

# OpT<sub>E</sub>X

## Format Based on Plain T<sub>E</sub>X and OPmac<sup>1</sup>

Version 1.04

Petr Olšák, 2020, 2021

<http://petr.olsak.net/optex>

OpT<sub>E</sub>X is LuaT<sub>E</sub>X format with Plain T<sub>E</sub>X and OPmac. Only LuaT<sub>E</sub>X engine is supported.

OpT<sub>E</sub>X should be a modern Plain T<sub>E</sub>X with power from OPmac (Fonts Selection System, colors, graphics, references, hyperlinks, indexing, bibliography, ...) with preferred Unicode fonts.

The main goal of OpT<sub>E</sub>X is:

- OpT<sub>E</sub>X keeps the simplicity (like in Plain T<sub>E</sub>X and OPmac macros).
- There is no old obscurities concerning various 8-bit encodings and various engines.
- OpT<sub>E</sub>X provides a powerful Fonts Selection System (for Unicode font families, of course).
- OpT<sub>E</sub>X supports hyphenations of all languages installed in your T<sub>E</sub>X system.
- All features from OPmac macros are copied. For example sorting words in the Index<sup>2</sup>, reading .bib files directly<sup>2</sup>, syntax highlighting<sup>2</sup>, colors, graphics, hyperlinks, references).
- Macros are documented in the same place where code is.
- User namespace of control sequences is separated from the internal namespace of OpT<sub>E</sub>X and primitives (\foo versus \\_foo). The namespaces for macro writers are designed too.

If you need to customize your document or you need to use something very specific, then you can copy relevant parts of OpT<sub>E</sub>X macros into your macro file and do changes to these macros here. This is a significant difference from L<sub>A</sub>T<sub>E</sub>X or ConTeXt, which is an attempt to create a new user level with a plenty of non-primitive parameters and syntax hiding T<sub>E</sub>X internals. The macros from OpT<sub>E</sub>X are simple and straightforward because they solve only what is explicitly needed, they do not create a new user level for controlling your document. We are using T<sub>E</sub>X directly in this case. You can use OpT<sub>E</sub>X macros, understand them, and modify them.

OpT<sub>E</sub>X offers a markup language for authors of texts (like L<sub>A</sub>T<sub>E</sub>X), i.e. the fixed set of tags to define the structure of the document. This markup is different from the L<sub>A</sub>T<sub>E</sub>X markup. It may offer to write the source text of the document somewhat clearer and more attractive.

The manual includes two parts: user documentation and technical documentation. The second part is generated directly from the sources of OpT<sub>E</sub>X. There are many hyperlinks from one part to second and vice versa.

This manual describes OpT<sub>E</sub>X features only. We suppose that the user knows T<sub>E</sub>X basics. They are described in many books. You can see a short document [T<sub>E</sub>X in nutshell](http://petr.olsak.net/tex-in-nutshell.html) too.

---

<sup>1</sup> OPmac package is a set of simple additional macros to Plain T<sub>E</sub>X. It enables users to take advantage of L<sub>A</sub>T<sub>E</sub>X functionality but keeps Plain T<sub>E</sub>X simplicity. See <http://petr.olsak.net/opmac-e.html> for more information about it.

<sup>2</sup> All these features are implemented by T<sub>E</sub>X macros, no external program is needed.

# Chapter 1

## User documentation

### 1.1 Starting with OpTeX

OpTeX is compiled as a format for LuaTeX. Maybe there is a command `optex` in your TeX distribution. Then you can write into the command line

```
optex document
```

You can try to process `optex op-demo` or `optex optex-doc`.

If there is no `optex` command, see more information about installation OpTeX at <http://petr.olsak.net/optex>.

A minimal document should be

```
\fontfam[LMfonts]  
Hello World! \bye
```

The first line `\fontfam[LMfonts]` tells that Unicode Latin Modern fonts (derived from Computer Modern) are used. If you omit this line then preloaded Latin Modern fonts are used but preloaded fonts cannot be in Unicode<sup>1</sup>. So the sentence `Hello World` will be OK without the first line, but you cannot print such sentence in other languages (for example `Ahoj světe!`) where Unicode fonts are needed because the characters like ě are not mapped correctly in preloaded fonts.

A somewhat larger example with common settings should be:

```
\fontfam[Termes] % selecting Unicode font family Termes (section 1.3.1)  
\typo{size}{11/13} % setting default font size and baselineskip (sec. 1.3.2)  
\margins{1 a4 (1,1,1,1)in} % setting A4 paper, 1 in margins (section 1.2.1)  
\cslang % Czech hyphenation patterns (section 1.7.1)
```

```
Tady je zkušební textík v českém jazyce.  
\bye
```

You can look at `op-demo.tex` file for a more complex, but still simple example.

### 1.2 Page layout

#### 1.2.1 Setting the margins

The `\margins` command declares margins of the document. This command have the following parameters:

```
\margins{/pg} {fmt} {left}, {right}, {top}, {bot}) {unit}  
example:  
\margins{1 a4 (2.5,2.5,2,2)cm}
```

Parameters are:

- `{pg}` ... 1 or 2 specifies one-page or two-pages design.
- `{fmt}` ... paper format (a4, a4l, a5, letter, etc. or user defined).
- `{left}, {right}, {top}, {bot}` ... gives the amount of left, right, top and bottom margins.
- `{unit}` ... unit used for values `{left}, {right}, {top}, {bot}`.

---

<sup>1</sup> This is a technical limitation of LuaTeX for fonts downloaded in formats: only 8bit fonts can be preloaded.

Each of the parameters  $\langle left \rangle$ ,  $\langle right \rangle$ ,  $\langle top \rangle$ ,  $\langle bot \rangle$  can be empty. If both  $\langle left \rangle$  and  $\langle right \rangle$  are nonempty then  $\text{\hspace}$  is set. Else  $\text{\hspace}$  is unchanged. If both  $\langle left \rangle$  and  $\langle right \rangle$  are empty then typesetting area is centered in the paper format. The analogical rule works when  $\langle top \rangle$  or  $\langle bot \rangle$  parameter is empty ( $\text{\vsize}$  instead  $\text{\hspace}$  is used). Examples:

```
\margins/1 a4 (,,,)mm % \hspace, \vsize untouched,
                      % typesetting area centered
\margins/1 a4 (,2,,)cm % right margin set to 2cm
                      % \hspace, \vsize untouched, vertically centered
```

If  $\langle pg \rangle=1$  then all pages have the same margins. If  $\langle pg \rangle=2$  then the declared margins are true for odd pages. The margins at the even pages are automatically mirrored in such case, it means that  $\langle left \rangle$  is replaced by  $\langle right \rangle$  and vice versa.

OpTeX declares following paper formats: a4, a4l (landscape a4), a5, a5l, a3, a3l, b5, letter and user can declare another own format by `\sdef`:

```
\sdef{_pgs:b5l}{(250,176)mm}
\sdef{_pgs:letterl}{(11,8.5)in}
```

The  $\langle fmt \rangle$  can be also in the form  $(\langle width \rangle, \langle height \rangle) \langle unit \rangle$  where  $\langle unit \rangle$  is optional. If it is missing then  $\langle unit \rangle$  after margins specification is used. For example:

```
\margins/1 (100,200) (7,7,7,7)mm
```

declares the paper  $100 \times 200$  mm with all four margins 7 mm. The spaces before and after  $\langle fmt \rangle$  parameter are necessary.

The command `\magscale`[ $\langle factor \rangle$ ] scales the whole typesetting area. The fixed point of such scaling is the upper left corner of the paper sheet. Typesetting (breakpoints etc.) is unchanged. All units are relative after such scaling. Only paper format's dimensions stay unscaled. Example:

```
\margins/2 a5 (22,17,19,21)mm
\magscale[1414] \margins/1 a4 (,,,)mm
```

The first line sets the  $\text{\hspace}$  and  $\text{\vsize}$  and margins for final printing at a5 format. The setting on the second line centers the scaled typesetting area to the true a4 paper while breaking points for paragraphs and pages are unchanged. It may be usable for review printing. After the review is done, the second line can be commented out.

### 1.2.2 Concept of the default page

OpTeX uses “output routine” for page design. It is very similar to the Plain TeX output routine. There is `\headline` followed by “page body” followed by `\footline`. The `\headline` is empty by default and it can be used for running headers repeated on each page. The `\footline` prints centered page number by default. You can set the `\footline` to empty using `\nopagenumbers` macro.

The margins declared by `\margins` macro (documented in the previous section 1.2.1) is concerned to the page body, i.e. the `\headline` and `\footline` are placed to the top and bottom margins.

The distance between the `\headline` and the top of the page body is given by the `\headlinedist` register. The distance between bottom of the page body and the `\footline` is given by `\footlinedist`. The default values are:

```
\headline = {}
\footline = {\_hss\_rmfixed \_folio \_hss} % \folio expands to page number
\headlinedist = 14pt % from baseline of \headline to top of page body
\footlinedist = 24pt % from last line in pagebody to baseline of footline
```

The page body should be divided into top insertions (floating tables and figures) followed by a real text and followed by footnotes. Typically, the only real text is here.

The `\pgbackground` tokens list is empty by default but it can be used for creating a background of each page (colors, picture, watermark for example). The macro `\draft` uses this register and puts big text DRAFT as a watermark to each page. You can try it.

More about the page layout is documented in sections [2.7.4](#) and [2.18](#).

### 1.2.3 Footnotes and marginal notes

The Plain TeX's macro `\footnote` can be used as usual. But a new macro `\fnote{<text>}` is defined. The footnote mark is added automatically and it is numbered on each chapter from one<sup>2</sup>. The `<text>` is scaled to 80 %. User can redefine footnote mark or scaling, as shown in the section [2.34](#).

The `\fnote` macro is fully applicable only in "normal outer" paragraph. It doesn't work inside boxes (tables, for example). If you are solving such a case then you can use the command `\fnotemark<numeric-label>` inside the box: only the footnote mark is generated here. When the box is finished you can use `\fnotetext{<text>}`. This macro puts the `<text>` to the footnote. The `<numeric-label>` has to be 1 if only one such command is in the box. Second `\fnotemark` inside the same box has to have the parameter 2 etc. The same number of `\fnotetexts` have to be written after the box as the number of `\fnotemarks` inserted inside the box. Example:

```
Text in a paragraph\fnote{First notice}...      % a "normal" footnote
\table{...}{...}\fnotemark1...\fnotemark2...}  % two footnotes in a box
\fnotetext{Second notice}
\fnotetext{Third notice}
...
\table{...}{...}\fnotemark1...}                  % one footnote in a box
\fnotetext{Fourth notice}
```

The marginal note can be printed by the `\mnote{<text>}` macro. The `<text>` is placed to the right margin on the odd pages and it is placed to the left margin on the even pages. This is done after second TeX run because the relevant information is stored in an external file and read from it again. If you need to place the notes only to the fixed margin write `\fixmnotes\right` or `\fixmnotes\left`.

The `<text>` is formatted as a little paragraph with the maximal width `\mnotesize` ragged left on the left margins or ragged right on the right margins. The first line of this little paragraph has its vertical position given by the position of `\mnote` in the text. The exceptions are possible by using the `up` keyword: `\mnote up<dimen>{<text>}`. You can set such `<dimen>` to each `\mnote` manually in final printing in order to margin notes do not overlap. The positive value of `<dimen>` shifts the note up and negative value shifts it down. For example `\mnote up 2\baselineskip{<text>}` shifts this marginal note two lines up.

## 1.3 Fonts

### 1.3.1 Font families

You can select the font family by `\fontfam[<Family-name>]`. The argument `<Family-name>` is case insensitive and spaces are ignored in it. For example, `\fontfam[LM Fonts]` is equal to `\fontfam[LMfonts]` and it is equal to `\fontfam[lmfonts]`. Several aliases are prepared, thus `\fontfam[Latin Modern]` can be used for loading Latin Modern family too.

If you write `\fontfam[?]` then all font families registered in OptEX are listed on the terminal and in the log file. If you write `\fontfam[catalog]` then a catalog of all fonts registered in

---

<sup>2</sup> You can declare `\fnotenumglobal` if you want footnotes numbered in whole document from one or `\fnotenumpages` if you want footnotes numbered at each page from one. Default setting is `\fnotenumchapters`

OpTeX and available in your TeX system is printed. The instructions on how to register your own font family are appended in the catalog.

If the family is loaded then *font modifiers* applicable in such font family are listed on the terminal: (\caps, \cond for example). And there are four basic *variant selectors* (\rm, \bf, \it, \bi). The usage of variant selectors is the same as in Plain TeX: {\it italics text}, {\bf bold text} etc.

The font modifiers (\caps, \cond for example) can be used before a variant selector and they can be (independently) combined: \caps\it or \cond\caps\bf. The modifiers keep their internal setting until the group ends or until another modifier that negates the previous feature is used. So {\caps \rm First text \it Second text} gives FIRST TEXT SECOND TEXT.

The font modifier without following variant selector does not change the font actually, it only prepares data used by next variant selectors. There is one special variant selector \currvar which does not change the selected variant but reloads the font due to (maybe newly specified) font modifier(s).

The context between variants \rm ↔ \it and \bf ↔ \bi is kept by the \em macro (emphasize text). It switches from current \rm to \it, from current \it to \rm, from current \bf to \bi and from current \bi to \bf. The italics correction \/ is inserted automatically, if needed. Example:

```
This is {\em important} text.      % = This is {\it important\}/} text.
\it This is {\em important} text. % = This is\/ {\rm important} text.
\bf This is {\em important} text. % = This is {\bi important\}/} text.
\bi This is {\em important} text. % = This is\/ {\bf important} text.
```

More about the OpTeX Font Selection System is written in the technical documentation in the section 2.13. You can mix more font families in your document, you can declare your own variant selectors or modifiers, etc.

### 1.3.2 Font sizes

The command \typosize[⟨fontsize⟩/⟨baselineskip⟩] sets the font size of text and math fonts and baselineskip. If one of these two parameters is empty, the corresponding feature stays unchanged. Don't write the unit of these parameters. The unit is internally set to \ptunit which is 1pt by default. You can change the unit by the command \ptunit=⟨something-else⟩, for instance \ptunit=1mm enlarges all font sizes declared by \typosize. Examples:

```
\typosize[10/12]    % default of Plain TeX
\typosize[11/12.5] % font 11pt, baseline 12.5pt
\typosize[8/]       % font 8pt, baseline unchanged
```

The commands for font size setting described in this section have local validity. If you put them into a group, the settings are lost when the group is finished. If you set something relevant with paragraph shape (baselineskip given by \typosize for example) then you must first finalize the paragraph before closing the group: {\typosize[12/14] ...⟨text of paragraph⟩... \par}.

The command \typoscale[⟨font-factor⟩/⟨baselineskip-factor⟩] sets the text and math fonts size and baselineskip as a multiple of the current fonts size and baselineskip. The factor is written in "scaled"-like way, it means that 1000 means factor one. The empty parameter is equal to the parameter 1000, i.e. the value stays unchanged. Examples:

```
\typoscale[800/800]    % fonts and baselineskip re-size to 80 %
\typoscale[\magstep2/] % fonts bigger 1,44times (\magstep2 expands to 1440)
```

First usage of \typosize or \typoscale macro in your document sets so-called *main values*, i.e. main font size and main baselineskip. They are internally saved in registers \mainfsize and \mainbaselineskip.

The `\typoscale` command does scaling with respect to current values by default. If you want to do it with respect to the main values, type `\scalemain` immediately before `\typoscale` command.

```
\typosize[12/14.4] % first usage in document, sets main values internally
\typosize[15/18]   % bigger font
\scalemain \typoscale[800/800] % reduces from main values, no from current.
```

The `\typosize` and `\typoscale` macros initialize the font family by `\rm`. You can re-size only the current font by the command `\thefontsize[⟨font-size⟩]` or the font can be rescaled by `\thefontscale[⟨factor⟩]`. These macros don't change math fonts sizes nor baselineskip.

There is “low level” `\setfontsize{⟨size-spec⟩}` command which behaves like a font modifier and sets given font size used by next variant selectors. It doesn't change the font size immediately, but the following variant selector does it. For example `\setfontsize{at15pt}\currvar` sets current variant to 15pt.

If you are using a font family with “optical sizes feature” (i. e. there are more recommended sizes of the same font which are not scaled linearly; a good example is Computer Modern aka Latin Modern fonts) then the recommended size is selected by all mentioned commands automatically.

More information about resizing of fonts is documented in the section [2.12](#).

### 1.3.3 Typesetting math

See the additional document [Typesetting Math with OpTeX](#) for more details about this issue.

OpTeX preloads a collection of 7bit Computer Modern math fonts and AMS fonts in its format for math typesetting. You can use them in any size and in the `\boldmath` variant. Most declared text font families (see `\fontfam` in the section [1.3.1](#)) are configured with a recommended Unicode math font. This font is automatically loaded unless you specify `\noloadmath` before first `\fontfam` command. See log file for more information about loading text font family and Unicode math fonts. If you prefer another Unicode math font, specify it by `\loadmath{⟨font-file⟩}` or `\loadmath{⟨font-name⟩}` before first `\fontfam` command.

Hundreds math symbols and operators like in AMSTeX are accessible. For example `\alpha`, `\geq`, `\sum`, `\sphericalangle`, `\bumpeq`, `\approx`. See AMSTeX manual or [Typesetting Math with OpTeX](#) for complete list of math symbols.

The following math alphabets are available:

<code>\mit</code>	% mathematical variables	<i>abc–xyz, ABC–XYZ</i>
<code>\it</code>	% text italics	<i>abc–xyz, ABC–XYZ</i>
<code>\rm</code>	% text roman	<i>abc–xyz, ABC–XYZ</i>
<code>\cal</code>	% normal calligraphics	<i>A<math>\mathcal{B}</math>C–X<math>\mathcal{Y}</math>Z</i>
<code>\script</code>	% script	<i>A<math>\mathcal{B}</math>C–X<math>\mathcal{Y}</math>Z</i>
<code>\frak</code>	% fracture	<i>a<math>\mathfrak{bc}</math>–x<math>\mathfrak{yz}</math>, A<math>\mathfrak{BC}</math>–X<math>\mathfrak{YZ}</math></i>
<code>\bbchar</code>	% double stroked letters	<i>A<math>\mathbb{C}</math>–X<math>\mathbb{Y}</math>Z</i>
<code>\bf</code>	% sans serif bold	<b><i>abc–xyz, ABC–XYZ</i></b>
<code>\bi</code>	% sans serif bold slanted	<b><i>abc–xyz, ABC–XYZ</i></b>

The last two selectors `\bf` and `\bi` select the sans serif fonts in math regardless of the current text font family. This is a common notation for vectors and matrices. You can re-declare them, see section [2.16.2](#) where definitions of Unicode math variants of `\bf` and `\bi` selectors are documented.

The math fonts can be scaled by `\typosize` and `\typoscale` macros. Two math fonts collections are prepared: `\normalmath` for normal weight and `\boldmath` for bold. The first one is set by default, the second one is usable for math formulae in titles typeset in bold, for example.

You can use `\mathbox{<text>}` inside math mode. It behaves as `{\hbox{<text>}}` (i.e. the `<text>` is printed in horizontal non-math mode) but the size of the `<text>` is adapted to the context of math size (text or script or scriptscript).

## 1.4 Typical elements of the document

### 1.4.1 Chapters and sections

The documents can be divided into chapters (`\chap`), sections (`\sec`), subsections (`\secc`) and they can be titled by `\tit` command. The parameters are separated by the end of current line (no braces are used):

```
\tit Document title <end of line>
\chap Chapter title <end of line>
\sec Section title <end of line>
\secc Subsection title <end of line>
```

The chapters are automatically numbered by one number, sections by two numbers (chapter.section), and subsections by three numbers. If there are no chapters then sections have only one number and subsections two.

The implicit design of the titles of chapter etc. is implemented in the macros `\_printchap`, `\_printsec` and `\_printsecc`. A designer can simply change these macros if he/she needs another behavior.

The first paragraph after the title of chapter, section, and subsection is not indented but you can type `\let\firstnoindent=\relax` if you need all paragraphs indented.

If a title is so long then it breaks into more lines in the output. It is better to hint at the breakpoints because TeX does not interpret the meaning of the title. Users can put the `\nl` (means newline) to the breakpoints.

If you want to arrange a title to more lines in your source file then you can use `^J` at the end of each line (except the last one). When `^J` is used, then the reading of the title continues at the next line. The “normal” comment character `%` doesn’t work in titles. You can use `\nl^J` if you want to have corresponding lines in the source and the output.

The chapter, section, or subsection isn’t numbered if the `\nonum` precedes. And the chapter, section, or subsection isn’t delivered to the table of contents if `\notoc` precedes. You can combine both prefixes.

### 1.4.2 Another numbered objects

Apart from chapters, sections, and subsections, there are another automatically numbered objects: equations, captions for tables and figures. The user can declare more numbered objects.

If the user writes the `\eqmark` as the last element of the display mode then this equation is numbered. The equation number is printed in brackets. This number is reset in each section by default.

If the `\eqalignno` is used, then user can put `\eqmark` to the last column before `\cr`. For example:

```
\eqalignno{
  a^2+b^2 &= c^2 \cr
  c &= \sqrt{a^2+b^2} & \eqmark \cr}
```

Another automatically numbered object is a caption which is tagged by `\caption/t` for tables and `\caption/f` for figures. The caption text follows. The `\cskip` can be used between `\caption` text and the real object (table or figure). You can use two orders: `<caption>\cskip <object>` or `<object>\cskip <caption>`. The `\cskip` creates appropriate vertical space between them. Example:

```

\caption/t The dependency of the computer-dependency on the age.
\cskip
\noindent\hfil\table{rl}{
    age & value \crl\noalign{\smallskip}
  0--1 & unmeasured \cr
  1--6 & observable \cr
  6--12 & significant \cr
  12--20 & extremal \cr
  20--40 & normal \cr
  40--60 & various \cr
  60--$\infty$ & moderate}

```

This example produces:

**Table 1.4.1** The dependency of the computer-dependency on the age.

age	value
0--1	unmeasured
1--6	observable
6--12	significant
12--20	extremal
20--40	normal
40--60	various
60--\$\infty\$	moderate

You can see that the word “Table” followed by a number is added by the macro `\caption/t`. The caption text is centered. If it occupies more lines then the last line is centered.

The macro `\caption/f` behaves like `\caption/t` but it is intended for figure captions with independent numbering. The word (Table, Figure) depends on the selected language (see section 1.7.1 about languages).

If you wish to make the table or figure as a floating object, you need to use Plain T<sub>E</sub>X macros `\midinsert` or `\topinsert` terminated by `\endinsert`. Example:

```

\topinsert % table and its caption printed at the top of the current page
<caption and table>
\endinsert

```

The pair `\midinsert... \endinsert` prefers to put the enclosed object to the current place. Only if this is unable due to page breaking, it behaves like `\topinsert... \endinsert`.

There are five prepared counters A, B, C, D and E. They are reset in each chapter and section<sup>3</sup>. They can be used in context of `\numberedpar {letter}{text}` macro. For example:

```

\def\theorem {\numberedpar A{Theorem}}
\def\corollary {\numberedpar A{Corollary}}
\def\definition {\numberedpar B{Definition}}
\def\example {\numberedpar C{Example}}

```

Three independent numbers are used in this example. One for Theorems and Corollaries second for Definitions and third for Examples. The user can write `\theorem Let $M$ be...` and the new paragraph is started with the text: **Theorem 1.4.1.** Let  $M$  be... You can add an optional parameter in brackets. For example, `\theorem [(L'Hôpital's rule)] Let $f$, $g$ be...` is printed like **Theorem 1.4.2 (L'Hôpital's rule).** Let  $f, g$  be...

---

<sup>3</sup> This feature can be changed, see the section 2.26 in the technical documentation.

### 1.4.3 References

Each automatically numbered object documented in sections 1.4.1 and 1.4.2 can be referenced if optional parameter [*label*] is appended to `\chap`, `\sec`, `\secc`, `\caption/t`, `\caption/f` or `\eqmark`. The alternative syntax is to use `\label[label]` before mentioned commands (not necessarily directly before). The reference is realized by `\ref[label]` or `\pgref[label]`. Example:

```
\sec[beatle] About Beatles

\noindent\hfil\table{rl}{...} % the table
\cskip
\caption/t [comp-depend] The dependency of the comp-dependency on the age.

\label[pythagoras]
$$ a^2 + b^2 = c^2 \eqmark $$
```

Now we can point to the section~`\ref[beatle]` on the page~`\pgref[beatle]` or write something about the equation~`\ref[pythagoras]`. Finally there is an interesting Table~`\ref[comp-depend]`.

If there are forward referenced objects then users have to run `TEX` twice. During each pass, the working `*.ref` file (with references data) is created and this file is used (if it exists) at the beginning of the document.

You can use the `\label[label]` before the `\theorem`, `\definition` etc. (macros defined with `\numberedpar`) if you want to reference these numbered objects. You can't use `\theorem[label]` because the optional parameter is reserved to another purpose here.

You can create a reference to whatever else by commands `\label[label]\wlabel{text}`. The connection between *label* and *text* is established. The `\ref[label]` will print *text*.

By default, labels are not printed, of course. But if you are preparing a draft version of your document then you can declare `\showlabels`. The labels are printed at their destination places after such a declaration.

### 1.4.4 Hyperlinks, outlines

If the command `\hyperlinks` *color-in* *color-out* is used at the beginning of the document, then the following objects are hyperlinked in the PDF output:

- numbers and texts generated by `\ref` or `\pgref`,
- numbers of chapters, sections, subsections, and page numbers in the table of contents,
- numbers or marks generated by `\cite` command (bibliography references),
- texts printed by `\url` or `\ulink` commands.

The last object is an external link and it is colored by *color-out*. Other links are internal and they are colored by *color-in*. Example:

```
\hyperlinks \Blue \Green % internal links blue, URLs green.
```

You can use another marking of active links: by frames which are visible in the PDF viewer but invisible when the document is printed. The way to do it is to define the macros `\_pgborder`, `\_tocborder`, `\_citeborder`, `\_refborder` and `\_urlborder` as the triple of RGB components of the used color. Example:

```
\def\_tocborder {1 0 0} % links in table of contents: red frame
\def\_pgborder {0 1 0}   % links to pages: green frame
\def\_citeborder {0 0 1} % links to references: blue frame
```

By default, these macros are not defined. It means that no frames are created.

The hyperlinked footnotes can be activated by `\fnotelinks <color-fnt> <color-fnf>` where footnote marks in the text have `<color-fnt>` and the same footnote marks in footnotes have `<color-fnf>`. You can define relevant borders `\_fntborder` and `\_fnfborder` analogically as `\_pgborder` (for example).

There are “low level” commands to create the links. You can specify the destination of the internal link by `\dest[<type>:<label>]`. The active text linked to the `\dest` can be created by `\ilink[<type>:<label>]{<text>}`. The `<type>` parameter is one of the `toc`, `pg`, `cite`, `ref`, or another special for your purpose. These commands create internal links only when `\hyperlinks` is declared.

The `\url` macro prints its parameter in `\tt` font and creates a potential breakpoints in it (after slash or dot, for example). If the `\hyperlinks` declaration is used then the parameter of `\url` is treated as an external URL link. An example: `\url{http://www.olsak.net}` creates `http://www.olsak.net`. The characters %, \, #, {, and } have to be protected by backslash in the `\url` argument, the other special characters ~, ^, & can be written as single character<sup>4</sup>. You can insert the `\|` command in the `\url` argument as a potential breakpoint.

If the linked text have to be different than the URL, you can use `\ulink[<url>]{<text>}` macro. For example: `\ulink[http://petr.olsak.net/optex]{\OpTeX/ page}` outputs to the text `OpTeX page`. The characters %, \, #, {, and } must be escaped in the `<url>` parameter.

The PDF format provides *outlines* which are notes placed in the special frame of the PDF viewer. These notes can be managed as a structured and hyperlinked table of contents of the document. The command `\outlines{<level>}` creates such outlines from data used for the table of contents in the document. The `<level>` parameter gives the level of opened sub-outlines in the default view. The deeper levels can be opened by mouse click on the triangle symbol after that.

If you are using a special unprotected macro in section titles then `\outlines` macro may crash. You must declare a variant of the macro for outlines case which is expandable. Use `\regmacro` in this case. See the section 1.5.1 for more information about `\regmacro`.

The command `\insertoutline{<text>}` inserts a next entry into PDF outlines at the main level 0. These entries can be placed before the table of contents (created by `\outlines`) or after it. Their hyperlink destination is in the place where the `\insertoutline` macro is used.

The command `\thisoutline{<text>}` uses `<text>` in the outline instead of default title text for the first following `\chap`, `\sec`, or `\secc`. Special case: `\thisoutline{\relax}` doesn’t create any outline for the following `\chap`, `\sec`, or `\secc`.

#### 1.4.5 Lists

The list of items is surrounded by `\begitems` and `\enditems` commands. The asterisk (\*) is active within this environment and it starts one item. The item style can be chosen by the `\style` parameter written after `\begitems`:

```
\style o % small bullet
\style O % big bullet (default)
\style - % hyphen char
\style n % numbered items 1., 2., 3., ...
\style N % numbered items 1), 2), 3), ...
\style i % numbered items (i), (ii), (iii), ...
\style I % numbered items I, II, III, IV, ...
\style a % items of type a), b), c), ...
\style A % items of type A), B), C), ...
\style x % small rectangle
\style X % big rectangle
```

---

<sup>4</sup> More exactly, there are the same rules as for `\code` command, see section 1.4.7.

For example:

```
\begitems
* First idea
* Second idea in subitems:
  \begitems \style i
    * First sub-idea
    * Second sub-idea
    * Last sub-idea
  \enditems
* Finito
\enditems
```

produces:

- First idea
- Second idea in subitems:
  - (i) First sub-idea
  - (ii) Second sub-idea
  - (iii) Last sub-idea
- Finito

Another style can be defined by the command `\sdef{_item:<style>}{<text>}`. Default item can be set by `\defaultitem={<text>}`. The list environments can be nested. Each new level of items is indented by next multiple of `\indent` value which is set to `\parindent` by default. The `\ilevel` register says what level of items is currently processed. Each `\begitems` starts `\everylist` tokens register. You can set, for example:

```
\everylist={\ifcase\ilevel\or \style X \or \style x \else \style - \fi}
```

You can say `\begitems \novspaces` if you don't want vertical spaces above and below the list. The nested item list is without vertical spaces automatically. More information about the design of lists of items should be found in the section [2.27](#).

A “selected block of text” can be surrounded by `\begblock... \endblock`. The default design of blocks of text is indented text in smaller font. The blocks of text can be nested.

#### 1.4.6 Tables

The macro `\table{<declaration>}{<data>}` provides similar `<declaration>` of tables as in L<sup>A</sup>T<sub>E</sub>X: you can use letters `l`, `r`, `c`, each letter declares one column (aligned to left, right, center, respectively). These letters can be combined by the `|` character (vertical line). Example

```
\table{||lc|r||}{\crl
  Month & commodity & price \crl i \tskip2pt
  January & notebook & \$ 700 \cr
  February & skateboard & \$ 100 \cr
  July & yacht & k\$ 170 \crl}
```

generates the result:

Month	commodity	price
January	notebook	\$ 700
February	skateboard	\$ 100
July	yacht	k\$ 170

Apart from `l`, `r`, `c` declarators, you can use the `p{<size>}` declarator which declares the column with paragraphs of given width. More precisely, a long text in the table cell is printed as a multiline paragraph with given width. By default, the paragraph is left-right justified. But there are alternatives:

- `p{<size>\fL}` fit left, i.e. left justified, ragged right,
- `p{<size>\fR}` fit right, i.e. right justified, ragged left,
- `p{<size>\fC}` fit center, i.e. ragged left plus right,
- `p{<size>\fS}` fit special, short one-line paragraph centered, long paragraph normal,
- `p{<size>\fX}` fit extra, left-right justified but last line centered.

You can use `(<text>)` in the `<declaration>`. Then this text is applied in each line of the table. For example `r(\kern10pt)1` adds more 10 pt space between `r` and `1` rows.

An arbitrary part of the `<declaration>` can be repeated by a `<number>` prefixed. For example `3c` means `ccc` or `c 3{|c}` means `c|c|c|c`. Note that spaces in the `<declaration>` are ignored and you can use them in order to more legibility.

The command `\cr` used in the `<data>` part of the table is generally known from Plain TeX. It marks the end of each row in the table. Moreover OpTeX defines following similar commands:

- `\crl` ... the end of the row with a horizontal line after it.
- `\crl1` ... the end of the row with a double horizontal line after it.
- `\crl1i` ... like `\crl` but the horizontal line doesn't intersect the vertical double lines.
- `\crl1ii` ... like `\crl1i` but horizontal line is doubled.
- `\crlp{<list>}` ... like `\crl1i` but the lines are drawn only in the columns mentioned in comma-separated `<list>` of their numbers. The `<list>` can include `<from>-<to>` declarators, for example `\crlp{1-3,5}` is equal to `\crlp{1,2,3,5}`.

The `\tskip{dimen}` command works like the `\noalign{\vskip{dimen}}` immediately after `\cr*` commands but it doesn't interrupt the vertical lines.

You can use the following parameters for the `\table` macro. Default values are listed too.

```
\everytable={}           % code used in \vbox before table processing
\thistable={}          % code used in \vbox, it is removed after using it
\tabiteml={\enspace}    % left material in each column
\tabitemr={\enspace}    % right material in each column
\tabstrut={\strut}     % strut which declares lines distance in the table
\tablinespace=2pt       % additional vert. space before/after horizontal lines
\vvkern=1pt            % space between lines in double vertical line
\hhkern=1pt            % space between lines in double horizontal line
\tabskip=0pt           % space between columns
\tabskipl=0pt \tabskipr=0pt % space before first and after last column
```

Example: if you do `\tabiteml={\$ \enspace } \tabitemr={ \enspace \$ }` then the `\table` acts like LATEX's array environment.

If there is an item that spans to more than one column in the table then the macro `\multispan{<number>}` (from Plain TeX) can help you. Another alternative is the command `\mspan{<number>} [<declaration>] {<text>}` which spans `<number>` columns and formats the `<text>` by the `<declaration>`. The `<declaration>` must include a declaration of only one column with the same syntax as common `\table <declaration>`. If your table includes vertical rules and you want to create continuous vertical rules by `\mspan`, then use rule declarators `|` after `c`, `l` or `r` letter in `\mspan <declaration>`. The exception is only in the case when `\mspan` includes the first column and the table have rules on the left side. The example of `\mspan` usage is below.

The `\frame{<text>}` makes a frame around `<text>`. You can put the whole `\table` into `\frame` if you need double-ruled border of the table. Example:

```
\frame{\table{|c||l||r|}{ \crl
\mspan3[|c|]{\bf Title} \crl \noalign{\kern\hhkern}\crl
first & second & third \crl1i
seven & eight & nine \crl1}}}
```

creates the following result:

Title		
first	second	third
seven	eight	nine

The `\vspan{number}{text}` shifts the `{text}` down in order it looks like to be in the center of the `{number}` lines (current line is first). You can use this for creating tables like in the following example:

```
\thistable{\tabstrut={\vrule height 20pt depth10pt width0pt}
          \baselineskip=20pt \tablinespace=0pt \rulewidth=.8pt}
\table{|8{c|}}{\crlp{3-8}}
  \mspan2[c|]{\vspan2{0}{\mspan3[c|]{Singular} & \mspan3[c|]{Plural} \crlp{3-8}}}
  \mspan2[c|]{\vspan2{1}{\mspan3[c|]{Neuter} & \mspan3[c|]{Masculine} & \mspan3[c|]{Feminine} & \mspan3[c|]{Masculine} & \mspan3[c|]{Feminine} & \mspan3[c|]{Neuter} \crlp{2,6-8}}}
  \vspan2{I}{\vspan2{2}{\mspan3[c|]{Inclusive} & \mspan3[c|]{Exclusive} \crlp{2,6-8}}}
  \vspan2{II}{\vspan2{3}{\mspan3[c|]{Informal} & \mspan3[c|]{Formal} \crlp{2-8}}}
  \vspan2{III}{\vspan2{4}{\mspan6[c|]{X} \crlp{2,4-7}}}
  \vspan2{IV}{\vspan2{5}{\mspan3[c|]{X} & \vspan2{0}{X & X} \crlp{2-8}}}
  \vspan2{V}{\vspan2{6}{\mspan3[c|]{X} & \vspan2{0}{X & X} \crlp{2,4-7}}}
  \vspan2{VI}{\vspan2{7}{\mspan3[c|]{X} & \vspan2{0}{X & X} \crlp{2-8}}}
}
```

You can use `\vspan` with non-integer parameter too if you feel that the result looks better, for example `\vspan{2.1}{text}`.

The rule width of tables and implicit width of all `\vrules` and `\hrules` can be set by the command `\rulewidth=<dimen>`. The default value given by TeX is 0.4 pt.

The `c`, `l`, `r` and `p` are default “declaration letters” but you can define more such letters by `\def\_tabdeclare{letter}{<left>##<right>}`. More about it is in technical documentation in section 2.30.5. See the definition of the `\_tabdeclarec` macro, for example.

The `:` columns boundary declarator is described in section 2.30.1. The tables with given width can be declared by `to<size>` or `pxto<size>`. More about it is in section 2.30.3. Many tips about tables can be seen on the site <http://petr.olsak.net/optex/optex-tricks.html>.

		Singular			Plural		
		Neuter	Masculine	Feminine	Masculine	Feminine	Neuter
I	Inclusive	o			x		
	Exclusive	o			x		
II	Informal	x			x		
	Formal	x			x		
III	Informal	o	x	x	x	x	o
	Formal		x				

#### 1.4.7 Verbatim

The display verbatim text have to be surrounded by the `\begtt` and `\endtt` couple. The in-line verbatim have to be tagged (before and after) by a character which is declared by `\verbchar{char}`. For example `\verbchar`` declares the character ` for in-line verbatim markup. And you can use ``\relax`` for verbatim `\relax` (for example). Another alternative of printing in-line verbatim text is `\code{<text>}` (see below).

If the numerical register `\ttline` is set to the non-negative value then display verbatim will number the lines. The first line has the number `\ttline+1` and when the verbatim ends then the `\ttline` value is equal to the number of the last line printed. Next `\begtt... \endtt` environment will follow the line numbering. OptTeX sets `\ttline=-1` by default.

The indentation of each line in display verbatim is controlled by `\ttindent` register. This register is set to the `\parindent` by default. Users can change the values of the `\parindent` and `\ttindent` independently.

The `\begtt` command starts the internal group in which the catcodes are changed. Then the `\everytt` tokens register is run. It is empty by default and the user can control fine behavior by

it. For example, the catcodes can be re-declared here. If you need to define an active character in the `\everytt`, use `\adef` as in the following example:

```
\everytt={\adef!{?}\adef?{!}}
\begtt
Each occurrence of the exclamation mark will be changed to
the question mark and vice versa. Really? You can try it!
\endtt
```

The `\adef` command sets its parameter as active *after* the parameter of `\everytt` is read. So you don't have to worry about active categories in this parameter.

There is an alternative to `\everytt` named `\everyintt` which is used for in-line verbatim surrounded by an `\verbchar` or processed by the `\code` command.

The `\everytt` is applied to all `\begtt... \endtt` environments (if it is not declared in a group). There are tips for such global `\everytt` definitions here:

```
\everytt={\typosize[9/11]} % setting font size for verbatim
\everytt={\ttline=0}         % each listing will be numbered from one
\everytt={\visiblesp}        % visualization of spaces
```

If you want to apply a special code only for one `\begtt... \endtt` environment then don't set any `\everytt` but put desired material at the same line where `\begtt` is. For example:

```
\begtt  \adef!{?}\adef?{!
Each occurrence of ? will be changed to ! and vice versa.
\endtt
```

The in-line verbatim surrounded by a `\verbchar` doesn't work in parameter of macros and macro definitions. (It works in titles declared by `\chap`, `\sec` etc. and in `\fnotes`, because these macros are specially defined in `OpTeX`). You can use more robust command `\code{\langle text\rangle}` in problematic situations, but you have to escape the following characters in the `\langle text\rangle`: `\`, `#`, `%`, braces (if the braces are unmatched in the `\langle text\rangle`), and space or `^` (if there are more than one subsequent spaces or `^` in the `\langle text\rangle`). Examples:

```
\code{\text, \%#} ... prints \text, %
\code{@{..}*^$ $} ... prints @{..}*^$ $ without escaping, but you can
                  escape these characters too, if you want.
\code{a \ b}      ... two spaces between a b, the second must be escaped
\code{xy\{z}       ... xy{z ... unbalanced brace must be escaped
\code{^^\M}        ... prints ^^\M, the second ^ must be escaped
```

You can print verbatim listing from external files by the `\verbinput` command. Examples:

```
\verbinput (12-42) program.c % listing from program.c, only lines 12-42
\verbinput (-60) program.c  % print from begin to the line 60
\verbinput (61-) program.c % from line 61 to the end
\verbinput (-) program.c   % whole file is printed
\verbinput (70+10) program.c % from line 70, only 10 lines printed
\verbinput (+10) program.c  % from the last line read, print 10 lines
\verbinput (-5+7) program.c % from the last line read, skip 5, print 7
\verbinput (+) program.c    % from the last line read to the end
```

You can insert additional commands for `\verbinput` before the first opening bracket. They are processed in the local group. For example, `\verbinput \hsize=20cm (-) program.c`.

The `\ttline` influences the line numbering by the same way as in `\begtt... \endtt` environment. If `\ttline=-1` then real line numbers are printed (this is the default). If `\ttline<-1` then no line numbers are printed.

The `\verbinput` can be controlled by `\everytt`, `\ttindent` just like in `\begtt... \endtt`.

The `\begtt... \endtt` pair or `\verbinput` can be used for listings of codes. Automatic syntax highlighting is possible, for example `\begtt \hisyntax{C}` activates colors for C programs. Or `\verbinput \hisyntax{HTML} (-) file.html` can be used for HTML or XML codes. OpTeX implements C, Python, TeX, HTML and XML syntax highlighting. More languages can be declared, see the section [2.28.2](#).

If the code is read by `\verbinput` and there are comment lines prefixed by two characters then you can set them by `\commentchars<first><second>`. Such comments are fully interpreted by TeX (i.e. not verbatim). Section [2.28.1](#) (page 133) says more about this feature.

## 1.5 Autogenerated lists

### 1.5.1 Table of contents

The `\maketoc` command prints the table of contents of all `\chap`, `\sec` and `\secc` used in the document. These data are read from the external `*.ref` file, so you have to run TeX more than once (typically three times if the table of contents is at the beginning of the document).

Typically, we don't want to repeat the name of the section "Table of contents" in the table of contents again. The direct usage of `\chap` or `\sec` isn't recommended here because the table of contents is typically not referenced to itself. You can print the unnumbered and unreferenced title of the section like this:

```
\nonum\notoc\sec Table of Contents
```

If you need a customization of the design of the TOC, read the section [2.24](#).

If you are using a special macro in section or chapter titles and you need different behavior of such macro in other cases then use `\regmacro{<case-toc>} {<case-mark>} {<case-outline>}`. The parameters are applied locally in given cases. The `\regmacro` can be used repeatedly: then its parameters are accumulated (for more macros). If a parameter is empty then original definition is used in given case. For example:

```
% default value of \mylogo macro used in text and in the titles:  
\def\mylogof{\leavevmode\hbox{{\Red\it My}\setfontsize{mag1.5}\rm Lo}Go}  
% another variants:  
\regmacro {\def\mylogof{\hbox{\Red My\Black LoGo}}} % used in TOC  
           {\def\mylogof{\hbox{{\it My}\rm LoGo}}}      % used in running heads  
           {\def\mylogof{MyLoGo}}                      % used in PDF outlines
```

### 1.5.2 Making the index

The index can be included in the document by the `\makeindex` macro. No external program is needed, the alphabetical sorting is done inside TeX at macro level.

The `\ii` command (insert to index) declares the word separated by the space as the index item. This declaration is represented as an invisible item on the page connected to the next visible word. The page number of the page where this item occurs is listed in the index entry. So you can type:

```
The \ii resistor resistor is a passive electrical component ...
```

You cannot double the word if you use the `\iid` instead of `\ii`:

```
The \iid resistor is a passive electrical component ...
```

or:

```
Now we'll deal with the \iid resistor .
```

Note that the dot or comma has to be separated by space when `\iid` is used. This space (before dot or comma) is removed by the macro in the current text.

The multiple-words entries are commonly arranged in the index as follows:

```
linear dependency 11, 40–50
— independency 12, 42–53
— space 57, 76
— subspace 58
```

To do this you have to declare the parts of the index entries by the / separator. Example:

```
{\bf Definition.}
\ii linear/space,vector/space
{\em Linear space} (or {\em vector space}) is a nonempty set of...
```

The number of the parts of one index entry (separated by /) is unlimited. Note, that you can spare your typing by the comma in the `\ii` parameter. The previous example is equivalent to `\ii linear/space \ii vector/space`.

Maybe you need to propagate to the index the similar entry to the linear/space in the form of space/linear. You can do this by the shorthand ,@ at the end of the `\ii` parameter. Example:

```
\ii linear/space,vector/space,@
is equivalent to:
\ii linear/space,vector/space \ii space/linear,space/vector
```

If you really need to insert the space into the index entry, write ~.

The `\ii` or `\iid` commands can be preceded by `\iitype <letter>`, then such reference (or more references generated by one `\ii`) has the specified type. The page numbers of such references should be formatted specially in the index. OpTeX implements only `\iitype b`, `\iitype i` and `\iitype u`: the page number in bold or in italics or underlined is printed in the index when these types are used. The default index type is empty, which prints page numbers in normal font. The TeXbook index is a good example.

The `\makeindex` creates the list of alphabetically sorted index entries without the title of the section and without creating more columns. OpTeX provides other macros `\begmulti` and `\endmulti` for more columns:

```
\begmulti <number of columns>
<text>
\endmulti
```

The columns will be balanced. The Index can be printed by the following code:

```
\sec Index
\begmulti 3 \makeindex \endmulti
```

Only “pure words” can be propagated to the index by the `\ii` command. It means that there cannot be any macro, TeX primitive, math selector, etc. But there is another possibility to create such a complex index entry. Use “pure equivalent” in the `\ii` parameter and map this equivalent to a real word that is printed in the index. Such mapping is done by `\iis` command. Example:

```
The \ii chiquadrat ${\chi^2}$-quadrat method is ...
If the \ii relax `relax` command is used then \TeX/ is relaxing.
...
\iis chiquadrat ${\chi^2}$-quadrat
\iis relax {\code{\relax}}
```

The `\iis <equivalent> {<text>}` creates one entry in the “dictionary of the exceptions”. The sorting is done by the `<equivalent>` but the `<text>` is printed in the index entry list.

The sorting rules when `\makeindex` runs depends on the current language. See section 1.7.1 about languages selection.

### 1.5.3 BibTEXing

The command `\cite[⟨label⟩]` (or `\cite[⟨label-1⟩,⟨label-2⟩,...,⟨label-n⟩]`) creates the citation in the form [42] (or [15, 19, 26]). If `\shortcitations` is declared at the beginning of the document then continuous sequences of numbers are re-printed like this: [3–5, 7, 9–11]. If `\sortcitations` is declared then numbers generated by one `\cite` command are sorted upward.

If `\nonumcitations` is declared then the marks instead of numbers are generated depending on the used bib-style. For example, the citations look like [Now08] or [Nowak, 2008].

The `\rcite[⟨labels⟩]` creates the same list as `\cite[⟨labels⟩]` but without the outer brackets. Example: [`\rcite[tbn]`, pg.~13] creates [4, pg. 13].

The `\ecite[⟨label⟩]{⟨text⟩}` prints the `⟨text⟩` only, but the entry labeled `⟨label⟩` is decided as to be cited. If `\hyperlinks` is used then `⟨text⟩` is linked to the references list.

You can define alternative formating of `\cite` command. Example:

```
\def\cite[#1]{(\rcite[#1])}      % \cite[⟨label⟩] creates (27)
\def\cite[#1]{$^{\text{#1}}$} % \cite[⟨label⟩] creates ^{27}
```

The numbers printed by `\cite` correspond to the same numbers generated in the list of references. There are two possibilities to generate this references list:

- Manually using `\bib[⟨label⟩]` commands.
- By `\usebib//⟨type⟩ ⟨style⟩ ⟨bib-base⟩` command which reads `*.bib` files directly.

Note that another two possibilities documented in OPmac (using external BibTEX program) isn't supported because BibTEX is an old program that does not support Unicode. And Biber seems to be not compliant with Plain T<sub>E</sub>X.

#### References created manually using `\bib[⟨label⟩]` command.

```
\bib [tbn] P. Olšák. {\it \TeX{}book naruby.} 468~s. Brno: Konvoj, 1997.
\bib [tst] P. Olšák. {\it Typografický systém \TeX.}
           269~s. Praha: CSTUG, 1995.
```

If you are using `\nonumcitations` then you need to declare the `⟨marks⟩` used by `\cite` command. To do it you must use long form of the `\bib` command in the format `\bib[⟨label⟩] = {⟨mark⟩}`. The spaces around equal sign are mandatory. Example:

```
\bib [tbn] = {Olšák, 2001}
P. Olšák. {\it \TeX{}book naruby.} 468~s. Brno: Konvoj, 2001.
```

**Direct reading of .bib files** is possible by `\usebib` macro. This macro reads and uses macro package `librarian.tex` by Paul Isambert. The usage is:

```
\usebib/c ⟨style⟩ ⟨bib-base⟩ % sorted by \cite-order (c=cite),
\usebib/s ⟨style⟩ ⟨bib-base⟩ % sorted by style (s=style).
% example:
\nocite[*] \usebib/s (simple) op-biblist % prints all from op-biblist.bib
```

The `⟨bib-base⟩` is one or more `*.bib` database source files (separated by spaces and without extension) and the `⟨style⟩` is the part of the filename `bib-⟨style⟩.opm` where the formatting of the references list is defined. OpT<sub>E</sub>X supports `simple` or `iso690` styles. The features of the `iso690` style is documented in the section 2.32.5 in detail. The `\usebib` command is more documented in section 2.32.2.

Not all records are printed from `⟨bib-base⟩` files: the command `\usebib` selects only such bib-records which were used in `\cite` or `\nocite` commands in your document. The `\nocite` behaves as `\cite` but prints nothing. It tells only that the mentioned bib-record should be printed in the reference list. If `\nocite[*]` is used then all records from `⟨bib-base⟩` are printed.

You can create more independent lists of references (you are creating proceedings, for example). Use `\bibpart {<name>}` to set the scope where `\cites` and references list are printed (and interconnected) independent of another parts of your document. The `\cite` labels used in different parts can be the same and they are not affected. References lists can be created manually by `\bib` or from a database by `\usebib`. Example:

```
\bibpart {AA}
... \cite[labelX] ... \cite[labelY] ... % They belong to AA bib-list
\usebib/c (simple) file.bib           % generates AA bib-list numbered 1, 2, ...
                                         % \cite prints [1], [2], ... by bib-list AA
\bibpart {BB}
... \cite[labelZ] ... \cite[labelX] ... % They belong to BB bib-list
\bibnum=0 \usebib/c (simple) my.bib   % generates BB bib-list numbered 1, 2, ...
                                         % \cite prints [1], [2], ... by bib-list BB
```

By default, `\bibpart` is empty. So `\cites` and the references list are connected using this empty internal name.

## 1.6 Graphics

### 1.6.1 Colors

OpTeX provides a small number of color selectors: `\Blue`, `\Red`, `\Brown`, `\Green`, `\Yellow`, `\Cyan`, `\Magenta`, `\White`, `\Grey`, `\LightGrey` and `\Black`. More such selectors can be defined by setting four CMYK components (using `\setcmykcolor`), or three RGB components (using `\setrgbcolor`) or one grey component (using `\setgreycolor`). For example

```
\def \Orange {\setcmykcolor{0 0.5 1 0}}
\def \Purple {\setrgbcolor{1 0 1}}
\def \DarkGrey {\setgreycolor{.1}}
```

The command `\morecolors` reads more definitions of color selectors from the L<sup>A</sup>T<sub>E</sub>X file `x11nam.def`. There are about 300 color names like `\DeepPink`, `\Chocolate` etc. If there are numbered variants of the same name, then the letters B, C, etc. are appended to the name in OpTeX. For example `\Chocolate` is Chocolate1, `\ChocolateB` is Chocolate2 etc.

The color selectors work locally in groups by default. See the technical documentation, section 2.20 for more information.

The basic colors `\Blue`, `\Red`, `\Cyan`, `\Yellow` etc. are defined with CMYK components using `\setcmykcolor`. On the other hand, you can define a color with three RGB components and `\morecolors` defines such RGB colors. By default, the color model isn't converted but only stored to PDF output for each used color. Thus, there may be a mix of color models in the PDF output which is not a good idea. You can overcome this problem by declaration `\onlyrgb` or `\onlycmyk`. Then only the selected color model is used for PDF output and if a used color is declared by another color model then it is converted. The `\onlyrgb` creates colors more bright (usable for computer presentations). On the other hand, CMYK makes colors more true<sup>5</sup> for printing.

You can define your color by a linear combination of previously defined colors using `\colordef`. For example:

```
\colordef \myCyan {.3\Green + .5\Blue} % 30 % green, 50 % blue, 20% white
\colordef \DarkBlue {\Blue + .4\Black} % Blue mixed with 40 % of black
\colordef \myGreen{\Cyan+\Yellow}      % exact the same as \Green
\colordef \MyColor {.3\Orange+.5\Green+.2\Yellow}
```

---

<sup>5</sup> Printed output is more equal to the monitor preview especially if you are using ICC profile for your printer.

The linear combination is done in CMYK subtractive color space by default (RGB colors used in `\colordef` argument are converted first). If the resulting component is greater than 1 then it is truncated to 1. If a convex linear combination (as in the last example above) is used then it emulates color behavior on a painter's palette. You can use `\rgbcOLORDEF` instead of `\colordef` if you want to mix colors in the additive RGB color space. If `\onlyrgb` is set then `\colordef` works like `\rgbcOLORDEF`.

The following example defines the macro for **colored text on colored background**. Usage:  
`\coloron{background}{foreground}{text}`

The `\coloron` macro can be defined as follows:

```
\def\coloron#1#2#3{%
  \setbox0=\hbox{#2#3}%
  \leavevmode \rlap{\#1\strut \vrule width\wd0}\box0
}
\coloron{Yellow}{Brown}{Brown text on yellow background}
```

### 1.6.2 Images

The `\inspic {filename}.{extension}` or `\inspic {filename}.{extension}{space}` inserts the picture stored in the graphics file with the name `{filename}.{extension}` to the document. You can set the picture width by `\picw={dimen}` before `\inspic` command which declares the width of the picture. The image files can be in the PNG, JPG, JBIG2 or PDF format.

The `\picwidth` is an equivalent register to `\picw`. Moreover, there is an `\picheight` register which denotes the height of the picture. If both registers are set then the picture will be (probably) deformed.

The image files are searched in `\picdir`. This token list is empty by default, this means that the image files are searched in the current directory. Example: `\picdir={img/}` supposes that image files are in `img` subdirectory. Note: the directory name must end by `/` in the `\picdir` declaration.

Inkscape<sup>6</sup> is able to save a picture to PDF and labels of the picture to another file<sup>7</sup>. This second file should be read by T<sub>E</sub>Xto print labels in the same font as document font. OpT<sub>E</sub>X supports this feature by `\linkinspic {filename}.pdf` command. It reads and displays both: PDF image and labels generated by Inkscape.

If you want to create vector graphics (diagrams, schema, geometry skicing) then you can do it by Wysiwyg graphics editor (Inkscape, Geogebra for example), export the result to PDF and include it by `\inspic`. If you want to “program” such pictures then Tikz package is recommended. It works in Plain T<sub>E</sub>X and OpT<sub>E</sub>X.

### 1.6.3 PDF transformations

All typesetting elements are transformed by linear transformation given by the current transformation matrix. The `\pdfsetmatrix {\langle a \rangle \langle b \rangle \langle c \rangle \langle d \rangle}` command makes the internal multiplication with the current matrix so linear transformations can be composed. One linear transformation given by the `\pdfsetmatrix` above transforms the vector  $[0, 1]$  to  $[\langle a \rangle, \langle b \rangle]$  and  $[1, 0]$  to  $[\langle c \rangle, \langle d \rangle]$ . The stack-oriented commands `\pdfsave` and `\pdfrestore` gives a possibility of storing and restoring the current transformation matrix and the position of the current point. This position has to be the same from T<sub>E</sub>X's point of view as from the transformation point of view when `\pdfrestore` is processed. Due to this fact the `\pdfsave\rlap{\langle transformed text \rangle}\pdfrestore` or something similar is recommended.

OpT<sub>E</sub>X provides two special transformation macros `\pdfscale` and `\pdfrotate`:

---

<sup>6</sup> A powerful and free Wysiwyg editor for creating vector graphics.

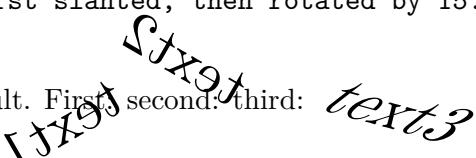

<sup>7</sup> Chose “Omit text in PDF and create LaTe<sub>X</sub> file” option.

```
\pdfscale{<horizontal-factor>}{<vertical-factor>}
\pdfrotate{<angle-in-degrees>}
```

These macros simply call the properly `\pdfsetmatrix` command.

It is known that the composition of transformations is not commutative. It means that the order is important. You have to read the transformation matrices from right to left. Example:

```
First: \pdfsave \pdfrotate{30}\pdfscale{-2}{2}\rlap{text1}\pdfrestore
      % text1 is scaled two times and it is reflected about vertical axis
      % and next it is rotated by 30 degrees left.
second: \pdfsave \pdfscale{-2}{2}\pdfrotate{30}\rlap{text2}\pdfrestore
      % text2 is rotated by 30 degrees left then it is scaled two times
      % and reflected about vertical axis.
third: \pdfsave \pdfrotate{-15.3}\pdfsetmatrix{2 0 1.5 2}\rlap{text3}%
      \pdfrestore % first slanted, then rotated by 15.3 degrees right
```

This gives the following result. First, second, third: 

You can see that TeX knows nothing about dimensions of transformed material, it treats it as with a zero dimension object. The `\transformbox{<transformation>}{<text>}` macro solves the problem. This macro puts the transformed material into a box with relevant dimensions. The `<transfromation>` parameter includes one or more transformation commands `\pdfsetmatrix`, `\pdfscale`, `\pdfrotate` with their parameters. The `<text>` is transformed text.

Example: `\frame{\transformbox{\pdfscale{1}{1.5}\pdfrotate{-10}}{m0j}}` creates .

The `\rotbox{<deg>}{<text>}` is shortcut for `\transformbox{\pdfrotate{<deg>}}{<text>}`.

#### 1.6.4 Ovals, circles

The `\inoval{<text>}` creates a box like this:  Multiline text can be put in an oval by the command `\inoval{\vbox{<text>}}`. Local settings can be set by `\inoval[<settings>]{<text>}` or you can re-declare global settings by `\ovalparams=<settings>`. The default settings are:

```
\ovalparams={\roundness=2pt          % diameter of circles in the corners
            \fcolor=\Yellow       % color used for filling oval
            \lcolor=\Red          % line color used in the border
            \lwidth=0.5bp         % line width in the border
            \shadow=N             % use a shadow effect
            \overlapmargins=N    % ignore margins by surrounding text
            \hhkern=0pt \vvkern=0pt} % left-righ margin, top-bottom margin
```

The total distance from text to oval boundary is `\hhkern+\roundness` at the left and right sides and `\vvkern+\roundness` at the top and bottom sides of the text.

If you need to set a parameters for the `<text>` (color, size, font etc.), put such setting right in front of the `<text>`: `\inoval{<text settings>}{<text>}`.

The `\incircle[\ratio=1.8]{<text>}` creates a box like this . The `\ratio` parameter means width/height. The usage is analogical like for oval. The default parameters are

```
\circleparams={\ratio=1 \fcolor=\Yellow \lcolor=\Red \lwidth=0.5bp
              \shadow=N \ignoremargins=N \hhkern=2pt \vvkern=2pt}
```

The macros `\clipinoval <x> <y> <width> <height> {<text>}` and `\clipincircle` (with the same parameters) print the `<text>` when a clipping path (oval or cirle with given `<with>`) and

$\langle height \rangle$  shifted its center by  $\langle x \rangle$  to right and by  $\langle y \rangle$  to up) is used. The `\roundness=5mm` is default for `\clipinoval` and user can change it. Example:

```
\clipincircle 3cm 3.5cm 6cm 7cm {\picw=6cm \inspic{myphoto.jpg}}
```

### 1.6.5 Putting images and texts wherever

The `\puttext`  $\langle x \rangle$   $\langle y \rangle$   $\{\langle text \rangle\}$  puts the  $\langle text \rangle$  shifted by  $\langle x \rangle$  right and by  $\langle y \rangle$  up from the current point of typesetting and does not change the position of the current point. Assume a coordinate system with origin in the current point. Then `\puttext`  $\langle x \rangle$   $\langle y \rangle$   $\{\langle text \rangle\}$  puts the text at the coordinates  $\langle x \rangle$ ,  $\langle y \rangle$ . More exactly the left edge of its baseline is at that position.

The `\putpic`  $\langle x \rangle$   $\langle y \rangle$   $\langle width \rangle$   $\langle height \rangle$   $\{\langle image-file \rangle\}$  puts an image given by  $\langle image-file \rangle$  (including extension) of given  $\langle width \rangle$  and  $\langle height \rangle$  at given position (its left-bottom corner). You can write `\nospec` instead  $\langle width \rangle$  or  $\langle height \rangle$  if this parameter is not specified.

## 1.7 Others

### 1.7.1 Using more languages

OpTeX prepares hyphenation patterns for all languages if such patterns are available in your TeX system. Only USenglish patterns (original from Plain TeX) are preloaded. Hyphenation patterns of all other languages are loaded on demand when you first use the `\langle iso-code \rangle lang` command in your document. For example `\delang` for German, `\cslang` for Czech, `\pllang` for Polish. The  $\langle iso-code \rangle$  is a shortcut of the language (mostly from ISO 639-1). You can list all available languages by `\langlist` macro. This macro prints now:

```
en(USenglish) enus(USenglishmax) engb(UKenglish) it(Italian) ia(Interlingua) id(Indonesian) cs(Czech) sk(Slovak)
de(nGerman) fr(French) pl(Polish) cy(Welsh) da(Danish) es(Spanish) sl(Slovenian) fi(Finnish) hu(Hungarian) tr(Turkish)
et(Estonian) eu(Basque) ga(Irish) nb(Bokmal) nn(Nynorsk) nl(Dutch) pt(Portuguese) ro(Romanian) hr(Croatian)
zh(Pinyin) is(Icelandic) hsb(Uppersorbian) af(Afrikaans) gl(Galician) kmr(Kurmanji) tk(Turkmen) la(Latin) lac(classicLatin)
lal(liturgicalLatin) elm(monoGreek) elp(Greek) grc(ancientGreek) ca(Catalan) cop(Coptic) mn(Mongolian)
sa(Sanskrit) ru(Russian) uk(Ukrainian) hy(Armenian) as(Assamese) hi(Hindi) kn(Kannada) lv(Latvian) lt(Lithuanian)
ml(Malayalam) mr(Marathi) or(Oriya) pa(Punjabi) ta(Tamil) te(Telugu) be(Belarusian) bg(Bulgarian) bn(Bengali)
cu(churchslavonic) deo(oldGerman) gsw(swissGerman) eo(Esperanto) fur(Friulan) gu(Gujarati) ka(Georgian)
mk(Macedonian) oc(Occitan) pi(Pali) pms(Piedmontese) rm(Romansh) sr(Serbian) sv(Swedish) th(Thai) ethi(Ethiopic)
fis(schoolFinnish)
```

For compatibility with e-plain macros, there is the command `\uselanguage{\langle language \rangle}`. The parameter  $\langle language \rangle$  is long-form of language name, i.e. `\uselanguage{Czech}` works the same as `\cslang`. The `\uselanguage` parameter is case insensitive.

For compatibility with Cgplain, there are macros `\ehyph`, `\chyp`, `\shyp` which are equivalent to `\enlang`, `\cslang` and `\sklang`.

You can switch between language patterns by `\langle iso-code \rangle lang` commands mentioned above. Default is `\enlang`.

OpTeX generates three phrases used for captions and titles in technical articles or books: “Chapter”, “Table” and “Figure”. These phrases need to be known in used language and it depends on the previously used language selectors `\langle iso-code \rangle lang`. OpTeX declares these words only for few languages: Czech, German, Spanish, French, Greek, Italian, Polish, Russian, Slovak and English, If you need to use these words in other languages or you want to auto-generate more words in your macros, then you can declare it by `\sdef` or `\_langw` commands as shown in section 2.37.3.

The `\makeindex` command needs to know the sorting rules used in your language. OpTeX defines only a few language rules for sorting: Czech, Slovak and English. How to declare sorting rules for more languages are described in the section 2.33.

If you declare `\langle iso-code \rangle quotes`, then the control sequences `\"` and `\'` should be used like this: `\"(quoted text)"` or `\'(quoted text)'` (note that the terminating character is the same

but it isn't escaped). This prints language-dependent normal or alternative quotes around *quoted text*. The language is specified by *iso-code*. OpTeX declares quotes only for Czech, German, Spanish, French, Greek, Italian, Polish, Russian, Slovak and English (`\csquotes`, `\dequotes`, ..., `\enquotes`). You can simply define your own quotes as shown in section 2.37.3. The `\"` is used for quotes visually more similar to the `"` character which can be primary quotes or secondary quotes depending on the language rules. Maybe you want to alternate the meaning of these two types of quotes. Use `\isocode\quotes\altquotes` in such case.

### 1.7.2 Pre-defined styles

OpTeX defines three style-declaration macros `\report`, `\letter` and `\slides`. You can use them at the beginning of your document if you are preparing these types of documents and you don't need to create your own macros.

The `\report` declaration is intended to create reports. It sets default font size to 11 pt and `\parindent` (paragraph indentation) to 1.2 em. The `\tit` macro uses smaller font because we assume that "chapter level" will be not used in reports. The first page has no page number, but the next pages are numbered (from number 2). Footnotes are numbered from one in the whole document. The macro `\author{authors}` can be used when `\report` is declared. It prints *authors* in italics at the center of the line. You can separate authors by `\nl` to more lines.

The `\letter` declaration is intended to create letters. See the files `op-letter-*.tex` for examples. The `\letter` style sets default font size to 11 pt and `\parindent` to 0 pt. It sets half-line space between paragraphs. The page numbers are not printed. The `\subject` macro can be used, it prints the word "Subject:" or "Věc" (or something else depending on current language) in bold. Moreover, the `\address` macro can be used when `\letter` is declared. The usage of the `\address` macro looks like:

```
\address
  <first line of address>
  <second line of address>
  <etc.>
  <empty line>
```

It means that you need not use any special mark at the end of lines: the ends of lines in the source file are the same as in printed output. The `\address` macro creates `\vtop` with address lines. The width of such `\vtop` is equal to the widest line used in it. So, you can use `\hfill\address...` to put the address box to the right side of the document. Or you can use `<prefixed text>\address...` to put *prefixed text* before the first line of the address.

The `\slides` style creates a simple presentation slides. See an example in the file `op-slides.tex`. Run `optex op-slides.tex` and see the documentation of `\slides` style in the file `op-slides.pdf`.

Analogical declaration macro `\book` is not prepared. Each book needs individual typographical care. You need to create specific macros for design.

### 1.7.3 Loading other macro packages

You can load more macro packages by `\input{<file-name>}` or by `\load[<file-names>]`. The first case (`\input`) is TeX primitive command, it can be used in the alternative old syntax `\input <filename><space>` too. The second case (`\load`) allows specifying a comma-separated list of included files. Moreover, it loads each macro file only once, it sets temporarily standard category codes during loading and it tries to load `<filename>.opm` or `<filename>.tex` or `<filename>`, the first occurrence wins. Example:

```
\load [qrcode, scanbase]
```

does `\input qrcode.opm` and `\input scanbase.tex`. It saves local information about the fact that these file names (`qrcode`, `scanbase`) were loaded, i.e. next `\load` will skip them.

It is strongly recommended to use the `\load` macro for loading external macros if you need them. On the other hand, if your source document is structured to more files (with individual chapters or sections), use simply the `\input` primitive.

The macro packages intended to OpTeX have the name `*.opm`. The following packages are distributed as part of OpTeX:

- `qrcode.opm` enables to create QR codes.
- `tikz.opm` does `\input tikz.tex`, i.e. loads TikZ. It adds OpTeX-specific code.
- `mte.opm` includes settings for microtypographic extensions (protrusions+expanding fonts).
- `vlna.opm` enables to protect of one-letter prepositions and more things automatically.
- `emoji.opm` defines `\emoji{\{name\}}` command for colored emoticons.
- `plain-at.opm` defines the old names from plain TeX.
- `pdfextra.opm` allows the use of many extra features from PDF standard (by M. Vlasák).

See these files in `optex/pkg/` or `optex/<pkgname>` for more information about them. The packages may have their documentation, try `texdoc <pkgname>`.

#### 1.7.4 Lorem ipsum dolor sit

A designer needs to concentrate on the design of the output and maybe he/she needs material for testing macros. There is the possibility to generate a neutral text for such experiments. Use `\lorem[<number>]` or `\lorem[<from>-<to>]`. It prints a paragraph (or paragraphs) with neutral text. The numbers `<number>` or `<from>`, `<to>` must be in the range 1 to 150 because there are 150 paragraphs with neutral text prepared for you. The `\lipsum` macro is equivalent to `\lorem`. Example: `\lipsum[1-150]` prints all prepared paragraphs.

#### 1.7.5 Logos

The control sequences for typical logos can be terminated by optional / which is ignored when printing. This makes logos more legible in the source file:

```
We are using \TeX/ because it is cool. \OpTeX/ is better than \LaTeX.
```

#### 1.7.6 The last page

The number of the last page (it may be different from the number of pages) is expanded by `\lastpage` macro. It expands to ? in first TeX run and to the last page in next TeX runs.

There is an example for footlines in the format “current page / last page”:

```
\footline={\hss \fixedrm \folio/\lastpage \hss}
```

The `\lastpage` expands to the last `\folio` which is a decimal number or Roman numeral (when `\pageno` is negative). If you need to know the total pages used in the document, use `\totalpages` macro. It expands to zero (in first TeX run) or to the number of all pages in the document (in next TeX runs).

#### 1.7.7 Use OpTeX

The command `\useOpTeX` (or `\useoptex`) does nothing in OpTeX but it causes an error (undefined control sequence) when another format is used. You can put it as the first command in your document:

```
\useOpTeX % we are using OpTeX format, no LaTeX :)
```

## 1.8 Summary

```
\tit Title (terminated by end of line)
\chap Chapter Title (terminated by end of line)
\sec Section Title (terminated by end of line)
\secc Subsection Title (terminated by end of line)

\maketoc      % table of contents generation
\ii item1,item2 % insertion the items to the index
\makeindex     % the index is generated

\label [labname] % link target location

\bib [labname] % an item in the list of references
\usebib/? (style) bib-base % direct using of .bib file, ? in {s,c}

\load [filenames]      % loading macro files
\fontfam [FamilyName] % selection of font family
\typosize [font-size/baselineskip] % size setting of typesetting
\typoscale [factor-font/factor-baselineskip] % size scaling
\thefontsize [size] \the fontsize [factor] % current font size

\inspic file.ext      % insert a picture, extensions: jpg, png, pdf
\table {rule}{data} % macro for the tables like in LaTeX

\fnote {text} % footnote (local numbering on each page)
\mnote {text} % note in the margin (left or right by page number)

\hyperlinks {color-in}{color-out} % PDF links activate as clickable
\outlines {level} % PDF will have a table of contents in the left tab

\magscale[factor] % resize typesetting, line/page breaking unchanged
\margins/pg format (left, right, top, bottom)unit % margins setting

\report \letter \slides % style declaration macros
```

## 1.9 API for macro writers

All TeX primitives and almost all O<sub>p</sub>T<sub>e</sub>X macros are accessible by two names: `\foo` (public or user name space) and `\_foo` (private name space). For example `\hbox` and `\_hbox` means the same TeX primitive. More about it is documented in section 2.2.

If this manual refers `\foo` then `\_foo` equivalent exists too. For example, we mention the `\addto` macro below. The `\_addto` equivalent exists too, but it is not explicitly mentioned here. If we refer only `\_foo` then its public equivalent does not exist. For example, we mention the `\_codedecl` macro below, so this macro is not available as `\codedecl`.

If you are writing a document or macros specific for the document, then use simply user namespace (`\foo`). If you are writing more general macros, then use private namespace (`\_foo`), but you should declare your own namespace by `\_namespace` macro and you have to follow the naming discipline described in section 2.2.4.

The alphabetically sorted list of macros typically usable for macro writers follows. More information about such macros can be found in the technical documentation. You can use hyperlinks here in order to go to the appropriate place of the technical documentation.

`\addto \macro{\langle text\rangle}` adds `\langle text\rangle` at the end of `\macro` body.  
`\adef \char{\langle body\rangle}` defines `\char` active character with meaning `\langle body\rangle`.  
`\afterfi {\langle text\rangle}{\langle ignored\rangle}\fi` expands to `\fi\langle text\rangle`.  
`\bp {\langle dimen expression\rangle}` expands TeX dimension to decimal number in `\bp` without unit.  
`\_codedecl \sequence {\langle info\rangle}` is used at beginning of macro files.  
`\colordef \macro {\langle mix of colors\rangle}` declares `\macro` as color switch.  
`\cs {\langle string\rangle}` expands `\langle string\rangle`.  
`\_doc ... \cod` encloses documentation text in the macro code.  
`\eoldef \macro #1{\langle body\rangle}` defines `\macro` with parameter separated to end of line.  
`\_endcode` closes the part of macro code in macro files.  
`\_endnamespace` closes name space declared by `\_namespace`.  
`\eqbox [\label]{\langle text\rangle}` creates `\hbox{\langle text\rangle}` with common width across whole document.  
`\expr {\langle expression\rangle}` expands to result of the `\langle expression\rangle` with decimal numbers.  
`\fontdef \f {\langle font spec.\rangle}` declares `\f` as font switch.  
`\fontlet \fa=\fb {\langle sizespec.\rangle}` declares `\fa` as the same font switch like `\fb` at given `\langle sizespec.\rangle`.  
`\foreach \list\do {\parameters}{\what}` is expandable loop over `\list`.  
`\foreachdef \macro {\parameters}{\what}` declares expandable `\macro` as loop over `\list`.  
`\fornum \from..\to\do {\what}` is expandable loop with numeric variable.  
`\incr \counter` increases and `\decr \counter` decreases `\counter` by one globally.  
`\ignoreit \one`, `\ignoresecond \one\two` ignores given parameter.  
`\expandafter \ignorept \the\dimen` expands to decimal number `\dimen` without `\pt`.  
`\isempty, \istoksempy, \isequal, \ismacro, \isdefined, \isinlist \isfile, \isfont` do various tests. Example: `\isinlist\list{\text}``\iftrue` does `\iftrue` if `\text` is in `\list`.  
`\isnextchar \char{\text1}{\text2}` performs `\text1` if next character is `\char`, else `\text2`.  
`\kv {\key}` expands to value when key-value parameters are used.  
`\loop ... \repeat` is classical Plain TeX loop.  
`\mathstyles {\math list}` enables to create macros dependent on current math style.  
`\_namespace {\pkg}` declares name space used by package writers.  
`\newcount, \newdimen` etc. are classical Plain TeX allocators.  
`\newif \iffoo` declares boolean `\iffoo` as in Plain TeX.  
`\_newifi \_iffoo` declares boolean `\_iffoo`.  
`\opinput {\filename}` reads file like `\input` but with standard catcodes.  
`\optdef \macro [{\opt-default}]\parameters{\body}` defines `\macro` with [opt.parameter].  
`\opwarning {\text}` prints `\text` to the terminal and .log file as warning.  
`\private \sequence \sequence ... ;` declares `\sequence`s for private name space.  
`\public \sequence \sequence ... ;` declares `\sequence`s for public name space.  
`\readkv \macro` reads parameters from `\macro` in key-value format.  
`\replstring \macro{\stringA}{\stringB}` replaces all `\stringA` to `\stringB` in `\macro`.  
`\sdef {\string}{\parameters}{\body}` behaves like `\def\string{\parameters}{\body}`.  
`\setctable` and `\restoretctable` manipulate with stack of catcode tables.

```

\slset {\langle stringA\rangle}{\langle stringB\rangle} behaves like \let\langle stringA\rangle=\langle stringB\rangle
\sxdef {\langle string\rangle}{parameters}{\langle body\rangle} behaves like \xdef\langle string\rangle{parameters}{\langle body\rangle}.
\trycs {\langle string\rangle}{\langle text\rangle} expands \langle string\rangle if it is defined else expands \langle text\rangle.
\useit {one}, \usesec {one}{two} uses given parameter.
\wlog {\langle text\rangle} writes \langle text\rangle to .log file.
\wterm {\langle text\rangle} writes \langle text\rangle to the terminal and .log file.
\xargs {what} {\langle token\rangle} {\langle token\rangle} ... ; repeats \langle what\rangle{\langle token\rangle} for each \langle token\rangle.

```

## 1.10 Compatibility with Plain T<sub>E</sub>X

All macros of Plain T<sub>E</sub>X are re-written in OpT<sub>E</sub>X. Common macros should work in the same sense as in original Plain T<sub>E</sub>X. Internal control sequences like \p@ or \f@t are removed and mostly replaced by control sequences prefixed by \_ (like \\_this). If you need to use the basic set of old Plain T<sub>E</sub>X control sequences like \p@ (for example you are reading an old macro file), use \load[plain-at].

All primitives and common macros have two control sequences with the same meaning: in prefixed and unprefixed form. For example \hbox is equal to \\_hbox. Internal macros of OpT<sub>E</sub>X have and use only prefixed form. User should use unprefixed forms, but prefixed forms are accessible too because the \_ is set as a letter category code globally (in macro files and users document too). User should re-define unprefixed forms of control sequences without worries that something internal will be broken (only the sequence \par cannot be re-defined without change of internal T<sub>E</sub>X behavior because it is hard-coded in T<sub>E</sub>X, unfortunately).

The Latin Modern 8bit fonts instead Computer Modern 7bit fonts are preloaded in the format, but only a few ones. The full family set is ready to use after the command \fontfam[LMfonts] which reads the fonts in OTF format.

Plain T<sub>E</sub>X defines \newcount, \bye etc. as \outer macros. OpT<sub>E</sub>X doesn't set any macro as \outer. Macros like \TeX, \rm are defined as \protected.

The text accents macros \", \', \v, \u, \=, \^, \., \H, \~, \` are undefined<sup>8</sup> in OpT<sub>E</sub>X. Use real letters like á, ř, ž in your source document instead of these old accents macros. If you really want to use them, you can initialize them by the \oldaccents command. But we don't recommend it.

The default paper size is not set as the letter with 1in margins but as A4 with 2.5 cm margins. You can change it, for example by \margins/1 letter (1,1,1,1)in. This example sets the classical Plain T<sub>E</sub>X page layout.

The origin for the typographical area is not at the top left 1in 1in coordinates but at the top left paper corner exactly. For example, \hoffset includes directly left margin.

The tabbing macros \settabs and \+ (from Plain T<sub>E</sub>X) are not defined in OpT<sub>E</sub>X because they are obsolete. But you can use the [OpT<sub>E</sub>X trick 0021](#) if you really need such feature.

The \sec macro is reserved for sections but original Plain T<sub>E</sub>X declares this control sequence for math secant<sup>9</sup>.

---

<sup>8</sup> The math accents macros like \acute, \bar, \dot, \hat still work.

<sup>9</sup> Use \\$\secant(x)\\$ to get  $\sec(x)$ .

# Chapter 2

## Technical documentation

This documentation is written in the source files `*.opm` between the `\_doc` and `\_cod` pairs or after the `\_endcode` command. When the format is generated by

```
luatex -ini optex.ini
```

then the text of the documentation is ignored and the format `optex.fmt` is generated. On the other hand, if you run

```
optex optex-doc.tex
```

then the same `*.opm` files are read when the second chapter of this documentation is printed.

A knowledge about  $\text{\TeX}$  is expected from the reader. You can see a short document [TeX in a Nutshell](#) or more detail [TeX by topic](#).

Notices about hyperlinks. If a control sequence is printed in red color in this documentation then this denotes its “main documentation point”. Typically, the listing where the control sequence is declared follows immediately. If a control sequence is printed in the blue color in the listing or in the text then it is an active link that points (usually) to the main documentation point. The main documentation point can be an active link that points to a previous text where the control sequence was mentioned. Such occurrences are active links to the main documentation point.

### 2.1 The main initialization file

The `optex.ini` file is read as the main file when the format is generated.

```
optex.ini  
1 %% This is part of the OpTeX project, see http://petr.olsak.net/optex  
2  
3 %% OpTeX ini file  
4 %% Petr Olsak <project started from: Jan. 2020>
```

Category codes are set first. Note that the `_` is set to category code “letter”, it can be used as a part of control sequence names. Other category codes are set as in plain  $\text{\TeX}$ .

```
optex.ini  
6 % Catcodes:  
7  
8 \catcode `\\{=1 % left brace is begin-group character  
9 \catcode `\\}=2 % right brace is end-group character  
10 \catcode `\\$=3 % dollar sign is math shift  
11 \catcode `\\&=4 % ampersand is alignment tab  
12 \catcode `\\#=6 % hash mark is macro parameter character  
13 \catcode `\\^=7 %  
14 \catcode `\\^K=7 % circumflex and uparrow are for superscripts  
15 \catcode `\\^A=8 % downarrow is for subscripts  
16 \catcode `\\^I=10 % ascii tab is a blank space  
17 \catcode `\\_=11 % underline can be used in control sequences  
18 \catcode `\\~=13 % tilde is active  
19 \catcode `\\^a0=13 % non breaking space in Unicode  
20 \catcode 127=12 % normal character
```

The `\optexversion` and `\fmtname` are defined.

```
optex.ini  
22 % OpTeX version  
23  
24 \def\optexversion{1.04 Aug.2021}  
25 \def\fmtname{OpTeX}  
26 \let\fmtversion=\optexversion
```

We check if  $\text{\LaTeX}$  engine is used at `-ini` state. And the `^J` character is set as `\newlinechar`.

```

28 % Engine testing:
29
30 \newlinechar=`^J
31 \ifx\directlua\undefined
32   \message{This format is based only on LuaTeX, use luatex -ini optex.ini`^J}
33   \endinput `fi
34
35 \ifx\bgroup\undefined \else
36   \message{This file can be used only for format initialisation, use luatex -ini`^J}
37   \endinput `fi

```

The basic macros for macro file syntax is defined, i.e. `\_endcode`, `\_doc` and `\_cod`. The `\_codedecl` will be re-defined later.

```

39 % Basic .opm syntax:
40
41 \let\_endcode =\endinput
42 \def \_codedecl #1#2{\message{#2`^J}}% information about .opm file
43 \long\def\_doc#1\_cod#2 {} % skip documentation

```

Individual \*.opm macro files are read.

```

45 % Initialization:
46
47 \message{OpTeX (Olsak's Plain TeX) initialization <\optexversion>`^J}
48
49 \input prefixed.opm      % prefixed primitives and code syntax
50 \input luatex-ini.opm    % LuaTeX initialization
51 \input basic-macros.opm % basic macros
52 \input alloc.opm         % allocators for registers
53 \input if-macros.opm     % special \if-macros, \is-macros and loops
54 \input parameters.opm    % parameters setting
55 \input more-macros.opm   % OpTeX useful macros (todo: doc)
56 \input keyval.opm        % key=value dictionaries
57 \input plain-macros.opm  % plainTeX macros
58 \input fonts-preload.opm % preloaded Latin Modern fonts
59 \input fonts-resize.opm  % font resizing (low-level macros)
60 \input fonts-select.opm  % font selection system
61 \input math-preload.opm  % math fams CM + AMS preloaded
62 \input math-macros.opm   % basic macros for math plus mathchardefs
63 \input math-unicode.opm   % macros for loading UnicodeMath fonts
64 \input fonts-opmac.opm   % font managing macros from OPmac
65 \input output.opm        % output routine
66 \input margins.opm       % macros for margins setting
67 \input colors.opm         % colors
68 \input ref-file.opm      % ref file
69 \input references.opm    % references
70 \input hyperlinks.opm    % hyperlinks
71 \input maketoc.opm       % maketoc
72 \input outlines.opm      % PDF outlines
73 \input pdfuni-string.opm % PDFUnicode strings for outlines
74 \input sections.opm       % titles, chapters, sections
75 \input lists.opm          % lists, \begitems, \enditems
76 \input verbatim.opm       % verbatim
77 \input hi-syntax.opm     % syntax highlighting of verbatim listings
78 \input graphics.opm       % graphics
79 \input table.opm          % table macro
80 \input multicolumns.opm  % more columns by \begmulti ... \endmulti
81 \input cite-bib.opm       % Bibliography, \cite
82 \input makeindex.opm      % Make index and sorting
83 \input fnotes.opm          % \fnotes, \mnnotes
84 \input styles.opm          % styles \report, \letter
85 \input logos.opm          % standard logos
86 \input uni-lcuc.opm       % Setting lccodes and uccodes for Unicode characters

88 \input languages.opm       % languages
89 \input others.opm          % miscellaneous

```

The file `optex.lua` is embedded into the format as byte-code. It is documented in section [2.39](#).

```

91 \_directlua{
92     % preload OpTeX's Lua code into format as bytecode
93     lua.bytecode[1] = assert(loadfile(kpse.find_file("optex", "lua")))
94 }

```

optex.ini

```

96 \_everyjob = {%
97     \_message{This is OpTeX (Olsak's Plain TeX), version <\optexversion>^^J}%
98     \_directlua{lua.bytecode[1]()% load OpTeX's Lua code
99     \_mathsbon % replaces \int_a^b to \int _a^b
100    \_inputref % inputs \jobname.ref if exists
101 }
102
103 \dump % You can redefine \dump if additional macros are needed. Example:
104     % \let\dump=\relax \input optex.ini \input mymacros \_dump

```

optex.ini

## 2.2 Concept of namespaces of control sequences

### 2.2.1 Prefixing internal control sequences

All control sequences used in OpTeX are used and defined with `_` prefix. The user can be sure that when he/she does `\def\foo` then neither internal macros of OpTeX nor TeX primitives will be damaged. For example `\def\if{...}` will not damage macros because OpTeX's macros are using `\_if` instead of `\if`.

All TeX primitives are initialized with two representative control sequences: `\word` and `\_word`, for example `\hbox` and `\_hbox`. The first alternative is reserved for users or such control sequences can be re-defined by a user.

OpTeX sets the character `_` as letter, so it can be used in control sequences. When a control sequence begins with this character then it means that it is a primitive or it is used in OpTeX macros as internal. User can redefine such prefixed control sequence only if he/she explicitly knows what happens.

We never change catcode of `_`, so internal macros can be redefined by user without problems if it is desired. We don't need something like `\makeatletter` from LATEX.

OpTeX defines all new macros as prefixed. For public usage of such macros, we need to set their non-prefixed versions. This is done by

```
\public <list of control sequences> ;
```

For example `\public \foo \bar` ; does `\let\foo=\_foo, \let\bar=\_bar`.

At the end of each code segment in OpTeX, the `\_public` macro is used. You can see which macros are defined for public usage in that code segment.

The macro `\private` does the reverse job of `\public` with the same syntax. For example `\private \foo \bar` ; does `\let\_foo=\foo, \let\_bar=\bar`. This should be used when an unprefix variant of a control sequence is declared already but we need the prefixed variant too.

In this documentation: if both variants of a control sequence are declared (prefixed and unprefixed), then the accompanying text mentions only the unprefixed variant. The code typically defines the prefixed variant and then the `\public` (or `\_public`) macro is used.

### 2.2.2 Namespace of control sequences for users

Users can define or declare any control sequence with a name without any `_`. This does not make any problem. Only one exception is the reserved control sequence `\par`. It is generated by the tokenizer (at empty lines) and used as internal in TeX.

User can define or declare control sequences with `_` character, for example `\my_control_sequence`, but with the following exceptions:

- Control sequences which begin with `_` are reserved for TeX primitives, OpTeX internal macros and packages internal macros.
- Multiletter control sequences in the form `\<word>_` or `\<word>_<one-letter>`, where `<word>` is a sequence of letters, are inaccessible, because they are interpreted as `\<word>` followed by `_` or as `\<word>` followed by `_<one-letter>`. This is important for writing math, for example:

```

\int_a^b ... is interpreted as \int _a^b
\max_M ... is interpreted as \max _M
\alpha_{ij} ... is interpreted as \alpha _{ij}

```

This feature is implemented using Lua code at input processor level, see the section 2.15 for more details. You can deactivate this feature by `\mathsboff`. After this, you can still write `$f_a^b$` (Unicode) or `\int_a^b` without problems but `\int_a^b` yields to undefined control sequence `\int_a`. You can activate this feature again by `\mathsbon`. The effect will take shape from next line read from input file.

- Control sequences in the form `\_<pkg>\_<word>` is intended for package writers as internal macros for a package with `<pkg>` identifier, see section 2.2.4.

The single-letter control sequences like `\%`, `\$`, `\^` etc. are not used in internal macros. Users can redefine them, but (of course) some classical features can be lost (printing percent character by `\%` for example).

### 2.2.3 Macro files syntax

Each segment of OpTeX macros is stored in one file with `.opm` extension (means OPtex Macros). Your local macros should be in a normal `*.tex` file.

The code in macro files starts by `\_codedecl` and ends by `\_endcode`. The `\_endcode` is equivalent for `\endinput`, so documentation can follow. The `\_codedecl` has syntax:

```
\_codedecl \sequence {Name <version>}
```

If the mentioned `\sequence` is defined, then `\_codedecl` does the same as `\endinput`: this protects from reading the file twice. We suppose, that `\sequence` is defined in the macro file.

It is possible to use the `\_doc ... \cod` pair between the macro lines. The documentation text should be here. It is ignored when macros are read but it can be printed using `doc.opm` macros like in this documentation.

### 2.2.4 Name spaces for package writers

Package writer should use internal names in the form `\_<pkg>\_<sequence>`, where `<pkg>` is a package label. For example: `\_qr_utfstring` from `qrcode.opm` package.

The package writer does not need to write repeatedly `\_pkg_foo \_pkg_bar` etc. again and again in the macro file.<sup>1</sup> When the `\_namespace {<pkg>}` is declared at the beginning of the macro file then all occurrences of `\.foo` will be replaced by `\_<pkg>\_foo` at the input processor level. The macro writer can write (and backward can read his/her code) simply with `\.foo`, `\.bar` control sequences and `\_<pkg>\_foo`, `\_<pkg>\_bar` control sequences are processed internally. The scope of the `\_namespace` command ends at the `\_endnamespace` command or when another `\_namespace` is used. This command checks if the same package label is not declared by the `\_namespace` twice.

The `\_nspublic` macro does `\let\foo = \_<pkg>\_foo` when `\_namespace{<pkg>}` is declared. Moreover, it prints a warning if `\foo` is defined already. The `\_nsprivate` macro does reverse operation to it without warnings. Example: you can define `\def\macro{...}` and then set it to the user name space by `\_nspublic \macro;`.

Don't load other packages (which are using their own namespace) inside your namespace. Do load them before your `\_namespace {<pkg>}` is initialized. Or close your namespace by `\_endnamespace` and open it again (after other packages are loaded) by `\_resetnamespace {<pkg>}`.

If the package writer needs to declare a control sequence by `\newif`, then there is an exception of the rule described above. Use `\_newifi\_if<pkg>\_bar`, for example `\_newifi\_ifqr\_incorner`. Then the control sequences `\_qr_incornertrue` and `\_qr_incornerfalse` can be used (or the sequences `\.incornertrue` and `\.incornerfalse` when `\_namespace{qr}` is used).

### 2.2.5 Summary about rules for external macro files published for OpTeX

If you are writing a macro file that is intended to be published for OpTeX, then you are greatly welcome. You should follow these rules:

- Don't use control sequences from the user namespace in the macro bodies if there is no explicit and documented reason to do this.
- Don't declare control sequences in the user namespace if there are no explicit and documented reasons to do this.

---

<sup>1</sup> We have not adopted the idea from expl3 language:

- Use control sequences from OptEX and primitive namespace in read-only mode, if there is not an explicit and documented reason to redefine them.
- Use `\_<pkg>\_<name>` for your internal macros or `\.<name>` if the `\_namespace{<pkg>}` is declared. See section 2.2.4.
- Use `\load` (or better: `\_load`) for loading more external macros if you need them. Don't use `\_input` explicitly in such cases. The reason is: the external macro file is not loaded twice if another macro or the user needs it explicitly too.
- Use `\_codedecl` as your first command in the macro file and `\_endcode` to close the text of macros.
- Use `\_doc ... \cod` pairs for documenting the code pieces.
- You can write more documentation after the `\_endcode` command.
- The OptEX catcodes are set when `\load` your package (i.e. plain TeX catcodes plus catcode of `_` is 11). If a catcode is changed during loading your package then it is forgot because `\load` returns to catcodes used before loading package. If you want to offer a catcode changing for users then insert it to a macro which can be used after loading.

If the macro file accepts these recommendations then it should be named by `<filename>.opm` where `<filename>` differs from file names used directly in OptEX and from other published macros. This extension `.opm` has precedence before `.tex` when the `\load` macro is used.

The `qrcode.opm` is the first example of how an external macro file for OptEX can look like.

## 2.2.6 The implementation of the namespaces

```
prefixed.opm
3 \_codedecl \public {Prefixing and code syntax <2021-08-16>} % preloaded in format
```

All TeX primitives have alternative control sequence `\_hbox \_string`, ...

```
prefixed.opm
9 \let\_\directlua = \directlua
10 \_directlua {
11     % enable all TeX primitives with _ prefix
12     tex.enableprimitives('_', tex.extraprimitives('tex'))
13     % enable all primitives without prefixing
14     tex.enableprimitives('', tex.extraprimitives())
15     % enable all primitives with _ prefix
16     tex.enableprimitives('_', tex.extraprimitives())
17 }
```

`\ea` is useful shortcut for `\expandafter`. We recommend to use always the private form of `\_ea` because there is high probability that `\ea` will be redefined by the user.

`\public <sequence> <sequence> ... ;` does `\let \<sequence> = \_<sequence>` for all sequences.  
`\private <sequence> <sequence> ... ;` does `\let \_<sequence> = \<sequence>` for all sequences.  
`\_checkexists <where> <prefix><sequence>` prints error if the control sequence propagated to a new name space by `\public` etc. macros is not declared.

`\xargs <what> <sequence> <sequence> ... ;` does `<what>\<sequence>` for each sequences.

```
prefixed.opm
38 \_let\_\ea =\expandafter % usefull shortcut
39
40 \_long\_def \_xargs #1#2{\_ifx #2;\_else \_\ea#1\_\ea#2\_\ea\_\xargs \_\ea #1\_\fi}
41
42 \_def \_pkglabel{}
43 \_def \_public {\_xargs \_publicA}
44 \_def \_publicA #1{%
45     \_checkexists \public _#1%
46     \_\ea\_\let \_\ea#1\_\csname _\csstring #1\_\endcsname
47 }
48 \_def \_private {\_xargs \_privateA}
49 \_def \_privateA #1{%
50     \_checkexists \private {}#1%
51     \_\ea\_\let \_\csname _\csstring #1\_\endcsname =#1%
52 }
53 \_def \_checkexists #1#2#3{\_unless \_ifcsname #2\_\csstring#3\_\endcsname
54     \_\errmessage {\_string#1: \_bslash#2\_\csstring#3 must be declared}\_\fi
55 }
56 \_public \public \private \xargs \ea ;
```

Each macro file should begin with `\_codedecl \macro {<info>}`. If the `\macro` is defined already then the `\endinput` protects to read such file more than once. Else the `<info>` is printed to the terminal and the file is read.

The `\_endcode` is defined as `\endinput` in the `optex.ini` file. `\wterm {<text>}` prints the `<text>` to the terminal and to the `.log` file, `\wlog {<text>}` prints the `<text>` only to the `.log` file (as in plain TeX)

```
prefixed.opm
128 \_def \_codedecl #1#2{%
129   \_ifx #1\undefined \_wlog{#2}%
130   \_else \_ea \_endinput \_fi
131 }
132 \_def \_wterm {\_immediate \_write16 }
133 \_def \_wlog {\_immediate\_\_write-1 } % write on log file (only)
134
135 \_public \wterm \wlog ;
```

The `\optexversion` and `\fmtname` are defined in the `optex.ini` file. Maybe, somebody will need a private version of these macros.

```
prefixed.opm
136 \_private \optexversion \fmtname ;
```

The `\mathsb{on}` and `\mathsb{off}` are defined in `math-macros.opm` file. Now, we define the macros `\_namespace {<pkg label>}`, `\_resetnamespace {<pkg label>}`, `\_endnamespace`, `\_nspublic` and `\_nsprivate` for package writers, see section 2.2.4.

```
prefixed.opm
137 \_def \_pkglabel{%
138 \_def \_namespace #1{%
139   \_ifcsname namesp:#1\_\_endcsname \_errmessage
140     {The name space "#1" is used already, it cannot be used twice}%
141   \_endinput
142   \_else \_resetnamespace{#1}\_fi
143 }
144 \_def \_resetnamespace #1{%
145   \_ea \_gdef \_csname namesp:#1\_\_endcsname {}%
146   \_gdef \_pkglabel{_#1}%
147   \_directlua{
148     callback.add_to_callback("process_input_buffer",
149       function (str)
150         return string.gsub(str, "\_nbb[.]( [a-zA-Z])", "\_nbb _#1\_pcent 1")
151       end, "_namespace")
152   }%
153 }
154 \_def \_endnamespace {%
155   \_directlua{ callback.remove_from_callback("process_input_buffer", "_namespace") }%
156   \_gdef \_pkglabel{}%
157 }
158
159 \_def \_nspublic {\_xargs \_nspublicA}
160 \_def \_nspublicA #1{%
161   \_checkexists \_nspublic {\_pkglabel _#1}%
162   \_unless \_ifx #1\undefined
163     \_opwarning{\_ea\ignoreit\pkglabel\_space redefines the meaning of \_string#1}\_fi
164   \_ea\let \_ea#1\_\_csname \_pkglabel _\_\_csstring #1\_\_endcsname
165 }
166 \_def \_nsprivate {\_xargs \_nsprivateA}
167 \_def \_nsprivateA #1{%
168   \_checkexists \_nsprivate {}#1%
169   \_ea\let \_csname \_pkglabel _\_\_csstring #1\_\_endcsname =#1%
170 }
```

## 2.3 pdfTeX initialization

Common pdfTeX primitives equivalents are declared here. Initial values are set.

```
luatex-ini.opm
171 3 \_codedecl \pdfprimitive {LuaTeX initialization code <2020-02-21>} % preloaded in format
172 4
173 5 \_let \_pdfpagewidth \pagewidth
174 6 \_let \_pdfpageheight \pageheight
```

```

## 2.4 Basic macros

We define first bundle of basic macros.

```

basic-macros.opm
3 \codedecl \sdef {Basic macros for \OpTeX <2021-07-20>} % preloaded in format
\bgrou, \egrou, \empty, \space, and \null are classical macros from plain \TeX.
basic-macros.opm
10 \let\bgrou={ \let\egrou=
11 \def \empty {}
12 \def \space {}
13 \def \null {\hbox{}}
14 \public \bgrou \egrou \empty \space \null ;

```

`\ignoreit` ignores next token or `{<text>}`, `\useit{<text>}` expands to `<text>` (removes outer braces), `\ignoressecond` uses first, ignores second parameter and `\usesesecond` ignores first, uses second parameter.

basic-macros.opm

```
23 \_long\_def \_ignoreit #1{}
24 \_long\_def \_useit #1{#1}
25 \_long\_def \_ignoressecond #1#2{#1}
26 \_long\_def \_usesesecond #1#2{#2}
27 \_public \ignoreit \useit \ignoressecond \usesesecond ;
```

`\bslash` is “normal backslash” with category code 12. `\nbb` is double backslash and `\pcnt` is normal %.  
They can be used in Lua codes, for example.

basic-macros.opm

```
36 \_edef \_bslash {\_csstring\\}
37 \_edef \_nbb {\_bslash\_bslash}
38 \_edef \_pcnt{\_csstring\%}
39 \_public \bslash \nbb \pcnt ;
```

`\sdef {<text>}` is equivalent to `\def\<text>`, where `\<text>` is a control sequence. You can use arbitrary parameter mask after `\sdef{<text>}`, don’t put the (unwanted) space immediately after closing brace }.  
`\sxdef {<text>}` is equivalent to `\xdef\<text>`.

`\slet {<textA>}{<textB>}` is equivalent to `\let \<textA> = \<textB>`.

basic-macros.opm

```
51 \_def \_sdef #1{\_ea\_def \_csname#1\_endcsname}
52 \_def \_sxdef #1{\_ea\_xdef \_csname#1\_endcsname}
53 \_def \_slet #1#2{\_ea\_let \_csname#1\_ea\_endcsname
54   \_ifcsname#2\_ea\_endcsname \_begin cname#2\_endcsname \_else \_undefined \_fi
55 }
56 \_public \sdef \sxdef \slet ;
```

`\adef {<char>}{<body>}` puts the `<char>` as active character and defines it as `{<body>}`. You can declare a macro with parameters too. For example `\adef @#1{...#1...}`.

basic-macros.opm

```
64 \_def \_adef #1{\_catcode`#1=13 \_begingroup \_lccode`~`#1\_lowercase{\_endgroup\_\def~}}
65 \_public \adef ;
```

`\cs {<text>}` is only a shortcut to `\csname <text>\endcsname`, but you need one more `\_ea` if you need to get the real control sequence `\<text>`.

`\trycs {<csname>}{<text>}` expands to `\<csname>` if it is defined else to the `<text>`.

basic-macros.opm

```
75 \_def \_cs #1{\_csname#1\_endcsname}
76 \_def \_trycs#1#2{\_ifcsname #1\_endcsname \_csname #1\_ea\_endcsname \_else #2\_fi}
77 \_public \cs \trycs ;
```

`\addto \macro{<text>}` adds `<text>` to your `\macro`, which must be defined.

basic-macros.opm

```
83 \_long\_def \_addto #1#2{\_ea\_def \_ea#1\_ea{#1#2}}
84 \_public \addto ;
```

`\incr{counter}` increases `<counter>` by one globally. `\decr{counter}` decreases `<counter>` by one globally.

basic-macros.opm

```
91 \_def \_incr #1{\_global\_advance#1by1 }
92 \_def \_decr #1{\_global\_advance#1by-1 }
93 \_public \incr \decr ;
```

`\opwarning {<text>}` prints warning on the terminal and to the log file.

basic-macros.opm

```
99 \_def \_opwarning #1{\_wterm{WARNING 1.\_the\_inputlineno: #1.}}
100 \_public \opwarning ;
```

`\loggingall` and `\tracingall` are defined similarly as in plain TeX, but they print more logging information to the log file and the terminal.

basic-macros.opm

```
108 \_def \_loggingall{\_tracingcommands=3 \_tracingstats=2 \_tracingpages=1
109   \_tracingoutput=1 \_tracinglostchars=1 \_tracingmacros=3
110   \_tracingparagraphs=1 \_tracingrestores=1 \_tracingscantokens=1
111   \_tracingifs=1 \_tracinggroups=1 \_tracingassigns=1 }
112 \_def \_tracingall{\_tracingonline=1 \_loggingall}
113 \_public \loggingall \tracingall ;
```

`\_byehook` is used in the `\bye` macro. Write a warning if the user did not load a Unicode Font. Write a “rerun” warning if the `.ref` file was newly created or it was changed (compared to the previous TeX run).

```
basic-macros.opm
122 \_def\byehook{%
123   \ifx\initunifonts\relax \relax\else \opwarning{Unicode font was not loaded}\fi
124   \immediate\closeout\reffile
125   \edef\_tmp{\mdfive{\jobname.ref}}%
126   \ifx\_\tmp\prevrefhash\else \opwarning{Try to rerun,
127     \jobname.ref file was \ifx\prevrefhash\empty created\else changed\fi}\fi
128 }
```

## 2.5 Allocators for TeX registers

Like plainTeX, the allocators `\newcount`, `\newwrite`, etc. are defined. The registers are allocated from 256 to the `\mai<type>` which is 65535 in LuaTeX.

Unlike in PlainTeX, the mentioned allocators are not `\outer`.

User can use `\dimen0` to `\dimen200` and similarly for `\skip`, `\muskip`, `\box`, and `\toks` directly. User can use `\count20` to `\count200` directly too. This is the same philosophy as in old plainTeX, but the range of directly used registers is wider.

Inserts are allocated from 254 to 201 using `\newinsert`.

You can define your own allocation concept (for example for allocation of arrays) from the top of the registers array. The example shows a definition of the array-like declarator of counters.

```
\newcount \maicount    % redefine maximal allocation index as variable
\maicount = \maicount % first value is top of the array

\def\newcountarray #1[#2]{% \newcountarray \foo[100]
  \global\advance\maicount by -#2\relax
  \ifnum \countalloc > \maicount
    \errmessage{No room for a new array of \string\count}%
  \else
    \global\chardef#1=\maicount
  \fi
}
\def\usecount #1[#2]{% \usecount \foo[2]
  \count\numexpr#1+#2\relax
}
```

alloc.opm

The limits are set first.

```
9 \chardef\maicount = 65535    % Max Allocation Index for counts registers in LuaTeX
10 \let\maidimen = \maicount
11 \let\maiskip = \maicount
12 \let\maimuskip = \maicount
13 \let\maibox = \maicount
14 \let\maitoks = \maicount
15 \chardef\mairead = 15
16 \chardef\maiwrite = 15
17 \chardef\maifam = 255
```

alloc.opm

Each allocation macro needs its own counter.

```
23 \countdef\countalloc=10 \countalloc=255
24 \countdef\dimenalloc=11 \dimenalloc=255
25 \countdef\skipalloc=12 \skipalloc=255
26 \countdef\muskipalloc=13 \muskipalloc=255
27 \countdef\boxalloc=14 \boxalloc=255
28 \countdef\toksalloc=15 \toksalloc=255
29 \countdef\readalloc=16 \readalloc=-1
30 \countdef\writealloc=17 \writealloc=-1
31 \countdef\famalloc=18 \famalloc=3
```

alloc.opm

The common allocation macro `\_allocator`  $\langle sequence \rangle \{ \langle type \rangle \} \langle primitive declarator \rangle$  is defined. This idea was used in classical plain TeX by Donald Knuth too but the macro from plain TeX seems to be more complicated:).

```
alloc.opm
41 \_def\_\_allocator #1#2#3{%
42   \_incr{\_cs{\_#2alloc}}%
43   \_ifnum\_\_cs{\_#2alloc}>\_\_cs{\_mai#2}%
44     \_errmessage{No room for a new \ea\_string\_\_csname #2\_\_endcsname}%
45   \_else
46     \_global#3#1=\_cs{\_#2alloc}%
47     \_wlog{\_string#1=\ea\_string\_\_csname #2\_\_endcsname\_\_the\_\_cs{\_#2alloc}}%
48   \_fi
49 }
```

The allocation macros `\newcount`, `\newdimen`, `\newskip`, `\newmuskip`, `\newbox`, `\newtoks`, `\newread`, `\newwrite` and `\newfam` are defined here.

```
alloc.opm
58 \_def\_\_newcount #1{\_allocator #1{count}\_\_countdef}
59 \_def\_\_newdimen #1{\_allocator #1{dimen}\_\_dimedef}
60 \_def\_\_newskip #1{\_allocator #1{skip}\_\_skipdef}
61 \_def\_\_newmuskip #1{\_allocator #1{muskip}\_\_muskipdef}
62 \_def\_\_newbox #1{\_allocator #1{box}\_\_chardef}
63 \_def\_\_newtoks #1{\_allocator #1{toks}\_\_toksdef}
64 \_def\_\_newread #1{\_allocator #1{read}\_\_chardef}
65 \_def\_\_newwrite #1{\_allocator #1{write}\_\_chardef}
66 \_def\_\_newfam #1{\_allocator #1{fam}\_\_chardef}
67
68 \_public \newcount \newdimen \newskip \newmuskip \newbox \newtoks \newread \newwrite \newfam ;
```

The `\newinsert` macro is defined differently than others.

```
alloc.opm
74 \_newcount\_\_insertalloc \_insertalloc=255
75 \_chardef\_\_insertmin = 201
76
77 \_def\_\_newinsert #1{%
78   \_decr\_\_insertalloc
79   \_ifnum\_\_insertalloc <\_\_insertmin
80     \_errmessage {No room for a new \_string\insert}%
81   \_else
82     \_global\_\_chardef#1=\_insertalloc
83     \_wlog {\_string#1=\_string\_\_insert\_\_the\_\_insertalloc}%
84   \_fi
85 }
86 \_public \newinsert ;
```

Other allocation macros `\newattribute` and `\newcatcodetable` have their counter allocated by the `\newcount` macro.

```
alloc.opm
93 \_newcount \_attributealloc \_attributealloc=0
94 \_chardef\_\_maiattribute=\_maicount
95 \_def\_\_newattribute #1{\_allocator #1{attribute}\_\_attributedef}
96
97 \_newcount \_catcodetablealloc \_catcodetablealloc=10
98 \_chardef\_\_maicatcodetable=32767
99 \_def\_\_newcatcodetable #1{\_allocator #1{catcodetable}\_\_chardef}
100
101 \_public \newattribute \newcatcodetable ;
```

We declare public and private versions of `\tmpnum` and `\tmpdim` registers separately. They are independent registers.

```
alloc.opm
108 \_newcount \tmpnum \_newcount \tmpnum
109 \_newdimen \tmpdim \_newdimen \tmpdim
```

A few registers are initialized like in plainTeX. We absolutely don't support the @category dance, so `\z@skip` `\z@`, `\p@` etc. are not defined in OptEX. If you need such control sequences then you can initialize them by `\load[plain-at]`.

Only the `\zo` and `\zoskip` (equivalents to `\z@` and `\z@skip`) are declared here and used in some internal macros of OptEX for improving speed.

```

alloc.opm
122 \_newdimen\_maxdimen \_maxdimen=16383.99999pt % the largest legal <dimen>
123 \_newdimen\_zo \_zo=0pt
124 \_newskip\_hideskip \_hideskip=-1000pt plus 1fill % negative but can grow
125 \_newskip\_centering \_centering=0pt plus 1000pt minus 1000pt
126 \_newskip\_zoskip \_zoskip=Opt plus0pt minus0pt
127 \_newbox\_voidbox % permanently void box register
128
129 \_public \maxdimen \hideskip \centering \voidbox ;

```

## 2.6 If-macros, loops, is-macros

```

if-macros.opm
3 \codedecl \newif {Special if-macros, is-macros and loops <2021-08-02>} % preloaded in format

```

### 2.6.1 Classical \newif

The `\newif` macro implements boolean value. It works as in plain TeX. It means that after `\newif\ifxxx` you can use `\xxxtrue` or `\xxxfalse` to set the boolean value and use `\ifxxx true\else false\fi` to test this value. The default value is false.

The macro `\newifi` enables to declare `\_ifxxx` and to use `\_xxxtrue` and `\_xxxfalse`. This means that it is usable for the internal namespace (\_prefixed macros).

```

if-macros.opm
18 \_def\newif #1{\_ea\_newifa \_string #1\_relax#1}
19 \_ea\_def \_ea\_newifa \_string\if #1\_relax#2{%
20   \_sdef{#1true}{\_let#2=\_iftrue}%
21   \_sdef{#1false}{\_let#2=\_iffalse}%
22   \_let#2=\_iffalse
23 }
24 \_def\newifi #1{\_ea\_newifiA \_string#1\_relax#1}
25 \_ea\_def \_ea\_newifiA \_string\_if #1\_relax#2{%
26   \_sdef{\_#1true}{\_let#2=\_iftrue}%
27   \_sdef{\_#1false}{\_let#2=\_iffalse}%
28   \_let#2=\_iffalse
29 }
30 \_public \newif ;

```

`\afterfi {<what to do>}<ignored>\fi` closes condition by `\fi` and processes `<what to do>`. Usage:

```
\if<something> \afterfi{<result is true>} \else \afterfi{<result is false>} \fi
```

```

if-macros.opm
40 \_def\afterfi#1#2\_\fi{\_\fi#1}
41 \_def\afterfi#1#2\fi{\_\fi#1}

```

### 2.6.2 Loops

The `\loop` `<codeA>` `\ifsomething` `<codeB>` `\repeat` loops `<codeA><codeB>` until `\ifsomething` is false. Then `<codeB>` is not executed and loop is finished. This works like in plain TeX, but implementation is somewhat better (you can use `\else` clause after the `\ifsomething`).

There are public version `\loop... \repeat` and private version `\_loop ... \_repeat`. You cannot mix both versions in one loop.

The `\loop` macro keeps its original plain TeX meaning. It is not expandable and nested `\loops` are possible only in a TeX group.

```

if-macros.opm
57 \_long\_def \_loop #1\_repeat{\_def\_body{#1}\_iterate}
58 \_long\_def \loop #1\repeat{\_def\_body{#1}\_iterate}
59 \_let \_repeat=\_fi % this makes \loop... \if... \repeat skippable
60 \_let \repeat=\_fi
61 \_def \_iterate {\_body \_ea \_iterate \_fi}

```

`\foreach` `<list>` `\do` `{<what>}` repeats `<what>` for each element of the `<list>`. The `<what>` can include `#1` which is substituted by each element of the `<list>`. The macro is expandable.

`\foreach` `<list>` `\do` `<parameter-mask>{<what>}` reads parameters from `<list>` repeatedly and does `<what>` for each such reading. The parameters are declared by `<parameter-mask>`. Examples:

```
\foreach (a,1)(b,2)(c,3)\do (#1,#2){#1=#2 }
\foreach word1,word2,word3,\do #1,{Word is #1.}
\foreach A=word1 B=word2 \do #1=#2 {"#1 is set as #2".}
```

Note that `\foreach <list>\do {<what>}` is equivalent to `\foreach <list>\do #1{<what>}`.

Recommendation: it is better to use private variants of `\foreach`. When the user writes `\input tikz` then `\foreach` macro is redefined! The private variants use `\_do` separator instead `\do` separator.

```
if-macros.opm
84 \_newcount\_frnum          % the numeric variable used in \fornum
85 \_def\_\_do{\_dounDEFINED} % we need to ask \_ifx#1\_\_do ...
86
87 \_long\_def\_\foreach #1\_\_do #2{\_isempty{#2}\_\_iftrue
88   \_afterfi{\_foreachA{#1}{##1}}\_\_else\_\_afterfi{\_foreachA{#1}{#2}}\_\_fi}
89 \_long\_def\_\foreachA #1#2#3{\_putforstack
90   \_immediateassignment \_long\_gdef\_\fbody#2{\_testparam##1..\_iftrue #3\_\ea\_\fbody\_\_fi}%
91   \_fbody #1#2\_\finbody\_\getforstack
92 }
93 \_def\_\testparam#1#2#3\_\_iftrue{\_ifx##1\_\empty\_\ea\_\finbody\_\_else}
94 \_def\_\finbody#1\_\finbody{}
95
96 \_long\_def\foreach #1\do#2{\_isempty{#2}\_\_iftrue
97   \_afterfi{\_foreachA{#1}{##1}}\_\_else\_\_afterfi{\_foreachA{#1}{#2}}\_\_fi}
```

`\fornum <from>..<to> \do {<what>}` or `\fornumstep <num>`: `<from>..<to> \do {<what>}` repeats `<what>` for each number from `<from>` to `<to>` (with step `<num>` or with step one). The `<what>` can include `#1` which is substituted by current number. The `<from>`, `<to>`, `<step>` parameters can be numeric expressions. The macro is expandable.

The test in the `\fornumb` says: if (`<to> < current number`) AND `<step>` is positive) or if (`<to> > current number`) AND `<step>` is negative) then close loop by `\_getforstack`. Sorry, the condition is written by somewhat cryptoid TeX language.

```
if-macros.opm
112 \_def\_\fornum#1..#2\_\_do{\_fornumstep 1:#1..#2\_\_do}
113 \_long\_def\_\fornumstep#1:#2..#3\_\_do#4{\_putforstack
114   \_immediateassigned{%
115     \_gdef\_\fbody##1{#4}%
116     \_global\_\frnum=\_numexpr#2\_\relax
117   }%
118   \_ea\_\fornumB\_\ea{\_the\_\numexpr#3\_\ea}\_\ea{\_the\_\numexpr#1}%
119 }
120 \_def\_\fornumb #1#2{\_ifnum#1\_\ifnum#2>0<\_else>\_\fi \_\frnum \_\getforstack
121   \_else \_\_afterfi{\_ea\_\fbody\_\ea{\_the\_\frnum}}%
122   \_immediateassignment\_\global\_\advance\_\frnum by#2
123   \_\fornumb{#1}{#2}}\_\fi
124 }
125 \_def\_\fornum#1..#2\_\_do{\_fornumstep 1:#1..#2\_\_do}
126 \_def\_\fornumstep#1:#2..#3\_\_do{\_fornumstep #1:#2..#3\_\_do}
```

The `\foreach` and `\fornum` macros can be nested and arbitrary combined. When they are nested then use `##1` for the variable of nested level, `####1` for the variable of second nested level etc. Example:

```
\foreach ABC \do {\fornum 1..5 \do {letter:#1, number: ##1. }}
```

Implementation note: we cannot use TeX-groups for nesting levels because we want to do the macros expandable. We must implement a special for-stack which saves the data needed by `\foreach` and `\fornum`. The `\_putforstack` is used when `\for*` is initialized and `\_getforstack` is used when the `\for*` macro ends. The `\_forlevel` variable keeps the current nesting level. If it is zero, then we need not save nor restore any data.

```
if-macros.opm
144 \_newcount\_\forlevel
145 \_def\_\putforstack{\_immediateassigned{%
146   \_ifnum\_\forlevel>0
147   \_sxdef\_\frnum:\_the\_\forlevel\_\ea}{\_the\_\frnum}%
148   \_global\_\slet\_\fbody:\_the\_\forlevel}{\_fbody}%
149   \_\fi
150   \_\incr\_\forlevel
151 }}
```

```

152 \_def\_\_getforstack{\_\_immediateassigned{%
153   \_decr\_forlevel
154   \_ifnum\_\_forlevel>0
155     \_global\_\_slet{_fbody}{_fbody:\_the\_\_forlevel}%
156     \_global\_\_frnum=\_cs{_frnum:\_the\_\_forlevel}\_space
157   \_fi
158 }
159 \_ifx\_\_immediateassignment\_\_undefined % for compatibility with older LuaTeX
160   \_let\_\_immediateassigned=\_useit \_let\_\_immediateassignment=\_empty
161 \_fi

```

User can define own expandable “foreach” macro by `\foreachdef \macro {parameter-mask}{what}` which can be used by `\macro {[list]}`. The macro reads repeatedly parameters from `{list}` using `{parameter-mask}` and does `{what}` for each such reading. For example

```

\foreachdef\mymacro #1{[#1]}
\mymacro{a,b,cd,efg,}

```

expands to [a][b][cd][efg]. Such user defined macros are more effective during processing than `\foreach` itself because they need not to operate with the for-stack.

```

176 \_def\_\_foreachdef#1#2{\_toks0[#2]%
177   \_long\_\_edef#1#1{\_ea\_\_noexpand\_\_csname _body:\_csstring#1\_\_endcsname
178   ##1\_\_the\_\_toks0 \_noexpand\_\_finbody}%
179   \_\_foreachdefA#1{#2}%
180 \_def\_\_foreachdefA#1#2#3{%
181   \_long\_\_sdef{_body:\_csstring#1}#2{\_testparam##1..\_iftrue #3\_\_cs{_body:\_csstring#1\_\_ea}\_fi}%
182
183 \_public \foreachdef ;

```

### 2.6.3 Is-macros

There are a collection of macros `\isempty`, `\istoksempy`, `\isequal`, `\ismacro`, `\isdefined`, `\isinlist`, `\isfile` and `\isfont` with common syntax:

```

\issomething {params} \iftrue {codeA} \else {codeB} \fi
or
\issomething {params} \iffalse {codeB} \else {codeA} \fi

```

The `\else` part is optional. The `{codeA}` is processed if `\issomething{params}` generates true condition. The `{codeB}` is processed if `\issomething{params}` generates false condition.

The `\iftrue` or `\iffalse` is an integral part of this syntax because we need to keep skippable nested `\if` conditions.

Implementation note: we read this `\iftrue` or `\iffalse` into unseparated parameter and repeat it because we need to remove an optional space before this command.

`\isempty {text}\iftrue` is true if the `{text}` is empty. This macro is expandable.

`\istoksempy {tokens variable}\iftrue` is true if the `{tokens variable}` is empty. It is expandable.

```

214 \_long\_\_def \_isempty #1#2{\_if\_\_relax\_\_detokenize{#1}\_\_relax \_else \_ea\_\_unless \_fi#2}
215 \_def \_istoksempy #1#2{\_ea\_\_isempty\_\_ea\_\_the#1}#2
216 \_public \isempty \istoksempy ;

```

`\isequal {textA}{textB}\iftrue` is true if the `{textA}` and `{textB}` are equal, only from strings point of view, category codes are ignored. The macro is expandable.

```

225 \_def\_\_isequal#1#2#3{\_directlua{%
226   if "\_luaescapestring{\_detokenize{#1}}"=="\_luaescapestring{\_detokenize{#2}}"
227   then else tex.print("\_nbb unless") end}#3}
228 \_public \isequal ;

```

`\ismacro \macro{text}\iftrue` is true if macro is defined as `{text}`. Category codes are ignored in this testing. The macro is expandable.

```

235 \_def\_\_ismacro#1{\_ea\_\_isequal\_\_ea{#1}}
236 \_public \ismacro ;

```

`\isdefined {csname}\iftrue` is true if `\{csname}` is defined. The macro is expandable.

```

if-macros.opm
243 \_def\isdefined #1#2{\_ifcsname #1\_endcsname \_else \_ea\_unless \_fi #2}
244 \_public \isdefined ;

```

`\isinlist \list{<text>}\iftrue` is true if the `<text>` is included the macro body of the `\list`. The category codes are relevant here. The macro is not expandable.

```

if-macros.opm
252 \_long\_def\isinlist#1#2{\_begingroup
253   \_long\_def\_tmp##1#2##2\_end/_%
254   {\_endgroup\_if\relax\_detokenize{##2}\relax \_ea\_unless\fi}%
255   \_ea\_tmp#1\_endlistsep#2\_end/_%
256 }
257 \_public \isinlist ;

```

`\isfile {<filename>}\iftrue` is true if the file `<filename>` exists and are readable by TeX.

```

if-macros.opm
264 \_newread \testin
265 \_def\isfile #1{%
266   \_openin\_testin ={#1}\relax
267   \_ifeof\_testin \_ea\_unless
268   \_else \_closein\_testin
269   \_fi
270 }
271 \_public \isfile ;

```

`\isfont {<fontname or [fontfile]>}\iftrue` is true if a given font exists. The result of this testing is saved to the `\_ifexistfam`.

```

if-macros.opm
279 \_newifi \_ifexistfam
280 \_def\isfont#1#2{%
281   \_begingroup
282   \_suppressfontnotfounderror=1
283   \_font\_testfont={#1}\relax
284   \_ifx\_testfont\_nullfont \_def\_tmp{\_existfamfalse \_unless}
285   \_else \_def\_tmp{\_existfamtrue}\_fi
286   \_ea \_endgroup \_tmp #2%
287 }
288 \_public \isfont ;

```

The last macro `\isnextchar <char>{<codeA>}{<codeB>}` has a different syntax than all other is-macros. It executes `<codeA>` if next character is equal to `<char>`. Else the `<codeB>` is executed. The macro is not expandable.

```

if-macros.opm
297 \_long\_def\isnextchar#1#2#3{\_begingroup\_toks0={\_endgroup#2}\_toks1={\_endgroup#3}%
298   \_let\_tmp= #1\_futurelet\_next\_isnextcharA
299 }
300 \_def\isnextcharA{\_the\_toks\_ifx\_tmp\_next0\_else1\_fi\_space}
301
302 \_public \isnextchar ;

```

## 2.7 Setting parameters

The behavior of document processing by OpTeX is controlled by *parameters*. The parameters are

- primitive registers used in build-in algorithms of TeX,
- registers declared and used by OpTeX macros.

Both groups of registers have their type: number, dimension, skip, token list.

The registers are represented by their names (control sequences). If the user re-defines this control sequence then the appropriate register exists steadily and build-in algorithms are using it without change. But user cannot access its value in this case. OpTeX declares two control sequences for each register: prefixed (private) and unprefixed (public). OpTeX macros use only prefixed variants of control sequences. The user should use the unprefixed variant with the same meaning and set or read the values of registers using the unprefixed variant. If the user re-defines the unprefixed control sequence of a register then OpTeX macros still work without change.

```

parameters.opm
3 \codedecl \normalbaselineskip {Parameter settings <2021-04-13>} % preloaded in format

```

## 2.7.1 Primitive registers

The primitive registers with the same default value as in plain T<sub>E</sub>X follow:

```
parameters.opm
10 \_parindent=20pt      % indentation of paragraphs
11 \_pretolerance=100    % parameters used in paragraph breaking algorithm
12 \_tolerance=200
13 \_hbadness=1000
14 \_vbadness=1000
15 \_doublehyphendemerits=10000
16 \_finalhyphendemerits=5000
17 \_adjdemerits=10000
18 \uchyph=1
19 \defaulthyphenchar=-\
20 \defaultskewchar=-1
21 \hfuzz=0.1pt
22 \vfuzz=0.1pt
23 \overfullrule=5pt
24 \linepenalty=10      % penalty between lines inside the paragraph
25 \hyphenpenalty=50    % when a word is bro-ken
26 \exhyphenpenalty=50 % when the hyphenmark is used explicitly
27 \binoppenalty=700   % between binary operators in math
28 \relpenalty=500    % between relations in math
29 \brokenpenalty=100  % after lines if they end by a broken word.
30 \displaywidowpenalty=50 % before last line of paragraph if display math follows
31 \predisplaypenalty=10000 % above display math
32 \postdisplaypenalty=0  % below display math
33 \delimiterfactor=901 % parameter for scaling delimiters
34 \delimitershortfall=5pt
35 \nulldelimiterspace=1.2pt
36 \scriptspace=0.5pt
37 \maxdepth=4pt
38 \splitmaxdepth=\_maxdimen
39 \boxmaxdepth=\_maxdimen
40 \parskip=0pt plus 1pt
41 \abovedisplayskip=12pt plus 3pt minus 9pt
42 \abovedisplayshortskip=0pt plus 3pt
43 \belowdisplayskip=12pt plus 3pt minus 9pt
44 \belowdisplayshortskip=7pt plus 3pt minus 4pt
45 \parfillskip=0pt plus 1fil
46 \thinmuskip=3mu
47 \medmuskip=4mu plus 2mu minus 4mu
48 \thickmuskip=5mu plus 5mu
```

Note that \topskip and \splittopskip are changed when first \typo size sets the main values (default font size and default \baselineskip).

```
parameters.opm
56 \topskip=10pt        % top edge of page-box to first baseline distance
57 \splittopskip=10pt
```

## 2.7.2 Plain T<sub>E</sub>X registers

Allocate registers that are used just like in plain T<sub>E</sub>X.

```
parameters.opm
64 % We also define special registers that function like parameters:
65 \newskip\_smallskipamount \smallskipamount=3pt plus 1pt minus 1pt
66 \newskip\_medskipamount \medskipamount=6pt plus 2pt minus 2pt
67 \newskip\_bigskipamount \bigskipamount=12pt plus 4pt minus 4pt
68 \newskip\_normalbaselineskip \normalbaselineskip=12pt
69 \newskip\_normallineskip \normallineskip=1pt
70 \newdimen\_normallineskiplimit \normallineskiplimit=0pt
71 \newdimen\_jot \jot=3pt
72 \newcount\_interdisplaylinepenalty \interdisplaylinepenalty=100
73 \newcount\_interfootnotelinepenalty \interfootnotelinepenalty=100
74
75 \def\_normalbaselines{\_lineskip=\normallineskip
76   \baselineskip=\normalbaselineskip \_lineskiplimit=\normallineskiplimit}
77
78 \def\_frenchspacing{\_sfcode`.=1000 \_sfcode`?\=1000 \_sfcode`!\=1000}
```

```

79  \_sfcode`\:!=1000 \_sfcode`\:=1000 \_sfcode`\,=1000 }
80 \_def\_nonfrenchspacing{\_sfcode`\.=3000 \_sfcode`\?=3000 \_sfcode`\!=3000
81   \_sfcode`\:=2000 \_sfcode`\:=1500 \_sfcode`\,=1250 }
82
83 \_public \normalbaselines \frenchspacing \nonfrenchspacing
84   \smallskipamount \medskipamount \bigskipamount
85   \normalbaselineskip \normallineskip \normallineskiplimit
86   \jot \interdisplaylinepenalty \interfootnotelinepenalty ;

```

### 2.7.3 Different settings than in plain $\text{\TeX}$

Default “baseline setting” is for 10 pt fonts (like in plain  $\text{\TeX}$ ). But  $\text{\typo size}$  and  $\text{\typo scale}$  macros re-declare it if another font size is used.

The  $\text{\nonfrenchspacing}$  is not set by default because the author of  $\text{Op}\text{\TeX}$  is living in Europe. If you set  $\text{\enlang}$  hyphenation patterns then  $\text{\nonfrenchspacing}$  is set.

```
parameters.opm
100 \_normalbaselines % baseline setting, 10 pt font size
```

The following primitive registers have different values than in plain  $\text{\TeX}$ . We prohibit orphans, set more information for tracing boxes, set page origin to the upper left corner of the paper (no at 1 in, 1 in coordinates) and set default page dimensions as A4, not letter.

```
parameters.opm
109 \_emergencystretch=20pt % we want to use third pass of paragraph building algorithm
110           % we don't need compatibility with old documents
111
112 \_clubpenalty=10000    % after first line of paragraph
113 \_widowpenalty=10000   % before last line of paragraph
114
115 \_showboxbreadth=150   % for tracing boxes
116 \_showboxdepth=7
117 \_errorcontextlines=15
118 \_tracinglostchars=2   % missing character warnings on terminal too
119
120 \_outputmode=1         % PDF output
121 \_pdfvorigin=0pt        % origin is exactly at upper left corner
122 \_pdfhorigin=0pt
123 \_hoffset=25mm          % margins are 2.5cm, no 1in
124 \_voffset=25mm
125 \_hsize=160mm           % 210mm (from A4 size) - 2*25mm (default margins)
126 \_vsize=244mm            % 297mm (from A4 size) - 2*25mm (default margins) -3mm baseline correction
127 \_pagewidth=210 true mm
128 \_pageheight=297 true mm
```

If you insist on plain  $\text{\TeX}$  values of these parameters then you can call the  $\text{\plaintexsetting}$  macro.

```
parameters.opm
135 \_def\_plaintexsetting{%
136   \_emergencystretch=0pt
137   \_clubpenalty=150
138   \_widowpenalty=150
139   \_pdfvorigin=1in
140   \_pdfhorigin=1in
141   \_hoffset=0pt
142   \_voffset=0pt
143   \_hsize=6.5in
144   \_vsize=8.9in
145   \_pagewidth=8.5 true in
146   \_pageheight=11 true in
147   \_nonfrenchspacing
148 }
149 \_public \plaintexsetting ;
```

### 2.7.4 $\text{Op}\text{\TeX}$ parameters

The main principle of how to configure  $\text{Op}\text{\TeX}$  is not to use only parameters. A designer can copy macros from  $\text{Op}\text{\TeX}$  and re-define them as required. This is a reason why we don't implement dozens of parameters, but we keep  $\text{Op}\text{\TeX}$  macros relatively simple. Example: do you want another design of

section titles? Copy macros `\_printsec` and `\_printsecc` from `sections.opm` file to your macro file and re-define them.

Notice for OPmac users: there is an important difference: all "string-like" parameters are token lists in Op<sub>T</sub>E<sub>X</sub> (OPmac uses macros for them). The reason of this difference: if a user sets parameter by unprefix (public) control sequence, an Op<sub>T</sub>E<sub>X</sub> macro can read *the same data* using a prefixed (private) control sequence.

The `\picdir` tokens list can include a directory where image files (loaded by `\inspic`) are saved. Empty `\picdir` (default value) means that image files are in the current directory (or somewhere in the T<sub>E</sub>X system where LuaT<sub>E</sub>X can find them). If you set a non-empty value to the `\picdir`, then it must end by / character, for example `\picdir={img/}` means that there exists a directory `img` in your current directory and the image files are stored here.

```
parameters.opm
175 \_newtoks\_\picdir
176 \_public \picdir ;
```

You can control the dimensions of included images by the parameters `\picwidth` (which is equivalent to `\picw`) and `\picheight`. By default these parameters are set to zero: the native dimension of the image is used. If only `\picwidth` has a nonzero value, then this is the width of the image (height is calculated automatically in order to respect the aspect of the image). If only `\picheight` has a nonzero value then the height is given, the width is calculated. If both parameters are non-zero, the height and width are given and the aspect ratio of the image is (probably) broken. We recommend setting these parameters locally in the group where `\inspic` is used in order to not influence the dimensions of other images. But there exist many situations you need to put the same dimensions to more images, so you can set this parameter only once before more `\inspic` macros.

```
parameters.opm
194 \_newdimen\_\picwidth \_\picwidth=0pt \_let\picw=\_\picwidth
195 \_newdimen\_\picheight \_\picheight=0pt
196 \_public \picwidth \picheight ;
```

The `\everytt` is the token list used in `\begtt...\\endtt` environment and in the verbatim group opened by `\verbinput` macro. You can include a code which is processed inside the group after basic settings were done. On the other hand, it is processed before the scanner of verbatim text is started. Your macros should influence scanner (catcode settings) or printing process of the verbatim code or both.

The code from the line immediately after `\begtt` is processed after the `\everytt`. This code should overwrite `\everytt` settings. Use `\everytt` for all verbatim environments in your document and use a code after `\begtt` locally only for this environment.

The `\everyintt` token list does similar work but acts in the in-line verbatim text processed by a pair of `\verbchar` characters or by `\code{\langle text\rangle}`. You can set `\everyintt={\Red}` for example if you want in-line verbatim in red color.

```
parameters.opm
219 \_newtoks\_\everytt
220 \_newtoks\_\everyintt
221 \_public \everytt \everyintt ;
```

The `\ttline` is used in `\begtt...\\endtt` environment or in the code printed by `\verbinput`. If `\ttline` is positive or zero, then the verbatim code has numbered lines from `\ttline+1`. The `\ttline` register is re-set to a new value after a code piece is printed, so next code pieces have numbered lines continuously. If `\ttline=-1`, then `\begtt...\\endtt` lines are without numbers and `\verbinput` lines show the line numbers of inputted file. If `\ttline<-1` then no line numbers are printed.

```
parameters.opm
235 \_newcount\_\ttline \_\ttline=-1 % last line number in \begtt...\\endtt
236 \_public \ttline ;
```

The `\ttindent` gives default indentation of verbatim lines printed by `\begtt...\\endtt` pair or by `\verbinput`.

The `\ttshift` gives the amount of shift of all verbatim lines to the right. Despite the `\ttindent`, it does not shift the line numbers, only the text.

The `\iindent` gives default indentations used in the table of contents, captions, lists, bib references. It is strongly recommended to re-set this value if you set `\parindent` to another value than plain T<sub>E</sub>X default 20pt. A well-typeset document should have the same dimension for all indentations, so you should say `\ttindent=\parindent` and `\iindent=\parindent`.

```

parameters.opm
256 \_newdimen\_ttindent \_ttindent=\_parindent % indentation in verbatim
257 \_newdimen\_ttshift
258 \_newdimen\_iindent \_iindent=\_parindent
259 \_public \ttindent \ttshift \iindent ;

```

The tabulator `^I` has its category code like space: it behaves as a space in normal text. This is a common plain TeX setting. But in the multiline verbatim environment it is active and expands to the `\hskip<dimen>` where `<dimen>` is the width of `\tabspaces` spaces. Default `\tabspaces=3` means that tabulator behaves like three spaces in multiline verbatim.

```

parameters.opm
271 \_newcount \_tabspaces \_tabspaces=3
272 \_public \tabspaces ;

```

If `\hicolors` is non-empty then its contents is used instead `\hicolors<name>` declared in the file `hisyntax-<name>.opm`. The user can give his/her preferences about colors for syntax highlighting by this tokens list. The full color set must be declared here.

```

parameters.opm
282 \_newtoks\hicolors
283 \_public \hicolors ;

```

The default item mark used between `\begitems` and `\enditems` is the bullet. The `\defaultitem` tokens list declares this default item mark.

The `\everyitem` tokens list is applied in vertical mode at the start of each item.

The `\everylist` tokens list is applied after the group is opened by `\begitems`

The `\ilevel` keeps the value of the current nesting level of the items list.

The `\listskipamount` gives vertical skip above and below the items list if `\ilevel=1`.

```

parameters.opm
300 \_newtoks\defaultitem \_defaultitem={\$\_bullet$\_enspace}
301 \_newtoks\everyitem
302 \_newtoks\everylist
303 \_newskip \listskipamount \listskipamount=\_medskipamount
304 \_newcount \ilevel
305 \_public \defaultitem \everyitem \everylist \listskipamount \ilevel ;

```

The `\tit` macro includes `\vglue\titskip` above the title of the document.

```

parameters.opm
311 \_newskip\titskip \_titskip=40pt \_relax % \vglue above title printed by \tit
312 \_public \titskip ;

```

The `\begmulti` and `\endmulti` pair creates more columns. The parameter `\colsep` declares the space between columns. If  $n$  columns are specified then we have  $n-1$  `\colseps` and  $n$  columns in total `\hsize`. This gives the definite result of the width of the columns.

```

parameters.opm
321 \_newdimen\colsep \_colsep=20pt % space between columns
322 \_public \colsep ;

```

Each line in the Table of contents is printed in a group. The `\everytocline` tokens list is processed here before the internal `\_tocl:<num>` macro which starts printing the line.

```

parameters.opm
330 \_newtoks\everytocline
331 \_public \everytocline ;

```

The `\bibtexhook` tokens list is used inside the group when `\usebib` command is processed after style file is loaded and before printing bib-entries. You can re-define a behavior of the style file here or you can modify the more declaration for printing (fonts, baselineskip, etc.) or you can define specific macros used in your `.bib` file.

The `\biboptions` is used in the iso690 bib-style for global options, see section 2.32.5.

The `\bibpart` saves the name of bib-list if there are more bib-lists in single document, see section 2.32.1.

```

parameters.opm
345 \_newtoks\bibtexhook
346 \_newtoks\biboptions
347 \_newtoks\bibpart
348 \_public \bibtexhook \biboptions \bibpart ;

```

`\everycapitonf` is used before printing caption in figures and `\everycapitont` is used before printing caption in tables.

```
parameters.opm
355 \_newtoks\_everycaptiont \_newtoks\_everycaptionf
356 \_public \everycaptiont \everycaptionf ;
```

The `\everyii` tokens list is used before `\noindent` for each Index item when printing the Index.

```
parameters.opm
363 \_newtoks\_everyii
364 \_public \everyii ;
```

The `\everymnote` is used in the `\mnote` group before `\noindent` which immediately precedes marginal note text.

The `\mnotesize` is the horizontal size of the marginal notes.

The `\mnoteindent` is horizontal space between body-text and marginal note.

```
parameters.opm
375 \_newtoks\_everymnote
376 \_newdimen\_mnotesize \_mnotesize=20mm % the width of the mnote paragraph
377 \_newdimen\_mnoteindent \_mnoteindent=10pt % distance between mnote and text
378 \_public \everymnote \mnotesize \mnoteindent ;
```

The `\table` parameters follow. The `\thistable` tokens list register should be used for giving an exception for only one `\table` which follows. It should change locally other parameters of the `\table`. It is reset to an empty list after the table is printed.

The `\everytable` tokens list register is applied in every table. There is another difference between these two registers. The `\thistable` is used first, then strut and baselineskip settings are done, then `\everytable` is applied and then the table is printed.

`\tabstrut` configures the height and depth of lines in the table. You can declare `\tabstrut={}`, then normal baselineskip is used in the table. This can be used when you don't use horizontal nor vertical lines in tables.

`\tabiteml` is applied before each item, `\tabitemr` is applied after each item of the table.

`\tablinspace` is additional vertical space between horizontal rules and the lines of the table.

`\hhkern` gives the space between horizontal lines if they are doubled and `\vvkern` gives the space between such vertical lines.

`\tabskipl` is `\tabskip` used before first column, `\tabskipr` is `\tabskip` used after the last column.

`\tsize` is virtual unit of the width of paragraph-like table items when `\table pxtosize` is used.

```
parameters.opm
412 \_newtoks\_everytable \_newtoks\_thistable
413 \_newtoks\_tabiteml \_newtoks\_tabitemr \_newtoks\_tabstrut
414 \_newdimen\_tablinspace \_newdimen\_vvkern \_newdimen\_hhkern \_newdimen\_tsize
415 \_newskip\_tabskipl \_newskip\_tabskipr
416 \_everytable={} % code used after settings in \vbox before table processing
417 \_thistable={} % code used when \vbox starts, is removed after using it
418 \_tabstrut={\strut}
419 \_tabiteml={\enspace} % left material in each column
420 \_tabitemr={\enspace} % right material in each column
421 \_tablinspace=2pt % additional vertical space before/after horizontal rules
422 \_vvkern=1pt % space between double vertical line and used in \frame
423 \_hhkern=1pt % space between double horizontal line and used in \frame
424 \_tabskipl=0pt\relax % \tabskip used before first column
425 \_tabskipr=0pt\relax % \tabskip used after the last column
426 \_public \everytable \thistable \tabiteml \tabitemr \tabstrut \tablinspace
427 \_vvkern \_hhkern \tsize \tabskipl \tabskipr ;
```

The `\eqalign` macro can be configured by `\eqlines` and `\eqstyle` tokens lists. The default values are set in order these macro behaves like in Plain TeX. The `\eqspace` is horizontal space put between equation systems if more columns in `\eqalign` are used.

```
parameters.opm
436 \_newtoks \_eqlines \_eqlines={\openup\jot}
437 \_newtoks \_eqstyle \_eqstyle={\strut\displaystyle}
438 \_newdimen \_eqspace \_eqspace=20pt
439 \_public \eqlines \eqstyle \eqspace ;
```

`\lmfil` is “left matrix filler” (for `\matrix` columns). The default value does centering because the right matrix filler is directly set to `\hfil`.

```
parameters.opm
446 \_newtoks \_lmfil \_lmfil={\hfil}
447 \_public \lmfil ;
```

The output routine uses token lists `\headline` and `\footline` in the same sense as plain TeX does. If they are non-empty then `\hfil` or `\hss` must be here because they are used inside `\hbox` to `\hsize`.

Assume that page-body text can be typeset in different sizes and different fonts and we don't know in what font context the output routine is invoked. So, it is strongly recommended to declare fixed variants of fonts at the beginning of your document. For example `\fontdef\rmfixed{\rm}`, `\fontdef\itfixed{\it}`. Then use them in headline and footnote:

```
\headline={\itfixed Text of headline, section: \fistmark \hss}
\footline={\rmfixed \ifodd\pageno \hfill\fi \folio \hfill}

parameters.opm

465 \_newtoks\_headline  \_headline={}
466 \_newtoks\_footline   \_footline={\_hss\rmfixed \_folio \_hss}
467 \_public \headline \footline ;
```

The distance between the `\headline` and the top of the page text is controlled by the `\headlinedist` register. The distance between the bottom of page-text and `\footline` is `\footlinedist`. More precisely: baseline of headline and baseline of the first line in page-text have distance `\headlinedist+\topskip`. The baseline of the last line in page-text and the baseline of the footnote have distance `\footlinedist`. Default values are inspired by plain TeX.

```
parameters.opm

481 \_newdimen \_headlinedist  \_headlinedist=14pt
482 \_newdimen \_footlinedist   \_footlinedist=24pt
483 \_public \headlinedist \footlinedist ;
```

The `\pgbottomskip` is inserted to the page bottom in the output routine. You can set less tolerance here than `\raggedbottom` does. By default, no tolerance is given.

```
parameters.opm

491 \_newskip \_pgbottomskip  \_pgbottomskip=0pt \_relax
492 \_public \pgbottomskip ;
```

The `\nextpages` tokens list can include settings which will be used at next pages. It is processed at the end of output routine with `\globaldefs=1` prefix. The `\nextpages` is reset to empty after processing. Example of usage:

```
\headline={} \nextpages={\headline={\rmfixed \firstmark \hfil}}
```

This example sets current page with empty headline, but next pages have non-empty headlines.

```
parameters.opm

506 \_newtoks \_nextpages
507 \_public \nextpages ;
```

The `\pgbackground` token list can include macros which generate a vertical list. It is used as page background. The top-left corner of such `\vbox` is at the top-left corner of the paper. Example creates the background of all pages yellow:

```
\pgbackground={\Yellow \hrule height 0pt depth\pdfpageheight width\pdfpagewidth}

parameters.opm

519 \_newtoks \_pgbackground  \_pgbackground={} % for page background
520 \_public \pgbackground ;
```

The parameters used in `\inoval` and `\incircle` macros can be re-set by `\ovalparams`, `\circleparams` tokens lists. The default values (documented in the user manual) are set in the macros.

```
parameters.opm

528 \_newtoks \_ovalparams
529 \_newtoks \_circleparams
530 \%_ovalparams={\_roundness=2pt \_fcolor=\Yellow \_lcolor=\Red \_lwidth=.5bp
531 \%           \_shadow=N \_overlapmargins=N \_hhkern=0pt \_vvkern=0pt }
532 \%_circleparams={\_ratio=1 \_fcolor=\Yellow \_lcolor=\Red \_lwidth=.5bp
533 \%           \_shadow=N \_overlapmargins=N \_hhkern=3pt \_vvkern=3pt}
534
535 \_newdimen \_roundness    \_roundness=5mm % used in \clippingoval macro
536
537 \_public \ovalparams \circleparams \roundness ;
```

OpTeX defines “Standard OpTeX markup language”<sup>2</sup> which lists selected commands from chapter 1 and gives their behavior when a converter from OpTeX document to HTML or Markdown or LATEX is used.

---

<sup>2</sup> Will be developed in 2021.

The structure-oriented commands are selected here, but the commands which declare typographical appearance (page layout, dimensions, selected font family) are omitted. More information for such a converter should be given in `\cnvinfo{<data>}`. OpTeX simply ignores this but the converter can read its configuration from here. For example, a user can write:

```
\cnvinfo {type=html, <cnv-to-html-data>}
\cnvinfo {type=markdown, <cnv-to-markdown-data>}
```

and the document can be processed by OpTeX to create PDF, or by a converter to create HTML, or by another converter to create Markdown.

```
558 \_let\cnvinfo=\_ignoreit
```

parameters.opm

## 2.8 More OpTeX macros

The second bundle of OpTeX macros is here.

```
3 \_codedecl \eoldef {OpTeX useful macros <2021-04-25>} % preloaded in format
```

more-macros.opm

We define `\opinput {<file name>}` macro which does `\input {<file name>}` but the catcodes are set to normal catcodes (like OpTeX initializes them) and the catcodes setting is returned back to the current values when the file is read. You can use `\opinput` in any situation inside the document and you will be sure that the file is read correctly with correct catcode settings.

To achieve this, we declare `\optextcatcodes` catcode table and `\plaintextcatcodes`. They save the commonly used catcode tables. Note that `\catcodetable` is a part of LuaTeX extension. The catcodetable stack is implemented by OpTeX macros. The `\setctable {catcode table}` pushes current catcode table to the stack and activates catcodes from the `<catcode table>`. The `\restorectable` returns to the saved catcodes from the catcode table stack.

The `\opinput` works inside the catcode table stack. It reads `\optextcatcodes` table and stores it to `\_tmpcatcodes` table. This table is actually used during `\input` (maybe catcodes are changed here). Finally, `\_restoretable` pops the stacks and returns to the catcodes used before `\opinput` is run.

```
29 \_def\opinput #1{\_setctable\_optextcatcodes
30   \_savecatcodetable\_\_tmpcatcodes \_catcodetable\_\_tmpcatcodes
31   \_input {#1}\_relax\restoretable}
32
33 \_newcatcodetable \_optextcatcodes
34 \_newcatcodetable \_plaintextcatcodes
35 \_newcatcodetable \_\_tmpcatcodes
36
37 \_public \optextcatcodes \plaintextcatcodes \opinput ;
38
39 \_savecatcodetable\_\_optextcatcodes
40 {\_catcode`_=8 \_savecatcodetable\plaintextcatcodes}
```

more-macros.opm

The implementation of the catcodetable stack follows.

The current catcodes are managed in the `\catcodetable0`. If the `\setctable` is used first (or at the outer level of the stack), then the `\catcodetable0` is pushed to the stack and the current table is re-set to the given `<catcode table>`. The numbers of these tables are stacked to the `\_ctablelist` macro. The `\restorectable` reads the last saved catcode table number from the `\_ctablelist` and uses it.

```
54 \_catcodetable0
55
56 \_def\setctable#1{\_edef\ctablelist{{\_the\catcodetable}\_ctablelist}%
57   \_catcodetable#1\relax
58 }
59 \_def\restorectable{\_ea\restoretableA\ctablelist\relax}
60 \_def\restoretableA#1#2\relax{%
61   \_ifx^#2^\opwarning
62     {You can't use \noindent\restoretable without previous \string\setctable}%
63   \_else \_def\ctablelist{#2}\_catcodetable#1\relax \_fi
64 }
65 \_def\ctablelist{.}
66
67 \_public \setctable \restorectable ;
```

more-macros.opm

When a special macro is defined with different catcodes then `\normalcatcodes` can be used at the end of such definition. The normal catcodes are restored. The macro reads catcodes from `\optecatodes` table and sets it to the main catcode table 0.

```
more-macros.opp
77 \_def\_\normalcatcodes {\_catcodetable\_\optexcatcodes \_\savecatcodetable0 \_\catcodetable0 }
78 \_public \normalcatcodes ;
```

The `\load` [*filename-list*] loads files specified in comma separated *filename-list*. The first space (after comma) is ignored using the trick #1#2,: first parameter is unseparated. The `\load` macro saves information about loaded files by setting `\_load:<filename>` as a defined macro.

If the `\_afterload` macro is defined then it is run after `\opinput`. The catcode setting should be here. Note that catcode setting done in the loaded file is forgotten after the `\opinput`.

```
more-macros.opp
92 \_def \_load [#1]{\_loadA #1,,,\_end}
93 \_def \_loadA #1#2,{\_ifx,#1 \_ea \_loadE \_else \_loadB{#1#2}\_ea\_\loadA\_fi}
94 \_def \_loadB #1{%
95   \_ifcsname _load:#1\_\endcsname \_else
96     \_isfile {#1.oppm}\_iftrue \_opinput {#1.oppm}\_else \_opinput {#1}\_fi
97     \_sxdef{\_load:#1}{%}
98     \_trycs{\_afterload}{}{\_let\_\_afterload=\_undefined
99     \_fi
100 }
101 \_def \_loadE #1\_\end{%
102 \_public \load ;
```

The declarator `\optdef\macro` [*opt default*] *params*{*replacement text*} defines the `\macro` with the optional parameter followed by normal parameters declared in *params*. The optional parameter must be used as the first first parameter in brackets [...]. If it isn't used then *opt default* is taken into account. The *replacement text* can use `\the\opt` because optional parameter is saved to the `\opt` tokens register. Note the difference from L<sup>A</sup>T<sub>E</sub>X concept where the optional parameter is in #1. OptEX uses #1 as the first normal parameter (if declared).

The `\nospaceafter` ignores the following optional space at expand processor level using the negative `\romannumeral` trick.

```
more-macros.opp
118 \_def\_\optdef#1[#2]{%
119   \_def#1{\_opt={#2}\_isnextchar[{\_cs{_oA:\_string#1}}{\_cs{_oB:\_string#1}}]%
120   \_sdef{_oA:\_string#1}[#1]{\_opt={##1}\_cs{_oB:\_string#1\_\nospaceafter}}%
121   \_sdef{_oB:\_string#1\_\nospaceafter}%
122 }
123 \_def\_\nospaceafter#1{\_ea#1\_\romannumeral-\`.}
124 \_newtoks\_\opt
125
126 \_public \opt \optdef ;
```

The declarator `\eoldef\macro` #1{*replacement text*} defines a `\macro` which scans its parameter to the end of the current line. This is the parameter #1 which can be used in the *replacement text*. The catcode of the `\endlinechar` is reset temporarily when the parameter is scanned.

The macro defined by `\eoldef` cannot be used with its parameter inside other macros because the catcode dancing is not possible here. But the `\bracedparam\macro`{*parameter*} can be used here. The `\bracedparam` is a prefix that re-sets temporarily the `\macro` to a `\macro` with normal one parameter.

The `\skiptoeol` macro reads the text to the end of the current line and ignores it.

```
more-macros.opp
144 \_def\_\eoldef #1{\_def #1{\_begingroup \_catcode`\^\~M=12 \_\eoldefA #1}%
145   \_ea\_\def\_\csname \_csstring #1:M\_\endcsname}
146 \_catcode`\^\~M=12 %
147 \_def\_\eoldefA #1#2^\~M{\_endgroup\_\csname \_csstring #1:M\_\endcsname{#2}}%
148 \_\normalcatcodes %
149
150 \_eoldef\_\skiptoeol#1{%
151   \_def\_\bracedparam#1{\_ifcsname \_csstring #1:M\_\endcsname
152     \_csname \_csstring #1:M\_\ea \_\endcsname
153     \_else \_csname \_in\_\csstring #1:M\_\ea \_\endcsname \_fi
154   }
155 \_public \eoldef \skiptoeol \bracedparam ;
```

`\scantoeol\macro` *text to end of line* scans the *text to end of line* in verbatim mode and runs the `\macro`{*text to end of line*}. The `\macro` can be defined `\def\macro#1{... \scantextokens{#1} ...}`.

The new tokenization of the parameter is processed when the parameter is used, no when the parameter is scanned. This principle is used in definition of `\chap`, `\sec`, `\secc` and `\Xtoc` macros. It means that user can write `\sec text`&`text` for example. Inline verbatim works in title sections.

The verbatim scanner of `\scantoeol` keeps category 7 for `\`` in order to be able to use `\`J` as comment character which means that the next line continues.

```
more-macros.opp
173 \_def\scantoeol#1{\def\_tmp{#1}\begingroup \_setscancatcodes \_scantoeolA}
174 \_def\setscancatcodes{\_setverb \_catcode`\^\^M=12\catcode`\^\^=7\catcode`\^\^=10\catcode`\^\^J=14 }
175 \_catcode`\^\^M=12 %
176 \_def\scantoeolA#1^\^M{\_endgroup \_tmp{#1}}%
177 \_normalcatcodes %
178
179 \_public \scantoeol ;
```

The `\replstring\macro{<textA>}{<textB>}` replaces all occurrences of `<textA>` by `<textB>` in the `\macro` body. The `\macro` must be defined without parameters. The occurrences of `<textA>` are not replaced if they are “hidden” in braces, for example `...{...<textA>...}....` The category codes in the `<textA>` must exactly match.

How it works: `\replstring\foo{<textA>}{<textB>}` prepares `\_replacestringsA#1<textA>{...}` and runs `\_replacestringsA<foo-body>?<textA>!<textA>`. So, #1 includes the first part of `<foo-body>` before first `<textA>`. It is saved to `\_tmptoks` and `\_replacestringsB` is run in a loop. It finishes processing or appends the next part to `\_tmptoks` separated by `<textB>` and continues loop. The final part of the macro removes the last ? from resulting `\_tmptoks` and defines a new version of the `\foo`.

```
more-macros.opp

204
205
206
207
208
209
210 \_public \replstring ;
```

The `\catcode` primitive is redefined here. Why? There is very common cases like `\catcode`<something>` or `\catcode"<number>` but these characters ``` or `"` can be set as active (typically by `\verbchar` macro). Nothing problematic happens if re-defined `\catcode` is used in this case.

If you really need primitive `\catcode` then you can use `\_catcode`.

```
more-macros.opp
222 \_def\catcode#1{\_catcode \_if`\_noexpand#1\ea`\_else\_if`\_noexpand#1"\_else
223   \_if'\_noexpand#1`\_else \_ea\ea\ea\ea\ea\ea\ea#1\fi\fi\fi}
```

The `\removespaces <text with spaces>{}` expands to `<textwithoutspaces>`.

The `\_ea\ignorept\the<dimen>` expands to a decimal number `\the<dimen>` but without pt unit.

```
more-macros.opp
232 \_def\removespaces #1 {\_isempty{#1}\_iffalse #1\ea\removespaces\fi}
233 \_ea\def \ea\ignorept \ea#\_ea1\detokenize{pt}{#1}
234
235 \public \removespaces \ignorept ;
```

You can use expandable `\bp{<dimen>}` convertor from TeX `<dimen>` (or from an expression accepted by `\dimexpr` primitive) to a decimal value in big points (used as natural unit in the PDF format). So, you can write, for example:

```
\pdfliteral{q \bp{.3\hsize-2mm} \bp{2mm} m 0 \bp{-4mm} 1 S Q}
```

You can use expandable `\expr{<expression>}` for analogical purposes. It expands to the value of the `<expression>` at expand processor level with `\_decdigits` digits after the decimal point. The `<expression>` can include `+-*()` and decimal numbers in common syntax.

The usage of prefixed versions `\_expr` or `\bp` is more recommended because a user can re-define the control sequences `\expr` or `\bp`.

```

more-macros.opm
254 \_def\_decdigits{3} % digits after decimal point in \_bp and \_expr outputs.
255 \_def\pttopb{%
256   \_directlua{tex.print(string.format('\_pcnt.\_decdigits f',
257     token.scan_dimen()/65781.76))}% pt to bp conversion
258 }
259 \def\bp#1{\ea\pttopb\dimexpr#1\relax}
260 \def\expr#1{\_directlua{tex.print(string.format('\_pcnt.\_decdigits f',#1))}}
261
262 \public \expr \bp ;

```

The pair `\_doc ... \_cod` is used for documenting macros and to printing the technical documentation of the OptEX. The syntax is:

```

\doc {ignored text}
<documentation>
\_cod {ignored text}

```

The `<documentation>` (and `<ignored text>` too) must be `<balanced text>`. It means that you cannot document only the `{` but you must document the `}` too.

```

more-macros.opm
277 \long\def\doc #1\cod {\_skiptoeol}

```

## 2.9 Using key=value format in parameters

Users or macro programmers can define macros with options in key=value format. It means a comma-separated list of equations key=value. First, we give an example.

Suppose that you want to define a macro `\myframe` with options: color of rules, color of text inside the frame, rule-width, space between text and rules. You want to use this macro as:

```

\myframe [margins=5pt,rule-width=2pt,frame-color=\Red,text-color=\Blue] {text1}
or
\myframe [frame-color=\Blue] {text2} % other parameters are default

```

You can define `\myframe` as follows:

```

\def\myframedefaults{%
  defaults:
  frame-color=\Black, % color of frame rules
  text-color=\Black, % color of text inside the frame
  rule-width=0.4pt, % width of rules used in the frame
  margins=2pt, % space between text inside and rules.
}

\optdef\myframe [] #1{\bgroup
  \ea\addto\ea\myframedefaults\ea{\ea,\the\opt}%
  \readkv\myframedefaults
  \rulewidth\kv{rule-width}
  \hh kern=\kv{margins}\vv kern=\kv{margins}\relax
  \kv{frame-color}\frame{\kv{text-color}\strut #1}%
} \egroup

```

We recommend using `\optdef` for defining macros with optional parameters written in `[]`. Then the optional parameters are saved in the `\opt` tokens register. First: we append the `\opt` (actual optional parameters) to `\myframedefaults` by `\addto` macro. Second: we read the parameters by `\readkv{<parameters list>}` macro. Third: the values can be used by expandable `\kv{<key>}` macro. The `\kv{<key>}` returns ??? if such key is not declared.

You can use keys without values in the parameters list too, but with additional care. For example, suppose `draft` option without parameter. If a user writes `\myframe [..., draft, ...]{text}` then `\myframe` should behave differently. We have to add `DRAFTv=0`, in `\myframedefaults` macro. Moreover, `\myframe` macro must include preprocessing of `\myframedefaults` using `\replstring` which replaces the occurrence of `draft` by `DRAFTv=1`.

```

\optdef\myframe [] #1{...
  \ea\addto\ea\myframedefaults\ea{\the\opt}%
  \replstring\myframedefaults{draft}{DRAFTv=1}%

```

```

\readkv\myframedefaults
...
\ifnum\kv{DRAFTv}=1 draft mode\else normal mode\fi
...
3 \codedecl \readkv {Key-value dictionaries <2020-12-21>} % preloaded in format

```

keyval.opm

**Implementation.** The `\readkv` expands its parameter and does replace-strings in order to remove spaces around equal signs and after commas. Double commas are removed. Then `\_kvscan` reads the parameters list finished by the double comma and saves values to `\_kv:<key>` macros.

The `\kv{<key>}` expands the `\_kv:<key>` macro. If this macro isn't defined then `\_kvunknown` is processed. You can re-define it if you want.

```

15 \_def\readkv#1{\_ea\_def\ea\_tmpb\ea{#1}%
16   \_replstring\tmpb{ }{=}\_replstring\tmpb{ =}{=}%
17   \_replstring\tmpb{, }{,}\_replstring\tmpb{,, }{,}%
18   \_ea \_kvscan \tmpb{,=,}%
19 \_def\kvscan #1#2=#3,{\_ifx#1,\_else \_sdef{_kv:#1#2}{#3}\_ea\kvscan\_fi}%
20 \_def\kv#1{\_trycs{_kv:#1}{\_kvunknown}}%
21 \_def\kvunknown{???
22
23 \public \readkv \kv ;

```

keyval.opm

## 2.10 Plain TeX macros

All macros from plain TeX are rewritten here. Differences are mentioned in the documentation below.

```
3 \codedecl \magstep {Macros from plain TeX <2021-04-09>} % preloaded in format
```

plain-macros.opm

The `\dospecials` works like in plain TeX but does nothing with `_`. If you need to do the same with this character, you can re-define:

```

\addto \dospecials{\do\_}

13 \_def\dospecials {\do\_ \do\\ \do{\do{}{\do{}{\do{}$ \do\&%
14   \do\#\do\^\do\^\~K\do\^\~A\do\%\do\~}
15 \chardef\_active = 13
16
17 \public \dospecials \active ;

```

plain-macros.opm

The shortcuts `\chardef@one` is not defined in OptEX. Use normal numbers instead of such obscurities. The `\magstep` and `\magstephalf` are defined with `\space`, (no `\relax`), in order to be expandable.

```

27 \_def \magstephalf{1095 }
28 \_def \magstep#1{\_ifcase#1 1000\or 1200\or 1440\or 1728\or 2074\or 2488\fi\_space}
29 \public \magstephalf \magstep ;

```

plain-macros.opm

Plain TeX basic macros and control sequences. `\endgraf`, `\endline`. The `\^L` is not defined in OptEX because it is obsolete.

```

37 \_def\^\~M{\ } % control <return> = control <space>
38 \_def\^\~I{\ } % same for <tab>
39
40 \_def\lq{\`{ }} \_def\rq{\'}%
41 \_def\lbrack{\{} \_def\rbrack{\}} % They are only public versions.
42 % \catcode`\^\~L=\active \outer\def\^\~L{\par} % ascii form-feed is "\outer\par" % obsolete
43
44 \_let\endgraf=\par \_let\endline=\_cr
45 \public \endgraf \endline ;

```

plain-macros.opm

Plain TeX classical `\obeylines` and `\obeyspaces`.

```

51 % In \obeylines, we say `\_let\^\~M=\par' instead of `\_def\^\~M{\par}'%
52 % since this allows, for example, `\_let\par=\cr \obeylines \halign{...}'%
53 {\_catcode`\^\~M=13 % these lines must end with %
54   \gdef\obeylines{\_catcode`\^\~M=13\_let\^\~M\_\par}%
55   \global\_let\^\~M=\par} % this is in case \^\~M appears in a \write
56 \_def\obeyspaces{\_catcode`\ =13 }%
57 {\_obeyspaces\global\_let =\space}%
58 \public \obeylines \obeyspaces ;

```

plain-macros.opm

Spaces. `\thinspace`, `\negthinspace`, `\enspace`, `\enskip`, `\quad`, `\quad`, `\smallskip`, `\medskip`, `\bigskip`, `\nointerlineskip`, `\offinterlineskip`, `\topglue`, `\vglue`, `\hglue`, `\slash`.

plain-macros.opm

```

68 \_protected\_def\_thinspace {\_kern .16667em }
69 \_protected\_def\_negthinspace {\_kern-.16667em }
70 \_protected\_def\_enspace {\_kern.5em }
71 \_protected\_def\_enskip {\_hskip.5em\_relax}
72 \_protected\_def\_quad {\_hskip1em\_relax}

84 \_def\_vglue {\_afterassignment\_vglA \_skip0=}
85 \_def\_vglA {\_par \_dimen0=\_prevdepth \_hrule height0pt
86   \nobreak\_vskip\_skip0 \_prevdepth=\_dimen0 }
87 \_def\_hglue {\_afterassignment\_hglA \_skip0=}
88 \_def\_hglA {\_leavevmode \_count255=\_spacefactor \_vrule width0pt
89   \nobreak\_hskip\_skip0 \_spacefactor=\_count255 }
90 \_protected\_def~{\_penalty10000 \ } % tie
91 \_protected\_def\_slash {\_penalty\exhyphenpenalty} % a `/' that acts like a `--'
92
93 \_public \topglue \vglue \hglue \slash ;

```

Penalties macros: `\break`, `\nobreak`, `\allowbreak`, `\filbreak`, `\goodbreak`, `\eject`, `\supereject`, `\dosupereject`, `\removelastskip`, `\smallbreak`, `\medbreak`, `\bigbreak`.

plain-macros.opm

```

102 \_protected\_def \_break {\_penalty-10000 }
103 \_protected\_def \_nobreak {\_penalty10000 }
104 \_protected\_def \_allowbreak {\_penalty0 }
105 \_protected\_def \_filbreak {\_par\_vfil\_penalty-200\_vfilneg}
106 \_protected\_def \_goodbreak {\_par\_penalty-500 }
107 \_protected\_def \_eject {\_par\_break}
108 \_protected\_def \_supereject {\_par\_penalty-20000 }
109 \_protected\_def \_dosupereject {\_ifnum \_insertpenalties>0 % something is being held over
110   \line{} \_kern-\_topskip \nobreak \vfill \_supereject \_fi}
111 \_def \_removelastskip {\_ifdim \_lastskip=\_zo \_else \_vskip-\_lastskip \_fi}
112 \_def \_smallbreak {\_par \_ifdim \_lastskip<\_smallskipamount
113   \removelastskip \_penalty-50 \_smallskip \_fi}
114 \_def \_medbreak {\_par \_ifdim \_lastskip<\_medskipamount
115   \removelastskip \_penalty-100 \_medskip \_fi}
116 \_def \_bigbreak {\_par \_ifdim \_lastskip<\_bigskipamount
117   \removelastskip \_penalty-200 \_bigskip \_fi}
118
119 \_public \break \nobreak \allowbreak \filbreak \goodbreak \eject \supereject \dosupereject
120   \removelastskip \smallbreak \medbreak \bigbreak ;

```

Boxes. `\line`, `\leftline`, `\rightline`, `\centerline`, `\rlap`, `\llap`, `\underline`.

plain-macros.opm

```

128 \_def \_line {\_hbox to \_hsize}
129 \_def \_leftline #1{\_line{\#1\_hss}}
130 \_def \_rightline #1{\_line{\_hss\#1}}
131 \_def \_centerline #1{\_line{\_hss\#1\_hss}}
132 \_def \_rlap #1{\_hbox to \_zo{\#1\_hss}}
133 \_def \_llap #1{\_hbox to \_zo{\_hss\#1}}
134 \_def \_underline #1{$\_setbox0=\_hbox{\#1}\_dp0=\_zo \_math \_underline{\_box0}$}
135
136 \_public \line \leftline \rightline \centerline \rlap \llap \underline ;

```

The `\strutbox` is declared as 10pt size dependent (like in plain TeX), but the macro `\setbaselineskip` (from `fonts-opmac.opm`) redefines it.

plain-macros.opm

```

143 \_newbox \_strutbox

```

```

144 \_setbox\_strutbox=\_hbox{\_vrule height8.5pt depth3.5pt width0pt}
145 \_def \_strut {\_relax\ifmmode\copy\strutbox\else\unhcopy\strutbox\fi}
146
147 \_public \strutbox \strut ;

```

Alignment. `\hidewidth \ialign \multispan`.

`plain-macros.ckpt`

```

153 \_def \_hidewidth {\_hskip\_hideskip} % for alignment entries that can stick out
154 \_def \_ialign{\_everycr={}\_tabskip=\_zskip \_halign} % initialized \halign
155 \_newcount\_mscount
156 \_def \_multispan #1{\_omit \_mscount=#1\relax
157   \_loop \_ifnum\_mscount>1 \_spanA \_repeat}
158 \_def \_spanA {\_span\omit \_advance\mscount by-1 }
159
160 \_public \hidewidth \ialign \multispan ;

```

Tabbing macros are omitted because they are obsolete.

Indentation and others. `\textindent`, `\item`, `\itemitem`, `\narrower`, `\raggedright`, `\ttraggedright`, `\leavevmode`.

`plain-macros.ckpt`

```

169 \_def \_hang {\_hangindent\parindent}
170 \_def \_textindent #1{\_indent\llap{#1\enspace}\_ignorespaces}
171 \_def \_item {\_par\_hang\textindent}
172 \_def \_itemitem {\_par\_indent \_hangindent2\parindent \_textindent}
173 \_def \_narrower {\_advance\leftskip\parindent
174   \_advance\rightskip\parindent}
175 \_def \_raggedright {\_rightskip=0pt plus2em
176   \_spaceskip=.3333em \_xspaceskip=.5em\relax}
177 \_def \_ttraggedright {\_tt \_rightskip=0pt plus2em\relax} % for use with \tt only
178 \_def \_leavevmode {\_unhbox\_voidbox} % begins a paragraph, if necessary
179
180 \_public \hang \textindent \item \itemitem \narrower \raggedright \ttraggedright \leavevmode ;

```

Few character codes are set for backward compatibility. But old obscurities (from plain TeX) based on `\mathhexbox` are not supported – an error message and recommendation to directly using the desired character is implemented by the `\usedirectly` macro). The user can re-define these control sequences of course.

`plain-macros.ckpt`

```

191 \%chardef\%=\%
192 \_let\% = \pcnt % more natural, can be used in lua codes.
193 \_chardef\&=\%
194 \_chardef\#=`\#
195 \_chardef\$=`\$
196 \_chardef\ss="FF
197 \_chardef\ae="E6
198 \_chardef\oe="F7
199 \_chardef\o="F8
200 \_chardef\AE="C6
201 \_chardef\OE="D7
202 \_chardef\O="D8
203 \_chardef\i="11 \chardef\j="12 % dotless letters
204 \_chardef\aa="E5
205 \_chardef\AA="C5

341
342 \_def \_bye {\_par \_vfill \_supereject \_byehook \_end}
343 \_public \showhyphens \bye ;

```

## 2.11 Preloaded fonts for text mode

The format in luatex can download only non-Unicode fonts. Latin Modern EC is loaded here. These fonts are totally unusable in LuaTeX when languages with out of ASCII or ISO-8859-1 alphabets are used (for example Czech). We load only a few 8bit fonts here especially for simple testing the format. But, if the user needs to do more serious work, he/she can use `\fontfam` macro to load a selected font family of Unicode fonts.

We have a dilemma: when the Unicode fonts cannot be preloaded in the format then the basic font set can be loaded by `\everyjob`. But why to load a set of fonts at the beginning of every job when it is highly likely that the user will load something completely different. Our decision is: there is a basic 8bit font set in the format (for testing purposes only) and the user should load a Unicode font family at beginning of the document.

The fonts selectors `\tenrm`, `\tenbf`, `\tenit`, `\tenbi`, `\tentt` are declared as `\public` here but only for backward compatibility. We don't use them in the Font Selection System. But the protected versions of these control sequences are used in the Font Selection System.

```

fonts-preload.opm
3 \codedecl \tenrm {Latin Modern fonts (EC) preloaded <2020-01-23>} % preloaded in format
4
5 % Only few text fonts are preloaded:
6
7 \font\tenrm=ec-lmr10 % roman text
8 \font\tenbf=ec-lmbx10 % boldface extended
9 \font\tenit=ec-lmri10 % text italic
10 \font\tenbi=ec-lmbxi10 % bold italic
11 \font\tentt=ec-lmtti10 % typewriter
12 \tenrm
13
14 \public \tenrm \tenbf \tenit \tenbi \tentt ;

```

## 2.12 Scaling fonts in text mode (low-level macros)

This section describes single part of Font Selection System: resizing fonts to various sizes. This feature is available in both modes: TFM mode (initialized when format starts) and OTF mode (after `\fontfam` or `\initunifonts` is used).

### 2.12.1 The `\setfontsize` macro

The `\setfontsize {<size spec>}` saves the information about `<size spec>`. This information is taken into account when a variant selector (for example `\rm`, `\bf`, `\it`, `\bi`) or `\resizethefont` is used. The `<size spec>` can be:

- `at<dimen>`, for example `\setfontsize{at12pt}`. It gives the desired font size directly.
- `scaled<scale factor>`, for example `\setfontsize{scaled1200}`. The font is scaled in respect to its native size (which is typically 10 pt). It behaves like `\font\... scaled<number>`.
- `mag<decimal number>`, for example `\setfontsize{mag1.2}`. The font is scaled in respect to the current size of the fonts given by the previous `\setfontsize` command.

The initialization value in `OpTeX` is given by `\setfontsize{at10pt}`.

The `\resizethefont` resizes the currently selected font to the size given by previous `\setfontsize`. For example

```
The 10 pt text is here,  
\setfontsize{at12pt} the 10 pt text is here unchanged...  
\resizethefont and the 12 pt text is here.
```

The `\setfontsize` command acts like *font modifier*. It means that it saves information about fonts but does not change the font actually until variant selector or `\resizethefont` is used.

The following example demonstrates the `mag` format of `\setfontsize` parameter. It is only a curious example probably not used in practical typography.

```
\def\smaller{\setfontsize{mag.9}\resizethefont}  
Text \smaller text \smaller text \smaller text.
```

### 2.12.2 The `\font` primitive

If you load a font directly by `\font` primitive and you want to create a size-dependent selector for such font then you can use `\resizethefont`:

```
\font\tencomfortaa=Comfortaa-Regular-T1 at10pt  
\def\comfortaa{\tencomfortaa\resizethefont}  
  
\comfortaa The 10 pt text is here  
\setfontsize{at12pt}  
\comfortaa The 12 pt text is here
```

The example above uses the 8 bit `tfm` font. You can use Unicode font too, of course. The `\fontfam` macro initializes the extended `\font` primitive features for `LuTeX` (see section 2.13.14). If you didn't use this command, you must initialize these features by the `\initunifonts` command explicitly, for example:

```
\initunifonts  
\font\tencyklop=[cyklop-regular] at10pt % the font cyklop-regular.otf is loaded  
\def\cyklop{\tencyklop\resizethefont}  
  
\cyklop The 10 pt text is here  
\setfontsize{at12pt}  
\cyklop The 12 pt text is here
```

### 2.12.3 The `\fontlet` declarator

We have another command for scaling: `\fontlet` which can resize arbitrary font given by its font switch. This font switch was declared by the `\font` primitive or the `\fontdef` macro.

```
\fontlet \<newfont> = \<fontswitch> <sizespec>  
example:  
\fontlet \bigfont = \_tenbf at15pt
```

The resulted `\bigfont` is the same as in the previous example where `\fontdef` was used. The advantage of `\fontdef` macro will be more clear when you load font families by `\fontfam` and you are using more font modifiers declared in such families.

Summary: you can declare font switches:

- by the `\font` primitive if you know the font file,
- by the `\fontlet` command if you know the font switch and the size, or
- by the `\fontdef` command if you know the variant and modifiers.

## 2.12.4 Optical sizes

There are font families with more font files where almost the same font is implemented in various design sizes: `cmr5`, `cmr6`, `cmr7`, `cmr8`, `cmr9`, `cmr10`, `cmr12`, `cmr17` for example. This feature is called “optical sizes”. `OpTeX` chooses a font with an optical size closest to desired size specified by the `\setfontsize`, when `at<dimen>` or `mag<coefficient>` is used. When `scaled<scale factor>` is used then optical size is chosen using the value of the `\defaultoptsizes` register and such font is scaled by the specified `<scale factor>`. There is `\defaultoptsizes=10pt` by default.

Font collections with optical sizes must be registered by the `\_regtfm` for `tfm` files or `\_regoptsizes` for Unicode fonts. `OpTeX` registers 8bit Latin Modern fonts in the format and OTF Latin Modern fonts in the `f-lmfonts.opm` file. See also section 2.13.12.

## 2.12.5 Implementation of resizing

Only “resizing” macros are implemented here. Other aspects of Font Selection System and their implementation are described in section 2.13.15.

```
3 \codedecl \setfontsize {Font resizing macros <2021-05-02>} % preloaded in format
```

The `\setfontsize` `{<sizespec>}` saves the `<sizespec>` to the `\_sizespec` macro. The `\_optsizes` value is calculated from the `<sizespec>`. If the `<sizespec>` is in the `mag<number>` format then the contents of the `\_sizespec` macro is re-calculated to the `at<dimen>` format using previous `\_optsizes` value.

```
14 \newdimen \optsizes \optsizes=10pt
15 \newdimen \defaultoptsizes \defaultoptsizes=10pt
16 \newdimen \lastmagsize
17
18 \def \setfontsize #1{%
19   \edef \sizespec{\#1}%
20   \ea \setoptsizes \sizespec \relax
21   \reloding
22 }
23 \def \setoptsizes {\isnextchar a{\setoptsizesA}
24   {\isnextchar m{\setoptsizesC}{\setoptsizesB}}}
25 \def \setoptsizesA at#1\relax{\optsizes=#1\relax \lastmagsize=\optsizes} % at<dimen>
26 \def \setoptsizesB scaled#1\relax{\optsizes=\defaultoptsizes\relax} % scaled<scalenumber>
27 \def \setoptsizesC mag#1\relax{%
28   \ifdim \lastmagsize>\z \optsizes=\lastmagsize \else \optsizes=\pdffontsize\font \fi
29   \optsizes=\#1\optsizes
30   \lastmagsize=\optsizes
31   \edef \sizespec{at\the\optsizes}%
32 }
33 \public \setfontsize \defaultoptsizes ;
```

`\fontlet` `{font switch A}` `{font switch B}` `{size spec}` does

`\font` `{font switch A}` = `{fontname}` `{size spec}`

The `{fontname}` is extracted using the primitive command `\_fontname` `{font switch B}`.

```
43 \def \fontlet#1#2{\_ifx #2=\ea \fontlet \ea#1\_else
44   \ea \font \ea#1 \ea \rfontskipat \fontname#2 \relax \space \fi
45 }
46 \public \fontlet ;
```

`\newcurrfontsize` `{size spec}` sets current font size to the `<size spec>` It is implemented by `\fontlet`. The font switch of the current font is extracted by `\_the\font`. We must re-create the control sequence

`\_the\_font` because its original meaning is set to “inaccessible” by TeX when `\font` primitive is started. `\resizethefont` is implemented by `\newcurrfontsize` using data from the `\_sizespec` macro.

```
fonts-resize.opm
60 \_def \_newcurrfontsize #1{%
61   \_edef\_\tmp{\_ea\_\csname \_the\_font\%}
62   \_ea \_fontlet \_csname \_tmp\_\ea\_\endcsname \_the\_font \_space #1\_\relax
63   \_ea\_\fontloaded \_csname \_tmp \_ea\_\endcsname \_csname \_tmp\_\endcsname
64 }
65 \_protected\_\def \_resizethefont{\_newcurrfontsize\_\sizespec}
66
67 \_public \newcurrfontsize \resizethefont ;
```

The `\_regtfm`  $\langle font\ id\rangle$   $\langle optical\ size\ data\rangle$  saves the  $\langle optical\ size\ data\rangle$  concerned to  $\langle font\ id\rangle$ . The  $\langle optical\ size\ data\rangle$  is in the form as shown below in the code where `\_regtfm` is used.

The `\_wichtfm`  $\langle fontname\rangle$  expands to the  $\langle fontname\rangle$  or to the corrected  $\langle fontname\rangle$  read from the  $\langle optical\ size\ data\rangle$ . It is used in the `\_rfontskipat` macro and it is used in `\fontlet` macro. It means that each  $\langle fontname\rangle$  generated by the `\fontname` primitive in the `\fontlet` macro is processed by the `\_wichtfm`. The real  $\langle fontname\rangle$  or corrected  $\langle fontname\rangle$  (depending on the optical data does not exist or exist) is the output of the expansion before `\font` primitive takes this output as its parameter.

The implementation detail: The `\_<font\ id>:reg` is defined as the  $\langle optical\ size\ data\rangle$  and all control sequences `\_<fontname>:reg` from this data line have the same meaning because of the `\_reversetfm` macro. The `\_wichtfm` expands this data line and apply `\_dowhichtfm`. This macro selects the right result from the data line by testing with the current `\_optsize` value.

```
fonts-resize.opm
92 \_def\_\regtfm #1 0 #2 *{\_ea\_\def \_csname \#1:reg\_\endcsname{#2 16380 \_\relax}%
93   \_def\_\tmpa{\#1}\_reversetfm #2 * %
94 }
95 \_def\_\reversetfm #1 #2 {%
96   \_ifcsname \#1:reg\_\ea\_\endcsname
97   \_csname \_tmpa:reg\_\endcsname
98   \_if*#2\_\else \_ea\_\reversetfm \_fi
99 }
100 \_def\_\wichtfm #1{%
101   \_ifcsname \#1:reg\_\endcsname
102   \_ea\_\ea\_\ea \_dowhichtfm
103   \_csname \#1:reg\_\ea\_\endcsname
104   \_else
105   #1%
106   \_fi
107 }
108 \_def\_\dowhichtfm #1 #2 {%
109   \_ifdim\_\optsize<\#2pt #1\_\ea\_\ignoretfm\_\else \_ea\_\dowhichtfm
110 \_fi
111 }
112 \_def\_\ignoretfm #1\_\relax{}
```

Optical sizes data for preloaded 8bit Latin Modern fonts:

```
fonts-resize.opm
118 \_regtfm lmr 0 ec-lmr5 5.5 ec-lmr6 6.5 ec-lmr7 7.5 ec-lmr8 8.5 ec-lmr9 9.5
119   ec-lmr10 11.1 ec-lmr12 15 ec-lmr17 *
120 \_regtfm lmbx 0 ec-lmbx5 5.5 ec-lmbx6 6.5 ec-lmbx7 7.5 ec-lmbx8 8.5 ec-lmbx9 9.5
121   ec-lmbx10 11.1 ec-lmbx12 *
122 \_regtfm lmri 0 ec-lmri7 7.5 ec-lmri8 8.5 ec-lmri9 9.5 ec-lmri10 11.1 ec-lmri12 *
123 \_regtfm lmtt 0 ec-lmtt8 8.5 ec-lmtt9 9.5 ec-lmtt10 11.1 ec-lmtt12 *
```

## 2.13 The Font Selection System

The basic principles of the Font Selection System used in OpTeX was documented in the section 1.3.1.

### 2.13.1 Terminology

We distinguish between

- *font switchers*, they are declared by the `\font` primitive or by `\fontlet` or `\fontdef` macros, they select given font.

- *variant selectors*, there are four basic variant selectors `\rm`, `\bf`, `\it`, `\bi`, there is a special selector `\currvar`. More variant selectors can be declared by the `\famvardef` macro. They select the font depending on the given variant and on the *font context* (i.e. on current family and on more features given by font modifiers). In addition, OpTEX defines `\tt` as variant selector independent of chosen font family. It selects typewriter-like font.
- *font modifiers* are declared in a family (`\cond`, `\caps`) or are “built-in” (`\setfontsize{<size spec>}`, `\setff{<features>}`). They do appropriate change in the *font context* but do not select the font.
- *family selectors* (for example `\Termes`, `\LMfonts`), they are declared typically in the *font family files*. They enable to switch between font families, they do appropriate change in the *font context* but do not select the font.

These commands set their values locally. When the TeX group is left then the selected font and the *font context* are returned back to the values used when the group was opened. They have the following features:

The *font context* is a set of macro values that will affect the selection of real font when the variant selector is processed. It includes the value of *current family*, current font size, and more values stored by font modifiers.

The *family context* is the current family value stored in the font context. The variant selectors declared by `\famvardef` and font modifiers declared by `\moddef` are dependent on the *family context*. They can have the same names but different behavior in different families.

The fonts registered in OpTEX have their macros in the *font family files*, each family is declared in one font family file with the name `f-filename.opm`. All families are collected in `fams-ini.opm` and users can give more declarations in the file `fams-local.opm`.

### 2.13.2 Font families, selecting fonts

The `\fontfam [<Font Family>]` opens the relevant font family file where the *<Font Family>* is declared. The family selector is defined here by rules described in the section 2.13.11. Font modifiers and variant selectors may be declared here. The loaded family is set as current and `\rm` variant selector is processed.

The available declared font modifiers and declared variant selectors are listed in the log file when the font family is load. Or you can print `\fontfam[catalog]` to show available font modifiers and variant selectors.

The font modifiers can be independent, like `\cond` and `\light`. They can be arbitrarily combined (in arbitrary order) and if the font family disposes of all such sub-variants then the desired font is selected (after variant selector is used). On the other hand, there are font modifiers that negates the previous font modifier, for example: `\cond`, `\extend`. You can reset all modifiers to their initial value by the `\resetmod` command.

You can open more font families by more `\fontfam` commands. Then the general method to selecting the individual font is:

`<family selector> <font modifiers> <variant selector>`

For example:

```
\fontfam [Heros] % Heros family is active here, default \rm variant.
\fontfam [Termes] % Termes family is active here, default \rm variant.
{\Heros \caps \cond \it The caps+condensed italics in Heros family is here.}
The Termes roman is here.
```

There is one special command `\currvar` which acts as a variant selector. It keeps the current variant and the font of such variant is reloaded with respect to the current font context by the previously given family selector and font modifiers.

You can use the `\setfontsize {<sizespec>}` command in the same sense as other font modifiers. It saves information about font size to the font context. See section 2.12. Example:

```
\rm default size \setfontsize{at14pt}\rm here is 14pt size \it italic is
in 14pt size too \bf bold too.
```

A much more comfortable way to resize fonts is using OPmac-like commands `\typosize` and `\typoscale`. These commands prepare the right sizes for math fonts too and they re-calculate many internal parameters like `\baselineskip`. See section 2.17 for more information.

### 2.13.3 Math Fonts

Most font families are connected with a preferred Unicode-math font. This Unicode-math is activated when the font family is loaded. If you don't prefer this and you are satisfied with 8bit math CM+AMS fonts preloaded in the OpTeX format then you can use command `\noloadmath` before you load a first font family.

If you want to use your specially selected Unicode-math font then use `\loadmath {[(font_file)]}` or `\loadmath {<font_name>}` before first `\fontfam` is used.

### 2.13.4 Declaring font commands

Font commands can be font switches, variant selectors, font modifiers, family selectors and defined font macros doing something with fonts.

- Font switches can be declared by `\font` primitive (see section 2.12.2) or by `\fontlet` command (see section 2.12.3) or by `\fontdef` command (see sections 2.13.5). When the font switches are used then they select the given font independently of the current font context. They can be used in `\output` routine (for example) because we need to set fixed fonts in headers and footers.
- Variant selectors are `\rm`, `\bf`, `\it`, `\bi`, `\tt` and `\currvar`. More variant selectors can be declared by `\famvardef` command. They select a font dependent on the current font context, see section 2.13.6. The `\tt` selector is documented in section 2.13.7.
- Font modifiers are “built-in” or declared by `\moddef` command. They do modifications in the font context but don't select any font.
  - “built-in” font modifiers are `\setfontsize` (see section 2.12), `\setff` (see section 2.13.9), `\setfontcolor`, `\setletterspace` and `\setwordspace` (see section 2.13.10). They are independent of font family.
  - Font modifiers declared by `\moddef` depend on the font family and they are typically declared in font family files, see section 2.13.11.
- Family selectors set the given font family as current and re-set data used by the family-dependent font modifiers to initial values and to the currently used modifiers. They are declared in font family files by `\_famdecl` macro, see section 2.13.11.
- Font macros can be defined arbitrarily by `\def` primitive by users. See an example in section 2.13.8.

All declaration commands mentioned here: `\font`, `\fontlet`, `\fontdef`, `\famvardef`, `\moddef`, `\_famdecl` and `\def` make local assignment.

### 2.13.5 The `\fontdef` declarator in detail

You can declare `\langle font-switch >` by the `\fontdef` command.

```
\fontdef\langle font-switch > {\langle family selector > \langle font modifiers > \langle variant selector >}
```

where `\langle family selector >` and `\langle font modifiers >` are optional and `\langle variant selector >` is mandatory.

The resulting `\langle font-switch >` declared by `\fontdef` is “fixed font switch” independent of the font context. More exactly, it is a fixed font switch when it is *used*. But it can depend on the current font modifiers and font family and given font modifiers when it is *declared*.

The `\fontdef` does the following steps. It pushes the current font context to a stack, it does modifications of the font context by given `\langle family selector >` and/or `\langle font modifiers >` and it finds the real font by `\langle variant selector >`. This font is not selected but it is assigned to the declared `\langle font switch >` (like `\font` primitive does it). Finally, `\fontdef` pops the font context stack, so the current font context is the same as it was before `\fontdef` is used.

### 2.13.6 The `\famvardef` declarator

You can declare a new variant selector by the `\famvardef` macro. This macro has similar syntax as `\fontdef`:

```
\famvardef\langle new variant selector > {\langle family selector > \langle font modifiers > \langle variant selector >}
```

where `\langle family selector >` and `\langle font modifiers >` are optional and `\langle variant selector >` is mandatory. The `\langle new variant selector >` declared by `\famvardef` should be used in the same sense as `\rm`, `\bf` etc. It can be used as the final command in next `\fontdef` or `\famvardef` declarators too. When the `\langle new variant selector >` is used in the normal text then it does the following steps: pushes current

font context to a stack, modifies font context by declared  $\langle\text{family selector}\rangle$  and/or  $\langle\text{font modifiers}\rangle$ , runs following  $\langle\text{variant selector}\rangle$ . This last one selects a real font. Then pops the font context stack. The new font is selected but the font context has its original values. This is main difference between  $\text{\famvardef}\text{\foo}\dots$  and  $\text{\def}\text{\foo}\dots$ .

Moreover, the  $\text{\famvardef}$  creates the  $\langle\text{new variant selector}\rangle$  family dependent. When the selector is used in another family context than it is defined then a warning is printed on the terminal “ $\langle\text{var selector}\rangle$  is undeclared in the current family” and nothing happens. But you can declare the same variant selector by  $\text{\famvardef}$  macro in the context of a new family. Then the same command may do different work depending on the current font family.

Suppose that the selected font family provides the font modifier  $\text{\medium}$  for mediate weight of fonts. Then you can declare:

```
\famvardef \mf {\medium\rm}
\famvardef \mi {\medium\it}
```

Now, you can use six independent variant selectors  $\text{\rm}$ ,  $\text{\bf}$ ,  $\text{\it}$ ,  $\text{\bi}$ ,  $\text{\mf}$  and  $\text{\mi}$  in the selected font family.

A  $\langle\text{family selector}\rangle$  can be written before  $\langle\text{font modifiers}\rangle$  in the  $\text{\famvardef}$  parameter. Then the  $\langle\text{new variant selector}\rangle$  is declared in the current family but it can use fonts from another family represented by the  $\langle\text{family selector}\rangle$ .

When you are mixing fonts from more families then you probably run into a problem with incompatible ex-heights. This problem can be solved using  $\text{\setfontsize}$  and  $\text{\famvardef}$  macros:

```
\fontfam[Heros] \fontfam[Termes]

\def\exhcorr{\setfontsize{mag.88}}
\famvardef\rmsans{\Heros\exhcorr\rm}
\famvardef\itsans{\Heros\exhcorr\it}
```

Compare ex-height of Termes  $\text{\rmsans}$  with Heros  $\text{\rm}$  and Termes.

The variant selectors (declared by  $\text{\famvardef}$ ) or font modifiers (declared by  $\text{\moddef}$ ) are (typically) control sequences in user name space ( $\text{\mf}$ ,  $\text{\caps}$ ). They are most often declared in font family files and they are loaded by  $\text{\fontfam}$ . A conflict with such names in user namespace can be here. For example: if  $\text{\mf}$  is defined by a user and then  $\text{\fontfam[Roboto]}$  is used then  $\text{\famvardef}\text{\mf}$  is performed for Roboto family and the original meaning of  $\text{\mf}$  is lost. But OpTeX prints warning about it. There are two cases:

```
\def\mf{Metafont}
\fontfam[Roboto] % warning: "The \mf is redefined by \famvardef" is printed
or
\fontfam[Roboto]
\def\mf{Metafont} % \mf variant selector redefined by user, we suppose that \mf
% is used only in the meaning of "Metafont" in the document.
```

### 2.13.7 The $\text{\tt}$ variant selector

$\text{\tt}$  is an additional special variant selector which is defined as “select typewriter font independently of the current font family”. By default, the typewriter font-face from LatinModern font family is used.

The  $\text{\tt}$  variant selector is used in OpTeX internal macros  $\text{\_ttfont}$  (verbatim texts) and  $\text{\_urlfont}$  (printing URL’s).

You can redefine the behavior of  $\text{\tt}$  by  $\text{\famvardef}$ . For example:

```
\fontfam[Cursor]
\fontfam[Heros]
\fontfam[Termes]
\famvardef\tt{\Cursor\setff{-liga;-tlig}\rm}
```

Test in Termes:  $\{\text{\tt text}\}$ .  $\{\text{\Heros\rm Test in Heros: }\{\text{\tt text}\}\}$ .

Test in URL  $\text{\url{http://something.org}}$ .

You can see that `\tt` stay family independent. This is a special feature only for `\tt` selector. New definition is used in `\_ttfont` and `\_urlfont` too. It is recommended to use `\setff{-liga;-tlig}` to suppress the ligatures in typewriter fonts.

If Unicode math font is loaded then the `\tt` macro selects typewriter font-face in math mode too. This face is selected from used Unicode math font and it is independent of `\famvardef\tt` declaration.

### 2.13.8 Font commands defined by `\def`

Such font commands can be used as fonts selectors for titles, footnotes, citations, etc. Users can define them.

The following example shows how to define a “title-font selector”. Titles are not only bigger but they are typically in the bold variant. When a user puts `{\it...}` into the title text then he/she expects bold italic here, no normal italic. You can remember the great song by John Lennon “Let It Be” and define:

```
\def\titlefont{\setfontsize{at14pt}\bf \let\it\bi}
...
{\titlefont Title in bold 14pt font and {\it bold 14pt italics} too}
```

OpTeX defines similar internal commands `\_titfont`, `\_chapfont`, `\_secfont` and `\_seccfont`, see section 2.26. The commands `\typosize` and `\boldify` are used in these macros. They set the math fonts to given size too and they are defined in section 2.17.

### 2.13.9 Modifying font features

Each OTF font provides “font features”. You can list these font features by `otfinfo -f font.otf`. For example, LinLibertine fonts provide `frac` font feature. If it is active then fractions like  $1/2$  are printed in a special form.

The font features are part of the font context data. The macro `\setff {<feature>}` acts like family independent font modifier and prepares a new `<feature>`. You must use a variant selector in order to reinitialize the font with the new font feature. For example `\setff{+frac}\rm` or `\setff{+frac}\currvar`. You can declare a new variant selector too:

```
\fontfam[LinLibertine]
\famvardef \fraclig {\setff{+frac}\currvar}
Compare 1/2 or 1/10 \fraclig to 1/2 or 1/10.
```

If the used font does not support the given font feature then the font is reloaded without warning nor error, silently. The font feature is not activated.

The `onum` font feature (old-style digits) is connected to `\caps` macro for Caps+SmallCaps variant in OpTeX font family files. So you need not create a new modifier, just use `{\caps\currvar 012345}`.

### 2.13.10 Special font modifiers

Despite the font modifiers declared in the font family file (and dependent on the font family), we have following font modifiers (independent of font family):

```
\setfontsize{<sizespec>}      % sets the font size
\setff{<font feature>}        % adds the font feature
\setfontcolor{<color>}        % sets font color
\setletterspace{<number>}     % sets letter spacing
\setwordspace{<scaling>}      % modifies word spacing
```

The `\setfontsize` command is described in the section 2.12. The `\setff` command was described in previous subsection.

`\setfontcolor {<color>}` specifies the color and the opacity of the text. The `<color>` parameter should be in the hexadecimal format of four bytes `<red><green><blue><opacity>`, for example `FF0080FF` means full red, zero green, half blue and full opacity. You can use names `red`, `green`, `blue`, `yellow`, `cyan`, `magenta`, `white`, `grey`, `lgrey` (without the backslash) instead of the hexadecimal specification. The empty parameter `<color>` means default black color.

These colors of fonts are implemented using LuaTeX internal font feature. This is different approach than using colors in section 2.20.

`\setletterspace {⟨number⟩}` specifies the letter spacing of the font. The `⟨number⟩` is a decimal number without unit. The unit is supposed as 1/100 of the font size. I.e. 2.5 means 0.25 pt when the font is at 10 pt size. The empty parameter `⟨number⟩` means no letter spacing which is the default.

`\setwordspace {⟨scaling⟩}` scales the default interword space (defined in the font) and its stretching and shrinking parameters by given `⟨scaling⟩` factor. For example `\setwordspace{2.5}` multiplies interword space by 2.5. `\setwordspace` can use different multiplication factors if its parameter is in the format `{⟨default⟩}/{⟨stretching⟩}/{⟨shrinking⟩}`. For example, `\setwordspace{/1/2.5/1}` enlarges only stretching 2.5 times.

You can use `\setff` with other font features provided by LuaTeX and `luaotfload` package (see documentation of `luaotfload` package for more information):

```
\setff{embolden=1.5}\rm % font is bolder because outline has nonzero width
\setff{slant=0.2}\rm % font is slanted by a linear transformation
\setff{extend=1.2}\rm % font is extended by a linear transformation.
\setff{colr=yes}\rm % if the font includes colored characters, use colors
\setff{upper}\rm % to uppercase (lower=lowercase) conversion at font level
\setff{fallback=name}\rm % use fonts from a list given by name if missing chars
```

Use font transformations `embolden`, `slant`, `extend` and `\setletterspace`, `\setwordspace` with care. The best setting of these values is the default setting in every font, of course. If you really need to set a different letter spacing then it is strongly recommended to add `\setff{-liga}` to disable ligatures. And setting a positive letter spacing probably needs to scale interword spacing too.

All mentioned font modifiers (except for `\setfontsize`) work only with Unicode fonts loaded by `\fontfam`.

### 2.13.11 How to create the font family file

The font family file declares the font family for selecting fonts from this family at the arbitrary size and with various shapes. Unicode fonts (OTF) are preferred. The following example declares the Heros family:

```
f-heros.otp
3 \famdecl [Heros] \Heros {TeX Gyre Heros fonts based on Helvetica}
4   {\caps \cond} {\rm \bf \it \bi} {FiraMath}
5   {[texgyreheros-regular]}
6   {\def \fontnamegen{[texgyreheros\_condV-\_currV]:\caps\fontfeatures}}
7
8 \wlog{\detokenize{%
9 Modifiers:^^J
10 \caps ..... caps & small caps^^J
11 \cond ..... condensed variants^^J
12 }}}
13
14 \moddef \resetmod {\fsetV caps={},cond={} \fvars regular bold italic bolditalic }
15 \moddef \caps {\fsetV caps+=smcp;\ffonum; }
16 \moddef \nocaps {\fsetV caps={}}
17 \moddef \cond {\fsetV cond=cn }
18 \moddef \nocond {\fsetV cond={}}
19
20 \initfontfamily % new font family must be initialized
21
22 \ifmathloading
23   \loadmath {[FiraMath-Regular]}
24   \addto\normalmath{\loadumathfamily 5 {xitsmath-regular}{} }
25   \addto\boldmath {\loadumathfamily 5 {xitsmath-bold}{} }
26   \addto\fрак{\fam5 }\addto\cal{\fam5 }
27   \normalmath
28   \wterm{MATH-FONT(5): "[XITSMath-Regular/Bold]" -- used for \string\cal, \string\fрак}
29   % \bf, \bi from FiraMath:
30   \let\bsansvariables=\bfvariables
31   \let\bsansGreek=\bfGreek
32   \let\bsansGreek=\bfGreek
33   \let\bsansdigits=\bfdigits
34   \let\bisansvariables=\bivariables
35   \let\bisansGreek=\bigreek
36   \Umathchardef \triangle "0 "5 "25B3 \Umathcode "25B3 "0 "5 "25B3
37 \fi
```

If you want to write such a font family file, you need to keep the following rules.

- Use the `\_famdecl` command first. It has the following syntax:

```
\_famdecl [<Name of family>] \<Familyselector> {<comments>}
           {<modifiers>} {<variant selectors>} {<comments about math fonts>}
           {<font-for-testing>}
           {\_def\_fontnamegen{<font name or font file name generated>}}
```

This writes information about font family at the terminal and prevents loading such file twice. Moreover, it probes existence of `<font-for-testing>` in your system. If it doesn't exist, the file loading is skipped with a warning on the terminal. The `\_ifexistfam` macro returns false in this case. The `\_fontnamegen` macro must be defined in the last parameter of the `\_famdecl`. More about it is documented below.

- You can use `\wlog{\_detokenize{...}}` to write additional information into a log file.
- You can declare optical sizes using `\regoptsizes` if there are more font files with different optical sizes (like in Latin Modern). See `f-lmfonts.opm` file for more information about this special feature.
- Declare font modifiers using `\moddef` if they are present. The `\resetmod` must be declared in each font family.
- Check if all your declared modifiers do not produce any space in horizontal mode. For example check: `X\caps Y`, the letters XY must be printed without any space.
- Optionally, declare new variants by the `\famvardef` macro.
- Run `\initfontfamily` to start the family (it is mandatory).
- If math font should be loaded, use `\loadmath{<math font>}`.

The `\_fontnamegen` macro (declared in the last parameter of the `\_famdecl`) must expand (at the expand processor level only) to a file name of the loaded font (or to its font name) and to optional font features appended. The Font Selection System uses this macro at the primitive level in the following sense:

```
\font \<font-switch> {\_fontnamegen} \_sizespec
```

Note that the extended `\font` syntax `\font\<font-switch> {<font name>:<font features>} <size spec.>` or `\font\<font-switch> {[<font file name>]}:<font features>} <size spec.>` is expected here.

### Example 1

Assume an abstract font family with fonts `xx-Regular.otf`, `xx-Bold.otf`, `xx-Italic.otf` and `xx-BoldItalic.otf`. Then you can declare the `\resetmod` (for initializing the family) by:

```
\_moddef\resetmod{\_fvars Regular Bold Italic BoldItalic }
```

and define the `\_fontnamegen` in the last parameter of the `\_famdecl` by:

```
\_famdecl ...
{\_def\_fontnamegen{[xx-\_currV]}}
```

The following auxiliary macros are used here:

- `\moddef` declares the family dependent modifier. The `\resetmod` saves initial values for the family.
- `\fvars` saves four names to the memory, they are used by the `\_currV` macro.
- `\_currV` expands to one of the four names dependent on `\rm` or `\bf` or `\it` or `\bi` variant is required.

Assume that the user needs `\it` variant in this family. Then the `\_fontnamegen` macro expands to `[xx-\_currV]` and it expands to `[xx-Italic]`. The Font Selection System uses `\font {[xx-Italic]}`. This command loads the `xx-Italic.otf` font file.

See more advanced examples are in `f-<family>.opm` files.

### Example 2

The `f-heros.opm` is listed here. Look at it. When Heros family is selected and `\bf` is asked then `\font {[texgyreheros-bold]}:+tlig; at10pt` is processed.

You can use any expandable macros or expandable primitives in the `\_fontnamegen` macro. The simple macros in our example with names `\_<word>V` are preferred. They expand typically to their content. The macro `\fsetV <word>=<content>` (terminated by a space) is equivalent to `\def\<word>V{<content>}` and you can use it in font modifiers. You can use the `\fsetV` macro in more general form:

```
\_fsetV <word-a>=<value-a>, <word-b>=<value-b> ...etc. terminated by a space
```

with obvious result `\def\_<word-a>V {<value-a>} \def\_<word-b>V {<value-b>}` etc.

### Example 3

If both font modifiers `\caps`, `\cond` were applied in Heros family, then `\def\_capsV{+smcp; \ffonum;}` and `\def\_condV{cn}` were processed by these font modifiers. If a user needs the `\bf` variant at 11 pt now then the

```
\font {[texgyreheroscn-bold]}: +smcp; +onum; +pnum; +tlig; } at 11pt
```

is processed. We assume that a font file `texgyreheroscn-bold.otf` is present in your TeX system.

### The `\_onlyif` macro

has the syntax `\_onlyif <word>=<value-a>,<value-b>,...<value-n>: {<what>}`. It can be used inside `\moddef` as simple IF statement: the `<what>` is processed only if `<word>` has `<value-a>` or `<value-b>` ... or `<value-n>`. See `f-roboto.opm` for examples of usage of many `\_onlyif`'s.

Recommendation: use the `\_fontfeatures` macro at the end of the `\_fontnamegen` macro in order to the `\setff`, `\setfontcolor`, `\setletterspace` macros can work.

### The `\moddef` macro

has the syntax `\moddef<modifier>{<what to do>}`. It does more things than simple `\def`:

- The modifier macros are defined as `\_protected`.
- The modifier macros are defined as family-dependent.
- If the declared control sequence is defined already (and it is not a font modifier) then it is re-defined with a warning.

The `\famvardef` macro has the same features.

The `\<Familyselector>` is defined by the `\_famdecl` macro as:

```
\protected\def\<Familyselector> {%
  \def\_currfamily {\<Familyselector>}%
  \def\_fontnamegen {...}%
    % this is copied from 7-th parameter of \_famdecl
  \resetmod
  <run all family-dependent font modifiers used before Familyselector without warnings>
```

### The `\_initfontfamily`

must be run after modifier's declaration. It runs the `\<Familyselector>` and it runs `\_rm`, so the first font from the new family is loaded and it is ready to use it.

### Name conventions

Create font modifiers, new variants, and the `\<Familyselector>` only as public, i.e. in user namespace without `_` prefix. We assume that if a user re-defines them then he/she needs not them, so we have no problems. If the user's definition was done before loading the font family file then it is re-defined and OptEX warns about it. See the end of section [2.13.4](#).

The name of `\<Familyselector>` should begin with an uppercase letter.

Please, look at [OptEX font catalogue](#) before you will create your font family file and use the same names for analogical font modifiers (like `\cond`, `\caps`, `\sans`, `\mono` etc.) and for extra variant selectors (like `\lf`, `\li`, `\kf`, `\ki` etc. used in Roboto font family).

If you are using the same font modifier names to analogical font shapes then such modifiers are kept when the family is changed. For example:

```
\fontfam [Termes] \fontfam[Heros]
\caps\cond\it Caps+Cond italic in Heros \Termes\currvar Caps italic in Termes.
```

The family selector first resets all modifiers data by `\resetmod` and then it tries to run all currently used family-dependent modifiers before the family switching (without warnings if such modifier is unavailable in the new family). In this example, `\Termes` does `\resetmod` followed by `\caps\cond`. The `\caps` is applied and `\cond` is silently ignored in Termes family.

If you need to declare your private modifier (because it is used in other modifiers or macros, for example), use the name `\_wordM`. You can be sure that such a name does not influence the private namespace used by OptEX.

## Additional notes

See the font family file `f-libertine-s.opm` which is another example where no font files but font names are used.

See the font family file `f-lmfonts.opm` or `f-poltawski.opm` where you can find the the example of the optical sizes declaration including documentation about it.

If you need to create a font family file with a non-Unicode font, you can do it. The `\_fontnamegen` must expand to the name of TFM file in this case. But we don't prefer such font family files, because they are usable only with languages with alphabet subset to ISO-8859-1 (Unicodes are equal to letter's codes of such alphabets), but middle or east Europe use languages where such a condition is not true.

### 2.13.12 How to write the font family file with optical sizes

You can use `\_optname` macro when `\_fontnamegen` is expanded. This macro is fully expandable and its input is `<internal-template>` and its output is a part of the font file name `<size-dependent-template>` with respect to given optical size.

You can declare a collection of `<size-dependent-template>`s for one given `<internal-template>` by the `\_regoptsizes` macro. The syntax is shown for one real case:

```
\_regoptsizes lmr.r lmroman?-regular  
      5 <5.5 6 <6.5 7 <7.5 8 <8.5 9 <9.5 10 <11.1 12 <15 17 <*
```

In general:

```
\_regoptsizes <internal-template> <general-output-template> <resizing-data>
```

Suppose our example above. Then `\_optname{lmr.r}` expands to `lmroman?-regular` where the question mark is substituted by a number depending on current `\_optsizes`. If the `\_optsizes` lies between two boundary values (they are prefixed by `<` character) then the number written between them is used. For example if  $11.1 < \_optsizes \leq 15$  then 12 is substituted instead question mark. The `<resizing-data>` virtually begins with zero `<0`, but it is not explicitly written. The right part of `<resizing-data>` must be terminated by `<*>` which means "less than infinity".

If `\_optname` gets an argument which is not registered `<internal-template>` then it expands to `\_failedoptname` which typically ends with an error message about missing font. You can redefine `\_failedoptname` macro to some existing font if you find it useful.

We are using a special macro `\_LMregfont` in `f-lmfonts.opm`. It sets the file names to lowercase and enables us to use shortcuts instead of real `<resizing-data>`. There are shortcuts `\_regoptFS`, `\_regoptT`, etc. here. The collection of `<internal-templates>` are declared, each of them covers a collection of real file names.

The `\_optfontalias {<new-template>} {<internal-template>}` declares `<new-template>` with the same meaning as previously declared `<internal-template>`.

The `\_optname` macro can be used even if no otical sizes are provided by a font family. Suppose that font file names are much more chaotic (because artists are very creative people), so you need to declare more systematic `<internal-templates>` and do an alias from each `<internal-template>` to `<real-font-name>`. For example, you can do it as follows:

```
\def\fontalias #1 #2 {\_regoptsizes #1 ?#2 {} <*  
%           alias name          real font name  
\fontalias crea-a-regular   {Creative Font}  
\fontalias crea-a-bold     {Creative FontBold}  
\fontalias crea-a-italic   {Creative oblique}  
\fontalias crea-a-bolditalic {Creative Bold plus italic}  
\fontalias crea-b-regular   {Creative Regular subfam}  
\fontalias crea-b-bold     {Creative subfam bold}  
\fontalias crea-b-italic   {Creative-subfam Oblique}  
\fontalias crea-b-bolditalic {Creative Bold subfam Oblique}
```

Another example of a font family with optical sizes is Antykwa Półtawskiego. The optical sizes feature is deactivated by default and it is switched on by `\osize` font modifier:

```
3 \famdecl [Poltawski] \Poltawski {Antykwa Poltawskiego, Polish traditional font family}  
4   {\light \noexpd \expd \eexpd \cond \ccond \osize \caps} {\rm \bf \it \bi} {}  
5   {[antpolt-regular]}
```

`f-poltawski.opm`

```

6      {\_def\fontnamegen {[antpol\liV\_condV-\currV]\_capsV\fontfeatures}}
7
8 \wlog{\detokenize{%
9 Modifiers:^^J
10 \light ..... light weight, \bf,\bi=semibold^^J
11 \noexpd ..... no expanded, no condensed, designed for 10pt size (default)^^J
12 \eexpd ..... expanded, designed for 6pt size^^J
13 \expd ..... semi expanded, designed for 8pt size^^J
14 \cond ..... semi condensed, designed for 12pt size^^J
15 \ccond ..... condensed, designed for 17pt size^^J
16 \osize ..... auto-sitches between \ccond \cond \noexpd \expd \eexpd by size^^J
17 \caps ..... caps & small caps^^J
18 };}
19
20 \moddef \resetmod {\fsetV li={} ,cond={},caps={} \fvars regular bold italic bolditalic }
21 \moddef \light {\fsetV li=lt }
22 \moddef \noexpd {\fsetV cond={} }
23 \moddef \eexpd {\fsetV cond=expd }
24 \moddef \expd {\fsetV cond=semiexpd }
25 \moddef \cond {\fsetV cond=semicond }
26 \moddef \ccond {\fsetV cond=cond }
27 \moddef \caps {\fsetV caps=+smcp;\ffonum; }
28 \moddef \nocaps {\fsetV caps={} }
29 \moddef \osize {\_def\fontnamegen{[antpol\liV\optname{x}-\currV]:\_capsV\fontfeatures}%
30 \regoptsizes x ? expd <7 semiexpd <9 {} <11.1 semicond <15 cond <*}
31
32 \initfontfamily % new font family must be initialized

```

### 2.13.13 How to register the font family in the Font Selection System

Once you have prepared a font family file with the name `f-<famname>.opm` and TeX can see it in your filesystem then you can type `\fontfam[<famname>]` and the file is read, so the information about the font family is loaded. The name `<famname>` must be lowercase and without spaces in the file name `f-<famname>.opm`. On the other hand, the `\fontfam` command is more tolerant: you can write uppercase letters and spaces here. The spaces are ignored and uppercase letters are converted to lowercase. For example `\fontfam [LM Fonts]` is equivalent to `\fontfam [LMfonts]` and both commands load the file `f-lmfonts.opm`.

You can use your font file in sense of the previous paragraph without registering it. But problem is that such families are not listed when `\fontfam[?]` is used and it is not included in the font catalog when `\fontfam[catalog]` is printed. The list of families taken in the catalog and listed on the terminal is declared in two files: `fams-ini.opm` and `fams-local.opm`. The second file is optional. Users can create it and write to it the information about user-defined families using the same syntax as in existed file `fams-ini.opm`.

The information from the user's `fams-local.opm` file has precedence. For example `fams-ini.opm` declares aliases Times→Termes etc. If you have the original Times purchased from Adobe then you can register your declaration of Adobe's Times family in `fams-local.opm`. When a user writes `\fontfam[Times]` then the original Times (not Termes) is used.

The `fams-ini.opm` and `fams-local.opm` files can use the macros `\faminfo`, `\famalias` and `\famtext`. See the example from `fams-ini.tex`:

```

fams-ini.opm
3 % Version <2020-02-28>. Loaded in format and secondly on demand by \fontfam[catalog]
4
5 \famtext {Special name for printing a catalog :}
6
7 \faminfo [Catalogue] {Catalogue of all registered font families} {fonts-catalog} {}
8 \famalias [Catalog]
9
10 \famtext {Computer Modern like family:}
11
12 \famfrom {GUST}
13 \faminfo [Latin Modern] {TeX Gyre fonts based on Computer Modern} {f-lmfonts}
14   { -, \nbold, \sans, \sans\nbold, \slant, \ttset, \ttset\slant, \ttset\caps, %
15     \ttprop, \ttprop\bolder, \quotset: {\rm\bf\it\bi}%
16     \caps: {\rm\it}%
17     \ttlight, \ttcond, \dunhill: {\rm\it} \upital: {\rm} }

```

```

18 \_famalias [LMfonts] \_famalias [Latin Modern Fonts] \_famalias [lm]
19
20 \_famtext {TeX Gyre fonts based on Adobe 35:}
21
22 \_faminfo [Termes] {TeX Gyre Termes fonts based on Times} {f-termes}
23   { -, \caps: {\rm\bf\it\bi} }
24 \_famalias [Times]
25
26 \_faminfo [Heros] {TeX Gyre Heros fonts based on Helvetica} {f-heros}
27   { -, \caps, \cond, \caps\cond: {\rm\bf\it\bi} }
28 \_famalias [Helvetica]

```

... etc.

The `\_faminfo` command has the syntax:

```
\_faminfo [<Family Name>] {[<comments>]} {[<file-name>]}
  { <mod-plus-vars> }
```

The `<mod-plus-vars>` data is used only when printing the catalog. It consists of one or more pairs `<mods>: {<vars>}`. For each pair: each modifier (separated by comma) is applied to each variant selector in `<vars>` and prepared samples are printed. The `-` character means no modifiers should be applied.

The `\_famalias` declares an alias to the last declared family.

The `\_famtext` writes a line to the terminal and the log file when all families are listed.

The `\_famfrom` saves the information about font type foundry or manufacturer or designer or license owner. You can use it before `\_faminfo` to print `\_famfrom` info into the catalog. The `\_famfrom` data is applied to each following declared families until new `\_famfrom` is given. Use `\_famfrom {}` if the information is not known.

### 2.13.14 Notices about extension of \font primitive

Unicode fonts are loaded by extended `\font` primitive. This extension is not activated in OptEX by default, `\initunifonts` macro activates it. You need not use `\initunifonts` explicitly if `\fontfam` macro is used because `\fontfam` runs it internally.

The `\initunifonts` loads the Lua code from the Luatfload package which implements the `\font` primitive extension. See its documentation `luatfload-latex.pdf` for information about all possibilities of extended `\font` primitive.

The OptEX format is initialized by `luatex` engine by default but you can initialize it by `luahbtex` engine too. Then the harfbuzz library is ready to use for font rendering as an alternative to built-in font renderer from Luatfload. The harfbuzz library gives more features for rendering Indic and Arabic scripts. But it is not used as default, you need to specify `mode=harf` in the `fontfeatures` field when `\font` is used. Moreover, when `mode=harf` is used, then you must specify `script` too. For example

```
\font\devafont=[NotoSansDevanagari-Regular]:mode=harf;script=dev2
```

If the `luahbtex` engine is not used then `mode=harf` is ignored. See Luatfload documentation for more information.

### 2.13.15 Implementation of the Font Selection System

```
3 \codedecl \fontfam {Fonts selection system <2021-07-16>} % preloaded in format
```

`fonts-select.otp`

The variant selectors `\rm`, `\bf`, `\it`, `\bi`, `\tt` are defined (roughly speaking) by

```
\def\<XX> {\_tryload<XX>\_ten<XX>}
```

where `<XX>` is “internal variant name” `rm` or `bf` or `it` or `bi` or `tt`. There are five “internal font switchers” `\_tenrm`, `\_tenbf`, `\_tenit`, `\_tenbi` and `\_tentt`. They are used almost for all fonts selected by the Fonts Selection System. For example, `\_tenbf` is the switcher for bold variant of the current family in the current font context. The `\bf` macro is defined as `\_tryloadbf \_tenbf`. If the font context (font family, font size, features) is not changed, then `\_tryloadbf` is `\relax` and `\_tenbf` font switcher selects given font. If the font context is changed, then `\_tryloadbf` is re-defined (see `\_reloading` macro) to load new bold variant of the font using `\_resizelfont`. The loaded font is saved to `\_tenbf` switcher and `\_tryloadbf` returns back to the `\relax` meaning. So, `\bf` macro loads new font with current font context and then selects it by `\_tenbf` selector. The word “ten” is used here only for historical reason;

the font can be at arbitrary size.

The `\_reloading` macro is run whenever font context is changed. It activates `\_tryload{XX}` for `{XX}` in `rm`, `bf`, `it` and `bi`. The `\_loadf{XX}\ten{XX}` is processed for this.

The `\_tryloadtt` is implemented differently because we want to keep family independence for `\tt` macro, see section 2.13.7. So, `\_tryloadtt` is defined constantly as “loading `\tt` font” and it is not re-defined to `\relax`. On the other hand, `\_tryloadtt` is re-defined in the `\initunifonts` macro or when `\famvardef\tt` is used.

```
fonts-select.opp
38 \_def\reloading{\_loadf{rm}\tenrm \_loadf{bf}\tenbf \_loadf{it}\tenit \_loadf{bi}\tenbi}
39 \_def\loadf#1#2{\_sdef{\_tryload#1}{\_ifmmode \_else \_resizelfont{#1}#2\fi}}
40 \_def\tryloadtt{\_resizelfont{tt}\tentt} % only in TFM mode
41
42 \_let\tryloadrm=\_relax
43 \_let\tryloadbf=\_relax
44 \_let\tryloadit=\_relax
45 \_let\tryloadbi=\_relax
```

The Font Selection system allows to use `\currvar` instead of an explicitly specified variant selector. The current variant is extracted from `\the\font` output which could be the `\ten{XX}` control sequence. Then `\currvar` expands to `\rm` or `\it` etc.

```
fonts-select.opp
54 \_protected \_def \currvar{\_cs{\currvar:\_ea \_csstring \the\font}}
55 \_sdef{\currvar:_tenrm}{\_rm}
56 \_sdef{\currvar:_tenbf}{\_bf}
57 \_sdef{\currvar:_tenit}{\_it}
58 \_sdef{\currvar:_tenbi}{\_bi}
59 \_sdef{\currvar:_tentt}{\_tt}
60 \_public \currvar ;
```

The `\resizelfont {variant-name}\{font switch}` is the heart of the Fonts Selection System. It resizes the font given by the variant with respect to the current font context and sets a new `{font-switch}`. The `(variant-name)` is `rm` or `bf` or `it` or `bi` or `tt`. The new `{font-switch}` is declared (roughly speaking) by:

```
\_font {font switch} = {fontname of}\ten{variant-name} \sizespec % in TFM mode
\font {font switch} = {\fontnamegen} \sizespec % in OTF mode
```

The font is loaded by `\doresizelfont{font switch}`. This macro has meaning `\doresizetfmfont` in TFM mode (default in format) and it switches to `\doresizeunifont` when `\initunifonts` is used.

The `(fontname of)` is generated by the `\fontname` TEX primitive where `\rfontskipat` removes the `at(dimen)` part of the `\fontname` output.

The `\whatresize` is defined as `(variant-name)`.

The `\fontloaded{font switch}` is a macro which can be used for post-processing when a font is loaded.

```
fonts-select.opp
82 \_def\resizelfont#1#2{%
83   \_edef\whatresize{\_doresizelfont#2\relax \fontloaded #2%
84   \_lastmagsize=\_zo

86 }
87 \_def\doresizetfmfont#1{\_logfont{#1}%
88   \_ea\font\ea{\_ea\rfontskipat
89     \fontname \cs{\ten\whatresize} \relax\space \sizespec \relax
90 }
91 \_let\doresizelfont=\doresizetfmfont
92 \_def\logfont#1{} % default is no logging of used fonts
93
94 \_def\rfontskipat#1{\_ifx#\_ea\rfskipatX \else\ea\rfskipatN\ea#1\fi}
95 \_def\rfskipatX #1 #2\relax{\_whichtfm{#1}}
96 \_def\rfskipatN #1 #2\relax{\_whichtfm{#1}}
```

`\doresizeunifont{font-switch}` implements the OTF mode of loading fonts `\doresizelfont`. There is a fallback to TFM mode if `\fontnamegen` is not defined.

The `\fontnamegen` expands to the font name/file:font-features depending on the current font context.

```
fonts-select.opp
106 \_def\doresizeunifont #1{\_logfont{#1}%
107   \_ifx\fontnamegen\undefined \doresizetfmfont#1\else
108     \font#1=\fontnamegen \sizespec \relax \setwsp#1\relax
109   \_fi
110 }
```

If a font is loaded by `\_resizelfont` or `\resizethefont` then the `\_fontloaded`*(font switch)* is called immediately after it. If the font is loaded first then its `\skewchar` is equal to  $-1$ . We run `\_newfontloaded`*(font switch)* and set `\skewchar=-2` in this case. A user can define a `\_newfontloaded` macro. We are sure that `\_newfontloaded` macro is called only once for each instance of the font given by its name, OTF features and size specification. The `\skewchar` value is globally saved to the font (like `\fontdimen`). If it is used in math typesetting then it is set to a positive value.

The `\_newfontloaded` should be defined for micro-typographic configuration of fonts, for example. See [OptTeX trick 0058](#).

```
fonts-select.opm
127 \_def\_\fontloaded #1{\_ifnum\_skewchar#1=-1 \_skewchar#1=-2 \_newfontloaded#1\_fi}
128 \_def\_\newfontloaded #1{}
```

`\initunifonts` macro extends LuaTeX's font capabilities, in order to be able to load Unicode fonts. Unfortunately, this part of OptTeX depends on the `luaotfload` package, which adapts ConTeXt's generic font loader for plain TeX and L<sup>A</sup>T<sub>E</sub>X. `luaotfload` uses Lua functions from L<sup>A</sup>T<sub>E</sub>X's `luatexbase` namespace, we provide our own replacements. Moreover, `\initunifont` switches with the `\_doresizelfont` macro to OTF mode which is represented by the macro `\_doresizeunifont`. Finally, `\initunifonts` sets itself to relax because we don't want to do this work twice.

`\ttunifont` is default font for `\tt` variant. User can re-define it or use `\famvardef\tt`.

```
fonts-select.opm
145 \_def\_\initunifonts #%
146   \_directlua{%
147     require('luaotfload-main')
148     luaotfload.main()

```

The `\famdecl` [*Family Name*] `\<Famselector>` {*comment*} {*modifiers*} {*variants*} {*math*} {*font for testing*} {`\def\_\fontnamegen{<data>}`} runs `\initunifonts`, then checks if `\<Famselector>` is defined. If it is true, then closes the file by `\endinput`. Else it defines `\<Famselector>` and saves it to the internal `\_f:<currfamily>:main.fam` command. The macro `\_initfontfamily` needs it. The `\_currfamily` is set to the `\<Famselector>` because the following `\moddef` commands need to be in the right font family context. The `\_currfamily` is set to the `\<Famselector>` by the `\<Famselector>` too, because `\<Famselector>` must set the right font family context. The font family context is given by the current `\_currfamily` value and by the current meaning of the `\_fontnamegen` macro. The `\_mathfaminfo` is saved for usage in the catalog.

```

`\fvars` *(rm-template)* *(bf-template)* *(it-template)* *(bi-template)* saves data for usage by the `\currV` macro. If a template is only dot then previous template is used (it can be used if the font family doesn't

dispose with all standard variants).

`\_currV` expands to a template declared by `\_fvars` depending on the `\langle variant name \rangle`. Usable only of standard four variants. Next variants can be declared by the `\famvardef` macro.

`\_fsetV \langle key \rangle=\langle value \rangle, \dots, \langle key \rangle=\langle value \rangle` expands to `\def\_\langle key \rangle V{\langle value \rangle}` in the loop.

`\_onlyif \langle key \rangle=\langle value-a \rangle, \langle value-b \rangle, \dots, \langle value-z \rangle`: `\{ \langle what \rangle \}` runs `\langle what \rangle` only if the `\_\langle key \rangle V` is defined as `\langle value-a \rangle` or `\langle value-b \rangle` or ... or `\langle value-z \rangle`.

`\_prepcommalist ab, {}, cd, \_end`, expands to `ab, , cd,` (auxiliary macro used in `\_onlyif`).

`\ffonum` is a shortcut for oldstyle digits font features used in font family files. You can do `\let\ffonum=\ignoreit` if you don't want to set old digits together with `\caps`.

```

```

The `\moddef \langle modifier \rangle \{ \langle data \rangle \}` simply speaking does `\def\langle modifier \rangle\{ \langle data \rangle \}`, but we need to respect the family context. In fact, `\protected\def\_\f: \langle current family \rangle : \langle modifier \rangle \{ \langle data \rangle \}` is performed and the `\langle modifier \rangle` is defined as `\_famdepend\langle modifier \rangle\{ \_f: \_currfamily: \langle modifier \rangle \}`. It expands to `\_f: \_currfamily: \langle modifier \rangle` value if it is defined or it prints the warning. When the `\currfamily` value is changed then we can declare the same `\langle modifier \rangle` with a different meaning.

When a user declares a prefixed variant of the `\langle modifier \rangle` then unprefixed modifier name is used in internal macros, this is the reason why we are using the `\remifirstunderscore\_\tmp` (where `\tmp` expands to `_ \langle something \rangle` or to `\langle something \rangle`). The `\remifirstunderscore` redefines `\tmp` in the way that it expands only to `\langle something \rangle` without the first `_`.

`\setnewmeaning \langle cs-name \rangle=\_tmpa \langle by-what \rangle` does exactly `\let \langle csname \rangle=\_tmpa` but warning is printed if `\langle cs-name \rangle` is defined already and it is not a variant selector or font modifier.

`\addtomodlist \langle font modifier \rangle` adds given modifier to `\modlist` macro. This list is used after `\resetmod` when a new family is selected by a family selector, see `\resetfam` macro. This allows reinitializing the same current modifiers in the font context after the family is changed.

```
fonts-select.opp

```

\fontdef <font-switch> {{data}} does:

```
\begingroup {data} \ea\endgroup \ea{font-switch} \the\font
```

It means that font modifiers used in <data> are applied in the group and the resulting selected font (current at the end of the group) is set to the <font-switch>. We want to declare <font-switch> in its real name directly by \font primitive in order to save this name for reporting later (in overfull messages, for example). This is the reason why \loadf is re-defined locally here. The <variant selector> used in <data> expands to \tryload<XX> \ten<XX>. The modified \tryload<XX> removes \ten<XX> and does \resizefont{{XX}}<font-switch><font-switch>, i.e. a font is loaded using real <font-switch> name and then it is selected as the current font.

```

315 \_def\_fontdef #1#2{\_begingroup
316   \_def\_loadf##1##2{\_sdef{\_tryload##1}###1{\_resizefont##1#1#1}}%

318   #2\ea\endgroup \ea\let \ea#1\_the\_font
319 }
320 \public \fontdef ;

```

fonts-select.opp

The \famvardef <XX> {{data}} does, roughly speaking:

```
\def <XX> {\fontdef \ten<XX> {{data}}\ten<XX>}
```

but the macro <XX> is declared as family-dependent. So, the real \famvardef <XX> {{data}} uses analogical trick like \moddef with the \famdepend macro. The \famvardef loads the auxiliary \famvardefA <XX> \ten<XX> \tryload<XX> {{data}}. It does:

- \def \tryload:<currfam>:<XX> {\fontdef \ten<XX> {{data}}} loads font \ten<XX>,
- \protected\def <XX> {\famdepend <XX> {\_f:<currfam>:<XX>}},
- \def \\_f:<currfam>:<XX> {\tryload:<currfam>:<XX>\ten<XX>} keeps family dependent definition,
- \def \currvar:\_ten<XX> {{}} in order to the \currvar macro work correctly.

\famvardef\tt behaves somewhat differently: it doesn't re-define the \tt macro which is defined as \tryloadtt \tentt in sections 2.14 and 2.16.2. It only re-defines the internal \tryloadtt macro. Note, that you cannot use \tt inside \famvardef\tt. So, new \tt macro does not load \ttunifont but uses font from a standard variant rm, bf, it or bi with given font context.

```

347 \_def\_famvardef#1{\_edef\_tmp{\_csstring#1}%

fonts-select.opp

The \fontfam [<Font Family>] does:

- Convert its parameter to lower case and without spaces, e.g. `\fontfamily`.
- If the file `f-\fontfamily.opm` exists read it and finish.
- Try to load user defined `fams-local.opm`.
- If the `\fontfamily` is declared in `fams-local.opm` or `fams-ini.opm` read relevant file and finish.
- Print the list of declared families.

The `fams-local.opm` is read by the `\tryloadfamslocal` macro. It sets itself to `\relax` because we need not load this file twice. The `\listfamnames` macro prints registered font families to the terminal and to the log file.

```
fonts-select.opm
381 \_def\_fontfam[#1]{%
382   \lowercase{\_edef\_famname{\_ea\_removespaces #1 {} } }%
383   \_isfile {f-\_famname.opm}\_iftrue \_opinput {f-\_famname.opm}%
384   \_else
385     \tryloadfamslocal
386     \edef\_famfile{\_trycs{\_famf:\_famname}{}}%
387     \_ifx\_famfile\empty \listfamnames
388     \_else \opinput {\_famfile.opm}%
389   \_fi\_
390 }
391 \_def\tryloadfamslocal{%
392   \_isfile {fams-local.opm}\_iftrue
393     \opinput {fams-local.opm}\_famfrom={}
394   \_fi
395   \_let \tryloadfamslocal=\_relax % need not to load fams-local.opm twice
396 }

402       \wterm{ \space\_noexpand\famf [##1] -- ##2}%
403     \_let\famalias=\famaliasA}%
404     \opinput {fams-ini.opm}%
405     \isfile {fams-local.opm}\_iftrue \opinput {fams-local.opm}\_fi
406     \message{^J}%
407   \end{group}
408 }
409 \_def\famaliasA{\_message{ \space\_space\_space -- alias:}
410   \def\famalias[##1]{\_message{##1}}\famalias
411 }
412 \public \fontfam ;
```

When the `fams-ini.opm` or `fams-local.opm` files are read then we need to save only a mapping from family names or alias names to the font family file names. All other information is ignored in this case. But if these files are read by the `\listfamnames` macro or when printing a catalog then more information is used and printed.

`\famtext` does nothing or prints the text on the terminal.

`\faminfo` [*<Family Name>*] {[*comments*} {[*file-name*} {[*mod-plus-vars*}]} does

`\def \famf:[familyname] {[file-name}]} or prints information on the terminal.`

`\famalias` [*<Family Alias>*] does `\def \famf:[familyalias] {[file-name}]}` where *file-name* is stored from the previous `\faminfo` command. Or prints information on the terminal.

`\famfrom` declares type foundry or owner or designer of the font family. It can be used in `fams-ini.opm` or `fams-local.opm` and it is printed in the font catalog.

```
fonts-select.opm
435 \_def\famtext #1{%
436 \_def\faminfo [#1]#2#3#4{%
437   \lowercase{\_edef\_tmp{\_ea\_removespaces #1 {} } }%
438   \sdef\famf{\_tmp}{#3}%
439   \def\famfile{#3}%
440 }
441 \_def\famalias [#1]{%
442   \lowercase{\_edef\_tmpa{\_ea\_removespaces #1 {} } }%
443   \sdef\famf{\_tmpa\ea}{\famfile}%
444 }
445 \newtoks\famfrom
```

```

446 \_input fams-init.opm
447 \_let\_famfile=\_undefined
448 \_famfrom={}

```

When the `\fontfam[catalog]` is used then the file `fonts-catalog.opm` is read. The macro `\faminfo` is redefined here in order to print catalog samples of all declared modifiers/variant pairs. The user can declare different samples and different behavior of the catalog, see the end of catalog listing for more information. The default parameters `\catalogsample`, `\catalogmathsample`, `\catalogonly` and `\catalogexclude` of the catalog are declared here.

```

461 \_newtoks \_catalogsample
462 \_newtoks \_catalogmathsample
463 \_newtoks \_catalogonly
464 \_newtoks \_catalogexclude
465 \_catalogsample={ABCDabcd Qsty fi fl áéíóúú řžč ÁÉÍÓÚ ŘŽČ 0123456789}
466
467 \_public \catalogonly \catalogexclude \catalogsample \catalogmathsample ;

```

fonts-select.opm

The font features are managed in the `\fontfeatures` macro. It expands to

- `\_defaultfontfeatures` – used for each font,
- `\_ffadded` – features added by `\setff`,
- `\_ffcolor` – features added by `\setfontcolor`,
- `\_ffletterspace` – features added by `\setletterspace`,
- `\_ffwordspace` – features added by `\setwordspace`.

The macros `\_ffadded`, `\_ffcolor`, `\_ffletterspace`, `\_ffwordspace` are empty by default.

```

483 \_def \_fontfeatures{\_defaultfontfeatures\ffadded\ffcolor\ffletterspace\ffwordspace}
484 \_def \_defaultfontfeatures {+tlig;}
485 \_def \_ffadded{}
486 \_def \_ffcolor{}
487 \_def \_ffletterspace{}
488 \_def \_ffwordspace{}

```

fonts-select.opm

The `\setff {<features>}` adds next font features to `\_ffadded`. Usage `\setff{}` resets empty set of all `\_ffadded` features.

```

495 \_def \_setff #1{%

The data are saved to the `\oz:`*<internal-template>* macro. When the `\optname` is expanded then the data are scanned by the macro `\optnameA` *<left-output>*?*<right-output>* *<mid-output>* <*size*> in the loop.

`\optfontalias` {*template A*}{{*template B*}} is defined as `\let\oz:{templateA}=\oz:{templateB}`.

## 2.14 Preloaded fonts for math mode

The Computer Modern and AMS fonts are preloaded here in classical math-fam concept, where each math family includes three fonts with max 256 characters (typically 128 characters).

On the other hand, when `\fontfam` macro is used in the document then text font family and appropriate math family is loaded with Unicode fonts, i.e. Unicode-math is used. It re-defines all settings given here.

The general rule of usage the math fonts in different sizes in OpTeX says: set three sizes by the macro `\setmathsizes` [*<text-size>/<script-size>/<scriptscript-size>*] and then load all math fonts in given sizes by `\normalmath` or `\boldmath` macros. For example

```
\setmathsizes[12/8.4/6]\normalmath ... math typesetting at 12 pt is ready.
```

```
math-preload.opm
```

```

3 \codedecl \normalmath {Math fonts CM + AMS preloaded <2020-05-06>} % preloaded in format

```

We have two math macros `\normalmath` for the normal shape of all math symbols and `\boldmath` for the bold shape of all math symbols. The second one can be used in bold titles, for example. These macros load all fonts from all given math font families.

```
math-preload.opm
```

```

12 \def\normalmath{%
13   \loadmathfamily 0 cmr % CM Roman
14   \loadmathfamily 1 cmmi % CM Math Italic

43
44 \_def \normalmath {\_normalmath} \_def\boldmath {\_boldmath}

```

The classical math family selectors `\mit`, `\cal`, `\bbchar`, `\frak` and `\script` are defined here. The `\rm`, `\bf`, `\it`, `\bi` and `\tt` does two things: they are variant selectors for text fonts and math family selectors for math fonts. The idea was adapted from plain TeX.

These macros are redefined when `unimat-codes.opm` is loaded, see the section 2.16.2.

```

`\_loadmathfamily <number> <font>` loads one math family, i.e. the triple of fonts in the text size, script size and script-script size. The `<font>` is `<font-id>` used in the `\_regtfm` parameter or the real TFM name. The family is saved as `\fam<number>`.

`\_setmathfamily <number> <font-switch>` loads one math family like `\_loadmathfamily` does it. But the second parameter is a `<font-switch>` declared previously by the `\font` primitive.

The font family is loaded at `\sizemtext`, `\sizemscript` and `\sizemsscript` sizes. These sizes are set by the `\setmathsizes [<text-size>/<script-size>/<scriptscript-size>]` macro. These parameters are given in the `\ptmunit` unit, it is set to `1\ptunit` and it is set to 1 pt by default.

`\_corrmsize <factor><space>` can be used just before `\_loadmathfamily` or `\_setmathfamily`. The `<factor>` is decimal number, it denotes scale-factor “size of loaded math font in `\textstyle` : size of text font”. You can use it in `\normalmath` or `\boldmath` macros if you want to do a corrections (for example due to different ex-height in text and math font). The `\_corrmsize` is applied only to one following `\_loadmathfamily` or `\_setmathfamily`. If it is missing then the `<factor>` is 1 for such math family (i.e. no size corrections).

```

math-preload.omp
148 \_def\corrmsize#1 {\_ptmunit=#1\ptunit} % for corrections of sizes in different fonts
149
150 \_def\_loadmathfamily #1 #2 {%

169 \_newdimen\_ptmunit \_ptmunit=1\ptunit
170
171 \_public \setmathsizes \ptunit \ptmunit ;

```

The `\_setmathdimens` macro is used in `\normalmath` or `\boldmath` macros. It makes math dimensions dependent on the font size (plain TeX sets them only for 10pt typesetting). The `\skewchar` of some math families are set here too.

```

math-preload.omp
180 \_def\_setmathdimens{%
181   PlainTeX sets these dimens for 10pt size only:
182   \_delimitershortfall=0.5\_fontdimen6\_textfont3
183   \_nulldelimiterspace=0.12\_fontdimen6\_textfont3
184   \_scriptspace=0.05\_fontdimen6\_textfont3
185   \_skewchar\_textfont1=127 \_skewchar\_scriptfont1=127
186   \_skewchar\_scriptscriptfont1=127

```

```

186  \_skewchar\_textfont2=48  \_skewchar\_scriptfont2=48
187  \_skewchar\_scriptscriptfont2=48
188  \_skewchar\_textfont6=127 \_skewchar\_scriptfont6=127
189  \_skewchar\_scriptscriptfont6=127
190 }

```

Finally, we preload a math fonts collection in [10/7/5] sizes when the format is generated. This is done when `\_suppressfontnotfounderror=1` because we need not errors when the format is generated. Maybe there are not all fonts in the TeX distribution installed.

```

200 \_suppressfontnotfounderror=1
201 \_setmathsizes[10/7/5]\_normalmath
202 \_suppressfontnotfounderror=0

```

math-preload.opp

## 2.15 Math macros

```

3 \_codedecl \sin {Math macros plus mathchardefs <2021-08-02>} % preloaded in format

```

math-macros.opp

The category code of the character `_` remains as the letter (11) and the mathocode of it is "8000. It means that it is an active character in math mode. It is defined as the subscript prefix.

There is a problem: The `x_n` is tokenized as `x`, `_`, `n` and it works without problems. But `\int_a^b` is tokenized as `\int_a`, `,`, `b`. The control sequence `\int_a` isn't defined. We must write `\int _a^b`.

The Lua code presented here solves this problem. But you cannot set your own control sequence in the form `\langle word\rangle_` or `\langle word\rangle_{one-letter}` (where `\langle word\rangle` is a sequence of letters) because such control sequences are inaccessible: preprocessor rewrites it.

The `\mathsb{on}` macro activates the rewriting rule `\langle word\rangle_{nonletter}` to `\langle word\rangle _{nonletter}` and `\langle word\rangle_{letter}\langle nonletter}` to `\langle word\rangle _{letter}\langle nonletter}` at input processor level. The `\mathsb{off}` deactivates it. You can ask by `\_ifmathsb` if this feature is activated or deactivated. By default, it is activated in the `\everyjob`, see section 2.1. Note, that the `\everyjob` is processed after the first line of the document is read, so the `\mathsb{on}` is activated from the second line of the document.

```

All control sequences declared by `\mathchardef` are supposed (by default) only for public usage. It means that they are declared without `_` prefix. If such sequences are used in internal `OpTeX` macro then their internal prefixed form is declared using `\_private` macro.

These encoding dependent declarations will be set to different values when `Unicode-math` font is loaded. The declared sequences for math symbols are not hyperlinked in this documentation.

`math-macros.otp`

645
646
647 \public \cases \bordermatrix ;

```

The `\eqalign` macro behaves like in Plain TeX by default. It creates the `\vcenter` in the math mode. The content is two column `\halign` with right-aligned left column and left-aligned right column. The table items are in `\displaystyle` and the `\baselineskip` is advanced by `\jot` (3pt in plain TeX). It follows from the default settings of `\eqlines` and `\eqstyle` parameters.

In OpTeX, this macro is more flexible. See section 4.4 in the [Typesetting Math with OpTeX](#). The `\baselineskip` value is set by the `\eqlines` parameter and math style by the `\eqstyle` parameter.

There are more possible columns than two (used in classical Plain TeX): `rlcrlcrlc` etc. where `r` and `l` columns are without spaces and `c` column (if used) has space `\eqspace`/2 at its both sides.

```

math-macros.opm
668 \long\def\_eqalign#1{\null\thinsk\vcenter{\the\eqlines\math
669   \ialign{\&\hfil\the\eqstyle##$\&\the\eqstyle{}##$\hfil
670     &\hspace{.5\eqspace}\hfil\the\eqstyle##$\&\hspace{.5\eqspace}\hfil
671     \crcr#1\crcr}\thinsk}
672
673 \public \eqalign ;

```

The `\displaylines{(formula)\cr (formula)\cr ... (formula)}` creates horizontally centered formulae. It behaves exactly as in Plain TeX. The `\halign` is applied directly in the outer display environment with lines of type `\hbox to\displaywidth`. This enables to break lines inside such display to more pages but it is impossible to use `\eqno` or `\leqno` or `\eqmark`.

OpTeX offers `\displaylines to<dimen>{(formula)\cr (formula)\cr ... (formula)}` as an alternative case of usage `\displaylines`. See section 4.3 in the [Typesetting Math with OpTeX](#). The centered formulas are in `\vcenter` in this case, so lines cannot be broken into more pages, but this case enables to use `\eqno` or `\leqno` or `\eqmark`.

1002 \nLeftrightarrow \nleftrightarrow \nexists ;
1003 \_public \not ;

```

`\mathstyles{<math list>}` behaves like `{<math list>}`, but you can use the following commands in the `<math list>`:

- `\currstyle` which expands to `\displaystyle`, `\textstyle`, `\scriptstyle` or `\scriptscriptstyle` depending on the current math style when `\mathstyles` was opened.
- `\dobystyle{<D>}{<T>}{<S>}{<SS>}` is expandable macro. It expands to `<D>`, `<T>`, `<S>` or `<SS>` depending on the current math style when `\mathstyles` was opened.
- The value of the `\stylenum` is 0, 1, 2 or 3 depending on the current math style when `\mathstyles` was opened.

Example of usage of `\mathstyles`: `\def\mathframe#1{\mathstyles{\frame{$\currstyle{#1}$}}}`.

```

math-macros.opm
1023 \_newcount\_\stylenum
1024 \_def\_\mathstyles#1{\_mathchoice{\_stylenum0 #1}{\_stylenum1 #1}%
1025 {\_stylenum2 #1}{\_stylenum3 #1}}
1026 \_def\_\dobystyle#1#2#3#4{\_ifcase\_\stylenum#1\_\or#2\_\or#3\_\or#4\_\fi}
1027 \_def\_\currstyle{\_dobystyle\_\displaystyle\_\textstyle\_\scriptstyle\_\scriptscriptstyle}
1028 \_public \mathstyles \dobystyle \currstyle \stylenum ;

```

The `\cramped` macro sets the cramped variant of the current style. Note that `\currstyle` initializes non-cramped variants. The example `\mathframe` above should be:

```
\def\mathframe#1{\mathstyles{\frame{$\currstyle\cramped{#1}$}}}
```

Second note: `\cramped` macro reads the current math style from the `\mathstyle` LuaTeX primitive, so it does not work in numerators of generalized fractions but you can use it before the fraction is opened: `$\cramped {x^2\over y^2}$`.

```

math-macros.opm
1042 \_def\_\cramped{\_ifcase\_\numexpr(\_mathstyle+1)/2\_\relax\_\or
1043 \_\crampeddisplaystyle \_\or \_\crampedtextstyle \_\or
1044 \_\crampedscriptstyle \_\or \_\crampedscriptscriptstyle \_\fi
1045 }
1046 \_public \cramped ;
```

The `\mathbox{<text>}` macro is copied from OPmac trick 078. It behaves like `\hbox{<text>}` but the `<text>` is scaled to a smaller size if it is used in scriptstyle or scriptscript style.

The `\textmff` and `\scriptmff` are redefined in order to respect optical sizes. If we are in script style then the math mode starts in text style, but optical size is given to script style. The `\mathbox` in non-Unicode math respects optical sizes using different principle.

```

math-macros.opm
1059 \_def\_\mathbox#1{\_mathstyles{\_hbox{%
1060 \_ifnum\_\stylenum<2 \_everymath{\_currstyle}%
1061 \_else
1062 \_ifnum\_\stylenum=2 \_def\_\textmff{ssty=1}\_\fi
1063 \_ifnum\_\stylenum=3 \_def\_\textmff{ssty=2}\_\def\_\scriptmff{ssty=2}\_\fi
1064 \_typoscale[\_dobystyle{}{}{700}{500}/]\_\fi #1}}%
1065 }
1066 \_public \mathbox ;
```

## 2.16 Unicode-math fonts

The `\loadmath{<Unicode-math font>}` macro loads math fonts and redefines all default math-codes using `\input unimath-codes.opm`. If Unicode-math font is loaded then `\_mathloadingfalse` is set, so the new Unicode-math font isn't loaded until `\doloadmath` is used.

`\loadboldmath {<bold-font>} \to {<normal-font>}` loads bold variant only if `<normal-font>` was successfully loaded by the previous `\loadmath`. For example:

```
\loadmath {[xitsmath-regular]}
\loadboldmath {[xitsmath-bold]} \to {[xitsmath-regular]}
```

There are very few Unicode-math fonts with full `\boldmath` support. I know only XITSMath-Bold and KpMath-Bold. If `\loadboldmath` is not used then “faked bold” created from `\normalmath` is used by default.

The `\loadmath` macro was successfully tested on:

```
\loadmath{[XITSMath-Regular]} ... XITS MATH
\loadmath{[latinmodern-math]} ... Latin Modern Math
\loadmath{[texgyretermes-math]} ... TeXGyre Termes Math
\loadmath{[texgyrebonum-math]} ... TeXGyre Bonum Math
\loadmath{[texgyrepagella-math]} ... TeXGyre Pagella Math
\loadmath{[texgyreschola-math]} ... TeXGyre Schola Math
\loadmath{[texgyredejavu-math]} ... TeXGyre DeJaVu Math
\loadmath{[LibertinusMath-Regular]} ... Libertinus Math
\loadmath{[FiraMath-Regular]} ... Fira Math
\loadmath{[Asana-Math]} ... Asana Math
\loadmath{[KpMath-Regular]} ... KP fonts Math
```

### 2.16.1 Unicode-math macros preloaded in the format

```
3 \codedecl \loadmath {Unicode Math fonts <2021-08-16>} % preloaded in format
```

math-unicode.omp

`\loadmath {<Unicode-math font>}` loads the given font. It does:

- define `\_unimathfont` as `<Unicode-math font>`,
- redefine `\normalmath` and `\boldmath` macros to their Unicode counterparts,
- load the `\_unimathfont` by `\normalmath`,
- print information about the loaded font on the terminal,
- redefine all encoding dependent setting by `\input unimath-codes.omp`,
- protect new loading by setting `\_ifmathloading` to false.

`\noloadmath` disallows Unicode-math loading by `\_mathloadingfalse`.

`\doloadmath` allows Unicode-math loading by `\_mathloadingtrue`.

```
19 \newifi \_ifmathloading \_mathloadingtrue
20
21 \def\noloadmath{\_mathloadingfalse}
22 \def\doloadmath{\_mathloadingtrue}
23
24 \def\loadmath#1{%
25   \ifmathloading
26     \initunifonts
27     \isfont{#1}\iffalse
28       \opwarning{Math font "#1" not found, skipped...}%
29     \else
30       \def\unimathfont{#1}%
31       \let\normalmath = \normalunimath \let\boldmath = \boldunimath
32       \normalmath
33       \wterm {MATH-FONT: "#1" -- unicode math prepared.}%
34       \ifx\nccharmA\_undefined \openinput {unimath-codes.omp}\_fi
35       \mathloadingfalse
36     \fi\fi}
37
38 \public \loadmath \noloadmath \doloadmath ;
```

math-unicode.omp

`\loadboldmath {<bold-font>} \to {<normal-font>}` defines `\_unimathboldfont` as `<bold-font>` only if `\_unimathfont` is defined as `<normal-font>`. It is used when `\boldmath` macro is run. When no `\_unimathboldfont` is defined then the `\boldmath` macro use “fake bold” generated by `embolden` LuaTeX font feature.

```

math-unicode.otp
48 \_def\loadboldmath#1#2\to #3{%
49   \_def\_\tmp{#3}\_ifx\unimathfont\_\tmp % do work only if #3 is loaded as normal Math
50   \_isfont{#1}\_iffalse
51     \_opwarning{Bold-Math font "#1" not found, skipped...}
52   \_else
53     \_def\unimathboldfont{#1}%
54     \wterm {MATH-FONT: "#1" -- unicode math bold prepared.}%
55   \_fi\_\fi}
56
57 \_public \loadboldmath ;

```

The Unicode version of the `\normalmath` and `\boldmath` macros are defined here as `\_normalunimath` and `\_boldunimath` macros. They are using `\_setunimathdimens` in a similar sense as `\_setmathdimens`. You can combine more fonts if you register them to another math families (5, 6, 7, etc.) in the `\normalmath` macro.

The default value of `\_normalunimath` shows a combination of base Unicode-math font with 8bit Math font at family 4. See definition of `\script` macro where `\fam4` is used.

```

math-unicode.otp
73 \_def\_normalunimath{%
74   \loadumathfamily 1 {\_unimathfont}{} % Base font
75   \loadmathfamily 4 rsfs % script
76   \setunimathdimens
77 }%
78 \_def\boldunimath{%
79   \_ifx\unimathboldfont \_undefined
80     \loadumathfamily 1 {\_unimathfont}{embolden=1.7;} % Base faked bold
81   \_else
82     \loadumathfamily 1 {\_unimathboldfont}{} % Base real bold font
83   \_fi
84   \loadmathfamily 4 rsfs % script
85   \setunimathdimens
86 }%
87 \_def\setunimathdimens{%
88   \_delimitershortfall=0.5\_fontdimen6\_textfont1
89   \_nulldelimiterspace=0.12\_fontdimen6\_textfont1
90   \_setbox0=\_hbox{\_everymath{}$\_fam1\_displaystyle{0\atop0}$}%
91   \_Umathfractiondelsize\_displaystyle = \_dimexpr(\_ht0-\_Umathaxis\_displaystyle)*2\_relax
92   \_setbox0=\_box\_voidbox
93 }

```

If you try the example above about `\loadboldmath{[xitsmath-bold]}` `\to {[xitsmath-regular]}` then you can find a bug in XITSMath-Bold font: the symbols for norm  $\|x\|$  are missing. So, we have to define `\boldmath` macro manually. The missing symbol is loaded from family 5 as no-bold variant in our example:

```

\loadmath{[xitsmath-regular]}
\def\boldmath{%
  \loadumathfamily 1 {[xitsmath-bold]}{} % Base font
  \loadmathfamily 4 rsfs % script
  \loadumathfamily 5 {[xitsmath-regular]}{}
  \def\|\{\_Udelimiter 0 5 "02016 \% % norm delimiter from family 5
  \setmathdimens
}

\loadumathfamily <number> {\<font>}{\<font features>} loads the given Unicode-math fonts in three sizes using single <font> with different mathsize=1,2,3 font features. The math font family is set with given <number>. The <font features> are added to the default \_mfontfeatures and to the size-dependent features ssty=1 if script size is asked or ssty=2 if scriptsize is asked.
\mparams<number> inserts additional font feature nomathparam if the <number> of the family is greater than 3. LuaTeX sets math parameters (thickness of fraction rules etc., see section 7.4 in LuaTeX documentation) repeatedly from loaded math fonts if nomathparam is not given. We want to load these parameters only from fonts at families 0–3 (and actually we are using only family 1 as main math font). The \_corrmsize <factor><space> can be used just before \loadumathfamily, see section 2.14 for more information.

```

The `\_textmff`, `\_scriptmff` and `\_sscriptmff` are font features for text, script and sscript sizes respectively. They are locally re-defined in `\mathbox` macro.

```
math-unicode.opm
132 \_def\umathname#1#2{"#1:\_mfontfeatures#2"}
133 \_def\_mfontfeatures{mode=base;script=math;}
134
135 \_def\_loadumathfamily #1 #2#3 {%
136   \_font\mF=\umathname{#2}{\_textmff \_mparams{#1}#3} at\_sizemtext \_textfont      #1=\_mF
137   \_font\mF=\umathname{#2}{\_scriptmff \_mparams{#1}#3} at\_sizemtext \_scriptfont     #1=\_mF
138   \_font\mF=\umathname{#2}{\_sscriptmff \_mparams{#1}#3} at\_sizemtext \_scriptscriptfont#1=\_mF
139   \_ptunit=\_ptunit
140 }
141 \_def\_textmff {ssty=0;mathsize=1;}
142 \_def\_scriptmff {ssty=1;mathsize=2;}
143 \_def\_sscriptmff{ssty=2;mathsize=3;}
144 \_def\_mparams#1{\_ifnum#1>3 nomathparam;\_fi}
```

Unicode math font includes all typical math alphabets together, user needs not to load more TeX math families. These math alphabets are encoded by different parts of Unicode table. We need auxiliary macros for setting mathcodes by selected math alphabet.

`\_umathrange`  $\{\langle from \rangle - \langle to \rangle\} \langle class \rangle \langle family \rangle \langle first \rangle$  sets `\Umathcodes` of the characters in the interval  $\langle from \rangle - \langle to \rangle$  to  $\langle first \rangle$ ,  $\langle first \rangle + 1$ ,  $\langle first \rangle + 2$  etc., but `\_umathcharholes` are skipped (`\_umathcharholes` are parts of the Unicode table not designed for math alphabets but they cause that the math alphabets are not continuously spread out in the table; I mean that the designers were under the influence of drugs when they created this part of the Unicode table). The  $\langle from \rangle - \langle to \rangle$  clause includes normal letters like A-Z.

`\_umahrangegreek`  $\langle first \rangle$  is the same as `\_umathrange`  $\{\langle alpha \rangle - \langle omega \rangle\} \langle first \rangle$ .

`\_umahrangEGREEK`  $\langle first \rangle$  is the same as `\_umathrange`  $\{\langle Alpha \rangle - \langle Omega \rangle\} \langle first \rangle$ .

`\greekdef`  $\langle control\ sequences \rangle$  `\_relax` defines each control sequence as a normal character with codes `\_umathnumB`, `\_umathnumB+1`, `\_umathnumB+2` etc. It is used for redefining the control sequences for math Greek `\alpha`, `\beta`, `\gamma` etc.

```
math-unicode.opm
175 \_newcount\umathnumA \_newcount\umathnumB

204 }
```

## 2.16.2 Macros and codes set when `\loadmatfont` is processed

The file `unimath-codes.opm` is loaded when the `\loadmath` is used. The macros here redefines globally all encoding dependent settings declared in the section 2.15.

```
3 \codedecl \ncharrmA {Uni math codes <2021-04-25>} % preloaded on demand by \loadmath
```

The control sequences for  $\alpha$ ,  $\beta$  etc are redefined here. The  $\alpha$  expands to the character with Unicode "03B1, this is a normal character  $\alpha$ . You can type it directly in your editor if you know how to do this.

```
12 \umathnumB="0391
13 \greekdef \Alpha \Beta \Gamma \Delta \Epsilon \Zeta \Eta \Theta \Iota \Kappa
14 \Lambda \Mu \Nu \Xi \Omicron \Pi \Rho \varTheta \Sigma \Tau \Upsilon \Phi
15 \Chi \Psi \Omega \relax
16
17 \umathnumB="03B1
18 \greekdef \alpha \beta \gamma \delta \varepsilon \zeta \eta \theta \iota \kappa
19 \lambda \mu \nu \xi \omicron \pi \rho \varsigma \sigma \tau \upsilon
20 \varphi \chi \psi \omega \varDelta \epsilon \vartheta \varkappa \phi
21 \varrho \varpi \relax
```

The math alphabets are declared here using the  $\_umathrange{\langle range \rangle}{\langle class \rangle}{\langle family \rangle}{\langle starting-code \rangle}$  macro.

```

```

`\_setnabla` is used in order to `\nabla` behaves like uppercase Greek letter, similar like `\Delta`. It depends on `\bf`, `\it` etc. selectors. If you want to deactivate this behavior, use `\def\_\setnabla#1 {}`.

`unimath-codes.opm`

```
84 \_def \_setnabla {\_Umathcode"2207 = 7 1}
85 \_def \_setnabla rm {\_setnabla"02207 }
86 \_def \_setnabla bf {\_setnabla"1D6C1 }
87 \_def \_setnabla it {\_setnabla"1D6FB }
88 \_def \_setnabla bi {\_setnabla"1D735 }
89 \_def \_setnabla sans {\_setnabla"1D76F }
90 \_def \_setnabla sans {\_setnabla"1D7A9 }
```

Digits are configured like math alphabets.

`unimath-codes.opm`

```
96 \_chardef\_digitrm0=``0
97 \_chardef\_digitbf0="1D7CE
98 \_chardef\_digitbb0="1D7D8
99 \_chardef\_digitsn0="1D7E2
100 \_chardef\_digitbs0="1D7EC
101 \_chardef\_digitt0="1D7F6
102
103 \_protected\_def\_rmdigits {\_umathrange{0-9}71\_digitrm0}
104 \_protected\_def\_bfdigits {\_umathrange{0-9}71\_digitbf0}
105 \_protected\_def\_bbdigits {\_umathrange{0-9}71\_digitbb0}
106 \_protected\_def\_sansdigits {\_umathrange{0-9}71\_digitsn0}
107 \_protected\_def\_bsansdigits {\_umathrange{0-9}71\_digitbs0}
108 \_protected\_def\_ttdigits {\_umathrange{0-9}71\_digitt0}
```

The `\cal`, `\bbchar`, `\frak`, `\script` and the `\rm`, `\bf`, `\it`, `\bi`, `\tt` are defined here. Their “8bit definitions” from the file `math-preload.opm` (section 2.14) are removed.

You can redefine them again if you need different behavior (for example you don’t want to use sans serif bold in math). What to do:

```
\_protected\_def\_bf
  {\_tryloadbf\_tenbf \_inmath{\_bfvariables\_bfGreek\_bfDigits}}
\_protected\_def\_bi
  {\_tryloadbi\_tenbi \_inmath{\_bivariabes\_bigreek\_bfGreek\_bfDigits}}
\_public \bf \bi ;
```

`\_inmath {<cmds>}` applies `<cmds>` only in math mode.

`unimath-codes.opm`

```

Each Unicode slot carries information about math type. This is saved in the file `MathClass-15.txt` which is copied to `mathclass.opm`. The file has the following format:

`mathclass.opm`

```
70 002E;P
71 002F;B
72 0030..0039;N
```

```

73 003A;P
74 003B;P
75 003C;R
76 003D;R
77 003E;R
78 003F;P
79 0040;N
80 0041..005A;A
81 005B;O
82 005C;B
83 005D;C
84 005E;N
85 005F;N

```

We have to read this information and convert it to the `\Umathcodes`.

```

Newly declared public control sequences are used in internal macros by OpTeX. We need to get new meanings for these control sequences in the private namespace.

unimath-codes.opm

```
419 \_private
420 \ldotp\cdotp\bullet\triangleleft\triangleright\mapstochar\rightarrow
421 \prime\lhook\rightarrowarrow\leftarrow\rhook\triangleright\triangleleft
422 \rbrace\lbrace\Relbar\Rightarrow\relbar\rightarrow\Leftarrow\mapstochar
423 \longrightarrow\Longleftrightarrow\unicoddevdots\unicodeddots\unicodeadots;
```

### 2.16.3 More Unicode-math examples

Example of using additional math font is in section 5.3 in the [optex-math.pdf](#) documentation

You can combine more Unicode math fonts in single formula simply by the `\addUmathfont` macro, see [OpTeX trick 0030](#).

See <http://tex.stackexchange.com/questions/308749> for technical details about Unicode-math.

### 2.16.4 Printing all Unicode math slots in used math font

This file can be used for testing your Unicode-math font and/or for printing TeX sequences which can be used in math.

Load Unicode math font first (for example by `\fontfam[termes]` or by `\loadmath{math-font}`) and then you can do `\input print-unimath.opm`. The big table with all math symbols is printed.

print-unimath.opm

```

## 2.17 Scaling fonts in document (high-level macros)

These macros are documented in section 1.3.2 from the user point of view.

```
3 \codel{typosize} {Font managing macros from OPmac <2021-03-10>} % preloaded in format
```

**\typosize** [*<font-size>/<baselineskip>*] sets given parameters. It sets text font size by the `\setfontsize` macro and math font sizes by setting internal macros `\sizemtext`, `\sizemscript` and `\sizemsscript`. It uses common concept font sizes: 100 %, 70 % and 50 %. The `\_setmainvalues` sets the parameters as main values when the `\typosize` is called first.

```
15 \protected{ \def \typosize [#1/#2]{%
16   \textfontsize{#1}\mathfontsize{#1}\setbaselineskip{#2}%
17   \_setmainvalues \ignorespaces
18 }
19 \protected{ \def \textfontsize #1{\_if$#1$\_else \setfontsize{at#1\ptunit}\_fi}
20
21 \def \mathfontsize #1{\_if$#1$\_else

69   \fi
70 }
```

`\setmainvalues` sets the current font size and `\baselineskip` values to the `\mainfontsize` and `\mainbaselineskip` registers and loads fonts at given sizes. It redefines itself as `\_setmainvaluesL` to set the main values only first. The `\_setmainvaluesL` does only fonts loading.

`\scalemain` returns to these values if they were set. Else they are set to 10/12 pt.

`\mfontsrule` gives the rule how math fonts are loaded when `\typosize` or `\typoscale` are used. The value of `\mfontsrule` can be:

- 0: no math fonts are loaded. User must use `\normalmath` or `\boldmath` explicitly.
- 1: `\_normalmath` is run if `\typosize`/`\typoscale` are used first or they are run at outer group level. No `\everymath`/`\everydisplay` are set in this case. If `\typosize`/`\typoscale` are run repeatedly in a group then `\_normalmath` is run only when math formula occurs. This is done using `\everymath`/`\everydisplay` and `\_setmathfonts`. `\mfontsrule=1` is default.
- 2: `\_normalmath` is run whenever `\typosize`/`\typoscale` are used. `\everymath`/`\everydisplay` registers are untouched.

```
fonts-opmac.opm
99 \newskip \mainbaselineskip \mainbaselineskip=0pt \relax
100 \newdimen \mainfsize \mainfsize=0pt

214   \_\_rmfixed
215 }
216 \_let \rmfixed = \_\_tenrm % user can redefine it

```

## 2.18 Output routine

The output routine `\optexoutput` is similar as in plain TeX. It does:

- `\begoutput` which does:
  - increments `\pgapageno`,
  - prints `\Xpage{\langle pgapageno\rangle}{\langle pageno\rangle}` to the `.ref` file (if `\openref` is active),
  - calculates `\hoffset`,
  - sets local meaning of macros used in headlines/footlines (see `\regmacro`).
- `\shipout\completereport`, which is `\vbox` of –
  - background box, if `\pgbackground` is non-empty,
  - headline box by `\makeheadline`, if the `\headline` is nonempty,
  - `\vbox` to `\vsize` of `\pagecontents` which consists of –
    - `\pagedest`, the page destination `pg:\langle pgapageno\rangle` for hyperlinks is created here,
    - `\topins` box if non-empty (from `\topinserts`),
    - `\box255` with completed vertical material from main vertical mode,
    - `\footnoterule` and `\footins` box if nonempty (from `\fnote`, `\footnote`),
    - `\pgbottomskip` (default is 0 pt).
  - footnote box by `\makefootline`, if the `\footline` is nonempty
- `\endoutput` which does:
  - increments `\pageno` using `\advancenext`
  - runs output routine repeatedly if `\dosupereject` is activated.

```
3 \codedecl \nopagenumbers {Output routine <2021-07-16>} % preloaded in format output.opm
```

\\_optexoutput is the default output routine. You can create another...

The \\_preshipout*(destination box number)**(box specification)* used here behaves similarly like \setbox but it does not only copy the box contents but adds the color literals depending on used attributes. It is defined using lua code, see section 2.39.

```
13 \_output={\_optexoutput}
14 \def \_optexoutput{\_begoutput \_preshipout0\_completepage \_shipout\_box0 \_endoutput} output.opm
```

Default \\_begoutput and \\_endoutput is defined. If you need another functionality implemented in the output routine, you can \addto\\_\begoutput{...} or \addto\\_\endoutput{...}. The settings here are local in the \output group.

The \\_preoffsets can set \hoffset differently for the left or right page. It is re-defined by the \margins macro..

The \\_regmark tokens list includes accumulated #2 from the \regmacro. Logos and other macros are re-defined here (locally) for their usage in headlines or footlines.

```
30 \def \_begoutput{\_incr\_gpageno
31   \immediate\wref\Xpage{\_the\_gpageno}{\_folio}}%
32   \setxhsize \_preoffsets \_the\_regmark
33 \def \_endoutput{\_advancepageno
34   {\_globaldefs=1 \_the\_nextpages \_nextpages={}%
35   \ifnum\outputpenalty>-20000 \else\dosupereject\fi
36 }
37 \def \_preoffsets {} output.opm
```

The \hsize value can be changed at various places in the document but we need to have a constant value \\_xhsize in the output routine (for headlines and footlines, for instance). This value is set from the current value of \hsize when \\_setxhsize macro is called. This macro destroys itself, so the value is set only once. Typically it is done in \margins macro or when first \\_optexoutput routine is called (see \\_begoutput). Or it is called at the begining of the \begtt... \endtt environment before \hsize value is eventually changed by the user in this environment.

```
51 \newdimen \xhsize
52 \def \_setxhsize {\_global \xhsize=\hsize \_global \let \_setxhsize=\relax} output.opm
```

\gpageno counts pages from one in the whole document

```
58 \newcount \gpageno
59 \public \gpageno ; output.opm
```

The \\_completepage is similar to what plain TeX does in its output routine. New is only \\_backgroundbox. It is \vbox with zero height with its contents (from \pgbackground) extended down. It is shifted directly to the left-upper corner of the paper.

The \\_resetcolor used here means that all newly created texts in output routine (texts used in headline, footnote) have default color.

```
70 \def \_completepage{\_vbox{%
71   \resetcolor
72   \ifstokempty \pgbackground
73     \iffalse \_backgroundbox{\_the\pgbackground}\_nointerlineskip \fi
74   \makeheadline
75   \vbox to\vsizet{\_boxmaxdepth=\maxdepth \_pagecontents}\_pagebody in plainTeX
76   \makefootline}%
77 }
78 \def \_backgroundbox #1{\_moveleft\hoffset\vbox to\zof{\_kern-\voffset #1\vsizet}} output.opm
```

\\_makeheadline creates \vbox to0pt with its contents (the \headline) shifted by \headlinedist up.

```
85 \def \_makeheadline {\_ifstokempty \headline \_iffalse
86   \vbox to\zof\vsizet
87     \baselineskip=\headlinedist \lineskip=-\maxdimen
88     \vbox to\xhsize{\_the\headline}\vbox{}\_nointerlineskip
89   \fi
90 } output.opm
```

The \\_makefootline appends the \footline to the page-body box.

```

96 \_def\_\_makefootline{\_istoksempy \_footline \_iffalse
97     \_baselineskip=\_footlinedist
98     \_lineskiplimit=-\_maxdimen \_hbox to\_\xsize{\_the\_\footline}
99     \_fi
100 }

```

The `\_pagecontents` is similar as in plain TeX. The only difference is that the `\_pagedest` is inserted at the top of `\_pagecontents`.

The `\_footnoterule` is defined here.

```

108 \_def\_\_pagecontents{\_pagedest % destination of the page
109 \_ifvoid\_\topins \_else \_unvbox\_\topins\_\fi
110 \_dimen0=\_dp255 \_unvbox255 % open up \box255
111 \_ifvoid\_\footins \_else % footnote info is present
112     \_vskip\_\skip\_\footins
113     \_footnoterule \_unvbox\_\footins\_\fi
114     \_kern-\_dimen0 \_vskip \_pgbottomskip
115 }
116 \_def \_pagedest {\{_def\_\destheight{25pt}\_dest[pg:\_the\_\gpageno]{}}
117 \_def \_footnoterule {\_kern-3pt \_hrule width 2truein \_kern 2.6pt }

```

`\pageno`, `\folio`, `\nopagenumbers`, `\advancepageno` and `\normalbottom` used in the context of the output routine from plain TeX is defined here. Only the `\raggedbottom` macro is defined differently. We use the `\pgbottomskip` register here which is set to 0pt by default.

```

128 \_countdef\_\pageno=0 \_pageno=1 % first page is number 1
129 \_def \_folio {\_ifnum\_\pageno<0 \_romannumerals-\_pageno \_else \_number\_\pageno \_fi}
130 \_def \_nopagenumbers {\_\footline={{}}
131 \_def \_advancepageno {%
132     \_ifnum\_\pageno<0 \_decr\_\pageno \_else \_incr\_\pageno \_fi
133 } % increase \pageno
134 \_def \_raggedbottom {\_topskip=\_dimexpr\_\topskip plus60pt \_pgbottomskip=0pt plus1fil\_\relax}
135 \_def \_normalbottom {\_topskip=\_dimexpr\_\topskip \_pgbottomskip=0pt\_\relax}
136
137 \_public \pageno \folio \nopagenumbers \advancepageno \raggedbottom \normalbottom ;

```

Macros for footnotes are the same as in plain TeX. There is only one difference: `\vfootnote` is implemented as `\opfootnote` with empty parameter #1. This parameter should do local settings inside the `\footins` group and it does it when `\fnote` macro is used.

The `\opfootnote` nor `\vfootnote` don't take the footnote text as a parameter. This is due to a user can do catcode settings (like inline verbatim) in the footnote text. This idea is adapted from plain TeX. The `\footnote` and `\footstrut` is defined as in plain TeX.

```

150 \_newinsert\_\footins
151 \_def \_footnote #1{\_let\_\osf=\_empty % parameter #2 (the text) is read later
152     \_ifhmode \_edef\_\osf{\_spacefactor\_\the\_\spacefactor}\_\fi

## 2.20 Colors

### 2.20.1 Basic concept

Setting of color in PDF is handled by graphics operators which change the graphics context. Colors for fills/strokes are distinguished, but apart from that, only one color is active at time and is used for all material drawn by following graphics operators, until next color is set. Each PDF content (e.g. page or form XObject) has its own graphics context, that is initialized from zero. Hence we have different concept of selecting fonts in TeX (it depends on TeX groups but does not depends on pages) and color handling in PDF.

TeX itself has no concept of colors. Colors have always been handled by inserting whatsits (either using **\special** for DVI or using **\pdfliteral**/**\pdffcolorstack** for PDF). It is very efficient and TeX doesn't even have to know anything about colors, but it is also problematic in many ways.

That is the reason why we decided to change color handling from **\pdffcolorstack** to **LuaTeX** attributes in version 1.04 of OpTeX. Using attributes, the color setting behaves exactly like font selection from TeX point of view: it respects TeX groups, colors can span more pages, independent colors can be set for **\inserts**, etc. Moreover, once a material is created (using **\setbox** for example) then it has its fonts and its colors frozen and you can rely on it when you are using e.g. **\unhbox**. There are no internal whatsits for colors which can interfere with other typesetting material. In the end something like setting text to red (**\Red text**) should have the same nice behavior like setting text to bold (**\bf text**).

LuaTeX attributes can be set like count register – one attribute holds one number at a time. But the value of attribute is propagated to each created typesetting element until the attribute is unset or set to another value. Very much like the font property. We use one attribute **\colorattr** for storing the currently selected color (in number form).

Macros `\setcmykcolor{<C> <M> <Y> <K>}` or `\setrgbcolor{<R> <G> <B>}` or `\setgreycolor{<Grey>}` are used in color selectors. These macros expand to internal `\_setcolor` macro which sets the `\_colorattr` attribute to an integer value and prepares mapping between this value and the real color data. This mapping is used just before each `\shipout` in output routine. The `\_preshipout` pseudo-primitive is used here, it converts attribute values to internal PDF commands for selecting colors.

## 2.20.2 Color mixing

The color mixing processed by the `\colordef` is done in the subtractive color model CMYK. If the result has a component greater than 1 then all components are multiplied by a coefficient in order to the maximal component is equal to 1.

You can move a shared amount of CMY components (i.e. their minimum) to the  $K$  component. This saves the color toners and the result is more true. This should be done by `\useK` command at the end of a linear combination used in `\colordef`. For example

```
\colordef \myColor {.3\Green + .4\Blue \useK}
```

The `\useK` command exactly does:

$$\begin{aligned} k' &= \min(C, M, Y), \\ C = (C - k')/(1 - k'), \quad M = (M - k')/(1 - k'), \quad Y = (Y - k')/(1 - k'), \\ K &= \min(1, K + k'). \end{aligned}$$

You can use minus instead of plus in the linear combination in `\colordef`. The given color is subtracted in such case and the negative components are rounded to zero immediately. For example

```
\colordef \Color {\Brown-\Black}
```

can be used for removing the black component from the color. You can use the `-\Black` trick after `\useK` command to remove grey components occurred during color mixing.

Finally, you can use `~` immediately preceded before the macro name of the color. Then the complementary color is used here.

```
\colordef\mycolor{\Grey+.6~\Blue} % the same as \colordef\mycolor{\Grey+.6\Yellow}
```

The `\rgbcOLORDEF` can be used to mix colors in additive color model RGB. If `\onlyrgb` is declared, then `\colordef` works as `\rgbcOLORDEF`.

If a CMYK to RGB or RGB to CMYK conversion is needed then direct conversion of given color is used (if declared using `\rgbcmykmap{<rgb>}{<cmyk>}`) or the following simple formulae are used (ICC profiles are not supported):

CMYK to RGB:

$$R = (1 - C)(1 - K), \quad G = (1 - M)(1 - K), \quad B = (1 - Y)(1 - K).$$

RGB to CMYK:

$$K' = \max(R, G, B), \quad C = (K' - R)/K', \quad M = (K' - G)/K', \quad Y = (K' - B)/K', \quad K = 1 - K'.$$

The RGB to CMYK conversion is invoked when a color is declared using `\setrgbcolor` and it is used in `\colordef` or if it is printed when `\onlycmyk` is declared. The CMYK to RGB conversion is invoked when a color is declared using `\setcmykcolor` and it is used in `\rgbcOLORDEF` or if it is printed when `\onlyrgb` is declared.

## 2.20.3 Implementation

colors.oppm

```
3 \_codedecl \colordef {Colors <2021-07-16>} % preloaded in format
```

The basic colors in CMYK `\Blue` `\Red` `\Brown` `\Green` `\Yellow` `\Cyan` `\Magenta` `\Grey` `\LightGrey` `\White` and `\Black` are declared here.

```

12 \_def\Blue      {\_setcmykcolor{1 1 0 0}}
13 \_def\Red       {\_setcmykcolor{0 1 1 0}}
14 \_def\Brown     {\_setcmykcolor{0 .67 .67 .5}}
15 \_def\Green     {\_setcmykcolor{1 0 1 0}}
16 \_def\Yellow    {\_setcmykcolor{0 0 1 0}}
17 \_def\Cyan      {\_setcmykcolor{1 0 0 0}}
18 \_def\Magenta   {\_setcmykcolor{0 1 0 0}}
19 \_def\Grey      {\_setcmykcolor{0 0 0 .5}}
20 \_def\LightGrey {\_setcmykcolor{0 0 0 .2}}
21 \_def\White     {\_setgreycolor{1}}
22 \_def\Black     {\_setgreycolor{0}}

```

By default, the `\setcmykcolor` `\setrgbcolor` and `\setgreycolor` macros with  $\{\langle componentns \rangle\}$  parameter expand to `\_setcolor{\langle color-data \rangle}{\langle fill-op \rangle}{\langle stroke-op \rangle}` where  $\langle color-data \rangle$  is  $\langle R \rangle$   $\langle G \rangle$   $\langle B \rangle$  or  $\langle C \rangle$   $\langle M \rangle$   $\langle Y \rangle$   $\langle K \rangle$  or  $\langle G \rangle$  and  $\langle fill-op \rangle$  is color operator for filling,  $\langle stroke-op \rangle$  is color operator for stroking.

```

33 \_def\_setcmykcolor#1{\_setcolor{#1}kK}
34 \_def\_setrgbcolor#1{\_setcolor{#1}{rg}{RG}}
35 \_def\_setgreycolor#1{\_setcolor{#1}gG}
36 \_public \setcmykcolor \setrgbcolor \setgreycolor ;

```

The `\onlyrgb` declaration redefines `\setcmykcolor` to do conversion to RGB just before `\_setcolor` is used. The `\onlycmyk` declaration redefines `\setrgbcolor` to do conversion to CMYK just before `\_setcolor` is used. Moreover, `\onlyrgb` re-defines three basic RGB colors for RGB color space and re-declares `\colordef` as `\rgbcOLORdef`.

```

47 \_def\onlyrgb{\_def\Red{\_setrgbcolor{1 0 0}}%
48   \_def\Green{\_setrgbcolor{0 1 0}}\_def\Blue{\_setrgbcolor{0 0 1}}%
49   \_let\_colordef=\_rgbcOLORdef
50   \_def\_setrgbcolor##1{\_setcolor{##1}{rg}{RG}}%
51   \_def\_setcmykcolor##1{\_ea\_setcolor\_ea{\_expanded{\_cmyktorgb ##1 ;}}{rg}{RG}}%
52   \_public \colordef \setrgbcolor \setcmykcolor ;}
53 \_def\onlycmyk#%
54   \_let\_colordef=\_cmykCOLORdef
55   \_def\_setrgbcolor##1{\_ea\_setcolor\_ea{\_expanded{\_rgbtocmyk ##1 ;}}{kK}}%
56   \_def\_setcmykcolor##1{\_setcolor{##1}kK}}%
57   \_public \colordef \setrgbcolor \setcmykcolor ;}
58 \_public \onlyrgb \onlycmyk ;

```

The `\colorattr` for coloring is allocated and `\_setcolor{\langle color-data \rangle}{\langle fill-op \rangle}{\langle stroke-op \rangle}` is defined here. This macro does `\_colorattr=\_colorcnt` if the  $\langle color data \rangle$  was not used before and prepare mapping from this integer value to the  $\langle color data \rangle$  and increments `\_colorcnt`. If the  $\langle color data \rangle$  were used already, then `\_setcolor` does `\_colorattr=⟨stored-value⟩`. This work is done by the `\translatecolor` macro. The following mapping macros are created:

```

\_color::⟨data⟩ ⟨fill-op⟩ ... expands to used ⟨attribute-value⟩
\_color:⟨attribute-value⟩ ... expands to ⟨data⟩ ⟨fill-op⟩
\_color-s:⟨attribute-value⟩ ... expands to ⟨data⟩ ⟨stroke-op⟩

```

The `\resetcolor` un-sets the color attribute, it means that default color (black) shall be used.

```

79 \_newattribute \_colorattr
80 \_newcount \_colorcnt \_colorcnt=1 % allocations start at 1
81 \_protected\def\setcolor{\_colorprefix\_colorattr=\_translatecolor}
82 \_def\resetcolor{\_colorattr=-"7FFFFFFF "}
83 \_def\translatecolor#1#2#3{\_ifcsname _color::#1 #2\_endcsname\lastnamedcs\_relax
84   \_else
85     \_colorcnt
86     \_sxdef{\_color::#1 #2}{\_the\_colorcnt}%
87     \_sxdef{\_color:\_the\_colorcnt}{#1 #2}%
88     \_sxdef{\_color-s:\_the\_colorcnt}{#1 #3}%
89     \_incr \_colorcnt
90   \_fi
91 }
92 % Black is the default color.
93 \_sdef{\_color::0 g}{0}
94 \_sdef{\_color:0}{0 g}
95 \_sdef{\_color-s:0}{0 G}

```

We support concept of non-local color, i.e. all changes of the color attribute are global by setting `\_colorprefix` to `\global`. `\localcolor` is the default, i.e. `\_colorprefix` is `\relax`. You can write `\global\Red` if you want to have global setting of the color.

```
105 \_protected\_def \_localcolor {\_let\_colorprefix=\_relax}
106 \_protected\_def \_nolocalcolor {\_let\_colorprefix=\_global}
107 \_public \localcolor \nolocalcolor ;
108 \_localcolor
```

`colors.opm`

We use Lua codes for RGB to CMYK or CMYK to RGB conversions and for addition color components in the `\colordef` macro. The `\rgbtocmyk`  $\langle R \rangle \langle G \rangle \langle B \rangle$  ; expands to  $\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle$  and the `\cmyktorgb`  $\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle$  ; expands to  $\langle R \rangle \langle G \rangle \langle B \rangle$ . The `\colorcrop`, `\colordefFin` and `\douseK` are auxiliary macros used in the `\colordef`. The `\colorcrop` rescales color components in order to they are in  $[0, 1]$  interval. The `\colordefFin` expands to the values accumulated in Lua code `color_C`, `color_M`, `color_Y` and `color_K`. The `\douseK` applies `\useK` to CMYK components.

The `\tocmyk:` $\langle rgb \rangle$  or `\torgb:` $\langle cmyk \rangle$  control sequences (given by `\rgbcmykmap`) have precedence.

```
125 \_def\rgbtocmyk #1 #2 #3 ;{\_trycs{\_tocmyk:#1 #2 #3}{%
126   \_ea \_stripzeros \_detokenize \_ea{\_directlua{
127     local kr = math.max(#1,#2,#3)
128     if (kr==0) then
129       tex.print('0. 0. 0. 1 ;')
130     else
131       tex.print(string.format('\_pcnt.3f \_pcnt.3f \_pcnt.3f \_pcnt.3f ;',
132         (kr-#1)/kr, (kr-#2)/kr, (kr-#3)/kr, 1-kr))
133     end
134   }}}
135 \_def\cmyktorgb #1 #2 #3 #4 ;{\_trycs{\_torgb:#1 #2 #3 #4}{%
136   \_ea \_stripzeros \_detokenize \_ea{\_directlua{
137     local kr = 1-#4
138     tex.print(string.format('\_pcnt.3f \_pcnt.3f \_pcnt.3f ;',
139       (1-#1)*kr, (1-#2)*kr, (1-#3)*kr))
140   }}}
141 \_def\colorcrop{\_directlua{
142   local m=math.max(color_C, color_M, color_Y, color_K)
143   if (m>1) then
144     color_C=color_C/m color_M=color_M/m color_Y=color_Y/m color_K=color_K/m
145   end
146 }
147 \_def\colordefFin{\_colorcrop \_ea \_stripzeros \_detokenize \_ea{\_directlua{
148   tex.print(string.format('\_pcnt.3f \_pcnt.3f \_pcnt.3f \_pcnt.3f ;',
149     color_C, color_M, color_Y, color_K))
150   }}}
151 \_def\douseK{\_colorcrop \_directlua{
152   kr=math.min(color_C, color_M, color_Y)
153   if (kr>=1) then
154     color_C=0 color_M=0 color_Y=0 color_K=1
155   else
156     color_C=(color_C-kr)/(1-kr) color_M=(color_M-kr)/(1-kr)
157     color_Y=(color_Y-kr)/(1-kr) color_K=math.min(color_K+kr,1)
158   end
159 }}
```

`colors.opm`

We have a problem with the `.3f` directive in Lua code. It prints trailed zeros: (0.300 instead desired 0.3) but we want to save PDF file space. The macro `\stripzeros` removes these trailing zeros at the expand processor level. So `\stripzeros 0.300 0.400 0.560` ; expands to `.3 .4 .56`.

```
168 \_def\stripzeros #1.#2 #3{\_ifx0#1\_else#1\_fi.\_stripzeroA #2 0 :%
169   \_ifx;#3\_else \_space \_ea\stripzeros\_ea#3\_\fi}
170 \_def\stripzeroA #10 #2:{\_ifx^#2^\_stripzeroC#1:\_else \_stripzeroB#1 0 :\_\fi}
171 \_def\stripzeroB #10 #2:{\_ifx^#2^\_stripzeroC#1:\_else #1\_\fi}
172 \_def\stripzeroC #1 #2:{#1}
```

`colors.opm`

`\rgbcmykmap`  $\{\langle R \rangle \langle G \rangle \langle B \rangle\} \{\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle\}$  declares mapping from RGB to CMYK and from CMYK to RGB for given color. It has precedence before general formulae used in the `\rgbtocmyk` and `\cmyktorgb` macros. Note, that the values  $\langle R \rangle \langle G \rangle \langle B \rangle$   $\langle C \rangle \langle M \rangle \langle Y \rangle \langle K \rangle$  must be given exactly in the same format as in `\setcmykcolor` and `\setrgbcolor` parameters. For example, 0.5 or .5 or .50 are different values from point of view of this mapping.

```
184 \_def\rgbcmymkmap#1#2{\_sxdef{_torgb:#2}{#1}\_sxdef{_tocmyk:#1}{#2}}
185 \_public \rgbcmymkmap ;
```

The `\rgbcolordef` and `\cmykcolordef` use common macro `\_commoncolordef` with different first four parameters. The `\_commoncolordef {selector}⟨K⟩⟨R⟩⟨G⟩⟨what-define⟩{⟨data⟩}` does the real work. It initializes the Lua variables for summation. It expands `⟨data⟩` in the group where color selectors have special meaning, then it adjusts the resulting string by `\replstring` and runs it. Example shows how the `⟨data⟩` are processed:

```
input ⟨data⟩: ".3\Blue + .6^KhakiC \useK -\Black"
expanded to: ".3 !=K 1 1 0 0 +.6!=R .804 .776 .45 \_useK -!=G 0"
adjusted to: "\_addcolor .3!=K 1 1 0 0 \_addcolor .6!=R .804 .776 .45
              \_useK \_addcolor -1!=G 0"
and this is processed.
```

`\_addcolor ⟨coef⟩!⟨mod⟩⟨type⟩` expands to `\_addcolor:⟨mod⟩⟨type⟩ ⟨coef⟩` for example it expands to `\_addcolor:=K ⟨coef⟩` followed by one or three or four numbers (depending on `⟨type⟩`). `⟨mod⟩` is = (use as is) or ^ (use complementary color). `⟨type⟩` is K for CMYK, R for RGB and G for GREY color space. Uppercase `⟨type⟩` informs that `\cmykcolordef` is processed and lowercase `⟨type⟩` informs that `\rgbcolordef` is processed. All variants of commands `\_addcolor:⟨mod⟩⟨type⟩` are defined. All of them expand to `\_addcolorA ⟨v1⟩ ⟨v2⟩ ⟨v3⟩ ⟨v4⟩` which adds the values of Lua variables. The `\rgbcolordef` uses `\_addcolorA ⟨R⟩ ⟨G⟩ ⟨B⟩ 0` and `\cmkykcolordef` uses `\_addcolorA ⟨C⟩ ⟨M⟩ ⟨Y⟩ ⟨K⟩`. So the Lua variable names are a little confusing when `\rgbcolordef` is processed.

Next, `\_commoncolordef` saves resulting values from Lua to `\_tmpb` using `\_colordefFin`. If `\rgbcolordef` is processed, then we must to remove the last `⟨K⟩` component which is in the format .0 in such case. The `\_stripK` macro does it. Finally, the `⟨what-define⟩` is defined as `{⟨selector⟩{⟨expanded _tmpb⟩}}`, for example `\_setcmykclor{1 0 .5 .3}`.

```
222 \_def\rgbcolordef {\_commoncolordef \_setrgbcolor krg}

```

Public versions of `\colordef` and `\useK` macros are declared using `\_def`, because the internal versions `\_\_colordef` and `\_\_useK` are changed during processing.

```

276 \_def \useK{\_\_useK}
277 \_def \colordef {\_\_colordef}
278 \_public \cmykcolordef \rgbcolordef ;

```

`colors.opm`

The L<sup>A</sup>T<sub>E</sub>X file `x11nam.def` is read by `\morecolors`. The numbers 0,1,2,3,4 are transformed to letters O, *none*, B, C, D in the name of the color. Colors defined already are not re-defined. The empty `\showcolor` macro should be re-defined for color catalog printing. For example:

```

\def\vr{\vrule height10pt depth2pt width20pt}
\def\_\_showcolor{\hbox{\tt \_bslash\_\_tmpb: \csname\_\_tmpb\endcsname \vr}\space\space}
\begin{multi} 4 \typo{10/14}
\morecolors
\end{multi}

294 \_def\_\_morecolors{%
295   \_long\_\_def\_\_tmp##1\preparecolorset##2##3##4##5{\_\_tmpa ##5;,,,;}
296   \_def\_\_tmpa##1##2##3##4;{\_ifx,##1,\_else
297     \_def\_\_tmpb##1\replstring\_\_tmpb{1}{}\replstring\_\_tmpb{2}{B}%
298     \replstring\_\_tmpb{3}{C}\replstring\_\_tmpb{4}{D}\replstring\_\_tmpb{0}{0}%
299     \_ifcsname\_\_tmpb\_\_endcsname \_else
300       \_sdef\_\_tmpb{\_setrgbcolor##2 ##3 ##4}\_showcolor\_\_fi
301       \_ea\_\_tmpa\_\_fi
302     }
303     \_ea\_\_tmp\_\_input x11nam.def
304   }
305 \_let\_\_showcolor=\_relax % re-define it if you want to print a color catalog
306 \_public \morecolors ;

```

`colors.opm`

## 2.21 The .ref file

A so called `.ref` (`\jobname.ref`) file is used to store data that will be needed in the next T<sub>E</sub>X run (information about references, TOC lines, etc.). If it exists it is read by `\everyjob`, when processing of the document starts, but it is not created at all if the document doesn't need any forward references. Here are the typical contents of a `.ref` file:

```

\Xrefversion{\<ref-version>}
\Xpage{\<gpageno>}{\<pageno>}
\Xtoc{\<level>}{\<type>}{\<text>}{}{\<title>}
\Xlabel{\<label>}{\<text>}
\Xlabel{\<label>}{\<text>}
...
\Xpage{\<gpageno>}{\<pageno>}
\Xlabel{\<label>}{\<text>}
...

```

- `\Xpage` corresponds to the beginning of a page. `\<gpageno>` is an internal page number, globally numbered from one. `\<pageno>` is the page number (`\the\pageno`) used in pagination (they may differ).
- `\Xtoc` corresponds to a chapter, section or subsection title on a page. `\<title>` is the title of the chapter (`\<level>=1`, `\<type>=chap`), section (`\<level>=2`, `\<type>=sec`) or subsection (`\<level>=3`, `\<type>=secc`).
- `\Xlabel` corresponds to a labelled object on a page. `\<label>` is the label provided by the user in `\label[\<label>]`, while `\<text>` is the text which should be used for the reference (section or table number, for example 2.3.14).

```
3 \codedecl \openref {File for references <2021-07-19>} % preloaded in format
```

ref-file.opm

The `\_inputref` macro is executed in `\everyjob`. It reads the `\jobname.ref` file, if it exists. After the file is read then it is removed and opened for writing.

```
11 \newwrite\reffile
12
13 \def\_inputref {%
14   \isfile{\jobname.ref}\iftrue
15   \input{\jobname.ref}%
16   \edef\_prevrefhash{\mdfive{\jobname.ref}}%
17   \gfnotenum=0 \lfnotenum=0 \mnotenum=0
18   \openref
19 \fi
20 }
```

ref-file.opm

`\mdfive{<file>}` expands to the MD5 hash of a given file. We use it to do consistency checking of the `.ref` file. First, we read the MD5 hash of `.ref` file from previous TeX run before it is removed and opened for writing again in the `\_inputref` macro. The hash is saved to `\_prevrefhash`. Second, we read the MD5 hash in the `\byehook` macro again and if these hashes differ, warning that “ref file has changed” is printed. Try running `optex op-demo` twice to see the effect.

```
32 \def\mdfive#1{\directlua{\mdfive("#1")}}
33 \def\_prevrefhash{}
```

ref-file.opm

If the `.ref` file does not exist, then it is not created by default. This means that if you process a document without any forward references then no `\jobname.ref` file is created (it would be unusable). The `\_wref` macro is a dummy in that case.

```
42 \def\_wrefrelax#1#2{%
43 \let\wref=\wrefrelax
```

ref-file.opm

If a macro needs to create and use the `.ref` file, then such macro must first use `\openref`. It creates the file and redefines `\wref`  $\langle macro \rangle \{ \langle data \rangle \}$  so that it saves the line  $\langle macro \rangle \langle data \rangle$  to the `.ref` file using the asynchronous `\write` primitive. Finally, `\openref` destroys itself, because we don't need to open the file again.

`\wref{csname}{<params>}` in fact does `\write\reffile{\string<csname>\langle params \rangle}` and similarly `\ewref{csname}{<params>}` does `\write\reffile{\string<csname>\langle expanded-params \rangle}`.

```
57 \def\_openref {%
58   \immediate\openout\reffile="\jobname.ref"\relax
59   \gdef\wref {\#1##2{\write\reffile{\_bslash\_csstring##1##2}}%
60   \immediate\write\reffile {\_pcnt\pcnt\_space OpTeX <\optexversion> - REF file}%
61   \immediate\wref \Xrefversion{\_REFversion}%
62   \gdef\openref{}%
63 }
64 \def\ewref {\#1##2{\edef\ewrefA{\#2}\ea\wref{\ea{\#1}\ea{\ewrefA}}}
65 \def\openref{\_openref}
```

ref-file.opm

We are using the convention that the macros used in `.ref` file are named `\_X<foo>`. We don't want to read `.ref` files from old, incompatible versions of OpTeX (and OPmac). This is ensured by using a version number and the `\Xrefversion` macro at the beginning of the `.ref` file:

```
\Xrefversion{\version}
```

The macro checks the version compatibility. Because OPmac does not understand `\_Xrefversion` we use `\Xrefversion` (with a different number of `\version` than OPmac) here. The result: OPmac skips `.ref` files produced by OpTeX and vice versa.

```
83 \def\_REFversion{6} % current version of .ref files in OpTeX
84 \def\Xrefversion{\_ifnum #1=\_REFversion\relax \else \endinput \fi}
85 \public \Xrefversion ; % we want to ignore .ref files generated by OPmac
```

ref-file.opm

You cannot define your own `.ref` macros before `.ref` file is read because it is read in `\everyjob`. But you can define such macros by using `\refdecl{\langle definitions of your ref macros \rangle}`. This command immediately writes `\langle definitions of your ref macros \rangle` to the `.ref` file. Then the next lines written to the `.ref` file can include your macros. An example from CTUstyle2:

```
\refdecl{%
  \def\totlist{} \def\tofilelist{}^J
  \def\Xtab#1#2#3{\addto\totlist{\totline{#1}{#2}{#3}}}^J
  \def\Xfig#1#2#3{\addto\tofilelist{\tofileline{#1}{#2}{#3}}}
}
```

We must read *<definitions of your ref macros>* while # has the catcode 12, because we don't want to duplicate each # in the .ref file.

```
ref-file.opm
106 \def\_refdecl{\_bgroup \catcode`#=12 \_refdeclA}
107 \def\_refdeclA #1{\egroup\_openref
108   \immediate\_write\_reffeile {\_pcent\_space \_string \refdecl:}%
109   \immediate\_write\_reffeile {\detokenize{#1}}%
110 }
111 \public \refdecl ;
```

## 2.22 References

If the references are “forward” (i. e. the \ref is used first, the destination is created later) or if the reference text is page number then we must read .ref file first in order to get appropriate information. See section 2.21 for more information about .ref file concept.

```
references.opm
3 \codeline \ref {References <2021-04-13>} % preloaded in format
```

\\_Xpage {\<gpageno>} {\<pageno>} saves the parameter pair into \currpage. Resets \lfnotenum; it is used if footnotes are numbered from one at each page.

```
references.opm
10 \def\_Xpage#1#2{\def\currpage{{#1}{#2}}\lfnotenum=0 }
```

Counter for the number of unresolved references \unresolvedrefs. It is set but unused in OpTeX versions 1.04+. You can add the report, for example:

```
\addto\_byehook{\ifnum\_unresolvedrefs>0 \opwarning
  {There are \the\_unresolvedrefs\_space unresolved references}\fi}
```

```
references.opm
22 \newcount\_unresolvedrefs
23 \unresolvedrefs=0
```

\\_Xlabel {\<label>} {\<text>} saves the \text to \lab:\<label> and saves [pg:\<gpageno>] {\<pageno>} to \pgref:\<label>.

```
references.opm
30 \def\_Xlabel#1#2{\sdef{\lab:#1}{#2}\sxdef{\pgref:#1}{\ea\bracketspg\currpage}}
31 \def\bracketspg#1#2[pg:#1]{#2}
```

\label[\<label>] saves the declared label to \lastlabel and \wlabel{\<text>} uses the \lastlabel and activates \wref\Xlabel{\<label>} {\<text>}.

```
references.opm
39 \def\_label[#1]{\isempty{#1}\iftrue \global\let\lastlabel=\undefined
40   \else \isdefined{10:#1}%
41     \iftrue \slidesshook\opwarning{Duplicated label [#1], ignored}\else \xdef\lastlabel{#1}\fi
42   \fi \ignorespaces
43 }
44 \let\slidesshook=\relax % redefined if \slides + \slideshow.
45 \def\wlabel#1{%
46   \ifx\lastlabel\undefined \else
47     \dest[ref:\lastlabel]%
48     \printlabel\lastlabel
49     \ewref\Xlabel {\lastlabel}{#1}%
50     \sxdef{\lab:\lastlabel}{#1}\sxdef{10:\lastlabel}{}%
51     \global\let\lastlabel=\undefined
52   \fi
53 }
54 \public \label \wlabel ;
```

\ref[\<label>] uses saved \lab:\<label> and prints (linked) \text. If the reference is backward then we know \lab:\<label> without any need to read REF file. On the other hand, if the reference is forwarded,

then we doesn't know `\_lab:<label>` in the first run of TeX and we print a warning and do `\_openref`. `\pgref[<label>]` uses `{<gpageno>}{{<pageno>}}` from `\_pgref:<label>` and prints (linked) `<pageno>` using `\_ilink` macro.

```
references.opm
67 \_def\_ref[#1]{\_isdefined{\_lab:#1}%
68   \_iftrue \_ilink{ref:#1}{\_csname _lab:#1\_endcsname}%
69   \_else ??\opwarning{label [#1] unknown. Try to TeX me again}%
70   \_incr\_unresolvedrefs \_openref
71   \_fi
72 }
73 \_def\_pgref[#1]{\_isdefined{\_pgref:#1}%
74   \_iftrue \_ea\ea\ea\ilink \_csname _pgref:#1\_endcsname
75   \_else ??\opwarning{pg-label [#1] unknown. Try to TeX me again}%
76   \_incr\_unresolvedrefs \_openref
77   \_fi
78 }
79 \_public \ref \pgref ;
```

Default `\printlabel` is empty macro (labels are not printed). The `\showlabels` redefines it as box with zero dimensions and with left lapped `[<label>]` in blue 10pt `\tt` font shifted up by 1.7ex.

```
references.opm
87 \_def\_printlabel#1{}
88 \_def\_showlabels {%
89   \_def\_printlabel##1{\_vbox to\zof{\_vss\llap{\_labelfont[##1]\_kern1.7ex}}{%
90     \_fontdef\_labelfont{\_setfontsize{at10pt}\_setfontcolor{blue}\_tt}
91   }
92 \_public \showlabels ;
```

## 2.23 Hyperlinks

There are six types of internal links and one type of external link used in OpTeX. They are used in the format `<type>:<spec>`.

- `ref:<label>` – the destination is created when `\label[<label>]` is used, see also the section 2.22.
- `toc:<tocrefnum>` – the destination is created at chap/sec/secc titles, see also the section 2.24.
- `pg:<gpageno>` – the destination is created at beginning of each page, see also the section 2.18.
- `cite:<bibpart>/<bibnum>` – the destination is created in bibliography reference, see section 2.32.1.
- `fnt:<gfnotenumber>` – link form text to footnote, see also section 2.34.
- `fnf:<gfnotenumber>` – link from footnote to text, see also section 2.34.
- `url:<url>` – used by `\url` or `\ulink`, see also the end of this section.

The `<tocrefnum>`, `<gpageno>`, `<bibnum>`, and `<gfnotenumber>` are numbers starting from one and globally incremented by one in the whole document. The registers `\tocrefnum`, `\gpageno`, `\bibnum`, and `\gfnotenumber` are used for these numbers.

When a chap/sec/secc title is prefixed by `\label[<label>]`, then both types of internal links are created at the same destination place: `toc:<tocrefnum>` and `ref:<label>`.

The color for active links can be declared by `\def\_<type>linkcolor`, the border around link can be declared by `\def\_<type>border`. These macros are not declared by default, so color for active links are given only by `\hyperlinks` macro and borders are invisible. For example `\def\_toclinkcolor{\Red}` means that links from table of contents are in red. Another example `\def\_tocborder{1 0 0}` causes red frames in TOC (not printed, only visible in PDF viewers).

```
hyperlinks.opm
3 \_codedecl \ulink {Hyperlinks <2021-05-14>} % preloaded in format
```

`\dest[<type>:<spec>]` creates a destination of internal links. The destination is declared in the format `<type>:<spec>`. If the `\hyperlinks` command in not used, then `\dest` does nothing else it is set to `\_destactive`. The `\_destactive` is implemented by `\_pdfdest` primitive. It creates a box in which the destination is shifted by `\_destheight`. The reason is that the destination is exactly at the top border of the PDF viewer but we want to see the line where the destination is. The destination box is positioned by a different way dependent on the current vertical or horizontal mode.

```

hyperlinks.opm
16 \_def \_destheight{1.4em}
17 \_def \_destactive[#1:#2]{\_if$#2$\_else \_ifvmode
18     \_tmpdim=\_prevdepth \_prevdepth=-1000pt
19     \_destbox[#1:#2]\_prevdepth=\_tmpdim
20 \_else \_destbox[#1:#2]%
21 \_fi\_\_fi
22 }
23 \_def \_destbox[#1]{\_vbox to\_\_zo{\_kern-\_destheight \_pdfdest name{#1} xyz\_\_vss}}
24 \_def \_dest[#1]{}
25 \_public \dest ;

```

Each hyperlink is created internally by `\_xlink{<type>}{<spec>}{<color>}{<text>}`. This macro expands to `\_quitvmode{<text>}` by default, i.e. no active hyperlink is created, only `<text>` is printed in horizontal mode. If `\hyperlinks` is used, then `\_xlink` gets meaning of `\_xlinkactive` and hyperlinks are created using `\pdfstartlink`, `\pdfendlink` primitives. The `<text>` has given `<color>` only when hyperlink is created. But if `\_<type>linkcolor` is defined, it has precedence.

The `\_linkdimens` macro declares the dimensions of link area.

A specific action can be defined for each link `<type>` by the macro `\_<type>action{<spec>}`. OpTeX defines only `\_urlaction{<url>}`. The default link action (when `\_<type>action` is not defined) is `goto name{<type>}:{<spec>}` (creates an internal link). It is declared in the `\_linkactions{<type>}{<spec>}` macro.

The `\pdfstartlink` primitive uses `attr{\_pdfborder{<type>}}`. The `\_pdfborder{<type>}` macro expands to `/C[? ? ?] /Border[0 0 .6]` if the `\_<type>border` macro (i.e. `\refborder`, `\citeborder`, `\tocborder`, `\pgborder`, `\urlborder`, `\fntborder` or `\fnfborder`) is defined.

```

hyperlinks.opm
52 \_protected\_def \_xlinkactive#1#2#3#4{\_quitvmode
53     \_pdfstartlink \_linkdimens attr{\_pdfborder{#1}}\_linkactions{#1}{#2}\_relax
54     {\_localcolor\trycs{#1linkcolor}{#3}#4}\_pdfendlink
55 }
56 \_protected\_def \_xlink#1#2#3#4{\_quitvmode{#4}}
57
58 \_def \_linkdimens{height.9em depth.3em}
59
60 \_def \_linkactions#1#2{\_ifcsname _#1action\endcsname
61     \_lastnamedcs{#2}\_else goto name{#1:#2}\_fi}
62 \_def \_urlaction #1{\user{/Subtype/Link/A <>/Type/Action/S/URI(#1)>>}}
63
64 \_def \_pdfborder#1{\_ifcsname _#1border\endcsname
65     /C [\_csname _#1border\endcsname] /Border [0 0 .6]\_else /Border [0 0 0]\_fi
66 }
```

`\link[<type>:{<spec>}]{<color>}{<text>}` creates a link. It is kept here for backward compatibility and it is equivalent to `\_xlink{<type>}{<spec>}{<color>}{<text>}`. If `\_<type>action` is not defined then `\link` creates internal link do the `\dest[<type>:{<spec>}]`. You can have more links with the same `<type>:{<spec>}` but only one `\dest` in the document.

`\ilink[<type>:{<spec>}]{<text>}` is equivalent to `\link` but the `<color>` is used from `\hyperlinks` declaration (or it is overwritten by `\def\_{<type>}linkcolor`).

`\ulink[<url>]{<text>}` creates external link. The `<url>` is detokenized with `\escapechar=-1` before it is used, so `\%, \#` etc. can be used in the `<url>`.

```

hyperlinks.opm
86 \_def \_link[#1:#2]{\_xlink{#1}{#2}}
87 \_def \_ilink[#1:#2]{\_xlink{#1}{#2}\_ilinkcolor{#3}}
88 \_def \_ulink[#1]{\_expanded{\_escapechar=-1 \_ea}\_expanded
89     {\_noexpand\_\_xlink{url}{\detokenize{#1}}}\_elinkcolor{#2}}
90
91 \_public \ilink \ulink \link ;
```

`\hyperlinks{<ilink_color>}{<ulink_color>}` activates `\dest`, `\xlink`, in order they create links.

```

hyperlinks.opm
98 \_def \_hyperlinks#1#2{%
99     \_let\_\dest=\_destactive \_let\_\xlink=\_xlinkactive
100     \_let\_\ilinkcolor=#1%
101     \_let\_\elinkcolor=#2%
102     \_public \dest \xlink ;%
103 }
104 \_public \hyperlinks ;
```

`\url{<url>}` does approximately the same as `\ulink[<url>]{<url>}`, but more work is done before the `\ulink` is processed. The link-version of `<url>` is saved to `\_tmpa` and the printed version in `\_tmpb`. The printed version is processed in four steps: 1. the `\|` are replaced by `[||]` (we suppose that such string does not exist in any URL). 2. it is detokenized with `\escapechar=-1`. 3. muti-strings and spaces are replaced by strings in braces `{...}`. 4. internal penalties and skips are put between characters using `\_urlA`, `\_urlB` and `\_urlC`. The step 4 do following: The `\_urlxskip` is inserted between each pair of “normal characters”, i.e. characters not declared by `\sdef{_ur:<character>}`. The special characters declared by `\sdef{_ur:<character>}` are replaced by the body of their corresponding macro. The `\_urlskip`, `\_urlbskip`, `\_urlgskip` are typical skips used for special characters, their meaning is documented in the code below. You can change them. Default values: penalty 9990 is inserted between each pair of normal characters, penalty 100 is inserted after special characters, nobreak before special characters. The URL can be broken at any place using these default values. If you want to disable breaking between normal characters, say `\let\urlxskip=\nobreak`.

The text version of the `<url>` is printed in `\_urlfont`.

```
hyperlinks.oppm
131 \_def\url#1{%
132   \_def\_\tmpa{#1}\_replstring\_\tmpa {\|}{%}
133   \_def\_\tmpb{#1}\_replstring\_\tmpb {\|}{[||]}%
134   {\_escapechar=-1 \_ea\_\edef\_\ea\_\tmpb\_\ea{\_detokenize\_\ea{\_tmpb}}%}

```

## 2.24 Making table of contents

```
maketoc.oppm
3 \codedecl \maketoc {Macros for maketoc <2021-07-18>} % preloaded in format
```

`\Xtoc {<level>}{<type>}{<number>}{<o-title>}{<title>}` (in `.ref` file) reads given data and appends them to the `\_toclist` as `\_tocline{<level>}{<type>}{<number>}{<o-title>}{<title>}{<gpageno>}{<pageno>}` where:

- `<level>`: 0 reserved, 1: chapter, 2: section, 3: subsection
- `<type>`: the type of the level, i.e. chap, sec, secc
- `<number>`: the number of the chapter/section/subsection in the format 1.2.3
- `<o-title>`: outlines title, if differs from `<title>`.
- `<title>`: the title text
- `<gpageno>`: the page number numbered from 1 independently of pagination
- `<pageno>`: the page number used in the pagination

The last two parameters are restored from previous `\_Xpage{pageno}-{gpageno}`, data were saved in the `\_currpage` macro.

We read the `<title>` parameter by `\scantoeol` from `.ref` file because the `<title>` can include something like ``.

`maketoc.opp`

```
26 \_def\_toclist{}  
27 \newifi \ifischap \ischapfalse  
28  
29 \_def\_Xtoc#1#2#3#4{\_ifnum#1=0 \ischaptrue\_fi  
30   \addto\_toclist{\_tocline{#1}{#2}{#3}{#4}}\scantoeol\_XtocA}  
31 \_def\_XtocA#1{\_addto\_toclist{#1}\ea\ea\addto\ea\_toclist\ea{\_currpage}}
```

`\_tocline{level}{type}{number}{o-title}{title}{gpageno}{pageno}` prints the record to the table of contents. It opens group, reduces `\leftskip`, `\rightskip`, runs the `\everytocline` (user can customise the design of TOC here) and runs `\tocl:{level} {number}{title}{pageno}` macro. This macro starts with vertical mode, inserts one record with given `<level>` and it should end by `\tocpar` which returns to horizontal mode. The `\tocpar` appends `\nobreak \hskip-2\iindent\null \par`. This causes that the last line of the record is shifted outside the margin given by `\rightskip`. A typical record (with long `<title>`) looks like this:

```
|           |  
\llap{number} text text text text  
          text text text text  
          text text ..... pageno
```

Margins given by `\leftskip` and `\rightskip` are denoted by | in the example above.

`\tocrefnum` is the global counter of all TOC records (used by hyperlinks).

`maketoc.opp`

```
56 \newcount \tocrefnum  
57 \def\_tocline#1#2#3#4#5#6#7%  
58   \advance\tocrefnum by1  
59   \bgroup  
60     \leftskip=\iindent \rightskip=2\iindent  
61     \ifischap \advance\leftskip by \iindent \fi  
62     \def\pgn{\_ilink[pg:#6]}%  
63     \the\everytocline  
64     \ifcsname _tocl:#1\endcsname  
65       \cs{_tocl:#1}{#3}{\scantextokens{#5}}{#7}\par  
66     \fi  
67   \egroup  
68 }  
69 \public \tocrefnum ;
```

You can re-define default macros for each level of tocline if you want.

Parameters are {*number*}{*title*}{*pageno*}.

`maketoc.opp`

```
76 \sdef{_tocl:1}#1#2#3{\_nofirst\bigskip  
77   \bf\llap{\_llap{\_toclink{#1}{#2}}\nobreak\hfill \pgn{#3}\_tocpar}  
78 \sdef{_tocl:2}#1#2#3{\_llap{\_toclink{#1}{#2}}\_tocdotfill \pgn{#3}\_tocpar}  
79 \sdef{_tocl:3}#1#2#3{\_advance\leftskip by\iindent \cs{_tocl:2}{#1}{#2}{#3}}}
```

The auxiliary macros are:

- `\_llap{\_toclink{text}}` does `\noindent\llap{linked text}`.
- `\_tocdotfill` creates dots in the TOC.
- `\_nofirst` macro applies the `\macro` only if we don't print the first record of the TOC.
- `\_tocpar` finalizes one TOC record with wrapped `<pageno>`.
- `\pgn{pageno}` creates `<pageno>` as link to real `<page>` saved in #6 of `\_tocline`. This is temporarily defined in the `\_tocline`.

`maketoc.opp`

```
94 \def\_llap{\_toclink#1{\_noindent  
95   \llap{\_ilink[toc:\the\tocrefnum]{\enspace#1\kern.4em}\kern.1em}}}  
96 \def\_tocdotfill{\nobreak\leaders\hbox to.8em{\hss.\hskip 1em plus1fill}\relax}  
97 \def\_nofirst #1{\_ifnum \lastpenalty=11333 \else #1\fi}  
98 \def\_tocpar{\nobreak \hskip-2\iindent\null \par}
```

If you want a special formating of TOC with adding more special lines (no generated as titles from `\chap`, `\sec`, `\secc`), you can define `\addtotoc{<level>}{<type>}{<number>}{<o-title>}{<title>}` macro:

```
\def\addtotoc#1#2#3#4#5{%
  \incr\_tocrefnum
  \dest[toc:\_the\_tocrefnum]%
  \ewref\_Xtoc{#1}{#2}{#3}{#4}#5%
}
```

and you can declare special lines (or something else) as an unused level (10 in the following example):

```
\sdef{_tocl:10}#1#2#3{\medskip\hbox{\Blue #2}\medskip}
```

Now, users can add a blue line into TOC by

```
\addtotoc{10}{blue-line}{}{\relax}{<blue text to be added in the TOC>}
```

anywhere in the document. Note that `\relax` in the fourth parameter means that outline will be not generated. And second parameter `blue-line` is only a comment (unused in macros).

`\maketoc` prints warning if TOC data is empty, else it creates TOC by running `\_toclist`

```
maketoc.opm
128 \_def\maketoc{\_par \_ifx\toclist\_empty
129   \_opwarning{\_noexpand\maketoc -- data unavailable, TeX me again}\_openref
130   \_incr\unresolvedrefs
131   \_else \begingroup

## 2.25 PDF outlines

### 2.25.1 Nesting PDF outlines

The problem is that PDF format needs to know the number of direct descendants of each outline if we need to create the tree of structured outlines. But we know only the level of each outline. The required data should be calculated from TOC data. We use two steps over TOC data saved in the `\_toclist` where each record is represented by one `\_tocline`.

The first step, the `\outlines` macro sets `\_tocline` to `\_outlinesA` and calculates the number of direct descendants of each record. The second step, the `\outlines` macro sets `\_tocline` to `\_outlinesB` and it uses prepared data and creates outlines.

Each outline is mapped to the control sequence of the type `\_ol:<num>` or `\_ol:<num>:<num>` or `\_ol:<num>:<num>:<num>` or etc. The first one is reserved for level 0, the second one for level 1 (chapters), the third one for level 2 (sections) etc. The number of direct descendants will be stored in these macros after the first step is finished. Each new outline of a given level increases the `<num>` at the given level. When the first step is processed then (above that) the `\_ol:...` sequence of the parent increases its value too. The `\_ol:....` sequences are implemented by `\_ol:\_count0:\_count1:\_count2` etc. For example, when section (level 2) is processed in the first step then we do:

```
\advance \count2 by 1
      % increases the mapping pointer of the type
      % \_ol:\_count0:\_count1:\_count2 of this section
\advance \_ol:\_count0:\_count1 by 1
      % increases the number of descendants connected
      % to the parent of this section.
```

When the second step is processed, then we only read the stored data about the number of descendants. And we use it in `count` parameter of `\_pdfoutline` primitive.

For linking, we use the same links as in TOC, i.e. the `toc:\_the\_tocrefnum` labels are used.

`\insertoutline {<text>}` inserts one outline with zero direct descendants. It creates a link destination of the type `oul:<num>` into the document (where `\insertoutline` is used) and the link itself is created too in the outline.

## 2.25.2 Strings in PDF outlines

There are only two encodings for PDF strings (used in PDFoutlines, PDFinfo, etc.). The first one is PDFDocEncoding which is single-byte encoding, but it misses most international characters.

The second encoding is Big Endian UTF-16 which is implemented in this file. It encodes a single character in either two or four bytes. This encoding is TeX-discomfortable because it looks like

```
<FEFF 0043 0076 0069 010D 0065 006E 00ED 0020 006A 0065 0020 007A 00E1 0074
011B 017E 0020 0061 0020 0078 2208 D835DD44>
```

This example shows a hexadecimal PDF string (enclosed in <> as opposed to the literal PDF string enclosed in ()). In these strings each byte is represented by two hexadecimal characters (0-9, A-F). You can tell the encoding is UTF-16BE, because it starts with “Byte order mark” FEFF. Each unicode character is then encoded in one or two byte pairs. The example string corresponds to the text “Cvičení je zátež a x ∈ M”. Notice the 4 bytes for the last character, M. (Even the whitespace would be OK in a PDF file, because it should be ignored by PDF viewers, but LuaTeX doesn’t allow it.)

```
pdfuni-string.opm
3 \codel{ \pdfunidef {PDFUnicde strings for outlines <2021-02-08>} % preloaded in format }
```

\\_hexprint is a command defined in Lua, that scans a number and expands to its UTF-16 Big Endian encoded form for use in PDF hexadecimal strings.

```
pdfuni-string.opm
10 \bgroup
11 \catcode`\%=12
12 \gdef\hexprint{\directlua{
13   local num = token.scan_int()
14   if num < 0x10000 then
15     tex.print(string.format("%04X", num))
16   else
17     num = num - 0x10000
18     local high = bit32.rshift(num, 10) + 0xD800
19     local low = bit32.band(num, 0x3FF) + 0xDC00
20     tex.print(string.format("%04X%04X", high, low))
21   end
22 }
23 \egroup
```

\pdfunidef\macro{<text>} does more things than only converting to hexadecimal PDF string. The <text> can be scanned in verbatim mode (it is true because \Xtoc reads the <text> in verbatim mode). First \edef do \scantextokens\unexpanded and second \edef expands the parameter according to current values on selected macros from \regoul. Then \removeoutmath converts ..\$x^2\$.. to ..x^2.., i.e removes dollars. Then \removeoutbraces converts ..{x}.. to ..x.... Finally, the <text> is detokenized, spaces are preprocessed using \replstring and then the \pdfunidefB is repeated on each character. It calls the \directlua chunk to print hexadecimal numbers in the macro \hexprint.

Characters for quotes (and separators for quotes) are activated by first \scatextokens and they are defined as the same non-active characters. But \regoul can change this definition.

```
pdfuni-string.opm
41 \def\pdfunidef#1#2{%

27   \_titfont \_noindent \scantextokens{#1}\_par}%
28   \_nobreak\bigskip
29 }
30 \_def\tit{\_scantoeol\printtit}
31
32 \public \tit ;

```

sections.opm

You can re-define `\_printchap`, `\_printsec` or `\_printsecc` macros if another design of section titles is needed. These macros get the `{title}` text in its parameter. The common recommendations for these macros are:

- Use `\_abovetitle{(penaltyA)}{(skipA)}` and `\_belowtitle{(skipB)}` for inserting vertical material above and below the section title. The arguments of these macros are normally used, i.e. `\_abovetitle` inserts `(penaltyA)(skipA)` and `\_belowtitle` inserts `(skipB)`. But there is an exception: if `\_belowtitle{(skipB)}` is immediately followed by `\_abovetitle{(penaltyA)}{(skipA)}` (for example section title is immediately followed by subsection title), then only `(skipA)` is generated, i.e. `(skipB)(penaltyA)(skipA)` is reduced only to `(skipA)`. The reason for such behavior: we don't want to duplicate vertical skip and we don't want to use the negative penalty in such cases. Moreover, `\_abovetitle{(penaltyA)}{(skipA)}` takes previous whatever vertical skip (other

than from `\_belowtitle`) and generates only greater from this pair of skips. It means that  $\langle\text{whatever-skip}\rangle\langle\text{penaltyA}\rangle\langle\text{skipA}\rangle$  is transformed to  $\langle\text{penaltyA}\rangle\max(\langle\text{whatever-skip}\rangle\langle\text{skipA}\rangle)$ . The reason for such behavior: we don't want to duplicate vertical skips (from `\_belowlistskip`, for example) above the title.

- Use `\_printrefnum[⟨pre⟩@⟨post⟩]` in horizontal mode. It prints  $\langle\text{pre}\rangle\langle\text{ref-num}\rangle\langle\text{post}\rangle$ . The  $\langle\text{ref-num}\rangle$  is `\_thechapnum` or `\_theseccnum` or `\_theseccnum` depending on what type of title is processed. If `\_nonum` prefix is used then `\_printrefnum` prints nothing. The macro `\_printrefnum` does more work: it creates destination of hyperlinks (if `\hyperlinks{...}` is used) and saves references from the label (if `\label[⟨label⟩]` precedes) and saves references for the table of contents (if `\maketoc` is used).
- Use `\nbpar` for closing the paragraph for printing title. This command inserts `\_nobreak` between each line of such paragraph, so the title cannot be broken into more pages.
- You can use `\_firstnoindent` in order to the first paragraph after the title is not indented.

```
sections.opm
72 \_def\_printchap #1{\_vfill\_supereject
73   \_vglue\medskipamount % shifted by topkip+\medskipamount
74   {\_chapfont \_noindent \_mtextr{chap} \_printrefnum[@]\_par
75     \_nobreak\_smallskip
76     \_noindent \_raggedright #1\_\nbpar}\_mark{#1}%
77   \_nobreak \_belowtitle{\_bigskip}%
78   \_firstnoindent
79 }
80 \_def\_printsec#1{\_par
81   \_abovetitle{\_penalty-400}\_bigskip
82   {\_secfont \_noindent \_raggedright \_printrefnum[@\quad]#1\_\nbpar}\_insertmark{#1}%
83   \_nobreak \_belowtitle{\_medskip}%
84   \_firstnoindent
85 }
86 \_def\_printsecc#1{\_par
87   \_abovetitle{\_penalty-200}{\_medskip\_smallskip}
88   {\_seccfont \_noindent \_raggedright \_printrefnum[@\quad]#1\_\nbpar}\_insertmark{#1}%
89   \_nobreak \_belowtitle{\_medskip}%
90   \_firstnoindent
91 }
```

The `\_sectionlevel` is the level of the printed section:

- `\_sectionlevel=0` – reserved for parts of the book (unused by default)
- `\_sectionlevel=1` – chapters (used in `\chap`)
- `\_sectionlevel=2` – sections (used in `\sec`)
- `\_sectionlevel=3` – subsections (used in `\secc`)
- `\_sectionlevel=4` – subsubsections (unused by default, see the [OpTeX trick 0033](#))

```
sections.opm
105 \newcount\sectionlevel
106 \def \secinfo {\_ifcase \_sectionlevel
107   part\or chap\or sec\or secc\or seccc\fi
108 }
```

The `\_chapx` initializes counters used in chapters, the `\_secx` initializes counters in sections and `\_seccx` initializes counters in subsections. If you have more types of numbered objects in your document then you can declare appropriate counters and do `\addto\chapx{yourcounter=0}` for example. If you have another concept of numbering objects used in your document, you can re-define these macros. All settings here are global because it is used by `{\_globaldefs=1 \_chapx}`.

Default concept: Tables, figures, and display maths are numbered from one in each section – subsections don't reset these counters. Footnotes declared by `\fnotenumchapters` are numbered in each chapter from one.

The `\_the*` macros `\_thechapnum`, `\_theseccnum`, `\_theseccnum`, `\_thetnum`, `\_thefnum` and `\_thednum` include the format of numbers used when the object is printing. If chapter is never used in the document then `\_chapnum=0` and `\_oth\chapnum`. expands to empty. Sections have numbers  $\langle\text{num}\rangle$  and subsections  $\langle\text{num}\rangle.\langle\text{num}\rangle$ . On the other hand, if chapter is used in the document then `\_chapnum>0` and sections have numbers  $\langle\text{num}\rangle.\langle\text{num}\rangle$  and subsections have numbers  $\langle\text{num}\rangle.\langle\text{num}\rangle.\langle\text{num}\rangle$ .

```

sections.opm
136 \_newcount \_chapnum % chapters
137 \_newcount \_secnum % sections
138 \_newcount \_seccnum % subsections

```

The `\notoc` and `\nonum` prefixes are implemented by internal `\_ifnotoc` and `\_ifnonum`. They are reset after each chapter/section/subsection by the `\_resetnonumnotoc` macro.

```

sections.opm
162 \_newifi \_ifnotoc \_notocfalse \_def \_notoc {\_global \_nototrue}
163 \_newifi \_ifnonum \_nonumfalse \_def \_nonum {\_global \_nonumtrue}
164 \_def \_resetnonumnotoc {\_global \_notocfalse \_global \_nonumfalse}
165 \_public \_notoc \_nonum ;

```

The `\chap`, `\sec`, and `\secc` macros are implemented here. The `\_inchap`, `\_insec` and `\_insecc` macros do the real work. First, we read the optional parameter [`<label>`], if it exists. The `\chap`, `\sec` and `\secc` macro reads its parameter using `\scantoeol`. This causes that they cannot be used inside other macros. Use `\_inchap`, `\_insec`, and `\_insecc` macros directly in such case.

```

sections.opm
176 \_optdef \_chap [] {\_trylabel \_scantoeol \_inchap}

199   \_printsecc {\_scantextokens {#1}} %
200   \_resetnonumnotoc
201 }
202 \_public \_chap \_sec \_secc ;

```

The `\_printrefnum[<pre>@<post>]` macro is used in `\_print*` macros.

Note that the `<tite-text>` is `\detokenized` before `\wref`, so the problem of “fragile macros” from old L<sup>A</sup>T<sub>E</sub>X never occurs. This fourth parameter is not delimited by `{...}` but by end of line. This gives possibility to have unbalanced braces in inline verbatim in titles.

```

sections.opm
213 \_def \_printrefnum [#1@#2]{\_leavevmode % we must be in horizontal mode

231 \_public \\thisoutline ;

```

sections.opm

The `\abovetitle{<penaltyA>}{<skipA>}` and `\belowtitle{<skipB>}` pair communicates using a special penalty 11333 in vertical mode. The `\belowtitle` puts the vertical skip (its value is saved in `\_savedtitleskip`) followed by this special penalty. The `\abovetitle` reads `\lastpenalty` and if it has this special value then it removes the skip used before and doesn't use the parameter. The `\abovetitle` creates `<skipA>` only if whatever previous skip is less or equal than `<skipA>`. We must save `<whatever-skip>`, remove it, create `<penaltyA>` (if `\belowtitle` does not precede) and create `<whatever-skip>` or `<skipA>` depending on what is greater. The amount of `<skipA>` is measured using `\setbox0=\\vbox`.

```

```

sections.opm

`\nbpar` sets `\interlinepenalty` value. `\nl` is “new line” in the text (or titles), but space in toc or headlines or outlines.

```

263 \_def\\_nbpar{\\_interlinepenalty=10000\\_endgraf}%
264
265 \_protected\\_def\\_nl{\\_unskip\\_hfil\\_break}
266 \_regmacro {\\_def\\_nl{\\_unskip\\_space}} {\\_def\\_nl{\\_unskip\\_space}} {\\_def\\_nl{ } }
267 \_regmacro {\\_def\\_nl{\\_unskip\\_space}} {\\_def\\_nl{\\_unskip\\_space}} {\\_def\\_nl{ } }
268
269 \_public \\nbpar \\nl ;

```

sections.opm

`\firstnoindent` puts a material to `\everypar` in order to next paragraph will be without indentation. It is useful after titles. If you dislike this feature then you can say `\let\\firstnoindent=\\relax`. The `\wipepar` removes the material from `\everypar`.

```

278 \_def \\_firstnoindent {\\_global\\_everypar={\\_wipepar \\_setbox7=\\_lastbox}}%
279 \_def \\_wipepar {\\_global\\_everypar={}}

```

sections.opm

The `\mark` (for running heads) is used in `\printsection` only. We suppose that chapters will be printed after `\vfil\\break`, so users can implement chapter titles for running headers directly by macros, no `\mark` mechanism is needed. But sections need `\marks`. And they can be mixed with chapter's running heads, of course.

The `\insertmark{<title text>}` saves `\mark` in the format `{<title-num>} {<title-text>}`, so it can be printed “as is” in `\headline` (see the space between them), or you can define a formating macro with two parameters for processing these data, if you need it.

```

294 \_def\\_insertmark#1{\\_mark{\\_ifnum\\_else\\_therefnum\\_fi} {\\_unexpanded{#1}}}}

```

sections.opm

TeX sets `\headline={}` by default, so no running headings are printed. You can activate the running headings by following code, for example:

```

\addto\_chapx {\_edef\_runningchap {\_thechapnum: \_unexpanded\_ea{\_savedtitle}}}
\def \formathead #1#2{\isempty{#1}\iffalse #1: #2\fi}
\headline = {%
  \ifodd \pageno
    \hfil \ea\formathead\firstmark{}{}%
  \else
    Chapter: \runningchap \hfil
  \fi
}

```

The `\secl<number> <title-text><eol>` should be used for various levels of sections (for example, when converting from Markdown to OptEX). `\secl1` is `\chap`, `\secl2` is `\sec`, `\secl3` is `\secc` and all more levels (for `<number> > 3`) are printed by the common `\seclp` macro. It declares only a simple design. If there is a requirement to use such more levels then the book designer can define something different here.

```
sections.opm
320 \def\secl{\_afterassignment\_secla \_sectionlevel=}
321 \def\_secla{\_ifcase\_sectionlevel
322   \or\ea\chap\or\ea\sec\or\ea\secc\else\ea\secl\fi}

325 \def\ignorepars{\_isnextchar\_par{\_ignoresecond}\_ignorepars}{}}
326
327 \public \secl ;
```

The `\caption/<letter>` increases `\_<letter>num` counter, edefines `\_thecapnum` as `\_the<letter>num` and defines `\_thecapitle` as language-dependent word using `\_mtext`, runs the `\_everycaption<letter>` tokens register. The group opened by `\caption` is finalized by first `\par` from an empty line or from `\vskip` or from `\endinsert`. The `\_printcaption<letter>` is called, it starts with printing of the caption. The `\cskip` macro inserts nonbreakable vertical space between the caption and the object.

```
sections.opm
342 \def\_caption/#1{\_def\_\tmpa{\#1}\_nospaceafter \_capA}
343 \optdef\_\capA []{\_trylabel \_incaption}
344 \def\_incaption {\_bgroup
345   \_ifcsname \_tmpa num\endcsname \ea\incr \_csname \_tmpa num\endcsname
346   \_else \opwarning{Unknown caption / \tmpa}\_fi
347   \edef\thecapnum {\_csname \_the\_\tmpa num\endcsname}%
348   \edef\thecapitle{\_mtext{\_tmpa}}%
349   \ea\the \_csname _everycaption\_\tmpa\endcsname
350   \def\_\par{\_nbs\_\egroup}\_let\par=\_par
351   \cs{\_printcaption\_\tmpa}%
352 }
353 \def \cskip {\_par\_\nobreak\_\medskip} % space between caption and the object
354
355 \public \caption \cskip ;
```

The `\_printcaptiont` and `\_printcaptionf` macros start in vertical mode. They switch to horizontal mode and use `\_wlabel\thecapnum` (in order to make reference and hyperlink destination) a they can use:

- `\_thecapitle` ... expands to the word Table or Figure (depending on the current language).
- `\_thecapnum` ... expands to `\the<letter>num` (caption number).

The `\captionsep` inserts a separator between auto-generated caption number and the following caption text. Default separator is `\_enspace` but if the caption text starts with dot or colon, then the space is not inserted. A user can write `\caption/t: My table` and “**Table 1.1:** My table” is printed. You can re-define the `\captionsep` macro if you want to use another separator.

```
sections.opm
374 \def \_printcaptiont {%
375   \_noindent \_wlabel\thecapnum {\_bf\thecapitle-\thecapnum}%
376   \_narrowlastlinecentered\_iindent \_futurelet\_next\captionsep
377 }
378 \def\captionsep{\_ifx\_next.\ea\bfnext \_else\_ifx\_next:\ea\ea\ea\bfnext
379   \_else \_enspace \_fi\_\fi}
380 \def\bfnext{\_bf#1}%
381 \let \_printcaptionf = \_printcaptiont % caption of figures = caption of tables
```

If you want to declare a new type of `\caption` with independent counter, you can use following lines, where `\caption/a` for Algorithms are declared:

```
\let\_printcaptiona = \printcaptionf \let\_everycaptiona = \everycaptionf
\newcount\_anum \addto\_secx {\_anum=0 }
\def\_theanum {\othe\_chapnum.\the\_secnum.\the\_anum}
\sdef{_mt:a:en}{Algorithm} \sdef{_mt:a:cs}{Algoritmus} % + your language...
```

The default format of `\caption` text is a paragraph in block narrower by `\_iindent` and with the last line is centered. This setting is done by the `\_narrowlastlinecentered` macro.

```
sections.opm
398 \_def\_narrowlastlinecentered#1{%
399   \leftskip=#1plus1fil
400   \rightskip=#1plus-1fil
401   \parfillskip=0pt plus2fil\relax
402 }
```

`\eqmark` is processed in display mode (we add `\eqno` primitive) or in internal mode when `\eqaligno` is used (we don't add `\eqno`).

```
sections.opm
409 \optdef\eqmark []{\trylabel \ineqmark}
410 \def\ineqmark{\incr\dnum
411   \ifinner\else\eqno\fi
412   \wlabel\thednum \hbox{\thednum}%
413 }
414 \public \eqmark ;
```

The `\numberedpar` *{letter}* {*{name}*} is implemented here.

```

436 \public \numberedpar ;
```

The `\printnumberedpar` *{theXnum}* {*{name}*} opens numbered paragraph and prints it. The optional parameter is in `\_the\_opt`. You can re-define it if you need another design.

`\printnumberedpar` needs not to be re-defined if you only want to print Theorems in italic and to insert vertical skips (for example). You can do this by the following code:

```
\def\theorem {\medskip\bgroup\it \numberedpar A[Theorem]}
\def\endtheorem {\par\egroup\medskip}

\theorem Let $M$ be... \endtheorem
```

```
sections.opm
454 \def \printnumberedpar #1#2{\_par
455   \noindent\wlabel #1%
456   {\bf #2 #1\istoksempty\_opt\_iffalse \space \the\_opt \_fi.}\space
457   \ignorespaces
458 }
```

## 2.27 Lists, items

```
lists.opm
3 \codedecl \begitems {Lists: begitems, enditems <2021-03-10>} % preloaded in format

\abovevskip is used above the list of items,
\belowvskip is used below the list of items and
\intervskip is used between items.
\listskipA is used as \listskipamount at level 1 of items.
\listskipB is used as \listskipamount at other levels.
\setlistskip sets the skip dependent on the current level of items
```

```
lists.opm
14 \def\abovevskip {\removelastskip \penalty-100 \vskip\listskipamount}
15 \def\belowvskip {\penalty-200 \vskip\listskipamount}
16 \def\intervskip {}
17 \def\listskipA {\medskipamount}
18 \def\listskipB {0pt plus .5\smallskipamount}
19
20 \def\setlistskip {%
21   \ifnum \ilevel = 1 \listskipamount = \listskipA \relax
22   \else \listskipamount = \listskipB \relax
23   \fi}
```

The `\itemnum` is locally reset to zero in each group declared by `\begitems`. So nested lists are numbered independently. Users can set initial value of `\itemnum` to another value after `\begitems` if they want. Each level of nested lists is indented by the new `\indent` from left. The default item mark is `\printitem`.

The `\begitems` runs `\abovevskip` only if we are not near below a title, where a vertical skip is placed already and where the `\penalty 11333` is. It activates `*` and defines it as `\startitem`.

The `\enditems` runs `\isnextchar\par{\noindent}` thus the next paragraph is without indentation if there is no empty line between the list and this paragraph (it is similar behavior as after display math).

```
lists.opm
42 \newcount\itemnum \itemnum=0
43 \newtoks\printitem
44
45 \def\begitems{\par
46   \bgroup
47   \advance \ilevel by1
48   \setlistskip
49   \ifnum\lastpenalty<10000 \abovevskip \fi
50   \itemnum=0 \def*{\relax\ifmmode*\else\ea\startitem\fi}
51   \advance\leftskip by\indent
52   \printitem=\defaultitem
53   \the\everylist \relax
54 }
55 \def\enditems{\par\belowvskip\egroup \isnextchar\par{\noindent}}
56
57 \def\startitem{\par \ifnum\itemnum>0 \intervskip \fi
58   \advance\itemnum by1
59   \the\everyitem \noindent\llap{\the\printitem}\ignorespaces
60 }
61 \public \begitems \enditems \itemnum ;
```

`\novspaces` sets `\listskipamount` to 0pt.

```
lists.opm
67 \def\novspaces {\removelastskip \listskipamount=0pt \relax}
68 \public \novspaces ;
```

Various item marks are saved in `\item:<letter>` macros. You can re-define them or define more such macros. The `\style <letter>` does `\printitem={\item:<letter>}`. More exactly: `\begitems` does `\printitem=\defaultitem` first, then `\style <letter>` does `\printitem={\item:<letter>}` when it is used and finally, `\startitem` alias `*` uses `\printitem`.

```
lists.opm
79 \def\style#1{%
80   \ifcsname _item:#1\endcsname \printitem=\ea{\csname _item:#1\endcsname}%
81   \else \printitem=\defaultitem \fi
```

```

82 }
83 \sdef{_item:o}{\raise.4ex\hbox{\scriptscriptstyle\bullet}}
84 \sdef{_item:-}{-}
85 \sdef{_item:n}{\the\itemnum.}
86 \sdef{_item:N}{\the\itemnum}
87 \sdef{_item:i}{(\romannumeral\itemnum)}
88 \sdef{_item:I}{\uppercase\ea{\romannumeral\itemnum}\kern.5em}
89 \sdef{_item:a}{\at\itemnum}
90 \sdef{_item:A}{\uppercase\ea{\at\itemnum}}
91 \sdef{_item:x}{\raise.3ex\fullrectangle{.6ex}\kern.4em}
92 \sdef{_item:X}{\raise.2ex\fullrectangle{1ex}\kern.5em}

```

`\athe{<num>}` returns the `<num>`s lowercase letter from the alphabet.

`\fullrectangle{<dimen>}` prints full rectangle with given `<dimen>`.

lists.opm

```

99 \def\fullrectangle#1{\hbox{\vrule height#1 width#1}}
100
101 \def\athe#1{\ifcase#1?\or a\or b\or c\or d\or e\or f\or g\or h\or
102   i\or j\or k\or l\or m\or n\or o\or p\or q\or r\or s\or t\or
103   u\or v\or w\or x\or y\or z\else ?\fi
104 }
105 \public \style ;

```

The `\begblock` macro selects fonts from footnotes `\fnset` and opens new indentation in a group. `\endblock` closes the group. This is implemented as an counterpart of Markdown's Blockquotes. Redefine these macros if you want to declare different design. The [OptEX trick 0031](#) shows how to create blocks with grey background splittable to more pages.

lists.opm

```

118 \def\begblock{\bgroup\fnset \medskip \advance\leftskip by\indent \firstnoindent}
119 \def\endblock{\par\medskip\egroup\isnextchar\par{}{\noindent}}
120
121 \public \begblock \endblock ;

```

## 2.28 Verbatim, listings

### 2.28.1 Inline and “display” verbatim

verbatim.opm

```

3 \codel{ \begtt {Verbatim <2021-04-18>} % preloaded in format

```

The internal parameters `\ttskip`, `\ttpenalty`, `\viline`, `\vifile` and `\ttfont` for verbatim macros are set.

verbatim.opm

```

11 \def\ttskip{\medskip} % space above and below \begtt, \verbinput
12 \mathchardef\ttpenalty=100 % penalty between lines in \begtt, \verbinput
13 \newcount\viline % last line number in \verbinput
14 \newread\vifile % file given by \verbinput
15 \def\ttfont{\tt} % default tt font

```

`\code{<text>}` expands to `\detokenize{<text>}` when `\escapechar=-1`. In order to do it more robust when it is used in `\write` then it expands as noexpanded `\code<space>` (followed by space in its csname). This macro does the real work.

The `\printinverbatim{<text>}` macro is used for `\code{<text>}` printing and for `<text>` printing. It is defined as `\hbox`, so the in-verbatim `<text>` will be never broken. But you can re-define this macro.

When `\code` occurs in PDF outlines then it does the same as `\detokenize`. The macro for preparing outlines sets `\escapechar` to `-1` and uses `\regou` token list before `\edef`.

The `\code` is not `\protected` because we want it expands to `\unexpanded{\code<space>{<text>}}` in `\write` parameters. This protect the expansions of the `\code` parameter (like `\backslash`, `\^` etc.).

verbatim.opm

```

36 \def\code#1{\unexpanded\ea{\csname _code \endcsname{#1}}}
37 \protected\sdef{_code }#1{\escapechar=-1 \ttfont \the\everyint \relax
38   \ea\printinverbatim\ea{\detokenize{#1}}}
39 \def\printinverbatim#1{\leavevmode\hbox{#1}}
40
41 \regmacro {}{\let\code=\detokenize \let\_code=\detokenize}
42 \public \code ;

```

The `\_setverb` macro sets all catcodes to “verbatim mode”. It should be used only in a group, so we prepare a new catcode table with “verbatim” catcodes and we define it as `\_catcodetable\_\_verbatimcatcodes`. After the group is finished then original catcode table is restored.

```
verbatim.omp
51 \_newcatcodetable \_\_verbatimcatcodes
52 \_def\_\_setverb{\_begingroup
53   \_def\do##1{\_catcode`##1=12 }
54   \_dospecials
55   \_savecatcodetable\_\_verbatimcatcodes % all characters are normal
56   \_endgroup
57 }
58 \_\_setverb
59 \_def\_\_setverb{\_catcodetable\_\_verbatimcatcodes }%
```

`\verbchar{char}` saves original catcode of previously declared `<char>` (if such character was declared) using `\_savedttchar` and `\_savedttcharc` values. Then new such values are stored. The declared character is activated by `\_aef` as a macro (active character) which opens a group, does `\_setverb` and other settings and reads its parameter until second the same character. This is done by the `\_readverb` macro. Finally, it prints scanned `<text>` by `\_printinverbatim` and closes group. Suppose that `\verbchar` is used. Then the following work is schematically done:

```
\_def "{\_begingroup \_setverb ... \_readverb}
\def \_readverb #1"\{_printinverbatim{#1}\_endgroup}
```

Note that the second occurrence of `"` is not active because `\_setverb` deactivates it.

```
verbatim.omp
78 \_def\_\verbchar#1{%
79   \_ifx\_\_savedttchar\_\_undefined\_\_else \_catcode\_\_savedttchar=\_savedttcharc \_fi
80   \_chardef\_\_savedttcharc=\#1
81   \_chardef\_\_savedttcharc=\_catcode`\#1
82   \_aef{\#1}{\_begingroup \_setverb \_aef{\ }{\_dsp}\_\_ttfont \_the\_\_everyint\_\_relax \_readverb}%
83   \_def\_\_readverb ##1#\{_printinverbatim{##1}\_endgroup}%
84 }
85 \_let \_activettchar=\_verbchar % for backward compatibility
86 \_public \verbchar \_activettchar ;
```

`\begtt` is defined only as public. We don't need a private `\begtt` variant. This macro opens a group and sets `%` as an active character (temporary). This will allow it to be used as the comment character at the same line after `\begtt`. Then `\begtti` is run. It is defined by `\eoldef`, so users can put a parameter at the same line where `\begtt` is. This `#1` parameter is used after `\everytt` parameters settings, so users can change them locally.

The `\begtti` macro does `\_setverb` and another preprocessing, sets `\endlinechar` to `^J` and reads the following text in verbatim mode until `\endtt` occurs. This scanning is done by `\_startverb` macro which is defined as:

```
\_def\_\_startverb #1\endtt #2^J{...}
```

We must to ensure that the backslash in `\endtt` has category 12 (this is a reason of the `\ea` chain in real code). The `#2` is something between `\endtt` and the end of the same line and it is simply ignored.

The `\_startverb` puts the scanned data to `\_prepareverbdata`. It sets the data to `\_tmpb` without changes by default, but you should re-define it in order to do special changes if you want. (For example, `\hsyntax` redefines this macro.) The scanned data have `^J` at each end of line and all spaces are active characters (defined as `\_u`). Other characters have normal category 11 or 12.

When `\_prepareverbdata` finishes then `\_startverb` runs `\_printverb` loop over each line of the data and does a final work: last skip plus `\noindent` in the next paragraph.

```
verbatim.omp
121 \_def\_\begtti{\_par \_begingroup \_aef\%##1\_\_relax\_\_begtti}
122 \_eoldef \_begtti#1{\_wipepar \_setxhsize

138  \_endgroup \_ttskip
139  \_isnextchar\_par{}{\_noindent}%
140 }
141 \_def\_prepareverbdata#1#2{\_def#1{#2}}

```

The `\_printverb` macro calls `\_printverpline{(line)}` repeatedly to each scanned line of verbatim text. The `\_printverb` is used from `\begtt...\\endtt` and from `\verbinput` too.

The `\_testcommentchars` replaces the following `\_iftrue` to `\_iffalse` by default unless the `\commentchars` are set. So, the main body of the loop is written in the `\_else` part of the `\_iftrue` condition. The `\_printverpline{(line)}` is called here.

The `\_printverpline{(line)}` expects that it starts in vertical mode and it must do `\par` to return the vertical mode. The `\_printverlinenum` is used here: it does nothing when `\_ttline<0` else it prints the line number using `\_llap`.

`\_puttpenalty` puts `\_tppenalty` before second and next lines, but not before first line in each `\begtt...\\endtt` environment.

```

verbatim.opp

182 \_def\_\puttpenalty{\_def\_\puttpenalty{\_penalty\_\tppenalty}}

```

Macro `\verbinput` uses a file read previously or opens the given file. Then it runs the parameter scanning by `\viscanparameter` and `\viscanminus`. Finally the `\doverbinput` is run. At the beginning of `\doverbinput`, we have `\_viline`= number of lines already read using previous `\verbinput`, `\_vinolines`= the number of lines we need to skip and `\_vidolnes`= the number of lines we need to print. A similar preparation is done as in `\begtt` after the group is opened. Then we skip `\_vinolines` lines in a loop and we read `\_vidolnes` lines. The read data is accumulated into `\_tmpb` macro. The next steps are equal to the steps done in `\_startverb` macro: data are processed via `\_prepareverbdata` and printed via `\_printverb` loop.

```

277
278 \public \verbinput ;

```

`\_savemathsb`, `\_restoremathsb` pair is used in `\begtt...\\endtt` or in `\verbinput` to temporary suppress the `\mathsbon` because we don't need to print `\int_a` in verbatim mode if `\int_a` is really written. The `\_restoremathsb` is defined locally as `\mathsbon` only if it is needed.

verbatim.opm

```
288 \_def\_\_savemathsb{\_ifmathsb \_mathsboff \_def\_\_restoremathsb{\_mathsbon}\_fi}
289 \_def\_\_restoremathsb{}
```

If the language of your code printed by `\verbinput` supports the format of comments started by two characters from the beginning of the line then you can set these characters by `\commentchars<first><second>`. Such comments are printed in the non-verbatim mode without these two characters and they look like the verbatim printing is interrupted at the places where such comments are. See the section 2.39 for good illustration. The file `optex.lua` is read by a single command `\verbinput (4-) optex.lua` here and the `\commentchars --` was set before it.

If you need to set a special character by `\commentchars` then you must to set the catcode to 12 (and space to 13). Examples:

```
\commentchars //          % C++ comments
\commentchars --         % Lua comments
{\catcode`%=12 \ea}\commentchars %%           % TeX comments
{\catcode`\#=12 \catcode`\ =13 \ea}\commentchars#{ } % bash comments
```

There is one limitation when TeX interprets the comments declared by `\commentchars`. Each block of comments is accumulated to one line and then it is re-interpreted by TeX. So, the ends of lines in the comments block are lost. You cannot use macros which need to scan end of lines, for example `\begtt...\\endtt` inside the comments block does not work. The character `%` is ignored in comments but you can use `\%` for printing or `%` alone for de-activating `\endpar` from empty comment lines.

Implementation: The `\commentchars<first><second>` redefines the `\_testcommentchars` used in `\printverb` in order to it removes the following `\_iftrue` and returns `\_iftrue` or `\_iffalse` depending on the fact that the comment characters are or aren't present at the beginning of tested line. If it is true (`\ifnum` expands to `\ifnum 10>0`) then the rest of the line is added to the `\_vcomments` macro.

The `\_hicomments` is `\relax` by default but it is redefined by `\commentchars` in order to keep no-colorized comments if we need to use feature from `\commentchars`.

The accumulated comments are printed whenever the non-comment line occurs. This is done by `\printcomments` macro. You can re-define it, but the main idea must be kept: it is printed in the group, `\_reloading \_rm` initializes normal font, `\catcodetable0` returns to normal catcode table used before `\verbinput` is started, and the text accumulated in `\_vcomments` must be printed by `\scantextokens` primitive.

verbatim.opm

```
341 \_def\_\_vcomments{%
342 \_let\_\_hicomments=\_relax
343
344 \_def\_\_commentchars#1#2{%
345   \_def\_\_testcommentchars ##1##2##3\_\_relax ##4\_\_iftrue{\_ifnum % not closed in this macro

347     \_ifx\_\_relax##3\_\_relax \_addto\_\_vcomments{\_endgraf}% empty comment=\enfgraf
348     \_else \_addto\_\_vcomments{##3 }\_\_fi}%
349   \_def\_\_hicomments{\_replfromto{\b\ln#1#2}{^J}{\w[#1#2###1]^{^J}}% used in \hisyntax
350 }
351 \_def\_\_testcommentchars #1\_\_iftrue{\_iffalse} % default value of \_testcommentchar
352 \_def\_\_printcomments{\_ttskip
353   {\_catcodetable0 \_reloading \_rm \_everypar={}}%
354   \_noindent \_ignorespaces \_scantextokens{\_ea{\_vcomments}\_par}%
355   \_ttskip
356 }
357 \_public \commentchars ;
```

The `\visiblep` sets spaces as visible characters `\_`. It redefines the `\_dsp`, so it is useful for verbatim modes only.

The `\_dsp` is equivalent to `\_` primitive. It is used in all verbatim environments: spaces are active and defined as `\_dsp` here.

verbatim.opm

```
368 \_def \_\_visiblep{\_ifx\_\_initunifonts\_\_relax \_def\_\_dsp{\_char9251 }%
369   \_else \_def\_\_dsp{\_char32 }\_\_fi}
370 \_let\_\_dsp=\ % primitive "direct space"
371
372 \_public \visiblep ;
```

## 2.28.2 Listings with syntax highlighting

The user can write

```
\begtt \hisyntax{C}
...
\endtt
```

to colorize the code using C syntax. The user can also write `\everytt={\hisyntax{C}}` to have all verbatim listings colorized.

`\hisyntax{<name>}` reads the file `hisyntax-<name>.opm` where the colorization is declared. The parameter `<name>` is case insensitive and the file name must include it in lowercase letters. For example, the file `hisyntax-c.opm` looks like this:

```
hisyntax-c.opm
3 \codedecl \_hisyntaxc {Syntax highlighting for C sources <2020-04-03>}
4
5 \newtoks \_hisyntaxc \_newtoks \_hicolorsc
6
7 \_global\_hicolorsc=%      colors for C language
8   \hicolor K \Red          % Keywords
9   \hicolor S \Magenta     % Strings
10  \hicolor C \Green        % Comments
11  \hicolor N \Cyan         % Numbers
12  \hicolor P \Blue         % Preprocessor
13  \hicolor O \Blue         % Non-letters
14 }
15 \_global\_hisyntaxc=%
16   \the\_hicolorsc
17   \_let\c=\_relax \_let\==\_relax \_let\o=\_relax
18   \_replfromto {/*}*/{} {\x C{/**1*}/}% /*...*/
19   \_replfromto {/}{\{}{\^J} {\z C{/#1}^{\^J}}% //...
20   \_replfromto {\_string#}{\^J} {\z P{\##1}^{\^J}}% #include ...
21   \_replthis {\_string"} {\{\_string"\}}% \" protected inside strings
22   \_replfromto {"}{"} {\x S{"#1"}}% "...
23 %
24 \_edef\_\tmpa {()}\_string{\_string}+*=/[]<,:;\_pcent\_\string&\_\string^!?\}% non-letters
25 \ea \foreach \_\tmpa
26   \_do {\_replthis{\#1}{\n\o#1\n}}
27 \foreach
28   {auto}{break}{case}{char}{continue}{default}{do}{double}%
29   {else}{entry}{enum}{extern}{float}{for}{goto}{if}{int}{long}{register}%
30   {return}{short}{sizeof}{static}{struct}{switch}{typedef}{union}%
31   {unsigned}{void}{while}
32   \_do {\_replthis{\n\#1\n}{\z K{\#1}}}
33   \_replthis{.}{\n.\n}                                % numbers
34 \foreach 0123456789
35   \_do {\_replfromto{\n\#1}{\n}{\c#1##1\e}}
36   \_replthis{\e.\c}{.}
37   \_replthis{\e.\n}{.\e}

40   \_replthis{E\o+\c}{E+}\_replthis{E\o-\c}{E-}
41   \_def\o#1{\z O{\#1}}
42   \_def\c#1\o{\z N{\#1}}
43 }
```

OpTeX provides `hisyntax-{c,python,tex,html}.opm` files. You can take inspiration from these files and declare more languages.

Users can re-declare colors by `\hicolors{...}` This value has precedence over `\_hicolors<name>` values declared in the `hicolors-<name>.opm` file. The steps are: copy `\_hicolors<name>={...}` from `hicolors-<name>.opm` to your document, rename it to `\hicolors={...}` and do your own colors modifications.

Another way to set non-default colors is to declare `\newtoks\hicolors<name>` (without the `_` prefix) and set the color palette there. It has precedence before `\_hicolors<name>` (with the `_` prefix) declared in the `hicolors-<name>.opm` file. This is useful when there are more hi-syntax languages used in one document.

## Notes for hi-syntax macro writers

The file `hisyntax-⟨name⟩.opm` is read only once and in a `\TeX` group. If there are definitions then they must be declared as global.

The file `hisyntax-⟨name⟩.opm` must (globally) declare `\_hisyntax⟨name⟩` token list where the action over verbatim text is declared typically by using the `\replfromto` or `\replthis` macros.

The verbatim text is prepared by the *pre-processing phase*, then `\_hisyntax⟨name⟩` is applied and then the *post-processing phase* does final corrections. Finally, the verbatim text is printed line by line.

The pre-processing phase does:

- Each space is replaced by `\n\_\n`, so `\n⟨word⟩\n` is the pattern for matching whole words (no subwords). The `\n` control sequence is removed in the post-processing phase.
- Each end of line is represented by `\n^J\n`.
- The `\_start` control sequence is added before the verbatim text and the `\_end` control sequence is appended to the end of the verbatim text. Both are removed in the post-processing phase.

Special macros are working only in a group when processing the verbatim text.

- `\n` represents nothing but it should be used as a boundary of words as mentioned above.
- `\t` represents a tabulator. It is prepared as `\n\t\n` because it can be at the boundary word boundary.
- `\x ⟨letter⟩{⟨text⟩}` can be used as replacing text. Consider the example

```
\replfromto{/*}{*/}{\x C{/*#1*/}}
```

This replaces all C comments `/*...*/` by `\x C{/*...*/}`. But C comments may span multiple lines, i.e. the `^J` should be inside it.

The macro `\x ⟨letter⟩{⟨text⟩}` is replaced by one or more occurrences of `\z ⟨letter⟩{⟨text⟩}` in the post-processing phase, each parameter `⟨text⟩` of `\z` is from from a single line. Parameters not crossing line boundary are represented by `\x C{⟨text⟩}` and replaced by `\z C{⟨text⟩}` without any change. But:

```
\x C{⟨text1⟩}^J{⟨text2⟩}^J{⟨text3⟩}
```

is replaced by

```
\z C{⟨text1⟩}^J\z C{⟨text2⟩}^J\z C{⟨text3⟩}
```

`\z ⟨letter⟩{⟨text⟩}` is expanded to `\_z:⟨letter⟩{⟨text⟩}` and if `\hicolor ⟨letter⟩ ⟨color⟩` is declared then `\_z:⟨letter⟩{⟨text⟩}` expands to `{⟨color⟩⟨text⟩}`. So, required color is activated for each line separately (e.g. for C comments spanning multiple lines).

- `\y {⟨text⟩}` is replaced by `\⟨text⟩` in the post-processing phase. It should be used for macros without a parameters. You cannot use unprotected macros as replacement text before the post-processing phase, because the post-processing phase is based on the expansion of the whole verbatim text.

`hi-syntax.opm`

```
3 \_codedecl \hisyntax {Syntax highlighting of verbatim listings <2020-04-04>} % preloaded in format
```

The macros `\replfromto` and `\replthis` manipulate the verbatim text that is already stored in the `\_tmpb` macro.

`\replfromto {⟨from⟩}{⟨to⟩}{⟨replacement⟩}` finds the first occurrence of `⟨from⟩` and the first occurrence of `⟨to⟩` following it. The `⟨text⟩` between them is packed into `#1` and available to `⟨replacement⟩` which ultimately replaces `⟨text⟩`.

`\replfromto` continues by finding next `⟨from⟩`, then, next `⟨to⟩` repeatedly over the whole verbatim text. If the verbatim text ends with opening `⟨from⟩` but has no closing `⟨to⟩`, then `⟨to⟩` is appended to the verbatim text automatically and the last part of the verbatim text is replaced too.

The first two parameters are expanded before use of `\replfromto`. You can use `\csstring\%` or something else here.

`hi-syntax.opm`

```
23 \_def\replfromto #1#2{\_edef\_tmpa{#1}{#2}\_ea\_replfromtoE\_tmpa}
24 \_def\replfromtoE#1#2#3{%
25   #1=from #2=to #3=replacement
26   \_def\_replfromto##1#1##2{\_addto\_tmpb{##1}%
27     \_ifx\_end##2\ea\_replstop \_else \_afterfi{\_replto##2}\_fi}%
28   \_def\_replto##1#2##2{%
29     \_ifx\_end##2\afterfi{\_replfin##1}\_else
30       \_addto\_tmpb{#3}%
31       \_afterfi{\_replfrom##2}\_fi}%
32   \_def\replfin##1#1\_end{\_addto\_tmpb{#3}\_replstop}%
33 }
```

```

32   \_edef\_\_tmpb{\_\_ea}\_\_ea\_\_replfrom\_\_tmpb#1\_\_end#2\_\_end\_\_end\_\_relax
33 }
34 \_\_def\_\_replstop#1\_\_end\_\_relax{}
35 \_\_def\_\_finrepl{}

```

The `\replthis {<pattern>}{<replacement>}` replaces each `<pattern>` by `<replacement>`. Both parameters of `\replthis` are expanded first.

```

hi-syntax.omp
43 \_\_def\_\_replthis#1#2{\_\_edef\_\_tmpa{{#1}{#2}}\_\_ea\_\_replstring\_\_ea\_\_tmpb \_\_tmpa}
44
45 \_\_public \_\_replfromto \_\_replthis ;

```

The patterns `<from>`, `<to>` and `<pattern>` are not found when they are hidden in braces `{...}`. E.g.

```
\_\_replfromto{/*}{*/}{\x C{/*#1/*}}
```

replaces all C comments by `\x C{...}`. The patterns inside `{...}` are not used by next usage of `\replfromto` or `\replthis` macros.

The `\_xscan` macro replaces occurrences of `\x` by `\z` in the post-processing phase. The construct `\x <letter>{<text>}` expands to `\_xscan {<letter>}{<text>}^J`. If #3 is `\_end` then it signals that something wrong happens, the `<from>` was not terminated by legal `<to>` when `\replfromto` did work. We must fix this by using the `\_xscanR` macro.

```

hi-syntax.omp
63 \_\_def\_\_xscan#1#2^J#3{\_\_ifx\_\_end#3 \_\_ea\_\_xscanR\_\_fi
64   \_\_z{#1}{#2}%
65   \_\_ifx^#3\_\_else ^J\_\_afterfi{\_\_xscan{#1}#3}\_\_fi}
66 \_\_def\_\_xscanR#1\_\_fi#2^J{^J}
```

The `\hicolor <letter> <color>` defines `\z:<letter>{<text>}` as `{<color><text>}`. It should be used in the context of `\x <letter>{<text>}` macros.

```

hi-syntax.omp
74 \_\_def\_\_hicolor #1#2{\_\_sdef{\_z:#1}##1{#2##1}}}
```

`\hisyntax{<name>}` re-defines default `\_prepareverbdata{macro}<verbtext>`, but in order to do it does more things: It saves `<verbtext>` to `\_tmpb`, appends `\n` around spaces and `^J` characters in pre-processing phase, opens `hisyntax-<name>.opm` file if `\_hisyntax<name>` is not defined. Then `\the\hisyntax<name>` is processed. Finally, the post-processing phase is realized by setting appropriate values to the `\x` and `\y` macros and doing `\_edef\_\_tmpb{\_\_tmpb}`.

```

hi-syntax.omp
87 \_\_def\_\_hisyntax#1{\_\_def\_\_prepareverbdata##1##2{%
88   \_\_let\n=\_\_relax \_\_let\b=\_\_relax \_\_def\t{\n\_\_noexpand\t}\n}\_\_let\_\_start=\_\_relax

```

127 \sdef{_halias:xml}{html}
128 \sdef{_halias:json}{c}

```

hi-syntax.opp

## 2.29 Graphics

The `\inspic` is defined by `\pdfximage` and `\pdfrefximage` primitives. If you want to use one picture more than once in your document, then the following code is recommended:

```

\newbox\mypic
\setbox\mypic = \hbox{\picw=3cm \inspic{<picture>}}

```

My picture: `\copy\mypic`, again my picture: `\copy\mypic`, etc.

This code downloads the picture data to the PFD output only once (when `\setbox` is processed). Each usage of `\copy\mypic` puts only a pointer to the picture data in the PDF.

If you want to copy the same picture in different sizes, then choose a “basic size” used in `\setbox` and all different sizes can be realized by the `\transformbox{<transformation>}{\copy\mypic}`.

```

3 \cdecl \inspic {Graphics <2021-07-16>} % preloaded in format

```

graphics.opp

`\inspic` accepts old syntax `\inspic <filename><space>` or new syntax `\inspic{<filename>}`. So, we need to define two auxiliary macros `\_inspicA` and `\_inspicB`.

You can include more `\pdfximage` parameters (like `page<number>`) in the `\_picparams` macro.

All `\inspic` macros are surrounded in `\hbox` in order user can write `\moveright\inspic ...` or something similar.

```

17 \def\inspic{\hbox\bgroup\isnextchar\bgroup\inspicB\inspicA}
18 \def\inspicA #1 {\inspicB {#1}}
19 \def\inspicB #1{%
20   \pdfximage \ifdim\picwidth=\zo \else width\picwidth\fi
21   \ifdim\picheight=\zo \else height\picheight\fi
22   \picparams {\the\picdir#1}%
23   \pdfrefximage\pdflastximage\egroup}
24
25 \def\picparams{}
26
27 \public \inspic ;

```

graphics.opp

Inkscape can save a picture to `*.pdf` file and labels for the picture to `*.pdf_tex` file. The second file is in L<sup>A</sup>T<sub>E</sub>X format (unfortunately) and it is intended to read immediately after `*.pdf` is included in order to place labels of this picture in the same font as the document is printed. We need to read this L<sup>A</sup>T<sub>E</sub>X file by plain T<sub>E</sub>X macros when `\inkinspic` is used. These macros are stored in the `\inkdefs` tokens list and it is used locally in the group. The solution is borrowed from OPmac trick 0032.

```

39 \def\inkinspic{\hbox\bgroup\isnextchar\bgroup\inkinspicB\inkinspicA}
40 \def\inkinspicA #1 {\inkinspicB {#1}}
41 \def\inkinspicB #1{%

\pdfscale{\(x\text{-scale}\)}{\(y\text{-scale}\)} and \pdfrotate{\(degrees\)} macros are implemented by \pdfsetmatrix primitive. We need to know the values of sin, cos function in the \pdfrotate. We use Lua code for this.

```

The \transformbox{\(transformation\)}{\(text\)} is copied from OPmac trick 0046.

The \rotbox{\(degrees\)}{\(text\)} is a combination of \rotsimple from OPmac trick 0101 and the \transformbox. Note, that \rotbox{-90} puts the rotated text to the height of the outer box (depth is zero) because code from \rotsimple is processed. But \rotbox{-90.0} puts the rotated text to the depth of the outer box (height is zero) because \transformbox is processed.

**\scantwodimens** scans two objects with the syntactic rule  $\langle dimen \rangle$  and returns  $\{\langle number \rangle\}\{\langle number \rangle\}$  in sp unit.

**\puttext**  $\langle right \rangle \langle up \rangle \{\langle text \rangle\}$  puts the  $\langle text \rangle$  to desired place: From current point moves  $\langle down \rangle$  and  $\langle right \rangle$ , puts the  $\langle text \rangle$  and returns back. The current point is unchanged after this macro ends.

**\putpic**  $\langle right \rangle \langle up \rangle \langle width \rangle \langle height \rangle \{\langle image-file \rangle\}$  does **\puttext** with the image scaled to desired  $\langle width \rangle$  and  $\langle height \rangle$ . If  $\langle width \rangle$  or  $\langle height \rangle$  is zero, natural dimension is used. The **\nospec** is a shortcut to such a natural dimension.

**\backgroundpic**  $\{\langle image-file \rangle\}$  puts the image to the background of each page. It is used in the **\slides** style, for example.

```

**\circle**  $\{\langle x \rangle\}\{\langle y \rangle\}$  creates an ellipse with  $\langle x \rangle$  axis and  $\langle y \rangle$  axis. The origin is in the center.

**\oval**  $\{\langle x \rangle\}\{\langle y \rangle\}\{\langle roundness \rangle\}$  creates an oval with  $\langle x \rangle$ ,  $\langle y \rangle$  size and with the given  $\langle roundness \rangle$ . The real size is bigger by  $2\langle roundness \rangle$ . The origin is at the left bottom corner.

**\mv**  $\{\langle x \rangle\}\{\langle y \rangle\}\{\langle curve \rangle\}$  moves current point to  $\langle x \rangle$ ,  $\langle y \rangle$ , creates the  $\langle curve \rangle$  and returns the current point back. All these macros are fully expandable and they can be used in the **\pdfliteral** argument.

The `\inoval{<text>}` is an example of `\oval` usage.

The `\incircle{<text>}` is an example of `\circle` usage.

The `\ratio`, `\lwidth`, `\fcolor`, `\lcolor`, `\shadow` and `\overlapmargins` are parameters, they can be set by user in optional brackets [...]. For example `\fcolor=\Red` does `\let\fcolorvalue=\Red` and it means filling color.

The `\_setfcolors` uses the `\_setcolor` macro to separate filling (non-stroking) color and stroking color.

Just before defining shadows, which require special graphics states, we define means for managing these graphics states. This is important, because otherwise our use of `\pdfpageresources` register might clash with other packages (TikZ) or even with our other usage (slides).

The macro `\addextgstate`*(PDF name)* *(PDF dictionary)* shall be used for adding more graphics states. It must be used *after* `\dump`. First use of it detects PGF/TikZ and either uses its mechanism or defines our own. Our mechanism is very similar though – use single `/ExtGState` dictionary for all pages (`\pdfpageresources` just points to it).

```

A generic macro `\clipinpath{x} {y} {curve} {text}` declares a clipping path by the `{curve}` shifted by the `{x}`, `{y}`. The `{text}` is typeset when such clipping path is active. Dimensions are given by bp without the unit here. The macros `\clipinoval{x} {y} {width} {height} {text}` and `\clipincircle{x} {y} {width} {height} {text}` are defined here. These macros read normal TeX dimensions in their parameters.

## 2.30 The \table macro, tables and rules

### 2.30.1 The boundary declarator :

The  $\langle declaration \rangle$  part of  $\backslash table\{\langle declaration \rangle\}\{\langle data \rangle\}$  includes column declarators (letters) and other material: the  $|$  or  $\langle cmd \rangle$ . If the boundary declarator  $:$  is not used then the boundaries of columns are just before each column declarator with exception of the first one. For example, the declaration  $\{|c||c(xx)(yy)c\}$  should be written more exactly using the boundary declarator  $:$  by  $\{|c|:c(xx)(yy):c\}$ . But you can set these boundaries to other places using the boundary declarator  $:$  explicitly, for example  $\{|c:||c(xx):(yy)c\}$ . The boundary declarator  $:$  can be used only once between each pair of column declarators.

Each table item has its group. The  $\langle cmd \rangle$  are parts of the given table item (depending on the boundary declarator position). If you want to apply a special setting for a given column, you can do this by  $\langle setting \rangle$  followed by column declarator. But if the column is not first, you must use  $:(\langle setting \rangle)$ . Example. We have three centered columns, the second one have to be in bold font and the third one have to be in red:  $\backslash table\{c:(\bf c):(Red)c\}\{\langle data \rangle\}$

### 2.30.2 Usage of the \tabskip primitive

The value of  $\backslash tabskip$  primitive is used between all columns of the table. It is glue-type, so it can be stretchable or shrinkable, see next section 2.30.3.

By default,  $\backslash tabskip$  is 0pt. It means that only  $\backslash tabiteml$ ,  $\backslash tabitemr$  and  $\langle cmds \rangle$  can generate visual spaces between columns. But they are not real spaces between columns because they are in fact the part of the total column width.

The  $\backslash tabskip$  value declared before the  $\backslash table$  macro (or in  $\backslash everytable$  or in  $\backslash thistable$ ) is used between all columns in the table. This value is equal to all spaces between columns. But you can set each such space individually if you use  $(\backslash tabskip=\langle value \rangle)$  in the  $\langle declaration \rangle$  immediately before boundary character. The boundary character represents the column pair for which the  $\backslash tabskip$  has individual value. For example  $c(\backslash tabskip=5pt):r$  gives  $\backslash tabskip$  value between  $c$  and  $r$  columns. You need not use boundary character explicitly, so  $c(\backslash tabskip=5pt)r$  gives the same result.

Space before the first column is given by the  $\backslash tabskipl$  and space after the last column is equal to  $\backslash tabskipr$ . Default values are 0pt.

Use nonzero  $\backslash tabskip$  only in special applications. If  $\backslash tabskip$  is nonzero then horizontal lines generated by  $\backslash crli$ ,  $\backslash crlli$  and  $\backslash crlp$  have another behavior than you probably expected: they are interrupted in each  $\backslash tabskip$  space.

### 2.30.3 Tables to given width

There are two possibilities how to create tables to given width:

- $\backslash table\ to\langle size \rangle\{\langle declaration \rangle\}\{\langle data \rangle\}$  uses stretchability or shrinkability of all spaces between columns generated by  $\backslash tabskip$  value and eventually by  $\backslash tabskipl$ ,  $\backslash tabskipr$  values. See example below.
- $\backslash table\ pxt\langle size \rangle\{\langle declaration \rangle\}\{\langle data \rangle\}$  expands the columns declared by  $p\{\langle size \rangle\}$ , if the  $\langle size \rangle$  is given by a virtual  $\backslash tsize$  unit. See the example below.

Example of  $\backslash table\ to\langle size \rangle$ :

```
\thistable{\tabskip=0pt plus1fil minus1fil}
\table to\hsize {lr}\{\langle data \rangle\}
```

This table has its width  $\backslash hsize$ . The first column starts at the left boundary of this table and it is justified left (to the boundary). The second column ends at the right boundary of the table and it is justified right (to the boundary). The space between them is stretchable and shrinkable to reach the given width  $\backslash hsize$ .

Example of  $\backslash table\ pxt\langle size \rangle$  (means “paragraphs expanded to”):

```
\table pxt\hsize {|c|p{\tsize}|}\{\cr
aaa & Ddkas jd dsjds ds cgha sfgs dd fddzf dfhz xxz
      dras ffg hksd kds d sdjds h sd jd dsjds ds cgha
      sfgs dd fddzf dfhz xxz. \crl
bb ddd ggg & Dsjds ds cgha sfgs dd fddzf dfhz xxz
      ddkas jd dsjds ds cgha sfgs dd fddzf. \crl }
```

aaa	Ddkas jd dsjds ds cgha sfgs dd fddzf dfhz xxz dras ffg hksd kds d sdjds h sd jd dsjds ds cgha sfgs dd fddzf dfhz xxz.
bb ddd ggg	Dsjds ds cgha sfgs dd fddzf dfhz xxz ddkas jd dsjds ds cgha sfgs dd fddzf.

The first `c` column is variable width (it gets the width of the most wide item) and the resting space to given `\hsize` is filled by the `p` column.

You can declare more than one `p{<coefficient>\tsize}` columns in the table when `pxto` keyword is used.

```
\table pxtot13cm {r p{3.5\tsize} p{2\tsize} p{\tsize} l}{<data>}
```

This gives the ratio of widths of individual paragraphs in the table 3.5:2:1.

#### 2.30.4 \eqbox: boxes with equal width across the whole document

The `\eqbox [<label>]{<text>}` behaves like `\hbox{<text>}` in the first run of TeX. But the widths of all boxes with the same label are saved to `.ref` file and the maximum box width for each label is calculated at the beginning of the next TeX run. Then `\eqbox [<label>]{<text>}` behaves like `\hbox to <dim:>label> {\hss <text>\hss}`, where `<dim:>label>` is the maximum width of all boxes labeled by the same `[[<label>]]`. The documentation of the L<sup>A</sup>T<sub>E</sub>X package `eqparbox` includes more information and tips.

The `\eqboxsize [<label>]{<dimen>}` expands to `<dim:>label>` if this value is known, else it expands to the given `<dimen>`.

The optional parameter `r` or `l` can be written before `[[<label>]]` (for example `\eqbox r[<label>]{<text>}`) if you want to put the text to the right or to the left side of the box width.

Try the following example and watch what happens after first TeX run and after the second one.

```
\def\leftitem#1{\par
  \noindent \hangindent=\eqboxsize[items]{2em}\hangafter=1
  \eqbox r[items]{#1}\ignorespaces}

\leftitem {\bf first} \lorem[1]
\leftitem {\bf second one} \lorem[2]
\leftitem {\bf final} \lorem[3]
```

#### 2.30.5 Implementation of the \table macro and friends

```
3 \codedecl \table {Basic macros for OpTeX <2021-08-04>} % preloaded in format
table.opm
```

The result of the `\table{<declaration>}{<data>}` macro is inserted into `\_tablebox`. You can change default value if you want by `\let\_tablebox=\vtop` or `\let\_tablebox=\relax`.

```
11 \let\_tablebox=\vbox
table.opm
```

We save the `to<size>` or `pxto<size>` to `#1` and `\_tableW` sets the `to<size>` to the `\_tablew` macro. If `pxto<size>` is used then `\_tablew` is empty and `\_tmpdim` includes given `<size>`. The `\_ifpxto` returns true in this case.

The `\table` continues by reading `{<declaration>}` in the `\_tableA` macro. Catcodes (for example the `|` character) have to be normal when reading `\table` parameters. This is the reason why we use `\catcodetable` here.

```
24 \newifi \_ifpxto
25 \def\table#1{\_tablebox\bgroun \tableW#1\empty\end
26   \bgroun \catcodetable\optexcatcodes \tableA}
27 \def\tableW#1#2\end{\_pxtofalse
28   \ifx#1\empty \def\tablew{}\else
29     \ifx#1\def\tablew{}\tableW#2\end\else \def\tablew{#1#2}\fi\fi
30 \def\tableWx #1\end{\_tmpdim=#1\relax \pxtotrue}
31 \public \table ;
table.opm
```

The `\tablinespace` is implemented by enlarging given `\tabstrut` by desired dimension (height and depth too) and by setting `\_lineskip=-2\_\tablinespace`. Normal table rows (where no `\hrule` is between them) have normal baseline distance.

The `\_tableA{⟨declaration⟩}` macro scans the `⟨declaration⟩` by `\_scantabdata#1\relax` and continues by processing `{⟨data⟩}` by `\_tableB`. The trick `\_tmptoks={⟨data⟩}\_edef\_\tmpb{\_the\_\tmptoks}` is used here in order to keep the hash marks in the `⟨data⟩` unchanged.

```
table.opm
44 \_def\_\tableA#1{\_egroup
45   \_the\_\thistable \_global\_\thistable={}%
46   \_ea\_\ifx\_\ea`\_the\_\tabstrut`\_setbox\_\tstrutbox=\_null
47   \_else \_setbox\_\tstrutbox=\_hbox{\_the\_\tabstrut}%
48     \_setbox\_\tstrutbox=\_hbox{\_vrule width\_\zo
49       height\_\dimexpr\_\ht\_\tstrutbox+\_tablinespace%
50       depth\_\dimexpr\_\dp\_\tstrutbox+\_tablinespace}%
51     \_offinterlineskip
52     \_lineskip=-2\_\tablinespace
53   \_fi
54   \_column=0 \_let\_\addtabitem=\_addtabitemx
55   \_def\_\tmpa{} \_tabdata={\_column1\_\relax}\_scantabdata#1\_\relax
56   \_the\_\everytable \_bgroup \_catcode`\#=12 \_tableB
57 }
```

The `\_tableB` saves `⟨data⟩` to `\_tmpb` and does `\replstrings` to prefix each macro `\crl` (etc.) by `\crcr`. See `\_tabreplstrings`. It cannot be used in a `\table` in another `\table`, so `\_tabreplstrings` is set to `\relax` locally.

The `\tabskip` value is saved for places between columns into the `\_tabskipmid` macro. Then it runs

```
\tabskip=\tabskip1 \halign{⟨converted declaration⟩}\tabskip=\tabskip1 \cr ⟨data⟩\crcr}
```

This sets the desired boundary values of `\tabskip`. The “between-columns” values are set as `\tabskip=\_tabskipmid` in the `⟨converted declaration⟩` immediately after each column declarator.

If `ppto` keyword was used, then we set the virtual unit `\tsize` to `-\hsize` first. Then the first attempt of the table is created in box 0. All collums where `p{..}\tsize` is used, are created as empty in this first pass. So, the `\wd0` is the width of all other columns. The `\_tsizesum` includes the sum of `\tsize`'s in `\hsize` units after firts pass. The desired table width is stored in the `\_tmpdim`, so `\_tmpdim-\_wd0` is the rest which have to be filled by `\tsize`. Then the `\tsize` is re-calculated and the real table is printed by `\halign` in the second pass.

If no `ppto` keyword was used, then we print the table using `\halign` directly. The `\_tablew` macro is nonempty if the `to` keyword was used.

The `⟨data⟩` are re-tokenized by `\_scantextokens` in order to be more robust to catcode changing inside the `⟨data⟩`. But inline verbatim cannot work in special cases here like `{}` for example.

```
table.opm
92 \_long\_\def\_\tableB #1{\_egroup \_def\_\tmpb{#1}%
93   \_tablereplstrings \_let\_\tablereplstrings=\_relax
94   \_edef\_\tabskipmid{\_the\_\tabskip}\_tabskip=\_tabskip1
95   \_ifppto
96     \_edef\_\tsizes{\_global\_\tsizesum=\_the\_\tsizesum \_gdef\_\noexpand\_\tsizelast{\_tsizelast}}%
97     \_tsizesum=\_zo \_def\_\tsizelast{0}%
98     \_tsize=-\hsize \_setbox0=\_vbox{\_tablepxreset \_halign \_tableC}%
99     \_advance\_\tmpdim by\_\wd0
100    \_ifdim \_\tmpdim >\_zo \_else \_tsizesum=\_zo \_fi
101    \_ifdim \_\tsizesum >\_zo \_tsize =\_expr{\_number\_\hsize/\_number\_\tsizesum}\_\tmpdim
102    \_else \_tsize=\_zo \_fi
103    \_tsizes % retoring values if there is a \table ppto inside a \table ppto.
104    \_setbox0=\_null \_halign \_tableC
105  \_else
106    \_halign\_\tablew \_tableC
107  \_fi \_egroup
108 }
109 \_def\_\tableC{\_ea{\_the\_\tabdata}\_tabskip=\_tabskip1\cr \_scantextokens\_\ea{\_tmpb\_\crcr}}}
```

`\_tabreplstrings` replaces each `\crl` etc. to `\crcr\crl`. The reason is: we want to use macros that scan its parameter to a delimiter written in the right part of the table item declaration. The `\crcr` cannot be hidden in another macro in this case.

```
table.opm
118 \_def\_\tablereplstrings{%
119   \_repstring\_\tmpb{\crl}{\_crcr\crl}\_repstring\_\tmpb{\crl}{\_crcr\crl}%
120   \_repstring\_\tmpb{\crl}{\_crcr\crl}\_repstring\_\tmpb{\crl}{\_crcr\crl}%
121 }
```

```

121   \_replstring\_\_tmpb{\crlp}{\_crcr\crlp}%
122 }
123
124 \_def\_\_tablepxpreset{} % can be used to de-activate references to .ref file
125 \_newbox\_\_tstrutbox    % strut used in table rows
126 \_newtoks\_\_tabdata     % the \halign declaration line

```

The `\_scantabdata` macro converts `\table`'s *(declaration)* to `\halign` *(converted declaration)*. The result is stored into `\_tabdata` tokens list. For example, the following result is generated when *(declaration)*=`|cr||cl|`.

```

tabdata: \_vrule\_\the\_\tabiteml{\_hfil#\_unskip\_hfil}\_\the\_\tabitemr\_\tabstrutA
&\_\the\_\tabiteml{\_hfil#\_unskip}\_\the\_\tabitemr
                                \_vrule\_\kern\_\vvkern\_\vrule\_\tabstrutA
&\_\the\_\tabiteml{\_hfil#\_unskip\_hfil}\_\the\_\tabitemr\_\tabstrutA
&\_\the\_\tabiteml{\_relax#\_unskip\_hfil}\_\the\_\tabitemr\_\vrule\_\tabstrutA
ddlinedata: &\_\_dditem &\_\_dditem\_\vvitem &\_\_dditem &\_\_dditem

```

The second result in the `\_ddlinedata` macro is a template of one row of the table used by `\crl` macro.

```

table.opm
146 \_def\_\_scantabdata#1{\_let\_\next=\_scantabdata
147   \_ifx\_\relax#1\_\let\_\next=\_relax
148   \_else\_\ifx|#1\_\addtabrule

155             \_else
156               \_\def\_\next{\_ea\_\scantabdataB\_\csname \_paramtabdeclare#1\_\endcsname}\_\fi
157             \_else \_\def\_\next{\_ea\_\scantabdataA\_\csname \_tabdeclare#1\_\endcsname}\%
158           \_\fi\_\fi\_\fi\_\fi\_\fi \_\next
159 }
160 \_def\_\scantabdataA#1{\_addtabitem
161   \_\ea\_\addtabdata\_\ea{#1}\_\tabstrutA \_\tabskip\_\tabskipmid\_\relax}\_\scantabdata}
162 \_def\_\scantabdataB#1#2{\_addtabitem
163   \_\ea\_\addtabdata\_\ea{#1#2}\_\tabstrutA \_\tabskip\_\tabskipmid\_\relax}\_\scantabdata}
164 \_def\_\scantabdataC {\_def\_\tmpb{}\_\afterassignment\_\scantabdataD \_\tmpnum=}
165 \_def\_\scantabdataD#1{\_loop \_\ifnum\_\tmpnum>0 \_\advance\_\tmpnum by-1 \_\addto\_\tmpb{#1}\_\repeat
166   \_\ea\_\scantabdata\_\tmpb}
167 \_def\_\scantabdataE#1{\_addtabdata{#1}\_\scantabdata}
168 \_def\_\scantabdataF {\_addtabitem\_\def\_\addtabitem{\_let\_\addtabitem=\_addtabitemx}\_\scantabdata}

```

The `\_addtabitemx` adds the boundary code (used between columns) to the *(converted declaration)*. This code is `\egroup &\bgroup \colnum=<value>\relax`. You can get the current number of column from the `\colnum` register, but you cannot write `\the\colnum` as the first object in a *(data)* item because `\halign` first expands the front of the item and the left part of the declaration is processed after this. Use `\relax\the\colnum` instead. Or you can write:

```

\def\showcolnum{\ea\def\ea\totcolnum\ea{\the\colnum}\the\colnum\!\totcolnum}
\table{ccc}{\showcolnum & \showcolnum & \showcolnum}

```

This example prints 1/3 2/3 3/3, because the value of the `\colnum` is equal to the total number of columns before left part of the column declaration is processed.

```

table.opm
188 \_newcount\_\colnum      % number of current column in the table
189 \_public \colnum ;
190
191 \_def\_\addtabitemx{\_ifnum\_\colnum>0
192   \_addtabdata{\_}\_\addto\_\ddlinedata{\&\_\_dditem}\_\fi
193   \_\advance\_\colnum by1 \_\let\_\tmpa=\_relax
194   \_\ifnum\_\colnum>1 \_\ea\_\addtabdata\_\ea{\_ea\_\colnum\_\the\_\colnum\_\relax}\_\fi}
195 \_def\_\addtabdata#1{\_tabdata\_\ea{\_the\_\tabdata#1}}

```

This code converts || or | from `\table` *(declaration)* to the *(converted declaration)*.

```
table.opm
201 \_def\_\_addtabvrule{%
202     \_ifx\_\_tmpa\_\_vrule \_addtabdata{\_kern\_\_vkern}%
203     \_ifnum\_\_colnum=0 \_addto\_\_vvleft{\_vvitem}\_else\_\_addto\_\_ddlinedata{\_vvitem}\_fi
204     \_else \_ifnum\_\_colnum=0 \_addto\_\_vvleft{\_vvitemA}\_else\_\_addto\_\_ddlinedata{\_vvitemA}\_fi\_\_fi
205     \_let\_\_tmpa=\_vrule \_addtabdata{\_vrule}%
206 }
207 \_def\_\_tabstrutA{\_copy\_\_tstrutbox}
208 \_def\_\_vvleft{%
209 \_def\_\_ddlinedata{}}
```

The default “declaration letters” `c`, `l`, `r` and `p` are declared by setting `\_tabdeclarec`, `\_tabdeclarel`, `\_tabdeclarer` and `\_paramtabdeclarep` macros. In general, define `\def\_\_tabdeclare<letter>{...}` for a non-parametric letter and `\def\_\_paramtabdeclare<letter>{...}` for a letter with a parameter. The double hash `##` must be in the definition, it is replaced by a real table item data. You can declare more such “declaration letters” if you want.

Note, that the `##` with fills are in group. The reason can be explained by following example:

```
\table{|c|c|}{\crl \Red A & B \crl}
```

We don’t want vertical line after red A to be in red.

```
table.opm
228 \_def\_\_tabdeclarec{\_the\_\_tabiteml{\_hfil##\_\_unskip\_\_hfil}\_the\_\_tabitemr}
229 \_def\_\_tabdeclarel{\_the\_\_tabiteml{\_relax##\_\_unskip\_\_hfil}\_the\_\_tabitemr}
230 \_def\_\_tabdeclarer{\_the\_\_tabiteml{\_hfil##\_\_unskip}\_the\_\_tabitemr}
```

The `\_paramtabdeclarep{<data>}` is invoked when `p{<data>}` declarator is used. First, it saves the `\hsize` value and then it runs `\_tablepar`. The `\_tablepar` macro behaves like `\_tableparbox` (which is `\vtop`) in normal cases. But there is a special case: if the first pass of `pxto` table is processed then `\hsize` is negative. We print nothing in this case, i.e. `\_tableparbox` is `\ignoreit` and we advance the `\_tsizesum`. The auxiliary macro `\_tsizelast` is used to do advancing only in the first row of the table. `\_tsizesum` and `\_tsizelast` are initialized in the `\_tableB` macro.

```
table.opm
245 \_def\_\_paramtabdeclarep#1{\_hsize=#1\_relax
246     \_the\_\_tabiteml \_tablepar{\_tableparB ##\_\_tableparC}\_the\_\_tabitemr
247 }
248 \_def\_\_tablepar{%
249     \_ifdim\_\_hsize<0pt
250     \_ifnum\_\_tsizelast<\_colnum \_global\_\_advance\_\_tsizesum by-\_\_hsize
251         \_xdef\_\_tsizelast{\_the\_\_colnum}\_fi
252     \_let\_\_tableparbox=\_\_ignoreit
253     \_fi
254     \_tableparA \_tableparbox
255 }
256 \_let\_\_tableparbox=\_vtop
257 \_let\_\_tableparA=\_empty
258 \_newdimen \_\_tsizesum
259 \_def\_\_tsizelast{0}
```

The `\_tableparB` initializes the paragraphs inside the table item and `\_tableparC` closes them. They are used in the `\_paramtabdeclarep` macro. The first paragraph is no indented.

```
table.opm
267 \_def\_\_tableparB{%
268     \_baselineskip=\_normalbaselineskip \_lineskiplimit=\_zo \_\_noindent
269     \_raise\_\_ht\_\_tstrutbox\_\_null \_\_hskip\_\_zo \_\_relax
270 }
271 \_def\_\_tableparC{%
272     \_\_unskip
273     \_ifvmode\_\_vskip\_\_dp\_\_tstrutbox \_else\_\_lower\_\_dp\_\_tstrutbox\_\_null\_\_fi
274 }
```

Users put optional spaces around the table item typically, i.e. they write `& text &` instead `&text&`. The left space is ignored by the internal TeX algorithm but the right space must be removed by macros. This is a reason why we recommend to use `\_unskip` after each `##` in your definition of “declaration letters”. This macro isn’t only the primitive `\unskip` because we allow usage of plain TeX `\hskip` macro: `\hskip text\hskip&`.

```
table.opm
285 \_def\_\_unskip{\_ifmmode\_\_else\_\_ifdim\_\_lastskip>\_zo \_\_unskip\_\_fi\_\_fi}
```

The `\fL`, `\fR`, `\fC` and `\fX` macros only do special parameters settings for paragraph building algorithm.

`table.opm`

```
292 \_let\fL=\_raggedright
293 \_def\fR{\_leftskip=0pt plus 1fill \_relax}
294 \_def\fC{\_leftskip=0pt plus1fill \_rightskip=0pt plus 1fill \_relax}
295 \_def\fX{\_leftskip=0pt plus1fil \_rightskip=0pt plus-1fil \_parfillskip=0pt plus2fil \_relax}
296 \_public \fL \fR \fC \fX ;
```

The `\fS` macro is more tricky. The `\_tableparbox` isn't printed immediately, but `\setbox2=` is prefixed by the macro `\_tableparA`, which is empty by default (used in `\_tablepar`). The `\_tableparD` is processed after the box is set: it checks if there is only one line and prints `\hbox to\hsize{\hfil<this line>\hfil}` in this case. In other cases, the box2 is printed.

`table.opm`

```
307 \_def\fS{\_relax
308   \_ifdim\hsize<0pt \_else \_def\tableparA{\_setbox2=}\_fi
309   \_addto\tableparC{\_aftergroup\tableparD}%
310 }
311 \_def\tableparD{\_setbox0=\vbox{\_unvcopy2 \_unskip \_global\setbox1=\_lastbox}%
312   \_ifdim\ht0>0pt \_box2 \_setbox0=\_box1
313   \_else \hbox to\hsize{\hfil \_unhbox1\unskip\unskip\hfil}\_setbox0=\_box2 \_fi
314 }
315 \_public \fS ;
```

The family of `\_cr*` macros `\crl`, `\crl1`, `\crl1i`, `\crl1l` and `\tskip <dimen>` is implemented here. The `\_zerotabrule` is used to suppress the negative `\lineskip` declared by `\tablinespace`.

`table.opm`

```
325 \_def\crl{\_crrc\_noalign{\_hrule}}
326 \_def\crl1{\_crrc\_noalign{\_hrule\kern\hh kern\hrule}}
327 \_def\zerotabrule {\_noalign{\_hrule height\zo width\zo depth\zo}}
328
329 \_def\crl1i{\_crrc \_zerotabrule \_omit

The `\mspan{<number>} [<declaration>] {<text>}` macro generates similar `\omit\span\omit\span` sequence as plain TeX macro `\multispan`. Moreover, it uses `\scantabdata` to convert `<declaration>` from `\table` syntax to `\halign` syntax.

`table.opm`

```
360 \_def\mspan{\_omit \_afterassignment\mspanA \_mscount=}
361 \_def\mspanA[#1]#2{\_loop \_ifnum\mscount>1 \_cs{\span}\_omit \_advance\mscount-1 \_repeat
362   \_count1=\_colnum \_colnum=0 \_def\tmpa{} \_tabdata={} \_scantabdata{\_relax
363   \_colnum=\_count1 \_setbox0=\vbox{\_halign\ea{\the\tabdata\cr#2\cr}%
364   \_global\setbox8=\_lastbox}%
365   \_setbox0=\hbox{\_unhbox8 \_unskip \_global\setbox8=\_lastbox}%
366   \_unhbox8 \ignorespaces}
367 \_public \mspan ;
```

The `\vspan{<number>} {<text>}` implementation is here. We need to lower the box by

```
((number)-1)*(\ht+\dp of \tabstrut) / 2.
```

The #1 parameter must be a one-digit number. If you want to set more digits then use braces.

```
379 \_def\_\vspan{\#1\#2{\_vspanA{\#1\#2}}}
380 \_def\_\vspanA{\#1\#2{\_vtop to\_\zof{\_hbox{\_lower \_dimexpr
381     \#1\_\dimexpr(\_ht\_\tstrutbox+\_dp\_\tstrutbox)/2\_\relax
382     -\_\dimexpr(\_ht\_\tstrutbox+\_dp\_\tstrutbox)/2\_\relax \_hbox{\#2}\}\_vss}}}
383 \_public \vspan ;
```

table.opm

The parameters of primitive `\vrule` and `\hrule` keeps the rule “last wins”. If we re-define `\hrule` to `\_orihrule height1pt` then each usage of redefined `\hrule` uses 1pt height if this parameter isn’t overwritten by another following `height` parameter. This principle is used for settings another default rule thickness than 0.4 pt by the macro `\rulewidth`.

```
394 \_newdimen\_\drulewidth \_drulewidth=0.4pt
395 \_let\_\orihrule=\_hrule \_let\_\orivrule=\_vrule
396 \_def\_\rulewidth{\_afterassignment\_\rulewidthA \_drulewidth}
397 \_def\_\rulewidthA{\_edef\_\hrulef{\_orihrule height\_\drulewidth}%
398             \_edef\_\vrulef{\_orivrule width\_\drulewidth}%
399             \_let\_\rulewidth=\_drulewidth
400             \_public \vrule \hrule \rulewidth;}
401 \_public \rulewidth ;
```

table.opm

The `\frame{<text>}` uses “`\vbox` in `\vtop`” trick in order to keep the baseline of the internal text at the same level as outer baseline. User can write `\frame{abcxyz}` in normal paragraph line, for example and gets the expected result: `[abcxyz]`. The internal margins are set by `\vvkern` and `\hhkern` parameters.

```
411 \_long\_\def\_\frame{\#1{%
412     \_hbox{\_vrule\_\vtop{\_vbox{\_hrule\_\kern\_\vvkern
413         \_hbox{\_kern\_\hhkern\_\relax\#1\_\kern\_\hhkern}%
414     }\_kern\_\vvkern\_\hrule}\_vrule}}
415 \_public \frame ;
```

table.opm

`\eqbox` and `\eqboxsize` are implemented here. The widths of all `\eqboxes` are saved to the `.ref` file in the format `\_Xeqbox{<label>}{<size>}`. The `.ref` file is read again and maximum box width for each `<label>` is saved to `\_eqb:<label>`.

```
424 \_def\_\Xeqbox{\#1\#2{%
425     \_ifcsname \_eqb:\#1\_\endcsname
426         \_ifdim \#2>\_cs{\_eqb:\#1}\_\relax \_sdef{\_eqb:\#1}{\#2}\_\fi

433     \_else \_box0 \_\fi
434 }
435 \_def\_\eqboxsize [\#1]\#2{\_trycs{\_eqb:\#1}{\#2}}
436
437 \public \eqbox \eqboxsize ;
```

table.opm

## 2.31 Balanced multi-columns

```
3 \_codedecl \begmulti {Balanced columns <2021-05-20>} % preloaded in format
```

multicolumns.opm

This code is documented in detail in the “TeXbook naruby”, pages 244–246, free available, <http://petr.olsak.net/tbn.html>, but in Czech. Roughly speaking, macros complete all material between `\begmulti{num-columns}` and `\endmulti` into one `\vbox 6`. Then the macro measures the amount of free space at the current page using `\pagegoal` and `\pagetotal` and does `\vsplit` of `\vbox 6` to columns with a height of such free space. This is done only if we have enough amount of material in `\vbox 6` to fill the full page by columns. This is repeated in a loop until we have less amount of material in `\vbox 6`. Then we run `\balancecolumns` which balances the last part of the columns. Each part of printed material is distributed to the main vertical list as `\hbox{<columns>}` and we need not do any change in the output routine.

If you have paragraphs in `\begmulti... \endmulti` environment then you may say `\raggedright` inside this environment and you can re-assign `\widowpenalty` and `\clubpenalty` (they are set to 10000 in `OpTeX`).

```

## 2.32 Citations, bibliography

### 2.32.1 Macros for citations and bibliography preloaded in the format

```
3 \citedecl \cite {Cite, Biblioraphy <2021-04-13>} % preloaded in format
```

cite-bib.opp

Registers used by \cite, \bib macros are declared here. The \bibnum counts the bibliography items from one. The \bibmark is used when \nonumcitations is set.

```

11 \newcount\bibnum % the bibitem counter
12 \newtoks\bibmark % the bibmark used if \nonumcitations
13 \newcount\lastcitem \lastcitem=0 % for \shortcitations
14 \public \bibnum \bibmark ;

```

cite-bib.opp

\bibp expands to \bibpart/. By default, \bibpart is empty, so internal links are in the form cite://<number>. If \bibpart is set to <bibpart>, then internal links are cite:<bibpart>/<number>.

```
23 \def\bibp{\the\bibpart/} % unique name for each bibliography list
```

cite-bib.opp

\cite [<label>,<label>,...,<label>] manages <labels> using \citeA and prints [<bib-marks>] using \printsavedcites.

\nocite [<label>,<label>,...,<label>] only manages <labels> but prints nothing.

\rcite [<label>,<label>,...,<label>] behaves like \cite but prints <bib-marks> without brackets.

\ecite [<label>]{<text>} behaves like \rcite [<label>] but prints <text> instead <bib-mark>. The <text> is hyperlinked like <bib-marks> when \cite or \rcite is used. The empty internal macro \savedcites will include the <bib-marks> list to be printed. This list is set by \citeA inside a group and it is used by \printsavedcites in the same group. Each \cite/\rcite/\ecite macro starts from empty list of <bib-marks> because new group is opened.

```

43 \def\cite[#1]{\citeA#1,,,\printsavedcites}}
44 \def\nocite[#1]{\citeA#1,,,{\relax}}
45 \def\rcite[#1]{\citeA#1,,,\printsavedcites}
46 \def\ecite[#1]{\bgroup\citeA#1,,,\ea\eciteB\ savedcites;{\relax}}
47 \def\eciteB#1,#2;#3{\_if?#1\_relax #3\_else \ilink[cite:\bibp#1]{#3}\_fi\egroup}
48 \def\savedcites{}
49
50 \public \cite \nocite \rcite \ecite ;

```

cite-bib.opp

<bib-marks> may be numbers or a special text related to cited bib-entry. It depends on \nonumcitations and on used bib-style. The mapping from <label> to <bib-mark> is done when \bib or \usebib is processed. These macros store the information to \Xbib{<bibpart>}{<label>}{<number>}{<nonumber>} where <number> and <nonumber> are two variants of <bib-mark> (numbered or text-like). This information is read from .ref file and it is saved to macros \bib:<bibpart>/<label> and \bim:<bibpart>/<number>. First one includes <number> and second one includes <nonumber>. The \lastbn:<bibpart> macro includes last number of bib-entry used in the document with given <bibpart>. A designer can use it to set appropriate indentation when printing the list of all bib-entries.

```

69 \_def\_\_Xbib#1#2#3#4{\_sxdef{_bib:#1/#2}{\_bibnn{#3}&}\%
70   \_if^#4\_\_else\_\_sxdef{_bib:#1/#3}{#4}\_fi\_\_sxdef{_lastbn:#1}{#3}\}

```

`\_citeA` (*label*), processes one label from the list of labels given in the parameter of `\cite`, `\nocite`, `\rcite` or `\ecite` macros. It adds the *(label)* to a global list `\_ctlst:(bibpart)`/ which will be used by `\usebib` (it must know what *(labels)* are used in the document to pick-up only relevant bib-entries from the database. Because we want to save space and to avoid duplications of *(label)* in the `\_ctlst:(bibpart)`/, we distinguish four cases:

- *(label)* was not declared by `\_Xbib` before and it is first such a *(label)* in the document: Then `\_bib:(bibpart)`/*(label)* is undefined and we save label using `\_addcitelist`, write warning on the terminal and define `\_bib:(bibpart)`/*(label)* as empty.
- *(label)* was not declared by `\_Xbib` before but it was used previously in the document: Then `\_bib:(bibpart)`/*(label)* is empty and we do nothing (only data to `\_savedcites` are saved).
- *(label)* was declared by `\_Xbib` before and it is first such *(label)* used in the document: Then `\_bib:(bibpart)`/*(label)* includes `\_bibnn{<number>}&` and we test this case by the command `\if &\_bibnn{<number>}&`. This is true when `\_bibnn{<number>}` expands to empty. The *(label)* is saved by `\_addcitelist` and `\_bib:(bibpart)`/*(label)* is re-defined directly as *(number)*.
- *(label)* was declared by `\_Xbib` and it was used previously in the document. Then we do nothing (only data to `\_savedcites` are saved).

The `\_citeA` macro runs repeatedly over the whole list of *(labels)*.

```

120   }
121 \_let\_\_bibnn=\_relax

```

Because we implement possibility of more independent bibliography lists distinguished by *(bibpart)*, the `\_addcitelist{<label>}` macro must add the *(label)* to given `\_ctlst:(bibpart)`/.

When `\_addcitelist` is processed before `\usebib`, then `\_citeI[<label>]` is added. `\usebib` will use this list for selecting right records from .bib file. Then `\usebib` sets `\_ctlst:(bibpart)`/ to `\_write`. If `\_addcitelist` is processed after `\usebib`, then `\_Xcite{<bibpart>}{<label>}` is saved to the .ref file. The `\_Xcite` creates `\_ctlstB:(bibpart)`/ as a list of saved `\_citeI[<label>]`. Finally, `\usebib` concats boths lists `\_ctlst:(bibpart)`/ and `\_ctlstB:(bibpart)`/ in the second TeX run.

```

147   }

```

The  $\langle bib\text{-}marks \rangle$  (in numeric or text form) are saved in `\_savedcites` macro separated by commas. The `\printsavedcites` prints them by normal order or sorted if `\sortcitations` is specified or condensed if `\shordcitations` is specified.

The `\sortcitations` appends the dummy number 300000 and we suppose that normal numbers of bib-entries are less than this constant. This constant is removed after the sorting algorithm. The `\shortcitations` sets simply `\_lastcitemumber=1`. The macros for  $\langle bib\text{-}marks \rangle$  printing follows (sorry, without detail documentation). They are documented in `opmac-d.pdf` (but only in Czech).

The `\bib` [ $\langle label \rangle$ ] or `\bib` [ $\langle label \rangle$ ] = $\{ \langle bib\text{-}mark \rangle \}$  prints one bib-entry without reading any database. The bib-entry follows after this command. This command counts the used `\bibs` from one by `\bibnum` counter and saves `\Xbib{\bibpart}{\label}{\number}{\nonumber}` into `.ref` file immediately us-

ing `\_wbib{<label>}{<number>}{<nonumber>}`. This is the core of creation of mapping from `<labels>` to `<number>` and `<nonumber>`.

`\_bibA` and `\_bibB` implement the scanner of the optional argument with the `\bibmark`.

`\_bibgl` is `\relax` by default but `\slides` do `\let\_bibgl=\_global`.

`\_dbib{<label>}` creates destination for hyperlinks.

```
cite-bib.opm
234 \_def\_\bib[#1]{\_def\_\tmp{\_isnextchar={\_bibA[#1]}{\_bibmark={} \_bibB[#1]}}%
235   \_ea\_\tmp\_\romannumeral-\`.\} % ignore optional space
236 \_def\_\bibA[#1]=#2{\_bibmark={#2}\_bibB[#1]}
237 \_def\_\bibB[#1]{\_par \_bibs skip
238   \_bibgl\_\advance\_\bibnum by1
239   \_noindent \_def\_\tmpb[#1]\_dbib{#1}\_wbib{#1}{\_the\_\bibnum}{\_the\_\bibmark}%
240   \_printbib \_ignorespaces
241 }
242 \_def\_\dbib#1{\_dest[cite:\_bibp\_\the\_\bibnum]\_printlabel{#1}}
243 \_def\_\wbib#1#2#3{%
244   \_ifx\_\wref\_\wrefrelax\_\else \_immediate\_\wref\_\Xbib{\_the\_\bibpart}{#1}{#2}{#3}\_\fi
245   \_unless \_ifcsname bib:\_bibp#1\_\endcsname \_\Xbib{\_the\_\bibpart}{#1}{#2}{#3}\_\fi
246 }
247 \_let\_\bibgl=\_relax
248
249 \_public \_bib ;
```

The `\_printbib` prints the bib-entry itself. You can re-define it if you want a different design. The `\_pritbib` starts in horizontal mode after `\noindent` and after the eventual hyperlink destination is inserted. By default, the `\_printbib` sets the indentation by `\hangindent` and prints numeric `<bib-marks>` by `\llap{[\the\bibnum]}` If `\nonumcitations` then the `\_citelinkA` is not empty and `<bib-marks>` (`\the\bibnum` nor `\the\bibmark`) are not printed. The text of bib-entry follows. User can create this text manually using `\bib` command or it is generated automatically from a `.bib` database by `\usebib` command.

The vertical space between bib-entries is controlled by `\_bibs skip` macro.

```
cite-bib.opm
266 \_def \_printbib {\_hangindent=\_iindent
267   \_ifx\_\citelinkA\_\empty \_hskip\_\iindent \_llap{[\_the\_\bibnum] }\_\fi
268 }
269 \_def \_bibs skip {\_ifnum\_\bibnum>0 \_smallskip \_fi}
```

The `\usebib` command is implemented in `usebib.opm` file which is loaded when the `\usebib` command is used first. The `usebib.opm` file loads the `librarian.tex` for scanning the `.bib` files. See the section 2.32.2, where the file `usebib.opm` is documented.

```
cite-bib.opm
279 \_def\_\usebib{\_par \_opinput {usebib.opm} \_usebib}
280 \_def\usebib{\_usebib}
```

`\nobibwarning [<list of bib-labels>]` declares a list of bib labels which are not fully declared in `.bib` file but we want to suppress the warning about it. List of bib labels are comma-separated case sensitive list without spaces.

```
cite-bib.opm
290 \_def\_\nobibwarnlist{},_
291 \_def\_\nobibwarning[#1]{\_global\_\addto\_\nobibwarnlist{#1},}
292 \_public \nobibwarning ;
```

## 2.32.2 The `\usebib` command

The file `usebib.opm` implements the command `\usebib/<sorttype> (<style>) <bibfiles>` where `<sorttype>` is one letter `c` (references ordered by citation order in the text) or `s` (references ordered by key in the style file), `<style>` is the part of the name `bib-<style>.opm` of the style file and `<bibfiles>` are one or more `.bib` file names without suffix separated by comma without space. Example:

```
\usebib/s (simple) mybase,yourbase
```

This command reads the `<bibfiles>` directly and creates the list of bibliographic references (only those declared by `\cite[]` or `\nocite[]` in the text). The formatting of such references is defined in the style file.

The principle “first entry wins” is used. Suppose `\usebib/s (simple) local,global`. If an entry with the same label is declared in `local.bib` and in `global.bib` too then the first wins. So, you can set exceptions in your `local.bib` file for your document.

The `bib-<style>.opm` declares entry types (like `@BOOK`, `@ARTICLE`) and declares their mandatory and optional fields (like `author`, `title`). When a mandatory field is missing in an entry in the `.bib` file then a warning is printed on the terminal about it. You can suppress such warnings by command `\nobibwarning [<bib-labels>]`, where `<bib-labels>` is a comma-separated list of labels (without spaces) where missing mandatory fields will be no warned.

Old `.bib` files may use the obscure notation for accents like `\o{a}`. Recommendation: convert such old files to Unicode encoding. If you are unable to do this then you can set `\bibtexhook=\oldaccents`.

### 2.32.3 Notes for bib-style writers

The `.bib` files include records in the format:

```
@<entry-type>{<label>,
  <field-name> = "<field-data>",
  <field-name> = "<field-data>",
  ...etc
}
```

see the file `demo/op-biblist.bib` for a real example. The `<entry-types>` and `<field-names>` are case insensitive.

Ancient BibTeX has read such files and has generated files appropriate for reading by L<sup>A</sup>T<sub>E</sub>X. It has worked with a set of `<entry-types>`, see the www page <http://en.wikipedia.org/wiki/BibTeX>. The set of entry types listed on this www page is de facto the BibTeX standard. The OpTeX bib style writer must “declare” all such entry types and more non-standard entry types can be declared too if there is a good reason for doing it. The word “declare” used in the previous sentence means that a bib-style writer must define the printing rules for each `<entry-type>`. The printing rules for `<entry-type>` include: which fields will be printed, in what order, by what format they will be printed on (italic, caps, etc.), which fields are mandatory, which are optional, and which are ignored in `.bib` records.

The style writer can be inspired by two styles already done: `bib-simple.opm` and `bib-iso690.opm`. The second one is documented in detail in section 2.32.5.

The printing rules for each `<entry-type>` must be declared by `\_sdef{_print:<entry-type>}` in `bib-<style>.opm` file. The `<entry-type>` has to be lowercase here. OpTeX supports following macros for a more comfortable setting of printing rules:

- `\_bprinta [<field-name>] {<if defined>} {<if not defined>}`. The part `<if defined>` is executed if `<field-name>` is declared in `.bib` file for the entry which is currently processed. Else the part `<if not defined>` is processed. The part `<if defined>` can include the `*` parameter which is replaced by the value of the `<field-name>`.
- The part `<if not defined>` can include the `\_bibwarning` command if the `<field-name>` is mandatory.
- `\_bprintb [<field-name>] {<if defined>} {<if not defined>}`. The same as `\_bprinta`, but the `##1` parameter is used instead `*`. Differences: `##1` parameter can be used more than once and can be enclosed in nested braces. The `*` parameter can be used at most once and cannot be enclosed in braces. Warning: if the `\_bprintb` commands are nested (`\_bprintb` in `\_bprintb`), then you need to write the `####1` parameter for internal `\_bprintb`. But if `\_bprinta` commands are nested then the parameter is not duplicated.
- `\_bprintc \macro {<if non-empty>}`. The `<if non-empty>` part is executed if `\macro` is non-empty. The `*` parameter can be used, it is replaced by the `\macro`.
- `\_bprintv [<field1>, <field2>, ...] {<if defined>} {<if not defined>}`. The part `<if defined>` is executed if `<field1>` or `<filed2>` or ... is defined, else the second part `<if not defined>` is executed. There is one filed name or the list field names separated by commas. The parts cannot include any parameters.

There are two special field-names: `!author` and `!editor`. The processed list of authors or editors are printed here instead of raw data, see the commands `\_authorname` and `\_editorname` below.

The bib-style writer can define `_print:BEGIN` and/or `_print:END`. They are executed at the beginning or end of each `<entry-type>`. The formatting does not solve the numbering and paragraph indentation of the entry. This is processed by `\_printbib` macro used in OpTeX (and may be redefined by the author or document designer).

The `\bibmark={something}` can be declared, for instance in the `_print:END` macro. Such “bibmark” is saved to the `.ref` file and used in next T<sub>E</sub>X run as `\cite` marks when `\nonumcitations` is set.

Moreover, the bib-style writer must declare the format of special fields `author` and `editor`. These fields include a list of names, each name is precessed individually in a loop. The `\_authorname` or `\_editorname` is called for each name on the list. The bib-style writer must define the `\_authorname` and `\_editorname` commands in order to declare the format of printing each individual name. The following control sequences can be used in these macros:

- `\_NameCount`: the number of the currently processed author in the list
- `\_namecont`: the total number of the authors in the list
- `\_Lastname`, `\_Firstname`, `\_Von`, `\_Junior`: the parts of the name.

The whole style file is read in the group during the `\usebib` command is executed before typesetting the reference list. Each definition or setting is local here.

The auto-generated phrases (dependent on current language) can be used in bib-style files by `\_mtext{bib.(identifier)}`, where `(ident)` is an identifier of the phrase and the phrase itself is defined by `\_sdef{\_mt:bib.(identifier)}:(language){(phrase)}`. See section 2.37.3 for more detail. Phrases for `(identifiers)`: and, etal, edition, citedate, volume, number, prepages, postpages, editor, editors, available, availablealso, bachthesis, masthesis, phdthesis are defined already, see the end of section 2.37.3.

If you are using non-standard field-names in `.bib` database and bib-style, you have to declare them by `\_CreateField {<fieldname>}`.

You can declare `\_SortingOrder` in the manner documented by `librarian` package.

User or author of the bib-style can create the hidden field which has a precedence while sorting names. Example:

```
\CreateField {sortedby}
\SpecialSort {sortedby}
```

Suppose that the `.bib` file includes:

```
...
author = "Jan Chadima",
sortedby = "Hzzadima Jan",
...
```

Now, this author is sorted between H and I, because the Ch digraph in this name has to be sorted by this rule.

If you need (for example) to place the auto-citations before other citations, then you can mark your entries in `.bib` file by `sortedby = "@"`, because this character is sorted before A.

#### 2.32.4 The `usebib.opm` macro file loaded when `\usebib` is used

```
usebib.opm
3 \_codedecl \MakeReference {Reading bib databases <2021-04-30>} % loaded on demand by \usebib
```

Loading the `librarian.tex` macro package. See `texdoc librarian` for more information about it.

We want to ignore `\errmessage` and we want not to create `\jobname.lbr` file.

```

```

### 2.32.5 Usage of the bib-iso690 style

This is the iso690 bibliographic style used by OptTeX.

See `op-biblist.bib` for an example of the `.bib` input. You can try it by:

```

\fntfam[LMfonts]
\nocite[*]
\usebib/s (iso690) op-biblist
\end

```

#### Common rules in `.bib` files

There are entries of type `@FOO{...}` in the `.bib` file. Each entry consists of fields in the form `name1=1"value"`, or `name1=1{value}`. No matter which form is used. If the value is pure numeric then you can say simply `name1=1value`. Warning: the comma after each field value is mandatory! If it is missing then the next field is ignored or badly interpreted.

The entry names and field names are case insensitive. If there exists a data field no mentioned here then it is simply ignored. You can use it to store more information (abstract, for example).

There are “standard fields” used in ancient bibTeX (author, title, editor, edition, etc., see <http://en.wikipedia.org/wiki/BibTeX>). The iso690 style introduces several “non-standard” fields: ednote, numbering, isbn, issn, doi, url, citedate, key, bibmark. They are documented here.

Moreover, there are two optional special fields:

- lang = language of the entry. The hyphenation plus autogenerated phrases and abbreviations will be typeset by this language.
- option = options by which you can control a special printing of various fields.

There can be only one option field per each entry with (maybe) more options separated by spaces. You can declare the global option(s) in your document applied for each entry by `\biboptions={...}`.

#### The author field

All names in the author list have to be separated by “ and ”. Each author can be written in various formats (the von part is typically missing):

```

Firstname(s) von Lastname
or
von Lastname, Firstname(s)
or
von Lastname, After, Firstname(s)

```

Only the Lastname part is mandatory. Examples:

```

Petr Olšák
or
Olšák, Petr

```

Leonardo Piero da Vinci

```

or
da Vinci, Leonardo Piero
or
da Vinci, painter, Leonardo Piero

```

The separator “`and`” between authors will be converted to comma during printing, but between the semifinal and final author the word “`and`” (or something different depending on the current language) is printed.

The first author is printed in reverse order: “LASTNAME, Firstname(s) von, After” and the other authors are printed in normal order: “Firstname(s) von LASTNAME, After”. This feature follows the ISO 690 norm. The Lastname is capitalized using uppercase letters. But if the `\caps\rm\Lastname`.

You can specify the option `aumax:<number>`. The `<number>` denotes the maximum authors to be printed. The rest of the authors are ignored and the `et~al.` is appended to the list of printed authors. This text is printed only if the `aumax` value is less than the real number of authors. If you have the same number of authors in the .bib file as you need to print but you want to append `et~al.` then you can use `auetal` option.

There is an `aumin:<number>` option which denotes the definitive number of printed authors if the author list is not fully printed due to `aumax`. If `aumin` is unused then `aumax` authors are printed in this case.

All authors are printed if `aumax:<number>` option isn’t given. There is no internal limit. But you can set the global options in your document by setting the `\bibtokens` tokens list. For example:

```
\bibtokens={aumax:7 aumin:1}
% if there are 8 or more authors then only the first author is printed.
```

Examples:

```
author = "John Green and Bob Brown and Alice Black",
```

output: GREEN, John, Bob BROWN, and Alice BLACK.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:1",
```

output: GREEN, John et al.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:2",
```

output: GREEN, John, Bob BROWN et al.

```
author = "John Green and Bob Brown and Alice Black",
option = "aumax:3",
```

output: GREEN, John, Bob BROWN, and Alice BLACK.

```
author = "John Green and Bob Brown and Alice Black",
option = "auetal",
```

output: GREEN, John, Bob BROWN, Alice BLACK et al.

If you need to add a text before or after the author’s list, you can use the `auprint:{<value>}` option. The `<value>` will be printed instead of the authors list. The `<value>` can include `\AU` macro which expands to the authors list. Example:

```
author = "Robert Calbraith",
option = "auprint:{\AU\space [pseudonym of J. K. Rowling]}",
```

output: CALBRAITH Robert [pseudonym of J. K. Rowling].

You can use the `autrim:<number>` option. All Firstnames of all authors are trimmed (i. e. reduced to initials) iff the number of authors in the author field is greater than or equal to `<number>`. There is an exception: `autrim:0` means that no Firstnames are trimmed. This is the default behavior. Another example: `autrim:1` means that all Firstnames are trimmed.

```
author = "John Green and Bob Brown and Alice Black",
option = "auetal autrim:1",
```

output: GREEN, J., B. BROWN, A. BLACK et al.

If you need to write a team name or institution instead of authors, replace all spaces by \\_ in this name. Such text is interpreted as Lastname. You can add the secondary name (interpreted as Firstname) after the comma. Example:

```
author = "Czech\ Technical\ University\ in\ Prague,  
Faculty\ of\ Electrical\ Engeneering",
```

output: CZECH TECHNICAL UNIVERSITY IN PRAGUE, Faculty of Electrical Engeneering.

### The editor field

The editor field is used for the list of the authors of the collection. The analogous rules as in author field are used here. It means that the authors are separated by “ and ”, the Firstnames, Lastnames, etc. are interpreted and you can use the options `edmax:<number>`, `edmin:<number>`, `edetal`, `edtrim:<number>` and `edprint:{<value>}` (with \ED macro). Example:

```
editor = "Jan Tomek and Petr Karas",  
option = "edprint:{\ED, editors.} edtrim:1",
```

Output: J. TOMEK and P. KARAS, editors.

If `edprint` option is not set then `{\ED, eds.}` or `{\ED, ed.}` is used depending on the entry language and on the singular or plural of the editor(s).

### The ednote field

The ednote field is used as the secondary authors and more editorial info. The value is read as raw data without any interpretation of Lastname, Firstname etc.

```
ednote = "Illustrations by Robert \upper{Agarwal}, edited by Tom \upper{Nowak}",
```

output: Illustrations by Robert AGARWAL, edited by Tom NOWAK.

The `\upper` command has to be used for Lastnames in the ednote field.

### The title field

This is the title of the work. It will be printed (in common entry types) by italics. The ISO 690 norm declares, that the title plus optional subtitle are in italics and they are separated by a colon. Next, the optional secondary title has to be printed in an upright font. This can be added by `titlepost:{<value>}`. Example:

```
title = "The Simple Title of The Work",  
or  
title = "Main Title: Subtitle",  
or  
title = "Main Title: Subtitle",  
option = "titlepost:{Secondary title}",
```

The output of the last example: *Main Title: Subtitle*. Secondary title.

### The edition field

This field is used only for second or more edition of cited work. Write only the number without the word ”edition”. The shortcut ”ed.” (or something else depending on the current language) is added automatically. Examples:

```
edition = "Second",  
edition = "2nd",  
edition = "2$^{\rm nd}$",  
edition = "2.",
```

Output of the last example: 2. ed.

```
edition = "2."  
lang = "cs",
```

Output: 2. vyd.

Note, that the example `edition="Second"` may cause problems. If you are using language ”cs” then the output is bad: Second vyd. But you can use `editionprint:{<value>}` option. The the `<value>` is printed instead of edition field and shortcut. The edition field must be set. Example:

```

edition = "whatever",
option  = "editionprint:{Second full revised edition}",

```

Output: Second full revised edition.

You can use \EDN macro in `editionprint` value. This macro is expanded to the edition value. Example:

```

edition = "Second",
option  = "editionprint:{\EDN\space full revised edition}",
or
edition = "Second full revised edition",
option  = "editionprint:{\EDN}",

```

### The address, publisher, year fields

This is an anachronism from ancient BibTeX (unfortunately no exclusive) that the address field includes only the city of the publisher's residence. No more data are here. The publisher field includes the name of the publisher.

```

address = "Berlin",
publisher = "Springer Verlag",
year = 2012,

```

Output: Berlin: Springer Verlag, 2012.

Note, that the year needn't to be inserted into quotes because it is pure numeric.

The letter a, b, etc. are appended to the year automatically if two or more subsequent entries in the bibliography list are not distinct by the first author and year fields. If you needn't this feature, you can use the `noautoletters` option.

You can use "yearprint:*value*" option. If it is set then the *value* is used for printing year instead the real field value. The reason: year is sort sensitive, maybe you need to print something else than only sorting key. Example:

```

year    = 2000,
option  = "yearprint:{© 2000}",

```

Output: © 2000, sorted by: 2000.

```

year    = "2012a",
option  = "yearprint:{2012}",

```

Output: 2012, sorted by: 2012a.

The address, publisher, and year are typically mandatory fields. If they are missing then the warning occurs. But you can set `unpublished` option. Then this warning is suppressed. There is no difference in the printed output.

### The url field

Use it without `\url` macro, but with `http://` prefix. Example:

```

url = "http://petr.olsak.net/opmac.html",

```

The ISO 690 norm recommends to add the text "Available from" (or something else if a different current language is used) before URL. It means, that the output of the previous example is:

Available from <http://petr.olsak.net/opmac.html>.

If the `cs` language is the current one than the output is:

Dostupné z: <http://petr.olsak.net/opmac.html>.

If the `urlalso` option is used, then the added text has the form "Available also from" or "Dostupné také z:" (if `cs` language is current).

### The citedate field

This is the citation date. The field must be in the form year/month/day. It means, that the two slashes must be written here. The output depends on the current language. Example:

```

citedate = "2004/05/21",

```

Output when `en` is current: [cit. 2004-05-21].

Output when `cs` is current: [vid. 21. 5. 2004].

### The `howpublished` field

This declares the available medium for the cited document if it is not in printed form. Alternatives: online, CD, DVD, etc. Example:

```
howpublished = "online",
```

Output: [online].

### The `volume`, `number`, `pages` and `numbering` fields

The volume is the “big mark” of the journal issue and the number is the “small mark” of the journal issue and pages includes the page range of the cited article in the journal. The volume is prefixed by Vol. , the number by No. , and the pages by pp. . But these prefixes depends on the language of the entry.

Example:

```
volume = 31,  
number = 3,  
pages = "37--42",
```

Output: Vol. 31, No. 3, pp. 37–42.

```
volume = 31,  
number = 3,  
pages = "37--42",  
lang = "cs",
```

Output: ročník 31, č. 3, s. 37–42.

If you disagree with the default prefixes, you can use the numbering field. When it is set then it is used instead of volume, number, pages fields and instead of any mentioned prefixes. The numbering can include macros \VOL, \NO, \PP, which are expanded to the respective values of fields. Example:

```
volume = 31,  
number = 3,  
pages = "37--42"  
numbering = "Issue~\VOL~\NO, pages~\PP",
```

Output: Issue 31/3, pages 37–42

Note: The volume, numbers, and pages fields are printed without numbering filed only in the @ARTICLE entry. It means, that if you need to visible them in the @INBOOK, @INPROCEEDINGS etc. entries, then you must use the numbering field.

### Common notes about entries

The order of the fields in the entry is irrelevant. We use the printed order in this manual. The exclamation mark (!) denotes the mandatory field. If the field is missing then a warning occurs during processing.

If the `unpublished` option is set then the fields address, publisher, year, isbn, and pages are not mandatory. If the `nowarn` option is set then no warnings about missing mandatory fields occur.

If the field is used but not mentioned in the entry documentation below then it is silently ignored.

- The @BOOK entry

This is used for book-like entries.

Fields: author(!), title(!), howpublished, edition, ednote, address(!), publisher(!), year(!), citedate, series, isbn(!), doi, url, note.

The ednote field here means the secondary authors (illustrator, cover design etc.).

- The @ARTICLE entry

This is used for articles published in a journal.

Fields: author(!), title(!), journal(!), howpublished, address, publisher, month, year, [numbering or volume, number, pages(!)], citedate, issn, doi, url, note.

If the numbering is used then it is used instead volume, number, pages.

- The @INBOOK entry

This is used for the part of a book.

Fields: author(!), title(!), booktitle(!), howpublished, edition, ednote, address(!), publisher(!), year(!), numbering, citedate, series, isbn or issn, doi, url, note.

The author field is used for author(s) of the part, the editor field includes author(s) or editor(s) of the whole document. The pages field specifies the page range of the part. The series field can include more information about the part (chapter numbers etc.).

The @INPROCEEDINGS and @CONFERENCE entries are equivalent to @INBOOK entry.

- The @THESIS entry

This is used for the student's thesis.

Fields: author(!), title(!), howpublished, address(!), school(!), month, year(!), citedate, type(!), ednote, doi, url, note.

The type field must include the text "Master's Thesis" or something similar (depending on the language of the outer document).

There are nearly equivalent entries: @BACHELORTHESES, @MASTERSTHESIS and @PHDTHESES. These entries set the type field to an appropriate value automatically. The type field is optional in this case. If it is used then it has precedence before the default setting.

- The @MISC entry

It is intended for various usage.

Fields: author, title, howpublished, ednote, citedate, doi, url, note.

You can use \AU, \ED, \EDN, \VOL, \NO, \PP, \ADDR, \PUBL, \YEAR macros in ednote field. These macros print authors list, editors list, edition, volume, number, pages, address, publisher, and year field values respectively.

The reason for this entry is to give to you the possibility to set the format of entry by your own decision. The most of data are concentrated in the ednote field.

- The @BOOKLET, @INCOLLECTION, @MANUAL, @PROCEEDINGS, @TECHREPORT, @UNPUBLISHED entries

These entries are equivalent to @MICS entry because we need to save the simplicity. They are implemented only for (almost) backward compatibility with the ancient BibTeX. But the ednote is mandatory field here, so you cannot use these entries from the old databases without warnings and without some additional work with the .bib file.

#### The cite-marks (bibmark) used when \nonumcitations is set

When \nonumcitations is set then \cite prints text-oriented bib-marks instead of numbers. This style file auto-generates these marks in the form "Lastname of the first author, comma, space, the year" if the bibmark field isn't declared. If you need to set an exception from this common format, then you can use bibmark field.

The OPmac trick <http://petr.olsak.net/opmac-tricks-e.html#bibmark> describes how to redefine the algorithm for bibmark auto-generating when you need the short form of the type [Au13].

#### Sorting

If \usebib/c is used then entries are sorted by citation order in the text. If \usebib/s is used then entries are sorted by "Lastname, Firstname(s)" of the first author and if more entries have this value equal, then the year is used (from older to newer). This feature follows the recommendation of the ISO 690 norm.

If you have the same authors and the same year, you can control the sorting by setting years like 2013, 2013a, 2013b, etc. You can print something different to the list using yearprint{\<value>} option, see the section about address, publisher, and year above. The real value of year field (i.e. not yearprint value) is also used in the text-oriented bib-marks when \nonumcitations is set.

If you have some problems with name sorting, you can use the hidden field key, which is used for sorting instead of the "Lastname Firstname(s)" of authors. If the key field is unset then the "Lastname Firstname(s)" is used for sorting normally. Example:

```
author      = "Světla Čmejrková",
key        = "Czzmejrkova Svetla",
```

This entry is now sorted between C and D.

The norm recommends placing the auto-citations at the top of the list of references. You can do this by setting key= "@" , to each entry with your name because the @ character is sorted before A.

#### Languages

There is the language of the outer document and the languages of each entry. The ISO 690 norm recommends that the technical notes (the prefix before URL, the media type, the "and" conjunction between the semifinal and final author) maybe printed in the language of the outer document. The data

of the entry have to be printed in the entry language (edition ed./vyd., Vol./ročník, No./č. etc.). Finally, there are the phrases independent of the language (for example In:). Unfortunately, the bibTeX supposes that the entry data are not fully included in the fields so the automaton has to add some text during processing (“ed.”, “Vol.”, “see also”, etc.). But what language has to be chosen?

The current value of the \language register at the start of the .bib processing is described as the language of the outer document. This language is used for technical notes regardless of the entry language. Moreover, each entry can have the lang field (short name of the language). This language is used for ed./vyd., vol./ročník, etc. and it is used for hyphenation too. If the lang is not set then the outer document language is used.

You can use \Mtext{bib.<identifier>} if you want to use a phrase dependent on outer document language (no on entry language). Example:

```
howpublished = "\Mtext{bib.blue-ray}"
```

Now, you can set the variants of bib.blue-ray phrase for various languages:

```
\sdef{\mt:bib.blue-ray:en} {Blue-ray disc}
\sdef{\mt:bib.blue-ray:cs} {Blue-ray disk}
```

### Summary of non-standard fields

This style uses the following fields unknown by bibTeX:

```
option    ... options separated by spaces
lang      ... the language two-letter code of one entry
ednote    ... edition info (secondary authors etc.) or
           global data in @MISC-like entries
citedate  ... the date of the citation in year/month/day format
numbering  ... format for volume, number, pages
isbn      ... ISBN
issn      ... ISSN
doi       ... DOI
url       ... URL
```

### Summary of options

```
aumax:<number>      ... maximum number of printed authors
aumin:<number>       ... number of printed authors if aumax exceeds
autrim:<number>      ... full Firstnames iff number of authors are less than this
auprint:{<value>}    ... text instead authors list (\AU macro may be used)
edmax, edmin, edtrim ... similar as above for editors list
edprint:{<value>}   ... text instead editors list (\ED macro may be used)
titlepost:{<value>}  ... text after title
yearprint:{<value>}  ... text instead real year (\YEAR macro may be used)
editionprint:{<value>} .. text instead of real edition (\EDN macro may be used)
urlalso     ... the ``available also from'' is used instead ``available from''
unpublished ... the publisher etc. fields are not mandatory
nowarn     ... no mandatory fields
```

Other options in the option field are silently ignored.

### 2.32.6 Implementation of the bib-iso690 style

```
bib-iso690.opm
3 \codeline{\_undefined {BIB style (iso690) <2021-04-07>} % loaded on demand by \usebib}
4
5 \ifx\optxbibstyle\undefined \errmessage
6   {This file can be read by: \string\usebib/? (iso690) bibfiles command only}
7 \endinput \fi
```

\maybedot (alias \. in the style file group) does not put the second dot.

```
bib-iso690.opm
13 \def\maybedot{\ifnum\_spacefactor=\sfcode`\.\_relax\_else.\_fi}
14 \tmpnum=\sfcode`\.\_advance\_tmpnum by-2 \sfcode`\.=\tmpnum
15 \sfcode`\?= \tmpnum \sfcode`\!=\tmpnum
16 \let\.=\maybedot % prevents from double periods
```

Option field.

## 2.33 Sorting and making Index

`makeindex.omp`

<sup>3</sup> `\codedecl \makeindex {Makeindex and sorting <2021-02-15>} % preloaded in format`

`\makeindex` implements sorting algorithm at TeX macro-language level. You need not any external program.

There are two passes in the sorting algorithm. The primary pass does not distinguish between a group of letters (typically non-accented and accented). If the result of comparing two string is equal in primary pass then the secondary pass is started. It distinguishes between variously accented letters. Czech rules, for example, says: not accented before dieresis before acute before circumflex before ring. At less priority: lowercase letters must be before uppercase letters.

The `\_sortingdata(iso-code)` implements these rules for the language `<iso-code>`. The groups between commas are not distinguished in the first pass. The second pass distinguishes all characters mentioned in the `\_sortingdata(iso-code)` (commas are ignored). The order of letters in the `\_sortingdata(iso-code)` macro is significant for the sorting algorithm. The Czech rules (`cs`) are implemented here:

```
makeindex.omp
25 \_def \_sortingdataacs {%
26   /,{ },-,&,@,%
27   aAäÁáÁ,%
28   bB,%
29   cC,%
30   ěČ,%
31   dDđĐ,%
32   eEéĚěĚ,%
33   fF,%
34   gG,%
35   hH,%
36   ^~T^~U^~V,% ch Ch CH
37   iIíÍ,%
38   jJ,%
39   kK,%
40   lLíÍlL,%
41   mM,%
42   nNñÑ,%
43   oOöÓóÓôÔ,%
44   pP,%
45   qQ,%
46   rRřŔ,%
47   řŔ,%
48   sS,%
49   šŠ,%
50   tTéŤ,%
51   uUúúúÚúÚ,%
52   vV,%
53   wW,%
54   xX,%
55   yYýŶ,%
56   zZ,%
57   žŽ,%
58   0,1,2,3,4,5,6,7,8,9,'%
59 }
```

Characters ignored by the sorting algorithm are declared in `\_ignoredchars(iso-code)`. The compound characters (two or more characters interpreted as one character in the sorting algorithm) are mapped to single invisible characters in `\_compoundchars(iso-code)`. Czech rules declare ch or Ch or CH as a single letter sorted between H and I. See `\_sortingdataacs` above where these declared characters are used.

The characters declared in `\_ignoredchars` are ignored in the first pass without additional condition. All characters are taken into account in second pass: ASCII characters with code < 65 are sorted first if they are not mentioned in the `\_sortingdata(iso-code)` macro. Others not mentioned characters have undefined behavior during sorting.

```
makeindex.omp
76 \_def \_ignoredcharsscs {.,;?!:"|()[]<>=+}
77 \_def \_compoundcharsscs {ch:^~T Ch:^~U CH:^~V} % DZ etc. are sorted normally
```

Slovak sorting rules are the same as Czech. The macro `\_sortingdataacs` includes Slovak letters too. Compound characters are the same. English sorting rules can be defined by `\_sortingdataacs` too because English alphabet is a subset of the Czech and Slovak alphabets. Only difference: `\_compoundcharssen` is empty in English rules.

You can declare these macros for more languages if you wish to use `\makeindex` with sorting rules with respect to your language. Note: if you need to map compound characters to a character, don't use

$\wedge\wedge I$  or  $\wedge\wedge M$  because these characters have very specific category codes. And use space to separate more mappings, like in `\_compoundcharsscs` above.

```
makeindex.opm
93 \_let \_sortingdatask = \_sortingdata
94 \_let \_compoundcharssk = \_compoundcharsscs
95 \_let \_ignoredcharssk = \_ignoredcharsscs
96 \_let \_sortingdataen = \_sortingdata
97 \_def \_compoundcharsen {}
98 \_let \_ignoredcharsen = \_ignoredcharsscs
```

Preparing to primary pass is implemented by the `\_setprimarysorting` macro. It is called from `\makeindex` macro and all processing of sorting is in a group.

```
makeindex.opm
105 \_def \_setprimarysorting {%
106   \_ea\_let \_ea\_sortingdata \_csname _sortingdata\_\_sortinglang\_\endcsname
107   \_ea\_let \_ea\_compoundchars \_csname _compoundchars\_\_sortinglang\_\endcsname
108   \_ea\_let \_ea\_ignoredchars \_csname _ignoredchars\_\_sortinglang\_\endcsname
109   \_ifx \_sortingdata\_\relax \_addto\_\nold{ sortingdata}%
110     \_let \_sortingdata = \_sortingdataen \_fi
111   \_ifx \_compoundchars\_\relax \_addto\_\nold{ compoundchars}%
112     \_let \_compoundchars = \_compoundcharsen \_fi
113   \_ifx \_ignoredchars\_\relax \_addto\_\nold{ ignoredchars}%
114     \_let \_ignoredchars = \_ignoredcharsen \_fi
115   \_ifx \_compoundchars\_\empty \_else
116     \_edef \_compoundchars {\_detokenize\_\ea{\_compoundchars}}\_\fi % all must be catcode 12
117   \_def \_act ##1{\_ifx##1\_\relax \_else
118     \_ifx##1,\_\advance\_\tmpnum by1
119     \_else \_lccode`##1=\_tmpnum \_fi
120     \_ea\_\act \_fi}%
121   \_tmpnum=65 \_ea\_\act \_sortingdata \_\relax
122   \_def \_act ##1{\_ifx##1\_\relax \_else
123     \_lccode`##1='\wedge I
124     \_ea\_\act \_fi}%
125   \_ea\_\act \_ignoredchars \_\relax
126 }
```

Preparing to secondary pass is implemented by the `\_setsecondarysorting` macro.

```
makeindex.opm
132 \_def \_setsecondarysorting {%
133   \_def \_act ##1{\_ifx##1\_\relax \_else
134     \_ifx##1,\_\else \_advance\_\tmpnum by1 \_lccode`##1=\_tmpnum \_fi
135     \_ea\_\act \_fi}%
136   \_tmpnum=64 \_ea\_\act \_sortingdata \_\relax
137 }
```

Strings to be sorted are prepared in `\,(string)` control sequences (to save `\TeX` memory). The `\_preparesorting` `\,(string)` converts `(string)` to `\_tmpb` with respect to the data initialized in `\_setprimarysorting` or `\_setsecondarysorting`.

The compound characters are converted to single characters by the `\_docompound` macro.

```
makeindex.opm
149 \_def \_preparesorting #1{%
150   \_edef \_tmpb {\_ea\_\ignorefirst\_\csstring #1}\% \,(string) -> <string>
151   \_ea \_docompound \_compoundchars \_\relax:{} % replace compound characters
152   \_lowercase \_ea{\_ea\_\def \_ea\_\tmpb \_ea{\_tmpb}}\% convert in respect to \_sortingdata
153   \_ea\_\replstring \_ea\_\tmpb \_ea{\_csstring\wedge I}\{}\% remove ignored characters
154 }
155 \_def \_docompound #1:#2 {%
156   \_ifx\_\relax#1\_\else \_replstring\_\tmpb {\#1}{\#2}\_ea\_\docompound \_fi
157 }
158 \_def \_ignorefirst#1{}
```

Macro `\_isAleB \,(string1) \,(string2)` returns the result of comparison of given two strings to `\_ifAleB` control sequence. Usage: `\isAleB \,(string1) \,(string2) \_ifAleB ... \_else ... \_fi` The converted strings (in respect of the data prepared for first pass) must be saved as values of `\,(string1)` and `\,(string2)` macros. The reason is speed: we don't want to convert them repeatedly in each comparison. The macro `\_testAleB (converted string1)&\_relax(converted-string2)\_relax \,(string1)\,(string2)` does the real work. It reads the first character from both converted strings, compares them and if it is equal then calls itself recursively else gives the result.

```

175 \newifi \ifAleB
176
177 \def\isAleB #1#2{%
178   \edef\tmpb {#1\relax#2\relax}%
179   \ea \testAleB \tmpb #1#2%
180 }
181 \def\testAleB #1#2\relax #3#4\relax #5#6{%
182   \if #1#3\if #1\testAleBsecondary #5#6% goto to the second pass:-
183     \else \testAleB #2\relax #4\relax #5#6%
184   \fi
185   \else \ifnum `#1<`#3 \AleBtrue \else \AleBfalse \fi
186   \fi
187 }
188 \def\testAleBsecondary#1#2{%
189   \bgroup
190     \setsecondarysorting
191     \preparesorting#1\let\tmpa=\tmpb \preparesorting#2%
192     \edef\tmpb{\tmpa0\relax\tmpb1\relax}%
193     \ea\testAleBsecondaryX \tmpb
194   \egroup
195 }
196 \def\testAleBsecondaryX #1#2\relax #3#4\relax {%
197   \if #1#3\testAleBsecondaryX #2\relax #4\relax
198   \else \ifnum `#1<`#3 \global\AleBtrue \else \global\AleBfalse \fi
199   \fi
200 }

```

Merge sort is very effectively implemented by TeX macros. The following code is created by my son Miroslav. The `\mergesort` macro expects that all items in `\iilist` are separated by a comma when it starts. It ends with sorted items in `\iilist` without commas. So `\dosorting` macro must prepare commas between items.

```

210 \def\mergesort #1#2,#3{%
211   \ifx,#1%          % prazdna-skupina,neco, (#2=neco #3=pokracovani)
212   \addto\iilist{#2,}% % dvojice skupin vyresena
213   \sortreturn{\fif\mergesort#3}% % \mergesort pokracovani
214   \fi
215   \ifx,#3%          % neco,prazna-skupina, (#1#2=neco #3=,)
216   \addto\iilist{#1#2,}% % dvojice skupin vyresena
217   \sortreturn{\fif\mergesort}% % \mergesort dalsi
218   \fi
219   \ifx\end#3%        % neco,konec (#1#2=neco)
220   \ifx\empty\iilist%  % neco=kompletni setrideny seznam
221     \def\iilist{#1#2}%
222     \sortreturn{\fif\fif\gobbletoend}% % koncim
223   \else              % neco=posledni skupina nebo \end
224     \sortreturn{\fif\fif}% % spojim \indexbuffer+necoa cele znova
225     \edef\iilist{\ea\ea\mergesort\iilist#1#2,#3}%
226   \fi\fi
227   \isAleB #1#3\ifAleB % zatriduju: p1+neco1,p2+neco2, (#1#2=p1+neco1 #3=p2)
228   \addto\iilist{#1}% % p1 do bufferu
229   \sortreturn{\fif\mergesort#2,#3}% % \mergesort neco1,p2+neco2,
230   \else              % p1>p2
231   \addto\iilist{#3}% % p2 do bufferu
232   \sortreturn{\fif\mergesort#1#2,%} % \mergesort p1+neco1,neco2,
233   \fi
234   \relax % zarazka, na ktere se zastavi \sortreturn
235 }
236 \def\sortreturn#1#2\fi\relax{#1} \def\fif{\fi}
237 \def\gobbletoend #1\end{}

```

The `\dosorting` `\list` macro redefines `\list` as sorted `\list`. The `\list` have to include control sequences in the form `\langle c \rangle \langle string \rangle`. These control sequences will be sorted with respect to `\langle strings \rangle` without change of meanings of these control sequences. Their meanings are irrelevant when sorting. The first character `\langle c \rangle` in `\langle c \rangle \langle string \rangle` should be whatever. It does not influence the sorting. OpTeX uses comma at this place for sorting indexes: `\,,\langle word1 \rangle \,,\langle word2 \rangle \,,\langle word3 \rangle ...`.

The current language (chosen for hyphenation patterns) is used for sorting data. If the macro `\sortinglang` is defined as `\langle iso-code \rangle` (for example `\def\sortinglang{de}`) then this has precedence

and current language is not used. Moreover, if you specify `\_asciisortingtrue` then ASCII sorting will be processed and all language sorting data will be ignored.

```
makeindex.opm
256 \_newifi \_ifasciisorting \_asciisortingfalse
257 \_def \_dosorting #1{%
258   \_beginninggroup
259   \_def \_nold{}%
260   \_ifx \_sotringlang \_undefined \_edef \_sortinglang{\_cs{\_lan:\_the\language}}\_fi
261   \_ifasciisorting
262     \_edef \_sortinglang{ASCII}%
263     \_def \_preparesorting##1{\_edef \_tmpb{\_ea\ignorefirst\csstring##1}}%
264     \_let \_setsecondarysorting=\_relax
265   \_else
266     \_setprimarysorting
267   \_fi
268   \_message{OpTeX: Sorting \_string#1 (\_sortinglang) ...^J}%
269   \_ifx \_nold \_empty \_else \_opwarning{Missing \_nold \_space for language (\_sortinglang)}\_fi
270   \_def \_act##1{\_preparesorting ##1\_edef##1{\_tmpb}}%
271   \_ea\ _xargs \_ea\ _act #1;%
272   \_def \_act##1{\_addto #1{##1,}}%
273   \_edef #1{\_ea}\_ea\ _xargs \_ea\ _act #1;%
274   \_edef \_iilist{\_ea}\_ea\ _mergesort #1\_\end,\_end
275   \_ea\ _endgroup
276   \_ea\ _def \_ea#1\_\ea{\_iilist}%
277 }
```

The `\makeindex` prints the index. First, it sorts the `\_iilist` second, it prints the sorted `\_iilist`, each item is printed using `\_printindexitem`.

```
makeindex.opm
285 \_def \_makeindex{\_par
286   \_ifx \_iilist \_empty \_opwarning{index data-buffer is empty. TeX me again}%
287   \_incr \_unresolvedrefs
288   \_else
289     \_dosorting \_iilist % sorting \_iilist
290     \_bgroup
291       \_rightskip=0pt plus1fil \_exhyphenpenalty=10000 \_leftskip=\_iindent
292       \_ea\ _xargs \_ea\ _printindexitem \_iilist ;\_par
293     \_egroup
294   \_fi
295 }
296 \_public \makeindex ;
```

The `\_printindexitem` `\_,<word>` prints one item to the index. If `\_,<word>` is defined then this is used instead real `<word>` (this exception is declared by `\iis` macro). Else `<word>` is printed by `\_printii`. Finally, `\_printiipages` prints the value of `\_,<word>`, i.e. the list of pages.

```
makeindex.opm
306 \_def \_printindexitem #1{%
307   \_ifcsname \_csstring #1\_\endcsname
308   \_ea\ _ea\ _ea \_printii \_csname \_csstring #1\_\endcsname &%
309   \_else
310   \_ea\ _ea\ _ea\ _printii \_ea\ _ignorefirst \_csstring #1&%
311   \_fi
312   \_ea\ _printiipages #1&
313 }
```

`\_printii` `<word>&` does more intelligent work because we are working with words in the form `<main-word>/<sub-word>/<sub-sub-word>`. The `\everyii` tokens register is applied before `\noindent`. User can declare something special here.

The `\_newiiletter{<letter>}` macro is empty by default. It is invoked if first letter of index entries is changed. You can declare a design between index entries here. You can try, for example:

```
makeindex.opm
\def \_newiiletter#1#2{%
  \bigskip \hbox{\setfontsize{at15pt}\bf\uppercase{#1}}\medskip
330 \_def \_printii #1#2&{%
331   \_ismacro \_lastii{#1}\_iffalse \_newiiletter{#1}{#2}\_def \_lastii{#1}\_fi
332   \_gdef \_currii{#1#2}\_the\everyii\_\noindent
333   \_hskip-\_iindent \_ignorespaces\printiiA#1#2//}
```

```

334 \_def\_printiiA #1/{\_if^#1^\_let\_previi=\_currii \_else
335   \_ea\_scantoken{\_previi&\_edef\_\tmpb{\_detokenize{#1}}%}
336   \_ifx\_\tmpa\_\tmpb \_iemandash \_else#1 \_gdef\_previi{}\_fi
337   \_ea\_\printiiA\_fi
338 }
339 \_def\_iemandash{\_kern.1em---\_space}
340 \_def\_lastii{}
341 \_def\_\newletter#1#2{}
342
343 \_def\_\scantoken#1/#2&{\_def\_previi{#2}\_edef\_\tmpa{\_detokenize{#1}}}}
344 \_def\_previi{} % previous index item

```

`\_printiipages` (*pglist*) & gets *pglist* in the form *pg*:*type*, *pg*:*type*, ... *pg*:*type* and it converts them to *pg*, *pg*, *from*--*to*, *pg* etc. The same pages must be printed only once and continuous consequences of pages must be compressed to the form *from*-*to*. Moreover, the consequence is continuous only if all pages have the same *type*. Empty *type* is most common, pages with **b** *type* must be printed as bold and with *i* *type* as italics. Moreover, the *pg* mentioned here are *gpageno*, but we have to print *pageno*. The following macros solve these tasks.

```

makeindex.opm
358 \_def\_\printiipages#1&{\_let\_pgtype=\_undefined \_tmpnum=0 \_printpages #1:, \_par}
359 \_def\_\printpages#1:#2,{% state automaton for compressing pages
360   \_ifx,#1,\_uselastpgnum
361   \_else \_def\_\tmpa{#2}%
362     \_ifx\_pgtype\_\tmpa \_else
363       \_let\_pgtype=\_tmpa
364       \_uselastpgnum \_usepgcomma \_pgprint#1:{#2}%
365       \_tmpnum=#1 \_returnfi \_fi
366   \_ifnum\_\tmpnum=#1 \_returnfi \_fi
367   \_advance\_\tmpnum by1
368   \_ifnum\_\tmpnum=#1 \_ifx\_\lastpgnum\_\undefined \_usepgdash\_fi
369     \_edef\_\lastpgnum{\_the\_\tmpnum:{\_pgtype}}%
370     \_returnfi \_fi
371   \_uselastpgnum \_usepgcomma \_pgprint#1:{#2}%
372   \_tmpnum=#1
373   \_relax
374   \_ea\_\printpages \_fi
375 }
376 \_def\_\returnfi #1\_\relax{\_fi}
377 \_def\_\uselastpgnum{\_ifx\_\lastpgnum\_\undefined
378   \_else \_ea\_\pgprint\_\lastpgnum \_let\_\lastpgnum=\_undefined \_fi
379 }
380 \_def\_\usepgcomma{\_ifnum\_\tmpnum>0, \_fi} % comma+space between page numbers
381 \_def\_\usepgdash{\_hbox{--}} % dash in the <from>--<to> form

```

You can re-define `\_pgprint` (*gpageno*):{(*iitype*)} if you need to implement more *iitypes*.

```

makeindex.opm
388 \_def\_\pgprint #1:#2{%
389   \_ifx ,#2,\_pgprintA{#1}\_returnfi \_fi
390   \_ifx b#2{\_bf \_pgprintA{#1}}\_returnfi \_fi
391   \_ifx i#2{\_it \_pgprintA{#1}}\_returnfi \_fi
392   \_ifx u#2\_\pgu{\_pgprintA{#1}}\_returnfi \_fi
393   \_pgprintA{#1}\_relax
394 }
395 \_def\_\pgprintA #1{\_ilink[pg:#1]{\_cs{_pgi:#1}}} % \ilink[pg:<gpageno>]{<pageno>}
396 \_def\_\pgu#1{\_leavevmode\_\vtop{\_hbox{#1}\kern.3ex\_\hrule{}}}
```

The `\iindex{<word>}` puts one *word* to the index. It writes `\_Xindex{<word>}{<iitype>}` to the .ref file. All other variants of indexing macros expand internally to `\iindex`.

```

makeindex.opm
404 \_def\_\iindex#1{\_isempty{#1}\_iffalse
405   \_openref{\_def~{} }\_ewref\_\Xindex{#1}{\_iitypesaved}}}\_fi
406 \_public \iindex ;
```

The `\_Xindex{<word>}{<iitype>}` stores \, <*word*> to the `\_iilist` if there is the first occurrence of the *word*. The list of pages where *word* occurs, is the value of the macro \, <*word*>, so the *gpageno*:*iitype* is appended to this list. Moreover, we need a mapping from *gpageno* to *pageno*, because we print *pageno* in the index, but hyperlinks are implemented by *gpageno*. So, the macro `\_pgi:<gpageno>` is defined as *pageno*.

```
418 \_def \_iilist {}
419 \_def \_Xindex #1#2{\_ea\_XindexA \_csname ,#1\_ea\_endcsname \_currpage {#2}}
420 \_def \_XindexA #1#2#3#4% #1=,<word> #2=<gpageno> #3=<pageno> #4=<iitype>
421     \ifx#1\relax \_global\_addto \_iilist {#1}%
422             \gdef #1{#2:#4}%
423     \else \_global\_addto #1{,#2:#4}%
424     \fi
425     \sxdef{_pgi:#2}{#3}%
426 }
```

The implementation of macros `\ii`, `\iid`, `\iis` follows. Note that `\ii` works in the horizontal mode in order to the `\write` whatsit is not broken from the following word. If you need to keep vertical mode, use `\iindex{<word>}` directly.

The `\iitype` {*type*} saves the *type* to the `\_iitypesaved` macro. It is used in the `\iindex` macro.

```
438 @_def\_ii #1 f{\_leavevmode\_def\_tmp{#1}\_iiA #1,,\_def\_iitypesaved{}}
439
440 \_def\_iiA #1,{\_if$#1$\_else\def\_tmpa{#1}%
441   \_ifx\_tmpa\_iatsign \ea\_iiB\_tmp,,\_else\iindex{#1}\_fi
442   \ea\iiA\_fi}
443 \_def\_iatsign{0}
444
445 \_def\_iiB #1,{\_if$#1$\_else \iiC#1\_\relax \ea\_iiB\_fi}
446 \_def\_iiC #1/#2\_\relax{\_if$#2$\_else\iindex{#2#1}\_fi}
447
448 \_def\_iid #1 {\_leavevmode\iindex{#1}#1\_\futurelet\_tmp\iiD\def\_iitypesaved{}}
449 \_def\iiD{\_ifx\_tmp,\_else\ifx\_tmp.\_else\space\_fi\_fi}
450
451 \_def\_iis #1 #2{\{_def-{}\}\_global\_\sdef{_,#1}{#2}}\_ignorespaces}
452
453 \_def\_iitypesaved{}
454 \_def\_iitype #1{\_def\iitypesaved{#1}\_ignorespaces}
455
456 \_public \ii \iid \iis \iitype ;
```

## 2.34 Footnotes and marginal notes

fnotes.omp

`\_gfnotenumber` is a counter which counts footnotes globally in the whole document.  
`\_lfnotenumber` is a counter which counts footnotes at each chapter from one. It is used for local page

`\_ifpgfnote` says that footnote numbers are counted on each page from one. We need to run `\openref`

<sup>1</sup>See also the discussion of the concept of "soft power" in Michael H. Howard, "Soft Power," *Journal of Democracy*, Vol. 10, No. 1 (January 1999), pp. 5–20.

\fnotenum is a macro that expands to footnote number counted in declared part. \fnotenumchapters declares footnotes numbered in each chapter from one (default), \fnotenumglobal declares footnotes numbered in whole document from one and \fnotenumpages declares footnotes numbered at each page from one.

```
18 \newcount\gfnotenum \gfnotenum=0  
19 \newcount\lfnotenum  
20  
21 \newif\ifpgfnote  
22 \def\fnotenumglobal {\def\fnotenum{\the\gfnotenum}\pgfnotefalse}  
23 \def\fnotenumchapters {\def\fnotenum{\the\lfnotenum}\pgfnotefalse}  
24 \def\fnotenumpages {\def\fnotenum{\trycs{fn}{\the\gfnotenum}{?}}\pgfnotetrue}  
25 \fnotenumchapters % default are footnotes counted from one in each chapter  
26 \def\fnotenum{\fnotenum}  
27 \public\fnotenumglobal\fnotenumchapters\fnotenumpages;  
28 \let\runningfnotes=\fnotenumglobal % for backward compatibility
```

The `\printfnote` prints the footnote mark. You can re-define this macro if you want another design of footnotes. For example

```
\fnotenumpages  
\def \_printfnotemark {\ifcase 0\fnotenum\or  
    *\or**\or***\or$^\mathbf{t}\$ \or$^\mathbf{t}\$ \or$^\mathbf{t}\$ \fi}
```

This code gives footnotes\* and \*\* and\*\*\* and† etc. and it supposes that there are no more than 6 footnotes at one page.

If you want to distinguish between footnote marks in the text and in the front of the footnote itself, then you can define `\_printfnotemarkA` and `\_printfnotemarkB`.

The `\fnotelinks<colorA><colorB>` implements the hyperlinked footnotes (from text to footnote and backward).

```
fnotes.opm
113 \_def \_printfnotemark {$~{\_fnotenum}}% default footnote mark
114 \_def \_printfnotemarkA {\_printfnotemark} % footnote marks used in text
115 \_def \_printfnotemarkB {\_printfnotemark} % footnote marks used in front of footnotes
116
117 \_def \_fnotelinks#1#2{%
118   <inText color> <inFootnote color>
119   \_def\_\printfnotemarkA{\_link[fnt:\_the\gfnotenum]{#1}{\_printfnotemark}%
120     \_dest[fnf:\_the\gfnotenum]}%
121   \_def\_\printfnotemarkB{\_link[fnf:\_the\gfnotenum]{#2}{\_printfnotemark}%
122     \_dest[fnt:\_the\gfnotenum]}%
123 }
124 \public \fnotelinks ;
```

Each footnote saves the `\_Xfnote` (without parameter) to the .ref file (if `\openref`). We can create the mapping from `<gfnotenum>` to `<pgfnotenum>` in the macro `\fn:<fnotenum>`. Each `\_Xpage` macro sets the `\_lfnotenum` to zero.

```
fnotes.opm
125 \_def \_Xfnote {\_incr\lfnotenum \_incr\gfnotenum
126   \_sxdef{\fn:\_the\gfnotenum}{\_the\lfnotenum}}
```

The `\fnote {<text>}` macro is simple, `\fnotemark` and `\fnotetext` does the real work.

```
fnotes.opm
127 \_def \_fnotemark{\_fnotemark1\_fnotetext}
128 \_def \_fnotemark#1{\{_advance\gfnotenum by#1\_advance\lfnotenum by#1\_relax \_printfnotemarkA}}
```

The `\fnotetext` calls `\opfootnote` which is equivalent to plain TeX `\vfootnote`. It creates new data to Insert `\footins`. The only difference is that we can propagate a macro parameter into the Insert group before the text is printed (see section 2.18). This propagated macro is `\fnset` which sets smaller fonts.

Note that `\vfootnote` and `\opfootnote` don't read the text as a parameter but during the normal horizontal mode. This is the reason why catcode changes (for example in-line verbatim) can be used here.

```
fnotes.opm
129 \_def \_fnotetext{\_incr\gfnotenum \_incr\lfnotenum} % global increment
130   \_ifpgfnote \_openref \_fi
131   \_wref \_Xfnote{}%
132   \_ifpgfnote \_ifcsname \fn:\_the\gfnotenum \_endcsname \_else
133     \_opwarning{unknown \noexpand\fnote mark. TeX me again}%
134     \_incr\_unresolvedrefs
135   \_fi\_\fi
136   \_opfootnote\fnset\_printfnotemarkB
137 }
138 \_def \_fnset{\_everypar={} \_scalemain \_typoscale[800/800]}
139
140 \public \fnote \fnotemark \fnotetext ;
```

By default `\mnote{<text>}` are in right margin at odd pages and they are in left margin at even pages. The `\mnote` macro saves its position to .ref file as `\_Xmnote` without parameter. We define `\mn:<mnotenum>` as `\right` or `\left` when the .ref file is read. The `\ifnum 0<#2` trick returns true if `<pageno>` has a numeric type and false if it is a non-numeric type (Roman numeral, for example). We prefer to use `<pageno>`, but only if it has the numeric type. We use `<gpageno>` in other cases.

```
fnotes.opm
141 \_newcount\mnotenum \_mnotenum=0 % global counter of mnotes
142 \_def \_Xmnote f\_\_incr\mnotenum \_ea \_XmnoteA \_currpage}
143 \_def \_XmnoteA #1#2{%
144   #1=<gpageno> #2=<pageno>
145   \_sxdef{\mn:\_the\mnotenum}{\_ifodd\_numtype{#2}{#1} \_right \_else \_left \_fi}}
146 \_def \_numtype #1#2{\_ifnum 0<#1 #1\else #2\fi}
```

User can declare `\fixmnotes\left` or `\fixmnotes\right`. It defines `\_mnotesfixed` as `\_left` or `\_right` which declares the placement of all marginal notes and such declaration has a precedence.

```
fnotes.opm
147 \_def \_fixmnotes #1{\_edef\_\mnotesfixed{\_cs{\_csstring #1}}}
148 \public \fixmnotes ;
```

The `\_mnoteD{<text>}` macro sets the position of the marginal note. The outer box of marginal note has zero width and zero depth and it is appended after current line using `\vadjust` primitive or it is inverted to vertical mode as a box with `\vskip-\baselineskip` followed.

```
fnotes.opm
135 \_def\ _mnote #1{\_ifx^#1^\_else \_mnoteC#1\ _end \_fi \_mnoteD}
136 \_def\ _mnoteC up#1\ _end{\_mnoteskip=#1\ _relax} % \mnote up<dimen> {<text>} syntax
137 \_long\ _def\ _mnoteD#1{\_ifvmode {\_mnoteA{#1}}\ _nobreak\ _vskip-\_baselineskip \_else
138   \_lower\ _dp\ _strutbox\ _hbox{}\ _vadjust{\_kern-\_dp\ _strutbox \_mnoteA{#1}\ _kern\ _dp\ _strutbox}%
139   \_fi
140 }
141 \_public \mnote ;
```

The `\mnoteskip` is a dimen value that denotes the vertical shift of marginal note from its normal position. A positive value means shift up, negative down. The `\mnoteskip` register is set to zero after the marginal note is printed. The new syntax `\mnote up<dimen>{<text>}` is possible too, but public `\mnoteskip` is kept for backward compatibility.

```
fnotes.opm
151 \_newdimen\ _mnoteskip
152 \_public \mnoteskip ;
```

The `\_mnoteA` macro does the real work. The `\_lrmnote{<left>}{<right>}` uses only first or only second parameter depending on the left or right marginal note.

```
fnotes.opm
160 \_long\ _def\ _mnoteA #1{\_incr\ _mnotenum
161   \_ifx\ _mnotesfixed\ _undefined
162     \_ifcsname _mn:\_the\ _mnotenum \_endcsname
163       \_edef\ _mnotesfixed{\_cs{\_mn:\_the\ _mnotenum}}%
164     \_else
165       \_opwarning{unknown \_noexpand\mnote side. TeX me again}\ _openref
166       \_incr\ _unresolvedrefs
167       \_def\ _mnotesfixed{\_right}%
168   \_fi\ _fi
169   \_hbox to0pt{\_wref\ _Xmnote{} \_everypar={}}%
170     \_lrmnote{\_kern-\_mnotesize \_kern-\_mnoteindent}{\_kern\ _hsize \_kern\ _mnoteindent}%
171     \_vbox to0pt{\_vss \_setbox0=\_vtop{\_hsize=\_mnotesize
172       \_lrmnote{\_leftskip=0pt plus 1fill \_rightskip=0pt}
173         \_rightskip=0pt plus 1fil \_leftskip=0pt}%
174       {\_the\ _everymnote\ _noindent#1\ _endgraf}%
175       \_dp0=0pt \_box0 \_kern\ _mnoteskip \_global\ _mnoteskip=0pt}\ _hss}%
176 }
177 \_def \_lrmnote#1#2{\_ea\ _ifx\ _mnotesfixed\ _left #1\ _else #2\ _fi}
```

We don't want to process `\fnote`, `\fnotemark`, `\mnote` in TOC, headlines nor outlines.

```
fnotes.opm
184 \_regmacro {\_def\fnote#1{}} {\_def\fnote#1{}} {\_def\fnote#1{}}
185 \_regmacro {\_def\fnotemark#1{}} {\_def\fnotemark#1{}} {\_def\fnotemark#1{}}
186 \_regmacro {\_def\mnote#1{}} {\_def\mnote#1{}} {\_def\mnote#1{}}
```

## 2.35 Styles

OpTeX provides three styles: `\report`, `\letter` and `\slides`. Their behavior is documented in user part of the manual in the section 1.7.2 and `\slides` style (for presentations) is documented in `op-slides.pdf` which is an example of the presentation.

### 2.35.1 `\report` and `\letter` styles

```
styles.opm
3 \_codedecl \report {Basic styles of OpTeX <2021-03-10>} % preloaded in format
```

We define auxiliary macro first (used by the `\address` macro)

The `\boxlines{<line-1>}{<eol>}{<line-2>}{<eol>}...{<line-n>}{<eol>}` returns to the outer vertical mode a box with `<line-1>`, next box with `<line-2>` etc. Each box has its natural width. This is reason why we cannot use paragraph mode where each resulting box has the width `\hsize`. The `<eol>` is set active and `\everypar` starts `\hbox{` and active `<eol>` closes this `\hbox` by `}`.

```

16 \_def\_\boxlines{%
17   \_def\_\boxlinesE{\_ifhmode\_\egroup\_\empty\_\fi}%
18   \_def\_\nl{\_\boxlinesE}%
19   \_bgroup \_lccode`\~`\^M\_\lowercase{\_egroup\_\let`}\_\boxlinesE
20   \_everypar{\_setbox0=\_lastbox\_\endgraf
21     \_hbox\_\bgroup \_catcode`\^M=13 \_let\par=\_nl \_aftergroup\_\boxlinesC}%
22 }
23 \_def\_\boxlinesC{\_futurelet\_\next\_\boxlinesD}
24 \_def\_\boxlinesD{\_ifx\_\next\_\empty\_\else\_\ea\_\egroup\_\fi}
25
26 \_public \boxlines ;

```

The `\report` style initialization macro is defined here.

```

32 \_def\_\report{
33   \_typosize[11/13.2]
34   \_vsize=\_dimexpr \_topskip + 52\_\baselineskip \_relax % added 2020-03-28
35   \_let\_\titfont=\_chapfont
36   \_titskip=3ex
37   \_eoldef\_\author##1{\_removelastskip\_\bigskip
38     {\_leftskip=0pt plusifill \_rightskip=\_leftskip \_it \_noindent ##1\_\par}\_nobreak\_\bigskip
39   }
40   \_public \author ;
41   \_parindent=1.2em \_iindent=\_parindent \_ttindent=\_parindent
42   \_footline={\_global\_\footline={\_hss\_\rmfixed\_\folio\_\hss}}%
43 }

```

The `\letter` style initialization macro is defined here.

The `\letter` defines `\address` and `\subject` macros.  
See the files `demo/op-letter-*.tex` for usage examples.

```

53 \_def\_\letter{
54   \_def\_\address{\_vtop\_\bgroup\_\boxlines \_parskip=0pt \_let\par=\_egroup}
55   \_def\_\subject{\{_bf \_\mttext{subj}: }\}}
56   \_public \address \subject ;
57   \_typosize[11/14]
58   \_vsize=\_dimexpr \_topskip + 49\_\baselineskip \_relax % added 2020-03-28
59   \_parindent=0pt
60   \_parskip=\_medskipamount
61   \_nopagenumbers
62 }
63 \_public \letter \report ;

```

The `\slides` macro reads macro file `slides.opm`, see the section 2.35.2.

```

69 \_def\_\slides{\_par
70   \_opinput{slides.opm}
71   \_adef*{\_relax\_\ifmmode*\_\else\_\ea\_\startitem\_\fi}
72 }
73 \_public \slides ;

```

## 2.35.2 `\slides` style for presentations

```

3 \_codedecl \slideshow {Slides style for OpTeX <2021-04-22>} % loaded on demand by \slides

```

Default margins and design is declared here. The `\ttfont` is scaled by `mag1.15` in order to balance the ex height of Helvetica (Heros) and LM fonts Typewriter. The `\begtt...\\endtt` verbatim is printed by smaller text.

```

12 \_margins/1 a5l (14,14,10,3)mm % landscape A5 format
13 \_def\_\wideformat{\_margins/1 (263,148) (16,16,10,3)mm } % 16:9 format
14
15 \_ifx\_\fontnamegen\_\undefined \_fontfam[Heros]
16   \_let\_\ttfont=\_undefined \_famvardef\_\ttfont{\_setfontsize{mag1.15}\_\tt}
17 \_fi
18 \_typosize[16/19]
19 \_def\_\urlfont{}
20 \_everytt={\_typosize[13/16] \_advance\_\hsize by10mm}

```

```

21 \fontdef\fixbf{\bf}
22
23 \nopagenumbers
24 \parindent=0pt
25 \ttindent=5mm
26 \parskip=5pt plus 4pt minus2pt
27 \rightskip=0pt plus 1fil
28 \ttindent=10pt
29 \def\ttskip{\smallskip}
30
31 \onlyrgb % RGB color space is better for presentations

```

The bottom margin is set to 3 mm. If we use 1 mm, then the baseline of \footline is 2 mm from the bottom page. This is the depth of the \Grey rectangle used for page numbers. It is r-lapped to \hoffset width because left margin = \hoffset = right margin. It is 14 mm for narrow pages or 16 mm for wide pages.

```

41 \footlinedist=1mm
42 \footline={\hss \rlap{%
43   \rlap{\Grey\kern.2\hoffset\vrule height6mm depth2mm width.8\hoffset}%
44   \hbox to\hoffset{\White\hss\folio\kern3mm}}}

```

The \subtit is defined analogically like \tit.

```

50 \eoldef\subtit#1{\vskip20pt {\leftskip=0pt plus1fill \rightskip=\leftskip
51 \subtitfont #1\nopar}}

```

The \pshow<num> prints the text in invisible (transparent) font when \layernum<num>. For transparency we need to define special graphics states.

```

59 \addextgstate{/Invisible <>ca 0 /CA 0>>}
60 \addextgstate {/Visible <>ca 1 /CA 1>>}
61
62 \def\Invisible {\pdfliteral{/Invisible gs}}
63 \def\Visible {\pdfliteral{/Visible gs}}
64 \def\Transparent {\Invisible \aftergroup\Visible}
65
66 \public \Invisible \Visible \Transparent ;
67
68 \def\use#1#2{\ifnum\layernum#1\relax#2\fi}
69 \def\pshow#1{\use{#1}\Red \use{#1}\Transparent \ignorespaces}

```

The main level list of items is activated here. The \item:X and \item:x are used and are re-defined here. If we are in a nested level of items and \pg+ is used then \egroups macro expands to the right number of \egroups to close the page correctly. The level of nested item lists is saved to the \ilevel register and used when we start again the next text after \pg+.

```

81 \newcount\gilevel
82 \def*{*}
83 \adeft{\relax\ifmmode\else\ea\startitem\fi} % defined also in styles.opm
84 \sdef{\item:X}{\Blue\raise.2ex\fullrectangle{.8ex}\kern.5em}
85 \sdef{\item:x}{\Blue\raise.3ex\fullrectangle{.6ex}\kern.4em}
86 \style X
87 \def\egroups{\par\_global\gilevel=\ilevel \egroup}
88 \everylist={\nospaces \ifcase\ilevel \or \style x \else \style - \fi
89 \addto\egroups{\egroup}}

```

The default values of \pg, i.e. \pg;, \pg+ and \pg. are very simple. They are used when \showsides is not specified.

```

96 \def\pg#1{\cs{\spg:#1}}
97 \sdef{\spg:;}{\vfil\break \lfnotenumreset}
98 \sdef{\spg:..}{\endslides}
99 \sdef{\spg:+}{\par}

```

The \endslides is defined as \end primitive (preceeded by \byehook), but slide-designer can redefine it. For example, [OpTeX trick 0029](#) shows how to define clickable navigation to the pages and how to check the data integrity at the end of the document using \endslides.

The `\bye` macro is redefined here as an alternative to `\pg..`

```
111 \_def\endslides{\_byehook \_end}
112 \_def\bye{\_pg.}
```

slides.opp

We need no numbers and no table of contents when using slides. The `\printsec` macro is redefined in order the title is centered and typeset in `\Blue`.

```
120 \_def\_titfont{\_typosize[42/60]\_bf \Blue}
121 \_def\_subtitfont{\_typosize[20/30]\_bf}
122 \_def\_secfont{\_typosize[25/30]\_bf \Blue}
123
124 \_nonum \_notoc \_let\_resetnonumnotoc=\_relax
125 \_def\_printsec#1{\_par
126   \_abovetitle{\_penalty-400}\_bigskip

128     \_printrefnum[@\quad]#1\_\_nbpar}\_insertmark{#1}%
129   \_nobreak \_belowtitle{\_medskip}%
130 }
```

slides.opp

When `\slideshow` is active then each page is opened by `\setbox\slidepage=\vbox\bgroup` (roughly speaking) and closed by `\egroup`. The material is `\unboxed` and saved for the usage in the next usage if `\pg+` is in process. The `\_slidelayer` is incremented instead `\pageno` if `\pg+`. This counter is equal to `\count1`, so it is printed to the terminal and log file next to `\pageno`.

The code is somewhat more complicated when `\layers` is used. Then `\layered-text` is saved to the `\layertext` macro, the material before it is in `\slidepage` box and the material after it is in `\slidepageB` box. The pages are completed in the `\loop` which increments the `\layernum` register and prints page by the `\printlayers`

219 \_public \slideopen ;

```

When \slideshow is active then the destinations of internal hyperlinks cannot be duplicated to more “virtual” pages because hyperlink destinations have to be unique in the whole document.

The \slideshow creates boxes of typesetting material and copies them to more pages. So, we have to suppress creating destinations in these boxes. This is done in the \slidelinks macro. We can move creating these destinations to the output routine. \sdestbox is saved value of the original \destbox which is redefined to do only \addto\destboxes{\sdestbox[\label]}. All destinations saved to \destboxes are created at the start of the next output routine in the \pagedest macro. The output routine removes \destboxes, so each destination is created only once.

Limitations of this solution: destinations are only at the start of the page, no at the real place where \wlabel was used. The first “virtual” page where \wlabel is used includes its destination. If you want to go to the final page of the partially uncovering ideas then use \label[\label]\wlabel{text} in the last part of the page (before \pg;) or use \pgref instead \ref.

```

slides.opp
244 \_def\slidelinks{%
245   \_def \_destbox[##1]{\_edef\_\tmp{\_noexpand\_sdestbox[##1]}%
246     \_global\ea\_addto\ea\_destboxes\ea{\_tmp}}%
247   \_def \_pagedest {%
248     \_hbox{\_def\_\destheight{25pt}\_sdestbox[pg:\_the\_\gpageno]\_destboxes}%
249     \_nointerlineskip \_gdef\_\destboxes{}%
250   }%

252 }
253 \_let\_\sdestbox = \_destbox
254 \_def\_\destboxes{} % initial value of \_destboxes
255 \_let\_\bibgl=\_global % \advance\bibnum must be global if they are at more pages

```

The \settinglayer is used in the \layertext macro to prevent printing “Duplicate label” warning when it is expanded. It is done by special value of \slidetook (used by the \label macro). Moreover, the warning about illegal use of \bib, \usebib in \layers environment is activated.

```

slides.opp
265 \_def\settinglayer{%
266   \_def\slidetook ##1##2{}%
267   \_def\_\bibB[##1]{\_mousebib}\_def\_\usebib##1 (##2) ##3 {\_mousebib}%
268 }
269 \_def\_\mousebib{\_opwarning{Don't use \noexpand\bib nor \noexpand\usebib in \string\layers}}

```

Default `\layers {num}` macro (when `\slideshow` is not activated) is simple. It prints the *(layered-text)* with `\layernum={num}+1` because we need the result after last layer is processed.

```
277 \_long\_def\_\_layers #1 #2\endlayers{\_par
278   \_layersopen {\_layernum=\_numexpr#1+1\_\relax #2\_\endgraf}\_layersclose}
279 \_let\_\_layersopen=\_relax
280 \_let\_\_layersclose=\_relax
281
282 \_def\layers{\_layers}
```

slides.opp

We must to redefine `\fnotenumpages` because the data from .ref file are less usable for implementing such a feature: the footnote should be in more layers repeatedly. But we can suppose that each page starts by `\pg;` macro, so we can reset the footnote counter by this macro.

```
292 \_def\_\fnotenumpages {\_def\_\fnotenum{\_the\_\lfnotenum}\_pgfnotefalse
293   \_def\_\lfnotenumreset{\_global\_\lfnotenum=0 }
294 \_let\_\lfnotenumreset=\_relax
295 \_public\ fnotenumpages ;
```

slides.opp

## 2.36 Logos

```
3 \_codedecl\TeX{Logos TeX, LuaTeX, etc. <2020-02-28>}% preloaded in format
```

logos.opp

Despite plain TeX each macro for logos ends by `\ignoreslash`. This macro ignores the next slash if it is present. You can use `\TeX/` like this for protecting the space following the logo. This is visually more comfortable. The macros `\TeX`, `\OpTeX`, `\LuaTeX`, `\XeTeX` are defined.

```
13 \_protected\_\def\_\TeX{T\_\kern-.1667em\_\lower.5ex\_\hbox{E}\_\kern-.125emX\_\ignoreslash}
14 \_protected\_\def\_\OpTeX{O\_\kern-.1em\_\TeX}
15 \_protected\_\def\_\LuaTeX{L\ua\_\TeX}
16 \_protected\_\def\_\XeTeX{X\_\kern-.125em\_\phantom{E}}
17   \_pdfsave\_\rlap{\_pdfscale{-1}{1}\_\lower.5ex\_\hbox{E}}\_\pdfrestore\_\kern-.1667em\_\TeX}
18
19 \_def\_\ignoreslash{\_isnextchar/\_ignoreit{}}
20
21 \_public\ \TeX\ \OpTeX\ \LuaTeX\ \XeTeX\ \ignoreslash ;
```

logos.opp

The `\_slantcorr` macro expands to the slant-correction of the current font. It is used to shifting A if the `\LaTeX` logo is in italic.

```
28 \_protected\_\def\_\LaTeX{\_tmpdim=.42ex L\_\kern-.36em \_\kern \_\slantcorr % slant correction
29   \_raise\ \_tmpdim \_\hbox{\_the\fontscale[710]A}%
30   \_\kern-.15em \_\kern-\_\slantcorr\ \_\TeX}
31 \_def\_\slantcorr{\_ea\_\ignorerept\ \_the\fontdimen1\_\font\_\tmpdim}
32
33 \_public\ \LaTeX ;
```

logos.opp

`\OPmac`, `\CS` and `\csplain` logos.

```
39 \_def\_\OPmac{\_leavevmode
40   \_\lower.2ex\_\hbox{\_the\fontscale[1400]0}\_\kern-.86em P{\_em\ mac}\_\ignoreslash}
41 \_def\_\CS{\$\_cal C\$}\_\kern-.1667em\_\lower.5ex\_\hbox{\$\_cal S\$}\_\ignoreslash}
42 \_def\_\csplain{\_CS plain\_\ignoreslash}
43
44 \_public\ \OPmac\ \CS\ \csplain ;
```

logos.opp

The expandable versions of logos used in Outlines need the expandable `\ignslash` (instead of the `\ignoreslash`).

```
51 \_def\_\ignslash#1{\_ifx/#1\_\else #1\_\fi}
52 \_regmacro {}{}% conversion for PDF outlines
53   \_def\TeX{\TeX\_\ignslash}\_def\OpTeX{\OpTeX\_\ignslash}%
54   \_def\LuaTeX{\LuaTeX\_\ignslash}\_def\XeTeX{\XeTeX\_\ignslash}%
55   \_def\LaTeX{\LaTeX\_\ignslash}\_def\OPmac{\OPmac\_\ignslash}%
56   \_def\CS{\CS}\_def\csplain{\csplain\_\ignslash}%
57 }
58 \_public\ \ignslash ;
```

logos.opp

## 2.37 Multilingual support

### 2.37.1 Lowercase, uppercase codes

All codes in Unicode table keep information about pairs lowercase-uppercase letters or single letter. We need to read such information and set appropriate `\lccode` and `\uccode`. The `\catcode` above the code 127 is not set, i. e. the `\catcode=12` for all codes above 127.

The file `UnicodeData.txt` is read if this file exists in your TeX distribution. The format is specified at <http://www.unicode.org/L2/L1999/UnicodeData.html>. We read only L1 (lowercase letters), Lu (uppercase letters) and Lo (other letters) and set appropriate codes. The scanner of `UnicodeData.txt` is implemented here in the group (lines 6 to 15). After the group is closed then the file `uni-lcuc.opm` is left by `\endinput`.

If the file `UnicodeData.txt` does not exist then internal data are used. They follow to the end of the file `uni-lcuc.opm`.

```

### 2.37.2 Hyphenations

```
hyphen-lan.opm
3 \codedecl \langlist {Initialization of hyphenation patterns <2021-03-29>} % preloaded in format
```

The  $\langle iso\text{-}code \rangle$  means a shortcut of language name (mostly by ISO 639-1). The following control sequences are used for language switching:

- `\_lan:<number>` expands to  $\langle iso\text{-}code \rangle$  of the language. The  $\langle number \rangle$  is an internal number of languages used as a value of `\language` register.
- `\_ulan:<long-lang>` expands to  $\langle iso\text{-}code \rangle$  too. This is transformation from long name of language (lowercase letters) to  $\langle iso\text{-}code \rangle$ .
- `\_<iso-code>Patt` (for example `\_csPatt`) is the language  $\langle number \rangle$  declared by `\chardef`.

- `\langle iso-code\rangle lang` (for example `\enlang`, `\cslang`, `\sklang`, `\delang`, `\pllang`) is language selector. It exists in two states
  - Initialization state: when `\langle iso-code\rangle lang` is used first then it must load the patterns into memory using Lua code. If it is done then the `\langle iso-code\rangle lang` re-defines itself to the processing state.
  - Processing state: it only sets `\language=\_<iso-code>Patt`, i.e it selects the hyphenation patterns. It does a little more language-dependent work, as mentioned below.
- `\_langspecific:<isocode>` is processed by `\langle iso-code\rangle lang` and it should include language-specific macros declared by the user or macro designer.

The USenglish patters are preloaded first:

```
hyphen-lan.opm
32 \_chardef\_enPatt=0
33 \_def\_pattlist{\_enPatt=0}
34 \_def\_langlist{\en(USenglish)}
35 \_sdef{\_lan:0}{\en}
36 \_sdef{\_ulan:usenglish}{\en}
37 \_def\_enlang{\_uselang{\en}\_enPatt23} % \lefthyph=2 \righthyp=3
38 \_def\enlang{\_enlang}
39 \_sdef{\_langspecific:\en}{\_nonfrenchspacing}
40
41 \_lefthyphenmin=2 \_righthypenmin=3 % disallow x- or -xx breaks
42 \_input hyphen % en(USenglish) patterns from TeX82
```

`\_prelang <iso-code> <long-lang> <hyph-file-spec> <number> <pre-hyph><post-hyph>` prepares the `\langle iso-code\rangle lang` to its initialization state. Roughly speaking, it does:

```
\chardef\_<iso-code>Patt = <number>
\def\_lan:<number> {\<iso-code>}
\def\_ulan:<long-lang> {\<iso-code>}
\def\_\<iso-code>lang {%
  \_loadpattr {\<hyph-file-spec>} <number> <long-lang> % loads patterns using Lua code
  \gdef\_\<iso-code>lang {\_uselang{\<iso-code>}\_<iso-code>Patt <pre-hyph><post-hyph>}
  \_\<iso-code>lang % runs itself in processing state
}
\def\<iso-code>lang {\_\<iso-code>lang} % public version \<iso-code>lang
```

You can see that `\<iso-code>lang` runs `\_loadpattr` and `\_uselang` first (in initialization state) and it runs only `\_uselang` when it is called again (in processing state).

```
hyphen-lan.opm
64 \_def\_\prelang #1 #2 #3 #4 #5 {%
65   \ea\_\chardef \_csname _#1Patt\_endcsname=#4
66   \_sdef{\_lan:#4}{\#1}\_lowercase{\_sdef{\_ulan:#2}}{\#1}%
67   \_def\_next{\_ea\_\noexpand\_csname _#1lang\_endcsname}%
68   \_ea\_\edef \_csname _#1lang\_endcsname {%
69     \_noexpand\_\loadpattr {\#3} #4 #2 % loads patterns
70     \gdef\_next{\_noexpand\_\uselang{\#1}\_csname _#1Patt\_endcsname #5}% re-defines itself
71     \_next % runs itself in processing state
72   }
73   \_addto\_\langlist{ \#1(\#2)}%
74   \_sdef{\#1lang\_\ea\_\ea{\_csname _#1lang\_endcsname}}% unprefixed \<isocode>lang
75 }
```

`\_loadpattr {\<hyph-file-spec>} <number> <long-lang>` loads hyphenation patterns and hyphenation exceptions for given language and registers them as `\language=<number>`.

The `<hyph-file-spec>` is a part of full file name which is read: `hyph-<hyph-file-spec>.tex`. The patterns and hyphenation exceptions are saved here in UTF-8 encoding. The `<hyph-file-spec>` should be a list of individual `<hyph-file-spec>`'s separated by commas, see the language Serbian below for an example.

```
hyphen-lan.opm
89 \_def\_\loadpattr {\#1 #2 #3 {%
90   \wlog{Loading hyphenation #3: (#1) \_string\language=\#2}%
91   \begin{group}\setbox0=\vbox{ we don't want spaces in horizontal mode
92     \language=\#2\def{\#3}%
93     \let\patterns=\patterns \let\hyphenation=\hyphenation \def\message{\#1}%
94     \loadpattr {\#1} , %
95   }\endgroup
```

```

96 }
97 \_def\_\_loadpattrsa #1,{\_.ifx,#1,\_else
98   \_isfile {hyph-#1}\_iftrue \_opinput{hyph-#1}%
99   \_else \_opwarning{No hyph. patterns #1 for \\, missing package?}%
100     \_def\_\_opwarning##1{}\_fi
101   \_ea \_loadpattrsa \_fi
102 }

```

### \uselang{\iso-code}\\_{iso-code}Patt <pre-hyph><post-hyph>

sets \language, \lefthyphenmin, \righthphenmin and runs \frenchspacing. This default language-dependent settings should be re-declared by \langs specific:\iso-code which is run finally (it is \relax by default, only \langs specific:en runs \nonfrenchspacing).

```

113 \_def\_\uselang#1#2#3#4{\_language=#2\_lefthyphenmin=#3\_righthphenmin=#4\_relax
114   \_frenchspacing % \nonfrenchspacing can be set in \cs{_langs specific:lan}
115   \_cs{_langs specific:#1}%
116 }

```

The \uselanguage {\long-lang} is defined here (for compatibility with e-plain users).

```

122 \_def\_\uselanguage#1{\_lowercase{\_cs{\_cs{_ulan:#1}lang}}}
123 \_public \uselanguage ;

```

The numbers for languages are declared as fixed constants (no auto-generated). This concept is inspired by CSplain. There are typical numbers of languages in CSplain: 5=Czech in IL2, 15=Czech in T1 and 115=Czech in Unicode. We keep these constants but we load only Unicode patterns (greater than 100), of course.

The `\langlist` includes names of all languages which are ready to load and use their hyphenation patterns. This list is printed to the terminal and to log at initEX state here. It can be used when processing documents too.

hyphen-lan.opm

```
219 \_message{Language hyph.patterns ready to load: \_langlist.
220   Use \_string<shortname>lang to initialize language,
221   \_string\cslang\_space for example}
222
223 \_public \langlist ;
```

Maybe, you need to do more language-specific actions than just switching hyphenation patterns. For example, you need to load a specific font with a specific script used in the selected language, you can define macros for quotation marks depending on the language, etc.

The example shows how to declare such language-specific things.

```
\def\langset #1 #2{\sdef{_langspecific:#1}{#2}}
\langset fr {... declare French quotation marks}
\langset de {... declare German quotation marks}
\langset gr {... switch to Greek fonts family}
... etc.
```

Note that you need not set language-specific phrases (like `\today`) by this code. Another concept is used for such tasks. See the section [2.37.3](#) for more details.

### 2.37.3 Multilingual phrases and quotation marks

languages.opm

```
3 \codedecl \mttext {Languages <2021-05-23>} % preloaded in format
```

Only four words are generated by OptEX macros: “Chapter”, “Table”, “Figure” and “Subject”. These phrases can be generated depending on the current value of `\language` register, if you use `\_mtext{<phrase-id>}`, specially `\_mtext{chap}`, `\_mtext{t}`, `\_mtext{f}` or `\_mtext{subj}`. If your macros generate more words then you can define such words by `\sdef{_mt:<phrase-id>}{<lang>}` where `<phrase-id>` is a label for the declared word and `<lang>` is a language shortcut (iso code).

```
languages.opm
16 \_def \_mtext#1{\_trycs{_mt:#1:\_trycs{_lan:\_the\_language}{en}}
17   {\_csname _mt:#1:en\endcsname}}
18
19 \_sdef{_mt:chap:en}{Chapter} \_sdef{_mt:chap:cs}{Kapitola} \_sdef{_mt:chap:sk}{Kapitola}
20 \_sdef{_mt:t:en}{Table} \_sdef{_mt:t:cs}{Tabulka} \_sdef{_mt:t:sk}{Tabuľka}
21 \_sdef{_mt:f:en}{Figure} \_sdef{_mt:f:cs}{Obrázek} \_sdef{_mt:f:sk}{Obrázok}
22 \_sdef{_mt:subj:en}{Subject} \_sdef{_mt:subj:cs}{Věc} \_sdef{_mt:subj:sk}{Vec}
```

Using `\_langw <lang> <chapter> <table> <figure> <subject>` you can declare these words more effectively:

```
languages.opm
30 \_def \_langw #1 #2 #3 #4 #5 {%
31   \_sdef{_mt:chap:#1}{#2}\_sdef{_mt:t:#1}{#3}\_sdef{_mt:f:#1}{#4}%
32   \_sdef{_mt:subj:#1}{#5}%
33 }
34
35 \_langw en Chapter Table Figure Subject
36 %-----
37 \_langw cs Kapitola Tabulka Obrázek Věc
38 \_langw de Kapitel Tabelle Abbildung Betreff
39 \_langw es Capítulo Tabla Figura Sujeto
40 \_langw fr Chaptire Tableau Figure Matière
41 \_langw it Capitolo Tabella Fig. Oggetto
42 \_langw pl Rozdział Tabela Ilustracja Temat
```

... etc. (see `languages.opm`)

You can add more words as you wish. For example `\today` macro:

```
languages.opm
51 \_def \_monthw #1 #2 #3 #4 #5 #6 #7 {%
52   \_sdef{_mt:m1:#1}{#2}\_sdef{_mt:m2:#1}{#3}\_sdef{_mt:m3:#1}{#4}%
53   \_sdef{_mt:m4:#1}{#5}\_sdef{_mt:m5:#1}{#6}\_sdef{_mt:m6:#1}{#7}%
54   \_monthwB #1
55 }
56 \_def \_monthwB #1 #2 #3 #4 #5 #6 #7 {%
57   \_sdef{_mt:m7:#1}{#2}\_sdef{_mt:m8:#1}{#3}\_sdef{_mt:m9:#1}{#4}%
58   \_sdef{_mt:m10:#1}{#5}\_sdef{_mt:m11:#1}{#6}\_sdef{_mt:m12:#1}{#7}%
59 }
60
61 \_monthw en January February March April May June
62           July August September October November December
63 \_monthw cs ledna února března dubna května června
64           července srpna září října listopadu prosince
65 \_monthw sk januára februára marca apríla mája júna
66           júla augusta septembra októbra novembra decembra
67 \_monthw it gennaio febbraio marzo aprile maggio giugno
68           luglio agosto settembre ottobre novembre dicembre
69
70
71 \_sdef{_mt:today:en}{\_mtext{m\the\_month} \_the\_day, \_the\_year}
72 \_sdef{_mt:today:cs}{\_the\_day.\_mtext{m\the\_month} \_the\_year}
73 \_slet{_mt:today:sk}{_mt:today:cs}
74
75 \_def\_\today{\_mtext{today}}
76 \_public \today ;
```

Quotes should be tagged by `\"(text)"` and `\'<text>'` if `\(iso-code)quotes` is declared at beginning of the document (for example `\enquotes`). If not, then the control sequences `\"` and `\'` are undefined. Remember, that they are used in another meaning when the `\oldaccents` command is used. The macros `\"` and `\'` are not defined as `\protected` because we need their expansion when `\outlines` are created. User can declare quotes by `\quoteschars{clqq}{crqq}{clq}{crq}`, where `{clqq}...{crqq}` are normal quotes and `{clq}...{crq}` are alternative quotes. or use `\altquotes` to swap between the meaning of these two types of quotes.

`\enquotes`, `\csquotes`, `\dequotes`, `\frquotes` etc. are defined here.

```

93 \_def \_enquotes {\_quoteschars ""`}
94 \_def \_csquotes {\_quoteschars „‘`}
95 \_def \_frquotes {\_quoteschars ““`}
96 \_let \_plquotes = \_frquotes
97 \_let \_esquotes = \_frquotes
98 \_let \_grquotes = \_frquotes
99 \_let \_ruquotes = \_frquotes
100 \_let \_itquotes = \_frquotes
101 \_let \_skquotes = \_csquotes
102 \_let \_dequotes = \_csquotes

```

The `\quoteschars{lqq}{rqq}{lq}{rq}` defines `"` and `'` as `\qqA` in normal mode and as expandable macros in outline mode. We want to well process the common cases: `"`&`"` or `"`{`"`. This is the reason why the quotes parameter is read in verbatim mode and retokenized again by `\scantextokens`. We want to allow to quote the quotes mark itself by `"`{`"}`. This is the reason why the sub-verbatim mode is used when the first character is `{` in the parameter.

The `"` is defined as `\qqA\qqB{lqq}{rqq}` and `'` as `\qqA\qqC{lq}{rq}`. The `\qqA\qqB{clqq}{crqq}` runs `\qqB{lqq}{rqq}{text}"`.

The `\regquotes{"`{`"}{L}{R}` does `\def{\#1}{\{L\}\#1\{R\}}` for outlines but the `"` separator is active (because `"` and `'` are active in `\pdfunidef`).

```

118 \_def \_quoteschars #1#2#3#4{\_def \_altquotes{\_quoteschars#3#4#1#2}\_public\altquotes;%
119   \_protected\def \"{\_qqA\qqB#1#2}\_protected\def \'{\_qqA\qqC#3#4}%
120   \_regmacro{}{}\{_regquotes\"#1#2\_regquotes' '#3#4}%
121 
122 \_def\qqA#1#2#3{\_bgroup\_setverb \_catcode`\ =10
123   \_isnextchar\bgroup{\_catcode`\{=1 \_catcode`\}=2 #1#2#3}{#1#2#3}%
124 \_long\def\qqB#1#2#3{\_egroup#1\_scantextokens{#3}#2%
125 \_long\def\qqC#1#2#3'{\_egroup#1\_scantextokens{#3}#2%
126 \_def\_regquotes#1#2#3#4{\_bgroup \_lccode`~-#2\_lowercase{\_egroup \_def#1##1-}{#3##1#4}}%

```

Sometimes should be usable to leave the markup "such" or 'such' i.e. without the first backslash. Then you can make the characters `"` and `'` active by the `\activequotes` macro and leave quotes without the first backslash. First, declare `\(iso-code)quotes`, then `\altquotes` (if needed) and finally `\activequotes`.

```

136 \_def\activequotes{\_let \_actqq=\\"_adef"\{_actqq}\_let \_actq='\_adef'\{_actq}%
137   \_regmacro{}{}\{_adef"\"_adef'{}"}%
138 
139 \_public \quoteschars \activequotes \enquotes \csquotes \skquotes \frquotes \plquotes
140   \esquotes \grquotes \ruquotes \itquotes \dequotes ;

```

Bibliography references generated by `\usebib` uses more language-dependent phrases. They are declared here. We don't want to save all these phrases into the format, so the trick with `\_endinput` is used here. When `\usebib` is processed then the following part of the file `languages.opm` is read again.

Only phrases of few languages are declared here now. If you want to declare phrases of your language, please create an "issue" or a "request" at <https://github.com/olsak/OpTeX> or send me an email with new phrases for your language (or language you know:). I am ready to put them here. Temporarily, you can put your definitions into `\bibtexhook` token list.

```

156 \_endinput % don't save these \def's to the format
157 
158 \_def\langb#1 #2#3#4#5#6#7#8#9{\_def\mbib##1##2{\_sdef{\_mt:bib.##2:#1}{##1}}%

181 \_let\skdateformat =\_csdateformat

```

## 2.38 Other macros

Miscellaneous macros are here.

```

3 \codedecl \uv {Miscenaleous <2020-08-02>} % preloaded in format

```

\useOpTeX and \useoptex are declared as \relax.

```

9 \_let \useOpTeX = \_relax \_let \useoptex = \_relax

```

The \lastpage and \totalpages get the information from the \currpage. The \Xpage from .ref file sets the \currpage.

```

16 \_def\totalpages {\_openref\_ea\ignoresecond\currpage}
17 \_def\lastpage {\_openref\_ea\usesecound\currpage}
18 \_def\currpage {{0}{?}}
19 \_public \lastpage \totalpages ;

```

We need \uv, \clqq, \crqq, \flqq, \frqq, \uslang, \ehyph \chyp, \shyp, for backward compatibility with \Cplain. Codes are set according to Unicode because we are using Czech only in Unicode when \LuaTeX{} is used.

```

28 % for compatibility with csplain:
29
30
31 \_chardef\clqq=8222 \_chardef\crqq=8220
32 \_chardef\flqq=171 \_chardef\frqq=187
33 \_chardef\promile=8240
34
35 \_def\uv#1{\clqq#1\crqq}
36
37 \_let\uslang=\enlang \_let\ehyph=\enlang
38 \_let\chyp=\cslang \_let\shyp=\sklang
39 \_let\csUnicode=\csPatt \_let\czUnicode=\csPatt \_let\skUnicode=\skPatt

```

The \letfont was used in \Cplain instead of \fontlet.

```

45 \_let \letfont = \fontlet

```

Non-breaking space in Unicode.

```

51 \let ^~a0=~

```

TikZ needs these funny control sequences.

```

57 \_ea\_\toksdef \_csname toks@\_endcsname=0
58 \_ea\_\let \_csname voidb@x\endcsname=\_voidbox

```

We don't want to read opmac.tex unless \input opmac is specified.

```

64 \_def\OPmacversion{OpTeX}

```

We allow empty lines in math formulae. It is more comfortable.

```

70 \_suppressmathparerror = 1

```

Lorem ipsum can be printed by \lipsum[<range>] or \lorem[<range>], for example \lipsum[3] or \lipsum[112-121], max=150.

First usage of `\lipsum` reads the L<sup>A</sup>T<sub>E</sub>X file `lipsum.ltd.tex` by `\_lipsumload` and prints the selected paragraph(s). Next usages of `\lipsum` prints the selected paragraph(s) from memory. This second and more usages of `\lipsum` are fully expandable. If you want to have all printings of `\lipsum` expandable, use dummy `\lipsum[0]` first.

`\lipsum` adds `\par` after each printed paragraph. If you don't need such `\par` here, use `\lipsumtext[<number>]`. This macro prints only one selected paragraph `<number>` and does not add `\par`.

```
others.opm
88 \_def\_\lipsumtext[#1]{\_lipsumload\_cs{_lip:#1}}
89 \_def\_\lipsum[#1]{\_lipsumA #1\_\empty-\_\empty\_\end}
90 \_def\_\lipsumA #1-#2\_\empty#3\_\end{%
91   \_fornum #1..\_ifx^#2^#1\_\else#2\_\fi \_do {\_lipsumtext[##1]\par}}
92 \_def\_\lipsumload{%
93   \_setbox0=\_vbox{\_tmpnum=0 % vertical mode during \input lipsum.ltd.tex

95     \_def\SetLipsumLanguage##1{}%
96     \_def\NewLipsumPar{\_incr\_tmpnum \_sxdef{_lip:\_the\_tmpnum}}%
97     \_opinput {lipsum.ltd.tex}%
98     \_global\let\lipsumload=\empty
99   }%
100 \_public \lipsum \lipsumtext ;
101 \_let \lorem=\lipsum
```

## 2.39 Lua code embedded to the format

The file `optex.lua` is loaded into the format in `optex.ini` as byte-code and initialized by `\everyjob`, see section 2.1.

The file implements part of the functionality from `luatexbase` namespace, nowadays defined by L<sup>A</sup>T<sub>E</sub>X kernel. `luatexbase` deals with modules, allocators, and callback management. Callback management is a nice extension and is actually used in OpT<sub>E</sub>X. Other functions are defined more or less just to suit luatfloat's use.

The allocations are declared in subsection 2.39.2, callbacks are implemented in subsection 2.39.3 and handling with colors can be found in the subsection 2.39.4.

```
4
```

optex.lua

### 2.39.1 General

Define namespace where some OpT<sub>E</sub>X functions will be added.

```
8
9 optex = optex or {}
10
```

Error function used by following functions for critical errors.

```
12 local function err(message)
13   error("\nerror: "..message.."\\n")
14 end
```

For a `\chardef`'d, `\countdef`'d, etc., `csname` return corresponding register number. The responsibility of providing a `\XXdef`'d name is on the caller.

```
18 function registernumber(name)
19   return token.create(name).index
20 end
```

MD5 hash of given file.

```
23 function mdfive(file)
24   local fh = io.open(file, "rb")
25   if fh then
26     local data = fh:read("*a")
27     fh:close()
28     tex.print(md5.sumhexa(data))
29   end
30 end
```

## 2.39.2 Allocators

```
33 alloc = alloc or {}
```

An attribute allocator in Lua that cooperates with normal `OpTeX` allocator.

```
36 local attributes = {}
37 function alloc.new_attribute(name)
38     local cnt = tex.count["_attributealloc"] + 1
39     if cnt > 65534 then
40         tex.error("No room for a new attribute")
41     else
42         tex.setcount("global", "_attributealloc", cnt)
43         texio.write_nl("log", "'..name..'"=\\"attribute"..tostring(cnt))
44         attributes[name] = cnt
45     end
46 end
47 end
```

Allocator for Lua functions ("pseudoprimitives"). It passes variadic arguments ("...") like "global" to `token.set_lua`.

```
51 local function_table = lua.get_functions_table()
52 local luafnalloc = 0
53 function define_lua_command(csname, fn, ...)
54     luafnalloc = luafnalloc + 1
55     token.set_lua(csname, luafnalloc, ...) -- WARNING: needs LuaTeX 1.08 (2019) or newer
56     function_table[luafnalloc] = fn
57 end

    provides_module is needed by older version of luatofload

60 provides_module = function() end
```

## 2.39.3 Callbacks

```
63 callback = callback or {}
```

Save `callback.register` function for internal use.

```
66 local callback_register = callback.register
67 function callback.register(name, fn)
68     err("direct registering of callbacks is forbidden, use 'callback.add_to_callback'")
69 end
```

Table with lists of functions for different callbacks.

```
72 local callback_functions = {}
```

Table that maps callback name to a list of descriptions of its added functions. The order corresponds with `callback_functions`.

```
75 local callback_description = {}
```

Table used to differentiate user callbacks from standard callbacks. Contains user callbacks as keys.

```
79 local user_callbacks = {}
```

Table containing default functions for callbacks, which are called if either a user created callback is defined, but doesn't have added functions or for standard callbacks that are "extended" (see `mlist_to_hlist` and its pre/post filters below).

```
84 local default_functions = {}
```

Table that maps standard (and later user) callback names to their types.

```
87 local callback_types = {
88     -- file discovery
89     find_read_file      = "exclusive",
90     find_write_file     = "exclusive",

197     callback_types[name] = cbtype
198     default_functions[name] = default or nil
199     user_callbacks[name] = true
200 end

```

Add a function to the list of functions executed when callback is called. For standard luatex callback a proxy function that calls our machinery is registered as the real callback function. This doesn't happen for user callbacks, that are called manually by user using `call_callback` or for standard callbacks that have default functions – like `mlist_to_hlist` (see below).

```

208 local call_callback
209 function callback.add_to_callback(name, fn, description)
210     if user_callbacks[name] or callback_functions[name] or default_functions[name] then
211         -- either:
212         -- a) user callback - no need to register anything
213         -- b) standard callback that has already been registered
214         -- c) standard callback with default function registered separately
215         --     (mlist_to_hlist)
216     elseif callback_types[name] then
217         -- This is a standard luatex callback with first function being added,
218         -- register a proxy function as a real callback. Assert, so we know
219         -- when things break, like when callbacks get redefined by future
220         -- luatex.
221         callback_register(name, function(...)
222             return call_callback(name, ...)
223         end)
224     else
225         err("cannot add to callback '..name..'' - no such callback exists")
226     end
227
228     -- add function to callback list for this callback
229     callback_functions[name] = callback_functions[name] or {}
230     table.insert(callback_functions[name], fn)
231
232     -- add description to description list

```

```

233     callback_description[name] = callback_description[name] or {}
234     table.insert(callback_description[name], description)
235 end

```

Remove a function from the list of functions executed when callback is called. If last function in the list is removed delete the list entirely.

```

239 function callback.remove_from_callback(name, description)
240     local descriptions = callback_description[name]
241     local index
242     for i, desc in ipairs(descriptions) do
243         if desc == description then
244             index = i
245             break
246         end
247     end
248

254         callback_functions[name] = nil
255
256         if not user_callbacks[name] and not default_functions[name] then
257             -- this is a standard callback with no added functions and no
258             -- default function (i.e. not mlist_to_hlist), restore standard
259             -- behaviour by unregistering.
260             callback_register(name, nil)
261         end
262     end
263
264     return fn, description
265 end

```

helper iterator generator for iterating over reverselist callback functions

```

268 local function reverse_ipairs(t)
269     local i, n = #t + 1, 1
270     return function()
271         i = i - 1
272         if i >= n then
273             return i, t[i]
274         end
275     end
276 end

```

Call all functions added to callback. This function handles standard callbacks as well as user created callbacks. It can happen that this function is called when no functions were added to callback – like for user created callbacks or `mlist_to_hlist` (see below), these are handled either by a default function (like for `mlist_to_hlist` and those user created callbacks that set a default function) or by doing nothing for empty function list.

```

285 function callback.call_callback(name, ...)
286     local cbtype = callback_types[name]
287     -- either take added functions or the default function if there is one
288     local functions = callback_functions[name] or {default_functions[name]}
289
290     if cbtype == nil then
291         err("cannot call callback '..name..'" - no such callback exists")
292     elseif cbtype == "exclusive" then
293         -- only one function, atleast default function is guaranteed by
294         -- create_callback
295         return functions[1](...)
296     elseif cbtype == "simple" then
297         -- call all functions one after another, no passing of data
298         for _, fn in ipairs(functions) do
299             fn(...)
300         end
301     end
302     return
303 end

```

```

302 elseif cbtype == "data" then

304     -- other arguments
305     local data = ...
306     for _, fn in ipairs(functions) do
307         data = fn(data, select(2, ...))
308     end
309     return data
310 end
311
312 -- list and reverselist are like data, but "true" keeps data (head node)
313 -- unchanged and "false" ends the chain immediately
314 local iter
315 if cbtype == "list" then
316     iter = ipairs
317 elseif cbtype == "reverselist" then
318     iter = reverse_ipairs
319 end
320
321 local head = ...
322 local new_head
323 local changed = false
324 for _, fn in iter(functions) do
325     new_head = fn(head, select(2, ...))
326     if new_head == false then
327         return false
328     elseif new_head ~= true then
329         head = new_head
330         changed = true
331     end
332 end
333 return not changed or head
334 end
335 call_callback = callback.call_callback

```

Create “virtual” callbacks `pre/post_mlist_to_hlist_filter` by setting `mlist_to_hlist` callback. The default behaviour of `mlist_to_hlist` is kept by using a default function, but it can still be overridden by using `add_to_callback`.

```

341 default_functions["mlist_to_hlist"] = node.mlist_to_hlist
342 callback.create_callback("pre_mlist_to_hlist_filter", "list")
343 callback.create_callback("post_mlist_to_hlist_filter", "reverselist")
344 callback_register("mlist_to_hlist", function(head, ...)
345     -- pre_mlist_to_hlist_filter
346     local new_head = call_callback("pre_mlist_to_hlist_filter", head, ...)
347     if new_head == false then
348         node.flush_list(head)
349         return nil
350     elseif new_head ~= true then
351         head = new_head
352     end
353     -- mlist_to_hlist means either added functions or standard luatex behavior
354     -- or node.mlist_to_hlist (handled by default function)
355     head = call_callback("mlist_to_hlist", head, ...)
356     -- post_mlist_to_hlist_filter
357     new_head = call_callback("post_mlist_to_hlist_filter", head, ...)
358     if new_head == false then
359         node.flush_list(head)
360         return nil
361     elseif new_head ~= true then
362         head = new_head
363     end
364     return head
365 end)

```

For preprocessing boxes just before shipout we define custom callback. This is used for coloring based on attributes. There is however a challenge - how to call this callback? We could redefine `\shipout` and `\pdfxform` (which both run `ship_out` procedure internally), but they would lose their primitive meaning – i.e. `\immediate` wouldn’t work with `\pdfxform`. The compromise is to require anyone to

run `\_preshipout`*<destination box number><box specification>* just before `\shipout` or `\pdfxform` if they want to call `pre_shipout_filter` (and achieve colors and possibly more).

```
376 callback.create_callback("pre_shipout_filter", "list")
377
378 local tex_setbox = tex.setbox
379 local token_scanint = token.scan_int
380 local token_scanlist = token.scan_list
381 define_lua_command("_preshipout", function()
382     local boxnum = token_scanint()
383     local head = token_scanlist()
384     head = call_callback("pre_shipout_filter", head)
385     tex_setbox(boxnum, head)
386 end)
```

Compatibility with L<sup>A</sup>T<sub>E</sub>X through luatexbase namespace. Needed for luatofloat.

```
390 luatexbase = {
391     registernumber = registernumber,
392     attributes = attributes,
393     provides_module = provides_module,
394     new_attribute = alloc.new_attribute,
395     callback_descriptions = callback.callback_descriptions,
396     create_callback = callback.create_callback,
397     add_to_callback = callback.add_to_callback,
398     remove_from_callback = callback.remove_from_callback,
399     call_callback = callback.call_callback,
400     callbacktypes = {}
401 }
```

`\tracingmacros` callback registered. Use `\tracingmacros=3` or `\tracingmacros=4` if you want to see the result.

```
405 callback.add_to_callback("input_level_string", function(n)
406     if tex.tracingmacros > 3 then
407         return "[" .. n .. "] "
408     elseif tex.tracingmacros > 2 then
409         return "~" .. string.rep(".",n)
410     else
411         return ""
412     end
413 end, "_tracingmacros")
```

## 2.39.4 Handling of colors using attributes

Because LuaT<sub>E</sub>X doesn't do anything with attributes, we have to add meaning to them. We do this by intercepting T<sub>E</sub>X just before it ships out a page and inject PDF literals according to attributes.

```
421 local node_id = node.id
422 local glyph_id = node_id("glyph")
423 local rule_id = node_id("rule")
424 local glue_id = node_id("glue")
425 local hlist_id = node_id("hlist")
426 local vlist_id = node_id("vlist")
427 local disc_id = node_id("disc")
428 local token_getmacro = token.get_macro
429
430 local direct = node.direct
431 local todirect = direct.todirect
432 local tonode = direct.tonode
433 local getfield = direct.getfield
434 local setfield = direct.setfield
435 local getwhd = direct.getwhd
436 local getid = direct.getid
437 local getlist = direct.getlist
438 local setlist = direct.setlist
439 local getleader = direct.getleader
440 local getattribute = direct.get_attribute
441 local insertbefore = direct.insert_before
442 local copy = direct.copy
```

```

443 local traverse = direct.traverse
444 local one_bp = tex.sp("1bp")
445 local string_format = string.format

```

The attribute for coloring is allocated in `colors.opm`

```

448 local color_attribute = registernumber("_colorattr")

```

Now we define function which creates whatsit nodes with PDF literals. We do this by creating a base literal, which we then copy and customize.

```

453 local pdf_base_literal = direct.new("whatsit", "pdf_literal")
454 setfield(pdf_base_literal, "mode", 2) -- direct mode
455 local function pdfliteral(str)
456     local literal = copy(pdf_base_literal)
457     setfield(literal, "data", str)
458     return literal
459 end
460 optex.directivepdfliteral = pdfliteral

```

The function `colorize(head, current, current_stroke)` goes through a node list and injects PDF literals according to attributes. Its arguments are the head of the list to be colored and the current color for fills and strokes. It is a recursive function – nested horizontal and vertical lists are handled in the same way. Only the attributes of “content” nodes (glyphs, rules, etc.) matter. Users drawing with PDF literals have to set color themselves.

Whatsit node with color setting PDF literal is injected only when a different color is needed. Our injection does not care about boxing levels, but this isn’t a problem, since PDF literal whatsits just instruct the `\shipout` related procedures to emit the literal.

We also set the stroke and non-stroke colors separately. This is because stroke color is not always needed – LuaTeX itself only uses it for rules whose one dimension is less than or equal to 1 bp and for fonts whose `mode` is set to 1 (outline) or 2 (outline and fill). Catching these cases is a little bit involved. For example rules are problematic, because at this point their dimensions can still be running ( $-2^{30}$ ) – they may or may not be below the one big point limit. Also the text direction is involved. Because of the negative value for running dimensions the simplistic check, while not fully correct, should produce the right results. We currently don’t check for the font mode at all.

Leaders (represented by glue nodes with leader field) are not handled fully. They are problematic, because their content is repeated more times and it would have to be ensured that the coloring would be right even for e.g. leaders that start and end on a different color. We came to conclusion that this is not worth, hence leaders are handled just opaquely and only the attribute of the glue node itself is checked. For setting different colors inside leaders, raw PDF literals have to be used.

We use the `node.direct` way of working with nodes. This is less safe, and certainly not idiomatic Lua, but faster and codewise more close to the way TeX works with nodes.

```

497 local function is_color_needed(head, n, id, subtype) -- returns non-stroke, stroke color needed
498     if id == glyph_id then
499         return true, false
500     elseif id == glue_id then
501         n = getleader(n)
502         if n then
503             id = getid(n)
504             if id == hlist_id or id == vlist_id then
505                 -- leaders with hlist/vlist get single color
506                 return true, false
507             else -- rule
508                 -- stretchy leaders with rules are tricky,
509                 -- just set both colors for safety
510                 return true, true
511             end
512         end
513     elseif id == rule_id then
514         local width, height, depth = getwhd(n)
515         if width <= one_bp or height + depth <= one_bp then
516             -- running (-2^30) may need both
517             return true, true
518         end
519     end
520     return true, false

```

```

520     end
521     return false, false
522 end
523
524 local function colorize(head, current, current_stroke)
525     for n, id, subtype in traverse(head) do
526         if id == hlist_id or id == vlist_id then
527             -- nested list, just recurse
528             local list = getlist(n)
529             list, current, current_stroke = colorize(list, current, current_stroke)
530             setlist(n, list)
531         elseif id == disc_id then
532             -- at this point only no-break (replace) list is of any interest
533             local replace = getfield(n, "replace")
534             if replace then
535                 replace, current, current_stroke = colorize(replace, current, current_stroke)

537             end
538         else
539             local nonstroke_needed, stroke_needed = is_color_needed(head, n, id, subtype)
540             local new = getattribute(n, color_attribute) or 0
541             local newcolor = nil
542             if current ~= new and nonstroke_needed then
543                 newcolor = token_getmacro("_color:..new")
544                 current = new
545             end
546             if current_stroke ~= new and stroke_needed then
547                 local stroke_color = token_getmacro("_color-s:..current")
548                 if stroke_color then
549                     if newcolor then
550                         newcolor = string_format("%s %s", newcolor, stroke_color)
551                     else
552                         newcolor = stroke_color
553                     end
554                     current_stroke = new
555                 end
556             end
557             if newcolor then
558                 head = insertbefore(head, n, pdfliteral(newcolor))
559             end
560         end
561     end
562     return head, current, current_stroke
563 end

```

Colorization should be run just before shipout. We use our custom callback for this. See the definition of `pre_shipout_filter` for details on limitations.

```

568 callback.add_to_callback("pre_shipout_filter", function(list)
569     -- By setting initial color to -1 we force initial setting of color on
570     -- every page. This is useful for transparently supporting other default
571     -- colors than black (although it has a price for each normal document).
572     local list = colorize(todirect(list), -1, -1)
573     return tonode(list)
574 end, "_colors")

```

We also hook into luatfload's handling of color. Instead of the default behavior (inserting colorstack whatsits) we set our own attribute. The hook has to be registered *after* luatfload is loaded.

```

579 function optex_hook_into_luatfload()
580     if not luatfload.set_colorhandler then
581         return -- old luatfload, colored fonts will be broken
582     end
583     local setattribute = direct.set_attribute
584     local token_setmacro = token.set_macro
585     local color_count = registernumber("_colorcnt")
586     local tex_getcount, tex_setcount = tex.getcount, tex.setcount
587     luatfload.set_colorhandler(function(head, n, rgbcOLOR) -- rgbcOLOR = "1 0 0 rg"
588         local attr = tonumber(token_getmacro("_color:..rgbcOLOR"))
589         if not attr then

```

```

590         attr = tex_getcount(color_count)
591         tex_setcount(color_count, attr + 1)
592         local strattr = tostring(attr)
593         token_setmacro("_color::..rgbcolor, strattr")
594         token_setmacro("_color:..strattr, rgbcolor")

## 2.40 Printing documentation

The `\printdoc` *<filename>* *<space>* and `\printdoctail` *<filename>* *<space>* commands are defined after the file `doc.opm` is load by `\load [doc]`.

The `\printcoc` starts reading of given *<filename>* from the second line. The file is read in the *listing mode*. The `\prin doctail` starts reading given *<filename>* from the first occurrence of the `\_endcode`. The file is read in normal mode (like `\input <filename>`).

The *listing mode* prints the lines as a listing of a code. This mode is finished when first `\_doc` occurs or first `\_endcode` occurs. At least two spaces or one tab character must precede before such `\_doc`. On the other hand, the `\_encode` must be at the left edge of the line without spaces. If this rule is not met then the listing mode continues.

If the first line or the last line of the listing mode is empty then such lines are not printed. The maximal number of printed lines in the listing mode is `\maxlines`. It is set to almost infinity (100000). You can set it to a more sensible value. Such a setting is valid only for the first following listing mode.

When the listing mode is finished by `\_doc` then the next lines are read in the normal way, but the material between `\begtt ... \endtt` pair is shifted by three letters left. The reason is that the three spaces of indentation is recommended in the `\_doc ... \cod` pair and this shifting is compensation for this indentation.

The `\cod` macro ignores the rest of the current line and starts the listing mode again.

When the listing mode is finished by the `\_endcode` then the `\endinput` is applied, the reading of the file opened by `\printdoc` is finished.

You cannot reach the end of the file (without `\_endcode`) in the listing mode.

The main documentation point is denoted by `\`\\<sequence>`` in red, for example `\`\\foo``. The user documentation point is the first occurrence of `\^\\<sequence>^`, for example `\^\\foo^`. There can be more such markups, all of them are hyperlinks to the main documentation point. And main documentation point is a hyperlink to the user documentation point if this point precedes. Finally, the `\~\\<sequence>`` (for example `\~\\foo``) are hyperlinks to the user documentation point.

By default, the hyperlink from main documentation point to the user documentation point is active only if it is backward link, i.e. the main documentation point is given later. The reason is that we don't know if such user documentation point will exist when creating main documentation point and we don't want broken links. If you are sure that user documentation point will follow then use prefix `\fw` before `\``, for example `\fw\`\\foo`` is main documentation point where the user documentation point is given later and forward hyperlink is created here.

Control sequences and their page positions of main documentation points and user documentation points are saved to the index.

The listing mode creates all control sequences which are listed in the index as an active link to the main documentation point of such control sequence and prints them in blue. Moreover, active links are control sequences of the type `\_foo` or `\.foo` although the documentation mentions only `\foo`. Another text is printed in black.

The listing mode is able to generate external links to another OpTeX-like documentation, if the macros `\<csname>` and `\el:<csname>` are defined. The second macro should create a hyperlink using `\_tmpa` where the link name of the `<csname>` is saved and `\_tmpb` where the name of the `<csname>` to be

printed is saved (`\tmpb` can include preceding `_` or `.` unlike `\_tmpa`). For example, suppose, that we have created `optex-doc.eref` file by:

```
TEXINPUTS='.;$TEXMF/{doc,tex}//' optex optex-doc
grep Xindex optex-doc.ref > optex-doc.eref
```

The `.eref` file includes only `\_Xindex{<csname>}{}</>` lines from `optex-doc.ref` file. Then we can use following macros:

```
\def\Xindex#1#2{\sdef{#1}{}\slet{el:#1}{optexdoclink}}
\def\optexdoclink{%
  \edef\extlink{url:\optexdocurl\csstring\#cs:\_tmpa}%
  \ea\urlactive\ea[\extlink]{\Cyan}{\csstring\\\_tmpb}%
\def\optexdocurl{http://petr.olsak.net/ftp/olsak/optex/optex-doc.pdf}%
\isfile{optex-doc.eref}\iftrue \input{optex-doc.eref}\fi}
```

All `\el:<csname>`, where `<csname>` is from `optex-doc.ref`, have the same meaning: `\optexdoclink` in this example. And `\optexdoclink` creates the external link in `\Cyan` color.

## 2.40.1 Implementation

```
3 \codeldecl \printdoc {Macros for documentation printing <2021-05-15>} % loaded on demand by \load[doc]
```

General declarations.

```
9 \fontfam[lmfonts]
10 \hyperlinks \Green \Green
11 \enlang
12 \enquotes
```

Maybe, somebody needs `\seccc` or `\secccc`?

```
18 \eoldef\seccc#1{\medskip \noindent{\bf#1}\par\nobreak\firstnoindent}
19 \def\secccc{\medskip\noindent$ \bullet $ }
```

`\enddocument` can be redefined.

```
25 \let\enddocument=\bye
```

A full page of listing causes underfull `\vbox` in output routine. We need to add a small tolerance.

```
32 \pgbottomskip=0pt plus10pt minus2pt
```

The listing mode is implemented here. The `\maxlines` is maximal lines of code printed in the listing mode. The `\catcodedot` sets dot as letter in listings (for package documentation where `\.foo` sequences exist).

```
41 \newcount \maxlines \maxlines=100000
42 \public \maxlines ;
43
44 \eoldef\cod#1{\par \wipepar
45   \vskip\parskip \medskip \ttskip
46   \begingroup
47   \typosize[8/10]
48   \let\printverbline=\printcodeline
49   \ttline=\inputlineno
50   \setverb \catcodedot
51   \ifnum\ttline<0 \let\printverblinenum=\relax \else \initverblinenum \fi
52   \adef{ }{\def} \adef{\t}{\parindent=\ttindent \parskip=0pt}
53   \def\t{\hspace{\dimexpr\tabspace em/2}\relax}%
54   \relax \ttfont
55   \endlinechar=```J
56   \def\tmpb{\start}%
57   \readverbline
58 }
59 \def\readverbline #1```J{%
60   \def\tmpa{\empty#1}%
61   \let\next=\readverbline
```

```

62  \_ea\_isinlist\ea\_tmpa\_ea{\_Doc}\_iftrue \_let\_next=\_processinput \_fi
63  \_ea\_isinlist\ea\_tmpa\_ea{\_Doctab}\_iftrue \_let\_next=\_processinput \_fi

65  \_ifx\_next\readverline \_addto\_tmpb{\#1^J}\_fi
66  \_next
67 }
68 {\_catcode`=13 \gdef\_aspace{ }\_def\_asp{\_ea\_noexpand\_aspace}
69 \edef\_Doc{\_asp\_\asp\_bslash _doc}
70 \bgroup \lccode`~='^I \lowercase{\egroup\edef\_Doctab{\_noexpand~\_bslash _doc}}
71 \edef\_Endcode{\_noexpand\_empty\_bslash _endcode}
72 \def\_catcodedot{\_catcode`.=11 }

```

The scanner of the control sequences in the listing mode replaces all occurrences of \ by `\_makecs`. This macro reads next tokens and accumulates them to \\_tmpa as long as they have category 11. It means that \\_tmpa includes the name of the following control sequence when `\_makecsF` is run. The printing form of the control sequence is set to \\_tmpb and the test of existence \,(*csname*) is performed. If it is true then active hyperlink is created. If not, then the first \_ or . is removed from \\_tmpa and the test is repeated.

```

doc.opm
85 \def\_makecs{\_def\_tmpa{}\_futurelet\_next\_makecsA}
