Printed August 26, 2006

Abstract

The standard distribution of LaTeX contains a number of document classes that are meant to be used, but also serve as examples for other users to create their own document classes. These document classes have become very popular among LaTeX users. But it should be kept in mind that they were designed for American tastes and typography. At one time they contained a number of hard-wired texts. This report describes babel, a package that makes use of the new capabilities of TeX version 3 to provide an environment in which documents can be typeset in a non-American language, or in more than one language.

1 The user interface

The user interface of this package is quite simple. It consists of a set of commands that switch from one language to another, and a set of commands that deal with shorthands. It is also possible to find out what the current language is.

\selectlanguage

When a user wants to switch from one language to another he can do so using the macro \selectlanguage. This macro takes the language, defined previously by a language definition file, as its argument. It calls several macros that should be defined in the language definition files to activate the special definitions for the language chosen.

otherlanguage

The environment otherlanguage does basically the same as \selectlanguage, except the language change is local to the environment. This environment is required for intermixing left-to-right typesetting with right-to-left typesetting. The language to switch to is specified as an argument to \begin{otherlanguage}.

\foreignlanguage

The command \foreignlanguage takes two arguments; the second argument is a phrase to be typeset according to the rules of the language named in its first argument. This command only switches the extra definitions and the hyphenation rules for the language, *not* the names and dates.

otherlanguage*

In the environment otherlanguage* only the typesetting is done according to the rules of the other language, but the text-strings such as 'figure', 'table', etc. are left as they were set outside this environment.

hyphenrules

The environment hyphenrules can be used to select *only* the hyphenation rules to be used. This can for instance be used to select 'nohyphenation', provided that in language.dat the 'language' nohyphenation is defined by loading serohyph.tex.

\languagename

The control sequence \languagename contains the name of the current language.

\iflanguage

If more than one language is used, it might be necessary to know which language is active at a specific time. This can be checked by a call to \iflanguage. This macro takes three arguments. The first argument is the name of a language; the second and third arguments are the actions to take if the result of the test is true or false respectively.

\useshorthands

The command \useshorthands initiates the definition of user-defined shorthand sequences. It has one argument, the character that starts these personal shorthands.

\defineshorthand

The command \defineshorthand takes two arguments: the first is a oneor two-character shorthand sequence, and the second is the code the shorthand should expand to.

 \aliansel{lambda}

The command **\aliasshorthand** can be used to let another character perform the same functions as the default shorthand character. If one prefers for example to use the character / over " in typing polish texts, this can be achieved by entering \aliasshorthand{"}{/}. Please note that the substitute shorthand character must have been declared in the preamble of your document, using a command such as \useshorthands{/} in this example.

\languageshorthands

The command \languageshorthands can be used to switch the shorthands on the language level. It takes one argument, the name of a language. Note that for this to work the language should have been specified as an option when loading the babel package.

\shorthandon \shorthandoff

It is sometimes necessary to switch a shorthand character off temporarily, because it must be used in an entirely different way. For this purpose, the user commands \shorthandoff and \shorthandon are provided. They each take a list of characters as their arguments. The command \shorthandoff sets the \catcode for each of the characters in its argument to other (12); the command \shorthandon sets the \catcode to active (13). Both commands only work on 'known' shorthand characters. If a character is not known to be a shorthand character its category code will be left unchanged.

\languageattribute

This is a user-level command, to be used in the preamble of a document (after \usepackage[...]{babel}), that declares which attributes are to be used for a given language. It takes two arguments: the first is the name of the language; the second, a (list of) attribute(s) to used. The command checks whether the language is known in this document and whether the attribute(s) are known for this language.

1.1 Languages supported by Babel

In the following table all the languages supported by Babel are listed, together with the names of the options with which you can load babel for each language.

Language	Option(s)
Afrikaans	afrikaans
Bahasa	bahasa
Basque	basque
Breton	breton
Bulgarian	bulgarian
Catalan	catalan
Croatian	croatian
Czech	czech
Danish	danish
Dutch	dutch
English	english, USenglish, american, UKenglish, british,
Liigiisii	canadian, australian, newzealand
Esperanto	esperanto
Estonian	estonian
Finnish	finnish
French	french, français, canadien, acadian
Galician	galician
German	austrian, german, germanb, ngerman, naustrian
Greek	greek, polutonikogreek
Hebrew	hebrew
Hungarian	magyar, hungarian
Icelandic	icelandic
Interlingua	interlingua
Irish Gaelic	irish
Italian	italian
Latin	latin
Laum Lower Sorbian	lowersorbian
North Sami	samin
TIOI III Daiiii	Samm

$\operatorname{ption}(s)$
rsk, nynorsk
lish
rtuges, portuguese, brazilian, brazil
manian
ssian
ottish
anish
vak
ovene
redish
rbian
rkish
rainian
persorbian
elsh

For some languages babel supports the options activeacute and activegrave; for typestting Russian texts, babel knows about the options LWN and LCY to specify the fontencoding of the cyrillic font used. Currently only LWN is supported.

1.2 Workarounds

If you use the document class book and you use \ref inside the argument of \chapter, IATEX will keep complaining about an undefined label. The reason is that the argument of \ref is passed through \uppercase at some time during processing. To prevent such problems, you could revert to using uppercase labels, or you can use \lowercase{\ref{foo}} inside the argument of \chapter.

2 Changes for $\LaTeX 2_{\varepsilon}$

With the advent of \LaTeX 2_{ε} the interface to babel in the preamble of the document has changed. With \LaTeX 2.09 one used to call up the babel system with a line such as:

\documentstyle[dutch,english]{article}

which would tell LATEX that the document would be written in two languages, Dutch and English, and that English would be the first language in use.

The $\LaTeX 2_{\varepsilon}$ way of providing the same information is:

```
\documentclass{article}
\usepackage[dutch,english]{babel}
```

or, making dutch and english global options in order to let other packages detect and use them:

```
\documentclass[dutch,english]{article}
\usepackage{babel}
\usepackage{varioref}
```

In this last example, the package varioref will also see the options and will be able to use them.

3 Changes in Babel version 3.7

In Babel version 3.7 a number of bugs that were found in version 3.6 are fixed. Also a number of changes and additions have occurred:

- Shorthands are expandable again. The disadvantage is that one has to type '{}a when the acute accent is used as a shorthand character. The advantage is that a number of other problems (such as the breaking of ligatures, etc.) have vanished.
- Two new commands, \shorthandon and \shorthandoff have been introduced to enable to temporarily switch off one or more shorthands.
- Support for typesetting Greek has been enhanced. Code from the kdgreek package (suggested by the author) was added and \greeknumeral has been added.
- Support for typesetting Basque is now available thanks to Juan Aguirregabiria.
- Support for typesetting Serbian with Latin script is now available thanks to Dejan Muhamedagić and Jankovic Slobodan.
- Support for typesetting Hebrew (and potential support for typesetting other right-to-left written languages) is now available thanks to Rama Porrat and Boris Lavva.
- Support for typesetting Bulgarian is now available thanks to Georgi Boshnakov.
- Support for typesetting Latin is now available, thanks to Claudio Beccari and Krzysztof Konrad Żelechowski.
- Support for typesetting North Sami is now available, thanks to Regnor Jernsletten.
- The options canadian, canadien and acadien have been added for Canadian English and French use.
- A language attribute has been added to the \mark... commands in order to make sure that a Greek header line comes out right on the last page before a language switch.
- Hyphenation pattern files are now read *inside a group*; therefore any changes a pattern file needs to make to lowercase codes, uppercase codes, and category codes are kept local to that group. If they are needed for the language, these changes will need to be repeated and stored in \extras...
- The concept of language attributes is introduced. It is intended to give the user some control over the features a language-definition file provides. Its first use is for the Greek language, where the user can choose the $\pi o \lambda v \tau o v \kappa \delta$ ("Polutoniko" or multi-accented) Greek way of typesetting texts. These attributes will possibly find wider use in future releases.
- The environment hyphenrules is introduced.
- The syntax of the file language.dat has been extended to allow (optionally) specifying the font encoding to be used while processing the patterns file.
- The command \providehyphenmins should now be used in language definition files in order to be able to keep any settings provided by the pattern file.

4 Changes in Babel version 3.6

In Babel version 3.6 a number of bugs that were found in version 3.5 are fixed. Also a number of changes and additions have occurred:

- A new environment otherlanguage* is introduced. it only switches the 'specials', but leaves the 'captions' untouched.
- The shorthands are no longer fully expandable. Some problems could only be solved by peeking at the token following an active character. The advantage is that '{}a works as expected for languages that have the 'active.
- Support for typesetting french texts is much enhanced; the file francais.ldf is now replaced by frenchb.ldf which is maintained by Daniel Flipo.
- Support for typesetting the russian language is again available. The language definition file was originally developed by Olga Lapko from CyrTUG. The fonts needed to typeset the russian language are now part of the babel distribution. The support is not yet up to the level which is needed according to Olga, but this is a start.
- Support for typesetting greek texts is now also available. What is offered in this release is a first attempt; it will be enhanced later on by Yannis Haralambous.
- in babel 3.6j some hooks have been added for the development of support for Hebrew typesetting.
- Support for typesetting texts in Afrikaans (a variant of Dutch, spoken in South Africa) has been added to dutch.ldf.
- Support for typesetting Welsh texts is now available.
- A new command \aliasshorthand is introduced. It seems that in Poland various conventions are used to type the necessary Polish letters. It is now possible to use the character / as a shorthand character instead of the character ", by issuing the command \aliasshorthand{"}{/}.
- The shorthand mechanism now deals correctly with characters that are already active.
- Shorthand characters are made active at \begin{document}, not earlier. This is to prevent problems with other packages.
- A preambleonly command \substitutefontfamily has been added to create .fd files on the fly when the font families of the Latin text differ from the families used for the Cyrillic or Greek parts of the text.
- Three new commands \LdfInit, \ldf@quit and \ldf@finish are introduced that perform a number of standard tasks.
- In babel 3.6k the language Ukrainian has been added and the support for Russian typesetting has been adapted to the package 'cyrillic' to be released with the December 1998 release of LATEX 2_{ε} .

5 Changes in Babel version 3.5

In Babel version 3.5 a lot of changes have been made when compared with the previous release. Here is a list of the most important ones:

• the selection of the language is delayed until \begin{document}, which means you must add appropriate \selectlanguage commands if you include \hyphenation lists in the preamble of your document.

- babel now has a language environment and a new command \foreignlanguage;
- the way active characters are dealt with is completely changed. They are called 'shorthands'; one can have three levels of shorthands: on the user level, the language level, and on 'system level'. A consequence of the new way of handling active characters is that they are now written to auxiliary files 'verbatim';
- A language change now also writes information in the .aux file, as the change might also affect typesetting the table of contents. The consequence is that an .aux file generated by a LaTeX format with babel preloaded gives errors when read with a LaTeX format without babel; but I think this probably doesn't occur;
- babel is now compatible with the inputenc and fontenc packages;
- the language definition files now have a new extension, ldf;
- the syntax of the file language.dat is extended to be compatible with the french package by Bernard Gaulle;
- each language definition file looks for a configuration file which has the same name, but the extension .cfg. It can contain any valid LATEX code.

6 The interface between the core of babel and the language definition files

In the core of the babel system, several macros are defined for use in language definition files. Their purpose is to make a new language known.

The macro \addlanguage is a non-outer version of the macro \newlanguage, defined in plain.tex version 3.x. For older versions of plain.tex and lplain.tex a substitute definition is used.

\adddialect

The macro \addialect can be used when two languages can (or must) use the same hyphenation patterns. This can also be useful for languages for which no patterns are preloaded in the format. In such cases the default behaviour of the babel system is to define this language as a 'dialect' of the language for which the patterns were loaded as \language0.

The language definition files must conform to a number of conventions, because these files have to fill in the gaps left by the common code in babel.def, i.e., the definitions of the macros that produce texts. Also the language-switching possibility which has been built into the babel system has its implications.

The following assumptions are made:

- Some of the language-specific definitions might be used by plain TFX users, so the files have to be coded so that they can be read by both LATEX and plain T_FX. The current format can be checked by looking at the value of the macro \fmtname.
- The common part of the babel system redefines a number of macros and environments (defined previously in the document style) to put in the names of macros that replace the previously hard-wired texts. These macros have to be defined in the language definition files.
- The language definition files define five macros, used to activate and deactivate the language-specific definitions. These macros are $\langle lang \rangle$ hyphenmins, $\langle lang \rangle$, $\langle lang \rangle$, $\langle lang \rangle$ and $\langle lang \rangle$; where $\langle lang \rangle$ is either the name of the language definition file or the name of the LATEX option that is to be used. These macros and their functions are discussed below.

\addlanguage

- When a language definition file is loaded, it can define $\logline \logline \logl$
- The language definition files can be read in the preamble of the document, but also in the middle of document processing. This means that they have to function independently of the current \catcode of the @ sign.

\providehyphenmins

The macro \providehyphenmins should be used in the language definition files to set the \lefthyphenmin and \righthyphenmin. This macro will check whether these parameters were provided by the hyphenation file before it takes any action.

The macro $\langle lang \rangle$ hyphenmins is used to store the values of the $\$ lefthyphenmin and $\$ righthyphenmin.

The macro $\backslash captions \langle lang \rangle$ defines the macros that hold the texts to replace the original hard-wired texts.

The macro $\langle lang \rangle$ defines $\langle lang \rangle$ and

The macro $\langle lang \rangle$ contains all the extra definitions needed for a specific language.

Because we want to let the user switch between languages, but we do not know what state T_EX might be in after the execution of $\texttt{\extras}\langle lang\rangle$, a macro that brings T_EX into a predefined state is needed. It will be no surprise that the name of this macro is $\texttt{\ensuremath{\mbox{noextras}}}\langle lang\rangle$.

This is a command to be used in the language definition files for declaring a language attribute. It takes three arguments: the name of the language, the attribute to be defined, and the code to be executed when the attribute is to be used.

To postpone the activation of the definitions needed for a language until the beginning of a document, all language definition files should use \main@language instead of \selectlanguage. This will just store the name of the language, and the proper language will be activated at the start of the document.

The macro \ProvidesLanguage should be used to identify the language definition files. Its syntax is similar to the syntax of the LATEX command \ProvidesPackage.

The macro \LdfInit performs a couple of standard checks that must be made at the beginning of a language definition file, such as checking the category code of the @-sign, preventing the .ldf file from being processed twice, etc.

The macro \ldf@quit does work needed if a .ldf file was processed earlier. This includes resetting the category code of the @-sign, preparing the language to be activated at \begin{document} time, and ending the input stream.

The macro \ldf@finish does work needed at the end of each .ldf file. This includes resetting the category code of the @-sign, loading a local configuration file, and preparing the language to be activated at \begin{document} time.

After processing a language definition file, LATEX can be instructed to load a local configuration file. This file can, for instance, be used to add strings to $\colongledge \colongledge \colongledge$

This command takes three arguments, a font encoding and two font family names. It creates a font description file for the first font in the given encoding. This .fd file will instruct IATEX to use a font from the second family when a font from the first family in the given encoding seems to be needed.

6.1 Support for active characters

In quite a number of language definition files, active characters are introduced. To facilitate this, some support macros are provided.

The internal macro \initiate@active@char is used in language definition files to instruct LaTeX to give a character the category code 'active'. When a character has been made active it will remain that way until the end of the document. Its definition may vary.

\captionslang

\datelang \extraslang

\noextraslang

\bbl@declare@ttribute

\main@language

\ProvidesLanguage

\LdfInit

\ldf@quit

\ldf@finish

\loadlocalcfg

\substitutefontfamily

\initiate@active@char

\bbl@activate \bbl@deactivate

The command \bbl@activate is used to change the way an active character expands. \bbl@activate 'switches on' the active behaviour of the character. \bbl@deactivate lets the active character expand to its former (mostly) non-active self.

\declare@shorthand

The macro \declare@shorthand is used to define the various shorthands. It takes three arguments: the name for the collection of shorthands this definition belongs to; the character (sequence) that makes up the shorthand, i.e. ~ or "a; and the code to be executed when the shorthand is encountered.

\bbl@add@special \bbl@remove@special

The TeXbook states: "Plain TeX includes a macro called \dospecials that is essentially a set macro, representing the set of all characters that have a special category code." [1, p. 380] It is used to set text 'verbatim'. To make this work if more characters get a special category code, you have to add this character to the macro \dospecial. LaTeX adds another macro called \@sanitize representing the same character set, but without the curly braces. The macros \bbl@add@special \langle char \rangle and \bbl@remove@special \langle char \rangle add and remove the character \langle char \rangle to these two sets.

6.2 Support for saving macro definitions

Language definition files may want to re define macros that already exist. Therefor a mechanism for saving (and restoring) the original definition of those macros is provided. We provide two macros for this 1 .

\babel@save

To save the current meaning of any control sequence, the macro **\babel@save** is provided. It takes one argument, $\langle csname \rangle$, the control sequence for which the meaning has to be saved.

\babel@savevariable

A second macro is provided to save the current value of a variable. In this context, anything that is allowed after the $\$ the primitive is considered to be a variable. The macro takes one argument, the $\langle variable \rangle$.

The effect of the preceding macros is to append a piece of code to the current definition of \originalTeX. When \originalTeX is expanded, this code restores the previous definition of the control sequence or the previous value of the variable.

6.3 Support for extending macros

\addto

The macro $\addto{\langle control\ sequence\rangle}{\langle T_EX\ code\rangle}$ can be used to extend the definition of a macro. The macro need not be defined. This macro can, for instance, be used in adding instructions to a macro like $\addto{\langle control\ sequence\rangle}$.

6.4 Macros common to a number of languages

\allowhyphens

In a couple of European languages compound words are used. This means that when TEX has to hyphenate such a compound word, it only does so at the '-' that is used in such words. To allow hyphenation in the rest of such a compound word, the macro \allowhyphens can be used.

\set@low@box

For some languages, quotes need to be lowered to the baseline. For this purpose the macro \set@low@box is available. It takes one argument and puts that argument in an \hbox, at the baseline. The result is available in \box0 for further processing.

\save@sf@q

Sometimes it is necessary to preserve the \spacefactor. For this purpose the macro \save@sf@q is available. It takes one argument, saves the current spacefactor, executes the argument, and restores the spacefactor.

\bbl@frenchspacing \bbl@nonfrenchspacing

The commands \bbl@frenchspacing and \bbl@nonfrenchspacing can be used to properly switch French spacing on and off.

¹This mechanism was introduced by Bernd Raichle.

7 Compatibility with german.sty

The file german.sty has been one of the sources of inspiration for the babel system. Because of this I wanted to include german.sty in the babel system. To be able to do that I had to allow for one incompatibility: in the definition of the macro \selectlanguage in german.sty the argument is used as the \(number \) for an \ifcase. So in this case a call to \selectlanguage might look like \selectlanguage{\german}.

In the definition of the macro \selectlanguage in babel.def the argument is used as a part of other macronames, so a call to \selectlanguage now looks like \selectlanguage{german}. Notice the absence of the escape character. As of version 3.1a of babel both syntaxes are allowed.

All other features of the original german.sty have been copied into a new file, called germanb.sty².

Although the babel system was developed to be used with IATEX, some of the features implemented in the language definition files might be needed by plain TEX users. Care has been taken that all files in the system can be processed by plain TEX.

8 Compatibility with ngerman.sty

When used with the options ngerman or naustrian, babel will provide all features of the package ngerman. There is however one exception: The commands for special hyphenation of double consonants ("ff etc.) and ck ("ck), which are no longer required with the new German orthography, are undefined. With the ngerman package, however, these commands will generate appropriate warning messages only.

9 Compatibility with the french package

It has been reported to me that the package french by Bernard Gaulle (gaulle@idris.fr) works together with babel. On the other hand, it seems not to work well together with a lot of other packages. Therefore I have decided to no longer load french.ldf by default. Instead, when you want to use the package by Bernard Gaulle, you will have to request it specifically, by passing either frenchle or frenchpro as an option to babel.

10 Identification

The file babel.sty³ is meant for $\LaTeX 2_{\varepsilon}$, therefor we make sure that the format file used is the right one.

\ProvidesLanguage

The identification code for each file is something that was introduced in LATEX 2_{ε} . When the command \ProvidesFile does not exist, a dummy definition is provided temporarily. For use in the language definition file the command \ProvidesLanguage is defined by babel.

```
10.1 \langle *!package \rangle
10.2 \ifx\ProvidesFile\@undefined
10.3 \def\ProvidesFile#1[#2 #3 #4]{%
10.4 \wlog{File: #1 #4 #3 <#2>}%
10.5 \kernel & patterns \rangle
10.6 \toks8{Babel <#3> and hyphenation patterns for }%
10.7 \langle /kernel & patterns \rangle
```

 $^{^2{\}rm The}$ 'b' is added to the name to distinguish the file from Partls' file.

 $^{^3}$ The file described in this section is called babel.dtx, has version number v3.8h and was last revised on 2005/11/23.

```
\let\ProvidesFile\@undefined
  10.8
  10.9
   As an alternative for \ProvidesFile we define \ProvidesLanguage here to be
   used in the language definition files.
10.10 (*kernel)

11.76 \DeclareOption{ukrainian}{\input{ukraineb.ldf}}
11.77 \DeclareOption{uppersorbian}{\input{usorbian.ldf}}
11.78 \DeclareOption{welsh}{\input{welsh.ldf}}
11.79 \DeclareOption{UKenglish}{\input{english.ldf}}
11.80 \DeclareOption{USenglish}{\input{english.ldf}}
```

For all those languages for which the option name is the same as the name of the language specific file we specify a default option, which tries to load the file specified. If this doesn't succeed an error is signalled.

```
11.81 \DeclareOption*{%
11.82 \InputIfFileExists{\CurrentOption.ldf}{}{%
11.83 \PackageError{babel}{%
11.84 Language definition file \CurrentOption.ldf not found}{%
11.85 Maybe you misspelled the language option?}}%
11.86 }
```

Another way to extend the list of 'known' options for babel is to create the file bblopts.cfg in which one can add option declarations.

Apart from all the language options we also have a few options that influence the behaviour of language definition files.

The following options don't do anything themselves, they are just defined in order to make it possible for language definition files to check if one of them was specified by the user.

```
11.92 \DeclareOption{activeacute}{}
11.93 \DeclareOption{activegrave}{}
```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```
11.94 \DeclareOption{KeepShorthandsActive}{}
```

The options have to be processed in the order in which the user specified them: 11.95 \ProcessOptions*

In order to catch the case where the user forgot to specify a language we check whether **\bbl@main@language**, has become defined. If not, no language has been loaded and an error message is displayed.

```
11.96 \ifx\bbl@main@language\@undefined
11.97 \PackageError{babel}{%
11.98 You haven't specified a language option}{%
11.99 You need to specify a language, either as a global
11.100 option\MessageBreak
11.101 or as an optional argument to the \string\usepackage\space
11.102 command; \MessageBreak
11.103 You shouldn't try to proceed from here, type x to quit.}
```

To prevent undefined command errors when the user insists on continuing we load babel.def here. He should expect more errors though.

```
11.104 \input{babel.def}
11.105 \fi
```

\substitutefontfamily

The command \substitutefontfamily creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

```
11.106 \def\substitutefontfamily#1#2#3{%
11.107
       \lowercase{\immediate\openout15=#1#2.fd\relax}%
11.108
       \immediate\write15{%
11.109
         \string\ProvidesFile{#1#2.fd}%
11.110
         [\the\year/\two@digits{\the\month}/\two@digits{\the\day}
11.111
          \space generated font description file]^^J
11.112
         \string\DeclareFontFamily{#1}{#2}{}^^J
         \string\DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}^J
11.113
         11.114
         \string\DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}^^J
11.115
         \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}^^J
11.116
         \left(\frac{1}{42}{b}{n}<->ssub * #3/bx/n}{}^{J}\right)
11.117
11.118
         \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{}^^J
         \string\DeclareFontShape{#1}{#2}{b}{s1}{<->ssub * #3/bx/s1}{}^^J
11.119
         \string\DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/bx/sc}{}^^J
11.120
11.121
         }%
11.122
       \closeout15
11.123
```

This command should only be used in the preamble of a document.

```
11.124 \@onlypreamble\substitutefontfamily
```

11.125 (/package)

12 The Kernel of Babel

The kernel of the babel system is stored in either hyphen.cfg or switch.def and babel.def. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns. The file babel.def contains some TEX code that can be read in at run time. When babel.def is loaded it checks if hyphen.cfg is in the format; if not the file switch.def is loaded.

Because plain T_EX users might want to use some of the features of the babel system too, care has to be taken that plain T_EX can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain T_EX and L^AT_EX, some of it is for the L^AT_EX case only.

When the command \AtBeginDocument doesn't exist we assume that we are dealing with a plain-based format. In that case the file plain.def is needed.

```
12.1 \( \dagger \text{kernel | core} \)
12.2 \( \if \text{AtBeginDocument\Quadefined} \)
```

But we need to use the second part of plain.def (when we load it from switch.def) which we can do by defining \adddialect.

```
12.3 \\ \text{kernel&!patterns} \ \def\adddialect{}

12.4 \input plain.def\relax

12.5 \fi

12.6 \( / \text{kernel} \ | \core \)

Check the presence of the command \iflanguage, if it is undefined read the file switch.def.

12.7 \( \*\core \)

12.8 \ifr\iflanguage\@undefined

12.9 \input switch.def\relax

12.10 \\ fi

12.11 \( / \core \)
```

12.1 Encoding issues (part 1)

The first thing we need to do is to determine, at \begin{document}, which latin fontencoding to use.

\latinencoding

When text is being typeset in an encoding other than 'latin' (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```
\begin{array}{l} 12.12 \ \langle *core \rangle \\ 12.13 \ \ AtEndOfPackage{\edef\latinencoding{\cf@encoding}} \end{array}
```

But this might be overruled with a later loading of the package fontenc. Therefor we check at the execution of \begin{document} whether it was loaded with the T1 option. The normal way to do this (using \@ifpackageloaded) is disabled for this package. Now we have to revert to parsing the internal macro \@filelist which contains all the filenames loaded.

```
12.14 \AtBeginDocument{%

12.15 \gdef\latinencoding{OT1}%

12.16 \ifx\cf@encoding\bbl@t@one

12.17 \xdef\latinencoding{\bbl@t@one}%

12.18 \else

12.19 \@ifl@aded{def}{t1enc}{\xdef\latinencoding{\bbl@t@one}}{}%

12.20 \fi

12.21 }
```

\latintext Then we can define the command \latintext which is a declarative switch to a latin font-encoding.

```
12.22 \DeclareRobustCommand{\latintext}{%  
12.23 \fontencoding{\latinencoding}\selectfont  
12.24 \def\encodingdefault{\latinencoding}}
```

\textlatin This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```
12.25 \ifx\@undefined\DeclareTextFontCommand  
12.26 \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}  
12.27 \else  
12.28 \DeclareTextFontCommand{\textlatin}{\latintext}  
12.29 \fi  
12.30 \langle / \text{core} \rangle
```

We also need to redefine a number of commands to ensure that the right font encoding is used, but this can't be done before babel.def is loaded.

12.2 Multiple languages

With TEX version 3.0 it has become possible to load hyphenation patterns for more than one language. This means that some extra administration has to be taken care of. The user has to know for which languages patterns have been loaded, and what values of \language have been used.

Some discussion has been going on in the TEX world about how to use \language. Some have suggested to set a fixed standard, i.e., patterns for each language should *always* be loaded in the same location. It has also been suggested to use the ISO list for this purpose. Others have pointed out that the ISO list contains more than 256 languages, which have *not* been numbered consecutively.

I think the best way to use \language, is to use it dynamically. This code implements an algorithm to do so. It uses an external file in which the person who maintains a TEX environment has to record for which languages he has hyphenation patterns and in which files these are stored. When hyphenation exceptions are stored in a separate file this can be indicated by naming that file after the file with the hyphenation patterns.

This "configuration file" can contain empty lines and comments, as well as lines which start with an equals (=) sign. Such a line will instruct LATEX that the hyphenation patterns just processed have to be known under an alternative name. Here is an example:

```
% File : language.dat
% Purpose : tell iniTeX what files with patterns to load.
english english.hyphenations
=british

dutch hyphen.dutch exceptions.dutch % Nederlands
german hyphen.ger
```

As the file switch.def needs to be read only once, we check whether it was read before. If it was, the command \iflanguage is already defined, so we can stop processing.

```
12.31 \ \langle *kernel \rangle \\ 12.32 \ \langle *!patterns \rangle \\ 12.33 \ \langle *expandafter \rangle \\ 12.34 \ \langle *expandafter \rangle \\ 12.35 \ \langle fi \\ 12.36 \ \langle /!patterns \rangle \\
```

\language Plain TEX version 3.0 provides the primitive \language that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```
12.37 \ifx\language\@undefined
12.38 \csname newcount\endcsname\language
12.39 \fi
```

\last@language Another counter is used to store the last language defined. For pre-3.0 formats an extra counter has to be allocated,

```
12.40 \ifx\newlanguage\Qundefined
12.41 \csname newcount\endcsname\lastQlanguage
plain TEX version 3.0 uses \count 19 for this purpose.
12.42 \else
12.43 \countdef\lastQlanguage=19
12.44 \fi
```

 $^{^4}$ This is because different operating systems sometimes use very different file-naming conventions.

\addlanguage

To add languages to TeX's memory plain TeX version 3.0 supplies \newlanguage, in a pre-3.0 environment a similar macro has to be provided. For both cases a new macro is defined here, because the original \newlanguage was defined to be \outer.

For a format based on plain version 2.x, the definition of \newlanguage can not be copied because \count 19 is used for other purposes in these formats. Therefor \addlanguage is defined using a definition based on the macros used to define \newlanguage in plain T_FX version 3.0.

```
12.45 \ifx\newlanguage\@undefined
       \def\addlanguage#1{%
12.46
         \global\advance\last@language \@ne
12.47
12.48
         \ifnum\last@language<\@cclvi
12.49
         \else
             \errmessage{No room for a new \string\language!}%
12.50
         \fi
12.51
12.52
         \global\chardef#1\last@language
12.53
         \wlog{\string#1 = \string\language\the\last@language}}
```

For formats based on plain version 3.0 the definition of \newlanguage can be simply copied, removing \outer.

```
12.54 \else  
12.55 \def\addlanguage{\alloc@9\language\chardef\@cclvi}  
12.56 \fi
```

\adddialect The macro \adddialect can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
12.57 \def\adddialect#1#2{%
12.58 \global\chardef#1#2\relax
12.59 \wlog{\string#1 = a dialect from \string\language#2}}
```

\iflanguage

Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, \int language, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of \language. Then, depending on the result of the comparison, it executes either the second or the third argument.

```
12.60 \def\iflanguage#1{%
       \expandafter\ifx\csname l@#1\endcsname\relax
12.61
12.62
         \@nolanerr{#1}%
12.63
       \else
         \bbl@afterfi{\ifnum\csname 10#1\endcsname=\language
12.64
12.65
           \expandafter\@firstoftwo
         \else
12.66
           \expandafter\@secondoftwo
12.67
         fi}%
12.68
12.69
       fi
```

\selectlanguage

The macro \selectlanguage checks whether the language is already defined before it performs its actual task, which is to update \language and activate language-specific definitions.

To allow the call of \selectlanguage either with a control sequence name or with a simple string as argument, we have to use a trick to delete the optional escape character.

To convert a control sequence to a string, we use the \string primitive. Next we have to look at the first character of this string and compare it with the escape character. Because this escape character can be changed by setting the internal integer \escapechar to a character number, we have to compare this number with the character of the string. To do this we have to use TeX's backquote notation to specify the character as a number.

If the first character of the \string'ed argument is the current escape character, the comparison has stripped this character and the rest in the 'then' part consists of the rest of the control sequence name. Otherwise we know that either the argument is not a control sequence or \escapechar is set to a value outside of the character range 0-255.

If the user gives an empty argument, we provide a default argument for \string. This argument should expand to nothing.

```
12.70 \edef\selectlanguage{%
12.71 \noexpand\protect
12.72 \expandafter\noexpand\csname selectlanguage \endcsname
12.73 }
```

Because the command \selectlanguage could be used in a moving argument it expands to \protect\selectlanguage_\(\). Therefor, we have to make sure that a macro \protect exists. If it doesn't it is \let to \relax.

```
12.74 \ifx\@undefined\protect\let\protect\relax\fi
```

As LATEX 2.09 writes to files expanded whereas LATEX 2_{ε} takes care not to expand the arguments of \write statements we need to be a bit clever about the way we add information to .aux files. Therefor we introduce the macro \xstring which should expand to the right amount of \string's.

```
12.75 \ifx\documentclass\@undefined
12.76 \def\xstring\\string\\string\\
12.77 \else
12.78 \let\xstring\\string
12.79 \fi
```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

\bbl@pop@language

But when the language change happens inside a group the end of the group doesn't write anything to the auxiliary files. Therefor we need TEX's aftergroup mechanism to help us. The command \aftergroup stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence \bbl@pop@language to be executed at the end of the group. It calls \bbl@set@language with the name of the current language as its argument.

\bbl@language@stack

The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called \bbl@language@stack and initially empty.

```
12.80 \xdef\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

\bbl@push@language \bbl@pop@language

The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```
12.81 \def\bbl@push@language{%
12.82 \xdef\bbl@language@stack{\languagename+\bbl@language@stack}%
12.83 }
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro \languagename. For this we first define a helper function.

\bbl@pop@lang

This macro stores its first element (which is delimited by the '+'-sign) in \languagename and stores the rest of the string (delimited by '-') in its third argument.

```
12.84 \def\bbl@pop@lang#1+#2-#3{%
12.85 \def\languagename{#1}\xdef#3{#2}%
12.86 }
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way:

```
12.87 \def\bbl@pop@language{%
```

```
12.88 	ext{ } 	ext{
```

This means that before \bbl@pop@lang is executed TEX first expands the stack, stored in \bbl@language@stack. The result of that is that the argument string of \bbl@pop@lang contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack) followed by the '-'-sign and finally the reference to the stack.

```
12.89 $$
12.90 \expandafter\bbl@set@language\expandafter{\languagename}%
12.91 }
```

Once the name of the previous language is retrieved from the stack, it is fed to \bbl@set@language to do the actual work of switching everything that needs switching.

```
12.92 \expandafter\def\csname selectlanguage \endcsname#1{%}
12.93 \bbl@push@language
12.94 \aftergroup\bbl@pop@language
12.95 \bbl@set@language{#1}}
```

\bbl@set@language

The macro \bbl@set@language takes care of switching the language environment and of writing entries on the auxiliary files.

```
12.96 \def\bbl@set@language#1{%
12.97 \edef\languagename{%
12.98 \ifnum\escapechar=\expandafter'\string#1\@empty
12.99 \else \string#1\@empty\fi}%
12.100 \select@language{\languagename}%
```

We also write a command to change the current language in the auxiliary files.

```
12.101 \if@filesw

12.102 \protected@write\@auxout{}{\string\select@language{\languagename}}%

12.103 \addtocontents{toc}{\xstring\select@language{\languagename}}%

12.104 \addtocontents{lof}{\xstring\select@language{\languagename}}%

12.105 \addtocontents{lot}{\xstring\select@language{\languagename}}%

12.106 \fi}
```

First, check if the user asks for a known language. If so, update the value of \language and call \originalTeX to bring TeX in a certain pre-defined state.

```
12.107 \def\select@language#1{%
12.108
       \expandafter\ifx\csname l@#1\endcsname\relax
12.109
          \@nolanerr{#1}%
        \else
12.110
12.111
          \expandafter\ifx\csname date#1\endcsname\relax
            \@noopterr{#1}%
12.112
          \else
12.113
12.114
            \language=\csname 1@#1\endcsname\relax
12.115
            \originalTeX
```

The name of the language is stored in the control sequence \languagename. The contents of this control sequence could be tested in the following way:

```
\edef\tmp{\string english}
\ifx\languagename\tmp
    ...
\else
    ...
\fi
```

The construction with \string is necessary because \languagename returns the name with characters of category code 12 (other). Then we have to redefine \originalTeX to compensate for the things that have been activated. To save memory space for the macro definition of \originalTeX, we construct the control sequence name for the \noextras $\langle lang \rangle$ command at definition time by expanding the \csname primitive.

```
12.116 \expandafter\def\expandafter\originalTeX

12.117 \expandafter{\csname noextras#1\endcsname

12.118 \languageshorthands{none}%

12.120 \babel@beginsave
```

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of \selectlanguage, and calling these macros.

```
12.121 \csname captions#1\endcsname
12.122 \csname date#1\endcsname
12.123 \csname extras#1\endcsname\relax
```

The switching of the values of $\ensuremath{\mbox{\mbox{\mbox{$\lorentheta}}}}$ then we check if $\ensuremath{\mbox{\mbox{$\langle lang\rangle$}}}$ hyphenmins is defined. If it is not, we set default values (2 and 3), otherwise the values in $\ensuremath{\mbox{$\langle lang\rangle$}}$ hyphenmins will be used.

```
12.124
            \babel@savevariable\lefthyphenmin
12.125
            \babel@savevariable\righthyphenmin
12.126
            \expandafter\ifx\csname #1hyphenmins\endcsname\relax
              \set@hyphenmins\tw@\thr@@\relax
12.127
12.128
            \else
              \expandafter\expandafter\expandafter\set@hyphenmins
12.129
                 \csname #1hyphenmins\endcsname\relax
12.130
12.131
            \fi
          \fi
12.132
12.133
        fi
```

 ${\tt otherlanguage}$

The otherlanguage environment can be used as an alternative to using the \selectlanguage declarative command. When you are typesetting a document which mixes left-to-right and right-to-left typesetting you have to use this environment in order to let things work as you expect them to.

The first thing this environment does is store the name of the language in \languagename; it then calls \selectlanguage_\u00f3 to switch on everything that is needed for this language The \ignorespaces command is necessary to hide the environment when it is entered in horizontal mode.

```
12.134 \long\def\otherlanguage#1{%

12.135 \csname selectlanguage \endcsname{#1}%

12.136 \ignorespaces

12.137 }
```

The \endotherlanguage part of the environment calls \originalTeX to restore (most of) the settings and tries to hide itself when it is called in horizontal mode.

```
12.138 \long\def\endotherlanguage{%
12.139 \originalTeX
12.140 \global\@ignoretrue\ignorespaces
12.141 }
```

otherlanguage*

The otherlanguage environment is meant to be used when a large part of text from a different language needs to be typeset, but without changing the translation of words such as 'figure'.

This environment makes use of \foreign@language.

```
12.142 \expandafter\def\csname otherlanguage*\endcsname#1{% 12.143 \foreign@language{#1}% 12.144 }
```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules.

```
12.145 \expandafter\def\csname endotherlanguage*\endcsname{% 12.146 \csname noextras\languagename\endcsname 12.147 }
```

\foreignlanguage

The \foreignlanguage command is another substitute for the \selectlanguage command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike \selectlanguage this command doesn't switch everything, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the \extras $\langle lang \rangle$ command doesn't make any \global changes. The coding is very similar to part of \selectlanguage.

```
12.148 \def\foreignlanguage\protect\csname foreignlanguage \endcsname\}
12.149 \expandafter\def\csname foreignlanguage \endcsname#1#2{%}
12.150 \begingroup
12.151 \originalTeX
12.152 \foreign@language{#1}%
12.153 #2%
12.154 \csname noextras#1\endcsname
12.155 \endgroup
12.156 }
```

\foreign@language This macro does the work for \foreignlanguage and the otherlanguage* environment.

```
12.157 \def\foreign@language#1{%
```

First we need to store the name of the language and check that it is a known language.

```
12.158 \def\languagename{#1}%
12.159 \expandafter\ifx\csname l@#1\endcsname\relax
12.160 \@nolanerr{#1}%
12.161 \else
```

If it is we can select the proper hyphenation table and switch on the extra definitions for this language.

```
12.162 \language=\csname l@#1\endcsname\relax 12.163 \languageshorthands{none}%
```

Then we set the left- and right hyphenmin variables.

```
\csname extras#1\endcsname
12.164
          \expandafter\ifx\csname #1hyphenmins\endcsname\relax
12.165
            \set@hyphenmins\tw@\thr@@\relax
12.166
          \else
12.167
            \expandafter\expandafter\expandafter\set@hyphenmins
12.168
              \csname #1hyphenmins\endcsname\relax
12.169
12.170
          \fi
        \fi
12.171
12.172
```

hyphenrules The environment hyphenrules can be used to select *just* the hyphenation rules. This environment does *not* change \languagename and when the hyphenation rules specified were not loaded it has no effect.

```
12.173 \def\hyphenrules#1{%
12.174
        \expandafter\ifx\csname 10#1\endcsname\@undefined
12.175
          \@nolanerr{#1}%
12.176
        \else
12.177
          \language=\csname 10#1\endcsname\relax
12.178
          \languageshorthands{none}%
       \fi
12.179
12.180
       }
12.181 \def\endhyphenrules{}
```

\providehyphenmins

The macro \providehyphenmins should be used in the language definition files to provide a *default* setting for the hyphenation parameters \lefthyphenmin and \righthyphenmin. If the macro $\langle lang \rangle$ hyphenmins is already defined this command has no effect.

```
12.182 \def\providehyphenmins#1#2{%

12.183 \expandafter\ifx\csname #1hyphenmins\endcsname\relax

12.184 \@namedef{#1hyphenmins}{#2}%

12.185 \fi}
```

\set@hyphenmins This macro sets the values of \lefthyphenmin and \righthyphenmin. It expects two values as its argument.

 $12.186 \end{area} $$112.186 \end{area} $$12.186 \end{area} $$12.$

LdfInit This macro is defined in two versions. The first version is to be part of the 'kernel' of babel, ie. the part that is loaded in the format; the second version is defined in babel.def. The version in the format just checks the category code of the ampersand and then loads babel.def.

```
12.187 \def\LdfInit{%

12.188 \chardef\atcatcode=\catcode'\@

12.189 \catcode'\@=11\relax

12.190 \input babel.def\relax
```

The category code of the ampersand is restored and the macro calls itself again with the new definition from babel.def

```
12.191 \catcode'\@=\atcatcode \let\atcatcode\relax 12.192 \LdfInit} 12.193 \langle |kernel\rangle
```

The second version of this macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the ampersand. We make sure that it is a 'letter' during the processing of the file.

```
12.194 (*core)
12.195 \def\LdfInit#1#2{%
12.196 \chardef\atcatcode=\catcode'\@
12.197 \catcode'\@=11\relax
```

Another character that needs to have the correct category code during processing of language definition files is the equals sign, '=', because it is sometimes used in constructions with the **\let** primitive. Therefor we store its current catcode and restore it later on.

```
12.198 \chardef\eqcatcode\catcode'\=
12.199 \catcode'\==12\relax
```

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to \LdfInit is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to \@backslashchar we are dealing with a control sequence which we can compare with \@undefined.

```
12.200 \let\bbl@tempa\relax
12.201 \expandafter\if\expandafter\@backslashchar
12.202 \expandafter\@car\string#2\@nil
12.203 \ifx#2\@undefined
12.204 \else
```

If so, we call \ldf@quit (but after the end of this \if construction) to set the main language, restore the category code of the @-sign and call \endinput.

```
12.205 \def\bbl@tempa{\ldf@quit{#1}}
```

```
12.206 \fi
12.207 \else
```

When #2 was not a control sequence we construct one and compare it with \relax.

```
12.208 \expandafter\ifx\csname#2\endcsname\relax
12.209 \else
12.210 \def\bbl@tempa{\ldf@quit{#1}}
12.211 \fi
12.212 \fi
12.213 \bbl@tempa
Finally we check \originalTeX.
12.214 \ifx\originalTeX\@undefined
```

```
12.214 \ifx\originalTeX\@undefined

12.215 \let\originalTeX\@empty

12.216 \else

12.217 \originalTeX

12.218 \fi}
```

\ldf@quit This macro interrupts the processing of a language definition file.

```
12.219 \def\ldf@quit#1{%
12.220 \expandafter\main@language\expandafter{#1}%
12.221 \catcode'\@=\atcatcode \let\atcatcode\relax
12.222 \catcode'\==\eqcatcode \let\eqcatcode\relax
12.223 \endinput
12.224 }
```

\ldf@finish This macro takes one argument. It is the name of the language that was defined in the language definition file.

We load the local configuration file if one is present, we set the main language (taking into account that the argument might be a control sequence that needs to be expanded) and reset the category code of the @-sign.

```
12.225 \def\ldf@finish#1{%
12.226 \loadlocalcfg{#1}%
12.227 \expandafter\main@language\expandafter{#1}%
12.228 \catcode'\@=\atcatcode \let\atcatcode\relax
12.229 \catcode'\==\eqcatcode \let\eqcatcode\relax
12.230 }
```

After the preamble of the document the commands \LdfInit, \ldf@quit and \ldf@finish are no longer needed. Therefor they are turned into warning messages in LATEX.

```
12.231 \@onlypreamble\LdfInit
12.232 \@onlypreamble\ldf@quit
12.233 \@onlypreamble\ldf@finish
```

\main@language \bbl@main@language

This command should be used in the various language definition files. It stores its argument in \bbl@main@language; to be used to switch to the correct language at the beginning of the document.

```
12.234 \def\main@language#1{%

12.235 \def\bbl@main@language{#1}%

12.236 \let\languagename\bbl@main@language

12.237 \language=\csname l@\languagename\endcsname\relax

12.238 }

The default is to use English as the resin language
```

The default is to use English as the main language.

```
12.239 \ifx\l@english\@undefined
12.240 \let\l@english\z@
12.241 \fi
12.242 \main@language{english}
```

We also have to make sure that some code gets executed at the beginning of the document.

```
12.243 \AtBeginDocument{%
```

```
12.244 \expandafter\selectlanguage\expandafter{\bbl@main@language}} 12.245 \langle /core \rangle
```

\originalTeX The macro\originalTeX should be known to TeX at this moment. As it has to be expandable we \let it to \@empty instead of \relax.

Because this part of the code can be included in a format, we make sure that the macro which initialises the save mechanism, **\babel@beginsave**, is not considered to be undefined.

 $12.248 \verb|\fined| let \verb|\babel@beginsave| relax \verb|\fined| let \|\babel@beginsave| relax \verb|\fined| let \|\babel@beginsave| relax \| relax \|\babel@beginsave| relax \| relax$

\@nolanerr \@nopatterns The babel package will signal an error when a documents tries to select a language that hasn't been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for \language=0 in that case. In most formats that will be (US)english, but it might also be empty.

\@noopterr When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about \PackageError it must be $\LaTeX 2_{\varepsilon}$, so we can safely use its error handling interface. Otherwise we'll have to 'keep it simple'.

```

12.280
            Making #1 an active character}}
12.281 \fi
```

The following code is meant to be read by iniTeX because it should instruct TeX to read hyphenation patterns. To this end the docstrip option patterns can be used to include this code in the file hyphen.cfg.

```
12.282 (*patterns)
```

\process@line Each line in the file language.dat is processed by \process@line after it is read. The first thing this macro does is to check whether the line starts with =. When the first token of a line is an =, the macro \process@synonym is called; otherwise the macro \process@language will continue.

```
12.283 \def\process@line#1#2 #3/{%

12.284 \ifx=#1

12.285 \process@synonym#2 /

12.286 \else

12.287 \process@language#1#2 #3/%

12.288 \fi

12.289 }
```

\process@synonym This macro takes care of the lines which start with an =. It needs an empty token register to begin with.

```
12.290 \toks@{}
12.291 \def\process@synonym#1 /{%
12.292 \ifnum\last@language=\m@ne
```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0.

As no hyphenation patterns are read in yet, we can not yet set the hyphenmin parameters. Therefor a commands to do so is stored in a token register and executed when the first pattern file has been processed.

```
12.295 \toks@\expandafter{\the\toks@

12.296 \expandafter\let\csname #1hyphenmins\expandafter\endcsname

12.297 \csname\languagename hyphenmins\endcsname}%

12.298 \else
```

Otherwise the name will be a synonym for the language loaded last.

```
\label{lambda} $$12.299 \quad \expandafter\chardef\csname 10#1\endcsname\lastOlanguage 12.300 $$\wlog{\string\10#1=\string\language\the\lastOlanguage}$
```

We also need to copy the hyphenmin parameters for the synonym.

```
12.301 \expandafter\let\csname #1hyphenmins\expandafter\endcsname
12.302 \csname\languagename hyphenmins\endcsname
12.303 \fi
12.304 }
```

\process@language

The macro \process@language is used to process a non-empty line from the 'configuration file'. It has three arguments, each delimited by white space. The third argument is optional, so a / character is expected to delimit the last argument. The first argument is the 'name' of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call \addlanguage to allocate a pattern register and to make that register 'active'.

```
12.305 \def\process@language#1 #2 #3/{%
12.306 \expandafter\addlanguage\csname 1@#1\endcsname
12.307 \expandafter\language\csname 1@#1\endcsname
12.308 \def\languagename{#1}%
```

Then the 'name' of the language that will be loaded now is added to the token register \toks8. and finally the pattern file is read.

```
12.309 \global\toks8\expandafter{\the\toks8#1, }%
```

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file language.dat by adding for instance ':T1' to the name of the language. The macro \bbl@get@enc extracts the font encoding from the language name and stores it in \bbl@hyph@enc.

```
12.310 \begingroup
```

```
12.311 \bbl@get@enc#1:\@@@
12.312 \ifx\bbl@hyph@enc\@empty
12.313 \else
12.314 \fontencoding{\bbl@hyph@enc}\selectfont
12.315 \fi
```

Some pattern files contain assignments to \lefthyphenmin and \righthyphenmin. TEX does not keep track of these assignments. Therefor we try to detect such assignments and store them in the $\langle lang \rangle$ hyphenmins macro. When no assignments were made we provide a default setting.

12.316 \lefthyphenmin\m@ne

Some pattern files contain changes to the \lambdaccode en \uccode arrays. Such changes should remain local to the language; therefor we process the pattern file in a group; the \patterns command acts globally so its effect will be remembered.

12.317 \input #2\relax

Now we globally store the settings of \lefthyphenmin and \righthyphenmin and close the group.

```
12.318 \ifnum\lefthyphenmin=\m@ne
12.319 \else
12.320 \expandafter\xdef\csname #1hyphenmins\endcsname{%}
12.321 \the\lefthyphenmin\the\righthyphenmin}%
12.322 \fi
12.323 \endgroup
```

If the counter \language is still equal to zero we set the hyphenmin parameters to the values for the language loaded on pattern register 0.

```
12.324 \ifnum\the\language=\z@
12.325 \expandafter\ifx\csname #1hyphenmins\endcsname\relax
12.326 \set@hyphenmins\tw@\thr@@\relax
12.327 \else
12.328 \expandafter\expandafter\expandafter\set@hyphenmins
12.329 \csname #1hyphenmins\endcsname
12.330 \fi
```

Now execute the contents of token register zero as it may contain commands which set the hyphenmin parameters for synonyms that were defined before the first pattern file is read in.

```
12.331 \the\toks@
12.332 \fi
```

Empty the token register after use.

```
12.333 \toks@{}%
```

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token.

```
12.334
        \def\bb1@tempa{#3}%
12.335
        \ifx\bbl@tempa\@empty
12.336
        \else
12.337
           \ifx\bbl@tempa\space
12.338
           \else
12.339
             \input #3\relax
          \fi
12.340
        \fi
12.341
12.342
        }
```

\bbl@get@enc The macro \bbl@get@enc extracts the font encoding from the language name and \bbl@hyph@enc stores it in \bbl@hyph@enc. It uses delimited arguments to achieve this.

```
12.343 \def\bbl@get@enc#1:#2\@@@{%
```

First store both arguments in temporary macros,

```
12.344 \def\bbl@tempa{#1}%
12.345 \def\bbl@tempb{#2}%
```

then, if the second argument was empty, no font encoding was specified and we're done.

```
12.346 \ifx\bbl@tempb\@empty
12.347 \let\bbl@hyph@enc\@empty
12.348 \else
```

But if the second argument was *not* empty it will now have a superfluous colon attached to it which we need to remove. This done by feeding it to \bbl@get@enc. The string that we are after will then be in the first argument and be stored in \bbl@tempa.

```
12.349 \bbl@get@enc#2\@@@
12.350 \edef\bbl@hyph@enc{\bbl@tempa}%
12.351 \fi}
```

\readconfigfile The configuration file can now be opened for reading.

```
12.352 \openin1 = language.dat
```

See if the file exists, if not, use the default hyphenation file hyphen.tex. The user will be informed about this.

Pattern registers are allocated using count register \last@language. Its initial value is 0. The definition of the macro \newlanguage is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize \last@language with the value -1.

```
12.358 \last@language\m@ne
```

We now read lines from the file until the end is found

```
12.359 \loop
```

While reading from the input, it is useful to switch off recognition of the endof-line character. This saves us stripping off spaces from the contents of the control sequence.

```
12.360 \endlinechar\m@ne
12.361 \read1 to \bbl@line
12.362 \endlinechar'\^^M
Empty lines are skipped.
12.363 \ifx\bbl@line\@empty
12.364 \else
```

Now we add a space and a / character to the end of **\bbl@line**. This is needed to be able to recognize the third, optional, argument of **\process@language** later on.

```
12.365 \edef\bbl@line{\bbl@line\space/}%
12.366 \expandafter\process@line\bbl@line
12.367 \fi
```

Check for the end of the file. To avoid a new if control sequence we create the necessary \iftrue or \iffalse with the help of \csname. But there is one complication with this approach: when skipping the loop...repeat TEX has to read \if/\fi pairs. So we have to insert a 'dummy' \iftrue.

```
12.368 \iftrue \csname fi\endcsname
12.369 \csname if\ifeof1 false\else true\fi\endcsname
12.370 \repeat
```

```
Reactivate the default patterns,
```

```
12.371 \language=0
12.372 \fi
```

and close the configuration file.

12.373 \closein1

Also remove some macros from memory

```
12.374 \let\process@language\@undefined
```

12.375 \let\process@synonym\@undefined

 $12.376 \ \text{let\process@line\@undefined}$

 $12.377 \ \verb|let|bbl@tempa|@undefined|$

 $12.378 \verb|\let\bbl@tempb\@undefined|$

12.380 \let\bbl@line\@undefined

12.381 \let\bbl@get@enc\@undefined

We add a message about the fact that babel is loaded in the format and with which language patterns to the \everyjob register.

12.3 Support for active characters

\bbl@add@special

The macro \bbl@add@special is used to add a new character (or single character control sequence) to the macro \dospecials (and \@sanitize if IATFX is used).

To keep all changes local, we begin a new group. Then we redefine the macros \do and \@makeother to add themselves and the given character without expansion.

```
12.389 \ensuremath{\mbox{$\langle$*core}\mid$ shorthands}} \\ 12.390 \ensuremath{\mbox{$\backslash$}} 12.391 \ensuremath{\mbox{$\langle$$hoexpand\mbox{$\backslash$}}} \\ 12.392 \ensuremath{\mbox{$\backslash$}} 12.392 \ensuremath{\mbox{$\backslash$}} \\ \ensuremath{\mbox{$\backslash$}} 12.392 \ensuremath{\mbo
```

To add the character to the macros, we expand the original macros with the additional character inside the redefinition of the macros. Because \@sanitize can be undefined, we put the definition inside a conditional.

```
12.393 \edef\x{\endgroup}
12.394 \def\noexpand\dospecials\do#1}%
12.395 \expandafter\ifx\csname @sanitize\endcsname\relax \else
12.396 \def\noexpand\@sanitize{\@sanitize\@makeother#1}%
12.397 \fi}%
```

The macro \x contains at this moment the following:

 $\verb|\documents| dod contents| \verb|\documents| documents|.$

If \@sanitize is defined, it contains an additional definition of this macro. The last thing we have to do, is the expansion of \x. Then \endgroup is executed, which restores the old meaning of \x, \do and \@makeother. After the group is closed, the new definition of \dospecials (and \@sanitize) is assigned.

```
12.398 \x}
```

\bbl@remove@special

The companion of the former macro is \bbl@remove@special. It is used to remove a character from the set macros \dospecials and \@sanitize.

To keep all changes local, we begin a new group. Then we define a help macro \xspace x, which expands to empty if the characters match, otherwise it expands to its nonexpandable input. Because \xspace TeX inserts a \xspace relax, if the corresponding xspacelse

or \fi is scanned before the comparison is evaluated, we provide a 'stop sign' which should expand to nothing.

```
12.399 \def\bbl@remove@special#1{\begingroup
          \def\x##1##2{\ifnum'#1='##2\noexpand\@empty
12.400
12.401

12.406
              \def\noexpand\@sanitize{\@sanitize}%
12 407
12.408
            \fi}%
12.409
       \x
```

12.4 Shorthands

\initiate@active@char

A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence $\operatorname{normal@char}\langle char\rangle$ to expand to the character in its 'normal state' and it defines the active character to expand to $\operatorname{normal@char}\langle char\rangle$ by default ($\operatorname{char}\rangle$ being the character to be made active). Later its definition can be changed to expand to $\operatorname{active@char}\langle char\rangle$ by calling $\operatorname{bbl@activate}\{\langle char\rangle\}$.

For example, to make the double quote character active one could have the following line in a language definition file:

```
\initiate@active@char{"}
```

\bbl@afterelse \bbl@afterfi Because the code that is used in the handling of active characters may need to look ahead, we take extra care to 'throw' it over the \else and \fi parts of an \if-statement⁵. These macros will break if another \if...\fi statement appears in one of the arguments.

```
12.410 \long\def\bbl@afterelse#1\else#2\fi{fi#1} \\ 12.411 \long\def\bbl@afterfi#1\fi{fi#1}
```

\peek@token

To prevent error messages when a shorthand, which normally takes an argument, sees a \par, or \}, or similar tokens, we need to be able to 'peek' at what is coming up next in the input stream. Depending on the category code of the token that is seen, we need to either continue the code for the active character, or insert the non-active version of that character in the output. The macro \peek@token therefore takes two arguments, with which it constructs the control sequence to expand next. It \let's \bbl@nexta and \bbl@nextb to the two possible macros. This is necessary for \bbl@test@token to take the right decision.

```
12.412 %\def\peek@token#1#2{%
12.413 % \expandafter\let\expandafter\bbl@nexta\csname #1\string#2\endcsname
12.414 % \expandafter\let\expandafter\bbl@nextb
12.415 % \csname system@active\string#2\endcsname
12.416 % \futurelet\bbl@token\bbl@test@token}
```

\bbl@test@token

When the result of peeking at the next token has yielded a token with category 'letter', 'other' or 'active' it is safe to proceed with evaluating the code for the shorthand. When a token is found with any other category code proceeding is unsafe and therefor the original shorthand character is inserted in the output. The

⁵This code is based on code presented in TUGboat vol. 12, no2, June 1991 in "An expansion Power Lemma" by Sonja Maus.

macro that calls \bbl@test@token needs to setup \bbl@nexta and \bbl@nextb in order to achieve this.

```
12.417 %\def\bbl@test@token{%
12.418 % \let\bbl@next\bbl@nexta
12.419 %
        \ifcat\noexpand\bbl@token a%
12.420 %
        \else
12.421 %
           \ifcat\noexpand\bbl@token=%
12.422 %
           \else
12.423 %
             \ifcat\noexpand\bbl@token\noexpand\bbl@next
12.424 %
12.425 %
               \let\bbl@next\bbl@nextb
             \fi
12.426 %
12.427 %
           \fi
12.428 %
        \fi
12.429 % \bbl@next}
```

The macro \initiate@active@char takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character.

```
12.430 \def\initiate@active@char#1{%

12.431 \expandafter\ifx\csname active@char\string##1\endcsname\relax

12.432 \bbl@afterfi{\@initiate@active@char{#1}}%

12.433 \fi}
```

Note that the definition of \@initiate@active@char needs an active character, for this the ~ is used. Some of the changes we need, do not have to become available later on, so we do it inside a group.

```
12.434 \begingroup
12.435 \catcode'\~\active
12.436 \def\x{\endgroup}
12.437 \def\@initiate@active@char##1{%
```

(where $\active@char(char)$ is one control sequence!).

```
12.482 \expandafter\gdef
12.483 \expandafter\%
12.484 \expandafter\%
12.485 \expandafter\active@prefix\expandafter##1%
12.486 \csname normal@char\string##1\endcsname}}%
12.487 \lccode'\~\@tempcnta
```

For the active caret we first expand to \bbl@act@caret in order to be able to handle math mode correctly.

```
12.489 \ifx##1^%
12.490 \@namedef{active@char\string##1}{\bbl@act@caret}%
12.491 \else
```

We define the first level expansion of $\activeQchar\langle char\rangle$ to check the status of the QsafeQactives flag. If it is set to true we expand to the 'normal' version of this character, otherwise we call $\activeQchar\langle char\rangle$.

```
12.492 \@namedef{active@char\string##1}{%
12.493 \if@safe@actives
```

```
12.494 \bbl@afterelse\csname normal@char\string##1\endcsname
12.495 \else
12.496 \bbl@afterfi\csname user@active\string##1\endcsname
12.497 \fi}%
12.498 \fi
```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn't exist we check for a shorthand with an argument.

```
\@namedef{user@active\string##1}{%
12.499
12.500
              \expandafter\ifx
12.501
              \csname \user@group @sh@\string##1@\endcsname
12.502
              \relax
                \bbl@afterelse\bbl@sh@select\user@group##1%

12.558
12.559
```

When a shorthand combination such as '' ends up in a heading TEX would see \protect'\protect'. To prevent this from happening a shorthand needs to be defined at user level.

```
12.560 \Qnamedef{userQshQ\string##1Q\string\protectQ}{%}
12.561 \csname userQactive\string##1\endcsname}%
12.562 }%
12.563 }\x
```

\bbl@sh@select

This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of hyphenation.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either \bbl@firstcs or \bbl@scndcs. Hence two more arguments need to follow it.

```
12.564 \def\bbl@sh@select#1#2{%
12.565 \expandafter\ifx\csname#1@sh@\string#2@sel\endcsname\relax
12.566 \bbl@afterelse\bbl@scndcs
12.567 \else
12.568 \bbl@afterfi\csname#1@sh@\string#2@sel\endcsname
12.569 \fi
12.570 }
```

\active@prefix

The command \active@prefix which is used in the expansion of active characters has a function similar to \OT1-cmd in that it \protects the active character whenever \protect is not \Otypeset@protect.

```
12.571 \def\active@prefix#1{%
12.572 \ifx\protect\@typeset@protect
12.573 \else
```

When \protect is set to \@unexpandable@protect we make sure that the active character is als *not* expanded by inserting \noexpand in front of it. The \@gobble is needed to remove a token such as \activechar: (when the double colon was the active character to be dealt with).

```
12.574 \ifx\protect\@unexpandable@protect
```

```
\bbl@afterelse\bbl@afterfi\noexpand#1\@gobble
12.575
12.576
12.577
            \bbl@afterfi\bbl@afterfi\protect#1\@gobble
          \fi
12.578
12.579
       fi
```

\if@safe@actives In some circumstances it is necessary to be able to change the expansion of an active character on the fly. For this purpose the switch @safe@actives is available. The setting of this switch should be checked in the first level expansion of \active@char $\langle char \rangle$.

```
12.580 \newif\if@safe@actives
12.581 \@safe@activesfalse
```

\bbl@restore@actives

When the output routine kicks in while the active characters were made "safe" this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them "unsafe" again.

```
12.582 \def\bbl@restore@actives\\if@safe@actives\@safe@activesfalse\fi}
```

This macro takes one argument, like \initiate@active@char. The macro is used \bbl@activate to change the definition of an active character to expand to $\active@char\langle char\rangle$ instead of \n ormal@char $\langle char \rangle$.

```
12.583 \def\bbl@activate#1{%
12.584
       \expandafter\def
       \expandafter#1\expandafter{%
12.585
          \expandafter\active@prefix
12.586
12.587
          \expandafter#1\csname active@char\string#1\endcsname}%
12.588 }
```

\bbl@deactivate This macro takes one argument, like \bbl@activate. The macro doesn't really make a character non-active; it changes its definition to expand to \normal@char $\langle char \rangle$.

```
12.589 \def\bbl@deactivate#1{%
       \expandafter\def
12.590
        \expandafter#1\expandafter{%
12.591
12.592
          \expandafter\active@prefix
          \expandafter#1\csname normal@char\string#1\endcsname}%
12.593
12.594 }
```

\bbl@firstcs These macros have two arguments. They use one of their arguments to build a \bbl@scndcs control sequence from.

```
12.595 \def\bbl@firstcs#1#2{\csname#1\endcsname}
12.596 \def\bbl@scndcs#1#2{\csname#2\endcsname}
```

\declare@shorthand The command \declare@shorthand is used to declare a shorthand on a certain level. It takes three arguments:

- 1. a name for the collection of shorthands, i.e. 'system', or 'dutch';
- 2. the character (sequence) that makes up the shorthand, i.e. ~ or "a;
- 3. the code to be executed when the shorthand is encountered.

```
12.597 \def\declare@shorthand#1#2{\@decl@short{#1}#2\@nil}
12.598 \def\@decl@short#1#2#3\@nil#4{%
12.599
        \def\bbl@tempa{#3}%
12.600
         \ifx\bbl@tempa\@empty
           \expandafter\let\csname #1@sh@\string#2@sel\endcsname\bbl@scndcs
12.601
           \label{lem:condition} $$ \operatorname{losh0}\left(\frac{44}{4}\right). $$
12.602
12.603
           \expandafter\let\csname #1@sh@\string#2@sel\endcsname\bbl@firstcs
12.604
12.605
           \ensuremath{\mbox{Qnamedef}{\#10sh0\string}\#20\string}\#30}{\#4}%
12.606
        fi
```

\textormath Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro \textormath is provided.

```
12.607 \def\textormath#1#2{%
12.608 \ifmmode
12.609 \bbl@afterelse#2%
12.610 \else
12.611 \bbl@afterfi#1%
12.612 \fi}
```

\user@group \language@group \system@group The current concept of 'shorthands' supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group 'english' and have a system group called 'system'.

```
12.613 \def\user@group{user}
12.614 \def\language@group{english}
12.615 \def\system@group{system}
```

\useshorthands This is the user level command to tell LATEX that user level shorthands will be used in the document. It takes one argument, the character that starts a shorthand.

12.616 \def\useshorthands#1{%

First note that this is user level.

12.617 \def\user@group{user}%

Then initialize the character for use as a shorthand character.

```
12.618 \initiate@active@char{#1}%
```

Now that TEX has seen the character its category code is fixed, but for the actions of \bbl@activate to succeed we need it to be active. Hence the trick with the \lccode to circumvent this.

```
12.619 \@tempcnta\lccode'\~
12.620 \lccode'~='#1%
12.621 \lowercase{\catcode'~\active\bbl@activate{~}}%
12.622 \lccode'\~\@tempcnta}
```

\defineshorthand Currently we only support one group of user level shorthands, called 'user'.

12.623 \def\defineshorthand{\declare@shorthand{user}}

\languageshorthands A user level command to change the language from which shorthands are used.

12.624 \def\languageshorthands#1{\def\language@group{#1}}

\aliasshorthand

 $12.625 \ensuremath{\mbox{\sc lasshorthand#1#2}}\%$

First the new shorthand needs to be initialized,

Then we need to use the \lccode trick to make the new shorthand behave like the old one. Therefore we save the current \lccode of the ~-character and restore it later. Then we \let the new shorthand character be equal to the original.

```
12.631 \Qtempcnta\lccode'\~
12.632 \lccode'~='#2%
12.633 \lowercase{\let~#1}%
12.634 \lccode'\~\Qtempcnta
12.635 \fi
12.636 \fi
12.637 }
```

\@notshorthand

```
12.638 \def\0notshorthand#1{\%}
12.639
             \PackageError{babel}{%
              The character '\string #1' should be made
12.640
               a shorthand character; \MessageBreak
12.641
12.642
               add the command \string\useshorthands\string{#1\string} to
12.643
               the preamble.\MessageBreak
12.644
               I will ignore your instruction}{}%
        }
12.645
```

\shorthandon The first level definition of these macros just passes the argument on to \bbl@switch@sh, adding \@nil at the end to denote the end of the list of char-\shorthandoff acters.

```
12.646 \mbox{ } \mbox{newcommand*} \mbox{shorthandon[1]{\bbl@switch@sh{on}#1\enil}}
12.647 \newcommand*\shorthandoff[1]{\bbl@switch@sh{off}#1\@nil}
```

The macro \bbl@switch@sh takes the list of characters apart one by one and \bbl@switch@sh subsequently switches the category code of the shorthand character according to the first argument of \bbl@switch@sh.

```
12.648 \def\bl@switch@sh#1#2#3\@nil{%}
```

But before any of this switching takes place we make sure that the character we are dealing with is known as a shorthand character. If it is, a macro such as \active@char" should exist.

```
12.649
       \@ifundefined{active@char\string#2}{%
12.650
         \PackageError{babel}{%
           The character '\string #2' is not a shorthand character
12.651
12.652
           in \languagename}{%
           Maybe you made a typing mistake?\MessageBreak
12.653
12.654
           I will ignore your instruction}}{%
         \csname bbl@switch@sh@#1\endcsname#2}%
12.655
```

Now that, as the first character in the list has been taken care of, we pass the rest of the list back to \bbl@switch@sh.

```
12.656
        \ifx#3\@empty\else
          \bbl@afterfi\bbl@switch@sh{#1}#3\@nil
12.657
12.658
```

\bbl@switch@sh@off All that is left to do is define the actual switching macros. Switching off is easy, we just set the category code to 'other' (12).

```
12.659 \def\bbl@switch@sh@off#1{\catcode'#112\relax}
```

\bbl@switch@sh@on

But switching the shorthand character back on is a bit more tricky. It involves making sure that we have an active character to begin with when the macro is being defined. It also needs the use of \lowercase and \lccode trickery to get everything to work out as expected. And to keep things local that need to remain local a group is opened, which is closed as soon as \x gets executed.

```
12.660 \begingroup
        \catcode'\~\active
12.661
12.662
        \def\x{\endgroup
          \def\bbl@switch@sh@on##1{%
12.663
            \lccode'~='##1%
12.664
12.665
            \lowercase{%
               \catcode `~\active
12.666
               }%
12.667
12.668
            }%
12.669
```

The next operation makes the above definition effective.

```
12.670 \x
12.671 %
```

To prevent problems with constructs such as \char"01A when the double quote is made active, we define a shorthand on system level.

When the right quote is made active we need to take care of handling it correctly in mathmode. Therefore we define a shorthand at system level to make it expand to a non-active right quote in textmode, but expand to its original definition in mathmode. (Note that the right quote is 'active' in mathmode because of its mathcode.)

```
12.673 \declare@shorthand{system}{'}{%
12.674 \textormath{\csname normal@char\string'\endcsname}%
12.675 {\sp\bgroup\prim@s}}
```

When the left quote is made active we need to take care of handling it correctly when it is followed by for instance an open brace token. Therefore we define a shorthand at system level to make it expand to a non-active left quote.

 $12.676 \end{system} \end{syst$

\bbl@prim@s
\bbl@pr@m@s

One of the internal macros that are involved in substituting \prime for each right quote in mathmode is \primes. This checks if the next character is a right quote. When the right quote is active, the definition of this macro needs to be adapted to look for an active right quote.

```
12.677 \def\bl@prim@s{%}
        \prime\futurelet\@let@token\bbl@pr@m@s}
12.678
12.679 \begingroup

          }
12.692
12.693 \x
12.694 (/core | shorthands)
```

Normally the $\tilde{\ }$ is active and expands to $\operatorname{penalty}_{\square}$. When it is written to the .aux file it is written expanded. To prevent that and to be able to use the character $\tilde{\ }$ as a start character for a shorthand, it is redefined here as a one character shorthand on system level.

```
12.695 \enskip \fill \cite{Continuous} 12.696 \enskip \fill \cite{Continuous} 12.697 \enskip \fill \cite{Continuous} \fill \cite{Continuous} 12.698 \enskip \cite{C
```

\OT1dqpos \T1dqpos The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the \footnote{Gencoding} macro. Therefor we define two macros here to store the position of the character in these encodings.

```
12.699 \expandafter\def\csname OT1dqpos\endcsname{127} 12.700 \expandafter\def\csname T1dqpos\endcsname{4}
```

When the macro \footnote{Tex} we define it here to expand to $\footnote{OT1}$

```
12.701 \ifx\f@encoding\@undefined
12.702 \def\f@encoding{OT1}
12.703 \fi
```

12.5 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

\languageattribute

The macro \languageattribute checks whether its arguments are valid and then activates the selected language attribute.

12.704 \newcommand\languageattribute[2]{%

First check whether the language is known.

```
12.705 \expandafter\ifx\csname l@#1\endcsname\relax
12.706 \@nolanerr{#1}%
12.707 \else
```

Than process each attribute in the list.

```
12.708 \@for\bbl@attr:=#2\do{%
```

We want to make sure that each attribute is selected only once; therefor we store the already selected attributes in \bbl@known@attribs. When that control sequence is not yet defined this attribute is certainly not selected before.

```
12.709 \ifx\bbl@known@attribs\@undefined
12.710 \in@false
12.711 \else
```

Now we need to see if the attribute occurs in the list of already selected attributes.

```
12.712 \edef\bbl@tempa{\noexpand\in@{,#1-\bbl@attr,}%
12.713 {,\bbl@known@attribs,}}%
12.714 \bbl@tempa
12.715 \fi
```

When the attribute was in the list we issue a warning; this might not be the users intention.

```
12.716 \ifin@
12.717 \PackageWarning{Babel}{%
12.718 You have more than once selected the attribute
12.719 '\bbl@attr'\MessageBreak for language #1}%
12.720 \else
```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated T_FX-code.

```
12.721

 12.728
                                                                            \fi
 12.729
 12.730
                                                     \fi}
```

This command should only be used in the preamble of a document.

12.731 \@onlypreamble\languageattribute

The error text to be issued when an unknown attribute is selected.

```
12.732 \newcommand*{\Cattrerr}[2]{%
12.733 \PackageError{babel}%
12.734 \{The attribute #2 is unknown for language #1.}%
12.735 \{Your command will be ignored, type <return> to proceed}}
```

\bbl@declare@ttribute This command adds the new language/attribute combination to the list of known attributes.

```
12.736 \def\bbl@declare@ttribute#1#2#3{%
12.737 \bbl@add@list\bbl@attributes{#1-#2}%
```

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro \extras... for the current language is extended, otherwise the attribute will not work as its code is removed from memory at \begin{document}.

```
12.738 \expandafter\def\csname#1@attr@#2\endcsname{#3}%
12.739 }
```

\bbl@ifattributeset

This internal macro has 4 arguments. It can be used to interpret TEX code based on whether a certain attribute was set. This command should appear inside the argument to \AtBeginDocument because the attributes are set in the document preamble, after babel is loaded.

The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

$12.740 \def\bl@ifattributeset#1#2#3#4{%}$

First we need to find out if any attributes were set; if not we're done.

```
12.741 \ifx\bbl@known@attribs\@undefined
12.742 \in@false
12.743 \else
```

The we need to check the list of known attributes.

```
12.744 \edef\bbl@tempa{\noexpand\in@{,#1-#2,}%

12.745 {,\bbl@known@attribs,}}%

12.746 \bbl@tempa

12.747 \fi
```

When we're this far \ifin@ has a value indicating if the attribute in question was set or not. Just to be safe the code to be executed is 'thrown over the \fi'.

```
12.748 \ifin@
12.749 \bbl@afterelse#3%
12.750 \else
12.751 \bbl@afterfi#4%
12.752 \fi
12.753 }
```

\bbl@add@list This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated

```
12.754 \def\bbl@add@list#1#2{%
        \ifx#1\@undefined
12.755
           \def#1{#2}%
12.756
12.757
        \else
12.758
           \ifx#1\@empty
             \def#1{#2}%
12.759
12.760
             \edef#1{#1,#2}%
12.761
12.762
           \fi
        \fi
12.763
        }
12.764
```

\bbl@ifknown@ttrib

An internal macro to check whether a given language/attribute is known. The macro takes 4 arguments, the language/attribute, the attribute list, the TEX-code to be executed when the attribute is known and the TEX-code to be executed otherwise.

```
12.765 \def\bbl@ifknown@ttrib#1#2{%
```

We first assume the attribute is unknown.

```
12.766 \let\bbl@tempa\@secondoftwo
```

Then we loop over the list of known attributes, trying to find a match.

When a match is found the definition of \bbl@tempa is changed.

```
12.770 \let\bbl@tempa\@firstoftwo
12.771 \else
12.772 \fi}%
Finally we execute \bbl@tempa.
12.773 \bbl@tempa
12.774 }
```

\bbl@clear@ttribs This macro removes all the attribute code from LATEX's memory at \begin{document} time (if any is present).

```
12.775 \def\bbl@clear@ttribs{%
12.776
       \ifx\bbl@attributes\@undefined\else
          \@for\bbl@tempa:=\bbl@attributes\do{%
12.777
            \expandafter\bbl@clear@ttrib\bbl@tempa.
12.778

12.779
          \let\bbl@attributes\@undefined
12.780
        \fi
12.781
12.782
12.783 \def\bbl@clear@ttrib#1-#2.{%
       \expandafter\let\csname#1@attr@#2\endcsname\@undefined}
12.785 \AtBeginDocument{\bbl@clear@ttribs}
```

12.6 Support for saving macro definitions

To save the meaning of control sequences using \babel@save, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see \selectlanguage and \originalTeX).

\babel@savecnt The initialization of a new save cycle: reset the counter to zero.

\babel@beginsave12.786 \def\babel@beginsave{\babel@savecnt\z@}

Before it's forgotten, allocate the counter and initialize all.

```
12.787 \newcount\babel@savecnt
12.788 \babel@beginsave
```

\babel@save The macro \babel@save\(csname\) saves the current meaning of the control sequence \(\lambda csname\rangle\) to \originalTeX⁶. To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to \originalTeX

and the counter is incremented.

```
12.789 \def\babel@save#1{%
12.790
        \expandafter\let\csname babel@\number\babel@savecnt\endcsname #1\relax
12.791
        \begingroup
          \toks@\expandafter{\originalTeX \let#1=}%
12.792
12.793
          \edef\x{\endgroup
            \def\noexpand\originalTeX{\the\toks@ \expandafter\noexpand
12 794
               \csname babel@\number\babel@savecnt\endcsname\relax}}%
12.795
12.796
        \backslash x
12.797
        \advance\babel@savecnt\@ne}
```

\babel@savevariable The macro \babel@savevariable $\langle variable \rangle$ saves the value of the variable. $\langle variable \rangle$ can be anything allowed after the \the primitive.

```
\label{loss} $$12.798 \def\babel@savevariable#1{\begingroup} $$12.799 \toks@\expandafter{\originalTeX #1=}% $$12.800 \edef\x{\endgroup} $$$12.801 \def\noexpand\originalTeX{\the\toks@ \the#1\relax}}% $$12.802 \x$$
```

 $^{^6}$ \originalTeX has to be expandable, i.e. you shouldn't let it to \relax.

\bbl@frenchspacing \bbl@nonfrenchspacing

Some languages need to have \frenchspacing in effect. Others don't want that. The command \bbl@frenchspacing switches it on when it isn't already in effect and \bbl@nonfrenchspacing switches it off if necessary.

```
12.803 \def\bbl@frenchspacing{%
12.804 \ifnum\the\sfcode'\.=\@m
12.805 \let\bbl@nonfrenchspacing\relax
12.806 \else
12.807 \frenchspacing
12.808 \let\bbl@nonfrenchspacing\nonfrenchspacing
12.809 \fi}
12.810 \let\bbl@nonfrenchspacing\nonfrenchspacing
```

12.7 Support for extending macros

\addto For each language four control sequences have to be defined that control the language-specific definitions. To be able to add something to these macro once they have been defined the macro \addto is introduced. It takes two arguments, a \(\langle control sequence \rangle \) and \(T_FX\)-code to be added to the \(\langle control sequence \rangle \).

If the $\langle control\ sequence \rangle$ has not been defined before it is defined now.

```
12.811 \def\addto#1#2{%

12.812 \ifx#1\@undefined

12.813 \def#1{#2}%

12.814 \else
```

The control sequence could also expand to \relax, in which case a circular definition results. The net result is a stack overflow.

```
12.815 \ifx#1\relax
12.816 \def#1{#2}%
12.817 \else
```

Otherwise the replacement text for the $\langle control\ sequence \rangle$ is expanded and stored in a token register, together with the TEX-code to be added. Finally the $\langle control\ sequence \rangle$ is redefined, using the contents of the token register.

```
12.818 {\toks@\expandafter{#1#2}%

12.819 \xdef#1{\the\toks@}}%

12.820 \fi

12.821 \fi

12.822 }
```

12.8 Macros common to a number of languages

\allowhyphens This macro makes hyphenation possible. Basically its definition is nothing more than \nobreak \hskip Opt plus Opt⁷.

\set@low@box The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```
\label{lower} $$12.827 \end{array} $$12.828 \dimen\z@\ht\z@ \advance\dimen\z@ -\ht\tw@% \\ 12.829 \setbox\z@\hbox{\lower\dimen\z@ \box\z@\ht\z@\ht\tw@ \dp\z@\dp\tw@} $$
```

\save@sf@q The macro \save@sf@q is used to save and reset the current space factor.

```
12.830 \def\save@sf@q #1{\leavevmode
12.831 \begingroup
12.832 \edef\@SF{\spacefactor \the\spacefactor}#1\@SF
```

 $^{^7\}text{TEX}$ begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```
12.833 \endgroup
12.834 }
```

\bbl@disc For some languages the macro \bbl@disc is used to ease the insertion of discretionaries for letters that behave 'abnormally' at a breakpoint.

12.9 Making glyphs available

The file babel.dtx⁸ makes a number of glyphs available that either do not exist in the OT1 encoding and have to be 'faked', or that are not accessible through Tienc.def.

12.10 Quotation marks

\quotedblbase

In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefor we make it available by lowering the normal open quote character to the baseline.

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
12.840 \ProvideTextCommandDefault{\quotedblbase}{% 12.841 \UseTextSymbol{OT1}{\quotedblbase}}
```

\quotesinglbase We also need the single quote character at the baseline.

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

\guillemotleft The guillemet characters are not available in OT1 encoding. They are faked.

\guillemotright12.847 \ProvideTextCommand{\guillemotleft}{0T1}{%

```
\ifmmode
12.848
          \11
12.849
        \else
12.850
          \save@sf@q{\nobreak
12.851
            \raise.2ex\hbox{$\scriptscriptstyle\ll$}\allowhyphens}%
12.852
12.853
12.854 \ProvideTextCommand{\guillemotright}{OT1}{%
        \ifmmode
12.856
          \gg
12.857
        \else
12.858
          \save@sf@q{\nobreak
            \raise.2ex\hbox{$\scriptscriptstyle\gg$}\allowhyphens}%
12.859
12.860
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.861 \ProvideTextCommandDefault{\guillemotleft}{% 12.862 \UseTextSymbol{OT1}{\guillemotleft}}
```

 $[\]overline{^{8}}$ The file described in this section has version number v3.8h, and was last revised on 2005/11/23.

```
12.863 \ProvideTextCommandDefault{\guillemotright}{% 12.864 \UseTextSymbol{OT1}{\guillemotright}}
```

\guilsinglleft The single guillemets are not available in OT1 encoding. They are faked.

\guilsinglright12.865 \ProvideTextCommand{\guilsinglleft}{OT1}{%

```
12.866
       \ifmmode
          <%
12.867
       \else
12.868
12.869
          \save@sf@q{\nobreak

         >%
12.875
        \else
          \save@sf@q{\nobreak
12.876
            \raise.2ex\hbox{$\scriptscriptstyle>$}\allowhyphens}%
12.877
       \fi}
12.878
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.879 \ProvideTextCommandDefault{\guilsinglleft}{%
12.880 \UseTextSymbol{OT1}{\guilsinglleft}}
12.881 \ProvideTextCommandDefault{\guilsinglright}{%
12.882 \UseTextSymbol{OT1}{\guilsinglright}}
```

12.11 Letters

\ij The dutch language uses the letter 'ij'. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.889 \ProvideTextCommandDefault{\ij}{% 12.890 \UseTextSymbol{0T1}{\ij}} 12.891 \ProvideTextCommandDefault{\IJ}{% 12.892 \UseTextSymbol{0T1}{\IJ}}
```

\dj The croatian language needs the letters \dj and \DJ; they are available in the T1 \DJ encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipcevic Mario, (stipcevic@olimp.irb.hr).

```

     12.962 \ProvideTextCommandDefault{\frqq}{\UseTextSymbol{OT1}\frqq}
```

12.13 Umlauts and trema's

The command \" needs to have a different effect for different languages. For German for instance, the 'umlaut' should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

\umlauthigh To be able to provide both positions of \" we provide two commands to switch \umlautlow the positioning, the default will be \umlauthigh (the normal positioning).

```
12.963 \def\umlauthigh{%
       \def\bbl@umlauta##1{\leavevmode\bgroup%
12.964
12.965
            \expandafter\accent\csname\f@encoding dqpos\endcsname
12.966
            ##1\allowhyphens\egroup}%
12.967
       \let\bbl@umlaute\bbl@umlauta}
12.968 \def\umlautlow{%
       \def\bbl@umlauta{\protect\lower@umlaut}}
12.969
12.970 \def\umlautelow{%
12.971
       \def\bbl@umlaute{\protect\lower@umlaut}}
12.972 \umlauthigh
```

\lower@umlaut The command \lower@umlaut is used to position the \" closer the the letter.

We want the umlaut character lowered, nearer to the letter. To do this we need an extra $\langle dimen \rangle$ register.

```
12.973 \expandafter\ifx\csname U@D\endcsname\relax 12.974 \csname newdimen\endcsname\U@D 12.975 \fi
```

The following code fools TEX's make_accent procedure about the current x-height of the font to force another placement of the umlaut character.

```
12.976 \ensuremath{\mbox{def}\lower@umlaut#1{\%}}
```

First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

```
12.977 \leavevmode\bgroup 12.978 \U@D 1ex%
```

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of .45ex depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.)

```
12.979 {\setbox\z@\hbox{%}
12.980 \expandafter\char\csname\f@encoding dqpos\endcsname}%
12.981 \dimen@ -.45ex\advance\dimen@\ht\z@
```

If the new x-height is too low, it is not changed.

```
2.982 \ifdim 1ex<\dimen@ \fontdimen5\font\dimen@ \fi}%
```

Finally we call the \accent primitive, reset the old x-height and insert the base character in the argument.

```
12.983 \expandafter\accent\csname\f@encoding dqpos\endcsname
12.984 \fontdimen5\font\U@D #1%
12.985 \egroup}
```

For all vowels we declare \" to be a composite command which uses \bbl@umlauta or \bbl@umlaute to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package fontenc with option OT1 is used. Therefor these declarations are postponed until the beginning of the document.

```
12.986 \AtBeginDocument{%
     \DeclareTextCompositeCommand{\"}{OT1}{a}{\bbl@umlauta{a}}%
12.987
     \DeclareTextCompositeCommand{\"}{OT1}{e}{\bbl@umlaute{e}}%
12.988
12.989
     \DeclareTextCompositeCommand{\"}{OT1}{i}{\bbl@umlaute{\i}}%
12.990
     \DeclareTextCompositeCommand{\"}{OT1}{\i}{\bbl@umlaute{\i}}%
12.991
     \DeclareTextCompositeCommand{\"}{OT1}{o}{\bbl@umlauta{o}}%
12.992
     12.993
     \DeclareTextCompositeCommand{\"}{OT1}{A}{\bbl@umlauta{A}}%
     \DeclareTextCompositeCommand{\"}{OT1}{E}{\bbl@umlaute{E}}}%
12.994
     \DeclareTextCompositeCommand{\"}{OT1}{I}{\bbl@umlaute{I}}%
12.995
     12.996
     12.997
12.998 }
```

12.14 The redefinition of the style commands

The rest of the code in this file can only be processed by LATEX, so we check the current format. If it is plain TEX, processing should stop here. But, because of the need to limit the scope of the definition of \format, a macro that is used locally in the following \if statement, this comparison is done inside a group. To prevent TEX from complaining about an unclosed group, the processing of the command \endinput is deferred until after the group is closed. This is accomplished by the command \aftergroup.

```
12.999 {\def\format{lplain}
12.1000 \ifx\fmtname\format
12.1001 \else
12.1002 \def\format{LaTeX2e}
12.1003 \ifx\fmtname\format
12.1004 \else
12.1005 \aftergroup\endinput
12.1006 \fi
12.1007 \fi}
```

Now that we're sure that the code is seen by LATEX only, we have to find out what the main (primary) document style is because we want to redefine some macros. This is only necessary for releases of LATEX dated before December 1991. Therefor this part of the code can optionally be included in babel.def by specifying the docstrip option names.

```
12.1008 (*names)
```

The standard styles can be distinguished by checking whether some macros are defined. In table 1 an overview is given of the macros that can be used for this purpose.

The macros that have to be redefined for the report and book document styles happen to be the same, so there is no need to distinguish between those two styles.

\doc@style First a parameter \doc@style is defined to identify the current document style.

This parameter might have been defined by a document style that already uses

article	:	both the \chapter and \opening macros are unde-
		fined
report and book	:	the \chapter macro is defined and the \opening is
		undefined
letter	:	the \chapter macro is undefined and the \opening
		is defined

Table 1: How to determine the main document style

macros instead of hard-wired texts, such as artikell.sty [6], so the existence of \doc@style is checked. If this macro is undefined, i.e., if the document style is unknown and could therefore contain hard-wired texts, \doc@style is defined to the default value '0'.

```
12.1010
        \def\doc@style{0}%
   This parameter is defined in the following if construction (see table 1):
12.1011
        \ifx\@undefined\opening
12.1012
          \ifx\@undefined\chapter
12.1013
            \def\doc@style{1}%
12.1014
          \else
12.1015
            \def\doc@style{2}%
12.1016
          \fi
12.1017
        \else
12.1018
          \def\doc@style{3}%
12.1019
        \fi%
12.1020 \fi%
```

12.14.1 Redefinition of macros

Now here comes the real work: we start to redefine things and replace hard-wired texts by macros. These redefinitions should be carried out conditionally, in case it has already been done.

For the figure and table environments we have in all styles:

```
12.1021 \end{figurename} {\end{figurename}} $$ 12.1021 \end{figurename} {\end{figurename}} $$ 12.1022 \end{figurename} {\end{figurename}} $$ $$ 12.1022 \end{figurename}. $$ $$ 12.1022 \end{figurename}. $$ $$ 12.1022 \end{figurename}. $$ 12.1022 \
```

The rest of the macros have to be treated differently for each style. When \doc@style still has its default value nothing needs to be done.

```
12.1023 \ifcase \doc@style\relax 12.1024 \or
```

This means that babel.def is read after the article style, where no \chapter and \opening commands are defined⁹.

First we have the \tableofcontents, \listoffigures and \listoftables:

```
12.1025 \@ifundefined{contentsname}%
           {\def\tableofcontents{\section*{\contentsname\@mkboth
12.1026
                 {\uppercase{\contentsname}}}{\uppercase{\contentsname}}}%
12.1027
12.1028
             \@starttoc{toc}}}{}
12.1029
12.1030 \@ifundefined{listfigurename}%
           {\def\listoffigures{\section*{\listfigurename\@mkboth
12.1031
12.1032
                 {\uppercase{\listfigurename}}}\uppercase{\listfigurename}}}%
12.1033
            \@starttoc{lof}}}{}
12.1034
12.1035 \@ifundefined{listtablename}%
           {\def\listoftables\{\section*{\listtablename\@mkboth.em}}
12.1036
```

⁹A fact that was pointed out to me by Nico Poppelier and was already used in Piet van Oostrum's document style option nl.

```
12.1037
                 {\uppercase{\listtablename}}{\uppercase{\listtablename}}}%
             \@starttoc{lot}}}{}
12.1038
      Then the \thebibliography and \theindex environments.
12.1039 \@ifundefined{refname}%
           {\def\thebibliography#1{\section*{\refname
12.1040
             \@mkboth{\uppercase{\refname}}{\uppercase{\refname}}}%
12.1041
12.1042
             \list{[\arabic{enumi}]}{\settowidth\labelwidth{[#1]}%
12.1043
               \leftmargin\labelwidth
               \advance \left( leftmargin \right) labelsep
12.1044
               \usecounter{enumi}}%
12.1045
               \def\newblock{\hskip.11em plus.33em minus.07em}%
12.1046
               \sloppy\clubpenalty4000\widowpenalty\clubpenalty
12.1047
               \sfcode'\.=1000\relax}{}
12.1048
12.1049
12.1050 \@ifundefined{indexname}%
           {\c def\theindex{\c coltrue\if@twocolumn\c colfalse\fi}}
12.1051
            \columnseprule \z@
12.1052
            \columnsep 35pt\twocolumn[\section*{\indexname}]%
12.1053
12.1054
              \@mkboth{\uppercase{\indexname}}{\uppercase{\indexname}}%
12.1055
              \thispagestyle{plain}%
              \parskip\z@ plus.3pt\parindent\z@\let\item\@idxitem}}{}
12.1056
      The abstract environment:
12.1057 \@ifundefined{abstractname}%
12.1058
           {\def\abstract{\if@twocolumn}
12.1059
           \section*{\abstractname}%
           \else \small
12.1060
           \begin{center}%
12.1061
12.1062
           {\bf \abstractname\vspace{-.5em}\vspace{\z@}}%
12.1063
           \end{center}%
           \quotation
12.1064
           \fi}}{}
12.1065
      And last but not least, the macro \part:
12.1066 \@ifundefined{partname}%
12.1067 {\def\@part[#1]#2{\ifnum \c@secnumdepth >\m@ne
12.1068
               \refstepcounter{part}%
12.1069
               \addcontentsline{toc}{part}{\thepart
12.1070
               \hspace{1em}#1}\else
12.1071
             \addcontentsline{toc}{part}{#1}\fi
          {\parindent\z@ \raggedright
12.1072
           \ifnum \c@secnumdepth >\m@ne
12.1073
             \Large \bf \partname{} \thepart
12.1074
             \par \nobreak
12.1075
           \fi
12.1076
12.1077
           \huge \bf
           #2\markboth{}{}\par}%
12.1078
12.1079
           \nobreak
12.1080
           \vskip 3ex\@afterheading}%
12.1081 }{}
      This is all that needs to be done for the article style.
12.1082 \or
      The next case is formed by the two styles book and report. Basically we have
   to do the same as for the article style, except now we must also change the
   \chapter command.
      The tables of contents, figures and tables:
12.1083 \@ifundefined{contentsname}%
12.1084
           {\def\tableofcontents{\@restonecolfalse
12.1085
             \if@twocolumn\@restonecoltrue\onecolumn
```

```

This was the last of the four standard document styles, so if \doc@style has another value we do nothing and just close the if construction.

```
12.1170 \fi
```

Here ends the code that can be optionally included when a version of LATEX is in use that is dated *before* December 1991.

```
12.1171 \langle /names \rangle
12.1172 \langle /core \rangle
```

12.15 Cross referencing macros

The LATEX book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category 'letter' or 'other'.

The only way to accomplish this in most cases is to use the trick described in the TeXbook [1] (Appendix D, page 382). The primitive \meaning applied to a

token expands to the current meaning of this token. For example, '\meaning\A' with \A defined as '\def\A#1{\B}' expands to the characters 'macro:#1->\B' with all category codes set to 'other' or 'space'.

\bbl@redefine

To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the 'sanitized' argument. The reason why we do it this way is that we don't want to redefine the LATEX macros completely in case their definitions change (they have changed in the past).

Because we need to redefine a number of commands we define the command \bbl@redefine which takes care of this. It creates a new control sequence, \org@...

- 12.1173 (*core | shorthands)
- 12.1174 \def\bbl@redefine#1{%
- \edef\bbl@tempa{\expandafter\@gobble\string#1}% 12.1175
- 12.1176 \expandafter\let\csname org@\bbl@tempa\endcsname#1
- \expandafter\def\csname\bbl@tempa\endcsname} 12.1177

This command should only be used in the preamble of the document.

12.1178 \@onlypreamble\bbl@redefine

This version of \babel@redefine can be used to redefine \long commands such \bbl@redefine@long as \ifthenelse.

- 12.1179 \def\bbl@redefine@long#1{%
- 12.1180 \edef\bbl@tempa{\expandafter\@gobble\string#1}%
- \expandafter\let\csname org@\bbl@tempa\endcsname#1 12.1181
- \expandafter\long\expandafter\def\csname\bbl@tempa\endcsname} 12.1182
- 12.1183 \@onlypreamble\bbl@redefine@long

\bbl@redefinerobust For commands that are redefined, but which might be robust we need a slightly more intelligent macro. A robust command foo is defined to expand to \protect\foo_ \sqcup . So it is necessary to check whether \foo_ \sqcup exists.

- 12.1184 \def\bbl@redefinerobust#1{%
- \edef\bbl@tempa{\expandafter\@gobble\string#1}% 12.1185
- \expandafter\ifx\csname \bbl@tempa\space\endcsname\relax 12.1186
- \expandafter\let\csname org@\bbl@tempa\endcsname#1 12.1187
- \expandafter\edef\csname\bbl@tempa\endcsname{\noexpand\protect 12.1188
- \expandafter\noexpand\csname\bbl@tempa\space\endcsname}% 12.1189
- 12.1190 \else
- 12.1191 \expandafter\let\csname org@\bbl@tempa\expandafter\endcsname
- 12.1192 \csname\bbl@tempa\space\endcsname
- 12.1193

The result of the code above is that the command that is being redefined is always robust afterwards. Therefor all we need to do now is define \foo_1.

\expandafter\def\csname\bbl@tempa\space\endcsname}

This command should only be used in the preamble of the document.

12.1195 \@onlypreamble\bbl@redefinerobust

\newlabel The macro \label writes a line with a \newlabel command into the .aux file to define labels.

```
12.1196 %\bbl@redefine\newlabel#1#2{%
```

12.1197 % \@safe@activestrue\org@newlabel{#1}{#2}\@safe@activesfalse}

We need to change the definition of the LATEX-internal macro \Onewl@bel. This is needed because we need to make sure that shorthand characters expand to their non-active version.

12.1198 \def\@newl@bel#1#2#3{%

First we open a new group to keep the changed setting of \protect local and then we set the @safe@actives switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```
12.1199
         ₹%
12.1200
           \@safe@activestrue
12.1201
           \@ifundefined{#1@#2}%
12.1202
             \relax
12.1203
12.1204
               \gdef \@multiplelabels {%
12.1205
                  \OlatexOwarningOnoOline{There were multiply-defined labels}}%
               \@latex@warning@no@line{Label '#2' multiply defined}%
12.1206
             ጉ%
12.1207
           \global\@namedef{#1@#2}{#3}%
12.1208
           }%
12.1209
12.1210
        }
```

An internal LATEX macro used to test if the labels that have been written on the .aux file have changed. It is called by the \enddocument macro. This macro needs to be completely rewritten, using \meaning. The reason for this is that in some cases the expansion of \#10#2 contains the same characters as the #3; but the character codes differ. Therefor LATEX keeps reporting that the labels may have changed.

```
12.1211 \CheckCommand*\@testdef[3]{%
12.1212 \def\reserved@a{#3}%
12.1213 \expandafter \ifx \csname #1@#2\endcsname \reserved@a
12.1214 \else
12.1215 \@tempswatrue
12.1216 \fi}
```

Now that we made sure that **\@testdef** still has the same definition we can rewrite it. First we make the shorthands 'safe'.

```
12.1217 \def\@testdef #1#2#3{%
12.1218 \@safe@activestrue
```

Then we use \bbl@tempa as an 'alias' for the macro that contains the label which is being checked.

12.1219 \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname

Then we define \bbl@tempb just as \@newl@bel does it.

```
12.1220 \def\bbl@tempb{#3}%
12.1221 \@safe@activesfalse
```

When the label is defined we replace the definition of \bbl@tempa by its meaning.

```
12.1222 \ifx\bbl@tempa\relax
12.1223 \else
12.1224 \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
12.1225 \fi
```

We do the same for \bbl@tempb.

2.1226 \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%

If the label didn't change, \bbl@tempa and \bbl@tempb should be identical macros.

```
12.1227 \ifx \bbl@tempa \bbl@tempb
12.1228 \else
12.1229 \@tempswatrue
12.1230 \fi}
```

\ref The same holds for the macro \ref that references a label and \pageref to reference a page. So we redefine \ref and \pageref. While we change these macros, we make them robust as well (if they weren't already) to prevent problems if they should become expanded at the wrong moment.

\citex The macro used to cite from a bibliography, \cite, uses an internal macro, \citex. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave \cite alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

Unfortunately, the packages natbib and cite need a different definition of \@citex... To begin with, natbib has a definition for \@citex with three arguments... We only know that a package is loaded when \begin{document} is executed, so we need to postpone the different redefinition.

```
12.1238 \AtBeginDocument{% 12.1239 \Oifpackageloaded{natbib}{%
```

Notice that we use \def here instead of \bbl@redefine because \org@@citex is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

```
12.1240 \def\@citex[#1][#2]#3{%

12.1241 \@safe@activestrue\edef\@tempa{#3}\@safe@activesfalse

12.1242 \org@@citex[#1][#2]{\@tempa}}%

12.1243 }{}}
```

The package cite has a definition of \@citex where the shorthands need to be turned off in both arguments.

```
12.1244 \AtBeginDocument{%}
12.1245 \Color \Col
```

\nocite The macro \nocite which is used to instruct BiBTEX to extract uncited references from the database.

The macro that is used in the .aux file to define citation labels. When packages such as natbib or cite are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where \@safe@activestrue is in effect. This switch needs to be reset inside the \hbox which contains the citation label. In order to determine during .aux file processing which definition of \bibcite is needed we define \bibcite in such a way that it redefines itself with the proper definition.

```
12.1251 \bbl@redefine\bibcite{%
```

We call \bbl@cite@choice to select the proper definition for \bibcite. This new definition is then activated.

```
12.1252 \bbl@cite@choice
12.1253 \bibcite}
```

\bbl@bibcite The macro \bbl@bibcite holds the definition of \bibcite needed when neither natbib nor cite is loaded.

\bbl@cite@choice The macro \bbl@cite@choice determines which definition of \bibcite is needed.

```
12.1256 \def\bbl@cite@choice{%
```

First we give \bibcite its default definition.

```
12.1257 \global\let\bibcite\bbl@bibcite
```

Then, when natbib is loaded we restore the original definition of \bibcite.

```
12.1258 \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{}%
```

For cite we do the same.

12.1259 \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{}%

Make sure this only happens once.

```
\global\let\bbl@cite@choice\relax
12.1260
12.1261
```

When a document is run for the first time, no .aux file is available, and \bibcite will not yet be properly defined. In this case, this has to happen before the document starts.

12.1262 \AtBeginDocument{\bbl@cite@choice}

\@bibitem One of the two internal LATEX macros called by \bibitem that write the citation label on the .aux file.

```
12.1263 \bbl@redefine\@bibitem#1{%
       \@safe@activestrue\org@@bibitem{#1}\@safe@activesfalse}
```

12.16 marks

\markboth

\markright Because the output routine is asynchronous, we must pass the current language attribute to the head lines, together with the text that is put into them. To achieve this we need to adapt the definition of \markright and \markboth somewhat.

```
12.1265 \bbl@redefine\markright#1{%
```

First of all we temporarily store the language switching command, using an expanded definition in order to get the current value of \languagename.

```
\edef\bbl@tempb{\noexpand\protect
12.1266
12.1267
           \noexpand\foreignlanguage{\languagename}}%
```

Then, we check whether the argument is empty; if it is, we just make sure the scratch token register is empty.

```
\def\bbl@arg{#1}%
12.1268
12.1269
         \ifx\bbl@arg\@empty
12.1270
          \t 0\
         \else
12.1271
```

Next, we store the argument to \markright in the scratch token register, together with the expansion of \bbl@tempb (containing the language switching command) as defined before. This way these commands will not be expanded by using \edef later on, and we make sure that the text is typeset using the correct language settings. While doing so, we make sure that active characters that may end up in the mark are not disabled by the output routine kicking in while \@safe@activestrue is in effect.

```
12.1272
           \expandafter\toks@\expandafter{%
12.1273
                    \bbl@tempb{\protect\bbl@restore@actives#1}}%
12.1274
        \fi
```

Then we define a temporary control sequence using \edef.

```
\edef\bbl@tempa{%
```

When \bbl@tempa is executed, only \languagename will be expanded, because of the way the token register was filled.

```
\noexpand\org@markright{\the\toks@}}%
12.1277
        \bbl@tempa
12.1278 }
```

The definition of \markboth is equivalent to that of \markright, except that we need two token registers.

```
12.1279 \bbl@redefine\markboth#1#2{%
        \edef\bbl@tempb{\noexpand\protect
12.1280
12.1281
          \noexpand\foreignlanguage{\languagename}}%
12.1282
        \def\bbl@arg{#1}%
        \ifx\bbl@arg\@empty
12.1283
```

```
\t 0
12.1284
12.1285
        \else
12.1286
         \expandafter\toks@\expandafter{%
                  \bbl@tempb{\protect\bbl@restore@actives#1}}%
12.1287
12.1288
12.1289
        \def\bbl@arg{#2}%
12.1290
       \ifx\bbl@arg\@empty
12.1291

                  \bbl@tempb{\protect\bbl@restore@actives#2}}%
12.1294
       \fi
12.1295
12.1296
        \edef\bbl@tempa{%
          12.1297
12.1298
       \bbl@tempa
12.1299 }
12.1300 (/core | shorthands)
```

12.17 Encoding issues (part 2)

\TeX Because documents may use font encodings other than one of the latin encodings, we make sure that the logos of TeX and LATeX always come out in the right encoding.

```
12.1301 \ensuremath{\mbox{$\times$}} \\ 12.1302 \ensuremath{\mbox{$\times$}} \\ 12.1303 \ensuremath{\mbox{$\times$}} \\ 12.1304 \ensuremath{\mbox{$\times$}} \\ 12.1304 \ensuremath{\mbox{$\times$}} \\ \end{aligned}
```

12.18 Preventing clashes with other packages

12.18.1 ifthen

\ifthenelse

Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

In order for this to work the argument of \isodd needs to be fully expandable. With the above redefinition of \pageref it is not in the case of this example. To overcome that, we add some code to the definition of \ifthenelse to make things work

The first thing we need to do is check if the package ifthen is loaded. This should be done at \begin{document} time.

```
12.1305 \ *package \\
12.1306 \ AtBeginDocument{%}

12.1307 \ @ifpackageloaded{ifthen}{%}

Then we can redefine \ ifthenelse:

12.1308 \ \ bbl@redefine@long\ ifthenelse#1#2#3{%}
```

We want to revert the definition of \pageref to its original definition for the duration of \ifthenelse, so we first need to store its current meaning.

```
12.1309 \let\bbl@tempa\pageref
12.1310 \let\pageref\org@pageref
```

Then we can set the \@safe@actives switch and call the original \ifthenelse. In order to be able to use shorthands in the second and third arguments of \ifthenelse the resetting of the switch and the definition of \pageref happens inside those arguments.

```
\@safe@activestrue
12.1311
12.1312
              \org@ifthenelse{#1}{%
12.1313
                \let\pageref\bbl@tempa
                \@safe@activesfalse
12.1314
                #2}{%
12.1315
12.1316
                \let\pageref\bbl@tempa
12.1317
                \@safe@activesfalse
12.1318
                #3}%
             ጉ%
12.1319
   When the package wasn't loaded we do nothing.
12.1320
12.1321
```

12.18.2 varioref

\@@vpageref When the package varioref is in use we need to modify its internal command \\vrefpagenum \@@vpageref in order to prevent problems when an active character ends up in the argument of \\vref.

```
12.1322 \AtBeginDocument{%
        \@ifpackageloaded{varioref}{%
12.1323
           \bbl@redefine\@@vpageref#1[#2]#3{%
12.1324
             \@safe@activestrue
12.1325
             \org@@@vpageref{#1}[#2]{#3}%
12.1326
12.1327
             \@safe@activesfalse}%
   The same needs to happen for \vrefpagenum.
12.1328
           \bbl@redefine\vrefpagenum#1#2{%
12.1329
             \@safe@activestrue
12.1330
             \org@vrefpagenum{#1}{#2}%
12.1331
             \@safe@activesfalse}%
```

The package varioref defines \Ref to be a robust command wich uppercases the first character of the reference text. In order to be able to do that it needs to access the exandable form of \ref . So we employ a little trick here. We redefine the (internal) command \Ref_{\sqcup} to call \ref instead of \ref . The disadvantgage of this solution is that whenever the derfinition of \Ref changes, this definition needs to be updated as well.

12.18.3 hhline

The Delaying the activation of the shorthand characters has introduced a problem with the hhline package. The reason is that it uses the ':' character which is made active by the french support in babel. Therefor we need to reload the package when the ':' is an active character.

So at \begin{document} we check whether hhline is loaded.

```
12.1336 \AtBeginDocument{% 12.1337 \@ifpackageloaded{hhline}%
```

Then we check whether the expansion of \normal@char: is not equal to \relax.

```
12.1338 {\expandafter\ifx\csname normal@char\string:\endcsname\relax 12.1339 \else
```

In that case we simply reload the package. Note that this happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```
12.1340 \makeatletter
12.1341 \def\@currname{hhline}\input{hhline.sty}\makeatother
12.1342 \fi}%
12.1343 {}}
```

12.18.4 General

\FOREIGNLANGUAGE

The package fancyhdr treats the running head and fout lines somewhat differently as the standard classes. A symptom of this is that the command \foreignlanguage which babel adds to the marks can end up inside the argument of \MakeUppercase. To prevent unexpected results we need to define \FOREIGNLANGUAGE here.

```
12.1344 \DeclareRobustCommand{\FOREIGNLANGUAGE} [1] {% 12.1345 \lowercase{\foreignlanguage{#1}}} 12.1346 \langle /package \rangle
```

\nfss@catcodes

IATEX's font selection scheme sometimes wants to read font definition files in the middle of processing the document. In order to guard against any characters having the wrong catcodes it always calls nfss@catcodes before loading a file. Unfortunately, the characters " and ' are not dealt with. Therefor we have to add them until IATEX does that herself.

```
12.1347 (*core | shorthands)
12.1348 \ifx\nfss@catcodes\@undefined
12.1349 \else
12.1350 \addto\nfss@catcodes{%
12.1351 \@makeother\'%
12.1352 \@makeother\'"%
12.1353 }
12.1354 \fi

12.1355 (/core | shorthands)
```

13 Local Language Configuration

\loadlocalcfg

At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

```
13.1 (*core)
```

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

```
13.2 \ifx\loadlocalcfg\Qundefined
     \def\loadlocalcfg#1{%
13.3
       \InputIfFileExists{#1.cfg}
13.4
             13.5
13.6
                     * Local config file #1.cfg used^^J%
13.7
                     *}%
             }
13.8
13.9
             {}}
13.10 \fi
```

Just to be compatible with LATEX 2.09 we add a few more lines of code:

```
13.11 \ifx\@unexpandable@protect\@undefined
       \def\@unexpandable@protect{\noexpand\protect\noexpand}
13.12
       \label{longdef} $$ \operatorname{\protected@write} 1#2#3{\%} $$
13.13
              \begingroup
13.14
13.15
               \let\thepage\relax
13.16
13.17
               \let\protect\@unexpandable@protect
13.18
               \edef\reserved@a{\write#1{#3}}%
13.19
               \reserved@a
13.20
              \endgroup
              \if@nobreak\ifvmode\nobreak\fi\fi
13.21
13.22
      }
13.23 \fi
13.24 (/core)
```

14 Driver files for the documented source code

Since babel version 3.4 all source files that are part of the babel system can be typeset separately. But to typeset them all in one document, the file babel.drv can be used. If you only want the information on how to use the babel system and what goodies are provided by the language-specific files, you can run the file user.drv through IATEX to get a user guide.

```

15 Conclusion

A system of document options has been presented that enable the user of IATEX to adapt the standard document classes of IATEX to the language he or she prefers to use. These options offer the possibility of switching between languages in one document. The basic interface consists of using one option, which is the same for all standard document classes.

In some cases the language definition files provide macros that can be useful to plain TEX users as well as to LATEX users. The babel system has been implemented so that it can be used by both groups of users.

16 Acknowledgements

I would like to thank all who volunteered as β -testers for their time. I would like to mention Julio Sanchez who supplied the option file for the Spanish language and Maurizio Codogno who supplied the option file for the Italian language. Michel Goossens supplied contributions for most of the other languages. Nico Poppelier helped polish the text of the documentation and supplied parts of the macros for the Dutch language. Paul Wackers and Werenfried Spit helped find and repair bugs.

During the further development of the babel system I received much help from Bernd Raichle, for which I am grateful.

18 The Esperanto language

The file esperanto.dtx¹⁰ defines all the language-specific macros for the Esperanto language.

For this language the character ^ is made active. In table 2 an overview is given of its purpose.

- c gives ĉ with hyphenation in the rest of the word allowed, this works for c, C, g, G, H, J, s, S, z, Z
- h prevents h from becoming too tall
- ^j gives ĵ
- ~u gives ŭ, with hyphenation in the rest of the word allowed
- ~U gives Ŭ, with hyphenation in the rest of the word allowed
- ^| inserts a \discretionary{-}{}{}

Table 2: The functions of the active character for Esperanto.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

- 18.1 (*code)
- 18.2 \LdfInit{esperanto}\captionsesperanto

When this file is read as an option, i.e. by the \usepackage command, esperanto will be an 'unknown' language in which case we have to make it known. So we check for the existence of \left(\left(\text{l@esperanto}\) to see whether we have to do something here.

- 18.3 \ifx\l@esperanto\@undefined
- 18.4 \Onopatterns{Esperanto}
- 18.5 \adddialect\l@esperantoO\fi

The next step consists of defining commands to switch to the Esperanto language. The reason for this is that a user might want to switch back and forth between languages.

\captionsesperanto

The macro \captionsesperanto defines all strings used in the four standard document classes provided with LATEX.

- 18.6 \addto\captionsesperanto{%

¹⁰The file described in this section has version number? and was last revised on?. A contribution was made by Ruiz-Altaba Marti (ruizaltb@cernvm.cern.ch). Code from the file esperant.sty by Jörg Knappen (knappen@vkpmzd.kph.uni-mainz.de) was included.

```
18.26 \def\alsoname{vidu anka\u{u}}% a^u vd. anka\u{u}
18.27 \def\proofname{Pruvo}%
18.28 \def\glossaryname{Glosaro}%
18.29 }
```

\dateesperanto

The macro \datesperanto redefines the command \today to produce Esperanto dates.

\extrasesperanto \noextrasesperanto

The macro \extrasesperanto performs all the extra definitions needed for the Esperanto language. The macro \noextrasesperanto is used to cancel the actions of \extrasesperanto.

For Esperanto the ^ character is made active. This is done once, later on its definition may vary.

```
18.35 \initiate@active@char{^}
```

Because the character ^ is used in math mode with quite a different purpose we need to add an extra level of evaluation to the definition of the active ^. It checks whether math mode is active; if so the shorthand mechanism is bypassed by a direct call of \normal@char^.

```
18.36 \addto\extrasesperanto{\aggeshorthands{esperanto}} \\ 18.37 \addto\extrasesperanto{\bbl@activate{^}} \\ 18.38 \addto\noextrasesperanto{\bbl@deactivate{^}}}
```

In order to prevent problems with the active ^ we add a shorthand on system level which expands to a 'normal ^.

 $18.39 \verb|\declare@shorthand{system}{^}{\csname normal@char\string^\endcsname}|$

And here are the uses of the active ^:

```
18.40 \eclare@shorthand{esperanto} {^c}_{\c}\allowhyphens} \\ 18.41 \eclare@shorthand{esperanto}_{^c}_{\c}\allowhyphens} \\ 18.42 \eclare@shorthand{esperanto}_{^g}_{\c}^{g}\allowhyphens} \\ 18.43 \eclare@shorthand{esperanto}_{^h}_{h}\allowhyphens} \\ 18.44 \eclare@shorthand{esperanto}_{^h}_{h}\allowhyphens} \\ 18.45 \eclare@shorthand{esperanto}_{^h}_{h}\allowhyphens} \\ 18.46 \eclare@shorthand{esperanto}_{^j}_{^h}_{allowhyphens} \\ 18.47 \eclare@shorthand{esperanto}_{^j}_{^h}_{allowhyphens} \\ 18.48 \eclare@shorthand{esperanto}_{^s}_{^s}_{^s}_{allowhyphens} \\ 18.49 \eclare@shorthand{esperanto}_{^s}_{^h}_{u}_{u}\allowhyphens} \\ 18.50 \eclare@shorthand{esperanto}_{^u}_{u}_{u}\allowhyphens} \\ 18.51 \eclare@shorthand{esperanto}_{^u}_{u}\u\allowhyphens} \\ 18.52 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.52 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.51 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.52 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.51 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.52 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.51 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.52 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens} \\ 18.53 \eclare@shorthand{esperanto}_{^l}_{u}_{u}\u\allowhyphens}
```

\Esper In esperant.sty Jörg Knappen provides the macros \esper and \Esper that can be used instead of \alph and \Alph. These macros are available in this file as well.

Their definition takes place in two steps. First the toplevel.

18.53 \def\esper#1{\@esper{\@nameuse{c@#1}}}

\hodiau In esperant.sty Jörg Knappen provides two alternative macros for \today, \hodiaun \hodiaun. The second macro produces an accusative version of the date in Esperanto.

 $18.63 \addto\datesperanto{\def\hodiau{la \today}} \\ 18.64 \def\hodiaun{la \number\day --an^de^\ifcase\month\or} \\ 18.65 \quad januaro\or februaro\or marto\or aprilo\or majo\or junio\or} \\ 18.66 \quad julio\or a\u\{u\}gusto\or septembro\or oktobro\or novembro\or} \\ 18.67 \quad decembro\fi, \space \number\year}$

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

18.68 \ldf@finish{esperanto} 18.69 $\langle /code \rangle$

19 The Interlingua language

The file interlingua.dtx¹¹ defines all the language definition macros for the Interlingua language. This file was contributed by Peter Kleiweg, kleiweg at let.rug.nl.

Interlingua is an auxiliary language, built from the common vocabulary of Spanish/Portuguese, English, Italian and French, with some normalisation of spelling. The grammar is very easy, more similar to English's than to neolatin languages. The site http://www.interlingua.com is mostly written in interlingua (as is http://interlingua.altervista.org), in case you want to read some sample of it.

You can have a look at the grammar at http://www.geocities.com/linguablau
The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

19.1 **(*code)**

19.2 \LdfInit{interlingua}{captionsinterlingua}

When this file is read as an option, i.e. by the \usepackage command, interlingua could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lointerlingua to see whether we have to do something here.

```
19.3 \ \text{ifx}\
```

19.4 \@nopatterns{Interlingua}

19.5 \adddialect\l@interlingua0\fi

The next step consists of defining commands to switch to (and from) the Interlingua language.

\interlinguahyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

19.6 \providehyphenmins{interlingua}{\tw@\tw@}

\captionsinterlingua

The macro \captionsinterlingua defines all strings used in the four standard documentclasses provided with IATFX.

```
19.7 \def\captionsinterlingua{%
       \def\prefacename{Prefacio}%

       \def\proofname{Prova}%
19.27
```

\def\glossaryname{Glossario}%

 $\verb|\dateinterlingua|$

19.28 19.29

The macro \dateinterlingua redefines the command \today to produce Interlingua dates.

 $^{^{11}}$ The file described in this section has version number v1.6 and was last revised on 2005/03/30.

```
19.30 \def\dateinterlingua{%
19.31 \def\today{le~\number\day\space de \ifcase\month\or
19.32     januario\or februario\or martio\or april\or maio\or junio\or
19.33     julio\or augusto\or septembre\or octobre\or novembre\or
19.34     decembre\fi
19.35     \space \number\year}}
```

\extrasinterlingua \noextrasinterlingua

The macro \extrasinterlingua will perform all the extra definitions needed for the Interlingua language. The macro \noextrasinterlingua is used to cancel the actions of \extrasinterlingua. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
19.36 \addto\extrasinterlingua{}
19.37 \addto\noextrasinterlingua{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

19.38 \ldf@finish{interlingua} 19.39 $\langle /code \rangle$

20 The Dutch language

The file $\mathtt{dutch.dtx^{12}}$ defines all the language-specific macros for the Dutch language and the 'Afrikaans' version¹³ of it.

For this language the character " is made active. In table 3 an overview is given of its purpose. One of the reasons for this is that in the Dutch language a word with a dieresis can be hyphenated just before the letter with the umlaut, but the dieresis has to disappear if the word is broken between the previous letter and the accented letter.

In [3] the quoting conventions for the Dutch language are discussed. The preferred convention is the single-quote Anglo-American convention, i.e. 'This is a quote'. An alternative is the slightly old-fashioned Dutch method with initial double quotes lowered to the baseline, "This is a quote", which should be typed as "'This is a quote".

- "a \"a which hyphenates as -a; also implemented for the other letters.
- "y puts a negative kern between i and j
- "Y puts a negative kern between I and J
- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "~ to produce a hyphencharcter without the following
 \discretionary{}{}.
- "" to produce an invisible 'breakpoint'.
- "' lowered double left quotes (see example below).
- "' normal double right quotes.
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 3: The extra definitions made by dutch.ldf

```
20.2 %
        \cs{CurrentOption}}
20.3 %
        The macro |\LdfInit| takes care of preventing that this file is
20.4 %
        loaded more than once, checking the category code of the
20.5 %
        \texttt{0} sign, etc.
20.6 %
20.7\% \cdot 1.996/10/30 Now use \cs{LdfInit} to perform
20.8 %
        initial checks}
20.9 %
        \begin{macrocode}
20.10 (*code)
20.11 \LdfInit\CurrentOption{captions\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, dutch could be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@dutch or l@afrikaans to see whether we have to do something here.

First we try to establish with which option we are being processed.

```
20.12 \def\bbl@tempa{dutch}
20.13 \ifx\CurrentOption\bbl@tempa
```

If it is dutch then we first check if the Dutch hyphenation patterns wer loaded,

```
20.14 \quad \text{ifx}\ \text{dutch}\ \text{undefined}
```

if no we issue a warning and make dutch a 'dialect' of either the hyphenation patterns that were loaded in slot 0 or of 'afrikaans' when it is available.

 $^{^{-12}}$ The file described in this section has version number v3.8i, and was last revised on $^{2005/03/30}$

¹³contributed by Stoffel Lombard (lombc@b31pc87.up.ac.za)

```
20.15 \@nopatterns{Dutch}
20.16 \ifx\l@afrikaans\undefined

\extrasdutch
\extrasafrikaans
\noextrasdutch
\noextrasafrikaans

The macros \extrasdutch and \captionsafrikaans will perform all the extra definitions needed for the Dutch language. The macros \noextrasdutch and noextrasafrikaans is used to cancel the actions of \extrasdutch and \captionsafrikaans.

For Dutch the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the dutch group of shorthands should be used.

```
20.93 \initiate@active@char{"}
```

Both version of the language use the same set of shorthand definitions althoug the 'ij' is not used in Afrikaans.

The 'umlaut' character should be positioned lower on all vowels in Dutch texts.

```
20.97 \end{subarranteentoption} 20.98 \umlautlow\umlautelow \\ 20.99 \end{subarranteentoption} \{\% \\ 20.100 \umlauthigh\}
```

\dutchhyphenmins The dutch hyphenation patterns can be used with \lefthyphenmin set to 2 and \afrikaanshyphenmins to 3.

```
20.101 \verb|\providehyphenmins{\CurrentOption}{\two\throug}|
```

\@trema In the Dutch language vowels with a trema are treated specially. If a hyphenation occurs before a vowel-plus-trema, the trema should disappear. To be able to do

this we could first define the hyphenation break behaviour for the five vowels, both lowercase and uppercase, in terms of \discretionary. But this results in a large \if-construct in the definition of the active ". Because we think a user should not use " when he really means something like '' we chose not to distinguish between vowels and consonants. Therefore we have one macro \@trema which specifies the hyphenation break behaviour for all letters.

 $20.102 \end{thm} allowhyphens \end{thm} all$

```
Now we can define the doublequote macros: the tremas,
```

```
20.103 \end{dutch} {\tt "a}{\texttt{\colored}} \end{dutch} {\tt "a}{\texttt{\colored}} \end{dutch} \end{dutch} {\tt "a}{\texttt{\colored}} \end{dutch} \end{dutch} {\tt "a}{\texttt{\colored}} \end{dutch} \end{dutch} {\tt "a}{\tt "a}{\tt "c} \end{dutch} \end{dutch} {\tt "a}{\tt "c} \end{dutch} 
 20.104 \end{dutch} {\tt "e}{\text{textormath}} {\tt Qtrema e}{\text{dutch}} {\tt "e}{\text{textormath}} {\tt otrema e}{\text{dutch}} {\tt otrema e}{\text{dutch}} {\tt otrema e}{\text{dutch}} {\tt otrema e}{\text{dutch}} {\tt otrema e}{\text{otrema e}}{\text{otrema e}}{\text{otrem
 20.105 \declare@shorthand{dutch}{"i}{\texttextormath}
20.106 {\allowhyphens\discretionary{-}{i}{\"{\i}}\allowhyphens}%
 20.107 {\ddot \imath}}
 20.108 \end{dutch} {\tt "o}{\text{textormath}} {\tt o}{\text{dutch}} {\tt o}{\text{o}} {\tt o} {\tt o} {\tt o}{\text{o}} {\tt o} {
 20.110 \declare@shorthand{dutch}{"'}{%
                                           \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
20.112 \declare@shorthand{dutch}{"'}{%
20.113 \quad \texttt{\textquotedblright}{\texttt{\mbox}{\texttt{\textquotedblright}}}\}
               and some additional commands:
 20.114 \end{dutch} {\tt "-} {\tt \nobreak-bbl@allowhyphens}
20.116 \declare@shorthand{dutch}{"|}{%
 20.117 \quad \texttt{\discretionary}{-}{}{\ker .03em}}{}}
 20.118 \label{lem:condition} $$20.118 \end{dutch}{""}{\hskip\z@skip}$
 20.119 \declare@shorthand{dutch}{"y}{\textormath{\ij{}}}{\ddot y}}
 20.120 \declare@shorthand{dutch}{"Y}{\textormath{\IJ{}}}{\ddot Y}}
               To enable hyphenation in two words, written together but separated by a slash,
               as in 'uitdrukking/opmerking' we define the command "/.
20.121 \declare@shorthand{dutch}{"/}{\textormath}
20.122 {\bbl@allowhyphens\discretionary{/}{}{/}\bbl@allowhyphens}{}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
20.127 \label{ldf@finish}\CurrentOption 20.128 $$ $$ $$ /\code$$
```

21 The English language

The file english.dtx¹⁴ defines all the language definition macros for the English language as well as for the American and Australian version of this language. For the Australian version the British hyphenation patterns will be used, if available, for the Canadian variant the American patterns are selected.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
21.1 (*code)
21.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, english could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lognalish to see whether we have to do something here.

We allow for the british english patterns to be loaded as either 'british', or 'UKenglish'. When neither of those is known we try to define \lognarish as an alias for \lognarican or \lognarish.

```

21.136 \langle /code \rangle
```

22 The German language

The file germanb.dtx¹⁵ defines all the language definition macros for the German language as well as for the Austrian dialect of this language¹⁶.

For this language the character " is made active. In table 4 an overview is given of its purpose. One of the reasons for this is that in the German language some character combinations change when a word is broken between the combination. Also the vertical placement of the umlaut can be controlled this way. The quotes

```
"a, also implemented for the other lowercase and
      uppercase vowels.
"s
      to produce the German \beta (like \ss{}).
"z
      to produce the German \beta (like \ss{}).
"ck
      for ck to be hyphenated as k-k.
      for ff to be hyphenated as ff-f, this is also imple-
"ff
      mented for l, m, n, p, r and t
"S
      for SS to be \uppercase{"s}.
"Z
      for SZ to be \uppercase{"z}.
"|
      disable ligature at this position.
"_
      an explicit hyphen sign, allowing hyphenation in the
      rest of the word.
11 11
      like "-, but producing no hyphen sign (for compund
      words with hyphen, e.g. x-""y).
      for a compound word mark without a breakpoint.
      for a compound word mark with a breakpoint, allow-
      ing hyphenation in the composing words.
11 6
      for German left double quotes (looks like ").
11 ,
      for German right double quotes.
      for French left double quotes (similar to <<).
      for French right double quotes (similar to >>).
```

Table 4: The extra definitions made by german.ldf

in table 4 can also be typeset by using the commands in table 5.

```
for German left double quotes (looks like ..).
\glqq
        for German right double quotes (looks like ").
\grqq
        for German left single quotes (looks like,).
\glq
        for German right single quotes (looks like ').
\grq
\flqq
        for French left double quotes (similar to <<).
        for French right double quotes (similar to >>).
\frqq
        for (French) left single quotes (similar to <).
\flq
\frq
        for (French) right single quotes (similar to >).
        the original quotes character (").
\dq
```

Table 5: More commands which produce quotes, defined by german.ldf

When this file was read through the option germanb we make it behave as if german was specified.

```
22.1 \def\bbl@tempa{germanb}
22.2 \ifx\CurrentOption\bbl@tempa
22.3 \def\CurrentOption{german}
22.4 \fi
```

 $[\]overline{^{15}}$ The file described in this section has version number v2.6k and was last revised on 2004/02/19.

¹⁶This file is a re-implementation of Hubert Partl's german.sty version 2.5b, see [4].

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
22.5 (*code)
```

22.6 \LdfInit\CurrentOption{captions\CurrentOption}

When this file is read as an option, i.e., by the \usepackage command, german will be an 'unknown' language, so we have to make it known. So we check for the existence of \logerman to see whether we have to do something here.

```
22.7 ifx\logerman\oundefined
22.8 \@nopatterns{German}
22.9
     \adddialect\l@german0
22.10 \fi
```

For the Austrian version of these definitions we just add another language.

22.11 \adddialect\l@austrian\l@german

The next step consists of defining commands to switch to (and from) the German language.

\captionsaustrian

\captionsgerman Either the macro \captionsgerman or the macro \captionsaustrian will define all strings used in the four standard document classes provided with IATEX.

```

   \mdqon All that's left to do now is to define a couple of commands for reasons of compat-
\mdqoff ibility with german.sty.
             \ck22.113 \def\mdqon{\shorthandon{"}}
                      22.114 \def\mdqoff{\shorthandoff{"}}
                      The macro \ldf@finish takes care of looking for a configuration file, setting
                             the main language to be switched on at \begin{document} and resetting the
                             category code of @ to its original value.
                      22.116 \ldf@finish\CurrentOption
                     22.117 (/code)
```

23 The German language – new orthography

The file ngermanb.dtx¹⁷ defines all the language definition macros for the German language with the 'new orthography' introduced in August 1998. This includes also the Austrian dialect of this language.

As with the 'traditional' German orthography, the character " is made active, and the commands in table 4 can be used, except for "ck and "ff etc., which are no longer required.

The internal language names are ngerman and naustrian.

When this file was read through the option ngermanb we make it behave as if ngerman was specified.

```
23.1 \def\bbl@tempa{ngermanb}
23.2 \ifx\CurrentOption\bbl@tempa
23.3 \def\CurrentOption{ngerman}
23.4 \fi
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
23.5 (*code)
```

23.6 \LdfInit\CurrentOption{captions\CurrentOption}

When this file is read as an option, i.e., by the \usepackage command, ngerman will be an 'unknown' language, so we have to make it known. So we check for the existence of \longerman to see whether we have to do something here.

```
23.7 \ifx\l@ngerman\@undefined
23.8 \@nopatterns{ngerman}
23.9 \adddialect\l@ngerman0
23.10 \fi
```

For the Austrian version of these definitions we just add another language.

23.11 \adddialect\l@naustrian\l@ngerman

The next step consists of defining commands to switch to (and from) the German language.

\captionsngerman \captionsnaustrian

Either the macro \captionnsgerman or the macro \captionsnaustrian will define all strings used in the four standard document classes provided with LATEX.

```
23.12 \@namedef{captions\CurrentOption}{%

\dateanustrian The macro \datenaustrian redefines the command \today to produce Austrian version of the German dates.

\extrasngerman
\extrasnaustrian
\noextrasngerman
\noextrasnaustrian

Either the macro \extrasngerman or the macros \extrasnaustrian will perform all the extra definitions needed for the German language. The macro \noextrasngerman is used to cancel the actions of \extrasngerman.

For German (as well as for Dutch) the "character is made active. This is done once, later on its definition may vary.

```
23.42 \initiate@active@char{"}
23.43 \@namedef{extras\CurrentOption}{%
23.44 \languageshorthands{ngerman}}
```

23.45 \expandafter\addto\csname extras\CurrentOption\endcsname{%

23.46 \bbl@activate{"}}

Don't forget to turn the shorthands off again.

23.47 \addto\noextrasngerman{\bbl@deactivate{"}}

In order for T_EX to be able to hyphenate German words which contain ' β ' (in the OT1 position Y) we have to give the character a nonzero \c (see Appendix H, the T_EX book).

```
23.48 \expandafter\addto\csname extras\CurrentOption\endcsname{%
```

23.49 \babel@savevariable{\lccode25}%

23.50 \lccode25=25}

The umlaut accent macro \" is changed to lower the umlaut dots. The redefinition is done with the help of \umlautlow.

```
23.51 \expandafter\addto\csname extras\CurrentOption\endcsname{%
```

23.52 \babel@save\"\umlautlow}

 $23.53 \verb|\CurrentOption|{\Lumlauthigh}|$

The current version of the 'new' German hyphenation patterns (dehyphn.tex is to be used with \lefthyphenmin and \righthyphenmin set to 2.

23.54 \providehyphenmins{\CurrentOption}{\tw0\tw0}

For German texts we need to make sure that \frenchspacing is turned on.

```
23.55 \expandafter\addto\csname extras\CurrentOption\endcsname{%
```

23.56 \bbl@frenchspacing}

23.57 \expandafter\addto\csname noextras\CurrentOption\endcsname{%

23.58 \bbl@nonfrenchspacing}

The code above is necessary because we need an extra active character. This character is then used as indicated in table 4.

To be able to define the function of ", we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
23.59 \begingroup \catcode'\"12
23.60 \def\x{\endgroup
23.61 \def\@SS{\mathchar"7019 }
23.62 \def\dq{"}}
23.63 \x
```

Now we can define the doublequote macros: the umlauts,

```
23.64 \declare@shorthand{ngerman}{"a}{\textormath{\"{a}\allowhyphens}{\ddot a}}
               23.65 \declare@shorthand{ngerman}{"o}{\textormath{\"{o}\allowhyphens}{\ddot o}}
               23.67 \end{1} {\allowhyphens} {\dot A} {\dot A} {\allowhyphens} {\dot A} {\dot A
              23.68 \end{are@shorthand{ngerman}{"0}{\text{v"{0}}}} allowhyphens}{\ddot 0}}
              23.70 \declare@shorthand{ngerman}{"e}{\textormath{\"{e}}}{\ddot e}}
               23.71 \declare@shorthand{ngerman}{"E}{\operatorname{L}}{\dot E}}

```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
23.92 \ldf@finish\CurrentOption 23.93 \langle /code \rangle
```

24 The Breton language

The file breton.dtx¹⁸ defines all the language-specific macros for the Breton language.

There are not really typographic rules for the Breton language. It is a local language (it's one of the celtic languages) which is spoken in Brittany (West of France). So we have a synthesis between french typographic rules and english typographic rules. The characters:,;,! and? are made active in order to get a whitespace automatically before these characters.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
24.1 \langle *code \rangle
24.2 \land LdfInit\{breton\} \land captionsbreton
```

When this file is read as an option, i.e. by the \usepackage command, breton will be an 'unknown' language in which case we have to make it known. So we check for the existence of \logbreton to see whether we have to do something here.

```
24.3 \ifx\l@breton\@undefined
24.4 \@nopatterns{Breton}
24.5 \adddialect\l@bretonO\fi
```

The next step consists of defining commands to switch to the English language. The reason for this is that a user might want to switch back and forth between languages.

\captionsbreton

24.28 }

The macro \captionsbreton defines all strings used in the four standard document classes provided with LATeX.

```
24.6 \addto\captionsbreton{%

```

 $^{^{18}\}mathrm{The}$ file described in this section has version number v1.0h and was last revised on 2005/03/29.

\extrasbreton \noextrasbreton

The macro \extrasbreton will perform all the extra definitions needed for the Breton language. The macro \noextrasbreton is used to cancel the actions of \extrasbreton.

The category code of the characters :, ;, ! and ? is made \active to insert a little white space.

```
24.35 \initiate@active@char{:}
24.36 \initiate@active@char{;}
24.37 \initiate@active@char{!}
24.38 \initiate@active@char{?}
```

We specify that the breton group of shorthands should be used.

24.39 \addto\extrasbreton{\languageshorthands{breton}}

These characters are 'turned on' once, later their definition may vary.

```
24.40 \addto\extrasbreton{%
24.41 \bbl@activate{:}\bbl@activate{;}%
24.42 \bbl@activate{!}\bbl@activate{?}}
Don't forget to turn the shorthands off again.
24.43 \addto\noextrasbreton{%
```

24.44 \bbl@deactivate{;}\% 24.45 \bbl@deactivate{!}\bbl@deactivate{?}}

The last thing \extrasbreton needs to do is to make sure that \frenchspacing is in effect. If this is not the case the execution of \noextrasbreton will switch it of again.

```
24.46 \addto\extrasbreton{\bbl@frenchspacing} 24.47 \addto\noextrasbreton{\bbl@nonfrenchspacing}
```

\breton@sh@;@ We have to reduce the amount of white space before ;, : and ! when the user types a space in front of these characters. This should only happen outside mathmode, hence the test with \ifmmode.

```
24.48 \declare@shorthand{breton}{;}{%
24.49 \ifmmode
24.50 \string;\space
24.51 \else\relax
```

In horizontal mode we check for the presence of a 'space' and replace it by a **\thinspace**.

\breton@sh@:@ Because these definitions are very similar only one is displayed in a way that the \breton@sh@!@ definition can be easily checked.

```
24.59 \declare@shorthand{breton}{:}{%
       \ifmmode\string:\space

28 The Greek language

The file <code>greek.dtx^{22}</code> defines all the language definition macros for the Greek language, i.e., as it used today with only one accent, and the attribute $\pi o \lambda \upsilon \tau o \upsilon \kappa \delta$ ("Polutoniko") for typesetting greek text with all accents. This separation arose out of the need to simplify things, for only very few people will be really interested to typeset polytonic Greek text.

\greektext \latintext \textgreek \textlatin \textol The commands \greektext and \latintext can be used to switch to greek or latin fonts. These are declarations.

The commands \textgreek and \textlatin both take one argument which is then typeset using the requested font encoding. The command \greekol switches to the greek outline font family, while the command \textol typests a short text in outline font. A number of extra greek characters are made available through the added text commands \stigma, \qoppa, \sampi, \ddigamma, \Digamma, \euro, \permill, and \vardigamma.

28.1 Typing conventions

Entering greek text can be quite difficult because of the many diacritical signs that need to be added for various purposes. The fonts that are used to typeset Greek make this a lot easier by offering a lot of ligatures. But in order for this to work, some characters need to be considered as letters. These characters are <, >, \sim , <, <, <, <, <, <, <, and |. Therefore their \lccode is changed when Greek is in effect. In order to let \uppercase give correct results, the \uccode of these characters is set to a non-existing character to make them disappear. Of course not all characters are needed when typesetting "modern" $\mu o \nu o \tau o \nu \iota \kappa \acute{o}$. In that case we only need the $^{\prime}$ and " symbols which are treated in the proper way.

28.2 Greek numbering

The Greek alphabetical numbering system, like the Roman one, is still used in everyday life for short enumerations. Unfortunately most Greeks don't know how to write Greek numbers bigger than 20 or 30. Nevertheless, in official editions of the last century and beginning of this century this numbering system was also used for dates and numbers in the range of several thousands. Nowadays this numbering system is primary used by the Eastern Orthodox Church and by certain scholars. It is hence necessary to be able to typeset any Greek numeral up to 999 999. Here are the conventions:

- There is no Greek numeral for any number less than or equal to 0.
- Numbers from 1 to 9 are denoted by letters alpha, beta, gamma, delta, epsilon, stigma, zeta, eta, theta, followed by a mark similar to the mathematical symbol "prime". (Nowadays instead of letter stigma the digraph sigma tau is used for number 6. Mainly because the letter stigma is not always available, so people opt to write down the first two letters of its name as an alternative. In our implementation we produce the letter stigma, not the digraph sigma tau.)
- Decades from 10 to 90 are denoted by letters iota, kappa, lambda, mu, nu, xi, omikron, pi, qoppa, again followed by the numeric mark. The qoppa used for this purpose has a special zig-zag form, which doesn't resemble at all the original 'q'-like qoppa.
- Hundreds from 100 to 900 are denoted by letters rho, sigma, tau, upsilon, phi, chi, psi, omega, sampi, followed by the numeric mark.

 $^{^{22}\}mathrm{The}$ file described in this section has version number v1.3l and was last revised on 2005/03/30. The original author is Apostolos Syropoulos (apostolo@platon.ee.duth.gr), code from kdgreek.sty by David Kastrup dak@neuroinformatik.ruhr-uni-bochum.de was used to enhance the support for typesetting greek texts.

- Any number between 1 and 999 is obtained by a group of letters denoting the hundreds decades and units, followed by a numeric mark.
- To denote thousands one uses the same method, but this time the mark is placed in front of the letter, and under the baseline (it is inverted by 180 degrees). When a group of letters denoting thousands is followed by a group of letters denoting a number under 1000, then both marks are used.

\greeknumeral

\Greeknumeral

Using these conventions one obtains numbers up to 999 999. The command \greeknumeral makes it possible to typeset Greek numerals. There is also an "uppercase" version of this macro: \Greeknumeral.

Another system which was in wide use only in Athens, could express any positive number. This system is implemented in package athnum.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
28.1 (*code)
```

28.2 \LdfInit\CurrentOption{captions\CurrentOption}

When the option polutonikogreek was used, redefine \CurrentOption to prevent problems later on.

```
28.3 \gdef\CurrentOption{greek}%
```

When this file is read as an option, i.e. by the \usepackage command, greek could be an 'unknown' language in which case we have to make it known. So we check for the existence of \logreek to see whether we have to do something here.

```
28.4 \ifx\l@greek\@undefined 28.5 \@nopatterns{greek}
```

28.6 \adddialect\l@greek0\fi

Now we declare the polutoniko language attribute.

```
28.7 \bbl@declare@ttribute{greek}{polutoniko}{%
```

This code adds the expansion of \extraspolutonikogreek to \extrasgreek and changes the definition of \today for Greek to produce polytonic month names.

```
28.8 \expandafter\addto\expandafter\extrasgreek
```

28.9 \expandafter{\extraspolutonikogreek}%

28.10 \let\captionsgreek\captionspolutonikogreek

28.11 \let\gr@month\gr@c@month

We need to take some extra precautions in order not to break older documents which still use the old polutonikogreek option.

```
28.12 \let\l@polutonikogreek\l@greek
28.13 \let\datepolutonikogreek\dategreek
28.14 \let\extraspolutonikogreek\extrasgreek
28.15 \let\noextraspolutonikogreek\noextrasgreek
28.16 }
```

Typesetting Greek texts implies that a special set of fonts needs to be used. The current support for greek uses the cb fonts created by Claudio Beccari²³. The cb fonts provide all sorts of *font combinations*. In order to use these fonts we define the Local GReek encoding (LGR, see the file greek.fdd). We make sure that this encoding is known to I^AT_EX, and if it isn't we abort.

```
28.17 \InputIfFileExists{lgrenc.def}{%
28.18 \message{Loading the definitions for the Greek font encoding}}{%
28.19 \errhelp{I can't find the lgrenc.def file for the Greek fonts}%
28.20 \errmessage{Since I do not know what the LGR encoding means^J
28.21 I can't typeset Greek.^J
28.22 I stop here, while you get a suitable lgrenc.def file}\@@end
28.23 }
```

Now we define two commands that offer the possibility to switch between Greek and Roman encodings.

²³Apostolos Syropoulos wishes to thank him for his patience, collaboration, cooments and suggestions.

\greektext The command \greektext will switch from Latin font encoding to the Greek font encoding. This assumes that the 'normal' font encoding is a Latin one. This command is a declaration, for shorter pieces of text the command \textgreek should be used.

```
28.24 \DeclareRobustCommand{\greektext}{%
28.25 \fontencoding{LGR}\selectfont
28.26 \def\encodingdefault{LGR}}
```

\textgreek This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

28.27 \DeclareRobustCommand{\textgreek}[1]{\leavevmode{\greektext #1}}

\textol A last aspect of the set of fonts provided with this version of support for typesetting Greek texts is that it contains an outline family. In order to make it available we define the command \textol.

```
28.28 \def\outlfamily{\usefont{LGR}{cmro}{m}{n}}
28.29 \DeclareTextFontCommand{\textol}{\outlfamily}
```

The next step consists in defining commands to switch to (and from) the Greek language.

\greekhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

```
28.30~\% Yannis Haralambous has suggested this value 28.31 \provide
hyphenmins{CurrentOption}{Qne}
```

\captionsgreek The macro \captionsgreek defines all strings used in the four standard document classes provided with LATEX.

```

                      \expandafter\Greeknumeral\expandafter{\the\year}}
               28.79
  \extrasgreek
                The macro \extrasgreek will perform all the extra definitions needed for the
                Greek language. The macro \noextrasgreek is used to cancel the actions of
\noextrasgreek
                \extrasgreek. For the moment these macros switch the fontencoding used and
                the definition of the internal macros \@alph and \@alph because in Greek we do
                use the Greek numerals.
               28.80 \addto\extrasgreek{\greektext}
               28.81 \addto\noextrasgreek{\latintext}
\gr@ill@value
                When the argument of \greeknumeral has a value outside of the acceptable
                bounds (0 < x < 999999) a warning will be issued (and nothing will be printed).
               28.82 \def\gr@ill@value#1{%
                     \PackageWarning{babel}{Illegal value (#1) for greeknumeral}}
     \anw@true
                When a a large number with three trailing zero's is to be printed those zeros and
                the numeric mark need to be discarded. As each 'digit' is processed by a separate
    \anw@false
                macro and because the processing needs to be expandable we need some helper
    \anw@print
                macros that help remember to not print the numeric mark (\anwtonos).
                   The command \anw@false switches the printing of the numeric mark off by
                making \anw@print expand to nothing. The command \anw@true (re)enables the
                printing of the numeric marc. These macro's need to be robust in order to prevent
                improper expansion during writing to files or during \uppercase.
               28.84 \DeclareRobustCommand\anw@false{%
               28.85
                      \DeclareRobustCommand\anw@print{}}
               28.86 \DeclareRobustCommand\anw@true{%
               28.87
                      \DeclareRobustCommand\anw@print{\anwtonos}}
               28.88 \anw@true
```

\greeknumeral

The command \greeknumeral needs to be fully expandable in order to get the right information in auxiliary files. Therefore we use a big $\ifont{if-construction}$ to check the value of the argument and start the parsing at the right level.

28.89 \def\greeknumeral#1{%

If the value is negative or zero nothing is printed and a warning is issued.

```
28.90 \ifnum#1<\@ne\space\gr@ill@value{#1}%
28.91 \else
28.92 \ifnum#1<10\expandafter\gr@num@i\number#1%
28.93 \else
28.94 \ifnum#1<100\expandafter\gr@num@ii\number#1%
28.95 \else
```

We use the available shorthands for 1.000 ($\mbox{\em cm}$) and 10.000 ($\mbox{\em cm}$) to save a few tokens

```
28.96 \ifnum#1<\@m\expandafter\gr@num@iii\number#1%
28.97 \else
28.98 \ifnum#1<\@M\expandafter\gr@num@iv\number#1%
28.99 \else
28.100 \ifnum#1<100000\expandafter\gr@num@v\number#1%
28.101 \else
28.102 \ifnum#1<1000000\expandafter\gr@num@vi\number#1%
28.103 \else
```

If the value is too large, nothing is printed and a warning is issued.

```
\space\gr@ill@value{#1}%
28.104
28.105
                        \fi
28.106
                     \fi
                   \fi
28.107
                \fi
28 108
              \fi
28.109
           \fi
28.110
         \fi
28.111
28.112 }
```

\Greeknumeral The command \Greeknumeral prints uppercase greek numerals. The parsing is performed by the macro \greeknumeral.

\greek@alph \greek@Alph In the previous release of this language definition the commands \greek@aplh and \greek@Alph were kept just for reasons of compatibility. Here again they become meaningful macros. They are definited in a way that even page numbering with greek numerals is possible. Since the macros \@alph and \@Alph will lose their original meaning while the Greek option is active, we must save their original value. macros \@alph

```
28.115 \let\latin@alph\@alph
28.116 \let\latin@Alph\@Alph
```

Then we define the Greek versions; the additional \expandafters are needed in order to make sure the table of contents will be correct, e.g., when we have appendixes.

Now we can set up the switching.

```
28.119 \addto\extrasgreek{%

28.120 \let\@alph\greek@alph

28.121 \let\@Alph\greek@Alph}

28.122 \addto\noextrasgreek{%

28.123 \let\@alph\latin@alph

28.124 \let\@Alph\latin@Alph}
```

\greek@roman \greek@Roman To prevent roman numerals being typeset in greek letters we need to adopt the internal IATEX commands \@roman and \@Roman. Note that this may cause errors where roman ends up in a situation where it needs to be expanded; problems are known to exist with the AMS document classes.

```
28.125 \let\latin@roman\@roman
           28.126 \let\latin@Roman\@Roman
           28.127 \def\greek@roman#1{\textlatin{\latin@roman{#1}}}
           28.128 \def\greek@Roman#1{\textlatin{\latin@Roman{#1}}}
           28.129 \addto\extrasgreek{%

            In greek typesetting we need a number of characters with more than one accent. In
```

\greek@tilde In greek typesetting we need a number of characters with more than one accent. In the underlying family of fonts (the cb fonts) this is solved using Knuth's ligature mechanism. Characters we need to have ligatures with are the tilde, the acute and grave accent characters, the rough and smooth breathings, the subscript, and the double quote character. In text input the ~ is normaly used to produce an unbreakable space. The command \~ normally produces a tilde accent. For polytonic Greek we change the definition of \~ to produce the tilde character itself, making sure it has category code 12.

```
28.163 \lccode'\!='\~
28.164 \lowercase{\def\x{\endgroup}}
28.165 \def\greek@tilde{!}}\x}
28.166 \addto\extraspolutonikogreek{%}
28.167 \babel@save\~\let\~\greek@tilde}
```

In order to get correct hyphenation we need to set the lower case code of a number of characters. The 'v' character has a special usage for the cb fonts: in fact this ligature mechanism detects the end of a word and assures that a final sigma is typeset with the proper sign wich is different from that of an initial or medial sigma; the 'v 'after an *isolated* sigma fools the ligature mechanism in order to typeset σ in place of ς . Because of this we make sure its lowercase code is not changed. For "modern" greek we have to deal only with ' and " and so things are easy.

```
28.168 \addto\extrasgreek{%
28.169
       \babel@savevariable{\lccode'v}\lccode'v='v%
       \babel@savevariable{\lccode'\';\lccode'\'='\',%
28.170
       \babel@savevariable{\lccode'\"}\lccode'\"='\"}
28.171
28.172 \addto\extraspolutonikogreek{%
28.173
       \babel@savevariable{\lccode'\<}\lccode'\<='\<%
       \babel@savevariable{\lccode'\>}\lccode'\>='\>%
28.174
       \babel@savevariable{\lccode'\~}\lccode'\~='\~%
28.175
       \babel@savevariable{\lccode'\|}\lccode'\|='\\%
28.176
       \babel@savevariable{\lccode'\';\lccode'\'='\'}
28.177
```

And in order to get rid of all accents and breathings when a string is \uppercased we also change a number of uppercase codes.

```
28.178 \addto\extrasgreek{%
28.179 \babel@savevariable{\uccode'\"}\uccode'\"='\"%
28.180 \babel@savevariable{\uccode'\'}\uccode'\'=159} %% 159 == ^^9f
28.181 \addto\extraspolutonikogreek{%
28.182 \babel@savevariable{\uccode'\~}\uccode'\~=159%
28.183 \babel@savevariable{\uccode'\>}\uccode'\>=159%
28.184 \babel@savevariable{\uccode'\}\uccode'\<=159%
28.185 \babel@savevariable{\uccode'\|}\uccode'\|='\|%
28.186 \babel@savevariable{\uccode'\'}\uccode'\'=159}
```

For this to work we make the character <code>^9f</code> a shorthand that expands to nothing. In order for this to work we need to make a character look like <code>^9f</code> in TEX's eyes. The trick is to have another character and assign it a different lowercase code. The execute the macros needed in a <code>lowercase</code> environment. Usually the tile <code>character</code> is used for such purposes. Before we do this we save it's original lowercase code to restore it once we're done.

```
28.187 \cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cd)\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cd)\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cdef(\cd)\cdef(\cdef(\cdef(\cdef(\cdef(\cd)\cdef(\cdef(\cdef(\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd)\cdef(\cd
```

We can also make the tilde character itself expand to a tilde with category code 12 to make the typing of texts easier.

```
28.193 \addto\extraspolutonikogreek{\languageshorthands{greek}}\% \\ 28.194 \declare@shorthand{greek}{^}{\greek@tilde}
```

We now define a few symbols which are used in the type setting of greek numerals, as well as some other symbols which are usefull, such as the $\epsilon v \rho \omega$ symbol, etc.

```
28.195 \end{\endaligned} $28.196 \end{\endaligned} $28.196 \end{\endaligned} $28.197 \end{\endaligned} $\{LGR\}_{\end{\endaligned} $28.198 \end{\endaligned} $\{LGR\}_{\end{\endaligned} $\{LGR\}_{\end{\endaligned} $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} \} $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endaligned} \} $\{LGR\}_{\end{\endaligned} } $\{LGR\}_{\end{\endalig
```

Since the $\tilde{}$ cannot be used to produce an unbreakable white space we must redefine at least the commands fnum@figure and fnum@table so they do not produce a $\tilde{}$ instead of white space.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
28.207 \ldf@finish{\CurrentOption} 28.208 \langle /code \rangle
```

29 The French language

The file frenchb.dtx²⁴, derived from frenchy.sty, defines all the language definition macros for the French language.

Customization for the French language is achieved following the book "Lexique des règles typographiques en usage à l'Imprimerie nationale" troisième édition (1994), ISBN-2-11-081075-0.

This file has been designed to be used with \LaTeX 2_{ε} , \LaTeX 2_{ε} , \LaTeX 2.09 and PlainTeX formats. If you are still using \LaTeX 2.09, you should consider switching to \LaTeX 2.5!

The command \selectlanguage{french} switches to the French language ²⁵, with the following effects:

- 1. French hyphenation patterns are made active;
- 2. 'double punctuation' is made active for correct spacing in French;
- 3. \today prints the date in French;
- 4. the caption names are translated into French (LATEX only);
- 5. the default items in itemize environment are set to '-' instead of •, and all vertical spacing and glue is deleted, a hook to reset standard IATEX spacing is provided (\FrenchItemizeSpacingfalse); it is possible to change '-' to something else ('-' for instance) by redefining \FrenchLabelItem; apart from the global hook \FrenchLabelItem, it is also possible to change the 'labelitems' at any level (1 to 4) in French, using the standard IATEX syntax, for instance: \renewcommand{\labelitemii}{\textbullet}; in order to be effective in French, the redefinitions have to be made when French is the current language (i.e. after the \begin{document}), the changes are saved when switching to another language and will be remembered of, when switching back to French;
- 6. vertical spacing in general LATEX lists is shortened, a hook to reset standard LATEX settings is provided (\FrenchListSpacingfalse);
- 7. the first paragraph of each section is indented (LATEX only);
- 8. the space after \dots is removed in French.

Some commands are provided in frenchb to make typesetting easier:

- 1. French quotation marks can be entered using the commands \log and fg which work in LaTeX 2_{ε} , LaTeX-2.09 and PlainTeX, their appearance depending on what is available to draw them; if you use LaTeX 2_{ε} and T1-encoding you can also enter them as << French quotation marks >> but then don't forget the unbreakable spaces, (\log and fg provide for correct line breaks and better horizontal spacing). \log and fg can be used outside French, they provide then English quotes "and".
- 2. A command \up is provided to typeset superscripts like M\up{me} (abbreviation for "Madame"), 1\up{er} (for "premier").
- 3. Family names should be typeset in small capitals and never be hyphenated, the macro \bsc (boxed small caps) does this, e.g., Leslie~\bsc{Lamport} will produce Leslie LAMPORT.
- 4. Commands \primo, \secundo, \tertio and \quarto may be used to enumerate in lists.

 $^{^{24}\}mathrm{The}$ file described in this section has version number ? and was last revised on ?.

²⁵\selectlanguage{francais} and \selectlanguage{frenchb} are kept for backward compatibility but should no longer be used.

- 5. Abbreviations for "Numéro" and "numéro" are obtained via the commands \No, \no.
- 6. Two commands are provided to typeset the symbol for "degré": \degre prints the raw character and \degres should be used to typeset temperatures (e.g., "20~\degres C" with an unbreakable space), or for alcohols' strengths (e.g., "45\degres" with no space in French).
- 7. In math mode the comma has to be surrounded with braces to avoid a spurious space being inserted after it, in decimal numbers for instance (see the TeXbook p. 134). The command \DecimalMathComma makes the comma be an ordinary character in French only (no space added); as a counterpart, if \DecimalMathComma is active, an explicit space has to be added in lists and intervals: \$[0,\ 1]\$, \$(x,\ y)\$. \StandardMathComma switches back to the standard behaviour of the comma.
- 8. A command \nombre is provided to easily typeset numbers: it works both in text and in math mode: inputting \nombre{3141,592653} will format this number properly according to the current language (French or non-French): each slice of three digits will be separated either with a comma in English or with a space in French (if you prefer a thin space instead of a normal space, just add the command \ThinSpaceInFrenchNumbers to the preamble of your document, or to frenchb.cfg). The command \nombre is a contribution of Vincent Jalby using ideas of David Carlisle in comma.sty.
- 9. frenchb has been designed to take advantage of the xspace package if present: adding \usepackage{xspace} in the preamble will force macros like \fg, \ier, \ieme, \dots, ..., to respect the spaces you type after them, for instance typing '1\ier juin' will print '1er juin' (no need for a forced space after 1\ier).
- 10. Two commands, \FrenchLayout and \StandardLayout (to be used only in the preamble) are provided to unify the layout of multilingual documents (it mainly concerns lists) regardless the current language (see section 30.10 for details).
- 11. Two commands \AddThinSpaceBeforeFootnotes and \FrenchFootnotes enable to customize the layout of footnotes following the French IN's specifications; the first one, which can only be used before the \begin{document}, adds a thinspace in the running text before the number or symbol calling the footnote; the second one modifies the footnote's layout: it typesets leading numbers as '1.' instead of '1'. \FrenchFootnotes has no effect on footnotes numbered with symbols (as in the \thanks command).

None of these commands are active by default, both can be best added to frenchb.cfg or to the preamble of the document. \FrenchFootnotes and \StandardFootnotes, which cancels the effect of \FrenchFootnotes for the text coming next, can be used anywhere in the document. The command \StandardFootnotes may be useful when some footnotes are numbered with letters (inside minipages for instance).

 $\AddThinSpaceBeforeFootnotes$ and \FrenchFootnotes act on all footnotes whatever the current language is.

All commands previously available in francais.ldf have been included in frenchb.ldf for compatibility, sometimes with updated definitions.

The french package, by Bernard Gaulle, was not designed to run with babel (although the latest versions claim to be babel compatible), but rather as a standalone package for the French language. It provides many more functionalities (like \lettrine, \sommaire...) not available in frenchb, at the cost of a much greater complexity and possible incompatibilities with other languages.

As french is known to produce the best layout available for French typography, I have borrowed many ideas from Bernard's file. I did my best to help users of both packages (french and frenchb) to exchange their sources files easily (see the example configuration file below in section 29), with one exception which affects the way French quotation marks are entered: frenchb uses macros (\og and \fg) while french uses active characters (<< and >>).

French typographic rules specify that some white space should be present before 'double punctuation' characters. These characters are;!? and: In order to get this white space automatically, the category code of these characters is made \active. In French, the user should input these four characters preceded with a space, but as many people forget about it (even among native French writers!), the default behaviour of frenchb is to automatically add a \thinspace before ';' '!' '?' and a normal (unbreakable) space before ':' (this is the rule in French typography). It's up to the user to add or not a space after 'double punctuation' characters: usually a space is necessary, but not always (before a full point or a closing brace for instance), so this cannot done automatically.

In (rare) cases where no space should be added before a 'double punctuation', either use \string; \string! \string! instead of ; :!?, or switch locally to English. For instance you can type C\string:TEX or \begin{otherlanguage}{english}{C:TEX}\end{otherlanguage} to avoid the space before : in a MS-DOS path.

Some users dislike this automatic insertion of a space before 'double punctuation', and prefer to decide themselves whether a space should be added or not; so a hook \NoAutoSpaceBeforeFDP is provided: if this command is added (in file frenchb.cfg, or anywhere in a document) frenchb will respect your typing, and introduce a suitable space before 'double punctuation' if and only if a space is typed in the source file before those signs.

The command \AutoSpaceBeforeFDP switches back to the default behaviour of frenchb.

Once you have built your format, a good precaution would be to perform some basic tests about hyphenation in French. For LATEX 2_{ε} I suggest this:

• run the following file, with the encoding suitable for your machine (*my-encoding* will be latin1 for UNIX machines and PCs running Windows, applemac for Macintoshs, or cp850 for PCs running DOS).

• check the hyphenations proposed by TEX in your log-file; in French you should get with both 7-bit and 8-bit encodings si-gnal contai-ner évé-ne-ment al-gèbre.

Do not care about how accented characters are displayed in the log-file, what matters is the position of the '-' hyphen signs *only*.

If they are all correct, your installation (probably) works fine, if one (or more) is (are) wrong, ask a local wizard to see what's going wrong and perform the test

again (or e-mail me about what happens).

Frequent mismatches:

- you get sig-nal con-tainer, this probably means that the hyphenation patterns you are using are for US-English, not for French;
- you get no hyphen at all in évé-ne-ment, this probably means that you are using CM fonts and the macro \accent to produce accented characters. Using EC fonts with built-in accented characters or MITEX with CM fonts avoids this type of mismatch.

frenchb has been improved using helpful suggestions from many people, the main contributions came from Vincent Jalby. Thanks to all of them!

Changes

First version released: 1.1 as of 1996/05/31 part of babel-3.6beta.

Changes in version 1.1b: update for babel-3.6.

Changes in version 1.2: new command \nombre to format numbers; removed command \fup borrowed from the french package (\up does a better job in LATEX 2_{ε}); also removed aliases \french and \english (frenchb.cfg is a better place for these).

Changes in version 1.3:

- The 'xspace' package, when present, now controls spacing after all (sensible) macros, formerly 'xspace' worked on \fg (suggested by Vincent Jalby);
- spacing after opening and before closing guillemets improved as suggested by Thierry Bouche;
- a replacement for poor looking guillemets in OT1 encoding (math fonts are used to emulate them) is provided if the file ot2wncyr.fd is found: this file defines an OT2 encoding using AMS Cyrillic fonts; these have builtin guillemets, they are text fonts, are free, and are distributed as META-FONT and Type1 fonts (good for pdftex!), the replacement was suggested by Gérard Degrez; if the files ot2wncyr.fd, wncy*.mf, wncy*.tfm, and wncy*.pfb aren't available on your system, you should get them from CTAN; if your system complains about missing wncy*.tfm fonts, it means your TEX system is incomplete, as a quick fix, you can either remove ot2wncyr.fd or add the command \LasyGuillemets to the preamble of your document or to frenchb.cfg, then frenchb will behave as it did in the previous versions. In case Cyrillic guillemets do not fit, it is possible to pick French guillemets from any font using the command \FrenchGuillemetsFrom which requires 4 arguments \FrenchGuillemetsFrom{coding}{font}{char-left}{char-right}, for instance, add \FrenchGuillemetsFrom{T1}{ppl}{19}{20} to the preamble of your document or to frenchb.cfg, to pick French guillemets from Palatino (fontname=ppl, char 19 and 20 are left and right guillemets in T1-encoding). This was suggested by Michel Bovani.
- the environment 'itemize' has been redesigned in French according to specifications from Jacques André and Thierry Bouche; it is possible to switch back to the settings of version 1.2: add \FrenchItemizeSpacingfalse after loading frenchb in the preamble (this can be useful to process old documents);
- two switches have been added to go back to standard LATEX list spacing \FrenchItemizeSpacingfalse and \FrenchListSpacingfalse;
- \nombre now properly handles signs in LATEX 2ε ;

- definition of \dots changed in French;
- in French, with the standard LATEX classes, captions in figures and tables are printed with an endash instead of a colon.

Changes in version 1.4:

- the redefinition of \@makecaption is changed not to overwrite the changes made by some classes (koma-script, amsart, ua-thesis...) as pointed out by Werner Lemberg;
- a hook, \FrenchGuillemetsFrom, is provided to pick French guillemets from any font (suggested by Michel Bovani, works *only* in OT1-encoding);
- a hook, \FrenchLabelItem, is provided to enable marks other than '-' (\textendash) in French lists (also suggested by Michel Bovani);
- \DecimalMathComma, \StandardMathComma, \ThinSpaceInFrenchNumbers added;
- \FrenchLayout and \StandardLayout added;
- an example of customization file frenchb.cfg is included in frenchb.dtx.

Changes in version 1.5:

- The settings for spacing in French lists are no longer tuned at the \@trivlist level but within \list; this enables the users to provide their own settings for the lists they define with \list (suggested by P. Pichaureau). Although the layout of the standard lists has not changed, some lists, based directly on \@trivlist or \trivlist, could possibly be typeset differently when upgrading from version 1.4 to 1.5. The command \FrenchOldTrivlisttrue could then, be useful to process older documents.
- Apart from the global hook \FrenchLabelItem, it is now also possible to change the 'labelitems' at any level (1 to 4) in French, using the standard IATEX syntax, for instance: \renewcommand{\labelitemii}{\textbullet}.
- The internal name for the French language has been changed from frenchb to french, it means that \captionsfrench, \datefrench, \extrasfrench, \noextrasfrenchb, \are to be used now instead of \captionsfrenchb, \datefrenchb, \extrasfrenchb, \noextrasfrenchb.
- From version 1.5f on, it is possible to customize the space inserted before a colon in French; its default value is \space (as in previous versions of frenchb), but it can now be changed to \thinspace by redefining \Fcolonspace.

Changes in version 1.6:

- Two new commands are provided: \AddThinSpaceBeforeFootnotes and \FrenchFootnotes; they enable to typeset footnotes according to the French IN's specifications (suggested by Jacques André).
- frenchb will make use of \textdegree (TS1 encoding) to typeset degrees whenever possible.
- Default guillemets have been changed in OT1 encoding only in version 1.6c: the former ones were picked up in the wncyr fonts, which forced the cyrillic encoding to OT2 when babel was loaded with option frenchb before a cyrillic language (russian, ukrainian or bulgarian). Now, LM fonts for T1-encoding are available, we pick up the guillemets from them, for OT1-encoding.

- The config file frenchb.cfg is now loaded only when LATEX 2ε is used (from version 1.6g).
- The command \degres now works also in math mode (from version 1.6g), but not in bold versions (it is a text character basically).

Customizing frenchb: an example of configuration file

```
29.1 (*cfg)
 29.3 %% If you want to customize frenchb, please DO NOT hack into the code,
 29.4 %% copy this file into a directory searched by TeX, preferably a
 29.5 %% personal one on multi-user systems, and customize it as you like.
 29.7 %% WARNING: If you exchange your documents with colleagues using
 29.8 %% a different TeX installation, it is best NOT TO HAVE a frenchb.cfg
 29.9 %% file, and add instead the customization commands to the preamble

30 T_EXnical details

30.1 Initial setup

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
30.1 \ensuremath{\mbox{$\langle * \mbox{$\langle * \st}$$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \st}$$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \mbox{$\langle * \st}$\langle * \mbox{$\langle * \mbox{$
```

\if@Two@E

We will need another 'if': \ifCTwoCE is true if and only if \LaTeX is running not in compatibility mode. It is used in the definitions of the command \nombre and \up. The definition is somewhat complicated, due to the fact that \ifCcompatibility is not recognized as a \if in \LaTeX LATEX-2.09 based formats.

```
30.8 \newif\if@Two@E \@Two@Etrue
30.9 \def\@FI@{\fi}
30.10 \ifx\@compatibilitytrue\@undefined
30.11 \@Two@Efalse \def\@FI@{\relax}
30.12 \else
30.13 \if@compatibility \@Two@Efalse \fi
30.14 \@FI@
```

Check if hyphenation patterns for the French language have been loaded in language.dat; we allow for the names 'french', 'francais', 'canadien' or 'acadian'. The latter two are both names used in Canada for variants of French that are in use in that country.

```
30.15 \ifx\l@french\@undefined
       \ifx\l@francais\@undefined
30.17
         \ifx\l@canadien\@undefined
30.18

30.29
       \fi
30.30 \fi
```

After the statement above \logrench is sure to always be defined.

The internal name for the French language will be 'french'; 'francais' and 'french' will be synonymous for 'french': first let both names use the same hyphenation patterns. Later we will have to set aliases for \captionsfrench, \datefrench, \extrasfrench and \noextrasfrench. As French uses the standard values of \lefthyphenmin (2) and \righthyphenmin (3), no special setting is required here.

```
30.31 \def\CurrentOption{french}
30.32 \ifx\l@francais\@undefined
30.33 \let\l@francais\l@french
30.34 \fi
30.35 \ifx\l@frenchb\@undefined
```

```
30.36 \let\l@frenchb\l@french 30.37 \fi
```

When this language definition file was loaded for one of the Canadian versions of French we need to make sure that a suitable hyphenation pattern register will be found by T_FX.

This language definition can be loaded for different variants of the French language. The 'key' babel macros are only defined once, using 'french' as the language name, but frenchb and francais are synonymous. As some users who choose frenchb or francais as option of babel, might customize \captionsfrenchb or \captionsfrancais in the preamble, we merge their changes at the \begin{document} when they do so (only possible in LATEX 2_{ε}). The other three commands for \date, \extras, and \noextras are not likely to be modified by end-users. The other variants of languages are defined by checking if the relevant option was used and then adding one extra level of expansion.

```

\extrasfrench \noextrasfrench

The macro \extrasfrench will perform all the extra definitions needed for the French language. The macro \noextrasfrench is used to cancel the actions of \extrasfrench.

In French "apostrophe" is used in hyphenation in expressions like 1'ambulance (French patterns provide entries for this kind of words). This means that the \lccode of "apostrophe" has to be non null in French for proper hyphenation of those expressions, and to be reset to null when exiting French.

```
30.84 \end{extras\CurrentOption} {\lccode'\''='\'} \\ 30.85 \end{encextras\CurrentOption} {\lccode'\''=0}
```

It is best to use \LaTeX so font changing commands, and to emulated those we need when they are not available, as in PlainTEX or \LaTeX 2.09. Be aware that old commands \sc, \it, etc. exist in \LaTeX 2.09 (i. e., they switch back to \normalfont instead of keeping the other font attributes unchanged).

```

30.98
      \fi
30.99 \fi
```

30.2 Caption names

The next step consists of defining the French equivalents for the LATEX caption names.

In French, captions in figures and tables should be printed with endash ('-') instead of the standard ':'. If another separator is preferred, see in the example configuration file above (section 29) how to change the default value of \CaptionSeparator.

We first store the standard definition of \@makecaption (e.g., the one provided in article.cls, report.cls, book.cls which is frozen for IATEX 2_{ε} according to Frank Mittelbach), in \STD@makecaption. 'ATBeginDocument' we compare it to its current definition (some classes like koma-script classes, AMS classes, ua-thesis.cls...change it). If they are identical, frenchb just adds a hook called \CaptionSeparator to \@makecaption, \CaptionSeparator defaults to ': ' as in the standard \@makecaption, and will be changed to ' – ' in French. If the definitions differ, frenchb doesn't overwrite the changes, but prints a message in the .log file.

```
30.100 \ifLaTeXe
        \long\def\STD@makecaption#1#2{%
30.101
          \vskip\abovecaptionskip

\captionsfrench

30.112

The macro \captionsfrench defines all strings used in the four standard document classes provided with LATEX. Some authors do not like some of these names; it is easy to change them in the preamble after loading frenchb (or in your file frenchb.cfg), e.g \addto\captionsfrench{\def\figurename{Figure}} will print 'Figure' in Roman instead of 'Fig.'.

```
30.138 \ifLaTeX

30.3 **Punctuation**

The 'double punctuation' characters (; ! ? and :) have to be made \active for an automatic control of the amount of space to insert before them.

```
30.170 \initiate@active@char{:}
30.171 \initiate@active@char{:}
30.172 \initiate@active@char{!}
30.173 \initiate@active@char{?}
```

We specify that the French group of shorthands should be used.

```
30.174 \expandafter\addto\csname extras\CurrentOption\endcsname{%
       \languageshorthands{french}}
```

These characters are 'turned on' once, later their definition may vary.

```
30.176 \expandafter\addto\csname extras\CurrentOption\endcsname{%
       \bbl@activate{:}\bbl@activate{;}%
       \bbl@activate{!}\bbl@activate{?}}
30.178
30.179 \expandafter\addto\csname noextras\CurrentOption\endcsname{%
       \bbl@deactivate{:}\bbl@deactivate{;}%
30.180
       \bbl@deactivate{!}\bbl@deactivate{?}}
30.181
```

One more thing \extrasfrench needs to do is to make sure that \frenchspacing is in effect. If this is not the case the execution of \noextrasfrench will switch it off again.

```
30.182 \expandafter\addto\csname extras\CurrentOption\endcsname{%
      \bbl@frenchspacing}
30.184 \expandafter\addto\csname noextras\CurrentOption\endcsname{%
      \bbl@nonfrenchspacing}
```

\french@sh@;@ We have to tune the amount of white space before;!? and:. This should only happen in horizontal mode, hence the test \ifhmode.

> In horizontal mode, if a space has been typed before ';' we remove it and put an unbreakable \thinspace instead. If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thin space, or as \@empty.

```
30.186 \ensuremath{\mbox{declare@shorthand{french}{;}}{\%}
30.187
           \ifhmode
30.188
             \ifdim\lastskip>\z@
30.189
                \unskip\penalty\@M\thinspace
30.190
              \else
30.191
                \FDP@thinspace
30.192
              \fi
           \fi
30.193
  Now we can insert a; character.
```

30.194

```
\string;}
```

\french@sh@!@ Because these definitions are very similar only one is displayed in a way that the \french@sh@?@ definition can be easily checked.

```
30.195 \declare@shorthand{french}{!}{%
30.196
          \ifhmode
30.197
             \ifdim\lastskip>\z@
30.198
               \unskip\penalty\@M\thinspace
30.199
             \else
30.200
               \FDP@thinspace

30.4 French quotation marks

EC/LM fonts and standard PostScript fonts have built-in guillemets, we of course use them. CM fonts have no French guillemets built-in, so we have to emulate them:

- if a file 't1lmr.fd' is found, we expect the LM fonts to be present on the system, so we pick up French guillemets from them; before version 1.6b, French guillemets were borrowed from the 'wncyr' fonts, this has been changed because it resulted in a conflict with the russian option of babel. Former Cyrillic guillemets are still available through the command \CyrillicGuillemets (for backward compatibility).
- otherwise we use math symbols, either LATEX's 'lasy' font if available, or TEX symbols \11 and \gg otherwise;

The standard names for French quotation marks are \guillemotleft and \guillemotright, these commands are defined in tlenc.def for T1-encoding. In LaTeX 2_{ε} formats, we first define these commands for OT1-encoding (for CM fonts), using either the Polish 'pl*' fonts or LaTeX's 'lasy' fonts. Other local text

encodings *should* define them too, but if they don't, the OT1 definitions will be used. The standard PostScript fonts should *always* be used together with T1-encoding (*not* OT1), for proper hyphenation and built-in (better looking) French quotation marks.

The next step is to provide correct spacing after \guillemotleft and before \guillemotright: a space precedes and follows quotation marks but no line break is allowed neither after the opening one, nor before the closing one. \guill@spacing which does the spacing, has been fine tuned by Thierry Bouche.

The top macros for quotation marks will be called \log ("ouvrez guillemets") and fg ("fermez guillemets").

The top level definitions for French quotation marks are switched on and off through the \extrasfrench \noextrasfrench mechanism. Outside French, \og and \fg will typeset standard English opening and closing double quotes.

As \DeclareTextCommand cannot be used after the \begin{document} we introduce internal definitions \begin@guill and \end@guill.

We'll try to be smart to users of D. CARLISLE's xspace package: if this package is loaded there will be no need for {} or \ to get a space after \fg.

\guillemotleft In $\mbox{Left} X 2_{\varepsilon}$ we provide a dummy definition for \og and \fg, just to display an \guillemotright error message in case \og or \fg have been defined elsewhere.

```
\label{eq:command} $$ \log_{0.233} \end{\g}_{\end} $$ \fg_{0.234} \end{\fg}_{\end} $$
```

30.5 French lists

\bbl@frenchlistspacing \bbl@nonfrenchlistspacing Vertical spacing in general lists should be shorter in French texts than the defaults provided by LATEX. Note that the easy way, just changing values of vertical spacing parameters when entering French and restoring them to their defaults on exit would not work; as most lists are based on \list we will redefine \list (up to version 1.4, the more internal command \@trivlist was redefined, this ensured that all lists would have common settings, but didn't allow the users to provide their own settings, as pointed out by P. Pichaureau). If standard LaTeX settings are preferred, it is easy to issue the command \FrenchListSpacingfalse in the preamble or in frenchb.cfg. Please note that changing the flag \FrenchListSpacing will not take effect immediately, but next time language French is switched on.

The amount of vertical space before and after a list is given by \topsep + \parskip (+ \partopsep if the list starts a new paragraph). IMHO, \parskip should be added *only* when the list starts a new paragraph, so I subtract \parskip from \topsep and add it back to \partopsep; this will normally make no difference because \parskip's default value is 0pt, but will be noticeable when \parskip is not null.

Of course, this code is only for LATEX.

```
30.285 \newif\ifFrenchListSpacing \FrenchListSpacingtrue \\ 30.286 \newif\ifFrenchOldTrivlist \\ 30.287 \ifLaTeX \\ 30.288 \let\listORI\list
```

\endlist is not redefined, but \endlistORI is provided for the users who prefer to define their own lists from the original command, they can code: \begin{listORI}{} \end{listORI}.

```
30.289 \let\endlistORI\endlist
30.290 \def\FR@listsettings{%
30.291 \setlength{\itemsep}{0.4ex plus 0.2ex minus 0.2ex}%
30.292 \setlength{\parsep}{0.4ex plus 0.2ex minus 0.2ex}%
30.293 \setlength{\topsep}{0.8ex plus 0.4ex minus 0.4ex}%
30.294 \setlength{\partopsep}{0.4ex plus 0.2ex minus 0.2ex}%
```

\parskip is of type 'skip', its mean value only (not the glue) should be substracted from \topsep and added to \partopsep, so convert \parskip to a 'dimen' using \@tempdima.

```
30.295 \@tempdima=\parskip
30.296 \addtolength{\topsep}{-\@tempdima}%
30.297 \addtolength{\partopsep}{\@tempdima}}%
30.298 \def\listFR#1#2{\listORI{#1}{\FR@listsettings #2}}%
```

Keep the \@trivlist redefinition from version 1.4 (only for compatibility reasons). The flag \ifFrenchOldTrivlist could happen to be useful to process older documents.

```

\bbl@frenchitemize \bbl@nonfrenchitemize

The layout of French itemize-lists has changed between version 1.2 and 1.3. Jacques André and Thierry Bouche pointed out to me that vertical spacing between items, before and after the list, should *null* with *no glue* added. Moreover horizontal spacing was not correct either: the item labels of a first level list should be vertically aligned on the paragraph's first character (at \parindent from the left margin). Checking the book "Lexique des règles typographiques en usage à l'Imprimerie nationale" confirmed their points, so the itemize environment has been totally redefined for French in version 1.3.

Several people pointed out to me that the layout of lists can either be set by the current language or be tuned independently of the language as part of the layout of the document. So hooks should be provided to switch off the special settings made in frenchb. Setting \frenchItemizeSpacingfalse after loading frenchb in the preamble switches back to settings of version 1.2 (this can be useful to process old documents). If you want all list spacings to be exactly what they are in standard IATEX $2_{\mathcal{E}}$, then add also \frenchListSpacingfalse in the preamble after loading frenchb. Both switches can also be set in frenchb.cfg. Please note that changing the flags \frenchItemizeSpacing and \frenchListSpacing will not take effect immediately, but next time language French is switched on.

The • is never used in French itemize-lists, a long dash '-' is preferred for all levels. The item label used in French is stored in \FrenchLabelItem\, it defaults to '-' and can be changed using \renewcommand (see the example configuration file above).

30.7 Formatting footnotes

\AddThinSpaceBeforeFootnotes \FrenchFootnotes \StandardFootnotes \AddThinSpaceBeforeFootnotes redefines \@footnotemark (whose definition is saved at the \begin{document} in order to include any customization that packages might have done) to add a thinspace before the number or symbol calling a footnote (any space typed in is removed first). \AddThinSpaceBeforeFootnotes has no effect on the layout of the footnote itself. Note that \thanks in \maketitle also relies on \@footnotemark, so the thinspace is added there too.

```
30.378 \newif\ifthinspace@FN
30.379 \newif\ifFR@fntlayout
30.380 \newdimen\parindentFFN
30.381 \ \text{ifLaTeXe}
        \newcommand{\AddThinSpaceBeforeFootnotes}{\thinspace@FNtrue}
30.382
        \AtBeginDocument{\let\@footnotemarkORI\@footnotemark
30.383
30.384
                          \def\@footnotemarkFR{\leavevmode\unskip\unkern
30.385
                                                 \,\@footnotemarkORI}%
                          \ifthinspace@FN
30.386
30.387

30.388
                          \fi}
```

We then define \@makefntextFR, a variant of \@makefntext which is responsible for the layout of footnotes, to match the specifications of the French 'Imprimerie Nationale': Footnotes will be indented by \parindentFFN, numbers (if any) typeset on the baseline (instead of textsuperscripts) and followed by a dot and an half quad space. Whenever symbols are used to number footnotes (as in \tanks for instance), we switch back to the standard layout (the French layout of footnotes is meant for footnotes numbered by arabic or roman digits). The value of \parindentFFN will be defined at the \begin{document}, as the maximum of \parindent and 1.5em.

```
30.389
        \def\ftnISsymbol{\@fnsymbol\c@footnote}
30.390
        \long\def\@makefntextFR#1{\ifx\thefootnote\ftnISsymbol
                                      \@makefntextORI{#1}%
30.391
                                    \else
30.392
                                      \parindent=\parindentFFN
30.393
                                      \rule\z@\footnotesep
30.394
30.395
                                      \setbox\@tempboxa\hbox{\@thefnmark}%
                                      \ifdim\wd\@tempboxa>\z@

```

30.8 Formatting numbers

\DecimalMathComma \StandardMathComma As mentioned in the TEXbook p. 134, the comma is of type \mathpunct in math mode: it is automatically followed by a space. This is convenient in lists and intervals but unpleasant when the comma is used as a decimal separator in French: it has to be entered as {,}. \DecimalMathComma makes the comma be an ordinary character (of type \mathord) in French only (no space added); \StandardMathComma switches back to the standard behaviour of the comma.

```

In English the decimal part starts with a point and thousands should be separated by a comma: an approximation of 1000π should be inputed as \$3{,}141.592{,}653\$ in math mode and as 3,141.592,653 in text.

In French the decimal part starts with a comma and thousands should be separated by a space; the same approximation of 1000π should be inputed as \$3\;141{,}592\;653\$ in math mode and as something like 3~141,592~653 in text: in math mode, the comma is of type \mathpunct (thus normally followed by a space) while the point is of type \mathord (no space added).

Thierry Bouche suggested that a second type of comma, of type \mathord would be useful in math mode, and proposed to introduce a command (named \decimalsep in this package), the expansion of which would depend on the current language.

Vincent Jalby suggested a command \nombre to conveniently typeset numbers: inputting \nombre{3141,592653} either in text or in math mode will format this number properly according to the current language (French or non-French).

\nombre accepts an optional argument which happens to be useful with the
package 'dcolumn', it specifies the decimal separator used in the source code:
\newcolumntype{d}{D{,}}{\decimalsep}{-1}}

```
\begin{tabular}{d}\hline
3,14 \\
  \nombre[,]{123,4567} \\
  \nombre[,]{9876,543}\\hline
\end{tabular}
```

will print a column of numbers aligned on the decimal point (comma or point depending on the current language), each slice of 3 digits being separated by a space or a comma according to the current language.

\decimalsep \thousandsep

We need a internal definition, valid in both text and math mode, for the comma (\@comma@) and another one for the unbreakable fixed length space (no glue) used in French (\f@thousandsep).

The commands \decimalsep and \thousandsep get default definitions (for the English language) when frenchb is loaded; these definitions will be updated when the current language is switched to or from French.

```

```

nombre The decimal separator used when inputing a number with \nombre has to be a comma. \nombre splits the inputed number into two parts: what comes before the first comma will be formatted by \@integerpart while the rest (if not empty) will be formatted by \@decimalpart. Both parts, once formatted separately will be merged together with between them, either the decimal separator \decimalsep or (in IATEX 2ε only) the optional argument of \nombre.

30.9 Dots...

LaTeX 2_{ε} 's standard definition of \dots in text-mode is \textellipsis which includes a \kern at the end; this space is not wanted in some cases (before a closing brace for instance) and \kern breaks hyphenation of the next word. We define \Frtextellipsis for French (in LaTeX 2_{ε} only).

The \if construction in the LaTeX 2_{ε} definition of \dots doesn't allow the use of xspace (xspace is always followed by a \fi), so we use the AMS-LaTeX construction of \dots; this has to be done 'AtBeginDocument' not to be overwritten when amsmath.sty is loaded after babel.

\Frtextellipsis

```
30.501 \ifLaTeXe
30.502 \DeclareTextCommandDefault{\Frtextellipsis}{%
30.503 .\kern\fontdimen3\font.\kern\fontdimen3\font.\xspace}
```

\Mdots@ and \Tdots@ORI hold the definitions of \dots in Math and Text mode. They default to those of amsmath-2.0, and will revert to standard IATEX definitions 'AtBeginDocument', if amsmath has not been loaded. \Mdots@ doesn't change when switching from/to French, while \Tdots@ is \Frtextellipsis in French and \Tdots@ORI otherwise.

```
30.504
       \newcommand{\Tdots@ORI}{\@xp\textellipsis}

30.518 \fi
```

30.10 Global layout

In multilingual documents, some typographic rules must depend on the current language (e.g., hyphenation, typesetting of numbers, spacing before double punctuation...), others should, IMHO, be kept global to the document: especially the layout of lists (see 30.5) and the indentation of the first paragraph of sections (see 30.6).

\FrenchLayout

In a multilingual document, a unified look, either the French one or the standard one, can be assigned to the whole document: adding \FrenchLayout will give a global "French look" to the document (e.g., lists, regardless the current language, will be typeset as in French) and \StandardLayout forces a global "US-English" look. Both of these commands can only be used before the \begin{document}. \StandardLayout can also be of interest for class designers who do not want frenchb to interfere with their global layout choices.

As of version 1.4, \FrenchLayout and \StandardLayout only affect:

- the layout of lists (see 30.5),
- the indentation of the first paragraph of sections (see 30.6).

```
30.519 \ifLaTeXe
       \newcommand{\FrenchLayout}{%
30.520
          \renewcommand{\StandardLayout}{%

30.11 Extra utilities

All that is left to do now is to provide the French user with some extra utilities.

```
\up eases the typesetting of superscripts like '1er'. \up relies on \textsuperscript
          when available (i. e., in \LaTeX 2_{\varepsilon}).
   \ieme
\up@size
          The internal macro \up@size holds the size at which the superscript will be type-
          set. The reason for this is that we have to specify it differently for different
          formats.
        30.550 \ifx\sevenrm\@undefined
        30.551
                \ifx\@ptsize\@undefined
        30.552
                  \let\up@size\small
        30.553
                  \ifx\selectfont\@undefined
        30.554
          In this case the format is the original LATEX-2.09:
                    \ifcase\@ptsize
        30.556
                      \let\up@size\ixpt\or
        30.557
                      \let\up@size\xpt\or
        30.558
                      \let\up@size\xipt
        30.559
          When \selectfont is defined we probably have NFSS available:
        30.560
        30.561
                    \ifcase\@ptsize
                      \def\up@size{\fontsize\@ixpt{10pt}\selectfont}\or
        30.562
        30.563
                      \def\up@size{\fontsize\@xpt{11pt}\selectfont}\or
                      \def\up@size{\fontsize\@xipt{12pt}\selectfont}
        30.564
        30.565
                    \fi
        30.566
                  \fi
                \fi
        30.567
        30.568 \else
          If we end up here it must be a plain based TeX format, so:
        30.569
                  \let\up@size\sevenrm
        30.570 \fi
          Now we can define \up. When \LaTeX 2_{\varepsilon} runs in compatibility mode (\LaTeX -2.09
          emulation), \textsuperscript is also defined, but does no good job, so we give
          two different definitions for \up using \if@Two@E.
        30.571 \if@Two@E
        30.572 \DeclareRobustCommand*{\up}[1]{\textsuperscript{#1}}
        30.573 \else
        30.574 \DeclareRobustCommand*{\up}[1]{\leavevmode\raise1ex\hbox{\up@size#1}}
        30.575 \fi
              \ieme is provided for compatibility with francais.sty, the other 5 for com-
          patibility with french.sty:
        30.576 \def\ieme{\up{\lowercase{e}}\xspace}
        30.577 \def\iemes{\up{\lowercase{es}}\xspace}
        30.578 \def\ier{\up{\lowercase{er}}\xspace}
        30.579 \def\iers{\up{\lowercase{ers}}\xspace}
        30.580 \def\iere{\up{\lowercase{re}}\xspace}
        30.581 \def\ieres{\up{\lowercase{res}}\xspace}
     \No And some more macros for numbering, first two support macros.
     \no_{30.582} \DeclareRobustCommand*{FrenchEnumerate}[1]{%}
  \primo30.583
                                       #1\up{\lowercase{o}}\kern+.3em}
\fprimo)30.584 \DeclareRobustCommand*{\FrenchPopularEnumerate}[1]{%
                                       #1\up{\lowercase{o}})\kern+.3em}
        30.585
              Typing \primo should result in '1°',
        30.586 \def\primo{\FrenchEnumerate1}
        30.587 \def\secundo{\FrenchEnumerate2}
        30.588 \def\tertio{\FrenchEnumerate3}
```

30.589 \def\quarto{\FrenchEnumerate4}

```
while typing \fprimo) gives '1°).

30.590 \def\fprimo) {\FrenchPopularEnumerate1}

30.591 \def\fsecundo) {\FrenchPopularEnumerate2}

30.592 \def\ftertio) {\FrenchPopularEnumerate3}

30.593 \def\fquarto) {\FrenchPopularEnumerate4}

Let's provide two macros for the common abbreviations of "Numéro".

30.594 \DeclareRobustCommand*{\No}{\Nup{\lowercase{o}}\kern+.2em}

30.595 \DeclareRobustCommand*{\no}{\nup{\lowercase{o}}\kern+.2em}
```

\bsc As family names should be written in small capitals and never be hyphenated, we provide a command (its name comes from Boxed Small Caps) to input
them easily; this is a simpler implementation of commands \fsc and \lsc from
french.sty: no automatic uppercase/lowercase conversion is performed. Usage:
Jean~\bsc{Duchemin}.

```
30.596 \ensuremath{\verb|\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\localareRobustCommand*{\locala
```

Some definitions for special characters. The first eight are mandatory for \oe etc. to work properly in moving arguments, the others just for convenience. We won't define \tilde as a Text Symbol not to conflict with the macro \tilde for math mode and use the name \tild instead. Note that \boi may not be used in math mode, its name in math mode is \backslash.

\degre needs a special treatment: it is \char6 in T1-encoding and \char23 in OT1-encoding, both can be accessed by the command \r{} for ring accent.

```

```

\degres We now define a macro \degres for typesetting the abbreviation for 'degrees' (as in 'degrees Celsius'). As the bounding box of the character 'degree' has very different widths in CM/EC and PostScript fonts, we fix the width of the bounding

box of \degres to 0.3 em, this lets the symbol 'degree' stick to the preceding (e.g., 45\degres) or following character (e.g., 20~\degres C).

If the TEX Companion fonts are available (textcomp.sty), we pick up \textdegree from them instead of using emulating 'degrees' from the \r{} accent. Otherwise we overwrite the (poor) definition of \textdegree given in latin1.def, applemac.def etc. (called by inputenc.sty) by our definition of \degrees. We also advice the user (once only) to use TS1-encoding.

```
30.629 \ifLaTeXe
       \def\Warning@degree@TSone{%
30.630
30.631
              \PackageWarning{frenchb.ldf}{%
                 Degrees would look better in TS1-encoding:
30.632
                 \MessageBreak add \protect
30.633
                 \usepackage{textcomp} to the preamble.
30.634
30.635
                 \MessageBreak Degrees used}}
        \AtBeginDocument{\expandafter\ifx\csname M@TS1\endcsname\relax
30.636
                            \DeclareRobustCommand*{\degres}{%
30.637
                              \leavevmode\hbox to 0.3em{\hss\degre\hss}%
30.638
                              \Warning@degree@TSone

30.649 \fi
```

MITEX's macros dealing with accents conflict with those of IATEX 2ε , so we check whether \csubinverse is defined or not. If \csubinverse is defined, we are in MITEX.

```
30.650 \ifLaTeXe
30.651 \AtBeginDocument{%
30.652 \ifx\csubinverse\@undefined
30.653 \DeclareTextCompositeCommand{\^}{0T1}{i}{\^\i}%
30.654 \DeclareTextCompositeCommand{\"}{0T1}{i}{\"\i}%
30.655 \fi
30.656 \fi
```

30.12 Date and clean up

\datefrench The macro \datefrench redefines the command \today to produce French dates.

```
30.657 \@namedef{date\CurrentOption}{%
30.658 \def\today{\number\day
30.659 \ifnum1=\day {\ier}\fi
30.660 \space \ifcase\month
30.661 \or janvier\or f\'evrier\or mars\or avril\or mai\or juin\or
30.662 juillet\or ao\^ut\or septembre\or octobre\or novembre\or
30.663 d\'ecembre\fi
30.664 \space \number\year}}
```

The macro \ldf@quit takes care for setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value. The config file searched for has to be 'frenchb.cfg', and \CurrentOption has been set to 'french', so \ldf@finish\CurrentOption cannot be used: we first load 'frenchb.cfg' (in LaTeX2e only), then call \ldf@quit\CurrentOption. The macrospace used by some control sequences we do not need any longer, is freed.

- $30.665 \ \texttt{\label{locality}}$

- $30.672 \verb|\lataTeXfalse|@undefined|$
- $30.675 \ \label{lem:cond} $30.675 \ \end{subseteq}$
- $30.676 \verb|\ldf@quit\CurrentOption|$
- $30.677 \langle /code \rangle$

31 The Italian language

The file italian.dtx²⁶ defines all the language-specific macros for the Italian language.

The features of this language definition file are the following:

- 1. The Italian hyphenation is invoked, provided that file ithyph.tex was loaded when the LATEX 2ε format was built; in case it was not, read the information coming with your distribution of the TEX software, and the babel documentation.
- 2. The language dependent fixed words to be inserted by such commands as \chapter, \caption, \tableofcontents, etc. are redefined in accordance with the Italian typographical practice.
- 3. Since Italian can be easily hyphenated and Italian practice allows to break a word before the last two letters, hyphenation parameters have been set accordingly, but a very high demerit value has been set in order to avoid word breaks in the penultimate line of a paragraph. Specifically the \clubpenalty, and the \widowpenalty are set to rather high values and \finalhyphendemerits is set to such a high value that hyphenation is prohibited between the last two lines of a paragraph.
- 4. Some language specific shortcuts have been defined so as to allow etymological hyphenation, specifically "inserts a break point in any word boundary that the typesetter chooses, provided it is not followed by and accented letter (very unlikely in Italian, where compulsory accents fall only on the last and ending vowel of a word, but may take place with compound words that include foreign roots), and "I when the desired break point falls before an accented letter.
- 5. The shortcut "" introduces the raised (English) opening double quotes; this shortcut proves its usefulness when one reminds that the Italian keyboard misses the backtick key, and the backtick on a Windows based platform may be obtained only by pressing the Alt key while inputting the numerical code 0096; very, very annoying!
- 6. The shortcuts "< and "> insert the French guillemots, sometimes used in Italian typography; with the T1 font encoding the ligatures << and >> should insert such signs directly, but not all the virtual fonts that claim to follow the T1 font encoding actually contain the guillemots; with the OT1 encoding the guillemots are not available and must be faked in some way. By using the "< and "> shortcuts (even with the T1 encoding) the necessary tests are performed and in case the suitable glyphs are taken from other fonts normally available with any good, modern IATEX distribution.
- 7. Three new specific commands \unit, \ped, and \ap are introduced so as to enable the correct composition of technical mathematics according to the ISO 31/XI recommendations. \unit does not get redefined if the babel package is loaded after the package units.sty whose homonymous command plays a different role and follows a different syntax.

For this language a limited number of shortcuts has been defined, table 6, some of which are used to overcome certain limitations of the Italian keyboard; in section 31.3 there are other comments and hints in order to overcome some other keyboard limitations.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

 $^{^{26}}$ The file described in this section has version number v1.2r and was last revised on 2005/11/17. The original author is Maurizio Codogno, (mau@beatles.cselt.stet.it). It has been largely revised by Johannes Braams and Claudio Beccari

- " inserts a compound word mark where hyphenation is legal; it allows etymological hyphenation which is recommended for technical terms, chemical names and the like; it does not work if the next character is represented with a control sequence or is an accented character.
- " | the same as the above without the limitation on characters represented with control sequences or accented ones.
- "" inserts open quotes ".
- "< inserts open guillemots.
- "> inserts closed guillemots.
- "/ equivalent to \slash

Table 6: Shortcuts for the Italian language

```
31.1 \langle *code \rangle
31.2 \LdfInit{italian}{captionsitalian}%
```

When this file is read as an option, i.e. by the \usepackage command, italian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@italian to see whether we have to do something here.

31.1 Support for etymological hyphenation

In his article on Italian hyphenation [1] Beccari pointed out that the Italian language gets hyphenated on a phonetic basis, although etymological hyphenation is allowed; this is in contrast with what happens in Latin, for example, where etymological hyphenation is always used. Since the patterns for both languages would become too complicated in order to cope with etymological hyphenation, in his paper Beccari proposed the definition of an active character '_' such that it could insert a "soft" discretionary hyphen at the compound word boundary. For several reasons that idea and the specific active character proved to be unpractical and was abandoned.

This problem is so important with the majority of the European languages, that babel from the very beginning developed the tradition of making the "character active so as to perform several actions that turned useful with every language. One of these actions consisted in defining the shortcut "I that was extensively used in German and in many other languages in order to insert a discretionary hyphen such that hyphenation would not be precluded in the rest of the word as it happens with the standard TFX command \-.

Meanwhile the ec fonts with the double Cork encoding (thus formerly called the dc fonts) have become more or less standard and are widely used by virtually all Europeans that write languages with many special national characters; by so doing they avoid the use of the \accent primitive which would be required with the standard cm fonts; with the latter fonts the primitive command \accent is such that hyphenation becomes almost impossible, in any case strongly impeached.

The ec fonts contain a special character, named "compound word mark", that occupies position 23 in the font scheme and may be input with the sequence ^~W. Up to now, apparently, this special character has never been used in a practical way for the typesetting of languages rich of compound words; also it has never been inserted in the hyphenation pattern files of any language. Beccari modified his pattern file ithyph.tex v4.8b for Italian so as to contain five new patterns that involve ^~W, and he tried to give the babel active character " a new shortcut definition, so as to allow the insertion of the "compound word mark" in the proper

place within any word where two semantic fragments join up. With such facility for marking the compound word boundaries, etymological hyphenation becomes possible even if the patterns know nothing about etymology (but the typesetter hopefully does!). In Italian such etymological hyphenation is desirable with technical terms, chemical names, and the like.

Even this solution proved to be inconvenient on certain UN*X platforms, so Beccari resorted to another approach that uses the babel active character " and relies on the category code of the character that follows ".

```
31.46 \initiate@active@char{"}%
31.47 \addto\extrasitalian{\bbl@activate{"}\languageshorthands{italian}}%
```

The active character " is now defined for language italian so as to perform different actions in math mode compared to text mode; specifically in math mode a double quote is inserted so as to produce a double prime sign, while in text mode the temporary macro \it@next is defined so as to defer any further action until the next token category code has been tested.

```
31.48 \declare@shorthand{italian}{"}{%
31.49 \ifmmode
31.50
         \def\it@next{''}%
31.51 \else
31.52
         \def\it@next{\futurelet\it@temp\it@cwm}%
31.53 \fi
31.54 \it@next
31.55 }%
```

\it@cwm The \it@next service control sequence is such that upon its execution a temporary variable \it@temp is made equivalent to the next token in the input list without actually removing it. Such temporary token is then tested by the macro \it@cwm and if it is found to be a letter token, then it introduces a compound word separator control sequence \it@allowhyphens whose expansion introduces a discretionary hyphen and an unbreakable space; in case the token is not a letter, then it is tested against \mid_{12} : if so a compound word separator is inserted and the \mid token is removed, otherwise another test is performed so as to see if another double quote sign follows: in this case a double open quote mark is inserted, otherwise two other tests are performed so as to see if guillemets have to be inserted, otherwise nothing is done. The double quote shortcut for inserting a double open quote sign is useful for people who are inputting Italian text by means of an Italian keyboard that unfortunately misses the grave or backtick key. By this shortcut "" becomes equivalent to " for inserting raised open high double quotes.

```

By this definition of "if one types macro"istruzione the possible break points become ma-cro-istru-zio-ne, while without the "mark they would be ma-croi-stru-zio-ne, according to the phonetic rules such that the macro prefix is not taken as a unit. A chemical name such as des"clor"fenir"amina"cloridrato is breakable as des-clor-fe-nir-ami-na-clo-ri-dra-to instead of de-sclor-fe-ni-ra-mi-na-...

In other language description files a shortcut is defined so as to allow a break point without actually inserting any hyphen sign; examples are given such as entrada/salida; actually if one wants to allow a breakpoint after the slash, it is much clearer to type \slash instead of / and LaTeX does everything by itself; here the shortcut "/ was introduced to stand for \slash so that one can type input"/output and allow a line break after the slash. This shortcut works only for the slash, since in Italian such constructs are extremely rare.

Attention: the expansion of " takes place before the actual expansion of OT1 or T1 accented sequences such as \'{a}; therefore this etymological hyphenation facility works as it should only when the semantic word fragments do not start with an accented letter; this in Italian is always avoidable, because compulsory accents fall only on the last vowel, but it may be necessary to mark a compound word where one or more components come from a foreign language and contain diacritical marks according to the spelling rules of that language. In this case the special shorthand "| may be used that performs exactly as " normally does, except that the | sign is removed from the token input list: kilo"|{\"o}rsted gets hyphenated as ki-lo-ör-sted.

31.2 Facilities required by the ISO 31/XI regulations

The ISO 31/XI regulations require that units of measure are typeset in upright font in any circumstance, math or text, and that in text mode they are separated from the numerical indication of the measure with an unbreakable (thin) space. The command \unit that was defined for achieving this goal happened to conflict with the homonymous command defined by the package units.sty; we therefore need to test if that package has already been loaded so as to avoid conflicts; we assume that if the user loads that package, s/he wants to use that package facilities and command syntax.

The same regulations require also that super and subscripts (apices and pedices) are in upright font, not in math italics, when they represent "adjectives" or appositions to mathematical or physical variables that do not represent countable or measurable entities such as, for example, $V_{\rm max}$ or $V_{\rm rms}$ for a maximum or a root mean square voltage, compared to V_i or V_T as the *i*-th voltage in a set, or a voltage that depends on the thermodynamic temperature T. See [2] for a complete description of the ISO regulations in connection with typesetting.

More rarely it happens to use superscripts that are not mathematical variables, such as the notation \mathbf{A}^T to denote the transpose of matrix \mathbf{A} ; text superscripts are useful also as ordinals or in old fashioned abbreviations in text mode; for example the feminine ordinal 1^a or the old fashioned obsolete abbreviation \mathbf{F}^{lli} for Fratelli in company names (compare with "Bros." for $\underline{\mathbf{bro}}$ there in American English); text subscripts are mostly used in logos.

\unit First we define the new (internal) commands \bbl@unit, \bbl@ap, and \bbl@ped \ap as robust ones.

Then we can use \let to define the user level commands, but in case the macros already have a different meaning before entering in Italian mode typesetting, we first memorize their meaning so as to restore them on exit.

```
31.92 \@ifpackageloaded{units}{}{%
31.93 \addto\extrasitalian{%
31.94 \babel@save\unit\let\unit\bbl@unit}%
31.95 }%
31.96 \addto\extrasitalian{%
31.97 \babel@save\ap\let\ap\bbl@ap
31.98 \babel@save\ped\let\ped\bbl@ped
31.99 }%
```

31.3 Accents

Most of the other language description files introduce a number of shortcuts for inserting accents and other language specific diacritical marks in a more comfortable way compared with the lengthy standard TeX conventions. When an Italian keyboard is being used on a Windows based platform, it exhibits such limitations that up to now no convenient shortcuts have been developed; the reason lies in the fact that the Italian keyboard lacks the grave accent (also known as "backtick"), which is compulsory on all accented vowels except the 'e', but, on the opposite, it carries the keys with all the accented lowercase vowels; the keyboard lacks also the tie ~ (tilde) key, while the curly braces require pressing three keys simultaneously.

The best solution Italians have found so far is to use a smart editor that accepts shortcut definitions such that, for example, by striking "(one gets directly { on the screen and the same sign is saved into the .tex file; the same smart editor should be capable of translating the accented characters into the standard TeX sequences when writing a file to disk (for the sake of file portability), and to transform the standard TeX sequences into the corresponding signs when loading a .tex file from disk to memory. Such smart editors do exist and can be downloaded from the CTAN archives.

For what concerns the missing backtick key, which is used also for inputting the open quotes, it must be noticed that the shortcut "" described above completely solves the problem for *double* raised open quotes; according to the traditions of particular publishing houses, since there are no compulsory regulations on the matter, the French guillemets may be used; in this case the T1 font encoding solves the problem by means of its built in ligatures << and >>. But...

31.4 Caporali or French double quotes

Although the T1 font encoding ligatures solve the problem, there are some circumstances where even the T1 font encoding cannot be used, either because the author/typesetter wants to use the OT1 encoding, or because s/he uses a font set that does not comply completely with the T1 font encoding; some virtual fonts, for example, are supposed to implement the double Cork font encoding but actually miss some glyphs; one such virtual font set is given by the ae virtual fonts, because they are supposed to implement such double font encoding simply using the cm fonts, of which the type 1 PostScript version exists and is freely available. Since guillemets (in Italian caporali) do not exist in any cm latin font, their glyphs must be substituted with something else that approaches them.

Since in French type setting guillemets are compulsory, the French language definition file resorts to a clever font substitution; such file exploits the LaTeX 2ε font selection machinery so as to get the guillemets from the Cyrillic fonts, because it suffices to locally change the default encoding. There are several sets of Cyrillic fonts, but the ones that obey the OT2 font encoding are generally distributed with all recent implementations of the TEX software; they are part of the American Mathematical Society fonts and come both as METAFONT source files and Type 1 PostScript .pfb files. The availability of such fonts should be guaranteed by the presence of the OT2cmr.fd font description file. Actually the presence of this file does not guarantee the completeness of your TEX implementation; should IATEX complain about a missing Cyrillic .tfm file (that kind of file that contains the font metric parameters) and/or about missing Cyrillic (.mf) files, then your TEX system is incomplete and you should download such fonts from the CTAN archives. Temporarily you may issue the command \LtxSymbCaporali so as to approximate the missing glyphs with the IATEX symbol fonts. In some case warning messages are issued so as to inform the typesetter about the necessity of resorting to some poor man solution.

In spite of these alternate fonts, we must avoid invoking unusual fonts if the available encoding allows to use built in caporali. As far as I know (CB) the only T1-encoded font families that miss the guillemets are the AE ones; we therefore first test if the default encoding id the T1 one and in this case if the AE families are the default ones; in order for this to work properly it is necessary to load these optional packages before babel. If the T1 encoding is not the default one when the Italian language is specified, then some substitutions must be done.

\LtxSymbCaporali \it@ocap \it@ccap We define some macros for substituting the default guillemets; first the emulation by means of the LATEX symbols; each one of these macro sets actually redefines the control sequences \it@ccap and \it@ccap that are the ones effectively activated by the shortcuts "< and ">.

```
 31.100 \end{align*} $$ 31.101 \end{align*} \end{align*} $$ 1.102 \end{align*} $$ ignorespaces* % $$ 31.104 \end{align*} \end{align*} $$ ignorespaces* % $$ 31.104 \end{align*} \end{align*} \end{align*} $$ ignorespaces* % $$ 31.105 \end{align*} \end{align*} $$ ignorespaces* % $$ 31.106 \end{align*} \end{align*} $$ ignorespaces* % $$ 31.106 \end{align*} \end{align*} $$ ignorespaces* % $$ 31.106 \end{align*} $$ ignorespaces* % $$ 31.106 \end{align*} \end{align*} $$ ignorespaces* % $$ 31.106 \end{align*} $$ ignorespaces* % $$ ignorespaces* % $$ 31.106 \end{align*} $$ ignorespaces* % $$ i
```

Then the substitution with any specific font that contains such glyphs; it might be the CBgreek fonts, the Cyrillic one, the super-cm ones, the lm ones, or any other the user might prefer (the code is adapted from the one that appears in the frenchb.ld file; thanks to Daniel Flipo). By default if the user did not select the T1 encoding, the existence of the CBgreek fonts is tested; if they exist the guillemets are taken from this font, and since its families are a superset of the default CM ones and they apply also to typeset slides with the standard class slides. If the CBgreek fonts are not found, then the existence of the Cyrillic ones is tested, although this choice is not suited for typesetting slides; otherwise the poor man solution of the LATEX special symbols is used. In any case the user can force the use of the Cyrillic guillemets substitution by issuing the declaration \CyrillicCaporali just before the \begin{document} statement; in alternative the user can specify with

```
\verb|\CaporaliFrom{|\langle encoding\rangle|}{\langle family\rangle}{\langle opening\ number\rangle}{\langle closing\ number\rangle}|
```

the encoding and family of the font s/he prefers, and the slot numbers of the opening and closing guillemets respectively. For example if the T1-encoded Latin Modern fonts are desired the specific command should be

```
\CaporaliFrom{T1}{lmr}{19}{20}
```

These user choices might be necessary for assuring the correct typesetting with fonts that contain the required glyphs and are available also in PostScript form so as to use them directly with pdflatex, for example.

```
31.108 \def\CaporaliFrom#1#2#3#4{%

32 The Latin language

The file latin.dtx²⁷ defines all the language-specific macros for the Latin language both in modern and medieval spelling.

For this language two "styles" of typesetting are implemented: "regular" or modern-spelling Latin, and medieval Latin. The medieval Latin specific commands can be activated by means of the language attribute medieval; the medieval spelling differs from the modern one by the systematic use of the lower case 'u' also where in modern spelling the letter 'v' is used; when typesetting with capital letters, on the opposite, the letter 'V' is used also in place of 'U'. Medieval spelling also includes the ligatures <code>\ae</code> (æ), <code>\oe</code> (œ), <code>\AE</code> (Æ), and <code>\OE</code> (Œ) that are not used in modern spelling, nor were used in the classical times.

Furthermore a third typesetting style withprosodicmarks is defined in order to use special shortcuts for inserting breves and macrons when typesetting grammars, dictionaries, teaching texts, and the like, where prosodic marks are important for the complete information on the words or the verses. The shortcuts, listed in table 7 and described in section 33, may interfere with other packages; therefore by default this third style is off and no interference is introduced. If this third style is used and interference is experienced, there are special commands for turning on and off the specific short hand commands of this style.

For what concerns babel and typesetting with LATEX, the differences between the two styles of spelling reveal themselves in the strings used to name for example the "Preface" that becomes "Praefatio" or "Præfatio" respectively. Hyphenation rules are also different, but the hyphenation pattern file lahyph.tex takes care of both versions of the language. Needless to say that such patterns must be loaded in the LATEX format by by running initex (or whatever the name of the initializer) on latex.ltx.

The name strings for chapters, figures, tables, etcetera, are suggested by prof. Raffaella Tabacco, a classicist of the University of Turin, Italy, to whom we address our warmest thanks. The names suggested by Krzysztof Konrad Żelechowski, when different, are used as the names for the medieval variety, since he made a word and spelling choice more suited for this variety.

For this language some shortcuts are defined according to table 7; all of them are supposed to work with both spelling styles, except where the opposite is explicitly stated.

- inserts the breve accent as ĭ; valid also for the other lowercase vowels, but it does not operate on the medieval ligatures æ and œ.
- =a inserts the macron accent as ā; valid also for the other lowercase vowels, but it does not operate on the medieval ligatures æ and œ.
- " inserts a compound word mark where hyphenation is legal; the next character must not be a medieval ligature æ or œ, nor an accented letter (foreign names).
- "| same as above, but operates also when the next character is a medieval ligature or an accented letter.

Table 7: Shortcuts defined for the Latin language. The characters ^ and = are active only when the language attribute withprosodicmarks has been declared, otherwise they are disabled; see section 33 for more details.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

32.1 (*code)

²⁷The file described in this section has version number v2.0g and was last revised on 2005/11/17. The original author is Claudio Beccari with contributions by Krzysztof Konrad Żelechowski, (kkz@alfa.mimuw.edu.pl)

32.2 \LdfInit{latin}{captionslatin}

When this file is read as an option, i.e. by the \usepackage command, latin will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@latin to see whether we have to do something here.

```
32.3 \ifx\l@latin\@undefined
32.4
        \@nopatterns{Latin}
         \adddialect\l@latin0\fi
32.5
    Now we declare the medieval language attribute.
 32.6 \bbl@declare@ttribute{latin}{medieval}{%
      \addto\captionslatin{\def\prefacename{Pr{\ae}fatio}}%
 32.7
      \def\november{Nouembris}%
 32.8
      \expandafter\addto\expandafter\extraslatin
32.9
      \expandafter{\extrasmedievallatin}%
32.10
32.11
    The third typesetting style withprosodicmarks is defined here
32.12 \bbl@declare@ttribute{latin}{withprosodicmarks}{%
      \expandafter\addto\expandafter\extraslatin
32.14
      \expandafter{\extraswithprosodicmarks}%
32.15
```

It must be remembered that the medieval and the withprosodicmarks styles may be used together.

The next step consists of defining commands to switch to (and from) the Latin language²⁸.

\captionslatin The macro \captionslatin defines all strings used in the four standard document classes provided with LATEX.

```
32.16 \ensuremath{\mbox{Qnamedef{captionslatin}}}{\%}

       \def\glossaryname{Glossarium}%
32.37
32.38
       }
```

In the above definitions there are some points that might change in the future or that require a minimum of attention from the typesetter.

1. the \enclname is translated by a passive verb, that literally means "(they) are being added"; if just one enclosure is joined to the document, the plural passive is not suited any more; nevertheless a generic plural passive might be incorrect but suited for most circumstances. On the opposite "Additur", the corresponding singular passive, might be more correct with one enclosure

 $^{^{28}\}mathrm{Most}$ of these names were kindly suggested by Raffaella Tabacco.

and less suited in general: what about the abbreviation "Add." that works in both cases, but certainly is less elegant?

- 2. The \headtoname is empty and gobbles the possible following space; in practice the typesetter should use the dative of the recipient's name; since nowadays not all such names can be translated into Latin, they might result indeclinable. The clever use of an appellative by the typesetter such as "Domino" or "Dominae" might solve the problem, but the header might get too impressive. The typesetter must make a decision on his own.
- 3. The same holds true for the copy recipient's name in the "Cc" field of \ccname.

\datelatin The macro \datelatin redefines the command \today to produce Latin dates; the choice of faked small caps Latin numerals is arbitrary and may be changed in the future. For medieval latin the spelling of 'Novembris' should be Novembris. This is taken care of by using a control sequence which can be redefined when the attribute 'medieval' is selected.

```
32.39 \def\datelatin{%
32.40
       \def\november{Novembris}%
32.41
       \def\today{%
         {\tt \{\check@mathfonts\fontsize\sf@size\zg\math@fontsfalse\selectfontsize\space{thmosphice} } \\
32.42
32.43
            \uppercase\expandafter{\romannumeral\day}}\nobreakspace
32.44
         \ifcase\month\or
32.45
         Ianuarii\or Februarii\or Martii\or Aprilis\or Maii\or Iunii\or
32.46
         Iulii\or Augusti\or Septembris\or Octobris\or \november\or
         Decembris\fi
32.47
         \space{\uppercase\expandafter{\romannumeral\year}}}
32.48
```

\romandate

Thomas Martin Widmann (viralbus@daimi.au.dk) developed a macro originally named \latindate (but to be renamed \romandate so as not to conflict with the standard babel conventions) that should compute and translate the current date into a date ab urbe condita with days numbered according to the kalendae and idus; for the moment this is a placeholder for Thomas' macro, waiting for a self standing one that keeps local all the intermediate data, counters, etc. If he succeeds, here is the place to add his macro.

\latinhyphenmins

The Latin hyphenation patterns can be used with both \lefthyphenmin and \righthyphenmin set to 2.

 $32.49 \providehyphenmins{CurrentOption}{\tw0}$

\extraslatin \noextraslatin For this language the \clubpenalty, \widowpenalty are set to rather high values and \finalhyphendemerits is set to such a high value that hyphenation is prohibited between the last two lines of a paragraph.

```
32.50 \addto\extraslatin{%
      \babel@savevariable\clubpenalty
32.51
32.52
       \babel@savevariable\widowpenalty
       \clubpenalty3000\widowpenalty3000}
32.53
```

Never ever break a word between the last two lines of a paragraph in latin texts.

```
32.54 \addto\extraslatin{%
      \babel@savevariable\finalhyphendemerits
32.55
```

32.56 \finalhyphendemerits50000000}

With medieval Latin we need the suitable correspondence between upper case V and lower case u, since in that spelling there is only one sign, and the u shape is the (uncial) version of the capital V. Everything else is identical with Latin.

```
32.57 \addto\extrasmedievallatin{%
32.58 \babel@savevariable{\lccode'\V}%
32.59 \babel@savevariable{\uccode'\u}%
32.60 \lccode \V= \u \uccode \u= \V}
```

\SetLatinLigatures

We need also the lccodes for æ and œ; since they occupy different positions in the OT1 TeX-fontencoding compared to the T1 one, we must save the lc- and the uccodes for both encodings, but we specify the new lc- and uccodes separately as it appears natural not to change encoding while typesetting the same language. The encoding is assumed to be set before starting to use the Latin language, so that if Latin is the default language, the font encoding must be chosen before requiring the babel package with the latin option, in any case before any \selectlanguage or \foreignlanguage command.

All this fuss is made in order to allow the use of the medieval ligatures æ and æ while typesetting with the medieval spelling; I have my doubts that the medieval spelling should be used at all in modern books, reports, and the like, as the uncial 'u' shape of the lower case 'v' and the above ligatures were fancy styles of the copyists who were able to write faster with those rounded glyphs; with typesetting there is no question of handling a quill penn...Since my (CB) opinion may be wrong, I managed to set up the instruments and it is up to the typesetter to use them or not.

```
32.61 \addto\extrasmedievallatin{%
       \babel@savevariable{\lccode'\^^e6}% T1

With the above definitions we are sure that \MakeUppercase works properly and \MakeUppercase{C{\ae}sar} correctly 'yields 'CÆSAR''; correspondingly \MakeUppercase{Heluetia} correctly yields "HELVETIA".

33 Latin shortcuts

For writing dictionaries or didactic texts we defined a third language attribute, or a third typesetting style, where a couple of other active characters are defined: ^for marking a vowel with the breve sign, and = for marking a vowel with the macro sign. Please take notice that neither the OT1 font encoding, nor the T1 one for most vowels, contain directly the marked vowels, therefore hyphenation of words containing these "accents" may become problematic; for this reason the above active characters not only introduce the required accent, but also the necessary code for allowing hyphenation in the rest of the word.

It must be remarked that the active characters ^ and = may have other meanings in other contexts. For example the equals sign is used by the graphic extensions for specifying keyword options for handling the graphic elements to be included in the document. At the same time, as mentioned in the previous paragraph, diacritical marking in Latin is used only for typesetting certain kind of documents, such as grammars and dictionaries. It is reasonable that the breve and macron active characters may be switched on and off at will, and in particular that they are off by default if the attribute withprosodicmarks has not been set.

\ProsodicMarksOn \ProsodicMarksOff We begin by adding to the normal typesetting style the definitions of the new commands \ProsodicMarksOn and \ProsodicMarksOff that should produce error messages when the third style is not declared:

```
33.1 \addto\extraslatin{\def\ProsodicMarksOn{%
33.2 \GenericError{(latin)\@spaces\@spaces\@spaces\\genericError
33.3
                 {Latin language error: \string\ProsodicMarksOn\space
33.4
                 is defined by setting the \MessageBreak
 33.5
                 language attribute to 'withprosodicmarks'\MessageBreak
 33.6
                 If you continue you are likely to encounter\MessageBreak
 33.7
                 fatal errors that I can't recover}%
33.8
                 {See the Latin language description in the babel
33.9
                 documentation for explanation}{\@ehd}}}
33.10 \addto\extraslatin{\let\ProsodicMarksOff\relax}
```

Then we temporarily set the caret and the equals sign to active characters so that they can receive their definitions:

```
33.11 \catcode'\= \active 33.12 \catcode'\^ \active
```

and we add the necessary declarations to the macros that are being activated when the Latin language and its typesetting styles are declared:

```
33.13 \addto\extraslatin{\languageshorthands{latin}}% \\ 33.14 \addto\extraswithprosodicmarks{\bbl@activate{^}}% \\ 33.15 \addto\extraswithprosodicmarks{\bbl@activate{=}}% \\ 33.16 \addto\noextraswithprosodicmarks{\bbl@deactivate{^}}% \\ 33.17 \addto\noextraswithprosodicmarks{\bbl@deactivate{=}}% \\ 33.18 \addto\extraswithprosodicmarks{\ProsodicMarks}
```

\ProsodicMarks Next we define the defining macro for the active characters

```
33.19 \def\ProsodicMarks{%
33.20 \def\ProsodicMarksOn{\catcode'\^ 13\catcode'\= 13\relax}%
33.21 \def\ProsodicMarksOff{\catcode'\^ 7\catcode'\= 12\relax}%
```

Notice that with the above redefinitions of the commands \ProsodicMarksOn and \ProsodicMarksOff, the operation of the newly defined shortcuts may be switched on and off at will, so that even if a picture has to be inserted in the document by means of the commands and keyword options of the graphicx package, it suffices to switch them off before invoking the picture including command, and switched on again afterwards; or, even better, since the picture very likely is being inserted within a figure environment, it suffices to switch them off within the environment, being conscious that their deactivation remains local to the environment.

```
\textormath{\u\{u\}\bbl@allowhyphens}{\hat\{u\}}}
33.33
33.34 \declare@shorthand{latin}{=a}{%
33.35
         \textormath{\={a}\bbl@allowhyphens}{\bar{a}}}%
33.36 \declare@shorthand{latin}{=e}{%
         \textormath{\={e}\bbl@allowhyphens}{\bar{e}}}%
33.38 \declare@shorthand{latin}{=i}{%
         \textormath{\={\i}\bbl@allowhyphens}{\bar{\imath}}}%
33.39
33.40 \declare@shorthand{latin}{=o}{%
         \textormath{\={o}\bbl@allowhyphens}{\bar{o}}}%
33.41
33.42 \declare@shorthand{latin}{=u}{%
         \textormath{=\{u\}\bbl@allowhyphens}{\bar\{u\}}}
33.43
33.44 }
```

Notice that the short hand definitions are given only for lower case letters; it would not be difficult to extend the set of definitions to upper case letters, but it appears of very little use in view of the kind of documents where prosodic marks are supposed to be used. Nevertheless in those rare cases when it's required to set some uppercase letters with their prosodic marks, it is always possible to use the standard LaTeX commands such as $\u\{I\}$ for typesetting \check{I} , or $\ensuremath{=}\{A\}$ for typesetting \check{A} .

Finally we restore the caret and equals sign initial default category codes.

```
33.45 \catcode'\= 12\relax
33.46 \catcode'\^ 7\relax
```

\LatinMarksOn We define \LatinMarksOff shortcuts.

We define two new commands so as to switch on and off the breve and macron shortcuts.

```
33.47 \addto\extraslatin{\def\LatinMarksOn{\shorthandon{^}\shorthandon{=}}} \\ 33.48 \addto\extraslatin{\def\LatinMarksOff{\shorthandoff{^}\shorthandoff{=}}} \\ 33.49 \addto\extraslatin{\LatinMarksOff}
```

It must be understood that by using the above prosodic marks, line breaking is somewhat impeached; since such prosodic marks are used almost exclusively in dictionaries, grammars, and poems (only in school textbooks), this shouldn't be of any importance for what concerns the quality of typesetting.

34 Etymological hyphenation

In order to deal in a clean way with prefixes and compound words to be divided etymologically, the active character " is given a special definition so as to behave as a discretionary break with hyphenation allowed after it. Most of the code for dealing with the active " is already contained in the core of babel, but we are going to use it as a single character shorthand for Latin.

```
34.1 \initiate@active@char{"}%
34.2 \addto\extraslatin{\bbl@activate{"}%
34.3 }
```

A temporary macro is defined so as to take different actions in math mode and text mode: specifically in the former case the macro inserts a double quote as it should in math mode, otherwise another delayed macro comes into action.

```
34.4 \declare@shorthand{latin}{"}{%
34.5 \ifmmode
34.6 \def\lt@@next{''}%
34.7 \else
34.8 \def\lt@@next{\futurelet\lt@temp\lt@cwm}%
34.9 \fi
34.10 \lt@@next
34.11 }%
```

In text mode the \lt@next control sequence is such that upon its execution a temporary variable \lt@temp is made equivalent to the next token in the input list without actually removing it. Such temporary token is then tested by the macro

\lt@cwm and if it is found to be a letter token, then it introduces a compound word separator control sequence \lt@allowhyphens whose expansion introduces a discretionary hyphen and an unbreakable space; in case the token is not a letter, the token is tested again to find if it is the character |, in which case it is gobbled and a discretionary break is introduced.

```
34.12 \def\lt@allowhyphens{\nobreak\discretionary{-}{}{\nobreak\hskip\z@skip}
34.13 \newcommand*{\lt@cwm}{\let\lt@n@xt\relax
      \ifcat\noexpand\lt@temp a%
34.14
         \let\lt@n@xt\lt@allowhyphens
34.15
34.16
       \else
34.17
         \if\noexpand\lt@temp\string|%
           \def\lt@n@xt{\lt@allowhyphens\@gobble}%
34.18
        \fi
34.19
      \fi
34.20
      \t000xt}
34.21
```

Attention: the category code comparison does not work if the temporary control sequence \lt@temp has been let equal to an implicit character, such as \ae; therefore this etymological hyphenation facility does not work with medieval Latin spelling when " immediately precedes a ligature. in order to overcome this drawback the shorthand "| may be used in such cases; it behaves exactly as ", but it does not test the implicit character control sequence. An input such as super"|{\ae}quitas^29 gets hyphenated as su-per-æqui-tas instead of su-pe-ræ-qui-tas.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
34.22 \ldf@finish{latin} 34.23 \langle /code \rangle
```

²⁹This word does not exist in "regular" Latin, and it is used just as an example.

35 The Portuguese language

The file portuges.dtx³⁰ defines all the language-specific macros for the Portuguese language as well as for the Brasilian version of this language.

For this language the character " is made active. In table 8 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "

 for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 8: The extra definitions made by portuges.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
35.1 (*code)
35.2 \LdfInit\CurrentOption{captions\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, portuges will be an 'unknown' language in which case we have to make it known. So we check for the existence of \logortuges to see whether we have to do something here. Since it is possible to load this file with any of the following four options to babel: portuges, portuguese, brazil and brazilian we also allow that the hyphenation patterns are loaded under any of these four names. We just have to find out which one was used.

```
35.3 \ifx\l@portuges\@undefined
       \ifx\l@portuguese\@undefined
 35.4
         \ifx\l@brazil\@undefined
 35.5
            \ifx\l@brazilian\@undefined
 35.6
              \@nopatterns{Portuguese}
 35.7
 35.8
              \adddialect\l@portuges0
 35.9
            \else
35.10
              \let\l@portuges\l@brazilian
35.11
           \fi
35.12
         \else
35.13
            \let\l@portuges\l@brazil
         \fi
35.14
       \else
35.15
         \let\l@portuges\l@portuguese
35.16
35.17
       \fi
35.18 \fi
```

By now \logortuges is defined. When the language definition file was loaded under a different name we make sure that the hyphenation patterns can be found.

```
35.19 \expandafter\ifx\csname l@\CurrentOption\endcsname\relax 35.20 \expandafter\let\csname l@\CurrentOption\endcsname\l@portuges 35.21 \fi
```

Now we have to decide whether this language definition file was loaded for Portuguese or Brasilian use. This can be done by checking the contents of \CurrentOption. When it doesn't contain either 'portuges' or 'portuguese' we make \bbl@tempb empty.

³⁰The file described in this section has version number v1.2p and was last revised on 2005/03/31. Contributions were made by Jose Pedro Ramalhete (JRAMALHE@CERNVM or Jose-Pedro_Ramalhete@MACMAIL) and Arnaldo Viegas de Lima arnaldo@VNET.IBM.COM.

```
35.22 \def\bbl@tempa{portuguese}
35.23 \ifx\CurrentOption\bbl@tempa
      \let\bbl@tempb\@empty
35.24
35.25 \else
       \def\bbl@tempa{portuges}
35.26
35.27
       \ifx\CurrentOption\bbl@tempa
35.28
         \let\bbl@tempb\@empty
35.29
       \else
         \def\bbl@tempb{brazil}
35.30
35.31
       \fi
35.32 \fi
35.33 \ifx\bbl@tempb\@empty
```

The next step consists of defining commands to switch to (and from) the Portuguese language.

\captionsportuges

The macro \captionsportuges defines all strings used in the four standard document classes provided with LATEX.

```
35.34 \@namedef{captions\CurrentOption}{%
35.35 \def\prefacename{Pref\'acio}%
35.36 \def\refname{Refer\^encias}%
35.37 \def\abstractname{Resumo}%
35.38 \def\bibname{Bibliografia}%
35.39 \def\chaptername{Cap\'{\i}tulo}%
35.40 \def\appendixname{Ap\^endice}%
```

Some discussion took place around the correct translations for 'Table of Contents' and 'Index'. the translations differ for Portuguese and Brasilian based the following history:

The whole issue is that some books without a real index at the end misused the term 'Índice' as table of contents. Then, what happens is that some books apeared with 'Índice' at the begining and a 'Índice Remissivo' at the end. Remissivo is a redundant word in this case, but was introduced to make up the difference. So in Brasil people started using 'Sumário' and 'Índice Remissivo'. In Portugal this seems not to be very common, therefore we chose 'Índice' instead of 'Índice Remissivo'.

```
\def\contentsname{Conte\'udo}%
35.41
35.42
         \def\listfigurename{Lista de Figuras}%
35.43
         \def\listtablename{Lista de Tabelas}%
         \def\indexname{\'Indice}%

         }
```

\datebrazil The macro \datebrazil redefines the command \today to produce Brasilian dates, for which the names of the months are not capitalized.

```
35.89 \@namedef{date\CurrentOption}{%
35.90 \def\today{\number\day\space de\space\ifcase\month\or
35.91 janeiro\or fevereiro\or mar\c{c}o\or abril\or maio\or junho\or
35.92 julho\or agosto\or setembro\or outubro\or novembro\or dezembro%
35.93 \fi
35.94 \space de\space\number\year}}
35.95 \fi
```

\portugeshyphenmins Set correct values for \lefthyphenmin and \righthyphenmin.

35.96 \providehyphenmins{\CurrentOption}{\tw@\thr@@}

 $\verb|\extrasportuges| \\ \verb|\noextrasportuges| \\$

The macro \extrasportuges will perform all the extra definitions needed for the Portuguese language. The macro \noextrasportuges is used to cancel the actions of \extrasportuges.

For Portuguese the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the portuguese group of shorthands should be used.

```
35.97 \initiate@active@char{"}
35.98 \@namedef{extras\CurrentOption}{\languageshorthands{portuges}}
35.99 \expandafter\addto\csname extras\CurrentOption\endcsname{%
35.100 \bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

35.101 \addto\noextrasportuges{\bbl@deactivate{"}}

First we define access to the guillemets for quotations,

```
35.102 \end{are@shorthand{portuges}{"<}{\%} $35.103 \textormath{\guillemotleft}{\mbox{guillemotleft}}} $35.104 \end{are@shorthand{portuges}{">}{\%} $35.10
```

35.105 \textormath{\guillemotright}{\mbox{\guillemotright}}}

then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \setminus -.

```
35.106 \end{portuges} {\tt "-} {\tt \nobreak-\bbl@allowhyphens}
```

 $35.107 \verb|\declare@shorthand{portuges}{""}{\hskip}z@skip}$

And we want to have a shorthand for disabling a ligature.

```
35.108 \end{are@shorthand{portuges}{"|}{% } $35.109 \textormath{\discretionary{-}{}{kern.03em}}{}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

```
35.110 \exp \text{addto} \ \text{extras} \ \text{CurrentOption} \ \text{as}.111 \ \ \ \text{babel@save} \ \text{same extras} \ \text{CurrentOption} \ \text{ame} \ \text{same} \ \text{same
```

\ord We also provide an easy way to typeset ordinals, both in the male (\ord or \ro) \ro and the female (\ord or \ra) form.

```
\orda35.114 \def\ord{$^{\rm o}$}
\ra35.115 \def\orda{$^{\rm a}$}
35.116 \let\ro\ord\let\ra\orda
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
35.117 \label{ldf@finishCurrentOption} 35.118 \label{ldfQfinishCurrentOption} 35.118 \label{ldfQfinishCurrentOption}
```

36 The Spanish language

The file spanish.dtx³¹ defines all the language-specific macros for the Spanish language.

Custumization is made following mainly the books on the subject by José Martínez de Sousa. By typesetting spanish.dtx directly you will get the full documentation (regrettably is in Spanish only, but it is pretty long). References in this part refers to that document. There are several aditional features documented in the Spanish version only.

This style provides:

- Translations following the International IATEX conventions, as well as \today.
- Shorthands listed in Table 9. Examples in subsection 3.4 are illustrative. Note that "~ has a special meaning in spanish different to other languages, and is used mainly in linguistic contexts.
 - 'a acute accented a. Also for: e, i, o, u (both lowercase and uppercase).
 - 'n ñ (also uppercase).
 - \tilde{n} n (also uppercase). Deprecated.
 - "u ü (also uppercase).
 - "a Ordinal numbers (also "A, "o, "0).
 - "c ç (also uppercase).
 - "rr rr, but -r when hyphenated
 - "- Like \-, but allowing hyphenation in the rest the word.
 - "= Like -, but allowing hyphenation in the rest the word.
 - " The hyphen is repeated at the very beginning of the next line if the word is hyphenated at this point.
 - "" Like "- but producing no hyphen sign.
 - ~- Like but with no break after the hyphen. Also for: en-dashes (~--) and em-dashes (~---).
 - "/ A slash slightly lowered, if necessary.
 - "| disable ligatures at this point.
 - "
 < Left guillemets.
 - "> Right guillemets.
 - << \begin{quoting}. (See text.)</pre>
 - >> \end{quoting}. (See text.)

Table 9: Extra definitions made by file spanish.ldf

- \deactivatetilden deactivates the ~n and ~N shorthands.
- In math mode a dot followed by a digit is replaced by a decimal comma.
- Spanish ordinals and abbeviations with \sptext as, for instance, 1\sptext{er}. The preceptive dot is included.
- Accented functions: lím, máx, mín, mód. You may globally omit the accents with \unaccentedoperators. Spaced functions: arc cos, etc. You may globally kill that space with \unspacedoperators. \dotlessi is provided for use in math mode.

 $[\]overline{\ \ \ }^{31}$ The file described in this section has version number v4.2b and was last revised on 2004/02/20. The original author from v4.0 on is Javier Bezos. Previous versions were by Julio Sánchez.

- A quoting environment and a related pair of shorthands << and >>. The command \deactivatequoting deactivates these shorthand in case you want to use < and > in some AMS commands and numerical comparisons.
- The command \selectspanish selects the spanish language and its short-hands. (Intended for the preamble.)
- \frenchspacing is used.
- Ellipsis are best typed ... or, within a sentence, \...
- There is a small space before \%.
- \lsc provides lowercase small caps. (See subsection 3.10.)

Just in case spanish is the main language, the group \layoutspanish is activated, which modifies the standard classes through the whole document (it cannot be deactivated) in the following way:

- Both enumerate and itemize are adapted to Spanish rules.
- Both \alph and \Alph include \tilde{n} after n.
- Symbol footmarks are one, two, three, etc., asteriscs.
- \bullet 0T1 guillemets are generated with two lasy symbols instead of small \11 and \gg.
- \roman is redefined to write small caps roman numerals, since lowercase roman numerals are not allowed. However, *MakeIndex* rejects entries containing pages in that format. The .idx file must be preprocessed if the document has this kind of entries with the provided romanidx.tex tool—just TFX it and follow the instructions.
- There is a dot after section numbers in titles and toc.

This group is ignored if you write \selectspanish* in the preamble.

Some additional commands are provided to be used in the spanish.cfg file:

- With \es@activeacute acute accents are always active, overriding the default babel behaviour.
- \es@enumerate sets the labels to be used by enumerate. The same applies to \es@itemize and itemize.
- \es@operators stores the operator commands. All of them are canceled with

\let\es@operators\relax

The commands \deactivatequoting, \deactivatetilden and \selectspanish may be used in this file, too.

A subset of these commands is provided for use in Plain TFX (with \input spanish.sty).

36.1 The Code

This file provides definition for both IATEX 2_{ε} and non IATEX 2_{ε} formats. Identify the ldf file.

36.1 (*code)

36.2 \ProvidesLanguage{spanish.ldf}

36.3 [2005/03/31 v4.2b Spanish support from the babel system]

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc. When this file is read

as an option, i.e. by the \usepackage command, spanish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \logonish to see whether we have to do something here.

```
36.4 \LdfInit{spanish}\captionsspanish
36.5 \ifx\undefined\l@spanish
36.6 \@nopatterns{Spanish}
36.7 \adddialect\l@spanish0
36.8 \fi
```

We define some tools which will be used in that style file: (1) we make sure that ~ is active, (2) \es@delayed delays the expansion of the code in conditionals (in fact, quite similar to \bbl@afterfi).

```
36.9 \edef\es@savedcatcodes{%}
36.10
       \catcode'\noexpand\~=\the\catcode'\~
       \catcode'\noexpand\"=\the\catcode'\"}
36.11
36.12 \catcode \~=\active
36.13 \catcode '\"=12
36.14 \log\ef\es@delayed#1\then#2\else#3\fi{%}
36.16
         \expandafter\@firstoftwo
36.17
       \else
36.18
         \expandafter\@secondoftwo
       \fi
36.19
       {#2}{#3}}
36.20
```

Two tests are introduced. The first one tells us if the format is $\LaTeX 2_{\mathcal{E}}$, and the second one if the format is plain or any other. If both are false, the format is $\LaTeX 2_{\mathcal{E}}$, and $\LaTeX 2_{\mathcal{E}}$.

```

We follow with the math group. It's not easy to add an accent in an operator. The difficulty is that we must avoid using text (that is, \mbox) because we have no control on font and size, and at time we should access \i , which is a text command forbidden in math mode. \dotlessi must be converted to uppercase if necessary in $\mbox{LTEX} 2_{\varepsilon}$. There are two versions, depending on the format.

```

Now comes the text shorthands. They are grouped in \shorthandsspanish and this style performs some operations before the babel shortands are called. The goals are to allow espression like \$a^{x'}\$ and to deactivate the shorthands making them of category 'other.' After providing a \'i shorthand, the new macros are defined.

37 The Catalan language

The file catalan.dtx³² defines all the language-specific macro's for the Catalan language.

For this language only the double quote character (") is made active by default. In table 10 an overview is given of the new macros defined and the new meanings of ". Additionally to that, the user can explicitly activate the acute accent or apostrophe (') and/or the grave accent (') characters by using the activeacute and activegrave options. In that case, the definitions shown in table 11 also become available 33.

- \1.1 geminated-l digraph (similar to l·l). \L.L produces the uppercase version.
- \lgem geminated-l digraph (similar to l·l). \Lgem produces the uppercase version.
- \up Macro to help typing raised ordinals, like 1^{er}. Takes one argument.
- \- like the old \-, but allowing hyphenation in the rest of the word.
- "i i with diaeresis, allowing hyphenation in the rest of the word. Valid for the following vowels: i, u (both lowercase and uppercase).
- "c c-cedilla (ç). Valid for both uppercase and lowercase c.
- "1 geminated-l digraph (similar to l·l). Valid for both uppercase and lowercase l.
- "< French left double quotes (similar to <<).
- "> French right double quotes (similar to >>).
- "- explicit hyphen sign, allowing hyphenation in the rest of the word.
- "| disable ligature at this position.

Table 10: Extra definitions made by file catalan.ldf (activated by default)

- 'e acute accented a, allowing hyphenation in the rest of the word. Valid for the following vowels: e, i, o, u (both lowercase and uppercase).
- 'a grave accented a, allowing hyphenation in the rest of the word. Valid for the following vowels: a, e, o (both lowercase and uppercase).

Table 11: Extra definitions made by file catalan.ldf (activated only when using the options activeacute and activegrave)

These active accents characters behave according to their original definitions if not followed by one of the characters indicated in that table.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

37.1 (*code)

$37.2 \LdfInit{catalan}\captionscatalan$

When this file is read as an option, i.e. by the \usepackage command, catalan could be an 'unknown' language in which case we have to make it known. So we

 $^{^{32}\}mathrm{The}$ file described in this section has version number v2.2p and was last revised on 2005/03/29.

³³Please note that if the acute accent character is active, it is necessary to take special care of coding apostrophes in a way which cannot be confounded with accents. Therefore, it is necessary to type 1'{}estri instead of 1'estri.

check for the existence of \lambdacatalan to see whether we have to do something here.

```
37.3 \ifx\l@catalan\@undefined
37.4 \@nopatterns{Catalan}
37.5 \adddialect\l@catalan0
37.6 \fi
```

The next step consists of defining commands to switch to (and from) the Catalan language.

\catalanhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $37.7 \providehyphenmins{catalan}{\tw0}$

\captionscatalan

The macro \captionscatalan defines all strings used in the four standard document classes provided with LATEX.

```

37.29
      \def\glossaryname{Glossari}%
37.30 }
```

\datecatalan The macro \datecatalan redefines the command \today to produce Catalan dates. Months are written in lowercase³⁴.

```
37.31 \def\datecatalan{%
37.32 \def\today{\number\day^\ifcase\month\or
37.33 de gener\or de febrer\or de mar\c{c}\or d'abril\or de maig\or
37.34 de juny\or de juliol\or d'agost\or de setembre\or d'octubre\or
37.35 de novembre\or de desembre\fi
37.36 \space de^\number\year}}
```

\extrascatalan \noextrascatalan

The macro \extrascatalan will perform all the extra definitions needed for the Catalan language. The macro \noextrascatalan is used to cancel the actions of \extrascatalan.

To improve hyphenation we give the grave character (') a non-zero lower case code; when we do that TEX will find more breakpoints in words that contain this character in its rôle as apostrophe.

```
37.37 \addto\extrascatalan{% 37.38 \lccode''=''} 37.39 \addto\noextrascatalan{% 37.40 \lccode''=0}
```

 $[\]overline{\ \ \ }^{34}$ This seems to be the common practice. See for example: E. Coromina, El 9 Nou: Manual de redacció i estil, Ed. Eumo, Vic, 1993

For Catalan, some characters are made active or are redefined. In particular, the "character receives a new meaning; this can also happen for the 'character and the 'character when the options activegrave and/or activeacute are specified.

```
37.41 \addto\extrascatalan{\languageshorthands{catalan}} \\ 37.42 \initiate@active@char{"} \\ 37.43 \addto\extrascatalan{\bbl@activate{"}}
```

Because the grave character is being used in constructs such as \catcode''=\active it needs to have it's original category code" when the auxiliary file is being read. Note that this file is read twice, once at the beginning of the document; then there is no problem; but the second time it is read at the end of the document to check whether any labels changes. It's this second time round that the actived grave character leads to error messages.

```
37.44 \@ifpackagewith{babel}{activegrave}{%
37.45
       \AtBeginDocument{%
         \if@filesw\immediate\write\@auxout{\catcode096=12}\fi}
37.46
       \initiate@active@char{'}%
37.47
37.48
37.49 \@ifpackagewith{babel}{activegrave}{%
       \addto\extrascatalan{\bbl@activate{'}}%
37.50
37.51
37.52 \@ifpackagewith{babel}{activeacute}{%
37.53
       \initiate@active@char{'}%
37.54
37.55 \@ifpackagewith{babel}{activeacute}{%
       \addto\extrascatalan{\bbl@activate{'}}%
37.56
37.57
      }{}
```

Now make sure that the characters that have been turned into shorthanfd characters expand to 'normal' characters outside the catalan environment.

```
37.58 \addto\noextrascatalan{\bbl@deactivate{"}} \\ 37.59 \@ifpackagewith{babel}{activegrave}{\%} \\ 37.60 \addto\noextrascatalan{\bbl@deactivate{'}}}{\} \\ 37.61 \@ifpackagewith{babel}{activeacute}{\%} \\ 37.62 \addto\noextrascatalan{\bbl@deactivate{'}}}{\}}
```

Apart from the active characters some other macros get a new definition. Therefore we store the current ones to be able to restore them later. When their current meanings are saved, we can safely redefine them.

We provide new definitions for the accent macros when one or both of the options activegrave or activeacute were specified.

```
37.63 \addto\extrascatalan{%
       \babel@save\"%
37.64
       \def\"{\protect\@umlaut}}%
37.65
37.66 \@ifpackagewith{babel}{activegrave}{%
       \babel@save\'%
37.67
37.68
       \addto\extrascatalan{\def\'{\protect\@grave}}
37.69
37.70 \@ifpackagewith{babel}{activeacute}{%
       \babel@save\'%
37.71
37.72
       \addto\extrascatalan{\def\'{\protect\@acute}}
37.73
```

All the code above is necessary because we need a few extra active characters. These characters are then used as indicated in tables 10 and 11.

\dieresis \textacute \textgrave The original definition of \" is stored as \dieresis, because the definition of \" might not be the default plain TEX one. If the user uses POSTSCRIPT fonts with the Adobe font encoding the " character is not in the same position as in Knuth's font encoding. In this case \" will not be defined as \accent"7F 1, but as \accent'310 #1. Something similar happens when using fonts that follow the

Cork encoding. For this reason we save the definition of $\$ and use that in the definition of other macros. We do likewise for $\$, and $\$.

```
37.74 \et\dieresis\" \\ 37.75 \et\diepackagewith{babel}{activegrave}{\left(\textgrave';}{37.76 \et\diepackagewith{babel}{activeacute}}{\left(\textgrave';}{}\right)}
```

\@umlaut \@acute \@grave We check the encoding and if not using T1, we make the accents expand but enabling hyphenation beyond the accent. If this is the case, not all break positions will be found in words that contain accents, but this is a limitation in TEX. An unsolved problem here is that the encoding can change at any time. The definitions below are made in such a way that a change between two 256-char encodings are supported, but changes between a 128-char and a 256-char encoding are not properly supported. We check if T1 is in use. If not, we will give a warning and proceed redefining the accent macros so that TEX at least finds the breaks that are not too close to the accent. The warning will only be printed to the log file.

```
37.77 \ifx\DeclareFontShape\@undefined

37.102 \fi
```

If the user setup has extended fonts, the Ferguson macros are required to be defined. We check for their existance and, if defined, expand to whatever they are defined to. For instance, \'a would check for the existance of a \@ac@a macro. It is assumed to expand to the code of the accented letter. If it is not defined, we assume that no extended codes are available and expand to the original definition but enabling hyphenation beyond the accent. This is as best as we can do. It is better if you have extended fonts or ML-TEX because the hyphenation algorithm can work on the whole word. The following macros are directly derived from ML-TEX.³⁵

Now we can define our shorthands: the diaeresis and "ela geminada" support, 37.103 \declare@shorthand{catalan}{"i}{\textormath{\Qumlaut\i}{\ddot\imath}}

³⁵A problem is perceived here with these macros when used in a multilingual environment where extended hyphenation patterns are available for some but not all languages. Assume that no extended patterns exist at some site for French and that french.sty would adopt this scheme too. In that case, 'e in French would produce the combined accented letter, but hyphenation around it would be suppressed. Both language options would need an independent method to know whether they have extended patterns available. The precise impact of this problem and the possible solutions are under study.

37.143
                   \allowhyphens}{}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is unfortunate for Catalan but not as much as for Dutch or German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns. However, the average length of words in Catalan makes this desirable and so it is kept here.

```
37.144 \addto\extrascatalan{% } 37.145 \babel@save{\-}% 37.146 \def\-{\bbl@allowhyphens\discretionary{-}{}{}\bbl@allowhyphens}}
```

\lgem Here we define a macro for typing the catalan "ela geminada" (geminated l). The macros \lgem and \Lgem have been chosen for its lowercase and uppercase representation, respectively³⁶.

The code used in the actual macro used is a combination of the one proposed by Feruglio and Fuster 37 and the proposal 38 from Valiente presented at the T_EX Users Group Annual Meeting in 1995. This last proposal has not been fully implemented due to its limitation to CM fonts.

\1.1 It seems to be the most natural way of entering the "ela geminda" to use the \L.L sequences \1.1 and \L.L. These are not really macro's by themselves but the macros \1 and \L with delimited arguments. Therefor we define two macros that check if the next character is a period. If not the "polish l" will be typeset, otherwise a "ela geminada" will be typeset and the next two tokens will be 'eaten'.

```

37.194 \DeclareRobustCommand*{\up}[1]{#1}

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

37.195 \ldf@finish{catalan} 37.196 $\langle /code \rangle$

 $^{^{39}\}mathrm{This}$ macro has been borrowed from francais.dtx

38 The Galician language

The file galician.dtx⁴⁰ defines all the language definition macros for the Galician language.

For this language the characters ' $\tilde{}$ and " are made active. In table 12 an overview is given of their purpose. These active accents character behave according

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- \- like the old \-, but allowing hyphenation in the rest of the word.
- 'a an accent that allows hyphenation. Valid for all vowels uppercase and lowercase.
- 'n a n with a tilde. This is included to improve compatibility with FTC. Works for uppercase too.
- "u a u with dieresis allowing hyphenation.
- "a feminine ordinal as in $1^{\underline{a}}$.
- "o masculine ordinal as in 1° .
- "n a n with tilde. Works for uppercase too.

Table 12: The extra definitions made by galician.ldf

to their original definitions if not followed by one of the characters indicated in that table.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

- 38.1 (*code)
- 38.2 \LdfInit{galician}\captionsgalician

When this file is read as an option, i.e. by the \usepackage command, galician could be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@galician to see whether we have to do something here.

- 38.3 \ifx\l@galician\@undefined
- 38.4 \@nopatterns{Galician}
- 38.5 \adddialect\l@galician0\fi

The next step consists of defining commands to switch to (and from) the Galician language.

\captionsgalician

The macro \captionsgalician defines all strings used in the four standard document classes provided with LATEX.

38.53 \addto\extrasgalician{\def\'{\protect\@acute}\}
38.54 \}{\}
```

All the code above is necessary because we need a few extra active characters. These characters are then used as indicated in table 12.

This option includes some support for working with extended, 8-bit fonts, if available. This assumes that the user has some macros predefined. For instance, if the user has a \@ac@a macro defined, the sequence \'a or 'a will both expand to whatever \@ac@a is defined to expand, presumably \(\hat{a}\). The names of these macros are the same as those in Ferguson's ML-TEX compatibility package on purpose. Using this method, and provided that adequate hyphenation patterns exist, it is possible to get better hyphenation for Galician than before. If the user has a terminal able to produce these codes directly, it is possible to do so. If the need arises to send the document to someone who does not have such support, it is

possible to mechanically translate the document so that the receiver can make use of it

To be able to define the function of the new accents, we first define a couple of 'support' macros.

\dieresis \textacute \texttilde The original definition of \" is stored as \dieresis, because the definition of \" might not be the default plain TEX one. If the user uses POSTSCRIPT fonts with the Adobe font encoding the " character is not in the same position as in Knuth's font encoding. In this case \" will not be defined as \accent"7F #1, but as \accent'310 #1. Something similar happens when using fonts that follow the Cork encoding. For this reason we save the definition of \" and use that in the definition of other macros. We do likewise for \' and \~.

38.58 \def\@umlaut#1{\allowhyphens\dieresis{#1}\allowhyphens}

\@umlaut \@acute \@tilde If the user setup has extended fonts, the Ferguson macros are required to be defined. We check for their existance and, if defined, expand to whatever they are defined to. For instance, \'a would check for the existance of a \@ac@a macro. It is assumed to expand to the code of the accented letter. If it is not defined, we assume that no extended codes are available and expand to the original definition but enabling hyphenation beyond the accent. This is as best as we can do. It is better if you have extended fonts or ML-TEX because the hyphenation algorithm can work on the whole word. The following macros are directly derived from ML-TEX.

```
38.59 \def\@tilde#1{\allowhyphens\texttilde{#1}\allowhyphens}
38.60 \@ifpackagewith{babel}{activeacute}{%
38.61 \def\@acute#1{\allowhyphens\textacute{#1}\allowhyphens}}{}

Now we can define our shorthands: the umlauts,
38.62 \declare@shorthand{galician}{"-}{\nobreak-\bbl@allowhyphens}
38.63 \declare@shorthand{galician}{"|}{\discretionary{-}{}{\kern.03em}}

38.78 \declare@shorthand{galician}{'I}{\textormath{\@acute I}{^{\prime} I}}
```

\declare@shorthand{galician}{'a}{\textormath{\@acute a}{^{\prime} a}}

\declare@shorthand{galician}{'e}{\textormath{\@acute e}{^{\prime} e}}

^{38.79 \}declare@shorthand{galician}{'0}{\textormath{\@acute 0}{^{\prime} 0}}

^{38.80 \}declare@shorthand{galician}{'U}{\textormath{\@acute U}{^{\prime} U}}

⁴¹A problem is perceived here with these macros when used in a multilingual environment where extended hyphenation patterns are available for some but not all languages. Assume that no extended patterns exist at some site for French and that french.sty would adopt this scheme too. In that case, 'e in French would produce the combined accented letter, but hyphenation around it would be suppressed. Both language options would need an independent method to know whether they have extended patterns available. The precise impact of this problem and the possible solutions are under study.

⁴²The code for the ordinals was taken from the answer provided by Raymond Chen (raymond@math.berkeley.edu) to a question by Joseph Gil (yogi@cs.ubc.ca) in comp.text.tex.

```
tildes,
38.81 \declare@shorthand{galician}{'n}{\textormath{\^n}{^{\prime} n}}
38.82 \declare@shorthand{galician}{'N}{\textormath{\^N}{^{\prime} N}}
the acute accent,
38.83 \declare@shorthand{galician}{''}{%
38.84 \textormath{\textquotedblright}{\sp\bgroup\prim@s'}}
38.85 }{}
38.86 \declare@shorthand{galician}{^n}{\textormath{\^n}{\detilde n}}
38.87 \declare@shorthand{galician}{^N}{\textormath{\^n}{\detilde N}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is unfortunate for Galician but not as much as for Dutch or German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns. However, the average length of words in Galician makes this desirable and so it is kept here.

```
38.88 \addto\extrasgalician{%
38.89 \babel@save{\-}%
38.90 \def\-{\bbl@allowhyphens\discretionary{-}{}{}\bbl@allowhyphens}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
38.91 \label{finish} galician} 38.92 \label{finish} (code)
```

39 The Basque language

The file basque.dtx⁴³ defines all the language definition macro's for the Basque language.

For this language the characters $\tilde{}$ and $\tilde{}$ are made active. In table 13 an overview is given of their purpose. These active accent characters behave according

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- \- like the old \-, but allowing hyphenation in the rest of the word.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- ~n a n with tilde. Works for uppercase too.

Table 13: The extra definitions made by basque.ldf

to their original definitions if not followed by one of the characters indicated in that table.

This option includes support for working with extended, 8-bit fonts, if available. Support is based on providing an appropriate definition for the accent macros on entry to the Basque language. This is automatically done by LATEX 2_{ε} or NFSS2. If T1 encoding is chosen, and provided that adequate hyphenation patterns⁴⁴ are available. The easiest way to use the new encoding with LATEX 2_{ε} is to load the package t1enc with \usepackage. This must be done before loading babel.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
39.1 (*code)
```

39.2 \LdfInit{basque}\captionsbasque

When this file is read as an option, i.e. by the \usepackage command, basque could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lobasque to see whether we have to do something here.

```

\texttilde

\dieresia The original definition of \" is stored as \dieresia, because the we do not know what is its definition, since it depends on the encoding we are using or on special macros that the user might have loaded. The expansion of the macro might use the TFX \accent primitive using some particular accent that the font provides or might check if a combined accent exists in the font. These two cases happen with respectively OT1 and T1 encodings. For this reason we save the definition of $\$ and use that in the definition of other macros. We do likewise for $\$ and $\$. The present coding of this option file is incorrect in that it can break when the encoding changes. We do not use \tilde as the macro name because it is already defined as \mathaccent.

```
39.50 \let\dieresia\"
39.51 \let\texttilde\~
```

\@umlaut \@tilde We check the encoding and if not using T1, we make the accents expand but enabling hyphenation beyond the accent. If this is the case, not all break positions will be found in words that contain accents, but this is a limitation in T_EX. An unsolved problem here is that the encoding can change at any time. The definitions below are made in such a way that a change between two 256-char encodings are supported, but changes between a 128-char and a 256-char encoding are not properly supported. We check if T1 is in use. If not, we will give a warning and proceed redefining the accent macros so that T_EX at least finds the breaks that are not too close to the accent. The warning will only be printed to the log file.

 tildes.
39.76 \declare@shorthand{basque}{^n}{\text{n}}{\text{n}}{\text{n}}{\text{n}}
39.77 \declare@shorthand{basque}{~N}{\textormath{\~N}{\@tilde N}}
 and some additional commands.
```

The shorthand "- should be used in places where a word contains an explicit hyphenation character. According to the Academy of the Basque language, when a word break occurs at an explicit hyphen it must appear *both* at the end of the first line *and* at the beginning of the second line.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
39.83 \ldf@finish{basque} 39.84 \/ code \)
```

⁴⁵The code for the ordinals was taken from the answer provided by Raymond Chen (raymond@math.berkeley.edu) to a question by Joseph Gil (yogi@cs.ubc.ca) in comp.text.tex.

40 The Romanian language

The file romanian.dtx⁴⁶ defines all the language-specific macros for the Romanian language.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

40.1 (*code)

40.2 \LdfInit{romanian}\captionsromanian

When this file is read as an option, i.e. by the \usepackage command, romanian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loromanian to see whether we have to do something here.

```
40.3 \ifx\l@romanian\@undefined

40.4 \@nopatterns{Romanian}

40.5 \adddialect\l@romanian0\fi
```

The next step consists of defining commands to switch to (and from) the Romanian language.

\captionsromanian

The macro \captionsromanian defines all strings used in the four standard document classes provided with LaTeX.

```
40.6 ls
 40.7 \addto\captionsromanian{%
      \displaystyle \left( \frac{Prefa}{c\{t\}} \right)

40.34 noiembrie\or decembrie\fi
40.35 \space \number\year}}
```

\extrasromanian

The macro \extrasromanian will perform all the extra definitions needed for the Romanian language. The macro \noextrasromanian is used to cancel the actions

 $^{^{46} \}rm The$ file described in this section has version number v1.2l and was last revised on 2005/03/31. A contribution was made by Umstatter Horst (hhu@cernvm.cern.ch).

of \extrasromanian For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
40.36 \addto\extrasromanian{} 40.37 \addto\noextrasromanian{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

 $40.38 \label{eq:condition} 40.39 \label{eq:code} \\ 40.39 \label{eq:code}$

41 The Danish language

The file danish.dtx⁴⁷ defines all the language definition macros for the Danish language.

For this language the character " is made active. In table 14 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "' lowered double left quotes (looks like ")
- "' normal double right quotes
- "< for French left double quotes (similar to <<).
- '> for French right double quotes (similar to >>).

Table 14: The extra definitions made by danish.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

41.1 (*code)

41.2 \LdfInit{danish}\captionsdanish

When this file is read as an option, i.e. by the \usepackage command, danish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@danish to see whether we have to do something here.

```
41.3 \ifx\l@danish\@undefined
```

- 41.4 \@nopatterns{Danish}
- 41.5 \adddialect\l@danish0\fi

\englishhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $41.6 \verb|\providehyphenmins{\CurrentOption}{\Qne\twQ}|$

The next step consists of defining commands to switch to (and from) the Danish language.

\captionsdanish

The macro \c aptions danish defines all strings used in the four standard document classes provided with LaTeX.

```
41.7 \addto\captionsdanish{\%}
```

41.28
41.29
```

\datedanish The macro \datedanish redefines the command \today to produce Danish dates.

```
41.30 \def\datedanish{%
41.31 $$ \def \rightarrow \infty.^{ifcase\month\or} 
         januar\or februar\or marts\or april\or maj\or juni\or
41.32
41.33
         juli\or august\or september\or oktober\or november\or december\fi
41.34
         \space\number\year}}
```

\extrasdanish The macro \extrasdanish will perform all the extra definitions needed for the \noextrasdanish Danish language. The macro \noextrasdanish is used to cancel the actions of \extrasdanish.

Danish typesetting requires \frenchspacing to be in effect.

- 41.35 \addto\extrasdanish{\bbl@frenchspacing}
- 41.36 \addto\noextrasdanish{\bbl@nonfrenchspacing}

For Danish the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the danish group of shorthands should be used.

```
41.37 \initiate@active@char{"}
41.38 \addto\extrasdanish{\languageshorthands{danish}}
41.39 \addto\extrasdanish{\bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

41.40 \addto\noextrasdanish{\bbl@deactivate{"}}

First we define access to the low opening double quote and guillemets for quotations,

```
41.41 \declare@shorthand{danish}{"'}{%
41.42 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
41.43 \declare@shorthand{danish}{"'}{%
     \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
41.45 \declare@shorthand{danish}{"<}{%
41.46 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
41.47 \declare@shorthand{danish}{">}{%
      \textormath{\guillemotright}{\mbox{\guillemotright}}}
```

then we define to be able to specify hyphenation breakpoints that behave a little different from \setminus -.

```
41.49 \end{danish} {"-} {\bf allowhyphens}
41.50 \label{lem:condition} $$41.50 \end{\danish}{""}{\hskip\z@skip}$
41.51 \end{anish}{"~}{\text{\colored}} hbox{-}}{-}}
41.52 \declare@shorthand{danish}{"=}{\nobreak-\hskip\z@skip}
```

And we want to have a shorthand for disabling a ligature.

```
41.53 \declare@shorthand{danish}{"|}{%
      \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
41.55 \ldf@finish{danish}
41.56 \langle /code \rangle
```

42 The Icelandic language

42.1 Overview

The file $iceland.dtx^{48}$ defines all the language definition macros for the Icelandic language

Customization for the Icelandic language was made following several official and semiofficial publications [2, 3, 1, 6, 5]. These publications do not always agree and we indicate those instances.

For this language the character " is made active. In table 15 an overview is given of its purpose. The shorthands in table 15 can also be typeset by using the

```
disable ligature at this position.
"_
           an explicit hyphen sign, allowing hyphenation in the
           rest of the word.
11 11
           like "-, but producing no hyphen sign (for compund
           words with hyphen, e.g. x-""y).
II ~
           for a compound word mark without a breakpoint.
"=
           for a compound word mark with a breakpoint, allow-
           ing hyphenation in the composing words.
11 6
           for Icelandic left double quotes (looks like ,,).
11 )
           for Icelandic right double quotes.
">
           for Icelandic 'french' left double quotes (similar to
           for Icelandic 'french' right double quotes (similar to
           <<).
"о
           for old Icelandic o
"0
           for old Icelandic O
"ó
           for old Icelandic ó
"Ó
           for old Icelandic Q
"e
           for old Icelandic e
"E
           for old Icelandic E
"é
           for old Icelandic é
"É
           for old Icelandic É
\tala
           for typesetting numbers
\grada
           for the 'degree' symbol
           for 'degrees', e.g. 5 °C
\gradur
\upp
           for textsuperscript
```

Table 16: Commands which produce quotes and old Icelandic diacritics, defined by icelandic.ldf

42.3 TEXnical details

When this file was read through the option icelandic we make it behave as if icelandic was specified.

```
42.1 \def\bbl@tempa{icelandic}
42.2 \ifx\CurrentOption\bbl@tempa
42.3 \def\CurrentOption{icelandic}
42.4 \fi
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
12.5 (*code)
```

42.6 \LdfInit\CurrentOption{captions\CurrentOption}

When this file is read as an option, i.e., by the \usepackage command, icelandic will be an 'unknown' language, so we have to make it known. So we check for the existence of \l@icelandic to see whether we have to do something here.

```
42.7 \ifx\l@icelandic\@undefined
42.8 \@nopatterns{Icelandic}
42.9 \adddialect\l@icelandic0
42.10 \fi
```

\if@Two@E We will need a new 'if': \if@Two@E is true if and only if LATEX 2_{ε} is running not in compatibility mode. It is used in the definitions of the command \tala and \upp. The definition is somewhat complicated, due to the fact that \if@compatibility is not recognized as a \if in LATEX-2.09 based formats.

```
42.11 \end{Compatibility true } $42.12 \end{Compatibility true } $42.13 \end{Compatibility true } $42.14 \end{Compatibility $$1.15 \else$ $42.16 \end{Compatibility $$CTwo@Efalse $$142.17 \end{Compatibility } $$1.17 \end{Compatibility} $$1.17 \end{
```

\extrasicelandic \noextrasicelandic The macro \extrasicelandic will perform all the extra definitions needed for the Icelandic language. The macro \noextrasicelandic is used to cancel the actions of \extrasicelandic.

For Icelandic the " character is made active. This is done once, later on its definition may vary.

```
42.18 \initiate@active@char{"}
42.19 \Onamedef{extras\CurrentOption}{%
     \languageshorthands{icelandic}}
42.21 \expandafter\addto\csname extras\CurrentOption\endcsname{%
      \bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

```
42.23 \addto\noextrasicelandic{\bbl@deactivate{"}}
```

The icelandic hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
42.24 \providehyphenmins{\CurrentOption}{\tw0\tw0}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 16.

To be able to define the function of ", we first define a couple of 'support' macros.

42.4 Captionnames and date

The next step consists of defining the Icelandic equivalents for the IATEX captionnames.

\captionsicelandic The macro \captionsicelandic will define all strings used used in the four standard document classes provided with LATEX.

```
42.25 \@namedef{captions\CurrentOption}{%
      \def\prefacename{Form\'{a}li}%
42.26
       \def\refname{Heimildir}%
42.27
      \def\abstractname{\',{U}tdr\',{a}ttur}%

      \def\listfigurename{Myndaskr\',{a}}%
42.33
42.34
      \def = T''(o)fluskr'(a)%
42.35
      \def\indexname{Atri{\dh}isor{\dh}askr\',{a}}%
42.36
      \def\figurename{Mynd}%
42.37
      \def\tablename{Tafla}%
42.38
      \def\partname{Hluti}%
       \def\enclname{Hj\'{a}lagt}%
42.39
      \def\ccname{Samrit}%
42.40
42.41
       \def\headtoname{Til:}% in letter
42.42
       \def \pagename {Bla{\dh}s\',{\i}{\dh}a}%
42.43
       \def\seename{Sj\'{a}}%
       \def\alsoname{Sj\'{a} einnig}%
42.44
42.45
       \def\proofname{S\"{o}nnun}%
42.46
       \def\glossaryname{Or{\dh}alisti}%
42.47 }
```

\dateicelandic The macro \dateicelandic redefines the command \today to produce Icelandic

```
42.48 \def\dateicelandic{%
      \def \dey{\number \day. ~\if case \month \or}
42.49
         jan\'{u}ar\or febr\'{u}ar\or mars\or apr\'{\i}l\or ma\'{\i}\or
42.50
         j'_{u}n'_{i}\circ j'_{u}l'_{i}\circ ''_{a}g'_{u}st\circ september\circ
42.51
         okt\'{o}ber\or n\'{o}vember\or desember\fi
42.52
42.53
         \space\number\year}}
```

42.5 Icelandic quotation marks

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
42.54 \begingroup \catcode'\"12
42.55 \def\x{\endgroup}
42.56 \def\@SS{\mathchar"7019 }
42.57 \def\dq{"}}
42.58 \x
```

Now we can define the icelandic and icelandic 'french' quotes. The icelandic 'french' guillemets are the reverse of french guillemets. We define single icelandic 'french' quotes for compatibility. Shorthands are provided for a number of different quotation marks, which make them useable both outside and inside mathmode.

```

42.69 \declare@shorthand{icelandic}{">}{\frqq}
42.70 \declare@shorthand{icelandic}{"<}{\flqq}
 and some additional commands:
42.71 \declare@shorthand{icelandic}{"-}{\nobreak}-\bbl@allowhyphens}
42.72 \declare@shorthand{icelandic}{"|}{%
42.73
       \textormath{\nobreak\discretionary{-}{}{\kern.03em}%
                     \bbl@allowhyphens}{}}
42.75 \declare@shorthand{icelandic}{""}{\hskip\z@skip}
42.76 \end{icelandic} {"~} {\texttt{\leavevmode} \end{-}} {-}} \label{eq:condition}
42.77 \declare@shorthand{icelandic}{"=}{\nobreak-\hskip\z@skip}
```

42.6 Old Icelandic

In old Icelandic some letters have special diacritical marks, described for example in *First Grammatical Treatise* [4, 5]. We provide these in the T1 encoding with the 'ogonek'. The ogonek is placed with the letters 'o', and 'O', 'ó' and 'Ó', 'e' and 'E', and 'é' and 'É'. Shorthands are provided for these as well.

The following code by Leszek Holenderski lifted from polish.dtx is designed to position the diacritics correctly for every font in every size. These macros need a few extra dimension variables.

```
42.78 \newdimen\pl@left 42.79 \newdimen\pl@down 42.80 \newdimen\pl@tright 42.81 \newdimen\pl@temp
```

\sob The macro \sob is used to put the 'ogonek' in the right place.

```
 42.82 \left| \frac{3#4#5{\pi}errs: letter and fractions hl,ho,vl,vo 42.83 \setbox0\hbox{#1}\setbox1\hbox{k{}}\setbox2\hbox{p}}, \\ 42.84 \pl@right=#2\wd0 \advance\pl@right by-#3\wd1 \\ 42.85 \pl@down=#5\ht1 \advance\pl@down by-#4\ht0 \\ 42.86 \pl@left=\pl@right \advance\pl@left by\wd1 \\ 42.87 \pl@temp=-\pl@down \advance\pl@temp by\dp2 \dp1=\pl@temp \\ 42.88 \end{pleme} \leavevmode \\ 42.89 \end{pleme} \kern\pl@right\lower\pl@down\box1\kern-\pl@left #1}
```

```

42.7 Formatting numbers

This section is lifted from frenchb.dtx by D. Flipo. In English the decimal part starts with a point and thousands should be separated by a comma: an approximation of 1000π should be inputed as \$3{,}141.592{,}653\$ in mathmode and as 3,141.592,653 in text.

In Icelandic the decimal part starts with a comma and thousands should be separated by a space [1] or by a period [5]; we have the space. The above approximation of 1000π should be inputed as \$3\;141{,}592\;653\$ in math-mode and as something like 3~141,592~653 in text. Braces are mandatory around the comma in math-mode, the reason is mentioned in the TeXbook p. 134: the comma is of type \mathpunct (thus normally followed by a space) while the point is of type \mathord (no space added).

Thierry Bouche suggested that a second type of comma, of type \mathord would be useful in math-mode, and proposed to introduce a command (named \decimalsep in this package), the expansion of which would depend on the current language.

Vincent Jalby suggested a command \nombre to conveniently typeset numbers: inputting $\nombre{3141,592653}$ either in text or in math-mode will format this number properly according to the current language (Icelandic or non-Icelandic). We use \nombre to define command \tala in Icelandic.

\tala accepts an optional argument which happens to be useful with the extension 'dcolumn', it specifies the decimal separator used in the *source code*: \newcolumntype{d}{D{,}}{\decimalsep}{-1}}

```
\begin{tabular}{d}\hline
3,14 \\
  \tala[,]{123,4567} \\
  \tala[,]{9876,543}\\hline
\end{tabular}
```

will print a column of numbers aligned on the decimal point (comma or point depending on the current language), each slice of 3 digits being separated by a space or a comma according to the current language.

\decimalsep \thousandsep We need a internal definition, valid in both text and math-mode, for the comma (\@comma@) and another one for the unbreakable fixed length space (no glue) used in Icelandic (\f@thousandsep).

The commands \decimalsep and \thousandsep get default definitions (for the English language) when icelandic is loaded; these definitions will be updated when the current language is switched to or from Icelandic.

 $42.106 \verb| \def\@comma@{\ifnmode\m@comma\else,\fi|} \\$

\tala The decimal separator used when inputing a number with \tala has to be a comma. \tala splits the inputed number into two parts: what comes before the first comma will be formatted by \@integerpart while the rest (if not empty) will be formatted by \@decimalpart. Both parts, once formatted separately will be merged together with between them, either the decimal separator \decimalsep or (in IATeX 2ε only) the optional argument of \tala.

```
42.115 \if@Two@E
       \newcommand{\tala}[2][\decimalsep]{%
42.116
               \def\@decimalsep{#1}\@tala#2\@empty,\@empty,\@nil}
42.117
42.118 \else
42.119
      \newcommand{\tala}[1]{%
               \def\@decimalsep{\decimalsep}\@tala#1\@empty,\@empty,\@nil}
42.120
42.121 \fi
42.122 \def\@tala#1,#2,#3\@nil{%
            \ifx\@emptv#2%
42.123
42.124
               \@integerpart{#1}%
42.125
             \else
               \@integerpart{#1}\@decimalsep\@decimalpart{#2}%
42.126
             \fi}
42.127
```

The easiest bit is the decimal part: We attempt to read the first four digits of the decimal part, if it has less than 4 digits, we just have to print them, otherwise \thousandsep has to be appended after the third digit, and the algorithm is applied recursively to the rest of the decimal part.

```
 42.128 \end{compart} $42.129 \end{compart} $42.129 \end{compart} $42.130 \end{compart} $42.131 \end{compart} $42.131 \end{compart} $42.132 \thousandsep\expandafter\end{compart} $42.133 \fi\}
```

Formatting the integer part is more difficult because the slices of 3 digits start from the *bottom* while the number is read from the top! This (tricky) code is borrowed from David Carlisle's comma.sty.

```
42.134 \def\@integerpart#1{\@@integerpart{}#1\@empty\@empty\@empty}
42.135 \ensuremath{\mbox{def}\mbox{@integerpart$\#1$#2$#3$#4{%}}
       \ifx\@empty#2%
42.136
42.137
          \@addthousandsep#1\relax
42.138
       \else
42.139
          \ifx\@empty#3%
            \@addthousandsep\@empty\@empty#1#2\relax
42.140
42.141
          \else
            \ifx\@empty#4%
42.142
               \@addthousandsep\@empty#1#2#3\relax
42.143
42.144
             \else
               \@@integerpartafterfi{#1#2#3#4}%
42.145
42.146
             \fi
42.147
          \fi
42.148
        \fi}
42.149 \def\@@integerpartafterfi#1\fi\fi\fi\fi\fi\fi\@@integerpart{#1}}
42.150 \def\@addthousandsep#1#2#3#4{#1#2#3%
       \if#4\relax
42.151
42.152 \else
```

```
42.153 \thousandsep\expandafter\@addthousandsep\expandafter#4% 42.154 \fi}
```

42.8 Extra utilities

We now provide the Icelandic user with some extra utilities.

\upp \upp is for typesetting superscripts. \upp relies on

\upp@size The internal macro \upp@size holds the size at which the superscript will be typeset. The reason for this is that we have to specify it differently for different formats.

```
42.155 \ifx\sevenrm\@undefined
42.156 \ifx\@ptsize\@undefined
42.157 \let\upp@size\small
42.158 \else
42.159 \ifx\selectfont\@undefined
```

In this case the format is the original LATEX-2.09:

```
42.160 \ifcase\@ptsize
42.161 \let\upp@size\ixpt\or
42.162 \let\upp@size\xpt\or
42.163 \let\upp@size\xipt
42.164 \fi
```

When \selectfont is defined we probably have NFSS available:

```
42.165
            \ifcase\@ptsize
42.166
              \def\upp@size{\fontsize\@ixpt{10pt}\selectfont}\or
42.167
              \def\upp@size{\fontsize\@xpt{11pt}\selectfont}\or
42.168
              \def\upp@size{\fontsize\@xipt{12pt}\selectfont}
42.169
42.170
            \fi
          \fi
42.171
42.172
       \fi
42.173 \else
```

If we end up here it must be a plain based TEX format, so:

```
42.174 \let\upp@size\sevenrm
42.175 \fi
```

Now we can define \upp. When $\LaTeX 2_{\varepsilon}$ runs in compatibility mode ($\LaTeX 2.09$ emulation), \textsuperscript is also defined, but does no good job, so we give two different definitions for \upp using \ifGTwoGE.

```
42.176 \if@Two@E
42.177 \DeclareRobustCommand*{\upp}[1]{\textsuperscript{#1}}
42.178 \else
42.179 \DeclareRobustCommand*{\upp}[1]{%
42.180 \leavevmode\raise1ex\hbox{\upp@size#1}}
42.181 \fi
```

Some definitions for special characters. $\grad a$ needs a special treatment: it is $\c T1$ -encoding and $\c T1$ -encoding.

```
42.182 \ifx\fmtname\LaTeXeFmtName
42.183
      \DeclareTextSymbol{\grada}{T1}{6}
42.184
       \DeclareTextSymbol{\grada}{OT1}{23}
42.185 \setminus else
       \def\T@one{T1}
42.186
        \ifx\f@encoding\T@one
42.187
42.188
          \newcommand{\grada}{\char6}
42.189
        \else
         \newcommand{\grada}{\char23}
42.190
42.191
       \fi
42.192 \fi
```

\gradur Macro for typesetting the abbreviation for 'degrees' (as in 'degrees Celsius'). As the bounding box of the character 'degree' has very different widths in CMR/DC and PostScript fonts, we fix the width of the bounding box of \gradur to 0.3 em, this lets the symbol 'degree' stick to the preceding (e.g., 45\gradur) or following character (e.g., 20~\gradur C).

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

 $42.195 \label{ldf@finish}$\currentOption $42.196 \cdot /\code$

43 The Norwegian language

The file norsk.dtx⁴⁹ defines all the language definition macros for the Norwegian language as well as for an alternative variant 'nynorsk' of this language.

For this language the character " is made active. In table 17 an overview is given of its purpose.

- "ff for ff to be hyphenated as ff-f, this is also implemented for b, d, f, g, l, m, n, p, r, s, and t. (o"ppussing)
- "ee Hyphenate "ee as \'e-e. (komit"een)
- "- an explicit hyphen sign, allowing hyphenation in the composing words. Use this for compound words when the hyphenation patterns fail to hyphenate properly. (alpin"-anlegg)
- "| Like "-, but inserts 0.03em space. Use it if the compound point is spanned by a ligature. (hoff"|intriger)
- "" Like "-, but producing no hyphen sign. (i""g\aa{}r)
- "~ Like -, but allows no hyphenation at all. (E"~cup)
- "= Like -, but allowing hyphenation in the composing words. (marksistisk"=leninistisk)
- "

 for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 17: The extra definitions made by norsk.sty

Rune Kleveland distributes a Norwegian dictionary for ispell (570000 words). It can be found at http://www.uio.no/~runekl/dictionary.html.

This dictionary supports the spellings spi"sslede for 'spisslede' (hyphenated spiss-slede) and other such words, and also suggest the spelling spi"sslede for 'spisslede' and 'spissslede'.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

43.1 (*code)

43.2 \LdfInit\CurrentOption{captions\CurrentOption}

When this file is read as an option, i.e. by the \usepackage command, norsk will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@norsk to see whether we have to do something here.

- 43.3 \ifx\l@norsk\@undefined
- 43.4 \@nopatterns{Norsk}
- 43.5 \adddialect\l@norsk0\fi

\norskhyphenmins

Some sets of Norwegian hyphenation patterns can be used with \lefthyphenmin set to 1 and \righthyphenmin set to 2, but the most common set nohyph.tex can't. So we use \lefthyphenmin=2 by default.

43.6 \providehyphenmins{\CurrentOption}{\tw@\tw@}

Now we have to decide which version of the captions should be made available. This can be done by checking the contents of \CurrentOption.

 $43.7 \def\bl@tempa{norsk}$

43.8 \ifx\CurrentOption\bbl@tempa

The next step consists of defining commands to switch to (and from) the Norwegian language.

⁴⁹The file described in this section has version number v2.0h and was last revised on 2005/03/30. Contributions were made by Haavard Helstrup (HAAVARD@CERNVM) and Alv Kjetil Holme (HOLMEA@CERNVM); the 'nynorsk' variant has been supplied by Per Steinar Iversen iversen@vxcern.cern.ch) and Terje Engeset Petterst (TERJEEP@VSFYS1.FI.UIB.NO); the shorthand definitions were provided by Rune Kleveland (runekl@math.uio.no).

\captionsnorsk The macro \captionsnorsk defines all strings used in the four standard document classes provided with LATEX.

```

                  \allowhyphens}{}}
43.118 \end{norsk}{"^}{\text{leavevmode} \end{norsk}}{-}}{-}
43.119 \declare@shorthand{norsk}{"=}{\penalty\@M-\hskip\z@skip}
     The macro \ldf@finish takes care of looking for a configuration file, setting
  the main language to be switched on at \begin{document} and resetting the
  category code of © to its original value.
43.120 \ldf@finish\CurrentOption
```

43.121 (/code)

44 The Swedish language

The file swedish.dtx⁵⁰ defines all the language-specific macros for the Swedish language. This file has borrowed heavily from finnish.dtx and germanb.dtx.

For this language the character " is made active. In table 18 an overview is given of its purpose. The vertical placement of the "umlaut" in some letters can be controlled this way.

- "a Gives ä, also implemented for "A, "o and "O.
- "w, "W gives å and Å.
- "ff for ff to be hyphenated as ff-f. Used for compound words, such as stra"ffånge, which should be hyphenated as straff-fånge. This is also implemented for b, d, f, g, l, m, n, p, r, s, and t.
- "| disable ligature at this position. This should be used for compound words, such as "stra"ffinrättning", which should not have the ligature "ffi".
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word, such as e. g. in "x"-axeln".
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as och/""eller).
- "~ for an explicit hyphen without a breakpoint; useful for expressions such as "2"~3 veckor" where no line-break is desirable.
- "= an explicit hyphen sign allowing subsequent hyphenation, for expressions such as "studiebidrag och -lån".
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 18: The extra definitions made by swedish.sty

Two variations for formatting of dates are added. \datesymd makes \today output dates formatted as YYYY-MM-DD, which is commonly used in Sweden today. \datesdmy formats the date as D/M YYYY, which is also very common in Sweden. These commands should be issued after \begindocument.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

- 44.1 **(*code)**
- 44.2 \LdfInit{swedish}\captionsswedish

When this file is read as an option, i.e. by the \usepackage command, swedish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lossedish to see whether we have to do something here.

- $44.3 \ifx\loswedish\oundefined$
- 44.4 \@nopatterns{Swedish}
- 44.5 \addialect\l@swedish0\fi

The next step consists of defining commands to switch to the Swedish language. The reason for this is that a user might want to switch back and forth between languages.

\captionsswedish

The macro \c aptions we dish defines all strings used in the four standard document classes provided with LATeX.

 $^{^{50}\}mathrm{The}$ file described in this section has version number v2.3d and was last revised on 2005/03/31. Contributions were made by Sten Hellman (HELLMAN@CERNVM.CERN.CH) and Erik Östhols (erik_osthols@yahoo.com).

                         }
                    The macro \datesdmy redefines the command \today to produce Swedish dates
                    in the format DD/MM YYYY, also common in Sweden.
                   44.39 \left\def\datesdmy{\%}\right
                         \def\today{\number\day/\number\month\space\number\year}%
                   44.40
                   44.41
                         }
                    The swedish hyphenation patterns can be used with \lefthyphenmin set to 2 and
\swedishhyphenmins
                    \righthyphenmin set to 2.
                   44.42 \providehyphenmins{swedish}{\tw@\tw@}
    \extrasswedish The macro \extrasswedish performs all the extra definitions needed for the
                    Swedish language. The macro \noextrasswedish is used to cancel the actions
  \noextrasswedish
                    of \extrasswedish.
                       For Swedish texts \frenchspacing should be in effect. We make sure this is
```

44.6 \addto\captionsswedish{%

199

the case and reset it if necessary.

44.43 \addto\extrasswedish{\bbl@frenchspacing} 44.44 \addto\noextrasswedish{\bbl@nonfrenchspacing}

For Swedish the " character is made active. This is done once, later on its definition may vary.

```
44.45 \initiate@active@char{"}
44.46 \addto\extrasswedish{\languageshorthands{swedish}}
44.47 \addto\extrasswedish{\bbl@activate{"}}

Don't forget to turn the shorthands off again.
44.48 \addto\noextrasswedish{\bbl@deactivate{"}}

The "umlaut" accent macro \" is changed to lower the "umlaut" dots. The redefinition is done with the help of \umlautlow.
44.49 \addto\extrasswedish{\babel@save\"\umlautlow}
44.50 \addto\noextrasswedish{\umlauthigh}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 18.

To be able to define the function of ", we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
44.51 \begingroup \catcode'\"12 \\ 44.52 \def\x{\endgroup} \\ 44.53 \def\@SS{\mathchar"7019} \\ 44.54 \def\dq{"}} \\ 44.55 \x
```

Now we can define the doublequote macros: the umlauts and å.

```
 44.56 \ declare@shorthand{swedish}{"w}{\ textormath{\{\aa}\ allowhyphens}{\ dot } $$ 44.57 \ declare@shorthand{swedish}{"a}{\ textormath{\"\{a\}\ allowhyphens}{\ dot } $$ 44.58 \ declare@shorthand{swedish}{"w}{\ textormath{\{\AA}\ allowhyphens}{\ dot } $$ 44.59 \ declare@shorthand{swedish}{"W}{\ textormath{\{\AA}\ allowhyphens}{\ dot } $$ 44.60 \ declare@shorthand{swedish}{"A}{\ textormath{\{\A}\ allowhyphens}{\ dot } $$ 44.61 \ declare@shorthand{swedish}{"0}{\ textormath{\{\A}\ allowhyphens}{\ dot } $$ 44.61 \ declare@shorthand{swedish}{"0}{\ textormath{\{\A}\ allowhyphens}{\ dot } $$ 44.61 \ declare@shorthand{swedish}{\ dot } $$ 44.61 \ declare@shorthand{swedis
```

discretionary commands

```
44.62 \ensuremath{\hdl} \
44.63 \declare@shorthand{swedish}{"B}{\textormath{\bbl@disc B{BB}}{B}}
44.64 \declare@shorthand{swedish}{"d}{\textormath{\bbl@disc d{dd}}{d}}
44.65 \end{swedish} {\tt "D}{\text{\colored} bbl@disc D{DD}}{\tt D}}
44.66 \ \ \ f{ff}{ff}{textormath{\bbl@disc\ f{ff}}{f}}
44.67 \declare@shorthand{swedish}{"F}{\textormath{\bbl@disc F{FF}}{F}}
44.68 \declare@shorthand{swedish}{"g}{\textormath{\bbl@disc g{gg}}{g}}
44.69 \end{swedish} {\tt "G}{\tt textormath{\bbl@disc\ G{GG}}{G}} \\
44.70 \end{swedish} {\tt "l}{\tt textormath{\bbl@disc\ 1{11}}{1}}
44.71 \declare@shorthand{swedish}{"L}{\textormath{\bbl@disc L{LL}}{L}}
44.72 \declare@shorthand{swedish}{"m}{\textormath{\bbl@disc m{mm}}{m}}
44.73 \declare@shorthand{swedish}{"M}{\textormath{\bbl@disc M{MM}}}{M}}
44.74 \declare@shorthand{swedish}{"n}{\textormath{\bbl@disc n{nn}}{n}}
44.75 \declare@shorthand{swedish}{"N}{\textormath{\bbl@disc N{NN}}{N}}
44.76 \declare@shorthand{swedish}{"p}{\textormath{\bbl@disc p{pp}}{p}}
44.77 \declare@shorthand{swedish}{"P}{\textormath{\bbl@disc P{PP}}{P}}
44.78 \declare@shorthand{swedish}{"r}{\textormath{\bbl@disc r{rr}}{r}}
44.79 \end{swedish} {\tt "R} {\tt textormath} {\tt bbl@disc R\{RR\}} {\tt R} {\tt textormath} {\tt bbl@disc R\{RR\}} {\tt R} {\tt RR} {\tt RR
44.80 \declare@shorthand{swedish}{"s}{\textormath{\bbl@disc s{ss}}{s}}
44.81 \end{swedish} {\tt "S}{\text{\colored} shorthand{swedish}} {\tt "S}{\text{\colored} shorthand{shorthand{swedish}}} {\tt "S}{\text{\colored} shorthand{shorthand{swedish}}} {\tt "S}{\text{\colored} shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand{shorthand
44.82 \ensuremath{\hllowedish}{"t}{\text{\hllowedish}}{t}}
44.83 \declare@shorthand{swedish}{"T}{\textormath{\bbl@disc T{TT}}{T}}
```

and some additional commands:

```
44.84 \end{swedish} {"-} {\nobreak-\bbl@allowhyphens} \\ 44.85 \end{swedish} {"|} {\% \\ 44.86 \textormath{\nobreak\discretionary}_-} {\kern.03em} {\% }
```

```
\label{thm:continuous} $$44.88 \clare@shorthand{swedish}{""}{\hskip\z@skip} $$44.89 \clare@shorthand{swedish}{""}{% $$44.90 \textormath{\leavevmode\hbox{-}\bbl@allowhyphens}{-}} $$44.91 \clare@shorthand{swedish}{"=}{\hbox{-}\allowhyphens}} $$
```

\- Redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch, Finnish, German and Swedish, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

```
 44.92 \add to \extrasswed is h{\def} -{\allowhyphens} \\ 44.94 \add to \extrasswed is h{\def} -{\allowhyphens} \\
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
44.95 \ldf@finish{swedish} 44.96 \langle / code \rangle
```

45 The North Sami language

The file samin.dtx⁵¹ defines all the language definition macros for the North Sami language.

Several Sami dialects/languages are spoken in Finland, Norway, Sweden and on the Kola Peninsula (Russia). The alphabets differ, so there will eventually be a need for more .dtx files for e.g. Lule and South Sami. Hence the name samin.dtx (and not sami.dtx or the like) in the North Sami case.

There are currently no hyphenation patterns available for the North Sami language, but you might consider using the patterns for Finnish (fi8hyph.tex), Norwegian (nohyph.tex) or Swedish (sehyph.tex). Add a line for the samin language to the language.dat file, and rebuild the LATEX format file. See the documentation for your LATEX distribution.

A note on writing North Sami in LATEX: The TI encoding and EC fonts do not include the T WITH STROKE letter, which you will need a workaround for. My suggestion is to place the lines

```
\newcommand{\txx}{\mbox{t\hspace{-.35em}-}}
\newcommand{\txx}{\mbox{T\hspace{-.5em}-}}
in the preamble of your documents. They define the commands
\txx{} for LATIN CAPITAL LETTER T WITH STROKE and
\tx{} for LATIN SMALL LETTER T WITH STROKE.
```

45.1 The code of samin.dtx

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
45.1 \langle *code \rangle

45.2 \backslash LdfInit{samin}{captionssamin}
```

When this file is read as an option, i.e. by the \usepackage command, samin could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lessamin to see whether we have to do something here.

```
45.3 \ifx\undefined\l@samin

45.4 \@nopatterns{Samin}

45.5 \adddialect\l@samin0\fi
```

The next step consists of defining commands to switch to (and from) the North Sami language.

\saminhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $45.6 \providehyphenmins{samin}{\tw0\tw0}$

\captionssamin

The macro $\colon Samin$ defines all strings used in the four standard document classes provided with LaTeX.

```

\noextrassamin

\extrassamin The macro \extrassamin will perform all the extra definitions needed for the North Sami language. The macro \noextrassamin is used to cancel the actions of \extrassamin. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
45.46 \addto\extrassamin{}
45.47 \addto\noextrassamin{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
45.48 \ldf@finish{samin}
45.49 (/code)
```

46 The Finnish language

The file finnish.dtx⁵² defines all the language definition macros for the Finnish language.

For this language the character " is made active. In table 19 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "= an explicit hyphen sign for expressions such as "pakastekaapit ja -arkut".
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "' lowered double left quotes (looks like ,,)
- "' normal double right quotes
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 19: The extra definitions made by finnish.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
46.1 \langle *code \rangle

46.2 \land finnish \land captions finnish
```

When this file is read as an option, i.e. by the \usepackage command, finnish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \logfinnish to see whether we have to do something here.

```
46.3 \ifx\l@finnish\@undefined
46.4 \@nopatterns{Finnish}
46.5 \adddialect\l@finnish0\fi
```

The next step consists of defining commands to switch to the Finnish language. The reason for this is that a user might want to switch back and forth between languages.

\captionsfinnish The macro \captionsfinnish defines all strings used in the four standard document classes provided with IATFX.

```
46.6 \addto\captionsfinnish{%

46.27 \def\glossaryname{Sanasto}%
46.28 }%
```

\datefinnish The macro \datefinnish redefines the command \today to produce Finnish dates.

```
46.29 \def\datefinnish{%
46.30 \def\today{\number\day.~\ifcase\month\or
46.31 tammikuuta\or helmikuuta\or maaliskuuta\or huhtikuuta\or
46.32 toukokuuta\or kes\"akuuta\or hein\"akuuta\or elokuuta\or
46.33 syyskuuta\or lokakuuta\or marraskuuta\or joulukuuta\fi
46.34 \space\number\year}}
```

\extrasfinnish \noextrasfinnish

Finnish has many long words (some of them compound, some not). For this reason hyphenation is very often the only solution in line breaking. For this reason the values of \hyphenpenalty, \exhyphenpenalty and \doublehyphendemerits should be decreased. (In one of the manuals of style Matti Rintala noticed a paragraph with ten lines, eight of which ended in a hyphen!)

Matti Rintala noticed that with these changes TEX handles Finnish very well, although sometimes the values of \tolerance and \emergencystretch must be increased. However, I don't think changing these values in finnish.ldf is appropriate, as the looseness of the font (and the line width) affect the correct choice of these parameters.

```
46.35 \addto\extrasfinnish{\%} \\ 46.36 \babel@savevariable\hyphenpenalty\hyphenpenalty=30\% \\ 46.37 \babel@savevariable\exhyphenpenalty\exhyphenpenalty=30\% \\ 46.38 \babel@savevariable\doublehyphendemerits\doublehyphendemerits=5000\% \\ 46.39 \babel@savevariable\finalhyphendemerits\finalhyphendemerits=5000\% \\ 46.40 \babel@savevariable\finalhyphendemerits\finalhyphendemerits=5000\% \\ 46.41 \addto\noextrasfinnish{\}}
```

Another thing \extrasfinnish needs to do is to ensure that \frenchspacing is in effect. If this is not the case the execution of \noextrasfinnish will switch it of again.

```
46.42 \addto\extrasfinnish{\bbl@frenchspacing} \\ 46.43 \addto\noextrasfinnish{\bbl@nonfrenchspacing} \\
```

For Finnish the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the finnish group of shorthands should be used.

```
46.44 \initiate@active@char{"}
46.45 \addto\extrasfinnish{\languageshorthands{finnish}}
Don't forget to turn the shorthands off again.
46.46 \addto\extrasfinnish{\bbl@activate{"}}
46.47 \addto\noextrasfinnish{\bbl@deactivate{"}}
The 'umlaut' character should be positioned lower or
```

The 'umlaut' character should be positioned lower on *all* vowels in Finnish texts.

```
46.48 \addto\extrasfinnish{\umlautlow\umlautelow}
46.49 \addto\noextrasfinnish{\umlauthigh}
```

First we define access to the low opening double quote and guillemets for quotations,

```
\label{lem:46.50 declare@shorthand{finnish}{"'}{% 46.51    \textormath{\quotedblbase}{\mbox{\quotedblbase}}} $$46.52 \declare@shorthand{finnish}{"'}{% }$
```

```
46.53 \textormath{\textquotedblright}{\mbox{\textquotedblright}}}
46.54 \declare@shorthand{finnish}{"<}{%
46.55 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
46.56 \declare@shorthand{finnish}{">}{%
46.57 \textormath{\guillemotright}{\mbox{\guillemotright}}}
then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \-.
46.58 \declare@shorthand{finnish}{"-}{\nobreak-\bbl@allowhyphens}
46.59 \declare@shorthand{finnish}{""}{\hbox{-}\bbl@allowhyphens}
46.60 \declare@shorthand{finnish}{"=}{\hbox{-}\bbl@allowhyphens}
And we want to have a shorthand for disabling a ligature.
46.61 \declare@shorthand{finnish}{"|}{%
46.62 \textormath{\discretionary{-}{}}{\kern.03em}}{}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TEX in this respect is very unfortunate for languages such as Dutch, Finnish and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TEX can generate from the hyphenation patterns.

```
46.63 \addto\extrasfinnish{\babel@save} \\ 46.64 \addto\extrasfinnish{\def}-{\bbl@allowhyphens} \\ 46.65 \addto\extrasfinnish{\def}-{\f}_{\f}\bbl@allowhyphens} \\
```

\finishhyphenmins

The finnish hyphenation patterns can be used with \lefthyphenmin set to 2 and \righthyphenmin set to 2.

```
46.66 \providehyphenmins{\CurrentOption}{\tw@\tw@}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
46.67 \ldf@finish{finnish}
46.68 \ldf@finish{finnish}
```

47 The Hungarian language

The file option magyar.dtx defines all the language definition macros for the Hungarian language.

The babel support for the Hungarian language until file version 1.3i was essentially changing the English document elements to Hungarian ones, but because of the differences between these too languages this was actually unusable ('Part I' was transferred to 'Rész I' which is not usable instead of 'I. rész'). To enhance the typesetting facilities for Hungarian the following should be considered:

- In Hungarian documents there is a period after the part, section, subsection etc. numbers.
- In the part, chapter, appendix name the number (or letter) goes before the name, so 'Part I' translates to 'I. rész'.
- The same is true with captions ('Table 2.1' goes to '2.1. táblázat').
- There is a period after the caption name instead of a colon. ('Table 2.1:' goes to '2.1. táblázat.')
- There is a period at the end of the title in a run-in head (when afterskip<0 in \@startsection).
- Special hyphenation rules must be applied for the so-called long double consonants (ccs, ssz....).
- The opening quotation mark is like the German one (the closing is the same as in English).
- In Hungarian figure, table, etc. referencing a definite article is also incorporated. The Hungarian definite articles behave like the English indefinite ones ('a/an'). 'a' is used for words beginning with a consonant and 'az' goes for a vowel. Since some numbers begin with a vowel some others with a consonant some commands should be provided for automatic definite article generation.

Until file version 1.3i⁵³ the special typesetting rules of the Hungarian language mentioned above were not taken into consideration. This version (v1.4j)⁵⁴ enables babel to typeset 'good-looking' Hungarian texts.

\ontoday

The \ontoday command works like \today but produces a slightly different date format used in expressions such as 'on February 10th'.

\Az

The commands \Az#1 and \az#1 write the correct definite article for the argument and the argument itself (separated with a ~). The star-forms (\Az* and \az*) produce the article only.

\Azr

\Azr#1 and \azr#1 treat the argument as a label so expand it then write the definite article for \r@#1, a non-breakable space then the label expansion. The star-forms do not print the label expansion. \Azr(#1 and \azr(#1 are used for equation referencing with the syntax \azr(label).

\Aref

There are two aliases \Aref and \aref for \Azr and \azr, respectively. During the preparation of a document it is not known in general, if the code 'a~\ref{label}' or the code 'az~\ref{label}' is the grammatically correct one. Writing '\aref{label}' instead of the previous ones solves the problem.

\Azp

\Azp#1 and \azp#1 also treat the argument as a label but use the label's page for definite article determination. There are star-forms giving only the definite article without the page number.

\Apageref

There are aliases \Apageref and \apageref for \Azp and \azp, respec-

⁵³That file was last revised on 1996/12/23 with a contribution by the next authors: Attila Koppányi (attila@cernvm.cern.ch), Árpád Bíró (JZP1104@HUSZEG11.bitnet), István Hamecz (hami@ursus.bke.hu) and Dezső Horváth (horvath@pisa.infn.it).

⁵⁴It was written by József Bérces (jozsi@docs4.mht.bme.hu) with some help from Ferenc Wettl (wettl@math.bme.hu) and an idea from David Carlisle (david@dcarlisle.demon.co.uk).

shortcut	explanation	example
"	same as \glqq in babel, or	''id\'ezet''—→,,idézet''
	\quotedblbase in T1 (open-	
	ing quotation mark, like ")	
'c, 'C	ccs is hyphenated as cs-cs	$lo`ccsan \longrightarrow locs-csan$
'd, 'D	ddz is hyphenated as dz-dz	e'ddz∖"unk—→edz-dzünk
'g, 'G	ggy is hyphenated as gy-gy	poʻggy∖'asz—→pogy-gyász
'1, 'L	lly is hyphenated as ly-ly	Kod∖'a'llyal—→Kodály-lyal
'n, 'N	nny is hyphenated as ny-ny	me'nnyei —→meny-nyei
's, 'S	ssz is hyphenated as sz-sz	vi 'ssza $\longrightarrow visz$ -sza
't, 'T	tty is hyphenated as ty-ty	po'ttyan—→poty-tyan
ʻz, ʻZ	zzs is hyphenated as zs-zs	$\mathtt{ri'zzsel} \longrightarrow \mathtt{rizs-zsel}$

Table 20: The shortcuts defined in magyar.ldf

tively. The code \apageref{label} is equivalent either to $a^{pageref{label}}$ or to $az^{pageref{label}}$.

\Azc

\Azc and \azc work like the \cite command but (of course) they insert the definite article. There can be several comma separated cite labels and in that case the definite article is given for the first one. They accept \cite's optional argument. There are star-forms giving the definite article only.

\Acite

There are aliases \Acite and \acite for \Azc and \azc, respectively.

For this language the character ' is made active. Table 20 shows the shortcuts. The main reason for the activation of the ' character is to handle the special hyphenation of the long double consonants.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
47.1 (*code)
```

47.2 \LdfInit{magyar}{caption\CurrentOption}

When this file is read as an option, i.e. by the \usepackage command, magyar will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@magyar or \l@hungarian to see whether we have to do something here.

```
47.3 \ifx\l@magyar\@undefined
47.4 \ifx\l@hungarian\@undefined
47.5 \@nopatterns{Magyar}
47.6 \adddialect\l@magyar0
47.7 \else
47.8 \let\l@magyar\l@hungarian
47.9 \fi
47.10 \fi
```

The statement above makes sure that \longyar is always defined; if \longyar is still undefined we make it equal to \longyar.

```
47.11 \ifx\l@hungarian\@undefined
47.12 \let\l@hungarian\l@magyar
47.13 \fi
```

The next step consists of defining commands to switch to (and from) the Hungarian language.

\captionsmagyar

The macro \captionsmagyar defines all strings used in the four standard document classes provided with LATEX.

```
47.14 \@namedef{captions\CurrentOption}{% 47.15 \def\prefacename{El\H osz\'o}%
```

For the list of references at the end of an article we have a choice between two words, 'Referenciák' (a Hungarian version of the English word) and 'Hivatkozások'. The latter seems to be in more widespread use.

```
\def\refname{Hivatkoz\'asok}%
```

If you have a document with a summary instead of an abstract you might want to replace the word 'Kivonat' with 'Összefoglaló'.

\def\abstractname{Kivonat}%

The Hungarian version of 'Bibliography' is 'Bibliografia', but a more natural word to use is 'Irodalomjegyzék'.

- \def\bibname{Irodalomjegyz\'ek}%
- \def\chaptername{fejezet}% 47.19
- \def\appendixname{F\"uggel\'ek}% 47.20
- \def\contentsname{Tartalomjegyz\'ek}% 47.21
- 47.22 \def\listfigurename{\'Abr\'ak jegyz\'eke}%
- 47.23 \def\listtablename{T\'abl\'azatok jegyz\'eke}%
- \def\indexname{T\'argymutat\'o}% 47.24
- 47.25 \def\figurename{\'abra}%
- \def\tablename{t\'abl\'azat}% 47.26
- \def\partname{r\'esz}% 47.27
- 47.28 \def\enclname{Mell\'eklet}%
- 47.29 \def\ccname{K\"orlev\'el--c\'\i mzettek}%
- 47.30 \def\headtoname{C\',\i mzett}%
- 47.31 \def\pagename{oldal}%
- 47.32\def\seename{1\'asd}%
- 47.33 \def\alsoname{l\'asd m\'eg}%

Besides the Hungarian word for Proof, 'Bizonyítás' we can also name Corollary (Következmény), Theorem (Tétel) and Lemma (Lemma).

- 47.34 \def\proofname{Bizony\'\i t\'as}%
- 47.35 \def\glossaryname{Sz\'ojegyz\'ek}%
- 47.36

The macro \datemagyar redefines the command \today to produce Hungarian \datemagyar dates.

- 47.37 \@namedef{date\CurrentOption}{%
- 47.38 \def\todav{%
- 47.39 \number\year.\nobreakspace\ifcase\month\or
- 47.40 janu\'ar\or febru\'ar\or m\'arcius\or
- 47.41 \'aprilis\or m\'ajus\or j\'unius\or
- j\'ulius\or augusztus\or szeptember\or 47.42
- 47.43okt\'ober\or november\or december\fi
- 47.44 \space\number\day.}}

\ondatemagyar The macro \ondatemagyar produces Hungarian dates which have the meaning 'on this day'. It does not redefine the command \today.

- 47.45 \@namedef{ondate\CurrentOption}{%
- 47.46 \number\year.\nobreakspace\ifcase\month\or
- 47.47 janu\'ar\or febru\'ar\or m\'arcius\or
- 47.48 \'aprilis\or m\'ajus\or j\'unius\or
- j\'ulius\or augusztus\or szeptember\or 47.49
- 47.50okt\'ober\or november\or december\fi
- 47.51 \space\ifcase\day\or
- 1-j'en\or 2-'an\or 4-'en\or 5-'en\or 47.52
- $6-\'\circ n\$ 7-\'en\or 8-\'an\or 9-\'en\or 10-\'en\or 47.53
- 11-\'en\or 12-\'en\or 13-\'an\or 14-\'en\or 15-\'en\or 47.54
- 16-\'an\or 17-\'en\or 18-\'an\or 19-\'en\or 20-\'an\or 47.55
- 47.5621-\'en\or 22-\'en\or 23-\'an\or 24-\'en\or 25-\'en\or
- 26-\'an\or 27-\'en\or 28-\'an\or 29-\'en\or 30-\'an\or 47.57
- 31-\'en\fi}

\noextrasmagyar

\extrasmagyar The macro \extrasmagyar will perform all the extra definitions needed for the Hungarian language. The macro \noextrasmagyar is used to cancel the actions of \extrasmagyar.

47.59 \@namedef{extras\CurrentOption}{%

```
47.60 \expandafter\let\expandafter\ontoday
47.61 \csname ondate\CurrentOption\endcsname}
47.62 \@namedef{noextras\CurrentOption}{\let\ontoday\@undefined}
```

Now we redefine some commands included into latex.ltx. The original form of a command is always saved with \babel@save and the changes are added to \extrasmagyar. This ensures that the Hungarian version of a macro is alive *only* if the Hungarian language is active.

\fnum@figure \fnum@table

In figure and table captions the order of the figure/table number and \figurename /\tablename must be changed. To achieve this \fnum@figure and \fnum@table are redefined and added to \extrasmagyar.

```
 47.63 \expandafter\addto\csname extras\CurrentOption\endcsname \{\% 47.64 \babel@save\fnum@figure \end{figure.nobreakspace\figurename} \}   47.66 \expandafter\addto\csname extras\CurrentOption\endcsname \{\% 47.67 \babel@save\fnum@table \end{figurename} \}   47.68 \end{figure}   47.68 \end{figurename} \}
```

\@makecaption The colon in a figure/table caption must be replaced by a dot by redefining \@makecaption.

```
47.69 \expandafter\addto\csname extras\CurrentOption\endcsname{%
       \babel@save\@makecaption
47.70
47.71
       \def\@makecaption#1#2{%
47.72
         \vskip\abovecaptionskip
47.73
         \sbox\@tempboxa{#1. #2}%
         \ifdim \wd\@tempboxa >\hsize
47.74
           {#1. #2\csname par\endcsname}
47.75
47.76
47.77
           \global \@minipagefalse
           \hb@xt@\hsize{\hfil\box\@tempboxa\hfil}%
47.78
47.79
         \vskip\belowcaptionskip}}
47.80
```

\@caption There should be a dot after the figure/table number in lof/lot, so \@caption is redefined.

```
47.81 \expandafter\addto\csname extras\CurrentOption\endcsname{%
47.82
       \babel@save\@caption
       \label{longdef@caption#1[#2]#3{%}} $$ \label{longdef@caption#1[#2]#3{%}} $$
47.83
47.84
         \csname par\endcsname
47.85
         \addcontentsline{\csname ext@#1\endcsname}{#1}%
            {\protect\numberline{\csname the#1\endcsname.}{\ignorespaces #2}}%
47.86
47.87
         \begingroup
47.88
            \@parboxrestore
47.89
            \if@minipage
47.90
              \@setminipage
47.91
47.92
            \normalsize
            \@makecaption{\csname fnum@#1\endcsname}%
47.93
                 {\ignorespaces #3}\csname par\endcsname
47.94
47.95
          \endgroup}}
```

\@seccntformat In order to have a dot after the section number \@seccntformat is redefined.

```
47.96 \end{fter} add to \end{fter} add to \end{fter} add to \end{fter} and the $47.97 $$ \end{fter} add to \end{fter}
```

\@sect Alas, \@sect must also be redefined to have that dot in toc too. On the other hand, we include a dot after a run-in head.

```
47.99 \end{star} add to \end{star} extras \end{star} urrent Option \end{star} ame \{\%47.100 \babel @save \end{star} extras \end{star} and \end{star} extras \end{star} extras
```

End of letter class.

47.373 }{}

47.371

After making the changes to the LATEX macros we define some new ones to handle the problem with definite articles.

\az is a user-level command which decides if the next character is a star. \@az is called for \az* and \az@ for \az.

```
47.374 \det a_{a\circ \{a\setminus \{a\in \{a\in \{az0\}\}\}\}}
```

\Az \Az is used at the beginning of a sentence. Otherwise it behaves the same as \az. 47.375 \def\Az{A\@ifstar{\@az}{\az@}}

\az@ is called if there is no star after \az or \Az. It calls \@az and writes #1 separating with a non-breakable space.

```
47.376 \def\az0#1{\0az{#1}\nobreakspace#1}
```

\@az This macro calls \hun@tempadef to remove the accents from the argument then calls \@@az that determines if a 'z' should be written after a/A (written by \az/\Az).

```
47.377 \def\@az\#1{\%} \\ 47.378 \hun@tempadef{relax}{relax}{\#1}{\%} \\ 47.379 \edef\@tempb{\noexpand\@@az\@tempa\hbox!}{\%} \\ 47.380 \@tempb{}
```

\hun@tempadef The macro \hun@tempadef has three tasks:

- Accent removal. Accented letters confuse $\backslash @@az$, the main definite article determinator macro, so they must be changed to their non-accented counterparts. Special letters must also be changed, eg. ceal determination of the determination of the confuse ceal determination of the determination of
- Labels must be expanded.
- To handle Roman numerals correctly, commands starting with \hun@ are defined for labels containing Roman numbers with the Roman numerals replaced by their Arabic representation. This macro can check if there is a \hun@ command.

There are three arguments:

- 1. The primary command that should be expanded if it exists. This is usually the \hun@ command for a label.
- 2. The secondary command which is used if the first one is \relax. This is usually the original LATEX command for a label.
- 3. This is used if the first two is \relax. For this one no expansion is carried out but the accents are still removed and special letters are changed.

                  47.452
```

\Azp Same as \azp except that it writes 'A' instead of 'a'.

\hun@alph@lehgth This is used to count the number of letters until a non-letter is found or the end of the argument is reached. It must be called as \hun@alph@lehgtharg\hbox\hbox! and \count@ must be set to zero. It is called by \@@az@string.

```
47.453 \end{alph@lehgth#1#2\hbox#3!{%} } 47.454 \end{alph@lehgth#1A%} 47.455 \advance\count@by \end{alph@lehgth#2\hbox\hbox!\fi} 47.456 \hun@alph@lehgth#2\hbox\hbox!\fi}
```

\@@az@string

This macro is called by \@@az if the argument begins with a letter. The task of \@@az@string is to determine if the argument starts with a vowel and in that case \let\@tempa\@tempb. After checking if the first letter is A, E, I, O, or U, \hun@alph@lehgth is called to determine the length of the argument. If it gives 1 (that is the argument is a single-letter one or the second character is not letter) then the letters L, M, N, R, S, X, and Y are also considered as a vowel since their Hungarian pronounced name starts with a vowel.

```

\@@az This macro is the core of definite article handling. It determines if the argument needs 'az' or 'a' definite article by setting \@tempa to 'z' or \@empty. It sets \@tempa to 'z' if

- the first character of the argument is 5; or
- the first character of the argument is 1 and the length of the number $\pmod{3} = 1$ (one-egy, thousand-ezer, million-egymillió,...); or
- the first character of the argument is a, A, e, E, i, I, o, O, u, or U; or

• the first character of the argument is l, L, m, M, n, N, r, R, s, S, x, X, y, or Y and the length of the argument is 1 or the second character is a non-letter.

At the end it calls \Otempa, that is, it either typesets a 'z' or nothing.

```

48 The Estonian language

 $^{\circ}$, (and uppercase);

The file ${\tt estonian.dtx^{55}}$ defines the language definition macro's for the Estonian language.

This file was written as part of the TWGML project, and borrows heavily from the babel German and Spanish language files germanb.ldf and spanish.ldf.

Estonian has the same umlauts as German (\ddot{a} , \ddot{o} , \ddot{u}), but in addition to this, we have also \tilde{o} , and two recent characters \check{s} and \check{z} , so we need at least two active characters. We shall use " and $\tilde{\ }$ to type Estonian accents on ASCII keyboards (in the 7-bit character world). Their use is given in table 21. These active accent

```
\"a, (and uppercase);
"о
     \"o, (and uppercase);
"u
    \"u, (and uppercase);
    \v s, (and uppercase);
~z
    \v z, (and uppercase);
" |
    disable ligature at this position;
     an explicit hyphen sign, allowing hyphenation in the
     rest of the word;
     like the old \-, but allowing hyphenation in the rest
     of the word:
     for Estonian low left double quotes (same as Ger-
11 )
     for Estonian right double quotes;
     for French left double quotes (also rather popular)
     for French right double quotes.
```

Table 21: The extra definitions made by estonian.ldf

characters behave according to their original definitions if not followed by one of the characters indicated in that table; the original quote character can be typed using the macro \dq.

We support also the T1 output encoding (and Cork-encoded text input). You can choose the T1 encoding by the command \usepackage[T1]{fontenc}. This package must be loaded before babel. As the standard Estonian hyphenation file eehyph.tex is in the Cork encoding, choosing this encoding will give you better hyphenation.

As mentioned in the Spanish style file, it may happen that some packages fail (usually in a \message). In this case you should change the order of the \usepackage declarations or the order of the style options in \documentclass.

48.1 Implementation

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
48.1 \(\psi \cdot\)
48.2 \LdfInit{estonian}\captionsestonian
```

If Estonian is not included in the format file (does not have hyphenation patterns), we shall use English hyphenation.

```
48.3 \ifx\l@estonian\@undefined
48.4 \@nopatterns{Estonian}
48.5 \adddialect\l@estonian0
48.6 \fi
```

 $^{^{55}}$ The file described in this section has version number v1.0h and was last revised on 2005/03/30. The original author is Enn Saar, (saar@aai.ee).

Now come the commands to switch to (and from) Estonian.

```
The macro \captionsestonian defines all strings used in the four standard doc-

49 The Albanian language

The file albanian.dtx⁵⁶ defines all the language definition macros for the Albanian language.

Albanian is written in a latin script, but it has 36 leters, 9 which are diletters (dh, gj, ll, nj, rr, sh, th, xh, zh), and two extra special characters.

For this language the character " is made active. In table 22 an overview is given of its purpose.

- "c \"c, also implemented for the uppercase
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "| disable ligature at this position
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- ' for Albanian left double quotes (looks like ").
- "' for Albanian right double quotes.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 22: The extra definitions made by albanian.ldf

Apart from defining shorthands we need to make sure that the first paragraph of each section is intended. Furthermore the following new math operators are defined (\tg, \ctg, \arctg, \arctg, \sh, \ch, \th, \cth, \arch, \arch,

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
49.1 (*code)
```

49.2 \LdfInit{albanian}\captionsalbanian

When this file is read as an option, i.e. by the \usepackage command, albanian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambdalbanian to see whether we have to do something here.

```
49.3 \ifx\l@albanian\@undefined
49.4 \@nopatterns{Albanian}
49.5 \adddialect\l@albanian\fi
```

The next step consists of defining commands to switch to (and from) the Albanian language.

 \colonimon

The macro \captionsalbanian defines all strings used in the four standard document classes provided with IATEX.

```
49.6 \addto\captionsalbanian{%

```

\noextrasalbanian

\extrasalbanian The macro \extrasalbanian will perform all the extra definitions needed for the Albanian language. The macro \noextrasalbanian is used to cancel the actions of \extrasalbanian.

> For Albanian the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the albanian group of shorthands should be used.

```
49.34 \initiate@active@char{"}
49.35 \addto\extrasalbanian{\languageshorthands{albanian}}
49.36 \addto\extrasalbanian{\bbl@activate{"}}
 Don't forget to turn the shorthands off again.
49.37 \addto\noextrasalbanian{\bbl@deactivate{"}}
 First we define shorthands to facilitate the occurrence of letters such as č.
49.38 \declare@shorthand{albanian}{"c}{\text{textormath}\{v c}{\text{c}}}
49.39 \declare@shorthand{albanian}{"e}{\text{v e}{\text{check e}}}
49.40 \declare@shorthand{albanian}{"C}{\textormath{\v C}{\check C}}
49.41 \declare@shorthand{albanian}{"E}{\text{Lextormath}(v E}{\text{Check E}}}
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
\textormath{\quotedblbase{}}{\mbox{\quotedblbase}}}
49.44 \declare@shorthand{albanian}{"'}{%
      \textormath{\textquotedblleft{}}{\mbox{\textquotedblleft}}}
49.46 \declare@shorthand{albanian}{"<}{%
      \textormath{\guillemotleft{}}{\mbox{\guillemotleft}}}
49.47
49.48 \declare@shorthand{albanian}{">}{%
      \textormath{\guillemotright{}}{\mbox{\guillemotright}}}
 then we define two shorthands to be able to specify hyphenation breakpoints that
 behave a little different from \-.
49.50 \declare@shorthand{albanian}{"-}{\nobreak-\bbl@allowhyphens}
49.51 \end{albanian} {\tt ""}{\hskip\z@skip}
 And we want to have a shorthand for disabling a ligature.
49.52 \declare@shorthand{albanian}{"|}{%
      \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

\bbl@nonfrenchindent

\bbl@frenchindent In albanian the first paragraph of each section should be indented. Add this code only in LATEX.

```
49.54 \ifx\fmtname plain \else
49.55 \let\@aifORI\@afterindentfalse
```

49.42 \declare@shorthand{albanian}{"'}{%

```
49.56 \def\bbl@frenchindent{\let\@afterindentfalse\@afterindenttrue}
49.57 \@afterindenttrue}

\dateczech The macro \dateczech redefines the command \today to produce Czech dates.

```
51.29 \def\deteczech{\%}
```

- $51.30 \def \def \number \day. ~\if case \month \or$
- $1.31 \qquad \texttt{ledna} or \ \texttt{vunora} or \ \texttt{b} \texttt{v{r}ezna} or \ \texttt{dubna} or \ \texttt{kv} \texttt{v{e}tna} or$
- 51.33 \v{r}\'{\i}jna\or listopadu\or prosince\fi
- 51.34 \space \number\year}}

 $^{^{58}}$ The file described in this section has version number v1.3k and was last revised on 2005/03/29. Contributions were made by Milos Lokajicek (LOKAJICK@CERNVM).

\extrasczech \noextrasczech

The macro \extrasczech will perform all the extra definitions needed for the Czech language. The macro \noextrasczech is used to cancel the actions of \extrasczech. This means saving the meaning of two one-letter control sequences before defining them.

```
51.35 \addto\extrasczech{\babel@save\q\let\q\v} 51.36 \addto\extrasczech{\babel@save\w\let\w\r}
```

For Czech texts \frenchspacing should be in effect. We make sure this is the case and reset it if necessary.

- 51.37 \addto\extrasczech{\bbl@frenchspacing} 51.38 \addto\noextrasczech{\bbl@nonfrenchspacing}
- \v IATEX's normal \v accent places a caron over the letter that follows it (ŏ). This is not what we want for the letters d, t, l and L; for those the accent should change shape. This is acheived by the following.

```
51.39 \AtBeginDocument{\%}
51.40 \DeclareTextCompositeCommand{\v}{0T1}{t}{\%}
51.41 t\kern-.23em\raise.24ex\hbox{'}}
51.42 \DeclareTextCompositeCommand{\v}{0T1}{d}{\%}
51.43 d\kern-.13em\raise.24ex\hbox{'}}
51.44 \DeclareTextCompositeCommand{\v}{0T1}{1}{\large \large \large
```

\lambda Fot the letters 1 and L we want to disinguish between normal fonts and monospaced \Lcaron fonts.

```
51.46 \def\lcaron{%
       \stbox0\hbox{M}\setbox\tw@\hbox{i}%
51.48

51.52
       \fi}
51.53 \def\Lcaron{%
       \label{locality} $$\left(M\right)\simeq M}\
51.54
       \ifdim\wd0>\wd\tw@\relax
51.55
         L to z {\kern-.28em'\hss}%
51.56
51.57
       \else
         L\abel{lambda} L\abel{lambda} L\abella .45ex\hbox to\z@{\scriptstyle -.40em '\hss}% 
51.58
       fi
51.59
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
51.60 \label{finish} \\ 51.61 \ensuremath{\langle /code \rangle}
```

52 The Polish language

The file $\mathtt{polish.dtx^{59}}$ defines all the language-specific macros for the Polish language.

For this language the character " is made active. In table 23 an overview is given of its purpose.

```
"a
     or \aob, for tailed-a (like a)
     or \Aob, for tailed-A (like A)
     or \eob, for tailed-e (like e)
"E
     or \Eob, for tailed-E (like E)
     or \'c, for accented c (like \(\decc\)), same with uppercase
     letters and n,o,s
"1
     or \lpb{}, for l with stroke (like l)
"L
     or \Lpb{}, for L with stroke (like Ł)
"r
     or \zkb{}, for pointed z (like \(\d{z}\)), cf. pronounciation
"R
     or \Zkb{}, for pointed Z (like Z)
"z
     or \'z, for accented z
"Z
     or \'z, for accented Z
"|
     disable ligature at this position.
     an explicit hyphen sign, allowing hyphenation in the
     rest of the word.
     like "-, but producing no hyphen sign (for compund
     words with hyphen, e.g. x-""y).
11 6
     for German left double quotes (looks like ").
11 )
     for German right double quotes.
     for French left double quotes (similar to <<).
     for French right double quotes (similar to >>).
```

Table 23: The extra definitions made by polish.sty

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
52.1 \ \langle *code \rangle \\ 52.2 \ \ LdfInit{polish} \ \ \ captionspolish
```

When this file is read as an option, i.e. by the \usepackage command, polish could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lopolish to see whether we have to do something here.

```
52.3 \ifx\l@polish\@undefined
52.4 \@nopatterns{Polish}
52.5 \adddialect\l@polish0\fi
```

The next step consists of defining commands to switch to (and from) the Polish language.

\captionspolish The macro \captionspolish defines all strings used in the four standard documentclasses provided with LATEX.

```
52.6 \addto\captionspolish{%

52.32
52.33
      \space\number\year}%
52.34 }
```

\noextraspolish

\extraspolish The macro \extraspolish will perform all the extra definitions needed for the Polish language. The macro \noextraspolish is used to cancel the actions of \extraspolish.

> For Polish the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the polish group of shorthands should be used.

```
52.35 \initiate@active@char{"}
52.36 \addto\extraspolish{\languageshorthands{polish}}
52.37 \addto\extraspolish{\bbl@activate{"}}
 Don't forget to turn the shorthands off again.
52.38 \addto\noextraspolish{\bbl@deactivate{"}}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 23.

If you have problems at the end of a word with a linebreak, use the other version without hyphenation tricks. Some TeX wizard may produce a better solution with forcasting another token to decide whether the character after the double quote is the last in a word. Do it and let us know.

In Polish texts some letters get special diacritical marks. Leszek Holenderski designed the following code to position the diacritics correctly for every font in every size. These macros need a few extra dimension variables.

```
52.39 \newdimen\pl@left
52.40 \newdimen\pl@down
52.41 \newdimen\pl@right
52.42 \newdimen\pl@temp
```

\sob The macro \sob is used to put the 'ogonek' in the right place.

```
52.43 \def\sob#1#2#3#4#5{%parameters: letter and fractions hl,ho,vl,vo
 52.44
                                                                           \c 1\hbox{$\scriptstyle \hbox{$\scriptstyle \hbox{

              \def\Zkb{\skb Z{.5}{.5}{1.1}{0}}
        52.91
```

\aob The ogonek is placed with the letters 'a', 'A', 'e', and 'E'.

To activate these codes the font changing commands as they are defined in LATEX are modified. The same is done for plain TEX's font changing commands.

When \selectfont is undefined the current format is spposed to be either plain (based) or LATEX 2.09.

```
52.92 \ifx\selectfont\@undefined
      \ifx\prm\@undefined \addto\rm{\textpl}\else \addto\prm{\textpl}\fi
52.94
      \ifx\pit\@undefined \addto\it{\textpl}\else \addto\pit{\textpl}\fi
      52.95
      \ifx\psl\@undefined \addto\sl{\textpl}\else \addto\psl{\textpl}\fi
52.96
      \ifx\psf\@undefined
                                         \else \addto\psf{\textpl}\fi
52.97
                                         \verb|\else \addto\psc{\texttextpl}\fi|
      \ifx\psc\@undefined
52.98
      \ifx\ptt\@undefined \addto\tt{\telepl}\else \addto\ptt{\telepl}\fi
52.99
52.100 \else
```

When \selectfont exists we assume $\text{LAT}_{\mathsf{F}}X \, 2_{\varepsilon}$.

```
52.101 \expandafter\addto\csname selectfont \endcsname{% 52.102 \csname\f@encoding @pl\endcsname} 52.103 \fi
```

Currently we support the OT1 and T1 encodings. For T1 we don't have to make a difference between typewriter fonts and other fonts, they all have the same glyphs.

```
52.104 \exp \text{dafter}
```

For OT1 we need to check the current font family, stored in \formula. Unfortunately we need a hack as \ttdefault is defined as a \long macro, while \formula formula is not.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
52.112 \begingroup \catcode'\"12
52.113 \def\x{\endgroup
52.114 \def\dq{"}}
52.115 \x
```

Now we can define the doublequote macros for diacritics,

```
\label{textormath} $$ 52.116 \eclare@shorthand{polish}{"a}{\text{Aob}}{\dot a} $$ 52.117 \eclare@shorthand{polish}{"A}{\text{textormath}}{\dot A} $$ 52.118 \eclare@shorthand{polish}{"c}{\text{textormath}}{\cot c} $$ 52.119 \eclare@shorthand{polish}{"c}{\text{textormath}}{\dot c} $$ 52.120 \eclare@shorthand{polish}{"e}{\text{textormath}}{\dot c} $$ 52.121 \eclare@shorthand{polish}{"E}{\text{textormath}}{\dot c} $$ 52.122 \eclare@shorthand{polish}{"l}{\text{textormath}}{\dot l} $$ 52.123 \eclare@shorthand{polish}{"l}{\text{textormath}}{\dot l} $$ 52.123 \eclare@shorthand{polish}{"l}{\text{textormath}}{\dot l} $$ 52.124 \eclare@shorthand{polish}{"n}{\text{textormath}}{\dot l} $$ 52.125 \eclare@shorthand{polish}{"n}{\text{textormath}}{\dot l} $$ 52.125 \eclare@shorthand{polish}{"n}{\text{textormath}}{\dot l} $$ 52.126 \eclare@shorthand{polish}{"0}{\text{textormath}}{\dot l} $$ 52.127 \eclare@shorthand{polish}{"0}{\text{textormath}}{\dot l} $$ 52.128 \eclare@shorthand{polish}{"s}{\text{textormath}}{\dot l} $$ 52.129 \eclare@shorthand{polish}{\dot l} $$ 52.129 \eclare@shorthand{po
```

\polishrz The command \polishrz defines the shorthands "r, "z and "x to produce pointed z, accented z and "x. This is the default as these shorthands were defined by this language definition file for quite some time.

```
52.130 \end*{\polishrz}{\%} $52.131 \declare@shorthand{polish}{"r}{\textormath{\zkb}{\ddot r}}\%
```

```
\label{thm:continuous} $52.132 \ \ellow{\colored} $\{\colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} \ \colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} \ \colored{\colored} \ \colored{\colored} $\{\colored{\colored} \ \colored{\colored} \ \colored{\colored}
```

The command \polishzx switches to a different set of shorthands, "z, "x and "r to produce pointed z, accented z and "r; a different shorthand notation also in use.

```
52.139 \newcommand*{\polishzx}{%

52.140 \declare@shorthand{polish}{"z}{\textormath{\zkb}{\ddot z}}%

52.141 \declare@shorthand{polish}{"Z}{\textormath{\Zkb}{\ddot Z}}%

52.142 \declare@shorthand{polish}{"x}{\textormath{\'z}{\acute x}}%

52.143 \declare@shorthand{polish}{"X}{\textormath{\'z}{\acute X}}%

52.144 \declare@shorthand{polish}{"r}{\dq r}%

52.145 \declare@shorthand{polish}{"R}{\dq R}%

52.146 }
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
52.147 \declare@shorthand{polish}{"'}{%
52.148 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
52.149 \declare@shorthand{polish}{"'}{%
52.150 \textormath{\textquotedblright}{\mbox{\textquotedblright}}}
52.151 \declare@shorthand{polish}{"<}{%
52.152 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}}
52.153 \declare@shorthand{polish}{">}{%
52.154 \textormath{\guillemotright}{\mbox{\guillemotright}}}
```

then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \setminus -.

```
52.155 \declare@shorthand{polish}{"-}{\nobreak-\bbl@allowhyphens} 52.156 \declare@shorthand{polish}{""}{\hskip\z@skip} And we want to have a shorthand for disabling a ligature.
```

and we want to have a shorthand for disabiling a figure

```
52.157 \end{polish}{"|}{\%} \\ 52.158 \textormath{\discretionary{-}{}{\kern.03em}}{\{}}
```

\mdqon All that's left to do now is to define a couple of commands for reasons of compat-\mdqoff ibility with polish.tex.

```
52.159 \def\mdqon{\shorthandon{"}} 52.160 \def\mdqoff{\shorthandoff{"}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
52.161 \ldf@finish{polish} 52.162 \ldf@finish{polish}
```

53 The Serbocroatian language

The file serbian.dtx⁶⁰ defines all the language definition macros for the Serbian language, typeset in a latin script. In a future version support for typesetting in a cyrillic script may be added.

For this language the character " is made active. In table 24 an overview is given of its purpose. One of the reasons for this is that in the Serbian language some special characters are used.

- "c $\$ \"c, also implemented for the lowercase and uppercase s and z.
- "d \dj, also implemented for "D
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "| disable ligature at this position
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- "' for Serbian left double quotes (looks like ,,).
- "' for Serbian right double quotes.
- "
 for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 24: The extra definitions made by serbian.ldf

Apart from defining shorthands we need to make sure taht the first paragraph of each section is intended. Furthermore the following new math operators are defined (\tg, \ctg, \arctg, \arctg, \sh, \ch, \th, \cth, \arch, \arch,

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

53.1 (*code)

$53.2 \LdfInit{serbian}\captionsserbian$

When this file is read as an option, i.e. by the \usepackage command, serbian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loserbian to see whether we have to do something here

```
53.3 \ifx\l@serbian\@undefined
```

- 53.4 \@nopatterns{Serbian}
- 53.5 \adddialect\l@serbian0\fi

The next step consists of defining commands to switch to (and from) the Serbocroatian language.

\captionsserbian

The macro \captionsserbian defines all strings used in the four standard document classes provided with IATEX.

- $53.6 \addto\captionsserbian{%}$

```

\extrasserbian \noextrasserbian

53.33

The macro \extrasserbian will perform all the extra definitions needed for the Serbocroatian language. The macro \noextrasserbian is used to cancel the actions of \extrasserbian.

For Serbian the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the serbian group of shorthands should be used.

```
53.34 \initiate@active@char{"}
53.35 \addto\extrasserbian{\languageshorthands{serbian}}
53.36 \addto\extrasserbian{\bbl@activate{"}}

Don't forget to turn the shorthands off again.
53.37 \addto\noextrasserbian{\bbl@deactivate{"}}

First we define shorthands to facilitate the occurence of letters such as č.
```

decembar\fi \space \number\year}}

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
53.46 \declare@shorthand{serbian}{"'}{%
53.47 \textormath{\quotedblbase{}}{\mbox{\quotedblbase}}}
53.48 \declare@shorthand{serbian}{"'}{%
53.49 \textormath{\textquotedblleft{}}{\mbox{\textquotedblleft}}}
53.50 \declare@shorthand{serbian}{"<}{%
53.51 \textormath{\guillemotleft{}}{\mbox{\guillemotleft}}}}
53.52 \declare@shorthand{serbian}{"">}{%
53.53 \textormath{\guillemotright{}}{\mbox{\guillemotright}}}}

then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \-.
53.54 \declare@shorthand{serbian}{""-}{\nobreak-\bbl@allowhyphens}}
53.55 \declare@shorthand{serbian}{""}{\hskip\z@skip}
```

And we want to have a shorthand for disabling a ligature.

```
53.56 \declare@shorthand{serbian}{"|}{%  
53.57 \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

 $\verb|\bbl@nonfrenchindent| only in LATFX.$

\bbl@frenchindent In Serbian the first paragraph of each section should be indented. Add this code

```
53.58 \ifx\fmtname plain \else
      \let\@aifORI\@afterindentfalse
53.59
53.60
      \def\bbl@frenchindent{\let\@afterindentfalse\@afterindenttrue
53.61
                             \@afterindenttrue}
      \def\bbl@nonfrenchindent{\let\@afterindentfalse\@aifORI
53.62
53.63
                                \@afterindentfalse}
      \addto\extrasserbian{\bbl@frenchindent}
53.64
53.65
     \addto\noextrasserbian{\bbl@nonfrenchindent}
53.66 \fi
```

\mathserbian Some math functions in Serbian math books have other names: e.g. sinh in Serbian is written as sh etc. So we define a number of new math operators.

```
53.67 \ensuremath{\mathop{\nolimits} \% \ same as \sinh}
53.68 \left( \frac{\modernoone}{\modernoone} \right) \%  same as \modernoone
53.69 \def\th{\mathop{\operator@font th}\nolimits} % same as \tanh
53.70 \def\cth{\mathop{\operator@font cth}\nolimits} % same as \coth
53.71 \def\arsh{\mathop{\operator@font arsh}\nolimits}
53.72 \def\arch{\mathop{\operator@font arch}\nolimits}
53.73 \def\arth{\mathop{\operator@font arth}\nolimits}
53.74 \ensuremath{\texttt{\nolimits}}
53.75 \left(\frac{mathop{\operatorname{operator@font tg}\cap imits} \% \text{ same as } \right)}
53.76 \ensuremath{\model{\model}\model}\ % same as \cot
53.77 \def\arctg{\mathop{\operator@font arctg}\nolimits} % same as \arctan
53.78 \def\arcctg{\mathop{\operator@font arcctg}\nolimits}
53.79 \def\Prob{\mathop{\mathsf P\hskip0pt}\nolimits}
53.80 \def\Expect{\mathop{\mathsf E\hskipOpt}\nolimits}
53.81 \def\Variance{\mathop{\mathsf D\hskipOpt}\nolimits}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
53.82 \ldf@finish{serbian}
53.83 (/code)
```

54 The Slovak language

The file $slovak.dtx^{61}$ defines all the language-specific macros for the Slovak language.

For this language the macro \q is defined. It was used with the letters (t, d, 1, and L) and adds a 'to them to simulate a 'hook' that should be there. The result looks like t. Since the the T1 font encoding has the corresponding characters it is mapped to \v . Therefore we recommend using T1 font encoding. If you don't want to use this encoding, please, feel free to redefine \q in your file. I think babel will honour this ;-).

For this language the characters ", ' and $^{\circ}$ are ade active. In table 25 an overview is given of its purpose. Also the vertical placement of the umlaut can be controlled this way.

- "a \"a, also implemented for the other lowercase and uppercase vowels.
- ^d \q d, also implemented for l, t and L.
- c \v c, also implemented for C, D, N, n, T, Z and z.
- \circ \circ , also implemented for O.
- 'a, also implemented for the other lowercase and uppercase l, r, y and vowels.
- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- "' for German left double quotes (looks like ").
- "' for German right double quotes.
- "< for French left double quotes (similar to <<).
- '> for French right double quotes (similar to >>).

Table 25: The extra definitions made by slovak.ldf

The quotes in table 25 can also be typeset by using the commands in table 26.

```
for German left double quotes (looks like ").
\glqq
        for German right double quotes (looks like ").
\grqq
        for German left single quotes (looks like,).
\glq
        for German right single quotes (looks like ').
\grq
\flqq
        for French left double quotes (similar to <<).
        for French right double quotes (similar to >>).
\frqq
        for (French) left single quotes (similar to <).
\flq
        for (French) right single quotes (similar to >).
\frq
        the original quotes character (").
\dq
        the original single quote (').
\sq
```

Table 26: More commands which produce quotes, defined by slovak.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

⁶¹The file described in this section has version number v1.3a and was last revised on 2005/03/31. It was written by Jana Chlebikova (chlebik@euromath.dk) and modified by Tobias Schlemmer (Tobias.Schlemmer@web.de).

```
54.1 (*code)
54.2 \LdfInit{slovak}\captionsslovak
```

When this file is read as an option, i.e. by the \usepackage command, slovak will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lossovak to see whether we have to do something here.

```

55 The Slovenian language

The file slovene.dtx⁶² defines all the language-specific macros for the Slovenian language.

For this language the character " is made active. In table 27 an overview is given of its purpose. One of the reasons for this is that in the Slovene language some special characters are used.

- "c \"c, also implemented for the lowercase and uppercase s and z.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- " for Slovene left double quotes (looks like ").
- "' for Slovene right double quotes.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 27: The extra definitions made by slovene.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
55.1 \langle *code \rangle

55.2 \land LdfInit\{slovene\} \land captionsslovene
```

When this file is read as an option, i.e. by the \usepackage command, slovene will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lossovene to see whether we have to do something here.

```
55.3 \ifx\l@slovene\@undefined

55.4 \@nopatterns{Slovene}

55.5 \adddialect\l@slovene0\fi
```

The next step consists of defining commands to switch to the Slovenian language. The reason for this is that a user might want to switch back and forth between languages.

\captionsslovene

The macro \captionsslovene defines all strings used in the four standard document classes provided with IATeX.

```
55.6 \addto\captionsslovene{%
       \def\prefacename{Predgovor}%
 55.7

55.16
       \def\figurename{Slika}%
55.17
55.18
       \def\tablename{Tabela}%
55.19
       \def\partname{Del}%
55.20
       \def\enclname{Priloge}%
```

^{55.21 \}def\ccname{Kopije}%
55.22 \def\headtoname{Prejme}%

⁶²The file described in this section has version number v1.2m and was last revised on 2005/03/31. Contributions were made by Danilo Zavrtanik, University of Ljubljana (YU) and Leon Žlajpah (leon.zlajpah@ijs.si).

```
\def\pagename{Stran}%
55.23
55.24
       \def\seename{glej}%
55.25
       \def\alsoname{glej tudi}%
       \def\proofname{Dokaz}%
55.26
       \def\glossaryname{Glossary}% <-- Needs translation
55.27
55.28
```

\dateslovene The macro \dateslovene redefines the command \today to produce Slovenian dates.

```
55.29 \def\dateslovene{%
      \def\today{\number\day.~\ifcase\month\or
55.30
        januar\or februar\or marec\or april\or maj\or junij\or
55.31
55.32
         julij\or avgust\or september\or oktober\or november\or december\fi
55.33
         \space \number\year}}
```

\extrasslovene \noextrasslovene

The macro \extrasslovene performs all the extra definitions needed for the Slovenian language. The macro \noextrasslovene is used to cancel the actions of \extrasslovene.

For Slovene the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the slovenian group of shorthands should be used.

```
55.34 \initiate@active@char{"}
55.35 \addto\extrasslovene{\languageshorthands{slovene}}
55.36 \addto\extrasslovene{\bbl@activate{"}}
 Don't forget to turn the shorthands off again.
55.37 \addto\noextrasslovene{\bbl@deactivate{"}}
 First we define shorthands to facilitate the occurrence of letters such as č.
```

```
55.38 \declare@shorthand{slovene}{"c}{\textormath{\v c}{\check c}}
55.39 \declare@shorthand{slovene}{"s}{\textormath{\v s}{\check s}}
55.40 \declare@shorthand{slovene}{"z}{\text{x}}{\text{z}}{\text{z}}
55.42 \ensuremath{\v S}{\check S}}
55.43 \ensuremath{\v Z}{\check Z}}
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
55.44 \declare@shorthand{slovene}{"'}{%
      \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
55.46 \declare@shorthand{slovene}{"'}{%
      \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
55.48 \ensuremath{\texttt{declare@shorthand{slovene}}{"<}}{\%}
      \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
55.50 \declare@shorthand{slovene}{">}{%
      \textormath{\guillemotright}{\mbox{\guillemotright}}}
```

then we define two shorthands to be able to specify hyphenation breakpoints that behavew a little different from \-.

```
55.52 \label{lower} $$5.52 \end{slovene} {\line 1.5} $$ \end{slovene} $$ $$1.52 \end{slovene} $$
55.53 \declare@shorthand{slovene}{""}{\hskip\z@skip}
```

And we want to have a shorthand for disabling a ligature.

```
55.54 \declare@shorthand{slovene}{"|}{%
      \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
55.56 \ldf@finish{slovene}
55.57 (/code)
```

56 The Russian language

The file russianb.dtx⁶³ defines all the language-specific macros for the Russian language. It needs the file cyrcod for success documentation with Russian encodings (see below).

For this language the character " is made active. In table 28 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--~ Cyrillic emdash in compound names (surnames).
- "--* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thinspace for initials with a breakpoint in following surname.
- for German left double quotes (looks like ").
- "' for German right double quotes (looks like ").
- " "< for French left double quotes (looks like \ll).
- "> for French right double quotes (looks like \gg).

Table 28: The extra definitions made by russianb

The quotes in table 28 can also be typeset by using the commands in table 29.

```
\cdash---
             Cyrillic emdash in plain text.
\cdash--~
             Cyrillic emdash in compound names (surnames).
\cdash--*
             Cyrillic emdash for denoting direct speech.
             for German left double quotes (looks like ").
\glqq
             for German right double quotes (looks like ").
\grqq
"\flqq
             for French left double quotes (looks like \ll).
             for French right double quotes (looks like \gg).
\frqq
\dq
             the original quotes character (").
```

Table 29: More commands which produce quotes, defined by babel

The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

The quotation marks traditionally used in Russian were borrowed from other languages (e.g., French and German) so they keep their original names.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
56.1 \langle *code \rangle

56.2 \land finit{russian}{captionsrussian}
```

When this file is read as an option, i.e., by the \usepackage command, russianb will be an 'unknown' language, in which case we have to make it known.

 $^{^{63}}$ The file described in this section has version number? and was last revised on?. This file was initially derived from the original version of german.sty, which has some definitions for Russian. Later the definitions from russian.sty version 1.0b (for LATEX 2.09), russian.sty version v2.5c (for LATEX 2 ε) and francais.sty version 4.5c and germanb.sty version 2.5c were added.

So we check for the existence of \lambda Crussian to see whether we have to do something here.

```
56.3 \ifx\l@russian\@undefined
56.4 \@nopatterns{Russian}
56.5 \adddialect\l@russian0
56.6 \fi
```

\latinencoding

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then...too bad!

```
56.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. Hopefully, X2 will eventually replace the two latter encodings (LCY and LWN). If the user wants to use another font encoding than the default (T2A), he has to load the corresponding file *before* russianb.sty. This may be done in the following way:

```
% override the default X2 encoding used in Babel
\usepackage[LCY,OT1]{fontenc}
\usepackage[english,russian]{babel}
```

Note: for the Russian language, the T2A encoding is better than X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Russian phrase or vice versa.

We parse the \cdp@list containing the encodings known to LATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
56.8 \ensuremath{\mbox{ def\reserved@a\#1\#2}{\%}}
56.9
        \edef\reserved@b{#1}%
        \edef\reserved@c{#2}%
56.10
        \ifx\reserved@b\reserved@c
56.11
56.12
           \let\cyrillicencoding\reserved@c
56.13
        \fi}
56.14 \def\cdp@elt#1#2#3#4{%
56.15
        \reserved@a{#1}{0T2}%
        \reserved@a{#1}{LWN}%
56.16
        \reserved@a{#1}{LCY}%
56.17
        \reserved@a{#1}{X2}%
56.18
56.19
        \reserved@a{\#1}{T2C}%
56.20
        \reserved@a{\#1}{T2B}\%
56.21
        \reserved@a{#1}{T2A}}
56.22 \cdp@list
```

Now, if \cyrillicencoding is undefined, then the user did not load any of supported encodings. So, we have to set \cyrillicencoding to some default value. We test the presence of the encoding definition files in the order from less preferable to more preferable encodings. We use the lowercase names (i.e., lcyenc.def instead of LCYenc.def).

If \cyrillicencoding is still undefined, then the user seems not to have a properly installed distribution. A fatal error.

```
\ifx\cyrillicencoding\undefined

56.71
            Y\or Z\else\@ctrerr\fi}}%
```

Unfortunately, the commands \AA and \aa are not encoding dependent in LATEX (unlike e.g., \oe or \DH). They are defined as \r{A} and \r{a}. This leads to unpredictable results when the font encoding does not contain the Latin letters 'A' and 'a' (like X2).

The following block redefines the character class of uppercase Greek letters and some accents, if it is equal to 7 (variable family), to avoid incorrect results if the font encoding in some math family does not contain these characters in places of OT1 encoding. The code was taken from amsmath.dtx. See comments and further explanation there.

```
56.77 % \begingroup\catcode \"=12
  56.78 % % uppercase greek letters:
  56.79 \ \% \ \end{56.79} \ \end

56.101 % \fi
56.102 % \endgroup
```

The user should use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
56.103 \@ifpackageloaded{inputenc}{}{%
56.104 \def\reserved@a{LWN}%
56.105 \ifx\reserved@a\cyrillicencoding\else
56.106 \def\reserved@a\cyrillicencoding\else
56.107 \ifx\reserved@a\cyrillicencoding\else
56.108 \PackageWarning{babel}%
56.109 {No input encoding specified for Russian language}
56.110 \fi\fi}
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings.

\cyrillictext \latintext

The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are *declarations*, for shorter peaces of text the commands \textlatin and \textcyrillic can be used.

```
56.113 % \def\encodingdefault{\latinencoding}}
56.114 \let\lat\latintext
```

\textcyrillic These commands take an argument which is then typeset using the requested font \textlatin encoding.

We make the T_FX

 $56.117~\colored\colo$

 $56.118 \label{lem:commandDefault{TeX}} {\tt textlatin{ltxTeX}}$

and LATEX logos encoding independent.

56.119 %\ifx\ltxLaTeX\undefined\let\ltxLaTeX\LaTeX\fi

56.120 %\ProvideTextCommandDefault{\LaTeX}{\textlatin{\ltxLaTeX}}

The next step consists of defining commands to switch to (and from) the Russian language.

\captionsrussian The macro \captionsrussian defines all strings used in the four standard document classes provided with LATEX. The two commands \cyr and \lat activate Cyrillic resp. Latin encoding.

```
56.121 \addto\captionsrussian{%
                       FIXME: Where is the \prefacename used?
56.122 %
                  \def\prefacename{%
56.123
                         {\cyr\CYRP\cyrr\cyre\cyrd\cyri\cyrs\cyrl\cyro\cyrv\cyri\cyre}}%
56.124
56.125 %
                         {\cyr\CYRV\cyrv\cyre\cyrd\cyre\cyrn\cyri\cyre}}%
56.126
                 \def\refname{%
56.127
                         {\cyr\CYRS\cyrp\cyri\cyrs\cyro\cyrk
                              \\cyrl\cyri\cyre\cyrr\cyra\cyrt\cyru\cyrr\cyrery}}%
56.129 % \def\refname{%
                         {\cyr\CYRL\cyri\cyrt\cyre\cyrr\cyra\cyrt\cyru\cyrr\cyra}}%
56.130 %

```

\extrasrussian

The macro \extrasrussian will perform all the extra definitions needed for the Russian language. The macro \noextrasrussian is used to cancel the actions of \extrasrussian.

The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'russian'.

56.200 \addto\extrasrussian{\cyrillictext}

When the encoding definition file was processed by LATEX the current font encoding is stored in \latinencoding, assuming that LATEX uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Russian language is no longer 'active'.

 $56.201 \add to \no extra srussian {\latin text}$

\verbatim@font In order to get both Latin and Cyrillic letters in verbatim text we need to change the definition of an internal IATEX command somewhat:

```
56.202 %\def\verbatim@font{%
56.203 % \let\encodingdefault\latinencoding
56.204 % \normalfont\ttfamily
56.205 % \expandafter\def\csname\cyrillicencoding-cmd\endcsname##1##2{%
56.206 % \ifx\protect\@typeset@protect
56.207 % \begingroup\UseTextSymbol\cyrillicencoding##1\endgroup
56.208 % \else\noexpand##1\fi}}
```

The category code of the characters ':', ';', '!', and '?' is made \active to insert a little white space.

For Russian (as well as for German) the "character also is made active.

Note: It is *very* questionable whether the Russian typesetting tradition requires additional spacing before those punctuation signs. Therefore, we make the corresponding code optional. If you need it, then define the frenchpunct docstrip option in babel.ins.

Borrowed from french. Some users dislike automatic insertion of a space before 'double punctuation', and prefer to decide themselves whether a space should be added or not; so a hook <code>\NoAutoSpaceBeforeFDP</code> is provided: if this command is added (in file <code>russianb.cfg</code>, or anywhere in a document) <code>russianb</code> will respect your typing, and introduce a suitable space before 'double punctuation' if and only if a space is typed in the source file before those signs.

The command \AutoSpaceBeforeFDP switches back to the default behavior of russianb.

```
56.209 \ \langle *frenchpunct \rangle \\ 56.210 \ \langle initiate@active@char\{:\} \\ 56.211 \ \langle initiate@active@char\{:\} \\ 56.212 \ \langle frenchpunct \rangle \\ 56.213 \ \langle *frenchpunct | spanishligs \rangle \\ 56.214 \ \langle initiate@active@char\{!\} \\ 56.215 \ \langle initiate@active@char\{?\} \\ 56.216 \ \langle frenchpunct | spanishligs \rangle \\ 56.217 \ \langle initiate@active@char\{"\} \\
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 28.

We specify that the Russian group of shorthands should be used.

```
56.218 \addto\extrasrussian{\languageshorthands{russian}}
```

These characters are 'turned on' once, later their definition may vary.

The X2 and T2* encodings do not contain spanish_shriek and spanish_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use \latinencoding here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

```
56.227 \* spanishligs \* \\ 56.228 \* declare@shorthand\{russian\} \* \{'\} \* UseTextSymbol \* \{OT1\} \* textquestiondown \* \\ 56.229 \* declare@shorthand\{russian\} \* \{!'\} \* \* UseTextSymbol \* \{OT1\} \* \* textexclamdown \* \\ 56.230 \* \langle spanishligs \rangle \* \\ \*
```

```
\russian@sh@;@ We have to reduce the amount of white space before;,: and!. This should only \russian@sh@:@ happen in horizontal mode, hence the test with \ifhmode.
```

```
\label{eq:continuous} $$ \sin @ sh @ ! @_{56.231} \ \end{punct} $$ \sin @ sh @ ? @_{56.232} \ \end{punct} $$ $$ $56.233 \ \ifhmode $$
```

In horizontal mode we check for the presence of a 'space', 'unskip' if it exists and place a 0.1em kerning.

```
56.234 \ifdim\lastskip\z@

56.235 \unskip\nobreak\kern.1em

56.236 \else
```

If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thinspace, or as \@empty.

```
56.237 \FDP@thinspace
56.238 \fi
56.239 \fi
```

Now we can insert a ';' character.

```
56.240 \string;}
```

The other definitions are very similar.

```
56.241 \declare@shorthand{russian}{:}{%
        \ifhmode
56.242
56.243
          \ifdim\lastskip>\z@

56.254
          \else
               \FDP@thinspace
56.255
          \fi
56.256
        \fi
56.257
        \string!}
56.258
56.259 \declare@shorthand{russian}{?}{%
56.260
        \ifhmode
56.261
          \ifdim\lastskip>\z@
56.262
             \unskip\nobreak\kern.1em
56.263
          \else
               \FDP@thinspace
56.264
56.265
          \fi
56.266
        \fi
56.267
        \string?}
```

\AutoSpaceBeforeFDP \NoAutoSpaceBeforeFDP \FDP@thinspace \FDP@thinspace is defined as unbreakable spaces if \AutoSpaceBeforeFDP is activated or as \@empty if \NoAutoSpaceBeforeFDP is in use. The default is \AutoSpaceBeforeFDP.

\FDPon The next macros allow to switch on/off activeness of double punctuation signs.

\system@sh@:@ When the active characters appear in an environment where their Russian be-\system@sh@!@ haviour is not wanted they should give an 'expected' result. Therefore we define shorthands at system level as well.

```
\label{eq:continuous} $$ \operatorname{continuous}_{0.281} \end{system}_{:}_{\operatorname{string}:} $$ 56.281 \end{system}_{:}_{\operatorname{string}:} $$ 56.282 \end{frenchpunct} $$ 56.283 \end{system}_{:}_{\operatorname{string}:} $$ 56.284 \end{system}_{!}_{\operatorname{string}:} $$ 56.285 \end{system}_{!}_{\operatorname{string}:} $$ 56.286 \end{system}_{:}_{\operatorname{string}:} $$ 56.286 \end{system}_{:}_{\operatorname{string}:} $$ 56.286 \end{system}_{:}_{\operatorname{string}:} $$ $$ 6.286 \end{system}_{:}_{\operatorname{string}:}_{\operatorname{string}:} $$ $$ $$ $$ (frenchpunct_{\operatorname{system}}_{:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:} $$ $$ $$ $$ $$ (frenchpunct_{\operatorname{system}}_{:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:}_{\operatorname{string}:
```

To be able to define the function of '"', we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as '".

```
56.287 \begingroup \catcode'\"12
56.288 \def\reserved@a{\endgroup
56.289 \def\@SS{\mathchar"7019 }
56.290 \def\dq{"}}
56.291 \reserved@a
```

Now we can define the double quote macros: german and french quotes. We use definitions of these quotes made in babel. sty. The french quotes are contained in the T2* encodings.

```
56.292 \declare@shorthand{russian}{"'}{\glqq} 56.293 \declare@shorthand{russian}{"'}}{\grqq} 56.294 \declare@shorthand{russian}{"'}{\flqq} 56.295 \declare@shorthand{russian}{"'>}{\frqq}
```

Some additional commands:

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
56.302 \declare@shorthand{russian}{"-}{%
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
56.303 \def\russian@sh@tmp{%
56.304 \if\russian@sh@next-\expandafter\russian@sh@emdash
56.305 \else\expandafter\russian@sh@hyphen\fi
56.306 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \russian@sh@next and \russian@sh@tmp is called.

```
56.307 \qquad \texttt{\futurelet\russian@sh@next\russian@sh@tmp} \\
```

```
Here are the definitions of hyphen and emdash. First the hyphen:
```

```
56.308 \def\russian@sh@hyphen{%
56.309
      \nobreak\-\bbl@allowhyphens}
```

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash...:

 $56.310 \det \sin @sh@emdash#1#2{\cdash-#1#2}$

\cdash ... these two parameters are useful for another macro: \cdash:

```
56.311 %\ifx\cdash\undefined % should be defined earlier
56.312 \def\cdash#1#2#3{\def\tempx@{#3}%
56.313 \det \text{-}\det \text{-}\det \text{-}\det \text{-}
```

 $56.314 \left(\frac{1}{2}\right) \$

56.317

56.315 \ifx\tempx@\tempb@\@Bcdash\else

56.316 \ifx\tempx@\tempc@\@Ccdash\else

\errmessage{Wrong usage of cdash}\fi\fi\fi}

second parameter (or third for \cdash) shows what kind of emdash to create in next step

ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "— where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user: he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae TFX uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

```
56.318 % What is more grammatically: .2em or .2\fontdimen6\font ?
56.319 \end{cdash{\ifdim\lastskip}\z@\unskip\nobreak\hskip.2em\fi}
       \cyrdash\hskip.2em\ignorespaces}%
```

emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
56.321 \end{Second if dim\lastskip} z@\unskip\fi
56.322 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

for denoting direct speech (a space like \enskip must follow the emdash);

```
56.323 \def\@Ccdash{\leavevmode
56.324 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%
56.325 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2* fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
56.326 % Is there an IF necessary?
56.327 \ifx\cyrdash\undefined
       \def\cyrdash{\hbox to.8em{--\hss--}}
56.328
56.329 \fi
```

Here a really new macro—to place thin space between initials. This macro used instead of \setminus , allows hyphenation in the following surname.

 $56.330 \end{ressian} {\tt ",} {\tt \nobreak\hskip.2em\ignorespaces}$

```
\mdqon All that's left to do now is to define a couple of commands for ".
```

```
\mdqoff56.331 \def\mdqon{\bbl@activate{"}}
       56.332 \def\mdqoff{\bbl@deactivate{"}}
```

The Russian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
56.333 \providehyphenmins{\CurrentOption}{\tw@\tw@} \\ 56.334 \% temporary hack: \\ 56.335 \ifx\englishhyphenmins\undefined \\ 56.336 \def\englishhyphenmins{\tw@\thr@@} \\ 56.337 \fi
```

Now the action \extrasrussian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasrussian will switch it off again.

```
56.338 \verb| addto| extrasrussian{ | bbl@frenchspacing} \\ 56.339 \verb| addto| noextrasrussian{ | bbl@nonfrenchspacing} \\
```

Next we add a new enumeration style for Russian manuscripts with Cyrillic letters, and later on we define some math operator names in accordance with Russian typesetting traditions.

\Asbuk We begin by defining \Asbuk which works like \Alph, but produces (uppercase) Cyrillic letters intead of Latin ones. The letters YO, ISHRT, HRDSN, ERY, and SFTSN are skipped, as usual for such enumeration.

\asbuk The macro \asbuk is similar to \alph; it produces lowercase Russian letters.

```
56.347 \def\asbuk#1{\expandafter\@asbuk\csname c@#1\endcsname} 56.348 \def\@asbuk#1{\ifcase#1\or 56.349 \cyra\or\cyrb\or\cyrv\or\cyrg\or\cyrd\or\cyrc\or 56.350 \cyrz\or\cyri\or\cyrk\or\cyrt\or\cyrn\or\cyrn\or 56.351 \cyrp\or\cyrr\or\cyrs\or\cyrt\or\cyrt\or\cyrt\or 56.352 \cyrc\or\cyrch\or\cyrsh\or\cyrsh\or\cyrshch\or\cyryu\or 56.353 \cyrya\else\@ctrerr\fi}
```

56.354 %\RequirePackage{textmath}

56.371

56.372 }

Set up default Cyrillic math alphabets. To use Cyrillic letters in math mode user should load the textmath package *before* loading fontenc package (or babel). Note, that by default Cyrillic letters are taken from upright font in math mode (unlike Latin letters).

```
56.355 \@ifundefined{sym\cyrillicencoding letters}{}{%
56.356 \SetSymbolFont{\cyrillicencoding letters}{bold}\cyrillicencoding
       \rmdefault\bfdefault\updefault
56.358 \DeclareSymbolFontAlphabet\cyrmathrm{\cyrillicencoding letters}
  And we need a few commands to be able to switch to different variants.
56.359 \DeclareMathAlphabet\cyrmathbf\cyrillicencoding
       \rmdefault\bfdefault\updefault
56.360

Some math functions in Russian math books have other names: e.g., sinh in Russian is written as sh etc. So we define a number of new math operators. \sinh: 56.373 \def\sh{\mathop{\operator@font sh}\nolimits} 56.374 \def\ch{\mathop{\operator@font ch}\nolimits} 56.375 \def\tg{\mathop{\operator@font tg}\nolimits} \arctan: 56.376 \def\arctg{\mathop{\operator@font arctg}\nolimits} arcctg: 56.377 \def\arcctg{\mathop{\operator@font arcctg}\nolimits} The following macro conflicts with \th defined in Latin 1 encoding: \tanh: 56.378 \addto\extrasrussian{% 56.379 \babel@save{\th}% 56.380 \let\ltx@th\th 56.381 \def\th{\textormath{\ltx@th}}% {\mathop{\operator@font th}\nolimits}}% 56.382 56.383 } \cot: $56.384 \ensuremath{\mbox{ hopf\operator@font ctg}\nolimits}$ \coth: 56.385 \def\cth{\mathop{\operator@font cth}\nolimits} \csc: 56.386 \def\cosec{\mathop{\operator@font cosec}\nolimits} And finally some other Russian mathematical symbols: $56.387 \def\Prob{\mathbb{\end}}\nolimits}$ $56.388 \def\Variance{\mathbf{D}}\nolimits}$

56.388 \def\Variance{\mathop{\kern\z@\mathsf{D}}\nolimits} 56.389 \def\nod{\mathop{\cyrmathrm{\cyrn.\cyrc.\cyrd.}}\nolimits} 56.390 \def\nok{\mathop{\cyrmathrm{\cyrn.\cyrc.\cyrk.}}\nolimits} 56.391 \def\NOD{\mathop{\cyrmathrm{\CYRN\CYRO\CYRD}}\nolimits} 56.392 \def\NOK{\mathop{\cyrmathrm{\CYRN\CYRO\CYRK}}\nolimits}

This is for compatibility with older Russian packages.

 $56.393 \end{CYRP\cyrr}\nolimits}$

56.394 \DeclareRobustCommand{\No}{%

 $56.395 \qquad \texttt{\formode{\nfss@text{\texttextnumero}}\else\textnumero\fi}$

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
56.396 \ldf@finish{russian} 56.397 \ldf@finish{russian}
```

57 The Bulgarian language

The file bulgarian.dtx⁶⁴ provides the language-specific macros for the Bulgarian language.

Users should take note of the vaious "cyrillic" dashes available now (see below). These should remove many causes of headache. Also, although by default the Bulgarian quotation marks will appear automatically when typesetting in Bulgarian, it is better to use the new commands \"' and \"' which explicitly typeset them. Note: automatic switch to Bulgarian quotation is withdrawn for the moment and may not be reintroduced at all.

For this language the character " is made active. In table 30 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--" Cyrillic emdash in compound names (surnames).
- "--* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compound words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thin space for initials with a breakpoint in following surname.
- " for German left double quotes (looks like ").
- "' for German right double quotes (looks like ").
- " " < for French left double quotes (looks like \ll).
- "> for French right double quotes (looks like \gg).

Table 30: The extra definitions made bybulgarian

The quotes in table 30 can also be typeset by using the commands in table 31.

```
\cdash---
             Cyrillic emdash in plain text.
\cdash--~
             Cyrillic emdash in compound names (surnames).
\cdash--*
             Cyrillic emdash for denoting direct speech.
\glqq
             for German left double quotes (looks like,,).
\grqq
             for German right double quotes (looks like ").
"\flqq
             for French left double quotes (looks like \ll).
\frqq
             for French right double quotes (looks like \gg).
             the original quotes character (").
\dq
```

Table 31: More commands which produce quotes, defined by babel

The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

The quotation marks traditionally used in Bulgarian were borrowed from German o they keep their original names. French quotation marks may be seen as well in older books.

⁶⁴The file described in this section has version number? and was last revised on?. This file was initially derived from the August-1998 version of russianb.dtx.

It is (reasonably) backward compatible with the 1994/1996 (non-babel) bulgarian style (bulgaria.sty) by Georgi Boshnakov—files prepared for that style should compile successfully (with vastly improved appearance due to usage of standard fonts).

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
57.1 (*code)
57.2 \LdfInit{bulgarian}{captionsbulgarian}
```

When this file is read as an option, i.e., by the \usepackage command, bulgarian will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lobulgarian to see whether we have to do something here.

```
57.3 \ifx\l@bulgarian\@undefined
57.4 \@nopatterns{Bulgarian}
57.5 \adddialect\l@bulgarian0
57.6 \fi
```

\latinencoding

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then ... too bad!

```
57.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. If the user wants to use a font encoding other than the default (T2A), he has to load the corresponding file *before* bulgarian.sty. This may be done in the following way:

```
\usepackage[LCY,0T1]{fontenc} %overwrite the default encoding;
\usepackage[english,bulgarian]{babel}
```

Note: most people would prefer the T2A to X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Bulgarian phrase or vice versa. On the other hand, switching the language is a good practice anyway. With a decent text processing program it does not involve more work than switching between the Bulgarian and English keyboard. Moreover that the far most common disruption occurs as a result of forgetting to switch back to cyrillic keyboard.

We parse the \cdp@list containing the encodings known to IATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
57.8 \def\reserved@a#1#2{%
57.9
        \edef\reserved@b{#1}%
        \edef\reserved@c{#2}%
57.10
57.11
        \ifx\reserved@b\reserved@c
57.12
          \let\cyrillicencoding\reserved@c
57.13
        \fi}
57.14 \def\cdp@elt#1#2#3#4{%
        \reserved@a{#1}{OT2}%
57.15
        \reserved@a{#1}{I.WN}%
57.16
        \reserved@a{#1}{LCY}%
57.17
        \reserved@a{#1}{X2}%
57.18
57.19
        \reserved@a{\#1}{T2C}%
57.20
        \reserved@a{#1}{T2B}%
        \reserved@a{#1}{T2A}}
57.21
57.22 \cdp@list
```

Now, if \cyrillicencoding is undefined, then the user did not load any of supported encodings. So, we have to set \cyrillicencoding to some default value. We test the presence of the encoding definition files in the order from less preferable to more preferable encodings. We use the lowercase names (i.e., lcyenc.def instead of LCYenc.def).

```
57.23 \ifx\cyrillicencoding\undefined
57.24 \IfFileExists{ot2enc.def}{\def\cyrillicencoding{OT2}}\relax
```

```
\IfFileExists{lwnenc.def}{\def\cyrillicencoding{LWN}}\relax
57.25
57.26
      \IfFileExists{lcyenc.def}{\def\cyrillicencoding{LCY}}\relax
57.27

57.101 \end\dot\end\dot\end\breve\end\bar
57.102 \fi
57.103 \endgroup
```

The user should use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
57.104 \@ifpackageloaded{inputenc}{}{%
57.105 \def\reserved@a{LWN}%
57.106 \ifx\reserved@a\cyrillicencoding\else
57.107 \def\reserved@a{OT2}%
57.108 \ifx\reserved@a\cyrillicencoding\else
57.109 \PackageWarning{babel}%
57.110 {No input encoding specified for Bulgarian language}\fi\fi}
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings. \cyrillictext \latintext The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are declarations, for shorter peaces of text the commands \textlatin and \textcyrillic can be

We comment out \latintext since it is defined in the core of babel (babel.def). We add the shorthand \lat for \latintext. Note that \cyrillictext has been defined above.

```
57.111 % \DeclareRobustCommand{\latintext}{%
57.112\ \%\ \fontencoding{\latinencoding}\
        \def\encodingdefault{\latinencoding}}
57.114 \let\lat\latintext
```

\textcyrillic These commands take an argument which is then typeset using the requested font \textlatin encoding. \textlatin is commented out since it is defined in the core of babel. (It is defined there with \DeclareRobustCommand instead.)

```
57.115 \DeclareTextFontCommand{\textcyrillic}{\cyrillictext}
57.116 % \DeclareTextFontCommand{\textlatin}{\latintext}
```

The next step consists of defining commands to switch to (and from) the Bulgarian language.

         \cyrd\cyre\cyrk\cyre\cyrm\cyrv\cyrr\cyri\fi}%
57.174
       \def\month@Roman{\expandafter\@Roman\month}%
57.175
57.176
       \def\today{\number\day~\month@bulgarian\ \number\year~\cyrg.}%
       \def\todayRoman{\number\day.\,\month@Roman.\,\number\year~\cyrg.}%
57.177
57.178 }
```

\todayRoman The month is often written with roman numbers in Bulgarian dates. Here we define date in this format:

```
57.179 \def\Romannumeral#1{\uppercase\expandafter{\romannumeral #1}}
57.180 \def\todayRoman{\number\day.\Romannumeral{\month}.\number\year^\cyrg.}
```

\extrasbulgarian

The macro \extrasbulgarian will perform all the extra definitions needed for the Bulgarian language. The macro \noextrasbulgarian is used to cancel the actions of \extrasbulgarian.

The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'bulgarian'.

```
57.181 \addto\extrasbulgarian{\cyrillictext}
```

When the encoding definition file was processed by LATEX the current font encoding is stored in \latinencoding, assuming that LATEX uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Bulgarian language is no longer 'active'.

```
57.182 \addto\noextrasbulgarian{\latintext}
```

For Bulgarian the "character also is made active.

```
57.183 \initiate@active@char{"}
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 30. We specify that the Bulgarian group of shorthands should be used.

$57.184 \add to \extrasbulgarian {\languages horthands {bulgarian}} \\$

These characters are 'turned on' once, later their definition may vary.

```
57.185 \addto\extrasbulgarian{%
57.186 \bbl@activate{"}}
57.187 \addto\noextrasbulgarian{%
57.188 \bbl@deactivate{"}}
```

The X2 and T2* encodings do not contain spanish_shriek and spanish_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use **\latinencoding** here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

```
57.189 \* spanishligs \* \\ 57.190 \* declare@shorthand{bulgarian} \* \{'\} \* \UseTextSymbol\{OT1\} \textquestiondown\} \\ 57.191 \* declare@shorthand{bulgarian} \* \{!'\} \* \UseTextSymbol\{OT1\} \textexclamdown\} \\ 57.192 \slashligs \* \Barrier \* \Barr
```

To be able to define the function of '"', we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \"can now be typed as '"'.

```
57.193 \begingroup \catcode'\"12

57.194 \def\reserved@a{\endgroup

57.195 \def\@SS{\mathchar"7019}

57.196 \def\dq{"}}

57.197 \reserved@a
```

Now we can define the double quote macros: german and french quotes. We use definitions of these quotes made in babel. sty. The french quotes are contained in the T2* encodings.

```
57.198 \declare@shorthand{bulgarian}{"'}{\grqq} 57.199 \declare@shorthand{bulgarian}{"'}{\grqq} 57.200 \declare@shorthand{bulgarian}{"<}{\flqq} 57.201 \declare@shorthand{bulgarian}{">}{\frqq}
```

Some additional commands:

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
57.208 \declare@shorthand{bulgarian}{"-}{%
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
57.209 \def\bulgarian@sh@tmp{%

57.210 \if\bulgarian@sh@next-\expandafter\bulgarian@sh@emdash

57.211 \else\expandafter\bulgarian@sh@hyphen\fi

57.212 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \bulgarian@sh@next and \bulgarian@sh@tmp is called.

```
57.213 \futurelet\bulgarian@sh@next\bulgarian@sh@tmp}
```

Here are the definitions of hyphen and emdash. First the hyphen:

```
57.214 \def\bulgarian@sh@hyphen{\nobreak-\bbl@allowhyphens}
```

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash . . . :

\cdash ... these two parameters are useful for another macro: \cdash:

```
57.216 \ifx\cdash\undefined % should be defined earlier
57.217 \def\cdash#1#2#3{\def\tempx@{#3}%
57.218 \def\tempa@{-}\def\tempb@{~}\def\tempc@{*}%
57.219 \ifx\tempx@\tempb@\@Acdash\else
57.220 \ifx\tempx@\tempb@\@Bcdash\else
57.221 \ifx\tempx@\tempc@\@Ccdash\else
57.222 \errmessage{Wrong usage of cdash}\fi\fi\fi\}
```

second parameter (or third for \c shows what kind of emdash to create in next step

"--- ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "—where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user:he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae T_EX uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

```
57.223 % What is more grammatically: .2em or .2\fontdimen6\font? 57.224 \end{conskip}\z@\unskip\nobreak\hskip.2em\fi <math display="inline">57.225 \cyrdash\hskip.2em\ignorespaces}\%
```

"--" emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
57.226 \def\@Bcdash{\leavevmode\ifdim\lastskip>\z@\unskip\fi
57.227 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

"--* for denoting direct speech (a space like \enskip must follow the emdash);

```
57.228 \def\@Ccdash{\leavevmode
57.229 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%
57.230 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2*fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
57.231 % Is there an IF necessary?
57.232 \ifx\cyrdash\undefined
57.233 \def\cyrdash{\hbox to.8em{--\hss--}}
57.234 \fi
```

Here a really new macro—to place thin space between initials. This macro used instead of \, allows hyphenation in the following surname.

```
57.235 \verb|\declare@shorthand{bulgarian}{",}{\nobreak\hskip.2em\ignorespaces}|
```

The Bulgarian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
57.236 \provide
hyphenmins{CurrentOption}{
tw@\tw@} <math display="inline">57.237 \fi
```

Now the action \extrasbulgarian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasbulgarian will switch it off again.

```
57.238 \addto\extrasbulgarian{\bbl@frenchspacing} 57.239 \addto\noextrasbulgarian{\bbl@nonfrenchspacing}
```

Make the double quotes produce the traditional quotes used in Bulgarian texts (these are the German quotes).

```
57.240 % \initiate@active@char{'}

57.241 % \initiate@active@char{'}

57.242 % \addto\extrasbulgarian{%

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

57.321 \ldf@finish{bulgarian} 57.322 $\langle/\mathsf{code}\rangle$

58 The Ukrainian language

The file ukraineb.dtx⁶⁵ defines all the language-specific macros for the Ukrainian language. It needs the file cyrcod for success documentation with Ukrainian encodings (see below).

For this language the character " is made active. In table 32 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--" Cyrillic emdash in compound names (surnames).
- "--* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thinspace for initials with a breakpoint in following surname.
- for German left double quotes (looks like ").
- "' for German right double quotes (looks like ").
- " "< for French left double quotes (looks like \ll).
- "> for French right double quotes (looks like >>).

Table 32: The extra definitions made by ukraineb

The quotes in table 32 (see, also table 28) can also be typeset by using the commands in table 33 (see, also table 29).

```
Cyrillic emdash in plain text.
\cdash---
\cdash--~
             Cyrillic emdash in compound names (surnames).
\cdash--*
             Cyrillic emdash for denoting direct speech.
             for German left double quotes (looks like ").
\glqq
             for German right double quotes (looks like ").
\grqq
"\flqq
             for French left double quotes (looks like \ll).
             for French right double quotes (looks like \gg).
\frqq
             the original quotes character (").
\dq
```

Table 33: More commands which produce quotes, defined by babel

The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

The quotation marks traditionally used in Ukrainian and Russian languages were borrowed from other languages (e.g. French and German) so they keep their original names.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
58.1 \ \langle * code \rangle
58.2 \ LdfInit{ukrainian}{captionsukrainian}
```

 $^{^{65}}$ The file described in this section has version number ?. This file was derived from the russianb.dtx version 1.1g.

When this file is read as an option, i.e., by the \usepackage command, ukraineb will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \loukrainian to see whether we have to do something here.

```
58.3 \ifx\l@ukrainian\@undefined
58.4 \@nopatterns{Ukrainian}
58.5 \adddialect\l@ukrainian0
58.6 \fi
```

\latinencoding

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then...too bad!

```
58.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. Hopefully, X2 will eventually replace the two latter encodings (LCY and LWN). If the user wants to use another font encoding than the default (T2A), he has to load the corresponding file *before* ukraineb.sty. This may be done in the following way:

```
% override the default X2 encoding used in Babel
\usepackage[LCY,OT1]{fontenc}
\usepackage[english,ukrainian]{babel}
```

Note: for the Ukrainian language, the T2A encoding is better than X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Ukrainian phrase or vice versa.

We parse the \cdp@list containing the encodings known to IATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
58.8 \def\reserved@a#1#2{%
58.9
        \edef\reserved@b{#1}%
        \edef\reserved@c{#2}%
58.10
58.11
        \ifx\reserved@b\reserved@c
          \let\cyrillicencoding\reserved@c
58.12
58.13
        fi
58.14 \def\cdp@elt#1#2#3#4{%
58.15
        \reserved@a{#1}{0T2}%
        \reserved@a{#1}{LWN}%
58.16
        \reserved@a{#1}{LCY}%
58.17
        \reserved@a{#1}{X2}%
58.18
        \reserved@a{#1}{T2C}%

```

Unfortunately, the commands AA and a are not encoding dependent in LaTeX (unlike e.g., o or DH). They are defined as $r{A}$ and $r{a}$. This leads to unpredictable results when the font encoding does not contain the Latin letters A and A (like A2).

```
58.72 \DeclareTextSymbolDefault{\AA}{0T1} 

58.73 \DeclareTextSymbolDefault{\aa}{0T1} 

58.74 \DeclareTextCommand{\aa}{0T1}{\rangle} 

58.75 \DeclareTextCommand{\AA}{0T1}{\rangle} A} 

58.76 \fi
```

The following block redefines the character class of uppercase Greek letters and some accents, if it is equal to 7 (variable family), to avoid incorrect results if the font encoding in some math family does not contain these characters in places of OT1 encoding. The code was taken from amsmath.dtx. See comments and further explanation there.

```
58.77 % \begingroup\catcode \"=12
  58.78 % % uppercase greek letters:
  58.79 \ \% \ def\@tempa#1{\expandafter\@tempb\meaning#1\relax\relax\relax}

58.102 % \endgroup
```

The user must use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
58.103 \@ifpackageloaded{inputenc}{}{%
58.104 \def\reserved@a{LWN}%
58.105 \ifx\reserved@a\cyrillicencoding\else
58.106 \def\reserved@a\CYrillicencoding\else
58.107 \ifx\reserved@a\cyrillicencoding\else
58.108 \PackageWarning{babel}%
58.109 {No input encoding specified for Ukrainian language}
58.110 \fi\fi}
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings.

\cyrillictext \latintext

The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are *declarations*, for shorter peaces of text the commands \textlatin and \textcyrillic can be used.

```
58.111 %\DeclareRobustCommand{\latintext}{% 58.112 % \fontencoding{\latinencoding}\selectfont
```

```
58.113 % \def\encodingdefault{\latinencoding}} 58.114 \let\latintext
```

\textcyrillic These commands take an argument which is then typeset using the requested font encoding.

```
58.115 \DeclareTextFontCommand{\textcyrillic}{\cyrillictext} 58.116 \\DeclareTextFontCommand{\textlatin}{\latintext}
```

We make the T_FX

58.117 %\ifx\ltxTeX\undefined\let\ltxTeX\TeX\fi

58.118 %\ProvideTextCommandDefault{\TeX}{\textlatin{\ltxTeX}}

and LATEX logos encoding independent.

58.119 %\ifx\ltxLaTeX\undefined\let\ltxLaTeX\LaTeX\fi

58.120 %\ProvideTextCommandDefault{\LaTeX}{\textlatin{\ltxLaTeX}}

The next step consists of defining commands to switch to (and from) the Ukrainian language.

\captionsukrainian

58.161

The macro \captionsukrainian defines all strings used in the four standard document classes provided with LATEX. The two commands \cyr and \lat activate Cyrillic resp. Latin encoding.

```
58.121 \addto\captionsukrainian{%

58.175
         \space\number\year~\cyrr.}}
58.176
```

\extrasukrainian The macro \extrasukrainian will perform all the extra definitions needed for the Ukrainian language. The macro \noextrasukrainian is used to cancel the actions of \extrasukrainian.

> The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'ukrainian'.

58.177 \addto\extrasukrainian{\cyrillictext}

When the encoding definition file was processed by IATEX the current font encoding is stored in \latinencoding, assuming that LATEX uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Ukrainian language is no longer 'active'.

58.178 \addto\noextrasukrainian{\latintext}

Next we must allow hyphenation in the Ukrainian words with apostrophe whenever we enter 'ukrainian'. This solution was proposed by Vladimir Volovich <vvv@vvv.vsu.ru>

```
58.179 \addto\extrasukrainian{\lccode'\'='\'}
58.180 \addto\noextrasukrainian{\lccode'\'=0}
```

\verbatim@font In order to get both Latin and Cyrillic letters in verbatim text we need to change the definition of an internal LATEX command somewhat:

```
58.181 %\def\verbatim@font{%
58.182 % \let\encodingdefault\latinencoding
58.183 % \normalfont\ttfamily
58.184 % \expandafter\def\csname\cyrillicencoding-cmd\endcsname##1##2{%
58.185 %
          \ifx\protect\@typeset@protect
58.186 %
            \begingroup\UseTextSymbol\cyrillicencoding##1\endgroup
58.187 %
          \else\noexpand##1\fi}}
```

The category code of the characters ':', ';', '!', and '?' is made \active to insert a little white space.

For Ukrainian (as well as for Russian and German) the "character also is made

Note: It is very questionable whether the Russian typesetting tradition requires additional spacing before those punctuation signs. Therefore, we make the corresponding code optional. If you need it, then define the frenchpunct docstrip option in babel.ins.

Borrowed from french. Some users dislike automatic insertion of a space before 'double punctuation', and prefer to decide themselves whether a space should be added or not; so a hook \NoAutoSpaceBeforeFDP is provided: if this command is added (in file ukraineb.cfg, or anywhere in a document) ukraineb will respect your typing, and introduce a suitable space before 'double punctuation' if and only if a space is typed in the source file before those signs.

The command \AutoSpaceBeforeFDP switches back to the default behavior of ukraineb.

```
58.188 \*frenchpunct\\
58.189 \initiate@active@char\{:\}
58.190 \initiate@active@char\{;\}
58.191 \/frenchpunct\\\
58.192 \*frenchpunct | spanishligs\\\
58.193 \initiate@active@char\{!\}
58.194 \initiate@active@char\{?\}
58.195 \/frenchpunct | spanishligs\\\
58.196 \initiate@active@char\{"\}
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 32.

We specify that the Ukrainian group of shorthands should be used.

```
58.197 \addto\extrasukrainian{\languageshorthands{ukrainian}}
```

These characters are 'turned on' once, later their definition may vary.

The X2 and T2* encodings do not contain spanish_shriek and spanish_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use **\latinencoding** here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

\ukrainian@sh@;@ We have to reduce the amount of white space before ;, : and !. This should only \ukrainian@sh@:@ happen in horizontal mode, hence the test with \ifhmode.

In horizontal mode we check for the presence of a 'space', 'unskip' if it exists and place a 0.1em kerning.

```
58.213 \ifdim\lastskip>\z@

58.214 \unskip\nobreak\kern.1em

58.215 \else
```

If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thinspace, or as \@empty.

```
58.216 \FDP@thinspace
58.217 \fi
58.218 \fi
Now we can insert a ';' character.
58.219 \string;}
```

The other definitions are very similar.

```
58.220 \declare@shorthand{ukrainian}{:}{%
                      58.221
                              \ifhmode

                      58.258
                                    \bbl@deactivate{!}}
        \system@sh@:@ When the active characters appear in an environment where their Ukrainian be-
        \system@sh@!@ haviour is not wanted they should give an 'expected' result. Therefore we define
                        shorthands at system level as well.
        \system@sh@?@
        \verb|\system@sh@;@_{58.259} | declare@shorthand{system}{:}{\string:}|
                      58.260 \declare@shorthand{system}{;}{\string;}
                      58.261 (/frenchpunct)
                      58.262 (*frenchpunct&!spanishligs)
```

To be able to define the function of '"', we first define a couple of 'support' macros.

58.263 \declare@shorthand{system}{!}{\string!}
58.264 \declare@shorthand{system}{?}{\string?}

58.265 (/frenchpunct&!spanishligs)

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as '".

```
58.266 \begingroup \catcode'\"12
58.267 \def\reserved@a{\endgroup
58.268 \def\@SS{\mathchar"7019 }
58.269 \def\dq{"}}
58.270 \reserved@a
```

Now we can define the double quote macros: german and french quotes. We use definitions of these quotes made in babel. sty. The french quotes are contained in the T2* encodings.

```
58.271 \declare@shorthand{ukrainian}{"'}{\glqq}
58.272 \declare@shorthand{ukrainian}{"'}{\grqq}
58.273 \declare@shorthand{ukrainian}{"'}{\flqq}
58.274 \declare@shorthand{ukrainian}{"'}{\frqq}
```

Some additional commands:

```
 58.275 \ declare@shorthand\{ukrainian\}{""}{\hskip}z@skip} \\ 58.276 \ declare@shorthand\{ukrainian\}{""}{\hskip}z@skip} \\ 58.277 \ declare@shorthand\{ukrainian\}{""}{\hobreak-\hskip}z@skip} \\ 58.278 \ declare@shorthand\{ukrainian\}{""}{\%} \\ 58.279 \ \hobreak\hobreak\discretionary{-}{}{\hobreak}\% \\ 58.280 \ \hallowhyphens}{}
```

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
58.281 \ensuremath{\mbox{declare@shorthand{ukrainian}{"-}}{\%}
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
58.282 \def\ukrainian@sh@tmp{%
58.283 \if\ukrainian@sh@next-\expandafter\ukrainian@sh@emdash
58.284 \else\expandafter\ukrainian@sh@hyphen\fi
58.285 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \ukrainian@sh@next and \ukrainian@sh@tmp is called.

```
58.286 \qquad \verb| futurelet\ukrainian@sh@next\ukrainian@sh@tmp| |
```

Here are the definitions of hyphen and emdash. First the hyphen:

```
58.287 \ensuremath{\mbox{\sc bhl@allowhyphen}}\xspace \\ 58.288 \ensuremath{\mbox{\sc hobreak-\bbl@allowhyphens}}\xspace
```

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash...:

```
58.289 \def\ukrainian@sh@emdash#1#2{\cdash-#1#2}
```

\cdash ... these two parameters are useful for another macro: \cdash:

second parameter (or third for \cdash) shows what kind of emdash to create in next step

"--- ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "— where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user: he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae T_EX uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

"--" emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
58.300 \def\@Bcdash{\leavevmode\ifdim\lastskip>\z@\unskip\fi
58.301 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

"--* for denoting direct speech (a space like \enskip must follow the emdash);

```
58.302 \def\@Ccdash{\leavevmode
58.303 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%
58.304 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2* fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
58.305 % Is there an IF necessary?
58.306 \ifx\cyrdash\undefined
58.307 \def\cyrdash{\hbox to.8em{--\hss--}}
58.308 \fi
```

Here a really new macro—to place thinspace between initials. This macro used instead of \, allows hyphenation in the following surname.

\mdqon All that's left to do now is to define a couple of commands for ".

```
\mdqoff58.310 \def\mdqon{\bbl@activate{"}}
58.311 \def\mdqofff{\bbl@deactivate{"}}
```

The Ukrainian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
58.312 \providehyphenmins{\CurrentOption}{\tw@\tw@} 58.313 % temporary hack: 58.314 \ifx\englishhyphenmins\undefined 58.315 \def\englishhyphenmins{\tw@\thr@@} 58.316 \fi
```

Now the action \extrasukrainian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasukrainian will switch it off again.

```
58.317 \addto\extrasukrainian{bbl@frenchspacing} \\ 58.318 \addto\noextrasukrainian{bbl@nonfrenchspacing}
```

Next we add a new enumeration style for Ukrainian manuscripts with Cyrillic letters, and later on we define some math operator names in accordance with Ukrainian and Russian typesetting traditions.

\Asbuk We begin by defining \Asbuk which works like \Alph, but produces (uppercase) Cyrillic letters intead of Latin ones. The letters CYRGUP, and SFTSN are skipped, as usual for such enumeration.

```
58.319 \def\Asbuk#1{\expandafter\@Asbuk\csname c@#1\endcsname}
58.320 \def\@Asbuk#1{\ifcase#1\or
58.321 \CYRA\or\CYRB\or\CYRV\or\CYRG\or\CYRD\or\CYRE\or\CYRIE\or
58.322 \CYRZH\or\CYRZ\or\CYRI\or\CYRII\or\CYRYI\or\CYRSHRT\or
58.323 \CYRK\or\CYRL\or\CYRM\or\CYRO\or\CYRP\or\CYRR\or
58.324 \CYRS\or\CYRT\or\CYRU\or\CYRF\or\CYRH\or\CYRC\or\CYRC\or
58.325 \CYRSH\Or\CYRSHCH\or\CYRYU\or\CYRYA\else\@ctrerr\fi}
```

\asbuk The macro \asbuk is similar to \alph; it produces lowercase Ukrainian letters.

```
58.326 \def\asbuk#1{\expandafter\@asbuk\csname c@#1\endcsname} 58.327 \def\@asbuk#1{\ifcase#1\or 58.328 \cyra\or\cyrv\or\cyrg\or\cyrd\or\cyrie\or 58.329 \cyrzh\or\cyrz\or\cyri\or\cyrii\or\cyryi\or\cyrishrt\or 58.330 \cyrk\or\cyrl\or\cyrm\or\cyrn\or\cyro\or\cyrr\or 58.331 \cyrs\or\cyrt\or\cyru\or\cyrf\or\cyrh\or\cyrc\or\cyrch\or 58.332 \cyrsh\or\cyrshch\or\cyryu\or\cyrya\else\@ctrerr\fi}
```

Set up default Cyrillic math alphabets. The math groups for cyrillic letters are defined in the encoding definition files. First, declare a new alphabet for symbols, \cyrmathrm, based on the symbol font for Cyrillic letters defined in the encoding definition file. Note, that by default Cyrillic letters are taken from upright font in math mode (unlike Latin letters).

```
58.333 %\RequirePackage{textmath}
58.334 \ensuremath{\mbox{\tt 0}} ifundefined{sym}\cyrillicencoding letters}{}{\%}
58.335 \SetSymbolFont{\cyrillicencoding letters}{bold}\cyrillicencoding
        \rmdefault\bfdefault\updefault
58.336
58.337 \verb|\DeclareSymbolFontAlphabet\\| cyrmathrm{\cyrillicencoding letters}|
  And we need a few commands to be able to switch to different variants.
58.338 \DeclareMathAlphabet\cyrmathbf\cyrillicencoding
       \rmdefault\bfdefault\updefault
58.339
58.340 \DeclareMathAlphabet\cyrmathsf\cyrillicencoding
       \sfdefault\mddefault\updefault
58.341
58.342 \DeclareMathAlphabet\cyrmathit\cyrillicencoding
       \rmdefault\mddefault\itdefault
58.344 \DeclareMathAlphabet\cyrmathtt\cyrillicencoding
58.345 \ttdefault\mddefault\updefault
58.346 %
58.347 \SetMathAlphabet\cyrmathsf{bold}\cyrillicencoding
       \sfdefault\bfdefault\updefault
58.349 \SetMathAlphabet\cyrmathit{bold}\cyrillicencoding
```

Some math functions in Ukrainian and Russian math books have other names: e.g., sinh in Russian is written as sh etc. So we define a number of new math operators.

```
\sinh:
```

58.350 58.351 }

```
58.352 \def\sh{\mathop{\operator@font sh}\nolimits}
  \cosh:
58.353 \def\ch{\mathop{\operator@font ch}\nolimits}
  \tan:
58.354 \def\tg{\mathop{\operator@font tg}\nolimits}
  \arctan:
58.355 \def\arctg{\mathop{\operator@font arctg}\nolimits}
  arcctg:
58.356 \def\arcctg{\mathop{\operator@font arcctg}\nolimits}
```

\rmdefault\bfdefault\itdefault

The following macro conflicts with \th defined in Latin 1 encoding: \tanh:

```
58.357 \addto\extrasrussian{%}
      \babel@save{\th}%
58.358
      \let\ltx@th\th
58.359
58.360
      \def\th{\textormath{\ltx@th}}%
                         {\mathop{\operator@font th}\nolimits}}%
58.361
58.362 }
  \cot:
58.363 \def\ctg{\mathop{\operator@font ctg}\nolimits}
58.364 \def\cth{\mathop{\operator@font cth}\nolimits}
58.365 \def\cosec{\mathop{\operator@font cosec}\nolimits}
     And finally some other Ukrainian and Russian mathematical symbols:
58.366 \end{Prob}\end{Amathop}{\end{P}}\nolimits}
58.367 \def\Variance{\mathbf{D}}\nolimits}
58.368 \def\nsd{\mathop{\cyrmathrm{\cyrn.\cyrs.\cyrd.}}\nolimits}
58.369 \def\nsk{\mathop{\cyrmathrm{\cyrn.\cyrs.\cyrk.}}\nolimits}
58.370 \def\NSD{\mathop{\cyrmathrm{\CYRN\CYRS\CYRD}}\nolimits}
58.371 \def\NSK{\mathop{\cyrmathrm{\CYRN\CYRS\CYRK}}\nolimits}
                                                                  % ??????
58.372
      \def\nod{\mathop{\cyrmathrm{\cyrn.\cyro.\cyrd.}}\nolimits}
      \def\nok{\mathop{\cyrmathrm{\cyrn.\cyro.\cyrk.}}\nolimits}
                                                                  % ??????
58.373
      % ??????
58.374
58.375 $$ \def\NOK{\mathbf{\mathbb{CYRN}\CYRO\CYRK}}\nolimits}
                                                                  % ??????
58.376 \end{CYRP\cyrr}\nolimits}
     This is for compatibility with older Ukrainian packages.
58.377 \DeclareRobustCommand{\No}{%
       \ifmmode{\nfss@text{\textnumero}}\else\textnumero\fi}
58.378
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
58.379 \ldf@finish{ukrainian}
58.380 \ldf@finish{ukrainian}
```

59 The Lower Sorbian language

The file lsorbian.dtx⁶⁶ It defines all the language-specific macros for Lower Sorbian.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
59.1 (*code)
```

59.2 \LdfInit{lsorbian}\captionslsorbian

When this file is read as an option, i.e. by the \usepackage command, lsorbian will be an 'unknown' languagein which case we have to make it known. So we check for the existence of \l@lsorbian to see whether we have to do something here.

```
59.3 \ifx\l@lsorbian\@undefined
```

- 59.4 \Onopatterns{Lsorbian}
- 59.5 \adddialect\l@lsorbian\l@usorbian\fi

The next step consists of defining commands to switch to (and from) the Lower Sorbian language.

\captionslsorbian

The macro \captionslsorbian defines all strings used in the four standard document classes provided with LATEX.

```
59.6 \addto\captionslsorbian{%
```

- 59.7 \def\prefacename{Zawod}%
- 59.8 \def\refname{Referency}%
- 59.9 \def\abstractname{Abstrakt}%

 $59.49 \ \text{let}\ \text{datelsorbian}\ \text{newdatelsorbian}$

\extraslsorbian \noextraslsorbian

The macro \extraslsorbian will perform all the extra definitions needed for the lsorbian language. The macro \noextraslsorbian is used to cancel the actions of \extraslsorbian. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
59.50 \addto\extraslsorbian{} 59.51 \addto\noextraslsorbian{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
59.52 \label{finish} $159.53 \color=100 (100 finish)$
```

60 The Upper Sorbian language

The file usorbian.dtx⁶⁷ It defines all the language-specific macros for Upper Sorbian.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

60.1 (*code)

60.2 \LdfInit{usorbian}\captionsusorbian

When this file is read as an option, i.e. by the \usepackage command, usorbian will be an 'unknown' languagein which case we have to make it known. So we check for the existence of \lambda@usorbian to see whether we have to do something here.

60.3 \ifx\l@usorbian\@undefined 60.4 \Onopatterns{Usorbian}

60.5 \adddialect\l@usorbian0\fi

The next step consists of defining commands to switch to (and from) the Upper Sorbian language.

\captionsusorbian

The macro \captionsusorbian defines all strings used in the four standard document classes provided with LATEX.

```
60.6 \addto\captionsusorbian{%
 60.7
       \def\prefacename{Zawod}%
60.8
       \def\refname{Referency}%

- 60.28

\newdateusorbian The macro \newdateusorbian redefines the command \today to produce Upper Sorbian dates.

```
60.29 \def\newdateusorbian{%
60.30
     \def \def \. ~\def \month \or
```

- 60.31 januara\or februara\or m\v erca\or apryla\or meje\or junija\or
- 60.32 julija\or awgusta\or septembra\or oktobra\or
- 60.33 nowembra\or decembra\fi
- \space \number\year}} 60.34

\olddateusorbian The macro \olddateusorbian redefines the command \today to produce old-style Upper Sorbian dates.

```
60.35 \def\olddateusorbian{%}
```

\def\today{\number\day.~\ifcase\month\or

 $^{^{67}}$ The file described in this section has version number v1.0i and was last revised on 2005/03/31. It was written by Eduard Werner (edi@kaihh.hanse.de).

```
60.37 wulkeho r\'o\v zka\or ma\l eho r\'o\v zka\or nal\v etnika\or
60.38 jutrownika\or r\'o\v zownika\or sma\v znika\or pra\v znika\or
60.39 \v znjenca\or po\v znjenca\or winowca\or nazymnika\or
60.40 hodownika\fi \space \number\year}}
```

The default will be the new-style dates.

60.41 \let\dateusorbian\newdateusorbian

\extrasusorbian

The macro \extrasusorbian will perform all the extra definitions needed for the Upper Sorbian language. It's pirated from germanb.sty. The macro \noextrasusorbian is used to cancel the actions of \extrasusorbian.

Because for Upper Sorbian (as well as for Dutch) the " character is made active. This is done once, later on its definition may vary.

```
60.42 \time eactive @ char{"} \\ 60.43 \add to \extrasusor bian{\languages horthands {usor bian}} \\ 60.44 \add to \extrasusor bian{\bbl@activate{"}} \\ \\ \hline
```

Don't forget to turn the shorthands off again.

60.45 \addto\noextrasusorbian{\bbl@deactivate{"}}

In order for TEX to be able to hyphenate German Upper Sorbian words which contain '\mathfrak{G}' we have to give the character a nonzero \lccode (see Appendix H, the TEXbook).

The umlaut accent macro \" is changed to lower the umlaut dots. The redefinition is done with the help of \umlautlow.

```
60.48 \addto\extrasusorbian{\babel@save\"\umlautlow} 60.49 \addto\noextrasusorbian{\umlauthigh}
```

The Upper Sorbian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

60.50 \providehyphenmins{\CurrentOption}{\tw@\tw@}

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ". Also we store the original meaning of the command \" for future use.

60.67 \declare@shorthand{usorbian}{"S}{SS}

Now we can define the doublequote macros: the umlauts,

```
german and french quotes,
               60.68 \declare@shorthand{usorbian}{"'}{%
                            \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
               60.70 \declare@shorthand{usorbian}{"'}{%
                            \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
               60.72 \declare@shorthand{usorbian}{"<}{%
                           \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
               60.74 \declare@shorthand{usorbian}{">}{%
                            \textormath{\guillemotright}{\mbox{\guillemotright}}}
               60.75
                  discretionary commands
               60.76 \declare@shorthand usorbian { "c}{\text{\bbl@disc ck}}{c}
               60.77 \declare@shorthand{usorbian}{"C}{\textormath{\bbl@disc CK}{C}}
               60.78 \declare@shorthand{usorbian}{"f}{\textormath{\bbl@disc f{ff}}}{f}}

```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of **©** to its original value.

```
60.98 \ldf@finish{usorbian}
60.99 (/code)
```

61 The Turkish language

The file turkish.dtx⁶⁸ defines all the language definition macros for the Turkish language⁶⁹.

Turkish typographic rules specify that a little 'white space' should be added before the characters ':', '!' and '='. In order to insert this white space automatically these characters are made 'active'. Also \frenhspacing is set.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

61.1 (*code)

61.2 \LdfInit{turkish}\captionsturkish

When this file is read as an option, i.e. by the \usepackage command, turkish could be an 'unknown' language in which case we have to make it known. So we check for the existence of \location \underset urkish to see whether we have to do something here.

- 61.3 \ifx\l@turkish\@undefined
- 61.4 \Onopatterns{Turkish}
- 61.5 \adddialect\l@turkish0\fi

The next step consists of defining commands to switch to (and from) the Turkish language.

\captionsturkish

The macro \captionsturkish defines all strings used in the four standard document classes provided with LATEX.

- 61.6 \addto\captionsturkish{%
- 61.7 \def\prefacename{\"Ons\"oz}%
- 61.8 \def\refname{Kaynaklar}%
- 61.9 \def\abstractname{\"Ozet}%

- 61.26 \def\alsoname{ayr\i ca bkz.}%
- 61.27 \def\proofname{Kan\i t}%
- 61.28 \def\glossaryname{Glossary}% <-- Needs translation
- 61.29 }%

\dateturkish The macro \dateturkish redefines the command \today to produce Turkish dates.

- $61.30 \def\dateturkish{\%}$
- $61.31 $$ \def \rightarrow {\sum_{i=1}^{1}}$
- 61.32 Ocak\or \c Subat\or Mart\or Nisan\or May\i{}s\or Haziran\or
- 61.33 Temmuz\or A\u gustos\or Eyl\"ul\or Ekim\or Kas\i{}m\or
- 61.34 Aral\i{}k\fi

 $^{^{68}\}mathrm{The}$ file described in this section has version number v1.2m and was last revised on 2005/03/31.

⁶⁹Mustafa Burc, z6001@rziris01.rrz.uni-hamburg.de provided the code for this file. It is based on the work by Pierre Mackay; Turgut Uyar, uyar@cs.itu.edu.tr supplied additional translations in version 1.2j and later

61.35 \space\number\year}}

\extrasturkish \noextrasturkish

The macro \extrasturkish will perform all the extra definitions needed for the Turkish language. The macro \noextrasturkish is used to cancel the actions of \extrasturkish.

Turkish typographic rules specify that a little 'white space' should be added before the characters ':', '!' and '='. In order to insert this white space automatically these characters are made \active, so they have to be treated in a special wav.

```
61.36 \initiate@active@char{:}
61.37 \initiate@active@char{!}
61.38 \initiate@active@char{=}
```

We specify that the turkish group of shorthands should be used.

61.39 \addto\extrasturkish{\languageshorthands{turkish}}

These characters are 'turned on' once, later their definition may vary.

```
61.40 \addto\extrasturkish{%
```

```
\bbl@activate{:}\bbl@activate{!}\bbl@activate{=}}
```

For Turkish texts \frenchspacing should be in effect. We make sure this is the case and reset it if necessary.

```
61.42 \addto\extrasturkish{\bbl@frenchspacing}
61.43 \addto\noextrasturkish{\bbl@nonfrenchspacing}
```

\turkish@sh@!@ The definitions for the three active characters were made using intermediate \turkish@sh@=@ macros. These are defined now. The insertion of extra 'white space' should only \turkish@sh@:@ happen outside math mode, hence the check \ifmmode in the macros.

```

62 The Hebrew language

The file hebrew.dtx⁷⁰ provides the following packages and files for Hebrew language support:

hebrew.ldf file defines all the language-specific macros for the Hebrew language.

rlbabel.def file is used by hebrew.ldf for bidirectional versions of the major LATEX commands and environments. It is designed to be used with other right-to-left languages, not only with Hebrew.

hebcal.sty package defines a set of macros for computing Hebrew date from Gregorian one.

Additional Hebrew input and font encoding definition files that should be included and used with hebrew.ldf are:

hebinp.dtx provides Hebrew input encodings, such as ISO 8859-8, MS Windows codepage 1255 or IBM PC codepage 862 (see Section 63 on page 327).

hebrew.fdd contains Hebrew font encodings, related font definition files and hebfont package that provides Hebrew font switching commands (see Section 64 on page 333 for further details).

LATEX 2.09 compatibility files are included with heb209.dtx and gives possibility to compile existing LATEX 2.09 Hebrew documents with small (if any) changes (see Section 65 on page 348 for details).

Finally, optional document class hebtech may be useful for writing theses and dissertations in both Hebrew and English (and any other languages included with babel). It designed to meet requirements of the Graduate School of the Technion — Israel Institute of Technology.

As of version 2.3e hebtech is no longer distributed together with heblatex. It should be part of a new "hebclasses" package

62.1 Acknowledgement

The following people have contributed to Hebrew package in one way or another, knowingly or unknowingly. In alphabetical order: Irina Abramovici, Yaniv Bargury, Yael Dubinsky, Sergio Fogel, Dan Haran, Rama Porrat, Michail Rozman, Alon Ziv.

Tatiana Samoilov and Vitaly Surazhsky found a number of serious bugs in preliminary version of Hebrew package.

A number of other people have contributed comments and information. Specific contributions are acknowledged within the document.

I want to thank my wife, Vita, and son, Mishka, for their infinite love and patience.

If you made a contribution and I haven't mentioned it, don't worry, it was an accident. I'm sorry. Just tell me and I will add you to the next version.

62.2 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating external files:

driver produce a documentation driver file
hebrew produce Hebrew language support file
rightleft create right-to-left support file
calendar create Hebrew calendar package

⁷⁰The Hebrew language support files described in this section have version number v2.3h and were last revised on 2005/03/30.

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{hebrew.ldf}{t}{\from{hebrew.dtx}{hebrew}}
```

62.3 Hebrew language definitions

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

When this file is read as an option, i.e., by the \usepackage command, hebrew will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lambda@hebrew to see whether we have to do something here.

```
62.3 \ifx\l@hebrew\@undefined
62.4 \@nopatterns{Hebrew}%
62.5 \adddialect\l@hebrew0
62.6 \fi
```

\hebrewencoding

FIX DOCS REGARDING 8BIT

Typesetting Hebrew texts implies that a special input and output encoding needs to be used. Generally, the user may choose between different available Hebrew encodings provided. The current support for Hebrew uses all available fonts from the Hebrew University of Jerusalem encoded in 'old-code' 7-bit encoding also known as Israeli Standard SI-960. We define for these fonts the Local Hebrew Encoding LHE (see the file hebrew.fdd for more details), and the LHE encoding definition file should be loaded by default.

Other fonts are available in windows-cp1255 (a superset of ISO-8859-8 with nikud). For those, the encoding HE8 should be used. Such fonts are, e.g., windows' TrueType fonts (once coverted to Type1 or MetaFont) and IBM's Type1 fonts.

However, if an user wants to use another font encoding, for example, cyrillic encoding T2 and extended latin encoding T1, — he/she has to load the corresponding file *before* the hebrew package. This may be done in the following way:

```
\usepackage[LHE,T2,T1]{fontenc}
\usepackage[hebrew,russian,english]{babel}
```

\def\HeblatexEncoding{HE8}

We make sure that the LHE encoding is known to LATEX at end of this package.

Also note that if you want to use the encoding HE8, you should define the

Also note that if you want to use the encoding HE8, you should define following in your document, before loading babel:

```
\def\HeblatexEncodingFile{he8enc}
62.7 \providecommand{\HeblatexEncoding}{LHE}%
62.8 \providecommand{\HeblatexEncodingFile}{lheenc}%
62.9 \newcommand{\heblatex@set@encoding}[2]{
62.10 }
62.11 \AtEndOfPackage{%
      \@ifpackageloaded{fontenc}{%
62.12
62.13
         \@ifl@aded{def}{%
62.14
           \HeblatexEncodingFile}{\def\hebrewencoding{\HeblatexEncoding}}{}%
62.15
         \input{\HeblatexEncodingFile.def}%
62.16
         \def\hebrewencoding{\HeblatexEncoding}%
62.17
62.18
```

We also need to load inputenc package with one of the Hebrew input encodings. By default, we set up the 8859-8 codepage. If an user wants to use many input encodings in the same document, for example, the MS Windows Hebrew codepage cp1255 and the standard IBM PC Russian codepage cp866, he/she has to load the corresponding file *before* the hebrew package too. This may be done in the following way:

```
\usepackage[cp1255,cp866]{inputenc}
\usepackage[hebrew,russian,english]{babel}
```

An user can switch input encodings in the document using the command \inputencoding, for example, to use the cp1255:

\inputencoding{cp1255}

```
62.19 \AtEndOfPackage{%
```

62.20 \@ifpackageloaded{inputenc}{}{\RequirePackage[8859-8]{inputenc}}}

The next step consists of defining commands to switch to (and from) the Hebrew language.

\hebrewhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin. They are set to 2.

 $62.21 \providehyphenmins{\CurrentOption}{\tw0\tw0}$

\captionshebrew The macro \captionshebrew replaces all captions used in the four standard document classes provided with \LaTeX 2 ε with their Hebrew equivalents.

```

62.75 \beginL\number#3\endL\endR}
```

\hebday The macro \hebday will replace \today command when in Hebrew mode.
62.76 \def\hebday{\hebdate{\day}{\month}{\year}}

\hebdalet\hebtsadi\hebmem\hebbet\hebresh\fi}

\datehebrew The macro \datehebrew redefines the command \today to produce Gregorian dates in Hebrew. It uses the macro \hebday.

 $62.77 \def\datehebrew{\left \cdot \right }$

The macro \extrashebrew will perform all the extra definitions needed for the Hebrew language. The macro \noextrashebrew is used to cancel the actions of \extrashebrew.

\extrashebrew

62.72

We switch font encoding to Hebrew and direction to right-to-left. We cannot use the regular language switching commands (for example, \sethebrew and \unsethebrew or \selectlanguage{hebrew}), when in restricted horizontal mode, because it will result in unbalanced \beginR or \beginL primitives. Instead, in TEX's restricted horizontal mode, the \L{latin text} and \R{hebrew text}, or \embox{latin text} and \hmbox{hebrew text} should be used.

Hence, we use \beginL and \beginL switching commands only when not in restricted horizontal mode.

```
62.78 \addto\extrashebrew{%
62.79 \tohebrew%
62.80 \ifhmode\ifinner\else\beginR\fi\fi}
```

\noextrashebrew The macro \noextrashebrew is used to cancel the actions of \extrashebrew. We switch back to the previous font encoding and restore left-to-right direction.

```
62.81 \addto\noextrashebrew{\%}
62.82 \fromhebrew\%
62.83 \ifhmode\ifinner\else\beginL\fi\fi}
```

Generally, we can switch to- and from- Hebrew by means of standard babel-defined commands, for example,

```
\selectlanguage{hebrew}
```

or

\begin{otherlanguage}{hebrew}
 some Hebrew text
\end{otherlanguage}

Now we define two additional commands that offer the possibility to switch to and from Hebrew language. These commands are backward compatible with the previous versions of hebrew.sty.

\sethebrew \unsethebrew

The command \sethebrew will switch from the current font encoding to the hebrew font encoding, and from the current direction of text to the right-to-left mode. The command \unsethebrew switches back.

Both commands use standard right-to-left switching macros \setrllanguage{ r2l language name} and \unsetrllanguage{r2l language name}, that defined in the rlbabel.def file.

```
62.84 \def\sethebrew{\setrllanguage{hebrew}} 62.85 \def\unsethebrew{\unsetrllanguage{hebrew}}
```

\hebrewtext \nohebrewtext

The following two commands are *obsolete* and work only in LATEX2.09 compatibility mode. They are synonyms of \sethebrew and \unsethebrew defined above.

```
62.86 \if@compatibility
62.87 \let\hebrewtext=\sethebrew
62.88 \let\nohebrewtext=\unsethebrew
62.89 \fi
```

\tohebrew \fromhebrew

These two commands change only the current font encoding to- and from- Hebrew encoding. Their implementation uses \@torl{language name} and \@fromrl macros defined in rlbabel.def file. Both commands may be useful *only* for package and class writers, not for regular users.

```
62.90 \def\tohebrew{\@torl{hebrew}}%
62.91 \def\fromhebrew{\@fromrl}
```

\@hebrew

Sometimes we need to preserve Hebrew mode without knowing in which environment we are located now. For these cases, the \@hebrew{hebrew text} macro will be useful. Not that this macro is similar to the \@number and \@latin macros defined in rlbabel.def file.

```
62.92 \def\@Qhebrew#1{\beginR{{\tohebrew#1}}\endR} 62.93 \def\@hebrew{\protect\@Qhebrew}
```

62.3.1 Hebrew numerals

We provide commands to print numbers in the traditional notation using Hebrew letters. We need commands that print a Hebrew number from a decimal input, as well as commands to print the value of a counter as a Hebrew number.

\if@gim@apost
\if@gim@final

Hebrew numbers can be written in various styles: with or without apostrophes, and with the letters kaf, mem, nun, pe, tsadi as either final or initial forms when they are the last letters in the sequence. We provide two flags to set the style options.

\hebrewnumeral
\Hebrewnumeralfinal

The commands that print a Hebrew number must specify the style locally: relying on a global style option could cause a counter to print in an inconsistent manner—for instance, page numbers might appear in different styles if the global style option changed mid-way through a document. The commands only allow three of the four possible flag combinations (I do not know of a use that requires the combination of final letters and no apostrophes –RA).

Each command sets the style flags and calls \@hebrew@numeral. Double braces are used in order to protect the values of \@tempcnta and \@tempcntb, which are changed by this call; they also keep the flag assignments local (this is not important because the global values are never used).

```
62.96 \newcommand*{\hebrewnumeral}[1] % no apostrophe, no final letters 62.97 {{\QgimQfinalfalse\QgimQapostfalse\QhebrewQnumeral{#1}}}
```

```
62.98 \newcommand*{\Hebrewnumeral}[1] % apostrophe, no final letters 62.99 {{\@gim@finalfalse\@gim@aposttrue\@hebrew@numeral{#1}}} 62.100 \newcommand*{\Hebrewnumeralfinal}[1] % apostrophe, final letters 62.101 {{\@gim@finaltrue\@gim@aposttrue\@hebrew@numeral{#1}}}
```

\alph \@alph \Alph \@Alph \Alphfinal Counter-printing commands are based on the above commands. The natural name for the counter-printing commands is \alph, because Hebrew numerals are the only way to represent numbers with Hebrew letters (kaf always means 20, never 11). Hebrew has no uppercase letters, hence no need for the familiar meaning of \Alph; we therefore define \alph to print counters as Hebrew numerals without apostrophes, and \Alph to print with apostrophes. A third form, \Alphfinal, is provided to print with apostrophes and final letters, as is required for Hebrew year designators. The commands \alph and \Alph are defined in latex.ltx, and we only need to redefine the internal commands \@alph and \@Alph; for \Alphfinal we need to provide both a wrapper and an internal command. The counter printing commands are made semi-robust: without the \protect, commands like \theenumii break (I'm not quite clear on why this happens, -RA); at the same time, we cannot make the commands too robust (e.g. with \DeclareRobustCommand) because this would enter the command name rather than its value into files like .aux, .toc etc. The old meanings of meaning of \@alph and \@alph are saved upon entering Hebrew mode and restored upon exiting it.

```
62.102 \addto\extrashebrew{%
       \let\saved@alph=\@alph%
62.103
62.104
       \let\saved@Alph=\@Alph%
62.105
       \renewcommand*{\@alph}[1]{\protect\hebrewnumeral{\number#1}}%
62.106
       \renewcommand*{\@Alph}[1]{\protect\Hebrewnumeral{\number#1}}%
62.107
       \def\Alphfinal#1{\expandafter\@Alphfinal\csname c@#1\endcsname}%
62.108
       \providecommand*{\@Alphfinal}[1]{\protect\Hebrewnumeralfinal{\number#1}}}
62.109 \addto\noextrashebrew{%
       \let\@alph=\saved@alph%
62.110
       \let\@Alph=\saved@Alph}
62.111
```

Note that \alph (without apostrophes) is already the appropriate choice for the second-level enumerate label, and \alph (with apostrophes) is an appropriate choice for appendix; however, the default LATEX labels need to be redefined for appropriate cross-referencing, see below. LATEX default class files specify \alph for the fourth-level enumerate level, this should probably be changed. Also, the way labels get flushed left by default looks inappropriate for Hebrew numerals, so we should redefine \labelenumii as well as \labelenumiv (presently not implemented).

\theenumii \theenumiv \label Cross-references to counter labels need to be printed according to the language environment in which a label was issued, not the environment in which it is called: for example, a label (1b) issued in a Latin environment should be referred to as (1b) in a Hebrew text, and label (2dalet) issued in a Hebrew environment should be referred to as (2dalet) in a Latin text. This was the unanimous opinion in a poll sent to the IvriTEX list. We therefore redefine \theenumii and \theenumiv, so that an explicit language instruction gets written to the .aux file.

```
62.112 \renewcommand{\theenumii}
62.113 {\if@rl\protect\hebrewnumeral{\number\c@enumii}\%
62.114 \else\protect\L{\protect\@@alph{\number\c@enumii}\fi}
62.115 \renewcommand{\theenumiv}
62.116 {\if@rl\protect\Hebrewnumeral{\number\c@enumiv}\%
62.117 \else\protect\L{\protect\@@alph{\number\c@enumiv}\fi}
```

We also need to control for the font and direction in which a counter label is printed. Direction is straightforward: a Latin label like (1b) should be written left-to-right when called in a Hebrew text, and a Hebrew label like (2dalet) should be written right-to-left when called in a Latin text. The font question is more delicate, because we should decide whether the numerals should be typeset in

the font of the language environment in which the label was issued, or that of the environment in which it is called.

- A purely numeric label like (23) looks best if it is set in the font of the surrounding language.
- But a mixed alphanumeric label like (1b) lookes weird if the '1' is taken from the Hebrew font; likewise, (2dalet) looks weird if the '2' is taken from a Latin font.
- Finally, mixing the two possibilities is worst, because a single Hebrew sentence referring to examples (1b) and (2) would take the '1' from the Latin font and the '2' from the Hebrew font, and this looks really awful. (It is also very hard to implement).

In light of the conflicting considerations it seems like there's no perfect solution. I have chosen to implement the top option, where numerals are taken from the font of the surrounding language, because it seems to me that reference to purely numeric labels is the most common, so this gives a good solution to the majority of cases and a mediocre solution to the minority.

We redefine the \label command which writes to the .aux file. Depending on the language environment we issue appropriate \beginR/L···\endR/L commands to control the direction without affecting the font. Since these commands do not affect the value of \if@rl, we cannot use the macro \@brackets to determine the correct brackets to be used with \p@enumiii; instead, we let the language environment determine an explicit definition.

```
62.118 \def \label #1{\Qbsphack}
62.119
        \if@rl
62.120
          \def\p@enumiii{\p@enumii)\theenumii(}%
          \protected@write\@auxout{}%
62.121
62.122
               {\string\newlabel{#1}{{\beginR\@currentlabel\endR}{\thepage}}}%
62.123
          \def\p@enumiii{\p@enumii(\theenumii)}%
62.124
62.125
          \protected@write\@auxout{}%
62.126
               {\string\newlabel{#1}{{\beginL\@currentlabel\endL}{\thepage}}}%
        \fi
62.127
62.128
        \@esphack}
```

NOTE: it appears that the definition of \label is language-independent and thus belongs in rlbabel.def, but this is not the case. The decision to typeset label numerals in the font of the surrounding language is reasonable for Hebrew, because mixed-font (1b) and (2dalet) are somewhat acceptable. The same may not be acceptable for Arabic, whose numeral glyphs are radically different from those in the Latin fonts. The decision about the direction may also be different for Arabic, which is more right-to-left oriented than Hebrew (two examples: dates like 15/6/2003 are written left-to-right in Hebrew but right-to-left in Arabic; equations like 1+2=3 are written left-to-right in Hebrew but right-to-left in Arabic elementary school textbooks using Arabic numeral glyphs). My personal hunch is that a label like (1b) in an Arabic text would be typeset left-to-right if the '1' is a Western glyph, but right-to-left if the '1' is an Arabic glyph. But this is just a guess, I'd have to ask Arab typesetters to find the correct answer. $\neg RA$.

\appendix

The following code provides for the proper printing of appendix numbers in tables of contents. Section and chapter headings are normally bilingual: regardless of the text language, the author supplies each section/chapter with two headings—one for the Hebrew table of contents and one for the Latin table of contents. It makes sense that the label should be a Latin letter in the Latin table of contents and a Hebrew letter in the Hebrew table of contents. The definition is similar to that of \theenumii and \theenumiv above, but additional \protect commands ensure that the entire condition is written the .aux file. The appendix number will therefore be typeset according to the environment in which it is used rather

than issued: a Hebrew number (with apostrophes) in a Hebrew environment and a Latin capital letter in a Latin environment (the command \@QAlph is set in rlbabel.def to hold the default meaning of LATEX [latin] \@Alph, regardless of the mode in which it is issued). The net result is that the second appendix will be marked with 'B' in the Latin table of contents and with 'bet' in the Hebrew table of contents; the mark in the main text will depend on the language of the appendix itself.

```
62.129 \@ifclassloaded{letter}{}{%
62.130 \@ifclassloaded{slides}{}{%
62.131
       \let\@@appendix=\appendix%
62.132
       \@ifclassloaded{article}{%
          \renewcommand\appendix{\@@appendix%
62.133
62.134
            \renewcommand\thesection
              {\protect\if@rl\protect\Hebrewnumeral{\number\c@section}%
62.135
               \protect\else\@@Alph\c@section\protect\fi}}}
62.136
62.137
        {\renewcommand\appendix{\@@appendix%
            \renewcommand\thechapter
62.138
              {\protect\if@rl\protect\Hebrewnumeral{\number\c@chapter}%
62.139
62.140
               \protect\else\@@Alph\c@chapter\protect\fi}}}}
```

QUESTION: is this also the appropriate way to refer to an appendix in the text, or should we retain the original label the same way we did with enumerate labels? ANOTHER QUESTION: are similar redefinitions needed for other counters that generate texts in bilingual lists like .lof/.fol and .lot/.tol? -RA.

\@hebrew@numeral

The command \@hebrew@numeral prints a Hebrew number. The groups of thousands, millions, billions are separated by apostrophes and typeset without apostrophes or final letters; the remainder (under 1000) is typeset conventionally, with the selected styles for apostrophes and final letters. The function calls on \gim@no@mil to typeset each three-digit block. The algorithm is recursive, but the maximum recursion depth is 4 because TeX only allows numbers up to $2^{31} - 1 = 2,147,483,647$. The typesetting routine is wrapped in \@hebrew in order to ensure that numbers are always typeset in Hebrew mode.

Initialize: \@tempcnta holds the value, \@tempcntb is used for calculations.

```
62.141 \newcommand*{\@hebrew@numeral}[1]
62.142 {\@hebrew{\@tempcnta=#1\@tempcntb=#1\relax
62.143 \divide\@tempcntb by 1000

If we're under 1000, call \gim@nomil
62.144 \ifnum\@tempcntb=0\gim@nomil\@tempcnta\relax
```

If we're above 1000 then force no apostrophe and no final letter styles for the value above 1000, recur for the value above 1000, add an apostrophe, and call \gim@nomil for the remainder.

```
62.145 \else{\@gim@apostfalse\@gim@finalfalse\@hebrew@numeral\@tempcntb}'%
62.146 \multiply\@tempcntb by 1000\relax
62.147 \advance\@tempcnta by -\@tempcntb\relax
62.148 \gim@nomil\@tempcnta\relax
62.149 \fi
62.150 }}
```

NOTE: is it the case that 15,000 and 16,000 are written as yod-he and yod-vav, rather than tet-vav and tet-zayin? This vaguely rings a bell, but I'm not certain. If this is the case, then the current behavior is incorrect and should be changed. —RA.

\gim@nomil

The command \gim@nomil typesets an integer between 0 and 999 (for 0 it typesets nothing). The code has been modified from the old hebcal.sty (appropriate credits—Boris Lavva and Michail Rozman?). \@tempcnta holds the total value that remains to be typeset. At each stage we find the highest valued letter that is less than or equal to \@tempcnta, and call on \gim@print to subtract this value and print the letter.

Initialize: \@tempcnta holds the value, there is no previous letter.

62.151 \newcommand*{\gim@nomil}[1]{\@tempcnta=#1\@gim@prevfalse Find the hundreds digit.

62.192 }
```

\gim@print \if@gim@prev The actual printing routine typesets a digit with the appropriate apostrophes: if a number sequence consists of a single letter then it is followed by a single apostrophe, and if it consists of more than one letter then a double apostrophe is inserted before the last letter. We typeset the letters one at a time, keeping a flag that tells us if any previous letters had been typeset.

For each letter, we first subtract its value from the total. Then,

• if the result is zero then this is the last letter; we check the flag to see if this is the only letter and print it with the appropriate apostrophe;

• if the result is not zero then there remain additional letters to be typeset; we print without an apostrophe and set the 'previous letter' flag.

\@tempcnta holds the total value that remains to be typeset. We first deduct the letter's value from \@tempcnta, so \@tempcnta is zero if and only if this is the last letter.

```
62.194 \newcommand*{\gim@print}[2]{% #2 is a letter, #1 is its value.
62.195 \advance\@tempcnta by -#1\relax% deduct the value from the remainder
```

If this is the last letter, we print with the appropriate apostrophe (depending on the style option): if there is a preceding letter, print "x if the style calls for apostrophes, x if it doesn't; otherwise, this is the only letter: print x' if the style calls for apostrophes, x if it doesn't.

```
62.196 \ifnum\@tempcnta=0% if this is the last letter
62.197 \if@gim@prev\if@gim@apost"\fi#2%
62.198 \else#2\if@gim@apost'\fi\fi%
```

If this is not the last letter: print a non-final form (by forcing a local style option) and set the 'previous letter' flag.

```
62.199 \else{\@gim@finalfalse#2}\@gim@prevtrue\fi}
```

\hebr The older Hebrew counter commands \hebr and \gim are retained in order to keep older documents from breaking. They are set to be equivalent to \alph, and their use is deprecated. Note that \hebr gives different results than it had in the past—it now typesets 11 as yod-alef rather than kaf.

```
62.200 \let\hebr=\alph
62.201 \let\gim=\alph
```

For backward compatibility with 'older' hebrew.sty packages, we define Hebrew equivalents of some useful LATEX commands. Note, however, that 8-bit macros defined in Hebrew are no longer supported.

```
 62.202 \end{10} \\ 62.203 \end{10} \\ 62.203 \end{10} \\ 62.204 \end{10} \\ 62.204 \end{10} \\ 62.205 \end{10} \\ 62.205 \end{10} \\ 62.206 \end{10} \\ 62.205 \e
```

\hadgesh produce "poor man's bold" (heavy printout), when used with normal font glyphs. It is advisable to use bold font (for example, *Dead Sea*) instead of this macro

\piska and \piskapiska sometimes used in 'older' hebrew sources, and should not be used in LATEX 2ε .

```
62.210 \if@compatibility
62.211 \def\piska#1{\item{#1}\hangindent=-\hangindent}
62.212 \def\piskapiska#1{\itemitem{#1}\hangindent=-\hangindent}
62.213 \fi
```

The following commands are simply synonyms for the standard ones, provided with LATEX 2ε .

```
62.214 \let\makafgadol=\textendash
62.215 \let\makafanak=\textendash
62.216 \let\geresh=\textquoteright
62.217 \let\opengeresh=\textquoteright
62.218 \let\closegeresh=\textquoteleft
62.219 \let\openquote=\textquotedblright
62.220 \let\closequote=\textquotedblleft
62.221 \let\leftquotation=\textquotedblright
62.222 \let\rightquotation=\textquotedblleft
```

We need to ensure that Hebrew is used as the default right-to-left language at \begin{document}. The mechanism of defining the \@rllanguagename is the same as in babel's \languagename: the last right-to-left language in the \usepackage{babel} line is set as the default right-to-left language at document beginning.

For example, the following code:

```
\usepackage[russian,hebrew,arabic,greek,english]{babel}
```

will set the Arabic language as the default right-to-left language and the English language as the default language. As a result, the commands \L{} and \embox{} will use English and \R{} and \hmbox{} will use Arabic by default. These defaults can be changed with the next \sethebrew or \selectlanguage \language name} command.

```
62.223 \AtBeginDocument{\def\@rllanguagename{hebrew}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
62.224 \ldf@finish{hebrew} 62.225 \ldot /hebrew
```

62.4 Right to left support

This file rlbabel.def defines necessary bidirectional macro support for LATEX 2ε . It is designed for use not only with Hebrew, but with any Right-to-Left languages, supported by babel. The macros provided in this file are language and encoding independent.

Right-to-left languages will use TEX extensions, namely TEX primitives \beginL, \endL and \beginR, \endR, currently implemented only in ε -TEX and in TEX--XET.

If ε -T_FX is used, we should switch it to the *enhanced* mode:

Note, that ε -TEX's format file should be created for *extended* mode. Mode can be checked by running ε -TEX on some TEX file, for example:

```
This is e-TeX, Version 3.14159-1.1 (Web2c 7.0) entering extended mode
```

The second line should be entering extended mode.

We check if user uses Right-to-Left enabled engine instead of regular Knuth's T_FX:

```
62.230 \ifx\beginL\@undefined%
62.231 \newlinechar'\^^J
62.232 \typeout{^^JTo avoid this error message,^^J%
62.233 run TeX--XeT or e-TeX engine instead of regular TeX.^^J}
62.234 \errmessage{Right-to-Left Support Error: use TeX--XeT or e-TeX
62.235 engine}%
62.236 \fi
```

62.4.1 Switching from LR to RL mode and back

\@torl and \@fromrl are called each time the horizontal direction changes. They do all that is necessary besides changing the direction. Currently their task is to change the encoding information and mode (condition \if@rl). They should not normally be called by users: user-level macros, such as \sethebrew

and \unsethebrew, as well as babel's \selectlanguage are defined in language definition files and should be used to change default language (and direction).

Local direction changing commands (for small pieces of text): $\L{}$, $\R{}$, $\ensuremath{\mbox{}}$ and $\hmbox{}$ are defined below in this file in language-independent manner.

\if@rl rltrue means that the main mode is currently Right-to-Left. rlfalse means that the main mode is currently Left-to-Right.

```
62.237 \newif\if@rl
```

\if@rlmain This is the main direction of the document. Unlike \if@rl it is set once and never changes.

rltrue means that the document is Right-to-Left. rlfalse means that the document is Left-to-Right.

Practically \if@rlmain is set according to the value of \if@rl in the beginning of the run.

```
62.238 \AtBeginDocument{% Here we set the main document direction
62.239 \newif\if@rlmain%
62.240 \if@rl% e.g: if the options to babel were [english,hebrew]

\Otorl Switches current direction to Right-to-Left: saves current Left-to-Right encoding in \lr@encodingdefault, sets required Right-to-Left language name in \Orllanguagename (similar to babel's \languagename) and changes derection.

The Right-to-Left language encoding should be defined in .ldf file as special macro created by concatenation of the language name and string encoding, for example, for Hebrew it will be \hebrewencoding.

```

\selectlanguage This standard babel's macro should be redefined to support bidirectional tables. We divide \selectlanguage implementation to two parts, and the first part calls the second \@@selectlanguage.

\@@selectlanguage

This new internal macro redefines a final part of the standard babel's \selectlanguage implementation.

Standard LATEX provides us with 3 tables: Table of Contents (.toc), List of Figures (.lof), and List of Tables (.lot). In multi-lingual texts mixing Left-to-Right languages with Right-to-Left ones, the use of various directions in one table results in very ugly output. Therefore, these 3 standard tables will be used now only for Left-to-Right languages, and we will add 3 Right-to-Left tables (their extensions are simply reversed ones): RL Table of Contents (.cot), RL List of Figures (.fol), and RL List of Tables (.lof).

```
62.267 \def\@@selectlanguage#1{%

```

\setrllanguage \unsetrllanguage

The \setrllanguage and \unsetrllanguage pair of macros is proved to very useful in bilingual texts, for example, in Hebrew-English texts. The language-specific commands, for example, \sethebrew and \unsethebrew use these macros as basis.

Implementation saves and restores other language in \other@languagename variable, and uses internal macro \omega@selectlanguage, defined above, to switch between languages.

```
62.281 \let\other@languagename=\languagename

62.292
         \@@selectlanguage(\languagename)}
```

\L Macros for changing direction, originally taken from TUGboat. Usage: \L{Left to Right text} and \R{Right to Left text}. Numbers should also be enclosed in \L{}, as in \L{123}.

\HeblatexRedefineL

Note, that these macros do not receive language name as parameter. Instead, the saved \@rllanguagename will be used. We assume that each Right-to-Left language defines \tolanguagename and \fromlanguagename macros in language definition file, for example, for Hebrew: \tohebrew and \fromhebrew macros in hebrew.ldf file.

The macros \L and \R include 'protect' to to make them robust and allow use, for example, in tables.

Due to the fact that some packages have different definitions for \L the macro \HeblatexRedefineL is provided to overide them. This may be required with hyperref, for instance.

```
62.293 \let\next=\

```

Take care of Right-to-Left indentation in every paragraph. Originally, \noindent was redefined for right-to-left by Yaniv Bargury, then the implementation was rewritten by Alon Ziv using an idea by Chris Rowley: \noindent now works unmodified.

\hmbox Useful vbox commands. All text in math formulas is best enclosed in these: LR \embox text in \embox and RL text in \hmbox. \mbox{} is useless for both cases, since it typesets in Left-to-Right even for Right-to-Left languages (additions by Yaniv Bargury).

```
62.313 \newcommand{\hmbox}[1]{\mbox{\R{#1}}} 62.314 \newcommand{\embox}[1]{\mbox{\L{#1}}}
```

\@brackets When in Right-to-Left mode, brackets should be swapped. This macro receives 3 parameters: left bracket, content, right bracket. Brackets can be square brackets, braces, or parentheses.

```
62.315 \ensuremath{\mbox{\mbox{$1$}}} $$ \ensuremath{\mbox{$4$}} $$ $$ 62.316 $$ #1#2#3\protect\fi} $$
```

\Cnumber \Cnumber preserves numbers direction from Left to Right. \Clatin in addition switches current encoding to the latin.

```
 62.317 \end{62.317 \end{62.318} $$ \end{62.318} \end{62.318} \end{62.319} \end{62.319} \end{62.319} \end{62.319} \end{62.320} \end{6
```

62.4.2 Counters

To make counter references work in Right to Left text, we need to surround their original definitions with an \@number{...} or \@latin{...}. Note, that language-specific counters, such as \hebr or \gim are provided with language definition file.

We start with saving the original definitions:

```
62.321 \let\@@arabic=\@arabic
62.322 \let\@@roman=\@roman
62.323 \let\@@Roman=\@Roman
62.324 \let\@@alph=\@alph
62.325 \let\@@Alph=\@Alph
```

```
\@arabic Arabic and roman numbers should be from Left to Right. In addition, roman numerals, both lower- and upper-case should be in latin encoding.
```

```
\label{lem:condition} $$ \end{align* $$ \end{align* $$ \end{align* $$ $$ (@Coman#1} \end{align* $$ $$ $$ \end{align* $$ $$ \end{align* $$ $$ $$ \end{align* $$ \
```

\arabicnorl This macro preserves the original definition of \arabic (overrides the overriding of \@arabic)

62.329 \def\arabicnorl#1{\expandafter\@@arabic\csname c@#1\endcsname}

\make@lr In Right to Left documents all counters defined in the standard document classes article, report and book provided with \LaTeX 2\varepsilon, such as \thesection, \thefigure, \theequation should be typed as numbers from left to right. To ensure direction, we use the following \make@lr{counter} macro:

```
62.330 \def\make@lr#1{\begingroup
62.331
          \toks@=\expandafter{#1}%
62.332
          \edef\x{\endgroup
62.333
        \def\noexpand#1{\noexpand\@number{\the\toks@}}}%
62.334
62.335 \@ifclassloaded{letter}{}{%
       \@ifclassloaded{slides}{}{%
62.336
          \make@lr\thesection
62.337
          \make@lr\thesubsection
62.338
62.339
          \make@lr\thesubsubsection
62.340
          \make@lr\theparagraph
62.341
          \make@lr\thesubparagraph
62.342
          \make@lr\thefigure
62.343
          \make@lr\thetable
       }
62.344
       \make@lr\theequation
62.345
62.346 }
```

62.4.3 Preserving logos

Preserve T_EX, L^AT_EX and L^AT_EX 2_{ε} logos.

```
\TeX
```

```
 62.347 \let @TeX\TeX \\ 62.348 \def \TeX{\Clatin{\QCTeX}}
```

\LaTeX

```
 62.349 \let\\  @CaTeX\\  LaTeX \\  @CaTeX{}
```

\LaTeXe

```
62.351 \let\@@LaTeXe\LaTeXe
62.352 \def\LaTeXe{\@latin{\@@LaTeXe}}
```

62.4.4 List environments

List environments in Right-to-Left languages, are ticked and indented from the right instead of from the left. All the definitions that caused indentation are revised for Right-to-Left languages. LATEX keeps track on the indentation with the \leftmargin and \rightmargin values.

list Thus we need to override the definition of the \list macro: when in RTL mode, the right margins are the beginning of the line.

```
62.353 \def\list#1#2{%
62.354 \ifnum \@listdepth >5\relax
62.355 \@toodeep
```

```
62.356
        \else
62.357
         \global\advance\@listdepth\@ne
62.358
        \fi
62.359
        \rightmargin\z0
        \listparindent\z@
62.360
62.361
        \itemindent\z@
62.362
        \csname @list\romannumeral\the\@listdepth\endcsname
62.363
        \def\@itemlabel{#1}%
       \let\makelabel\@mklab
62.364
       \@nmbrlistfalse
62.365
       #2\relax
62.366
       \@trivlist
62.367
       \parskip\parsep
62.368
62.369
       \parindent\listparindent
       \advance\linewidth -\rightmargin
62.370
62.371
        \advance\linewidth -\leftmargin
  The only change in the macro is the \if@rl case:
62.372
          \advance\@totalleftmargin \rightmargin
62.373
62.374
       \else
62.375
          \advance\@totalleftmargin \leftmargin
62.376
       \fi
        \parshape \@ne \@totalleftmargin \linewidth
62.377
62.378
       \ignorespaces}
  to work Right-to-Left with the help of \@brackets macro defined above.
```

The \labelenumii and \p@enumiii commands use parentheses. They are revised \p@enumiii

```
62.379 \def\labelenumii{\@brackets(\theenumii)}
62.380 \def\p@enumiii{\p@enumii\@brackets(\theenumii)}
```

62.4.5Tables of moving stuff

Tables of moving arguments: table of contents (toc), list of figures (lof) and list of tables (lot) are handles here. These three default LATEX tables will be used now exclusively for Left to Right stuff.

Three additional Right-to-Left tables: RL table of contents (cot), RL list of figures (fol), and RL list of tables (tol) are added. These three tables will be used exclusively for Right to Left stuff.

\@tableofcontents \@listoffigures \@listoftables We define 3 new macros similar to the standard LATEX tables, but with one parameter — table file extension. These macros will help us to define our additional tables below.

\lambda The toc entry for section did not work in article style. Also it does not print dots, \lambda l@subsection which is funny when most of your work is divided into sections.

\l@subsubsection \l@paragraph

It was revised to use \@dottedtocline as in report.sty (by Yaniv Bargury) and was updated later for all kinds of sections (by Boris Lavva).

\l@subparagraph62.591 \@ifclassloaded{article}{%

62.4.6 Two-column mode

This is the support of twocolumn option for the standard LaTeX 2ε classes. The following code was originally borrowed from the ArabTeX package, file latexext.sty, copyright by Klaus Lagally, Institut fuer Informatik, Universitaet Stuttgart. It was updated for this package by Boris Lavva.

\@outputdblcol \set@outputdblcol rl@outputdblcol

First column is **\@leftcolumn** will be shown at the right side, Second column is **\@outputbox** will be shown at the left side.

\set@outputdblcol IS CURRENTLY DISABLED. TODO: REMOVE IT [tzafrir]

62.4.7 Footnotes

\rl@outputdblcol%

62.603

\footnoterule

The Right-to-Left footnote rule is simply reversed default Left-to-Right one. Footnotes can be used in RL or LR main modes, but changing mode while a footnote is pending is still unsolved.

```
62.634 \let \@0footnoterule = \footnoterule \\ 62.635 \def \footnoterule {\if@rl\hb@xt0\hsize{\hss\vbox{\cotnoterule}}}\% \\ 62.636 \end{center} \end{center}
```

62.4.8 Headings and two-side support

When using headings or myheadings modes, we have to ensure that the language and direction of heading is the same as the whole chapter/part of the document. This is implementing by setting special variable \headlanguage when starting new chapter/part.

In addition, when selecting the twoside option (default in book document class), the LR and RL modes need to be set properly for things on the heading and footing. This is done here too.

ps@headings First, we will support the standard letter class:

```
ps@myheadings62.637 \@ifclassloaded{letter}{%
     {\tt headeven} 62.638
                      \def\headodd{\protect\if@rl\beginR\fi\headtoname{}
      \mathtt{headodd}^{62.639}
                                     \ignorespaces\toname

62.4.9 Postscript Porblems

Any command that is implemented by PostScript directives, e.g commands from the ps-tricks package, needs to be fixed, because the PostScript directives are being interpeted after the document has been converted by TEXto visual Hebrew (DVI, PostScript and PDF have visual Hebrew).

```
For instance: Suppose you wrote in your document:
```

\textcolor{cyan}{some ltr text}

This would be interpeted by T_FXto something like:

[postscript:make color cyan] some LTR text[postscript:make color black]

However, with the bidirectionality support we get:

\textcolor{cyan}{\hebalef\hebbet}

Translated to:

[postscript:make color black]{bet}{alef}[postscript:make color cyan] While we want:

[postscript:make color cyan]{bet}{alef}[postscript:make color black] The following code will probably work at least with code that stays in the same line:

@textcolor

62.4.11 Bibliography and citations

\@cite Citations are produced by the macro \@cite{LABEL}{NOTE}. Both the citation \@biblabel and the note is typeset in the current direction. We have to use \@brackets \@lbibitem

macro in \@cite and \@biblabel macros. In addition, when using alpha or similar bibliography style, the \@lbibitem is used and have to be update to support bot Right-to-Left and Left-to-Right citations.

```

62.954 \vskip\belowcaptionskip}
```

62.4.12 Additional bidirectional commands

- Section headings are typeset with the default global direction.
- Text in section headings in the reverse language *do not* have to be protected for the reflection command, as in: \protect\L{Latin Text}, because \L and \R are robust now.
- Table of contents, list of figures and list of tables should be typeset with the \tableofcontents, \listoffigures and \listoftables commands respectively.
- The above tables will be typeset in the main direction (and language) in effect where the above commands are placed.
- Only 2 tables of each kind are supported: one for Right-to-Left and another for Left-to-Right directions.

How to include line to both tables? One has to use bidirectional sectioning commands as following:

- 1. Use the \bxxx version of the sectioning commands in the text instead of the \xxx version (xxx is one of: part, chapter, section, subsection, subsubsection, caption).
- 2. Syntax of the \bxxx command is $\bxxx{RL text}{LR text}$. Both arguments are typeset in proper direction by default (no need to change direction for the text inside).
- 3. The section header inside the document will be typeset in the global direction in effect at the time. i.e. The {RL text} will be typeset if Right-to-Left mode is in effect and {LR text} otherwise.

```
\bpart

```

62.5 Hebrew calendar

The original version of the package hebcal.sty⁷¹ for TEX and LATEX2.09, entitled "TEX & LATEX macros for computing Hebrew date from Gregorian one" was created by Michail Rozman, misha@iop.tartu.ew.su⁷²

```
Released: Tammuz 12, 5751–June 24, 1991
```

```
Corrected: Shebat 10, 5752—January 15, 1992 by Rama Porrat Corrected: Adar II 5, 5752—March 10, 1992 by Misha Corrected: Tebeth, 5756—January 1996 Dan Haran (haran@math.tau.ac.il)
```

The package was adjusted for babel and LATEX 2ε by Boris Lavva.

Changes to the printing routine (only) by Ron Artstein, June 1, 2003.

This package should be included *after* the babel with hebrew option, as following:

```
\documentclass[...]{...}
\usepackage[hebrew,...,other languages,...]{babel}
\usepackage{hebcal}
```

Two main user-level commands are provided by this package:

\Hebrewtoday

Computes today's Hebrew date and prints it. If we are presently in Hebrew mode, the date will be printed in Hebrew, otherwise — in English (like Shebat 10, 5752).

\Hebrewdate

Computes the Hebrew date from the given Gregorian date and prints it. If we are presently in Hebrew mode, the date will be printed in Hebrew, otherwise — in English (like Shebat 10, 5752). An example of usage is shown below:

 $^{^{71}}$ The following description of hebcal package is based on the comments included with original source by the author, Michail Rozman.

⁷²Please direct any comments, bug reports, questions, etc. about the package to this address.

The package option full sets the flag \@full@hebrew@year, which causes years from the current millenium to be printed with the thousands digit (hetav-shin-samekh-gimel). Without this option, thousands are not printed for the current millenium. NOTE: should this be a command option rather than a package option? -RA.

62.5.1 Introduction

The Hebrew calendar is inherently complicated: it is lunisolar – each year starts close to the autumn equinox, but each month must strictly start at a new moon. Thus Hebrew calendar must be harmonized simultaneously with both lunar and solar events. In addition, for reasons of the religious practice, the year cannot start on Sunday, Wednesday or Friday.

For the full description of Hebrew calendar and for the list of references see:

Nachum Dershowitz and Edward M. Reingold, "Calendarical Calculations", Software–Pract.Exper., vol. 20 (9), pp.899–928 (September 1990).

C translation of LISP programs from the above article available from Mr. Wayne Geiser, geiser%pictel@uunet.uu.net.

The 4th distribution (July 1989) of hdate/hcal (Hebrew calendar programs similar to UNIX date/cal) by Mr. Amos Shapir, amos@shum.huji.ac.il, contains short and very clear description of algorithms.

62.5.2 Registers, Commands, Formatting Macros

The command \Hebrewtoday produces today's date for Hebrew calendar. It is similar to the standard \LaTeX 2 ε command \today. In addition three numerical registers \Hebrewday, \Hebrewmonth and \Hebrewgear are set. For setting this registers without producing of date string command \Hebrewsetreg can be used.

The command $\ensuremath{\mbox{\mbox{Hebrewdate}}\{Gday\}\{Gmonth\}\{Gyear\}\ }$ produces Hebrew calendar date corresponding to Gregorian date Gday.Gmonth.Gyear. Three numerical registers $\ensuremath{\mbox{\m$

For converting arbitrary Gregorian date Gday.Gmonth.Gyear to Hebrew date Hday.Hmonth.Hyear without producing date string the command:

 $\HebrewFromGregorian\{Gday\}\{Gmonth\}\{Gyear\}\{Hday\}\{Hmonth\}\{Hyear\}\}$

```
can be used.

62.979 (*calendar)

62.980 \newif\if@full@hebrew@year

62.981 \@full@hebrew@yearfalse

62.982 \DeclareOption{full}{\@full@hebrew@yeartrue}

62.983 \ProcessOptions

62.984 \newcount\Hebrewday \newcount\Hebrewmonth \newcount\Hebrewyear
```

\Hebrewdate Hebrew calendar date corresponding to Gregorian date Gday.Gmonth.Gyear. If Hebrew (right-to-left) fonts & macros are not loaded, we have to use English format.

```
\Hebrewtoday Today's date in Hebrew calendar.
```

\Hebrewsetreg Set registers: today's date in hebrew calendar.

```
62.995 \def\Hebrewsetreg{%
62.996 \HebrewFromGregorian{\day}{\month}{\year}
62.997 {\Hebrewday}{\Hebrewmonth}{\Hebrewyear}}
```

\FormatDate Prints a Hebrew calendar date Hebrewday. Hebrewmonth. Hebrewyear.

```
62.998 \def\FormatDate#1#2#3{%
62.999 \if@rl%
62.1000 \FormatForHebrew{#1}{#2}{#3}%
62.1001 \else%
62.1002 \FormatForEnglish{#1}{#2}{#3}
62.1003 \fi}
```

To prepare another language version of Hebrew calendar commands, one should change or add commands here.

We start with Hebrew language macros.

\HebrewYearName

Prints Hebrew year as a Hebrew number. Disambiguates strings by adding lamed-pe-gimel to years of the first Jewish millenium and to years divisible by 1000. Suppresses the thousands digit in the current millenium unless the package option full is selected. NOTE: should this be provided as a command option rather than a package option? –RA.

63 Hebrew input encodings

Hebrew input encodings defined in file hebinp.dtx⁷³ should be used with inputenc \LaTeX 2 ε package. This package allows the user to specify an input encoding from this file (for example, ISO Hebrew/Latin 8859-8, IBM Hebrew codepage 862 or MS Windows Hebrew codepage 1255) by saying:

```
\usepackage[encoding name]{inputenc}
```

The encoding can also be selected in the document with:

```
\inputencoding{encoding name}
```

The only practical use of this command within a document is when using text from several documents to build up a composite work such as a volume of journal articles. Therefore this command will be used only in vertical mode.

The encodings provided by this package are:

- si960 7-bit Hebrew encoding for the range 32–127. This encoding also known as "old-code" and defined by Israeli Standard SI-960.
- 8859-8 ISO 8859-8 Hebrew/Latin encoding commonly used in UNIX systems. This encoding also known as "new-code" and includes hebrew letters in positions starting from 224.
- cp862 IBM 862 code page commonly used by DOS on IBM-compatible personal computers. This encoding also known as "pc-code" and includes hebrew letters in positions starting from 128.
- cp1255 MS Windows 1255 (hebrew) code page which is similar to 8859-8. In addition to hebrew letters, this encoding contains also hebrew vowels and dots (nikud).

Each encoding has an associated .def file, for example 8859-8.def which defines the behaviour of each input character, using the commands:

```
\DeclareInputText{slot}{text} \DeclareInputMath{slot}{math}
```

 $^{^{73}\}mathrm{The}$ files described in this section have version number v1.1b and were last revised on 2004/02/20.

This defines the input character *slot* to be the *text* material or *math* material respectively. For example, 8859-8.def defines slots "EA (letter hebalef) and "B5 (μ) by saying:

```
\DeclareInputText{224}{\hebalef}
\DeclareInputMath{181}{\mu}
```

Note that the *commands* should be robust, and should not be dependent on the output encoding. The same *slot* should not have both a text and a math declaration for it. (This restriction may be removed in future releases of inputenc).

The .def file may also define commands using the declarations:

 $\verb|\providecommand| or \verb|\ProvideTextCommandDefault|. For example, 8859-8.def defines:$

```
\ProvideTextCommandDefault{\textonequarter}{\ensuremath{\frac14}} \DeclareInputText{188}{\textonequarter}
```

The use of the 'provide' forms here will ensure that a better definition will not be over-written; their use is recommended since, in general, the best defintion depends on the fonts available.

See the documentation in inputenc.dtx for details of how to declare input definitions for various encodings.

63.1 Default definitions for characters

First, we insert a $\mbox{\mbox{\tt makeatletter}}$ at the beginning of all .def files to use @ symbol in the macros' names.

```
63.1 (-driver)\makeatletter
```

Some input characters map to internal functions which are not in either the T1 or OT1 font encoding. For this reason default definitions are provided in the encoding file: these will be used unless some other output encoding is used which supports those glyphs. In some cases this default defintion has to be simply an error message.

Note that this works reasonably well only because the encoding files for both OT1 and T1 are loaded in the standard LaTeX format.

The name \textblacksquare is derived from the AMS symbol name since Adobe seem not to want this symbol. The default definition, as a rule, makes no claim to being a good design.

```
63.16 (*cp862)
63.17 \ProvideTextCommandDefault{\textblacksquare}
63.18 {\vrule \@width .3em \@height .4em \@depth -.1em\relax}
63.19 (/cp862)
Some commands can't be faked, so we have them generate an error message.
63.20 (*8859 - 8 | cp862 | cp1255)
63.21 \ProvideTextCommandDefault{\textcent}
```

```
{\TextSymbolUnavailable\textcent}
63.22
63.23 \ProvideTextCommandDefault{\textyen}
63.24
         {\TextSymbolUnavailable\textyen}
63.25 \langle /8859 - 8 \mid cp862 \mid cp1255 \rangle
63.26 \ \langle *8859 - 8 \rangle
63.27 \ProvideTextCommandDefault{\textcurrency}
         {\TextSymbolUnavailable\textcurrency}
63.29 \ \langle /8859 - 8 \rangle
63.30 (*cp1255)
63.31 \ProvideTextCommandDefault{\newsheqel}
         {\TextSymbolUnavailable\newsheqel}
63.32
63.33 (/cp1255)
63.34 \ (*8859 - 8 \mid cp1255)
63.35 \ProvideTextCommandDefault{\textbrokenbar}
         {\TextSymbolUnavailable\textbrokenbar}
63.37 \langle /8859 - 8 \mid cp1255 \rangle
63.38 (*cp1255)
63.39 \ProvideTextCommandDefault{\textperthousand}
         {\TextSymbolUnavailable\textperthousand}
63.40
63.41 (/cp1255)
```

Characters that are supposed to be used only in math will be defined by \providecommand because \providecommand because \providecommand assumes that the font encoding for math fonts is static.

63.2 The SI-960 encoding

The SI-960 or "old-code" encoding only allows characters in the range 32–127, so we only need to provide an empty si960.def file.

63.3 The ISO 8859-8 encoding and the MS Windows cp1255 encoding

The 8859-8.def encoding file defines the characters in the ISO 8859-8 encoding. The MS Windows Hebrew character set incorporates the Hebrew letter repertoire of ISO 8859-8, and uses the same code points (starting from 224). It has also some important additions in the 128-159 and 190-224 ranges.

```

```

Finally, we reset the category code of the @ sign at the end of all .def files. 63.269 (-driver)\makeatother

64 Hebrew font encodings

Don't forget to update the docs...

64.1 THIS SECTION IS OUT OF DATE. UPDATE DOCS TO MATCH HE8 ENCODING

The file hebrew.fdd⁷⁴ contains the Local Hebrew Encoding (LHE) definition, the external font information needed to use the Hebrew 7-bit fonts (old code fonts) and hebfont package that provides Hebrew font switching commands.

Using this file as an input, lheenc.def encoding definition file, all .fd files (font definition files) and font switching package for available Hebrew fonts are generated. We chose to use 7-bit encoding as default font encoding, because:

- 1. There are many 7-bit encoded Hebrew fonts available, more then for any other encoding.
- 2. Available TeX Hebrew fonts do not include latin alphabet, and we can safely map Hebrew glyphs to the ASCII positions (0-127).

 $^{^{74}\}mathrm{The}$ files described in this section have version number v1.2c and were last revised on 2005/05/20.

Current definition of the LHE encoding supports only Hebrew letters (\heblalef-\hebtav), but not Hebrew points, such as \hebdagesh, \hebqamats, \hebpatah, \hebshindot, etc. We are working now on such addition.

64.2 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating external files:

driver produce a documentation driver file

HE8enc produce the encoding definition for CodePage 1255 (HE8)

HE8cmr make Hebrew default font in HE8
HE8cmss make Hebrew sans-serif font in HE8
HE8cmtt make Hebrew typewriter font in HE8

HE8OmegaHebrew Hebrew font from the Omega project (by ???)

HE8aharoni Hebrew sans-serif font (Culmus)
HE8david Hebrew serif font (Culmus)
HE8drugulin Hebrew old serif font (Culmus)
HE8ellinia Hebrew isans-serif font (Culmus)
HE8frankruehl Hebrew serif font (Culmus)

HE8KtavYad Hebrew handwriting font (Culmus)

HE8MiriamMono Hebrew monospaced font

HE8Nachlieli Hebrew sans-serif font (Culmus)

HE8CourierShalom Hebrew Shalom (Courier) font (by IBM)
HE8HelveticaNarkissTam Hebrew NarkisTam (Helvetica) (by Zvi Narkis)
HE8TimesNarkissim Hebrew Narkissim (Times) (by Zvi Narkis)

HE8mfdavid Hebrew David font (by ???)
HE8mffrank Hebrew Frank-Ruehl font (by ??)

HE8mffrankthick Hebrew Frank-Ruehl (thick) font (by ??) HE8mffrankthin Hebrew Frank-Ruehl (thin) font (by ??)

HE8mfmiriam Hebrew Miriam font (by ???)
HE8mfmiriamwide Hebrew Miriam (wide) font (by ???)
HE8mfnarkistam Hebrew Narkis Tam font (by ???)

LHEenc produce the encoding definition for Local Hebrew Encoding (LHE)

LHEcmr make Hebrew default font in LHE
LHEcmss make Hebrew sans-serif font in LHE
LHEcmtt make Hebrew typewriter font in LHE

LHEclas make Hebrew classic font (by Joel M. Hoffman) in LHE
LHEshold make Hebrew shalom old font (by Jonathan Brecher) in LHE
LHEshscr make Hebrew shalom script font (by Jonathan Brecher) in LHE
LHEshstk make Hebrew shalom stick font (by Jonathan Brecher) in LHE

LHEfr make Hebrew frank-ruehl font in LHE

LHEcrml make Hebrew carmel font (by Dr. Samy Zafrany) in LHE
LHEredis make Hebrew redis font (by Prof. Jacques J. Goldberg) in LHE

nowarn option for font definition files, that used

to produce "silent" font substitutions without giving warnings

hebfont create Hebrew font switching commands package

A typical docstrip command file would then have entries like:

\generateFile{lhecmr.fd}{t}{\from{hebrew.fdd}{LHEcmr,nowarn}}

64.3 The LHEencoding definition file

The Hebrew font encoding LHE is based upon the old-code encoding also known as the Israeli Standard SI-960. Many Hebrew T_FX fonts from the Hebrew University

of Jerusalem are encoded in this encoding. It only uses the lower 128 positions of the font table. As local encoding its name start with the letter 'L'.

First we define the Local Hebrew Encoding; specify a default for the font substitution process for the LHE encoding and supply a font to be used when all else fails.

Because not everyone can input Hebrew input text directly from the keyboard we need to define control sequences for all the Hebrew glyphs in the fonts. In addition, we want to support many input encodings for Hebrew and to keep the language definition file (hebrew.ldf) independent of the encoding. Therefore, we exploit the standard \LaTeX $2_{\mathcal{E}}$ font encoding mechanism to define control sequences for all the Hebrew glyphs in the fonts in encoding-specific way. The language definition file uses only the control sequences and doesn't need to check the current font or input encoding.

In the LHE encoding (7-bit encoding) all the Hebrew glyphes reside in the *lower* half of the font. Currently, only the Hebrew letters are supported. They use the same positions as the latin small letters in ASCII encoding and the position of '.

The symbol '(glyph 96) is used by Hebrew letter *Alef*, so we need to define its lccode to allow hyphenation. All other letters retain the same lccodes as their latin counterparts.

```
64.12 \(\rightarrow\)lccode \(\dagger\)- (-(
 Hebrew letters occupy the positions 96–122 in LHE encoding:

64.4.4 Hebrew classic font

Hclassic and hcaption fonts are distributed freely from CTAN sites and copyrighted by Joel M. Hoffman, of 19 Hillcrest Lane, Rye, NY 10580 USA, e-mail: 72700.402@compuserve.com.

Hclassic is a modernized Classical Hebrew font (in the same way that Knuth's cmr family is a modernized Roman font — but his fonts are much nicer). Hcaption is a slanted version of hclassic font. Both fonts contain all of the Hebrew consonants, the (rarely used) ligature alef-lamed and two versions of the letter ayin for use with and without vowels. Hclassic also contains all of the vowels found in Hebrew, a symbol for meteg, and dots for use as a dagesh and for differentiating shin and sin letters.

Currently, only the Hebrew consonants (hebalef - hebtav) from these fonts are supported by \LaTeX 2 ε , however one can use vowels and dots directly with PLAIN TEX macros. We are working on generic vowels and dots support for \LaTeX 2 ε .

64.4.5 Hebrew shalom fonts

All three shalom fonts (ShalomScript10, ShalomStick10 and ShalomOldStyle10) have been created by Jonathan Brecher, of 9 Skyview Road, Lexington, MA 02173-1112 USA, e-mail: brecher@husc.harvard.edu.

All shalom fonts have been written in POSTSCRIPT via Fontographer on a Mac. The fonts have been converted to METAFONT by Rama Porrat (e-mail: rama@cc.huji.ac.il), using the utility typo, a font editor + converter between font formats (a commercial product). ShalomScript10.mf is the METAFONT equivalent of ShalomScript.ps, ShalomStick10.mf came from ShalomStick.ps and ShalomOldStyle10.mf originated in ShalomOldStyle.ps.

The fonts differ in the letters' style. ShalomScript10 contains hand writing Hebrew letters; ShalomStick10 contains sans-serif letters, and ShalomOldStyle10 contains old style letters. All three fonts contain vowels and dots (nikud). While converting to METAFONT, letters and symbols within the fonts have been arranged so as to get a usable font for writing Hebrew documents in TeX or IATeX, with as well as without vowels.

Currently, only the Hebrew consonants (hebalef - hebtav) from these fonts are supported by LaTeX 2_{ε} , however one can use vowels and dots directly with Plain TeX macros. We are working on generic vowels and dots support for LaTeX 2_{ε} .

64.234 \langle +nowarn \rangle  {<->ssub * redis/bx/n}{}
64.235 (/LHEredis)
```

64.5 The HE8encoding definition file

The Hebrew font encoding HE8 is based upon an extention by Microsoft to the ISO-8859-8 standard. This is an 8bit encoding. The extentions include hebrew points ("Nikud").

First we define the Codepage 1255; specify a default for the font substitution process for the HE8 encoding and supply a font to be used when all else fails.

```
64.236 \*HE8enc\
64.237 \DeclareFontEncoding{HE8}{}{}
64.238 \DeclareFontSubstitution{HE8}{cmr}{m}{n}
64.239 \DeclareErrorFont{HE8}{cmr}{m}{10}
64.240 \/HE8enc\

Then we define a few commands in the HE8 encoding.

64.241 \*HE8enc\
64.242 \ProvideTextCommand{\textcopyright}{HE8}{\textcircled{\@latin{c}}}
64.243 \ProvideTextCommand{\textregistered}{HE8}{\textcircled{\scshape%}
64.244 \@latin{r}}
64.245 \ProvideTextCommand{\texttrademark}{HE8}{\textsuperscript{\@latin{TM}}}
64.246 \/HE8enc\
```

64.5.1 CHECK HERE FOR HE8 UPDATES

Because not everyone can input Hebrew input text directly from the keyboard we need to define control sequences for all the Hebrew glyphs in the fonts. In addition, we want to support many input encodings for Hebrew and to keep the language definition file (hebrew.ldf) independent of the encoding. Therefore, we exploit the standard \LaTeX font encoding mechanism to define control sequences for all the Hebrew glyphs in the fonts in encoding-specific way. The language definition file uses only the control sequences and doesn't need to check the current font or input encoding.

In the LHE encoding (7-bit encoding) all the Hebrew glyphes reside in the *lower* half of the font. Currently, only the Hebrew letters are supported. They use the same positions as the latin small letters in ASCII encoding and the position of '. Some general symbols:

```
64.247 (*HE8enc)
64.248 \ProvideTextCommand{\textcopyright}{HE8}{\textcircled{\@latin{c}}}
64.249 \ProvideTextCommand{\textregistered}{HE8}{\textcircled{\scshape%
                                                  \@latin{r}}}
64.251 \ProvideTextCommand{\texttrademark}{HE8}{\textsuperscript{\Qlatin{TM}}}}
64.252 (/HE8enc)

64.6.13 Hebrew font switching commands

The hebfont package defines a number of high-level commands (all starting with \text.. similar to the standard LATEX 2ε font-change commands, for example \textbf) that have one argument and typeset this argument in the requested

Command	Corresponds to	Font family
	\rmfamily	Jerusalem font
	\bfseries	Dead Sea font
	\itshape	Old Jaffa font
	\slshape	
	\emph	
	\sffamily	Tel-Aviv font
	\ttfamily	
	\fontfamily{crml}	Carmel fonts
	\fontfamily{fr}	Frank-Ruehl fonts
	\fontfamily{redis}	Redis fonts
	\fontfamily{redis}	Classic fonts
	\fontfamily{shold}	Shalom Old Style font
	\fontfamily{shscr}	Shalom Script font
	\fontfamily{shstk}	Shalom Stick font

Table 34: Hebrew font-change commands with arguments

The font change commands provided here all start with \text.. to emphasize that they are for use in normal text and to be easily memorable.

way. These commands are defined for all available Hebrew fonts defined above and change only font parameters but not direction.

For example, to use Hebrew Classic font family, the following sequence of commands should be included in a LATEX 2ε document:

```
\sethebrew
```

\textclas{Hebrew text printed with Classic fonts}

or to use Hebrew with Classic fonts locally:

```
\R{\textclas{Hebrew text printed with Classic fonts}}
```

We declare $AT_{FX} 2_{\mathcal{E}}$ font commands, e.g. \textim{...} for all available fonts. Table 34 shows the meanings of all these new high-level commands.

\textjm Switches to Jerusalem font which is default regular Hebrew font ("roman" family). Commands \textrm{...} and old-style {\rm ...} will produce the same result.

```

64.492 64.493

64.494

64.495

Old font command	$Font \ name$	Comment
{\jm}	Jerusalem	default regular (roman) font
{\ds}	Dead Sea	default bold font
{\oj}	Old Jaffa	default italic and slanted font
		used also to emphasize text
{\ta}	Tel-Aviv	default sans-serif and typewriter font

Table 35: Hebrew old font-change commands for compatibility mode

```
 64.520 & \ensuremath{\shape} & \ensuremat
```

65 Hebrew in LaTeX 2.09 compatibility mode

\documentstyle command in the preamble of LATEX document indicates that it is a LATEX 2.09 document, and should be processed in *compatibility mode*. In such documents, one of the following three Hebrew style options can be included:

- 1. hebrew_newcode indicates that document will use UNIX ISO 8859-8 or Windows cp1255 input encoding, i.e. *Alef* letter will be represented as 224.
- 2. hebrew_p indicates that document is encoded with IBM PC cp862 encoding, i.e. *Alef* letter will be represented as 128.
- 3. hebrew_oldcode indicates that document uses old 7-bit encoding, as defined in Israeli Standard 960, i.e. *Alef* is character number 96.

Note, that other hebrew-related styles, such as hebcal can be included *after* the abovenamed Hebrew style option, for example:

```
\documentstyle[12pt,hebrew_p,hebcal]{report}.
```

Any Hebrew document which compiled under LaTeX 2.09 should compile under compatibility mode, unless it uses low-level commands such as \tenm.

65.1 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating the external files:

```
newcode produce hebrew_newcode.sty
pccode produce hebrew_p.sty
oldcode produce hebrew_oldcode.sty
```

65.2 Obsolete style files

For each of the Hebrew LATEX 2.09 Hebrew styles, we produce a file which uses correct input encoding and calls babel with Hebrew and English language options. This means that any styles which say \input hebrew_newcode.sty or \documentstyle[...hebrew_newcode...] {...} should still work.

```
65.1 \*newcode | pccode | oldcode\
65.2 \NeedsTeXFormat{LaTeX2e}
65.3 \/newcode | pccode | oldcode\
```

```
65.4 \( \shear \) \( \shear \)
```

66 The Bahasa Indonesian language

The file bahasa.dtx⁷⁵ defines all the language definition macros for the Bahasa Indonesia / Bahasa Melayu language. Bahasa just means 'language' in Bahasa Indonesia / Bahasa Melayu. Since both national versions of the language use the same writing, although differing in pronounciation, this file can be used for both languages.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
66.1 (*code)
66.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, bahasa could be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@bahasa to see whether we have to do something here.

For both Bahasa Indonesia and Bahasa Malaysia the same set of hyphenation patterns can be used which are available in the file inhyph.tex. However it could be loaded using any of the possible Babel options for the Indonesian and Malaysian languase. So first we try to find out whether this is the case.

```
66.3 \ifx\l@bahasa\@undefined
       \ifx\l@bahasai\@undefined
66.4
         \ifx\l@indon\@undefined
66.5
66.6
            \ifx\l@indonesian\@undefined
              \ifx\l@bahasam\@undefined
 66.7
                \ifx\l@malay\@undefined
 66.8
 66.9
                  \ifx\l@meyalu\@undefined
66.10
                     \@nopatterns{Bahasa Indonesia}
66.11
                     \adddialect\l@bahasa0\relax
66.12
                  \else
66.13
                     \let\l@bahasa\l@meyalu
66.14
                  \fi
66.15
                \else
66.16
                  \let\l@bahasa\l@malay
                \fi
66.17
66.18
              \else
66.19
                \let\l@bahasa\l@bahasam
              \fi
66.20
66.21
            \else
              \let\l@bahasa\l@indonesian
66.22
           \fi
66.23
66.24
         \else
66.25
            \let\l@bahasa\l@indon

      \def\partname{Bagian}%
66.50 % Subject: Subyek
66.51 % From: Dari
66.52
      \def\enclname{Lampiran}%
66.53
      \def\ccname{cc}%
66.54
      \def\headtoname{Kepada}%
      \def\pagename{Halaman}%
66.55
66.56 % Notes (Endnotes): Catatan
      \def\seename{lihat}%
66.57
      \def\alsoname{lihat juga}%
66.58
66.59
      \def\proofname{Bukti}%
66.60
      \def\glossaryname{Daftar Istilah}%
66.61
```

\datebahasa Th

The macro \datebahasa redefines the command \today to produce Bahasa Indonesian dates.

```
66.62 \@namedef{date\CurrentOption}{%
66.63 \def\today{\number\day^\ifcase\month\or
66.64 Januari\or Pebruari\or Maret\or April\or Mei\or Juni\or
66.65 Juli\or Agustus\or September\or Oktober\or Nopember\or Desember\fi
66.66 \space \number\year}}
```

\extrasbahasa \noextrasbahasa

The macro \extrasbahasa will perform all the extra definitions needed for the Bahasa language. The macro \extrasbahasa is used to cancel the actions of \extrasbahasa. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
66.67 \Qnamedef{extras\CurrentOption}{} 66.68 \Qnamedef{noextras\CurrentOption}{}
```

\bahasahyphenmins

The bahasa hyphenation patterns should be used with \lefthyphenmin set to 2 and \righthyphenmin set to 2.

66.69 \providehyphenmins{\CurrentOption}{\tw@\tw@}

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
66.70 \ldf@finish{\CurrentOption} 66.71 \langle / code \rangle
```

67 The Bahasa Malaysia language

The file bahasam.dtx⁷⁶ defines all the language definition macros for the Bahasa Malaysia language. Bahasa just means 'language' in Bahasa Malaysia. A number of terms differ from those used in bahasa indonesia.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
67.1 (*code)
67.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, bahasa could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lobahasa to see whether we have to do something here.

For both Bahasa Malaysia and Bahasa Indonesia the same set of hyphenation patterns can be used which are available in the file inhyph.tex. However it could be loaded using any of the possible Babel options for the Malaysian and Indonesian languase. So first we try to find out whether this is the case.

```

67.30 \fi
```

Now that we are sure the \longlequalay has some valid definition we need to make sure that a name to access the hyphenation patterns, corresponding to the option used, is available.

```
67.31 \expandafter\expandafter\let
67.32 \expandafter\csname
67.33 \expandafter l\expandafter @\CurrentOption\endcsname
67.34 \l@malay
```

The next step consists of defining commands to switch to (and from) the Bahasa language.

\captionsbahasam

The macro \captionsbahasam defines all strings used in the four standard document classes provided with LATEX.

 $^{^{76}}$ The file described in this section has version number v1.0j and was last revised on 2005/11/23.

```
67.35 \@namedef{captions\CurrentOption}{%
      \def\prefacename{Pendahuluan}%
67.36
      \def\refname{Pustaka}%
67.37
      \def\abstractname{Ringkasan}% (sometime it's called 'intisari'
67.38
67.39
                                      or 'ikhtisar')
67.40
      \def\bibname{Bibliografi}%
67.41
      \def\chaptername{Bab}%
67.42
      \def\appendixname{Lampiran}%
67.43
      \def\contentsname{Kandungan}%
67.44
      \def\listfigurename{Senarai Gambar}%
      \def\listtablename{Senarai Jadual}%
67.45
67.46
      \def\indexname{Indeks}%
67.47
      \def\figurename{Gambar}%
      \def\tablename{Jadual}%
67.48
      \def\partname{Bahagian}%
67.49
67.50 % Subject: Subyek
67.51 % From: Dari
      \def\enclname{Lampiran}%
67.52
      \def\ccname{cc}%
67.53
      \def\headtoname{Kepada}%
67.54
      \def\pagename{Halaman}%
67.55
67.56 % Notes (Endnotes): Catatan
67.57
      \def\seename{lihat}%
67.58
      \def\alsoname{lihat juga}%
      \def\proofname{Bukti}%
67.59
67.60
      \def\glossaryname{Istilah}%
67.61
```

\datebahasam The macro \datebahasam redefines the command \today to produce Bahasa Malaysian dates.

```
67.62 \@namedef{date\CurrentOption}{%
67.63 \def\today{\number\day^\ifcase\month\or
67.64 Januari\or Pebruari\or Mac\or April\or Mei\or Jun\or
67.65 Julai\or Ogos\or September\or Oktober\or November\or Disember\fi
67.66 \space \number\year}}
```

\extrasbahasam \noextrasbahasam

The macro \extrasbahasa will perform all the extra definitions needed for the Bahasa language. The macro \extrasbahasa is used to cancel the actions of \extrasbahasa. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
67.67 \@namedef{extras\CurrentOption}{} 67.68 \@namedef{noextras\CurrentOption}{}
```

\bahasamhyphenmins

The bahasam hyphenation patterns should be used with \lefthyphenmin set to 2 and \righthyphenmin set to 2.

 $67.69 \verb|\providehyphenmins{\CurrentOption}{\tw@} tw@$

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
67.70 \ldf@finish{\CurrentOption} 67.71 \langle /code \rangle
```

68 Not renaming hyphen.tex

As Don Knuth has declared that the filename hyphen.tex may only be used to designate his version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T_FX-format. When asked he responded:

That file name is "sacred", and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file locally phen.tex or whatever they like, but they mustn't diddle with hyphen.tex (or plain.tex except to preload additional fonts).

The files bplain.tex and blplain.tex can be used as replacement wrappers around plain.tex and lplain.tex to acheive the desired effect, based on the babel package. If you load each of them with iniTeX, you will get a file called either bplain.fmt or blplain.fmt, which you can use as replacements for plain.fmt and lplain.fmt.

As these files are going to be read as the first thing iniTEX sees, we need to set some category codes just to be able to change the definition of \input

```
68.1\ \langle *bplain \mid blplain \rangle 68.2\ \langle -4 \mid \% \mid -4 \mid \% \mid
```

Now let's see if a file called hyphen.cfg can be found somewhere on TeX's input path by trying to open it for reading...

```
68.5 \openin O hyphen.cfg
```

If the file wasn't found the following test turns out true.

```
68.6 \ifeof0
68.7 \else
```

When hyphen.cfg could be opened we make sure that it will be read instead of the file hyphen.tex which should (according to Don Knuth's ruling) contain the american English hyphenation patterns and nothing else.

We do this by first saving the original meaning of \input (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
68.8 \let\a\input
```

Then \input is defined to forget about its argument and load hyphen.cfg instead.

```
68.9 \def\input #1 {%
68.10 \let\input\a
68.11 \a hyphen.cfg
```

Once that's done the original meaning of \input can be restored and the definition of \a can be forgotten.

```
68.12 \let\a\undefined 68.13 } 68.14 \fi
68.15 \langle /bplain \mid blplain \rangle
```

Now that we have made sure that hyphen.cfg will be loaded at the right moment it is time to load plain.tex.

```
68.16 \langle bplain \rangle \ a plain.tex
68.17 \langle blplain \rangle \ a plain.tex
```

Finally we change the contents of \fmtname to indicate that this is *not* the plain format, but a format based on plain with the babel package preloaded.

```
68.18 \langle bplain \rangle \\ def fmtname{babel-plain} \\ 68.19 \langle blplain \rangle \\ def fmtname{babel-lplain}
```

When you are using a different format, based on plain.tex you can make a copy of blplain.tex, rename it and replace plain.tex with the name of your format file.

69 Support for formats based on PlainTeX

The following code duplicates or emulates parts of IATEX 2_{ε} that are needed for babel.

```
69.1 (*code)
69.2 \ifx\adddialect\@undefined
```

When \adddialect is still undefined we are making a format. In that case only the first part of this file is needed.

```
69.3 \def\@empty{}
```

We need to define \loadlocalcfg for plain users as the LATEX definition uses \InputIfFileExists.

```
\def\loadlocalcfg#1{%
69.5
       \openin0#1.cfg
69.6
       \ifeof0
69.7
         \closein0
69.8
       \else
69.9
         \closein0
         69.10
69.11
          \immediate\write16{* Local config file #1.cfg used}%
69.12
          \immediate\write16{*}%
69.13
          }
         \input #1.cfg\relax
69.14
69.15
 We have to execute \@endofldf in this case
       \@endofldf
69.16
69.17
```

We want to add a message to the message LATEX 2.09 puts in the \everyjob register. This could be done by the following code:

```
\let\orgeveryjob\everyjob
\def\everyjob#1{%
  \orgeveryjob\#1}%
  \orgeveryjob\expandafter{\the\orgeveryjob\immediate\write16{%
      hyphenation patterns for \the\loaded@patterns loaded.}}%
  \let\everyjob\orgeveryjob\let\orgeveryjob\@undefined}
```

The code above redefines the control sequence \everyjob in order to be able to add something to the current contents of the register. This is necessary because the processing of hyphenation patterns happens long before LATEX fills the register. There are some problems with this approach though.

- When someone wants to use several hyphenation patterns with SLTEX the above scheme won't work. The reason is that SLTEX overwrites the contents of the \everyjob register with its own message.
- Plain TeX does not use the **\everyjob** register so the message would not be displayed.

To circumvent this a 'dirty trick' can be used. As this code is only processed when creating a new format file there is one command that is sure to be used, \dump. Therefore the original \dump is saved in \org@dump and a new definition is supplied.

```
69.18 \let\orig@dump=\dump
69.19 \def\dump{%
```

To make sure that LATEX 2.09 executes the \@begindocumenthook we would want to alter \begin{document}, but as this done too often already, we add the new code at the front of \@preamblecmds. But we can only do that after it has been defined, so we add this piece of code to \dump.

```
\ifx\@ztryfc\@undefined
69.21
         \else
69.22
           \toks0=\expandafter{\@preamblecmds}
           \edef\@preamblecmds{\noexpand\@begindocumenthook\the\toks0}
69.23
69.24
           \def\@begindocumenthook{}
69.25
 This new definition starts by adding an instruction to write a message on the
 terminal and in the transcript file to inform the user of the preloaded hyphenation
 patterns.
69.26
         \everyjob\expandafter{\the\everyjob%
           \immediate\write16{\the\toks8 loaded.}}%
69.27
 Then everything is restored to the old situation and the format is dumped.
         \let\dump\orig@dump\let\orig@dump\@undefined\dump}
69.29
       \expandafter\endinput
69.30 \fi
 The rest of this file is not processed by iniT<sub>F</sub>X but during the normal document
 run. A number of LATEX macro's that are needed later on.

The following little macro \in@ is taken from latex.ltx; it checks whether its first argument is part of its second argument. It uses the boolean \in@; allocating a new boolean inside conditionally executed code is not possible, hence the construct with the temporary definition of \bbl@tempa.

```
69.135 \def\bbl@tmpa{\csname newif\endcsname\ifin@}
69.136 \ifx\in@\@undefined
69.137 \def\in@#1#2{%
69.138 \def\in@@##1#1##2##3\in@@{%
69.139 \ifx\in@##2\in@false\else\in@true\fi}%
69.140 \in@@#2#1\in@\in@@}
69.141 \else
69.141 \else
69.142 \let\bbl@tmpa\@empty
69.143 \fi
69.144 \bbl@tmpa
```

LATEX has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain TeX we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```
69.145 \ensuremath{\mbox{\sc Ge}}\ensuremath{\mbox{\sc Ge}}\ensuremath{\mbox{\sc H}}\ensuremath{\mbox{\sc H}}\ensuremat
```

The IATEX macro \@ifl@aded checks whether a file was loaded. This functionality is not needed for plain TeX but we need the macro to be defined as a no-op.

```
69.147 \end{center} 147 \end{center} 3#4{}
```

For the following code we need to make sure that the commands $\ensuremath{\texttt{Newcommand}}$ and $\ensuremath{\texttt{Newcommand}}$ exist with some sensible definition. They are not fully equivalent to their IATEX $2_{\mathcal{E}}$ versions; just enough to make things work in plain TeXenvironments.

```
69.148 \ifx\@tempcnta\@undefined
69.149 \csname newcount\endcsname\@tempcnta\relax
69.150 \fi
69.151 \ifx\@tempcntb\@undefined
69.152 \csname newcount\endcsname\@tempcntb\relax
69.153 \fi
```

To prevent wasting two counters in LATEX 2.09 (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (\cutout10).

Change History

albanian-1.0a General: Started first version of the file
babel-1.5b
General: Added support for canadien and acadian
babel 2.0a
General: Added text about german.sty
babel 2.0b
General: Changed order of code to prevent plain TEXfrom seeing all of it babel 2.1
General: Modified user interface, \langTeX no longer necessary
babel 2.1a
General: Incorporated Nico's comments
babel 2.1b
General: rename \language to \current@language
babel 2.1c
General: abstract for report fixed, missing }, found by Nicolas Brouard
babel 2.1d
General: Missing right brace in definition of abstract environment, found by
Werenfried Spit
General: Incorporated more comments from Nico
babel 2.2
General: Renamed \newlanguage to \addlanguage
babel 2.2a
General: Modified the documentation somewhat
babel 3.0
General: Moved part of the code to hyphen.doc in preparation for $T_E X 3.0 \ldots 1$
babel 3.0a General: Updated comments in various places
\iflanguage: Added \Obsphack and \Oesphack
\selectlanguage: Added \@bsphack and \@esphack
Replaced \gdef with \def
babel 3.0b
General: Removed some problems in change log
babel 3.0c
General: Renamed babel.sty and latexhax.sty to .com
\iflanguage: Added comment character after #2
babel 3.0d
\@noopterr: Added a percent sign to remove unwanted white space 26
General: Removed use of \@ifundefined
\doc@style: Removed use of \@ifundefined 49
\iflanguage: Removed space hacks and use of \@ifundefined 19
Removed superfluous \expandafter 19
\process@language: Added the collection of pattern names
Reinserted \expandafter 27 Removed superfluous \expandafter 27
Removed superfluous \expandafter
Removed superfluous \expandafter
babel 3.1
General: Added the support for active characters and for extending a macro
Removed definition of \if@restonecol 49
Removed the need for latexhax
\addto: Added macro
\readconfigfile: Removed the extra if control sequence 29
Removed use of \toks0
\selectlanguage: \originalTeX should only be executed once
General: Some Changes by br
\adddialect: Added \relax

\addlanguage: Added a %, removed by	19
\babel@beginsave: Added macro	42
\babel@save: Added macro	42
\babel@savecnt: Added macro	42
\babel@savevariable: Added macro	42
\bbl@add@special: Added macro	30
\bbl@remove@special: Added macro	30
\iflanguage: Rephrased \ifnum test	19
\selectlanguage: Modified to allow arguments that start with an escape character	20
babel 3.2a	1
General: Fixups of the code and documentation	$\frac{1}{26}$
\originalTeX: Set \originalTeX to \empty, because it should be expandable. \readconfigfile: Free macro space for \process@language	$\frac{20}{30}$
\selectlanguage: Added \relax as first command to stop an expansion if	30
\protect is empty retax as mist command to stop an expansion in	21
Added three \expandafters to save macro space for \originalTeX	22
Moved definition of \originalTeX before $\ensuremath{\texttt{Vextras}} \langle lang \rangle$	$\frac{-2}{22}$
Set \originalTeX to \empty, because it should be expandable	$\frac{-}{22}$
Simplified the modification to allow the use in a \write command	20
babel 3.2b	
\allowhyphens: Moved macro from language definition files	43 43
\save@sf@q: Moved macro from language definition files \set@low@box: Moved macro from language definition files	43
babel 3.2c	45
$\verb \babel@save: missing backslash led to errors when executing \verb \originalTeX $	42
babel 3.2d	
\babel@save: saving in \babel@i and restoring from \@babel@i doesn't work very well	42
babel 3.2e	
General: Added slovak	61
babel 3.3	
General: \headpagename should be \pagename	52
Added catalan and galician	61
Added turkish	
Included driver file, and prepared for distribution	1
babel 3.4	01
General: Added bahasa	
Added language definition file for bahasa	
Updated for \LaTeX 2ε	
\addto: Changed to use toks registerbabel 3.4b	45
General: Added a small driver to be able to process just this file	1
Use the ltxdoc class instead of article	
babel 3.4c	-
General: lhyphen.cfg has become lthyphen.cfg	13
babel 3.4e	
\@nolanerr: Use \PackageError in IATEX 2_{ε} mode	26
\@nopatterns: Macro added	26
\process@language: Added code to detect assignments to left- and righthyphenmin in the patternfile.	28
\ProvidesLanguage: Redid the identification code, provided dummy definition of	20
\ProvidesFile for plain TFX	12
babel 3.4g	
\@testdef: Moved the \def inside the macrocode environment	54
babel 3.5a	
\@noopterr: Added \@activated to log active characters	26
General: Added a system shorthand for the right quote	39
Added breton, irish, scottish	61
Changed extension of language definition files to ldf	13
Provided common code to handle the active double quote	1
Replaced 16 system shorthands to deal with hex numbers by one	39

\bbl@activate: Added macro	36
\bbl@deactivate: Added macro	
·	
\bbl@main@language: Macro added	
\bbl@pr@m@s: Added macro	39
\bbl@set@language: write the language change to the auxiliary files	21
\initiate@active@char: Added a check for right quote and adapt \pr@m@s if	
necessary	32
Added macro	31
\main@language: Macro added	25
babel 3.5b	
General: Added brazilian as alternative for brazil	14
Added Isorbian, usorbian	61
Added the estonian option	14
lthyphen.cfg has become hyphen.cfg	13
	31
\initiate@active@char: Renamed macro	
\pageref: Made \ref and \pageref robust (PR1353)	54
\process@language: Added optional reading of file with hyphenation exceptions	
\process@line: added macro	27
\process@synonym: added macro	27
\readconfigfile: Now add a \space and a / character	29
\selectlanguage: Added an extra level of expansion to separate the switching	
mechanism from writing to aux files	20
Addedd default setting of hyphenmin parameters	22
Changed the name of the internal macro to \selectlanguage	20
Separated the setting of the hyphenmin values	22
Store the name of the current language in a control sequence instead of passing	
the whole macro construct to strip the escape character in the argument of	
\selectlanguage	
babel 3.5c	20
	26
\Conopterr: Added missing closing brace	
General: Changed the order of including the language files somewhat (PR1652)	61
corrected a few typos (PR1652)	
Repaired a typo (itlaic, PR1652)	44
babel 3.5d	
General: Added british as an alternative for english with a preference for british	
hyphenation	
Added options to influence behaviour of active acute and grave accents	
Load french.ldf when it is found instead of frenchb.ldf	
Load language definition files $after$ the check for the hyphenation patterns .	13
Merged glyphs.dtx into this file	. 1
\active@prefix: \@protected@cmd has vanished from ltoutenc.dtx	35
\declare@shorthand: Make a 'note' when a shorthand with an argument is de-	
fined.	36
\foreignlanguage: Macro added	23
\initiate@active@char: Skip the language-level active char with argument if no	
shorthands with arguments were defined	34
Skip the user-level active char with argument if no shorthands with arguments	94
	24
were defined	34
\loadlocalcfg: Added macro	59
\pageref: use a different control sequence while making \ref and \pageref ro-	٠,
bust	54
otherlanguage: environment added	22
babel 3.5e	
otherlanguage: changed name	22
babel 3.5f	
\Obibitem: Now use \bbl@redefine	56
\@citex: Now use \bbl@redefine	55
\@testdef: Complete rewrite of this macro as the same character ended up with	
different category codes in the labels that are being compared. Now use	
\meaning	54
Now use \bbl@redefine	
Use \strip@prefix only on \bbl@tempa when it is not \relax	54

	General: Added a system shorthand for the left quote	
	Added the greek option	14
	No need to reset the category code of the tilde as \initiate@active@char now	
	correctly deals with active characters	39
	Now use the file frenchb.ldf from Daniel Flipo for french support	14
	repaired a typo	1
	replaced \tmp, \bbl@tmp and \bbl@temp with \bbl@tempa	1
	\aliasshorthand: New command	37
	\bbl@disc: Macro moved from language definition files	
	\bbl@redefine: Macro added	53
	\bbl@redefinerobust: Define *foo instead of \foo	
	Macro added	
	\bbl@set@language: Now also define \languagename at this level	
	\bblQtestQtoken: macro added	
	\bibcite: Now use \bbl@redefine	
	\DJ: New definition of \dj, see PR 2058	
	\frq: corrected spelling of \quilsingl	
	now use \textormath in these definitions	
	\frqq: corrected spelling of \quillemot	
	now use \textormath in these definitions	
		47
	\initiate@active@char: Deal correctly with already active characters, provide	
	top level expansion and define all lower level expansion macros outside of the	20
	\else branch.	
	restore the \lccode of the tie	
	Restore the category code of a shorthand char at end of package	33
	store the \lccode of the tie before changing it	
	use \peek@token to check whether it is safe to proceed 34,	
	\lower@umlaut: Added a \allowhyphens	
	removed \allowhyphens	
	\newlabel: Now use \bbl@redefine	
	\nocite: Now use \bbl@redefine	
	\pageref: Now use \bbl@redefinerobust	
	redefine *ref if it exists instead of \ref	54
	redefine \setref instead of \ref and \pageref in LATEX $2_{\mathcal{E}}$	
	Reverse the previous change as it inhibits the use of active characters in labels	54
	\peek@token: macro added	31
	\process@language: Use \empty instead of \@empty as the latter is unknown in	
	plain	28
	\ProvidesLanguage: Need to temporarily change the definition of \ProvidesFile	
	for December 1995 release	12
	Store version in \fileversion	12
	\readconfigfile: Moved the fiddling with \dump to bbplain.dtx as it is no	
	longer needed for LATEX	30
	\selectlanguage: Added a missing percent character	20
	Moved check for escape character one level down in the expansion	20
	otherlanguage*: environment added	22
hal	pel 3.5g	
Dai	General: Added definition of \Babel	61
	Added greek	61
	Added option afrikaans	
	Removed the use of \patterns@loaded altogether	
	replaced \undefined with \@undefined to be consistent with IATEX	1
	\ifthenelse: Redefinition of \ifthenelse added to circumvent problems with	~
	\pageref in the argument of \isodd	57
	\initiate@active@char: Top level expansion of \normal@char char where char	
	is already active, should be the expansion of the active character, not the	
	active character itself as this causes an endless loop	
	\nfss@catcodes: Need to add the double quote and acute characters to \nfss@catc	
	to prevent problems when reading in .fd files	
	\process@line: Simplified code, removing \bbl@eq@	
	$\verb \ProvidesLanguage: Save a few csnames; use \verb \bblQtempa instead of \verb \ProvidesFil $	е
	and store message in \toks8	12

babel 3.6a	
\@@vpageref: Redefinition of \@@vpageref added to circumvent problems with	
active: in the argument of \vref when varioref is used	58
General: Added welsh	61
Removed \babel@core@loaded, no longer needed with the advent of \LdfInit	17
\ldf@finish: Macro added	25
\ldf@quit: Macro added	25
\LdfInit: Macro added	24
\main@language: \main@language now also sets \languagename and \l@languager	name
for use by other packages in the preamble of a document	25
\selectlanguage: Check for the existence of \date instead of \l0	21
babel 3.6b	
\addto: Also check if control sequence expands to \relax	43
babel 3.6c	
General: When \LdfInit is undefined we need to load babel.def from babel.sty	13
\bbl@main@language: When hyphen.cfg is not loaded in the format \l@english	
might not be defined; assume english is language 0	25
babel 3.6d	
\foreign@language: Added \relax to prevent disappearance of the first token	
after this command.	23
New macro	23
set the language shorthands to 'none' before switching on the extras	23
\foreignlanguage: Introduced \foreign@language	23
\selectlanguage: set the language shorthands to 'none' before switching on the	
extras	22
otherlanguage*: Introduced \foreign@language	22
babel 3.6e	
General: Added option frenchb an alias for français	14
Added options UKenglish and USenglish	15
babel 3.6f	
General: Added option KeepShorthandsActive	15
\bbl@redefine@long: Macro added	53
\ifthenelse: \ifthenelse needs to be long	57
\initiate@active@char: Made restoring of the category code of shorthand char-	
acters optional	33
babel 3.6h	
\readconfigfile: Added a couple of \expandafters to copy the contents of	
\toks8 into \everyjob instead of the reference	30
babel 3.6i	
lem:lem:lem:lem:lem:lem:lem:lem:lem:lem:	53
\Otestdef: \OsafeCactivesfalse is now part of the label definition	54
Make sure that shorthands don't get expanded at the wrong moment	54
General: Added basque	61
Added default option	15
Added the Basque option	14
Added the ukrainian option	15
Added the possibility to have a bblopts.cfg file with option declarations	15
\bbl@afterfi: Made \bbl@afterelse and \bbl@afterfi \long	31
\bbl@test@token: renamed \bbl@token to \bbl@test@token to prevent a clash	
with ArabTeX	31
\declare@shorthand: Make it possible to distinguish the constructed control se-	
quences for the case with argument	36
\ifthenelse: Now reset the @safe@actives switch inside the 2nd and 3rd argu-	
ments of \ifthenelse	
\initiate@active@char: Make shorthands active during .aux file processing .	33
Remove the use of \peek@token again	
Remove the use of \peek@token again and make the \active@arg com-	
mands \long	
\latinencoding: Macro added, moved from .ldf files	
\latintext: Macro added, moved from .ldf files	
\markboth Added redefinition of \mark commands	56

\peek@token: Renamed \test@token to \bbl@test@token to prevent a clash with	0.1
ArabT _E X	31
\system@group: Have a user group called 'user' by default	37
\textlatin: Macro added, moved from .ldf filesbabel 3.6k	17
\latinencoding: Use T1 encoding when it is a known encoding	17
babel 3.6l	11
General: Don't load babel.def now, but rather define \LdfInit temporarily in	
order to load babel.def at the right time, preventing problems with the	
temporary definition of \bbl@redefine	12
babel 3.6m	10
\latinencoding: Can't use \@ifpackageloaded need to parse \@filelist	17
babel 3.6n	11
\latinencoding: Added a check for 'manual' selection of T1 encoding, without	
loading fontenc	17
moved checking for fontenc right to the top of babel.sty	
babel 3.60	17
General: Moved the rest of the font encoding related definitions to their original	17
place	17
babel 3.6p	1 5
General: Added the ngerman and naustrian options	15
babel 3.6q	1.77
\latinencoding: Better solution then parsing \@filelist, use \@ifl@aded	17
babel 3.6r	
General: We do need to load babel.def right now as \ProvidesLanguage needs	
to be defined before the .ldf files are read and the reason for for 3.6l has	10
been removed	13
babel 3.6s	
\bibcite: Need to determine 'online' which definition of \bibcite is needed .	55
babel 3.6u	
\latinencoding: Moved this code to babel.def	17
babel 3.6v	
\bbl@bibcite: Macro \bbl@bibcite added	55
\bbl@cite@choice: Macro \bbl@cite@choice added	55
\bibcite: Also check for cite it can't handle \@safe@activesfalse in its second	
argument	55
babel 3.7a	
\@newl@bel: Call \@safe@activestrue directly	53
\@testdef: Removed \@safe@activesfalse from the label definition	54
General: Added icelandic	61
Added the hebrew option	14
Added the icelandic option	14
Added the polutonikogreek option	14
No longer define the control sequence \KeepShorthandsActive	15
Now need packages t1enc and supertabular to be loaded; the documentation	
for icelandic needs its .ldf file to be present	60
\allowhyphens: Make \allowhyphens a no-op for T1 fontencoding	43
\bbl@switch@sh: Added command	38
\foreignlanguage: Added executing \originalTeX	23
\grq: Make the definition of \grq dependent on the font encoding	46
\grqq: Make the definition of \grqq dependent on the font encoding	46
\iflamguage: Now evaluate the \ifnum test $after$ the \fi from the \ifx test and	
	19
\initiate@active@char: Commented out peek@token and \test@token as short-	
hands are made expandable again	31
Use \@ifpackagewith to determine whether shorthand characters need to re-	
main active	33
\LaTeX: Make TeX and LaTeX logos encoding-independent	57
\process@language: Read pattern files in a group	28
\ProvidesLanguage: Added macro to prevent problems with unexpected \Provides	sFil
1	12
Removed superfluous braces	13

\shorthandoff: Added command	
babel 3.7b	
General: Added Latin	
Added the latin option	
\iflanguage: Slight enhancement: added braces around first argument of	
\bbl@afterfibabel 3.7c	. 19
General: Added an error message for when no language option was specified	16
Added hebrew and serbian	
Added support for language attributes	40
Added ukrainian	
define \adddialect before loading plain.def here	
No longer us a redefinition of an internal macro, just check \bbl@main@languag	
and load babel.def	
Removed redefinition of \@roman and \@Roman	
set the correct language attribute for polutoniko greek	
\initiate@active@char: Only execute \initiate@active@char for each charac	
ter	
\markboth: Avoid expanding the arguments by storing them in token registers	56
Removed the use of \head@lang (PR 2990)	
\process@language: Added the execution of the contents of \toks@	
Also store \languagename for possible later use in \process@synonym	
need to set hyphenmin values globally	
Only set hyphenmin values when the pattern file changed them	
Set \lefthyphenmin to \mone inside the group; explicitly set the hyphenmin	
parameters for language 0	
\process@line: added an extra argument in order to prevent a trailing space	
from becoming part of the control sequence when defining a synonym (PI	
2851)	
\process@synonym: Now also store hyphenmin parameters for language syn	
onyms	
Use a token register to temporarily store a command to set hyphenmin param	
eters for the synonym which is defined <i>before</i> the first pattern file is processe	a 21
babel 3.7d	
General: Fixed a few typos in \changes entries which made typesetting the cod	
impossible	
\initiate@active@char: Make sure the active character doesn't get expanded	
more then once by the $\ensuremath{\texttt{\ def}}$ by adding $\ensuremath{\texttt{\ def}}$ by adding $\ensuremath{\texttt{\ def}}$	-
1.1.1.0.7	. 32
babel 3.7e	01
General: Added missing hebrew files	
\bbl@clear@ttribs: When \bbl@attributes is undefined this should be a no-o	
\initiate@active@char: pass the argument on with braces in order to preven	
it from breaking up	
previous change was rubbish; use \let instead of \edef	
hyphenrules: Added environment hyphenrules	23
babel 3.7f	
General: Added bulgarian	
Added samin	
Added the bulgarian option	
Added the samin option	
\bbl@get@enc: Added macro	
\bbl@ifattributeset: macro added	
\bbl@prim@s: Need to redefine \prim@s as well as plain TeX's definition use	
\next	
\bbl@set@language: Macro \bbl@set@language introduced	
\ifthenelse: \pageref needs to have its babel definition reinstated in the second	
and third arguments	
\initiate@active@char: Added an extra shorthand combination on user level to	
catch an interfering \protect	
Insert a check for math mode in the definition of \normal@char?	. 32

Introduced an extra level of expansion in the definition of an active caret Make an exception for the active caret which needs an extra level of expansion	
remove the braces again	34
The redefinition needs to take place on level higher, \prim@s needs to be redefined	32
\process@language: Allow for the encoding to be used as part of the language	
name	27
\providehyphenmins: added macro	24
\save@sf@q: PR3119, don't start a paragraph in a local group	43
\selectlanguage: Use \aftergroup to keep the language grouping correct in	20
auxiliary files PR3091	20
\@citex: The shorthands need to be deactivated for the second argument of	55
\@citex only. General: Added option acadian	55 13
Added option canadian	14
Added option canadien	14
\initiate@active@char: use \textormath to get rid of the \fi (PR 3266)	32
babel 3.7h	
General: Added a number of missing comment characters which caused spurious	
white space	. 1
babel 3.7j	
General: only load frenchb.ldf	14
\bbl@pop@language: Introduce the language stack mechanism	20
Now use the language stack mechanism	21
\FOREIGNLANGUAGE: Define \FOREIGNLANGUAGE unconditionally \\\substitutefontfamily: create file with lowercase name \\\\.	59 16
· · · · · · · · · · · · · · · · · · ·	
otherlanguage: rely on \selectlanguage to keep track of the nesting	22
\useshorthands: The change from 11/112001 was incomplete	37
When T _E X has seen a character its category code is fixed; need to use a 'stand-	
in' for the call of \bbl@activate	37
babel 3.7k	
\textlatin: Use \DeclareTextFontComand	17
babel 3.7m	0.0
Consol Add the intelligence antique	26
General: Added the interlingua option	14
\bbrapoparanguage. Removed the superintous empty deminition of \bbrapoparangu	_
\bbl@restore@actives: New macro added	36
\markboth: added \bbl@restore@actives to the mark	56
\selectlanguage: Check for the existence of both \l0 and \date	
babel 3.7o	
\active@prefix: Added handling of the situation where \protect is set to \@unexpandable@protect	35
\ldf@finish: Also restore the category code of the equals sign	$\frac{25}{25}$
\ldf@quit: Also restore the category code of the equals sign	25
\LdfInit: make sure the equals sign has its default category code	24
\vrefpagenum: Added redefinition of \vrefpagenum which deals with ranges of	
pages	58
babel 3.8a	
General: Added interlingua	61
Also load package url	60
babel 3.8b \bbl@sh@select: Added command	35
\declare@shorthand: We need to support shorthands with and without argument	99
in different groups; added the name of the group to the storage macro	36
\frq: Made \flq and \frq fontencoding dependent	46
\frqq: Made \flq and \frqq fontencoding dependent\	47
\grq: Made \glq fontencoding dependent as well	46
\grqq: Made \grqq fontencoding dependent as well	46
\hhline: added \string to prevent unwanted expansion of the colon	58

\initiate@active@char: Now use \bbl@sh@select	4, 35
babel 3.8c General: Added option australian	13
Added the newzealand option	15 15
\markboth: No need to add anything to an empty mark, prevented this by check-	
ing the contents of the arguments	56
No need to add <i>anything</i> to an empty mark; prevented this by checking the contents of the argument	
babel 3.8e	50
General: Many enhancements to the text by Andrew Young	. 1
babel 3.8f	
\markboth: Make the definition independent of the original definition; expand \languagename before passing it into the token registers	
babel 3.8g \Ref: We also need to adapt \Ref which needs to be able to uppercase the first	
letter of the expansion of \ref	
babel 3.8h	00
General: added malay, meyaluy and bahasam for the Bahasa Malaysia support .	14
Added albanian and bahasam	61
Added option albanian	13
added synonyms indonesian, indon and bahasai for the original bahasa (indone-	
sia) support	14
bahasa-0.9c	
General: Now use \@patterns to produce the warning	•
bahasa-1.0b	352
\captionsbahasa: Added \proofname for AMS-LATEX	351
\captionsbahasam: Added \proofname for AMS-LATEX\	352
bahasa-1.0d	002
General: Replaced \undefined with \@undefined and \empty with \@empty for	•
consistency with LATEX	
1 1	351
\captionsbahasam: Replaced 'Proof' by 'Bukti' (PR2214)	352
bahasa-1.0e	
General: Moved the definition of \atcatcode right to the beginning 350,	
Now use \ldf@finish to wrap up	
Now use \LdfInit to perform initial checks	
\bahasahyphenmins: use \bahasahyphenmins to store the correct values	351
$\begin{tabular}{ll} \begin{tabular}{ll} \beg$	353
\datebahasa: Use \edef to define \today	351
\datebahasam: Use \edef to define \today\	353
bahasa-1.0g	000
\datebahasa: Februari should be spelled as Pebruari	351
\datebahasam: Februari should be spelled as Pebruari	353
bahasa-1.0h	
\bahasahyphenmins: Now use \providehyphenmins to provide a default value	351
\bahasamhyphenmins: Now use \providehyphenmins to provide a default value	353
\captionsbahasa: Added \glossaryname	351
\captionsbahasam: Added \glossaryname	352
bahasa-1.0i	
\captionsbahasa: Inserted translation for Glossary\captionsbahasam: Inserted translation for Glossary	351 352
bahasa-v1.0k Canonali Maka it possible that this file is leaded by yavines entions	9E0
General: Make it possible that this file is loaded by variuos options bahasam-0.9f	350
General: A number of changes to make this specific to Bahasa Mayasia	352
bahasam-v1.0j	004
General: Make it possible that this file is loaded by various options	352
bahasa 1.0f	
\datebahasa: use \def instead of \edef to save memory	351

\datebahasam: use \def instead of \edef to save memory	353
basque-1.0b	
General: Removed empty groups after guillemot characters	181
\datebasque: use \def instead of \edef	180
Use \edef to define \today to save memory	180
basque-1.0c	
\datebasque: fixed typo in April's name	180
basque-1.0d	
\noextrasbasque: Deactivate shorthands ouside of Basque	180
basque-1.0e	100
\basquehyphenmins: Now use \providehyphenmins to provide a default value	180
\captionsbasque: Added \glossaryname	179
basque-1.0f	110
General: Changed url's for the patterns file	179
\captionsbasque: Added translation for Glossary	179
bbplain-0.1	119
General: Added redefinition of \dump to add a message to \everyjob	355
	555
bbplain-1.0c	255
General: Add execution of \@begindocumenthook to \@preamblecmds	355
Added definition of \loadlocalcfg	355
Moved the \dump code here from babel.dtx	355
bbplain-1.0d	
General: Also reset category codes after loading the configuration file as \AtEndOff	_
is undefined in this case	355
bbplain-1.0e	
General: Added the \newcommand code	358
Provide a more complete emulation of \DeclareRobustCommand and \newcommand	nd
	357
bbplain-1.0f	
General: added \@empty	355
Added \textquotedblright and \textquoteright	361
Added definition of \scriptsize	361
Consistently use \@undefined instead of \undefined	355
Use \toks8 instead of \patterns@loaded	356
bbplain-1.0g	
General: Added \ss and \i	361
bbplain-1.0h	
General: Only load the necessary parts into the format, let this file be read agian	
by babel.def	
bbplain-1.0i	300
General: \document is not a LATEX2.09-only command; AMSTEXdefines it too	
now use \@ztryfc to detect LATFX2.09	355
bbplain-1.0j	500
General: \@begindocumenthook might already be defined	357
Add the definition of \@begindocumenthook to the LATEX2.09 format	355
· · · · · · · · · · · · · · · · · · ·	333
bbplain-1.0k	250
General: \newcount is an \outer command, can't use it inside an \if construct	
missing \@undefined added	357
bbplain-1.0l	
General: Mixed up the definition of \@tempcntb	358
bbplain-1.0m	
General: Set \if@filesw to \iffalse only for plain TEX	357
bbplain-1.0n	
General: Added \@secondoftwo	356
Added the source for the format wrapper files	354
Repaired typo and added missing \endcsname	357
bbplain-1.0o	
General: Added definition of \int	358
bbplain-1.0p	
General: Added \@ifl@aded as a no-op	358
bbplain-1.0q	
General: Added \@ifundefined	356

bbplain-1.0r	
General: Added \textquotedblleft and \textquoteleft	361
breton-1.0	
General: First release	85
breton-1.0b	
\captionsbreton: Added \proofname for AMS-IATEX	85
\noextrasbreton: Use the new mechanism for dealing with active chars	86
breton-1.0c	
General: Postpone the \DeclareTextCompositeCommands untill \AtBeginDocumen	t.
General 1 ostpone the \Dectarerextcompositecommands until \kebeginbocumen	
	01
breton-1.0e	0.7
General: Now use \ldf@finish to wrap up	87
Now use \LdfInit to perform initial checks	
Replaced \undefined with \Qundefined and \empty with \Qundefined for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning	. 85
breton-1.0f	
\datebreton: use \def instead of \edef	85
Use \edef to define \today to save memory	85
breton-1.0g	
\noextrasbreton: Deactivate shorthands ouside of Breton	86
breton-1.0h	
\captionsbreton: Added \glossaryname	85
bulgarian-0.99	00
	_
General: This is a prerelease version of this file. Features needing further testing	
are removed	259
bulgarian-1.0b	
\extrasbulgarian: Now use \providehyphenmins to provide a default value	266
bulgarian-1.0c	
General: Added missing closing brace	261
\dq: repaired typo	265
bulgarian-1.0d	
General: Change definition of \th only for this language	268
bulgarian-1.0e	_00
\cdash: Two occurences of \emp were changed into tab followed by emp	266
(cash. Two occurrences of temp were changed into tab followed by emp	200
catalan-1.1	
\captionscatalan: \headpagename should be \pagename	169
catalan-2.0	109
	1.00
General: Removed code to load latexhax.com	168
\captionscatalan: Added some names	169
\extrascatalan: Macro completely rewritten	169
\noextrascatalan: Macro completely rewritten	169
catalan-2.0b	
General: Incorporated the changes from spanish.sty	168
catalan-2.1	
General: Update for \LaTeX 2ε	168
catalan-2.1d	
General: Now use \@nopatterns to produce the warning	169
Removed the use of \filedate and moved identification after the loading of	
babel.def	168
\captionscatalan: Added a few missing translations	169
\textsup \te	170
catalan-2.2a	
General: All the code to deal with active characters is now in babel.def	171
\extrascatalan: Handling of active characters completely rewritten	169
\noextrascatalan: All the code for handling active characters is now moved to)
babel.def	170
catalan-2.2b	
General: Changed mathmode definition of acute shorthands to expand to a single)
prime followed by the next character in the input	172
Made the activation of the grave and acute accents optional	168
\captionscatalan: Added \proofname for AMS-IATEX	169
\datecatalan: Month names in lowercase	169
\aaoooaoataaa. 1/1011011 11011103 111 10W010030	± 00

\Lgem: Added support for typing the catalan "ela geminada" with the macros	
\lgem and \Lgem	173
\noextrascatalan: Make activating the accent characters optional	170
	174
catalan-2.2c

\extrasafrikaans: Removed \global definitions	72
\noextrasafrikaans: Removed \global definitions	72
dutch-3.2	
General: added case for "y and "Y	73
\extrasafrikaans: Save all redefined macros	$\frac{72}{72}$
\noextrasafrikaans: Try to restore everything to its former state	12
General: Added reset of catcode of @ before \endingut	70
Renamed babel.sty in babel.com	
dutch-3.2b	•
General: removed typo (allowhpyhens)	73
dutch-3.2c	
General: Removed code to load latexhax.com	70
removed use of \@ifundefined	70
dutch-3.3	
General: Rewritten parts of the code to use the new features of babel version 3.1	70
\extrasafrikaans: Macro complete rewritten	72
\noextrasafrikaans: Macro complete rewritten	72
dutch-3.3a	
\Ctrema: renamed \Cumlaut to \Ctrema	73
General: Added \save@sf@q macro from germanb and rewrote all quote macros	79
to use it	72
\captionsdutch: added \seename and \alsoname	70 71
dutch-3.3b	11
General: Added warning, if no dutch patterns loaded	70
\captionsdutch: added \prefacename	71
\extrasafrikaans: modified handling of \dospecials and \@sanitize	72
\noextrasafrikaans: modified handling of \dospecials and \@sanitize	

dutch-3.4b	
General: moved definition of \allowhyphens, \set@low@box and \save@sf@q to	
babel.com	72
dutch-3.5	
\captionsdutch: \headpagename should be \pagename	71
dutch-3.6	
General: Update or LaTeX2e	70
dutch-3.6c	
General: Now use \@nopatterns to produce the warning	70
Removed the use of \filedate, moved identification after the loading of ba-	
bel.def	70
dutch-3.7a	
General: Moved identification code to the top of the file	70
Moved the definition of \ij and \IJ to glyphs.def	73
moved the definition of the double quote character at the baseline to	
glyhps.def	72
Now use \Declaredqdutch to define the functions of the active double quote	73
Removed \dlqq, \@dlqq, \drqq, \@drqq and \dieresis	72
Rewrote the code with respect to the active double quote character	70
The support macros for the active double quote have been moved to babel.def	73
Use \ddot instead of \@MATHUMLAUT	73
Use more general mechanism of \declare@shorthand	73
\afrikaanshyphenmins: use \dutchhyphenmins to store the correct values	72
\IJ: Changed the kerning in the faked ij to match the dc-version of it	45
dutch-3.7b	70
General: Added "" shorthand	73
dutch-3.7c	71
\color{local} \captionsdutch: We need the " to be active while defining \color{local} captionsdutch dutch-3.7d	11
\captionsdutch: Added \proofname for AMS-LATEX	71
dutch-3.7f	' 1
General: Replaced \undefined with \@undefined and \empty with \@empty for	
consistency with LATEX	70
dutch-3.8a	
General: Merged in the definitions for 'afrikaans'	70
Now use \ldf@finish to wrap up	73
this needs a more complicated check as 'afrikaans' may or may not have its	
own hyphenation patterns	70
\noextrasafrikaans: Made all definitions dependant on \CurrentOption	72
dutch-3.8b	
\captionsdutch: Use Bew"ys instead of Bewijs	71
dutch-3.8c	
General: Added the "~ shorthand	73
dutch-3.8e	
General: Added a shorthand with the slash character	73
Forgot to replace 'german' by 'dutch' when copying definition for " $^{\sim}$	73
Removed empty groups after double quote characters	73
\dateafrikaans: use \def instead of \edef	72
Use \edef to define \today to save memory	72
\datedutch: use \def instead of \edef	71
Use \edef to define \today to save memory	71
dutch-3.8h	-0
\afrikaanshyphenmins: Now use \providehyphenmins to provide a default value	
\afrikaanshyphenmins: Now use \providehyphenmins to provide a default value \captionsdutch: Added \glossaryname	72 71
\afrikaanshyphenmins: Now use \providehyphenmins to provide a default value \captionsdutch: Added \glossaryname	71

General: Removed the use of \filedate, moved Identification after loading of	
babel.def	65
Use \@nopatterns for the warning esperanto-1.4e	65
General: Moved identification code to the top of the file esperanto-1.4f	65
General: Corrected typos (PR1652)	65
esperanto-1.4g \captionsesperanto: Added \proofname for AMS-IATEX	65
esperanto-1.4h General: Added a few shorthands	66
esperanto-1.4i	
General: Moved the definition of \atcatcode right to the beginning Now use \ldf@finish to wrap up	65 67
Now use \LdfInit to perform initial checks	65
tency with IATEX	65 65
esperanto-1.4j General: fixed typo in table caption (funtion instead of function)	65
esperanto-1.4k \dateesperanto: Removed Rthe use of \edef again	
Use \edef to define \today to save memory	

esperanto-1.4l	
General: Added a shorthand definition on system level	66
esperanto-1.4n	
\noextrasesperanto: Added a check for math mode to the definition of the short-	
hand character	66
esperanto-1.4p	
\captionsesperanto: Added \glossaryname	65
esperanto-1.4q	
\captionsesperanto: Added translation for Glossary	65
\esper: Removed the extra level of expansion for more than five items, as was	
done in $ extstyle extst$	66
estonian-1.0b	
General: corrected typos	222
estonian-1.0c	
\captionsestonian: Added \proofname for AMS-IATEX	223
estonian-1.0d	
General: The second argument was missing in the definition of some of the double-	
quote shorthands	224
\captionsestonian: Added translation of 'Proof'	223
\noextrasestonian: Removed the code that changes category, lower case, uper	
case and space factor codes	223
estonian-1.0e	
General: Now use \ldf@finish to wrap up	225
Now use \LdfInit to perform initial checks	222
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning.	222
estonian-1.0f	
General: Removed empty groups after double quote and guillemot characters	225
\dateestonian: use \def instead of \edef	223
Use \edef to define \today to save memory	223
estonian-1.0g	
General: use \bbl@t@one instead of \bbl@next	224
estonian-1.0h	
\captionsestonian: Added \glossaryname	223
\estonianhyphenmins: Now use \providehyphenmins to provide a default value	224
finnish-1.0a	
General: Renamed babel.sty in babel.com	204
finnish-1.0b	
General: Removed use of \@ifundefined	204
finnish-1.1	
General: Added a warning when no hyphenation patterns were loaded	204
Brought up-to-date with babel 3.2a	204
\captionsfinnish: \headpagename should be \pagename	204
Added \seename, \alsoname and \prefacename	204
finnish-1.1.2	
\captionsfinnish: Added translations	204
finnish-1.2	
General: Update for LATEX 2ε	204
finnish-1.3c	
General: Now use \@nopatterns to produce the warning	204
Removed the use of \filedate and moved identification after the loading of	
babel.def	204
finnish-1.3d	
General: Removed a few references to babel.com	204
finnish-1.3e	
\datefinnish: Added a'.' after the number of the day	205
finnish-1.3f	
$\verb \finishhyphenmins: use \verb \finnishhyphenmins to store the correct values$	206
\noextrasfinnish: Added the setting of \frenchspacing	205
Added the setting of more hyphenation parameters, according to $PR1027$.	205
finnish-1.3g	
\-: Added change of \	206

\captionsfinnish: Added \proofname for AMS-LATEX\noextrasfinnish: Added the active double quote	204 205
finnish-1.3h	
\captionsfinnish: Added finnish word for 'Proof'	204
General: Now use \ldf@finish to wrap up	206
Now use \LdfInit to perform initial checks	204
Replaced \undefined with \@undefined and \empty with \@empty for consis-	201
	204
tency with LaTeX, moved the definition of \atcatcode right to the beginning. finnish-1.3k	204
\datefinnish: use \def instead of \edef	205
Use \edef to define \today to save memory	205
\noextrasfinnish: Removed empty groups after double quote and guillemot	
characters	205
finnish-1.3m	
\noextrasfinnish: Added misisng closing brace	205
finnish-1.3n	
\-:\allowhyphens should have been \bbl@allowhyphens	206
\captionsfinnish: Added \glossaryname	204
\finishhyphenmins: Now use \providehyphenmins to provide a default value	
• • • • • • • • • • • • • • • • • • • •	206
\noextrasfinnish: Deactive shorthands ouside of Finnish	205
finnish-1.3o	
\captionsfinnish: Provided translation for Glossary	204
finnish-1.3p	
\noextrasfinnish: "= should also use \bbl@allowhyphens	206
frenchb-1.1	
General: Add some font changing definitions	112
Added \AllTeX	126
Added \leavevmode in \bsc	126
Added a hook to insert space or not before 'double punctuation' 102,	115
Added command \bsc	126
Added T1-encodings for œ, Œ, æ, Æ. Do not re-define these symbols outside	
Fig. 2	126
Corrected definitions of \boi.	126
Do not redefine \^ and \" in MlT _F X, because it would break hyphenation. The	
	127
, , , , , , , , , , , , , , , , , , , ,	
Do not use commands related to encodings outside LATEX 2ε	126
v L v	127
Special care has to be taken with MIT _E X	127
\bbl@nonfrenchitemize: Save original definitions of label items, instead of hard	
coding them in \bbl@nonfrenchitems (suggested by Vincent Jalby)	118
	118
\captionsfrench: This code is useless in PlainTEX, check the format before load-	
ing it	113
\degres: Added \leavevmode in the \degres's definition	127
Fixed width bounding box for correct spacing with both CM, EC and	
PostScript fonts	
\fg: A warning is now issued if \og or \fg have been defined elsewhere in a	
\fprimo): Avoid using math superscripts in text mode (suggested by V. Jalby),	
use \up instead. The symbol 'degree' has nothing to do in \FrenchPopularEnur	nerate
	125
\french@sh@;@: Added a hook to insert space or not before 'double punctuation'.	
\ieme: \Optsize may not be undefined, i.e. in slides.cls	125
- Company of the Comp	
Added 5 macros from french.sty and missing \lowercase	125
Internal macro \up@size introduced by Johannes Braams to replace \small,	105
too fragile in 2.09).	125
Use \textsuperscript in LATEX 2ε , as suggested by Vincent Jalby	125
\if@Two@E: New test \if@Two@E.	110
\ifLaTeXe: Use \fmtname to check the format instead of \newcommand; define	
\PlainFmtName and \LaTeYeFmtName	110

frenchb-1.1b	
General: Moved the definition of \atcatcode right to the beginning	102
Now use \ldf@finish to wrap up	127
Now use \LdfInit to perform initial checks	110
Removed test for \lambda@english	110
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with L ^A T _E X frenchb-1.2	102
	110n.
Check for hyphenation patterns	110
New macros \nombre \decimalsep and \thousandsep added to format num-	
bers.	121
Removed \AllTeX	126
The config file searched for is 'frenchb.cfg' regardless \CurrentOption	127
\bbl@nonfrenchindent: Corrected typo \bbl@nonfrenchident	119
\captionsfrench: Added aliases \captionsfrenchb and \captionsfrancais.	113
\datefrench: Added aliases \datefrenchb and \datefrancais. Use \ier instead	
of \up	127
\noextrasfrench: 'french' 'frenchb' and 'francais' are synonymous regardless of	
\CurrentOption	112
frenchb-1.2b	
General: Spacing after opening and before closing guillemets slightly enlarged and	
some glue added, as suggested by Th. Bouche. Unlike \kern, \hskip doesn't	
inhibit hyphenation, nothing like \allowhyphens is required	116
\fg: Define \xspace as if it is not defined by D. Carlisle 'xspace.sty'. Will be	
used in \fg, and \ieme \ieres (new for this release)	116
\ieme: Use \xspace to control spacing after \ieme \ieres.	125
\thousandsep: Definition of \nombre changed to correct a bug with moving ar-	
guments in IATEX-2.09.	121
Extra care taken to handle signs properly inside \nombre in LATEX 2_{ε}	121
frenchb-1.3	
	123
Avoid mixing text and math mode whenever possible: check if \textminus and	
co. are available	122
New implementation of guillemets	115
Use \r to access the character 'degree', as suggested by V. Jalby	126
Use \textbackslash to define \boi	126
\bbl@nonfrenchitemize: Change to \textendash, completely redesign the itemize environment in French and add a hook to switch back to \LaTeXe	
standard itemize lists.	110
\bbl@nonfrenchlistspacing: Add a switch to allow \LaTeXe standard settings.	
\nombre: Added \Cempty to the definitions of \nbCfirst and \nbCsuite, as	111
suggested by V. Jalby, to cope with possibly empty integer part as in	
\nombre,123	199
frenchb-1.3b	122
	127
frenchb-1.3c	141
	112
	113
	125
frenchb-1.3d	120
General: Spacing after opening and before closing guillemets changed again: nor-	
mal space with little glue (suggested by Th. Bouche)	116
\datefrench: Move this code to the end of file, until \ier is defined (due to use	110
of \edef); expansion of \ier has to be stopped anyway	127
frenchb-1.3e	141
General: Try to use AMS Cyrillic fonts to provide better looking guillemets in	
OT1 encoding.	115
frenchb-1.3f	
General: Deleted sectioning command \section \ About French Typography \	102

\ifLaTeXe: Use \magnification to check if the format is plain (i.e not LATEX). Checking the format's name was not reliable: plain-like formats may not be)
called just 'plain' but 'babel-plain'.	110
frenchb-1.3g	
\datefrench: Replaced \edef with \def to prevent problems with unexpandable accent commands	
frenchb-1.4	
General: Add a hook to let the comma be in math mode of type \mathord in	1
French, as a decimal separator should be	
Bovani).	115
Add definitions for \at, \circonflexe and \tild in other encodings (mlTeX's LO1)	
Added this section.	124
\bbl@nonfrenchitemize: \newif only in LaTeX	118
Add a hook \FrenchLabelItem which defaults to \textendash, this was sug-	
gested by Michel Bovani to allow some customization of label items	
frenchb-1.4a	
General: frenchb-1.3 silently redefined \@makecaption, overwriting changes made by some classes like koma-script, ua-thesis(pointed out by Werner Lem-	
berg). New implementation suggested by Vincent Jalby \captionsfrench: Changed '-' to \textendash in \CaptionSeparator in case the)
ligature doesn't exist (tt-fonts)	113
frenchb-1.4c	
General: Bug correction: \xspace didn't work in \dots without amsmath.sty.	123
frenchb-1.4d	
General: AMS-LaTeX 2.0 provides a much better spacing for \dots than 1.2, so)
let's take advantage of it when amsmath (up to 1.2 or newer) is loaded	123
Do NOT set catcodes of French quotes to 12 before launching \initiate@activ	
in frenchb.cfg, (problem on Mac reported by M.Bovani)	107
\datefrench: Changed \noexpand\ier to \ier, as a result of the replacement	;
of \edef by \def, see previous change. Also add braces around \ier for	
xspace.sty.	
frenchb-1.4e	
General: Captions print twice with AMS classes (amsart, amsbook). Bug reported	L
by Jean-François Mertens. Revert to implementation of version 1.4, which is	
safer as makecaption can be changed unpredictably.	
frenchb-1.4f	
General: Only issue a warning if \@makecaption exists	112
\captionsfrench: Added \glossaryname	113
\thousandsep: Added a new hook \ThinSpaceInFrenchNumbers to have thin	,
spaces instead of normal spaces (the default) when formatting French numbers.	-
	121
frenchb-1.5a \bbl@nonfrenchitemize: Redesign \itemize to allow users to change the markers	
of any level in itemize lists.	
\bbl@nonfrenchlistspacing: Redefine \list instead of \@trivlist to provide more freedom to the user, but still allow the former way with \ifFrenchOldTri	ivlist
	117
frenchb-1.5b	
General: Added support for canadien and acadian	110
frenchb-1.5d	
General: Load frenchb.cfg first and change \ldf@finish to \ldf@quit The internal name for the French language is changed from 'french' to 'french'.	127
	110
frenchb-1.5f	
General: Added a hook to customize the space before the colon in French (thin or normal)	115
\fg: \og and \fg should not be expanded when written to a file; use \renewcomman (in \laTeX) to redefine them instead of \lat or \def	d 116

frenchb-1.5g
General: Instead of issuing a warning when \captionsfrancais or \captionsfrenchb
are customized in the preamble, we merge the changes into \captionsfrench. 111
Let \LdfInit check for \datefrench instead of \NoAutoSpaceBeforeFDP, as
the later is also defined by russianb.ldf
\bbl@nonfrenchitemize: \parskip is of type 'skip', its mean value only (not the
glue) should be moved from \topsep to \partopsep: substracting glue can
lead to weird results. Bug pointed out by Michel Bovani
the glue) should be moved from \topsep to \partopsep: substracting glue
can lead to weird results. Bug pointed out by Michel Bovani
frenchb-1.6a
General: Add two hooks to customize footnotes: \AddThinSpaceBeforeFootnotes
and \FrenchFootnotes (suggested by Jacques André)
\degrees: Replace \degrees by \textdegree from textcomp.sty when possible (sug-
gested by Michel Bovani)
frenchb-1.6b
General: Default OT1 guillemets are now borrowed from Polish fonts, rather than
from wncyr
frenchb-1.6c
General: Bug correction: it is necessary to re-execute \captionsfrench after
merging \captionsfrenchb and \captionsfrancais 111
OT1 'Polish' guillemets are now taken from the LM fonts which will be part
of TL8
\StandardLayout: Bug correction: the definitions of \labelitemi \itemize
need to be saved in \StandardLayout 124
frenchb-1.6e
General: The change from \mathpunct to \mathord should be encoding indepen-
dent (suggested by Michel Bovani): just strip the highest hexadecimal digit
to switch from type \mathpunct to type \mathord 121
frenchb-1.6f
\StandardFootnotes: Move \newif and \newdimen commands outside \ifLaTeXe
\fi for compatibility with the plain format
frenchb-1.6g General: frenchb.cfg is now loaded only with LaTeX2e, as the customization makes
sense only in LaTeX2e. Suggested by J.F. Burnol
\degres: Add \hbox in the definition of \degres when textcomp.sty is loaded, so
that \degrees can be used in math mode
that (488135 can be abed in math mode
galician-1.1
General: Update for \LaTeX 2_{ε}
galician-1.1c
General: Now use \@nopatterns to produce the warning 175
Removed the use of \filedate and moved identification after the loading of
${\tt babel.def} \hspace{0.1in} \dots \hspace{0.1in} 175$
\textacute: Renamed from \acute as that is a \mathaccent 177
\texttilde: Renamed from \tilde as that is a \mathaccent 177
galician-1.1d
\captionsgalician: Added a few missing translations
\dategalician: Corrected the name of the month marzo from marzal 176
galician-1.2a
\extrasgalician: Handling of active characters completely rewritten 176
\noextrasgalician: All the code for handling active characters is now moved to
babel.def
galician-1.2b Concret: Changed mathemede definition of soute shorthands to expand to a single
General: Changed mathmode definition of acute shorthands to expand to a single prime followed by the next character in the input
captionsgalician: Added \proofname for AMS-IATEX
galician-1.2c
\noextrasgalician: Make active accent optional
galician-1.2d
General: Added "as an axtra shorthand
\noextrasgalician: Need to split up the \@ifpackagewith statement 176

galician-1.2e	
General: Now use \ldf@finish to wrap up	178
Now use \LdfInit to perform initial checks	175
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning.	175
galician-1.2f	
General: Added \leavevmode to definitions of "a and "o	177
\noextrasgalician: Added some comment signs to prevent unwanted spaces in	
the output	176
galician-1.2h	
\dategalician: use \def instead of \edef	176
<u> </u>	176

germanb-1.0a	110
General: Incorporated Nico's comments	78
germanb-1.0b	10
General: fixed typo in definition for austrian language found by Werenfried Spit	70
nspit@fys.ruu.nl	18
germanb-1.0c	70
General: Fixed some typos	78
germanb-1.1	
General: When using PostScript fonts with the Adobe fontencoding, the dieresis-	
accent is located elsewhere, modified code	
\noextrasaustrian: Added \dieresis	79
germanb-1.1a	
General: Modified the documentation somewhat	78
germanb-2.0	
General: Modified for babel 3.0	78
Now use \adddialect for austrian	79
Now use \adddialect if language undefined	7 9
germanb-2.0a	
General: Removed some problems in change log	78
germanb-2.0b	
\extrasaustrian: added some comment chars to prevent white space	7 9
\noextrasaustrian: added some comment chars to prevent white space	7 9
germanb-2.1	
General: Removed bug found by van der Meer	78
germanb-2.2	
General: Removed global assignments, brought uptodate with german.tex v2.3d	78
\captionsaustrian: \pagename should be \headpagename	79
Removed \global definitions	79
\extrasaustrian: Save all redefined macros	79
\noextrasaustrian: Try to restore everything to its former state	79
germanb-2.2a	
General: Renamed babel.sty in babel.com	78
germanb-2.2d	.0
General: Removed use of \@ifundefined	79
germanb-2.3	13
9	78
General: Rewritten parts of the code to use the new features of babel version 3.1	10
General: Added \approxected macro and rewrete all quote macros to use it	90
General: Added \save@sf@q macro and rewrote all quote macros to use it	80
Added warning, if no german patterns loaded	79
Brought up-to-date with german.tex v2.3e (plus some bug fixes) [br]	78
\captionsaustrian: Added \prefacename, \seename and \alsoname	79
\dategerman: Added \month@german	79

germanb-2.3h	
General: moved definition of \allowhyphens, \set@low@box and \save@sf@q to	
babel.com	80
germanb-2.4	
\captionsaustrian: \headpagename should be \pagename	79
germanb-2.5	
General: Update or LATFX 2ε	78
germanb-2.5c	
General: Now use \@nopatterns to produce the warning	79
Removed the use of \filedate and moved the identification after the loading	
of babel.def	78
germanb-2.6a	••
General: \umlautlow and \umlauthigh moved to glyphs.dtx, as well as \newumlau	+
(now \lowerQumlaut	80
Moved all quotation characters to glyphs.dtx	80
Moved the identification to the top of the file	78
Rewrote the code that handles the active double quote character	78
Use \ddot instead of \@MATHUMLAUT	80
\noextrasaustrian: All the code to handle the active double quote has been	0.0
moved to babel.def	80
Removeed \3 as it is no longer in german.ldf	80
use \germanhyphenmins to store the correct values	80
germanb-2.6b	
\captionsaustrian: Added \proofname for AMS-LATEX	79
germanb-2.6c	
General: added the \allowhyphens	80
Moved \german@dq@disc to babel.def, calling it \bbl@disc	80
\noextrasaustrian: Use decimal number instead of hat-notation as the hat may	
be activated	80
germanb-2.6d	
General: Moved the definition of \atcatcode right to the beginning	78
Now use \ldf@finish to wrap up	81
Now use \LdfInit to perform initial checks	79
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with IATEX	78
\captionsaustrian: Construct control sequence on the fly	79
\noextrasaustrian: Construct control sequence \extrasgerman or \extrasaustri	ian
on the fly	
germanb-2.6f	
General: Copied the coding for "f from german.dtx version 2.5d	81
use \SS instead of SS, removed braces after \ss	
\ck: Now use \shorthandon and \shorthandoff	81
\dateaustrian: use \def instead of \edef	79
Use \edef to define \today to save memory	79
\dategerman: use \def instead of \edef	79
Use \edef to define \today to save memory	79
	19
germanb-2.6i	90
\noextrasaustrian: Deactivate shorthands ouside of German	80
germanb-2.6j	70
\captionsaustrian: Added \glossaryname	79
\noextrasaustrian: Now use \providehyphenmins to provide a default value	80
germanb-2.6k	
\noextrasaustrian: Turn frenchspacing on, as in german.sty	80
greek-1.0b	
General: Moved the definition of \atcatcode right to the beginning	94
	101
Now use \LdfInit to perform initial checks	95
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with L ^A T _E X	94
\textgreek: Added a level of braces to keep encoding change local	96
greek-1.0c	
\greek@tilde: Added command	99

greek-1.1
\Grtoday: Added macro \Grtoday 97
greek-1.1a
\dategreek: Fixed typo, Oktwbr'iou instead of Oktobr'iou 97 \greek@Alph: removed two superfluous @'s which made \@alph undefined 98
greek-1.1b
\noextrasgreek: Added setting of \uccodes (after kdgreek.sty) 100 Added shorthand for \char255
Made tilde expand to a tilde with \catcode 12 100
greek-1.1c
General: Added a couple of symbols, needed for \greeknumeral 100
\noextrasgreek: fixed two typos
\dategreek: Macro \gr@month now produces the name of the month 97
greek-1.1e
General: Added caption name for proof
Most symbols are removed and are now defined in package grsymb 100
\gr@month: Macro added 97
\noextrasgreek: Added lowercase code for v
9f, instead of ff
Shorthand is changed. Active character is now \c greek-1.2
General: Added caption names for \polutonikogreek 96
Classical Greek is now a dialect
\gr@c@greek: Added macro \datepolutonikogreek
\noextrasgreek: Added lowercase codes for "modern" greek
Added uppercase codes for "modern" Greek. The old codes are now for "Polutoniko" Greek
Definitions for "modern" Greek are now the definitions of "Polutoniko" Greek 100
greek-1.2a
General: filename lgrenc.def now lowercase
\noextrasgreek: Need shorthand to exist for "monotoniko" Greek, not "polutoniko" Greek
greek-1.2b
General: Classical Greek is now called "Polutoniko" Greek. The previous name was at least misleading
\dategreek: use \def instead of \edef
ned to be expandable
greek-1.2c General: Package grsymb has been eliminated because the CB fonts v2.0 do not
inlcude certain symbols and so the remaining symbol definitions have been
moved here
This version conforms to version 2.0 of the CB fonts and consequently we added a few new symbol-producing commands
greek-1.2e
\greek@Roman: Moved redefinition of \@roman back to the language specific file 98 greek-1.2f
\ltx@amp: Now switch the definition of \& from \extrasgreek 99 greek-1.3a
General: polutoniko is now an attribute to Greek, no longer a 'dialect' 94 \gr@c@greek: removed macro \datepolutonikogreek 97 greek-1.3b
\greeknumeral: Added \expandafter and \number (PR3000) in order to make a
counter an acceptable argument
\ltx@amp: Added a missing opening brace
General: Fixed type, bliene, enlishe instead of bline, enlishe 96

\greek@Roman: \@roman and \@Roman need to be added to \extraspolutonikogre	
greek-1.3e	. 90
\greek@Roman: \@roman and \@Roman need not be in \extraspolutonikogreek when they are already in \extrasgreek	
\noextrasgreek: \extrasgreek and \extraspolutonikogreek should be complementary	-
greek-1.3f	
General: Added some code to make older documents work greek-1.3g	95
General: \noextraspolutonikogreek was missing greek-1.3h	95
\captionsgreek: Added \glossaryname	
\captionsgreek: The final sigma in all names appears as 's' instead of 'c' \noextrasgreek: uc code of 'v' is switched to V so that mixed text appears correctly in headers	S
greek-1.3j	
\noextrasgreek: Because other languages might make the caret active, we can't use the double caret notation here	100
Ues the tilde as an alias for character 159 greek-1.3k	100
\greek@tilde: Make sure the character "is not active during the definition of \greek@tilde	
\textgreek: Added \leavevmode as was done with \latintext	
greek-1.3l General: Commented these lines out as this change has made it into LaTeX itself.	101
heb209 1.0a	
General: Initial version. Provides hebrew_newcode, hebrew_oldcode and hebrew_p style files for LaTeX 2.09 (by Boris Lavva)	
hebfdd-1.0a General: Initial version. Supports only 7-bit LHE font encoding and all available Hebrew TEX fonts (by Boris Lavva)	
General: fixed lhecmr.fd to use oldjaf10 for a slanted font available Hebrew TEX fonts (by Tzafrir Cohen)	
hebfdd-1.1a General: Adding 8-bit HE8 fonts. Note that most of them cannot be distributed	1
with hebleTeX (by Tzafrir Cohen)hebfdd-1.2a	
General: Adding configurations for the Culmus fonts, currently 0.90 (by Tzafrin Cohen)	
hebfdd-1.2b General: Reinstated the test whether LHE or HE8 is to be used	333
hebin p $1.0\mathrm{a}$ General: Initial version. Provides 8859-8, cp 862, cp1255, and old 7-bit input	
encodings (by Boris Lavva)	327
General: Renamed hebrew letters: \alef to \hebalef etc. (by Tzafrir Cohen)	327
hebinp 1.1a General: Renamed CP1255 nikud \patah to \hebpatah etc. Added the macro \DisableNikud - may not be a good idea (by Tzafrir Cohen)	327
hebrew-1.2c General: Typo's in the docstrip guards made HE8nachlieli.fd unusable	333
hebrew-2.0b \captionshebrew: Added \glossaryname	292
hebrew-2.3h	
\hebrewencoding: Make LHE the default encoding for compatibility reasons hebrew 0.1	291
General: Preliminary IATEX Hebrew option (by Sergio Fogel)	200

hebrew 0.2	
General: Corrections and additions (by Rama Porrat)	290
hebrew 0.6	
General: Additions (by Yael Dubinsky)	290
hebrew 1.2	
General: Bilingual tables, penalties, documentation and more changes (by Yaniv	
Bargury)	290
hebrew 1.30	
General: Font selection, various (by Alon Ziv)	290
hebrew 1.31	
General: Bug fixes (by Alon Ziv)	290
hebrew 1.32	
General: Made font-change command for numbers '\protect'ed (by Alon Ziv)	290
hebrew 1.33	
General: Made \refstepcounter work using \@ltor (by Alon Ziv)	290
hebrew 1.34	
General: Moved font loading to another file. Added \mainsec. Made all text	;
strings be produced by control codes (similar to LATEX2.09 Mar '92). Fixed	
\noindent (by Alon Ziv)	
hebrew 1.35	
General: Moved the texts to a file selected by the current encoding (by Alon Ziv)	290
hebrew 1.36	
General: Use T _E X tricks to redefine \thexxxx without keeping old definitions.	
Use only \Qeng for direction/font change (removed \Qltor). Switched from	
use of \mainsec to code taken from babel system (by Alon Ziv)	
hebrew 1.37	200
General: Use \add@around in defining font size commands. Small bug fixes (by	
Alon Ziv)	
hebrew 1.38	200
General: \everypar changed so that \noindent works unmodified (by Alon Ziv,	
thanks to Chris Rowley)	
hebrew 1.39	200
General: Redefined primitive sectioning commands. Changed \include so it finds	,
.h, .xet, and .ltx files (no extension needed). Reinstated use of \@ltor (by	
Alon Ziv)	
hebrew 1.40	250
General: Added the \@brackets hack (by Alon Ziv)	290
hebrew 1.41	230
General: Reworked towards using NFSS2. Changed some macro names to be more	
logical: renamed \@ltor to \@number, \@eng to \@latin, and (in hebrew.ldf)	
\Cheb to \Chebrew (by Alon Ziv)	
	290
hebrew 1.42	
General: Made list environments work better. Fixed thebibliography environment (by Alon Ziv)	
hebrew 2.0a	290
	ı
General: Completely rewritten for $\text{LAT}_{EX} 2_{\varepsilon}$ and babel support. Various input and	
font encodings (with NFSS2) are supported too. The original hebrew.sty is	
divided to a number of packages and definition files for better readability	
and extensibility. Added some user- and code-level documentation inside the	
.dtx and .fdd files, and LATEX-driven installation with hebrew.ins (by Boris	
Lavva)	290
hebrew 2.0b	000
\hebrewhyphenmins: Now use \providehyphenmins to provide a default value	292
hebrew 2.1	
General: corrections from Sivan Toledo: sender name in letter, and section name	
in headings. (by Tzafrir Cohen)	<i>2</i> 90
hebrew 2.2	
General: renamed hebrew letters to heb* (e.g.: alef renamed to hebalef) (by	
Tzafrir Cohen)	<i>2</i> 90
hebrew 2.3 Converse added governed \@ifalanalanded(glides) to allow the use of the glides	
General: added several \@ifclassloaded{slides} to allow the use of the slides	
class. (by Tzafrir Cohen)	290

hebrew 2.3a	
General: The documentation should now be built fine (broken since at least 2.1,	,
and probably 2.0) (by Tzafrir Cohen)	290
hebrew 2.3b	
General: minor clean-ups. The documentation builds now with no warnings. Also removed \R from the caption macro (added in 2.1) Added internal \@ensure@I	_
and \@ensure@R (Is there a real need for them? Maybe should they be exposed?) (by Tzafrir Cohen)	
hebrew 2.3c	
General: a temporary fix to the \gim macro. Should be replaced by stuff from hebcal. (by Tzafrir Cohen)	
hebrew 2.3d	
General: Initial support for the prosper class. Added \arabicnorl . (by Tzafrin Cohen)	
hebrew 2.3e	,
General: Removing hebtech from this distriution (not relevant to babel), added \\HeblatexEncoding. some docs cleanup (by Tzafrir Cohen)	
hebrew 2.3f	
General: redefined \list instead of redefining every environment that uses it some pscolor handling, removed HeblatexEncoding (don't use 2.3e) (by Tzafrin	r
Cohen)	290
icelandic-1.1	
General: Added definitions for old icelandic.	189
icelandic-1.1a	
General: Added definitions for formatting numbers in Icelandic and some extra	ι
	190
icelandic-1.1b	
General: Added references to various publications used	190
icelandic-1.1c	
General: Removed code already present in babel.def	186
\dateicelandic: use \def instead of \edef Use \edef to define \today to save memory	188 188
icelandic-1.1e	100
\noextrasicelandic: Deactivate shorthands ouside of Icelandic	188
icelandic-1.1f	
\captionsicelandic: Added \glossaryname	188
\noextrasicelandic: Now use \providehyphenmins to provide a default value icelandic-1.1g	188
\captionsicelandic: Added translation for Glossary	188
Only use 7-bit ASCII characters in order to keep the texts input encoding independant	
irish-1.0b	
General: Corrected typo (PR1652)	90
irish-1.0c	
$\label{lem:lambda} $$ \operatorname{Added proofname for AMS-IAT_EX}$ irish-1.0e$	90
General: Now use \ldf@finish to wrap up	91 90
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning	. 90
irish-1.0f	
\captionsirish: Added missing translations provided in PR 2719	90
\dateirish: use \def instead of \edef	
\irishhyphenmins: Added definition of \hyphenmins	
irish-1.0h	50
\captionsirish: Added \glossaryname	90
\irishhyphenmins: Now use \providehyphenmins to provide a default value .	
italian-0.99	
General: First version, from english.doc	129
italian-1.0	
General: Modified for babel 3.0	129

Now use \adddialect if language undefined	130
italian-1.0a	
General: removed typo	129
italian-1.0b	
	129
italian-1.0c	
\captionsitalian: \pagename should be \headpagename	130
Removed \global definitions	130
	130
italian-1.0d	
\captionsitalian: 'contiene' substitued by 'Allegati' as suggested by Marco	
Bozzo (BOZZO@CERNVM)	130
italian-1.0e	100
General: Renamed babel.sty in babel.com	129
italian-1.0h	190
	130
italian-1.1	120
General: Added a warning when no hyphenation patterns were loaded	130
Brought up-to-date with babel 3.2a	129
\captionsitalian: \headpagename should be \pagename	130
•	130
italian-1.2	100
<u>.</u>	129
italian-1.2b	
\captionsitalian: Changed some of the words following suggestions from Clau-	
	130
\italianhyphenmins: Added setting of left and righthyphenmin according to	
Claudio Beccari's suggestion	131
\noextrasitalian: Added setting of club- and widowpenalty	131
Added setting of finalhyphendemerits	131
italian-1.2e	
· · ·	130
Removed the use of \filedate and moved identification after the loading of	
	129
italian-1.2f	
I	129
italian-1.2g	
· 1	130
italian-1.2h	
• •	130
	131
italian-1.2i	
General: Now use \ldf@finish to wrap up	137
· •	129
Replaced \undefined with \Qundefined and \empty with \Qundefined for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning.	129
italian-1.2j	
General: Added braces around second arg of \LdfInit	129
italian-1.2l	
· / · 1 / · 1	129
Added useful macros for fulfilling ISO 31/XI regulations	133
\noextrasitalian: Changed example "begl'italiani" (obsolete spelling) with an-	
other, "nell'altezza", that behaves the same way	131
italian-1.2m	
General: Added support for etymological hyphenation	129
Support for etymological hyphenation	131
\italianhyphenmins: Now use \providehyphenmins to provide a default value	131
italian-1.2n	
General: Added several commands for the caporali double quotes and for simpli-	
v e	129
	129
Completely new etymological hyphenation facility	132

italian-1.2o	
General: Added \glossaryname	129
italian-1.2p	
General: Removed redefinition of \add@acc since its functionality has been intro-	
duced into the kernel of LaTeX 2001/06/01 129,	134
italian-1.2q	
General: Added test for avoiding conflict with package units.sty; adjusted caporali	
functionality, since the previous one did not work with the standard (although	
obsolete) slides class file	
Redefined the caporali machinery so as to avoid incompatibilities with the	
slides class, as there are no Cyrillic slides fonts as there are for Latins script	
\ped: Added testing for avoiding conflicts with the units.sty package	133
italian-1.2r	100
\it@cwm: Added \nobreak to \it@cwm and corrected \it@next	132
latin-0.99	
General: Added shortcuts for breve, macron, and etymological hyphenation (CB)	138
First version, from italian.dtx (CB)	138
latin-1.2	100
General: Added suggestions from Krzysztof Konrad Żelechowski (CB)	138
latin-2.0	100
General: Completely new etymological hyphenation (CB)	138
latin-2.0a	100
General: Revised by JB	138
\latinhyphenmins: Now use \providehyphenmins to provide a default value	140
latin-2.0b	
General: Simplified shortcuts for etymological hyphenation; modified breve and	
macro shortcuts; language attribute medieval declared	138
latin-2.0d	
General: Restored caret and equals sign category codes before exiting	138
latin-2.0e	
General: Introduced the language attribute 'withprosodicmarks'; modified use of	
breve and macron shortcuts in order to avoid possible conflicts with other	
packages	138
latin-2.0f	
\datelatin: Added a comment character to prevent unwanted space	140
latin-2.0g	
General: Added a \nobreak	144
\LatinMarksOff: Added two commands	
	143
\ProsodicMarks: changed \allowhyphens to \bbl@allowhyphens

characters	
slovene-1.2l	210
\noextrasslovene: Deactivate shorthands ouside of Slovene	246
slovene-1.2m	
\captionsslovene: Added \glossaryname	245
spanishb 1.1	
General: \es@lsc rewritten to incorporate the procedure so far available in \roman	L
only	153
Again rewriten in full. Now that character is accesible as \dotlessi	154
Corrected \indexname to the promised text	151
dotless math i handling rewritten	154
T	158
spanish 4.0a	
General: After the . is activated, it is redefined to avoid errors if followed by a clos-	
ing brace. Changed \edef by \mathchardef. Use \babel@savevariableinstea of \noextrasspanish	
All files renamed from spanish to spanish as requested by the Spanish TeX	
list, since this style should replace the current Spanish option. Julio Sanchez	
gave up supporting his files and he has withdrawn from his TeX activities.	
The last distributed version as spanishb was 1.1	151
Introduced \ldf@finish	164
Introduced \LdfInit setup	151
Moved \let\es@activeacute\@undefined to \AtEndOfPackage	164
Test for 209 moved from sty	151
The extras subdivided into three further groups	152
spanish 4.0b	
General: Added missing \nolimits	155
Added support for custom-bib	164
Introduced \es@umlaut to allow further division in words containing gü	159
spanish 4.0c	150
General: Added missing space at the end of \es@umlaut	159

Merged \es@op@i and \es@op@a into a single command. The (re)defided commands have been changed as suggested by JoseRa Portillo and Juan Luis Varona. Now it conforms the UNE 5010 norm. Code is no longer duplicated—	;
	155
\operator@font is defined for lplain instead	154
Optimized a bit	154
•	
Removed the explicit trigonometric declaration. While some functions are pre-	
ceptive (sen, tg) some other are optional and defined in \spanishoperators.	
This is because there is no norm in Spanish and there is quite a chaos in their	
form. Restored the forms of v 1.1	
Subtituted \char\hyphenchar\font for some instances of	160
spanish 4.0d	150
General: Changed some parts for babel ins to generate the files	150
Removed the tilde settings because they are included in babel.def	159
Restored the test for \LdfInit. It is redundant for LaTeX209 but not for plain	
With a shoddy piece of work, the plain variant works (at last). Instead of	
inputting babel.def we input switch.def. To be changed, I think, since	
now plain.def is read twice	150
spanish 4.0e	
General: \es@quoting is written to the aux file, too	161
Adapted to 3.6k with some minor changes, since most of features intended for	
3.7 are included now	150
Added \leavevmode	153
Added ignorespaces to \es@dots	154
Removed duplicated \loadlocalcfg	164
Replaced all instances of allowhyphens by \bbl@allowhyphens	150
The catcode is restored in the aux file, too	159
spanish 4.0f	
General: Beginning of changes to follow the doc conventions	150
spanish 4.0g	
General: Replaced \ProvidesFile by \ProvidesLanguage	150
Restored the assignment of \operator@font which was misteriously missing	155
The code introduced the $99/03/29$ (see above) has been removed	150
spanish 4.0h	
General: Added \deactivatetilden	160
spanish 4.0i	
General: Added \bbletal	164
Replaced wrong \spanishoperators by \es@b	155
the mthesis and phdthesis text were reverted. Fixed	164
spanish 4.0j	101
General: Added shorthands for \protect following active chars. This way, they	
work in headers	159
Removed an extra line in the lplain option	155
Renamed spanish.tex as spanish.lpf	150
	100
spanish 4.0k	
General: Minor improvementes in \es@dotlessi. Now it behaves like the dot-	
lessi.sty package	
Restored the \es@op@i command, because we have to discriminate \dotlessi	
and i	155
spanish 4.0l	
General: Added the \es@activate command, which makes the shorthands more	
robust in math mode. In particular, any of them may be followed by a closing	
brace	
We make a preevaluation of acute; in math mode, the shorthand mechanism is	i
bypassed. That's done *after* the test of the protection status	161
spanish 4.1a	
General: \sptext protected	150
Added \spanishdecimal	150
Added basic code for spanish shorthands	156
Debugged and added support for the babel groups	156
Introduced the \es@delayed mechanism for "conflictive" conditionals	151
Modified \@marginparreset in order to kill the continuing guillemets	150

spanish 4.1b	
General: Added the Spanish et sign	150
spanish 4.1c	
General: Added \glossaryname	151
Added support for primes which are either 'active' or 'other'	158
Removed an unnecessary macro	159
Revised so that it now uses the babel shorthands	156
The box used in itemize made slightly smaller (.1ex)	162
spanish 4.1d	
General: Disabled if in xmltex	161
Now there are two versions of percent sign	154
Removed extra \endinput	164
Removed extra \enspace which formatted differently \item with brackets.	162
spanish 4.1f	
General: \i not used directly in the upper/lowercase list	154
The spacefactor is restored with the method used in LaTeX2e	158
spanish 4.2a	
General: Added \spanishsignitems	162
Added raised ¿ and '	160
Added the mechanism to select del or de	152
Deactivation of dot as a special case	156
Mispaced \es@enumerate and \es@itemize moved into \layoutspanish	162
Names including \acute can be formed	155
The dot is deactitated, too	152
spanish 4.2b	102
General: Added er and ER	160
If an entry toc has an empty \numberline the dot is not printed	162
swedish-1.0a	102
General: Renamed babel.sty in babel.com	198
swedish-1.0b	100
