontselector \_endgroup
89 }
90 \_def \_fontlet#1#2{\_ifx #2=\_ea\_\fontlet \_ea#1\_\else
91   \_ea \_font \_ea#1 \_ea \_rfontskipat \_fontname#2 \_relax \_space \_fi
92 }
93 \_def \_keepmeaning #1#2{\_global \_let \_keepmeaningdata=#1%
94   #2 \_let #1=\_keepmeaningdata \_global \_let \_keepmeaningdata=\_undefined
95 }
96 \_public \fontdef \fontlet ;

```

`\newcurrfontsize` {*size spec*} sets current font size to the *{size spec}* It is implemented by `\fontlet`. The font switch of the current font is extracted by `\_the\font`. We must re-create the control sequence `\_the\font` because its original meaning is set to “inaccessible” by TeX when `\font` primitive is started.

`\resizethefont` is implemented by `\newcurrfontsize` using data from the `\_sizespec` macro.

```
fonts-resize.opm
```

```

110 \_def \_newcurrfontsize #1{%
111   \_edef \_tmp{\_ea \_csstring \_the \_font}%
112   \_ea \_fontlet \_csname \_tmp \_ea \_endcsname \_the \_font \_space #1 \_relax
113   \_csname \_tmp \_endcsname
114 }
115 \_protected \_def \_resizethefont{\_newcurrfontsize \_sizespec}
116

```

```
117 \_public \newcurrfontsize \resizethefont ;
```

The variant selector is defined by `\protected\def\XX{\_tryloadXX \_tenXX}`. The `\_tryloadXX` can be in `\_relax` state if no font modifiers were declared. But normally it does `\_resizefont{XX}\tenXX`. This meaning is activated by the `\_reloading` macro.

```
fonts-resize.opm
```

```
126 \_def\_reloading{\_loadf{rm}\_tenrm \_loadf{bf}\_tenbf
127   \_loadf{it}\_tenit \_loadf{bi}\_tenbi
128 }
129 \_def\_loadf#1#2{\_sdef{\_tryload#1}{\_ifmmode \_else \_resizefont[#1]#2\_fi}}
130 \_def\_tryloadtt{\_resizefont{tt}\_tentt}
131
132 \_let\_tryloadrm=\_relax
133 \_let\_tryloadbf=\_relax
134 \_let\_tryloadit=\_relax
135 \_let\_tryloadbi=\_relax
```

The font selection system allows to use `\currvar` instead explicitly specified variant selector. The current variant is extracted from `\the\font` output which could be `\_tenXX` control sequence. Then `\currvar` expands to `\_rm` or `\_it` etc.

```
fonts-resize.opm
```

```
144 \_protected \_def \currvar{\_cs{\_currvar:\_ea \_csstring \_the\font}}
145 \_sdef{\_currvar:\_tenrm}{\_rm}
146 \_sdef{\_currvar:\_tenbf}{\_bf}
147 \_sdef{\_currvar:\_tenit}{\_it}
148 \_sdef{\_currvar:\_tenbi}{\_bi}
149 \_sdef{\_currvar:\_tentt}{\_tt}
150 \_public \currvar ;
```

The `\_regtfm {font id} {optical size data}` saves the `{optical size data}` concerned to `{font id}`. The `{optical size data}` is in the form as shown below in the code where `\_regtfm` is used.

The `\_wichtfm {fontname}` expands to the `{fontname}` or to the corrected `{fontname}` read from the `{optical size data}`. It is used in the `\_rfontskipat` macro and it is used in `\fontlet` macro. It means that each `{fontname}` generated by the `\fontname` primitive in the `\fontlet` macro is processed by the `\_wichtfm`. The real `{fontname}` or corrected `{fontname}` (depending on the optical data does not exist or exist) is the output of the expansion before `\font` primitive takes this output as its parameter.

The implementation detail: The `\_{font id}:reg` is defined as the `{optical size data}` and all control sequences `\_{fontname}:reg` from this data line has the same meaning because of the `\_reversetfm` macro. The `\_wichtfm` expands this data line and apply `\_dowhichtfm`. This macro select the right result from the data line by testing with the current `\_optsize` value.

```
fonts-resize.opm
```

```
175 \_def\_regtfm #1 0 #2 *{\_ea\_\def \_csname _#1:reg\endcsname{\#2 16380 \_relax}%
176   \_def\_\tmpa{\#1}\_reversetfm #2 * %
177 }
178 \_def\_reversetfm #1 #2 {%
179   we need this data for \_setmathfamily
180   \_ea\_\let\_\csname _#1:reg\_\ea\_\endcsname
181   \_\csname \_\tmpa:reg\_\endcsname

```

## 2.12 The Font Selection System

The basic principles of the Font Selection System used in OpTeX was documented in the section 1.3.1.

### 2.12.1 Terminology

We distinguish between

- *font switchers*, they are declared by the `\font` primitive or by `\fontlet` or `\fontdef` macros,
- *variant selectors*, there are four basic variant selectors `\rm`, `\bf`, `\it`, `\bi`, there is a special selector `\currvar` and more variant selectors can be declared by the `\famvardef` macro.
- *font modifiers* (for example `\cond`, `\caps`, `\setfontsize{size spec}`), they are in two types: build in (like `\setfontsize`) or declared modifiers (by by the `\moddef` macro).
- *family selectors* (for example `\Termes`, `\LMfonts`), they are declared typically in the *font family files*.

These selectors / switchers sets its values locally. When the TeX group is leaved then selected font and the *font context* are returned back to the values used when the group was opened. They have the following features:

- The *font switchers* select fonts independent on the font context.
- The *variant selectors* select the font depending on the font context and on the specified variant.
- The *font modifiers* create a change in the font context but they don't select the font itself.
- The *family selectors* set a family in the font context and resets all font modifiers. They don't select the font itself.

The variant selectors and declared font modifiers are defined in the family context. They can behave differently in different families.

The fonts registered in OpTeX have their macros in the *font family files*, each family is declared in one font family file with the name `f-famname.opm`. All families are collected in `fams-ini.opm` and user can give more declarations in the file `fams-local.opm`.

### 2.12.2 Font families, selecting fonts

The `\fontfam [Font Family]` opens the relevant font family file where the `<Font Family>` is declared. The family selector is defined here by rules described in the section 2.12.7. Font modifiers and variant selectors may be declared here. Their definitions depends on given family. The family is set as active in the font context and `\rm` variant selector is run.

The available declared font modifiers and declared variant selectors are listed in the log file when font family is load. Or you can print `\fontfam[catalog]` to show available font modifiers and variant selectors.

The font modifiers can be independent, like `\cond` and `\light`. They can be arbitrary combined (in arbitrary order) and if the font family disposes with all such sub-variants then the desired font is selected (after variant selector is used). On the other hand there are font modifiers which negates the previous font modifier, for example `\cond`, `\extend`. You can reset all modifiers to their initial value by the `\resetmod` command.

You can open more font families by more `\fontfam` commands. Then the general method to selecting the individual font is:

`<family selector> <font modifiers> <variant selector>`

For example:

```

\fontfam [Heros] % Heros family is active here, default \rm variant.
\fontfam [Termes] % Termes family is active here, default \rm variant.
{\Heros \caps \cond \it The caps+condensed italics in Heros family is here.}
The Termes roman is here.

```

There is one special command `\currvar` which acts as variant selector. It keeps the current variant and the font of such variant is reloaded with respect to the current font context by previously given family selector and font modifiers.

You can use the `\setfontsize {<sizespec>}` command in the same sense as other font modifiers. It saves only information about font size to the font context. See section 2.11. Example:

```
\rm default size \setfontsize{at14pt}\rm here is 14pt size \it italic is
in 14pt size too \bf bold too.
```

Much more comfortable way to resize fonts is using OPmac-like command `\typosize`, `\typoscale`. These commands prepare the right sizes for math fonts too and re-calculates many internal parameters like `\baselineskip`. See section 2.16 for more information.

### 2.12.3 Math Fonts

Most font families are connected with a preferred Unicode-math font. This Unicode-math is activated when the font family is loaded. If you don't prefer this and you are satisfied with 8bit math CM+AMS fonts preloaded in the OpTeX format then you can use command `\noloadmath` before you load a first font family.

If you want to use your specially selected Unicode-math font then use `\loadmath {[<font_file>]}` or `\loadmath {<font_name>}` before first `\fontfam` is used.

### 2.12.4 Declaring font commands

The font switches can be declared by `\font` primitive or by `\fontdef` or `\fontlet` macros. See the sections 2.11.1 and 2.11.2 for more details. The general format for `\fontdef` is

```
\fontdef\langle font switch\rangle {\langle family selector\rangle \langle font modifiers\rangle \langle variant selector\rangle}
```

Such font switches should be used in `\output` routine (headers, footers) for example. We need fixed sizes here. But they are less usable in common text. For example the document includes notices in smaller font. When the notice is started then we want to do all variants smaller: `\rm`, `\it`, `\bf`, etc. It means that the smaller font for notices should be initialized by `\setfontsize{at9pt}\rm` for example. If you want a “notices font selector” then you can do `\def\noticefont{\setfontsize{at9pt}\rm}`. This font selector does not change the `\baselineskip`. If you want to do this then put different `\baselineskip` setting to your definition. But you must not forget that the end of group before `\par` is a typical mistake of T<sub>E</sub>X users: the last paragraph is in smaller font but in normal baselineskip, because `\baselineskip` setting is taken into account when `\par` command is processed.

Somewhat more complicated task is the “title font selector”, because titles are not only bigger but they are typically in bold variant. When the user puts `{\it...}` into the title then he/she expects bold italic here, no normal italic. You can remember the great song by John Lennon “Let It Be” and define:

```
\def\titlefont{\setfontsize{at14pt}\bf \let\it\bi}
...
{\titlefont here we have bold 14pt font and {\it here} was bold 14pt italics}
```

You can declare a new variant slector by the `\famvardef` macro. This macro has similar syntax as `\fontdef`:

```
\famvardef\langle new variant selector\rangle {\langle font modifiers\rangle \langle variant selector\rangle}
```

The `\langle new variant selector\rangle` should be used in the same sense as `\rm`, `\bf` etc. It can be used as the final command in the `\fontdef` or `\famvardef` declarators too. When the `\langle new variant selector\rangle` is used in normal text then it does following steps: pushes current font context to a stack, modifies font context by declared `\langle font modifiers\rangle`, runs following `\langle variant selector\rangle`. It selects a font. Then pops the stack. The font context have its original values but new font is selected.

The `\famvardef` creates the `\langle new variant selector\rangle` family dependent. When the selector is used in another family than it is defined then warning is printed on the terminal “`\langle var selector\rangle` is undeclared in current family” and nothing happens. But you can declare the same variant selector by `\famvardef` macro in the context of new family. Then the same command will be do different work depending on the current font family.

Suppose that the selected font family provides the font modifier `\medium` for mediate weight of fonts but supports only basic variant selectors `\rm`, `\bf`, `\it`, and `\bi`. Then you can declare:

```
\famvardef \mr {\medium\rm}
\famvardef \mi {\medium\it}
```

Now, you can use six independent variant selectors `\rm`, `\bf`, `\it`, `\bi`, `\mr` and `\mi` in the selected font family.

A `\langle family selector \rangle` can be written before `\langle font modifiers \rangle` in the `\famvardef` parameter. Then the `\langle new variant selector \rangle` is declared in the current family but it can use fonts from another family represented by the `\langle family selector \rangle`.

When you are mixing fonts from more families then you probably run into problem with incompatible ex-heights. This problem can be solved using `\setfontsize` and `\famvardef` macros:

```
\fontfam[Heros] \fontfam[Termes]

\def\exhcorr{\setfontsize{mag.88}}
\famvardef\rmsans{\Heros\exhcorr\rm}
\famvardef\itsans{\Heros\exhcorr\it}
```

Compare ex-height of Termes `\rmsans` with Heros `\rm` and Termes.

There exists analogical declarator `\moddef` for declaration family dependent font modifiers. It is described in detail the section [2.12.7](#).

### 2.12.5 Modifying font features

Each OTF font provides “font features”. You can list these font features by `otfinfo -f font.otf`. For example LinLibertine fonts provide `frac` font feature. If it is active then fractions like  $1/2$  are printed in a special form.

The font features are part of the font context data. The macro `\setff \{<feature>\}` acts like family independent font modifier and prepares a new `\langle feature \rangle`. You must use a variant selector in order to reinitialize the font with the new font feature. For example `\setff{+frac}\rm` or `\setff{+frac}\currvar`. You can declare a new variant selector too:

```
\fontfam[LinLibertine]
\famvardef \fraclig {\setff{+frac}\currvar}
Compare 1/2 or 1/10 \fraclig to 1/2 or 1/10.
```

If the used font does not supports given font feature then font is reloaded without warning nor error, silently. The font feature is not activated.

The `onum` font feature (old style digits) is connected to `\caps` macro for Caps+SmallCaps variant in OpTeX font family files. So you need not to create a new modifier, just use `\caps\currvar 012345`.

### 2.12.6 Special font modifiers

Despite the font modifiers declared in the font family file (and dependent on the font family), we have following font modifiers (independent of font family):

```
\setfontsize{\size} % sets the font size
\setff{\fontfeature} % adds the font feature
\setfontcolor{\color} % sets font color
\setletterspace{\number} % sets letter spacing
\setwordspace{\scaling} % modifies word spacing
```

The `\setfontsize` command is described in the section [2.11](#). The `\setff` command was described in previous subsection.

`\setfontcolor \{<color>\}` specifies the color and the opacity of the text. The `<color>` parameter should be in hexadecimal format of four bytes `<red><green><blue><opacity>`, for example `FF0080FF` means full red, zero green, half blue and full opacity. You can use names `red`, `green`, `blue`, `yellow`, `cyan`, `magenta`, `white`, `grey`, `lgrey` (without backslash) instead of the hexadecimal specification. The empty parameter `<color>` means default black color.

That colors of fonts are implemented using LuaTeX internal font feature. This is different approach than using colors in section [2.19](#).

`\setletterspace {⟨number⟩}` specifies letter spacing of the font. The ⟨number⟩ is decimal number without unit. The unit is supposed as 1/100 of the font size. I.e. 2.5 means 0.25 pt when the font is at 10 pt size. The empty parameter ⟨number⟩ means no letter spacing which is default.

`\setwordspace {⟨scaling⟩}` scales the default inter word space (defined in the font) and its stretching and shrinking parameters by given ⟨scaling⟩ factor. For example `\setwordspace{2.5}` multiplies inter word space by 2.5.

If you need another font transformations, you can use `\setff` with following font features provided by LuaTeX:

```
\setff{embolden=1.5}\rm % font is bolder because outline has nonzero width
\setff{slant=0.2}\rm    % font is slanted by a linear transformation
\setff{extend=1.2}\rm   % font is extended by a linear transformation.
\setff{colr=yes}\rm     % if the font includes colored characters, use colors
```

Use font transformations mentioned above and `\setletterspace`, `\setwordspace` with care. The best setting of these values is default setting in every font, of course. If you really needs to set a different letter spacing then it is strongly recommended to add `\setff{-liga}` in order to disable ligatures. And setting a positive letter spacing probably needs to scale inter word spacing too.

All mentioned font modifiers (with the exception of `\setfontsize`) work only with Unicode fonts loaded by `\fontfam`.

## 2.12.7 How to create the font family file

The font family file declares the font family for selecting fonts from such family at arbitrary size and with various shapes. Unicode fonts (OTF) are preferred. The following example declares the Heros family:

```
f-heros.opm
3 \famdecl [Heros] \Heros {TeX Gyre Heros fonts based on Helvetica}
4   {\caps \cond} {\rm \bf \it \bi} {FiraMath}
5   {[texgyreheros-regular]}
6   {\def\_fontnamegen{[texgyreheros\_condV-\_currV]:\_capsV\_fontfeatures}}
7
8 \wlog{\detokenize{%
9 Modifiers:^^J
10 \caps ..... caps & small caps^^J
11 \cond ..... condensed variants^^J
12 }}%
13
14 \moddef \resetmod {\fsetV caps={},cond={} \fvars regular bold italic bolditalic }
15 \moddef \caps {\fsetV caps=+smcp;+onum; }
16 \moddef \nocaps {\fsetV caps={}}
17 \moddef \cond {\fsetV cond=cn }
18 \moddef \nocond {\fsetV cond={}}
19
20 \initfontfamily % new font family must be initialized
21
22 \loadmath {[FiraMath-Regular]}
```

If you want to write such font file, you need to keep following rules.

- Use the `\famdecl` command first. It has the following syntax:

```
\famdecl [<Name of family>] <Familyselector> {<comments>}
  {<modifiers>} {<variant selectors>} {<comments about math fonts>}
  {<font-for-testing>}
  {\def\_fontnamegen{<font name or font file name generated>}}
```

This writes information about font family at the terminal and prevents loading such file twice. Moreover, it probes existence of `<font-for-testing>` in your system. If it doesn't exist, the file loading is skipped with a warning on the terminal. The `\ifexistfam` macro returns false in such case. The `\fontnamegen` macro must be defined in the last parameter of the `\famdecl`. More about it is documented below.

- You can use `\wlog{\detokenize{...}}` to write additional information into log file.
- You can declare optical sizes using `\regoptsizes` if there are more font files with different optical sizes (like in Latin Modern). See `f-lmfonts.ofm` file for more information about this special feature.

- Declare font modifiers using `\_moddef` if they are present. The `\resetmod` must be declared in each font family.
- Check if all your declared modifiers does not produce any space in horizontal mode. For example check: X`\caps` Y, the letters XY must be printed without any space.
- Optionally, declare new variants by the `\famvardef` macro.
- Run `\_initfontfamily` in order to start the family.
- If math font should be loaded, use `\_loadmath{<math font>}`.

The `\_fontnamegen` macro (declared in the last parameter of the `\_famdecl`) must expand (at expand processor level only) to a file name of loaded font (or to its font name) and to optional font features appended. The Font Selection System uses this macro at primitive level in the following sense:

```
\font \<selector> {\_fontnamegen} \_sizespec
```

Note that the extended `\font` syntax `\font\<selector> {\<font name>:\<font features>}\<size spec>` or `\font\<selector> {[<font file name>] :\<font features>}\<size spec>` is expected here.

**Example.** Assume an abstract font family with fonts `xx-Regular.otf`, `xx-Bold.otf`, `xx-Italic.otf` and `xx-BoldItalic.otf`. Then you can declare the `\resetmod` (for initializing the family) by:

```
\_moddef\resetmod{\_fvars Regular Bold Italic BoldItalic }
```

and define the `\_fontnamegen` in the last parameter of the `\_famdecl` by:

```
\_famdecl ...
{\def\_fontnamegen{[xx-\_currV]}}
```

The following auxiliary macros are used here:

- `\moddef` declares the family dependent modifier. The `\resetmod` saves initial values for the family.
- `\_fvars` saves four names to the memory, they are used by the `\_currV` macro.
- `\_currV` expands to one of the four names dependent on `\rm` or `\bf` or `\it` or `\bi` variant is required.

Assume that the user needs `\it` variant in this family. Then the `\_fontnamegen` macro expands to `[xx-\_currV]` and it expands to `[xx-Italic]`. The Font Selection System uses `\font {[xx-Italic]}`. This command loads the `xx-Italic.otf` font file.

See more advanced examples in `f-<family>.opm` files. The `f-heros.opm` is listed here. When Heros family is selected and `\bf` is asked then

```
\font {[texgyreheros-bold]:+tlig;} at10pt
```

is processed.

You can use any expandable macros or expandable primitives in the `\_fontnamegen` macro. The simple macros in our example with names `\_<word>V` are preferred. They expand typically to their content. The macro `\_fsetV <word>=<content>` (terminated by a space) is equivalent to `\def\_<word>V{<content>}` and you can use it in font modifiers. You can use the `\_fsetV` macro in more general form:

```
\_fsetV <word-a>=<value-a>,<word-b>=<value-b> ...etc. terminated by a space
```

with obvious result `\def\_{<word-a>V}{<value-a>}\def\_{<word-b>V}{<value-b>}` etc.

Example: if both font modifiers `\caps` and `\cond` were applied from the Heros family, then `\def\_\capsV{+smcp;+onum}` and `\def\_\condV{cn}` were processed by these font modifiers. If user needs the `\bf` variant at 11 pt now then the

```
\font {[texgyreheroscn-bold]:+smcp;+onum;+tlig;} at11pt
```

is processed. We assume that a font file `texgyreheroscn-bold.otf` is present in your TeX system.

Recommendation: the `\_fontfeatures` macro at the end of the `\_fontnamegen` macro in order to the `\setff`, `\setfontcolor`, `\setletterspace` macros can work.

The `\moddef` macro does more things than simple `\def`:

- The modifier macros are defined as `\_protected`.
- The modifier macros are defined as family-dependent.

The `\famvardef` macro has the same features.

The  $\langle\text{Familyselector}\rangle$  is defined by the `\_famdecl` macro as:

```
\protected\def\langle Familyselector \rangle {%
  \def\_currfamily {\langle Familyselector \rangle}%
  \def\_fontnamegen {\langle font name or font file name generated \rangle}%
  \resetmod
```

The **font context** consists from

- Family context, i.e. `\_currfamily` and `\_fontnamegen` values saved by the  $\langle\text{Familyselector}\rangle$ ,
- `\_sizespec` value saved by the `\setfontsize` macro,
- whatever what influences the expansion of the `\_fontnamegen` macro, they are typically macros `\_<key>V` saved by the font modifiers.

The `\_initfontfamily` must be run after modifers decaration. It sets `\_let\_resetmod=\resetmod` and runs the  $\langle\text{Familyselector}\rangle$ . Finally, it runs `\_rm`, so first font from new family is loaded and it is ready to use it.

**Name conventions.** Create font modifiers, new variants and the  $\langle\text{Familyselector}\rangle$  only as public, i.e. without `_` prefix. We assume that if user re-defines them then he/she needs not them, so we have no problems.

The name of  $\langle\text{Familyselector}\rangle$  should begin with uppercase letter.

If you need to declare your private modifier (because it is used in another modifiers or macros, for example), use the name `\_wordM`. You can be sure that such name does not influence the private name space used by OpTeX.

**Additional notes.** See the font family file `f-libertine-s.opm` which is another example where no font files but font names are used.

See the font family file `f-lmfonts.opm` where you can find the the example of the optical sizes declaration including a documentation about it.

If you need to create font family file with non-Unicode font, you can do it. The `\_fontnamegen` must expand to the name of TFM file in such case. But we don't prefer such font family files, because they are usable only with languages with alphabet subset to ISO-8859-1 (Unicodes are equal to letter codes of such alphabets), but middle or east Europe use languages where such condition is not true.

## 2.12.8 How to write the font family file with optical sizes

You can use `\optname` macro when `\_fontnamegen` in expanded. This macro is fully expandable and its input is  $\langle\text{internal-template}\rangle$  and its output is a part of the font file name  $\langle\text{size-dependent-template}\rangle$  with respect to given optical size.

You can declare a collection of  $\langle\text{size-dependent-template}\rangle$ s for one given  $\langle\text{internal-template}\rangle$  by the `\_regoptsizes` macro. The syntax is shown for one real case:

```
\_regoptsizes lmr.r lmroman?-regular
  5 <5.5 6 <6.5 7 <7.5 8 <8.5 9 <9.5 10 <11.1 12 <15 17 <*
```

In general:

```
\_regoptsizes <internal-template> <general-output-template> <resizing-data>
```

Suppose our example above. Then `\optname{lmr.r}` expands to `lmroman?-regular` where the question mark is substituted by a number depending on current `\_optsizes`. If the `\_optsizes` lies between two boundary values (they are prefixed by `<` character) then the number written between them is used. For example if  $11.1 < \_optsizes \leq 15$  then 12 is substituted instead question mark. The  $\langle\text{resizing-data}\rangle$  virtually begins with zero `<0`, but it is not explicitly written. The right part of  $\langle\text{resizing-data}\rangle$  must be terminated by `<*` which means "less than infinity".

If `\optname` gets an argument which is not registered  $\langle\text{internal-template}\rangle$  then it expands to `\_failedoptname` which typically ends to error message about missing font. You can redefine `\_failedoptname` macro to some existing font if you find it useful.

We are using a special macro `\LMregfont` in `f-lmfonts.opm`. It sets the file names to lowercase and enables to use a shortcasts instead real  $\langle\text{resizing-data}\rangle$ . There are shortcats `\_regoptFS`, `\_regoptT`,

etc. here. The collection of *<internal-templates>* are declared, each of them covers a collection of real file names.

The `\_optfontalias {<new-template>} {{<internal-template>}}` declares *<new-template>* with the same meaning as previously declared *<internal-template>*.

The `\_optname` macro can be used even if no otical sizes are provided by a font family. Suppose that font file names are much more chaotic (because artists are very creative people), so you need to declare more systematic *<internal-templates>* and do an alias from each *<internal-template>* to *<real-font-name>*. For example, you can do it as follows:

```
\def\fontalias #1 #2 {\_regoptsizes #1 ?#2 {} <*>
%           alias name      real font name
\fontalias crea-a-regular   {Creative Font}
\fontalias crea-a-bold     {Creative FontBold}
\fontalias crea-a-italic   {Creative oblique}
\fontalias crea-a-bolditalic {Creative Bold plus italic}
\fontalias crea-b-regular   {Creative Regular subfam}
\fontalias crea-b-bold     {Creative subfam bold}
\fontalias crea-b-italic   {Creative-subfam Oblique}
\fontalias crea-b-bolditalic {Creative Bold subfam Oblique}
```

## 2.12.9 How to register the font family in the Font Selection System

Once you have prepared a font family file with the name `f-<famname>.opm` and TeX is able to see it in your filesystem then you can type `\fontfam[<famname>]` and the file is read, so the information about the font family is loaded. The name *<famname>* must be lowercase and without spaces in the file name `f-<famname>.opm`. On the other hand the `\fontfam` command is more tolerant: you can write uppercase letters and spaces here. The spaces are ignored and uppercase letters are converted to lowercase. For example `\fontfam [LM Fonts]` is equivalent to

and both commands load the file `f-lmfonts.opm`.

You can use your font file in sense of previous paragraph without registering it. But problem is that such families are not listed when `\fontfam[?]` is used and it is not included in font catalogue when `\fontfam[catalog]` is printed. The list of families taken in the catalogue and listed on the terminal is declared in two files: `fams-ini.opm` and `fams-local.opm`. The second file is optional. User can create it and write to it the information about user-defined families using the same syntax as in existed file `fams-ini.opm`.

The information from the user's `fams-local.opm` file has precedence. For example `fams-ini.opm` declares aliases Times→Termes etc. If you have the original Times purchased from Adobe then you can register your declaration of Adobe's Times family in `fams-local.opm`. When a user writes `\fontfam[Times]` then the original Times (not Termes) is used.

The `fams-ini.opm` and `fams-local.opm` files use the macros `\_faminfo`, `\_famalias` and `\_famtext`. See the example from `fams-ini.tex`:

```
fams-ini.opm
3 % Version <2020-02-28>. Loaded in format and secondly on demand by \fontfam[catalog]
4
5 \_famtext {Special name for printing a catalogue:}
6
7 \_faminfo [Catalogue] {Catalogue of all registered font families} {fonts-catalog} {}
8 \_famalias [Catalog]
9
10 \_famtext {Computer Modern like family:}
11
12 \_faminfo [Latin Modern] {TeX Gyre fonts based on Computer Modern} {f-lmfonts}
13   { -, \nbold, \sans, \sans\nbold, \slant, \ttset, \ttset\slant, \ttset\caps, %
14     \ttprop, \ttprop\bolder, \quotset: {\rm\bf\it\bi}
15     \caps: {\rm\it}
16     \ttlight, \ttcond, \dunhill: {\rm\it} \upital: {\rm} }
17 \_famalias [LMfonts] \_famalias [Latin Modern Fonts]
18
19 \_famtext {TeX Gyre fonts based on Adobe 35:}
20
21 \_faminfo [Termes] {TeX Gyre Termes fonts based on Times} {f-termes}
22   { -, \caps: {\rm\bf\it\bi} }
23 \_famalias [Times]
```

```

24 \_faminfo [Heros] {TeX Gyre Heros fonts based on Helvetica} {f-heros}
25   { -, \caps, \cond, \caps\cond: f\rm\bf\it\bi{} }
27 \_famalias [Helvetica]

```

... etc.

The `\_faminfo` command has the syntax:

```
\_faminfo [<Family Name>] {[<comments>]} {[<file-name>]}
  { <mod-plus-vars> }
```

The `<mod-plus-vars>` data is used only when printing catalogue. It consists with one or more pairs `<mods>: {<vars>}` `<mods>: {<vars>}` etc. For each pair: each modifiers (separated by comma) are applied to each `<vars>` and prepared sample is printed. The `-` character means no modifiers should be applied.

The `\_famalias` declares an alias to the last declared family.

The `\_famtext` writes a line to the terminal and to the log file when all families are listed.

## 2.12.10 Implementation of the Font Selection System

```
3 \_codeldecl \fontfam {Fonts selection system <2020-03-18>} % preloaded in format
```

The `\initunifonts` initializes extended `\font` primitive (to be able to load Unicode fonts). Unfortunately, this part of OpTeX depends on L<sup>A</sup>T<sub>E</sub>X lua codes `ltluatex.lua` and `luaotfload-main.lua`. And this code need to be declared a control sequence `\e@alloc@attribute@count` by `\countdef` primitive. Moreover, the `\initunifont` switches with the `\_doresizefont` macro to OTF mode which is represented by the macro `\_doresizeunifont`. This mode includes a fallback to TFM mode if `\_fontnamegen` is not defined. Finally, the `\initunifnt` sets itself to relax because we need not to do this work twice.

```
fonts-select.opm
19 \_def\_\initunifonts {%
20   \_ea\_\newcount \_csname e@alloc@attribute@count\_endcsname
21   \_global \_csname e@alloc@attribute@count\_endcsname=-1
22   \_directlua{%
23     require("ltluatex")
24     require('luaotfload-main') local _void = luaotfload.main ()
25   }%
26   \_gdef\_\rfskipatX ##1" ##2\_relax{"##1"}%
27   \_global\_\let \_doresizefont=\_doresizeunifont
28   \_gdef\_\tryloadtt {\\_fontdef\_\tentt{\_def\_\fontnamegen{[lmmmono10-regular]}\_rm}}%
29   \_global\_\let \_initunifonts=\_relax % we need not to do this work twice
30   \_global\_\let \_initunifonts=\_relax
31 }
32 \_gdef\_\doresizeunifont #1{\_logfont{#1}%
33   \_ifx\_\fontnamegen\_\undefined \_doresizetfmfont#1\_else
34     \_font#1=\_fontnamegen} \_sizespec \_relax \_setwsp#1\_\relax
35   \_fi
36 }
37 \_public \initunifonts ;
```

The `\_famdecl [<Family Name>] \<Famselector> {[<comment>]} {[<modifiers>]} {[<variants>]} {[<math>]}` `{<font for testing>}` `{\def\_\fontnamegen{[<data>]}}` runs `\initunifonts`, then checks if `\<Famselector>` is defined. If it is true, then closes the file by `\endinput`. Else it defines `\<Famselector>` and saves it to the `\_mainfamcommand` macro because the `\_initfontfamily` needs it. The `\_currfamily` is set to the `<Famselector>` because the following `\moddef` commands need to be in the right font family context. The `\_currfamily` is set to the `<Famselector>` by the `\<Famselector>` too, because `\<Famselector>` must set the right faily context. The font family context is given by the current `\_currfamily` value and by the actual meaning of the `\_fontnamegen` macro.

```
fonts-select.opm
52 \_def\_\famdecl [#1]#2#3#4#5#6#7#8{%
53   \_initunifonts \_uniaccents
54   \_ifx #2\_\undefined
55     \_isfont{#7}\_iffalse
56       \_opwarning{Family [#1] skipped, font "#7" not found}\_ea\_\ea\_\ea\_\endinput \_else
57       \_edef\_\currfamily {\_csstring #2}%
58       \_def\_\mainfamcommand{#2}\_def\_\mathfaminfo{#6}%
59       \_protected\_\edef#2{\_def\_\noexpand\_\currfamily{\_csstring #2}\_unexpanded{#8\_\resetmod}}%
```

```

60      \_wterm {FONT: [#1] -- \_string#2 \_detokenize{(#3)^~J mods:{#4} vars:{#5} math:{#6}}}%
61      \_fi
62      \_else \_ea #2\ea\_endinput \_fi
63  }
64 \_def\initfontfamily{%
65   \mainfamcommand \reloading \rm
66 }

```

\regoptsizes *internal-template* <*left-output*>?<*right-output*> <*resizing-data*> prepares data for using by the \optname *internal-template* macro. The data are saved to the \oz:*internal-template* macro. When the \optname is expanded then the data are scanned by the macro \optnameA <*left-output*>?<*right-output*> <*mid-output*> <*size*> in the loop.

\optfontalias {\template A}{\template B} is defined as \let\oz:\templateA=\oz:\templateB. fonts-select.opm

```

79 \_def\regoptsizes #1 #2?#3 #4*{\_sdef{_oz:#1}{#2?#3 #4* }}
80 \_def\optname #1{\_ifcsname _oz:#1\endcsname
81   \ea\ea\ea \_optnameA \csname _oz:#1\ea\endcsname

\fvars *rm-template* <*bf-template*> <*it-template*> <*bi-template*> saves data for usage by the \currV macro. If a template is only dot then previous template is used (it can be used if the font family doesn't dispose with all standard variants).

\currV expands to a template declared by \fvars depending on the *variant name*. Usable only of standard four variants. Next variants can be declared by the \famvardef macro.

\fset <key>=<value>, ..., <key>=<value> expands to \def\<key>V{\<value>} in the loop.

\onlyif <key>=<value-a>, <value-b>..., <value-z>: {\<what>} runs <what> only if the \<key>V is defined as <value-a> or <value-b> or ... or <value-z>. fonts-select.opm

```

The \moddef \<modifier> {\<data>} simply speaking does \def\<modifier>{\<data>}, but we need to respect the family context. In fact, \protected\def\f :<current family>:<modifier>{\<data>} is performed and the \<modifier> is defined as \famdepend\<modifier>{\\_f:\\_currfamily:<modifier>}. It expands to \f:\\_currfamily:<modifier> value if it is defined or it prints warning. When the \currfamily value is changed then we can declare the same \<modifier> with different meaning.

When user declare a prefixed variant of the \<modifier> then unprefixed modifier name is used in internal macros, this is reason why we are using the \remifirstunderscore\\_\tmp (where \tmp expands to \\_something or to something). The \remifirstunderscore redefines \tmp in the way that it expands only to something without the first \_.

```

149 \_def \_moddef #1#2{\_edef\_tmp{\_csstring#1}\_remfirstunderscore\_tmp

```

The `\famvardef \langle XX \rangle {<data>}` uses analogical trick like `\moddef` with the `\famdepend` macro. The auxiliary `\famvardefA \langle XX \rangle \ten<XX> \tryload<XX> {<data>}` is used. It does:

- `\protected\def \langle XX \rangle {\_famdepend \langle XX \rangle {_f:\_currfamily:<XX>}}`,
- `\def \_f:<current family>:<XX> {\_tryload<XX> \ten<XX>}` keeps family dependent definition,
- `\def \_tryload<XX> {\fontdef \ten<XX> {<data>}}` loads actually the font `\ten<XX>`,
- `\def \currvar:_ten<XX> {\langle XX \rangle}` in ordef to the `\currvar` macro work correctly.

```

197 \_public \famvardef ;

```

The `\fontfam [<Font Family>]` does:

- Convert its parameter to lower case and without spaces, e.g. `<fontfamily>`.
- If the file `f-<fontfamily>.opm` exists read it and finish.
- Try to load user defined `fams-local.opm`.
- If the `<fontfamily>` is declared in `fams-local.opm` or `fams-ini.opm` read relevant file and finish.
- Print the list of declared families.

The `fams-local.opm` is read by the `\tryloadfamslocal` macro. It sets itself to `\relax` because we need not to load this file twice. The `\listfamnames` macro prints registered font families to the terminal and to the log file.

```

215 \_def\fontfam[#1]{%
216   \_lowercase{\_edef\famname{\_ea\removespaces #1 {} }}%

244   \_def\famalias[##1]{\_message{##1}}\_famalias
245 }
246 \_public \fontfam ;

```

When the `fams-ini.opm` or `fams-loca.opm` files are read then we need to save only a mapping from family names or alias names to the font family file names. All other information is ignored in this case. But if these files are read by the `\listfamnames` macro or when printing a catalog then more information is used and printed.

`\famtext` does nothing or prints the text on the terminal.

`\faminfo` [*{Family Name}*] {[*comments*} {[*file-name*} {[*mod-plus-vars*}]} does

`\def\famf:`*{familyname}* {[*file-name*}]} or prints information on the terminal.

`\famalias` [*{Family Alias}*] does `\def\famf:`*{familyalias}* {[*file-name*}]} where *{file-name}* is stored from the previous `\faminfo` command. Or prints information on the terminal.

```

265 \_def\famtext #1{%
266 \_def\faminfo [#1]#2#3#4{%
267   \_lowercase{\_edef\_\tmp{\_ea\_removespaces #1 {} }}%
268   \_sdef\famf:\_\tmp{#3}%
269   \_def\famfile{#3}%
270 }
271 \_def\famalias [#1]{%
272   \_lowercase{\_edef\famname{\_ea\_removespaces #1 {} }}%
273   \_sdef\famf:\_famname\_\ea{\_famfile}%
274 }
275 \_input fams-ini.opm
276 \_let\famfile=\_undefined

```

When the `\fontfam[catalog]` is used then the file `fonts-tatalog.opm` is read. The macro `\faminfo` is redefined here in order to print catalog samples of all declared modifiers/variant pairs. The user can declare different samples and different behavior of the catalog, see the end of catalog listing for more information. The default parameters `\catalogsample`, `\catalogmathsample`, `\catalogonly` and `\catalogexclude` of the catalog are declared here.

```

289 \_newtoks \catalogsample
290 \_newtoks \catalogmathsample
291 \_newtoks \catalogonly
292 \_newtoks \catalogexclude
293 \catalogsample={ABCDabcd Qsty fi fl áéíóüü řžč ÁÉÍÓÚ ŘŽČ 0123456789}
294
295 \_public \catalogonly \catalogexclude \catalogsample \catalogmathsample ;

```

The font features are managed in the `\fontfeatures` macro. They have their implicit values saved in the `\defaultfontfeatures` and the `\setff` {[*features*}]} can add next font features. If there is the same font feature as the newly added one then the old value is removed from the `\fontfeatures` list.

```

305 \_def \defaultfontfeatures {+tlig;}
306 \_def \setff #1{%
307   \_ifx^#1^\_let \fontfeatures=\_defaultfontfeatures
308   \_else \_edef\fontfeatures{\fontfeatures #1;}\_fi

316     \_fi
317 }
318 \_public \setff ;

```

The `\setfontcolor` and `\setletterspace` are macros based on the special font features provided by `LuaTeX` (and by `XeTeX` too but it is not our business). The `\setwordspace` recalculates the `\fontdimen2,3,4` of the font using the `\setwsp` macro which is used by the `\doresizeunifont` macro. It activates a dummy font feature `+Ws` too in order the font is reloaded by the `\font` primitive (with independent `\fontdimen` registers).

```

## 2.13 Preloaded fonts for math mode

The Computer Modern and AMS fonts are preloaded here in classical math-fam concept, where each math family includes three fonts with max 256 characters (typically 128 characters).

On the other hand, when `\fontfam` macro is used in the document then text font family and appropriate math family is loaded with Unicoded fonts, i.e. Unicoded-math is used. It re-defines all settings given here.

The general rule of usage the math fonts in different sizes in `OpTeX` says: set three sizes by the macro `\setmathsizes [⟨text-size⟩/⟨script-size⟩/⟨scriptscript-size⟩]` and then load all math fonts in given sizes by `\normalmath` or `\boldmath` macros. For example

```
\setmathsizes[12/8.4/6]\normalmath ... math typesetting at 12 pt is ready.
```

```

math-preload.opm
3 \_codedecl \normalmath {Math fonts CM + AMS preloaded <2020-05-06>} % preloaded in format

```

We have two math macros `\normalmath` for normal shape of all math symbols and `\boldmath` for bold shape of all math symbols. The second one can be used in bold titles, for example. These macros load all fonts from all given math font families.

```

12 \_def\_\normalmath{%
13   \_loadmathfamily 0 cmr % CM Roman
14   \_loadmathfamily 1 cmmi % CM Math Italic
15   \_loadmathfamily 2 cmsy % CM Standard symbols

41 }
42 \_count18=9 % families declared by \newfam are 12, 13, ...
43
44 \_def \normalmath {\_\normalmath} \_def\boldmath {\_\boldmath}

```

The classical math family selectors `\mit`, `\cal`, `\bbchar`, `\frak` and `\script` are defined here. The `\rm`, `\bf`, `\it`, `\bi` and `\tt` does two things: they are variant selectors for text fonts and math family selectors for math fonts. The idea was adapted from plain TeX.

These macros are redefined when `unimat-codes.opm` is loaded, see the section [2.15.2](#).

```

57 \_chardef\_\bffam = 8
58 \_chardef\_\bifam = 9
59 %\_chardef\_\ttfam = 10
60 %\_chardef\_\itfam = 11

```

`\_loadmathfamily` *number* *font* loads one math family, i.e. the triple of fonts in the text size, script size and script-script size. The *font* is *font-id* used in the `\_regtfm` parameter or the real TFM name. The family is saved as `\famnumber`.

`\_setmathfamily` *number* *font-switch* loads one math family like `\_loadmathfamily` does it. But the second parameter is a *font-switch* declared previously by the `\font` primitive.

The font family is loaded at `\_sizemtext`, `\_sizemscript` and `\_sizemsscript` sizes. These sizes are set by the `\setmathsizes` [*text-size*/*script-size*/*scriptscript-size*] macro. These parameters are given in the `\ptmunit` unit, it is set to 1`\ptunit` and it is set to 1 pt by default.

`\_corrmsizes` should be used in the `\normalmath` and `\boldmath` macros if you need a size correction when a selected math family is loaded. It is similar as ex-height correction but for math fonts.

```

164
165 \_public \setmathsizes \ptunit \ptmunit ;

```

The `\_setmathdimens` macro is used in `\normalmath` or `\boldmath` macros. It makes math dimensions dependent on the font size (plain TeX sets them only for 10pt typesetting). The `\skewchar` of some math families are set here too.

```
math-preload.opm
174 \_def\_\_setmathdimens{%
175   \_delimitershortfall=0.5\_fontdimen6\_textfont3
176   \_nulldelimiterspace=0.12\_fontdimen6\_textfont3
177   \_scriptspace=0.05\_fontdimen6\_textfont3
178   \_skewchar\_textfont1=127 \_skewchar\_scriptfont1=127
179   \_skewchar\_scriptscriptfont1=127
180   \_skewchar\_textfont2=48 \_skewchar\_scriptfont2=48
181   \_skewchar\_scriptscriptfont2=48
182   \_skewchar\_textfont6=127 \_skewchar\_scriptfont6=127
183   \_skewchar\_scriptscriptfont6=127
184 }
```

Finally, we preload a math fonts collection in [10/7/5] sizes when the format is generated. This is done when `\_suppressfontnotfounderror=1` because we need not errors when format is generated. Maybe there are not all fonts in the TeX distribution installed.

```
math-preload.opm
194 \_suppressfontnotfounderror=1
195 \_setmathsizes[10/7/5]\_normalmath
196 \_suppressfontnotfounderror=0
```

## 2.14 Math macros

```
math-macros.opm
3 \_codedecl \sin {Math macros plus mathchardefs <2020-06-13>} % preloaded in format
```

The category code of the character `_` remains as letter (11) and the mathcode of it is "8000. It means that it is active character in math mode. It is defined as subscript prefix.

There is a problem: The `x_n` is tokenized as `x`, `_`, `n` and it works without problem. But `\int_a^b` is tokenized as `\int_a`, `^`, `b`. The control sequence `\int_a` isn't defined. We must write `\int _a^b`.

The Lua code presented here solves this problem. But you cannot set our own control sequence in the form `\(word)_` or `\(word)_<one-letter>` (where `(word)` is sequence of letters) because such control sequences are inaccessible: preprocessor rewrites it.

The `\mathsb` macro activates the rewriting rule `\(word)_<nonletter>` to `\(word) _<nonletter>` and `\(word)_<letter><nonletter>` to `\(word) _<letter><nonletter>` at input processor level. The `\mathsboff` deactivates it. You can ask by `\_ifmathsb` if this feature is activated or deactivated. By default, it is activated in the `\everyjob`, see section 2.1.

```
math-macros.opm

```

All control sequences declared by `\mathchardef` are supposed (by default) only for public usage. It means that they are declared without `_` prefix. If such sequences are used in internal `OpTeX` macro then their internal prefixed form is declared using `\_private` macro.

These encoding dependent declarations will be set to different values when Unicode-math font is loaded. The declared sequences for math symbols are not hyperlinked in this documentation.

The `\eqalign` macro behaves like in Plain TeX by default. It creates the `\vcenter` in the math mode. The contents is two column `\halign` with right aligned left column and left aligned right column. The table items are in `\displaystyle` and the `\baselineskip` is advanced by `\jot` (3pt in plain TeX). It follows from the default settings of `\eqlines` and `\eqstyle` parameters.

In OpTeX, this macro is more flexible. See section 4.4 in the [Typesetting Math with OpTeX](#). The `\baselineskip` value is set by the `\eqlines` parameter and math style by the `\eqstyle` parameter.

There are more possible columns than two (used in classical Plain TeX): `r``lc``rl``crlc` etc. where `r` and `l` columns are without spaces and `c` column (if used) has the space `\eqspace/2` at its both sides.

```

661 \_long\def\eqalign#1{\_null\_thinsk\_vcenter{\_the\_eqlines\_math

665
666 \_public \eqalign ;

```

The `\displaylines{(formula)\cr (formula)\cr ... (formula)}` creates horizontally centered formulae. It behaves exactly as in Plain TeX. The `\halign` is applied directly in the outer display environment with lines of type `\hbox to\displaywidth`. This enables to break lines inside such display to more pages but it is impossible to use `\eqno` or `\leqno` or `\eqmark`.

OpTeX offers `\displaylines to<dimen>{(formula)\cr (formula)\cr ... (formula)}` as an alternative case of usage `\displaylines`. See section 4.3 in the [Typesetting Math with OpTeX](#). The centered

formulas are in `\vcenter` in this case, so lines cannot be broken to more pages, but this case enables to use `\eqno` or `\leqno` or `\eqmark`.

```

```

`\mathstyles{⟨math list⟩}` behaves like `{⟨math list⟩}`, but you can use following commands in the `⟨math list⟩`:

- `\currstyle` which expands to `\displaystyle`, `\textstyle`, `\scriptstyle` or `\scriptscriptstyle` depending on the current math style when `\mathstyles` was opened.
- `\dobystyle{⟨D⟩}{⟨T⟩}{⟨S⟩}{⟨SS⟩}` is expandable macro. It expands to `⟨D⟩`, `⟨T⟩`, `⟨S⟩` or `⟨SS⟩` depending on the current math style when `\mathstyles` was opened.
- The value of the `\stylenum` is 0, 1, 2 or 3 depending on the current math style when `\mathstyles` was opened.

Example of usage of `\mathstyles`: `\def\mathframe#1{\mathstyles{\frame{$\currstyle#1$}}}`.

```

math-macros.omp
1016 \_newcount\_\stylenum
1017 \_def\_\mathstyles#1{{\_mathchoice{\_stylenum0 #1}{\_stylenum1 #1}%
1018   {\_stylenum2 #1}{\_stylenum1 #1}}}
1019 \_def\_\dobystyle#1#2#3#4{\_ifcase\_\stylenum#1\_\or#2\_\or#3\_\or#4\_\fi}
1020 \_def\_\currstyle{\dobystyle\_\displaystyle\_\textstyle\_\scriptstyle\_\scriptscriptstyle}
1021 \_public \mathstyles \dobystyle \currstyle \stylenum ;

```

The `\mathbox{⟨text⟩}` macro is copied from OPmac trick 078. It behaves like `\hbox{⟨text⟩}` but the `⟨text⟩` is scaled to smaller size if it is used in scriptstyle or scriptscript style.

```

math-macros.omp
1029 \_def\_\mathbox#1{{\_mathstyles{\_hbox{%
1030   \_ifnum\_\stylenum<2 \_everymath{\_currstyle}%
1031   \_else \_typoscale[\_dobystyle{}{}{700}{500}/]\_fi #1}}}}
1032 }
1033 \_public \mathbox ;

```

## 2.15 Unicode-math fonts

The `\loadmath{⟨Unicode-math font⟩}` macro loads math fonts and redefines all default math-codes using `\input unimath-codes.omp`. If Unicode-math font is loaded then `\_mathloadingfalse` is set, so new UnicodeMath font isn't loaded until `\doloadmath` is used.

`\loadboldmath{⟨bold-font⟩} \to {⟨normal-font⟩}` loads bold variant only if `⟨normal-font⟩` was successfully loaded by the `\loadmath`. For example:

```

\loadmath {[xitsmath-regular]}
\loadboldmath {[xitsmath-bold]} \to {[xitsmath-regular]}

```

You can combine more fonts, if you register them to another math families (5, 6, 7, etc.) in the `\normalmath` macro.

The default value of `\normalmath` shows a combination of base Unicode Math font with 8bit Math font at family 4. See definition of `\script` macro where `\fam4` is used. Of course, we need to set `\rmvariables` too, because 8bit font accepts only codes less than 255.

See <http://tex.stackexchange.com/questions/308749/> for more technical details.

The `\loadmath` macro was successfully tested on:

```

\loadmath{[XITSMath-Regular]}      ... XITS MATH
\loadmath{[latinmodern-math]}     ... Latin Modern Math
\loadmath{[texgyretermes-math]}   ... TeXGyre Termes Math
\loadmath{[texgyrebonum-math]}    ... TeXGyre Bonum Math
\loadmath{[texgyrepagella-math]}  ... TeXGyre Pagella Math
\loadmath{[texgyreschola-math]}   ... TeXGyre Schola Math
\loadmath{[texgyredejavu-math]}   ... TeXGyre DeJaVu Math
\loadmath{[LibertinusMath-Regular]} ... Libertinus Math
\loadmath{[FiraMath-Regular]}     ... Fira Math
\loadmath{[Asana-Math]}          ... Asana Math

```

### 2.15.1 Unicode-math macros preloaded in the format

```
3 \codedecl \loadmath {Unicode Math fonts <2020-06-06>} % preloaded in format           math-unicode.opm
```

`\loadmath {⟨Unicode-math font⟩}` loads given font. It does:

- define `\_unimathfont` as `⟨Unicode-math font⟩`,
- redefine `\normalmath` and `\boldmath` macros to their Unicode counterparts,
- load the `\_unimathfont` by `\normalmath`,
- print information about loaded font on the terminal,
- redefine all encoding dependent setting by `\input unimath-codes.opm`,
- protect new loading by setting `\_ifmathloading` to false.

`\noloadmath` disallows Unicode-math loading by `\_mathloadingfalse`.

`\doloadmath` allows Unicode-math loading by `\_mathloadingtrue`.

```
19 \_newifi \_ifmathloading \_mathloadingtrue           math-unicode.opm
20
21 \_def\_noloadmath{\_mathloadingfalse}
22 \_def\_doloadmath{\_mathloadingtrue}
23
24 \_def\_loadmath#1{%
25   \_ifmathloading
26   \_initunifonts
27   \_isfont{#1}\_iffalse
28   \_opwarning{Math font "#1" not found, skipped...}%
29   \_else
30   \_def\_unimathfont{#1}%
31   \_let\_normalmath = \_normalunimath \_let\_boldmath = \_boldunimath
32   \_normalmath
33   \_wterm {MATH-FONT: "#1" -- unicode math prepared.}%
34   \_opinput {unimath-codes.opm}%
35   \_mathloadingfalse
36   \_fi\_\_fi}
37
38 \_public \loadmath \noloadmath \doloadmath ;
```

`\loadboldmath {⟨bold-font⟩} \to {⟨normal-font⟩}` defines `\_unimathboldfont` as `⟨bold-font⟩` only if `\_unimathfont` is defined as `⟨normal-font⟩`. It is used when `\boldmath` macro is run. When no `\_unimathboldfont` is defined then the `\boldmath` macro use “fake bold” generated by `embolden` LuaTeX font feature.

```
48 \_def\_loadboldmath#1#2\to #3{%
49   \_def\_tmp{#3}\_ifx\unimathfont\_tmp % do work only if #3 is loaded as normal Math
50   \_isfont"#1"\_iffalse
51   \_opwarning{Bold-Math font "#1" not found, skipped...}
52   \_else
53   \_def\_unimathboldfont{#1}%
54   \_wterm {MATH-FONT: "#1" -- unicode math bold prepared.}%
55   \_fi\_\_fi}
56
57 \_public \loadboldmath ;           math-unicode.opm
```

The Unicode version of the `\normalmath` and `\boldmath` macros are defined here as `\_normalunimath` and `\_boldunimath` macros. They are using `\_setunimathdimens` in similar sense as `\_setmathdimens`.

```

66 \_def\_\_normalunimath{%
67   \_loadumathfamily 1 {\_unimathfont}{} % Base font
68   \_loadmathfamily 4 rsfs           % script
69   \_setunimathdimens
70 }%
71 \_def\_\_boldunimath{%
72   \_ifx\_\_unimathboldfont \_undefined
73     \_loadumathfamily 1 {\_unimathfont}{embolden=1.7;} % Base faked bold
74   \_else
75     \_loadumathfamily 1 {\_unimathboldfont}{} % Base real bold font
76   \_fi
77   \_loadmathfamily 4 rsfs           % script
78   \_setunimathdimens
79 }%
80 \_def\_\_setunimathdimens{%
81   PlainTeX sets these dimens for 10pt size only:
82   \_delimitershortfall=0.5\_\_fontdimen6\_\_textfont3
83   \_nulldelimiterspace=0.12\_\_fontdimen6\_\_textfont3
84   \_scriptspace=0.05\_\_fontdimen6\_\_textfont3
85   {\_everymath{} \_global\_\_setbox0=\_hbox{\$\_displaystyle{0\atop0}\$}}% correction for \choose
86   \_Umathfractiondelsize\_\_displaystyle = \_dimexpr(\_ht0-\_Umathaxis\_\_displaystyle)*2\_\_relax
87 }

```

`\_loadumathfamily <number> {<font>}{<font features>}` loads the given Unicode-math fonts in three sizes given by the `\setmathsizes` macro and sets it as the math family `<number>`. The `<font features>` are added to the default `\_mfontfeatures` and to the size dependent features `+ssty=0` if script size is asked or `+ssty=1` if scriptsize is asked. If the fath family 1 is loaded then the family 2 and 3 is set by the same font because TeX needs to read dimension information about generating math formulae from these three math families. All information needed by TeX is collected in single Unicode-math font.

```

```

Unicode math font includes all typical math alphabets together, user needs not to load more TeX math families. These math alphabets are encoded by different parts of Unicode table. We need auxiliary macros for setting mathcodes by selected math alphabet.

`\_umathrange {<from>}-<to>}{<class>}{<family>}\<first>` sets `\Umathcodes` of the characters in the interval `<from> - <to>` to `\<first>, \<first>+1, \<first>+2` etc., but `\_umathcharholes` are skipped (`\_umathcharholes` are parts of the Unicode table not designed for math alphabets but they causes that the math alphabets are not continuously spread out in the table; I mean that the designers were under the influence of drugs when they created this part of the Unicode table). The `<from> - <to>` clause includes normal letters like A-Z.

`\_umahrangegreek \<first>` is the same as `\_umathrange {<alpha>}-<omega>}\<first>`.

`\_umahrangEGREEK \<first>` is the same as `\_umathrange {<Alpha>}-<Omega>}\<first>`.

`\_greekdef {control sequences} \_relax` defines each control sequence as a normal character with codes `\_umathnumB, \_umathnumB+1, \_umathnumB+2` etc. It is used for redefining the control sequences for math Greek `\alpha, \beta, \gamma` etc.

## 2.15.2 Macros and codes set when \loadmatfont is processed

The file `unimath-codes.omp` is loaded when the `\loadmath` is used. The macros here redefines globally all encoding dependent settings declared in the section 2.14.

```
unimath-codes.omp
3 \codeldecl \ncharrmA {Uni math codes <2020-06-13>} % preloaded on demand by \loadmath
```

The control sequences for `\alpha`, `\beta` etc are redefined here. The `\alpha` expands to the character with unicode "03B1, this is normal character  $\alpha$ . You can type it directly in your editor, if you know how to do this.

```
unimath-codes.omp
12 \_umathnumB="0391
13 \_greekdef \Alpha \Beta \Gamma \Delta \Epsilon \Zeta \Eta \Theta \Iota \Kappa
14   \Lambda \Mu \Nu \Xi \Omicron \Pi \Rho \varTheta \Sigma \Tau \Upsilon \Phi
15   \Chi \Psi \Omega \relax
16
17 \_umathnumB="03B1
18 \_greekdef \alpha \beta \gamma \delta \varepsilon \zeta \eta \theta \iota \kappa
19   \lambda \mu \nu \xi \omicron \pi \rho \varsigma \sigma \tau \upsilon
20   \varphi \chi \psi \omega \varDelta \epsilon \vartheta \varkappa \phi
21   \varrho \varpi \relax
```

The math alphabets are declared here using the `\umathrange{<range>}{<class>}{<family>}{<starting-code>}` macro.

```

The `\cal`, `\bbchar`, `\frak`, `\script` and the `\rm`, `\bf`, `\it`, `\bi`, `\tt` are defined here. Their “8bit definitions” from the file `math-preload.opm` (section 2.13) are removed.

You can redefine them again if you need different behavior (for example you don’t want to use sans serif bold in math). What to do:

```

\_protected\_def\_bf
  {\_tryloadbf\_tenbf \_inmath{\_bfvariables\_bfgreek\_bfGreek\_bfdigits}}
\_protected\_def\_bi
  {\_tryloadbi\_tenbi \_inmath{\_bivariabes\_bigreek\_bfGreek\_bfdigits}}
\_public \bf \bi ;

```

`\_inmath` {`<cmds>`} applies `<cmds>` only in math mode.

```

110 \_protected\_def\_inmath#1{\_relax \_ifmmode#1\_\_fi} % to keep off \loop processing in text mode
111
112 % You can redefine these macros to follow your wishes.
113 % For example you need upright lowercase greek letters, you don't need
114 % \bf and \bi behaves as sans serif in math, ...
115
116 \_protected\_def\_rm {\_tryloadrm \_tenrm \_inmath{\_rmvariables \_rmdigits}}
117 \_protected\_def\_it {\_tryloadit \_tenit \_inmath{\_itvariables}}
118 \_protected\_def\_bf
119   {\_tryloadbf \_tenbf \_inmath{\_bsansvariables \_bsansgreek \_bsansGreek \_bsansdigits}}
120 \_protected\_def\_bi

```

```

121   {\_tryloadbi \_tenbi \_inmath{\_bisansvariables \_bisansgreek \_bsansGreek \_bsansdigits}}
122 \_protected\_def\_\tt {\_tryloadtt \_tentt \_inmath{\_ttvariables \_ttdigits}}
123 \_protected\_def\_\bbchar {\_bbvariables \_bbdigits}
124 \_protected\_def\_\cal {\_calvariables}
125 \_protected\_def\_\frak {\_frakvariables}
126 \_protected\_def\_\misans {\_isansvariables \_sansdigits}
127 \_protected\_def\_\mbisans {\_bisansvariables \_bisansgreek \_bsansGreek \_bsansdigits}
128 \_protected\_def\_\script {\_rmvariables \_fam4 }
129 \_protected\_def\_\mit {\_itvariables \_rmdigits \_itgreek \_rmGreek }
130
131 \_public \rm \it \bf \bi \tt \bbchar \cal \frak \misans \mbisans \script \mit ;

```

Each Unicode slot carries information about math type. This is saved in the file `mathclass.txt` which is copied to `mathclass.opm`. The file has the following format:

```

mathclass.opm
70 002E;P
71 002F;B
72 0030..0039;N
73 003A;P
74 003B;P
75 003C;R
76 003D;R
77 003E;R
78 003F;P
79 0040;N
80 0041..005A;A
81 005B;O
82 005C;B
83 005D;C
84 005E;N
85 005F;N

```

We have to read this information and convert it to the `\Umathcodes`.

```

unimath-codes.opm
141 \begingroup % \input mathclass.opm (which is a copy of MathClass.txt):

```

Newly declared public control sequences are used in internal macros by OpTeX. We need to get new meanings of these control sequences in private name space.

unimath-codes.opm

```

376 \_private
377   \ldotp \cdotp \bullet \triangleleft \triangleright \mapstochar \rightarrow
378   \prime \lhook \rightarrow \leftarrow \rhook \triangleright \triangleleft
379   \Relbar \rightarrow \relbar \rightarrow \Leftarrow \mapstochar

```

```
380 \longrightarrow \Longleftarrow \vdots \ddots ;
```

### 2.15.3 A few observations

You can combine more fonts in math, if you register them to another math families (5, 6, 7, etc.) in the `\normalmath` macro.

The default value of `\normalmath` shows a combination of base Unicode Math font with 8bit Math font at family 4. See definition of the `\script` macro where `\fam4` is used. Of course, we need to set `\rmvariables` too, because 8bit font accepts only codes less than 255.

XITSmath-bold needs correction: the norm symbol  $\|x\|$  is missing here. So, you can define:

```
\def\_boldmath{%
  \loadumathfamily 1 {[xitsmath-bold]}{} % Base font
  \loadmathfamily 4 rsfs % script
  \loadumathfamily 5 {[xitsmath-regular]}{}
  \def\|\Udelimiter 0 5 "02016 {}% norm delimiter from family 5
  \setmathdimens
}
```

### 2.15.4 Printing all Unicode math slots in used math font

This file can be used for testing your Unicode Math font and/or for printing TeX sequences which can be used in math.

Load Unicode math font first (for example by `\fontfam[termes]` or by `\loadmath{<math-font>}`) and then you can do `\input print-unimath.opm`. The big table with all math symbols is printed.

```
3 \codeline{\_undefined {Printing Unicode-math table \string<2020-06-08>}}

## 2.16 Scaling fonts in document (high-level macros)

These macros are documented in section 1.3.2 from user point of view.

```
3 \_codeldecl \typosize {Font managing macros from OPmac <2020-04-28>} % loaded in format
```

\typosize [*font-size*/*baselineskip*] sets given parameters. It sets text font size by the \setfontsize macro and math font sizes by setting internal macros \sizemtext, \sizemscript and \sizemsscript. It uses common concept font thes sizes: 100 %, 70 % and 50 %. The \setmainvalues sets the parameters as main values when the \typosize is called first.

```
15 \_protected\_def \_typosize [#1/#2]{%
16   \_textfontsize{#1}\_mathfontsize{#1}\_setbaselineskip{#2}%
17   \_setmainvalues \_ignorespaces
18 }
19 \_protected\_def \_textfontsize #1{\_if$#1$\_else \_setfontsize{at#1\_ptunit}\_fi}
20
21 \_def \_mathfontsize #1{\_if$#1$\_else
22   \_tmpdim=#1\_ptunit
23   \_edef\_\sizemtext{\_ea\_\ignorept \_the\_\tmpdim \_ptmunit}%
24   \_tmpdim=0.7\_\tmpdim
25   \_edef\_\sizemscript{\_ea\_\ignorept \_the\_\tmpdim \_ptmunit}%
26   \_tmpdim=#1\_ptunit \_tmpdim=0.5\_\tmpdim
27   \_edef\_\sizemsscript{\_ea\_\ignorept \_the\_\tmpdim \_ptmunit}%
28   \_fi
29 }
30 \_public \typosize ;
```

\typoscale [*font-factor*/*baseline-factor*] scales font size and baselineskip by given factors in respect to current values. It calculates the \typosize parameters and runs the \typosize.

```
38 \_protected\_def \_typoscale [#1/#2]{%
39   \_ifx$#1$\_def\_\tmp{[ / ]}\_else
40     \_settmpdim{#1}\_optsize
41     \_edef\_\tmp{[\_ea\_\ignorept \_the\_\tmpdim]}\_fi
42   \_ifx$#2$\_edef\_\tmp{[\_tmp]}\_else
43     \_settmpdim{#2}\_baselineskip
44     \_edef\_\tmp{[\_tmp \_ea\_\ignorept \_the\_\tmpdim]}\_fi
45   \_ea\_\typosize\_\tmp
46 }
47 \_def\_\settmpdim#1#2{%
48   \_tmpdim=#1pt \_divide\_\tmpdim by1000
49   \_tmpdim=\_ea\_\ignorept \_the#2\_\tmpdim
50 }
51 \_public \typoscale ;
```

\setbaselineskip {*baselineskip*} sets new \baselineskip and more values of registers which are dependent on the *baselineskip* including the \strutbox.

```
59 \_def \_setbaselineskip #1{\_if$#1$\_else
60   \_tmpdim=#1\_ptunit
61   \_baselineskip=\_tmpdim \_relax
62   \_bigskipamount=\_tmpdim plus.33333\_\tmpdim minus.33333\_\tmpdim
63   \_medskipamount=.5\_\tmpdim plus.16666\_\tmpdim minus.16666\_\tmpdim
64   \_smallskipamount=.25\_\tmpdim plus.08333\_\tmpdim minus.08333\_\tmpdim
65   \_normalbaselineskip=\_tmpdim
66   \_jot=.25\_\tmpdim
67   \_maxdepth=.33333\_\tmpdim
68   \_setbox\_\strutbox=\_hbox{\_vrule height.709\_\tmpdim depth.291\_\tmpdim width0pt}%
69   \_fi
70 }
```

\setmainvalues sets the current font size and \baselineskip values to the \mainfsize and \mainbaselineskip registers. It redefines itself in order to set the main values only first. \scalemain returns to these values if they were set. Else they are set to 10/12 pt.

```
81 \_newskip  \_mainbaselineskip  \_mainbaselineskip=0pt \_relax
82 \_newdimen \_mainfosize        \_mainfosize=0pt
83
84 \_def\_\_setmainvalues {%
85   \_mainbaselineskip=\_baselineskip
86   \_mainfosize=\_optsiz
87   \_topskip=\_mainfosize \_splittopskip=\_topskip
88   \_ifmmode \_else \_bf \_it \_bi \_rm \_fi % load all basic variants of the family
89   \_normalmath % load fonts if \typosize is running first
90   \_let \_setmainvalues =\_setmainvaluesL
91 }
92 \_def\_\_setmainvaluesL {\_ifmmode \_normalmath \_else
93   \_rm \_everymath={\_normalmath}\_everydisplay={\_normalmath}\_fi}
94 \_def\_\_scalemain {%
95   \_ifdim \_mainfosize=0pt
96     \_mainfosize=10pt \_mainbaselineskip=12pt
97     \_let \_setmainvalues=\_setmainvaluesL
98   \_fi
99   \_optsiz=\_mainfosize \_baselineskip=\_mainbaselineskip
100 }
101 \_public \_scalemain \_mainfosize \_mainbaselineskip ;
```

`\thefontsize` [*size*] and `\thescale` [*factor*] do modification of the size of the current font. They are implemented by the `\newcurrfontsize` macro.

```
109 \_protected\_def\_the fontsize[#1]{\_if$#1$\_else
110     \_tmpdim=#1\_ptunit
111     \_newcurrfontsize{at\_\_tmpdim}%
112 \_fi
113 \_ignorespaces
114 }
115 \_protected\_def\_the font scale[#1]{\_ifx$#1$\_else
116     \_tmpdim=1pt \_divide\_\_tmpdim by1000
117     \_tmpdim=\_ea\_\ea\_\ea\_\ignorerept \_pdffontsize\_\font \_tmpdim
118     \_newcurrfontsize{at\_\_tmpdim}%
119 \_fi
120 \_ignorespaces
121 }
122 \_public \the fontsize \the font scale ;
```

`\em` keeps the weight of the current vaiant and switches roman  $\leftrightarrow$  italic. It adds the italic correction by the `\_additcorr` and `\_afteritcorr` macros. The second does not add italic correction if the next character is dot or comma.

```
character is not or comma.                                              fonts-opmac.opm

131 \_protected\_def\_em {%
132   \_ea\_ifx \_the\_font \_tenit \_additcorr \_rm  \_else
133   \_ea\_ifx \_the\_font \_tenbf \_bi \_aftergroup\_\_afteritcorr\_\_else
134   \_ea\_ifx \_the\_font \_tenbi \_additcorr \_bf  \_else
135   \_it \_aftergroup\_\_afteritcorr\_fi\_\_fi\_\_fi
136 }
137 \_def\_\_additcorr{\_ifdim\_lastskip>0pt
138   \_skip0=\_lastskip \_unskip\_\_italcorr \_hskip\_\_skip0 \_else\_\_italcorr \_fi}
139 \_def\_\_afteritcorr{\_futurelet\_\_next\_\_afteritcorrA}
140 \_def\_\_afteritcorrA{\_ifx\_\_next.\_else\_\_ifx\_\_next,\_else \_italcorr \_fi\_\_fi}
141 \_let\_\_italcorr=\_
```

The `\boldify` macro does `\let\it\bi` and `\let\normalmath=\boldmath`.

```
147 \_protected\_def \boldify {%
148   \_let \setmainvalues=\setmainvaluesL
149   \_let\it =\bi \_let\rm =\bf \_let\normalmath=\boldmath \bf
150 }
151 \ public \em \boldify ;
```

We need to use a font selector for default pagination. Because we don't know what default font size will be selected by the user, we use this `\_rmfixed` macro. It sets the `\rm` font from default font size (declared by first `\typo` command and redefines itself be only the font switch for next pages.

<sup>161</sup> \ def \ rrmfixed f% used in default \footline fonts-opmac.opm

```

162  {\_ifdim\mainfsize=0pt \mainfsize=10pt \fi
163  \fontdef\rmfixed{\_setfsize{at\mainfsize}\_resetmod\rm}%
164  \global\let\rmfixed=\rmfixed % next use will be font switch only
165  \rmfixed
166 }
167 \let\rmfixed=\tenrm % user can redefine it

```

## 2.17 Output routine

The output routine `\optexoutput` is similar as in plain TeX. It does:

- `\begoutput` which does:
  - increments `\gpageno`,
  - prints `\Xpage{\gpageno}{\pageno}` to the `.ref` file (if `\openref` is active),
  - calculates `\hoffset`,
  - sets local meaning of macros used in headlines/footlines (see `\regmacro`).
- `\shipout\_completepage`, which is `\vbox` of –
  - background box, if `\pgbackground` is non-empty,
  - headline box by `\makeheadline`, if the `\headline` is nonempty,
  - `\vbox` to `\vsize` of `\pagecontents` which consists of –
    - `\pagedest`, the page destination `pg:\gpageno` for hyperlinks is created here,
    - `\topins` box if non-empty (from `\topinserts`),
    - `\box255` with completed vertical material from main vertical mode,
    - `\footnoterule` and `\footins` box if nonempty (from `\fnote`, `\footnote`),
    - `\pgbottomskip` (default is 0 pt).
  - footline box by `\makefootline`, if the `\footline` is nonempty
- `\endoutput` which does:
  - increments `\pageno` using `\advancepageno`
  - runs output routine repeatedly if `\dosupereject` is activated.

```

3 \codedecl \nopagenumbers {Output routine <2020-03-28>} % preloaded in format

```

`output.opm`

`\optexoutput` is default output routine. You can create another...

```

9 \output={\optexoutput}
10 \def \optexoutput{\begoutput \shipout\_completepage \endoutput}

```

`output.opm`

Default `\begoutput` and `\endoutput` is defined. If you need another functionality implemented in the output routine, you can `\addto\begin{output}{...}` or `\addto\end{output}{...}`. The settings here is local in the `\output` group.

The `\preoffsets` can set `\hoffset` differently for left or right page. It is re-defined by the `\margins` macro..

The `\regmark` tokens list includes accumulated #2 from the `\regmacro`. Logos and another macros are re-defined here (locally) for their usage in headlines or footlines.

```

26 \def \begoutput{\_incr\gpageno
27 \immediate\wref\Xpage{\_the\gpageno}{\_folio}%
28 \setxhsize \preoffsets \the\regmark
29 \def \endoutput{\_advancepageno
30 {\_globaldefs=1 \_the\nextpages \nextpages={}%
31 \ifnum\outputpenalty>-20000 \else\dosupereject\fi
32 }
33 \def \preoffsets {}}

```

`output.opm`

The `\hsize` value can be changed at various places in the document but we need to have constant value `\xhsize` in output routine (for headlines and footlines, for instance). This value is set from current value of `\hsize` when `\setxhsize` macro is called. This macro destroys itself, so the value is set only once. Typically it is done when first `\optexoutput` routine is called (see `\begoutput`). Or it is called at beginning of the `\begtt... \endtt` environment before `\hsize` value is eventually changed by user in this environment.

```

46 \newdimen \xhsize
47 \def\setxhsize {\_global\xhsize=\hsize \_global\let\setxhsize=\relax}

```

`output.opm`

\gpageno counts pages from one in whole document

```
53 \_newcount\gpageno  
54 \_public \gpageno ;
```

output.opm

The \completepage is similar what plain TeX does in its output routine. New is only \backgroundbox. It is \vbox with zero height with its contents (from \pgbackground) laped down. It is shifted directly to the left-upper corner of the paper.

The \ensureblack sets the typesetting of its parameter locally to \Black color. We needn't do this if colors are never used in the document. So, default value of the \ensureblack macro is empty. But first usage of color macros in the document re-defines \ensureblack. See the section 2.19 for more details.

```
69 \_def\completepage{\vbox{  
70     \_istoksempy \pgbackground  
71         \_iffalse \ensureblack{\backgroundbox{\the\pgbackground}\nointerlineskip}\_fi  
72         \ensureblack{\makeheadline}{  
73             \vbox to\vsiz {\_boxmaxdepth=\_maxdepth \pagecontents}\_pagebody in plainTeX  
74             \ensureblack{\makefootline}{  
75 }  
76 \_def \ensureblack #1{#1} % will be re-defined by color macros  
77 \_let \openfnotestack = \relax % will be re-defined by color macros  
78 \_def \backgroundbox #1{\moveleft\hoffset\vbox to0pt{\kern-\voffset #1\vsiz}}
```

output.opm

\makeheadline creates \vbox to0pt with its contents (the \headline) shifted by \headlinedist up.

```
85 \_def\makeheadline {\_istoksempy \headline \_iffalse  
86     \vbox to0pt{\vsiz  
87         \baselineskip=\headlinedist \lineskip=-\maxdimen  
88         \hbox to\xhsiz {\the\headline}\hbox{}\nointerlineskip  
89     }\_fi  
90 }
```

output.opm

The \makefootline appends the \footline to the page-body box.

```
96 \_def\makefootline{\_istoksempy \footline \_iffalse  
97     \baselineskip=\footlinedist  
98     \lineskip=-\maxdimen \hbox to\xhsiz {\the\footline}  
99     \_fi  
100 }
```

output.opm

The \pagecontents is similar as in plain TeX. The only differnece is that the \pagedest is inserted at the top of \pagecontents and \ensureblack is applied to the \topins and \footins material. The \footnoterule is defined here.

```
109 \_def\pagecontents{\pagedest % destination of the page  
110     \_ifvoid\topins \_else \ensureblack{\unvbox\topins}\_fi  
111     \dimen0=\dp255 \unvbox255 % open up \box255  
112     \_ifvoid\footins \_else % footnote info is present  
113         \vskip\skip\footins  
114         \ensureblack{\footnoterule \openfnotestack \unvbox\footins}\_fi  
115         \kern-\dimen0 \vskip \pgbottomskip  
116     }\_fi  
117 \_def \pagedest {{\_def\destheight{25pt}\_dest[pg:\the\gpageno]}}  
118 \_def \footnoterule {\kern-3pt \hrule width 2truein \kern 2.6pt }
```

output.opm

\pageno, \folio, \nopagenumbers, \advancepageno and \normalbottom used in the context of the output routine from plain TeX is defined here. Only the \raggedbottom macro is defined differently. We use the \pgbottomskip register here which is set to 0 pt by default.

```
129 \_countdef\pageno=0 \pageno=1 % first page is number 1  
130 \_def \folio {\_ifnum\pageno<0 \romannumeral-\pageno \_else \number\pageno \_fi}  
131 \_def \nopagenumbers {\_footline={}}  
132 \_def \advancepageno {  
133     \_ifnum\pageno<0 \global\advance\pageno by-1 \_else \incr\pageno \_fi  
134 } % increase \pageno  
135 \_def \raggedbottom {\_topskip=\dimexpr\topskip plus60pt \pgbottomskip=0pt plus1fil\relax}  
136 \_def \normalbottom {\_topskip=\dimexpr\topskip \pgbottomskip=0pt\relax}  
137
```

output.opm

```
138 \_public \pageno \folio \nopagenumbers \advancepageno \raggedbottom \normalbottom ;
```

Macros for footnotes are the same as in plain TeX. There is only one difference: `\vfootnote` is implemented as `\_opfootnote` with empty parameter #1. This parameter should do a local settings inside the `\footins` group and it does it when `\fnote` macro is used.

The `\_opfootnote` nor `\vfootnote` don't take the footnote text as a parameter. This is due to user can do catcode settings (like inline verbatim) in the footnote text. This idea is adapted from plain TeX.

The `\footnote` and `\footstrut` is defined as in plain TeX.

`output.opm`

```
151 \_newinsert\_footins
152 \_def \_footnote #1{\_let\osf=\empty % parameter #2 (the text) is read later
153   \_ifhmode \_edef\osf{\_spacefactor\the\_spacefactor}\_fi

## 2.18 Margins

The `\margins` macro is documented in the section [1.2.1](#).

```

margins.opm
3 \_codedecl \margins {Macros for margins setting <2020-03-14>} % preloaded in format

\margins/{pg} {fmt} ({left},{right},{top},{bot}){unit} takes its parameters, does calculation and sets
\hoffset, \voffset, \hsize and \vsize registers. Note that OpTeX sets the page origin at the top left
corner of the paper, no at the obscure position 1in, 1in. It is much more comfortable for macro writers.

## 2.19 Colors

The colors have different behavior than fonts. A marks (whatsits) with color information are stored into PDF output and TeX doesn't interpret them. The PDF viewer (or PDF interpreter in a printer) reads these marks and switches colors according to them. This is totally independent on TeX group mechanism. You can declare `\nolocalcolor` at the beginning of the document, if you want this behavior. In this case, if you set a color then you must to return back to black color using `\Black` manually.

By default, OpTeX sets `\localcolor`. It means that the typesetting returns back to a previous color at the end of current group, so you cannot write `\Black` explicitly. This is implemented using `\aftergroup` feature. There is a limitation of this feature: when a color selector is used in a group of a box, which is saved by `\setbox`, then the activity or reconstruction of previous color are processed at `\setbox` time, no in the box itself. You must correct it by double group:

```

\setbox0=\hbox{\Red text} % bad: \Black is done after \setbox
\setbox0=\hbox{\{\Red text\}} % good: \Black is done after group inside the box

```

The implementation of colors is based on colorstack, so the current color can follow across more pages. It is not so obvious because PDF viewer (or PDF interpreter) manipulates with colors locally at each PDF page and it initializes each PDF page with black on white color.

Macros `\setcmykcolor{<C> <M> <Y> <K>}` or `\setrgbcolor{<R> <G> <B>}` or `\setgreycolor{<Grey>}` should be used in color selectors or user can specify these macros explicitly.

The color mixing processed by the `\colordef` is done in the subtractive color model CMYK. If the result has a component greater than 1 then all components are multiplied by a coefficient in order to maximal component is equal to 1.

You can move a shared amount of CMY components (i.e. their minimum) to the  $K$  component. This saves the color tonners and the result is more true. This should be done by `\useK` command at the end of a linear combination used in `\colordef`. For example

```
\colordef \myColor {.3\Green + .4\Blue \useK}
```

The `\useK` command exactly does:

$$\begin{aligned} k' &= \min(C, M, Y), \\ C &= (C - k')/(1 - k'), \quad M = (M - k')/(1 - k'), \quad Y = (Y - k')/(1 - k'), \\ K &= \min(1, K + k'). \end{aligned}$$

You can use minus instead plus in the linear combination in `\colordef`. The given color is substracted in such case and the negative components are rounded to zero immediately. For example

```
\colordef \Color {\Brown-\Black}
```

can be used for removing black component from the color. You can use the `-\Black` trick after `\useK` command in order to remove grey components occured during color mixing.

Finally, you can use `~` immediately preceeded before macro name of the color. Then the complementary color is used here.

```
\colordef\mycolor{\Grey+.6^\Blue} % the same as \colordef\mycolor{\Grey+.6\Yellow}
```

The `\rgbcOLORDEF` can be used to mix colors in additive color model RGB. If `\onlyrgb` is declared, then `\colordef` works as `\rgbcOLORDEF`.

If a CMYK to RGB or RGB to CMYK conversion is needed then the following simple formulae are used (ICC profiles are not supported):

CMYK to RGB:

$$R = (1 - C)(1 - K), \quad G = (1 - M)(1 - K), \quad B = (1 - Y)(1 - K).$$

RGB to CMYK:

$$K' = \max(R, G, B), \quad C = (K' - R)/K', \quad M = (K' - G)/K', \quad Y = (K' - B)/K', \quad K = 1 - K'.$$

The RGB to CMYK conversion is invoked when a color is declared using `\setrgbcolor` and it is used in `\colordef` or if it is printed when `\onlycmyk` is declared. The CMYK to RGB conversion is invoked when a color is declared using `\setcmykcolor` and it is used in `\rgbcolordef` or if it is printed when `\onlyrgb` is declared.

```
3 \codel{colordef}{Colors <2020-03-18>} % loaded in format
```

`colors.opm`

We declare internal boolean value `\_iflocalcolor` ad do `\localcolor` as default.

```
10 \newifi \_iflocalcolor \_localcolortrue
11 \protected\def \localcolor {\_localcolortrue}
12 \protected\def \nolocalcolor {\_localcolorfalse}
13 \public \localcolor \nolocalcolor ;
```

`colors.opm`

The basic colors in CMYK `\Blue` `\Red` `\Brown` `\Green` `\Yellow` `\Cyan` `\Magenta` `\Grey` `\LightGrey` `\White` and `\Black` are declared here.

```
22 \def\Blue {\setcmykcolor{1 0 0 0}}
23 \def\Red {\setcmykcolor{0 1 1 0}}
24 \def\Brown {\setcmykcolor{0 0.67 0.67 0.5}}
25 \def\Green {\setcmykcolor{1 0 1 0}}
26 \def\Yellow {\setcmykcolor{0 0 1 0}}
27 \def\Cyan {\setcmykcolor{1 0 0 0}}
28 \def\Magenta {\setcmykcolor{0 1 0 0}}
29 \def\Grey {\setcmykcolor{0 0 0 0.5}}
30 \def\LightGrey {\setcmykcolor{0 0 0 0.2}}
31 \def\White {\setgreycolor{1}}
32 \def\Black {\setgreycolor{0}}
```

`colors.opm`

By default, the `\setcmykcolor` `\setrgbcolor` and `\setgreycolor` macros with `{⟨componetns⟩}` parameter expand to `\_setcolor{⟨pdf-primitive⟩}` using `\_formatcmyk` or `\_formatrgb` or `\_formatgrey` expandable macros. For example `\setrgbcolor{1 0 0}` expands to `\_setcolor{1 0 0 rg 1 0 0 RG}`. We set both types of colors (for lines (K or RG or G) and for fills (r or rg or g) together in the `⟨pdf-primitive⟩` command. This is the reason why the `\fillstroke` uses both its parameters. If only fills are needed you can do `\def\_fillstroke#1#2{#1}`. If only strokes are needed you can do `\def\_fillstroke#1#2{#2}`.

```
47 \def\setcmykcolor#1{\_setcolor{\_formatcmyk{#1}}}
48 \def\setrgbcolor#1{\_setcolor{\_formatrgb{#1}}}
49 \def\setgreycolor#1{\_setcolor{\_formatgrey{#1}}}
50 \def\formatcmyk#1{\_fillstroke{#1 k}{#1 K}}
51 \def\formatrgb#1{\_fillstroke{#1 rg}{#1 RG}}
52 \def\formatgrey#1{\_fillstroke{#1 g}{#1 G}}
53 \def\fillstroke#1#2{#1}
54 \public \setcmykcolor \setrgbcolor \setgreycolor ;
```

`colors.opm`

The `\onlyrgb` declaration redefines `\formatcmyk` in order it expands to its conversion to RGB `⟨pdf-primitive⟩`. This conversion is done by the `\cmyktorgb` macro. Moreover, `\onlyrgb` re-defines three basic RGB colors for RGB color space and re-declares `\colordef` as `\rgbcolordef`. The `\onlycmyk` macro does a similar work, it re-defines `\formatrgb` macro. The Grey color space is unchanged and works in both main settings (RGB or CMYK) without collisions.

```
66 \def\onlyrgb{\def\Red{\setrgbcolor{1 0 0}}%
67   \def\Green{\setrgbcolor{0 1 0}}\def\Blue{\setrgbcolor{0 0 1}}%
68   \let\_colordef=\rgbcolordef
69   \def\formatrgb##1{\_fillstroke{##1 rg}{##1 RG}}%
70   \def\formatcmyk##1{\_fillstroke{\cmyktorgb ##1 ; rg}\{\cmyktorgb ##1 ; RG\}}%
71 \def\onlycmyk{\def\formatcmyk##1{\_fillstroke{##1 k}{##1 K}}%
72   \def\formatrgb##1{\_fillstroke{\rgbtocmyk ##1 ; k}\{\rgbtocmyk ##1 ; K\}}%
73 \public \onlyrgb \onlycmyk ;
```

`colors.opm`

The `\setcolor` macro redefines empty `\ensureblack` macro (used in output routine for headers and footers) to `\ensureblackA` which sets Black at the start of its parameter and returns to the current color at the end of its parameter.

The current color is saved into `\currentcolor` macro and colorstack is pushed. Finally, the `\colorstackpop` is initialized by `\aftergroup` if `\localcolor` is declared.

You can save current color to your macro by `\let\yourmacro=\currentcolor` and you can return to this color by the command `\setcolor\yourmacro`.

```

89 \_protected\_def \_setcolor #1{\_global\_let\ensureblack=\_ensureblackA
90   \_iflocalcolor \_edef\currentcolor{#1}\colorstackpush\currentcolor
91     \_aftergroup\colorstackpop
92   \_else       \_xdef\currentcolor{#1}\colorstackset\currentcolor \_fi
93 }
94 \_def\pdfblackcolor{0 g 0 G}
95 \_edef\currentcolor{\pdfblackcolor}
96 \_def\ensureblackA#1{\_global\_let\openfnotestack=\_openfnotestackA
97   \colorstackpush\pdfblackcolor #1\colorstackpop}

```

The colorstack is initialized here and the basic macros `\_colorstackpush`, `\_colorstackpop` and `\_colorstackset` are defined here.

```

105 \_mathchardef\colorstackcnt=0 % Implicit stack usage
106 \_def\colorstackpush#1{\_pdfcolorstack\colorstackcnt push{#1}}
107 \_def\colorstackpop{\_pdfcolorstack\colorstackcnt pop}
108 \_def\colorstackset#1{\_pdfcolorstack\colorstackcnt set{#1}}

```

We need to open a special color stack for footnotes, because footnotes can follow on next pages and their colors are independent on colors used in the main page-body. The `\_openfnotestack` is defined as `\_openfnotestackA` when the `\_setcolor` is used first. The `\_fnotestack` is initialized in `\everyjob` because the initialization is not saved to the format.

```

119 \%_mathchardef\fnotestack=\_pdfcolorstackinit page {0 g 0 G} % must be in \everyjob
120 \_def\openfnotestackA {\_pdfcolorstack\fnotestack current}

```

We use lua codes for RGB to CMYK or CMYK to RGB conversions and for addition color components in the `\colordef` macro. The `\rgbtocmyk`  $\langle R \rangle \langle G \rangle \langle B \rangle$  ; expands to  $\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle$  and the `\cmyktorgb`  $\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle$  ; expands to  $\langle R \rangle \langle G \rangle \langle B \rangle$ . The `\colorcrop`, `\colordefFin` and `\douseK` are auxiliary macros used in the `\colordef`. The `\colorcrop` rescales color components in order to they are in  $[0, 1]$  interval. The `\colordefFin` expands to the values accumulated in Lua code `color_C`, `color_M`, `color_Y` and `color_K`. The `\douseK` applies `\useK` to CMYK components.

```

134 \_def\rgbtocmyk #1 #2 #3 ;{%
135   \_ea \_stripzeros \_detokenize \_ea{\_directlua{
136     local kr = math.max(#1,#2,#3)
137     if (kr==0) then
138       tex.print('0. 0. 0. 1 ;')
139     else
140       tex.print(string.format('\_pcnt.3f \_pcnt.3f \_pcnt.3f \_pcnt.3f ;',

159   }}}
160 \_def\douseK{\_colorcrop \_directlua{
161   kr=math.min(color_C, color_M, color_Y)
162   if (kr>=1) then
163     color_C=0 color_M=0 color_Y=0 color_K=1
164   else
165     color_C=(color_C-kr)/(1-kr) color_M=(color_M-kr)/(1-kr)
166     color_Y=(color_Y-kr)/(1-kr) color_K=math.min(color_K+kr,1)
167   end
168 }

```

We have a problem with the `%.3f` directive in Lua code. It prints trailed zeros: (0.300 instead desired 0.3) but we want to save PDF file space. The macro `\_stripzeros` removes these trailing zeros at expand processor level. So `\_stripzeros 0.300 0.400 0.560 ;` expands to `.3 .4 .56`.

```
colors.opm
177 \_def\_\_stripzeros #1.#2 #3{\_ifx0#1\_else#1\_fi.\_stripzeroA #2 0 :%
178     \_ifx;#3\_else \_space \_ea\_\_stripzeros\_\_ea#3\_\_fi}
179 \_def\_\_stripzeroA #10 #2:{\_ifx^#2^\_stripzeroC#1:\_else \_stripzeroB#1 0 :\_fi}
180 \_def\_\_stripzeroB #10 #2:{\_ifx^#2^\_stripzeroC#1:\_else #1\_\_fi}
181 \_def\_\_stripzeroC #1 #2:{#1}
```

The `\rgbcOLORdef` and `\cmykCOLORdef` use common macro `\commoncolordef` with different first four parameters. The `\commoncolordef <selector><K><R><G><what-define>{<data>}` does the real work. It initializes the Lua variables for summation. It expands `<data>` in the group where color selectors have special meaning, then it adjusts the resulting string by `\replstring` and runs it. Example shows how the `<data>` are processed:

```
input <data>: ".3\Blue + .6^\KhakiC \useK -\Black"
expanded to: ".3 !=K 1 1 0 0 +.6^!=R .804 .776 .45 \useK -!=G 0"
adjusted to: "\_addcolor .3!=K 1 1 0 0 \_addcolor .6!=R .804 .776 .45
              \useK \_addcolor -1!=G 0"
and this is processed.
```

`\_addcolor <coef>!<mod><type>` expands to `\_addcolor:<mod><type> <coef>` for example it expands to `\_addcolor:=K <coef>` followed by one or three or four numbers (depending on `<type>`). `<mod>` is = (use as is) or ^ (use complementary color). `<type>` is K for CMYK, R for RGB and G for GREY color space. Uppercase `<type>` informs that `\cmykCOLORdef` is processed and lowercase `<type>` informs that `\rgbcOLORdef` is processed. All variants of commands `\_addcolor:<mod><type>` are defined. All of them expand to `\_addcolorA <v1> <v2> <v3> <v4>` which adds the values of Lua variables. The `\rgbcOLORdef` uses `\_addcolorA <R> <G> <B> 0` and `\cmykCOLORdef` uses `\_addcolorA <C> <M> <Y> <K>`. So the Lua variable names are a little confusing when `\rgbcOLORdef` is processed.

Next, `\commoncolordef` saves resulting values from Lua to `\_tmpb` using `\colordefFin`. If `\rgbcOLORdef` is processed, then we must to remove the last `<K>` component which is in the format .0 in such case. The `\_stripK` macro does it. Finally, the `<what-define>` is defined as `<selector>{<expanded _tmpb>}`, for example `\setcmykcolor{1 0 .5 .3}`.

```

261 \sdef{addcolor:=r}#1 #2 #3 #4 {\_addcolorA #1 #2 #3 #4 0 }
262 \sdef{addcolor:^r}#1 #2 #3 #4 {\_addcolorA #1 (1-#2) (1-#3) (1-#4) 0 }
263 \def\stripK#1 .0;{#1}
264 \let\colordef=\cmykcolordef % default \colordef is \cmykcolordef

```

Public versions of `\colordef` and `\useK` macros are declared using `\def`, because the internal versions `\colordef` and `\useK` are changed during processing.

```

272 \def \useK{\useK}
273 \def \colordef {\colordef}
274 \public \cmykcolordef \rgbcolordef ;

```

The L<sup>A</sup>T<sub>E</sub>X file `x11nam.def` is read by `\morecolors`. The numbers 0,1,2,3,4 are transformed to letters O, *none*, B, C, D in the name of the color. Colors defined already are not re-defined. The empty `\showcolor` macro should be re-defined for color catalog printing. For example:

```

\def\vr{\vrule height10pt depth2pt width20pt}
\def\_showcolor{\hbox{\tt\_bslash\_tmpb: \csname\_tmpb\endcsname \vr}\space\space}
\begin{multi} 4 \typo{11/14}
\morecolors
\end{multi}

290 \def\_morecolors{%
291   \long\def\_tmp##1\preparecolorset##2##3##4##5{\_tmpa ##5;,,,;}
292   \def\_tmpa##1##2##3##4{\_ifx##1,\_else
293     \def\_tmpb##1\replstring{\tmpb{1}{}}\replstring{\tmpb{2}{B}}%
294     \replstring{\tmpb{3}{C}}\replstring{\tmpb{4}{D}}\replstring{\tmpb{0}{O}}%
295     \ifcsname \tmpb\endcsname \_else
296       \sdef{\tmpb}{\setrgbcolor##2 ##3 ##4}\_showcolor\_fi
297     \ea\_tmpa\_fi
298   }
299   \ea\_tmp\_input x11nam.def
300 }
301 \let\_showcolor=\relax % re-define it if you want to print a color catalog
302 \public \morecolors ;

```

## 2.20 The .ref file

The `.ref` file has the name `\jobname.ref` and it saves information about references, TOC lines, etc. All data needed in next T<sub>E</sub>X run are saved here. OpT<sub>E</sub>X reads this file at the beginning of the document (using `\everyjob`) if such file exists. The `.ref` file looks like:

```

\xrefversion{ref-version}
\xpage{<gpageno>}{<pageno>}
\xtoc{<level>}{{<type>}{<text>}{<title>}}
\xlabel{<label>}{{<text>}}
\xlabel{<label>}{{<text>}}
...
\xpage{<gpageno>}{<pageno>}
\xlabel{<label>}{{<text>}}
...

```

where `<gpageno>` is internal page number globally numbered from one and `<pageno>` is a page number (`\the\pageno`) used in pagination (they may be differ). Each page begins with `\Xpage`. The `<label>`

is a label used by user in `\label[<label>]` and `<text>` is a text which should be referenced (the number of section or table, for example 2.3.14). The `<title>` is a title of the chapter (`<level>=1, <type>=chap`), section (`<level>=2, <type>=sec`), subsection (`<level>=3, <type>=secc`). The `\_Xpage` is written at beginning of each page, the `\_Xtoc` is written when chapter or section or subsection title exists on the page and `\_Xlabel` when labeled object prefixed by `\label[<label>]` exists on the page.

The `.ref` file is read when the processing of the document starts using `\everyjob`. It is read, removed and opened to writing immediately. But the `.ref` file should be missing. If none forward references are needed in the document then `.ref` file is not created. For example, you only want to test a simple plain `TEX` macro, you create `test.tex` file, you do `optex test` and you don't need to see empty `test.ref` file in your directory.

```
3 \codel{ \openref {File for references <2020-02-14>} % preloaded in format } ref-file.opm
```

The `\_inputref` macro is used in `\everyjob`. It reads `\jobname.ref` file if it exists. After the file is read then it is removed and opened to write a new contents to this file.

```
11 \newwrite\reffile
12
13 \def\inputref {%
14   \isfile{\jobname.ref}\iftrue
15     \input {\jobname.ref}
16     \gfnoteum=0 \lfnoteum=0 \mnoteum=0
17   \openrefA{\string\inputref}%
18   \fi
19 } ref-file.opm
```

If the file does not exists then it is not created by default. It means that if you process a document without any forward references then no `\jobname.ref` file is created because it is unusable. The `\_wref` macro is dummy in such case.

```
28 \def\wrefrelax#1#2{}
29 \let\wref=\wrefrelax ref-file.opm
```

If a macro needs to create and to use `.ref` file then such macro must use `\openref`. When the file is created (using internal `\openrefA`) then the `\wref \macro{<data>}` is redefined in order to save the line `\macro{<data>}` to the `.ref` file using asynchronous `\write` primitive. Finally, the `\openref` destroys itself, because we need not to open the file again.

```
40 \def\openref {%
41   \ifx \wref\wrefrelax \openrefA{\string\openref}\fi
42   \gdef\openref{}%
43 }
44 \def\openrefA #1{%
45   \immediate\openout\reffile="\jobname.ref"\relax
46   \gdef\wref {\write\reffile{\string##1##2}}%
47   \immediate\write\reffile {\percent\percent\space OPTeX <\optexversion> - REF file (#1)}%
48   \immediate\wref \Xrefversion{\REFversion}%
49 }
50 \def\openref{\openref}
```

We are using convention that the macros used in `.ref` file are named `\_X<foo>`. If there is a new version of `OpTeX` with different collection of such macros then we don't want to read the `.ref` files produced by an old version of `OpTeX` or by `OPmac`. So first line of `.ref` file is in the form

`\Xrefversion{<version>}`

We can check the version compatibility by this macro. Because `OPmac` does not understand `\_Xrefversion` we use `\Xrefversion` (with different number of `<version>` from `OPmac`) here. The result: `OPmac` skips the `.ref` files produced by `OpTeX` and vice versa.

```
68 \def\REFversion{4} % actual version of .ref files in OpTeX
69 \def\Xrefversion#1{\ifnum #1=\REFversion\relax \else \endinput \fi}
70 \public \Xrefversion ; % we want to ignore .ref files generated by OPmac ref-file.opm
```

You cannot define your special `.ref` macros before `.ref` file is read because it is read in `\everyjob`. But you can define such macros using `\refdecl{definitions of your ref macros}`. This command sends to

.ref file your *definitions of your ref macros* immediately. Next lines in .ref file should include our macros. Example from CTUstyle2:

```
\refdecl{%
    \def\totlist{} \def\tofilelist{}^J
    \def\xtab#1#2#3{\addto\totlist{\totline{#1}{#2}{#3}}}^J
    \def\xfig#1#2#3{\addto\tofilelist{\tofileline{#1}{#2}{#3}}}
}
```

We must read *definition of your ref macros* when catcode of # is 12 because we needn't to duplicate each # in the .ref file.

```
90 \_def\_refdecl{\_bgroup \_catcode`\#=12 \_refdeclA}
91 \_def\_refdeclA #1{\egroup\_openref
92     \_immediate\_write\_reffeile f\_{\_pcnt\_\space \_string \_refdecl:}%
93     \_immediate\_write\_reffeile f\detokenize{#1}}%
94 }
95 \_public \refdecl ;
```

ref-file.opm

## 2.21 References

If the references are “forward” (i. e. the \ref is used first, the destination is created later) or if the reference text is page number then we must read .ref file first in order to get appropriate information. See section 2.20 for more information about .ref file concept.

```
3 \_codedecl \ref {References <2020-03-03>} % preloaded in format
```

references.opm

\\_Xpage {\<gpageno>}{\<pageno>} saves the parameter pair into \\_currpage. Resets \\_lfnotenum; it is used if footnotes are numbered from one at each page.

```
10 \_def\_Xpage#1#2{\_def\_currpage{{#1}{#2}}\_lfnotenum=0 }
```

references.opm

Counter for number of unresolved references \\_unresolvedrefs.

```
16 \_newcount\_unresolvedrefs
17 \_unresolvedrefs=0
```

references.opm

\\_Xlabel {\<label>}{\<text>} saves the *text* to \\_lab:{*label*} and saves [pg:{*gpageno*}]{*pageno*} to \\_pgref:{*label*}.

```
24 \_def\_Xlabel#1#2{\_sdef{\_lab:#1}{#2}\_sxdef{\_pgref:#1}{\ea\bracketspg\currpage}}
25 \_def\bracketspg#1#2{[pg:#1]{#2}}
```

references.opm

\label [*label*] saves the decalred label to \\_lastlabel and \wlabel{\<text>} uses the \\_lastlabel and activates \wref{\\_Xlabel{\<label>}{\<text>}}.

```
33 \_def\_label[#1]{\_isempty{#1}\_iftrue \_global\let \_lastlabel=\_undefined
34 \_else \_isdefined{10:#1}%
35     \_iftrue \_opwarning{duplicated label [#1], ignored}\_else \_xdef\lastlabel{#1}\_fi
36 \_fi \_ignorespaces
37 }
38 \_def\_wlabel#1{%
39     \_ifx\lastlabel\undefined \_else
40         \_dest[ref:\_lastlabel]%
41         \_printlabel\lastlabel
42         \_edef\temp{\_lastlabel}{#1}%
43         \ea\wref \ea\Xlabel \ea{\temp}%
44         \sxdef{\_lab:\_lastlabel}{#1}\sxdef{10:\_lastlabel}{}%
45         \global\let\lastlabel=\_undefined
46     \_fi
47 }
48 \_public \label \wlabel ;
```

references.opm

\ref [*label*] uses saved \\_lab:{*label*} and prints (linked) *text*. If the reference is backwarded then we know \\_lab:{*label*} without any need to read REF file. On the other hand, if the reference is forwarded, then we doesn't know \\_lab:{*label*} in first run of TeX and we print warning and do \\_openref.

\pgref[*label*] uses {\*gpageno*}{{*pageno*}} from \pgref:*label* and prints (linked) *pageno* using \ilink macro.

```
61 \_def\ref[#1]{\isdefined{lab:#1}%
62   \iftrue \ilink[ref:#1]{\csname _lab:#1\_endcsname}%
63   \else ??\opwarning{label [#1] unknown. Try to TeX me again}%
64   \incr\_unresolvedrefs \openref
65   \fi
66 }
67 \_def\pgref[#1]{\isdefined{pgref:#1}%
68   \iftrue \ea\ea\ea\ilink \csname pgref:#1\_endcsname
69   \else ??\opwarning{pg-label [#1] unknown. Try to TeX me again}%
70   \incr\_unresolvedrefs \openref
71   \fi
72 }
73 \public \ref \pgref ;
```

Default \printlabel is empty macro (labels are not printed). The \showlabels redefines it as box with zero dimensions and with left lapped [*label*] in blue 10pt \tt font shifted up by 1.7ex.

```
81 \_def\printlabel#1{}
82 \_def\showlabels {%
83   \_def\printlabel##1{\vbox to0pt{\vss\llap{\labelfont[##1]\kern1.7ex}}%
84   \fontdef\labelfont{\setfontsize{10pt}\setfontcolor{blue}\tt}
85 }
86 \public \showlabels ;
```

## 2.22 Hyperlinks

There are four types of the internal links and one type of external link:

- ref:<*label*> – the destination is created when \label[<*label*>] is used, see also the section 2.21.
- toc:<*tocrefnum*> – the destination is created at chap/sec/secc titles, see also the section 2.23.
- pg:<*gpageno*> – the destination is created at beginning of each page, see also the section 2.17.
- cite:<*bibnum*> – the destination is created in bibliography reference, see also the section 2.31.1.
- url:<*url*> – used by \url or \ulink, see also the end of this section.

The <*tocrefnum*>, <*gpageno*> and <*bibnum*> are numbers starting from one and globally incremented by one in whole document. The registers \tocrefnum, \gpageno and \bibnum are used for these numbers.

When a chap/sec/secc title is prefixed by \label[<*label*>], then both types of internal links are created at the same destination place: toc:<*tocrefnum*> and ref:<*label*>.

```
3 \codedecl \ulink {Hyperlinks <2020-04-22>} % preloaded in format
```

\dest[<*type*>:<*spec*>] creates a destination of internal links. The destination is declared in the format <*type*>:<*spec*>. If the \hyperlinks command in not used, then \dest does nothing else it is set to \destactive. The \destactive is implemented by \pdfdest primitive. It creates a box in which the destination is shifted by \destheight. The reason is that the destination is exactly at top border of the PDF viewer but we want to see the line where destination is. The destination box is positioned by different way dependent on current vertical or horizontal mode.

```
16 \_def\destheight{1.4em}
17 \_def\destactive[#1:#2]{\if$#2$\else\ifvmode
18   \tmpdim=\prevdepth \prevdepth=-1000pt
19   \destbox[#1:#2]\prevdepth=\tmpdim
20 \else \destbox[#1:#2]%
21 \fi\fi
22 }
23 \_def\destbox[#1]{\vbox to0pt{\kern-\destheight \pdfdest name{#1} xyz\vs}}
24 \_def\dest[#1]{}
25 \public \dest ;
```

\link[<*type*>:<*spec*>]{<*color*>}{<*text*>} creates an internal link to \dest with the same <*type*>:<*spec*>. You can have more links with the same <*type*>:<*spec*> but only one \dest in the document. If \hyperlinks command is not used, then \link only prints <*text*> else it is set to \linkactive. The \linkactive is implemented by \pdfstartlink... \pdfendlink primitives.

\ilink[*<type>*:*<spec>*]{*<text>*} is equivalent to \link but the *<color>* is used from \hyperlinks declaration.

```
hyperlinks.opm
40 \_protected\_def\_linkactive[#1:#2]#3#4{\_leavevmode\pdfstartlink height.9em depth.3em
41     \pdfborder{#1} goto name{#1:#2}\_relax {#3#4}\pdfendlink
42 }
43 \_protected\_def\_link[#1]#2#3{\_leavevmode{#3}}
44 \_protected\_def\_ilink[#1]#2{\_leavevmode{#2}}
45 \public \ilink \link ;
```

\ulink[*<url>*]{*<text>*} creates external link. It prints only te *<text>* by default but the \hyperlinks declaration defines it as \urlactive[url:*<url>*]{*<text>*}. The external link is created by the \pdfstartlink...pdfendlink primitives. The *<url>* is detokenized with \escapechar=-1 before it is used, so \% , \# etc. can be used in the *<url>*.

```
hyperlinks.opm
55 \_protected\_def\_urlactive[#1:#2]#3#4{\_leavevmode{\_escapechar=-1
56     \pdfstartlink height.9em depth.3em \pdfborder{#1}%
57     user{/Subtype/Link/A <>/Type/Action/S/URI(\detokenize{#2})>>}\_relax
58     {#3#4}\pdfendlink}%
59 }
60 \_def\_ulink[#1]#2{\_leavevmode{#2}}
61 \_def\_urlcolor{%
62 \public \ulink ;
```

The \pdfstartlink primitive uses \pdfborder{*<type>*} in its parameter (see \linkactive or \urlactive macros). The \pdfborder{*<type>*} expands to attr{/C[? ? ?] /Border[0 0 .6]} if the \<type>border (i.e. \refborder, \citeborder, \tocborder, \pgborder, \urlborder, \fntborder or \fnfborder) is defined. User can define it in order to create colored frames around active links. For example \def\tocborder{1 0 0} causes red frames in TOC (not printed, only visible in PDF viewers).

```
hyperlinks.opm
76 \_def\_pdfborder#1{\_ifcsname _#1border\_endcsname
77     attr{/C[\_csname _#1border\_endcsname] /Border[0 0 .6]}%
78     \else attr{/Border[0 0 0]}\_fi
79 }
```

\hyperlinks{*ilink\_color*}{*ulink\_color*} activates \dest, \link, \ilink, \ulink in order they create links. These macros are redefined here to their “active” version.

```
hyperlinks.opm
87 \_def\_hyperlinks#1#2{%
88     \_let\_dest=\_destactive \_let\_link=\_linkactive
89     \_def\_ilink[##1]##2{\_link[##1]{\_localcolor{#1}{##2}}\%
90     \_def\_ulink[##1]##2{\_urlactive[url:##1]{\_localcolor{#2}{##2}}\%
91     \public \dest \ilink \ulink ;%
92 }
93 \public \hyperlinks ;
```

\url{*<url>*} does approximately the same as \ulink[*<url>*]{*<url>*}, but more work is done before the \ulink is processed. The link-version of *<url>* is saved to \tmpa and the printed version in \tmpb. The printed version is modified in order to set a breakpoints to special places of the *<url>*. For example // is replaced by \urlskip\urlskip\urlbskip where \urlskip adds a small nobreakable glue between these two slashes and before them and \urlbskip adds a breakable glue after them.

The text version of the *<url>* is printed in \urlfont.

```
hyperlinks.opm
107 \_def\_url#1{%
108     \_def\_tmpa{#1}\_replstring\_tmpa {\|}{\}{}%
109     {\_escapechar=-1 \ea}\_ea\_edef\ea\_tmpa\_ea{\_detokenize\ea{\_tmpa}}%
110     \_def\_tmpb{#1}\_replstring\_tmpb {\|}{\_urlbskip}%
111     \_replstring\_tmpb {/\!/} {\_urlskip\_urlslashslash\_urlbskip}%
112     \_replstring\_tmpb {/\!} {\_urlskip\_\_urlbskip}%
113     \_replstring\_tmpb {.\!} {\_urlskip\_\_urlbskip}%
114     \_replstring\_tmpb {?\!} {\_urlskip?\_urlbskip}%
115     \_replstring\_tmpb {=\!} {\_urlskip=\_urlbskip}%
116     \ea\_replstring\ea\_tmpb \ea{\_string &} {\_urlbskip\_char`\& \urlskip}%
117     \ea\_replstring\ea\_tmpb \ea{\_bslash\!} {\_penalty0}%
118     \ea\_ulink \ea[\_tmpa] {\_urlfont\_tmpb\_\null}%
119 }}
```

```

120 \_def\urlfont{\tt}
121 \_def\urlskip{\null\nobreak\hskip0pt plus0.05em\_relax}
122 \_def\urlbskip{\penalty100 \hskip0pt plus0.05em\_relax}
123 \_def\urlslashslash{/\_urlskip/}
124
125 \_public \url ;

```

## 2.23 Making table of contents

maketoc.opp

```

3 \codedecl \maketoc {Macros for maketoc <2020-03-12>} % preloaded in format

```

\\_Xtoc {\<level>} {\<type>} {\<number>} {\<title>} (in .ref file) reads the specified data and appends them to the \\_toclist as \\_tocline{\<level>} {\<type>} {\<number>} {\<title>} {\<gpageno>} {\<pageno>} where:

- {\<level>}: 0 reserved, 1: chapter, 2: section, 3: subsection
- {\<type>}: the type of the level, i.e. chap, sec, secc
- {\<number>}: the number of the chapter/section/subsection in the format 1.2.3
- {\<title>}: the title text
- {\<gpageno>}: the page number numbered from 1 independently of pagination
- {\<pageno>}: the page number used in the pagination

The last two parameters are restored from previous \\_Xpage{\<pageno>} {\<gpageno>} , data were saved in the \\_currpage macro.

We read the {\<title>} parameter by \scantoeol from .ref file because the {\<title>} can include something like `{`.

maketoc.opp

```

25 \_def\_toclist{}
26 \newifi \_ifischap \_ischapfalse
27
28 \_def\_Xtoc#1#2#3{\_ifnum#1=0 \_ischaptrue\_fi
29   \_addto\_toclist{\_tocline{\#1}{\#2}{\#3}\_scantoeol\_XtocA}
30 \_def\_XtocA#1{\_addto\_toclist{\#1}\_ea\_addto\_ea\_toclist\_ea{\_currpage}}

```

\\_tocline{\<level>} {\<type>} {\<number>} {\<title>} {\<gpageno>} {\<pageno>} prints the record to the table of contents. It opens group, reduces \leftskip, \rightskip, runs the \everytocline (user can customise the design of TOC here) and runs \\_tocl:{\<level>} {\<number>} {\<title>} {\<gpageno>} macro. This macro starts with vertical mode, inserts one record with given {\<level>} and it should end by \\_tocpar which returns to horizontal mode. The \\_tocpar appends \nobreak \hspace{-2\leftmargin} \\_par. This causes that the last line of the record is shifted outside the margin given by \rightskip. A typical record (with long {\<title>} ) looks like:

```

|           |
\llap{\<number>} text text text text
               text text text text
               text text ..... <pageno>

```

Margins given by \leftskip and \rightskip are denoted by | in the example above.

\tocrefnum is global counter of all TOC records (used by hyperlinks).

maketoc.opp

```

55 \newcount \_tocrefnum
56 \_def\_tocline#1#2#3#4#5#6{%
57   \_advance\_tocrefnum by1
58   \_bgroup
59     \_leftskip=\_indent \_rightskip=2\_indent
60     \_ifischap \_advance\leftskip by \_indent \_fi
61     \_def\_pgn{\_ilink[pg:#5]}%
62     \_the\everytocline
63     \_ifcsname _tocl:#1\endcsname
64       \_cs{_tocl:#1}{#3}{\_scantextokens{#4}}{#6}\_par
65     \_fi
66   \_egroup
67 }
68 \_public \tocrefnum ;

```

You can re-define default macros for each level of tocline if you want.

Parameters are  $\{\langle number \rangle\}\{\langle title \rangle\}\{\langle pageno \rangle\}$ .

```
maketoc.opm
75 \sdef{_tocl:1}#1#2#3{\_nofirst\_bigskip \bf \llap{toclink{\#1}{\#2}\hfill \pgn{\#3}\_tocpar}
76 \sdef{_tocl:2}#1#2#3{\_llap{toclink{\#1}{\#2}\_tocdotfill \pgn{\#3}\_tocpar}
77 \sdef{_tocl:3}#1#2#3{\_advance\leftskip by\iindent \cs{_tocl:2}{\#1}{\#2}{\#3}}}
```

The auxiliary macros are:

- `\llap{text}` does `\noindent\llap{linked text}`.
- `\tocdotfill` creates dots in the TOC.
- `\nofirst` macro applies the `\macro` only if we don't print the first record of the TOC.
- `\tocpar` finalizes one TOC records with `\leftskip` *pageno*.
- `\pgn{pageno}` creates *pageno* as link to real *gpage* saved in #6 of `\tocline`. This is temporarily defined in the `\tocline`.

```
maketoc.opm
92 \def\llap#1{\noindent
93   \llap{\iink[toc:\the\tocrefnum]{\enspace#1\kern.4em}\kern.1em}}
94 \def\tocdotfill{\nobreak\leaders\hbox to.8em{\hss.\hss}\hskip 1em plus1fill\relax}
95 \def\nofirst #1{\ifnum \lastpenalty=11333 \else #1\fi}
96 \def\tocpar{\nobreak \hskip-2\iindent\null \par}
```

`\maketoc` prints warning if TOC data is empty, else it creates TOC by running `\toclist`

```
maketoc.opm
103 \def\maketoc{\par \ifx\toclist\empty
104   \opwarning{\noexpand\maketoc -- data unavailable, TeX me again}\openref
105   \incr\unresolvedrefs
106   \else \begingroup
107     \tocrefnum=0 \penalty11333
108     \the\regtoc \toclist
109   \endgroup \fi
110 }
```

`\regmacro` appends its parameters to `\regtoc`, `\regmark` and `\regoul`. These token lists are used in `\maketoc`, `\begoutput` and `\pdfunidef`.

```
maketoc.opm
118 \newtoks \regtoc \newtoks \regmark \newtoks \regoul
119
120 \def\regmacro #1#2#3{%
121   \toksapp\regtoc{\#1}\toksapp\regmark{\#2}\toksapp\regoul{\#3}%
122 }
123 \public \maketoc \regmacro ;
```

## 2.24 PDF outlines

### 2.24.1 Nesting PDF outlines

The problem is that PDF format needs to know the number of direct descendants of each outline if we need to create the tree of structured outlines. But we know only the level of each outline. The required data should be calculated from TOC data. We use two steps over TOC data saved in the `\toclist` where each record is represented by one `\tocline`.

First step, the `\outlines` macro sets `\tocline` to `\outlinesA` and calculates the number of direct descendants of each record. Second step, the `\outlines` macro sets `\tocline` to `\outlinesB` and it uses prepared data and create outlines.

Each outline is mapped to the control sequence of the type `\ol{:num}` or `\ol{:num}:num` or `\ol{:num}:num:num` or etc. The first one is reserved for level 0, the second one for level 1 (chapters), third one for level 2 (sections) etc. The number of direct descendants will be stored in these macros after first step is finished. Each new outline of given level increases the *num* at given level. When the first step is processed then (above that) the `\ol{...}` sequence of the parent increases its value too. The `\ol{...}` sequences are implemented by `\ol:\count0:\count1:\count2` etc. For example, when section (level 2) is processed in the first step then we do:

```

\advance \count2 by 1
    % increases the mapping pointer of the type
    % \_ol:<\_count0:\_count1:\_count2> of this section
\advance \<_ol:\_count0:\_count1> by 1
    % increases the number of descendants connected
    % to the parent of this section.

```

When second step is processed, then we only read the stored data about the number of descendants. Ad we use it in `count` parameter of `\_pdfoutline` primitive.

For linking, we use the same links as in TOC, i.e. the `toc:\_the\_tocrefnum` labels are used.

`\insertoutline {<text>}` inserts one outline with zero direct descendants. It creates link destination of the type `oul:<num>` into the document (where `\insertoutline` is used) and the link itself is created too in the outline.

```

## 2.24.2 Strings in PDF outlines

There are only two encodings for PDF strings (used in PDFoutlines, PDFinfo etc.). First one is PDFDocEncoding which is one-byte encoding, but most Czech or Slovak characters are missing here.

The second encoding is PDFunicode encoding which is implemented in this file. This encoding is TeX-discomfortable, because it looks like

```
\376\377\000C\000v\000i\001\015\000e\000n\000\355\000\040\000j\000e\000\040
\000z\000\341\000t\001\033\001\176
```

This example is real encoding of the string "Cvičení je zátěž". You can see that this is UTF-16 encoding (two bytes per character) with two starting bytes FFFF. Moreover, each byte is encoded by three octal digits preceded by backslash. The only exception is the visible ASCII character encoding: such a character is encoded by its real byte preceded by \000.

```
pdfuni-string.opm
3 \_codedecl \pdfunidef {PDFunicode strings for outlines <2020-03-12>} % preloaded in format
```

The `\_octalprint` is lua script which prints the character code in the octal notation.

```
pdfuni-string.opm
10 \_edef\_\octalprint#1#2{\_noexpand\_directlua{%
11     #1=character-code #2=character
12     if ('#2'>='A' and '#2'<='Z') or ('#2'>='a' and '#2'<='z') then
13         tex.print(string.format('000\_\pcnt s','#2'))
14     else
15         local num=#1\_\pcnt256
16         tex.print(string.format('\_\pcnt 030\_\nbb\_\pcnt030',(#1-num)/256,num))
17     end
18 }}
```

`\pdfunidef\macro{<text>}` does more things than only converting to octal notation. The `<text>` can be scanned in verbatim mode (it is true because `\_Xtoc` reads the `<text>` in verbatim mode). First `\edef` do `\scantextokens\unexpanded` and second `\edef` expands the parameter according to current values on selected macros from `\regoul`. Then `\removeoutmath` converts `..$x^2$..` to `..x^2..`, i.e removes dollars. Then `\removeoutbraces` converts `..{x}..` to `..x....` Finaly, the `<text>` is detokenized, spaces are preprocessed using `\replstring` and then the `\pdfunidefB` is repeated on each character. It calls the `\directlua` chunk to print octal numbers in the macro `\octalprint`.

```
pdfuni-string.opm
32 \_def\_\pdfunidef#1#2{%
33     \_beginninggroup
34     \_the\_\regoul \_relax % \_regmacro alternatives of logos etc.

62 \_def\_\removeoutmath #1#2#1{\_ifx\_\end#2\_\else #2\_\ea\_\removeoutmath\_\fi}
```

The `\_prepinverb`*macro*`\_separator`{*text*}, e.g. `\_prepinverb\tmpb{aaa|bbb|cccc|dd|ee}` does `\def\tmpb{\su{aaa }bbb\su{ cccc }dd\su{ ee}}` where *su* is `\scantextokens\unexpanded`. It means that in-line verbatim are not argument of `\scantextoken`. First `\edef\tmpb` tokenizes again the *text* but not the parts which were in the in-line verbatim.

`pdfuni-string.opp`

```
73 \_def\_\_prepinverb#1#2#3{\_def#1{}%
74   \_def\_\_dotmpb##1#2##2{\_addto#1{\_scantextokens{\_unexpanded{##1}}}}%
75   \_ifx\_end##2\_else\ea\_\_dotmpbA\ea##2\_fi}%
76   \_def\_\_dotmpbA##1#2{\_addto#1{##1}\_\_dotmpb}%
77   \_dotmpb#3#2\_end
78 }
```

The `\regmacro` is used in order to set the values of macros `\em`, `\rm`, `\bf`, `\it`, `\bi`, `\tt`, `\text` and `\sim` to values usable in PDF outlines.

`pdfuni-string.opp`

```
86 \_regmacro {}{}{\_let\em=\_empty \_let\rm=\_empty \_let\bf=\_empty
87   \_let\it=\_empty \_let\bi=\_empty \_let\text=\_empty \_let\sim=\_empty
88   \_let-=\space
89 }
90 \public \pdfunidef ;
```

## 2.25 Chapters, sections, subsections

`sections.opp`

```
3 \_codedecl \chap {Titles, chapters, sections, subsections <2020-03-28>} % preloaded in format
```

We are using scaled fonts for titles `\titfont`, `\chapfont`, `\secfont` and `\seccfont`. They are scaled from main fonts size of the document, which is declared by first `\typosize[fo-size]/[b-size]` command.

`sections.opp`

```
13 \_def \_titfont {\_scalemain\_typoscale[\_magstep4/\_magstep5]\_boldify}
14 \_def \_chapfont {\_scalemain\_typoscale[\_magstep3/\_magstep3]\_boldify}
15 \_def \_secfont {\_scalemain\_typoscale[\_magstep2/\_magstep2]\_boldify}
16 \_def \_seccfont {\_scalemain\_typoscale[\_magstep1/\_magstep1]\_boldify}
```

The `\tit` macro is defined using `\scantoeol` and `\printtit`. It means that the parameter is separated by end of line and inline verbatim is allowed. The same principle is used in the `\chap`, `\sec` and `\secc` macros.

`sections.opp`

```
25 \_def\_\_printtit #1{\_vglue\_\_titskip
26   {\_leftskip=0pt plus1fill \_rightskip=\_leftskip % centering
27   \_titfont \_noindent \_scantextokens{#1}\_par}%
28   \_nobreak\_\bigskip
29 }
30 \_def\_\_tit{\_scantoeol\_\_printtit}
31
32 \public \tit ;
```

You can re-define `\printchap`, `\printsec` or `\printsecc` macros if another design of section titles is needed. These macros gets the *title* text in its parameter. The common recommendations for these macros are:

- Use `\abovetitle{penaltyA}{{skipA}}` and `\belowtitle{skipB}` for inserting vertical material above and below the section title. The arguments of these macros are normally used, i.e. `\abovetitle` inserts *penaltyA*`\skipA` and `\belowtitle` inserts *skipB*. But there is an exception: if `\belowtitle{skipB}` is immediately followed by `\abovetitle{penaltyA}{{skipA}}` (for example section title is immediately followed by subsection title), then only *skipA* is generated, i.e. *skipB*`\penaltyA\skipA` is reduced only to *skipA*. The reason of such behavior: we don't want to duplicate vertical skip and we don't want to use negative penalty in such cases. Moreover, `\abovetitle{penaltyA}{{skipA}}` takes previous whatever vertical skip (other than from `\belowtitle`) and generates only greater from this pair of skips. It means that *whatever-skip*`\penaltyA\skipA` is transformed to `\penaltyA\max(whatever-skip\skipA)`. The reason of such behavior: we don't want to duplicate vertical skips (from `\belowlistskip`, for example) above the title.
- Use `\printrefnum[pre@post]` in horizontal mode. It prints *pre*`\ref-num`*post*. The *ref-num* is `\thechapnum` or `\theseccnum` or `\thesecnum` depending on what type of title is processed. If

\nonum prefix is used then \printrefnum prints nothing. The macro \printrefnum does more work: it creates destination of hyperlinks (if \hyperlinks{}{} is used) and saves references from label (if \label[*label*] precedes) and saves references for table of contents (if \maketoc is used).

- Use \nbpar for closing the paragraph for printing title. This command inserts \nobreak between each line of such paragraph, so the title cannot be broken to more pages.
- You can use \firstnoindent in order to the first paragraph after the title is not indented.

```
sections.opm
72 \def\printchap #1{\vfill\supereject
73   \vglue\medskipamount % shifted by topkip+\medskipamount
74   {\chapfont \noindent \mttext{chap} \printrefnum[@]\par
75     \nobreak\smallskip
76     \noindent \raggedright #1\sb{\nbpar}\mark{#1}%
77     \nobreak \belowtitle{\bigskip}%
78     \firstnoindent
79 }
80 \def\printsec#1{\par
81   \abovetitle{\penalty-400}\bigskip
82   {\secfont \noindent \raggedright \printrefnum[@\quad]#1\sb{\nbpar}\insertmark{#1}%
83     \nobreak \belowtitle{\medskip}%
84     \firstnoindent
85 }
86 \def\printsecc#1{\par
87   \abovetitle{\penalty-200}{\medskip\smallskip}
88   {\seccfont \noindent \raggedright \printrefnum[@\quad]#1\sb{\nbpar}%
89     \nobreak \belowtitle{\medskip}%
90     \firstnoindent
91 }
```

The \sectionlevel is the level of the printed section:

- \sectionlevel=0 – reserved for parts of the book (unused by default)
- \sectionlevel=1 – chapters (used in \chap)
- \sectionlevel=2 – sections (used in \sec)
- \sectionlevel=3 – subsections (used in \secc)
- \sectionlevel=4 – subsubsections (unused by default)

```
sections.opm
104 \newcount\sectionlevel
105 \def \secinfo {\ifcase \sectionlevel
106   part\or chap\or sec\or secc\or seccc\fi
107 }
```

The \chapx initializes counters used in chapters, the \secx initializes counters in sections and \seccx initializes counters in subsections. If you have more types of numbered objects in your document then you can declare appropriate counters and do \addto\chapx{\yourcounter=0} for example. If you have another concept of numbering objects used in your document, you can re-define these macros. All settings here are global because it is used by {\globaldefs=1 \chapx}.

Default concept: Tables, figures and display maths are numbered from one in each section – subsections doesn't reset these counters. Footnotes declared by \fnotenumchapters are numbered in each chapter from one.

The \the\* macros \thechapnum, \theseignum, \theseccnum, \thetnum, \thefnum and \thednum include the format of numbers used when the object is printing. If chapter is never used in the document then \chapnum=0 and \othe\chapnum. expands to empty. Sections have numbers *num* and subsections *num*.*num*. On the other hand, if chapter is used in the document then \chapnum>0 and sections have numbers *num*.*num* and subsections have numbers *num*.*num*.*num*.

```
sections.opm
136 \newcount \chapnum % chapters
137 \newcount \secnum % sections
138 \newcount \seccnum % subsections
139 \newcount \tnum % table numbers
140 \newcount \fnum % figure numbers
141 \newcount \dnum % numbered display maths
142
143 \def \chapx {\secx \secnum=0 \fnotenum=0 }
144 \def \secx {\seccx \seccnum=0 \tnum=0 \fnum=0 \dnum=0 \resetABCDE }
```

```

145 \_def \_seccx {}

166 \_public \notoc \nonum ;

```

The `\chap`, `\sec` and `\secc` macros are implemented here. The `\_inchap`, `\_insec` and `\_insecc` macros does the real work. First, we read the optional parameter `[<label>]`, if it exists. The `\chap`, `\sec` and `\secc` macro reads its parameter using `\scantoeol`. This causes that they cannot be used inside other macros. Use `\_inchap`, `\_insec` and `\_insecc` macros directly in such case.

```

```

The `\_abovetitle`{*penaltyA*} {*skipA*} and `\_belowtitle`{*skipB*} pair communicates using a special penalty 11333 in vertical mode. The `\_belowtitle` puts the vertical skip (its value is saved in `\_savedtitleskip`) followed by this special penalty. The `\_abovetitle` reads `\lastpenalty` and if it has this special value then it removes the skip used before and don't use the parameter. The `\abovetitle` creates *skipA* only if whatever previous skip is less or equal than *skipA*. We must save *whatever-skip*, remove it, create *penaltyA* (if `\belowtitle` does not preceded) and create *whatever-skip* or *skipA* depending on what is greater. The amount of *skipA* is measured using `\setbox0=\vbox`.

```
sections.opm  
241 \_newskip \_savedtitleskip  
242 \_newskip \_savedlastskip  
243 \_def\abovetitle #1#2{\_savedlastskip=\_lastskip % <whatever-skip>  
244 \_ifdim\lastskip>0pt \_vskip-\_lastskip \_fi  
245 \_ifnum\lastpenalty=11333 \_vskip-\_savedtitleskip \_else #1\_fi  
246 \_ifdim\_savedlastskip>0pt \_setbox0=\_vbox{#2\global\tmpdim=\_lastskip}%  
247 \_else \tmpdim=\_maxdimen \_fi

249 }  
250 \_def\belowtitle #1{#1\global\_savedtitleskip=\_lastskip \_penalty11333 }
```

`\nbspace` sets `\interlinepenalty` value. `\nl` is “new line” in text (or titles), but space in toc or headlines or outlines.

```
sections.opm  
257 \_def\nbspace{\_interlinepenalty=10000\_endgraf}  
258  
259 \_protected\_def\_nl{\_hfil\break}  
260 \_regmacro {\_def\_nl{\_unskip\_space}} {\_def\_nl{\_unskip\_space}} {\_def\_nl{ }}  
261 \_regmacro {\_def\nl{\_unskip\_space}} {\_def\nl{\_unskip\_space}} {\_def\nl{ }}  
262  
263 \_public \nbspace \nl ;
```

`\firstnoindent` puts a material to `\everypar` in order to next paragraph will be without indentation. It is useful after titles. If you dislike this feature then you can say `\let\firstnoindent=\relax`. The `\wipepar` removes the material from `\everypar`.

```
sections.opm  
272 \_def \firstnoindent {\_global\everypar={\_wipepar \_setbox7=\_lastbox}}  
273 \_def \wipepar {\_global\everypar={}}
```

The `\mark` (for running heads) is used in `\printsection` only. We suppose that chapters will be printed after `\vfil\break`, so user can implement chapter titles for running headers directly by macros, no `\mark` mechanism is needed. But sections need `\marks`. And they can be mixed with chapter's running heads, of course.

The `\insertmark`{*title text*} saves `\mark` in the format `{<title-num>} {<title-text>}`, so it can be printed “as is” in `\headline` (see the space between them), or you can define a formating macro with two parameters for processing these data, if you need it.

```
sections.opm  
288 \_def\insertmark#1{\_mark{\_ifnumon\else\therefnum\fi} {\_unexpanded{\_savedtitle}}}
```

OptEX sets `\headline={}` by default, so no running headings are printed. You can activate the running headings by following code, for example:

```
\addto\_chapx {\_edef\_runningchap {\_thechapnum: \_unexpanded\ea{\_savedtitle}}}  
\def \formathead #1#2{\isempty{#1}\iffalse #1: #2\fi}  
\headline = {}%  
\ifodd \pageno  
    \hfil \ea\formathead\firstmark{}{}%  
\else  
    Chapter: \runningchap \hfil  
\fi  
}
```

The `\caption`/*letter* uses `\_<letter>num` counter. The group opened by `\caption` is finalized by first `\par` from empty line or from `\vskip` or from `\endinsert`. The `\printcaption`*letter* is called, it starts with printing of the caption.

The `\cskip` macro inserts nobreakable vertical space between caption and the object.

```

sections.opm
313 \_def\_caption{\_def\_tmpa{\_nospaceafter \_capA}
314 \_optdef\_capA []{\_trylabel \_incaption}
315 \_def\_incaption {\_bgroup
316   \_ifcsname _\tmpa num\_endcsname \_ea\_incr \_csname _\tmpa num\_endcsname
317   \_else \_opwarning{Unknown caption /\_tmpa}\_fi
318   \_edef\_thecapnum {\_csname _the\_\tmpa num\_endcsname}%
319   \_edef\_thecaptitle{\_mtext{\_tmpa}}%
320   \_ifcsname _everycaption\_tmpa\_endcsname
321     \_ea\_the \_csname _everycaption\_tmpa\_endcsname \_fi
322   \_def\_par{\_nbspace\egroup}\_let\par=\_par
323   \_cs{\_printcaption\_\tmpa}%
324 }
325 \_def \_cskip {\_par\nobreak\medskip} % space between caption and the object
326
327 \_public \caption \cskip ;

```

The `\_printcaptiont` and `\_printcaptionf` macros start in vertical mode. They switch to horizontal mode and use `\_wlabel\thecapnum` (in order to make reference and hyperlink destination) a they can use:

- `\_thecaptitle` ... expands to the word Table or Figure (depending on the current language).
- `\_thecapnum` ... expands to `\the<letter>num` (caption number).

```

sections.opm
340 \_def \_printcaptiont {%
341   \_noindent \_wlabel\thecapnum {\_bf\thecaptitle-\thecapnum}\_enspace
342   \_narrowlastlinecentered\_iindent
343 }
344 \_let \_printcaptionf = \_printcaptiont % caption of figures = caption of tables

```

The default format of `\caption` text is paragraph in block narrower by `\_iindent` and with the last line is centered. This setting is done by the `\_narrowlastlinecentered` macro.

```

sections.opm
352 \_def \_narrowlastlinecentered#1{%
353   \_leftskip=#1plus1fil
354   \_rightskip=#1plus-1fil
355   \_parfillskip=0pt plus2fil
356 }

```

`\eqmark` is processed in display mode (we add `\eqno` primitive) or in internal mode when `\eqalignno` is used (we don't add `\eqno`).

```

sections.opm
363 \_optdef\_eqmark []{\_trylabel \_ineqmark}
364 \_def \_ineqmark{\_incr\_dnum
365   \_ifinner\else\eqno \_fi
366   \_wlabel\thednum \_thednum
367 }
368 \_public \eqmark ;

```

The `\numberedpar` *<letter>*{*<name>*} is implemented here.

```

sections.opm

388   \_ea \_printnumberedpar \_csname _the\_\tmpa num\_\ea\_\endcsname\_\ea{\_tmpb}}}
389
390 \_public \numberedpar ;

```

The `\_printnumberedpar \theXnum {<name>}` opens numbered paragraph and prints it. The optional parameter is in `\_the\_opt`. You can re-define it if you need another design.

`\_printnumberedpar` needs not to be re-defined if you only want to print Theorems in italic and to insert vertical skips (for example). You can do this by the following code:

```
\def\theorem {\medskip\bgroup\it \numberedpar A{Theorem}}
\def\endtheorem {\par\egroup\medskip}
```

```
\theorem Let $M$ be... \endtheorem
```

sections.opm

```
408 \_def \_printnumberedpar #1#2{\_par
409   \_noindent\wlabel #1%
410   {\_bf #2 #1\_istoksempty\_opt\iffalse \_space \_the\_opt \_fi.}\_space
411   \_ignorespaces
412 }
```

## 2.26 Lists, items

lists.opm

```
3 \_codedecl \begitems {Lists: begitems, enditems <2020-04-21>} % preloaded in format
```

`\_aboveliskip` is used above the list of items,

`\_belowliskip` is used below the list of items and

`\_interliskip` is used between items.

`\_listskipA` is used as `\listskipamount` at level 1 of items.

`\_listskipB` is used as `\listskipamount` at other levels.

`\_setlistskip` sets the skip dependent on the current level of items

lists.opm

```
14 \_def\aboveliskip {\removelastskip \penalty-100 \vskip\_listskipamount}
15 \_def\belowliskip {\penalty-200 \vskip\_listskipamount}
16 \_def\interliskip {}
17 \_def\listskipA {\medskipamount}
18 \_def\listskipB {0pt plus .5\_smallskipamount}

19
20 \_def\setlistskip {%
21   \ifnum \ilevel = 1 \listskipamount = \listskipA \relax
22   \else \listskipamount = \listskipB \relax
23   \fi}
```

The `\itemnum` is locally reset to zero in each group declared by `\begitems`. So nested lists are numbered independently. User can set initial value of `\itemnum` to another value after `\begitems` if he/she want. Each level of nested lists is indented by new `\indent` from left. Default item mark is `\_printitem`. The `\begitems` runs `\aboveliskip` only if we are not near below a title, where a vertical skip is placed already and where the `\penalty 11333` is. It activates `*` and defines it as `\_startitem`.

The `\enditems` runs `\_isnextchar\par{}{\_noindent}` thus the next paragraph is without indentation if there is no empty line between the list and this paragraph (it is similar behavior as after display math).

lists.opm

```
42 \newcount\_itemnum \itemnum=0
43 \newtoks\printitem
44
45 \def\beginitems{\par
46   \bgroup
47   \advance \ilevel by1
48   \setlistskip
49   \ifnum\lastpenalty<10000 \aboveliskip \fi
50   \itemnum=0 \edef*\{\_startitem}
51   \advance\leftskip by\indent
52   \printitem=\defaultitem
53   \the\everylist \relax
54 }
55 \def\enditems{\par \belowliskip\egroup \_isnextchar\par{}{\_noindent}}
56
57 \def\startitem{\par \ifnum\_itemnum>0 \interliskip \fi
58   \advance\_itemnum by1
59   \the\everyitem \noindent\llap{\the\printitem}\ignorespaces}
```

```

60 }
61 \_public \begitems \enditems \itemnum ;

```

\novspaces sets \listskipamount to 0pt.

```

67 \_def\_{\_novspaces}{\_removelastskip \_listskipamount=0pt \_relax}
68 \_public \novspaces ;

```

Various item marks are saved in \item:<letter> macros. You can re-define them or define more such macros. The \style <letter> does \printitem=\{\item:<letter>\}. More exactly: \begitems does \printitem=\defaultitem first, then \style <letter> does \printitem=\{\item:<letter>\} when it is used and finally, \startitem alias \* uses \printitem.

```

79 \_def\_{\_style#1}{%
80   \_ifcsname _item:#1\_endcsname \_printitem=\ea{\_csname _item:#1\_endcsname}%

104 }
105 \_public \style ;

```

## 2.27 Verbatim, listings

### 2.27.1 Inline and “display” verbatim

```

3 \codedecl \begtt {Verbatim <2020-04-22>} % preloaded in format

```

The internal parameters \ttskip, \tppenalty, \viline, \vifile and \ttfont for verbatim macros are set.

```

11 \_def\_{\ttskip}{\medskip}          % space above and below \begtt, \verbinput
12 \_mathchardef\_{\tppenalty}=100     % penalty between lines in \begtt, \verbinput
13 \_newcount\_{\viline}              % last line number in \verbinput
14 \_newread\_{\vifile}              % file given by \verbinput
15 \_def\_{\ttfont}{\tt}               % default tt font

```

\code{<text>} expands to \detokenize{<text>} when \escapechar=-1. In order to do it more robust when it is used in \write then it expands as noexpanded \code<space> (followed by space in its csname). This macro does the real work.

The \printinverbatim{<text>} macro is used for \code{<text>} printing and for `<text>` printing. It is defined as \hbox, so the in-verbatim <text> will be never broken. But you can re-define this macro.

When \code occurs in PDF outlines then it does the same as \detokenize. The macro for preparing outlines sets \escapechar to -1 and uses \regoul token list before \edef.

The \code is not \protected because we want it expands to \unexpanded{\code<space>{<text>}} in \write parameters. This protect the expansions of the \code parameter (like \\, ^ etc.).

```

36 \_def\_{\code#1}{\unexpanded\ea{\_csname _code \_endcsname[#1]}}

```

```

37 \_protected\_\sdef{\_code }#1{{\_\escapechar=-1 \_ttfont \_the\_\everyintt \_relax
38   \_ea\_\printinverbatim\_\ea{\_\detokenize{#1}}}}
39 \_def\_\printinverbatim#1{\_\leavevmode\_\hbox{#1}}
40
41 \_regmacro {}{}{\_let\code=\_detokenize \_let\_\code=\_detokenize}
42 \_public \code ;

```

The `\_setverb` macro sets all catcodes to “verbatim mode”. It should be used only in a group, so we prepare a new catcode table with “verbatim” catcodes and we define it as `\_catcodetable\_\verbatimcatcodes`. After the group is finished then original catcode table is restored.

```

verbatim.omp
51 \_newcatcodetable \_\verbatimcatcodes
52 \_def\_\setverb{\_begingroup
53   \_def\do##1{\_\catcode`##1=12 }
54   \_dospecials
55   \_savecatcodetable\_\verbatimcatcodes % all characters are normal
56   \_endgroup
57 }
58 \_setverb
59 \_def\_\setverb{\_catcodetable\_\verbatimcatcodes }%
```

`\activettchar{char}` saves original catcode of previously declared `{char}` (if such character was declared) using `\savedttchar` and `\savedttcharc` values. Then new such values are stored. The declared character is activated by `\_adef` as a macro (active character) which opens a group, does `\_setverb` and other settings and reads its parameter until second the same character. This is done by the `\readverb` macro. Finally it prints scanned `{text}` by `\printinverbatim` and closes group. Suppose that `\activettchar` is used. Then the following work is schematically done:

```

\_def " {\_begingroup \_setverb ... \_readverb}
\_def \_readverb #1"\_\printinverbatim{#1}\_endgroup}
```

Note that the second occurrence of " is not active because `\_setverb` deactivates it.

```

verbatim.omp
78 \_def\_\activettchar#1{%
79   \_ifx\_\savedttchar\_\undefined\_\else \_catcode\_\savedttchar=\_savedttcharc \_\fi
80   \_chardef\_\savedttchar=\#1
81   \_chardef\_\savedttcharc=\_catcode`\#1
82   \_adef{#1}{\_begingroup \_setverb \_adef{ }{\_ttfont \_the\_\everyintt\_\relax \_readverb}%
83   \_def\_\readverb ##1#1{\_\printinverbatim{##1}\_endgroup}%
84 }
85 \_public \activettchar ;
```

`\begtt` is defined only as public. We don't need private `\begtt` variant. This macro is defined by `\eoldef`, so user can put a parameter at the same line where `\begtt` is. This `#1` parameter is used after `\everytt` parameters settings, so user can change them locally.

The `\begtt` macro opens group, does `\_setverb` and another preprocessing, sets `\endlinechar` to `^J` and reads the following text in verbatim mode until `\endtt` occurs. This scanning is done by `\startverb` macro which is defined as:

```

\_def\_\startverb #1\endtt #2^J{...}
```

We must to ensure that the backslash in `\endtt` has category 12 (this is a reason of the `\ea` chain in real code). The `#2` is something between `\endtt` and end of the same line and it is simply ignored.

The `\startverb` puts the scanned data to `\_prepareverbdata`. It sets the data to `\_tmpb` without changes by default, but you should re-define it in order to do special changes, if you want. (For example, `\hisyntax` redefines this macro.) The scanned data have `^J` at each end of line and all spaces are active characters (defined as `\_l`). Other characters have normal category 11 or 12.

When `\_prepareverbdata` finishes then `\startverb` runs `\printverb` loop over each line of the data and does a final work: last skip plus `\noindent` in the next paragraph.

The `\printverb` macro calls `\printverbline{<line>}` to each scanned line of verbatim text. This macro expect that it starts in vertical mode and it must do `\par` in order to return the vertical mode. The `\printverblinenumber` is used here: it does nothing when `\_ttline<0` else it prints the line number using `\_llap`.

```

verbatim.omp

```

Macro `\verbinput` uses a file read previously or opens the given file. Then it runs the parameter scanning by `\viscanparameter` and `\viscanminus`. Finally the `\doverbinput` is run. At beginning of `\doverbinput`, we have `\viline`= number of lines already read using previous `\verbinput`, `\vinolines`= the number of lines we need to skip and `\vidolnes`= the number of lines we need to print. Similar preparation is done as in `\begtt` after the group is opened. Then we skip `\vinolines` lines in a loop and we read `\vidolnes` lines. The read data is accumulated into `\tmpb` macro. The next steps are equal to the steps done in `\startverb` macro: data are processed via `\prepareverbdata` and printed via `\printverb` loop.

```

`verbatim.omp`

## 2.27.2 Listings with syntax highlighting

The user can write

```

\begtt \hisyntax{C}
...
\endtt

```

and the code is colorized by C syntax. The user can write `\everytt={\hisyntax{C}}` and all verbatim listings are colorized.

The `\hisyntax{<name>}` reads the file `hisyntax-<name>.opm` where the colorization is declared. The parameter `<name>` is case insensitive and the file name must include it in lowercase letters. For example the file `hisyntax-c.opm` looks like:

```
hisyntax-c.opm
3 \codel \_hisyntaxc {Syntax highlighting for C sources <2020-04-03>}
4

OpTeX provides `hisyntax-{c,python,tex,html}.opm` files. You can take inspiration from these files and declare more languages.

User can re-declare colors by `\hicolors{...}` This value has precedence before `\_hicolors<name>` values declared in the `hicolors-<name>.opm` file. What exactly to do: copy `\_hicolors<name>={...}` from `hicolors-<name>.opm` to your document, rename it as `\hicolors{...}` and do you own colors modifications.

Another way to set non-default colors is to declare `\newtoks\hicolors<name>` (without the `_` prefix) and set the colors palette here. It has precedence before `\_hicolors<name>` (with the `_` prefix) declared in the `hicolors-<name>.opm` file. This is useful when there are more hi-syntax languages used in one document.

### Notes for hi-syntax macro writers

The file `hisyntax-<name>.opm` is read only once in the TeX group. If there are definitions then they must be declared as global.

The `hisyntax-<name>.opm` file must (globally) declare `\_hisyntax<name>` tokens string where the action over verbatim text is declared typically by `\replfromto` or `\replthis` macros.

The verbatim text is prepared by *pre-processing phase*, then the `\_hisyntax<name>` is applied and then *post-processing phase* does final corrections. Finally, the verbatim text is printed line by line.

The pre-processing phase does:

- Each space is replaced by `\n\_\_n`, so `\n<word>\n` should be a pattern to finding whole words (no subwords). The `\n` control sequence is removed in the post-processing phase.
- Each end of line is represented by `\n^J\n`.
- The `\_start` control sequence is added before the verbatim text and `\_end` control sequence is appended to the end of the verbatim text. These control sequences are removed in post-processing phase.

There are special macros working only in a group when processing the verbatim text.

- `\n` means noting but it should be used as a boundary of words as mentioned above.
- `\t` means a tabulator. It is prepared as `\n\t\n` because it can be at the boundary of a word.
- `\x <letter>{<text>}` can be used as replacing text. Suppose the example

```
\replfromto{/**}{*/}{\x C{/**#1*/}}
```

This replaces all C comments `/*...*/` by `\x C{/*...*/}`. But the C comments may span more lines, i.e. the `^J` should be inside it.

The macro `\x <letter>{<text>}` is replaced by one or more `\z <letter>{<text>}` in post-processing phase where each parameter `<text>` of `\z` keeps inside one line. Inside-line parameters are represented by `\x C{<text>}` and they are replaced to `\z C{<text>}` without any change. But:

```
\x C{<text1>^J<text3>^J<text3>}
is replaced by
\z C{<text1>}^J\z C{<text2>}^J\z C{<text3>}
```

The `\z <letter>{<text>}` is expanded to `\_z:<letter>{<text>}` and if `\hicolor <letter> <color>` is declared then `\_z:<letter>{<text>}` expands to `{<color><text>}`. So, required color is activated at all lines (separately) where C comment spans.

- `\y {<text>}` is replaced by `\<text>` in the post processing phase. It should be used for macros without a parameter. You cannot use unprotected macros as replacement text before the post-processing phase, because the post-processing phase is based on expansion whole verbatim text.

[hi-syntax.opm](#)

```
3 \codedecl \hisyntax {Syntax highlighting of verbatim listings <2020-04-04>} % preloaded in format
```

The following macros `\replfromto` and `\replthis` manipulate with the verbatim text which has been read already and stored in the `\_tmpb` macro.

The `\replfromto {<from>}{<to>}{<what>}` finds first `<from>` then the first `<to>` following by `<from>` pattern and the `<text>` between them is packed to `#1`. Then `<from><text><to>` is replaced by `<what>`. The `<what>` parameter can use `#1` which is replaced by the `<text>`.

The `\replfromto` continues by finding next `<from>`, then, next `<to>` repeatedly over the whole verbatim text. If the verbatim text is ended by opened `<from>` but not closing by `<to>` then `<to>` is appended to the verbatim text automatically and the last part of verbatim text is replaced too.

First two parameters are expanded before usage of `\replfromto`. You can use `\csstring\%` or something else here.

[hi-syntax.opm](#)

```
24 \_def\replfromto #1#2{\_edef\_tmpa{{#1}{#2}}\ea\replfromtoE\tmpa}
25 \_def\replfromtoE#1#2#3% #1=from #2=to #3=what to replace
26   \_def\replfrom##1#1##2{\_addto\tmpb{#1}%
27     \_ifx\_end##2\ea\replstop \_else \_afterfi{\_replto##2}\_fi}%
28   \_def\replto##1#2##2{%
29     \_ifx\_end##2\_afterfi{\_replfin##1}\_else
30     \_addto\tmpb{#3}%
31     \_afterfi{\_replfrom##2}\_fi}%
32   \_def\replfin##1\_\end{\_addto\tmpb{#3}\_replstop}%
33   \_edef\tmpb{\_ea}\ea\replfrom\tmpb#1\_end#2\_end\_\relax
34 }
35 \_def\replstop#\_end\_\relax{}
36 \_def\finrepl{}
```

The `\replthis {<pattern>}{<what>}` replaces each `<pattern>` by `<what>`. Both parameters of `\replthis` are expanded first.

[hi-syntax.opm](#)

```
43 \_def\replthis#1#2{\_edef\_tmpa{{#1}{#2}}\ea\replstring\ea\tmpb \tmpa}
44
45 \_public \replfromto \replthis ;
```

The patterns `<from>`, `<to>` and `<pattern>` are not found when they are hidden in braces `{...}`. Example:

```
\replfromto{/*}{*/}{\x C{/*#1/*}}
```

replaces all C comments by `\x C{...}`. The patterns inside `{...}` are not used by next usage of `\replfromto` or `\replthis` macros.

The `\_xscan` macro does replacing `\x` by `\z` in the post-processing phase. The `\x <letter>{<text>}` expands to `\_xscan {<letter>}<text>^J^J`. If #3 is `\_end` then it signals that something wrong happens, the `<from>` was not terminated by legal `<to>` when `\replfromto` did work. We must to fix it by the `\_xscanR` macro.

```
hi-syntax.opm
63 \_def\_xscan#1#2^J#3{\_ifx\_end#3 \_ea\_\_xscanR\_fi
64   \z{#1}{#2}%
65   \_ifx^#3\_else ^J\_\_afterfi{\_xscan{#1}#3}\_fi}
66 \_def\_\_xscanR#1\_\_fi#2^J}
```

The `\hicolor <letter> <color>` defines `\z<letter>{<text>}` as `{<color>}<text>`. It should be used in the context of `\x <letter>{<text>}` macros.

```
hi-syntax.opm
74 \_def\_\hicolor #1#2{\_sdef{\z:#1}##1{[#2##1]}}
```

The `\hisyntax{<name>}` re-defines default `\_prepareverbdata<macro><verbtext>` in order to it does more things: It saves `<verbtext>` to `\tmpb`, appends `\n` around spaces and `^J` characters in pre-processing phase, it opens `hisyntax-<name>.opm` file if `\hisyntax<name>` is not defined. Then `\the\isyntax<name>` is processed. Finally, the post-processing phase is realized by setting appropriate values to `\x` and `\y` macros and doing `\edef\tmpb{\tmpb}`.

```
hi-syntax.opm
87 \_def\_\hisyntax#1{\_def\_\_prepareverbdata##1##2{%

125 \_sdef{\_hialias:xml}{html}
126 \_sdef{\_hialias:json}{c}
```

## 2.28 Graphics

The `\inspic` is defined by `\pdfximage` and `\pdfrefximage` primitives. If you want to use one picture more than once in your document, then the following code is recommended:

```
\newbox\mypic
\setbox\mypic = \hbox{\picw=3cm \inspic{<picture>}}
```

My picture: `\copy\mypic`, again my picture: `\copy\mypic`, etc.

This code downloads the picture data to the PDF output only once (when `\setbox` is processed). Each usage of `\copy\mypic` puts only a pointer to the picture data in the PDF.

If you want to copy the same picture in different sizes, then choose a “basic size” used in `\setbox` and all different sizes can be realized by the `\transformbox{<transformation>} \copy\mypic`.

```
3 \codedecl \inspic {Graphics <2020-04-12>} % preloaded in format
```

`graphics.opm`

`\inspic` accepts old syntax `\inspic <filename><space>` or new syntax `\inspic{<filename>}`. So, we need to define two auxiliary macros `\_inspicA` and `\_inspicB`.

You can include more `\pdfximage` parameters (like `page<number>`) in the `\_picparams` macro.

All `\inspic` macros are surrounded in `\hbox` in order user can write `\moveleft\inspic ...` or something similar.

```
17 \def\inspic{\hbox\bgroup\_isnextchar\bgroup\_inspicB\_inspicA}
18 \def\inspicA #1 {\_inspicB {#1}}
19 \def\inspicB #1{%
20   \pdfximage \ifdim\picwidth=0pt \else width\picwidth\fi
21   \ifdim\picheight=0pt \else height\picheight\fi
22   \picparams {\the\picdir#1}%
23   \pdfrefximage\pdflastximage\egroup}
24
25 \def\picparams{}
26
27 \public \inspic ;
```

`graphics.opm`

Inkscape is able to save a picture to `*.pdf` file and labels for the picture to `*.pdf_tex` file. The second file is in L<sup>A</sup>T<sub>E</sub>X format (unfortunately) and it is intended to read immediately it after `*.pdf` is included in order to place labels of this picture in the same font as document is printed. We need to read this L<sup>A</sup>T<sub>E</sub>X file by plain T<sub>E</sub>X macros when `\inkinspic` is used. These macros are stored in the `\_inkdefs` tokens list and it is used locally in the group. The solution is borrowed from OPmac trick 0032.

```

86 \_public \pdfscale \pdfrotate ;

```

The \transformbox{\(transformation\)}{\(text\)} is copied from OPmac trick 0046.

The \rotbox{\(degrees\)}{\(text\)} is a combination of \rotsimple from OPmac trick 0101 and the \transformbox. Note, that \rotbox{-90} puts the rotated text to the height of the outer box (depth is zero) because code from \rotsimple is processed. But \rotbox{-90.0} puts the rotated text to the depth of the outer box (height is zero) because \transformbox is processed.

**\circle**  $\{\langle x \rangle\}\{\langle y \rangle\}$  creates an ellipse with  $\langle x \rangle$  axis and  $\langle y \rangle$  axis. The origin is in the center.

**\oval**  $\{\langle x \rangle\}\{\langle y \rangle\}\{\langle roundness \rangle\}$  creates an oval with  $\langle x \rangle$ ,  $\langle y \rangle$  size and with given  $\langle roundness \rangle$ . The real size is bigger by  $2\langle roundness \rangle$ . The origin is at the left bottom corner.

**\mv**  $\{\langle x \rangle\}\{\langle y \rangle\}\{\langle curve \rangle\}$  moves current point to  $\langle x \rangle$ ,  $\langle y \rangle$ , creates the  $\langle curve \rangle$  and returns back the current point. All these macros are fully expandable and they can be used in the **\pdfliteral** argument.

```

The `\inoval{<text>}` is an example of `\_oval` usage.

The `\incircle{<text>}` is an example of `\_circle` usage.

The `\ratio`, `\linewidth`, `\fcolor`, `\lcolor`, `\shadow` and `\overlapmargins` are parameters, they can be set by user in optional brackets [...]. For example `\fcolor=\Red` does `\_let\fc当地=Red` and it means filling color.

The `\setflcolor` uses the `\_fillstroke` macro to separate filling color and drawing color.

A shadow effect is implemented here. The shadow is equal to the silhouette of the given path in gray-transparent color shifted by `\_shadowmoveto` vector and with blurred boundary. A waistline with the width  $2 * \_shadowb$  around the boundary is blurred. The `\shadowlevels` levels of transparent shapes is used for creating this effect. The `\shadowlevels+1/2` level is equal to the shifted given path.

```

329 \def\shadowlevels{9}          % number of layers for blurr effect
330 \def\shadowdarknessA{0.025}  % transparency of first shadowlevels/2 layers
331 \def\shadowdarknessB{0.07}   % transparency of second half of layers
332 \def\shadowmoveto{1.8 -2.5} % vector defines shifting layer (in bp)
333 \def\shadowb{1}              % 2*shadowb = blurring area thickness

```

The `\_pdfpageresources` primitive is used to define transparency. It does not work when used in a box. So, we use it at the begining of the output routine. The modification of the output routine is done using `\_insertshadowresources` only once when the shadow effect is used first.

## 2.29 The `\table` macro, tables and rules

### 2.29.1 The boundary declarator :

The `<declaration>` part of `\table{<declaration>}{{<data>}}` includes column declarators (letters) and other material: the `|` or `(<cmd>)`. The boundaries of columns are just before each column declarator (with exception of the first one) if the boundary declarator `:` is not used. For example, the declaration `{|c||c(xx)(yy)c}` should be written more exactly using the boundary declarator `:` by `{|c||:c(xx)(yy):c}`. But you can set these boundaries to another places using the boundary declarator `:` explicitly, for example `{|c:||c(xx):(yy)c}`. The boundary declarator `:` can be used only once between each two column declarators.

Each table item have its own group. The `(<cmd>)` are parts of the given table item (depending on the boundary declarator position). If you want to apply a special setting for given column, you can do this by `(<setting>)` followed by column declarator. But if such column is not first, you must use `:(<setting>)`. Example. We have three centered columns, the second one have to be in bold font and the third one have to be in red: `\table{c:(\bf)c:(\Red)c}{<data>}`

### 2.29.2 Usage of the `\tabskip` primitive

The value of `\tabskip` primitive is used between all columns of the table. It is glue-type, so it can be stretchable or shrinkable, see next section [2.29.3](#).

By default, `\tabskip` is 0 pt. It means that only `\tabiteml`, `\tabitemr` and `((cmds))` can generate visual spaces between columns. But they are not real spaces between columns because they are in fact the part of the total column width.

The `\tabskip` value declared before the `\table` macro (or in `\everytable` or in `\thistable`) is used between all columns in the table. This value is equal for all spaces between columns. But you can set each such space individually if you use `(\tabskip=<value>)` in the `<declaration>` immediately before boundary character. The boundary character represents the column pair for which the `\tabskip` have individual value. For example `c(\tabskip=5pt):r` gives `\tabskip` value between `c` and `r` columns. You need not to use boundary character explicitly, so `c(\tabskip=5pt)r` gives the same result.

The space before first column is given by the `\tabskipl` and the space after last column is equal to `\tabskipr`. Default values are 0 pt.

Use nonzero `\tabskip` only in special applications. If `\tabskip` is nonzero then horizontal lines generated by `\crl`, `\crl` and `\crl` have another behavior than you probably expected: they are interrupted in each `\tabskip` space.

### 2.29.3 Tables to given width

There are two possibilities how to create tables to given width:

- `\table to<size>{<declaration>}{{<data>}}` uses stretchability or shrinkability of all spaces between columns generated by `\tabskip` value and eventually by `\tabskipl`, `\tabskipr` values. See example below.
- `\table pxtosize{<declaration>}{{<data>}}` expands the columns declared by `p{<size>}`, if the `<size>` is given by a virtual `\tsize` unit. See example below.

Example of `\table to<size>:`

```
\thistable{\tabskip=0pt plus1fil minus1fil}
\table to\hsize {lr}{<data>}
```

This table has its width `\hsize`. First column starts at the left boundary of this table and it is justified left (to the boundary). Second column ends at the right boundary of the table and it is justified right (to the boundary). The space between them are stretchable and shrinkable in order to reach given width `\hsize`.

Example of `\table pxtosize` (means “paragraphs expanded to”):

```
\table pxtosize {|c|p{\tsize}|}{\crl
aaa & Ddkas jd dsjds ds cgha sfgs dd fddzf dfhz xxz
      dras ffg hksd kds d sdjds h sd jd dsjds ds cgha
      sfgs dd fddzf dfhz xxz. \crl
bb ddd ggg & Dsjds ds cgha sfgs dd fddzf dfhz xxz
      ddkas jd dsjds ds cgha sfgs dd fddzf. \crl }
```

aaa	Ddkas jd dsjds ds cgha sfgs dd fddzf dfhz xxz dras ffg hksd kds d sdjds h sd jd dsjds ds cgha sfgs dd fddzf dfhz xxz.
bb ddd ggg	Dsjds ds cgha sfgs dd fddzf dfhz xxz ddkas jd dsjds ds cgha sfgs dd fddzf.

The first `c` column is variable width (it gets the width of most wide item) and the resting space to given `\hsize` is filled by the `p` column.

You can declare more than one `p{<coefficient>\tsize}` columns in the table when `pxto` keyword is used. The total sum of `<coefficients>` must be exactly one. For example,

```
\table pxtosize {r p{.3\tsize} p{.5\tsize} p{.2\tsize} 1}{<data>}
```

This gives the ratio of widths of individual paragraphs in the table.

### 2.29.4 \eqbox: boxes with equal width across the whole document

The `\eqbox [<label>]{<text>}` behaves like `\hbox{<text>}` in the first run of TeX. But the widths of all boxes with the same label are saved to `.ref` file and the maximum box width for each label is calculated at the beginning of the next TeX run. Then `\eqbox [<label>]{<text>}` behaves like `\hbox to <dim:label> {\hss <text>\hss}`, where `<dim:label>` is the maximum width of all boxes labeled

by the same [*label*]. The documentation of the L<sup>A</sup>T<sub>E</sub>X package `eqparbox` includes more information and tips.

The `\eqboxsize` [*label*] {*dimen*} expands to *dim:label* if this value is known, else it expands to the given *dimen*.

The optional parameter `r` or `l` can be written before [*label*] (for example `\eqbox r[label]{text}`) if you want to put the text to the right or to the left side of the box width.

Try the following example and watch what happens after first T<sub>E</sub>X run and after second one.

```
\def\leftitem#1{\par
  \noindent \hangindent=\eqboxsize[items]{2em}\hangafter=1
  \eqbox r[items]{#1 }\ignorespaces}

\leftitem {\bf first}      \lorem[1]
\leftitem {\bf second one} \lorem[2]
\leftitem {\bf final}      \lorem[3]
```

## 2.29.5 Implementation of the `\table` macro and friends

```
3 \codel{table}{Basic macros for OpTeX <2020-05-26>} % preloaded in format
table.opp
```

The result of the `\table{declaration}{data}` macro is inserted into `\_tablebox`. You can change default value if you want by `\let\tablebox=\vtop` or `\let\tablebox=\relax`.

```
11 \let\tablebox=\vbox
table.opp
```

We save the `to<size>` or `pxto<size>` to #1 and `\_tableW` sets the `to<size>` to the `\_tablew` macro. If `pxto<size>` is used then `\_tablew` is empty and `\_tmpdim` includes given *size*. The `\_ifpxto` returns true in this case.

The `\table` continues by reading {*declaration*} in the `\_tableA` macro. Catcodes (for example the `|` character) have to be normal when reading `\table` parameters. This is the reason why we use `\catcodetable` here.

```
24 \newifi \_ifpxto
25 \def\table#1{\_tablebox\bgrou{\_tableW#1\_empty}\end
26   \bgrou{\_catcodetable\optexcatcodes\tableA}
27 \def\tableW#1#2\end{\_pxtodef
28   \ifx#1\empty \def\tablew{}\else
29     \ifx#1p \def\tablew{\_tableWx#2}\end \else \def\tablew{#1#2}\_fi\fi
30 \def\tableWx x#1\end{\_tmpdim=#1\relax \pxtotrue}
31 \public \table ;
table.opp
```

The `\tablinespace` is implemented by enlarging given `\tabstrut` by desired dimension (height and depth too) and by setting `\_lineskip=-2\tablinespace`. Normal table rows (where no `\hrule` is between them) have normal baseline distance.

The `\_tableA{declaration}` macro scans the *declaration* by `\_scantabdata#1\relax` and continues by reading {*data*} by the `\_tableB` macro.

```
43 \def\tableA#1{\_egroup
44   \the\thistable \global\thistable={}
45   \ea\ifx\ea`^{\the\tabstrut}`\setbox\tstrutbox=\null
46   \else \setbox\tstrutbox=\hbox{\the\tabstrut}%
47     \setbox\tstrutbox=\hbox{\vrule width0pt
48       height\dimexpr\ht\tstrutbox+\tablinespace
49       depth\dimexpr\dp\tstrutbox+\tablinespace}%
50     \offinterlineskip
51     \lineskip=-2\tablinespace
52   \fi
53   \colnum=0 \let\addtabitem=\addtabitemx
54   \def\tmpa{} \tabdata={\colnum\relax}\scantabdata#1\relax
55   \the\everytable \tableB
56 }
```

The `\_tableB{data}` saves *data* to `\_tmpb` and does four `\replstrings` to prefix each macro `\crl` (etc.) by `\_crcr`. The reason is: we want to use macros which scan its parameter to the delimiter.

written in right part of table item declaration. See `\fS` for example. The `\crcr` cannot be hidden in other macro in such case.

The `\tabskip` value is saved for places between columns into the `\_tabskipmid` macro. Then it runs

```
\tabskip=\tabskip1 \halign{\langle converted declaration\rangle\tabskip=\tabskipr \cr <data>\crcr}
```

This sets the desired boundary values of `\tabskip`. The “between-columns” values are set as `\tabskip=\_tabskipmid` in the `\langle converted declaration\rangle` immediately after each column declarator.

If `pxto` keyword was used, then we set the virtual unit `\tsize` to `\hsize` first. Then the first attempt of the table is created in box 0. Then the `\tsize` is re-calculated using `\wd0` and the real table is printed by `\halign` in the second pass.

If no `pxto` keyword was used, then we print the table using `\halign` directly. The `\_tablew` macro is nonempty if the `to` keyword was used.

Because the color selector with `\aftergroup` can be used inside the table item, we must to create second real group for each table item. This is reason why we start `\langle converted declaration\rangle` by `\bgroup` and we end it by `\egroup` in the `\_tableC` macro. Each `&` character is stored as `\egroup&\bgroup` in `\langle converted declaration\rangle`. The `\halign\_\tablew\_\tableC` really does:

```
\halign\_\tablew{\bgroup\langle converted declaration\rangle\egroup\tabskip=\tabskipr \cr<data>\crcr}
```

table.opp

```
94 \_def\_\tableB#1{\_def\_\tmpb{#1}%

```

The `\scantabdata` macro converts `\table`’s `\langle declaration\rangle` to `\halign` `\langle converted declaration\rangle`. The result is stored into `\tabdata` tokens list. For example, the following result is generated when `\langle declaration\rangle=|cr||cl|`.

```
tabdata: \_vrule\_\the\_\tabiteml\_\hfil#\_unskip\_\hfil\_\the\_\tabitemr\_\tabstrutA
&\_\the\_\tabiteml\_\hfil#\_unskip\_\the\_\tabitemr
                                \_vrule\_\kern\_\v kern\_\v kern\_\vrule\_\tabstrutA
&\_\the\_\tabiteml\_\hfil#\_unskip\_\hfil\_\the\_\tabitemr\_\tabstrutA
&\_\the\_\tabiteml#\_unskip\_\hfil\_\the\_\tabitemr\_\v rule\_\tabstrutA
ddlinedata: &\_dditem &\_dditem\_\v vitem &\_dditem &\_dditem
```

The second result in the `\ddlinedata` macro is a template of one row of the table used by `\crl` macro.

The `\_addtabitemx` adds the boundary code (used between columns) to the *(converted declaration)*. This code is `\egroup &\bgroup \colnum=<value>\relax`. You can get the current number of column from the `\colnum` register, but you cannot write `\the\colnum` as the first object in a *(data)* item because `\halign` first expands the front of the item and the left part of the declaration is processed after this. Use `\relax\the\colnum` instead. Or you can write:

```

\def\showcolnum{\ea\def\ea\totcolnum\ea{\the\colnum}\the\colnum\totcolnum}
\table{ccc}{\showcolnum & \showcolnum & \showcolnum}

```

This example prints 1/3 2/3 3/3, because the value of the `\colnum` is equal to the total number of columns before left part of the column declaration is processed.

```

```

The default “declaration letters” c, l, r and p are declared by setting `\tabdeclarec`, `\tabdeclarer`, `\tabdeclarer` and `\paramtabdeclarep` macros. In general, define `\def\tabdeclare<letter>{...}` for a non-parametric letter and `\def\paramtabdeclare<letter>{...}` for a letter with a parameter. The double hash ## must be in the definition, it is replaced by a real table item data. You can declare more such “declaration letters” if you want.

```

table.opm
205 \_def\tabdeclarec{\_the\tabiteml\hfil##\unskip\hfil\_the\tabitemr}
206 \_def\tabdeclarer{\_the\tabiteml\relax##\unskip\hfil\_the\tabitemr}
207 \_def\tabdeclarer{\_the\tabiteml\hfil##\unskip\the\tabitemr}

211   \ifvmode\vskip\dp\tstrutbox \else\lower\dp\tstrutbox\hbox{}\_fi\the\tabitemr}

```

User puts optional spaces around the table item typically, i.e. he/she writes & text & instead &text&. The left space is ignored by internal TeX algorithm but the right space must be removed by macros. This is a reason why we recommend to use `\unskip` after each ## in your definition of “declaration letters”. This macro isn’t only the primitive `\unskip` because we allow usage of plain TeX `\hskip` macro: &`\hskip text\hskip&`.

```

table.opm
222 \_def\unskip{\_ifmmode\_else\ifdim\lastskip>0pt \unskip\_fi\_fi}

```

The `\fL`, `\fR`, `\fC` and `\fX` macros only does a special parameters settings for paragraph building algorithm. The `\fS` prints the paragraph into box 0 first, measures the number of lines by the `\prevgraf` primitive and use (or don’t use) `\hfil` (for centering) before the first line.

```

231 \_let\fL=\_raggedright

```

The `\mspan{<number>}[<declaration>]{<text>}` macro generates similar `\omit\span\omit\span` sequence as plain TeX macro `\multispan`. Moreover, it uses `\scantabdata` to convert `<declaration>` from `\table` syntax to `\halign` syntax.

```

284 \_def\mspan{\_omit \_tabdata={\_tabstrutA}\_let\_\tmpa=\_relax \_afterassignment\mspanA \_mscount=}
285 \_def\mspanA[#1]#2{\_loop \_ifnum\mscount>1 \_cs{\_span}\_omit \_advance\mscount-1 \_repeat
286 \_count1=\_colnum \_colnum=0 \_def\_\tmpa{\_tabdata={}}\_scantabdata#1\relax

288 \_global\setbox8=\_lastbox}%
289 \_setbox0=\hbox{\_unhbox8 \_unskip \_global\setbox8=\_lastbox}%
290 \_unhbox8 \_ignorespaces}
291 \_public \mspan ;

```

The `\vspan{<number>}{<text>}` implementation is here. We need to lower the box by

$$(\langle number\rangle-1)*(\text{ht}+\text{dp of }\text{tabstrut}) / 2.$$

The #1 parameter must be one-digit number. If you want to set more digits then use braces.

```

303 \_def\vspan#1#2{\_vtop to Opt{\_hbox{\_lower \_dimexpr
304 \#1\dimexpr(\_ht\_\tstrutbox+\_dp\_\tstrutbox)/2\_\relax
305 -\dimexpr(\_ht\_\tstrutbox+\_dp\_\tstrutbox)/2\_\relax \hbox{\#2}\_vss}}}
306 \_public \vspan ;

```

The parameters of primitive `\vrule` and `\hrule` keeps the rule “last wins”. If we re-define `\hrule` to `\orihrule height1pt` then each usage of redefined `\hrule` uses 1pt height if this parameter isn’t overwritten by another following `height` parameter. This principle is used for settings another default rule thickness than 0.4 pt by the macro `\rulewidth`.

```

317 \newdimen\drulewidth \drulewidth=0.4pt
318 \let\orirule=\hrule \let\orivrule=\vrule
319 \def\rulewidth{\afterassignment\rulewidthA \drulewidth}
320 \def\rulewidthA{\edef\hrule{\orirule height\drulewidth}%
321 \edef\vrule{\orivrule width\drulewidth}%
322 \let\rulewidth=\drulewidth
323 \public \vrule \hrule \rulewidth;}
324 \public \rulewidth ;

```

The `\frame{<text>}` uses “`\vbox in \vtop` trick in order to keep the baseline of the internal text at the same level as outer baseline. User can write `\frame{abcxyz}` in normal paragraph line, for example and gets the expected result: `[abcxyz]`. The internal margins are set by `\vvkern` and `\hhkern` parameters.

```

334 \long\def\frame#1{%
335   \hbox{\vrule\vtop{\vbox{\hrule\kern\vvkern
336     \hbox{\kern\hhkern\relax#1\kern\hhkern}%
337   }\kern\vvkern\hrule}\vrule}%
338 \public \frame ;

```

`\eqbox` and `\eqboxsize` are implemented here. The widths of all `\eqboxes` are saved to the `.ref` file in the format `\Xeqbox{<label>}{<size>}`. The `.ref` file is read again and maximum box width for each `<label>` is saved to `\eqb:<label>`.

```

347 \def\Xeqbox#1#2{%
348   \ifcsname eqb:#1\endcsname
349     \ifdim #2>\cs{eqb:#1}\relax \sdef{eqb:#1}{#2}\fi

356 \else \box0 \fi
357 }
358 \def\eqboxsize [#1]{\trycs{eqb:#1}{#2}}
359
360 \public \eqbox \eqboxsize ;

```

## 2.30 Balanced multi-columns

```

3 \codedecl \begmulti {Balanced columns <2020-03-26>} % preloaded in format

```

This code is documented in detail in the “`TeXbook naruby`”, pages 244–246, free available, <http://petr.olsak.net/tbn.html>, but in Czech. Roughly speaking, macros complete all material between `\begmulti<num-columns>` and `\endmulti` into one `\vbox` 6. Then the macro measures the amount of free space at the current page using `\pagegoal` and `\pagetotal` and does `\vsplit` of `\vbox` 6 to columns with height of such free space. This is done only if we have enough amount of material in `\vbox` 6 to fill full page by columns. This is repeated in loop until we have less amount of material in `\vbox` 6. Then we run `\balancecolumns` which balances the last part of columns. Each part of printed material is distributed to main vertical list as `\hbox{<columns>}` and we need not do any change in the output routine.

If you have paragraphs in `\begmulti... \endmulti` environment then you may say `\raggedright` inside this environment and you can re-assign `\widowpenalty` and `\clubpenalty` (they are set to 10000 in `OpTeX`).

```

24 \def\multiskip{\medskip}      % space above and below \begmulti...\endmulti
25

## 2.31 Citations, bibliography

### 2.31.1 Macros for citations and bibliography preloaded in the format

cite-bib.opp

```

3 \_codedecl \cite {Cite, Biblioraphy <2020-03-09>} % loaded in format

```

Registers used by `\cite`, `\bib` macros are declared here. The `\bibnum` counts the bibliography items from one. The `\bibmark` is used when `\nonumcitations` is set.

cite-bib.opp

```

11 \_newcount\_\bibnum % the bibitem counter
12 \_newtoks\_\bibmark % the bibmark used if \nonumcitations
13 \_newcount\_\lastcitem \_\lastcitem=0 % for \shortcitations
14 \_public \bibnum \bibmark ;

```

`\cite [<label>, <label>, ..., <label>]` manages `<labels>` using `\_citeA` and prints `[<bib-marks>]` using `\_printsavedcites`.

`\nocite [<label>, <label>, ..., <label>]` only manages `<labels>` but prints nothing.

`\rcite [<label>, <label>, ..., <label>]` behaves like `\cite` but prints `<bib-marks>` without brackets.

`\ecite [<label>]{<text>}` behaves like `\rcite [<label>]` but prints `<text>` instead `<bib-mark>`. The `<text>` is hyperlinked like `<bib-marks>` when `\cite` or `\rcite` is used. The empty internal macro `\_savedcites` will include the `<bib-marks>` list to be printed. This list is set by `\_citeA` inside group and it is used by `\_printsavedcites` in the same group. Each `\cite/\rcite/\ecite` macro starts from empty list of `<bib-marks>` because new group is opened.

cite-bib.opp

```

34 \_def\_\cite[#1]{{\_\citeA#1,,, [\_printsavedcites]}}
35 \_def\_\nocite[#1]{{\_\citeA#1,,,}}
36 \_def\_\rcite[#1]{{\_\citeA#1,,, \_printsavedcites}}
37 \_def\_\ecite[#1]{{\_\bgroup\_\citeA#1,,, \_ea\_\eciteB\_\savedcites;}}
38 \_def\_\eciteB#1,#2;#3{\_if?#1\relax #3\else \_ilink[cite:#1]{#3}\_fi\_\egroup}
39 \_def\_\savedcites{}
40
41 \_public \cite \nocite \rcite \ecite ;

```

`<bib-marks>` may be numbers or a special text related to cited bib-entry. It depends on `\nonumcitations` and on used bib-style. The mapping from `<label>` to `<bib-mark>` is done when `\bib` or `\usebib` is processed. These macros store the information to `\_Xbib{<label>}{<number>}{<nonumber>}` where `<number>` and `<nonumber>` are two variants of `<bib-mark>` (numbered or text-like). This information is read from `.ref` file and it is saved to macros `\_bib:<label>` and `\_bibm:<number>`. First one includes number and second one includes `<nonumber>`. The `\lastbibnum` macro includes last number of bib-entry used in the document. A designer can use it to set appropriate indentation when printing the list of all bib-entries.

cite-bib.opp

```

57 \_def\_\Xbib#1#2#3{\_sdef\_\bib:#1}{\_bibnn{#2}\&%

```

`\_citeA <label>`, processes one label from list of labels given in the parameter of `\cite`, `\nocite`, `\rcite` or `\ecite` macros. It adds the `<label>` to global list `\_citelist` which will be used by `\usebib` (it must to know what `<labels>` are used in the document in order to pick-up only relevant bib-entries from the database. Because we want to save space and not to save the same `<label>` to `\_citelist` twice, we distinguish four cases:

- `<label>` was not declared by `\_Xbib` and it is first such `<label>` in the document: Then `\_bib:<label>` is undefined and we save label using `\_addcitlist`, write warning on the terminal and define `\_bib:<label>` as empty.
- `<label>` was not declared by `\_Xbib` but it was used previously in the document: Then `\_bib:<label>` is empty and we do nothing (only data to `\_savedcites` are saved).
- `<label>` was declared by `\_Xbib` and it is first such `<label>` in the document: Then `\_bib:<label>` includes `\_bibnn{<number>}\&` and we test this case by `\_if &\_bibnn{<number>}\&`. This is true when `\_bibnn{<number>}` expands to empty. The `<label>` is saved by `\_addcitlist` and `\_bib:<label>` is re-defined directly as `<number>`.
- `<label>` was declared by `\_Xbib` and it was used previously in the document. Then we do nothing (only data to `\_savedcites` are saved).

The `\_citeA` macro runs repeatedly over whole list of  $\langle labels \rangle$ .

The  $\langle bib-marks \rangle$  (in numeric or text form) are saved in `\_savedcites` macro separated by commas. The `\_printsavedcites` prints them by normal order or sorted if `\sortcitations` is specified or condensed if `\shortcitations` is specified.

The `\sortcitations` appends the dummy number 300000 and we suppose that normal numbers of bib-entries are less than this constant. This constant is removed after sorting algorithm. The `\shortcitations` sets simply `\lastcitem=1`. The macros for  $\langle bib-marks \rangle$  printing follows (sorry, without detail documentation). They are documented in opmac-d.pdf (but only in Czech).

The `\bib` [*<label>*] {*<optional bib-mark>*} prints one bib-entry without reading any database. The bib-entry follows after this command. This command counts the used `\bibs` from one by `\bibnum` counter and saves `\_Xbib{<label>}{\_the\_\bibnum}{\_the\_\bibmark}` into `.ref` file immediately using `\_wbib`. This is the core of creation of mapping from *(labels)* to *(bib-marks)*.

```

cite-bib.opm
191 \_def\_\bib[#1]{\_def\_\tmp{\_isnextchar={\_bibA[#1]}{\_bibmark={}\_\bibB[#1]}}%
192          \_ea\_\tmp\_\romannumeral-\`.\} % ignore optional space
193 \_def\_\bibA[#1]=#2{\_bibmark={#2}\_\bibB[#1]}
194 \_def\_\bibB[#1]{\_par \_bibskip
195          \_advance\_\bibnum by1
196          \_noindent \_def\_\tmpb{#1}\_wbib{#1}{\_the\_\bibnum}{\_the\_\bibmark}%
197          \_printlabel{#1}%
198          \_printbib \_ignorespaces
199      }
200 \_def\_\wbib#1#2#3{\_dest[cite:\_the\_\bibnum]%
201          \_ifx\_\wref\_\wrefrelax\_\else \_immediate\_\wref\_\Xbib{{#1}{#2}{#3}}\_\fi
202
203 \_public \bib ;

```

The `\_printbib` prints the bib-entry itself. You can re-define it if you want different design. The `\_pritbib` starts in horizontal mode after `\noindent` and after the eventual hyperlink destination is inserted. By default, the `\_printbib` sets the indentation by `\hangindent` and prints numeric *(bib-marks)* by `\llap{[\the\bibnum]}` If `\nonumcitations` then the `\_citelinkA` is not empty and *(bib-marks)* (`\the\bibnum` nor `\the\bibmark`) are not printed. The text of bib-entry follows. User can create this text manually using `\bib` command or it is generated automatically from a `.bib` database by `\usebib` command.

The vertical space between bib-entries is controlled by `\_bibskip` macro.

```

cite-bib.opm
220 \_def \_printbib {\_hangindent=\_iindent
221          \_ifx\_\citelinkA\_\empty \_hskip\_\iindent \_llap{[\_the\_\bibnum] } \_\fi
222      }
223 \_def \_bibskip {\_ifnum\_\bibnum>0 \_smallskip \_\fi}

```

The `\usebib` command is implemented in `usebib.opm` file which is loaded when the `\usebib` command is firstly used. The `usebib.opm` file loads the `librarian.tex` for scanning the `.bib` files. See the section 2.31.2, where the file `usebib.opm` is documented.

```

cite-bib.opm
233 \_def\_\usebib{\_par \_opinput {usebib.opm} \_usebib}
234 \_def\usebib{\_usebib}
```

The macros above works if all `\cite` (or similar) commands are used before the `\usebib` command is used because `\usebib` prints only such bib-entries their *(labels)* are saved in the `\_citelist`. But if some `\cite` is used after `\usebib`, then `\usebib` sets `\_addcitelist` to `\_writeXcite`, so such `\cite` saves the information to the `.reffile` in the format `\_Xcite{<label>}`. Such information are copied to

\\_citelistB during reading .ref file and \usebib concats two lists of  $\langle labels \rangle$  from \\_citelist and \\_citelistB and uses this concatenated list.

cite-bib.opm

```
248 \_def\_\_xcite#1{\_addto\_\_citelistB{\_citeI[#1]}}
249 \_def\_\_writeXcite#1{\_openref\_\_immediate\_\_wref\_\_xcite{[#1]}}
250 \_def\_\_citelistB{}
```

### 2.31.2 The \usebib command

The file usebib.opm implements the command \usebib/ $\langle sorttype \rangle$  ( $\langle style \rangle$ )  $\langle bibfiles \rangle$  where  $\langle sorttype \rangle$  is one letter **c** (references ordered by citation order in the text) or **s** (references ordered by key in the style file),  $\langle style \rangle$  is the part of the name **bib- $\langle style \rangle$ .opm** of the style file and  $\langle bibfiles \rangle$  are one or more .bib file names without suffix separated by comma without space. Example:

```
\usebib/s (simple) mybase, yourbase
```

This command reads the  $\langle bibfiles \rangle$  directly and creates the list of bibliographies references (only those declared by \cite[] or \nocite[] in the text). The formatting of such references is defined in the style file. The usage is mentioned in user documentation too.

The principle “first entry wins” is used. Suppose \usebib/s (simple) local,global. If an entry with the same label is declared in local.bib and in global.bib too then the first wins. So, you can set an exceptions in your local.bib file for your document.

#### Notes for style writers

The **bib- $\langle style \rangle$ .opm** file must define the commands:

- \\_authorname ... formatting of one name in the authors list. The macro can use the following data: \\_NameCount (the number of the currently processed author name in the list), 0\\_\\_namecount (the total number of the authors in the list), \\_Lastname, \\_Firstname, \\_Von, \\_Junior (the parts of the name). See the documentation of the librarian package for more info.
- \\_editorname ... the same as \\_authorname, but for editors list.
- \_print: $\langle entrytype \rangle$  (defined by \\_sdef) for formatting the entry of  $\langle entrytype \rangle$ . The  $\langle entrytype \rangle$  have to be lowercase. This command can use the command:
- \\_bprinta [ $\langle fieldname \rangle$ ] {\mathit{if defined}} {\mathit{if not defined}}. The part  $\langle if defined \rangle$  is executed if  $\langle fieldname \rangle$  is declared in .bib file for the entry which is currently processed. Else the part  $\langle if not defined \rangle$  is processed. The part  $\langle if defined \rangle$  can include the \* parameter which is replaced by the value of the  $\langle fieldname \rangle$ . The part  $\langle if not defined \rangle$  can include the \\_bibwarning command if the  $\langle fieldname \rangle$  is mandatory.
- \\_bprintb [ $\langle fieldname \rangle$ ] {\mathit{if defined}} {\mathit{if not defined}}. The same as \\_bprinta, but the ##1 parameter is used instead \*. Differences: ##1 parameter can be used more than once and can be enclosed in nested braces. The
- parameter can be used at most once and cannot be enclosed in braces. Warning: if the \\_bprintb commands are nested (\\_bprintb in \\_bprintb), then you need to write #####1 parameter for internal \\_bprintb. But if \\_bprinta commands are nested then the parameter is not duplicated.
- \\_pbprintc \macro {\mathit{if non-empty}}. The  $\langle if non-empty \rangle$  part is executed if \macro is non-empty. The
- parameter can be used, it is replaced by the \macro.
- \\_bprintv [ $\langle field1 \rangle, \langle field2 \rangle, \dots$ ] {\mathit{if defined}} {\mathit{if not defined}}. The part  $\langle if defined \rangle$  is executed if  $\langle field1 \rangle$  or  $\langle field2 \rangle$  or ... is defined, else the second part  $\langle if not defined \rangle$  is executed. There is one filed name or the list field names separated by commas. The parts cannot include any parameter.

There are two special fieldnames: !author and !editor. The processed list of authors or editors (by repeatedly calling \\_authorname or \\_editorname) are used here instead of raw data.

You can define \_print:BEGIN and/or \_print:END which is executed at the begin or end of each  $\langle entrytype \rangle$ . The formatting does not solve the numbering and paragraph indentation of the entry. This is processed by \\_printbib macro used in OpTeX (and may be redefined by the author or document designer).

You can declare \\_bimark={something} in the \_print:END macro. This bibmark is saved to the .ref file (created by OpTeX) and used in the next TeX run as \cite marks when \nonumcitations is set.

The whole style file is read in the group during \usebib command is executed before typesetting the reference list. Each definition or setting is local here.

If you are using non-standard fieldnames in .bib database and bib. style, you has to declare them by `\_CreateField {<fieldname>}.`

You can declare `\_SortingOrder` in the manner documented by librarian package.

If your style adds some words or abbreviations you can make them multilingual by saying `\_mtext{<label>}` instead such word and `\_mtdef{<label>} {<English>} {<Czech>} {<Slovak>}` declaration. The right part is printed by current value of the `\language` register. You can add more languages by re-defining the `\_mtdef` command. See the section [2.36.3](#) for more information.

If you are using `\nonumcitations`, then the `\_bibmark` tokens register have to be prepared in the style file (in `_print:BEGIN`, `_print:END`, in `\_authorname` etc.) This value will be used in the `\cite[]` places in the document.

The example of the style file is in `bib-simple.opm`.

User or author of the `bib.` style can create the hidden field which has a precedence while sorting names. Example:

```
\CreateField {sortedby}
\SpecialSort {sortedby}
```

Suppose that the .bib file includes:

```
...
author = "Jan Chadima",
sortedby = "Hzzadima Jan",
...
```

Now, this author is sorted between H and I, because the Ch digraph in this name has to be sorted by this rule.

If you need (for example) to place the autocitations before other citations, then you can mark your entries in .bib file by `sortedby = "@"`, because this character is sorted before A.

### 2.31.3 The `usebib.opm` macro file loaded when `\usebib` is used

```
3 \_codedecl \MakeReference {Reading bib databases <2020-03-13>} % loaded on demand by \usebib
```

Loading the `librarian.tex` macro package. See `texdoc librarian` for more information about it.

We want to ignore `\errmessage` and we want not to create `\jobname.lbr` file.

### 2.31.4 Usage of the bib-iso690 style

This is the iso690 bibliographic style used by  $\text{\LaTeX}$ .

See `op-example.bib` for an example of the `.bib` input. You can try it by:

```
\fontfamily{LMfonts}  
\nocite{*}  
\usebibstyle{iso690} op-example  
\end
```

#### Common rules in `.bib` files

There are entries of type `@FOO{...}` in the `.bib` file. Each entry consists of fields in the form `name1=1"value"`, or `name1=1{value}`. No matter which form is used. If the value is pure numeric then you can say simply `name1=1value`. Warning: the comma after each field value is mandatory! If it is missing then the next field is ignored or bad interpreted.

The entry names and field names are case insensitive. If there exist a data field no mentioned here then it is simply ignored. You can use it to store more information (abstract, for example).

There are “standard fields” used in ancient  $\text{bib}\text{\TeX}$  (author, title, editor, edition, etc., see <http://en.wikipedia.org/wiki/BibTeX>). The iso690 style introduces several “non-standard” fields: ednote, numbering, isbn, issn, doi, url, citedate, key, bibmark. They are documented here.

Moreover, there are two optional special fields:

- lang = language of the entry. The hyphenation plus autogenerated phrases and abbreviations will be typeset by this language.
- option = options by which you can control special printing of various fields.

There can be only one option field per each entry with (may be) more options separated by spaces. You can declare the global option(s) in your document applied for each entry by `\biboptions={...}`.

#### The author field

All names in the author list have to be separated by “ and ”. Each author can be written by various formats (the von part is typically missing):

```
Firstname(s) von Lastname  
or  
von Lastname, Firstname(s)  
or  
von Lastname, After, Firstname(s)
```

Only the Lastname part is mandatory. Examples:

```
Petr Olšák
```

```
or
```

```
Olsák, Petr
```

```
Leonardo Piero da Vinci
```

```
or
```

```
da Vinci, Leonardo Piero
```

```
or
```

```
da Vinci, painter, Leonardo Piero
```

The separator “ and ” between authors will be converted to comma during printing, but between semi-final and final author the word “and” (or something different depending on current language) is printed.

The first author is printed in reverse order: “LASTNAME, Firstname(s) von, After” and the others author are printed in normal order: “Firstname(s) von LASTNAME, After”. This feature follows the ISO 690 norm. The Lastname is capitalized using uppercase letters. But if the `\caps\rm>Lastname`.

You can specify the option `aumax:<number>`. The `<number>` denotes the maximum authors to be printed. The rest of authors are ignored and the `et~al.` is appended to the list of printed authors. This

text is printed only if the `aumax` value is less than the real number of authors. If you have the same number of authors in the .bib file as you need to print but you want to append `et~al.` then you can use `auetal` option.

There is an `aumin:<number>` option which denotes the definitive number of printed authors if the author list is not fully printed due to `aumax`. If `aumin` is unused then `aumax` authors is printed in such case.

All authors are printed if `aumax:<number>` option isn't given. There is no internal limit. But you can set the global options in your document by setting the `\biboptions` tokens list. For example:

```
\biboptions={aumax:7 aumin:1}
% if there is 8 or more authors then only first author is printed.
\entdd
```

Examples:

```
\begtt
```

```
author = "John Green and Bob Brown and Alice Black",
```

output: GREEN, John, Bob BROWN, and Alice BLACK.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:1",
```

output: GREEN, John et al.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:2",
```

output: GREEN, John, Bob BROWN et al.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:3",
```

output: GREEN, John, Bob BROWN, and Alice BLACK.

```
author = "John Green and Bob Brown and Alice Black",
option = "auetal",
```

output: GREEN, John, Bob BROWN, Alice BLACK et al.

If you need to add a text before or after authors list, you can use the `auprint:{<value>}` option. The `<value>` will be printed instead of the authors list. The `<value>` can include `\AU` macro which expands to the authors list. Example:

```
author = "Robert Calbraith",
option = "auprint:{\AU\space [pseudonym of J. K. Rowling]}",
```

output: CALBRAITH Robert [pseudonym of J. K. Rowling].

You can use the `autrim:<number>` option. All Firstnames of all authors are trimmed (i. e. reduced to initials) iff the number of authors in the author field is greater than or equal to `<number>`. There is an exception: `autrim:0` means that no Firstnames are trimmed. This is default behavior. Another example: `autrim:1` means that all Firstnames are trimmed.

```
author = "John Green and Bob Brown and Alice Black",
option = "auetal autrim:1",
```

output: GREEN, J., B. BROWN, A. BLACK et al.

If you need to write a team name or institution instead authors, replace all spaces by `\_` in this name. Such text is interpreted as Lastname. You can add the secondary name (interpreted as Firstname) after comma. Example:

```
author = "Czech\ Technical\ University\ in\ Prague,
Faculty\ of\ Electrical\ Engeneering",
```

output: CZECH TECHNICAL UNIVERSITY IN PRAGUE, Faculty of Electrical Engeneering.

### The editor field

The editor field is used for list of the authors of the collection. The analogous rules as in author field are used here. It means that the authors are separated by “ and ”, the Firstnames, Lastnames etc. are

interpreted and you can use the options `edmax:<number>`, `edmin:<number>`, `edetal`, `edtrim:<number>` and `edprint:{<value>}` (with \ED macro). Example:

```
editor = "Jan Tomek and Petr Karas",
option = "edprint:{\ED, editors.} edtrim:1",
```

Output: J. TOMEK and P. KARAS, editors.

If `edprint` option is not set then `{\ED, eds.}` or `{\ED, ed.}` is used depending on the entry language and on the singular or plural of the editor(s).

### The `ednote` field

The `ednote` field is used as the secondary authors and more editorial info. The value is read as raw data without any interpretation of Lastname, Firstname etc.

```
ednote = "Illustrations by Robert \upper{Agarwal}, edited by Tom \upper{Nowak}",
output: Illustrations by Robert AGARWAL, edited by Tom NOWAK.
```

The `\upper` command have to be used for Lastnames in `ednote` field.

### The `title` field

This is the title of the work. It will be printed (in common entry types) by italics. The ISO 690 norm declares, that the title plus optional subtitle are in italics and they are separated by colon. Next, the optional secondary title have to be printed in upright font. This can be added by `titlepost:{<value>}`. Example:

```
title = "The Simple Title of The Work",
or
title = "Main Title: Subtitle",
or
title = "Main Title: Subtitle",
option = "titlepost:{Secondary title}",
```

The output of the last example: *Main Title: Subtitle*. Secondary title.

### The `edition` field

This field is used only for second or more edition of cited work. Write only the number without the word "edition". The shortcut "ed." (or something else depending on current language) is added automatically. Examples:

```
edition = "Second",
edition = "2nd",
edition = "2$^{\rm nd}$",
edition = "2.",
```

Output of the last example: 2. ed.

```
edition = "2."
lang     = "cs",
```

Output: 2. vyd.

Note, that the example `edition="Second"` may cause problems. If you are using language "cs" then the output is bad: Second vyd. But you can use `editionprint:{<value>}` option. The the `<value>` is printed instead of edition field and shortcut. The edition field must be set. Example:

```
edition = "whatever",
option  = "editionprint:{Second full revised edition}",
```

Output: Second full revised edition.

You can use \EDN macro in `editionprint` value. This macro is expanded to the edition value. Example:

```
edition = "Second",
option  = "editionprint:{\EDN\space full revised edition}",
or
edition = "Second full revised edition",
option  = "editionprint:{\EDN}",
```

### The address, publisher, year fields

This is an anachronism from ancient BibTEX (unfortunately no exclusive) that the address field includes only the city of the publisher residence. No more data are here. The publisher field includes the name of the publisher.

```
address = "Berlin",
publisher = "Springer Verlag",
year = 2012,
```

Output: Berlin: Springer Verlag, 2012.

Note, that the year needn't to be inserted into quotes because it is pure numeric.

The letter a, b etc. are appended to the year automatically, if two or more subsequent entries in the bibliography list are not distinct by the first author and year fields. If you needn't this feature, you can use the `noautoletters` option.

You can use "yearprint:*value*" option. If it is set then the *value* is used for printing year instead the real field value. The reason: year is sort sensitive, may be you need to print something else than only sorting key. Example:

```
year = 2000,
option = "yearprint:{@ 2000}",
```

Output: © 2000, sorted by: 2000.

```
year = "2012a",
option = "yearprint:{2012}",
```

Output: 2012, sorted by: 2012a.

The address, publisher and year are typically mandatory fields. If they are missing then the warning occurs. But you can set `unpublished` option. Then this warning is suppressed. There is no difference in the printed output.

### The url field

Use it without \url macro, but with `http://` prefix. Example:

```
url = "http://petr.olsak.net/opmac.html",
```

The ISO 690 norm recommends to add the text "Available from" (or something else if different current language is used) before URL. It means, that the output of previous example is:

Available from <http://petr.olsak.net/opmac.html>.

If the `cs` language is the current one than the output is:

Dostupné z: <http://petr.olsak.net/opmac.html>.

If the `urlalso` option is used, then the added text has the form "Available also from" or "Dostupné také z:" (if `cs` language is current).

### The citedate field

This is the citation date. The field must be in the form year/month/day. It means, that the two slashes must be written here. The output depends on the current language. Example:

```
citedate = "2004/05/21",
```

Output when `en` is current: [cit. 2004-05-21].

Output when `cs` is current: [vid. 21. 5. 2004].

### The howpublished field

This declares the available medium for cited document if it is not in printed form. Alternatives: online, CD, DVD, etc. Example:

```
howpublished = "online",
```

Output: [online].

### The volume, number, pages and numbering fields

The volume is the "big mark" of the journal issue and the number is the "small mark" of the journal issue and pages includes the page range of the cited article in the journal. The volume is prefixed by Vol. , the number by No. and the pages by pp. . But these prefixes depends on the language of the entry.

Example:

```
volume = 31,  
number = 3,  
pages = "37--42",
```

Output: Vol. 31, No. 3, pp. 37–42.

```
volume = 31,  
number = 3,  
pages = "37--42",  
lang = "cs",
```

Output: ročník 31, č. 3, s. 37–42.

If you disagree with the default prefixes, you can use the numbering field. When it is set then it is used instead of volume, number, pages fields and instead of any mentioned prefixes. The numbering can include macros \VOL, \NO, \PP, which are expanded to the respective values of fields. Example:

```
volume = 31,  
number = 3,  
pages = "37--42"  
numbering = "Issue~\VOL~\NO, pages~\PP",
```

Output: Issue 31/3, pages 37–42

Note: The volume, numbers and pages fields are printed without numbering filed only in the @ARTICLE entry. It means, that if you need to visible them in the @INBOOK, @INPROCEEDINGS etc. entries, then you must to use numbering field.

### Common notes about entries

The order of the fields in the entry is irrelevant. We use the printed order in this manual. The exclamation mark (!) denotes the mandatory field. If such field is missing then the warning occurs during processing.

If the `unpublished` option is set then the fields address, publisher, year, isbn and pages are not mandatory. If the `nowarn` option is set then no warnings about missing mandatory fields occurs.

If the field is used but not mentioned in the entry documentation below then it is silently ignored.

- The @BOOK entry

This is used for book-like entries.

Fields: author(!), title(!), howpublished, edition, ednote, address(!), publisher(!), year(!), citedate, series, isbn(!), doi, url, note.

The ednote field here means the secondary authors (illustrator, cover design etc.).

- The @ARTICLE entry

This is used for articles published in a journal.

Fields: author(!), title(!), journal(!), howpublished, address, publisher, month, year, [numbering or volume, number, pages(!)], citedate, issn, doi, url, note.

If the numbering is used then it is used instead volume, number, pages.

- The @INBOOK entry

This is used for the part of a book.

Fields: author(!), title(!), booktitle(!), howpublished, edition, ednote, address(!), publisher(!), year(!), numbering, citedate, series, isbn or issn, doi, url, note.

The author field is used for author(s) of the part, the editor field includes author(s) or editor(s) of whole document. The pages field specifies the page range of the part. The series field can include more information about the part (chapter numbers etc.).

The @INPROCEEDINGS and @CONFERENCE entries are equivalent to @INBOOK entry.

- The @THESIS entry

This is used for student's thesis.

Fields: author(!), title(!), howpublished, address(!), school(!), month, year(!), citedate, type(!), ednote, doi, url, note.

The type field must include the text "Master's Thesis" or something similar (depending on the language of the outer document).

There are nearly equivalent entries: @BACHELORTHESES, @MASTERSTHESIS and @PHDTHESES. These entries set the type field to an appropriate value automatically. The type field is optional in such case. If it is used then it has a precedence before default setting.

- The @MISC entry

It is intended for various usage.

Fields: author, title, howpublished, ednote, citedate, doi, url, note.

You can use \AU, \ED, \EDN, \VOL, \NO, \PP, \ADDR, \PUBL, \YEAR macros in ednote field. These macros print authors list, editors list, edition, volume, number, pages, address, publisher and year field values respectively.

The reason of this entry is to give to you the possibility to set the format of entry by your own decision. The most of data are concentrated in ednote field.

- The @BOOKLET, @INCOLLECTION, @MANUAL, @PROCEEDINGS, @TECHREPORT, @UNPUBLISHED entries

These entries are equivalent to @MICS entry because we need to save the simplicity. They are implemented only for (almost) backward compatibility with the ancient Bib<sub>TEX</sub>. But the ednote is mandatory field here, so you cannot use these entries from the old databases without warnings and without some additional work with the .bib file.

#### The cite-marks (bibmark) used when \nonumcitations is set

When \nonumcitations is set then \cite prints text oriented bib-marks instead numbers. This style file autogenerated these marks in the form “Lastname of the first author, comma, space, the year” if bibmark field isn’t declared. If you need to set an exception from this common format, then you can use bibmark field.

The OPmac trick <http://petr.olsak.net/opmac-tricks-e.html#bibmark> describes how to redefine the algorithm for bibmark auto-generating when you need the short form of the type [Au13].

#### Sorting

If \usebib/c is used then entries are sorted by citation order in the text. If \usebib/s is used then entries are sorted by “Lastname, Firstname(s)” of the first author and if more entries have this value equal, then the year is used (from older to newer). This feature follows the recommendation of the ISO 690 norm.

If you have the same authors and the same year, you can control the sorting by setting years as 2013, 2013a, 2013b, etc. You can print something different to the list using yearprint{<value>} option, see the section about address, publisher and year above. The real value of year field (ie. not yearprint value) is also used in the text oriented bib-marks when \nonumcitations is set.

If you have some problems with name sorting, you can use the hidden field key, which is used for sorting instead of the “Lastname Firstname(s)” of authors. If the key field is unset then the “Lastname Firstname(s)” is used for sorting normally. Example:

```
author      = "Světla Čmejrková",
key        = "Czzmejrkova Svetla",
```

This entry is now sorted between C and D.

The norm recommends to place the autocitations to the top of the list of references. You can do this by setting key<sub>U</sub>=“@”, to each entry with your name because the @ character is sorted before A.

#### Languages

There is the language of the outer document and the languages of each entry. The ISO 690 norm recommends that the technical notes (the prefix before URL, the media type, the “and” conjunction between semifinal and final author) may be printed in the language of the outer document. The data of the entry have to be printed in the entry language (edition ed./vyd., Vol./ročník, No./č. etc.). Finally there are the phrases independent on the language (for example In:). Unfortunately, the bib<sub>TEX</sub> supposes that the entry data are not fully included in value parts of the fields (see edition, volume etc. fields) so the automaton have to add some text during processing. But what language have to be chosen?

The current value of the \language register at the start of the .bib processing is decided as the language of the outer document. This language is used for technical notes regardless of the entry language. Each entry can have the lang field with the two-letter mark of the entry language. This language is used for ed./vyd., vol./ročník etc. and it is used for hyphenation too. If the entry language is not set then the outer document language is used.

If the outer document language is known before creating of the .bib file, you can store some language-dependent phrases into it. On the other hand, if the main document language is unknown, you can use the \Mtext macro to create the text multilingual. Example:

```
howpublished = "\Mtext{blue-ray}"
```

Now, you can set the variants of blue-ray into your macros:

```
\_mtdef {blue-ray} {Blue-ray disc} {Blue-ray disk} {}
```

### Tips for using more languages

This style prefers English, Czech and Slovak languages. However, you can add more languages. Use the shortcuts of language names (de and pl in the example below). You can define all phrases for your language:

```
\def\mtdefx#1#2#3{\sdef{_mt:#1:de}{#2}\sdef{_mt:#1:pl}{#3}}
```

% German	% Polish
\mtdefx {bib.and}	{ und }
\mtdefx {bib.phdthesis}	{Ph.D. Dissertation} {Praca doktorska}
...	

See more about language phrases in the [2.36.3](#) section.

### Summary of non-standard fields

This style uses the following fields unkown by bibTeX:

option	... options separated by spaces
lang	... the language two-letter code of one entry
ednote	... editorial info (secondary authors etc.) or global data in @MISC-like entries
citedate	... the date of the citation in year/month/day format
numbering	... format for volume, number, pages
isbn	... ISBN
issn	... ISSN
doi	... DOI
url	... URL

### Summary of options

aumax:<number>	... maximum number of printed authors
aumin:<number>	... number of printed authors if aumax exceeds
autrim:<number>	... full Firstnames iff number of authors are less than this
auprint:{<value>}	... text instead authors list (\AU macro may be used)
edmax, edmin, edtrim	... similar as above for editors list
edprint:{<value>}	... text instead editors list (\ED macro may be used)
titlepost:{<value>}	... text after title
yearprint:{<value>}	... text instead real year (\YEAR macro may be used)
editionprint:{<value>}	. text instead real edition (\EDN macro may be used)
urlalso	... the ``available also from'' is used instead ``available from''
unpublished	... the publisher etc. fields are not mandatory
nowarn	... no mandatory fields

Another options in the option field are silently ignored.

### 2.31.5 Implementation of the bib-iso690 style

```
bib-iso690.opm
3 % bibliography style (iso690), version <2020-03-10>, loaded on demand by \usebib
4
5 \_ifx\optxbibstyle\undefined \_errmessage
6   {This file can be read by: \string\usebib/? (iso690) bibfiles command only}
7 \_endinput \fi
```

\\_maybedot (alias \. in the style file group) does not put second dot.

```
bib-iso690.opm
13 \_def\_maybedot{\_ifnum\_spacefactor=\_sfcode`\_.\_relax\_else.\_fi}

## 2.32 Sorting and making Index

makeindex.opp

```

3 \cdecl \makeindex {Makeindex and sorting <2020-04-26>} % loaded in format

```

\makeindex implements sorting algorithm at TeX macro-language level. You need not any external program.

There are two passes in sorting algorithm. Primary pass does not distinguish between a group of letters (typically non-accented and accented). If the result of comparing two string is equal in primary pass then secondary pass is started. It distinguishes between variously accented letters. Czech rules, for example says: not accented before dieresis before acute before circumflex before ring. At less priority: lowercase letters must be before uppercase letters.

The \sortingdata*(iso-code)* implements these rules for the language *(iso-code)*. The groups between commas are not distinguished in the first pass. The second pass distinguishes all characters mentioned in the \sortingdata*(iso-code)* (commas are ignored). The order of letters in the \sortingdata*(iso-code)* macro is significant for sorting algorithm. The Czech rules (cs) are implemented here:

makeindex.opp

```

56   zZ,%
57   žŽ,%
58   0,1,2,3,4,5,6,7,8,9,'%
59 }

```

Characters ignored by sorting algorithm are declared in `\_ignoredchars(iso-code)`. The compound characters (two or more characters interpreted as one character in sorting algorithm) is mapped to single invisible characters in `\_compoundchars(iso-code)`. Czech rules declares ch or Ch or CH as a single letter sorted between H and I. See `\_sortingdatacs` above where these declared characters are used.

The characters declared in `\_ignoredchars` are ignored in first pass without additional condition. All characters are taken into account in second pass: ASCII characters with code '65 are sorted first if they are not mentioned in the `\_sortingdata(iso-code)` macro. Others not mentioned characters have undefined behavior during sorting.

```

makeindex.opm
76 \_def \_ignoredcharscs {.,;?!:"|()[]<>=+}
77 \_def \_compoundcharscs {ch:^^T Ch:^^U CH:^^V} % DZ etc. are sorted normally

```

Slovak sorting rules are the same as Czech. The macro `\_sortingdatacs` includes Slovak letters too. Compound characters are the same. English sorting rules can be defined by `\_sortingdatacs` too because English alphabet is subset of Czech and Slovak alphabets. Only difference: `\_compoundcharchen` is empty in English rules.

You can declare these macros for more languages, if you wish to use `\makeindex` with sorting rules in respect to your language. Note: if you need to map compound characters to a character, don't use `^I` or `^M` because these characters have very specific category code. And use space to separate more mappings, like in `\_compoundcharscs` above.

```

makeindex.opm
93 \_let \_sortingdata = \_sortingdatacs
94 \_let \_compoundcharssk = \_compoundcharscs
95 \_let \_ignoredcharssk = \_ignoredcharscs
96 \_let \_sortingdataen = \_sortingdatacs
97 \_def \_compoundcharchen {}
98 \_let \_ignoredcharchen = \_ignoredcharscs

```

Preparing to primary pass is implemented by the `\_setprimarysorting` macro. It is called from `\makeindex` macro and all processing of sorting is in a group.

```

makeindex.opm
105 \_def \_setprimarysorting {%
106   \_ea\_let \_ea\_sortingdata \_csname _sortingdata\_sortinglang\_endcsname
107   \_ea\_let \_ea\_compoundchars \_csname _compoundchars\_sortinglang\_endcsname
108   \_ea\_let \_ea\_ignoredchars \_csname _ignoredchars\_sortinglang\_endcsname
109   \_ifx \_sortingdata\_relax \_addto\_nold{ sortingdata}%
110     \_let \_sortingdata = \_sortingdataen \_fi
111   \_ifx \_compoundchars\_relax \_addto\_nold{ compoundchars}%
112     \_let \_compoundchars = \_compoundcharchen \_fi
113   \_ifx \_ignoredchars\_relax \_addto\_nold{ ignoredchars}%
114     \_let \_ignoredchars = \_ignoredcharchen \_fi
115   \_ifx \_compoundchars\_empty \_else
116     \_edef \_compoundchars {\_detokenize\ea{\_compoundchars}}\fi % all must be catcode 12
117   \_def \_act ##1{\_ifx##1\relax \_else
118     \_ifx##1,\_advance\_\tmpnum by1
119     \_else \_lccode`##1=\_tmpnum \_fi
120     \_ea\_act \_fi}%
121   \_tmpnum=65 \_ea\_act \_sortingdata \_relax
122   \_def \_act ##1{\_ifx##1\relax \_else
123     \_lccode`##1='^I
124     \_ea\_act \_fi}%
125   \_ea\_act \_ignoredchars \_relax
126 }

```

Preparing to secondary pass is implemented by the `\_setsecondarysorting` macro.

```

makeindex.opm
132 \_def \_setsecondarysorting {%
133   \_def \_act ##1{\_ifx##1\relax \_else
134     \_ifx##1,\_else \_advance\_\tmpnum by1 \_lccode`##1=\_tmpnum \_fi
135     \_ea\_act \_fi}%
136   \_tmpnum=65 \_ea\_act \_sortingdata \_relax

```

```
137 }
```

Strings to be sorted are prepared in `\,(string)` control sequences (in order to save \TeX memory). The `\_preparesorting \,(string)` converts `(string)` to `\_tmpb` with respect to the data initialized in `\_setprimarysorting` or `\_setsecondarysorting`.

The compound characters are converted to single characters by the `\_docompound` macro.

```
makeindex.opm
149 \_def \_preparesorting #1{%
150   \_edef \_tmpb {\_ea \_ignorefirst\_\_csstring #1}%, \,(string) -> <string>
151   \_ea \_docompound \_compoundchars \_relax:{}% replace compound characters
152   \_lowercase \_ea{\_ea\_\_def \_ea\_\_tmpb \_ea{\_tmpb}}% convert in respect to \_sortingdata
153   \_ea\_\_replstring \_ea\_\_tmpb \_ea{\_csstring\^\^\_I}{}% remove ignored characters
154 }
155 \_def \_docompound #1:#2 {%
156   \_ifx\_\_relax#1\_\_else \_replstring\_\_tmpb {#1}{#2}\_ea\_\_docompound \_fi
157 }
158 \_def \_ignorefirst#1{}
```

Macro `\_isAleB \,(string1) \,(string2)` returns the result of comparison of given two strings to `\_ifAleB` control sequence. Usage: `\isAleB \,(string1) \,(string2) \_ifAleB ... \_else ... \_fi` The converted strings (in respect of the data prepared for first pass) must be saved as values of `\,(string1)` and `\,(string2)` macros. The reason is speed: we don't want to convert them repeatedly in each comparison. The macro `\_testAleB (converted string1)&\_relax(converted-string2)\_relax \,(string1)\,(string2)` does the real work. It reads first character from both converted strings, compares them and if it is equal then calls itself recursively else gives result.

```

Merge sort is very effectively implemented by \TeX macros. The following code is created by my son Miroslav. The `\_mergesort` macro expects that all items in `\_iilist` are separated by comma when it starts. It ends with sorted items in `\_iilist` without commas. So `\_dosorting` macro must prepare commas between items.

```
makeindex.opm
210 \_def \_mergesort #1#2,#3{% by Miroslav Olsak

```

The `\dosorting` \list macro redefines \list as sorted \list. The \list have to include control sequences in the form `\langle c\rangle\langle string`. These control sequences will be sorted in respect to `\langle strings` without change of meanings of these control sequences. Their meanings are irrelevant when sorting. The first character `\langle c` in `\langle c\rangle\langle string` should be whatever. It does not influence the sorting.  $\text{OpTeX}$  uses comma at this place for sorting indexes: `\langle word1\rangle \langle word2\rangle \langle word3\rangle \dots`

The actual language (chosen for hyphenation patterns) is used for sorting data. If the `\sortinglang` macro is defined as `\langle iso-code\rangle`(for example `\def\sortinglang{de}`) then this has precedence and actual language is not used. Moreover, if you specify `\asciisortingtrue` then ASCII sorting will be processed and all language sorting data will be ignored.

```

296 \public \makeindex ;
```

The `\_printindexitem`  $\backslash, \langle word \rangle$  prints one item to the index. If  $\backslash_, \langle word \rangle$  is defined then this is used instead real  $\langle word \rangle$  (this exception is declared by `\iis` macro). Else  $\langle word \rangle$  is printed by `\_printii`. Finally, `\_printiipages` prints the value of  $\backslash, \langle word \rangle$ , i.e. the list of pages.

```
makeindex.opm
306 \_def\_printindexitem #1{%
307   \ifcsname _\csname #1\_endcsname
308     \ea\ea\ea \_printii \csname _\csname #1\_endcsname &%
309   \else
310     \ea\ea\ea\ea\_printii \ea\ignorefirst \csstring #1&%
311   \fi
312   \ea\_printiipages #1&
313 }
```

`\_printii`  $\langle word \rangle \&$  does more intelligent work because we are working with words in the form  $\langle main-word \rangle / \langle sub-word \rangle / \langle sub-sub-word \rangle$ . The `\everyii` tokens register is applied before `\noindent`. User can declare something special here.

The `\newiiletter`  $\{\langle letter \rangle\}$  macro is empty by default. It is invoked if first letter of index entries is changed. You can declare a design between index entries here. You can try, for example:

```
\def\_newiiletter#1#2{%
  \bigskip \hbox{\setfontsize{at15pt}\bf\uppercase{#1}}\medskip}
```

```
makeindex.opm
330 \_def\_printii #1#2&{%
331   \ismacro\lastii{#1}\iffalse \newiiletter{#1}{#2}\def\lastii{#1}\fi
332   \gdef\currii{#1#2}\the\everyii\noindent
333   \hskip-\iindent \ignorespaces\_printiiA#1#2//%
334 \_def\printiiA #1{\if^#1\let\_previi=\currii \else
335   \ea\scanprevii\_previi&\edef\tmpb{\detokenize{#1}}%
336   \ifx\tmpa\tmpb \iimdash \else#1 \gdef\_previi{} \fi
337   \expandafter\_printiiA\fi
338 }
339 \_def\iimdash{\kern.1em--\space}
340 \_def\lastii{}
341 \_def\newiiletter#1#2{%
342
343 \_def\scanprevii#1/#2&{\def\_previi{#2}\edef\tmpa{\detokenize{#1}}}
344 \_def\_previi{} % previous index item
```

`\_printiipages`  $\langle pglist \rangle \&$  gets  $\langle pg \rangle : \langle type \rangle, \langle pg \rangle : \langle type \rangle, \dots \langle pg \rangle : \langle type \rangle$  and it converts them to  $\langle pg \rangle, \langle pg \rangle, \langle from \rangle -- \langle to \rangle, \langle pg \rangle$  etc. The same pages must be printed only once and continuous consequences of pages must be compressed to the form  $\langle from \rangle - \langle to \rangle$ . Moreover, the consequence is continuous only if all pages have the same  $\langle type \rangle$ . Empty  $\langle type \rangle$  is most common, pages with `b`  $\langle type \rangle$  must be printed as bold and with `i`  $\langle type \rangle$  as italics. Moreover, the  $\langle pg \rangle$  mentioned here are  $\langle gpageno \rangle$ , but we have to print  $\langle pageno \rangle$ . The following macros solves these tasks.

```
makeindex.opm
358 \_def\_printiipages#1&{\_let\pgtype=\undefined \tmpnum=0 \printpages #1:, \par}
359 \_def\printpages#1:#2,{% state automaton for compriming pages
360   \ifx,#1,\uselastpgnum
361   \else \def\tmpa{#2}%
362   \ifx\pgtype\tmpa \else
363     \let\pgtype=\tmpa
364     \uselastpgnum \usepgcomma \pgprint#1:{#2}%
365     \tmpnum=#1 \returnfi \fi
366   \ifnum\tmpnum=#1 \returnfi \fi
367   \advance\tmpnum by1
368   \ifnum\tmpnum=#1 \ifx\lastpgnum\undefined \usepgdash\fi
369     \edef\lastpgnum{\the\tmpnum:\{\pgtype\}}%
370     \returnfi \fi
371   \uselastpgnum \usepgcomma \pgprint#1:{#2}%
372   \tmpnum=#1
373   \relax
374   \ea\printpages \fi
375 }
376 \_def\returnfi #1\relax{\fi}
377 \_def\uselastpgnum{\ifx\lastpgnum\undefined
378   \else \ea\pgprint\lastpgnum \let\lastpgnum=\undefined \fi
379 }
```

```

380 \_def\_usepgcomma{\_ifnum\_tmpnum>0, \_fi} % commat+space between page numbers
381 \_def\_usepgdash{\_hbox{--}} % dash in the <from>--<to> form

```

You can re-define `\_pgprint {gpageno}:{iitype}` if you need to implement more *iitypes*.

```

makeindex.opm

388 \_def\pgprint #1:#2{%
389   \_ifx ,#2,\_pgprintA{#1}\_returnfi \_fi
390   \_ifx b#2{\_bf \_pgprintA{#1}}\_returnfi \_fi
391   \_ifx i#2{\_it \_pgprintA{#1}}\_returnfi \_fi
392   \_ifx u#2\pgu{\_pgprintA{#1}}\_returnfi \_fi
393   \_pgprintA{#1}\_relax
394 }
395 \_def\pgprintA #1{\_ilink[pg:#1]{\_cs_{pgi:#1}}} % \ilink[pg:<gpageno>]{<pageno>}
396 \_def\pgu#1{\_leavevmode\vtop{\_hbox{#1}\kern.3ex\hrule}}
```

The `\iindex{<word>}` puts one *word* to the index. It writes `\Xindex{<word>}{<iitype>}` to the .ref file. All othes variants of indexing macros expands internally to `\iindex`.

```

makeindex.opm

404 \_def\iindex#1{\_isempty{#1}\_iffalse\openref{\def~{ }%
405   \edef\act{\_noexpand\wref\_\noexpand\Xindex{#1}{\_iitypesaved}}}\_act}\_fi
406 \_public \iindex ;
```

The `\Xindex{<word>}{<iitype>}` stores `\<word>` to the `\_iilist` if there is first occurrence of the *word*. The list of pages where *word* occurs, is the value of the macro `\<word>`, so the `<gpageno>:{<iitype>}` is appended to this list. Moreover, we need a mapping from `<gpageno>` to `<pageno>`, because we print `<pageno>` in the index, but hyperlinks are implemented by `<gpageno>`. So, the macro `\_pgi:<gpageno>` is defined as `<pageno>`.

```

makeindex.opm

418 \_def \_iilist {}
419 \_def \_Xindex #1#2{\_ea\_\_IndexA \_csname ,#1\_\ea\_\endcsname \_currpage {#2}}
420 \_def \_IndexA #1#2#3#4{%
421   #1\_,<word> #2=<gpageno> #3=<pageno> #4=<iitype>
422   \_ifx#1\_\relax \_global\_\addto \_iilist {#1}%
423   \_gdef #1{#2:#4}%
424 \_else \_global\_\addto #1{,#2:#4}%
425 \_fi
426 \_sxdef\pgi:#2}{#3}%
427 }
```

The implementation of macros `\ii`, `\iid`, `\iis` follows. Note that `\ii` works in horizontal mode on order to the `\write` whatsit is not broken from the following word. If you need to keep vertical mode, use `\iindex{<word>}` directly.

The `\iitype {<type>}` saves the *type* to the `\_iitypesaved` macro. It is used in the `\iindex` macro.

```

makeindex.opm

## 2.33 Footnotes and marginal notes

`3 \codedecl \fnote {Footnotes, marginal notes} % loaded in format`

`\_gfnotenum` is counter which counts footnotes globally in the document. whole document, chapters, pages.

`\_lfnotenum` is counter which counts footnotes at each chapter from one. It is used for local page footnote counters too.

`\_ifpgfnote` says that footnote numbers are counted on each page from one. We need to run `\openref` in such case.

`\fnotenum` is a macro which expands to footnote number counted in declared part.

`\fnotenumchapters` declares footnotes numbered in each chapter from one (default), `\fnotenumglobal` declares footnotes numbered in whole document from one and `\fnotenumpages` declares footnotes numbered at each page from one.

```
19 \_newcount\_\_gfnotenum \_gfnotenum=0  
20 \_newcount\_\_lfnotenum  
21  
22 \_newifi \_ifpgfnote  
23 \_def \_fnotenumglobal {\_def\_\_fnotenum{\_the\_\_gfnotenum}\_pgfnotefalse}  
24 \_def \_fnotenumchapters {\_def\_\_fnotenum{\_the\_\_lfnotenum}\_pgfnotefalse}  
25 \_def \_fnotenumpages {\_def\_\_fnotenum{\_trycs{_fn:\_the\_\_gfnotenum}{?}}\_pgfnotetrue}  
26 \_fnotenumchapters % default are footnotes counted from one in each chapter  
27 \_def \fnotenum{\_fnotenum}  
28 \_public \fnotenumglobal \fnotenumchapters \fnotenumpages ;  
29 \_let \runningfnotes = \fnotenumglobal % for backward compatibility
```

The `\printfnotemark` prints the footnote mark. You can re-define this macro if you want another design of footnotes. For example

This code gives footnotes\* and \*\* and\*\*\* and† etc. and it supposes that there are no more than 6 footnotes at one page.

If you want to distinguish between footnote marks in the text and in the front of footnote itself, then you can define `\printfnotemarkA` and `\printfnotemarkB`.

The `\fnote{links}{colorA}{colorB}` implements the hyperlinked footnotes (from text to footnote and backward).

```

49 \_def \_printfnotemark {${^\{\_fnotenum\}}$} % default footnote mark
50 \_def \_printfnotemarkA {\_printfnotemark} % footnote marks used in text
51 \_def \_printfnotemarkB {\_printfnotemark} % footnote marks used in front of footnotes
52
53 \_def \_fnotelinks#1#2{%
54   \_def\printfnotemarkA{\_link[fnt:\_the\_gfnotenum]{\_localcolor#1}{\_printfnotemark}}%
55   \_dest[fnf:\_the\_gfnotenum]}%
56   \_def\printfnotemarkB{\_link[fnf:\_the\_gfnotenum]{\_localcolor#2}{\_printfnotemark}}%
57   \_dest[fnt:\_the\_gfnotenum]}%
58 }
59 \public \fnotelinks ;

```

Each footnote saves the `\_Xfnote` (without parameter) to the `.ref` file (if `\openref`). We can create the mapping from `\_gfnotenum` to `\pgfnotenum` in the macro `\_fn:<fnotenum>`. Each `\_Xpage` macro sets the `\_lfnotenum` to zero.

```
68 \def \Xfnote {\_incr\_lfnotenum \_incr\gfnotenum  
69 \sxdef{\fn:\the\gfnotenum}{\the\lfnotenum}}
```

The `\fnote{<text>}` macro is simple, `\fnotemark` and `\fnotetext` does the real work.

76 \\_def\\_\\_fnote{\\_fnotemark1\\_\\_fnotetext}  
77 \\_def\\_\\_fnotemark#1{\{} \ advance\\_\\_gfnoteenum by#1\\_\\_ advance\\_\\_lfnoteenum by#1\\_\\_ relax \ printfnnotemarkA\{}

The `\fnotetext` calls `\_opfootnote` which is equivalent to plain TeX `\vfootnote`. It creates new data to Insert `\footins`. The only difference is that we are able to propagate a macro parameter into Insert.

group before the text is printed (see section 2.17). This propagated macro is `\_fnset` which sets smaller fonts.

Note that `\vfootnote` and `\opfootnote` doesn't read the text as a parameter but during normal horizontal mode. This is reason why catcode changes (for example in-line verbatim) can be used here.

```
fnotes.opm
91 \_def\_fnotetext{\_incr\_gfnotenumber \_incr\_lfnotenum % global increment
92   \_ifpgfnote \_openref \_fi
93   \_wref \_Xfnote{}%
94   \_ifpgfnote \_ifcsname _fn:\_the\_gfnotenumber \_endcsname \_else
95     \_opwarning{unknown \_noexpand\fnote mark. TeX me again}%
96     \_incr\_unresolvedrefs
97   \_fi\_\_fi
98   \_opfootnote\fnset\printfnotemarkB
99 }
100 \_def\fnset{\_everypar={} \_scalemain \_typoscale[800/800]}
101
102 \_public \fnote \fnotemark \fnotetext ;
```

By default `\mnote{<text>}` are in right margin at odd pages and they are in left margin at even pages. The `\mnote` macro saves its position to `.ref` file as `\_Xmnote` without parameter. We define `\_mn:{<mnotenum>}` as `\right` or `\left` when the `.ref` file is read. The `\ifnum 0<#2` trick returns true if `<pageno>` has numeric type and false if it is non-numeric type (Roman numeral, for example). We prefer to use `<pageno>`, but only if it has numeric type. We use `<gpageno>` in other cases.

```
fnotes.opm
114 \_newcount\mnotenum \_mnotenum=0 % global counter of mnotes
115 \_def \_Xmnote f\_\_incr\_mnotenum \ea \_XmnoteA \_currpage}
116 \_def \_XmnoteA #1#2% #1=<gpageno> #2=<pageno>
117   \_sxdef{\_mn:\_the\_mnotenum}{\_ifod\_\_numtype{#2}{#1} \_right \_else \_left \_fi}
118 \_def \_numtype #1#2{\_ifnum 0<#1 #1\else #2\fi}
```

User can declare `\fixmnotes\left` or `\fixmnotes\right`. It defines `\_mnotesfixed` as `\left` or `\right` which declares the placement of all marginal notes and such declaration has a precedence.

```
fnotes.opm
126 \_def \_fixmnotes #1{\_edef\mnotesfixed{\_cs{\_csstring #1}}}
127 \_public \fixmnotes ;
```

The `\_mnoteD{<text>}` macro sets the position the marginal note. The outer box of marginal note has zero width and zero depth and it is appended after current line using `\vadjust` primitive or it is inverted to vertical mode as a box with `\vskip-\baselineskip` followed.

```
fnotes.opm
136 \_def\mnote #1{\_ifx^#1^ \_else \_mnoteC#1\end \_fi \_mnoteD}
137 \_def\mnoteC up#1\end{\_mnoteskip#1\relax} % \mnote up<dimen> {<text>} syntax
138 \_long\def\mnoteD#1{\_ifvmode {\_mnoteA{#1}}\nobreak\vskip-\_baselineskip \_else
139   \_lower\dp\strutbox\hbox{}\vadjust{\_kern-\_dp\strutbox \_mnoteA{#1}\_kern\dp\strutbox}%
140   \_fi
141 }
142 \_public \mnote ;
```

The `\mnoteskip` is a dimen which denotes the vertical shift of marginal note from its normal position. Positive value means shift up, negative down. The `\mnoteskip` register is set to zero after the marginal note is printed. The new syntax `\mnote up(<dimen>){<text>}` is possible too, but public `\mnoteskip` is kept for backward compatibility.

```
fnotes.opm
152 \_newdimen\mnoteskip
153 \_public \mnoteskip ;
```

The `\_mnoteA` macro does the real work. The `\_lrmnote{<left>}{<right>}` uses only first or only second parameter depending on the left or right marginal note.

```
fnotes.opm
161 \_long\def\mnoteA #1{\_incr\_mnotenum

186 \_regmacro {\_def\fnotemark#1{}} {\_def\fnotemark#1{}} {\_def\fnotemark#1{}}
187 \_regmacro {\_def\mnote#1{}} {\_def\mnote#1{}} {\_def\mnote#1{}}

```

## 2.34 Styles

OpTeX provides three styles: `\report`, `\letter` and `\slides`. Their behavior is documented in user part of the manual in the section 1.7.2 and `\slides` style (for presentations) is documented in `op-slides.pdf` which is an example of the presentation.

### 2.34.1 `\report` and `\letter` styles

`styles.opp`

```

3 \_codedecl \report {Basic styles of OpTeX <2020-03-28>} % preloaded in format

```

We define auxiliary macro first (used by the `\address` macro)

The `\boxlines {<line-1> <eol> <line-2> <eol> ... <line-n> <eol>}` returns to the outer vertical mode a box with `<line-1>`, next box with `<line-2>` etc. Each box has its natural width. This is reason why we cannot use paragraph mode where each resulting box has the width `\hsize`. The `<eol>` is set active and `\everypar` starts `\hbox{` and active `<eol>` closes this `\hbox` by `}`.

`styles.opp`

```

16 \_def\boxlines{%
17  \_def\_boxlinesE{\_ifhmode\_egroup\_empty\_fi}%
18  \_def\_nl{\_boxlinesE}%
19  \_bgroup \_lccode`\~`\^M\_lowercase{\_egroup\_let~}\_boxlinesE
20  \_everypar{\_setbox0=\_lastbox\_endgraf
21   \_hbox\(_bgroup \_catcode`\^M=13 \_let\par=\_nl \_aftergroup\_boxlinesC}%
22 }
23 \_def\_boxlinesC{\_futurelet\_next\_boxlinesD}
24 \_def\_boxlinesD{\_ifx\_next\_\empty\_else\_ea\_egroup\_fi}
25
26 \_public \boxlines ;

```

The `\report` and `\letter` style initialization macros are defined here.

The `\letter` defines `\address` and `\subject` macros.

`styles.opp`

```

34 \_def\report{
35  \_typosize[11/13.2]
36  \_vsizer=\_dimexpr \_topskip + 52\baselineskip \_relax % added 2020-03-28
37  \_let\_titfont=\_chapfont
38  \_titskip=3ex
39  \_eoldef\author##1{\_removelastskip\bigskip
40   \_leftskip=0pt plus1fill \_rightskip=\_leftskip \_it \_noindent ##1\par}\_nobreak\bigskip
41 }
42 \_public \author ;
43 \_parindent=1.2em \_iindent=\_parindent \_ttindent=\_parindent
44 \_footline={\_global\_footline={\_hss\rmfixed\folio\hss}}
45 }
46 \_def\letter{
47  \_def\_address{\_vtop\(_bgroup\boxlines \_parskip=0pt \_let\par=\_egroup}
48  \_def\_subject{\{_bf \_mtext{subj}: }\}
49  \_public \address \subject ;
50  \_typosize[11/14]
51  \_vsizer=\_dimexpr \_topskip + 49\baselineskip \_relax % added 2020-03-28

```

```

52   \_parindent=0pt
53   \_parskip=\_medskipamount
54   \_nopagenumbers
55 }
56 \_public \letter \report ;

```

The `\slides` macro reads macro file `slides.opm`, see the section 2.34.2.

```

62 \_def\slides{\_par
63   \_input slides.opm
64 }
65 \_public \slides ;

```

## 2.34.2 `\slides` style for presentations

```

3 \codedecl \slideshow {Slides style for OpTeX <2020-03-19>} % loaded on demand by \slides

```

Default margins and design is declared here. The `\ttfont` is scaled by `mag1.15` in order to balance the ex height of Helvetica (Heros) and LM fonts Typewriter. The `\begtt... \endtt` verbatim is printed by smaller text.

```

12 \_margins/1 a5l (14,14,10,3)mm % landscape A5 format
13 \_def\wideformat{\_margins/1 (263,148) (16,16,10,3)mm } % 16:9 format
14
15 \_fontfam[Heros]
16 \_typosize[16/19]
17 \_famvardef\_ttfont{\_setfontsize{mag1.15}\_tt}
18 \_def\urlfont{}
19 \_everytt={\_typosize[13/16] \advance\hsize by10mm}
20 \_fontdef\_fixbf{\_bf}
21
22 \_nopagenumbers
23 \_parindent=0pt
24 \_ttindent=5mm
25 \_parskip=5pt plus 4pt minus2pt
26 \_rightskip=0pt plus 1fil
27 \_ttindent=10pt
28 \_def\_ttskip{\_smallskip}
29
30 \_onlyrgb % RGB color space is better for presentations

```

The bottom margin is set to 3 mm. If we use 1 mm, then baseline of `\footline` is 2 mm from the bottom page. This is depth of the `\Grey` rectangle used for page numbers. It is r-lapped to `\hoffset` width because left margin = `\hoffset` = right margin. It is 14 mm for narrow pages or 16 mm for wide pages.

```

40 \_footlinedist=1mm
41 \_footline={\_hss \_rlap{%
42   \_rlap{\Grey\kern.2\hoffset\vrule height6mm depth2mm width.8\hoffset}%
43   \_hbox to\hoffset{\White\hss\folio\kern3mm}}}

```

The `\subtit` is defined analogically like `\tit`.

```

49 \_eoldef\subtit#1{\_vskip20pt f\leftskip=0pt plus1fill \_rightskip=\_leftskip
50   \_subtitfont #1\_\_bpar}}

```

The `\pshow{num}` prints the text in invisible (transparent) font when `\layernum<(num)`. The transparency is set by `\pdfpageresources` primitive.

```

58 \pdfpageresources{/ExtGState <> /Invisible << /Type /ExtGState /ca 0 /CA 0 >>
59   /Visible << /Type /ExtGState /ca 1 /CA 1 >> >>}
60 \addto\morepgresources{/Invisible << /Type /ExtGState /ca 0 /CA 0 >>
61   /Visible << /Type /ExtGState /ca 1 /CA 1 >> >>}
62 \def\Invisible {\_pdfliteral{/Invisible gs}}
63 \def\Visible {\_pdfliteral{/Visible gs}}
64 \def\Transparent {\Invisible \aftergroup \Visible}
65
66 \_def\use#1#2{\_ifnum\layernum#1\relax#2\fi}
67 \_def\pshow#1{\_use{#1}\Red \_use{<#1}\Transparent \_ignorespaces}

```

The main level list of items is activated here. The `\_item:X` and `\_item:x` are used and are re-defined here. If we are in nested level of items and `\pg+` is used then `\egroups` macro expands to the right number of `\egroups` in order to close page correctly. The level of nested item lists is saved to the `\_ilevel` register and used when we start again the next text after `\pg+`.

```
slides.opp
79 \_newcount\gilevel
80 \_def\*{*}
81 \_adef*\{_startitem}
82 \_sdef{\_item:X}{\Blue\_raise.2ex\fullrectangle{.8ex}\kern.5em}
83 \_sdef{\_item:x}{\Blue\_raise.3ex\fullrectangle{.6ex}\kern.4em}
84 \_style X
85 \_def\egroups{\_par\global\gilevel=\_ilevel \_egroup}
86 \_everylist={\_nospaces \_ifcase\_ilevel \_or \_style x \_else \_style - \_fi
87 \_addto\egroups{\_egroup}}
```

The default values of `\pg`, i.e. `\pg;`, `\pg+` and `\pg`. are very simple. They are used when `\showslides` is not specified.

```
slides.opp
94 \_def\pg#1{\_cs{\_spg:#1}}
95 \_sdef{\_spg:;}{\_vfil\break \_lfnotenumreset}
96 \_sdef{\_spg:.}{\_end}
97 \_sdef{\_spg:+}{\_par}
```

We need no numbers and no table of contents when using slides. The `\printsec` macro is redefined in order the title is centered and typeset in `\Blue`.

```
slides.opp
105 \_def\titfont{\_typosize[42/60]\bf \Blue}
106 \_def\subtitfont{\_typosize[20/30]\bf}
107 \_def\secfont{\_typosize[25/30]\bf \Blue}
108
109 \_nonum \notoc \let\resetnonumnotoc=\relax
110 \_def\printsec#1{\_par
111 \_abovetitle{\_penalty-400}\bigskip
112 {\_secfont \noindent \leftskip=0pt plus1fill \rightskip=\leftskip
113 \_printrefnum[@\quad]#1\_\_bpar\insertmark{#1}%
114 \nobreak \belowtitle{\medskip}%
115 }
```

When `\slideshow` is active then each page is opened by `\setbox\slidepage=\vbox\bgroup` (roughly speaking) and closed by `\egroup`. The material is `\unboxed` and saved for the usage in the next usage if `\pg+` is in process. The `\_slidelayer` is incremented instead `\pageno` if `\pg+`. This counter is equal to `\count1`, so it is printed to the terminal and log file next to `\pageno`.

The code is somewhat more complicated when `\layers` is used. Then `\layeredtext` is saved to the `\_layertext` macro, the material before it is in `\slidepage` box and the material after it is in `\_slidepageB` box. The pages are completed in the `\loop` which increments the `\layernum` register.

```
slides.opp
133 \_newbox\slidepage \_newbox\slidepageB
134 \_countdef\slidelayer=1
135 \_def\decr#1{\_global\advance#1 by-1 }

189 }
190 \public \subtit \slideshow \pg \wideformat \use \pshow ;

```

Default `\layers {num}` macro (when `\slideshow` is not activated) is simple. It prints the *(layered-text)* with `\layernum={num}+1` because we need the result after last layer is processed.

```

198 \_def\_layers #1 {\_par\layernum=\numexpr#1+1\relax}
199 \_let\endlayers=\relax
200
201 \_def\layers{\_layers}

```

We must to redefine `\fnotenumpages` because the data from .ref file are less usable for implementing such feature: the footnote should be in more layers repeatedly. But we can suppose that each page starts by `\pg;` macro, so we can reset the footnote counter by this macro.

```

211 \_def \fnotenumpages {\_def\fnotenum{\_the\_lfnotenum}\_pgfnotefalse
212     \_def\lfnotenumreset{\_global\lfnotenum=0 }}
213 \_let \lfnotenumreset=\relax
214 \public \fnotenumpages ;

```

## 2.35 Logos

```

3 \codedecl \TeX {Logos TeX, LuaTeX, etc. <2020-02-28>} % preloaded in format

```

Despite plain TeX each macro for logos ends by `\ignoreslash`. This macro ignores next slash if it is present. You can use `\TeX/` like `this` for protecting the space following the logo. This is visually more comfortable. The macros `\TeX`, `\OpTeX`, `\LuaTeX`, `\XeTeX` are defined.

```

13 \protected\def \TeX {T\kern-.1667em\lower.5ex\hbox{E}\kern-.125em}\_ignoreslash}
14 \protected\def \OpTeX {O\kern-.1em\TeX}
15 \protected\def \LuaTeX {Lua\TeX}
16 \protected\def \XeTeX {X\kern-.125em\phantom E}
17     \pdfsave\rlap{\pdfscale{-1}{1}\lower.5ex\hbox{E}}\pdfrestore \kern-.1667em \TeX

```

```

18
19 \_def\ignoreslash {\_futurelet\_next \_ignoreslashA}
20 \_def\ignoreslashA {\_ifx\_next/\_ea\ignoreit\_fi}
21
22 \_public \TeX \OpTeX \LuaTeX \XeTeX \ignoreslash ;

```

The `\_slantcorr` macro expands to slant-correction of current font. It is used to shifting A if the `\LaTeX` logo is in italic.

```

logos.opm
29 \_protected\_def \LaTeX{\_tmpdim=.42ex L\_kern-.36em \kern \_slantcorr % slant correction
30 \_raise \_tmpdim \hbox{\_the\fontscale[710]A}%
31 \_kern-.15em \kern-\_slantcorr \TeX}
32 \_def\slantcorr{\_ea\ignorept \the\fontdimen1\font\_tmpdim}
33
34 \_public \LaTeX ;

```

`\OPmac`, `\CS` and `\csplain` logos.

```

logos.opm
40 \_def\OPmac{\_leavevmode
41 \_lower.2ex\hbox{\_the\fontscale[1400]0}\kern-.86em P{\_em mac}\ignoreslash}
42 \_def\CS{\$\_cal C\$\_kern-.1667em\_lower.5ex\hbox{\$\_cal S\$}\ignoreslash}
43 \_def\csplain{\_CS plain\ignoreslash}
44
45 \_public \OPmac \CS \csplain ;

```

The expandable versions of logos used in Outlines needs the expandable `\ingnslash` (instead of the `\ignoreslash`).

```

logos.opm

58 }
59 \_public \ignslash ;

```

## 2.36 Multilingual support

### 2.36.1 Lowercase, uppercase codes

All codes in unicode table keep information about pairs lowecase-uppercase letters or single letter. We need to read such information and set appropriate `\lccode` and `\uccode`. The `\catcode` above the code 127 is not set, i.e. the `\catcode=12` for all codes above 127.

The file `uni-lcuc.opm` does this work. It is not much interesting file, only first few lines from 15928 lines in total is shown here.

```

uni-lcuc.opm
3 % Preloaded in format. A copy o uni-lcuc.tex fom csplain is here:
4
5 % uni-lcuc.tex -- sets \lccodes and \uccodes for Unicode chars, nothing more

... etc. (see uni-lcuc.opm)

```

## 2.36.2 Hyphenations

```
hyphen-lan.opm
3 \_codedecl \langlist {Initialization of hyphenation patterns <2020-03-10>} % preloaded in format
```

The  $\langle iso\text{-}code \rangle$  means a shortcut of language name (mostly by ISO 639-1). The following control sequences are used for language switching:

- $\_lan:\langle number \rangle$  expands to  $\langle iso\text{-}code \rangle$  of the language. The number is internal number of languages used as a value of `\language` register.
- $\_ulan:\langle long\text{-}lang \rangle$  expands to  $\langle iso\text{-}code \rangle$  too. This is transformation from long name of language (lowercase letters) to  $\langle iso\text{-}code \rangle$ .
- $\_ \langle iso\text{-}code \rangle \text{Patt}$  (for example `\_csPatt`) is the language  $\langle number \rangle$  declared by `\chardef`.
- $\langle iso\text{-}code \rangle \text{lang}$  (for example `\enlang`, `\cslang`, `\sklang`, `\delang`, `\pllang`) is language selector. It exists in two states
  - Initialization state: when  $\langle iso\text{-}code \rangle \text{lang}$  is used first then it must load the patterns into memory using Lua code. If it is done then the  $\langle iso\text{-}code \rangle \text{lang}$  re-defines itself to processing state.
  - Processing state: it only sets `\language=\_ \langle iso\text{-}code \rangle \text{Patt}`, i.e it selects the hyphenation patterns. It does a little more language-dependent work, as mentioned below.
- $\_langspecific:\langle isocode \rangle$  is processed by  $\langle iso\text{-}code \rangle \text{lang}$  and it should include language-specific macros declared by user or macro designer.

The USenglish patters are preloaded first:

```
hyphen-lan.opm
32 \_chardef\enPatt=0
33 \_def\_patlist{\enPatt=0}
34 \_def\_langlist{\en(USenglish)}
35 \_sdef{\_lan:0}{en}
36 \_sdef{\_ulan:usenglish}{en}
37 \_def\_enlang{\uselang{\en}\enPatt23} % \lefthyph=2 \righthyp=3
38 \_def\enlang{\_enlang}
39 \_sdef{\_langspecific:en}{\_nonfrenchspacing}
40
41 \lefthyphenmin=2 \righthypenmin=3 % disallow x- or -xx breaks
42 \input hyphen % en(USenglish) patterns from TeX82
```

`\preplang`  $\langle iso\text{-}code \rangle$   $\langle long\text{-}lang \rangle$   $\langle number\text{-}cs \rangle$   $\langle number \rangle$   $\langle pre\text{-}hyph \rangle \langle post\text{-}hyph \rangle$  prepares the  $\langle iso\text{-}code \rangle \text{lang}$  to its initialization state. Roughly speaking, it does:

```

\chardef\_\langle iso\text{-}code \rangle \text{Patt} = \langle number \rangle
\def\_\lan:\langle number \rangle {\langle iso\text{-}code \rangle}
\def\_\ulan:\langle long\text{-}lang \rangle {\langle iso\text{-}code \rangle}
\def\_\langle iso\text{-}code \rangle \text{lang} {%
  \_loadpattrs \langle long\text{-}lang \rangle \langle number \rangle % loads patterns using Lua code
  \gdef\_\langle iso\text{-}code \rangle \text{lang} {\uselang{\langle iso\text{-}code \rangle}\_ \langle iso\text{-}code \rangle \text{Patt} \langle pre\text{-}hyph \rangle \langle post\text{-}hyph \rangle}%
  \_ \langle iso\text{-}code \rangle \text{lang} % runs itself in processing state
}
\def\langle iso\text{-}code \rangle \text{lang} {\_ \langle iso\text{-}code \rangle \text{lang}} % public version \langle iso\text{-}code \rangle \text{lang}
```

You can see that  $\langle iso\text{-}code \rangle \text{lang}$  runs `\_loadpattrs`  $\langle long\text{-}lang \rangle$   $\langle iso\text{-}code \rangle$  in initialization state and `\uselang` in processing state.

```
hyphen-lan.opm

```

\uselang{(iso-code)}\\_(iso-code)Patt <pre-hyph><post-hyph>

sets \language, \lefthyphenmin, \righthphenmin and runs \frenchspacing. This default language-dependent settings should be re-declared by \langs specific:<iso-code> which is run finally (it is \relax by default, only \langs specific:en runs \nonfrenchspacing).

hyphen-lan. opm

```

91 \_def\_\uselang#1#2#3#4{\_language=#2\_\lefthyphenmin=#3\_\righthphenmin=#4\_\relax
92   \_frenchspacing % \nonfrenchspacing can be set in \cs{_langs specific:lan}
93   \_cs{_langs specific:#1}%
94 }

```

The \uselanguage {<long-lang>} is defined here (for compatibility with e-plain users).

hyphen-lan. opm

```

100 \_def\_\uselanguage#1{\_lowercase{\_cs{\_cs{_ulan:#1}lang}}}
101 \_public \uselanguage ;

```

The numbers for languages are declared as fixed constants (no auto-generated). This concept is inspired from CSplain. There are typical numbers of languages in CSplain: 5=Czech in IL2, 15=Czech in T1 and 115=Czech in Unicode. We keep these constants but we load only Unicode patterns (greater than 100), of course.

hyphen-lan. opm

```

The `\langlist` includes names of all languages which are ready to load and use their hyphenation patterns. This list is printed to terminal and to log at iniTeX state here. It can be used when processing document too.

`hyphen-lan.opm`

```

176 \_message{Language hyph.patterns ready to load: \_langlist.
177   Use \_string<shortname>lang to initialize language,
178   \_string\cslang\_space for example}
179
180 \_public \langlist ;

```

Maybe, you need to do more language specific actions than just switching hyphenation patterns. For example you need to load a specific font with a specific script used in selected language, you can define a macros for quotation marks depending on the language etc.

The example shows how to declare such language specific things.

```

\def\langset #1 #2{\sdef{_langs specific:#1}{#2}}
\langset fr {... declare French quotation marks}
\langset de {... declare German quotation marks}
\langset gr {... switch to Greek fonts family}
... etc.

```

Note that you need not to set language specific phrases (like `\today`) by this code. Another concept is used for such tasks. See the section [2.36.3](#) for more details.

### 2.36.3 Multilingual phrases and quotation marks

`languages.opm`

```

3 \_codedecl \_mtext {Languages <2020-04-29>} % preloaded in format

```

Only four words are generated by OptEX macros: “Chapter”, “Table”, “Figure” and “Subject”. These phrases can be generated depending on the current value of `\language` register, if you use `\_mtext{<phrase-id>}`, specially `\_mtext{chap}`, `\_mtext{t}`, `\_mtext{f}` or `\_mtext{subj}`. If your macros generate more words then you can define such words by `\sdef{_mt:<phrase-id>:<lang>}` where `<phrase-id>` is a label for declared word and `<lang>` is language shortcut (iso code).

`languages.opm`

```

16 \_def\mtext#1{\_trycs{_mt:#1:\_trycs{_lan:\_the\_language}{en}}}
17   {\_csname _mt:#1:en\endcsname}
18

```

```

19 \_sdef{_mt:chap:en}{Chapter} \_sdef{_mt:chap:cs}{Kapitola} \_sdef{_mt:chap:sk}{Kapitola}
20 \_sdef{_mt:t:en}{Table} \_sdef{_mt:t:cs}{Tabulka} \_sdef{_mt:t:sk}{Tabuľka}
21 \_sdef{_mt:f:en}{Figure} \_sdef{_mt:f:cs}{Obrázek} \_sdef{_mt:f:sk}{Obrazok}
22 \_sdef{_mt:subj:en}{Subject} \_sdef{_mt:subj:cs}{Věc} \_sdef{_mt:subj:sk}{Vec}

```

Using `\_langw` `<lang>` `<chapter>` `<table>` `<figure>` `<subject>` you can declare these words more effectively:

```

languages.opm
30 \_def \_langw #1 #2 #3 #4 #5 {%
31   \_sdef{_mt:chap:#1}{#2}\_sdef{_mt:t:#1}{#3}\_sdef{_mt:f:#1}{#4}%
32   \_sdef{_mt:subj:#1}{#5}%
33 }
34
35 \_langw en Chapter Table Figure Subject
36 %-----
37 \_langw cs Kapitola Tabulka Obrázek Věc
38 \_langw de Kapitel Tabelle Abbildung Betreff
39 \_langw es Capítulo Tabla Figura Sujeto
40 \_langw fr Chaptire Tableau Figure Matière
41 \_langw it Capitolo Tabella Fig. Soggetto
42 \_langw pl Rozdział Tabela Ilustracja Temat
... etc. (see languages.opm)

```

You can add more words as you wish. For example `\today` macro:

```

languages.opm
51 \_def \_monthw #1 #2 #3 #4 #5 #6 #7 {%
52   \_sdef{_mt:m1:#1}{#2}\_sdef{_mt:m2:#1}{#3}\_sdef{_mt:m3:#1}{#4}%
53   \_sdef{_mt:m4:#1}{#5}\_sdef{_mt:m5:#1}{#5}\_sdef{_mt:m6:#1}{#5}%
54   \_monthwB #1
55 }
56 \_def \_monthwB #1 #2 #3 #4 #5 #6 #7 {%
57   \_sdef{_mt:m7:#1}{#2}\_sdef{_mt:m8:#1}{#3}\_sdef{_mt:m9:#1}{#4}%
58   \_sdef{_mt:m10:#1}{#5}\_sdef{_mt:m11:#1}{#5}\_sdef{_mt:m12:#1}{#5}%
59 }
60
61 \_monthw en January February March April May June
62           July August September October November December
63 \_monthw cs ledna února března dubna května června
64           července srpna září října listopadu prosince
65 \_monthw sk januára februára marca apríla mája júna
66           júla augusta septembra októbra novembra decembra
67
68 \_sdef{_mt:today:en}{\_mtext{m\the\_month} \_the\_day, \_the\_year}
69 \_sdef{_mt:today:cs}{\_the\_day.\_mtext{m\the\_month} \_the\_year}
70 \_slet{_mt:today:sk}{_mt:today:cs}
71
72 \_def \_today{\_mtext{today}}
73 \_public \_today ;

```

Quotes should be tagged by `\"(text)"` and `\' (text)'` if `\(iso-code)quotes` is declared at beginning of the document (for example `\enquotes`). If not, then the control sequences `\"` and `\'` are undefined. Remember, that they are used in another meaning when `\oldaccents` command is used. The macros `\"` and `\'` are not defined as `\protected` because we need their expansion when `\outlines` are created. User can declare quotes by `\quoteschars{clqq}{crqq}{clq}{crq}`, where `{clqq}...{crqq}` are normal quotes and `{clq}...{crq}` are alternative quotes. or use `\altquotes` to swap between meaning of these two types of quotes.

`\enquotes`, `\csquotes`, `\dequotes`, `\frquotes` etc. are defined here.

```

languages.opm
90 \_def \_enquotes {\_quoteschars {"'"}}
91 \_def \_csquotes {\_quoteschars {"'`"}}
92 \_def \_frquotes {\_quoteschars {"<>"}}
93 \_let \_plquotes = \_frquotes
94 \_let \_esquotes = \_frquotes
95 \_let \_grquotes = \_frquotes
96 \_let \_ruquotes = \_frquotes
97 \_let \_itquotes = \_frquotes
98 \_let \_skquotes = \_csquotes
99 \_let \_dequotes = \_csquotes

```

The `\quoteschars{lqq}{rqq}{lq}{rq}` defines `"` and `'` as `\_qqA` in normal mode and as expandable macros in outline mode. We want to well process the common cases: `"`&`"` or `"`{`"`. This is reason why the quotes parameter is read in verbatim mode and retokenized again by `\scantextokens`. We want to allow to quote the quotes mark itself by `"`"}`"`. This is reason why the sub-verbatim mode is used when first character is `{` in the parameter.

The `"` is defined as `\_qqA\qqB{lqq}{rqq}` and `'` as `\_qqA\qqC{lq}{rq}`. The `\_qqA\qqB{clqq}{crqq}` runs `\_qqB{lqq}{rqq}{text}"`.

```
languages.opm
113 \_def \_quoteschars #1#2#3#4{\_def \_altquotes{\_quoteschars#3#4#1#2}\_public\altquotes;%
114   \_protected\_def "\{\_qqA\qqB#1#2}\_protected\_def '\{\_qqA\qqC#3#4}%
115   \_regmacro{}{}{\_def "\##1"\{#1##1#2}\_def '\##1'\{#3##1#4}}%
116 
117 \_def \_qqA#1#2#3{\_bgroup\_setverb \_catcode`\ =10
118   \_isnextchar\_bgroup{\_catcode`\{=1 \_catcode`\}=2 #1#2#3}\{#1#2#3}}
119 \_long\_def \_qqB#1#2#3"\{_egroup#1\scantextokens{#3}#2}
120 \_long\_def \_qqC#1#2#3'{\_egroup#1\scantextokens{#3}#2}
```

Sometimes should be usable to leave the markup "such" or 'such' i.e. without the first backslash. Then you can make the characters `"` and `'` active by the `\activequotes` macro and leave quotes without first backslash. First, declare `\(iso-code)quotes`, then `\altquotes` (if needed) and finally `\activequotes`.

`\resetaquotes` redefines expandable version of `"<text>"` and `'<text>'` used in outlines in order to the delimiter is *active* character. We are testing if `\quoteschars` were used now because the error in outlines can be more confusing.

```
languages.opm
135 \_def \_activequotes{\_edef"\""\_edef'\'"\_resetaquotes}
136 
137 \_bgroup \_catcode`\ =13 \_lccode`\~="\" \_lccode`\,="\' \_lowercase{\_egroup
138   \_def \_resetaquotes{%
139     \_bgroup \_the \_regoul \_edef \_tmp{?"}\_egroup % test if \quoteschar were used
140     \_regmacro{}{}{\_edef"\##1~{\"##1"}\_edef'\##1,\{\'##1'}}%
141   }
142 
143 \_public \quoteschars \activequotes \enquotes \csquotes \skquotes \frquotes \plquotes
144   \esquotes \grquotes \ruquotes \itquotes \dequotes ;
```

## 2.37 Other macros

Miscellaneous macros are here.

```
others.opm
3 \_codedecl \uv {Miscenaleous <2020-05-22>} % preloaded in format
9 \_let \useOpTeX = \_relax \_let \useoptex = \_relax
```

The `\lastpage` and `\totalpages` get the information from the `\currpage`. The `\Xpage` from .ref file sets the `\currpage`.

```
others.opm
16 \_def \_totalpages {\_openref\ea\lastpageA\currpage}
17 \_def \_lastpage {\_openref\ea\lastpageB\currpage}
18 \_def \_lastpageA #1#2{\#1}
19 \_def \_lastpageB #1#2{\#2}
20 \_def \_currpage {{0}{?}}
21 \_public \lastpage \totalpages ;
```

We need `\uv`, `\clqq`, `\crqq`, `\flqq`, `\frqq`, `\uslang`, `\ehyph`, `\chyph`, `\shyph`, for backward compatibility with `\csplain`. Codes are set according to Unicode, because we are using Czech only in Unicode when `\LuaTeX` is used.

```
others.opm
30 
31 % for compatibility with csplain:
32 
33 \_chardef\clqq=8222 \_chardef\crqq=8220
34 \_chardef\flqq=171 \_chardef\frqq=187
35 \_chardef\promile=8240
36 
```

```

37 \_def\uv#1{\clqq#1\crqq}
38
39 \_let\uslang=\enlang \_let\ehyph=\enlang
40 \_let\chyp=\cslang \_let\shyp=\sklang
41 \_let\csUnicode=\csPatt \_let\czUnicode=\csPatt \_let\skUnicode=\skPatt

```

The `\letfont` was used in `\Cplain` instead of `\fontlet`.

```
47 \_let \letfont = \fontlet
```

`others.opm`

Non breaking space in Unicode.

```
53 \let ^~a0=~
```

`others.opm`

TikZ needs these funny control sequences.

```

59 \_ea\_\toksdef \_csname tok@\_endcsname=0
60 \_ea\_\let \_csname voidb@x\_\endcsname=\_voidbox

```

`others.opm`

We don't want to read `opmac.tex` unless `\input opmac` is specified.

```
66 \_def\OPmacversion{0pTeX}
```

`others.opm`

We allow empty lines in math formulae. It is more comfortable.

```
72 \_suppressmathparerror = 1
```

`others.opm`

LoREM ipsum can be printed by `\lipsum[⟨range⟩]` or `\lorem[⟨range⟩]`, for example `\lipsum[3]` or `\lipsum[112–121]`, max=150.

First usage of `\lipsum` reads the L<sup>A</sup>T<sub>E</sub>X file `lipsum.ltd.tex` and prints the selected paragraph(s). Next usages of `\lipsum` prints the selected paragraph(s) from memory. This second and more usages of `\lipsum` are fully expandable. If you want to have all printings of `\lipsum` expandable, use dummy `\lipsum[0]` first.

```

85 \_def \lipsum {%
86   {\_long\_def\ProvidesFile##1[##2]##3{\_ifx\_\par##3\_relax\_else \_ea##3\_\fi}\_tmpnum=0
87   \_def\NewLipsumPar{\_advance\_\tmpnum by1
88   \_afterassignment\_\negativermmn \_sxdef{lipsum:\_the\_\tmpnum}}%
89   \_opinput {lipsum.ltd.tex}%

97 }
98 \def\lipsum {\_lipsum}
99 \def\lorem {\_lipsum}

```

`others.opm`

## 2.38 Printing documentation

The `\printdoc` ⟨filename⟩⟨space⟩ and `\printdoctail` ⟨filename⟩⟨space⟩ commands are defined after the file `doc.opm` is load by `\load` [doc].

The `\printcoc` starts reading of given ⟨filename⟩ from the second line. The file is read in the *listing mode*. The `\printdoctail` starts reading given ⟨filename⟩ from the first occurrence of the `\_encode`. The file is read in normal mode (like `\input` ⟨filename⟩).

The *listing mode* prints the lines as listing of a code. This mode is finished when first `\_\_doc` occurs or first `\_endcode` occurs. At least two spaces must precede before such `\_doc`. On the other hand, the `\_encode` must be at the left edge of the line without spaces. If this rule is not met then the listing mode continues.

If the first line or the last line of the listing mode is empty then such lines are not printed. The maximal number of printed lines in the listing mode is `\maxlines`. Is is set to almost infinity (100000). You can set it to a more sensible value. Such setting is valid only for the first following listing mode.

When the listing mode is finished by `\_doc` then next lines are read in the normal way, but the material between `\begtt` ... `\endtt` pair is shifted by three letters left. The reason is that the three

spaces of indentation is recommended in the `\_doc ... \_cod` pair and this shifting is a compensation of this indentation.

The `\_cod` macro ignores the rest of current line and starts the listing mode again.

When the listing mode is finished by the `\_endcode` then the `\endinput` is applied, the reading of the file opened by `\printdoc` is finished.

You cannot reach the end of the file (without `\_endcode`) in the listing mode.

The listing mode creates all control sequences which are listed in the index as active link to the main documentation point of such control sequence and prints them in blue. Other text is printed in black.

The main documentation point is denoted by `\`\\(sequence)`` in red, for example `\`\\foo``. The user documentation point is the first occurrence of `\``\\(sequence)``, for example `\``\\foo``. There can be more such markups, all of them are hyperlinks to the main documentation point. And main documentation point is hyperlink to the user documentation point, if such point exists. Finally, the `\~`\\(sequence)`` (for example `\~`\\foo``) are hyperlinks to the user documentation point.

`doc.opm`

```
3 \_codedecl \printdoc {Macros for documentation printing <2020-04-28>}
```

General declarations.

`doc.opm`
