## 1 Introduction

This package contains the LaTeX support for the font PT Serif developed by ParaType for the project *Public Types of Russian Federation* and released under an open user license. The font was designed by Alexandra Korolkova, Olga Umpeleva and Vladimir Yefimov. For more information see the web-site of [ParaType](#).

PT Serif has four basic styles: regular, **bold**, *italic*, ***bold italic*** and two caption styles: *caption* and *caption italic*. The font covers standard Western, Central European and Cyrillic code pages and contains also characters of all title languages of Russian Federation.

This package supports encodings T1, OT1, IL2, TS1, T2A, T2B, T2C and X2. If there is some important encoding missing, let me know and I will try to add it to some future release.

The fonts are included in the original TrueType format and in the converted Type 1 format.

Font PT Serif can be used together with the font PT Sans.

## 2 License

The font PT Serif is licensed under Paratype Free Font License (the license is included).

The fonts in TrueType format are original files provided by ParaType. The fonts in Type 1 format are not original files. They were converted by me using FontForge and may be distributed for  $\text{\TeX}$  only. The distribution of these converted fonts was kindly allowed by ParaType.

All the support files are licensed under  $\text{\LaTeX}$ Project Public License, either version 1.3 of this license or (at your option) any later version.

## 3 Implementation

The package was created using *fonttools* but with some changes. The prefix of the encoding files was changed from *a\_* to *ptserif\_* to avoid name clashes. The style files are very different and font definition files include also font substitutions.

There are two map-files that you can use for the installation of the fonts with *updmap*: *PTSerif-truetype.map* and *PTSerif-type1.map*. You should use just one of them. The file *PTSerif-type1.map* is a safe choice and you will get the full power of  $\text{\TeX}$ . If you just want to create PDF files with  $\text{pdf\TeX}$  or  $\text{pdf\LaTeX}$  you can use the file *PTSerif-truetype.map* and the original TrueType fonts will be used.

## 4 Using the Package

There are two families PTSerif-TLF and PTSerifCaption-TLF that you can set with packages PTSerif and PTSerifCaption. You must explicitly use the package *fontenc* or *textcomp* (if needed). For example:

```
\usepackage[T1]{fontenc}
\usepackage{PTSerif}
```

If you want to use this font together with another font with somewhat different proportions, you may use the option *scaled*:

```
\usepackage[scaled=0.9]{PTSerif}
```

You might also want to change the default font family of the document:

```
\renewcommand{\familydefault}{\sfdefault}
```

You can typeset some text in a desired font like this:

```
{\usefont{T1}{PTSerifCaption-TLF}{m}{it}Text in caption italic font}
```

## 5 Known Bugs

The caption styles are independent font family. It is your choice where you will use them.

Please [send me](#) bug reports and suggestions about this package.
