The dozenal Package, v3.3

Donald P. Goodman III

April 9, 2013

Abstract

The dozenal package provides some simple mechanisms for working with the dozenal (duodecimal or "base 12") numerical system. It redefines all basic LaTeX counters, provides a command for converting arbitrary decimal numbers into dozenal, and provides new, real Metafont characters for ten and eleven, though the commands for producing them can be redefined to produce any figure. As of v2.0, it also includes Type 1 versions of the fonts, used automatically whenever T1 encoding is selected for the document. This package uses the \basexii algorithm by David Kastrup.

4	Implementation	4

1 Introduction

While most would probably call it at best overoptimistic and at worst foolish, some people (the author included) do still find themselves attracted to the dozenal (base-twelve) system. These people, however, have been pretty hard up¹ in the LATEX world. There is no package file available which produces dozenal counters, like page and chapter numbers, nor were there any (I made a pretty diligent search) dozenal characters for ten and eleven, leaving dozenalists forced to use such makeshift ugliness as the "X/E" or "T/E" or "*/#" or whatever other standard they decided to use. While this sort of thing may be acceptable in ASCII, it's absolutely unacceptable in a beautiful, typeset document.

 $^{^{1}\}mathrm{This}$ is an Americanism for "out of luck" or "in difficult circumstances," for those who do not know.

Enter the dozenal package. This package automates all the messiness of being a dozenalist and using LATEX. It redefines all the counters (though you'll have to redefine them yourself if you're using your own), provides an algorithm (generously donated by the intrepid David Kastrup) for converting arbitrary positive whole numbers into dozenal (this is eTeX, but all modern distributions will compile that), and finally, it includes original dozenal characters, specifically designed to blend in well with Knuth's Computer Modern fonts, though they should do fine with the more common body fonts, as well.

This document was typeset in accordance with the LATEX DOCSTRIP utility.

2 Usage

The dozenal package provides four new commands (though I can only take credit for two of them). The first, and by far the most important given the purpose and content of this package, is **\basexii**. This is a very simple command which takes the following structure:

 $\begin{cases} \begin{cases} \begin{cases} \align=\color=0.5\colo$

What the above means is that the command is **\basexii** and it takes three mandatory arguments: first, the number to be converted into dozenal; second, the symbol that should be used for ten; and third, the symbol that should be used for eleven. This number should be positive and whole; that is, it should be zero or higher, and it should not contain a fractional part. TEX is a typesetting program, after all; if you want a robust decimal to dozenal converter, there are many options that any dozenalists caring enough to use this package will already know about.

This \basexii algorithm was produced by David Kastrup, well known and admired in the TeX world for his many useful packages and other contributions. He posted this algorithm on comp.text.tex; it is included here with his kind and generous permission.

That one would want to use the same ten and eleven symbols throughout a document seems a reasonable assumption; therefore, I have provided a simplified version of the **\basexii** command, **\dozens**. **\dozens** takes only a single argument, the number to be converted; the ten and eleven symbols used are those produced by the commands **\x** and **\e**, to which we'll get in a moment.

\x and \e are the commands used to quickly and easily access the symbols for ten and eleven without having to use active characters (the TEX gurus will know what that means; if you don't know, that's okay; you don't need to to use this package effectively). In any case, \x and \e default to using the special dozenal characters that are part of this package; they could be easily redefined if for some reason you don't like the Pitman characters (which this package, and the Dozenal Society of Great Britain, prefer), in the following manner:

$\mbox{renewcommand}\x{X}$

Or whichever characters you like to use. If you prefer the Dozenal Society of America's proposed characters (a stylized X and E), then this package will disappoint

\basexii

dozens

\x \e you. May I suggest $\$ in (χ) and xi (ξ) as a stopgap while you locate or produce real characters of your own? Sorry; I'm an American myself, but I much prefer the Pitman characters for a variety of reasons (feel free to email me if you care), and creating fonts in METAFONT, even small and inconsequential ones like this, is too much work for characters that I don't even like.

The dozenal package also redefines all the standard IATEX counters, such as section and enumii. If you've defined your own counters, you'll need to define them yourself; however, this is an easy matter:

\renewcommand\thecounter{\basexii{\arabic{counter}}{\x}{\e}}

For example. Of course, you can fill in the \x and \e with whatever you want (though it would make more sense to simply redefine \x and \e, so that all the counters would use the same characters), or you could use the \dozens command instead. Whatever your pleasure might be.

nocounters

The nocounters option to the package prevents the redefinition of these counters. The effect of this is that the commands of the package (\basexii, \dozens, etc.) are made available, but all the counters will still be in decimal. This permits using dozenal characters in an otherwise decimal document; it also proves useful in dozenal document in which these counters are undefined (e.g., minimal).

3 The Fonts

The fonts provided by the dozenal package are essentially complete fonts which contain only the Pitman dozenal characters; these are 7 for ten and 8 for eleven. These characters are designed to blend well with the Computer Modern fonts; they work passable well with Times-type fonts and with kpfonts, and possibly with others.

The characters also come in all the appropriate shapes and sizes; a few examples follow.

	Roman	Italic	Boldface
Footnotesize	3.5	8 °E	32
Normalsize	3.5	3 S	35
LARGE	3.5	$z \varepsilon$	35
Huge	3 5	<i>7 E</i>	35

They will work in paragraph or math mode without distinction.

As of v4.0, dozenal also includes fonts for tally marks specifically designed for use in the dozenal base. In many European countries tallies are kept in a very similar way; this font demonstrates a way that such tally marks can be made consistent as well as dozenal.

The fonts are called dozch, if for some reason direct access to them is needed. The Type 1 versions are prefixed fdz; e.g., fdzr8a.

4 Implementation

First, we name the package that we provide. This is not exactly the most difficult part of the code.

 $_1\$ v4.0 support for dozenal fonts] Now we need to make sure that we have fixltx2e loaded, so that the **\TextorMath**

2 \RequirePackage{fixltx2e}

Now we ensure that ifpdf is loaded, so that we can test for pdf or dvi modes.

3 \RequirePackage{ifpdf}

magic will work.

Now we declare the option "nocounters", which prevents dozenal from redefining all the counters. This prevents errors in document classes which don't have these counters, such as minimal. Defines the command \nocounters if and only if the options is named.

- 4 \DeclareOption{nocounters}{%
- 5 \def\nocounters{}%
- 6 }%
- 7 \ProcessOptions\relax

We then define the font that we're using for our METAFONT-produced Pitman characters. Incidentally, we also define the command \doz, though I can't foresee any decent use for it except in packages and preambles; it is then used to define \x and \e, which provide the ten and eleven symbols for all the counter redefinitions. This includes definitions for both T1 and OT1 encodings, so it will work with either.

- 8 \DeclareFontFamily{OT1}{dozch}{}
- 9 \DeclareFontShape{OT1}{dozch}{m}{n}{<-6> dozchars6 <7> dozchars7 <8> dozchars8 <9> dozchars9 <1
- ${\tt 10 \backslash DeclareFontShape\{0T1\}\{dozch\}\{b\}\{n\}\{<->\ dozchb10\ \}\{\}\}}$
- 11 \DeclareFontShape{OT1}{dozch}{bx}{n}{<-6> dozchbx6 <7> dozchbx7 <8> dozchbx8 <9> dozchbx9 <10-1
 12 \DeclareFontShape{OT1}{dozch}{m}{sl}{<-8> dozchs18 <9> dozchs19 <10-11> dozchs110 <12-> dozchs1
- 13 \DeclareFontShape{OT1}{dozch}{bx}{s1}{<-> dozchbxs110 }{}
- 14 \DeclareFontShape $\{0T1\}\{dozch\}\{m\}\{it\}\{<-7>\ dozchit7 <8>\ dozchit8 <9>\ dozchit9 <10-11>\ dozchit10$
- 15 \DeclareFontShape{OT1}{dozch}{bx}{it}{<-> dozchbxi10 }{}
- 16 \ifpdf
- 17 \pdfmapfile{=fdz.map}
- 18 \fi
- 19 \DeclareFontFamily{T1}{dozch}{}
- 20 \DeclareFontShape{T1}{dozch}{m}{n}{<-> fdzr8r }{}
- 21 \DeclareFontShape{T1}{dozch}{bx}{n}{<-> fdzb8r }{}
- 22 \DeclareFontShape{T1}{dozch}{m}{s1}{<-> fdzs8r }{}
- 23 \DeclareFontShape{T1}{dozch}{bx}{s1}{<-> fdzbo8r }{}
- 24 \DeclareFontShape{T1}{dozch}{m}{it}{<-> fdzso8r }{}
- 25 \DeclareFontShape{T1}{dozch}{bx}{it}{<-> fdzbi8r }{}

```
26 \newcommand\doz[1]{{\fontfamily{dozch}\selectfont #1}}
27 \newcommand\x{\TextOrMath{\protect\doz{{X}}}{\X}}\%
28 \newcommand\e{\TextOrMath{\protect\doz{{E}}}{\E}}\%
29 \DeclareSymbolFont{dozens}{OT1}{dozch}{m}{n}
30 \DeclareMathSymbol{\X}{\mathord}{dozens}{69}

Put in some additional code for the tally marks.
32 \newcommand\tally[1]{\%
33 \doz{#1}\%
34 }\%
```

Then we define our command which will produce the dozenal numbers from decimal sources. This algorithm was taken directly from the publicly available archives of comp.text.tex, where it was posted by the well-known and redoubtable David Kastrup. We also define the \dozens command, a simplified \basexii (which, in fact, depends utterly upon \basexii), just to make it easy for everyone.

```
35 \def\basexii#1#2#3{\ifcase\numexpr(#1)\relax
```

- $36\ 0\color1\color3\color4\color0\color7\color9\color#2\color#3\else$
- $37 \expand after \expand after \number \numexpr((\#1)-6)/12 \expand after \basexii\expand after \all after \a$
- 38 \newcommand\dozens[1]{\basexii{#1}{\x}{\e}}

57 } % end undefined

Now, of course, we simply redefine all the counters. This covers only those counters included in the basic LATEX document classes, however, so if you've written your own, you'll need to redefine them yourself.

This first bit ensures that the counters are redefined even if the command \mainmatter is not defined. We have to do this outside of the \g@addto@macro below; otherwise, in documents where \mainmatter is defined but not used, the counters will not be redefined. This way, they're redefined in all cases.

This also takes care of ensuring that the counters are only redefined if the "nocounters" options was *not* specified.
