USAGE AND FUNCTIONALITY

OVERVIEW

The Transliterator provides two commands: `\setuptransliterator` preferably goes into the preamble and allows for global configuration. The Transliterator is invoked locally by `\transliterate` which does the actual transliteration of text passages.

```
\setuptransliterator [.,..*=.,..]
* mode          = ru_old ru_ru_transcript_de ru_transcript_de_exp
                  ru_transcript_en all sr_tolt sr_tocy bg_de iso9_ocs ocs
                  ocs_gla ru_cz ocs_cz gr gr_n
  hyphenate     = cs sk hr
  deficient_font = yes no
  hinting        = yes no
  sr_exceptions = yes no
```

```
\transliterate [.,..*=.,..]
* inherits: \setuptransliterator
```

LOADING AND CONFIGURING THE MODULE

In order to use the Transliterator in a document we put the following somewhere before `\starttext`.

```
\usemodule[transliterator]
```

Although it has some defaults already set at this point they will most likely not correspond to what is needed in the document. To override the presets we use the command `\setuptransliterator[#1]`. It takes a comma separated list of two key-value pairs: `mode` and `hyphenate`. Through `mode` we specify the transliteration method. By the time of this writing this can be one of the following set:

Nota bene: The description at this point only serves as a placeholder as the transliteration modes are discussed in detail later in this document.

mode	description
all	ISO 9 complete
bg_de	Bulgarian, German „scientific“ transliteration
gr	transliteration for Greek
gr_n	transliteration for Greek obeying nasalizations
iso9_ocs	== all plus non-ISO additions for Old (Church) Slavonic
ocs	“scientific” transliteration for Old (Church) Slavonic
ocs_cz	Czech transcription for Old (Church) Slavonic
ocs_gla	“scientific” transliteration for Old (Church) Slavonic / Glagolitic alphabet
ru	ISO 9 Russian
ru_cz	Czech transcription for Russian
ru_old	ISO 9 Russian plus pre-1918 chars (the default)
ru_transcript_de	German transcription for Russian
ru_transcript_en	English transcription for Russian
sr_toc�	Serbian, Latin to Cyrillic
sr_tolt	Serbian, Cyrillic to Latin

Table 1 Transliteration modes.

Through the `hyphenate` argument it is possible to adjust the language that is used for hyphenation. Specifying `\setuptransliterator[hyphenate=nl]` will let every transliterated part of the document be processed according to dutch rules, leaving the overall `\language[#1]` configuration unchanged for the rest of the content.

Another argument, `deficient_font` can be used in combination with the modes `all`, `ru_old` and `iso9_ocs`. It lets you circumvent the deficiency that some fonts show concerning the characters that ISO 9 assigns to cyrillic “ь” and “ѣ”. Set it to `true` to enable it.

The actual transliteration is done using the macro `\transliterate[#1]{#2}`. The second argument takes the raw string in the original language that we want to process, while the first, optional argument accepts local adjustments for `mode` and `hyphenate`. Thus, we would typeset one of Epicuros’ sayings like this:

```
\transliterate[mode=gr]{κακὸν ἀνάγκη, ἀλλ' οὐδεμία ἀνάγκη ζῆν  
μετὰ ἀνάγκης}
```

which yields “kakon anagkē, all’ udemia anagkē zēn meta anagkēs” in the PDF output. Alternatively there is an environment, `\starttransliterate[#1]`, as well, that takes the same arguments.

There are two special switches for the *Serbian* patterns, `hinting` and `sr_exceptions`, allowing for a little more fine-tuning. If activated, `hinting`

provides the special character “*” as a means to indicate positions, where the sequences “lj” and “nj” are to be treated as separate consonants. E. g. `\transliterate[mode=sr_tocyl]{in*jekcija}` is correctly transliterated as ињекција, and not ињекција. Likewise, further exceptions that are internally represented as a lookup table can be toggled off or on by the `sr_exceptions` switch. This pertains to words like “nadživeti” (result: надживети) but may lead to accidental false positives in cases that the module author didn’t foresee. By default both hinting and lexical exceptions are set to `yes`.

For orientation purposes the Transliterator comes with two macros that allow for closer inspection of the internal tables. `\showOneTranslitTab{#1}` outputs, obviously, a single table; their identifiers can be found in the `trans_tables_*.lua` files in the transliterator directory. The lazy alternative is `\showTranslitTabs` which prints all registered tables in a row nicely formatted as indexable sections. (Be warned, this may take some time.)

INTRODUCTION

What's all this, then?

GRAHAM CHAPMAN

At the first glance, *transliteration* – the accurate representation of letters from one alphabet in another – seems obsolete after the advent of Unicode which made its way even into TeX lately. Why not just go on and write down everything in the original script? But still there are lots of situations where transliteration is desirable, e. g. some scholarly habits might prescribe it in the main text with citations in footnotes left in the original alphabet; or transliteration might alleviate comparison within one language that happens to be written in different scripts; finally, including text in a foreign script might be impossible if there is no appropriate font which fits the main text. However, it is still most convenient for the writer to keep the untransliterated original in the document source as this allows for reusing it in another context where different transliterations rules might apply. The Transliterator module is meant to provide both: have the original in the source and a transliteration only in the final document.

Another way of handling foreign languages is *transcription*. It aims at producing some representation that does not rely on symbolisms alien to the language and thus to be at least “pronounceable” without further knowledge. As transcription methods are language specific and highly idiosyncratic they complicate the restoration of the original phrase because information may be lost. The Transliterator provides means of transcription as well but in most cases you should refrain from using them (`[mode=ru_transcript_en]`, `[mode=ru_transcript_de]`).

For Cyrillic scripts the best quality is achieved using the standardized transliteration according to ISO 9.¹ This method not only covers all contemporary languages that are written in a variety of Cyrillic but provides a bijective mapping on latin characters as well. Consequently, you can unambiguously revert the transliteration into its original form which was impossible with previous versions of ISO 9 because they contained several exceptions depending on the original language. Although fifteen years old it has not yet made its way

¹ ISO (1995).

into scholarly publications at large so it might not immediately look familiar.² The diacritics are not identical to the “scientific” transliteration used in Slavic studies but as long as your editor does not enforce its traditional method you should always prefer ISO 9 ([mode=ru], [mode=ru_old], [mode=all]).

But ISO 9, too, has its shortcomings. It has no definitions for historical forms of the cyrillic script like pre-XVIII-century Russian and Old (Church) Slavonic while those are covered by the scholarly transliterations. To amend the situation the Transliterator provides an extension to ISO 9 for Old Slavonic containing the glyphs І, љ, Ѣ, Ѩ, Ѫ, ѫ, Ѧ, ѩ, Ѫ, Ѯ and Ѱ taken from the scientific transliteration ([mode=iso9_ocs]). If you prefer more coherency you might want to use pure “scientific” transliteration ([mode=ocs]). This method is complemented by [mode=ocs_gla], the only option the Transliterator offers for the Glagolitic alphabet; they can be used consistently along each other as they were taken from the same book.³

As far as I know there is no standardized transliteration for Greek so I had to resort to the one that is used in scholarly literature. Its main drawback is that it has no representation for diacritics apart from (rough) breathing, but it respects specific rules for diphthongs and vowels in initial positions ([mode=gr]). There is one alternative mode for those who prefer their γ phonetically resolved to /n/ before velars (γ, ξ, χ and ξ; [mode=gr_n]).

Concerning the hyphenation within transliterated passages the default is set to [hyphenate=cs] (Czech) which produces reasonable results when using all, iso9_ocs or ru_cz. For stuff like the English and German transcription use their respective native hyphenation.⁴ However, as there is no hyphenation pattern I know of that closely resembles the transliteration of Greek you might have to resort to putting \discretionary hyphens when line breaking does not satisfy.

The Transliterator as a whole is nothing more than a bunch of dictionaries containing substitution rules for tokens that may occur in the text. These tokens may be single characters or strings of more than one character. As

² A hasty glance at the latest issues of around 20 journals in a local library revealed that 2 of them actually are using ISO 9, these are *Przegląd wschodni* as of Nr. X, 3 (2008) and *Kwartalnik historyczny* as of CXVI, 3 (2009); the latter even contains a table on p. 218 showing a subset of the ISO 9 transliteration rules.

³ Birnbaum/Schaeken (1999) p. 77 [<http://www.schaeken.nl/lu/research/online/publications/akslstud/index.htm>].

⁴ You'll have to specify this through \setuptransliterator or locally because the default hyphenation is *not* the same as your documents'.

there is no simple way to impose order onto those dictionaries the rules for one transliteration method are, if needed, distributed over more than one table which will be applied successively to ensure that multi-character rules are processed first.

mode	time(1) in s	ConTeXt
<none>	8.98	8.82
all	8.37	8.25

ru_transcript_de	14.83	14.71

Table 1 Processing time for corpus Evgenij Onegin according to GNU time(1) and the ConTeXt stats.

erator should have little impact on document processing time at large, with the exception of the German transcription mode, perhaps.⁵ Transliterating (and typesetting in MKIV) Aleksandr Puškin’s verse novel Evgenij Onegin, a corpus of about 27000 words, in [mode=all] shows little to no delay at all. In fact, typesetting cyrillic letters with russian hyphenation seems slow things down so much that transliteration may be faster and uses slightly less memory.⁶

Following suggestions from the mailing list, the Transliterator uses *LPEG* when substituting. This means a huge speed improvement for most substitution modes when compared to the older mechanism that used `string.gsub` iteratively. In ordinary use when transliterating single words or short phrases the Transliterator

⁵ The problem lies within the rule set for the German transcription which dictates different instructions depending on the environment of a character; these may conflict, i. e. it is impossible to substitute a character stream in a single run as some rules may apply only to the result of previous rule. Let me know if there’s a way to tell LPEG to backtrack to the last character of a match and not to continue on the next.

EXAMPLES

CYRILLIC SCRIPTS

ISO 9 AND DERIVATIVES

Several transliteration rules are either strictly ISO 9 compliant (`ru`, `ru_old`, `all`) or contain ISO 9 as a subset (`iso9_ocs`).⁷

В ворота гостиницы губернского города NN въехала довольно красивая рессорная небольшая бричка, в какой ездят холостяки: отставные подполковники, штабс-капитаны, помешники, имеющие около сотни душ крестьян, — словом, все те, которых называют господами средней руки. В бричке сидел господин, не красавец, но и не дурной наружности, ни слишком толст, ни слишком тонок; нельзя сказать, чтобы стар, однако ж и не так чтобы слишком молод.

V vorota gostinicy gubernskogo goroda NN v"ehala dovoľno krasivââ ressornââ nebol'sââ brička, v kakov ezdát holostâki: otstavnye podpolkovniki, štabs-kapitany, pomešniki, imenûše okolo sotni duš krest'ân, — slovom, vse te, kotoryh nazývajt gospodami srednej ruki. V bričke siedel gospodin, ne krasavec, no i ne durnoj naružnosti, ni sliškom tolst, ni sliškom tonok; nel'zâ skazat', čtoby star, odnako ž i ne tak čtoby sliškom molod.

“SCIENTIFIC” TRANSLITERATION

These transliterations are widely used among scholars, mainly linguists and, to a lesser extent, historians. They comprise large character sets in order to represent the original text adequately and facilitate comparison of texts of the same language written in different scripts; they are not, however, as easily reversible as ISO 9.

Figure 7 [mode=ocs,hyphenate=cs] *Transliteration for Old Slavonic used in Slavic studies, taken from the excellent book of Birnbaum/Schaeken (1999).⁸*

⁸ This one and both of the following Czech transliterations, although elegantly dealing with hard and weak signs by taking characters from the Cyrillic alphabet, are not unquestioned from a typographical point of view: “If contrasting faces are used for phonetic transcriptions and main text, each entire phonetic word or passage, not just the individual phonetic characters, should be set in the chosen phonetic face. Patchwork typography, in which the letters of a single word come from different faces and fonts, is a sign of typographic failure. [...] Such mixtures are almost sure to fail unless all the fonts involved have been designed as a single family.” (Bringhurst (2008)) From this follows that it is advisable to reconsider your font whether it indeed provides the needed glyphs from Russian as well.

Прошло семь лет после 12-го года. Взволнованное историческое море Европы улеглось в свои берега. Оно казалось застывшим; но таинственные силы, движущие человечество (тайные потоки, потому что законы, определяющие их движение, неизвестны нам), продолжали свое действие. Несмотря на то, что поверхность исторического моря казалась неподвижной, так же непрерывно, как движение времени, двигалось человечество. Слагались, разлагались различные группы людских сплотов; подготавливались причины образования и разложения государств, перемещений народов.

Prošlo sedam let posle 12.-go goda. Vzvolneno istoričesko more Evropy uleglo se v svoi berega. Ono kazalo se zatichšim; no taistvennye sily, dvigajuščie čelovečestvo (taistvennye potoku, čto zakony, opredeljajuščie ich dvizhenie, neizvestny nam), prodolžali svoye dejstvie. Nesmotra na to, čto poverchnost istoričeskogo morja kazala se nepodvižnoj, tak že nepreryvno, kak dvizhenie vremeni, dvigalosy čelovečestvo. Slagalisa, razlagalisa različnye gruppy ljudskikh sceplenij; podgotovljalisy pričiny obrazovaniya i razloženija gosudarstv, peremešcij narodov.

LEGACY NATIONAL TRANSCRIPTIONS

At the moment there are tables for “old school” transcription into three languages: English (via `ru_transcript_en`), German (`ru_transcript_de`) and Czech (`ocs_cz`). At least the German one is almost unreadable if used with strings longer than two words. As we have the bijective ISO 9 mapping at hand there should be no reason at all to use any of them.

Figure 13 [mode=ru_transcript_en,hyphenate=en] English transcription for contemporary Russian.

Прошло семь лет после 12-го года. Взволнованное историческое море Европы улеглось в свои берега. Оно казалось застихшим; но таинственные силы, двигающие человечество (тайные потоки, что определяют его движение, неизвестны нам), продолжали свое действие. Несмотря на то, что поверхность исторического моря казалась неподвижной, так же непрерывно, как движение времени, двигалось человечество. Слагались, разлагались различные группы людских сцеплений; готовились причины образования и разложения государств, перемещений народов.

Figure 14 [mode=ru_transcript_de,hyphenate=deo] German transcription for contemporary Russian.⁹

⁹ Following Drosdowski/Müller/Scholze-Stubenrecht/Wermke (1952) p. 82; all the canonical rules are implemented save one: *-ego* and *-ovo* should resolve to *-ewo* and *-wo* respectively iff genitive endings. As this is a grammatical rather than graphical criterion writing a substitution algorithm would amount to do natural language parsing. To make things worse this rule is phonetically confused as it would not take care of other contexts where *z* in those patterns is articulated as /v/ like for instance in *сегодня* (which is a historical genitive, though ...). So even if this could be implemented it would not be advisable to use such a rule.

Figure 15 [mode=oocs_gla,hyphenate=cs] “Scientific” transliteration for Old Slavonic written in the Glagolitic alphabet as used in *Birnbaum/Schaeken (1999)*.

GREEK

The Transliterator offers two modes for handling Greek: gr and gr_n. They differ only on one aspect. gr transliterates the canonical Greek alphabet as well as the special glyphs Digamma, Quoppa and Sampi. gr_n behaves exactly the same way except that nasalization is observed such that γ+[\gamma|\kappa] yields n+[g|k].

οἵνῳ δὲ κάρτα προσκέαται, καὶ σφι οὐκ ἔμε-
σα ἔξεστι, οὐκέτι οὐρῆσαι ἀντίον ἄλλου. ταῦτα
μέν νυν οὕτω φυλάσσεται, μεθύσκομενοι δὲ
ἐώντας βιούλεσστας τὸ σπουδαέστατον τῶν
πρηγμάτων: τὸ δὲ ἀδή σφι βιούλουμένοισι,
τοῦτο τῇ ὑστεράῃ νήρουσα προτιθεῖ ὁ στέ-
γαρχος, ἐν τού ἀν ἐόντες βιούλεύνωται, καὶ
ἡν μὲν ἀδή καὶ νήρουσι, χρέωνται αὐτῷ, ἡν
δὲ μὴ ἀδή, μετιεῖσι. τὰ δὲ ἀν νήρουντες προβού-
λεύσωνται, μεθύσκομενοι ἐπιδιαγνώσκουνται.

oinō de karta proskeatai, kai sphi uk emesai
exesti, uki uresei antion allu. tauta men nyn
hutō phylasetai, methyskomenoi de eothasi
buleuesthai ta spudaiestata; ton pragmaton:
to d' an hadē sphi buleuomenoisi, tuto tē
hysteraiē nephusi protithei ho stegarchos, en
tu an eontes buleuontai, kai en men hadē
kai nephusi, chreontai autō, en demē hadē,
metieisi. ta d' an nephontes probuleusontai,
methyskomenoi epidiajinōskusi.
