February 25, 2021 at 08:35

2* The present implementation has a long ancestry, beginning in the summer of 1977, when Michael F. Plass and Frank M. Liang designed and coded a prototype based on some specifications that the author had made in May of that year. This original protoTeX included macro definitions and elementary manipulations on boxes and glue, but it did not have line-breaking, page-breaking, mathematical formulas, alignment routines, error recovery, or the present semantic nest; furthermore, it used character lists instead of token lists, so that a control sequence like `\halign` was represented by a list of seven characters. A complete version of TeX was designed and coded by the author in late 1977 and early 1978; that program, like its prototype, was written in the SAIL language, for which an excellent debugging system was available. Preliminary plans to convert the SAIL code into a form somewhat like the present “web” were developed by Luis Trabb Pardo and the author at the beginning of 1979, and a complete implementation was created by Ignacio A. Zabala in 1979 and 1980. The TeX82 program, which was written by the author during the latter part of 1981 and the early part of 1982, also incorporates ideas from the 1979 implementation of TeX in MESA that was written by Leonidas Guibas, Robert Sedgewick, and Douglas Wyatt at the Xerox Palo Alto Research Center. Several hundred refinements were introduced into TeX82 based on the experiences gained with the original implementations, so that essentially every part of the system has been substantially improved. After the appearance of “Version 0” in September 1982, this program benefited greatly from the comments of many other people, notably David R. Fuchs and Howard W. Trickey. A final revision in September 1989 extended the input character set to eight-bit codes and introduced the ability to hyphenate words from different languages, based on some ideas of Michael J. Ferguson.

No doubt there still is plenty of room for improvement, but the author is firmly committed to keeping TeX82 “frozen” from now on; stability and reliability are to be its main virtues.

On the other hand, the WEB description can be extended without changing the core of TeX82 itself, and the program has been designed so that such extensions are not extremely difficult to make. The *banner* string defined here should be changed whenever TeX undergoes any modifications, so that it will be clear which version of TeX might be the guilty party when a problem arises.

This program contains code for various features extending TeX, therefore this program is called ‘ ε -TeX’ and not ‘TeX’; the official name ‘TeX’ by itself is reserved for software systems that are fully compatible with each other. A special test suite called the “TRIP test” is available for helping to determine whether a particular implementation deserves to be known as ‘TeX’ [cf. Stanford Computer Science report CS1027, November 1984].

MLTeX will add new primitives changing the behaviour of TeX. The *banner* string has to be changed. We do not change the *banner* string, but will output an additional line to make clear that this is a modified TeX version.

A similar test suite called the “e-TRIP test” is available for helping to determine whether a particular implementation deserves to be known as ‘ ε -TeX’.

```

define eTeX_version = 2 { \eTeXversion }
define eTeX_revision = ".6" { \eTeXrevision }
define eTeX_version_string = "-2.6" { current  $\varepsilon$ -TeX version }
define eTeX_banner = `This_is_e-TeX,Version_3.141592653`, eTeX_version_string
    { printed when  $\varepsilon$ -TeX starts }

define pdfTeX_version = 140 { \pdfTeXversion }
define pdfTeX_revision = "22" { \pdfTeXrevision }
define pdfTeX_version_string = "-1.40.22" { current pdfTeX version }
define pdfTeX_banner = `This_is_pdfTeX,Version_3.141592653`, eTeX_version_string,
    pdfTeX_version_string { printed when pdfTeX starts }

define TeX_banner_k = `This_is_TeXk,Version_3.141592653` { printed when TeX starts }
define TeX_banner = `This_is_TeX,Version_3.141592653` { printed when TeX starts }

define banner = pdfTeX_banner
define banner_k = pdfTeX_banner

```

```

define TEX  $\equiv$  PDFTEX { change program name into PDFTEX }
define TeXXeT_code = 0 { the TeX-XqT feature is optional }
define eTeX_states = 1 { number of  $\varepsilon$ -TeX state variables in eqtb }

```

4* The program begins with a normal Pascal program heading, whose components will be filled in later, using the conventions of WEB. For example, the portion of the program called ‘⟨Global variables 13⟩’ below will be replaced by a sequence of variable declarations that starts in §13 of this documentation. In this way, we are able to define each individual global variable when we are prepared to understand what it means; we do not have to define all of the globals at once. Cross references in §13, where it says “See also sections 20, 26, ...,” also make it possible to look at the set of all global variables, if desired. Similar remarks apply to the other portions of the program heading.

```

define mtype  $\equiv$  t@&y@&p@&e { this is a WEB coding trick: }
format mtype  $\equiv$  type { ‘mtype’ will be equivalent to ‘type’ }
format type  $\equiv$  true { but ‘type’ will not be treated as a reserved word }
⟨Compiler directives 9⟩
program TEX; { all file names are defined dynamically }
const ⟨Constants in the outer block 11*⟩
mtype ⟨Types in the outer block 18⟩
var ⟨Global variables 13⟩
procedure initialize; { this procedure gets things started properly }
  var ⟨Local variables for initialization 19*⟩
  begin ⟨Initialize whatever TeX might access 8*⟩
  end;
⟨Basic printing procedures 57⟩
⟨Error handling procedures 78⟩

```

6* For Web2c, labels are not declared in the main program, but we still have to declare the symbolic names.

```

define start_of_TEX = 1 { go here when TeX’s variables are initialized }
define final_end = 9999 { this label marks the ending of the program }

```

7* Some of the code below is intended to be used only when diagnosing the strange behavior that sometimes occurs when TeX is being installed or when system wizards are fooling around with TeX without quite knowing what they are doing. Such code will not normally be compiled; it is delimited by the codewords ‘**debug ... gubed**’, with apologies to people who wish to preserve the purity of English.

Similarly, there is some conditional code delimited by ‘**stat ... tats**’ that is intended for use when statistics are to be kept about TeX’s memory usage. The **stat ... tats** code also implements diagnostic information for `\tracingparagraphs`, `\tracingpages`, and `\tracingrestores`.

```

define debug  $\equiv$  ifdef(‘TEXMF_DEBUG’)
define gubed  $\equiv$  endif(‘TEXMF_DEBUG’)
format debug  $\equiv$  begin
format gubed  $\equiv$  end

define stat  $\equiv$  ifdef(‘STAT’)
define tats  $\equiv$  endif(‘STAT’)
format stat  $\equiv$  begin
format tats  $\equiv$  end

```

8* This program has two important variations: (1) There is a long and slow version called **INITEX**, which does the extra calculations needed to initialize T_EX’s internal tables; and (2) there is a shorter and faster production version, which cuts the initialization to a bare minimum. Parts of the program that are needed in (1) but not in (2) are delimited by the codewords ‘**init** . . . **tini**’ for declarations and by the codewords ‘**Init** . . . **Tini**’ for executable code. This distinction is helpful for implementations where a run-time switch differentiates between the two versions of the program.

```

define init  $\equiv$  ifdef(‘INITEX’)
define tini  $\equiv$  endif(‘INITEX’)
define Init  $\equiv$ 
  init
  if ini_version then
    begin
define Tini  $\equiv$ 
  end ; tini
format Init  $\equiv$  begin
format Tini  $\equiv$  end
format init  $\equiv$  begin
format tini  $\equiv$  end

```

⟨ Initialize whatever T_EX might access [8*](#) ⟩ \equiv

⟨ Set initial values of key variables [21](#) ⟩

Init ⟨ Initialize table entries (done by **INITEX** only) [182](#) ⟩ **Tini**

See also section [1909*](#).

This code is used in section [4*](#).

11* The following parameters can be changed at compile time to extend or reduce T_EX's capacity. They may have different values in INITEX and in production versions of T_EX.

```

define file_name_size  $\equiv$  maxint
define ssup_error_line = 255
define ssup_max_strings  $\equiv$  2097151
      { Larger values than 65536 cause the arrays to consume much more memory. }
define ssup_trie_opcode  $\equiv$  65535
define ssup_trie_size  $\equiv$  "3FFFFFFF
define ssup_hyph_size  $\equiv$  65535 { Changing this requires changing (un)dumping! }
define infn_hyphen_size  $\equiv$  610 { Must be not less than hyph_prime! }
define max_font_max = 9000 { maximum number of internal fonts; this can be increased, but
      hash_size + max_font_max should not exceed 29000. }
define font_base = 0 { smallest internal font number; must be  $\geq$  min_quarterword; do not change this
      without modifying the dynamic definition of the font arrays. }

```

(Constants in the outer block 11*) \equiv

```

hash_offset = 514; { smallest index in hash array, i.e., hash_base }
      { Use hash_offset = 0 for compilers which cannot decrement pointers. }
trie_op_size = 35111;
      { space for "opcodes" in the hyphenation patterns; best if relatively prime to 313, 361, and 1009. }
neg_trie_op_size = -35111; { for lower trie_op_hash array bound; must be equal to  $-trie\_op\_size$ . }
min_trie_op = 0; { first possible trie op code for any language }
max_trie_op = ssup_trie_opcode; { largest possible trie opcode for any language }
pool_name = TEXMF_POOL_NAME; { this is configurable, for the sake of ML-TEX }
      { string of length file_name_size; tells where the string pool appears }
engine_name = TEXMF_ENGINE_NAME; { the name of this engine }

inf_mem_bot = 0; sup_mem_bot = 1; inf_main_memory = 3000; sup_main_memory = 256000000;

inf_hyph_size = infn_hyphen_size; { Must be not less than hyph_prime! }
inf_expand_depth = 10; sup_expand_depth = 10000000;

```

See also sections 675, 679, 695, 721, and 1628.

This code is used in section 4*.

12* Like the preceding parameters, the following quantities can be changed at compile time to extend or reduce TEX's capacity. But if they are changed, it is necessary to rerun the initialization program INITEX to generate new tables for the production TEX program. One can't simply make helter-skelter changes to the following constants, since certain rather complex initialization numbers are computed from them. They are defined here using WEB macros, instead of being put into Pascal's **const** list, in order to emphasize this distinction.

```
define hash_size = 15000 { maximum number of control sequences; it should be at most about
                           (mem_max - mem_min)/10; see also font_max }
define hash_prime = 8501 { a prime number equal to about 85% of hash_size }
define hyph_prime = 607 { another prime for hashing \hyphenation exceptions; if you change this,
                           you should also change inf_hyphen_size. }
```

16* Here are some macros for common programming idioms.

```
define negate(#) ≡ # ← -# { change the sign of a variable }
define loop ≡ while true do { repeat over and over until a goto happens }
format loop ≡ xclause { WEB's xclause acts like 'while true do' }
define do_nothing ≡ { empty statement }
define return ≡ goto exit { terminate a procedure call }
format return ≡ nil
define empty = 0 { symbolic name for a null constant }
```

19* The original Pascal compiler was designed in the late 60s, when six-bit character sets were common, so it did not make provision for lowercase letters. Nowadays, of course, we need to deal with both capital and small letters in a convenient way, especially in a program for typesetting; so the present specification of T_EX has been written under the assumption that the Pascal compiler and run-time system permit the use of text files with more than 64 distinguishable characters. More precisely, we assume that the character set contains at least the letters and symbols associated with ASCII codes '40 through '176; all of these characters are now available on most computer terminals.

Since we are dealing with more characters than were present in the first Pascal compilers, we have to decide what to call the associated data type. Some Pascals use the original name *char* for the characters in text files, even though there now are more than 64 such characters, while other Pascals consider *char* to be a 64-element subrange of a larger data type that has some other name.

In order to accommodate this difference, we shall use the name *text_char* to stand for the data type of the characters that are converted to and from *ASCII_code* when they are input and output. We shall also assume that *text_char* consists of the elements *chr(first_text_char)* through *chr(last_text_char)*, inclusive. The following definitions should be adjusted if necessary.

define *text_char* \equiv *ASCII_code* { the data type of characters in text files }

define *first_text_char* = 0 { ordinal number of the smallest element of *text_char* }

define *last_text_char* = 255 { ordinal number of the largest element of *text_char* }

\langle Local variables for initialization 19* $\rangle \equiv$

i: *integer*;

See also sections 181 and 1102.

This code is used in section 4*.

20* The T_EX processor converts between ASCII code and the user's external character set by means of arrays *xord* and *xchr* that are analogous to Pascal's *ord* and *chr* functions.

(Global variables 13) +≡

```

xord: array [text_char] of ASCII_code; { specifies conversion of input characters }
xchr: array [ASCII_code] of text_char; { specifies conversion of output characters }
xprn: array [ASCII_code] of ASCII_code; { non zero iff character is printable }
mubyte_read: array [ASCII_code] of pointer; { non zero iff character begins the multi byte code }
mubyte_write: array [ASCII_code] of str_number;
    { non zero iff character expands to multi bytes in log and write files }
mubyte_cswrite: array [0 .. 127] of pointer;
    { non null iff cs mod 128 expands to multi bytes in log and write files }
mubyte_skip: integer; { the number of bytes to skip in buffer }
mubyte_keep: integer; { the number of chars we need to keep unchanged }
mubyte_skeep: integer; { saved mubyte_keep }
mubyte_prefix: integer; { the type of mubyte prefix }
mubyte_tablein: boolean; { the input side of table will be updated }
mubyte_tableout: boolean; { the output side of table will be updated }
mubyte_relax: boolean; { the relax prefix is used }
mubyte_start: boolean; { we are making the token at the start of the line }
mubyte_sstart: boolean; { saved mubyte_start }
mubyte_token: pointer; { the token returned by read_buffer }
mubyte_stoken: pointer; { saved first token in mubyte primitive }
mubyte_sout: integer; { saved value of mubyte_out }
mubyte_slog: integer; { saved value of mubyte_log }
spec_sout: integer; { saved value of spec_out }
no_convert: boolean; { conversion suppressed by noconvert primitive }
active_noconvert: boolean; { true if noconvert primitive is active }
write_noexpanding: boolean; { true only if we need not write expansion }
cs_converting: boolean; { true only if we need csname converting }
special_printing: boolean; { true only if we need converting in special }
message_printing: boolean; { true if message or errmessage prints to string }

```

23* The ASCII code is “standard” only to a certain extent, since many computer installations have found it advantageous to have ready access to more than 94 printing characters. Appendix C of *The TeXbook* gives a complete specification of the intended correspondence between characters and TeX’s internal representation.

If TeX is being used on a garden-variety Pascal for which only standard ASCII codes will appear in the input and output files, it doesn’t really matter what codes are specified in *xchr*[0 .. ‘37], but the safest policy is to blank everything out by using the code shown below.

However, other settings of *xchr* will make TeX more friendly on computers that have an extended character set, so that users can type things like ‘#’ instead of ‘\ne’. People with extended character sets can assign codes arbitrarily, giving an *xchr* equivalent to whatever characters the users of TeX are allowed to have in their input files. It is best to make the codes correspond to the intended interpretations as shown in Appendix C whenever possible; but this is not necessary. For example, in countries with an alphabet of more than 26 letters, it is usually best to map the additional letters into codes less than ‘40. To get the most “permissive” character set, change ‘_’ on the right of these assignment statements to *chr*(*i*).

⟨Set initial values of key variables 21⟩ +≡

```
{ Initialize xchr to the identity mapping. }
for i ← 0 to ‘37 do xchr[i] ← i;
for i ← ‘177 to ‘377 do xchr[i] ← i; { Initialize encTeX data. }
for i ← 0 to 255 do mubyte_read[i] ← null;
for i ← 0 to 255 do mubyte_write[i] ← 0;
for i ← 0 to 127 do mubyte_cswrite[i] ← null;
mubyte_keep ← 0; mubyte_start ← false; write_noexpanding ← false; cs_converting ← false;
special_printing ← false; message_printing ← false; no_convert ← false; active_noconvert ← false;
```

24* The following system-independent code makes the *xord* array contain a suitable inverse to the information in *xchr*. Note that if *xchr*[*i*] = *xchr*[*j*] where *i* < *j* < ‘177, the value of *xord*[*xchr*[*i*]] will turn out to be *j* or more; hence, standard ASCII code numbers will be used instead of codes below ‘40 in case there is a coincidence.

⟨Set initial values of key variables 21⟩ +≡

```
for i ← first_text_char to last_text_char do xord[chr(i)] ← invalid_code;
for i ← ‘200 to ‘377 do xord[xchr[i]] ← i;
for i ← 0 to ‘176 do xord[xchr[i]] ← i; { Set xprn for printable ASCII, unless eight_bit_p is set. }
for i ← 0 to 255 do xprn[i] ← (eight_bit_p ∨ ((i ≥ “_” ∧ (i ≤ “~”))); { The idea for this dynamic
translation comes from the patch by Libor Skarvada <libor@informatics.muni.cz> and Petr
Sojka <sojka@informatics.muni.cz>. I didn’t use any of the actual code, though, preferring a
more general approach. }
{ This updates the xchr, xord, and xprn arrays from the provided translate_filename. See the
function definition in texmfmp.c for more comments. }
if translate_filename then read_tcx_file;
```

26* Most of what we need to do with respect to input and output can be handled by the I/O facilities that are standard in Pascal, i.e., the routines called *get*, *put*, *eof*, and so on. But standard Pascal does not allow file variables to be associated with file names that are determined at run time, so it cannot be used to implement T_EX; some sort of extension to Pascal’s ordinary *reset* and *rewrite* is crucial for our purposes. We shall assume that *name_of_file* is a variable of an appropriate type such that the Pascal run-time system being used to implement T_EX can open a file whose external name is specified by *name_of_file*.

```
(Global variables 13) +=
name_of_file: ↑text_char;
name_length: 0 .. file_name_size;
{ this many characters are actually relevant in name_of_file (the rest are blank) }
```

27* All of the file opening functions are defined in C.

28* And all the file closing routines as well.

30* Input from text files is read one line at a time, using a routine called *input_ln*. This function is defined in terms of global variables called *buffer*, *first*, and *last* that will be described in detail later; for now, it suffices for us to know that *buffer* is an array of *ASCII_code* values, and that *first* and *last* are indices into this array representing the beginning and ending of a line of text.

```
(Global variables 13) +=
buffer: ↑ASCII_code; { lines of characters being read }
first: 0 .. buf_size; { the first unused position in buffer }
last: 0 .. buf_size; { end of the line just input to buffer }
max_buf_stack: 0 .. buf_size; { largest index used in buffer }
```

31* The *input_ln* function brings the next line of input from the specified file into available positions of the buffer array and returns the value *true*, unless the file has already been entirely read, in which case it returns *false* and sets *last* ← *first*. In general, the *ASCII_code* numbers that represent the next line of the file are input into *buffer[first]*, *buffer[first + 1]*, . . . , *buffer[last − 1]*; and the global variable *last* is set equal to *first* plus the length of the line. Trailing blanks are removed from the line; thus, either *last* = *first* (in which case the line was entirely blank) or *buffer[last − 1] ≠ "␣"*.

An overflow error is given, however, if the normal actions of *input_ln* would make *last* ≥ *buf_size*; this is done so that other parts of T_EX can safely look at the contents of *buffer[last + 1]* without overstepping the bounds of the *buffer* array. Upon entry to *input_ln*, the condition *first* < *buf_size* will always hold, so that there is always room for an “empty” line.

The variable *max_buf_stack*, which is used to keep track of how large the *buf_size* parameter must be to accommodate the present job, is also kept up to date by *input_ln*.

If the *bypass_eoln* parameter is *true*, *input_ln* will do a *get* before looking at the first character of the line; this skips over an *eoln* that was in *f*↑. The procedure does not do a *get* when it reaches the end of the line; therefore it can be used to acquire input from the user’s terminal as well as from ordinary text files.

Standard Pascal says that a file should have *eoln* immediately before *eof*, but T_EX needs only a weaker restriction: If *eof* occurs in the middle of a line, the system function *eoln* should return a *true* result (even though *f*↑ will be undefined).

Since the inner loop of *input_ln* is part of T_EX’s “inner loop”—each character of input comes in at this place—it is wise to reduce system overhead by making use of special routines that read in an entire array of characters at once, if such routines are available. The following code uses standard Pascal to illustrate what needs to be done, but finer tuning is often possible at well-developed Pascal sites.

We define *input_ln* in C, for efficiency. Nevertheless we quote the module ‘Report overflow of the input buffer, and abort’ here in order to make WEAVE happy, since part of that module is needed by e-TeX.

```
@{Report overflow of the input buffer, and abort 35*}@}
```

32* The user's terminal acts essentially like other files of text, except that it is used both for input and for output. When the terminal is considered an input file, the file variable is called *term_in*, and when it is considered an output file the file variable is *term_out*.

```

define term_in  $\equiv$  stdin { the terminal as an input file }
define term_out  $\equiv$  stdout { the terminal as an output file }

33* Here is how to open the terminal files. *t_open_out* does nothing. *t_open_in*, on the other hand, does the work of “rescanning,” or getting any command line arguments the user has provided. It’s defined in C.

```
define t_open_out ≡ { output already open for text output }
```

34* Sometimes it is necessary to synchronize the input/output mixture that happens on the user’s terminal, and three system-dependent procedures are used for this purpose. The first of these, *update_terminal*, is called when we want to make sure that everything we have output to the terminal so far has actually left the computer’s internal buffers and been sent. The second, *clear_terminal*, is called when we wish to cancel any input that the user may have typed ahead (since we are about to issue an unexpected error message). The third, *wake_up_terminal*, is supposed to revive the terminal if the user has disabled it by some instruction to the operating system. The following macros show how these operations can be specified with UNIX. *update_terminal* does an *fflush*. *clear_terminal* is redefined to do nothing, since the user should control the terminal.

```

define update_terminal ≡ fflush(term_out)
define clear_terminal ≡ do_nothing
define wake_up_terminal ≡ do_nothing { cancel the user’s cancellation of output }

```

35* We need a special routine to read the first line of T_EX input from the user's terminal. This line is different because it is read before we have opened the transcript file; there is sort of a "chicken and egg" problem here. If the user types '`\input paper`' on the first line, or if some macro invoked by that line does such an `\input`, the transcript file will be named '`paper.log`'; but if no `\input` commands are performed during the first line of terminal input, the transcript file will acquire its default name '`texput.log`'. (The transcript file will not contain error messages generated by the first line before the first `\input` command.)

The first line is even more special if we are lucky enough to have an operating system that treats T_EX differently from a run-of-the-mill Pascal object program. It's nice to let the user start running a T_EX job by typing a command line like '`tex paper`'; in such a case, T_EX will operate as if the first line of input were '`paper`', i.e., the first line will consist of the remainder of the command line, after the part that invoked T_EX.

The first line is special also because it may be read before T_EX has input a format file. In such cases, normal error messages cannot yet be given. The following code uses concepts that will be explained later. (If the Pascal compiler does not support non-local `goto`, the statement '`goto final_end`' should be replaced by something that quietly terminates the program.)

Routine is implemented in C; part of module is, however, needed for e-TeX.

(Report overflow of the input buffer, and abort **35***) \equiv

```
begin cur_input.loc_field  $\leftarrow$  first; cur_input.limit_field  $\leftarrow$  last - 1; overflow("buffer_size", buf_size);
end
```

This code is used in sections **31*** and **1753**.

37* The following program does the required initialization. If anything has been specified on the command line, then `t_open_in` will return with `last > first`.

function `init_terminal`: *boolean*; { gets the terminal input started }

```
  label exit;
  begin t_open_in;
  if last > first then
    begin loc  $\leftarrow$  first;
    while (loc < last)  $\wedge$  (buffer[loc] = ^_) do incr(loc);
    if loc < last then
      begin init_terminal  $\leftarrow$  true; goto exit;
      end;
    end;
  loop begin wake_up_terminal; write(term_out, ^**^); update_terminal;
  if  $\neg$ input_ln(term_in, true) then { this shouldn't happen }
    begin write_ln(term_out); write_ln(term_out, ^!_End_of_file_on_the_terminal..._why?^);
    init_terminal  $\leftarrow$  false; return;
    end;
  loc  $\leftarrow$  first;
  while (loc < last)  $\wedge$  (buffer[loc] = " ") do incr(loc);
  if loc < last then
    begin init_terminal  $\leftarrow$  true; return; { return unless the line was all blank }
    end;
  write_ln(term_out, ^Please_type_the_name_of_your_input_file.^);
  end;
exit: end;
```

38* String handling. Control sequence names and diagnostic messages are variable-length strings of eight-bit characters. Since Pascal does not have a well-developed string mechanism, TeX does all of its string processing by homegrown methods.

Elaborate facilities for dynamic strings are not needed, so all of the necessary operations can be handled with a simple data structure. The array *str_pool* contains all of the (eight-bit) ASCII codes in all of the strings, and the array *str_start* contains indices of the starting points of each string. Strings are referred to by integer numbers, so that string number *s* comprises the characters *str_pool*[*j*] for *str_start*[*s*] ≤ *j* < *str_start*[*s* + 1]. Additional integer variables *pool_ptr* and *str_ptr* indicate the number of entries used so far in *str_pool* and *str_start*, respectively; locations *str_pool*[*pool_ptr*] and *str_start*[*str_ptr*] are ready for the next string to be allocated.

String numbers 0 to 255 are reserved for strings that correspond to single ASCII characters. This is in accordance with the conventions of WEB, which converts single-character strings into the ASCII code number of the single character involved, while it converts other strings into integers and builds a string pool file. Thus, when the string constant "." appears in the program below, WEB converts it into the integer 46, which is the ASCII code for a period, while WEB will convert a string like "hello" into some integer greater than 255. String number 46 will presumably be the single character '.'; but some ASCII codes have no standard visible representation, and TeX sometimes needs to be able to print an arbitrary ASCII character, so the first 256 strings are used to specify exactly what should be printed for each of the 256 possibilities.

Elements of the *str_pool* array must be ASCII codes that can actually be printed; i.e., they must have an *xchr* equivalent in the local character set. (This restriction applies only to preloaded strings, not to those generated dynamically by the user.)

Some Pascal compilers won't pack integers into a single byte unless the integers lie in the range −128 .. 127. To accommodate such systems we access the string pool only via macros that can easily be redefined.

```
define si(#) ≡ # { convert from ASCII_code to packed_ASCII_code }
define so(#) ≡ # { convert from packed_ASCII_code to ASCII_code }
```

<Types in the outer block 18> +≡

```
pool_pointer = integer; { for variables that point into str_pool }
str_number = 0 .. ssup_max_strings; { for variables that point into str_start }
packed_ASCII_code = 0 .. 255; { elements of str_pool array }
```

39* <Global variables 13> +≡

```
str_pool: ↑packed_ASCII_code; { the characters }
str_start: ↑pool_pointer; { the starting pointers }
pool_ptr: pool_pointer; { first unused position in str_pool }
str_ptr: str_number; { number of the current string being created }
init_pool_ptr: pool_pointer; { the starting value of pool_ptr }
init_str_ptr: str_number; { the starting value of str_ptr }
```

47* The initial values of *str_pool*, *str_start*, *pool_ptr*, and *str_ptr* are computed by the INITEX program, based in part on the information that WEB has output while processing TeX.

<Declare additional routines for string recycling 1873*>

```
init function get_strings_started: boolean;
    { initializes the string pool, but returns false if something goes wrong }
label done, exit;
var k, l: 0 .. 255; { small indices or counters }
    g: str_number; { garbage }
begin pool_ptr ← 0; str_ptr ← 0; str_start[0] ← 0; <Make the first 256 strings 48>;
    <Read the other strings from the TEX.POOL file and return true, or give an error message and return
        false 51*>;
exit: end;
tini
```

49* The first 128 strings will contain 95 standard ASCII characters, and the other 33 characters will be printed in three-symbol form like ‘`^^A`’ unless a system-dependent change is made here. Installations that have an extended character set, where for example $xchr[32] = \text{'\#'}'$, would like string `'32` to be printed as the single character `'32` instead of the three characters `'136`, `'136`, `'132` (`^^Z`). On the other hand, even people with an extended character set will want to represent string `'15` by `^^M`, since `'15` is *carriage_return*; the idea is to produce visible strings instead of tabs or line-feeds or carriage-returns or bell-rings or characters that are treated anomalously in text files.

Unprintable characters of codes 128–255 are, similarly, rendered `^^80–^^ff`.

The boolean expression defined here should be *true* unless T_EX internal code number k corresponds to a non-troublesome visible symbol in the local character set. An appropriate formula for the extended character set recommended in *The T_EXbook* would, for example, be $k \in [0, '10 \dots '12, '14, '15, '33, '177 \dots '377]$. If character k cannot be printed, and $k < '200$, then character $k + '100$ or $k - '100$ must be printable; moreover, ASCII codes $['41 \dots '46, '60 \dots '71, '136, '141 \dots '146, '160 \dots '171]$ must be printable. Thus, at least 80 printable characters are needed.

`< Character k cannot be printed 49* > \equiv
 $(k < \text{"_"}) \vee (k > \text{"~"})$`

This code is used in section 48.

51* `< Read the other strings from the TEX.POOL file and return true, or give an error message and return false 51* > \equiv
 $g \leftarrow \text{loadpoolstrings}((\text{pool_size} - \text{string_vacancies}))$;
if $g = 0$ then
 begin wake_up_terminal; write_ln(term_out, ‘!_You_have_to_increase_POOLSIZE.’);
 $\text{get_strings_started} \leftarrow \text{false}$; return;
 end;
 $\text{get_strings_started} \leftarrow \text{true}$;`

This code is used in section 47*.

52* Empty module

53* Empty module

54* On-line and off-line printing. Messages that are sent to a user's terminal and to the transcript-log file are produced by several '*print*' procedures. These procedures will direct their output to a variety of places, based on the setting of the global variable *selector*, which has the following possible values:

term_and_log, the normal setting, prints on the terminal and on the transcript file.

log_only, prints only on the transcript file.

term_only, prints only on the terminal.

no_print, doesn't print at all. This is used only in rare cases before the transcript file is open.

pseudo, puts output into a cyclic buffer that is used by the *show_context* routine; when we get to that routine we shall discuss the reasoning behind this curious mode.

new_string, appends the output to the current string in the string pool.

0 to 15, prints on one of the sixteen files for `\write` output.

The symbolic names '*term_and_log*', etc., have been assigned numeric codes that satisfy the convenient relations $no_print + 1 = term_only$, $no_print + 2 = log_only$, $term_only + 2 = log_only + 1 = term_and_log$.

Three additional global variables, *tally* and *term_offset* and *file_offset*, record the number of characters that have been printed since they were most recently cleared to zero. We use *tally* to record the length of (possibly very long) stretches of printing; *term_offset* and *file_offset*, on the other hand, keep track of how many characters have appeared so far on the current line that has been output to the terminal or to the transcript file, respectively.

```
define no_print = 16 { selector setting that makes data disappear }
define term_only = 17 { printing is destined for the terminal only }
define log_only = 18 { printing is destined for the transcript file only }
define term_and_log = 19 { normal selector setting }
define pseudo = 20 { special selector setting for show_context }
define new_string = 21 { printing is deflected to the string pool }
define max_selector = 21 { highest selector setting }
```

⟨Global variables 13⟩ +≡

log_file: *alpha_file*; { transcript of TeX session }

selector: 0 .. *max_selector*; { where to print a message }

dig: **array** [0 .. 22] **of** 0 .. 15; { digits in a number being output }

tally: *integer*; { the number of characters recently printed }

term_offset: 0 .. *max_print_line*; { the number of characters on the current terminal line }

file_offset: 0 .. *max_print_line*; { the number of characters on the current file line }

trick_buf: **array** [0 .. *ssup_error_line*] **of** *ASCII_code*; { circular buffer for pseudoprinting }

trick_count: *integer*; { threshold for pseudoprinting, explained later }

first_count: *integer*; { another variable for pseudoprinting }

59* An entire string is output by calling *print*. Note that if we are outputting the single standard ASCII character *c*, we could call *print*("c"), since "c" = 99 is the number of a single-character string, as explained above. But *print_char*("c") is quicker, so T_EX goes directly to the *print_char* routine when it knows that this is safe. (The present implementation assumes that it is always safe to print a visible ASCII character.)

⟨ Basic printing procedures 57 ⟩ +≡

```

procedure print(s : integer); { prints string s }
  label exit;
  var j: pool_pointer; { current character code position }
      nl: integer; { new-line character to restore }
  begin if s ≥ str_ptr then s ← "???" { this can't happen }
  else if s < 256 then
    if s < 0 then s ← "???" { can't happen }
    else begin if (selector > pseudo) ∧ (¬special_printing) ∧ (¬message_printing) then
      begin print_char(s); return; { internal strings are not expanded }
    end;
    if ((Character s is the current new-line character 262)) then
      if selector < pseudo then
        begin print_ln; no_convert ← false; return;
      end
      else if message_printing then
        begin print_char(s); no_convert ← false; return;
      end;
    if (mubyte_log > 0) ∧ (¬no_convert) ∧ (mubyte_write[s] > 0) then s ← mubyte_write[s]
    else if xprn[s] ∨ special_printing then
      begin print_char(s); no_convert ← false; return;
    end;
    no_convert ← false; nl ← new_line_char; new_line_char ← -1;
    { temporarily disable new-line character }
    j ← str_start[s];
    while j < str_start[s + 1] do
      begin print_char(so(str_pool[j])); incr(j);
    end;
    new_line_char ← nl; return;
  end;
  j ← str_start[s];
  while j < str_start[s + 1] do
    begin print_char(so(str_pool[j])); incr(j);
  end;
exit: end;

```

61* Here is the very first thing that T_EX prints: a headline that identifies the version number and format package. The *term_offset* variable is temporarily incorrect, but the discrepancy is not serious since we assume that this part of the program is system dependent.

```

⟨Initialize the output routines 55⟩ +≡
if src_specials_p ∨ file_line_error_style_p ∨ parse_first_line_p then wterm(banner_k)
  else wterm(banner);
  wterm(version_string);
  if format_ident = 0 then wterm_ln(`_(preloaded_format=`, dump_name, `)`)
else begin slow_print(format_ident); print_ln;
  end;
if shellenabledp then
  begin wterm(`_`);
  if restrictedshell then
    begin wterm(`restricted_`);
    end;
  wterm_ln(`\write18_enabled.`);
  end;
if src_specials_p then
  begin wterm_ln(`_Source_specials_enabled.`);
  end;
if translate_filename then
  begin wterm(`_`); fputs(translate_filename, stdout); wterm_ln(` `);
  end;
update_terminal;

```

71* Here is a procedure that asks the user to type a line of input, assuming that the *selector* setting is either *term_only* or *term_and_log*. The input is placed into locations *first* through *last* − 1 of the *buffer* array, and echoed on the transcript file if appropriate.

This procedure is never called when *interaction* < *scroll_mode*.

```

define prompt_input(#) ≡
  begin wake_up_terminal; print(#); term_input;
  end { prints a string and gets a line of input }

procedure term_input; { gets a line from the terminal }
  var k: 0 .. buf_size; { index into buffer }
  begin update_terminal; { now the user sees the prompt for sure }
  if ¬input_ln(term_in, true) then fatal_error("End_of_file_on_the_terminal!");
  term_offset ← 0; { the user's line ended with ⟨return⟩ }
  decr(selector); { prepare to echo the input }
  k ← first;
  while k < last do
    begin print_buffer(k)
    end;
  print_ln; incr(selector); { restore previous status }
end;

```

73* The global variable *interaction* has four settings, representing increasing amounts of user interaction:

```

define batch_mode = 0 { omits all stops and omits terminal output }
define nonstop_mode = 1 { omits all stops }
define scroll_mode = 2 { omits error stops }
define error_stop_mode = 3 { stops at every opportunity to interact }
define unspecified_mode = 4 { extra value for command-line switch }
define print_err(#) ≡
    begin if interaction = error_stop_mode then wake_up_terminal;
    if file_line_error_style_p then print_file_line
    else print_nl("!␣");
    print(#);
    end

```

⟨Global variables 13⟩ +≡

```

interaction: batch_mode .. error_stop_mode; { current level of interaction }
interaction_option: batch_mode .. unspecified_mode; { set from command line }

```

74* ⟨Set initial values of key variables 21⟩ +≡

```

if interaction_option = unspecified_mode then interaction ← error_stop_mode
else interaction ← interaction_option;

```

81* The *jump_out* procedure just cuts across all active procedure levels. The body of *jump_out* simply calls ‘*close_files_and_terminate*;’ followed by a call on some system procedure that quietly terminates the program.

```

format noreturn ≡ procedure
define do_final_end ≡
    begin update_terminal; ready_already ← 0;
    if (history ≠ spotless) ∧ (history ≠ warning-issued) then uexit(1)
    else uexit(0);
    end

```

⟨Error handling procedures 78⟩ +≡

```

noreturn procedure jump_out;
    begin close_files_and_terminate; do_final_end;
    end;

```

82* Here now is the general *error* routine.

⟨Error handling procedures 78⟩ +≡

```
procedure error; { completes the job of error reporting }
  label continue, exit;
  var c: ASCII_code; { what the user types }
      s1, s2, s3, s4: integer; { used to save global variables when deleting tokens }
  begin if history < error_message_issued then history ← error_message_issued;
      print_char("."); show_context;
      if (halt_on_error_p) then
        begin history ← fatal_error_stop; jump_out;
        end;
      if interaction = error_stop_mode then ⟨Get user's advice and return 83⟩;
      incr(error_count);
      if error_count = 100 then
        begin print_nl("(That_makes_100_errors;_please_try_again.)"); history ← fatal_error_stop;
        jump_out;
        end;
      ⟨Put help message on the transcript file 90⟩;
exit: end;
```

84* It is desirable to provide an ‘E’ option here that gives the user an easy way to return from TEX to the system editor, with the offending line ready to be edited. We do this by calling the external procedure *call_edit* with a pointer to the filename, its length, and the line number. However, here we just set up the variables that will be used as arguments, since we don’t want to do the switch-to-editor until after TeX has closed its files.

There is a secret ‘D’ option available when the debugging routines haven’t been commented out.

```
define edit_file ≡ input_stack[base_ptr]
⟨Interpret code c and return if done 84*⟩ ≡
  case c of
    "0", "1", "2", "3", "4", "5", "6", "7", "8", "9": if deletions_allowed then
      ⟨Delete c – "0" tokens and goto continue 88⟩;
  debug "D": begin debug_help; goto continue; end; gubed
  "E": if base_ptr > 0 then
    if input_stack[base_ptr].name_field ≥ 256 then
      begin edit_name_start ← str_start[edit_file.name_field];
      edit_name_length ← str_start[edit_file.name_field + 1] – str_start[edit_file.name_field];
      edit_line ← line; jump_out;
      end;
  "H": ⟨Print the help information and goto continue 89⟩;
  "I": ⟨Introduce new material from the terminal and return 87⟩;
  "Q", "R", "S": ⟨Change the interaction level and return 86⟩;
  "X": begin interaction ← scroll_mode; jump_out;
  end;
othercases do_nothing
endcases;
⟨Print the menu of available options 85⟩
```

This code is used in section 83.

93* The following procedure prints T_EX's last words before dying.

```

define succumb ≡
  begin if interaction = error_stop_mode then interaction ← scroll_mode;
    { no more interaction }

  debug if interaction > batch_mode then debug_help;
  gubed
  history ← fatal_error_stop; jump_out; { irrecoverable error }
  end

⟨Error handling procedures 78⟩ +=
noreturn procedure fatal_error(s : str_number); { prints s, and that's it }
  begin normalize_selector;
  print_err("Emergency_stop"); help1(s); succumb;
  end;

```

94* Here is the most dreaded error message.

```

⟨Error handling procedures 78⟩ +=
noreturn procedure overflow(s : str_number; n : integer); { stop due to finiteness }
  begin normalize_selector; print_err("TEX_capacity_exceeded, sorry"); print(s);
  print_char("="); print_int(n); print_char("");
  help2("If you really absolutely need more capacity,")
  ("you can ask a wizard to enlarge me."); succumb;
  end;

```

95* The program might sometime run completely amok, at which point there is no choice but to stop. If no previous error has been detected, that's bad news; a message is printed that is really intended for the T_EX maintenance person instead of the user (unless the user has been particularly diabolical). The index entries for 'this can't happen' may help to pinpoint the problem.

```

⟨Error handling procedures 78⟩ +=
noreturn procedure confusion(s : str_number); { consistency check violated; s tells where }
  begin normalize_selector;
  if history < error_message_issued then
    begin print_err("This can't happen"); print(s); print_char("");

    end
  else begin print_err("I can't go on meeting you like this");
    help2("One of your faux pas seems to have wounded me deeply...")
    ("in fact, I'm barely conscious. Please fix it and try again.");
    end;
  succumb;
  end;

```

104* Physical sizes that a TeX user specifies for portions of documents are represented internally as scaled points. Thus, if we define an ‘sp’ (scaled point) as a unit equal to 2^{-16} printer’s points, every dimension inside of TeX is an integer number of sp. There are exactly 4,736,286.72 sp per inch. Users are not allowed to specify dimensions larger than $2^{30} - 1$ sp, which is a distance of about 18.892 feet (5.7583 meters); two such quantities can be added without overflow on a 32-bit computer.

The present implementation of TeX does not check for overflow when dimensions are added or subtracted. This could be done by inserting a few dozen tests of the form ‘**if** $x \geq '10000000000$ **then** *report_overflow*’, but the chance of overflow is so remote that such tests do not seem worthwhile.

TeX needs to do only a few arithmetic operations on scaled quantities, other than addition and subtraction, and the following subroutines do most of the work. A single computation might use several subroutine calls, and it is desirable to avoid producing multiple error messages in case of arithmetic overflow; so the routines set the global variable *arith_error* to *true* instead of reporting errors directly to the user. Another global variable, *remainder*, holds the remainder after a division.

define *remainder* \equiv *tex_remainder*

⟨Global variables 13⟩ +=

arith_error: *boolean*; { has arithmetic overflow occurred recently? }

remainder: *scaled*; { amount subtracted to get an exact division }

109* When TeX “packages” a list into a box, it needs to calculate the proportionality ratio by which the glue inside the box should stretch or shrink. This calculation does not affect TeX’s decision making, so the precise details of rounding, etc., in the glue calculation are not of critical importance for the consistency of results on different computers.

We shall use the type *glue_ratio* for such proportionality ratios. A glue ratio should take the same amount of memory as an *integer* (usually 32 bits) if it is to blend smoothly with TeX’s other data structures. Thus *glue_ratio* should be equivalent to *short_real* in some implementations of Pascal. Alternatively, it is possible to deal with glue ratios using nothing but fixed-point arithmetic; see *TUGboat* 3,1 (March 1982), 10–27. (But the routines cited there must be modified to allow negative glue ratios.)

define *set_glue_ratio_zero*(#) \equiv # \leftarrow 0.0 { store the representation of zero ratio }

define *set_glue_ratio_one*(#) \equiv # \leftarrow 1.0 { store the representation of unit ratio }

define *float*(#) \equiv # { convert from *glue_ratio* to type *real* }

define *unfloat*(#) \equiv # { convert from *real* to type *glue_ratio* }

define *float_constant*(#) \equiv #.0 { convert *integer* constant to *real* }

⟨Types in the outer block 18⟩ +=

128* **Packed data.** In order to make efficient use of storage space, T_EX bases its major data structures on a *memory_word*, which contains either a (signed) integer, possibly scaled, or a (signed) *glue_ratio*, or a small number of fields that are one half or one quarter of the size used for storing integers.

If x is a variable of type *memory_word*, it contains up to four fields that can be referred to as follows:

$x.int$	(an <i>integer</i>)
$x.sc$	(a <i>scaled integer</i>)
$x.gr$	(a <i>glue_ratio</i>)
$x.hh.lh, x.hh.rh$	(two halfword fields)
$x.hh.b0, x.hh.b1, x.hh.rh$	(two quarterword fields, one halfword field)
$x.qqqq.b0, x.qqqq.b1, x.qqqq.b2, x.qqqq.b3$	(four quarterword fields)

This is somewhat cumbersome to write, and not very readable either, but macros will be used to make the notation shorter and more transparent. The Pascal code below gives a formal definition of *memory_word* and its subsidiary types, using packed variant records. T_EX makes no assumptions about the relative positions of the fields within a word.

Since we are assuming 32-bit integers, a halfword must contain at least 16 bits, and a quarterword must contain at least 8 bits. But it doesn't hurt to have more bits; for example, with enough 36-bit words you might be able to have *mem_max* as large as 262142, which is eight times as much memory as anybody had during the first four years of T_EX's existence.

N.B.: Valuable memory space will be dreadfully wasted unless T_EX is compiled by a Pascal that packs all of the *memory_word* variants into the space of a single integer. This means, for example, that *glue_ratio* words should be *short_real* instead of *real* on some computers. Some Pascal compilers will pack an integer whose subrange is '0 .. 255' into an eight-bit field, but others insist on allocating space for an additional sign bit; on such systems you can get 256 values into a quarterword only if the subrange is '-128 .. 127'.

The present implementation tries to accommodate as many variations as possible, so it makes few assumptions. If integers having the subrange '*min_quarterword* .. *max_quarterword*' can be packed into a quarterword, and if integers having the subrange '*min_halfword* .. *max_halfword*' can be packed into a halfword, everything should work satisfactorily.

It is usually most efficient to have *min_quarterword* = *min_halfword* = 0, so one should try to achieve this unless it causes a severe problem. The values defined here are recommended for most 32-bit computers.

```

define min_quarterword = 0 {smallest allowable value in a quarterword}
define max_quarterword = 255 {largest allowable value in a quarterword}
define min_halfword ≡ -"FFFFFFF {smallest allowable value in a halfword}
define max_halfword ≡ "FFFFFFF {largest allowable value in a halfword}

```

129* Here are the inequalities that the quarterword and halfword values must satisfy (or rather, the inequalities that they mustn't satisfy):

⟨Check the "constant" values for consistency 14⟩ +≡

```

init if (mem_min ≠ mem_bot) ∨ (mem_max ≠ mem_top) then bad ← 10;
tini
if (mem_min > mem_bot) ∨ (mem_max < mem_top) then bad ← 10;
if (min_quarterword > 0) ∨ (max_quarterword < 127) then bad ← 11;
if (min_halfword > 0) ∨ (max_halfword < 32767) then bad ← 12;
if (min_quarterword < min_halfword) ∨ (max_quarterword > max_halfword) then bad ← 13;
if (mem_bot - sup_main_memory < min_halfword) ∨ (mem_top + sup_main_memory ≥ max_halfword)
    then bad ← 14;
if (max_font_max < min_halfword) ∨ (max_font_max > max_halfword) then bad ← 15;
if font_max > font_base + max_font_max then bad ← 16;
if (save_size > max_halfword) ∨ (max_strings > max_halfword) then bad ← 17;
if buf_size > max_halfword then bad ← 18;
if max_quarterword - min_quarterword < 255 then bad ← 19;

```

130* The operation of adding or subtracting *min_quarterword* occurs quite frequently in TeX, so it is convenient to abbreviate this operation by using the macros *qi* and *qo* for input and output to and from quarterword format.

The inner loop of TeX will run faster with respect to compilers that don't optimize expressions like ' $x + 0$ ' and ' $x - 0$ ', if these macros are simplified in the obvious way when *min_quarterword* = 0. So they have been simplified here in the obvious way.

The WEB source for TeX defines $hi(\#) \equiv \# + min_halfword$ which can be simplified when *min_halfword* = 0. The Web2C implementation of TeX can use $hi(\#) \equiv \#$ together with *min_halfword* < 0 as long as *max_halfword* is sufficiently large.

```

define  qi( $\#$ )  $\equiv$   $\#$     { to put an eight_bits item into a quarterword }
define  qo( $\#$ )  $\equiv$   $\#$     { to take an eight_bits item from a quarterword }
define  hi( $\#$ )  $\equiv$   $\#$     { to put a sixteen-bit item into a halfword }
define  ho( $\#$ )  $\equiv$   $\#$     { to take a sixteen-bit item from a halfword }

```

131* The reader should study the following definitions closely:

```

define  sc  $\equiv$  int    { scaled data is equivalent to integer }

```

<Types in the outer block 18> +=

```

quarterword = min_quarterword .. max_quarterword; halfword = min_halfword .. max_halfword;
two_choices = 1 .. 2;    { used when there are two variants in a record }
four_choices = 1 .. 4;   { used when there are four variants in a record }
#include "texmfmem.h"; word_file = gzFile;

```

134* The *mem* array is divided into two regions that are allocated separately, but the dividing line between these two regions is not fixed; they grow together until finding their “natural” size in a particular job. Locations less than or equal to *lo_mem_max* are used for storing variable-length records consisting of two or more words each. This region is maintained using an algorithm similar to the one described in exercise 2.5–19 of *The Art of Computer Programming*. However, no size field appears in the allocated nodes; the program is responsible for knowing the relevant size when a node is freed. Locations greater than or equal to *hi_mem_min* are used for storing one-word records; a conventional **AVAIL** stack is used for allocation in this region.

Locations of *mem* between *mem_bot* and *mem_top* may be dumped as part of preloaded format files, by the **INITEX** preprocessor. Production versions of **TeX** may extend the memory at both ends in order to provide more space; locations between *mem_min* and *mem_bot* are always used for variable-size nodes, and locations between *mem_top* and *mem_max* are always used for single-word nodes.

The key pointers that govern *mem* allocation have a prescribed order:

$$\text{null} \leq \text{mem_min} \leq \text{mem_bot} < \text{lo_mem_max} < \text{hi_mem_min} < \text{mem_top} \leq \text{mem_end} \leq \text{mem_max}.$$

Empirical tests show that the present implementation of **TeX** tends to spend about 9% of its running time allocating nodes, and about 6% deallocating them after their use.

⟨Global variables 13⟩ +≡

yzmem: ↑*memory_word*; { the big dynamic storage area }

⟨Initialize bigger nodes with *SyncTeX* information 1913*⟩;

get_node ← *r*;

exit: **end**;

153* An *hlist_node* stands for a box that was made from a horizontal list. Each *hlist_node* is seven words long, and contains the following fields (in addition to the mandatory *type* and *link*, which we shall not mention explicitly when discussing the other node types): The *height* and *width* and *depth* are scaled integers denoting the dimensions of the box. There is also a *shift_amount* field, a scaled integer indicating how much this box should be lowered (if it appears in a horizontal list), or how much it should be moved to the right (if it appears in a vertical list). There is a *list_ptr* field, which points to the beginning of the list from which this box was fabricated; if *list_ptr* is *null*, the box is empty. Finally, there are three fields that represent the setting of the glue: *glue_set*(*p*) is a word of type *glue_ratio* that represents the proportionality constant for glue setting; *glue_sign*(*p*) is *stretching* or *shrinking* or *normal* depending on whether or not the glue should stretch or shrink or remain rigid; and *glue_order*(*p*) specifies the order of infinity to which glue setting applies (*normal*, *fil*, *fill*, or *filll*). The *subtype* field is not used in TeX. In ϵ -TeX the *subtype* field records the box direction mode *box_lr*.

```

define synctex_field_size = 2 { Declare the SyncTeX field size to store the SyncTeX information: 2
    integers for file tag and line }

define list_ptr(#)  $\equiv$  link[# + list_offset] { beginning of the list inside the box }
define glue_order(#)  $\equiv$  subtype[# + list_offset] { applicable order of infinity }
define glue_sign(#)  $\equiv$  type[# + list_offset] { stretching or shrinking }
define normal = 0 { the most common case when several cases are named }
define stretching = 1 { glue setting applies to the stretch components }
define shrinking = 2 { glue setting applies to the shrink components }
define glue_offset = 6 { position of glue_set in a box node }
define glue_set(#)  $\equiv$  mem[# + glue_offset].gr { a word of type glue_ratio for glue setting }

```

156* A *rule_node* stands for a solid black rectangle; it has *width*, *depth*, and *height* fields just as in an *hlist_node*. However, if any of these dimensions is -2^{30} , the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a “running dimension.” The *width* is never running in an hlist; the *height* and *depth* are never running in a vlist.

```

define rule_node = 2 { type of rule nodes }
define rule_node_size = 4 + synctex_field_size { number of words to allocate for a rule node }
define null_flag  $\equiv$  -'10000000000 {  $-2^{30}$ , signifies a missing item }
define is_running(#)  $\equiv$  (# = null_flag) { tests for a running dimension }

```

159* A *mark_node* has a *mark_ptr* field that points to the reference count of a token list that contains the user's `\mark` text. In addition there is a *mark_class* field that contains the mark class.

```

define mark_node = 4 { type of a mark node }
define small_node_size = 2 { number of words to allocate for most node types }
define medium_node_size = small_node_size + synctex_field_size { number of words to allocate for
    synchronized node types like math, kern, glue and penalty nodes }
define mark_ptr(#)  $\equiv$  link(# + 1) { head of the token list for a mark }
define mark_class(#)  $\equiv$  info(# + 1) { the mark class }

```

162* The *new_ligature* function creates a ligature node having given contents of the *font*, *character*, and *lig_ptr* fields. We also have a *new_lig_item* function, which returns a two-word node having a given *character* field. Such nodes are used for temporary processing as ligatures are being created.

```

function new_ligature(f : internal_font_number; c : quarterword; q : pointer): pointer;
  var p : pointer; { the new node }
  begin p  $\leftarrow$  get_node(small_node_size); type(p)  $\leftarrow$  ligature_node; font(lig_char(p))  $\leftarrow$  f;
    character(lig_char(p))  $\leftarrow$  c; lig_ptr(p)  $\leftarrow$  q; subtype(p)  $\leftarrow$  0; new_ligature  $\leftarrow$  p;
  end;

function new_lig_item(c : quarterword): pointer;
  var p : pointer; { the new node }
  begin p  $\leftarrow$  get_node(small_node_size); character(p)  $\leftarrow$  c; lig_ptr(p)  $\leftarrow$  null; new_lig_item  $\leftarrow$  p;
  end;

```

165* A *math_node*, which occurs only in horizontal lists, appears before and after mathematical formulas. The *subtype* field is *before* before the formula and *after* after it. There is a *width* field, which represents the amount of surrounding space inserted by `\mathsurround`.

In addition a *math_node* with *subtype* > *after* and *width* = 0 will be (ab)used to record a regular *math_node* reinserted after being discarded at a line break or one of the text direction primitives (`\beginL`, `\endL`, `\beginR`, and `\endR`).

```

define math_node = 9 { type of a math node }
define before = 0 { subtype for math node that introduces a formula }
define after = 1 { subtype for math node that winds up a formula }
define M_code = 2
define begin_M_code = M_code + before { subtype for \beginM node }
define end_M_code = M_code + after { subtype for \endM node }
define L_code = 4
define begin_L_code = L_code + begin_M_code { subtype for \beginL node }
define end_L_code = L_code + end_M_code { subtype for \endL node }
define R_code = L_code + L_code
define begin_R_code = R_code + begin_M_code { subtype for \beginR node }
define end_R_code = R_code + end_M_code { subtype for \endR node }
define end_LR(#)  $\equiv$  odd(subtype(#))
define end_LR_type(#)  $\equiv$  (L_code * (subtype(#) div L_code) + end_M_code)
define begin_LR_type(#)  $\equiv$  (# - after + before)

function new_math(w : scaled; s : small_number): pointer;
  var p : pointer; { the new node }
  begin p  $\leftarrow$  get_node(medium_node_size); type(p)  $\leftarrow$  math_node; subtype(p)  $\leftarrow$  s; width(p)  $\leftarrow$  w;
    new_math  $\leftarrow$  p;
  end;

```

170* And here's a function that creates a glue node for a given parameter identified by its code number; for example, *new_param_glue*(*line_skip_code*) returns a pointer to a glue node for the current `\lineskip`.

```
function new_param_glue(n : small_number): pointer;
  var p: pointer; { the new node }
  q: pointer; { the glue specification }
  begin p ← get_node(medium_node_size); type(p) ← glue_node; subtype(p) ← n + 1; leader_ptr(p) ← null;
  q ← ⟨ Current mem equivalent of glue parameter number n 242 ⟩; glue_ptr(p) ← q;
  incr(glue_ref_count(q)); new_param_glue ← p;
end;
```

171* Glue nodes that are more or less anonymous are created by *new_glue*, whose argument points to a glue specification.

```
function new_glue(q : pointer): pointer;
  var p: pointer; { the new node }
  begin p ← get_node(medium_node_size); type(p) ← glue_node; subtype(p) ← normal;
  leader_ptr(p) ← null; glue_ptr(p) ← q; incr(glue_ref_count(q)); new_glue ← p;
end;
```

174* The *new_kern* function creates a kern node having a given width.

```
function new_kern(w : scaled): pointer;
  var p: pointer; { the new node }
  begin p ← get_node(medium_node_size); type(p) ← kern_node; subtype(p) ← normal; width(p) ← w;
  new_kern ← p;
end;
```

176* Anyone who has been reading the last few sections of the program will be able to guess what comes next.

```
function new_penalty(m : integer): pointer;
  var p: pointer; { the new node }
  begin p ← get_node(medium_node_size); type(p) ← penalty_node; subtype(p) ← 0;
  { the subtype is not used }
  penalty(p) ← m; new_penalty ← p;
end;
```

183* If T_EX is extended improperly, the *mem* array might get screwed up. For example, some pointers might be wrong, or some “dead” nodes might not have been freed when the last reference to them disappeared. Procedures *check_mem* and *search_mem* are available to help diagnose such problems. These procedures make use of two arrays called *free* and *was_free* that are present only if T_EX’s debugging routines have been included. (You may want to decrease the size of *mem* while you are debugging.)

define *free* \equiv *free_arr*

⟨Global variables 13⟩ +≡

{ The debug memory arrays have not been allocated yet. }

debug *free*: **packed array** [0 .. 9] **of** *boolean*; { free cells }

was_free: **packed array** [0 .. 9] **of** *boolean*; { previously free cells }

was_mem_end, *was_lo_max*, *was_hi_min*: *pointer*; { previous *mem_end*, *lo_mem_max*, and *hi_mem_min* }

panicking: *boolean*; { do we want to check memory constantly? }

gubed

192* Boxes, rules, inserts, whatsits, marks, and things in general that are sort of “complicated” are indicated only by printing ‘`[]`’.

```

procedure print_font_identifier(f : internal_font_number);
  begin if pdf_font_blink[f] = null_font then print_esc(font_id_text(f))
  else print_esc(font_id_text(pdf_font_blink[f]))
  if pdf_tracing_fonts > 0 then
    begin print("□"); print(font_name[f]);
    if font_size[f] ≠ font_dsize[f] then
      begin print("@"); print_scaled(font_size[f]); print("pt");
      end;
    print("");
    end
  else if pdf_font_expand_ratio[f] ≠ 0 then
    begin print("□");
    if pdf_font_expand_ratio[f] > 0 then print("+");
    print_int(pdf_font_expand_ratio[f]); print("");
    end;
  end;
procedure short_display(p : integer); { prints highlights of list p }
  var n : integer; { for replacement counts }
  begin while p > mem_min do
    begin if is_char_node(p) then
      begin if p ≤ mem_end then
        begin if font(p) ≠ font_in_short_display then
          begin if (font(p) > font_max) then print_char("*")
          else print_font_identifier(font(p));
          print_char("□"); font_in_short_display ← font(p);
          end;
          print_ASCII(qo(character(p)));
          end;
        end
      else { Print a short indication of the contents of node p 193 };
      p ← link(p);
      end;
    end;
  end;

```

194* The *show_node_list* routine requires some auxiliary subroutines: one to print a font-and-character combination, one to print a token list without its reference count, and one to print a rule dimension.

```

procedure print_font_and_char(p : integer); { prints char_node data }
  begin if p > mem_end then print_esc("CLOBBBERED.")
  else begin if (font(p) > font_max) then print_char("*")
    else print_font_identifier(font(p));
    print_char("␣"); print_ASCII(qo(character(p)));
  end;
end;

procedure print_mark(p : integer); { prints token list data in braces }

  if (p < hi_mem_min) ∨ (p > mem_end) then print_esc("CLOBBBERED.")
  else show_token_list(link(p), null, max_print_line − 10);
  print_char("}");
end;

procedure print_rule_dimen(d : scaled); { prints dimension in rule node }
  begin if is_running(d) then print_char("")
  else print_scaled(d);
end;

```

204* The code will have to change in this place if *glue_ratio* is a structured type instead of an ordinary *real*. Note that this routine should avoid arithmetic errors even if the *glue_set* field holds an arbitrary random value. The following code assumes that a properly formed nonzero *real* number has absolute value 2^{20} or more when it is regarded as an integer; this precaution was adequate to prevent floating point underflow on the author's computer.

```

⟨ Display the value of glue_set(p) 204* ⟩ ≡
  g ← float(glue_set(p));
  if (g ≠ float_constant(0)) ∧ (glue_sign(p) ≠ normal) then
    begin print("␣glue␣set␣");
    if glue_sign(p) = shrinking then print("−␣"); { The Unix pc folks removed this restriction with a
      remark that invalid bit patterns were vanishingly improbable, so we follow their example without
      really understanding it. if abs(mem[p + glue_offset].int) < 4000000 then print('?.?') else }
    if fabs(g) > float_constant(20000) then
      begin if g > float_constant(0) then print_char(">")
      else print("<␣−");
      print_glue(20000 * unity, glue_order(p), 0);
      end
    else print_glue(round(unity * g), glue_order(p), 0);
    end

```

This code is used in section 202.

220* Now we are ready to delete any node list, recursively. In practice, the nodes deleted are usually charnodes (about 2/3 of the time), and they are glue nodes in about half of the remaining cases.

```

procedure flush_node_list(p : pointer); { erase list of nodes starting at p }
  label done; { go here when node p has been freed }
  var q: pointer; { successor to node p }
  begin while p ≠ null do
    begin q ← link(p);

229* The semantic nest. T_EX is typically in the midst of building many lists at once. For example, when a math formula is being processed, T_EX is in math mode and working on an mlist; this formula has temporarily interrupted T_EX from being in horizontal mode and building the hlist of a paragraph; and this paragraph has temporarily interrupted T_EX from being in vertical mode and building the vlist for the next page of a document. Similarly, when a `\vbox` occurs inside of an `\hbox`, T_EX is temporarily interrupted from working in restricted horizontal mode, and it enters internal vertical mode. The “semantic nest” is a stack that keeps track of what lists and modes are currently suspended.

At each level of processing we are in one of six modes:

vmode stands for vertical mode (the page builder);

hmode stands for horizontal mode (the paragraph builder);

mmode stands for displayed formula mode;

–*vmode* stands for internal vertical mode (e.g., in a `\vbox`);

–*hmode* stands for restricted horizontal mode (e.g., in an `\hbox`);

–*mmode* stands for math formula mode (not displayed).

The mode is temporarily set to zero while processing `\write` texts.

Numeric values are assigned to *vmode*, *hmode*, and *mmode* so that T_EX’s “big semantic switch” can select the appropriate thing to do by computing the value $abs(mode) + cur_cmd$, where *mode* is the current mode and *cur_cmd* is the current command code.

```

define vmode = 1 { vertical mode }
define hmode = vmode + max_command + 1 { horizontal mode }
define mmode = hmode + max_command + 1 { math mode }

procedure print_mode(m : integer); { prints the mode represented by m }
begin if m > 0 then
  case m div (max_command + 1) of
    0: print("vertical_mode");
    1: print("horizontal_mode");
    2: print("display_math_mode");
  end
else if m = 0 then print("no_mode")
  else case (–m) div (max_command + 1) of
    0: print("internal_vertical_mode");
    1: print("restricted_horizontal_mode");
    2: print("math_mode");
  end;
end;

procedure print_in_mode(m : integer); { prints the mode represented by m }
begin if m > 0 then
  case m div (max_command + 1) of
    0: print("^_in_vertical_mode");
    1: print("^_in_horizontal_mode");
    2: print("^_in_display_math_mode");
  end
else if m = 0 then print("^_in_no_mode")
  else case (–m) div (max_command + 1) of
    0: print("^_in_internal_vertical_mode");
    1: print("^_in_restricted_horizontal_mode");
    2: print("^_in_math_mode");
  end;
end;

```

This code is used in section 236.

238* The table of equivalents. Now that we have studied the data structures for T_EX’s semantic routines, we ought to consider the data structures used by its syntactic routines. In other words, our next concern will be the tables that T_EX looks at when it is scanning what the user has written.

The biggest and most important such table is called *eqtb*. It holds the current “equivalents” of things; i.e., it explains what things mean or what their current values are, for all quantities that are subject to the nesting structure provided by T_EX’s grouping mechanism. There are six parts to *eqtb*:

- 1) *eqtb*[*active_base* .. (*hash_base* − 1)] holds the current equivalents of single-character control sequences.
- 2) *eqtb*[*hash_base* .. (*glue_base* − 1)] holds the current equivalents of multiletter control sequences.
- 3) *eqtb*[*glue_base* .. (*local_base* − 1)] holds the current equivalents of glue parameters like the current *baselineskip*.
- 4) *eqtb*[*local_base* .. (*int_base* − 1)] holds the current equivalents of local halfword quantities like the current box registers, the current “catcodes,” the current font, and a pointer to the current paragraph shape. Additionally region 4 contains the table with MLT_EX’s character substitution definitions.
- 5) *eqtb*[*int_base* .. (*dimen_base* − 1)] holds the current equivalents of fullword integer parameters like the current hyphenation penalty.
- 6) *eqtb*[*dimen_base* .. *eqtb_size*] holds the current equivalents of fullword dimension parameters like the current *hsize* or amount of hanging indentation.

Note that, for example, the current amount of *baselineskip* glue is determined by the setting of a particular location in region 3 of *eqtb*, while the current meaning of the control sequence ‘\baselineskip’ (which might have been changed by \def or \let) appears in region 2.

240* Many locations in *eqtb* have symbolic names. The purpose of the next paragraphs is to define these names, and to set up the initial values of the equivalents.

In the first region we have 256 equivalents for “active characters” that act as control sequences, followed by 256 equivalents for single-character control sequences.

Then comes region 2, which corresponds to the hash table that we will define later. The maximum address in this region is used for a dummy control sequence that is perpetually undefined. There also are several locations for control sequences that are perpetually defined (since they are used in error recovery).

```

define active_base = 1    { beginning of region 1, for active character equivalents }
define single_base = active_base + 256  { equivalents of one-character control sequences }
define null_cs = single_base + 256  { equivalent of \csname\endcsname }

  eq_type(undefined_control_sequence) ← undefined_cs; equiv(undefined_control_sequence) ← null;
  eq_level(undefined_control_sequence) ← level_zero;
  for k ← active_base to eqtb_top do eqtb[k] ← eqtb[undefined_control_sequence];

```

248* Region 4 of *eqtb* contains the local quantities defined here. The bulk of this region is taken up by five tables that are indexed by eight-bit characters; these tables are important to both the syntactic and semantic portions of TeX. There are also a bunch of special things like font and token parameters, as well as the tables of `\toks` and `\box` registers.

```

254* Region 5 of *eqtb* contains the integer parameters and registers defined here, as well as the *del_code* table. The latter table differs from the *cat_code* .. *math_code* tables that precede it, since delimiter codes are fullword integers while the other kinds of codes occupy at most a halfword. This is what makes region 5 different from region 4. We will store the *eq_level* information in an auxiliary array of quarterwords that will be defined later.

258* The integer parameters should really be initialized by a macro package; the following initialization does the minimum to keep TeX from complete failure.

```

⟨Initialize table entries (done by INITEX only) 182⟩ +≡
for k ← int_base to del_code_base - 1 do eqtb[k].int ← 0;
char_sub_def_min ← 256; char_sub_def_max ← -1; { allow \charsubdef for char 0 }
{ tracing_char_sub_def ← 0 is already done }
mag ← 1000; tolerance ← 10000; hang_after ← 1; max_dead_cycles ← 25; escape_char ← "\";
end_line_char ← carriage_return;
for k ← 0 to 255 do del_code(k) ← -1;
del_code(".") ← 0; { this null delimiter is used in error recovery }

```

259* The following procedure, which is called just before TeX initializes its input and output, establishes the initial values of the date and time. It calls a *date_and_time* C macro (a.k.a. *dateandtime*), which calls the C function *get_date_and_time*, passing it the addresses of *sys_time*, etc., so they can be set by the routine. *get_date_and_time* also sets up interrupt catching if that is conditionally compiled in the C code.

We have to initialize the *sys_* variables because that is what gets output on the first line of the log file. (New in 2021.)

```

procedure fix_date_and_time;
begin date_and_time(sys_time, sys_day, sys_month, sys_year); time ← sys_time;
{ minutes since midnight }
day ← sys_day; { day of the month }
month ← sys_month; { month of the year }
year ← sys_year; { Anno Domini }
end;

```

270* Here is a procedure that displays the contents of *eqtb*[*n*] symbolically.

```

⟨Declare the procedure called print_cmd_chr 320⟩
stat procedure show_eqtb(n : pointer);
begin if n < active_base then print_char("?") { this can't happen }
else if (n < glue_base) ∨ ((n > eqtb_size) ∧ (n ≤ eqtb_top)) then ⟨Show equivalent n, in region 1 or 2 241⟩
else if n < local_base then ⟨Show equivalent n, in region 3 247⟩
else if n < int_base then ⟨Show equivalent n, in region 4 251⟩
else if n < dimen_base then ⟨Show equivalent n, in region 5 260⟩
else if n ≤ eqtb_size then ⟨Show equivalent n, in region 6 269⟩
else print_char("?"); { this can't happen either }

end;
tats

```

271* The last two regions of *eqtb* have fullword values instead of the three fields *eq_level*, *eq_type*, and *equiv*. An *eq_type* is unnecessary, but TeX needs to store the *eq_level* information in another array called *req_level*.

```

⟨Global variables 13⟩ +≡
zeqtb: ↑memory_word;
req_level: array [int_base .. eqtb_size] of quarterword;

```

274* **The hash table.** Control sequences are stored and retrieved by means of a fairly standard hash table algorithm called the method of “coalescing lists” (cf. Algorithm 6.4C in *The Art of Computer Programming*). Once a control sequence enters the table, it is never removed, because there are complicated situations involving `\gdef` where the removal of a control sequence at the end of a group would be a mistake preventable only by the introduction of a complicated reference-count mechanism.

The actual sequence of letters forming a control sequence identifier is stored in the *str_pool* array together with all the other strings. An auxiliary array *hash* consists of items with two halfword fields per word. The first of these, called *next(p)*, points to the next identifier belonging to the same coalesced list as the identifier corresponding to *p*; and the other, called *text(p)*, points to the *str_start* entry for *p*’s identifier. If position *p* of the hash table is empty, we have *text(p)* = 0; if position *p* is either empty or the end of a coalesced hash list, we have *next(p)* = 0. An auxiliary pointer variable called *hash_used* is maintained in such a way that all locations *p* ≥ *hash_used* are nonempty. The global variable *cs_count* tells how many multiletter control sequences have been defined, if statistics are being kept.

A global boolean variable called *no_new_control_sequence* is set to *true* during the time that new hash table entries are forbidden.

```

define next(#) ≡ hash[#].lh  { link for coalesced lists }
define text(#) ≡ hash[#].rh  { string number for control sequence name }
define hash_is_full ≡ (hash_used = hash_base)  { test if all positions are occupied }
define font_id_text(#) ≡ text(font_id_base + #)  { a frozen font identifier’s name }

⟨Global variables 13⟩ +=
hash: ↑two_halves;  { the hash table }
yhash: ↑two_halves;  { auxiliary pointer for freeing hash }
hash_used: pointer;  { allocation pointer for hash }
hash_extra: pointer;  { hash_extra = hash above eqtb_size }
hash_top: pointer;  { maximum of the hash array }
eqtb_top: pointer;  { maximum of the eqtb }
hash_high: pointer;  { pointer to next high hash location }
no_new_control_sequence: boolean;  { are new identifiers legal? }
cs_count: integer;  { total number of known identifiers }

```

276* ⟨Set initial values of key variables 21⟩ +=

```

no_new_control_sequence ← true;  { new identifiers are usually forbidden }
prim_next(0) ← 0; prim_text(0) ← 0;
for k ← 1 to prim_size do prim[k] ← prim[0];

```

  end; { move current string up to make room for another }
for  $k \leftarrow j$  to  $j + l - 1$  do  $append\_char(buffer[k])$ ;
 $text(p) \leftarrow make\_string$ ;  $pool\_ptr \leftarrow pool\_ptr + d$ ;
stat  $incr(cs\_count)$ ; tats
end

```

This code is used in section [278](#).

284* Single-character control sequences do not need to be looked up in a hash table, since we can use the character code itself as a direct address. The procedure *print_cs* prints the name of a control sequence, given a pointer to its address in *eqtb*. A space is printed after the name unless it is a single nonletter or an active character. This procedure might be invoked with invalid data, so it is “extra robust.” The individual characters must be printed one at a time using *print*, since they may be unprintable.

The conversion from control sequence to byte sequence for encTeX is implemented here. Of course, the simplest way is to implement an array of string pointers with *hash_size* length, but we assume that only a few control sequences will need to be converted. So *mubyte_cswrite*, an array with only 128 items, is used. The items point to the token lists. First token includes a csname number and the second points the string to be output. The third token includes the number of another csname and fourth token its pointer to the string etc. We need to do the sequential searching in one of the 128 token lists.

⟨Basic printing procedures 57⟩ +≡

```

procedure print_cs(p : integer); { prints a purported control sequence }
  var q: pointer; s: str_number;
  begin if active_noconvert ∧ (¬no_convert) ∧ (eq_type(p) = let) ∧ (equiv(p) = normal + 11) then
    { noconvert }
    begin no_convert ← true; return;
  end;
  s ← 0;
  if cs_converting ∧ (¬no_convert) then
    begin q ← mubyte_cswrite[p mod 128];
    while q ≠ null do
      if info(q) = p then
        begin s ← info(link(q)); q ← null;
        end
      else q ← link(link(q));
    end;
    no_convert ← false;
    if s > 0 then print(s)
  else if p < hash_base then { single character }
    if p ≥ single_base then
      if p = null_cs then
        begin print_esc("csname"); print_esc("endcsname"); print_char("␣");
        end
      else begin print_esc(p − single_base);
        if cat_code(p − single_base) = letter then print_char("␣");
        end
      else if p < active_base then print_esc("IMPOSSIBLE.")
      else print(p − active_base)
    else if ((p ≥ undefined_control_sequence) ∧ (p ≤ eqtb_size)) ∨ (p > eqtb_top) then
      print_esc("IMPOSSIBLE.")
    else if (text(p) ≥ str_ptr) then print_esc("NONEXISTENT.")
    else begin if (p ≥ prim_eqtb_base) ∧ (p < frozen_null_font) then
      print_esc(prim_text(p − prim_eqtb_base) − 1)
    else print_esc(text(p));
    print_char("␣");
  end;
exit: end;

```

287* Many of T_EX's primitives need no *equiv*, since they are identifiable by their *eq-type* alone. These primitives are loaded into the hash table as follows:

if $(hash_offset < 0) \vee (hash_offset > hash_base)$ **then** $bad \leftarrow 42$;

322* **Input stacks and states.** This implementation of TeX uses two different conventions for representing sequential stacks.

- 1) If there is frequent access to the top entry, and if the stack is essentially never empty, then the top entry is kept in a global variable (even better would be a machine register), and the other entries appear in the array *stack*[0 .. (*ptr* − 1)]. For example, the semantic stack described above is handled this way, and so is the input stack that we are about to study.
- 2) If there is infrequent top access, the entire stack contents are in the array *stack*[0 .. (*ptr* − 1)]. For example, the *save_stack* is treated this way, as we have seen.

The state of TeX’s input mechanism appears in the input stack, whose entries are records with six fields, called *state*, *index*, *start*, *loc*, *limit*, and *name*. This stack is maintained with convention (1), so it is declared in the following way:

⟨Types in the outer block 18⟩ +≡

```
in_state_record = record state_field, index_field: quarterword;
                  start_field, loc_field, limit_field, name_field: halfword;
                  synctex_tag_field: integer; { stack the tag of the current file }
end;
```

323* ⟨Global variables 13⟩ +≡

```
input_stack: ↑in_state_record;
input_ptr: 0 .. stack_size; { first unused location of input_stack }
max_in_stack: 0 .. stack_size; { largest value of input_ptr when pushing }
cur_input: in_state_record; { the “top” input state, according to convention (1) }
```

324* We’ve already defined the special variable *loc* ≡ *cur_input.loc_field* in our discussion of basic input-output routines. The other components of *cur_input* are defined in the same way:

```
define state ≡ cur_input.state_field { current scanner state }
define index ≡ cur_input.index_field { reference for buffer information }
define start ≡ cur_input.start_field { starting position in buffer }
define limit ≡ cur_input.limit_field { end of current line in buffer }
define name ≡ cur_input.name_field { name of the current file }
define synctex_tag ≡ cur_input.synctex_tag_field { SyncTeX tag of the current file }
```

326* Additional information about the current line is available via the *index* variable, which counts how many lines of characters are present in the buffer below the current level. We have *index* = 0 when reading from the terminal and prompting the user for each line; then if the user types, e.g., ‘\input paper’, we will have *index* = 1 while reading the file `paper.tex`. However, it does not follow that *index* is the same as the input stack pointer, since many of the levels on the input stack may come from token lists. For example, the instruction ‘\input paper’ might occur in a token list.

The global variable *in_open* is equal to the *index* value of the highest non-token-list level. Thus, the number of partially read lines in the buffer is *in_open* + 1, and we have *in_open* = *index* when we are not reading a token list.

If we are not currently reading from the terminal, or from an input stream, we are reading from the file variable *input_file*[*index*]. We use the notation *terminal_input* as a convenient abbreviation for *name* = 0, and *cur_file* as an abbreviation for *input_file*[*index*].

The global variable *line* contains the line number in the topmost open file, for use in error messages. If we are not reading from the terminal, *line_stack*[*index*] holds the line number for the enclosing level, so that *line* can be restored when the current file has been read. Line numbers should never be negative, since the negative of the current line number is used to identify the user’s output routine in the *mode_line* field of the semantic nest entries.

If more information about the input state is needed, it can be included in small arrays like those shown here. For example, the current page or segment number in the input file might be put into a variable *page*, maintained for enclosing levels in ‘*page_stack*: **array** [1 .. *max_in_open*] **of** *integer*’ by analogy with *line_stack*.

define *terminal_input* \equiv (*name* = 0) { are we reading from the terminal? }

define *cur_file* \equiv *input_file*[*index*] { the current *alpha_file* variable }

⟨ Global variables 13 ⟩ +=

in_open: 0 .. *max_in_open*; { the number of lines in the buffer, less one }

open_parens: 0 .. *max_in_open*; { the number of open text files }

input_file: ↑*alpha_file*;

line: *integer*; { current line number in the current source file }

line_stack: ↑*integer*;

source_filename_stack: ↑*str_number*;

full_source_filename_stack: ↑*str_number*;

328* Here is a procedure that uses *scanner_status* to print a warning message when a subfile has ended, and at certain other crucial times:

⟨Declare the procedure called *runaway* 328*⟩ ≡

```
procedure runaway;
  var p: pointer; { head of runaway list }
  begin if scanner_status > skipping then
    begin case scanner_status of
      defining: begin print_nl("Runaway_definition"); p ← def_ref;
        end;
      matching: begin print_nl("Runaway_argument"); p ← temp_head;
        end;
      aligning: begin print_nl("Runaway_preamble"); p ← hold_head;
        end;
      absorbing: begin print_nl("Runaway_text"); p ← def_ref;
        end;
    end; { there are no other cases }
    print_char("?"); print_ln; show_token_list(link(p), null, error_line - 10);
  end;
end;
```

This code is used in section 137.

330* The *param_stack* is an auxiliary array used to hold pointers to the token lists for parameters at the current level and subsidiary levels of input. This stack is maintained with convention (2), and it grows at a different rate from the others.

⟨Global variables 13⟩ +≡

```
param_stack: ↑pointer; { token list pointers for parameters }
param_ptr: 0 .. param_size; { first unused entry in param_stack }
max_param_stack: integer; { largest value of param_ptr, will be ≤ param_size + 9 }
```

340* But the trick is distracting us from our current goal, which is to understand the input state. So let's concentrate on the data structures that are being pseudoprinted as we finish up the *show_context* procedure.

⟨Pseudoprint the line 340*⟩ ≡

```
begin_pseudoprint;
if buffer[limit] = end_line_char then j ← limit
else j ← limit + 1; { determine the effective end of the line }
i ← start; mubyte_skeep ← mubyte_keep; mubyte_sstart ← mubyte_start; mubyte_start ← false;
if j > 0 then
  while i < j do
    begin if i = loc then set_trick_count;
      print_buffer(i);
    end;
  mubyte_keep ← mubyte_skeep; mubyte_start ← mubyte_sstart
```

This code is used in section 334.

350* The *begin_file_reading* procedure starts a new level of input for lines of characters to be read from a file, or as an insertion from the terminal. It does not take care of opening the file, nor does it set *loc* or *limit* or *line*.

```

procedure begin_file_reading;
begin if in_open = max_in_open then overflow("text_input_levels", max_in_open);
if first = buf_size then overflow("buffer_size", buf_size);
incr(in_open); push_input; index ← in_open; source_filename_stack[index] ← 0;
full_source_filename_stack[index] ← 0; eof_seen[index] ← false; grp_stack[index] ← cur_boundary;
if_stack[index] ← cond_ptr; line_stack[index] ← line; start ← first; state ← mid_line; name ← 0;
    { terminal_input is now true }
    ⟨ Prepare terminal input SyncTeX information 1916* ⟩;
end;

```

353* To get TeX's whole input mechanism going, we perform the following actions.

```

⟨ Initialize the input routines 353* ⟩ ≡
begin input_ptr ← 0; max_in_stack ← 0; source_filename_stack[0] ← 0;
full_source_filename_stack[0] ← 0; in_open ← 0; open_parens ← 0; max_buf_stack ← 0; grp_stack[0] ← 0;
if_stack[0] ← null; param_ptr ← 0; max_param_stack ← 0; first ← buf_size;
repeat buffer[first] ← 0; decr(first);
until first = 0;
scanner_status ← normal; warning_index ← null; first ← 1; state ← new_line; start ← 1; index ← 0;
line ← 0; name ← 0; force_eof ← false; align_state ← 1000000;
if ¬init_terminal then goto final_end;
limit ← last; first ← last + 1; { init_terminal has set loc and last }
end

```

This code is used in section 1515*.

354* **Getting the next token.** The heart of TEX’s input mechanism is the *get_next* procedure, which we shall develop in the next few sections of the program. Perhaps we shouldn’t actually call it the “heart,” however, because it really acts as TEX’s eyes and mouth, reading the source files and gobbling them up. And it also helps TEX to regurgitate stored token lists that are to be processed again.

The main duty of *get_next* is to input one token and to set *cur_cmd* and *cur_chr* to that token’s command code and modifier. Furthermore, if the input token is a control sequence, the *eqtb* location of that control sequence is stored in *cur_cs*; otherwise *cur_cs* is set to zero.

Underlying this simple description is a certain amount of complexity because of all the cases that need to be handled. However, the inner loop of *get_next* is reasonably short and fast.

When *get_next* is asked to get the next token of a `\read` line, it sets *cur_cmd* = *cur_chr* = *cur_cs* = 0 in the case that no more tokens appear on that line. (There might not be any tokens at all, if the *end_line_char* has *ignore* as its catcode.)

Some additional routines used by the `encTEX` extension have to be declared at this point.

⟨Declare additional routines for `encTEX` 1897*⟩

```
360* ⟨Tell the user what has run away and try to recover 360*⟩ ≡
begin runaway; { print a definition, argument, or preamble }
if cur_cs = 0 then print_err("File_ended")
else begin cur_cs ← 0; print_err("Forbidden_control_sequence_found");
  end;
⟨Print either ‘definition’ or ‘use’ or ‘preamble’ or ‘text’, and insert tokens that should lead to
  recovery 361*⟩;
print("_of_"); sprint_cs(warning_index);
help4("I_suspect_you_have_forgotten_a_}~,_causing_me")
("to_read_past_where_you_wanted_me_to_stop.")
("I'll_try_to_recover;_but_if_the_error_is_serious,")
("you'd_better_type_`E`_or_`X`_now_and_fix_your_file.");
error;
end
```

This code is used in section 358.

361* The recovery procedure can’t be fully understood without knowing more about the TEX routines that should be aborted, but we can sketch the ideas here: For a runaway definition or a runaway balanced text we will insert a right brace; for a runaway preamble, we will insert a special `\cr` token and a right brace; and for a runaway argument, we will set *long_state* to *outer_call* and insert `\par`.

```
⟨Print either ‘definition’ or ‘use’ or ‘preamble’ or ‘text’, and insert tokens that should lead to
  recovery 361*⟩ ≡
p ← get_avail;
case scanner_status of
  defining: begin print("_while_scanning_definition"); info(p) ← right_brace_token + "}";
    end;
  matching: begin print("_while_scanning_use"); info(p) ← par_token; long_state ← outer_call;
    end;
  aligning: begin print("_while_scanning_preamble"); info(p) ← right_brace_token + "}"; q ← p;
    p ← get_avail; link(p) ← q; info(p) ← cs_token_flag + frozen_cr; align_state ← -1000000;
    end;
  absorbing: begin print("_while_scanning_text"); info(p) ← right_brace_token + "}";
    end;
end; { there are no other cases }
ins_list(p)
```

This code is used in section 360*.

363* Now we're ready to take the plunge into *get_next* itself. Parts of this routine are executed more often than any other instructions of TeX.

```

define switch = 25 { a label in get_next }
define start_cs = 26 { another }

procedure get_next; { sets cur_cmd, cur_chr, cur_cs to next token }
  label restart, { go here to get the next input token }
    switch, { go here to eat the next character from a file }
    reswitch, { go here to digest it again }
    start_cs, { go here to start looking for a control sequence }
    found, { go here when a control sequence has been found }
    exit; { go here when the next input token has been got }
var k: 0 .. buf_size; { an index into buffer }
    t: halfword; { a token }
    i, j: 0 .. buf_size; { more indexes for encTeX }
    mubyte_incs: boolean; { control sequence is converted by mubyte }
    p: pointer; { for encTeX test if noexpanding }
    cat: 0 .. max_char_code; { cat_code(cur_chr), usually }
    c, cc: ASCII_code; { constituents of a possible expanded code }
    d: 2 .. 3; { number of excess characters in an expanded code }
begin restart: cur_cs ← 0;
if state ≠ token_list then ⟨ Input from external file, goto restart if no input found 365* ⟩
else ⟨ Input from token list, goto restart if end of list or if a parameter needs to be expanded 379* ⟩;
  ⟨ If an alignment entry has just ended, take appropriate action 364 ⟩;
exit: end;

```

```

365* ⟨ Input from external file, goto restart if no input found 365* ⟩ ≡
begin switch: if loc ≤ limit then { current line not yet finished }
  begin { Use k instead of loc for type correctness. }
    k ← loc; cur_chr ← read_buffer(k); loc ← k; incr(loc);
    if (mubyte_token > 0) then
      begin state ← mid_line; cur_cs ← mubyte_token − cs_token_flag; goto found;
      end;
    reswitch: cur_cmd ← cat_code(cur_chr); ⟨ Change state if necessary, and goto switch if the current
      character should be ignored, or goto reswitch if the current character changes to another 366 ⟩;
    end
  else begin state ← new_line;
    ⟨ Move to next line of file, or goto restart if there is no next line, or return if a \read line has
      finished 382 ⟩;
    check_interrupt; goto switch;
    end;
  end

```

This code is used in section 363*.

376* Control sequence names are scanned only when they appear in some line of a file; once they have been scanned the first time, their *eqtb* location serves as a unique identification, so TeX doesn't need to refer to the original name any more except when it prints the equivalent in symbolic form.

The program that scans a control sequence has been written carefully in order to avoid the blowups that might otherwise occur if a malicious user tried something like ‘\catcode`15=0’. The algorithm might look at *buffer*[*limit* + 1], but it never looks at *buffer*[*limit* + 2].

If expanded characters like ‘ \wedge A’ or ‘ \wedge df’ appear in or just following a control sequence name, they are converted to single characters in the buffer and the process is repeated, slowly but surely.

```

⟨Scan a control sequence and set state  $\leftarrow$  skip_blanks or mid_line 376*⟩  $\equiv$ 
begin if loc > limit then cur_cs  $\leftarrow$  null_cs { state is irrelevant in this case }
else begin start_cs: mubyte_incs  $\leftarrow$  false; k  $\leftarrow$  loc; mubyte_skeep  $\leftarrow$  mubyte_keep;
  cur_chr  $\leftarrow$  read_buffer(k); cat  $\leftarrow$  cat_code(cur_chr);
  if (mubyte_in > 0)  $\wedge$  ( $\neg$ mubyte_incs)  $\wedge$  ((mubyte_skip > 0)  $\vee$  (cur_chr  $\neq$  buffer[k])) then
    mubyte_incs  $\leftarrow$  true;
    incr(k);
  if mubyte_token > 0 then
    begin state  $\leftarrow$  mid_line; cur_cs  $\leftarrow$  mubyte_token - cs_token_flag; goto found;
    end;
  if cat = letter then state  $\leftarrow$  skip_blanks
  else if cat = spacer then state  $\leftarrow$  skip_blanks
    else state  $\leftarrow$  mid_line;
  if (cat = letter)  $\wedge$  (k  $\leq$  limit) then ⟨Scan ahead in the buffer until finding a nonletter; if an expanded
    code is encountered, reduce it and goto start_cs; otherwise if a multiletter control sequence is
    found, adjust cur_cs and loc, and goto found 378*⟩
  else ⟨If an expanded code is present, reduce it and goto start_cs 377*⟩;
  mubyte_keep  $\leftarrow$  mubyte_skeep; cur_cs  $\leftarrow$  single_base + read_buffer(loc); incr(loc);
  end;
found: cur_cmd  $\leftarrow$  eq_type(cur_cs); cur_chr  $\leftarrow$  equiv(cur_cs);
if cur_cmd  $\geq$  outer_call then check_outer_validity;
if write_noexpanding then
  begin p  $\leftarrow$  mubyte_cswrite[cur_cs mod 128];
  while p  $\neq$  null do
    if info(p) = cur_cs then
      begin cur_cmd  $\leftarrow$  relax; cur_chr  $\leftarrow$  256; p  $\leftarrow$  null;
      end
    else p  $\leftarrow$  link(link(p));
  end;
end
end

```

This code is used in section 366.

377* Whenever we reach the following piece of code, we will have $cur_chr = buffer[k-1]$ and $k \leq limit + 1$ and $cat = cat_code(cur_chr)$. If an expanded code like $\wedge\wedge A$ or $\wedge\wedge df$ appears in $buffer[(k-1) \dots (k+1)]$ or $buffer[(k-1) \dots (k+2)]$, we will store the corresponding code in $buffer[k-1]$ and shift the rest of the buffer left two or three places.

⟨ If an expanded code is present, reduce it and **goto** *start_cs* 377* ⟩ \equiv

```

begin if  $buffer[k] = cur\_chr$  then if  $cat = sup\_mark$  then if  $k < limit$  then
  begin  $c \leftarrow buffer[k+1]$ ; if  $c < '200$  then { yes, one is indeed present }
    begin  $d \leftarrow 2$ ;
    if  $is\_hex(c)$  then if  $k+2 \leq limit$  then
      begin  $cc \leftarrow buffer[k+2]$ ; if  $is\_hex(cc)$  then  $incr(d)$ ;
      end;
    if  $d > 2$  then
      begin  $hex\_to\_cur\_chr$ ;  $buffer[k-1] \leftarrow cur\_chr$ ;
      end
    else if  $c < '100$  then  $buffer[k-1] \leftarrow c + '100$ 
    else  $buffer[k-1] \leftarrow c - '100$ ;
     $limit \leftarrow limit - d$ ;  $first \leftarrow first - d$ ;
    if  $mubyte\_in > 0$  then  $mubyte\_keep \leftarrow k - loc$ ;
    while  $k \leq limit$  do
      begin  $buffer[k] \leftarrow buffer[k+d]$ ;  $incr(k)$ ;
      end;
    goto start_cs;
  end;
end;
end

```

This code is used in sections 376* and 378*.

378* \langle Scan ahead in the buffer until finding a nonletter; if an expanded code is encountered, reduce it and **goto** *start_cs*; otherwise if a multiletter control sequence is found, adjust *cur_cs* and *loc*, and **goto** *found* 378* $\rangle \equiv$

```

begin repeat cur_chr  $\leftarrow$  read_buffer(k); cat  $\leftarrow$  cat_code(cur_chr);
  if mubyte_token  $>$  0 then cat  $\leftarrow$  escape;
  if (mubyte_in  $>$  0)  $\wedge$  ( $\neg$ mubyte_incs)  $\wedge$  (cat = letter)  $\wedge$  ((mubyte_skip  $>$  0)  $\vee$  (cur_chr  $\neq$  buffer[k]))
    then mubyte_incs  $\leftarrow$  true;
    incr(k);
until (cat  $\neq$  letter)  $\vee$  (k  $>$  limit);
 $\langle$  If an expanded code is present, reduce it and goto start_cs 377*  $\rangle$ ;
if cat  $\neq$  letter then
  begin decr(k); k  $\leftarrow$  k - mubyte_skip;
  end;
if k  $>$  loc + 1 then { multiletter control sequence has been scanned }
begin if mubyte_incs then { multibyte in csname occurs }
  begin i  $\leftarrow$  loc; j  $\leftarrow$  first; mubyte_keep  $\leftarrow$  mubyte_skeep;

    end;
    if j = first + 1 then cur_cs  $\leftarrow$  single_base + buffer[first]
    else cur_cs  $\leftarrow$  id_lookup(first, j - first);
    end
  else cur_cs  $\leftarrow$  id_lookup(loc, k - loc);
  loc  $\leftarrow$  k; goto found;
end;
end

```

This code is used in section 376*.

379* Let's consider now what happens when *get_next* is looking at a token list.

⟨Input from token list, **goto restart** if end of list or if a parameter needs to be expanded [379*](#)⟩ ≡

```

if loc ≠ null then { list not exhausted }
  begin t ← info(loc); loc ← link(loc); { move to next }
  if t ≥ cs_token_flag then { a control sequence token }
    begin cur_cs ← t − cs_token_flag; cur_cmd ← eq_type(cur_cs); cur_chr ← equiv(cur_cs);
    if cur_cmd ≥ outer_call then
      if cur_cmd = dont_expand then ⟨Get the next token, suppressing expansion 380⟩
      else check_outer_validity;
    if write_noexpanding then
      begin p ← mubyte_cswrite[cur_cs mod 128];
      while p ≠ null do
        if info(p) = cur_cs then
          begin cur_cmd ← relax; cur_chr ← 256; p ← null;
          end
        else p ← link(link(p));
      end;
    end
  else begin cur_cmd ← t div '400; cur_chr ← t mod '400;
    case cur_cmd of
      left_brace: incr(align_state);
      right_brace: decr(align_state);
      out_param: ⟨Insert macro parameter and goto restart 381⟩;
      othercases do_nothing
    endcases;
  end;
end
else begin { we are done with this token list }
  end_token_list; goto restart; { resume previous level }
end

```

This code is used in section [363*](#).

385* If the user has set the *pausing* parameter to some positive value, and if nonstop mode has not been selected, each line of input is displayed on the terminal and the transcript file, followed by ‘=>’. TEX waits for a response. If the response is simply *carriage_return*, the line is accepted as it stands, otherwise the line typed is used instead of the line in the file.

procedure *firm_up_the_line*;

var *k*: 0 .. *buf_size*; { an index into *buffer* }

begin *limit* \leftarrow *last*;

if *pausing* > 0 **then**

if *interaction* > *nonstop_mode* **then**

begin *wake_up_terminal*; *print_ln*; *k* \leftarrow *start*;

while *k* < *limit* **do**

begin *print_buffer*(*k*)

end;

first \leftarrow *limit*; *prompt_input*("=>"); { wait for user response }

if *last* > *first* **then**

begin for *k* \leftarrow *first* **to** *last* - 1 **do** { move line down in buffer }

buffer[*k* + *start* - *first*] \leftarrow *buffer*[*k*];

limit \leftarrow *start* + *last* - *first*;

end;

end;

end;

388* Expanding the next token. Only a dozen or so command codes $> \text{max_command}$ can possibly be returned by *get_next*; in increasing order, they are *undefined_cs*, *expand_after*, *no_expand*, *input*, *if_test*, *fi_or_else*, *cs_name*, *convert*, *the*, *top_bot_mark*, *call*, *long_call*, *outer_call*, *long_outer_call*, and *end_template*.

The *expand* subroutine is used when *cur_cmd* $>$ *max_command*. It removes a “call” or a conditional or one of the other special operations just listed. It follows that *expand* might invoke itself recursively. In all cases, *expand* destroys the current token, but it sets things up so that the next *get_next* will deliver the appropriate next token. The value of *cur_tok* need not be known when *expand* is called.

Since several of the basic scanning routines communicate via global variables, their values are saved as local variables of *expand* so that recursive calls don’t invalidate them.

```

This code is used in section 524.

539* The file names we shall deal with have the following structure: If the name contains ‘/’ or ‘:’ (for Amiga only), the file area consists of all characters up to and including the final such character; otherwise the file area is null. If the remaining file name contains ‘.’, the file extension consists of all such characters from the last ‘.’ to the end, otherwise the file extension is null.

We can scan such file names easily by using two global variables that keep track of the occurrences of area and extension delimiters:

⟨Global variables 13⟩ +≡

area_delimiter: *pool_pointer*; { the most recent ‘/’, if any }

ext_delimiter: *pool_pointer*; { the most recent ‘.’, if any }

540* Input files that can’t be found in the user’s area may appear in a standard system area called *TEX_area*. Font metric files whose areas are not given explicitly are assumed to appear in a standard system area called *TEX_font_area*. These system area names will, of course, vary from place to place.

In C, the default paths are specified separately.

541* Here now is the first of the system-dependent routines for file name scanning.

procedure *begin_name*;

begin *area_delimiter* \leftarrow 0; *ext_delimiter* \leftarrow 0; *quoted_filename* \leftarrow false;

end;

542* And here’s the second. The string pool might change as the file name is being scanned, since a new \csname might be entered; therefore we keep *area_delimiter* and *ext_delimiter* relative to the beginning of the current string, instead of assigning an absolute address like *pool_ptr* to them.

function *more_name*(*c* : *ASCII_code*): *boolean*;

begin if (*c* = "␣") \wedge *stop_at_space* \wedge (\neg *quoted_filename*) **then** *more_name* \leftarrow false

else if *c* = "" **then**

begin *quoted_filename* \leftarrow \neg *quoted_filename*; *more_name* \leftarrow true;

end

else begin *str_room*(1); *append_char*(*c*); { contribute *c* to the current string }

if *IS_DIR_SEP*(*c*) **then**

begin *area_delimiter* \leftarrow *cur_length*; *ext_delimiter* \leftarrow 0;

end

else if *c* = "." **then** *ext_delimiter* \leftarrow *cur_length*;

more_name \leftarrow true;

end;

end;

543* The third. If a string is already in the string pool, the function *slow_make_string* does not create a new string but returns this string number, thus saving string space. Because of this new property of the returned string number it is not possible to apply *flush_string* to these strings.

```

procedure end_name;
  var temp_str: str_number; { result of file name cache lookups }
      j, s, t: pool_pointer; { running indices }
      must_quote: boolean; { whether we need to quote a string }

    end;
  cur_ext  $\leftarrow$  slow_make_string; { remake extension string }
  end;
end;

```

544* Conversely, here is a routine that takes three strings and prints a file name that might have produced them. (The routine is system dependent, because some operating systems put the file area last instead of first.)

```

define check_quoted(#) ≡ { check if string # needs quoting }
  if # ≠ 0 then
    begin j ← str_start[#];
    while (¬must_quote) ∧ (j < str_start[# + 1]) do
      begin must_quote ← str_pool[j] = "␣"; incr(j);
      end;
    end
define print_quoted(#) ≡ { print string #, omitting quotes }
  if # ≠ 0 then
    for j ← str_start[#] to str_start[# + 1] − 1 do
      if so(str_pool[j]) ≠ "" then print(so(str_pool[j]))

```

(Basic printing procedures 57) +≡

```

procedure print_file_name(n, a, e : integer);
  var must_quote: boolean; { whether to quote the filename }
  j: pool_pointer; { index into str_pool }
  begin must_quote ← false; check_quoted(a); check_quoted(n);
  check_quoted(e); { FIXME: Alternative is to assume that any filename that has to be quoted has at least
    one quoted component...if we pick this, a number of insertions of print_file_name should go away.
    must_quote := ((a ≠ 0) and (str_pool[str_start[a]] = "")) or ((n ≠ 0) and (str_pool[str_start[n]] = "")) or
    ((e ≠ 0) and (str_pool[str_start[e]] = "")); }
  if must_quote then print_char("");
  print_quoted(a); print_quoted(n); print_quoted(e);
  if must_quote then print_char("");
  end;

```

545* Another system-dependent routine is needed to convert three internal TEX strings into the *name_of_file* value that is used to open files. The present code allows both lowercase and uppercase letters in the file name.

```

define append_to_name(#) ≡
  begin c ← #;
  if ¬(c = "") then
    begin incr(k);
    if k ≤ file_name_size then name_of_file[k] ← xchr[c];
    end
  end
procedure pack_file_name(n, a, e : str_number);
  var k: integer; { number of positions filled in name_of_file }
  c: ASCII_code; { character being packed }
  j: pool_pointer; { index into str_pool }
  begin k ← 0;
  if name_of_file then libc_free(name_of_file);
  name_of_file ← xmalloc_array(ASCII_code, length(a) + length(n) + length(e) + 1);
  for j ← str_start[a] to str_start[a + 1] − 1 do append_to_name(so(str_pool[j]));
  for j ← str_start[n] to str_start[n + 1] − 1 do append_to_name(so(str_pool[j]));
  for j ← str_start[e] to str_start[e + 1] − 1 do append_to_name(so(str_pool[j]));
  if k ≤ file_name_size then name_length ← k else name_length ← file_name_size;
  name_of_file[name_length + 1] ← 0;
  end;

```

546* A messier routine is also needed, since format file names must be scanned before T_EX's string mechanism has been initialized. We shall use the global variable *TEX_format_default* to supply the text for default system areas and extensions related to format files.

Under UNIX we don't give the area part, instead depending on the path searching that will happen during file opening. Also, the length will be set in the main program.

```

define format_area_length = 0 { length of its area part }
define format_ext_length = 4 { length of its '.fmt' part }
define format_extension = ".fmt" { the extension, as a WEB constant }

⟨Global variables 13⟩ +=
format_default_length: integer;
TEX_format_default: cstring;

```

547* We set the name of the default format file and the length of that name in C, instead of Pascal, since we want them to depend on the name of the program.

549* Here is the messy routine that was just mentioned. It sets *name_of_file* from the first *n* characters of *TEX_format_default*, followed by *buffer*[*a* .. *b*], followed by the last *format_ext_length* characters of *TEX_format_default*.

We dare not give error messages here, since T_EX calls this routine before the *error* routine is ready to roll. Instead, we simply drop excess characters, since the error will be detected in another way when a strange file name isn't found.

```

procedure pack_buffered_name(n : small_number; a, b : integer);
  var k: integer; { number of positions filled in name_of_file }
      c: ASCII_code; { character being packed }
      j: integer; { index into buffer or TEX_format_default }
  begin if n + b - a + 1 + format_ext_length > file_name_size then
    b ← a + file_name_size - n - 1 - format_ext_length;
    k ← 0;
  if name_of_file then libc_free(name_of_file);
  name_of_file ← xmalloc_array(ASCII_code, n + (b - a + 1) + format_ext_length + 1);
  for j ← 1 to n do append_to_name(xord[ucharcast(TEX_format_default[j])]);
  for j ← a to b do append_to_name(buffer[j]);
  for j ← format_default_length - format_ext_length + 1 to format_default_length do
    append_to_name(xord[ucharcast(TEX_format_default[j])]);
  if k ≤ file_name_size then name_length ← k else name_length ← file_name_size;
  name_of_file[name_length + 1] ← 0;
end;

```

550* Here is the only place we use *pack_buffered_name*. This part of the program becomes active when a “virgin” TEX is trying to get going, just after the preliminary initialization, or when the user is substituting another format file by typing ‘&’ after the initial ‘**’ prompt. The buffer contains the first line of input in *buffer[loc .. (last - 1)]*, where *loc* < *last* and *buffer[loc]* ≠ “ \square ”.

⟨Declare the function called *open_fmt_file* 550*⟩ ≡

```
function open_fmt_file: boolean;
  label found, exit;
  var j: 0 .. buf_size; { the first space after the format file name }
  begin j ← loc;
  if buffer[loc] = "&" then
    begin incr(loc); j ← loc; buffer[last] ← " $\square$ ";
    while buffer[j] ≠ " $\square$ " do incr(j);
    pack_buffered_name(0, loc, j - 1); { Kpathsea does everything }
    if w_open_in(fmt_file) then goto found;
    wake_up_terminal; wterm(`Sorry,  $\square$ I $\square$ can $\square$ ^ $\square$ t $\square$ find $\square$ the $\square$ format $\square$ ^`);
    fputs(stringcast(name_of_file + 1), stdout); wterm(`^ $\square$ will $\square$ try $\square$ ^`);
    fputs(TEX_format_default + 1, stdout); wterm_ln(`^ $\square$ .^`); update_terminal;
    end; { now pull out all the stops: try for the system plain file }
    pack_buffered_name(format_default_length - format_ext_length, 1, 0);
  if  $\neg$ w_open_in(fmt_file) then
    begin wake_up_terminal; wterm(`I $\square$ can $\square$ ^ $\square$ t $\square$ find $\square$ the $\square$ format $\square$ file $\square$ ^`);
    fputs(TEX_format_default + 1, stdout); wterm_ln(`^ $\square$ !^`); open_fmt_file ← false; return;
    end;
  found: loc ← j; open_fmt_file ← true;
  exit: end;
```

This code is used in section 1479*.

551* Operating systems often make it possible to determine the exact name (and possible version number) of a file that has been opened. The following routine, which simply makes a T_EX string from the value of *name_of_file*, should ideally be changed to deduce the full name of file *f*, which is the file most recently opened, if it is possible to do this in a Pascal program.

This routine might be called after string memory has overflowed, hence we dare not use ‘*str_room*’.

```

function make_name_string: str_number;
  var k: 1 .. file_name_size; { index into name_of_file }
      save_area_delimiter, save_ext_delimiter: pool_pointer;
      save_name_in_progress, save_stop_at_space: boolean;
  begin if (pool_ptr + name_length > pool_size)  $\vee$  (str_ptr = max_strings)  $\vee$  (cur_length > 0) then
      make_name_string  $\leftarrow$  "?"
  else begin for k  $\leftarrow$  1 to name_length do append_char(xord[name_of_file[k]]);
      make_name_string  $\leftarrow$  make_string; { At this point we also set cur_name, cur_ext, and cur_area to
      match the contents of name_of_file. }
      save_area_delimiter  $\leftarrow$  area_delimiter; save_ext_delimiter  $\leftarrow$  ext_delimiter;
      save_name_in_progress  $\leftarrow$  name_in_progress; save_stop_at_space  $\leftarrow$  stop_at_space;
      name_in_progress  $\leftarrow$  true; begin_name; stop_at_space  $\leftarrow$  false; k  $\leftarrow$  1;
      while (k  $\leq$  name_length)  $\wedge$  (more_name(name_of_file[k])) do incr(k);
      stop_at_space  $\leftarrow$  save_stop_at_space; end_name; name_in_progress  $\leftarrow$  save_name_in_progress;
      area_delimiter  $\leftarrow$  save_area_delimiter; ext_delimiter  $\leftarrow$  save_ext_delimiter;
      end;
  end;
function a_make_name_string(var f : alpha_file): str_number;
  begin a_make_name_string  $\leftarrow$  make_name_string;
  end;
function b_make_name_string(var f : byte_file): str_number;
  begin b_make_name_string  $\leftarrow$  make_name_string;
  end;
function w_make_name_string(var f : word_file): str_number;
  begin w_make_name_string  $\leftarrow$  make_name_string;
  end;

```

552* Now let's consider the “driver” routines by which TeX deals with file names in a system-independent manner. First comes a procedure that looks for a file name in the input by calling *get_x.token* for the information.

```

procedure scan_file_name;
  label done;
  var save_warning_index: pointer;
  begin save_warning_index ← warning_index; warning_index ← cur_cs;
    { store cur_cs here to remember until later }
  ⟨ Get the next non-blank non-relax non-call token 430⟩;
    { here the program expands tokens and removes spaces and \relaxes from the input. The \relax
    removal follows LuaTeX's implementation, and other cases of balanced text scanning. }
  back_input; { return the last token to be read by either code path }
  if cur_cmd = left_brace then scan_file_name_braced
  else begin name_in_progress ← true; begin_name; ⟨ Get the next non-blank non-call token 432⟩;
    loop begin if (cur_cmd > other_char) ∨ (cur_chr > 255) then { not a character }
      begin back_input; goto done;
    end; { If cur_chr is a space and we're not scanning a token list, check whether we're at the end
      of the buffer. Otherwise we end up adding spurious spaces to file names in some cases. }
    if (cur_chr = "␣") ∧ (state ≠ token_list) ∧ (loc > limit) then goto done;
    if ¬more_name(cur_chr) then goto done;
    get_x_token;
    end;
  end;
done: end_name; name_in_progress ← false; warning_index ← save_warning_index;
  { restore warning_index }
end;

```

556* If some trouble arises when TeX tries to open a file, the following routine calls upon the user to supply another file name. Parameter *s* is used in the error message to identify the type of file; parameter *e* is the default extension if none is given. Upon exit from the routine, variables *cur_name*, *cur_area*, *cur_ext*, and *name_of_file* are ready for another attempt at file opening.

```

procedure prompt_file_name(s, e : str_number);
  label done;
  var k: 0 .. buf_size; { index into buffer }
      saved_cur_name: str_number; { to catch empty terminal input }

```

This code is used in section 560*.

563* Let's turn now to the procedure that is used to initiate file reading when an ‘\input’ command is being processed. Beware: For historic reasons, this code foolishly conserves a tiny bit of string pool space; but that can confuse the interactive ‘E’ option.

```

procedure start_input; {  $\text{\TeX}$  will  $\backslash\text{input}$  something }
  label done;
  var temp_str: str_number; v: pointer;
  begin scan_file_name; { set cur_name to desired file name }
  pack_cur_name;
  loop begin begin_file_reading; { set up cur_file and new level of input }
    tex_input_type  $\leftarrow$  1; { Tell open_input we are  $\backslash\text{input}$ . }
    { Kpathsea tries all the various ways to get the file. }
    if kpse_in_name_ok(stringcast(name_of_file + 1))  $\wedge$  a_open_in(cur_file, kpse_tex_format) then
      goto done;
    end_file_reading; { remove the level that didn't work }
    prompt_file_name("input_file_name", "");
  end;
done: name  $\leftarrow$  a_make_name_string(cur_file); source_filename_stack[in_open]  $\leftarrow$  name;
  full_source_filename_stack[in_open]  $\leftarrow$  make_full_name_string;
  if name = str_ptr - 1 then { we can try to conserve string pool space now }
    begin temp_str  $\leftarrow$  search_string(name);
    if temp_str > 0 then
      begin name  $\leftarrow$  temp_str; flush_string;
    end;
  end;
  if job_name = 0 then
    begin job_name  $\leftarrow$  get_job_name(cur_name); open_log_file;
    end; { open_log_file doesn't show_context, so limit and loc needn't be set to meaningful values yet }
  if term_offset + length(full_source_filename_stack[in_open]) > max_print_line - 2 then print_ln
  else if (term_offset > 0)  $\vee$  (file_offset > 0) then print_char("_");
  print_char("("); incr(open_parens); slow_print(full_source_filename_stack[in_open]); update_terminal;
  if tracing_stack_levels > 0 then
    begin begin_diagnostic; print_ln; print_char("~"); v  $\leftarrow$  input_ptr - 1;
    if v < tracing_stack_levels then
      while v > 0 do
        begin print_char("."); decr(v);
        end
      else print_char("~");
      slow_print("INPUT_"); slow_print(cur_name); slow_print(cur_ext); print_ln; end_diagnostic(false);
    end;
  state  $\leftarrow$  new_line;  $\langle$  Prepare new file SyncTeX information 1915*  $\rangle$ ;
   $\langle$  Read the first line of the new file 564  $\rangle$ ;
end;

```

574* So that is what TFM files hold. Since T_EX has to absorb such information about lots of fonts, it stores most of the data in a large array called *font_info*. Each item of *font_info* is a *memory_word*; the *fix_word* data gets converted into *scaled* entries, while everything else goes into words of type *four_quarters*.

When the user defines `\font\font`, say, T_EX assigns an internal number to the user's font `\font`. Adding this number to *font_id_base* gives the *eqtb* location of a “frozen” control sequence that will always select the font.

⟨Types in the outer block 18⟩ +≡

```
internal_font_number = integer; { font in a char_node }
font_index = integer; { index into font_info }
nine_bits = min_quarterword .. non_char;
```

575* Here now is the (rather formidable) array of font arrays.

```
define non_char ≡ qi(256) { a halfword code that can't match a real character }
define non_address = 0 { a spurious bchar_label }
```

⟨Global variables 13⟩ +≡

```
font_info: ↑memory_word; { the big collection of font data }
fmem_ptr: font_index; { first unused word of font_info }
font_ptr: internal_font_number; { largest internal font number in use }
font_check: ↑four_quarters; { check sum }
font_size: ↑scaled; { “at” size }
font_dsize: ↑scaled; { “design” size }
font_params: ↑font_index; { how many font parameters are present }
font_name: ↑str_number; { name of the font }
font_area: ↑str_number; { area of the font }
font_bc: ↑eight_bits; { beginning (smallest) character code }
font_ec: ↑eight_bits; { ending (largest) character code }
font_glue: ↑pointer; { glue specification for interword space, null if not allocated }
font_used: ↑boolean; { has a character from this font actually appeared in the output? }
hyphen_char: ↑integer; { current \hyphenchar values }
skew_char: ↑integer; { current \skewchar values }
bchar_label: ↑font_index;
    { start of lig_kern program for left boundary character, non_address if there is none }
font_bchar: ↑nine_bits; { boundary character, non_char if there is none }
font_false_bchar: ↑nine_bits; { font_bchar if it doesn't exist in the font, otherwise non_char }
```

576* Besides the arrays just enumerated, we have directory arrays that make it easy to get at the individual entries in *font_info*. For example, the *char_info* data for character *c* in font *f* will be in *font_info*[*char_base*[*f*] + *c*].*qqqq*; and if *w* is the *width_index* part of this word (the *b0* field), the width of the character is *font_info*[*width_base*[*f*] + *w*].*sc*. (These formulas assume that *min_quarterword* has already been added to *c* and to *w*, since T_EX stores its quarterwords that way.)

⟨Global variables 13⟩ +≡

```
char_base: ↑integer; { base addresses for char_info }
width_base: ↑integer; { base addresses for widths }
height_base: ↑integer; { base addresses for heights }
depth_base: ↑integer; { base addresses for depths }
italic_base: ↑integer; { base addresses for italic corrections }
lig_kern_base: ↑integer; { base addresses for ligature/kerning programs }
kern_base: ↑integer; { base addresses for kerns }
exten_base: ↑integer; { base addresses for extensible recipes }
param_base: ↑integer; { base addresses for font parameters }
```

577* ⟨Set initial values of key variables 21⟩ +≡

578* T_EX always knows at least one font, namely the null font. It has no characters, and its seven parameters are all equal to zero.

⟨ Initialize table entries (done by INITEX only) [182](#) ⟩ +≡

580* Of course we want to define macros that suppress the detail of how font information is actually packed, so that we don't have to write things like

$$font_info[width_base[f] + font_info[char_base[f] + c].qqqq.b0].sc$$

too often. The WEB definitions here make $char_info(f)(c)$ the *four-quarters* word of font information corresponding to character c of font f . If q is such a word, $char_width(f)(q)$ will be the character's width; hence the long formula above is at least abbreviated to

$$char_width(f)(char_info(f)(c)).$$

Usually, of course, we will fetch q first and look at several of its fields at the same time.

The italic correction of a character will be denoted by $char_italic(f)(q)$, so it is analogous to $char_width$. But we will get at the height and depth in a slightly different way, since we usually want to compute both height and depth if we want either one. The value of $height_depth(q)$ will be the 8-bit quantity

$$b = height_index \times 16 + depth_index,$$

and if b is such a byte we will write $char_height(f)(b)$ and $char_depth(f)(b)$ for the height and depth of the character c for which $q = char_info(f)(c)$. Got that?

The tag field will be called $char_tag(q)$; the remainder byte will be called $rem_byte(q)$, using a macro that we have already defined above.

Access to a character's *width*, *height*, *depth*, and *tag* fields is part of TeX's inner loop, so we want these macros to produce code that is as fast as possible under the circumstances.

MLTeX will assume that a character c exists iff either exists in the current font or a character substitution definition for this character was defined using `\charsubdef`. To avoid the distinction between these two cases, MLTeX introduces the notion "effective character" of an input character c . If c exists in the current font, the effective character of c is the character c itself. If it doesn't exist but a character substitution is defined, the effective character of c is the base character defined in the character substitution. If there is an effective character for a non-existing character c , the "virtual character" c will get appended to the horizontal lists.

The effective character is used within $char_info$ to access appropriate character descriptions in the font. For example, when calculating the width of a box, MLTeX will use the metrics of the effective characters. For the case of a substitution, MLTeX uses the metrics of the base character, ignoring the metrics of the accent character.

If character substitutions are changed, it will be possible that a character c neither exists in a font nor there is a valid character substitution for c . To handle these cases *effective_char* should be called with its first argument set to *true* to ensure that it will still return an existing character in the font. If neither c nor the substituted base character in the current character substitution exists, *effective_char* will output a warning and return the character $font_bc[f]$ (which is incorrect, but can not be changed within the current framework).

Sometimes character substitutions are unwanted, therefore the original definition of $char_info$ can be used using the macro *orig_char_info*. Operations in which character substitutions should be avoided are, for example, loading a new font and checking the font metric information in this font, and character accesses in math mode.

```

586* T_EX checks the information of a TFM file for validity as the file is being read in, so that no further checks will be needed when typesetting is going on. The somewhat tedious subroutine that does this is called *read_font_info*. It has four parameters: the user font identifier *u*, the file name and area strings *nom* and *aire*, and the “at” size *s*. If *s* is negative, it’s the negative of a scale factor to be applied to the design size; *s* = −1000 is the normal case. Otherwise *s* will be substituted for the design size; in this case, *s* must be positive and less than 2048 pt (i.e., it must be less than 2²⁷ when considered as an integer).

The subroutine opens and closes a global file variable called *tfm_file*. It returns the value of the internal font number that was just loaded. If an error is detected, an error message is issued and no font information is stored; *null_font* is returned in this case.

```

define bad_tfm = 11 { label for read_font_info }
define abort ≡ goto bad_tfm { do this when the TFM data is wrong }
<Declare additional functions for MLTEX 1882*>

  if bch_label < nl then bchar_label[f] ← bch_label + lig_kern_base[f]
  else bchar_label[f] ← non_address;
  font_bchar[f] ← qi(bchar); font_false_bchar[f] ← qi(bchar);
  if bchar ≤ ec then
    if bchar ≥ bc then
      begin qw ← orig_char_info(f)(bchar); { N.B.: not qi(bchar) }
      if char_exists(qw) then font_false_bchar[f] ← non_char;
      end;
  font_name[f] ← nom; font_area[f] ← aire; font_bc[f] ← bc; font_ec[f] ← ec; font_glue[f] ← null;
  adjust(char_base); adjust(width_base); adjust(lig_kern_base); adjust(kern_base); adjust(exten_base);
  decr(param_base[f]); fmem_ptr ← fmem_ptr + lf; font_ptr ← f; g ← f; goto done

```

This code is used in section 588.

604* Before we forget about the format of these tables, let's deal with two of TeX's basic scanning routines related to font information.

(Declare procedures that scan font-related stuff **604***) \equiv

```

function test_no_ligatures(f : internal_font_number): integer;
  label exit;
  var c: integer;
  begin test_no_ligatures  $\leftarrow$  1;
  for c  $\leftarrow$  font_bc[f] to font_ec[f] do
    if char_exists(orig_char_info(f)(c)) then
      if odd(char_tag(orig_char_info(f)(c))) then
        begin test_no_ligatures  $\leftarrow$  0; return;
        end;
  exit: end;

function get_tag_code(f : internal_font_number; c : eight_bits): integer;
  var i: small_number;
  begin if is_valid_char(c) then
    begin i  $\leftarrow$  char_tag(orig_char_info(f)(c));
    if i = lig_tag then get_tag_code  $\leftarrow$  1
    else if i = list_tag then get_tag_code  $\leftarrow$  2
    else if i = ext_tag then get_tag_code  $\leftarrow$  4
    else get_tag_code  $\leftarrow$  0;
    end
  else get_tag_code  $\leftarrow$  -1;
  end;

procedure scan_font_ident;
  var f: internal_font_number; m: halfword;
  begin (Get the next non-blank non-call token 432);
  if (cur_cmd = def_font)  $\vee$  (cur_cmd = letterspace_font)  $\vee$  (cur_cmd = pdf_copy_font) then f  $\leftarrow$  cur_font
  else if cur_cmd = set_font then f  $\leftarrow$  cur_chr
    else if cur_cmd = def_family then
      begin m  $\leftarrow$  cur_chr; scan_four_bit_int; f  $\leftarrow$  equiv(m + cur_val);
      end
    else begin print_err("Missing_font_identifier");
      help2("I_was_looking_for_a_control_sequence_whose")
      ("current_meaning_has_been_defined_by_\font."); back_error; f  $\leftarrow$  null_font;
      end;
    cur_val  $\leftarrow$  f;
  end;

```

See also section **605**.

This code is used in section **435**.

608* When TeX wants to typeset a character that doesn't exist, the character node is not created; thus the output routine can assume that characters exist when it sees them. The following procedure prints a warning message unless the user has suppressed it.

```

procedure char_warning(f : internal_font_number; c : eight_bits);
  var old_setting: integer; { saved value of tracing_online }
  begin if tracing_lost_chars > 0 then
    begin old_setting ← tracing_online;
    if eTeX_ex ∧ (tracing_lost_chars > 1) then tracing_online ← 1;
    if tracing_lost_chars > 2 then print_err("Missing_character:_There_is_no_")
    else begin begin_diagnostic; print_nl("Missing_character:_There_is_no_")
      end;
    print_ASCII(c);
    if tracing_lost_chars > 2 then
      begin print("_"); print_hex(c); print("");
      end;
    print("_in_font_"); slow_print(font_name[f]);
    if tracing_lost_chars < 3 then print_char("!");
    tracing_online ← old_setting;
    if tracing_lost_chars > 2 then
      begin help0; error;
      end
    else end_diagnostic(false);
    end; { of tracing_lost_chars > 0 }
  end; { of procedure }

```

609* Here is a function that returns a pointer to a character node for a given character in a given font. If that character doesn't exist, *null* is returned instead.

This allows a character node to be used if there is an equivalent in the *char_sub_code* list.

```

function new_character(f : internal_font_number; c : eight_bits): pointer;
  label exit;
  var p: pointer; { newly allocated node }
  ec: quarterword; { effective character of c }
  begin ec ← effective_char(false, f, qi(c));
  if font_bc[f] ≤ qo(ec) then
    if font_ec[f] ≥ qo(ec) then
      if char_exists(orig_char_info(f)(ec)) then { N.B.: not char_info }
        begin p ← get_avail; font(p) ← f; character(p) ← qi(c); new_character ← p; return;
        end;
      char_warning(f, c); new_character ← null;
    exit: end;

```

619* **Shipping pages out.** After considering TeX’s eyes and stomach, we come now to the bowels.

The *ship_out* procedure is given a pointer to a box; its mission is to describe that box in DVI form, outputting a “page” to *dvi_file*. The DVI coordinates $(h, v) = (0, 0)$ should correspond to the upper left corner of the box being shipped.

Since boxes can be inside of boxes inside of boxes, the main work of *ship_out* is done by two mutually recursive routines, *hlist_out* and *vlist_out*, which traverse the hlists and vlists inside of horizontal and vertical boxes.

As individual pages are being processed, we need to accumulate information about the entire set of pages, since such statistics must be reported in the postamble. The global variables *total_pages*, *max_v*, *max_h*, *max_push*, and *last_bop* are used to record this information.

The variable *doing_leaders* is *true* while leaders are being output. The variable *dead_cycles* contains the number of times an output routine has been initiated since the last *ship_out*.

A few additional global variables are also defined here for use in *vlist_out* and *hlist_out*. They could have been local variables, but that would waste stack space when boxes are deeply nested, since the values of these variables are not needed during recursive calls.

⟨Global variables 13⟩ +≡

total_pages: *integer*; { the number of pages that have been shipped out }

max_v: *scaled*; { maximum height-plus-depth of pages shipped so far }

max_h: *scaled*; { maximum width of pages shipped so far }

max_push: *integer*; { deepest nesting of *push* commands encountered so far }

last_bop: *integer*; { location of previous *bop* in the DVI output }

dead_cycles: *integer*; { recent outputs that didn’t ship anything out }

doing_leaders: *boolean*; { are we inside a leader box? }

{ character and font in current *char_node* }

c: *quarterword*;

f: *internal_font_number*;

rule_ht, *rule_dp*, *rule_wd*: *scaled*; { size of current rule being output }

g: *pointer*; { current glue specification }

lq, *lr*: *integer*; { quantities used in calculations for leaders }

622* Some systems may find it more efficient to make *dvi_buf* a **packed** array, since output of four bytes at once may be facilitated.

⟨Global variables 13⟩ +≡

dvi_buf: $\uparrow eight_bits$; { buffer for DVI output }

half_buf: *integer*; { half of *dvi_buf_size* }

dvi_limit: *integer*; { end of the current half buffer }

dvi_ptr: *integer*; { the next available buffer address }

dvi_offset: *integer*; { *dvi_buf_size* times the number of times the output buffer has been fully emptied }

dvi_gone: *integer*; { the number of bytes already output to *dvi_file* }

624* The actual output of *dvi_buf*[*a* . . *b*] to *dvi_file* is performed by calling *write_dvi*(*a*, *b*). For best results, this procedure should be optimized to run as fast as possible on each particular system, since it is part of TeX’s inner loop. It is safe to assume that *a* and *b* + 1 will both be multiples of 4 when *write_dvi*(*a*, *b*) is called; therefore it is possible on many machines to use efficient methods to pack four bytes per word and to output an array of words with one system call.

In C, we use a macro to call *fwrite* or *write* directly, writing all the bytes in one shot. Much better even than writing four bytes at a time.

625* To put a byte in the buffer without paying the cost of invoking a procedure each time, we use the macro *dvi_out*.

The length of *dvi_file* should not exceed "7FFFFFFF"; we set *cur_s* \leftarrow -2 to prevent further DVI output causing infinite recursion.

```

define dvi_out(#) ≡ begin dvi_buf[dvi_ptr]  $\leftarrow$  #; incr(dvi_ptr);
    if dvi_ptr = dvi_limit then dvi_swap;
    end

procedure dvi_swap; { outputs half of the buffer }
begin if dvi_ptr > ("7FFFFFFF" - dvi_offset) then
    begin cur_s  $\leftarrow$  -2; fatal_error("dvi_length_exceeds_" "7FFFFFFF");
    end;
if dvi_limit = dvi_buf_size then
    begin write_dvi(0, half_buf - 1); dvi_limit  $\leftarrow$  half_buf; dvi_offset  $\leftarrow$  dvi_offset + dvi_buf_size;
    dvi_ptr  $\leftarrow$  0;
    end
else begin write_dvi(half_buf, dvi_buf_size - 1); dvi_limit  $\leftarrow$  dvi_buf_size;
    end;
dvi_gone  $\leftarrow$  dvi_gone + half_buf;
end;

```

626* Here is how we clean out the buffer when TeX is all through; *dvi_ptr* will be a multiple of 4.

```

⟨ Empty the last bytes out of dvi_buf 626* ⟩ ≡
if dvi_limit = half_buf then write_dvi(half_buf, dvi_buf_size - 1);
if dvi_ptr > ("7FFFFFFF" - dvi_offset) then
    begin cur_s  $\leftarrow$  -2; fatal_error("dvi_length_exceeds_" "7FFFFFFF");
    end;
if dvi_ptr > 0 then write_dvi(0, dvi_ptr - 1)

```

This code is used in section 670*.

629* Here's a procedure that outputs a font definition. Since TeX82 uses at most 256 different fonts per job, *fnt_def1* is always used as the command code.

```

procedure dvi_font_def(f : internal_font_number);
var k: pool_pointer; { index into str_pool }
begin if f ≤ 256 + font_base then
    begin dvi_out(fnt_def1); dvi_out(f - font_base - 1);
    end
else begin dvi_out(fnt_def1 + 1); dvi_out((f - font_base - 1) div '400);
    dvi_out((f - font_base - 1) mod '400);
    end;
dvi_out(qo(font_check[f].b0)); dvi_out(qo(font_check[f].b1)); dvi_out(qo(font_check[f].b2));
dvi_out(qo(font_check[f].b3));
dvi_four(font_size[f]); dvi_four(font_dsize[f]);
dvi_out(length(font_area[f])); dvi_out(length(font_name[f]));
⟨ Output the font name whose internal number is f 630 ⟩;
end;

```

```

645*  $\langle$  Initialize variables as ship_out begins 645*  $\rangle \equiv$ 
  dvi_h  $\leftarrow$  0; dvi_v  $\leftarrow$  0; cur_h  $\leftarrow$  h_offset; dvi_f  $\leftarrow$  null_font;

```

648* We ought to give special care to the efficiency of one part of *hlist_out*, since it belongs to TeX's inner loop. When a *char_node* is encountered, we save a little time by processing several nodes in succession until reaching a non-*char_node*. The program uses the fact that *set_char_0* = 0.

In MLTeX this part looks for the existence of a substitution definition for a character *c*, if *c* does not exist in the font, and create appropriate DVI commands. Former versions of MLTeX have spliced appropriate character, kern, and box nodes into the horizontal list. Because the user can change character substitutions or `\charsubdefmax` on the fly, we have to test again for valid substitutions. (Additional it is necessary to be careful—if leaders are used the current hlist is normally traversed more than once!)

```

          end;
      end;
  end

```

This code is used in section **894**.

896* It is convenient to have a procedure that converts a *math_char* field to an “unpacked” form. The *fetch* routine sets *cur_f*, *cur_c*, and *cur_i* to the font code, character code, and character information bytes of a given noad field. It also takes care of issuing error messages for nonexistent characters; in such cases, *char_exists*(*cur_i*) will be *false* after *fetch* has acted, and the field will also have been reset to *empty*.

```

procedure fetch(a : pointer); {unpack the math_char field a}
  begin cur_c ← character(a); cur_f ← fam_fnt(fam(a) + cur_size);
  if cur_f = null_font then ⟨Complain about an undefined family and set cur_i null 897⟩
  else begin if (qo(cur_c) ≥ font_bc[cur_f]) ∧ (qo(cur_c) ≤ font_ec[cur_f]) then
    cur_i ← orig_char_info(cur_f)(cur_c)
  else cur_i ← null_character;
  if ¬(char_exists(cur_i)) then
    begin char_warning(cur_f, qo(cur_c)); math_type(a) ← empty; cur_i ← null_character;
    end;
  end;
end;

```

914* ⟨Switch to a larger accent if available and appropriate **914***⟩ ≡

```

loop begin if char_tag(i) ≠ list_tag then goto done;
  y ← rem_byte(i); i ← orig_char_info(f)(y);
  if ¬char_exists(i) then goto done;
  if char_width(f)(i) > w then goto done;
  c ← y;
  end;

```

done:

This code is used in section **912**.

923* If the nucleus of an *op_noad* is a single character, it is to be centered vertically with respect to the axis, after first being enlarged (via a character list in the font) if we are in display style. The normal convention for placing displayed limits is to put them above and below the operator in display style.

The italic correction is removed from the character if there is a subscript and the limits are not being displayed. The *make_op* routine returns the value that should be used as an offset between subscript and superscript.

After *make_op* has acted, *subtype(q)* will be *limits* if and only if the limits have been set above and below the operator. In that case, *new_hlist(q)* will already contain the desired final box.

⟨Declare math construction procedures 908⟩ +≡

```

function make_op(q : pointer): scaled;

1095* The patterns are stored in a compact table that is also efficient for retrieval, using a variant of “trie memory” [cf. *The Art of Computer Programming* **3** (1973), 481–505]. We can find each pattern $p_1 \dots p_k$ by letting z_0 be one greater than the relevant language index and then, for $1 \leq i \leq k$, setting $z_i \leftarrow \text{trie_link}(z_{i-1}) + p_i$; the pattern will be identified by the number z_k . Since all the pattern information is packed together into a single *trie_link* array, it is necessary to prevent confusion between the data from inequivalent patterns, so another table is provided such that $\text{trie_char}(z_i) = p_i$ for all i . There is also a table $\text{trie_op}(z_k)$ to identify the numbers $n_0 \dots n_k$ associated with $p_1 \dots p_k$.

The theory that comparatively few different number sequences $n_0 \dots n_k$ actually occur, since most of the n ’s are generally zero, seems to fail at least for the large German hyphenation patterns. Therefore the number sequences cannot any longer be encoded in such a way that $\text{trie_op}(z_k)$ is only one byte long. We have introduced a new constant *max_trie_op* for the maximum allowable hyphenation operation code value; *max_trie_op* might be different for TeX and INITEX and must not exceed *max_halfword*. An opcode will occupy a halfword if *max_trie_op* exceeds *max_quarterword* or a quarterword otherwise. If $\text{trie_op}(z_k) \neq \text{min_trie_op}$, when $p_1 \dots p_k$ has matched the letters in $hc[(l - k + 1) \dots l]$ of language t , we perform all of the required operations for this pattern by carrying out the following little program: Set $v \leftarrow \text{trie_op}(z_k)$. Then set $v \leftarrow v + \text{op_start}[t]$, $\text{hyf}[l - \text{hyf_distance}[v]] \leftarrow \max(\text{hyf}[l - \text{hyf_distance}[v]], \text{hyf_num}[v])$, and $v \leftarrow \text{hyf_next}[v]$; repeat, if necessary, until $v = \text{min_trie_op}$.

trie_pointer = 0 .. *ssup_trie_size*; { an index into *trie* }
trie_opcode = 0 .. *ssup_trie_opcode*; { a trie opcode }

1096* For more than 255 trie op codes, the three fields *trie_link*, *trie_char*, and *trie_op* will no longer fit into one memory word; thus using web2c we define *trie* as three array instead of an array of records. The variant will be implemented by reusing the opcode field later on with another macro.

define *trie_link*(#) ≡ *trie_trl*[#] { “downward” link in a trie }
define *trie_char*(#) ≡ *trie_trc*[#] { character matched at this trie location }

     $v \leftarrow hyf\_next[v]$ ;
  until  $v = min\_trie\_op$ ;
  end

```

This code is used in section 1098*.

1100* The exception table that is built by TeX's `\hyphenation` primitive is organized as an ordered hash table [cf. Amble and Knuth, *The Computer Journal* **17** (1974), 135–142] using linear probing. If α and β are words, we will say that $\alpha < \beta$ if $|\alpha| < |\beta|$ or if $|\alpha| = |\beta|$ and α is lexicographically smaller than β . (The notation $|\alpha|$ stands for the length of α .) The idea of ordered hashing is to arrange the table so that a given word α can be sought by computing a hash address $h = h(\alpha)$ and then looking in table positions h , $h - 1$, \dots , until encountering the first word $\leq \alpha$. If this word is different from α , we can conclude that α is not in the table. This is a clever scheme which saves the need for a hash link array. However, it is difficult to increase the size of the hyphen exception arrays. To make this easier, the ordered hash has been replaced by a simple hash, using an additional array *hyph_link*. The value 0 in *hyph_link*[k] means that there are no more entries corresponding to the specific hash chain. When *hyph_link*[k] > 0 , the next entry in the hash chain is *hyph_link*[k] $- 1$. This value is used because the arrays start at 0.

The words in the table point to lists in *mem* that specify hyphen positions in their *info* fields. The list for $c_1 \dots c_n$ contains the number k if the word $c_1 \dots c_n$ has a discretionary hyphen between c_k and c_{k+1} .

```

⟨Types in the outer block 18⟩ +≡
   $hyph\_pointer = 0 \dots ssup\_hyph\_size$ ;
  { index into hyphen exceptions hash table; enlarging this requires changing (un)dump code }

```

This code is used in section **1115***.

1118* Before we discuss trie building in detail, let's consider the simpler problem of creating the *hyf_distance*, *hyf_num*, and *hyf_next* arrays.

Suppose, for example, that TeX reads the pattern 'ab2cde1'. This is a pattern of length 5, with $n_0 \dots n_5 = 002001$ in the notation above. We want the corresponding *trie_op* code v to have *hyf_distance*[v] = 3, *hyf_num*[v] = 2, and *hyf_next*[v] = v' , where the auxiliary *trie_op* code v' has *hyf_distance*[v'] = 0, *hyf_num*[v'] = 1, and *hyf_next*[v'] = *min_trie_op*.

TeX computes an appropriate value v with the *new_trie_op* subroutine below, by setting

$$v' \leftarrow \text{new_trie_op}(0, 1, \text{min_trie_op}), \quad v \leftarrow \text{new_trie_op}(3, 2, v').$$

This subroutine looks up its three parameters in a special hash table, assigning a new value only if these three have not appeared before for the current language.

The hash table is called *trie_op_hash*, and the number of entries it contains is *trie_op_ptr*.

⟨Global variables 13⟩ +≡

```

init trie_op_hash: array [neg_trie_op_size .. trie_op_size] of 0 .. trie_op_size;
    { trie op codes for quadruples }
trie_used: array [ASCII_code] of trie_opcode; { largest opcode used so far for this language }
trie_op_lang: array [1 .. trie_op_size] of ASCII_code; { language part of a hashed quadruple }
trie_op_val: array [1 .. trie_op_size] of trie_opcode; { opcode corresponding to a hashed quadruple }
trie_op_ptr: 0 .. trie_op_size; { number of stored ops so far }
tini
max_op_used: trie_opcode; { largest opcode used for any language }
small_op: boolean; { flag used while dumping or undumping }
```

1119* It's tempting to remove the *overflow* stops in the following procedure; *new_trie_op* could return *min_trie_op* (thereby simply ignoring part of a hyphenation pattern) instead of aborting the job. However, that would lead to different hyphenation results on different installations of TeX using the same patterns. The *overflow* stops are necessary for portability of patterns.

(Declare procedures for preprocessing hyphenation patterns **1119***) \equiv

```
function new_trie_op(d, n : small_number; v : trie_opcode): trie_opcode;
  label exit;
  var h: neg_trie_op_size .. trie_op_size; { trial hash location }

This code is used in section **1117**.

1120* After *new_trie_op* has compressed the necessary opcode information, plenty of information is available to unscramble the data into the final form needed by our hyphenation algorithm.

(Sort the hyphenation op tables into proper order **1120***) \equiv

```
op_start[0]  $\leftarrow$  -min_trie_op;
for j  $\leftarrow$  1 to 255 do op_start[j]  $\leftarrow$  op_start[j - 1] + qo(trie_used[j - 1]);
for j  $\leftarrow$  1 to trie_op_ptr do trie_op_hash[j]  $\leftarrow$  op_start[trie_op_lang[j]] + trie_op_val[j]; { destination }
for j  $\leftarrow$  1 to trie_op_ptr do
  while trie_op_hash[j] > j do
    begin k  $\leftarrow$  trie_op_hash[j];
      t  $\leftarrow$  hyf_distance[k]; hyf_distance[k]  $\leftarrow$  hyf_distance[j]; hyf_distance[j]  $\leftarrow$  t;
      t  $\leftarrow$  hyf_num[k]; hyf_num[k]  $\leftarrow$  hyf_num[j]; hyf_num[j]  $\leftarrow$  t;
      t  $\leftarrow$  hyf_next[k]; hyf_next[k]  $\leftarrow$  hyf_next[j]; hyf_next[j]  $\leftarrow$  t;
      trie_op_hash[j]  $\leftarrow$  trie_op_hash[k]; trie_op_hash[k]  $\leftarrow$  j;
    end
```

This code is used in section **1127**.

1121* Before we forget how to initialize the data structures that have been mentioned so far, let's write down the code that gets them started.

```

⟨Initialize table entries (done by INITEX only) 182⟩ +=
  for  $k \leftarrow -trie\_op\_size$  to  $trie\_op\_size$  do  $trie\_op\_hash[k] \leftarrow 0$ ;
  for  $k \leftarrow 0$  to 255 do  $trie\_used[k] \leftarrow min\_trie\_op$ ;
   $max\_op\_used \leftarrow min\_trie\_op$ ;  $trie\_op\_ptr \leftarrow 0$ ;

```

1122* The linked trie that is used to preprocess hyphenation patterns appears in several global arrays. Each node represents an instruction of the form “if you see character c , then perform operation o , move to the next character, and go to node l ; otherwise go to node r .” The four quantities c , o , l , and r are stored in four arrays $trie_c$, $trie_o$, $trie_l$, and $trie_r$. The root of the trie is $trie_l[0]$, and the number of nodes is $trie_ptr$. Null trie pointers are represented by zero. To initialize the trie, we simply set $trie_l[0]$ and $trie_ptr$ to zero. We also set $trie_c[0]$ to some arbitrary value, since the algorithm may access it.

The algorithms maintain the condition

$$trie_c[trie_r[z]] > trie_c[z] \quad \text{whenever } z \neq 0 \text{ and } trie_r[z] \neq 0;$$

in other words, sibling nodes are ordered by their c fields.

```

define  $trie\_root \equiv trie\_l[0]$  { root of the linked trie }
⟨Global variables 13⟩ +=
  init  $trie\_c$ :  $\uparrow packed\_ASCII\_code$ ; { characters to match }
   $trie\_o$ :  $\uparrow trie\_opcode$ ; { operations to perform }
   $trie\_l$ :  $\uparrow trie\_pointer$ ; { left subtrie links }
   $trie\_r$ :  $\uparrow trie\_pointer$ ; { right subtrie links }
   $trie\_ptr$ :  $trie\_pointer$ ; { the number of nodes in the trie }
   $trie\_hash$ :  $\uparrow trie\_pointer$ ; { used to identify equivalent subtrees }
  tini

```

1125* The compressed trie will be packed into the $trie$ array using a “top-down first-fit” procedure. This is a little tricky, so the reader should pay close attention: The $trie_hash$ array is cleared to zero again and renamed $trie_ref$ for this phase of the operation; later on, $trie_ref[p]$ will be nonzero only if the linked trie node p is the smallest character in a family and if the characters c of that family have been allocated to locations $trie_ref[p] + c$ in the $trie$ array. Locations of $trie$ that are in use will have $trie_link = 0$, while the unused holes in $trie$ will be doubly linked with $trie_link$ pointing to the next larger vacant location and $trie_back$ pointing to the next smaller one. This double linking will have been carried out only as far as $trie_max$, where $trie_max$ is the largest index of $trie$ that will be needed. To save time at the low end of the trie, we maintain array entries $trie_min[c]$ pointing to the smallest hole that is greater than c . Another array $trie_taken$ tells whether or not a given location is equal to $trie_ref[p]$ for some p ; this array is used to ensure that distinct nodes in the compressed trie will have distinct $trie_ref$ entries.

```

define  $trie\_ref \equiv trie\_hash$  { where linked trie families go into  $trie$  }
define  $trie\_back(\#) \equiv trie\_tro[\#]$  { use the opcode field now for backward links }
⟨Global variables 13⟩ +=
  init  $trie\_taken$ :  $\uparrow boolean$ ; { does a family start here? }
   $trie\_min$ : array [ $ASCII\_code$ ] of  $trie\_pointer$ ; { the first possible slot for each character }
   $trie\_max$ :  $trie\_pointer$ ; { largest location used in  $trie$  }
   $trie\_not\_ready$ :  $boolean$ ; { is the trie still in linked form? }
  tini

```

1126* Each time `\patterns` appears, it contributes further patterns to the future trie, which will be built only when hyphenation is attempted or when a format file is dumped. The boolean variable *trie_not_ready* will change to *false* when the trie is compressed; this will disable further patterns.

⟨Initialize table entries (done by INITEX only) 182⟩ +≡
trie_not_ready \leftarrow *true*;

1133* When the whole trie has been allocated into the sequential table, we must go through it once again so that *trie* contains the correct information. Null pointers in the linked trie will be represented by the value 0, which properly implements an “empty” family.

```
define clear_trie  $\equiv$  { clear trie[r] }
  begin trie_link(r)  $\leftarrow$  0; trie_op(r)  $\leftarrow$  min_trie_op; trie_char(r)  $\leftarrow$  min_quarterword;
    { trie_char  $\leftarrow$  qi(0) }
  end
⟨Move the data into trie 1133*⟩  $\equiv$ 
  if trie_max = 0 then { no patterns were given }
    begin for r  $\leftarrow$  0 to 256 do clear_trie;
      trie_max  $\leftarrow$  256;
    end
  else begin if hyph_root > 0 then trie_fix(hyph_root);
    if trie_root > 0 then trie_fix(trie_root); { this fixes the non-holes in trie }
    r  $\leftarrow$  0; { now we will zero out all the holes }
    repeat s  $\leftarrow$  trie_link(r); clear_trie; r  $\leftarrow$  s;
    until r > trie_max;
  end;
  trie_char(0)  $\leftarrow$  qi("?"); { make trie_char(c)  $\neq$  c for all c }
```

This code is used in section 1141*.

1135* Now let’s go back to the easier problem, of building the linked trie. When INITEX has scanned the ‘`\patterns`’ control sequence, it calls on *new_patterns* to do the right thing.

⟨Declare procedures for preprocessing hyphenation patterns 1119*⟩ +≡
procedure *new_patterns*; { initializes the hyphenation pattern data }
 label *done*, *done1*;
 var *k, l*: 0 .. 64; { indices into *hc* and *hyf*; not always in *small_number* range }
 digit_sensed: boolean; { should the next digit be treated as a letter? }
 v: *trie_opcode*; { trie op code }
 p, q: *trie_pointer*; { nodes of trie traversed during insertion }
 first_child: boolean; { is *p* = *trie_l*[*q*]? }
 c: *ASCII_code*; { character being inserted }
 begin if *trie_not_ready* then
 begin *set_cur_lang*; *scan_left_brace*; { a left brace must follow `\patterns` }
 ⟨Enter all of the patterns into a linked trie, until coming to a right brace 1136⟩;
 if *saving_hyph_codes* > 0 then ⟨Store hyphenation codes for current language 1852⟩;
 end
 else begin *print_err*("Too_late_for_"); *print_esc*("patterns");
 help1("All_patterns_must_be_given_before_typesetting_begins."); *error*;
 link(*garbage*) \leftarrow *scan_toks*(*false*, *false*); *flush_list*(*def_ref*);
 end;
 end;

1138* When the following code comes into play, the pattern $p_1 \dots p_k$ appears in $hc[1 \dots k]$, and the corresponding sequence of numbers $n_0 \dots n_k$ appears in $hyf[0 \dots k]$.

```

⟨Insert a new pattern into the linked trie 1138*⟩ ≡
begin ⟨Compute the trie op code,  $v$ , and set  $l \leftarrow 0$  1140*⟩;
 $q \leftarrow 0$ ;  $hc[0] \leftarrow cur\_lang$ ;
while  $l \leq k$  do
  begin  $c \leftarrow hc[l]$ ;  $incr(l)$ ;  $p \leftarrow trie\_l[q]$ ;  $first\_child \leftarrow true$ ;
  while  $(p > 0) \wedge (c > so(trie\_c[p]))$  do
    begin  $q \leftarrow p$ ;  $p \leftarrow trie\_r[q]$ ;  $first\_child \leftarrow false$ ;
    end;
  if  $(p = 0) \vee (c < so(trie\_c[p]))$  then
    ⟨Insert a new trie node between  $q$  and  $p$ , and make  $p$  point to it 1139*⟩;
     $q \leftarrow p$ ; { now node  $q$  represents  $p_1 \dots p_{l-1}$  }
  end;
if  $trie\_o[q] \neq min\_trie\_op$  then
  begin  $print\_err("Duplicate\_pattern")$ ;  $help1("(\text{See\_Appendix\_H.})")$ ;  $error$ ;
  end;
 $trie\_o[q] \leftarrow v$ ;
end

```

This code is used in section 1136.

```

1139* ⟨Insert a new trie node between  $q$  and  $p$ , and make  $p$  point to it 1139*⟩ ≡
begin if  $trie\_ptr = trie\_size$  then  $overflow("pattern\_memory", trie\_size)$ ;
 $incr(trie\_ptr)$ ;  $trie\_r[trie\_ptr] \leftarrow p$ ;  $p \leftarrow trie\_ptr$ ;  $trie\_l[p] \leftarrow 0$ ;
if  $first\_child$  then  $trie\_l[q] \leftarrow p$  else  $trie\_r[q] \leftarrow p$ ;
 $trie\_c[p] \leftarrow si(c)$ ;  $trie\_o[p] \leftarrow min\_trie\_op$ ;
end

```

This code is used in sections 1138*, 1852, and 1853.

```

1140* ⟨Compute the trie op code,  $v$ , and set  $l \leftarrow 0$  1140*⟩ ≡
if  $hc[1] = 0$  then  $hyf[0] \leftarrow 0$ ;
if  $hc[k] = 0$  then  $hyf[k] \leftarrow 0$ ;
 $l \leftarrow k$ ;  $v \leftarrow min\_trie\_op$ ;
loop begin if  $hyf[l] \neq 0$  then  $v \leftarrow new\_trie\_op(k - l, hyf[l], v)$ ;
  if  $l > 0$  then  $decr(l)$  else goto done1;
end;
done1:

```

This code is used in section 1138*.

1141* Finally we put everything together: Here is how the trie gets to its final, efficient form. The following packing routine is rigged so that the root of the linked tree gets mapped into location 1 of *trie*, as required by the hyphenation algorithm. This happens because the first call of *first_fit* will “take” location 1.

⟨Declare procedures for preprocessing hyphenation patterns 1119*⟩ +≡

```
procedure init_trie;
  var p: trie_pointer; { pointer for initialization }
      j, k, t: integer; { all-purpose registers for initialization }
      r, s: trie_pointer; { used to clean up the packed trie }
  begin ⟨Get ready to compress the trie 1127⟩;
  if trie_root ≠ 0 then
    begin first_fit(trie_root); trie_pack(trie_root);
    end;
  if hyph_root ≠ 0 then ⟨Pack all stored hyph_codes 1854⟩;
  ⟨Move the data into trie 1133*⟩;
  trie_not_ready ← false;
end;
```

1163* Pages are built by appending nodes to the current list in \TeX 's vertical mode, which is at the outermost level of the semantic nest. This vlist is split into two parts; the “current page” that we have been talking so much about already, and the “contribution list” that receives new nodes as they are created. The current page contains everything that the page builder has accounted for in its data structures, as described above, while the contribution list contains other things that have been generated by other parts of \TeX but have not yet been seen by the page builder. The contribution list starts at $\text{link}(\text{contrib_head})$, and it ends at the current node in \TeX 's vertical mode.

When \TeX has appended new material in vertical mode, it calls the procedure *build_page*, which tries to catch up by moving nodes from the contribution list to the current page. This procedure will succeed in its goal of emptying the contribution list, unless a page break is discovered, i.e., unless the current page has grown to the point where the optimum next page break has been determined. In the latter case, the nodes after the optimum break will go back onto the contribution list, and control will effectively pass to the user's output routine.

We make $\text{type}(\text{page_head}) = \text{glue_node}$, so that an initial glue node on the current page will not be considered a valid breakpoint.

⟨ Initialize the special list heads and constant nodes 964 ⟩ $\vdash \equiv$

$\text{type}(\text{page_head}) \leftarrow \text{glue_node}; \text{subtype}(\text{page_head}) \leftarrow \text{normal};$
 $\{ \text{Sync}\text{\TeX} \text{ watch point: } \text{box}(\text{page_head}) \text{ size } i = \text{glue_node} \text{ size} \}$

1209* We leave the *space_factor* unchanged if *sf_code*(*cur_chr*) = 0; otherwise we set it equal to *sf_code*(*cur_chr*), except that it should never change from a value less than 1000 to a value exceeding 1000. The most common case is *sf_code*(*cur_chr*) = 1000, so we want that case to be fast.

The overall structure of the main loop is presented here. Some program labels are inside the individual sections.

```

define adjust_space_factor ≡
    main_s ← sf_code(cur_chr);
    if main_s = 1000 then space_factor ← 1000
    else if main_s < 1000 then
        begin if main_s > 0 then space_factor ← main_s;
        end
        else if space_factor < 1000 then space_factor ← 1000
        else space_factor ← main_s
    end

⟨Append character cur_chr and the following characters (if any) to the current hlist in the current font;
goto reswitch when a non-character has been fetched 1209*⟩ ≡

1511* Here we do whatever is needed to complete T_EX's job gracefully on the local operating system. The code here might come into play after a fatal error; it must therefore consist entirely of “safe” operations that cannot produce error messages. For example, it would be a mistake to call *str_room* or *make_string* at this time, because a call on *overflow* might lead to an infinite loop. (Actually there's one way to get error messages, via *prepare_mag*; but that can't cause infinite recursion.)

If *final_cleanup* is bypassed, this program doesn't bother to close the input files that may still be open.

This code is used in section 1510*.

1516* Debugging. Once T_EX is working, you should be able to diagnose most errors with the `\show` commands and other diagnostic features. But for the initial stages of debugging, and for the revelation of really deep mysteries, you can compile T_EX with a few more aids, including the Pascal runtime checks and its debugger. An additional routine called *debug_help* will also come into play when you type ‘D’ after an error message; *debug_help* also occurs just before a fatal error causes T_EX to succumb.

The interface to *debug_help* is primitive, but it is good enough when used with a Pascal debugger that allows you to set breakpoints and to read variables and change their values. After getting the prompt ‘**debug #**’, you type either a negative number (this exits *debug_help*), or zero (this goes to a location where you can set a breakpoint, thereby entering into dialog with the Pascal debugger), or a positive number *m* followed by an argument *n*. The meaning of *m* and *n* will be clear from the program below. (If *m* = 13, there is an additional argument, *l*.)

```

define breakpoint = 888 { place where a breakpoint is desirable }
⟨Last-minute procedures 1511*⟩ +=
debug procedure debug_help; { routine to display various things }
label breakpoint, exit;
var k, l, m, n: integer;
begin clear_terminal;
loop
  begin wake_up_terminal; print_nl("debug_#_(-1_to_exit):"); update_terminal; read(term_in, m);
  if m < 0 then return
  else if m = 0 then dump_core { do something to cause a core dump }
    else begin read(term_in, n);
      case m of
        ⟨Numbered cases for debug_help 1517*⟩

This code is used in section 1516*.

1519* First let's consider the format of *whatsit* nodes that are used to represent the data associated with `\write` and its relatives. Recall that a *whatsit* has *type* = *whatsit_node*, and the *subtype* is supposed to distinguish different kinds of *whatsits*. Each node occupies two or more words; the exact number is immaterial, as long as it is readily determined from the *subtype* or other data.

We shall introduce five *subtype* values here, corresponding to the control sequences `\openout`, `\write`, `\closeout`, `\special`, and `\setlanguage`. The second word of I/O *whatsits* has a *write_stream* field that identifies the write-stream number (0 to 15, or 16 for out-of-range and positive, or 17 for out-of-range and negative). In the case of `\write` and `\special`, there is also a field that points to the reference count of a token list that should be sent. In the case of `\openout`, we need three words and three auxiliary subfields to hold the string numbers for name, area, and extension.

```

define write_node_size = 2 { number of words in a write/whatsit node }
define open_node_size = 3 { number of words in an open/whatsit node }
define open_node = 0 { subtype in whatsits that represent files to \openout }
define write_node = 1 { subtype in whatsits that represent things to \write }
define close_node = 2 { subtype in whatsits that represent streams to \closeout }
define special_node = 3 { subtype in whatsits that represent \special things }
define language_node = 4 { subtype in whatsits that change the current language }
define what_lang(#)  $\equiv$  link(# + 1) { language number, in the range 0 .. 255 }
define what_lhm(#)  $\equiv$  type(# + 1) { minimum left fragment, in the range 1 .. 63 }
define what_rhm(#)  $\equiv$  subtype(# + 1) { minimum right fragment, in the range 1 .. 63 }
define write_tokens(#)  $\equiv$  link(# + 1) { reference count of token list to write }
define write_stream(#)  $\equiv$  type(# + 1) { stream number (0 to 17) }
define mubyte_zero  $\equiv$  64
define write_mubyte(#)  $\equiv$  subtype(# + 1) { mubyte value + mubyte_zero }
define open_name(#)  $\equiv$  link(# + 1) { string number of file name to open }
define open_area(#)  $\equiv$  info(# + 2) { string number of file area for open_name }
define open_ext(#)  $\equiv$  link(# + 2) { string number of file extension for open_name }

```

1522* Extensions might introduce new command codes; but it's best to use *extension* with a modifier, whenever possible, so that *main_control* stays the same.

1645* **The extended features of ε -TeX.** The program has two modes of operation: (1) In TeX compatibility mode it fully deserves the name TeX and there are neither extended features nor additional primitive commands. There are, however, a few modifications that would be legitimate in any implementation of TeX such as, e.g., preventing inadequate results of the glue to DVI unit conversion during *ship_out*. (2) In extended mode there are additional primitive commands and the extended features of ε -TeX are available.

The distinction between these two modes of operation initially takes place when a ‘virgin’ **eINITEX** starts without reading a format file. Later on the values of all ε -TeX state variables are inherited when **eVIRTEX** (or **eINITEX**) reads a format file.

The code below is designed to work for cases where ‘**init ... tini**’ is a run-time switch.

```

⟨ Enable  $\varepsilon$ -TeX, if requested 1645* ⟩ ≡
init if (etex_p  $\vee$  (buffer[loc] = "*"))  $\wedge$  (format.ident = " $\sqcup$ (INITEX)") then
  begin no_new_control_sequence  $\leftarrow$  false; ⟨ Generate all  $\varepsilon$ -TeX primitives 1646 ⟩
  if (buffer[loc] = "*") then incr(loc);
  eTeX_mode  $\leftarrow$  1; { enter extended mode }
  ⟨ Initialize variables for  $\varepsilon$ -TeX extended mode 1810 ⟩
  end;
tini
if  $\neg$ no_new_control_sequence then { just entered extended mode ? }
  no_new_control_sequence  $\leftarrow$  true else

```

This code is used in section 1515*.

1649* **define** *eTeX_ex* \equiv (*eTeX_mode* = 1) { is this extended mode? }

```

⟨ Global variables 13 ⟩ +≡
eTeX_mode: 0 .. 1; { identifies compatibility and extended mode }
etex_p: boolean; { was the -etex option specified }

```

1657* In order to handle **\everyeof** we need an array *eof_seen* of boolean variables.

```

⟨ Global variables 13 ⟩ +≡
eof_seen:  $\uparrow$ boolean; { has eof been seen? }

```

1718* We detach the hlist, start a new one consisting of just one kern node, append the reversed list, and set the width of the kern node.

```

⟨ Reverse the complete hlist and set the subtype to reversed 1718* ⟩ ≡
begin save_h  $\leftarrow$  cur_h; temp_ptr  $\leftarrow$  p; p  $\leftarrow$  new_kern(0); sync_tag(p + medium_node_size)  $\leftarrow$  0;
  { SyncTeX: do nothing, it is too late }
  link(prev_p)  $\leftarrow$  p; cur_h  $\leftarrow$  0; link(p)  $\leftarrow$  reverse(this_box, null, cur_g, cur_glue); width(p)  $\leftarrow$   $-cur_h$ ;
  cur_h  $\leftarrow$  save_h; set_box_lr(this_box)(reversed);
end

```

This code is used in section 1711.

1719* We detach the remainder of the hlist, replace the math node by an edge node, and append the reversed hlist segment to it; the tail of the reversed segment is another edge node and the remainder of the original list is attached to it.

```

⟨ Reverse an hlist segment and goto reswitch 1719* ⟩ ≡
begin save_h  $\leftarrow$  cur_h; temp_ptr  $\leftarrow$  link(p); rule_wd  $\leftarrow$  width(p); free_node(p, medium_node_size);
  { SyncTeX: p is a math_node }
  cur_dir  $\leftarrow$  reflected; p  $\leftarrow$  new_edge(cur_dir, rule_wd); link(prev_p)  $\leftarrow$  p;
  cur_h  $\leftarrow$  cur_h - left_edge + rule_wd; link(p)  $\leftarrow$  reverse(this_box, new_edge(reflected, 0), cur_g, cur_glue);
  edge_dist(p)  $\leftarrow$  cur_h; cur_dir  $\leftarrow$  reflected; cur_h  $\leftarrow$  save_h; goto reswitch;
end

```

This code is used in section 1714.

1722* \langle Move the non-*char_node* p to the new list **1722*** $\rangle \equiv$

```

begin  $q \leftarrow link(p)$ ;
case  $type(p)$  of
 $hlist\_node, vlist\_node, rule\_node, kern\_node$ :  $rule\_wd \leftarrow width(p)$ ;
 $\langle$  Cases of reverse that need special treatment 1723  $\rangle$

1770* A group entered (or a conditional started) in one file may end in a different file. Such slight anomalies, although perfectly legitimate, may cause errors that are difficult to locate. In order to be able to give a warning message when such anomalies occur, ε -TeX uses the *grp_stack* and *if_stack* arrays to record the initial *cur_boundary* and *cond_ptr* values for each input file.

```

 $\langle$  Global variables 13  $\rangle + \equiv$ 
grp_stack:  $\uparrow$ save_pointer; { initial cur_boundary }
if_stack:  $\uparrow$ pointer; { initial cond_ptr }

```

1851* When reading `\patterns` while `\savingshyphcodes` is positive the current *lc_code* values are stored together with the hyphenation patterns for the current language. They will later be used instead of the *lc_code* values for hyphenation purposes.

The *lc_code* values are stored in the linked trie analogous to patterns p_1 of length 1, with *hyph_root* = *trie_r*[0] replacing *trie_root* and *lc_code*(p_1) replacing the *trie_op* code. This allows to compress and pack them together with the patterns with minimal changes to the existing code.

```

define hyph_root  $\equiv$  trie_r[0] { root of the linked trie for hyph_codes }
 $\langle$  Initialize table entries (done by INITEX only) 182  $\rangle + \equiv$ 

```

1864* **System-dependent changes for Web2c.** Here are extra variables for Web2c. (This numbering of the system-dependent section allows easy integration of Web2c and e-TeX, etc.)

```

⟨Global variables 13⟩ +≡
edit_name_start: pool_pointer; { where the filename to switch to starts }
edit_name_length, edit_line: integer; { what line to start editing at }
ipc_on: cinttype; { level of IPC action, 0 for none [default] }
stop_at_space: boolean; { whether more_name returns false for space }

```

1865* The *edit_name_start* will be set to point into *str_pool* somewhere after its beginning if TeX is supposed to switch to an editor on exit.

```

⟨Set initial values of key variables 21⟩ +≡
edit_name_start ← 0; stop_at_space ← true;

```

1866* These are used when we regenerate the representation of the first 256 strings.

```

⟨Global variables 13⟩ +≡
save_str_ptr: str_number;
save_pool_ptr: pool_pointer;
shellenabledp: cinttype;
restrictedshell: cinttype;
output_comment: ↑char;
k, l: 0 .. 255; { used by ‘Make the first 256 strings’, etc. }

```

1867* When debugging a macro package, it can be useful to see the exact control sequence names in the format file. For example, if ten new csnames appear, it’s nice to know what they are, to help pinpoint where they came from. (This isn’t a truly “basic” printing procedure, but that’s a convenient module in which to put it.)

```

⟨Basic printing procedures 57⟩ +≡
procedure print_csnames(hstart : integer; hfinish : integer);
var c, h: integer;
begin write_ln(stderr, ^fmtdebug:csnames_ from ^, hstart, ^ to ^, hfinish, ^: ^);
for h ← hstart to hfinish do
  begin if text(h) > 0 then
    begin { if have anything at this position }
    for c ← str_start[text(h)] to str_start[text(h) + 1] - 1 do
      begin put_byte(str_pool[c], stderr); { print the characters }
    end;
    write_ln(stderr, ^ | ^);
  end;
end;
end;

```

1868* Are we printing extra info as we read the format file?

```

⟨Global variables 13⟩ +≡
debug_format_file: boolean;

```

1869* A helper for printing file:line:error style messages. Look for a filename in *full_source_filename_stack*, and if we fail to find one fall back on the non-file:line:error style.

(Basic printing procedures 57) +≡

```

procedure print_file_line;
  var level: 0 .. max_in_open;
  begin level ← in_open;
  while (level > 0) ∧ (full_source_filename_stack[level] = 0) do decr(level);
  if level = 0 then print_nl("!␣")
  else begin print_nl(""); print(full_source_filename_stack[level]); print(":");
    if level = in_open then print_int(line)
    else print_int(line_stack[level + 1]);
    print(":␣");
  end;
end;

```

1870* To be able to determine whether `\write18` is enabled from within TeX we also implement `\eof18`. We sort of cheat by having an additional route *scan_four_bit_int_or_18* which is the same as *scan_four_bit_int* except it also accepts the value 18.

(Declare procedures that scan restricted classes of integers 459) +≡

```

procedure scan_four_bit_int_or_18;
  begin scan_int;
  if (cur_val < 0) ∨ ((cur_val > 15) ∧ (cur_val ≠ 18)) then
    begin print_err("Bad␣number");
    help2("Since␣I␣expected␣to␣read␣a␣number␣between␣0␣and␣15,")
    ("I␣changed␣this␣one␣to␣zero."); int_error(cur_val); cur_val ← 0;
    end;
  end;

```

1871* Dumping the *xord*, *xchr*, and *xprn* arrays. We dump these always in the format, so a TCX file loaded during format creation can set a default for users of the format.

(Dump *xord*, *xchr*, and *xprn* 1871*) ≡

```

dump_things(xord[0], 256); dump_things(xchr[0], 256); dump_things(xprn[0], 256);

```

This code is used in section 1483*.

1872* Undumping the *xord*, *xchr*, and *xprn* arrays. This code is more complicated, because we want to ensure that a TCX file specified on the command line will override whatever is in the format. Since the tcx file has already been loaded, that implies throwing away the data in the format. Also, if no *translate_filename* is given, but *eight_bit_p* is set we have to make all characters printable.

(Undump *xord*, *xchr*, and *xprn* 1872*) ≡

```

if translate_filename then
  begin for k ← 0 to 255 do undump_things(dummy_xord, 1);
  for k ← 0 to 255 do undump_things(dummy_xchr, 1);
  for k ← 0 to 255 do undump_things(dummy_xprn, 1);
  end
else begin undump_things(xord[0], 256); undump_things(xchr[0], 256); undump_things(xprn[0], 256);
  if eight_bit_p then
    for k ← 0 to 255 do xprn[k] ← 1;
  end;

```

This code is used in section 1484*.

1873* **The string recycling routines.** T_EX uses 2 upto 4 *new* strings when scanning a filename in an `\input`, `\openin`, or `\openout` operation. These strings are normally lost because the reference to them are not saved after finishing the operation. *search_string* searches through the string pool for the given string and returns either 0 or the found string number.

⟨Declare additional routines for string recycling 1873*⟩ ≡

```
function search_string(search : str_number): str_number;
  label found;
  var result: str_number; s: str_number; { running index }
      len: integer; { length of searched string }
  begin result ← 0; len ← length(search);
  if len = 0 then { trivial case }
    begin result ← ""; goto found;
  end
  else begin s ← search - 1; { start search with newest string below s; search > 1! }
    while s > 255 do { first 256 strings depend on implementation!! }
      begin if length(s) = len then
        if str_eq_str(s, search) then
          begin result ← s; goto found;
        end;
        decr(s);
      end;
    end;
  found: search_string ← result;
end;
```

See also section 1874*.

This code is used in section 47*.

1874* The following routine is a variant of *make_string*. It searches the whole string pool for a string equal to the string currently built and returns a found string. Otherwise a new string is created and returned. Be cautious, you can not apply *flush_string* to a replaced string!

⟨Declare additional routines for string recycling 1873*⟩ +≡

```
function slow_make_string: str_number;
  label exit;
  var s: str_number; { result of search_string }
      t: str_number; { new string }
  begin t ← make_string; s ← search_string(t);
  if s > 0 then
    begin flush_string; slow_make_string ← s; return;
  end;
  slow_make_string ← t;
exit: end;
```

1875* More changes for Web2c. Sometimes, recursive calls to the *expand* routine may cause exhaustion of the run-time calling stack, resulting in forced execution stops by the operating system. To diminish the chance of this happening, a counter is used to keep track of the recursion depth, in conjunction with a constant called *expand_depth*.

This does not catch all possible infinite recursion loops, just the ones that exhaust the application calling stack. The actual maximum value of *expand_depth* is outside of our control, but the initial setting of 10000 should be enough to prevent problems.

⟨Global variables 13⟩ +≡
expand_depth_count: integer;

1876* ⟨Set initial values of key variables 21⟩ +≡
expand_depth_count ← 0;

1877* When *scan_file_name* starts it looks for a *left_brace* (skipping *\relaxes*, as other *\toks*-like primitives). If a *left_brace* is found, then the procedure scans a file name contained in a balanced token list, expanding tokens as it goes. When the scanner finds the balanced token list, it is converted into a string and fed character-by-character to *more_name* to do its job the same as in the “normal” file name scanning.

procedure *scan_file_name_braced*;

```

var save_scanner_status: small_number; { scanner_status upon entry }
    save_def_ref: pointer; { def_ref upon entry, important if inside ‘\message’ }
    save_cur_cs: pointer; s: str_number; { temp string }
    p: pointer; { temp pointer }
    i: integer; { loop tally }
    save_stop_at_space: boolean; { this should be in tex.ch }
    dummy: boolean; { Initializing }

```

```

begin save_scanner_status ← scanner_status; { scan_toks sets scanner_status to absorbing }
    save_def_ref ← def_ref; { scan_toks uses def_ref to point to the token list just read }
    save_cur_cs ← cur_cs; { we set cur_cs back a few tokens to use in runaway errors }
    { Scanning a token list }

```

```

    cur_cs ← warning_index; { for possible runaway error }
    { mimick call_func from pdfTeX }

```

```

if scan_toks(false, true) ≠ 0 then do_nothing; { actually do the scanning }
    { s ← tokens_to_string(def_ref); }

```

```

    old_setting ← selector; selector ← new_string; show_token_list(link(def_ref), null, pool_size - pool_ptr);
    selector ← old_setting; s ← make_string; { turns the token list read in a string to input }
    { Restoring some variables }

```

```

    delete_token_ref(def_ref); { remove the token list from memory }

```

```

    def_ref ← save_def_ref; { and restore def_ref }

```

```

    cur_cs ← save_cur_cs; { restore cur_cs }

```

```

    scanner_status ← save_scanner_status; { restore scanner_status }

```

```

    { Passing the read string to the input machinery }

```

```

    save_stop_at_space ← stop_at_space; { save stop_at_space }

```

```

    stop_at_space ← false; { set stop_at_space to false to allow spaces in file names }

```

```

    begin_name;

```

```

for i ← str_start[s] to str_start[s + 1] - 1 do dummy ← more_name(str_pool[i]);
    { add each read character to the current file name }

```

```

    stop_at_space ← save_stop_at_space; { restore stop_at_space }

```

```

end;

```

1878* **System-dependent changes for MLT_EX.** The boolean variable *mltex_p* is set by web2c according to the given command line option (or an entry in the configuration file) before any T_EX function is called.

⟨Global variables 13⟩ +≡

mltex_p: *boolean*;

1879* The boolean variable *mltex_enabled_p* is used to enable MLT_EX's character substitution. It is initialized to *false*. When loading a FMT it is set to the value of the boolean *mltex_p* saved in the FMT file. Additionally it is set to the value of *mltex_p* in IniT_EX.

⟨Global variables 13⟩ +≡

mltex_enabled_p: *boolean*; { enable character substitution }

1880* ⟨Set initial values of key variables 21⟩ +≡

mltex_enabled_p ← *false*;

1881* The function *effective_char* computes the effective character with respect to font information. The effective character is either the base character part of a character substitution definition, if the character does not exist in the font or the character itself.

Inside *effective_char* we can not use *char_info* because the macro *char_info* uses *effective_char* calling this function a second time with the same arguments.

If neither the character *c* exists in font *f* nor a character substitution for *c* was defined, you can not use the function value as a character offset in *char_info* because it will access an undefined or invalid *font_info* entry! Therefore inside *char_info* and in other places, *effective_char*'s boolean parameter *err_p* is set to *true* to issue a warning and return the incorrect replacement, but always existing character *font_bc[f]*.

<Declare ε -TeX procedures for scanning 1679> +≡

```
function effective_char(err_p : boolean; f : internal_font_number; c : quarterword): integer;
  label found;
  var base_c: integer; { or eightbits: replacement base character }
      result: integer; { or quarterword }
  begin result ← c; { return c unless it does not exist in the font }
  if ¬mltex_enabled_p then goto found;
  if font_ec[f] ≥ qo(c) then
    if font_bc[f] ≤ qo(c) then
      if char_exists(orig_char_info(f)(c)) then { N.B.: not char_info(f)(c) }
        goto found;
    if qo(c) ≥ char_sub_def_min then
      if qo(c) ≤ char_sub_def_max then
        if char_list_exists(qo(c)) then
          begin base_c ← char_list_char(qo(c)); result ← qi(base_c); { return base_c }
          if ¬err_p then goto found;
          if font_ec[f] ≥ base_c then
            if font_bc[f] ≤ base_c then
              if char_exists(orig_char_info(f)(qi(base_c))) then goto found;
          end;
        if err_p then { print error and return existing character? }
          begin begin_diagnostic; print_nl("Missing_character: There is no ");
            print("substitution for "); print_ASCII(qo(c)); print(" in font "); slow_print(font_name[f]);
            print_char("!"); end_diagnostic(false); result ← qi(font_bc[f]);
            { N.B.: not non-existing character c! }
          end;
  found: effective_char ← result;
  end;
```

1882* The function *effective_char_info* is equivalent to *char_info*, except it will return *null_character* if neither the character *c* exists in font *f* nor is there a substitution definition for *c*. (For these cases *char_info* using *effective_char* will access an undefined or invalid *font_info* entry. See the documentation of *effective_char* for more information.)

(Declare additional functions for L^AT_EX 1882*) \equiv

```
function effective_char_info(f : internal_font_number; c : quarterword): four_quarters;
  label exit;
  var ci: four_quarters; { character information bytes for c }
    base_c: integer; { or eightbits: replacement base character }
  begin if  $\neg$ mltex_enabled_p then
    begin effective_char_info  $\leftarrow$  orig_char_info(f)(c); return;
    end;
  if font_ec[f]  $\geq$  qo(c) then
    if font_bc[f]  $\leq$  qo(c) then
      begin ci  $\leftarrow$  orig_char_info(f)(c); { N.B.: not char_info(f)(c) }
      if char_exists(ci) then
        begin effective_char_info  $\leftarrow$  ci; return;
        end;
      end;
    if qo(c)  $\geq$  char_sub_def_min then
      if qo(c)  $\leq$  char_sub_def_max then
        if char_list_exists(qo(c)) then
          begin { effective_char_info  $\leftarrow$  char_info(f)(qi(char_list_char(qo(c)))); }
          base_c  $\leftarrow$  char_list_char(qo(c));
          if font_ec[f]  $\geq$  base_c then
            if font_bc[f]  $\leq$  base_c then
              begin ci  $\leftarrow$  orig_char_info(f)(qi(base_c)); { N.B.: not char_info(f)(c) }
              if char_exists(ci) then
                begin effective_char_info  $\leftarrow$  ci; return;
                end;
              end;
            end;
          end;
        effective_char_info  $\leftarrow$  null_character;
      exit: end;
```

This code is used in section 586*.

1883* This code is called for a virtual character *c* in *hlist_out* during *ship_out*. It tries to build a character substitution construct for *c* generating appropriate DVI code using the character substitution definition for this character. If a valid character substitution exists DVI code is created as if *make_accent* was used. In all other cases the status of the substitution for this character has been changed between the creation of the character node in the hlist and the output of the page—the created DVI code will be correct but the visual result will be undefined.

Former MLTeX versions have replaced the character node by a sequence of character, box, and accent kern nodes splicing them into the original horizontal list. This version does not do this to avoid a) a memory overflow at this processing stage, b) additional code to add a pointer to the previous node needed for the replacement, and c) to avoid wrong code resulting in anomalies because of the use within a `\leaders` box.

```

⟨ Output a substitution, goto continue if not possible 1883* ⟩ ≡
begin ⟨ Get substitution information, check it, goto found if all is ok, otherwise goto continue 1886* ⟩;
found: ⟨ Print character substitution tracing log 1887* ⟩;
⟨ Rebuild character using substitution information 1888* ⟩;
end

```

This code is used in section 648*.

1884* pdfTeX's *pdf_hlist_out* uses a similar, but slightly modified code section of the (almost) same name.

```

⟨ (pdfTeX) Output a substitution, goto continue if not possible 1884* ⟩ ≡
begin ⟨ Get substitution information, check it, goto found if all is ok, otherwise goto continue 1886* ⟩;
found: ⟨ Print character substitution tracing log 1887* ⟩;
⟨ (pdfTeX) Rebuild character using substitution information 1889* ⟩;
end

```

This code is used in section 731*.

1885* The global variables for the code to substitute a virtual character can be declared as local. Nonetheless we declare them as global to avoid stack overflows because *hlist_out* can be called recursively.

```

⟨ Global variables 13 ⟩ +≡
accent_c, base_c, replace_c: integer;
ia_c, ib_c: four-quarters; { accent and base character information }
base_slant, accent_slant: real; { amount of slant }
base_x_height: scaled; { accent is designed for characters of this height }
base_width, base_height: scaled; { height and width for base character }
accent_width, accent_height: scaled; { height and width for accent }
delta: scaled; { amount of right shift }

```

1886* Get the character substitution information in *char_sub_code* for the character *c*. The current code checks that the substitution exists and is valid and all substitution characters exist in the font, so we can *not* substitute a character used in a substitution. This simplifies the code because we have not to check for cycles in all character substitution definitions.

(Get substitution information, check it, goto *found* if all is ok, otherwise goto *continue* 1886*) ≡

```

if qo(c) ≥ char_sub_def_min then
  if qo(c) ≤ char_sub_def_max then
    if char_list_exists(qo(c)) then
      begin base_c ← char_list_char(qo(c)); accent_c ← char_list_accent(qo(c));
      if (font_ec[f] ≥ base_c) then
        if (font_bc[f] ≤ base_c) then
          if (font_ec[f] ≥ accent_c) then
            if (font_bc[f] ≤ accent_c) then
              begin ia_c ← char_info(f)(qi(accent_c)); ib_c ← char_info(f)(qi(base_c));
              if char_exists(ib_c) then
                if char_exists(ia_c) then goto found;
              end;
              begin_diagnostic; print_nl("Missing_character: Incomplete_substitution");
              print_ASCII(qo(c)); print("_="); print_ASCII(accent_c); print("_"); print_ASCII(base_c);
              print("_in_font"); slow_print(font_name[f]); print_char("!"); end_diagnostic(false);
              goto continue;
            end;
            begin_diagnostic; print_nl("Missing_character: There_is_no_"); print("substitution_for_");
            print_ASCII(qo(c)); print("_in_font"); slow_print(font_name[f]); print_char("!");
            end_diagnostic(false); goto continue

```

This code is used in sections 1883* and 1884*.

1887* For *tracinglostchars* > 99 the substitution is shown in the log file.

(Print character substitution tracing log 1887*) ≡

```

if tracing_lost_chars > 99 then
  begin begin_diagnostic; print_nl("Using_character_substitution:"); print_ASCII(qo(c));
  print("_="); print_ASCII(accent_c); print("_"); print_ASCII(base_c); print("_in_font");
  slow_print(font_name[f]); print_char("."); end_diagnostic(false);
  end

```

This code is used in sections 1883* and 1884*.

1888* This outputs the accent and the base character given in the substitution. It uses code virtually identical to the *make_accent* procedure, but without the node creation steps.

Additionally if the accent character has to be shifted vertically it does *not* create the same code. The original routine in *make_accent* and former versions of MLTeX creates a box node resulting in *push* and *pop* operations, whereas this code simply produces vertical positioning operations. This can influence the pixel rounding algorithm in some DVI drivers—and therefore will probably be changed in one of the next MLTeX versions.

(Rebuild character using substitution information 1888*) \equiv

```

1892* System-dependent changes for encT_{EX}.

define *encTeX_banner* \equiv ‘ \square encTeX \square v. \square Jun. \square 2004’

1893* The boolean variable *encTeX_p* is set by web2c according to the given command line option (or an entry in the configuration file) before any T_{EX} function is called.

⟨Global variables 13⟩ + \equiv

encTeX_p: *boolean*;

1894* The boolean variable *encTeX_enabled_p* is used to enable encT_{EX}’s primitives. It is initialised to *false*. When loading a FMT it is set to the value of the boolean *encTeX_p* saved in the FMT file. Additionally it is set to the value of *encTeX_p* in IniT_{EX}.

⟨Global variables 13⟩ + \equiv

encTeX_enabled_p: *boolean*; {enable encTeX}

1895* ⟨Set initial values of key variables 21⟩ + \equiv

encTeX_enabled_p \leftarrow *false*;

1896* Auxiliary functions/procedures for encT_{EX} (by Petr Olsak) follow. These functions implement the \mubyte code to convert the multibytes in *buffer* to one byte or to one control sequence. These functions manipulate a mubyte tree: each node of this tree is token list with n+1 tokens (first token consist the byte from the byte sequence itself and the other tokens point to the branches). If you travel from root of the tree to a leaf then you find exactly one byte sequence which we have to convert to one byte or control sequence. There are two variants of the leaf: the “definitive end” or the “middle leaf” if a longer byte sequence exists and the mubyte tree continues under this leaf. First variant is implemented as one memory word where the link part includes the token to which we have to convert and type part includes the number 60 (normal conversion) or 1.52 (insert the control sequence). The second variant of “middle leaf” is implemented as two memory words: first one has a type advanced by 64 and link points to the second word where info part includes the token to which we have to convert and link points to the next token list with the branches of the subtree.

The inverse: one byte to multi byte (for log printing and \write printing) is implemented via a pool. Each multibyte sequence is stored in a pool as a string and *mubyte_write*[*printed char*] points to this string.

```
define new_mubyte_node  $\equiv$  link(p)  $\leftarrow$  get_avail; p  $\leftarrow$  link(p); info(p)  $\leftarrow$  get_avail; p  $\leftarrow$  info(p)

```

This code is used in section 1479*.

1901* *The Synchronize T_EXnology.* This section is devoted to the *Synchronize T_EXnology* - or simply *SyncT_EX* - used to synchronize between input and output. This section explains how synchronization basics are implemented. Before we enter into more technical details, let us recall in a few words what is synchronization.

T_EX typesetting system clearly separates the input and the output material, and synchronization will provide a new link between both that can help text editors and viewers to work together. More precisely, forwards synchronization is the ability, given a location in the input source file, to find what is the corresponding place in the output. Backwards synchronization just performs the opposite: given a location in the output, retrieve the corresponding material in the input source file.

For better code management and maintainance, we adopt a naming convention. Throughout this program, code related to the *Synchronize T_EXnology* is tagged with the “*synctex*” key word. Any code extract where *SyncT_EX* plays its part, either explicitly or implicitly, (should) contain the string “*synctex*”. This naming convention also holds for external files. Moreover, all the code related to *SyncT_EX* is gathered in this section, except the definitions.

1902* Enabling synchronization should be performed from the command line, *synctexoption* is used for that purpose. This global integer variable is declared here but it is not used here. This is just a placeholder where the command line controller will put the *SyncT_EX* related options, and the *SyncT_EX* controller will read them.

1903* \langle Global variables 13 $\rangle + \equiv$
synctexoption: integer;

1904* A convenient primitive is provided: `\synctex=1` in the input source file enables synchronization whereas `\synctex=0` disables it. Its memory address is *synctex_code*. It is initialized by the *SyncT_EX* controller to the command-line option if given. The controller may filter some reserved bits.

1905* \langle Put each of T_EX’s primitives into the hash table 244 $\rangle + \equiv$
primitive("synctex", *assign_int*, *int_base* + *synctex_code*);

1906* \langle synctex case for *print_param* 1906* $\rangle \equiv$
synctex_code: *print_esc*("synctex");

This code is used in section 255*.

1907* In order to give the *SyncT_EX* controller read and write access to the contents of the `\synctex` primitive, we declare *synctexoffset*, such that *mem*[*synctexoffset*] and `\synctex` correspond to the same memory storage. *synctexoffset* is initialized to the correct value when quite everything is initialized.

1908* \langle Global variables 13 $\rangle + \equiv$
synctexoffset: integer; { holds the true value of *synctex_code* }

1909* \langle Initialize whatever T_EX might access 8* $\rangle + \equiv$
synctexoffset \leftarrow *int_base* + *synctex_code*;

1910* \langle Initialize synctex primitive 1910* $\rangle \equiv$
synctex_init_command;

This code is used in section 1510*.

1911* Synchronization is achieved with the help of an auxiliary file named ‘*jobname.synctex*’ (*jobname* is the contents of the `\jobname` macro), where a *SyncT_EX* controller implemented in the external *synctex.c* file will store geometrical information. This *SyncT_EX* controller will take care of every technical details concerning the *SyncT_EX* file, we will only focus on the messages the controller will receive from the T_EX program.

The most accurate synchronization information should allow to map any character of the input source file to the corresponding location in the output, if relevant. Ideally, the synchronization information of the input material consists of the file name, the line and column numbers of every character. The synchronization information in the output is simply the page number and either point coordinates, or box dimensions and position. The problem is that the mapping between these informations is only known at ship out time, which means that we must keep track of the input synchronization information until the pages ship out.

As T_EX only knows about file names and line numbers, but forgets the column numbers, we only consider a restricted input synchronization information called *SyncT_EX information*. It consists of a unique file name identifier, the *SyncT_EX file tag*, and the line number.

Keeping track of such information, should be different whether characters or nodes are involved. Actually, only certain nodes are involved in *SyncT_EX*, we call them *synchronized nodes*. Synchronized nodes store the *SyncT_EX* information in their last two words: the first one contains a *SyncT_EX file tag* uniquely identifying the input file, and the second one contains the current line number, as returned by the `\inputlineno` primitive. The *synctex_field_size* macro contains the necessary size to store the *SyncT_EX* information in a node.

When declaring the size of a new node, it is recommended to use the following convention: if the node is synchronized, use a definition similar to *my_synchronized_node_size=xxx+synctex_field_size*. Moreover, one should expect that the *SyncT_EX* information is always stored in the last two words of a synchronized node.

1912* By default, every node with a sufficiently big size is initialized at creation time in the *get_node* routine with the current *SyncT_EX* information, whether or not the node is synchronized. One purpose is to set this information very early in order to minimize code dependencies, including forthcoming extensions. Another purpose is to avoid the assumption that every node type has a dedicated getter, where initialization should take place. Actually, it appears that some nodes are created using directly the *get_node* routine and not the dedicated constructor. And finally, initializing the node at only one place is less error prone.

1913* \langle Initialize bigger nodes with *SyncT_EX* information 1913* $\rangle \equiv$
 if $s \geq \textit{medium_node_size}$ **then**
 begin $\textit{sync_tag}(r + s) \leftarrow \textit{synctex_tag}$; $\textit{sync_line}(r + s) \leftarrow \textit{line}$;
 end;

This code is used in section 143*.

1914* Instead of storing the input file name, it is better to store just an identifier. Each time T_EX opens a new file, it notifies the *SyncT_EX* controller with a *synctex_start_input* message. This controller will create a new *SyncT_EX* file tag and will update the current input state record accordingly. If the input comes from the terminal or a pseudo file, the *synctex_tag* is set to 0. It results in automatically disabling synchronization for material input from the terminal or pseudo files.

1915* \langle Prepare new file *SyncT_EX* information 1915* $\rangle \equiv$
 $\textit{synctex_start_input}$; { Give control to the *SyncT_EX* controller }

This code is used in section 563*.

1916* \langle Prepare terminal input *SyncT_EX* information 1916* $\rangle \equiv$
 $\textit{synctex_tag} \leftarrow 0$;

This code is used in section 350*.

1917* \langle Prepare pseudo file *SyncT_EX* information 1917* $\rangle \equiv$
synctex_tag $\leftarrow 0$;

This code is used in section 1752*.

1918* \langle Close *SyncT_EX* file and write status 1918* $\rangle \equiv$
synctex_terminate(*log_opened*); { Let the *SyncT_EX* controller close its files. }

This code is used in section 1511*.

1919* Synchronized nodes are boxes, math, kern and glue nodes. Other nodes should be synchronized too, in particular math nodes. _T_EX assumes that math, kern and glue nodes have the same size, this is why both are synchronized. *In fine*, only horizontal lists are really used in *SyncT_EX*, but all box nodes are considered the same with respect to synchronization, because a box node type is allowed to change at execution time.

The next sections are the various messages sent to the *SyncT_EX* controller. The argument is either the box or the node currently shipped out. The vertical boxes are not recorded, but the code is available for clients.

1920* \langle Start sheet *SyncT_EX* information record 1920* $\rangle \equiv$
synctex_sheet(*mag*);

This code is used in section 666*.

1921* \langle Finish sheet *SyncT_EX* information record 1921* $\rangle \equiv$
synctex_teehs;

This code is used in section 666*.

1922* \langle Start vlist *SyncT_EX* information record 1922* $\rangle \equiv$
synctex_vlist(*this_box*);

This code is used in sections 657* and 738*.

1923* \langle Finish vlist *SyncT_EX* information record 1923* $\rangle \equiv$
synctex_tsilv(*this_box*);

This code is used in sections 657* and 738*.

1924* \langle Start hlist *SyncT_EX* information record 1924* $\rangle \equiv$
synctex_hlist(*this_box*);

This code is used in sections 647* and 729*.

1925* \langle Finish hlist *SyncT_EX* information record 1925* $\rangle \equiv$
synctex_tsilh(*this_box*);

This code is used in sections 647* and 729*.

1926* \langle Record void list *SyncT_EX* information 1926* $\rangle \equiv$
if *type*(*p*) = *vlist_node* **then**
 begin *synctex_void_vlist*(*p*, *this_box*);
 end
else begin *synctex_void_hlist*(*p*, *this_box*);
 end;

This code is used in sections 651*, 660*, 733*, and 742*.

1927* \langle Record current point *SyncT_EX* information 1927* $\rangle \equiv$
synctex_current;

This code is used in sections 648* and 731*.

1928* \langle Record horizontal *rule_node* or *glue_node* SyncT_EX information 1928* $\rangle \equiv$
`synctex.horizontal_rule_or_glue(p, this_box);`

This code is used in sections 650* and 732*.

1929* \langle Record *kern_node* SyncT_EX information 1929* $\rangle \equiv$
`synctex.kern(p, this_box);`

This code is used in sections 650* and 732*.

1930* \langle Record *math_node* SyncT_EX information 1930* $\rangle \equiv$
`synctex.math(p, this_box);`

This code is used in sections 650* and 732*.

1931* When making a copy of a synchronized node, we might also have to duplicate the SyncT_EX information by copying the two last words. This is the case for a *box_node* and for a *glue_node*, but not for a *math_node* nor a *kern_node*. These last two nodes always keep the SyncT_EX information they received at creation time.

1932* \langle Copy the box SyncT_EX information 1932* $\rangle \equiv$
`sync_tag(r + box_node_size) \leftarrow sync_tag(p + box_node_size);`
`sync_line(r + box_node_size) \leftarrow sync_line(p + box_node_size);`

This code is used in sections 224* and 1730*.

1933* \langle Copy the rule SyncT_EX information 1933* $\rangle \equiv$

$$\{ \text{sync_tag}(r + \text{rule_node_size}) \leftarrow \text{sync_tag}(p + \text{rule_node_size});$$

$$\text{sync_line}(r + \text{rule_node_size}) \leftarrow \text{sync_line}(p + \text{rule_node_size}); \}$$

This code is used in section 224*.

1934* \langle Copy the medium sized node SyncT_EX information 1934* $\rangle \equiv$
`sync_tag(r + medium_node_size) \leftarrow sync_tag(p + medium_node_size);`
`sync_line(r + medium_node_size) \leftarrow sync_line(p + medium_node_size);`

This code is used in sections 224* and 1730*.

1935* *Nota Bene:* The SyncT_EX code is very close to the memory model. It is not connected to any other part of the code, except for memory management. It is possible to neutralize the SyncT_EX code rather simply. The first step is to define a null *synctex_field_size*. The second step is to comment out the code in “Initialize bigger nodes...” and every “Copy ... SyncT_EX information”. The last step will be to comment out the *synctex_tag_field* related code in the definition of *synctex_tag* and the various “Prepare ... SyncT_EX information”. Then all the remaining code should be just harmless. The resulting program would behave exactly the same as if absolutely no SyncT_EX related code was there, including memory management. Of course, all this assumes that SyncT_EX is turned off from the command line.

1936* System-dependent changes.

1937* This function used to be in pdfTeX, but is useful in tex too.

```

function get_nullstr: str_number;
  begin get_nullstr ← "";
  end;

```

1938* Index. Here is where you can find all uses of each identifier in the program, with underlined entries pointing to where the identifier was defined. If the identifier is only one letter long, however, you get to see only the underlined entries. *All references are to section numbers instead of page numbers.*

This index also lists error messages and other aspects of the program that you might want to look up some day. For example, the entry for “system dependencies” lists all sections that should receive special attention from people who are installing T_EX in a new operating environment. A list of various things that can’t happen appears under “this can’t happen”. Approximately 40 sections are listed under “inner loop”; these account for about 60% of T_EX’s running time, exclusive of input and output.

The following sections were changed by the change file: 2, 4, 6, 7, 8, 11, 12, 16, 19, 20, 23, 24, 26, 27, 28, 30, 31, 32, 33, 34, 35, 37, 38, 39, 47, 49, 51, 52, 53, 54, 59, 61, 71, 73, 74, 81, 82, 84, 93, 94, 95, 104, 109, 128, 129, 130, 131, 134, 143, 153, 156, 159, 162, 165, 170, 171, 174, 176, 183, 192, 194, 204, 220, 224, 227, 229, 231, 233, 237, 238, 240, 248, 254, 255, 256, 258, 259, 270, 271, 274, 276, 277, 279, 284, 287, 288, 293, 305, 312, 322, 323, 324, 326, 328, 330, 340, 350, 353, 354, 360, 361, 363, 365, 376, 377, 378, 379, 385, 388, 398, 426, 427, 440, 527, 539, 540, 541, 542, 543, 544, 545, 546, 547, 549, 550, 551, 552, 556, 558, 560, 562, 563, 574, 575, 576, 577, 578, 580, 586, 587, 589, 590, 596, 600, 602, 603, 604, 608, 609, 619, 622, 624, 625, 626, 629, 645, 647, 648, 649, 650, 651, 657, 660, 666, 668, 670, 673, 729, 731, 732, 733, 738, 742, 750, 882, 895, 896, 914, 923, 1085, 1095, 1096, 1098, 1099, 1100, 1101, 1103, 1105, 1106, 1109, 1114, 1115, 1116, 1118, 1119, 1120, 1121, 1122, 1125, 1126, 1133, 1135, 1138, 1139, 1140, 1141, 1163, 1209, 1211, 1212, 1225, 1267, 1311, 1315, 1343, 1387, 1391, 1395, 1396, 1397, 1398, 1399, 1400, 1406, 1407, 1408, 1428, 1433, 1436, 1441, 1451, 1455, 1456, 1459, 1477, 1478, 1479, 1481, 1482, 1483, 1484, 1485, 1486, 1487, 1488, 1490, 1491, 1492, 1493, 1494, 1495, 1496, 1497, 1498, 1499, 1500, 1501, 1505, 1510, 1511, 1512, 1513, 1515, 1516, 1517, 1519, 1522, 1526, 1528, 1532, 1599, 1600, 1612, 1614, 1617, 1619, 1634, 1645, 1649, 1657, 1718, 1719, 1722, 1726, 1730, 1735, 1736, 1752, 1770, 1851, 1864, 1865, 1866, 1867, 1868, 1869, 1870, 1871, 1872, 1873, 1874, 1875, 1876, 1877, 1878, 1879, 1880, 1881, 1882, 1883, 1884, 1885, 1886, 1887, 1888, 1889, 1890, 1891, 1892, 1893, 1894, 1895, 1896, 1897, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938.

- <(pdfTeX) Move down or output leaders 744> Used in section 741.
- <(pdfTeX) Move right or output leaders 735> Used in section 732*.
- <(pdfTeX) Output a box in a vlist 742*> Used in section 741.
- <(pdfTeX) Output a box in an hlist 733*> Used in section 732*.
- <(pdfTeX) Output a leader box at *cur_h*, then advance *cur_h* by *leader_wd* + *lx* 737> Used in section 736.
- <(pdfTeX) Output a leader box at *cur_v*, then advance *cur_v* by *leader_ht* + *lx* 746> Used in section 745.
- <(pdfTeX) Output a rule in a vlist, **goto** *next_p* 743> Used in section 741.
- <(pdfTeX) Output a rule in an hlist 734> Used in section 732*.
- <(pdfTeX) Output a substitution, **goto** *continue* if not possible 1884*> Used in section 731*.
- <(pdfTeX) Output leaders in a vlist, **goto** *fin_rule* if a rule or to *next_p* if done 745> Used in section 744.
- <(pdfTeX) Output leaders in an hlist, **goto** *fin_rule* if a rule or to *next_p* if done 736> Used in section 735.
- <(pdfTeX) Rebuild character using substitution information 1889*> Used in section 1884*.
- <(pdfTeX) Ship box *p* out 751> Used in section 750*.
- <Accumulate the constant until *cur_tok* is not a suitable digit 471> Used in section 470.
- <Add the width of node *s* to *act_width* 1045> Used in section 1043.
- <Add the width of node *s* to *break_width* 1016> Used in section 1014.
- <Add the width of node *s* to *disc_width* 1044> Used in section 1043.
- <Adjust for the magnification ratio 483> Used in section 479.
- <Adjust for the setting of `\globaldefs` 1390> Used in section 1387*.
- <Adjust *shift_up* and *shift_down* for the case of a fraction line 920> Used in section 917.
- <Adjust *shift_up* and *shift_down* for the case of no fraction line 919> Used in section 917.
- <Adjust the LR stack for the *hlist_out* routine; if necessary reverse an hlist segment and **goto** *reswitch* 1714>
Used in section 1713.
- <Adjust the LR stack for the *hpack* routine 1708> Used in section 823.
- <Adjust the LR stack for the *init_math* routine 1734> Used in section 1733.
- <Adjust the LR stack for the *just_reverse* routine 1736*> Used in section 1735*.
- <Adjust the LR stack for the *post_line_break* routine 1705> Used in sections 1053, 1055, and 1704.
- <Adjust the additional data for last line 1846> Used in section 1025.
- <Adjust the final line of the paragraph 1850> Used in section 1037.
- <Adjust transformation matrix for the magnification ratio 758> Used in section 757.
- <Advance *cur_p* to the node following the present string of characters 1041> Used in section 1040.
- <Advance past a whatsit node in the *line_break* loop 1606> Used in section 1040.
- <Advance past a whatsit node in the pre-hyphenation loop 1607> Used in section 1071.
- <Advance *r*; **goto** *found* if the parameter delimiter has been fully matched, otherwise **goto** *continue* 420>
Used in section 418.
- <Allocate entire node *p* and **goto** *found* 147> Used in section 145.
- <Allocate from the top of node *p* and **goto** *found* 146> Used in section 145.
- <Allocate memory for the new virtual font 716> Used in section 712.
- <Apologize for inability to do the operation now, unless `\unskip` follows non-glue 1282> Used in section 1281.
- <Apologize for not loading the font, **goto** *done* 593> Used in section 592.
- <Append a ligature and/or kern to the translation; **goto** *continue* if the stack of inserted ligatures is nonempty 1085*> Used in section 1081.
- <Append a new leader node that uses *cur_box* 1254> Used in section 1251.
- <Append a new letter or a hyphen level 1137> Used in section 1136.
- <Append a new letter or hyphen 1112> Used in section 1110.
- <Append a normal inter-word space to the current list, then **goto** *big_switch* 1217> Used in section 1205.
- <Append a penalty node, if a nonzero penalty is appropriate 1065> Used in section 1054.
- <Append an insertion to the current page and **goto** *contribute* 1183> Used in section 1175.
- <Append any *new_hlist* entries for *q*, and any appropriate penalties 941> Used in section 934.
- <Append box *cur_box* to the current list, shifted by *box_context* 1252> Used in section 1251.
- <Append character *cur_chr* and the following characters (if any) to the current hlist in the current font; **goto** *reswitch* when a non-character has been fetched 1209*> Used in section 1205.

- < Append characters of *hu[j ..]* to *major_tail*, advancing *j* 1092 > Used in section 1091.
- < Append inter-element spacing based on *r_type* and *t* 940 > Used in section 934.
- < Append tabskip glue and an empty box to list *u*, and update *s* and *t* as the prototype nodes are passed 983 >
Used in section 982.
- < Append the accent with appropriate kerns, then set $p \leftarrow q$ 1301 > Used in section 1299.
- < Append the current tabskip glue to the preamble list 952 > Used in section 951.
- < Append the display and perhaps also the equation number 1380 > Used in section 1375.
- < Append the glue or equation number following the display 1381 > Used in section 1375.
- < Append the glue or equation number preceding the display 1379 > Used in section 1375.
- < Append the new box to the current vertical list, followed by the list of special nodes taken out of the box by the packager 1063 > Used in section 1054.
- < Append the value *n* to list *p* 1113 > Used in section 1112.
- < Assign the values *depth_threshold* \leftarrow *show_box_depth* and *breadth_max* \leftarrow *show_box_breadth* 254* > Used in section 216.
- < Assignments 1393, 1394, 1397*, 1400*, 1401, 1402, 1404, 1408*, 1410, 1411, 1417, 1418, 1424, 1428*, 1429, 1432, 1440 >
Used in section 1387*.
- < Attach list *p* to the current list, and record its length; then finish up and **return** 1296 > Used in section 1295.
- < Attach the limits to *y* and adjust *height(v)*, *depth(v)* to account for their presence 925 > Used in section 924.
- < Back up an outer control sequence so that it can be reread 359 > Used in section 358.
- < Basic printing procedures 57, 58, 59*, 60, 62, 63, 64, 65, 284*, 285, 544*, 873, 1599*, 1819, 1867*, 1869*, 1896*, 1898* >
Used in section 4*.
- < Break the current page at node *p*, put it in box 255, and put the remaining nodes on the contribution list 1192 > Used in section 1189.
- < Break the paragraph at the chosen breakpoints, justify the resulting lines to the correct widths, and append them to the current vertical list 1050 > Used in section 989.
- < Build a character packet 717 > Used in section 712.
- < Build a linked list of free objects 810 > Used in sections 811 and 812.
- < Calculate DVI page dimensions and margins 644 > Used in section 645*.
- < Calculate page dimensions and margins 755 > Used in section 752.
- < Calculate the length, *l*, and the shift amount, *s*, of the display lines 1325 > Used in section 1321.
- < Calculate the natural width, *w*, by which the characters of the final line extend to the right of the reference point, plus two ems; or set $w \leftarrow max_dimen$ if the non-blank information on that line is affected by stretching or shrinking 1322 > Used in section 1321.
- < Calculate variations of marginal kerns 820 > Used in section 1025.
- < Call the packaging subroutine, setting *just_box* to the justified box 1064 > Used in section 1054.
- < Call *try_break* if *cur_p* is a legal breakpoint; on the second pass, also try to hyphenate the next word, if *cur_p* is a glue node; then advance *cur_p* to the next node of the paragraph that could possibly be a legal breakpoint 1040 > Used in section 1037.
- < Carry out a ligature replacement, updating the cursor structure and possibly advancing *j*; **goto** *continue* if the cursor doesn't advance, otherwise **goto** *done* 1086 > Used in section 1084.
- < Case statement to copy different types and set *words* to the number of initial words not yet copied 224* >
Used in section 223.
- < Cases for 'Fetch the *dead_cycles* or the *insert_penalties*' 1691 > Used in section 445.
- < Cases for evaluation of the current term 1788, 1792, 1793, 1795 > Used in section 1780.
- < Cases for fetching a dimension value 1668, 1671, 1801 > Used in section 450.
- < Cases for fetching a glue value 1804 > Used in section 1777.
- < Cases for fetching a mu value 1805 > Used in section 1777.
- < Cases for fetching an integer value 1648, 1662, 1665, 1800 > Used in section 450.
- < Cases for noads that can follow a *bin_noad* 907 > Used in section 902.
- < Cases for nodes that can appear in an mlist, after which we **goto** *done_with_node* 904 > Used in section 902.
- < Cases for *alter_integer* 1693 > Used in section 1422.
- < Cases for *conditional* 1763, 1764, 1766 > Used in section 527*.

- < Cases for *do_marks* 1823, 1825, 1826, 1828 > Used in section 1822.
- < Cases for *eq_destroy* 1831 > Used in section 297.
- < Cases for *input* 1746 > Used in section 404.
- < Cases for *print_param* 1656, 1697 > Used in section 255*.
- < Cases for *show_whatever* 1674, 1688 > Used in section 1469.
- < Cases of DVI commands that can appear in character packet 719 > Used in section 717.
- < Cases of ‘Let *d* be the natural width’ that need special treatment 1733 > Used in section 1323.
- < Cases of *assign_toks* for *print_cmd_chr* 1655 > Used in section 249.
- < Cases of *expandafter* for *print_cmd_chr* 1760 > Used in section 288*.
- < Cases of *flush_node_list* that arise in mlists only 872 > Used in section 220*.
- < Cases of *handle_right_brace* where a *right_brace* triggers a delayed action 1261, 1276, 1294, 1308, 1309, 1344, 1349, 1362 > Used in section 1244.
- < Cases of *hlist_out* that arise in mixed direction text only 1717 > Used in sections 650* and 732*.
- < Cases of *if_test* for *print_cmd_chr* 1761 > Used in section 514.
- < Cases of *input* for *print_cmd_chr* 1745 > Used in section 403.
- < Cases of *last_item* for *print_cmd_chr* 1647, 1661, 1664, 1667, 1670, 1776, 1799, 1803 > Used in section 443.
- < Cases of *left_right* for *print_cmd_chr* 1695 > Used in section 1365.
- < Cases of *main_control* for *hmode* + *valign* 1700 > Used in section 1306.
- < Cases of *main_control* that are for extensions to T_EX 1525 > Used in section 1221.
- < Cases of *main_control* that are not part of the inner loop 1221 > Used in section 1205.
- < Cases of *main_control* that build boxes and lists 1232, 1233, 1239, 1243, 1249, 1266, 1268, 1270, 1273, 1278, 1280, 1285, 1288, 1292, 1298, 1302, 1306, 1310, 1313, 1316, 1326, 1330, 1334, 1338, 1340, 1343*, 1347, 1351, 1356, 1366, 1369 > Used in section 1221.
- < Cases of *main_control* that don’t depend on *mode* 1386, 1444, 1447, 1450, 1452, 1461, 1466 > Used in section 1221.
- < Cases of *prefix* for *print_cmd_chr* 1768 > Used in section 1385.
- < Cases of *print_cmd_chr* for symbolic printing of primitives 245, 249, 257, 267, 288*, 357, 403, 411, 438, 443, 495, 514, 518, 955, 1159, 1229, 1235, 1248, 1265, 1284, 1291, 1319, 1333, 1346, 1355, 1365, 1385, 1396*, 1399*, 1407*, 1427, 1431, 1437, 1439, 1449, 1454, 1463, 1468, 1471, 1524 > Used in section 320.
- < Cases of *read* for *print_cmd_chr* 1757 > Used in section 288*.
- < Cases of *register* for *print_cmd_chr* 1829 > Used in section 438.
- < Cases of *reverse* that need special treatment 1723, 1724, 1725 > Used in section 1722*.
- < Cases of *set_page_int* for *print_cmd_chr* 1690 > Used in section 443.
- < Cases of *set_shape* for *print_cmd_chr* 1862 > Used in section 288*.
- < Cases of *show_node_list* that arise in mlists only 864 > Used in section 201.
- < Cases of *the* for *print_cmd_chr* 1684 > Used in section 288*.
- < Cases of *toks_register* for *print_cmd_chr* 1830 > Used in section 288*.
- < Cases of *un_vbox* for *print_cmd_chr* 1859 > Used in section 1284.
- < Cases of *valign* for *print_cmd_chr* 1699 > Used in section 288*.
- < Cases of *xray* for *print_cmd_chr* 1673, 1682, 1687 > Used in section 1468.
- < Cases where character is ignored 367 > Used in section 366.
- < Change buffered instruction to *y* or *w* and **goto found** 640 > Used in section 639.
- < Change buffered instruction to *z* or *x* and **goto found** 641 > Used in section 639.
- < Change current mode to *-vmode* for **\halign**, *-hmode* for **\valign** 949 > Used in section 948.
- < Change discretionary to compulsory and set *disc_break* \leftarrow *true* 1056 > Used in section 1055.
- < Change font *dvi_f* to *f* 649* > Used in section 648*.
- < Change state if necessary, and **goto switch** if the current character should be ignored, or **goto reswitch** if the current character changes to another 366 > Used in section 365*.
- < Change the case of the token in *p*, if a change is appropriate 1465 > Used in section 1464.
- < Change the current style and **goto delete_q** 937 > Used in section 935.
- < Change the interaction level and **return** 86 > Used in section 84*.
- < Change this node to a style node followed by the correct choice, then **goto done_with_node** 905 > Used in section 904.

- < Character k cannot be printed 49* > Used in section 48.
- < Character s is the current new-line character 262 > Used in sections 58 and 59*.
- < Check flags of unavailable nodes 188 > Used in section 185.
- < Check for LR anomalies at the end of *hlist_out* 1715 > Used in section 1712.
- < Check for LR anomalies at the end of *hpack* 1709 > Used in section 821.
- < Check for LR anomalies at the end of *ship_out* 1727 > Used in sections 666* and 750*.
- < Check for charlist cycle 596* > Used in section 595.
- < Check for improper alignment in displayed math 950 > Used in section 948.
- < Check for non-existing destinations 796 > Used in section 794.
- < Check for non-existing pages 797 > Used in section 794.
- < Check for special treatment of last line of paragraph 1840 > Used in section 1001.
- < Check if node p is a new champion breakpoint; then **goto** *done* if p is a forced break or if the page-so-far is already too full 1149 > Used in section 1147.
- < Check if node p is a new champion breakpoint; then if it is time for a page break, prepare for output, and either fire up the user's output routine and **return** or ship out the page and **goto** *done* 1180 > Used in section 1172.
- < Check single-word *avail* list 186 > Used in section 185.
- < Check that another \$ follows 1373 > Used in sections 1370, 1370, and 1382.
- < Check that the necessary fonts for math symbols are present; if not, flush the current math lists and set *danger* \leftarrow *true* 1371 > Used in sections 1370 and 1370.
- < Check that the nodes following *hb* permit hyphenation and that at least *l_hyf* + *r_hyf* letters have been found, otherwise **goto** *done1* 1074 > Used in section 1069.
- < Check the “constant” values for consistency 14, 129*, 312*, 548, 1425 > Used in section 1510*.
- < Check variable-size *avail* list 187 > Used in section 185.
- < Clean up the memory by removing the break nodes 1039 > Used in sections 989 and 1037.
- < Clear dimensions to zero 822 > Used in sections 821 and 842.
- < Clear off top level from *save_stack* 304 > Used in section 303.
- < Close the format file 1507 > Used in section 1478*.
- < Close *SyncTeX* file and write status 1918* > Used in section 1511*.
- < Coerce glue to a dimension 477 > Used in sections 475 and 481.
- < Compiler directives 9 > Used in section 4*.
- < Complain about an undefined family and set *cur_i* null 897 > Used in section 896*.
- < Complain about an undefined macro 396 > Used in section 391.
- < Complain about missing `\endcsname` 399 > Used in sections 398* and 1764.
- < Complain about unknown unit and **goto** *done2* 485 > Used in section 484.
- < Complain that `\the` can't do this; give zero result 454 > Used in section 439.
- < Complain that the user should have said `\mathaccent` 1342 > Used in section 1341.
- < Compleat the incompleteat noad 1361 > Used in section 1360.
- < Complete a potentially long `\show` command 1474 > Used in section 1469.
- < Compute $f = \lfloor 2^{28}(1 + p/q) + \frac{1}{2} \rfloor$ 113 > Used in section 112.
- < Compute $p = \lfloor qf/2^{28} + \frac{1}{2} \rfloor - q$ 116 > Used in section 114.
- < Compute $f = \lfloor xn/d + \frac{1}{2} \rfloor$ 1797 > Used in section 1796.
- < Compute result of *multiply* or *divide*, put it in *cur_val* 1416 > Used in section 1412.
- < Compute result of *register* or *advance*, put it in *cur_val* 1414 > Used in section 1412.
- < Compute the amount of skew 915 > Used in section 912.
- < Compute the badness, b , of the current page, using *awful_bad* if the box is too full 1182 > Used in section 1180.
- < Compute the badness, b , using *awful_bad* if the box is too full 1150 > Used in section 1149.
- < Compute the demerits, d , from r to *cur_p* 1033 > Used in section 1029.
- < Compute the discretionary *break_width* values 1014 > Used in section 1011.
- < Compute the hash code h 280 > Used in section 278.
- < Compute the magic offset 939 > Used in section 1515*.
- < Compute the mark pointer for mark type t and class *cur_val* 1821 > Used in section 412.

- ⟨ Compute the minimum suitable height, w , and the corresponding number of extension steps, n ; also set $width(b)$ 888 ⟩ Used in section 887.
- ⟨ Compute the new line width 1024 ⟩ Used in section 1009.
- ⟨ Compute the primitive code h 283 ⟩ Used in section 281.
- ⟨ Compute the register location l and its type p ; but **return** if invalid 1413 ⟩ Used in section 1412.
- ⟨ Compute the sum of two glue specs 1415 ⟩ Used in section 1414.
- ⟨ Compute the sum or difference of two glue specs 1791 ⟩ Used in section 1789.
- ⟨ Compute the trie op code, v , and set $l \leftarrow 0$ 1140* ⟩ Used in section 1138*.
- ⟨ Compute the values of $break_width$ 1011 ⟩ Used in section 1010.
- ⟨ Consider a node with matching width; **goto found** if it's a hit 639 ⟩ Used in section 638.
- ⟨ Consider the demerits for a line from r to cur_p ; deactivate node r if it should no longer be active; then **goto continue** if a line from r to cur_p is infeasible, otherwise record a new feasible break 1025 ⟩ Used in section 1003.
- ⟨ Constants in the outer block 11*, 675, 679, 695, 721, 1628 ⟩ Used in section 4*.
- ⟨ Construct a box with limits above and below it, skewed by $delta$ 924 ⟩ Used in section 923*.
- ⟨ Construct a sub/superscript combination box x , with the superscript offset by $delta$ 933 ⟩ Used in section 930.
- ⟨ Construct a subscript box x when there is no superscript 931 ⟩ Used in section 930.
- ⟨ Construct a superscript box x 932 ⟩ Used in section 930.
- ⟨ Construct a vlist box for the fraction, according to $shift_up$ and $shift_down$ 921 ⟩ Used in section 917.
- ⟨ Construct an extensible character in a new box b , using recipe $rem_byte(q)$ and font f 887 ⟩ Used in section 884.
- ⟨ Contribute an entire group to the current parameter 425 ⟩ Used in section 418.
- ⟨ Contribute the recently matched tokens to the current parameter, and **goto continue** if a partial match is still in effect; but abort if $s = null$ 423 ⟩ Used in section 418.
- ⟨ Convert a final bin_noad to an ord_noad 903 ⟩ Used in sections 900 and 902.
- ⟨ Convert cur_val to a lower level 455 ⟩ Used in section 439.
- ⟨ Convert math glue to ordinary glue 906 ⟩ Used in section 904.
- ⟨ Convert $nucleus(q)$ to an hlist and attach the sub/superscripts 928 ⟩ Used in section 902.
- ⟨ Convert string s into a new pseudo file 1751 ⟩ Used in section 1750.
- ⟨ Copy the box $SyncTeX$ information 1932* ⟩ Used in sections 224* and 1730*.
- ⟨ Copy the medium sized node $SyncTeX$ information 1934* ⟩ Used in sections 224* and 1730*.
- ⟨ Copy the rule $SyncTeX$ information 1933* ⟩ Used in section 224*.
- ⟨ Copy the tabskip glue between columns 969 ⟩ Used in section 965.
- ⟨ Copy the templates from node cur_loop into node p 968 ⟩ Used in section 967.
- ⟨ Copy the token list 492 ⟩ Used in section 491.
- ⟨ Create a character node p for $nucleus(q)$, possibly followed by a kern node for the italic correction, and set $delta$ to the italic correction if a subscript is present 929 ⟩ Used in section 928.
- ⟨ Create a character node q for the next character, but set $q \leftarrow null$ if problems arise 1300 ⟩ Used in section 1299.
- ⟨ Create a new array element of type t with index i 1817 ⟩ Used in section 1816.
- ⟨ Create a new glue specification whose width is cur_val ; scan for its stretch and shrink components 488 ⟩ Used in section 487.
- ⟨ Create a page insertion node with $subtype(r) = qi(n)$, and include the glue correction for box n in the current page state 1184 ⟩ Used in section 1183.
- ⟨ Create an active breakpoint representing the beginning of the paragraph 1038 ⟩ Used in section 1037.
- ⟨ Create and append a discretionary node as an alternative to the unhyphenated word, and continue to develop both branches until they become equivalent 1089 ⟩ Used in section 1088.
- ⟨ Create equal-width boxes x and z for the numerator and denominator, and compute the default amounts $shift_up$ and $shift_down$ by which they are displaced from the baseline 918 ⟩ Used in section 917.
- ⟨ Create link annotations for the current hbox if needed 730 ⟩ Used in section 729*.
- ⟨ Create new active nodes for the best feasible breaks just found 1010 ⟩ Used in section 1009.

- < Create the *format.ident*, open the format file, and inform the user that dumping has begun 1506 > Used in section 1478*.
- < Create thread for the current vbox if needed 739 > Used in section 738*.
- < Current *mem* equivalent of glue parameter number *n* 242 > Used in sections 170* and 172.
- < Deactivate node *r* 1034 > Used in section 1025.
- < Declare ε -TeX procedures for expanding 1749, 1807, 1812, 1816 > Used in section 388*.
- < Declare ε -TeX procedures for scanning 1679, 1769, 1778, 1783, 1881* > Used in section 435.
- < Declare ε -TeX procedures for token lists 1680, 1750 > Used in section 490.
- < Declare ε -TeX procedures for tracing and input 306, 1658, 1659, 1753, 1754, 1771, 1773, 1774, 1818, 1820, 1834, 1835, 1836, 1837, 1838 > Used in section 290.
- < Declare ε -TeX procedures for use by *main_control* 1653, 1676, 1692 > Used in section 989.
- < Declare action procedures for use by *main_control* 1219, 1223, 1225*, 1226, 1227, 1230, 1236, 1237, 1240, 1245, 1246, 1251, 1255, 1260, 1262, 1267*, 1269, 1271, 1272, 1275, 1277, 1279, 1281, 1286, 1289, 1293, 1295, 1299, 1303, 1305, 1307, 1311*, 1312, 1314, 1318, 1327, 1331, 1335, 1336, 1339, 1341, 1348, 1350, 1352, 1357, 1367, 1370, 1376, 1387*, 1446, 1451*, 1455*, 1464, 1469, 1478*, 1526*, 1621, 1936* > Used in section 1205.
- < Declare additional functions for MLTeX 1882* > Used in section 586*.
- < Declare additional routines for encTeX 1897* > Used in section 354*.
- < Declare additional routines for string recycling 1873*, 1874* > Used in section 47*.
- < Declare math construction procedures 908, 909, 910, 911, 912, 917, 923*, 926, 930, 936 > Used in section 900.
- < Declare procedures for preprocessing hyphenation patterns 1119*, 1123, 1124, 1128, 1132, 1134, 1135*, 1141* > Used in section 1117.
- < Declare procedures needed for displaying the elements of mlists 865, 866, 868 > Used in section 197.
- < Declare procedures needed for expressions 1779, 1784 > Used in section 487.
- < Declare procedures needed in *do_extension* 1527, 1528*, 1535, 1550, 1554, 1560, 1564, 1571, 1575, 1585, 1597 > Used in section 1526*.
- < Declare procedures needed in *hlist_out*, *vlist_out* 1612*, 1614*, 1617*, 1716, 1720 > Used in section 647*.
- < Declare procedures needed in *pdf_hlist_out*, *pdf_vlist_out* 727, 772, 778, 785, 1562, 1627, 1632, 1633, 1634* > Used in section 729*.
- < Declare procedures that need to be declared forward for pdfTeX 686, 689, 698, 699, 700, 703, 1543, 1553 > Used in section 190.
- < Declare procedures that scan font-related stuff 604*, 605 > Used in section 435.
- < Declare procedures that scan restricted classes of integers 459, 460, 461, 462, 463, 1808, 1870* > Used in section 435.
- < Declare subprocedures for *after_math* 1741 > Used in section 1370.
- < Declare subprocedures for *init_math* 1730*, 1735* > Used in section 1314.
- < Declare subprocedures for *line_break* 1000, 1003, 1051, 1070, 1117 > Used in section 989.
- < Declare subprocedures for *prefixed_command* 1391*, 1405, 1412, 1419, 1420, 1421, 1422, 1423, 1433*, 1441* > Used in section 1387*.
- < Declare subprocedures for *scan_expr* 1790, 1794, 1796 > Used in section 1779.
- < Declare subprocedures for *var_delimiter* 883, 885, 886 > Used in section 880.
- < Declare the function called *do_marks* 1822 > Used in section 1152.
- < Declare the function called *fin_mlist* 1360 > Used in section 1350.
- < Declare the function called *open_fmt_file* 550* > Used in section 1479*.
- < Declare the function called *reconstitute* 1081 > Used in section 1070.
- < Declare the procedure called *align_peek* 959 > Used in section 974.
- < Declare the procedure called *fire_up* 1187 > Used in section 1169.
- < Declare the procedure called *get_preamble_token* 956 > Used in section 948.
- < Declare the procedure called *handle_right_brace* 1244 > Used in section 1205.
- < Declare the procedure called *init_span* 961 > Used in section 960.
- < Declare the procedure called *insert_relax* 405 > Used in section 388*.
- < Declare the procedure called *macro_call* 415 > Used in section 388*.
- < Declare the procedure called *print_cmd_chr* 320 > Used in section 270*.

- < Declare the procedure called *print_skip_param* 243 > Used in section 197.
- < Declare the procedure called *runaway* 328* > Used in section 137.
- < Declare the procedure called *show_token_list* 314 > Used in section 137.
- < Decry the invalid character and **goto** *restart* 368 > Used in section 366.
- < Delete $c - "0"$ tokens and **goto** *continue* 88 > Used in section 84*.
- < Delete the page-insertion nodes 1194 > Used in section 1189.
- < Destroy the t nodes following q , and make r point to the following node 1057 > Used in section 1056.
- < Determine horizontal glue shrink setting, then **return** or **goto** *common_ending* 838 > Used in section 831.
- < Determine horizontal glue stretch setting, then **return** or **goto** *common_ending* 832 > Used in section 831.
- < Determine the displacement, d , of the left edge of the equation, with respect to the line size z , assuming that $l = \text{false}$ 1378 > Used in section 1375.
- < Determine the shrink order 839 > Used in sections 838, 850, and 970.
- < Determine the stretch order 833 > Used in sections 832, 847, and 970.
- < Determine the value of $\text{height}(r)$ and the appropriate glue setting; then **return** or **goto** *common_ending* 846 > Used in section 842.
- < Determine the value of $\text{width}(r)$ and the appropriate glue setting; then **return** or **goto** *common_ending* 831 > Used in section 821.
- < Determine vertical glue shrink setting, then **return** or **goto** *common_ending* 850 > Used in section 846.
- < Determine vertical glue stretch setting, then **return** or **goto** *common_ending* 847 > Used in section 846.
- < Discard erroneous prefixes and **return** 1388 > Used in section 1387*.
- < Discard the prefixes `\long` and `\outer` if they are irrelevant 1389 > Used in section 1387*.
- < Dispense with trivial cases of void or bad boxes 1153 > Used in section 1152.
- < Display `\rule spec` for whatsit node created by pdfTeX 1598 > Used in sections 1600*, 1600*, and 1600*.
- < Display adjustment p 215 > Used in section 201.
- < Display box p 202 > Used in section 201.
- < Display choice node p 869 > Used in section 864.
- < Display discretionary p 213 > Used in section 201.
- < Display fraction noad p 871 > Used in section 864.
- < Display glue p 207 > Used in section 201.
- < Display if this box is never to be reversed 1701 > Used in section 202.
- < Display insertion p 206 > Used in section 201.
- < Display kern p 209 > Used in section 201.
- < Display leaders p 208 > Used in section 207.
- < Display ligature p 211 > Used in section 201.
- < Display mark p 214 > Used in section 201.
- < Display math node p 210 > Used in section 201.
- < Display node p 201 > Used in section 200.
- < Display normal noad p 870 > Used in section 864.
- < Display penalty p 212 > Used in section 201.
- < Display rule p 205 > Used in section 201.
- < Display special fields of the unset node p 203 > Used in section 202.
- < Display the current context 334 > Used in section 333.
- < Display the insertion split cost 1186 > Used in section 1185.
- < Display the page break cost 1181 > Used in section 1180.
- < Display the token (m, c) 316 > Used in section 315.
- < Display the value of b 528 > Used in section 524.
- < Display the value of $\text{glue_set}(p)$ 204* > Used in section 202.
- < Display the whatsit node p 1600* > Used in section 201.
- < Display token p , and **return** if there are problems 315 > Used in section 314.
- < Do first-pass processing based on $\text{type}(q)$; **goto** *done_with_noad* if a noad has been fully processed, **goto** *check_dimensions* if it has been translated into *new_hlist*(q), or **goto** *done_with_node* if a node has been fully processed 902 > Used in section 901.

- < Do ligature or kern command, returning to *main_lig_loop* or *main_loop_wrapup* or *main_loop_move* 1216 >
Used in section 1214.
- < Do magic computation 342 > Used in section 314.
- < Do some work that has been queued up for `\write` 1619* > Used in section 1617*.
- < Do typesetting the DVI commands in virtual character packet 726 > Used in section 725.
- < Drop current token and complain that it was unmatched 1242 > Used in section 1240.
- < Dump ML_{TeX}-specific data 1890* > Used in section 1478*.
- < Dump a couple more things and the closing check word 1504 > Used in section 1478*.
- < Dump constants for consistency check 1483* > Used in section 1478*.
- < Dump enc_{TeX}-specific data 1899* > Used in section 1478*.
- < Dump pdftex data 1502 > Used in section 1478*.
- < Dump regions 1 to 4 of *eqtb* 1491* > Used in section 1489.
- < Dump regions 5 and 6 of *eqtb* 1492* > Used in section 1489.
- < Dump the ε -_{TeX} state 1651, 1755 > Used in section 1483*.
- < Dump the array info for internal font number *k* 1498* > Used in section 1496*.
- < Dump the dynamic memory 1487* > Used in section 1478*.
- < Dump the font information 1496* > Used in section 1478*.
- < Dump the hash table 1494* > Used in section 1489.
- < Dump the hyphenation tables 1500* > Used in section 1478*.
- < Dump the string pool 1485* > Used in section 1478*.
- < Dump the table of equivalents 1489 > Used in section 1478*.
- < Dump *xord*, *xchr*, and *xprn* 1871* > Used in section 1483*.
- < Either append the insertion node *p* after node *q*, and remove it from the current page, or delete *node(p)* 1197 > Used in section 1195.
- < Either insert the material specified by node *p* into the appropriate box, or hold it for the next page; also delete node *p* from the current page 1195 > Used in section 1189.
- < Either process `\ifcase` or set *b* to the value of a boolean condition 527* > Used in section 524.
- < Empty the last bytes out of *dvi_buf* 626* > Used in section 670*.
- < Enable ε -_{TeX}, if requested 1645* > Used in section 1515*.
- < Ensure that box 255 is empty after output 1203 > Used in section 1201.
- < Ensure that box 255 is empty before output 1190 > Used in section 1189.
- < Ensure that *trie_max* $\geq h + 256$ 1129 > Used in section 1128.
- < Enter a hyphenation exception 1114* > Used in section 1110.
- < Enter all of the patterns into a linked trie, until coming to a right brace 1136 > Used in section 1135*.
- < Enter as many hyphenation exceptions as are listed, until coming to a right brace; then **return** 1110 >
Used in section 1109*.
- < Enter *skip_blanks* state, emit a space 371 > Used in section 369.
- < Error handling procedures 78, 81*, 82*, 93*, 94*, 95* > Used in section 4*.
- < Evaluate the current expression 1789 > Used in section 1780.
- < Examine node *p* in the hlist, taking account of its effect on the dimensions of the new box, or moving it to the adjustment list; then advance *p* to the next node 823 > Used in section 821.
- < Examine node *p* in the vlist, taking account of its effect on the dimensions of the new box; then advance *p* to the next node 843 > Used in section 842.
- < Expand a nonmacro 391 > Used in section 388*.
- < Expand macros in the token list and make *link(def_ref)* point to the result 1615 > Used in section 1614*.
- < Expand the next part of the input 504 > Used in section 503.
- < Expand the token after the next token 392 > Used in section 391.
- < Explain that too many dead cycles have occurred in a row 1199 > Used in section 1187.
- < Express astonishment that no number was here 472 > Used in section 470.
- < Express consternation over the fact that no alignment is in progress 1304 > Used in section 1303.
- < Express shock at the missing left brace; **goto found** 501 > Used in section 500.
- < Feed the macro body and its parameters to the scanner 416 > Used in section 415.

- ⟨Fetch a box dimension 446⟩ Used in section 439.
- ⟨Fetch a character code from some table 440*⟩ Used in section 439.
- ⟨Fetch a font dimension 451⟩ Used in section 439.
- ⟨Fetch a font integer 452⟩ Used in section 439.
- ⟨Fetch a penalties array element 1863⟩ Used in section 449.
- ⟨Fetch a register 453⟩ Used in section 439.
- ⟨Fetch a token list or font identifier, provided that *level = tok_val* 441⟩ Used in section 439.
- ⟨Fetch an internal dimension and **goto** *attach_sign*, or fetch an internal integer 475⟩ Used in section 474.
- ⟨Fetch an item in the current node, if appropriate 450⟩ Used in section 439.
- ⟨Fetch something on the *page_so_far* 447⟩ Used in section 439.
- ⟨Fetch the *dead_cycles* or the *insert_penalties* 445⟩ Used in section 439.
- ⟨Fetch the *par_shape* size 449⟩ Used in section 439.
- ⟨Fetch the *prev_graf* 448⟩ Used in section 439.
- ⟨Fetch the *space_factor* or the *prev_depth* 444⟩ Used in section 439.
- ⟨Find an active node with fewest demerits 1048⟩ Used in section 1047.
- ⟨Find hyphen locations for the word in *hc*, or **return** 1098*⟩ Used in section 1070.
- ⟨Find optimal breakpoints 1037⟩ Used in section 989.
- ⟨Find the best active node for the desired looseness 1049⟩ Used in section 1047.
- ⟨Find the best way to split the insertion, and change *type(r)* to *split_up* 1185⟩ Used in section 1183.
- ⟨Find the glue specification, *main_p*, for text spaces in the current font 1218⟩ Used in sections 1217 and 1219.
- ⟨Finish an alignment in a display 1382⟩ Used in section 986.
- ⟨Finish displayed math 1375⟩ Used in section 1370.
- ⟨Finish hlist *SyncTeX* information record 1925*⟩ Used in sections 647* and 729*.
- ⟨Finish issuing a diagnostic message for an overfull or underfull hbox 837⟩ Used in section 821.
- ⟨Finish issuing a diagnostic message for an overfull or underfull vbox 849⟩ Used in section 842.
- ⟨Finish line, emit a **\par** 373⟩ Used in section 369.
- ⟨Finish line, emit a space 370⟩ Used in section 369.
- ⟨Finish line, **goto** *switch* 372⟩ Used in section 369.
- ⟨Finish math in text 1372⟩ Used in section 1370.
- ⟨Finish sheet *SyncTeX* information record 1921*⟩ Used in section 666*.
- ⟨Finish shipping 759⟩ Used in section 751.
- ⟨Finish stream of page/form contents 760⟩ Used in section 759.
- ⟨Finish the PDF file 794⟩ Used in section 1511*.
- ⟨Finish the DVI file 670*⟩ Used in section 1511*.
- ⟨Finish the extensions 1623⟩ Used in section 1511*.
- ⟨Finish the natural width computation 1732⟩ Used in section 1322.
- ⟨Finish the reversed hlist segment and **goto** *done* 1726*⟩ Used in section 1725.
- ⟨Finish vlist *SyncTeX* information record 1923*⟩ Used in sections 657* and 738*.
- ⟨Finish *hlist_out* for mixed direction typesetting 1712⟩ Used in sections 647* and 729*.
- ⟨Fire up the user's output routine and **return** 1200⟩ Used in section 1187.
- ⟨Fix the reference count, if any, and negate *cur_val* if *negative* 456⟩ Used in section 439.
- ⟨Flush PDF mark lists 765⟩ Used in section 759.
- ⟨Flush resource lists 764⟩ Used in section 759.
- ⟨Flush the box from memory, showing statistics if requested 667⟩ Used in sections 666* and 750*.
- ⟨Flush the prototype box 1740⟩ Used in section 1375.
- ⟨Flush *pdf_start_link_node*'s created by *append_link* 783⟩ Used in section 782.
- ⟨Forbidden cases detected in *main_control* 1224, 1274, 1287, 1320⟩ Used in section 1221.
- ⟨Generate ProcSet 768⟩ Used in section 762.
- ⟨Generate XObject resources 767⟩ Used in section 762.
- ⟨Generate a *down* or *right* command for *w* and **return** 637⟩ Used in section 634.
- ⟨Generate a *y0* or *z0* command in order to reuse a previous appearance of *w* 636⟩ Used in section 634.

- ⟨Generate all ε -TeX primitives 1646, 1654, 1660, 1663, 1666, 1669, 1672, 1681, 1683, 1686, 1689, 1694, 1698, 1744, 1756, 1759, 1767, 1775, 1798, 1802, 1806, 1858, 1861⟩ Used in section 1645*.
- ⟨Generate array of annotations or beads in page 771⟩ Used in section 769.
- ⟨Generate font resources 766⟩ Used in section 762.
- ⟨Generate parent pages object 770⟩ Used in section 769.
- ⟨Get ready to compress the trie 1127⟩ Used in section 1141*.
- ⟨Get ready to start line breaking 990, 1001, 1008, 1022⟩ Used in section 989.
- ⟨Get substitution information, check it, goto *found* if all is ok, otherwise goto *continue* 1886*⟩ Used in sections 1883* and 1884*.
- ⟨Get the first line of input and prepare to start 1515*⟩ Used in section 1510*.
- ⟨Get the next non-blank non-call token 432⟩ Used in sections 431, 467, 481, 529, 552*, 604*, 1221, 1766, 1781, and 1782.
- ⟨Get the next non-blank non-relax non-call token 430⟩ Used in sections 429, 552*, 1254, 1260, 1327, 1336, 1387*, 1402, and 1446.
- ⟨Get the next non-blank non-sign token; set *negative* appropriately 467⟩ Used in sections 466, 474, and 487.
- ⟨Get the next token, suppressing expansion 380⟩ Used in section 379*.
- ⟨Get user's advice and **return** 83⟩ Used in section 82*.
- ⟨Give diagnostic information, if requested 1206⟩ Used in section 1205.
- ⟨Give improper \hyphenation error 1111⟩ Used in section 1110.
- ⟨Global variables 13, 20*, 26*, 30*, 32*, 39*, 50, 54*, 73*, 76, 79, 96, 104*, 110, 117, 133, 134*, 135, 136, 142, 183*, 191, 199, 231*, 264, 271*, 274*, 275, 293*, 308, 319, 323*, 326*, 327, 330*, 331, 332, 355, 383, 389, 408, 413, 414, 436, 464, 473, 506, 515, 519, 538, 539*, 546*, 553, 558*, 565, 575*, 576*, 581, 619*, 622*, 632, 643, 676, 680, 687, 691, 696, 701, 704, 708, 710, 723, 774, 809, 816, 817, 819, 827, 835, 858, 893, 898, 938, 944, 988, 995, 997, 999, 1002, 1007, 1013, 1021, 1046, 1067, 1075, 1080, 1082, 1096*, 1101*, 1118*, 1122*, 1125*, 1146, 1155, 1157, 1164, 1207, 1250, 1442, 1457, 1475, 1481*, 1509, 1520, 1523, 1541, 1545, 1548, 1555, 1557, 1568, 1581, 1625, 1630, 1637, 1649*, 1657*, 1702, 1747, 1770*, 1811, 1813, 1832, 1839, 1855, 1856, 1864*, 1866*, 1868*, 1875*, 1878*, 1879*, 1885*, 1893*, 1894*, 1903*, 1908*⟩ Used in section 4*.
- ⟨Go into display math mode 1321⟩ Used in section 1314.
- ⟨Go into ordinary math mode 1315*⟩ Used in sections 1314 and 1318.
- ⟨Go through the preamble list, determining the column widths and changing the alignrecords to dummy unset boxes 975⟩ Used in section 974.
- ⟨Grow more variable-size memory and **goto restart** 144⟩ Used in section 143*.
- ⟨Handle \readline and **goto done** 1758⟩ Used in section 509.
- ⟨Handle \unexpanded or \detokenize and **return** 1685⟩ Used in section 491.
- ⟨Handle a glue node for mixed direction typesetting 1696⟩ Used in sections 653, 735, and 1723.
- ⟨Handle a math node in *hlist_out* 1713⟩ Used in sections 650* and 732*.
- ⟨Handle non-positive logarithm 121⟩ Used in section 119.
- ⟨Handle saved items and **goto done** 1860⟩ Used in section 1286.
- ⟨Handle situations involving spaces, braces, changes of state 369⟩ Used in section 366.
- ⟨If a line number class has ended, create new active nodes for the best feasible breaks in that class; then **return** if $r = last_active$, otherwise compute the new *line_width* 1009⟩ Used in section 1003.
- ⟨If all characters of the family fit relative to h , then **goto found**, otherwise **goto not_found** 1130⟩ Used in section 1128.
- ⟨If an alignment entry has just ended, take appropriate action 364⟩ Used in section 363*.
- ⟨If an expanded code is present, reduce it and **goto start_cs** 377*⟩ Used in sections 376* and 378*.
- ⟨If dumping is not allowed, abort 1480⟩ Used in section 1478*.
- ⟨If instruction cur_i is a kern with cur_c , attach the kern after q ; or if it is a ligature with cur_c , combine noads q and p appropriately; then **return** if the cursor has moved past a noad, or **goto restart** 927⟩ Used in section 926.
- ⟨If no hyphens were found, **return** 1077⟩ Used in section 1070.
- ⟨If node cur_p is a legal breakpoint, call *try_break*; then update the active widths by including the glue in $glue_ptr(cur_p)$ 1042⟩ Used in section 1040.

- ⟨If node *p* is a legal breakpoint, check if this break is the best known, and **goto** *done* if *p* is null or if the page-so-far is already too full to accept more stuff 1147⟩ Used in section 1145.
- ⟨If node *q* is a style node, change the style and **goto** *delete_q*; otherwise if it is not a noad, put it into the hlist, advance *q*, and **goto** *done*; otherwise set *s* to the size of noad *q*, set *t* to the associated type (*ord_noad* .. *inner_noad*), and set *pen* to the associated penalty 935⟩ Used in section 934.
- ⟨If node *r* is of type *delta_node*, update *cur_active_width*, set *prev_r* and *prev_prev_r*, then **goto** *continue* 1006⟩ Used in section 1003.
- ⟨If the current list ends with a box node, delete it from the list and make *cur_box* point to it; otherwise set *cur_box* ← *null* 1256⟩ Used in section 1255.
- ⟨If the current page is empty and node *p* is to be deleted, **goto** *done1*; otherwise use node *p* to update the state of the current page; if this node is an insertion, **goto** *contribute*; otherwise if this node is not a legal breakpoint, **goto** *contribute* or *update_heights*; otherwise set *pi* to the penalty associated with this breakpoint 1175⟩ Used in section 1172.
- ⟨If the cursor is immediately followed by the right boundary, **goto** *reswitch*; if it's followed by an invalid character, **goto** *big_switch*; otherwise move the cursor one step to the right and **goto** *main_lig_loop* 1211*⟩ Used in section 1209*.
- ⟨If the next character is a parameter number, make *cur_tok* a *match* token; but if it is a left brace, store '*left_brace*, *end_match*', set *hash_brace*, and **goto** *done* 502⟩ Used in section 500.
- ⟨If the preamble list has been traversed, check that the row has ended 966⟩ Used in section 965.
- ⟨If the right-hand side is a token parameter or token register, finish the assignment and **goto** *done* 1403⟩ Used in section 1402.
- ⟨If the string *hyph_word*[*h*] is less than *hc*[1 .. *hn*], **goto** *not_found*; but if the two strings are equal, set *hyf* to the hyphen positions and **goto** *found* 1106*⟩ Used in section 1105*.
- ⟨If the string *hyph_word*[*h*] is less than or equal to *s*, interchange (*hyph_word*[*h*], *hyph_list*[*h*]) with (*s*, *p*) 1116*⟩ Used in section 1115*.
- ⟨If there's a ligature or kern at the cursor position, update the data structures, possibly advancing *j*; continue until the cursor moves 1084⟩ Used in section 1081.
- ⟨If there's a ligature/kern command relevant to *cur_l* and *cur_r*, adjust the text appropriately; exit to *main_loop_wrapup* 1214⟩ Used in section 1209*.
- ⟨If this font has already been loaded, set *f* to the internal font number and **goto** *common_ending* 1436*⟩ Used in section 1433*.
- ⟨If this *sup_mark* starts an expanded character like \^A or \^df , then **goto** *reswitch*, otherwise set *state* ← *mid_line* 374⟩ Used in section 366.
- ⟨If *tmp_k1* is not null then append that kern 1215⟩ Used in sections 1209* and 1214.
- ⟨Ignore the fraction operation and complain about this ambiguous case 1359⟩ Used in section 1357.
- ⟨Implement `\closeout` 1531⟩ Used in section 1526*.
- ⟨Implement `\immediate` 1620⟩ Used in section 1526*.
- ⟨Implement `\openout` 1529⟩ Used in section 1526*.
- ⟨Implement `\pdfannot` 1556⟩ Used in section 1526*.
- ⟨Implement `\pdfcatalog` 1577⟩ Used in section 1526*.
- ⟨Implement `\pdfcolorstack` 1537⟩ Used in section 1526*.
- ⟨Implement `\pdfdest` 1563⟩ Used in section 1526*.
- ⟨Implement `\pdfendlink` 1559⟩ Used in section 1526*.
- ⟨Implement `\pdfendthread` 1567⟩ Used in section 1526*.
- ⟨Implement `\pdffakespace` 1594⟩ Used in section 1526*.
- ⟨Implement `\pdffontattr` 1587⟩ Used in section 1526*.
- ⟨Implement `\pdffontexpand` 1533⟩ Used in section 1526*.
- ⟨Implement `\pdfglyptounicode` 1590⟩ Used in section 1526*.
- ⟨Implement `\pdfincludechars` 1586⟩ Used in section 1526*.
- ⟨Implement `\pdfinfo` 1576⟩ Used in section 1526*.
- ⟨Implement `\pdfinterwordspaceoff` 1593⟩ Used in section 1526*.
- ⟨Implement `\pdfinterwordspaceon` 1592⟩ Used in section 1526*.

- <Implement `\pdfliteral` 1536> Used in section 1526*.
- <Implement `\pdfmapfile` 1588> Used in section 1526*.
- <Implement `\pdfmapline` 1589> Used in section 1526*.
- <Implement `\pdfnames` 1578> Used in section 1526*.
- <Implement `\pdfnombuiltintounicode` 1591> Used in section 1526*.
- <Implement `\pdfobj` 1542> Used in section 1526*.
- <Implement `\pdfoutline` 1561> Used in section 1526*.
- <Implement `\pdfprimitive` 394> Used in section 391.
- <Implement `\pdfrefobj` 1544> Used in section 1526*.
- <Implement `\pdfrefxform` 1547> Used in section 1526*.
- <Implement `\pdfrefximage` 1552> Used in section 1526*.
- <Implement `\pdfresettimer` 1584> Used in section 1526*.
- <Implement `\pdfrestore` 1540> Used in section 1526*.
- <Implement `\pdfrunninglinkoff` 1595> Used in section 1526*.
- <Implement `\pdfrunninglinkon` 1596> Used in section 1526*.
- <Implement `\pdfsavepos` 1574> Used in section 1526*.
- <Implement `\pdfsave` 1539> Used in section 1526*.
- <Implement `\pdfsetmatrix` 1538> Used in section 1526*.
- <Implement `\pdfsetrandomseed` 1583> Used in section 1526*.
- <Implement `\pdfsnaprefpoint` 1570> Used in section 1526*.
- <Implement `\pdfsnapycomp` 1573> Used in section 1526*.
- <Implement `\pdfsnapy` 1572> Used in section 1526*.
- <Implement `\pdfstartlink` 1558> Used in section 1526*.
- <Implement `\pdfstartthread` 1566> Used in section 1526*.
- <Implement `\pdfthread` 1565> Used in section 1526*.
- <Implement `\pdftrailerid` 1580> Used in section 1526*.
- <Implement `\pdftrailer` 1579> Used in section 1526*.
- <Implement `\pdfxform` 1546> Used in section 1526*.
- <Implement `\pdfximage` 1551> Used in section 1526*.
- <Implement `\setlanguage` 1622> Used in section 1526*.
- <Implement `\special` 1532*> Used in section 1526*.
- <Implement `\write` 1530> Used in section 1526*.
- <Incorporate a whatsit node into a vbox 1603> Used in section 843.
- <Incorporate a whatsit node into an hbox 1604> Used in section 823.
- <Incorporate box dimensions into the dimensions of the hbox that will contain it 825> Used in section 823.
- <Incorporate box dimensions into the dimensions of the vbox that will contain it 844> Used in section 843.
- <Incorporate character dimensions into the dimensions of the hbox that will contain it, then move to the next node 826> Used in section 823.
- <Incorporate glue into the horizontal totals 830> Used in section 823.
- <Incorporate glue into the vertical totals 845> Used in section 843.
- <Increase the number of parameters in the last font 607> Used in section 605.
- <Increase k until x can be multiplied by a factor of 2^{-k} , and adjust y accordingly 120> Used in section 119.
- <Initialize additional fields of the first active node 1842> Used in section 1038.
- <Initialize bigger nodes with *SyncTeX* information 1913*> Used in section 143*.
- <Initialize for hyphenating a paragraph 1066> Used in section 1037.
- <Initialize syntex primitive 1910*> Used in section 1510*.
- <Initialize table entries (done by INITEX only) 182, 240*, 246, 250, 258*, 268, 277*, 578*, 672, 1062, 1121*, 1126*, 1392, 1477*, 1613, 1650, 1815, 1851*> Used in section 8*.
- <Initialize the LR stack 1707> Used in sections 821, 1711, and 1731.
- <Initialize the current page, insert the `\topskip` glue ahead of p , and **goto** *continue* 1176> Used in section 1175.
- <Initialize the input routines 353*> Used in section 1515*.

- ⟨Initialize the output routines 55, 61*, 554, 559⟩ Used in section 1510*.
- ⟨Initialize the print *selector* based on *interaction* 75⟩ Used in sections 1441* and 1515*.
- ⟨Initialize the special list heads and constant nodes 964, 971, 994, 1156, 1163*⟩ Used in section 182.
- ⟨Initialize variables as *pdf_ship_out* begins 752⟩ Used in section 751.
- ⟨Initialize variables as *ship_out* begins 645*⟩ Used in section 668*.
- ⟨Initialize variables for PDF output 792⟩ Used in section 750*.
- ⟨Initialize variables for ε -TeX compatibility mode 1809⟩ Used in sections 1650 and 1652.
- ⟨Initialize variables for ε -TeX extended mode 1810⟩ Used in sections 1645* and 1652.
- ⟨Initialize whatever TeX might access 8*, 1909*⟩ Used in section 4*.
- ⟨Initialize *hlist_out* for mixed direction typesetting 1711⟩ Used in sections 647* and 729*.
- ⟨Initiate input from new pseudo file 1752*⟩ Used in section 1750.
- ⟨Initiate or terminate input from a file 404⟩ Used in section 391.
- ⟨Initiate the construction of an hbox or vbox, then **return** 1259⟩ Used in section 1255.
- ⟨Input and store tokens from the next line of the file 509⟩ Used in section 508.
- ⟨Input for **\read** from the terminal 510⟩ Used in section 509.
- ⟨Input from external file, **goto restart** if no input found 365*⟩ Used in section 363*.
- ⟨Input from token list, **goto restart** if end of list or if a parameter needs to be expanded 379*⟩ Used in section 363*.
- ⟨Input the first line of *read_file*[*m*] 511⟩ Used in section 509.
- ⟨Input the next line of *read_file*[*m*] 512⟩ Used in section 509.
- ⟨Insert LR nodes at the beginning of the current line and adjust the LR stack based on LR nodes in this line 1704⟩ Used in section 1054.
- ⟨Insert LR nodes at the end of the current line 1706⟩ Used in section 1054.
- ⟨Insert a delta node to prepare for breaks at *cur_p* 1017⟩ Used in section 1010.
- ⟨Insert a delta node to prepare for the next active node 1018⟩ Used in section 1010.
- ⟨Insert a dummy node to be sub/superscripted 1353⟩ Used in section 1352.
- ⟨Insert a new active node from *best_place*[*fit_class*] to *cur_p* 1019⟩ Used in section 1010.
- ⟨Insert a new control sequence after *p*, then make *p* point to it 279*⟩ Used in section 278.
- ⟨Insert a new pattern into the linked trie 1138*⟩ Used in section 1136.
- ⟨Insert a new primitive after *p*, then make *p* point to it 282⟩ Used in section 281.
- ⟨Insert a new trie node between *q* and *p*, and make *p* point to it 1139*⟩ Used in sections 1138*, 1852, and 1853.
- ⟨Insert a token containing *frozen_endv* 401⟩ Used in section 388*.
- ⟨Insert a token saved by **\afterassignment**, if any 1445⟩ Used in section 1387*.
- ⟨Insert glue for *split_top_skip* and set $p \leftarrow \text{null}$ 1144⟩ Used in section 1143.
- ⟨Insert hyphens as specified in *hyph_list*[*h*] 1107⟩ Used in section 1106*.
- ⟨Insert macro parameter and **goto restart** 381⟩ Used in section 379*.
- ⟨Insert the appropriate mark text into the scanner 412⟩ Used in section 391.
- ⟨Insert the current list into its environment 986⟩ Used in section 974.
- ⟨Insert the pair (*s*, *p*) into the exception table 1115*⟩ Used in section 1114*.
- ⟨Insert the $\langle v_j \rangle$ template and **goto restart** 963⟩ Used in section 364.
- ⟨Insert token *p* into TeX's input 348⟩ Used in section 304.
- ⟨Interpret code *c* and **return** if done 84*⟩ Used in section 83.
- ⟨Introduce new material from the terminal and **return** 87⟩ Used in section 84*.
- ⟨Issue an error message if $\text{cur_val} = \text{fmem_ptr}$ 606⟩ Used in section 605.
- ⟨Justify the line ending at breakpoint *cur_p*, and append it to the current vertical list, together with associated penalties and other insertions 1054⟩ Used in section 1051.
- ⟨Last-minute procedures 1511*, 1513*, 1514, 1516*⟩ Used in section 1508.
- ⟨Lengthen the preamble periodically 967⟩ Used in section 966.
- ⟨Let *cur_h* be the position of the first box, and set $\text{leader_wd} + lx$ to the spacing between corresponding parts of boxes 655⟩ Used in sections 654 and 736.
- ⟨Let *cur_v* be the position of the first box, and set $\text{leader_ht} + lx$ to the spacing between corresponding parts of boxes 664⟩ Used in sections 663 and 745.

- ⟨ Let d be the natural width of node p ; if the node is “visible,” **goto** *found*; if the node is glue that stretches or shrinks, set $v \leftarrow \text{max_dimen}$ 1323 ⟩ Used in section 1322.
- ⟨ Let d be the natural width of this glue; if stretching or shrinking, set $v \leftarrow \text{max_dimen}$; **goto** *found* in the case of leaders 1324 ⟩ Used in section 1323.
- ⟨ Let d be the width of the whatsit p 1605 ⟩ Used in section 1323.
- ⟨ Let j be the prototype box for the display 1737 ⟩ Used in section 1731.
- ⟨ Let n be the largest legal code value, based on *cur_chr* 1409 ⟩ Used in section 1408*.
- ⟨ Link node p into the current page and **goto** *done* 1173 ⟩ Used in section 1172.
- ⟨ Local variables for dimension calculations 476 ⟩ Used in section 474.
- ⟨ Local variables for finishing a displayed formula 1374, 1738 ⟩ Used in section 1370.
- ⟨ Local variables for formatting calculations 337 ⟩ Used in section 333.
- ⟨ Local variables for hyphenation 1076, 1087, 1097, 1104 ⟩ Used in section 1070.
- ⟨ Local variables for initialization 19*, 181, 1102 ⟩ Used in section 4*.
- ⟨ Local variables for line breaking 1036, 1068 ⟩ Used in section 989.
- ⟨ Look ahead for another character, or leave *lig_stack* empty if there’s none there 1213 ⟩ Used in section 1209*.
- ⟨ Look at all the marks in nodes before the break, and set the final link to *null* at the break 1154 ⟩ Used in section 1152.
- ⟨ Look at the list of characters starting with x in font g ; set f and c whenever a better character is found; **goto** *found* as soon as a large enough variant is encountered 882* ⟩ Used in section 881.
- ⟨ Look at the other stack entries until deciding what sort of DVI command to generate; **goto** *found* if node p is a “hit” 638 ⟩ Used in section 634.
- ⟨ Look at the variants of (z, x) ; set f and c whenever a better character is found; **goto** *found* as soon as a large enough variant is encountered 881 ⟩ Used in section 880.
- ⟨ Look for parameter number or ## 505 ⟩ Used in section 503.
- ⟨ Look for the word $hc[1 \dots hn]$ in the exception table, and **goto** *found* (with *hyf* containing the hyphens) if an entry is found 1105* ⟩ Used in section 1098*.
- ⟨ Look up the characters of list n in the hash table, and set *cur_cs* 1765 ⟩ Used in section 1764.
- ⟨ Look up the characters of list r in the hash table, and set *cur_cs* 400 ⟩ Used in section 398*.
- ⟨ Make a copy of node p in node r 223 ⟩ Used in section 222.
- ⟨ Make a ligature node, if *ligature_present*; insert a null discretionary, if appropriate 1210 ⟩ Used in section 1209*.
- ⟨ Make a partial copy of the whatsit node p and make r point to it; set *words* to the number of initial words not yet copied 1601 ⟩ Used in sections 224* and 1730*.
- ⟨ Make a second pass over the mlist, removing all noads and inserting the proper spacing and penalties 934 ⟩ Used in section 900.
- ⟨ Make final adjustments and **goto** *done* 603* ⟩ Used in section 588.
- ⟨ Make node p look like a *char_node* and **goto** *reswitch* 824 ⟩ Used in sections 650*, 732*, 823, and 1323.
- ⟨ Make sure that f is in the proper range 1787 ⟩ Used in section 1780.
- ⟨ Make sure that *page_max_depth* is not exceeded 1178 ⟩ Used in section 1172.
- ⟨ Make sure that pi is in the proper range 1005 ⟩ Used in section 1003.
- ⟨ Make the contribution list empty by setting its tail to *contrib_head* 1170 ⟩ Used in section 1169.
- ⟨ Make the first 256 strings 48 ⟩ Used in section 47*.
- ⟨ Make the height of box y equal to h 913 ⟩ Used in section 912.
- ⟨ Make the running dimensions in rule q extend to the boundaries of the alignment 980 ⟩ Used in section 979.
- ⟨ Make the unset node r into a *vlist_node* of height w , setting the glue as if the height were t 985 ⟩ Used in section 982.
- ⟨ Make the unset node r into an *hlist_node* of width w , setting the glue as if the width were t 984 ⟩ Used in section 982.
- ⟨ Make variable b point to a box for (f, c) 884 ⟩ Used in section 880.
- ⟨ Manufacture a control sequence name 398* ⟩ Used in section 391.
- ⟨ Math-only cases in non-math modes, or vice versa 1222 ⟩ Used in section 1221.

- < Merge the widths in the span nodes of q with those of p , destroying the span nodes of q 977 > Used in section 975.
- < Modify the end of the line to reflect the nature of the break and to include `\rightskip`; also set the proper value of *disc_break* 1055 > Used in section 1054.
- < Modify the glue specification in *main_p* according to the space factor 1220 > Used in section 1219.
- < Move down or output leaders 662 > Used in section 659.
- < Move down without outputting leaders 1635 > Used in section 1634*.
- < Move node p to the current page; if it is time for a page break, put the nodes following the break back onto the contribution list, and **return** to the user's output routine if there is one 1172 > Used in section 1169.
- < Move node p to the new list and go to the next node; or **goto done** if the end of the reflected segment has been reached 1721 > Used in section 1720.
- < Move pointer s to the end of the current list, and set *replace_count*(r) appropriately 1093 > Used in section 1089.
- < Move right or output leaders 653 > Used in section 650*.
- < Move the characters of a ligature node to *hu* and *hc*; but **goto done3** if they are not all letters 1073 > Used in section 1072.
- < Move the cursor past a pseudo-ligature, then **goto main_loop_lookahead** or *main_lig_loop* 1212* > Used in section 1209*.
- < Move the data into *trie* 1133* > Used in section 1141*.
- < Move the non-*char_node* p to the new list 1722* > Used in section 1721.
- < Move to next line of file, or **goto restart** if there is no next line, or **return** if a `\read` line has finished 382 > Used in section 365*.
- < Negate a boolean conditional and **goto reswitch** 1762 > Used in section 391.
- < Negate all three glue components of *cur_val* 457 > Used in sections 456 and 1777.
- < Nullify *width*(q) and the tabskip glue following this column 976 > Used in section 975.
- < Numbered cases for *debug_help* 1517* > Used in section 1516*.
- < Open *tfm_file* for input 589* > Used in section 588.
- < Open *vf_file*, return if not found 713 > Used in section 712.
- < Other local variables for *try_break* 1004, 1841 > Used in section 1003.
- < Output PDF outline entries 789 > Used in section 788.
- < Output a Form node in a hlist 1644 > Used in section 1642.
- < Output a Form node in a vlist 1641 > Used in section 1636.
- < Output a Image node in a hlist 1643 > Used in section 1642.
- < Output a Image node in a vlist 1640 > Used in section 1636.
- < Output a box in a vlist 660* > Used in section 659.
- < Output a box in an hlist 651* > Used in section 650*.
- < Output a leader box at *cur_h*, then advance *cur_h* by *leader_wd* + *lx* 656 > Used in section 654.
- < Output a leader box at *cur_v*, then advance *cur_v* by *leader_ht* + *lx* 665 > Used in section 663.
- < Output a rule in a vlist, **goto next_p** 661 > Used in section 659.
- < Output a rule in an hlist 652 > Used in section 650*.
- < Output a substitution, **goto continue** if not possible 1883* > Used in section 648*.
- < Output article threads 790 > Used in section 794.
- < Output fonts definition 799 > Used in section 794.
- < Output leaders in a vlist, **goto fin_rule** if a rule or to *next_p* if done 663 > Used in section 662.
- < Output leaders in an hlist, **goto fin_rule** if a rule or to *next_p* if done 654 > Used in section 653.
- < Output name tree 802 > Used in section 794.
- < Output node p for *hlist_out* and move to the next node, maintaining the condition *cur_v* = *base_line* 648* > Used in section 647*.
- < Output node p for *pdf_hlist_out* and move to the next node, maintaining the condition *cur_v* = *base_line* 731* > Used in section 729*.
- < Output node p for *pdf_vlist_out* and move to the next node, maintaining the condition *cur_h* = *left_edge* 740 > Used in section 738*.

- < Output node p for *vlist_out* and move to the next node, maintaining the condition $cur_h = left_edge$ 658 >
Used in section 657*.
- < Output outlines 788 > Used in section 794.
- < Output pages tree 800 > Used in section 794.
- < Output statistics about this job 1512* > Used in section 1511*.
- < Output the catalog object 804 > Used in section 794.
- < Output the cross-reference stream dictionary 812 > Used in section 794.
- < Output the current Pages object in this level 801 > Used in section 800.
- < Output the current node in this level 803 > Used in section 802.
- < Output the font definitions for all fonts that were used 671 > Used in section 670*.
- < Output the font name whose internal number is f 630 > Used in section 629*.
- < Output the non-*char_node* p for *hlist_out* and move to the next node 650* > Used in section 648*.
- < Output the non-*char_node* p for *pdf_hlist_out* and move to the next node 732* > Used in section 731*.
- < Output the non-*char_node* p for *pdf_vlist_out* 741 > Used in section 740.
- < Output the non-*char_node* p for *vlist_out* 659 > Used in section 658.
- < Output the trailer 813 > Used in section 794.
- < Output the whatsit node p in a vlist 1610 > Used in section 659.
- < Output the whatsit node p in an hlist 1611 > Used in section 650*.
- < Output the whatsit node p in *pdf_hlist_out* 1642 > Used in section 732*.
- < Output the whatsit node p in *pdf_vlist_out* 1636 > Used in section 741.
- < Output the *obj_tab* 811 > Used in section 794.
- < Pack all stored *hyph_codes* 1854 > Used in section 1141*.
- < Pack the family into *trie* relative to h 1131 > Used in section 1128.
- < Package an unset box for the current column and record its width 970 > Used in section 965.
- < Package the display line 1743 > Used in section 1741.
- < Package the preamble list, to determine the actual tabskip glue amounts, and let p point to this prototype box 978 > Used in section 974.
- < Perform computations for last line and **goto found** 1843 > Used in section 1026.
- < Perform the default output routine 1198 > Used in section 1187.
- < Pontificate about improper alignment in display 1383 > Used in section 1382.
- < Pop the condition stack 522 > Used in sections 524, 526, 535, and 536.
- < Pop the expression stack and **goto found** 1786 > Used in section 1780.
- < Prepare all the boxes involved in insertions to act as queues 1193 > Used in section 1189.
- < Prepare for display after a non-empty paragraph 1731 > Used in section 1322.
- < Prepare for display after an empty paragraph 1729 > Used in section 1321.
- < Prepare new file *SyncTeX* information 1915* > Used in section 563*.
- < Prepare pseudo file *SyncTeX* information 1917* > Used in section 1752*.
- < Prepare terminal input *SyncTeX* information 1916* > Used in section 350*.
- < Prepare to deactivate node r , and **goto deactivate** unless there is a reason to consider lines of text from r to *cur_p* 1028 > Used in section 1025.
- < Prepare to insert a token that matches *cur_group*, and print what it is 1241 > Used in section 1240.
- < Prepare to move a box or rule node to the current page, then **goto contribute** 1177 > Used in section 1175.
- < Prepare to move whatsit p to the current page, then **goto contribute** 1608 > Used in section 1175.
- < Print a short indication of the contents of node p 193 > Used in sections 192* and 674.
- < Print a symbolic description of the new break node 1020 > Used in section 1019.
- < Print a symbolic description of this feasible break 1030 > Used in section 1029.
- < Print additional data in the new active node 1849 > Used in section 1020.
- < Print additional resources 763 > Used in section 762.
- < Print character substitution tracing log 1887* > Used in sections 1883* and 1884*.
- < Print either ‘definition’ or ‘use’ or ‘preamble’ or ‘text’, and insert tokens that should lead to recovery 361* > Used in section 360*.
- < Print location of current line 335 > Used in section 334.

- < Print newly busy locations 189 > Used in section 185.
- < Print string s as an error message 1459* > Used in section 1455*.
- < Print string s on the terminal 1456* > Used in section 1455*.
- < Print the CreationDate key 807 > Used in section 805.
- < Print the ModDate key 808 > Used in section 805.
- < Print the Producer key 806 > Used in section 805.
- < Print the banner line, including the date and time 562* > Used in section 560*.
- < Print the help information and **goto** *continue* 89 > Used in section 84*.
- < Print the list between *printed_node* and *cur_p*, then set *printed_node* \leftarrow *cur_p* 1031 > Used in section 1030.
- < Print the menu of available options 85 > Used in section 84*.
- < Print the result of command c 498 > Used in section 496.
- < Print two lines using the tricky pseudoprinted information 339 > Used in section 334.
- < Print type of token list 336 > Used in section 334.
- < Process an active-character control sequence and set *state* \leftarrow *mid_line* 375 > Used in section 366.
- < Process an expression and **return** 1777 > Used in section 450.
- < Process node-or-noad q as much as possible in preparation for the second pass of *mlist_to_hlist*, then move to the next item in the *mlist* 901 > Used in section 900.
- < Process the font definitions 715 > Used in section 712.
- < Process the preamble 714 > Used in section 712.
- < Process whatsit p in *vert.break* loop, **goto** *not_found* 1609 > Used in section 1148.
- < Prune the current list, if necessary, until it contains only *char_node*, *kern_node*, *hlist_node*, *vlist_node*, *rule_node*, and *ligature_node* items; set n to the length of the list, and set q to the list's tail 1297 > Used in section 1295.
- < Prune unwanted nodes at the beginning of the next line 1053 > Used in section 1051.
- < Pseudoprint the line 340* > Used in section 334.
- < Pseudoprint the token list 341 > Used in section 334.
- < Push the condition stack 521 > Used in section 524.
- < Push the expression stack and **goto** *restart* 1785 > Used in section 1782.
- < Put each of T_EX's primitives into the hash table 244, 248*, 256*, 266, 287*, 356, 402, 410, 437, 442, 494, 513, 517, 579, 954, 1158, 1228, 1234, 1247, 1264, 1283, 1290, 1317, 1332, 1345, 1354, 1364, 1384, 1395*, 1398*, 1406*, 1426, 1430, 1438, 1448, 1453, 1462, 1467, 1522*, 1905* > Used in section 1514.
- < Put help message on the transcript file 90 > Used in section 82*.
- < Put the characters *hu*[$i + 1 \dots i$] into *post.break*(r), appending to this list and to *major_tail* until synchronization has been achieved 1091 > Used in section 1089.
- < Put the characters *hu*[$l \dots i$] and a hyphen into *pre.break*(r) 1090 > Used in section 1089.
- < Put the fraction into a box with its delimiters, and make *new_hlist*(q) point to it 922 > Used in section 917.
- < Put the \leftskip glue at the left and detach this line 1061 > Used in section 1054.
- < Put the optimal current page into box 255, update *first_mark* and *bot_mark*, append insertions to their boxes, and put the remaining nodes back on the contribution list 1189 > Used in section 1187.
- < Put the (positive) 'at' size into s 1435 > Used in section 1434.
- < Put the \rightskip glue after node q 1060 > Used in section 1055.
- < Read and check the font data; *abort* if the TFM file is malformed; if there's no room for this font, say so and **goto** *done*; otherwise *incr*(*font_ptr*) and **goto** *done* 588 > Used in section 586*.
- < Read box dimensions 598 > Used in section 588.
- < Read character data 595 > Used in section 588.
- < Read extensible character recipes 601 > Used in section 588.
- < Read font parameters 602* > Used in section 588.
- < Read ligature/kern program 600* > Used in section 588.
- < Read next line of file into *buffer*, or **goto** *restart* if the file has ended 384 > Used in section 382.
- < Read the first line of the new file 564 > Used in section 563*.
- < Read the other strings from the TEX.POOL file and return *true*, or give an error message and return *false* 51* > Used in section 47*.

- ⟨ Read the TFM header 594 ⟩ Used in section 588.
- ⟨ Read the TFM size fields 591 ⟩ Used in section 588.
- ⟨ Readjust the height and depth of *cur_box*, for `\vtop` 1263 ⟩ Used in section 1262.
- ⟨ Rebuild character using substitution information 1888* ⟩ Used in section 1883*.
- ⟨ Reconstitute nodes for the hyphenated word, inserting discretionary hyphens 1088 ⟩ Used in section 1078.
- ⟨ Record a new feasible break 1029 ⟩ Used in section 1025.
- ⟨ Record current point *SyncTeX* information 1927* ⟩ Used in sections 648* and 731*.
- ⟨ Record horizontal *rule_node* or *glue_node* *SyncTeX* information 1928* ⟩ Used in sections 650* and 732*.
- ⟨ Record void list *SyncTeX* information 1926* ⟩ Used in sections 651*, 660*, 733*, and 742*.
- ⟨ Record *kern_node* *SyncTeX* information 1929* ⟩ Used in sections 650* and 732*.
- ⟨ Record *math_node* *SyncTeX* information 1930* ⟩ Used in sections 650* and 732*.
- ⟨ Recover from an unbalanced output routine 1202 ⟩ Used in section 1201.
- ⟨ Recover from an unbalanced write command 1616 ⟩ Used in section 1615.
- ⟨ Recycle node *p* 1174 ⟩ Used in section 1172.
- ⟨ Reduce to the case that $a, c \geq 0$, $b, d > 0$ 123 ⟩ Used in section 122.
- ⟨ Reduce to the case that $f \geq 0$ and $q > 0$ 115 ⟩ Used in section 114.
- ⟨ Remove the last box, unless it's part of a discretionary 1257 ⟩ Used in section 1256.
- ⟨ Replace nodes *ha* .. *hb* by a sequence of nodes that includes the discretionary hyphens 1078 ⟩ Used in section 1070.
- ⟨ Replace the tail of the list by *p* 1363 ⟩ Used in section 1362.
- ⟨ Replace *z* by *z'* and compute α, β 599 ⟩ Used in section 598.
- ⟨ Report LR problems 1710 ⟩ Used in sections 1709 and 1727.
- ⟨ Report a runaway argument and abort 422 ⟩ Used in sections 418 and 425.
- ⟨ Report a tight hbox and **goto** *common_ending*, if this box is sufficiently bad 841 ⟩ Used in section 838.
- ⟨ Report a tight vbox and **goto** *common_ending*, if this box is sufficiently bad 852 ⟩ Used in section 850.
- ⟨ Report an extra right brace and **goto** *continue* 421 ⟩ Used in section 418.
- ⟨ Report an improper use of the macro and abort 424 ⟩ Used in section 423.
- ⟨ Report an overfull hbox and **goto** *common_ending*, if this box is sufficiently bad 840 ⟩ Used in section 838.
- ⟨ Report an overfull vbox and **goto** *common_ending*, if this box is sufficiently bad 851 ⟩ Used in section 850.
- ⟨ Report an underfull hbox and **goto** *common_ending*, if this box is sufficiently bad 834 ⟩ Used in section 832.
- ⟨ Report an underfull vbox and **goto** *common_ending*, if this box is sufficiently bad 848 ⟩ Used in section 847.
- ⟨ Report overflow of the input buffer, and abort 35* ⟩ Used in sections 31* and 1753.
- ⟨ Report that an invalid delimiter code is being changed to null; set *cur_val* $\leftarrow 0$ 1337 ⟩ Used in section 1336.
- ⟨ Report that the font won't be loaded 587* ⟩ Used in section 586*.
- ⟨ Report that this dimension is out of range 486 ⟩ Used in section 474.
- ⟨ Reset PDF mark lists 754 ⟩ Used in section 752.
- ⟨ Reset resource lists 753 ⟩ Used in sections 752 and 775.
- ⟨ Reset *cur_tok* for unexpandable primitives, goto restart 395 ⟩ Used in sections 439 and 466.
- ⟨ Restore resource lists 777 ⟩ Used in section 775.
- ⟨ Resume the page builder after an output routine has come to an end 1201 ⟩ Used in section 1276.
- ⟨ Retrieve the prototype box 1739 ⟩ Used in sections 1370 and 1370.
- ⟨ Reverse an hlist segment and **goto** *reswitch* 1719* ⟩ Used in section 1714.
- ⟨ Reverse the complete hlist and set the subtype to *reversed* 1718* ⟩ Used in section 1711.
- ⟨ Reverse the linked list of Page and Pages objects 798 ⟩ Used in section 794.
- ⟨ Reverse the links of the relevant passive nodes, setting *cur_p* to the first breakpoint 1052 ⟩ Used in section 1051.
- ⟨ Save current position in DVI mode 1618 ⟩ Used in section 1617*.
- ⟨ Save current position to *pdf_last_x_pos*, *pdf_last_y_pos* 1638 ⟩ Used in sections 1636 and 1642.
- ⟨ Save current position to *pdf_snapx_refpos*, *pdf_snapy_refpos* 1639 ⟩ Used in sections 1636 and 1642.
- ⟨ Save resource lists 776 ⟩ Used in section 775.
- ⟨ Scan a control sequence and set *state* \leftarrow *skip_blanks* or *mid_line* 376* ⟩ Used in section 366.
- ⟨ Scan a factor *f* of type *o* or start a subexpression 1782 ⟩ Used in section 1780.

- ⟨Scan a numeric constant 470⟩ Used in section 466.
- ⟨Scan a parameter until its delimiter string has been found; or, if $s = null$, simply scan the delimiter string 418⟩ Used in section 417.
- ⟨Scan a subformula enclosed in braces and **return** 1329⟩ Used in section 1327.
- ⟨Scan ahead in the buffer until finding a nonletter; if an expanded code is encountered, reduce it and **goto** *start_cs*; otherwise if a multiletter control sequence is found, adjust *cur_cs* and *loc*, and **goto** *found* 378*⟩ Used in section 376*.
- ⟨Scan an alphabetic character code into *cur_val* 468⟩ Used in section 466.
- ⟨Scan an optional space 469⟩ Used in sections 468, 474, 481, 705, 1376, 1542, 1554, 1554, 1556, and 1563.
- ⟨Scan and build the body of the token list; **goto** *found* when finished 503⟩ Used in section 499.
- ⟨Scan and build the parameter part of the macro definition 500⟩ Used in section 499.
- ⟨Scan and evaluate an expression e of type l 1780⟩ Used in section 1779.
- ⟨Scan decimal fraction 478⟩ Used in section 474.
- ⟨Scan file name in the buffer 557⟩ Used in section 556*.
- ⟨Scan for all other units and adjust *cur_val* and f accordingly; **goto** *done* in the case of scaled points 484⟩
Used in section 479.
- ⟨Scan for **fil** units; **goto** *attach_fraction* if found 480⟩ Used in section 479.
- ⟨Scan for **mu** units and **goto** *attach_fraction* 482⟩ Used in section 479.
- ⟨Scan for units that are internal dimensions; **goto** *attach_sign* with *cur_val* set if found 481⟩ Used in section 479.
- ⟨Scan preamble text until *cur_cmd* is *tab_mark* or *car_ret*, looking for changes in the tabskip glue; append an alignrecord to the preamble list 953⟩ Used in section 951.
- ⟨Scan the argument for command c 497⟩ Used in section 496.
- ⟨Scan the font size specification 1434⟩ Used in section 1433*.
- ⟨Scan the next operator and set o 1781⟩ Used in section 1780.
- ⟨Scan the parameters and make *link*(r) point to the macro body; but **return** if an illegal **\par** is detected 417⟩ Used in section 415.
- ⟨Scan the preamble and record it in the *preamble* list 951⟩ Used in section 948.
- ⟨Scan the template $\langle u_j \rangle$, putting the resulting token list in *hold_head* 957⟩ Used in section 953.
- ⟨Scan the template $\langle v_j \rangle$, putting the resulting token list in *hold_head* 958⟩ Used in section 953.
- ⟨Scan units and set *cur_val* to $x \cdot (cur_val + f/2^{16})$, where there are x sp per unit; **goto** *attach_sign* if the units are internal 479⟩ Used in section 474.
- ⟨Search *eqtb* for equivalents equal to p 273⟩ Used in section 190.
- ⟨Search *hyph_list* for pointers to p 1108⟩ Used in section 190.
- ⟨Search *save_stack* for equivalents that point to p 307⟩ Used in section 190.
- ⟨Select the appropriate case and **return** or **goto** *common_ending* 535⟩ Used in section 527*.
- ⟨Set initial values of key variables 21, 23*, 24*, 74*, 77, 80, 97, 118, 184, 233*, 272, 276*, 294, 309, 390, 409, 465, 507, 516, 577*, 582, 620, 623, 633, 677, 681, 688, 697, 709, 711, 724, 818, 828, 836, 859, 945, 1103*, 1165, 1208, 1443, 1458, 1476, 1521, 1549, 1569, 1582, 1626, 1631, 1703, 1748, 1814, 1833, 1857, 1865*, 1876*, 1880*, 1895*⟩ Used in section 8*.
- ⟨Set line length parameters in preparation for hanging indentation 1023⟩ Used in section 1022.
- ⟨Set the glue in all the unset boxes of the current list 979⟩ Used in section 974.
- ⟨Set the glue in node r and change it from an unset node 982⟩ Used in section 981.
- ⟨Set the unset box q and the unset boxes in it 981⟩ Used in section 979.
- ⟨Set the value of b to the badness for shrinking the line, and compute the corresponding *fit_class* 1027⟩
Used in section 1025.
- ⟨Set the value of b to the badness for stretching the line, and compute the corresponding *fit_class* 1026⟩
Used in section 1025.
- ⟨Set the value of b to the badness of the last line for shrinking, compute the corresponding *fit_class*, and **goto** *found* 1845⟩ Used in section 1843.
- ⟨Set the value of b to the badness of the last line for stretching, compute the corresponding *fit_class*, and **goto** *found* 1844⟩ Used in section 1843.
- ⟨Set the value of *output_penalty* 1188⟩ Used in section 1187.

- <Set the value of x to the text direction before the display 1728> Used in sections 1729 and 1731.
- <Set up data structures with the cursor following position j 1083> Used in section 1081.
- <Set up the hlist for the display line 1742> Used in section 1741.
- <Set up the values of *cur_size* and *cur_mu*, based on *cur_style* 877> Used in sections 894, 900, 901, 904, 928, 934, 936, and 937.
- <Set variable c to the current escape character 261> Used in section 63.
- <Set variable w to indicate if this case should be reported 1772> Used in sections 1771 and 1773.
- <Ship box p out 668*> Used in section 666*.
- <Show equivalent n , in region 1 or 2 241> Used in section 270*.
- <Show equivalent n , in region 3 247> Used in section 270*.
- <Show equivalent n , in region 4 251> Used in section 270*.
- <Show equivalent n , in region 5 260> Used in section 270*.
- <Show equivalent n , in region 6 269> Used in section 270*.
- <Show the auxiliary field, a 237*> Used in section 236.
- <Show the box context 1678> Used in section 1676.
- <Show the box packaging info 1677> Used in section 1676.
- <Show the current contents of a box 1472> Used in section 1469.
- <Show the current meaning of a token, then **goto** *common_ending* 1470> Used in section 1469.
- <Show the current value of some parameter or register, then **goto** *common_ending* 1473> Used in section 1469.
- <Show the font identifier in *eqtb*[n] 252> Used in section 251.
- <Show the halfword code in *eqtb*[n] 253> Used in section 251.
- <Show the status of the current page 1161> Used in section 236.
- <Show the text of the macro being expanded 427*> Used in section 415.
- <Simplify a trivial box 895*> Used in section 894.
- <Skip to `\else` or `\fi`, then **goto** *common_ending* 526> Used in section 524.
- <Skip to node *ha*, or **goto** *done1* if no hyphenation should be attempted 1071> Used in section 1069.
- <Skip to node *hb*, putting letters into *hu* and *hc* 1072> Used in section 1069.
- <Sort p into the list starting at *rover* and advance p to *rlink*(p) 150> Used in section 149.
- <Sort the hyphenation op tables into proper order 1120*> Used in section 1127.
- <Split off part of a vertical box, make *cur_box* point to it 1258> Used in section 1255.
- <Squeeze the equation as much as possible; if there is an equation number that should go on a separate line by itself, set $e \leftarrow 0$ 1377> Used in section 1375.
- <Start a new current page 1166> Used in section 1192.
- <Start hlist *SyncTeX* information record 1924*> Used in sections 647* and 729*.
- <Start sheet *SyncTeX* information record 1920*> Used in section 666*.
- <Start stream of page/form contents 757> Used in section 752.
- <Start vlist *SyncTeX* information record 1922*> Used in sections 657* and 738*.
- <Store additional data for this feasible break 1847> Used in section 1029.
- <Store additional data in the new active node 1848> Used in section 1019.
- <Store *cur_box* in a box register 1253> Used in section 1251.
- <Store maximum values in the *hyf* table 1099*> Used in section 1098*.
- <Store *save_stack*[*save_ptr*] in *eqtb*[p], unless *eqtb*[p] holds a global value 305*> Used in section 304.
- <Store all current *lc_code* values 1853> Used in section 1852.
- <Store hyphenation codes for current language 1852> Used in section 1135*.
- <Store the current token, but **goto** *continue* if it is a blank space that would become an undelimited parameter 419> Used in section 418.
- <Store the packet being built 718> Used in section 717.
- <Subtract glue from *break_width* 1012> Used in section 1011.
- <Subtract the width of node v from *break_width* 1015> Used in section 1014.
- <Suppress expansion of the next token 393> Used in section 391.
- <Swap the subscript and superscript into box x 916> Used in section 912.
- <Switch to a larger accent if available and appropriate 914*> Used in section 912.

- <Tell the user what has run away and try to recover 360*> Used in section 358.
- <Terminate the current conditional and skip to \fi 536> Used in section 391.
- <Test box register status 531> Used in section 527*.
- <Test if an integer is odd 530> Used in section 527*.
- <Test if two characters match 532> Used in section 527*.
- <Test if two macro texts match 534> Used in section 533.
- <Test if two tokens match 533> Used in section 527*.
- <Test relation between integers or dimensions 529> Used in section 527*.
- <The em width for *cur_font* 584> Used in section 481.
- <The x-height for *cur_font* 585> Used in section 481.
- <Tidy up the parameter just scanned, and tuck it away 426*> Used in section 418.
- <Transfer node *p* to the adjustment list 829> Used in section 823.
- <Transplant the post-break list 1058> Used in section 1056.
- <Transplant the pre-break list 1059> Used in section 1056.
- <Treat *cur_chr* as an active character 1328> Used in sections 1327 and 1331.
- <Try the final line break at the end of the paragraph, and **goto** *done* if the desired breakpoints have been found 1047> Used in section 1037.
- <Try to allocate within node *p* and its physical successors, and **goto** *found* if allocation was possible 145> Used in section 143*.
- <Try to break after a discretionary fragment, then **goto** *done5* 1043> Used in section 1040.
- <Try to get a different log file name 561> Used in section 560*.
- <Try to hyphenate the following word 1069> Used in section 1040.
- <Try to recover from mismatched \right 1368> Used in section 1367.
- <Types in the outer block 18, 25, 38*, 101, 109*, 131*, 168, 230, 291, 322*, 574*, 621, 694, 707, 722, 1095*, 1100*, 1624, 1629, 1675> Used in section 4*.
- <Undump MLTeX-specific data 1891*> Used in section 1479*.
- <Undump a couple more things and the closing check word 1505*> Used in section 1479*.
- <Undump constants for consistency check 1484*> Used in section 1479*.
- <Undump encTeX-specific data 1900*> Used in section 1479*.
- <Undump pdftex data 1503> Used in section 1479*.
- <Undump regions 1 to 6 of *eqtb* 1493*> Used in section 1490*.
- <Undump the ε -TeX state 1652> Used in section 1484*.
- <Undump the array info for internal font number *k* 1499*> Used in section 1497*.
- <Undump the dynamic memory 1488*> Used in section 1479*.
- <Undump the font information 1497*> Used in section 1479*.
- <Undump the hash table 1495*> Used in section 1490*.
- <Undump the hyphenation tables 1501*> Used in section 1479*.
- <Undump the string pool 1486*> Used in section 1479*.
- <Undump the table of equivalents 1490*> Used in section 1479*.
- <Undump *xord*, *xchr*, and *xprn* 1872*> Used in section 1484*.
- <Update the active widths, since the first active node has been deleted 1035> Used in section 1034.
- <Update the current height and depth measurements with respect to a glue or kern node *p* 1151> Used in section 1147.
- <Update the current marks for *fire_up* 1827> Used in section 1189.
- <Update the current marks for *vsplit* 1824> Used in section 1154.
- <Update the current page measurements with respect to the glue or kern specified by node *p* 1179> Used in section 1172.
- <Update the value of *printed_node* for symbolic displays 1032> Used in section 1003.
- <Update the values of *first_mark* and *bot_mark* 1191> Used in section 1189.
- <Update the values of *last_glue*, *last_penalty*, and *last_kern* 1171> Used in section 1169.
- <Update the values of *max_h* and *max_v*; but if the page is too large, **goto** *done* 669> Used in sections 668* and 751.

- ⟨ Update width entry for spanned columns 972 ⟩ Used in section 970.
- ⟨ Use code *c* to distinguish between generalized fractions 1358 ⟩ Used in section 1357.
- ⟨ Use node *p* to update the current height and depth measurements; if this node is not a legal breakpoint, **goto** *not_found* or *update_heights*, otherwise set *pi* to the associated penalty at the break 1148 ⟩ Used in section 1147.
- ⟨ Use size fields to allocate font information 592 ⟩ Used in section 588.
- ⟨ Wipe out the whatsit node *p* and **goto** *done* 1602 ⟩ Used in section 220*.
- ⟨ Wrap up the box specified by node *r*, splitting node *p* if called for; set *wait* \leftarrow *true* if node *p* holds a remainder after splitting 1196 ⟩ Used in section 1195.
- ⟨ Write out Form stream header 756 ⟩ Used in section 752.
- ⟨ Write out PDF annotations 781 ⟩ Used in section 780.
- ⟨ Write out PDF bead rectangle specifications 786 ⟩ Used in section 780.
- ⟨ Write out PDF link annotations 782 ⟩ Used in section 780.
- ⟨ Write out PDF mark destinations 784 ⟩ Used in section 780.
- ⟨ Write out page object 769 ⟩ Used in section 759.
- ⟨ Write out pending PDF marks 780 ⟩ Used in section 759.
- ⟨ Write out pending forms 775 ⟩ Used in section 761.
- ⟨ Write out pending images 779 ⟩ Used in section 761.
- ⟨ Write out pending raw objects 773 ⟩ Used in section 761.
- ⟨ Write out resource lists 761 ⟩ Used in section 759.
- ⟨ Write out resources dictionary 762 ⟩ Used in section 759.
- ⟨ syntex case for *print_param* 1906* ⟩ Used in section 255*.
