## 1 Introduction

This document is a reference manual for the Markdown package. It is split into three sections. This section explains the purpose and the background of the package and outlines its prerequisites. Section 2 describes the interfaces exposed by the package along with usage notes and examples. It is aimed at the user of the package. Section 3 describes the implementation of the package. It is aimed at the developer of the package and the curious user.

### 1.1 About Markdown

The Markdown package provides facilities for the conversion of markdown markup to plain  $\text{\TeX}$ . These are provided both in the form of a Lua module and in the form of plain  $\text{\TeX}$ ,  $\text{\LaTeX}$ , and Con $\text{\TeX}$ t macro packages that enable the direct inclusion of markdown documents inside  $\text{\TeX}$  documents.

Architecturally, the package consists of the Lunamark Lua module by John MacFarlane, which was slimmed down and rewritten for the needs of the package. On top of Lunamark sits code for the plain  $\text{\TeX}$ ,  $\text{\LaTeX}$ , and Con $\text{\TeX}$ t formats by Vít Novotný.

```
1 if not modules then modules = {} end modules ['markdown'] = {  
2     version    = "1.0.1",  
3     comment    = "A module for the conversion from markdown to plain TeX",  
4     author     = "John MacFarlane, Hans Hagen, Vít Novotný",

7 }
```

## 1.2 Feedback

Please use the markdown project page on GitHub<sup>1</sup> to report bugs and submit feature requests. Before making a feature request, please ensure that you have thoroughly studied this manual. If you do not want to report a bug or request a feature but are simply in need of assistance, you might want to consider posting your question on the  $\text{\TeX}$ - $\text{\LaTeX}$  Stack Exchange<sup>2</sup>.

## 1.3 Acknowledgements

I would like to thank the Faculty of Informatics at the Masaryk University in Brno for providing me with the opportunity to work on this package alongside my studies. I would also like to thank the creator of the Lunamark Lua module, John Macfarlane, for releasing Lunamark under a permissive license that enabled its inclusion into the package.

The  $\text{\TeX}$  part of the package draws inspiration from several sources including the source code of  $\text{\TeX} 2\epsilon$ , the minted package by Geoffrey M. Poore – which likewise tackles the issue of interfacing with an external interpreter from  $\text{\TeX}$ , the filecontents package by Scott Pakin, and others.

## 1.4 Prerequisites

This section gives an overview of all resources required by the package.

### 1.4.1 Lua Prerequisites

The Lua part of the package requires the following Lua modules:

**LPeg** A pattern-matching library for the writing of recursive descent parsers via the Parsing Expression Grammars (PEGs). It is used by the Lunamark library to parse the markdown input.

```
8     local lpeg = require("lpeg")
```

**Selene Unicode** A library that provides support for the processing of wide strings. It is used by the Lunamark library to cast image, link, and footnote tags to the lower case.

```
9     local unicode = require("unicode")
```

---

<sup>1</sup><https://github.com/witiko/markdown/issues>

<sup>2</sup><https://tex.stackexchange.com>

**MD5** A library that provides MD5 crypto functions. It is used by the Lunamark library to compute the digest of the input for caching purposes.

```
10 local md5 = require("md5")
```

All the abovelisted modules are statically linked into the LuaTeX engine (see [1, Section 3.3]).

#### 1.4.2 Plain TeX Prerequisites

The plain TeX part of the package requires the following Lua module:

**Lua File System** A library that provides access to the filesystem via os-specific syscalls. It is used by the plain TeX code to create the cache directory specified by the `\markdownOptionCacheDir` macro before interfacing with the Lunamark library.

The plain TeX code makes use of the `isDir` method that was added to the module by the LuaTeX engine developers (see [1, Section 3.2]). This method is not present in the base library.

The Lua File System module is statically linked into the LuaTeX engine (see [1, Section 3.3]).

The plain TeX part of the package also requires that the plain TeX format (or its superset) is loaded and that either the LuaTeX `\directlua` primitive or the shell access file stream 18 is available.

#### 1.4.3 L<sup>A</sup>T<sub>E</sub>X Prerequisites

The L<sup>A</sup>T<sub>E</sub>X part of the package requires that the L<sup>A</sup>T<sub>E</sub>X<sub>2ε</sub> format is loaded and also, since it uses the plain TeX implementation, all the plain TeX prerequisites (see Section 1.4.2).

```
11 \NeedsTeXFormat{LaTeX2e}%
```

The following L<sup>A</sup>T<sub>E</sub>X<sub>2ε</sub> packages are also required:

**keyval** A package that enables the creation of parameter sets. This package is used to provide the `\markdownSetup` macro, the package options processing, as well as the parameters of the `markdown*` L<sup>A</sup>T<sub>E</sub>X environment.

**url** A package that provides the `\url` macro for the typesetting of URLs. It is used to provide the default token renderer prototype (see Section 2.2.4) for links.

**graphicx** A package that provides the `\includegraphics` macro for the typesetting of images. It is used to provide the corresponding default token renderer prototype (see Section 2.2.4).

**paralist** A package that provides the `compactitem`, `compactenum`, and `compactdesc` macros for the typesetting of tight bulleted lists, ordered lists, and definition lists. It is used to provide the corresponding default token renderer prototypes (see Section 2.2.4).

**ifthen** A package that provides a concise syntax for the inspection of macro values. It is used to determine whether or not the paralist package should be loaded based on the user options.

**fancyvrb** A package that provides the `\VerbatimInput` macros for the verbatim inclusion of files containing code. It is used to provide the corresponding default token renderer prototype (see Section 2.2.4).

#### 1.4.4 ConTeXt prerequisites

The ConTeXt part of the package requires that either the Mark II or the Mark IV format is loaded and also, since it uses the plain TeX implementation, all the plain TeX prerequisites (see Section 1.4.2).

## 2 User Guide

This part of the manual describes the interfaces exposed by the package along with usage notes and examples. It is aimed at the user of the package.

Since neither TeX nor Lua provide interfaces as a language construct, the separation to interfaces and implementations is purely abstract. It serves as a means of structuring this manual and as a promise to the user that if they only access the package through the interfaces, the future versions of the package should remain backwards compatible.

### 2.1 Lua Interface

The Lua interface provides the conversion from markdown to plain TeX. This interface is used by the plain TeX implementation (see Section 3.2) and will be of interest to the developers of other packages and Lua modules.

The Lua interface is implemented by the `markdown` Lua module.

```
12 local M = {}
```

#### 2.1.1 Conversion from Markdown to Plain TeX

The Lua interface exposes the `new(options)` method. This method creates converter functions that perform the conversion from markdown to plain TeX according to the table `options` that contains options recognized by the Lua interface. (see Section

[2.1.2](#)). The `options` parameter is optional; when unspecified, the behaviour will be the same as if `options` were an empty table.

```
13 M.new = {}
```

The following example Lua code converts the markdown string `_Hello world!_` to a TeX output using the default options and prints the TeX output:

```
local md = require("markdown")
local convert = md.new()
print(convert("_Hello world!_"))
```

## 2.1.2 Options

The Lua interface recognizes the following options. When unspecified, the value of a key is taken from the `defaultOptions` table.

```
14 local defaultOptions = {}
```

`blankBeforeBlockquote=true, false` default: false  
  
true      Require a blank line between a paragraph and the following blockquote.  
false     Do not require a blank line between a paragraph and the following blockquote.

```
15 defaultOptions.blankBeforeBlockquote = false
```

`blankBeforeHeading=true, false` default: false  
  
true      Require a blank line between a paragraph and the following header.  
false     Do not require a blank line between a paragraph and the following header.

```
16 defaultOptions.blankBeforeHeading = false
```

`cacheDir=<directory>` default: .

The path to the directory containing auxiliary cache files.

When iteratively writing and typesetting a markdown document, the cache files are going to accumulate over time. You are advised to clean the cache directory every now and then, or to set it to a temporary filesystem (such as `/tmp` on UN\*X systems), which gets periodically emptied.

```
17 defaultOptions.cacheDir = ".."
```

<code>definitionLists=true, false</code>	default: false
<code>true</code>	Enable the pandoc definition list syntax extension:
	<pre>Term 1       :       : Definition 1  Term 2 with *inline markup*       :       : Definition 2        { some code, part of Definition 2 }        Third paragraph of definition 2.</pre>
<code>false</code>	Disable the pandoc definition list syntax extension.
<code>18 defaultOptions.definitionLists = false</code>	
<code>hashEnumerators=true, false</code>	default: false
<code>true</code>	Enable the use of hash symbols (#) as ordered item list markers.
<code>false</code>	Disable the use of hash symbols (#) as ordered item list markers.
<code>19 defaultOptions.hashEnumerators = false</code>	
<code>hybrid=true, false</code>	default: false
<code>true</code>	Disable the escaping of special plain TeX characters, which makes it possible to intersperse your markdown markup with TeX code. The intended usage is in documents prepared manually by a human author. In such documents, it can often be desirable to mix TeX and markdown markup freely.
<code>false</code>	Enable the escaping of special plain TeX characters outside verbatim environments, so that they are not interpreted by TeX. This is encouraged when typesetting automatically generated content or markdown documents that were not prepared with this package in mind.
<code>20 defaultOptions.hybrid = false</code>	
<code>footnotes=true, false</code>	default: false

<code>true</code>	Enable the pandoc footnote syntax extension:  Here is a footnote reference, [^1] and another.[^longnote]  [^1]: Here is the footnote.  [^longnote]: Here's one with multiple blocks.  Subsequent paragraphs are indented to show that they belong to the previous footnote.  { some.code }
<code>false</code>	Disable the pandoc footnote syntax extension.
<code>21 defaultOptions.footnotes = false</code>	
<code>preserveTabs=true, false</code>	default: false
<code>true</code>	Preserve all tabs in the input.
<code>false</code>	Convert any tabs in the input to spaces.
<code>22 defaultOptions.preserveTabs = false</code>	
<code>smartEllipses=true, false</code>	default: false
<code>true</code>	Convert any ellipses in the input to the \markdownRendererEllipsis TeX macro.
<code>false</code>	Preserve all ellipses in the input.
<code>23 defaultOptions.smartEllipses = false</code>	
<code>startNumber=true, false</code>	default: true
<code>true</code>	Make the number in the first item in ordered lists significant. The item numbers will be passed to the \markdownRenderer01ItemWithNumber TeX macro.

```
false      Ignore the number in the items of ordered lists. Each item will only  
           produce a \markdownRendererOlItem TeX macro.
```

```
24 defaultOptions.startNumber = true
```

tightLists=true, false default: true

```
true      Lists whose bullets do not consist of multiple paragraphs will  
           be detected and passed to the \markdownRendererOlBeginTight,  
           \markdownRendererOlEndTight, \markdownRendererUlBeginTight,  
           \markdownRendererUlEndTight, \markdownRendererDlBeginTight,  
           and \markdownRendererDlEndTight macros.
```

```
false     Lists whose bullets do not consist of multiple paragraphs will be treated  
           the same way as lists that do.
```

```
25 defaultOptions.tightLists = true
```

## 2.2 Plain TeX Interface

The plain TeX interface provides macros for the typesetting of markdown input from within plain TeX, for setting the Lua interface options (see Section 2.1.2) used during the conversion from markdown to plain TeX, and for changing the way markdown the tokens are rendered.

```
26 \def\markdownVersion{2016/06/03} %
```

The plain TeX interface is implemented by the `markdown.tex` file that can be loaded as follows:

```
\input markdown
```

It is expected that the special plain TeX characters have the expected category codes, when `\input`ting the file.

### 2.2.1 Typesetting Markdown

The interface exposes the `\markdownBegin`, `\markdownEnd`, and `\markdownInput` macros.

The `\markdownBegin` macro marks the beginning of a markdown document fragment and the `\markdownEnd` macro marks its end.

```
27 \let\markdownBegin\relax
```

```
28 \let\markdownEnd\relax
```

You may prepend your own code to the `\markdownBegin` macro and redefine the `\markdownEnd` macro to produce special effects before and after the markdown block.

There are several limitations to the macros you need to be aware of. The first limitation concerns the `\markdownEnd` macro, which must be visible directly from the input line buffer (it may not be produced as a result of input expansion). Otherwise, it will not be recognized as the end of the markdown string otherwise. As a corollary, the `\markdownEnd` string may not appear anywhere inside the markdown input.

Another limitation concerns spaces at the right end of an input line. In markdown, these are used to produce a forced line break. However, any such spaces are removed before the lines enter the input buffer of TeX (see [2, p. 46]). As a corollary, the `\markdownBegin` macro also ignores them.

The `\markdownBegin` and `\markdownEnd` macros will also consume the rest of the lines at which they appear. In the following example plain TeX code, the characters `c`, `e`, and `f` will not appear in the output.

```
\input markdown
a
b \markdownBegin c
d
e \markdownEnd   f
g
\bye
```

Note that you may also not nest the `\markdownBegin` and `\markdownEnd` macros.

The following example plain TeX code showcases the usage of the `\markdownBegin` and `\markdownEnd` macros:

```
\input markdown
\markdownBegin
_Hello_ **world** ...
\markdownEnd
\bye
```

The `\markdownInput` macro accepts a single parameter containing the filename of a markdown document and expands to the result of the conversion of the input markdown document to plain TeX.

29 \let\markdownInput\relax

This macro is not subject to the abovelisted limitations of the `\markdownBegin` and `\markdownEnd` macros.

The following example plain TeX code showcases the usage of the `\markdownInput` macro:

```
\input markdown
\markdownInput{hello.md}
\bye
```

## 2.2.2 Options

The plain  $\text{\TeX}$  options are represented by  $\text{\TeX}$  macros. Some of them map directly to the options recognized by the Lua interface (see Section 2.1.2), while some of them are specific to the plain  $\text{\TeX}$  interface.

**2.2.2.1 File and directory names** The `\markdownOptionHelperScriptFileName` macro sets the filename of the helper Lua script file that is created during the conversion from markdown to plain  $\text{\TeX}$  in  $\text{\TeX}$  engines without the `\directlua` primitive. It defaults to `\jobname.markdown.lua`, where `\jobname` is the base name of the document being typeset.

The expansion of this macro must not contain quotation marks ("") or backslash symbols (\). Mind that  $\text{\TeX}$  engines tend to put quotation marks around `\jobname`, when it contains spaces.

30 `\def\markdownOptionHelperScriptFileName{\jobname.markdown.lua}%`

The `\markdownOptionInputTempFileName` macro sets the filename of the temporary input file that is created during the conversion from markdown to plain  $\text{\TeX}$  in  $\text{\TeX}$  engines without the `\directlua` primitive. It defaults to `\jobname.markdown.out`. The same limitations as in the case of the `\markdownOptionHelperScriptFileName` macro apply here.

31 `\def\markdownOptionInputTempFileName{\jobname.markdown.in}%`

The `\markdownOptionOutputTempFileName` macro sets the filename of the temporary output file that is created during the conversion from markdown to plain  $\text{\TeX}$  in  $\text{\TeX}$  engines without the `\directlua` primitive. It defaults to `\jobname.markdown.out`. The same limitations apply here as in the case of the `\markdownOptionHelperScriptFileName` macro.

32 `\def\markdownOptionOutputTempFileName{\jobname.markdown.out}%`

The `\markdownOptionCacheDir` macro corresponds to the Lua interface `cacheDir` option that sets the name of the directory that will contain the produced cache files. The option defaults to `_markdown-\jobname`, which is a similar naming scheme to the one used by the minted  $\text{\LaTeX}$  package. The same limitations apply here as in the case of the `\markdownOptionHelperScriptFileName` macro.

33 `\def\markdownOptionCacheDir{_markdown-\jobname}%`

**2.2.2.2 Lua Interface Options** The following macros map directly to the options recognized by the Lua interface (see Section 2.1.2) and are not processed by the plain TeX implementation, only passed along to Lua. They are undefined, which makes them fall back to the default values provided by the Lua interface.

```
34 \let\markdownOptionBlankBeforeBlockquote\undefined  
35 \let\markdownOptionBlankBeforeHeading\undefined  
36 \let\markdownOptionDefinitionLists\undefined  
37 \let\markdownOptionHashEnumerator\undefined  
38 \let\markdownOptionHybrid\undefined  
39 \let\markdownOptionFootnotes\undefined  
40 \let\markdownOptionPreserveTabs\undefined  
41 \let\markdownOptionSmartEllipses\undefined  
42 \let\markdownOptionStartNumber\undefined  
43 \let\markdownOptionTightLists\undefined
```

### 2.2.3 Token Renderers

The following TeX macros may occur inside the output of the converter functions exposed by the Lua interface (see Section 2.1.1) and represent the parsed markdown tokens. These macros are intended to be redefined by the user who is typesetting a document. By default, they point to the corresponding prototypes (see Section 2.2.4).

**2.2.3.1 Line Break Renderer** The `\markdownRendererLineBreak` macro represents a forced line break. The macro receives no arguments.

```
44 \def\markdownRendererLineBreak{  
45   \markdownRendererLineBreakPrototype}
```

**2.2.3.2 Ellipsis Renderer** The `\markdownRendererEllipsis` macro replaces any occurrence of ASCII ellipses in the input text. This macro will only be produced, when the `smartEllipses` option is `true`. The macro receives no arguments.

```
46 \def\markdownRendererEllipsis{  
47   \markdownRendererEllipsisPrototype}
```

**2.2.3.3 Code Span Renderer** The `\markdownRendererCodeSpan` macro represents inlined code span in the input text. It receives a single argument that corresponds to the inlined code span.

```
48 \def\markdownRendererCodeSpan{  
49   \markdownRendererCodeSpanPrototype}
```

**2.2.3.4 Link Renderer** The `\markdownRendererLink` macro represents a hyperlink. It receives three arguments: the label, the URI, and the title of the link.

```
50 \def\markdownRendererLink{%
51   \markdownRendererLinkPrototype}%
```

**2.2.3.5 Image Renderer** The `\markdownRendererImage` macro represents an image. It receives three arguments: the label, the URL, and the title of the image.

```
52 \def\markdownRendererImage{%
53   \markdownRendererImagePrototype}%
```

**2.2.3.6 Bullet List Renderers** The `\markdownRendererUlBegin` macro represents the beginning of a bulleted list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
54 \def\markdownRendererUlBegin{%
55   \markdownRendererUlBeginPrototype}%
```

The `\markdownRendererUlBeginTight` macro represents the beginning of a bulleted list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
56 \def\markdownRendererUlBeginTight{%
57   \markdownRendererUlBeginTightPrototype}%
```

The `\markdownRendererUlItem` macro represents an item in a bulleted list. The macro receives no arguments.

```
58 \def\markdownRendererUlItem{%
59   \markdownRendererUlItemPrototype}%
```

The `\markdownRendererUlEnd` macro represents the end of a bulleted list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
60 \def\markdownRendererUlEnd{%
61   \markdownRendererUlEndPrototype}%
```

The `\markdownRendererUlEndTight` macro represents the end of a bulleted list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
62 \def\markdownRendererUlEndTight{%
63   \markdownRendererUlEndTightPrototype}%
```

**2.2.3.7 Ordered List Renderers** The `\markdownRendererOlBegin` macro represents the beginning of an ordered list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
64 \def\markdownRenderer01Begin{%
65   \markdownRenderer01BeginPrototype}%
```

The `\markdownRenderer01Begin` macro represents the beginning of an ordered list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
66 \def\markdownRenderer01BeginTight{%
67   \markdownRenderer01BeginTightPrototype}%
```

The `\markdownRenderer01Item` macro represents an item in an ordered list. This macro will only be produced, when the `startNumber` option is `false`. The macro receives no arguments.

```
68 \def\markdownRenderer01Item{%
69   \markdownRenderer01ItemPrototype}%
```

The `\markdownRenderer01ItemWithNumber` macro represents an item in an ordered list. This macro will only be produced, when the `startNumber` option is `true`. The macro receives no arguments.

```
70 \def\markdownRenderer01ItemWithNumber{%
71   \markdownRenderer01ItemWithNumberPrototype}%
```

The `\markdownRenderer01End` macro represents the end of an ordered list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
72 \def\markdownRenderer01End{%
73   \markdownRenderer01EndPrototype}%
```

The `\markdownRenderer01EndTight` macro represents the end of an ordered list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
74 \def\markdownRenderer01EndTight{%
75   \markdownRenderer01EndTightPrototype}%
```

**2.2.3.8 Definition List Renderers** The following macros are only produced, when the `definitionLists` option is `true`.

The `\markdownRendererDlBegin` macro represents the beginning of a definition list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
76 \def\markdownRendererDlBegin{%
77   \markdownRendererDlBeginPrototype}%
```

The `\markdownRendererDlBeginTight` macro represents the beginning of a definition list that contains an item with several paragraphs of text (the list is not tight).

This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
78 \def\markdownRendererDlBeginTight{%
79   \markdownRendererDlBeginTightPrototype}%
```

The `\markdownRendererDlItem` macro represents an item in a definition list. The macro receives a single argument that corresponds to the term being defined.

```
80 \def\markdownRendererDlItem{%
81   \markdownRendererDlItemPrototype}%
```

The `\markdownRendererDlEnd` macro represents the end of a definition list that contains an item with several paragraphs of text (the list is not tight). The macro receives no arguments.

```
82 \def\markdownRendererDlEnd{%
83   \markdownRendererDlEndPrototype}%
```

The `\markdownRendererDlEndTight` macro represents the end of a definition list that contains no item with several paragraphs of text (the list is tight). This macro will only be produced, when the `tightLists` option is `false`. The macro receives no arguments.

```
84 \def\markdownRendererDlEndTight{%
85   \markdownRendererDlEndTightPrototype}%
```

**2.2.3.9 Emphasis Renderers** The `\markdownRendererEmphasis` macro represents an emphasized span of text. The macro receives a single argument that corresponds to the emphasized span of text.

```
86 \def\markdownRendererEmphasis{%
87   \markdownRendererEmphasisPrototype}%
```

The `\markdownRendererStrongEmphasis` macro represents a strongly emphasized span of text. The macro receives a single argument that corresponds to the emphasized span of text.

```
88 \def\markdownRendererStrongEmphasis{%
89   \markdownRendererStrongEmphasisPrototype}%
```

**2.2.3.10 Block Quote Renderers** The `\markdownRendererBlockQuoteBegin` macro represents the beginning of a block quote. The macro receives no arguments.

```
90 \def\markdownRendererBlockQuoteBegin{%
91   \markdownRendererBlockQuoteBeginPrototype}%
```

The `\markdownRendererBlockQuoteEnd` macro represents the end of a block quote. The macro receives no arguments.

```
92 \def\markdownRendererBlockQuoteEnd{%
93   \markdownRendererBlockQuoteEndPrototype}%
```

**2.2.3.11 Code Block Renderer** The `\markdownRendererInputVerbatim` macro represents a code block. The macro receives a single argument that corresponds to the filename of a file containing the code block to input.

```
94 \def\markdownRendererInputVerbatim{%
95   \markdownRendererInputVerbatimPrototype}%
```

**2.2.3.12 Heading Renderers** The `\markdownRendererHeadingOne` macro represents a first level heading. The macro receives a single argument that corresponds to the heading text.

```
96 \def\markdownRendererHeadingOne{%
97   \markdownRendererHeadingOnePrototype}%
```

The `\markdownRendererHeadingTwo` macro represents a second level heading. The macro receives a single argument that corresponds to the heading text.

```
98 \def\markdownRendererHeadingTwo{%
99   \markdownRendererHeadingTwoPrototype}%
```

The `\markdownRendererHeadingThree` macro represents a third level heading. The macro receives a single argument that corresponds to the heading text.

```
100 \def\markdownRendererHeadingThree{%
101   \markdownRendererHeadingThreePrototype}%
```

The `\markdownRendererHeadingFour` macro represents a fourth level heading. The macro receives a single argument that corresponds to the heading text.

```
102 \def\markdownRendererHeadingFour{%
103   \markdownRendererHeadingFourPrototype}%
```

The `\markdownRendererHeadingFive` macro represents a fifth level heading. The macro receives a single argument that corresponds to the heading text.

```
104 \def\markdownRendererHeadingFive{%
105   \markdownRendererHeadingFivePrototype}%
```

The `\markdownRendererHeadingSix` macro represents a sixth level heading. The macro receives a single argument that corresponds to the heading text.

```
106 \def\markdownRendererHeadingSix{%
107   \markdownRendererHeadingSixPrototype}%
```

**2.2.3.13 Horizontal Rule Renderer** The `\markdownRendererHorizontalRule` macro represents a horizontal rule. The macro receives no arguments.

```
108 \def\markdownRendererHorizontalRule{%
109   \markdownRendererHorizontalRulePrototype}%
```

**2.2.3.14 Footnote Renderer** The `\markdownRendererFootnote` macro represents a footnote. This macro will only be produced, when the `footnotes` option is `true`. The macro receives a single argument that corresponds to the footnote text.

```

110 \def\markdownRendererFootnote{%
111   \markdownRendererFootnotePrototype}%

```

## 2.2.4 Token Renderer Prototypes

The following TeX macros provide definitions for the token renderers (see Section 2.2.3) that have not been redefined by the user. These macros are intended to be redefined by macro package authors who wish to provide sensible default token renderers. They are also redefined by the L<sup>A</sup>T<sub>E</sub>X and ConT<sub>E</sub>Xt implementations (see sections 3.3 and 3.4).

```

## 2.2.5 Logging Facilities

The `\markdownInfo`, `\markdownWarning`, and `\markdownError` macros provide access to logging to the rest of the macros. Their first argument specifies the text of the info, warning, or error message.

```
146 \def\markdownInfo#1{%
147 \def\markdownWarning#1{%

```

The `\markdownError` macro receives a second argument that provides a help text suggesting a remedy to the error.

```
148 \def\markdownError#1{%

```

You may redefine these macros to redirect and process the info, warning, and error messages.

## 2.2.6 Miscellanea

The `\markdownLuaRegisterIBCallback` and `\markdownLuaUnregisterIBCallback` macros specify the Lua code for registering and unregistering a callback for changing the contents of the line input buffer before a TeX engine that supports direct Lua access via the `\directlua` macro starts looking at it. The first argument of the `\markdownLuaRegisterIBCallback` macro corresponds to the callback function being registered.

Local members defined within `\markdownLuaRegisterIBCallback` are guaranteed to be visible from `\markdownLuaUnregisterIBCallback` and the execution of the two macros alternates, so it is not necessary to consider the case, when one of the macros is called twice in a row.

```
149 \def\markdownLuaRegisterIBCallback#1{%
150   local old_callback = callback.find("process_input_buffer")
151   callback.register("process_input_buffer", #1)}%
152 \def\markdownLuaUnregisterIBCallback{%
153   callback.register("process_input_buffer", old_callback)}%
```

The `\markdownMakeOther` macro is used by the package, when a TeX engine that does not support direct Lua access is starting to buffer a text. The plain TeX implementation changes the category code of plain TeX special characters to other, but there may be other active characters that may break the output. This macro should temporarily change the category of these to *other*.

```
154 \let\markdownMakeOther\relax
```

The `\markdownReadAndConvert` macro implements the `\markdownBegin` macro. The first argument specifies the token sequence that will terminate the markdown input (`\markdownEnd` in the instance of the `\markdownBegin` macro) when the plain TeX special characters have had their category changed to *other*. The second argument specifies the token sequence that will actually be inserted into the document, when the ending token sequence has been found.

```
155 \let\markdownReadAndConvert\relax
156 \begingroup
```

Locally swap the category code of the backslash symbol (`\`) with the pipe symbol (`|`). This is required in order that all the special symbols in the first argument of the `markdownReadAndConvert` macro have the category code *other*.

```
157 \catcode`\|=0\catcode`\\=12%
158 \gdef\markdownBegin{%
159   \markdownReadAndConvert{\markdownEnd}%
160   {|\markdownEnd}}%
161 \endgroup
```

The macro is exposed in the interface, so that the user can create their own markdown environments. Due to the way the arguments are passed to Lua (see Section 3.2.5), the first argument may not contain the string `]` (regardless of the category code of the bracket symbol `[]`).

## 2.3 L<sup>A</sup>T<sub>E</sub>X Interface

The L<sup>A</sup>T<sub>E</sub>X interface provides L<sup>A</sup>T<sub>E</sub>X environments for the typesetting of markdown input from within L<sup>A</sup>T<sub>E</sub>X, facilities for setting Lua interface options (see Section 2.1.2) used during the conversion from markdown to plain T<sub>E</sub>X, and facilities for changing the way markdown tokens are rendered. The rest of the interface is inherited from the plain T<sub>E</sub>X interface (see Section 2.2).

The L<sup>A</sup>T<sub>E</sub>X interface is implemented by the `markdown.sty` file, which can be loaded from the L<sup>A</sup>T<sub>E</sub>X document preamble as follows:

```
\usepackage[<options>]{markdown}
```

where `<options>` are the L<sup>A</sup>T<sub>E</sub>X interface options (see Section 2.3.2).

### 2.3.1 Typesetting Markdown

The interface exposes the `markdown` and `markdown*` L<sup>A</sup>T<sub>E</sub>X environments, and redefines the `\markdownInput` command.

The `markdown` and `markdown*` L<sup>A</sup>T<sub>E</sub>X environments are used to typeset markdown document fragments. The starred version of the `markdown` environment accepts L<sup>A</sup>T<sub>E</sub>X interface options (see Section 2.3.2) as its only argument. These options will only influence this markdown document fragment.

```
162 \newenvironment{markdown}\relax\relax
163 \newenvironment{markdown*}[1]\relax\relax
```

You may prepend your own code to the `\markdown` macro and append your own code to the `\endmarkdown` macro to produce special effects before and after the `markdown` L<sup>A</sup>T<sub>E</sub>X environment (and likewise for the starred version).

Note that the `markdown` and `markdown*`  $\text{\LaTeX}$  environments are subject to the same limitations as the `\markdownBegin` and `\markdownEnd` macros exposed by the plain  $\text{\TeX}$  interface.

The following example  $\text{\LaTeX}$  code showcases the usage of the `markdown` and `markdown*` environments:

<code>\documentclass{article}</code>	<code>\documentclass{article}</code>
<code>\usepackage{markdown}</code>	<code>\usepackage{markdown}</code>
<code>\begin{document}</code>	<code>\begin{document}</code>
<code>% ...</code>	<code>% ...</code>
<code>\begin{markdown}</code>	<code>\begin{markdown*}{smartEllipses}</code>
<code>_Hello_ **world** ...</code>	<code>_Hello_ **world** ...</code>
<code>\end{markdown}</code>	<code>\end{markdown*}</code>
<code>% ...</code>	<code>% ...</code>
<code>\end{document}</code>	<code>\end{document}</code>

The `\markdownInput` macro accepts a single mandatory parameter containing the filename of a markdown document and expands to the result of the conversion of the input markdown document to plain  $\text{\TeX}$ . Unlike the `\markdownInput` macro provided by the plain  $\text{\TeX}$  interface, this macro also accepts  $\text{\LaTeX}$  interface options (see Section 2.3.2) as its optional argument. These options will only influence this markdown document.

The following example  $\text{\LaTeX}$  code showcases the usage of the `\markdownInput` macro:

```
\documentclass{article}
\usepackage{markdown}
\begin{document}
% ...
\markdownInput [smartEllipses] {hello.md}
% ...
\end{document}
```

### 2.3.2 Options

The  $\text{\LaTeX}$  options are represented by a comma-delimited list of  $\langle\langle key\rangle\rangle=\langle value\rangle$  pairs. For boolean options, the  $\langle value\rangle$  part is optional, and  $\langle\langle key\rangle\rangle$  will be interpreted as  $\langle\langle key\rangle\rangle=true$ .

The  $\text{\LaTeX}$  options map directly to the options recognized by the plain  $\text{\TeX}$  interface (see Section 2.2.2) and to the markdown token renderers and their prototypes recognized by the plain  $\text{\TeX}$  interface (see Sections 2.2.3 and 2.2.4).

The  $\text{\LaTeX}$  options may be specified when loading the  $\text{\LaTeX}$  package (see Section 2.3), when using the `markdown*`  $\text{\LaTeX}$  environment, or via the `\markdownSetup` macro. The `\markdownSetup` macro receives the options to set up as its only argument.

```
164 \newcommand\markdownSetup[1]{%
165   \setkeys{markdownOptions}{#1}}%
```

**2.3.2.1 Plain  $\text{\TeX}$  Interface Options** The following options map directly to the option macros exposed by the plain  $\text{\TeX}$  interface (see Section 2.2.2).

```
166 \RequirePackage[keyval]
167 \define@key{markdownOptions}{helperScriptFileName}{%
168   \def\markdownOptionHelperScriptFileName{#1}}%
169 \define@key{markdownOptions}{inputTempFileName}{%
170   \def\markdownOptionInputTempFileName{#1}}%
171 \define@key{markdownOptions}{outputTempFileName}{%
172   \def\markdownOptionOutputTempFileName{#1}}%
173 \define@key{markdownOptions}{blankBeforeBlockquote}[true]{%
174   \def\markdownOptionBlankBeforeBlockquote{#1}}%
175 \define@key{markdownOptions}{blankBeforeHeading}[true]{%
176   \def\markdownOptionBlankBeforeHeading{#1}}%
177 \define@key{markdownOptions}{cacheDir}{%
178   \def\markdownOptionCacheDir{#1}}%
179 \define@key{markdownOptions}{definitionLists}[true]{%
180   \def\markdownOptionDefinitionLists{#1}}%
181 \define@key{markdownOptions}{hashEnumerators}[true]{%
182   \def\markdownOptionHashEnumerators{#1}}%
183 \define@key{markdownOptions}{hybrid}[true]{%
184   \def\markdownOptionHybrid{#1}}%
185 \define@key{markdownOptions}{footnotes}[true]{%
186   \def\markdownOptionFootnotes{#1}}%
187 \define@key{markdownOptions}{preserveTabs}[true]{%
188   \def\markdownOptionPreserveTabs{#1}}%
189 \define@key{markdownOptions}{smartEllipses}[true]{%
190   \def\markdownOptionSmartEllipses{#1}}%
191 \define@key{markdownOptions}{startNumber}[true]{%
192   \def\markdownOptionStartNumber{#1}}%
```

If the `tightLists=false` option is specified, when loading the package, then the `paralist` package for typesetting tight lists will not be automatically loaded. This precaution is meant to minimize the footprint of this package, since some document-classes (beamer) do not play nice with the `paralist` package.

```
193 \define@key{markdownOptions}{tightLists}[true]{%
194   \def\markdownOptionTightLists{#1}}%
```

The following example  $\text{\LaTeX}$  code showcases a possible configuration of plain  $\text{\TeX}$  interface options `\markdownOptionHybrid`, `\markdownOptionSmartEllipses`, and `\markdownOptionCacheDir`.

```
\markdownSetup{
    hybrid,
    smartEllipses,
    cacheDir = /tmp,
}
```

**2.3.2.2 Plain  $\text{\TeX}$  Markdown Token Renderers** The  $\text{\LaTeX}$  interface recognizes an option with the `renderers` key, whose value must be a list of options that map directly to the markdown token renderer macros exposed by the plain  $\text{\TeX}$  interface (see Section 2.2.3).

```
195 \define@key{markdownOptions}{renderers}{%
196   \setkeys{markdownRenderers}{#1}%
197 \define@key{markdownRenderers}{lineBreak}{%
198   \renewcommand\markdownRendererLineBreak{\#1}%
199 \define@key{markdownRenderers}{ellipsis}{%
200   \renewcommand\markdownRendererEllipsis{\#1}%
201 \define@key{markdownRenderers}{codeSpan}{%
202   \renewcommand\markdownRendererCodeSpan[1]{\#1}%
203 \define@key{markdownRenderers}{link}{%
204   \renewcommand\markdownRendererLink[3]{\#1}%
205 \define@key{markdownRenderers}{image}{%
206   \renewcommand\markdownRendererImage[3]{\#1}%
207 \define@key{markdownRenderers}{ulBegin}{%
208   \renewcommand\markdownRendererUlBegin{\#1}%
209 \define@key{markdownRenderers}{ulBeginTight}{%
210   \renewcommand\markdownRendererUlBeginTight{\#1}%
211 \define@key{markdownRenderers}{ulItem}{%
212   \renewcommand\markdownRendererUlItem{\#1}%
213 \define@key{markdownRenderers}{ulEnd}{%
214   \renewcommand\markdownRendererUlEnd{\#1}%
215 \define@key{markdownRenderers}{ulEndTight}{%
216   \renewcommand\markdownRendererUlEndTight{\#1}%
217 \define@key{markdownRenderers}{olBegin}{%
218   \renewcommand\markdownRendererOlBegin{\#1}%
219 \define@key{markdownRenderers}{olBeginTight}{%
220   \renewcommand\markdownRendererOlBeginTight{\#1}%
221 \define@key{markdownRenderers}{olItem}{%
222   \renewcommand\markdownRendererOlItem{\#1}%
223 \define@key{markdownRenderers}{olItemWithNumber}{%
224   \renewcommand\markdownRendererOlItemWithNumber[1]{\#1}%
225 \define@key{markdownRenderers}{olEnd}{%
226   \renewcommand\markdownRendererOlEnd{\#1}%
227 \define@key{markdownRenderers}{olEndTight}{%
228   \renewcommand\markdownRendererOlEndTight{\#1}%

```

```

229 \define@key{markdownRenderers}{dlBegin}{%
230   \renewcommand\markdownRendererDlBegin{\#1}%
231 \define@key{markdownRenderers}{dlBeginTight}{%
232   \renewcommand\markdownRendererDlBeginTight{\#1}%
233 \define@key{markdownRenderers}{dlItem}{%
234   \renewcommand\markdownRendererDlItem[1]{\#1}%
235 \define@key{markdownRenderers}{dlEnd}{%
236   \renewcommand\markdownRendererDlEnd{\#1}%
237 \define@key{markdownRenderers}{dlEndTight}{%
238   \renewcommand\markdownRendererDlEndTight{\#1}%
239 \define@key{markdownRenderers}{emphasis}{%
240   \renewcommand\markdownRendererEmphasis[1]{\#1}%
241 \define@key{markdownRenderers}{strongEmphasis}{%
242   \renewcommand\markdownRendererStrongEmphasis[1]{\#1}%
243 \define@key{markdownRenderers}{blockQuoteBegin}{%
244   \renewcommand\markdownRendererBlockQuoteBegin{\#1}%
245 \define@key{markdownRenderers}{blockQuoteEnd}{%
246   \renewcommand\markdownRendererBlockQuoteEnd{\#1}%
247 \define@key{markdownRenderers}{inputVerbatim}{%
248   \renewcommand\markdownRendererInputVerbatim[1]{\#1}%
249 \define@key{markdownRenderers}{headingOne}{%
250   \renewcommand\markdownRendererHeadingOne[1]{\#1}%
251 \define@key{markdownRenderers}{headingTwo}{%
252   \renewcommand\markdownRendererHeadingTwo[1]{\#1}%
253 \define@key{markdownRenderers}{headingThree}{%
254   \renewcommand\markdownRendererHeadingThree[1]{\#1}%
255 \define@key{markdownRenderers}{headingFour}{%
256   \renewcommand\markdownRendererHeadingFour[1]{\#1}%
257 \define@key{markdownRenderers}{headingFive}{%
258   \renewcommand\markdownRendererHeadingFive[1]{\#1}%
259 \define@key{markdownRenderers}{headingSix}{%
260   \renewcommand\markdownRendererHeadingSix[1]{\#1}%
261 \define@key{markdownRenderers}{horizontalRule}{%
262   \renewcommand\markdownRendererHorizontalRule{\#1}%
263 \define@key{markdownRenderers}{footnote}{%
264   \renewcommand\markdownRendererFootnote[1]{\#1}%

```

The following example  $\text{\LaTeX}$  code showcases a possible configuration of the `\markdownRendererLink` and `\markdownRendererEmphasis` markdown token renderers.

```

\markdownSetup{
  renderer = {
    link = {\#3},                      % Render links as the link title.
    emphasis = {\emph{\#1}},      % Render emphasized text via '\emph'.
  }
}

```

**2.3.2.3 Plain  $\text{\TeX}$  Markdown Token Renderer Prototypes** The  $\text{\TeX}$  interface recognizes an option with the `rendererPrototypes` key, whose value must be a list of options that map directly to the markdown token renderer prototype macros exposed by the plain  $\text{\TeX}$  interface (see Section 2.2.4).

```

265 \define@key{markdownOptions}{rendererPrototypes}{%
266   \setkeys{markdownRendererPrototypes}{#1}%
267 \define@key{markdownRendererPrototypes}{lineBreak}{%
268   \renewcommand\markdownRendererLineBreakPrototype{#1}%
269 \define@key{markdownRendererPrototypes}{ellipsis}{%
270   \renewcommand\markdownRendererEllipsisPrototype{#1}%
271 \define@key{markdownRendererPrototypes}{codeSpan}{%
272   \renewcommand\markdownRendererCodeSpanPrototype[1]{#1}%
273 \define@key{markdownRendererPrototypes}{link}{%
274   \renewcommand\markdownRendererLink[3]{#1}%
275 \define@key{markdownRendererPrototypes}{image}{%
276   \renewcommand\markdownRendererImage[3]{#1}%
277 \define@key{markdownRendererPrototypes}{ulBegin}{%
278   \renewcommand\markdownRendererUlBeginPrototype{#1}%
279 \define@key{markdownRendererPrototypes}{ulBeginTight}{%
280   \renewcommand\markdownRendererUlBeginTightPrototype{#1}%
281 \define@key{markdownRendererPrototypes}{ulItem}{%
282   \renewcommand\markdownRendererUlItemPrototype{#1}%
283 \define@key{markdownRendererPrototypes}{ulEnd}{%
284   \renewcommand\markdownRendererUlEndPrototype{#1}%
285 \define@key{markdownRendererPrototypes}{ulEndTight}{%
286   \renewcommand\markdownRendererUlEndTightPrototype{#1}%
287 \define@key{markdownRendererPrototypes}{olBegin}{%
288   \renewcommand\markdownRendererOlBeginPrototype{#1}%
289 \define@key{markdownRendererPrototypes}{olBeginTight}{%
290   \renewcommand\markdownRendererOlBeginTightPrototype{#1}%
291 \define@key{markdownRendererPrototypes}{olItem}{%
292   \renewcommand\markdownRendererOlItemPrototype{#1}%
293 \define@key{markdownRendererPrototypes}{olItemWithNumber}{%
294   \renewcommand\markdownRendererOlItemWithNumberPrototype[1]{#1}%
295 \define@key{markdownRendererPrototypes}{olEnd}{%
296   \renewcommand\markdownRendererOlEndPrototype{#1}%
297 \define@key{markdownRendererPrototypes}{olEndTight}{%
298   \renewcommand\markdownRendererOlEndTightPrototype{#1}%
299 \define@key{markdownRendererPrototypes}{dlBegin}{%
300   \renewcommand\markdownRendererDlBeginPrototype{#1}%
301 \define@key{markdownRendererPrototypes}{dlBeginTight}{%
302   \renewcommand\markdownRendererDlBeginTightPrototype{#1}%
303 \define@key{markdownRendererPrototypes}{dlItem}{%
304   \renewcommand\markdownRendererDlItemPrototype[1]{#1}%
305 \define@key{markdownRendererPrototypes}{dlEnd}{%
306   \renewcommand\markdownRendererDlEndPrototype{#1}}%

```

```

307 \define@key{markdownRendererPrototypes}{dlEndTight}{%
308   \renewcommand\markdownRendererDlEndTightPrototype[#1]{}%
309 \define@key{markdownRendererPrototypes}{emphasis}{%
310   \renewcommand\markdownRendererEmphasisPrototype[1]{#1}%
311 \define@key{markdownRendererPrototypes}{strongEmphasis}{%
312   \renewcommand\markdownRendererStrongEmphasisPrototype[1]{#1}%
313 \define@key{markdownRendererPrototypes}{blockQuoteBegin}{%
314   \renewcommand\markdownRendererBlockQuoteBeginPrototype[#1]{}%
315 \define@key{markdownRendererPrototypes}{blockQuoteEnd}{%
316   \renewcommand\markdownRendererBlockQuoteEndPrototype[#1]{}%
317 \define@key{markdownRendererPrototypes}{inputVerbatim}{%
318   \renewcommand\markdownRendererInputVerbatimPrototype[1]{#1}%
319 \define@key{markdownRendererPrototypes}{headingOne}{%
320   \renewcommand\markdownRendererHeadingOnePrototype[1]{#1}%
321 \define@key{markdownRendererPrototypes}{headingTwo}{%
322   \renewcommand\markdownRendererHeadingTwoPrototype[1]{#1}%
323 \define@key{markdownRendererPrototypes}{headingThree}{%
324   \renewcommand\markdownRendererHeadingThreePrototype[1]{#1}%
325 \define@key{markdownRendererPrototypes}{headingFour}{%
326   \renewcommand\markdownRendererHeadingFourPrototype[1]{#1}%
327 \define@key{markdownRendererPrototypes}{headingFive}{%
328   \renewcommand\markdownRendererHeadingFivePrototype[1]{#1}%
329 \define@key{markdownRendererPrototypes}{headingSix}{%
330   \renewcommand\markdownRendererHeadingSixPrototype[1]{#1}%
331 \define@key{markdownRendererPrototypes}{horizontalRule}{%
332   \renewcommand\markdownRendererHorizontalRulePrototype[#1]{}%
333 \define@key{markdownRendererPrototypes}{footnote}{%
334   \renewcommand\markdownRendererFootnotePrototype[1]{#1}}%

```

The following example  $\text{\LaTeX}$  code showcases a possible configuration of the `\markdownRendererImagePrototype` and `\markdownRendererCodeSpanPrototype` markdown token renderer prototypes.

```

\markdownSetup{
  renderers = {
    image = {\includegraphics{#2}},
    codeSpan = {\texttt{#1}},    % Render inline code via '\texttt'.
  }
}

```

## 2.4 ConTeXt Interface

The ConTeXt interface provides a start-stop macro pair for the typesetting of markdown input from within ConTeXt. The rest of the interface is inherited from the plain TeX interface (see Section 2.2).

```
335 \writestatus{loading}{ConTeXt User Module / markdown}%
336 \unprotect
```

The ConTeXt interface is implemented by the `t-markdown.tex` ConTeXt module file that can be loaded as follows:

```
\usemodule[t][markdown]
```

It is expected that the special plain TeX characters have the expected category codes, when `\input`ting the file.

#### 2.4.1 Typesetting Markdown

The interface exposes the `\startmarkdown` and `\stopmarkdown` macro pair for the typesetting of a markdown document fragment.

```
337 \let\startmarkdown\relax
338 \let\stopmarkdown\relax
```

You may prepend your own code to the `\startmarkdown` macro and redefine the `\stopmarkdown` macro to produce special effects before and after the markdown block.

Note that the `\startmarkdown` and `\stopmarkdown` macros are subject to the same limitations as the `\markdownBegin` and `\markdownEnd` macros exposed by the plain TeX interface.

The following example ConTeXt code showcases the usage of the `\startmarkdown` and `\stopmarkdown` macros:

```
\usemodule[t][markdown]
\starttext
\startmarkdown
_Hello_ **world** ...
\stopmarkdown
\stoptext
```

## 3 Technical Documentation

This part of the manual describes the implementation of the interfaces exposed by the package (see Section 2) and is aimed at the developers of the package, as well as the curious users.

### 3.1 Lua Implementation

The Lua implementation implements `writer` and `reader` objects that provide the conversion from markdown to plain TeX.

The Lunamark Lua module implements writers for the conversion to various other formats, such as DocBook, Groff, or HTML. These were stripped from the module and the remaining markdown reader and plain TeX writer were hidden behind the converter functions exposed by the Lua interface (see Section 2.1).

```
339 local upper, gsub, format, length =
340   string.upper, string.gsub, string.format, string.len
341 local concat = table.concat
342 local P, R, S, V, C, Cg, Cb, Cmt, Cc, Ct, B, Cs, any =
343   lpeg.P, lpeg.R, lpeg.S, lpeg.V, lpeg.C, lpeg.Cg, lpeg.Cb,
344   lpeg.Cmt, lpeg.Cc, lpeg.Ct, lpeg.B, lpeg.Cs, lpeg.P(1)
```

### 3.1.1 Utility Functions

This section documents the utility functions used by the Lua code. These functions are encapsulated in the `util` object. The functions were originally located in the `lunamark/util.lua` file in the Lunamark Lua module.

```
345 local util = {}
```

The `util.err` method prints an error message `msg` and exits. If `exit_code` is provided, it specifies the exit code. Otherwise, the exit code will be 1.

```
346 function util.err(msg, exit_code)
347   io.stderr:write("markdown.lua: " .. msg .. "\n")
348   os.exit(exit_code or 1)
349 end
```

The `util.cache` method computes the digest of `string` and `salt`, adds the `suffix` and looks into the directory `dir`, whether a file with such a name exists. If it does not, it gets created with `transform(string)` as its content. The filename is then returned.

```
350 function util.cache(dir, string, salt, transform, suffix)
351   local digest = md5.sumhexa(string .. (salt or ""))
352   local name = util.pathname(dir, digest .. suffix)
353   local file = io.open(name, "r")
354   if file == nil then -- If no cache entry exists, then create a new one.
355     local file = assert(io.open(name, "w"))
356     local result = string
357     if transform ~= nil then
358       result = transform(result)
359     end
360     assert(file:write(result))
361     assert(file:close())
362   end
363   return name
364 end
```

The `util.table_copy` method creates a shallow copy of a table `t` and its metatable.

```

365 function util.table_copy(t)
366   local u = { }
367   for k, v in pairs(t) do u[k] = v end
368   return setmetatable(u, getmetatable(t))
369 end

```

The `util.expand_tabs_in_line` expands tabs in string `s`. If `tabstop` is specified, it is used as the tab stop width. Otherwise, the tab stop width of 4 characters is used. The method is a copy of the tab expansion algorithm from [3, Chapter 21].

```

370 function util.expand_tabs_in_line(s, tabstop)
371   local tab = tabstop or 4
372   local corr = 0
373   return (s:gsub("()\t", function(p)
374     local sp = tab - (p - 1 + corr) % tab
375     corr = corr - 1 + sp
376     return string.rep(" ", sp)
377   end))
378 end

```

The `util.walk` method walks a rope `t`, applying a function `f` to each leaf element in order. A rope is an array whose elements may be ropes, strings, numbers, or functions. If a leaf element is a function, call it and get the return value before proceeding.

```

379 function util.walk(t, f)
380   local typ = type(t)
381   if typ == "string" then
382     f(t)
383   elseif typ == "table" then
384     local i = 1
385     local n
386     n = t[i]
387     while n do
388       util.walk(n, f)
389       i = i + 1
390       n = t[i]
391     end
392   elseif typ == "function" then
393     local ok, val = pcall(t)
394     if ok then
395       util.walk(val,f)
396     end
397   else
398     f(tostring(t))
399   end
400 end

```

The `util.flatten` method flattens an array `ary` that does not contain cycles and returns the result.

```

401 function util.flatten(ary)
402   local new = {}
403   for _,v in ipairs(ary) do
404     if type(v) == "table" then
405       for _,w in ipairs(util.flatten(v)) do
406         new[#new + 1] = w
407       end
408     else
409       new[#new + 1] = v
410     end
411   end
412   return new
413 end

```

The `util.rope_to_string` method converts a rope `rope` to a string and returns it. For the definition of a rope, see the definition of the `util.walk` method.

```

414 function util.rope_to_string(rope)
415   local buffer = {}
416   util.walk(rope, function(x) buffer[#buffer + 1] = x end)
417   return table.concat(buffer)
418 end

```

The `util.rope_last` method retrieves the last item in a rope. For the definition of a rope, see the definition of the `util.walk` method.

```

419 function util.rope_last(rope)
420   if #rope == 0 then
421     return nil
422   else
423     local l = rope[#rope]
424     if type(l) == "table" then
425       return util.rope_last(l)
426     else
427       return l
428     end
429   end
430 end

```

Given an array `ary` and a string `x`, the `util.intersperse` method returns an array `new`, such that `ary[i] == new[2*(i-1)+1]` and `new[2*i] == x` for all  $1 \leq i \leq \#ary$ .

```

431 function util.intersperse(ary, x)
432   local new = {}
433   local l = #ary
434   for i,v in ipairs(ary) do
435     local n = #new
436     new[n + 1] = v
437     if i ~= l then
438       new[n + 2] = x

```

```

439     end
440   end
441   return new
442 end

```

Given an array `ary` and a function `f`, the `util.map` method returns an array `new`, such that `new[i] == f(ary[i])` for all  $1 \leq i \leq \#ary$ .

```

443 function util.map(ary, f)
444   local new = {}
445   for i,v in ipairs(ary) do
446     new[i] = f(v)
447   end
448   return new
449 end

```

Given a table `char_escapes` mapping escapable characters to escaped strings and optionally a table `string_escapes` mapping escapable strings to escaped strings, the `util.escape` method returns an escaper function that escapes all occurrences of escapable strings and characters (in this order).

The method uses LPeg, which is faster than the Lua `string.gsub` built-in method.

```
450 function util.escape(char_escapes, string_escapes)
```

Build a string of escapable characters.

```

451   local char_escapes_list = ""
452   for i,_ in pairs(char_escapes) do
453     char_escapes_list = char_escapes_list .. i
454   end

```

Create an LPeg capture `escapable` that produces the escaped string corresponding to the matched escapable character.

```
455   local escapable = S(char_escapes_list) / char_escapes
```

If `string_escapes` is provided, turn `escapable` into the

$$\sum_{(k,v) \in \text{string\_escapes}} P(k) / v + \text{escapable}$$

capture that replaces any occurrence of the string `k` with the string `v` for each  $(k, v) \in \text{string\_escapes}$ . Note that the pattern summation is not commutative and the its operands are inspected in the summation order during the matching. As a corollary, the strings always take precedence over the characters.

```

456   if string_escapes then
457     for k,v in pairs(string_escapes) do
458       escapable = P(k) / v + escapable
459     end
460   end

```

Create an LPeg capture `escape_string` that captures anything `escapable` does and matches any other unmatched characters.

```
461 local escape_string = Cs((escapable + any)^0)
Return a function that matches the input string s against the escape_string capture.
462     return function(s)
463         return lpeg.match(escape_string, s)
464     end
465 end
```

The `util.pathname` method produces a pathname out of a directory name `dir` and a filename `file` and returns it.

```
466 function util.pathname(dir, file)
467     if #dir == 0 then
468         return file
469     else
470         return dir .. "/" .. file
471     end
472 end
```

### 3.1.2 Plain $\text{\TeX}$ Writer

This section documents the `writer` object, which implements the routines for producing the  $\text{\TeX}$  output. The object is an amalgamate of the generic,  $\text{\TeX}$ ,  $\text{\LaTeX}$  writer objects that were located in the `lunamark/writer/generic.lua`, `lunamark/writer/tex.lua`, and `lunamark/writer/latex.lua` files in the Lunamark Lua module.

Although not specified in the Lua interface (see Section 2.1), the `writer` object is exported, so that the curious user could easily tinker with the methods of the objects produced by the `writer.new` method described below. The user should be aware, however, that the implementation may change in a future revision.

```
473 M.writer = {}
```

The `writer.new` method creates and returns a new  $\text{\TeX}$  writer object associated with the Lua interface options (see Section 2.1.2) `options`. When `options` are unspecified, it is assumed that an empty table was passed to the method.

The objects produced by the `writer.new` method expose instance methods and variables of their own. As a convention, I will refer to these `<member>`s as `writer-><member>`.

```
474 function M.writer.new(options)
475     local self = {}
476     options = options or {}
```

Make the `options` table inherit from the `defaultOptions` table.

```
477     setmetatable(options, { __index = function (_, key)
478         return defaultOptions[key] end })
```

```

    Define writer->suffix as the suffix of the produced cache files.
479   self.suffix = ".tex"

    Define writer->space as the output format of a space character.
480   self.space = " "

    Define writer->plain as a function that will transform an input plain text block s
    to the output format.
481   function self.plain(s)
482     return s
483   end

    Define writer->paragraph as a function that will transform an input paragraph s
    to the output format.
484   function self.paragraph(s)
485     return s
486   end

    Define writer->pack as a function that will take the filename name of the output
    file prepared by the reader and transform it to the output format.
487   function self.pack(name)
488     return [[\"input\"] .. name .. [\"\\relax\"]]
489   end

    Define writer->interblocksep as the output format of a block element separator.
490   self.interblocksep = "\n\n"

    Define writer->containersep as the output format of a container separator.
491   self.containersep = "\n\n"

    Define writer->eof as the end of file marker in the output format.
492   self.eof = [[\"\\relax\"]]

    Define writer->linebreak as the output format of a forced line break.
493   self.linebreak = "\\\\[\\markdownRendererLineBreak \""

    Define writer->ellipsis as the output format of an ellipsis.
494   self.ellipsis = "\\\\[\\markdownRendererEllipsis{}\""

    Define writer->hrule as the output format of a horizontal rule.
495   self.hrule = "\\\\[\\markdownRendererHorizontalRule \""

    Define a table escaped containing the mapping from special plain TeX characters
    to their escaped variants.
496   local escaped = {
497     ["{"] = "\\\\",",
498     ["}"] = "\\\\",",
499     ["$"] = "\\\\",",
500     [%"] = "\\\\",",
501     [&"] = "\\\\",",
502     [_"] = "\\\\",",

```

```

503     ["#"] = "\\\#",
504     [")"] = "\\\^{}",
505     [")"] = "\\\char92{}",
506     [")"] = "\\\char126{}",
507     [")"] = "\\\char124{}", }

```

Use the `escaped` table to create an escaper function `escape`.

```
508 local escape = util.escaper(escaped)
```

Define `writer->string` as a function that will transform an input plain text span `s` to the output format. If the `hybrid` option is `true`, use an identity function. Otherwise, use the `escape` function.

```

509 if options.hybrid then
510   self.string = function(s) return s end
511 else
512   self.string = escape
513 end

```

Define `writer->code` as a function that will transform an input inlined code span `s` to the output format.

```

514 function self.code(s)
515   return {"\\markdownRendererCodeSpan{" , escape(s) , "}"}
516 end

```

Define `writer->link` as a function that will transform an input hyperlink to the output format, where `lab` corresponds to the label, `src` to URI, and `tit` to the title of the link.

```

517 function self.link(lab,src,tit)
518   return {"\\markdownRendererLink{" , lab , "}",
519           "{" , self.string(src) , "}",
520           "{" , self.string(tit) , "}"}
521 end

```

Define `writer->image` as a function that will transform an input image to the output format, where `lab` corresponds to the label, `src` to the URL, and `tit` to the title of the image.

```

522 function self.image(lab,src,tit)
523   return {"\\markdownRendererImage{" , lab , "}",
524           "{" , self.string(src) , "}",
525           "{" , self.string(tit) , "}"}
526 end

```

Define `writer->bulletlist` as a function that will transform an input bulleted list to the output format, where `items` is an array of the list items and `tight` specifies, whether the list is tight or not.

```

527 local function ulitem(s)
528   return {"\\markdownRendererUlItem " , s}
529 end

```

```

530
531     function self.bulletlist(items,tight)
532         local buffer = {}
533         for _,item in ipairs(items) do
534             buffer[#buffer + 1] = ulitem(item)
535         end
536         local contents = util.intersperse(buffer,"\n")
537         if tight and options.tightLists then
538             return {"\\markdownRendererUlBeginTight\n",contents,
539                     "\n\\markdownRendererUlEndTight "}
540         else
541             return {"\\markdownRendererUlBegin\n",contents,
542                     "\n\\markdownRendererUlEnd "}
543         end
544     end

```

Define `writer->ollist` as a function that will transform an input ordered list to the output format, where `items` is an array of the list items and `tight` specifies, whether the list is tight or not. If the optional parameter `startnum` is present, it should be used as the number of the first list item.

```

545     local function olitem(s,num)
546         if num ~= nil then
547             return {"\\markdownRendererOlItemWithNumber{"..num.."}",s}
548         else
549             return {"\\markdownRendererOlItem ",s}
550         end
551     end
552
553     function self.orderedlist(items,tight,startnum)
554         local buffer = {}
555         local num = startnum
556         for _,item in ipairs(items) do
557             buffer[#buffer + 1] = olitem(item,num)
558             if num ~= nil then
559                 num = num + 1
560             end
561         end
562         local contents = util.intersperse(buffer,"\n")
563         if tight and options.tightLists then
564             return {"\\markdownRendererOlBeginTight\n",contents,
565                     "\n\\markdownRendererOlEndTight "}
566         else
567             return {"\\markdownRendererOlBegin\n",contents,
568                     "\n\\markdownRendererOlEnd "}
569         end
570     end

```

Define `writer->definitionlist` as a function that will transform an input definition list to the output format, where `items` is an array of tables, each of the form `{ term = t, definitions = defs }`, where `t` is a term and `defs` is an array of definitions. `tight` specifies, whether the list is tight or not.

```

571   local function dlitem(term,defs)
572     return {"\\markdownRendererDlItem{",term,"}\n",defs}
573   end
574
575   function self.definitionlist(items,tight)
576     local buffer = {}
577     for _,item in ipairs(items) do
578       buffer[#buffer + 1] = dlitem(item.term,
579         util.intersperse(item.definitions, self.interblocksep))
580     end
581     local contents = util.intersperse(buffer, self.containersep)
582     if tight and options.tightLists then
583       return {"\\markdownRendererDlBeginTight\n\n", contents,
584         "\n\n\\markdownRendererDlEndTight\n"}
585     else
586       return {"\\markdownRendererDlBegin\n\n", contents,
587         "\n\n\\markdownRendererDlEnd\n"}
588     end
589   end

```

Define `writer->emphasis` as a function that will transform an emphasized span `s` of input text to the output format.

```

590   function self.emphasis(s)
591     return {"\\markdownRendererEmphasis{",s,"}"}
592   end

```

Define `writer->strong` as a function that will transform a strongly emphasized span `s` of input text to the output format.

```

593   function self.strong(s)
594     return {"\\markdownRendererStrongEmphasis{",s,"}"}
595   end

```

Define `writer->blockquote` as a function that will transform an input block quote `s` to the output format.

```

596   function self.blockquote(s)
597     return {"\\markdownRendererBlockQuoteBegin\n",s,
598         "\n\\markdownRendererBlockQuoteEnd "}
599   end

```

Define `writer->verbatim` as a function that will transform an input code block `s` to the output format.

```

600   function self.verbatim(s)
601     local name = util.cache(options.cacheDir, s, nil, nil, ".verbatim")
602     return {"\\markdownRendererInputVerbatim{",name,"}"}

```

```

603     end

Define writer->heading as a function that will transform an input heading s at
level level to the output format.

604     function self.heading(s,level)
605         local cmd
606         if level == 1 then
607             cmd = "\\\\[markdownRendererHeadingOne"
608         elseif level == 2 then
609             cmd = "\\\\[markdownRendererHeadingTwo"
610         elseif level == 3 then
611             cmd = "\\\\[markdownRendererHeadingThree"
612         elseif level == 4 then
613             cmd = "\\\\[markdownRendererHeadingFour"
614         elseif level == 5 then
615             cmd = "\\\\[markdownRendererHeadingFive"
616         elseif level == 6 then
617             cmd = "\\\\[markdownRendererHeadingSix"
618         else
619             cmd = ""
620         end
621         return {cmd,"{",s,"}"}
622     end

```

Define `writer->footnote` as a function that will transform an input footnote `s` to
the output format.

```

623     function self.note(s)
624         return {"\\\[markdownRendererFootnote{" ,s ,"}"}
625     end
626
627     return self
628 end

```

### 3.1.3 Markdown Reader

This section documents the `reader` object, which implements the routines for parsing
the markdown input. The object corresponds to the markdown reader object that was
located in the `lunamark/reader/markdown.lua` file in the Lunamark Lua module.

Although not specified in the Lua interface (see Section 2.1), the `reader` object is
exported, so that the curious user could easily tinker with the methods of the objects
produced by the `reader.new` method described below. The user should be aware,
however, that the implementation may change in a future revision.

The `reader.new` method creates and returns a new TeX reader object associated
with the Lua interface options (see Section 2.1.2) `options` and with a writer object
`writer`. When `options` are unspecified, it is assumed that an empty table was passed
to the method.

The objects produced by the `reader.new` method expose instance methods and variables of their own. As a convention, I will refer to these `<member>`s as `reader-><member>`.

```

629 M.reader = {}
630 function M.reader.new(writer, options)
631   local self = {}
632   options = options or {}
   Make the options table inherit from the defaultOptions table.
633   setmetatable(options, { __index = function (_, key)
634     return defaultOptions[key] end })

```

**3.1.3.1 Top Level Helper Functions** Define `normalize_tag` as a function that normalizes a markdown reference tag by lowercasing it, and by collapsing any adjacent whitespace characters.

```

635 local function normalize_tag(tag)
636   return unicode.utf8.lower(
637     gsub(util.rope_to_string(tag), "[ \n\r\t]+", " "))
638 end

```

Define `expandtabs` either as an identity function, when the `preserveTabs` Lua interface option is `true`, or to a function that expands tabs into spaces otherwise.

```

639 local expandtabs
640 if options.preserveTabs then
641   expandtabs = function(s) return s end
642 else
643   expandtabs = function(s)
644     if s:find("\t") then
645       return s:gsub("[^\n]*", util.expand_tabs_in_line)
646     else
647       return s
648     end
649   end
650 end

```

### 3.1.3.2 Top Level Parsing Functions

```

651 local syntax
652 local blocks
653 local inlines
654
655 local parse_blocks =
656   function(str)
657     local res = lpeg.match(blocks, str)
658     if res == nil then
659       error(format("parse_blocks failed on:\n%s", str:sub(1,20)))

```

```

660     else
661         return res
662     end
663   end
664
665   local parse_inlines =
666   function(str)
667     local res = lpeg.match(inlines, str)
668     if res == nil then
669       error(format("parse_inlines failed on:\n%s",
670           str:sub(1,20)))
671     else
672       return res
673     end
674   end
675
676   local parse_inlines_no_link =
677   function(str)
678     local res = lpeg.match(inlines_no_link, str)
679     if res == nil then
680       error(format("parse_inlines_no_link failed on:\n%s",
681           str:sub(1,20)))
682     else
683       return res
684     end
685   end

```

### 3.1.3.3 Generic PEG Patterns

686 local percent	= P("%")

1286 inlines_no_link_t.Link = fail
1287 inlines_no_link = Ct(inlines_no_link_t)

```

**3.1.3.15 Exported Conversion Function** Define `reader->convert` as a function that converts markdown string `input` into a plain TeX output and returns it. Note that the converter assumes that the input has UNIX line endings.

```

1288 function self.convert(input)
1289   references = {}

```

When determining the name of the cache file, create salt for the hashing function out of the passed options recognized by the Lua interface (see Section 2.1.2). The `cacheDir` option is disregarded.

```

1290   local opt_string = {}
1291   for k,_ in pairs(defaultOptions) do
1292     local v = options[k]
1293     if k ~= "cacheDir" then
1294       opt_string[#opt_string+1] = k .. "=" .. tostring(v)
1295     end
1296   end
1297   table.sort(opt_string)
1298   local salt = table.concat(opt_string, ",")
```

Produce the cache file, transform its filename via the `writer->pack` method, and return the result.

```

1299   local name = util.cache(options.cacheDir, input, salt, function(input)
1300     return util.rope_to_string(parse_blocks(input)) .. writer.eof
1301   end, ".md" .. writer.suffix)
1302   return writer.pack(name)
1303 end
1304 return self
1305 end
```

### 3.1.4 Conversion from Markdown to Plain TeX

The `new` method returns the `reader->convert` function of a reader object associated with the Lua interface options (see Section 2.1.2) `options` and with a writer object associated with `options`.

```

1306 function M.new(options)
1307   local writer = M.writer.new(options)
1308   local reader = M.reader.new(writer, options)
```

```

1309     return reader.convert
1310 end
1311
1312 return M

```

## 3.2 Plain TeX Implementation

The plain TeX implementation provides macros for the interfacing between TeX and Lua and for the buffering of input text. These macros are then used to implement the macros for the conversion from markdown to plain TeX exposed by the plain TeX interface (see Section 2.2).

### 3.2.1 Logging Facilities

```

1313 \def\markdownInfo#1{%
1314   \message{(.\the\inputlineno) markdown.tex info: #1.}%

### 3.2.3 Lua Snippets

The `\markdownLuaOptions` macro expands to a Lua table that contains the plain  $\text{\TeX}$  options (see Section 2.2.2) in a format recognized by Lua (see Section 2.1.2). Note that the boolean options are not sanitized and expect the plain  $\text{\TeX}$  option macros to expand to either `true` or `false`.

```

1355 \def\markdownLuaOptions{%
1356   \ifx\markdownOptionBlankBeforeBlockquote\undefined\else
1357     blankBeforeBlockquote = \markdownOptionBlankBeforeBlockquote,
1358   \fi
1359   \ifx\markdownOptionBlankBeforeHeading\undefined\else
1360     blankBeforeHeading = \markdownOptionBlankBeforeHeading,
1361   \fi
1362   \ifx\markdownOptionCacheDir\undefined\else
1363     cacheDir = "\markdownOptionCacheDir",
1364   \fi
1365   \ifx\markdownOptionDefinitionLists\undefined\else
1366     definitionLists = \markdownOptionDefinitionLists,
1367   \fi
1368   \ifx\markdownOptionHashEnumerators\undefined\else
1369     hashEnumerators = \markdownOptionHashEnumerators,
1370   \fi
1371   \ifx\markdownOptionHybrid\undefined\else
1372     hybrid = \markdownOptionHybrid,
1373   \fi
1374   \ifx\markdownOptionFootnotes\undefined\else
1375     footnotes = \markdownOptionFootnotes,
1376   \fi
1377   \ifx\markdownOptionPreserveTabs\undefined\else
1378     preserveTabs = \markdownOptionPreserveTabs,
1379   \fi

```

```

1380 \ifx\markdownOptionSmartEllipses\undefined\else
1381     smartEllipses = \markdownOptionSmartEllipses,
1382 \fi
1383 \ifx\markdownOptionStartNumber\undefined\else
1384     startNumber = \markdownOptionStartNumber,
1385 \fi
1386 \ifx\markdownOptionTightLists\undefined\else
1387     tightLists = \markdownOptionTightLists,
1388 \fi}
1389 }%

```

The `\markdownPrepare` macro contains the Lua code that is executed prior to any conversion from markdown to plain TeX. It exposes the `convert` function for the use by any further Lua code.

```
1390 \def\markdownPrepare{%
```

First, ensure that the `\markdownOptionCacheDir` directory exists.

```

1391 local lfs = require("lfs")
1392 local cacheDir = "\markdownOptionCacheDir"
1393 if lfs.isdir(cacheDir) == true then else
1394     assert(lfs.mkdir(cacheDir))
1395 end

```

Next, load the `markdown` module and create a converter function using the plain TeX options, which were serialized to a Lua table via the `\markdownLuaOptions` macro.

```

1396 local md = require("markdown")
1397 local convert = md.new(\markdownLuaOptions)
1398 }%

```

### 3.2.4 Lua \write18 Bridge

The following TeX code is intended for TeX engines that do not provide direct access to Lua, but expose the shell of the operating system through the output file stream 18 (XeTeX, pdflatex). The `\markdownLuaExecute` and `\markdownReadAndConvert` macros defined here and in Section 3.2.5 are meant to be transparent to the remaining code.

The package assumes that although the user is not using the LuaTeX engine, their TeX distribution contains it, and uses shell access to produce and execute Lua scripts using the TeXLua interpreter (see [1, Section 3.1.1]).

```
1399 \ifx\directlua\undefined
```

The macro `\markdownLuaExecuteFileStream` contains the number of the output file stream that will be used to store the helper Lua script in the file named `\markdownOptionHelperScriptFileName` during the expansion of the macro `\markdownLuaExecute`, and to store the markdown input in the file

named `\markdownOptionInputTempFileName` during the expansion of the macro `\markdownReadAndConvert`.

```
1400 \csname newwrite\endcsname\markdownLuaExecuteFileStream
```

The `\markdownLuaExecuteShellEscape` macro contains the numeric value of either the `\pdfshellescape` (Lua<sub>T</sub>E<sub>X</sub>, Pdf<sub>T</sub>E<sub>X</sub>) or the `\shellescape` (X<sub>H</sub>T<sub>E</sub>X) commands. This value indicates, whether the shell access is enabled (1), disabled (0), or restricted (2). If neither of these commands is defined, act as if the shell access were enabled.

```
1401 \csname newcount\endcsname\markdownLuaExecuteShellEscape
1402 \ifx\pdfshellescape\undefined
1403   \ifx\shellescape\undefined
1404     \markdownLuaExecuteShellEscape=1%
1405   \else
1406     \markdownLuaExecuteShellEscape=\shellescape
1407   \fi
1408 \else
1409   \markdownLuaExecuteShellEscape=\pdfshellescape
1410 \fi
```

The `\markdownLuaExecute` macro executes the Lua code it has received as its first argument. The Lua code may not directly interact with the T<sub>E</sub>X engine, but it can use the `print` function in the same manner it would use the `tex.print` method.

```
1411 \def\markdownLuaExecute#1{%
```

If the shell is accessible, create the file `\markdownOptionHelperScriptFileName` and fill it with the input Lua code prepended with kpathsea initialization, so that Lua modules from the T<sub>E</sub>X distribution are available.

```
1412 \ifnum\markdownLuaExecuteShellEscape=1%
1413   \immediate\openout\markdownLuaExecuteFileStream=%
1414     \markdownOptionHelperScriptFileName
1415   \markdownInfo{Writing a helper Lua script to the file
1416     "\markdownOptionHelperScriptFileName"}%
1417   \immediate\write\markdownLuaExecuteFileStream{%
1418     local kpse = require('kpse')
1419     kpse.set_program_name('luatex') #1}%
1420   \immediate\closeout\markdownLuaExecuteFileStream
```

Execute the generated `\markdownOptionHelperScriptFileName` Lua script using the T<sub>E</sub>XLua binary and store the output in the `\markdownOptionOutputTempFileName` file.

```
1421 \markdownInfo{Executing a helper Lua script from the file
1422   "\markdownOptionHelperScriptFileName" and storing the result in the
1423   file "\markdownOptionOutputTempFileName"}%
1424 \immediate\write18{texlua "\markdownOptionHelperScriptFileName" >
1425   "\markdownOptionOutputTempFileName"}%
```

```
\input the generated \markdownOptionOutputTempFileName file.
```

```
1426      \input\markdownOptionOutputTempFileName\relax  
1427      \else
```

If the shell is inaccessible, let the user know and suggest a remedy.

```
1428      \markdownError{I can not access the shell}{Either run the TeX  
1429          compiler with the --shell-escape or the --enable-write18 flag,  
1430          or set shell_escape=t in the texmf.cnf file}%
1431      \fi}%
```

The `\markdownReadAndConvertTab` macro contains the tab character literal.

```
1432  \begingroup
1433      \catcode`\\=12%
1434      \gdef\markdownReadAndConvertTab{\^I}%
1435  \endgroup
```

The `\markdownReadAndConvert` macro is largely a rewrite of the `\ATEX2e\filecontents` macro to plain `\TeX`.

```
1436  \begingroup
```

Make the newline and tab characters active and swap the character codes of the backslash symbol (`\`) and the pipe symbol (`|`), so that we can use the backslash as an ordinary character inside the macro definition.

```
1437  \catcode`\^M=13%
1438  \catcode`\^I=13%
1439  \catcode`|=0%
1440  \catcode`\\=12%
1441  \gdef\markdownReadAndConvert#1#2{%
1442      \begingroup%
```

Open the `\markdownOptionInputTempFileName` file for writing.

```
1443  |immediate|openout|markdownLuaExecuteFileStream%
1444      |markdownOptionInputTempFileName%
1445  |markdownInfo{Buffering markdown input into the temporary %
1446      input file "|markdownOptionInputTempFileName" and scanning %
1447      for the closing token sequence "#1"}%
```

Locally change the category of the special plain `\TeX` characters to *other* in order to prevent unwanted interpretation of the input. Change also the category of the space and tab characters, so that we can retrieve them unaltered.

```
1448  |def|do##1{|catcode`##1=12}|dospecials%
1449  |catcode`|=12%
1450  |markdownMakeOther%
```

The `\markdownReadAndConvertProcessLine` macro will process the individual lines of output. Note the use of the comments to ensure that the entire macro is at a single line and therefore no (active) newline symbols are produced.

```
1451  |def|markdownReadAndConvertProcessLine##1#1##2#1##3|relax{%
```

When the ending token sequence does not appear in the line, store the line in the `\markdownOptionInputTempFileName` file.

```
1452     |ifx|relax##3|relax%
1453         |immediate|write|markdownLuaExecuteFileStream{##1}%
1454     |else%
```

When the ending token sequence appears in the line, make the next newline character close the `\markdownOptionInputTempFileName` file, return the character categories back to the former state, convert the `\markdownOptionInputTempFileName` file from markdown to plain TeX, `\input` the result of the conversion, and expand the ending control sequence.

```
1455     |def^^M{%
1456         |markdownInfo{The ending token sequence was found}%
1457         |immediate|write|markdownLuaExecuteFileStream{ }%
1458         |immediate|closeout|markdownLuaExecuteFileStream{ }%
1459         |endgroup%
1460         |markdownInput|markdownOptionInputTempFileName{ }%
1461         #2}%
1462     |fi%
```

Repeat with the next line.

```
1463     ^^M}%
```

Make the tab character active at expansion time and make it expand to a literal tab character.

```
1464     |catcode`|^^I=13%
1465     |def^^I{|markdownReadAndConvertTab}%
```

Make the newline character active at expansion time and make it consume the rest of the line on expansion. Throw away the rest of the first line and pass the second line to the `\markdownReadAndConvertProcessLine` macro.

```
1466     |catcode`|^^M=13%
1467     |def^^M##1^^M{%
1468         |def^^M####1^^M{%
1469             |markdownReadAndConvertProcessLine####1#1#1|relax}%
1470         ^^M}%
1471     ^^M}%
```

Reset the character categories back to the former state.

```
1472     |endgroup
```

### 3.2.5 Direct Lua Access

The following TeX code is intended for TeX engines that provide direct access to Lua (LuaTeX). The `\markdownLuaExecute` and `\markdownReadAndConvert` defined here and in Section 3.2.4 are meant to be transparent to the remaining code.

```
1473 \else
```

The direct Lua access version of the `\markdownLuaExecute` macro is defined in terms of the `\directlua` primitive. The `print` function is set as an alias to the `\tex.print` method in order to mimic the behaviour of the `\markdownLuaExecute` definition from Section 3.2.4,

```
1474 \def\markdownLuaExecute#1{\directlua{local print = tex.print #1}}%
```

In the definition of the direct Lua access version of the `\markdownReadAndConvert` macro, we will be using the hash symbol (#), the underscore symbol (\_), the caret symbol (^), the dollar sign (\$), the backslash symbol (\), the percent sign (%), and the braces ({})) as a part of the Lua syntax.

```
1475 \begingroup
```

To this end, we will make the underscore symbol, the dollar sign, and caret symbols ordinary characters,

```
1476 \catcode`\_=12%
1477 \catcode`\$=12%
1478 \catcode`\^=12%
```

swap the category code of the hash symbol with the slash symbol (/).

```
1479 \catcode`\/=6%
1480 \catcode`\#=12%
```

swap the category code of the percent sign with the at symbol (@).

```
1481 \catcode`\@=14%
1482 \catcode`\%=12%
```

swap the category code of the backslash symbol with the pipe symbol (|),

```
1483 \catcode`|=0@
1484 \catcode`\|=12@
```

Braces are a part of the plain TeX syntax, but they are not removed during expansion, so we do not need to bother with changing their category codes.

```
1485 |gdef|\markdownReadAndConvert/1/2{@
```

Make the `\markdownReadAndConvertAfter` macro store the token sequence that will be inserted into the document after the ending token sequence has been found.

```
1486 |def|\markdownReadAndConvertAfter{/2}@
1487 |markdownInfo{Buffering markdown input and scanning for the
1488 closing token sequence "/1"}@
1489 |directlua{@
```

Set up an empty Lua table that will serve as our buffer.

```
1490 |markdownPrepare
1491 local buffer = {}
```

Create a regex that will match the ending input sequence. Escape any special regex characters (like a star inside `\end{markdown*}`) inside the input.

```
1492 local ending_sequence = ".-([[[/]]):gsub(
1493 "([%(%).%/%/+%-%*%?%[%]%^%$])", "%/%1")
```

Register a callback that will notify you about new lines of input.

1494 | markdownLuaRegisterIBCallback{function(line)

When the ending token sequence appears on a line, unregister the callback, convert the contents of our buffer from markdown to plain TeX, and insert the result into the input line buffer of TeX.

```
1495     if line:match(ending_sequence) then
1496         |markdownLuaUnregisterIBCallback
1497         local input = table.concat(buffer, "\n") .. "\n\n"
1498         local output = convert(input)
1499         return [[\markdownInfo{The ending token sequence was found}]] ..
1500             output .. [[\markdownReadAndConvertAfter]]
```

When the ending token sequence does not appear on a line, store the line in our buffer, and insert either `\fi`, if this is the first line of input, or an empty token list to the input line buffer of TeX.

```
1501     else
1502         buffer[#buffer+1] = line
1503         return [[\]] .. (#buffer == 1 and "fi" or "relax")
1504     end
1505     endl} }@
```

Insert `\iffalse` after the `\markdownReadAndConvert` macro in order to consume the rest of the first line of input.

1506 |iffalse}@

Reset the character categories back to the former state.

```
1507    \endgroup  
1508 \fi
```

### 3.2.6 Typesetting Markdown

The `\markdownInput` macro uses an implementation of the `\markdownLuaExecute` macro to convert the contents of the file whose filename it has received as its single argument from markdown to plain TeX.

1509 \begingroup

Swap the category code of the backslash symbol and the pipe symbol, so that we may use the backslash symbol freely inside the Lua code.

```
1510 \catcode`|=0%
1511 \catcode`\|=12%
1512 \gdef\markdownInput#1{%
1513     \markdownInfo{Including markdown document "#1"}%
1514     \markdownLuaExecute{%
1515         \markdownPrepare
1516         local input = assert(io.open("#1","r")):read("*a")
```

Since the Lua converter expects UNIX line endings, normalize the input.

```
1517     print(convert(input:gsub("\r\n?", "\n")))}%  
1518 |endgroup
```

### 3.3 L<sup>A</sup>T<sub>E</sub>X Implementation

The L<sup>A</sup>T<sub>E</sub>X implementation makes use of the fact that, apart from some subtle differences, L<sup>A</sup>T<sub>E</sub>X implements the majority of the plain T<sub>E</sub>X format (see [4, Section 9]). As a consequence, we can directly reuse the existing plain T<sub>E</sub>X implementation.

```
1519 \input markdown  
1520 \ProvidesPackage{markdown}[\markdownVersion]%
```

#### 3.3.1 Logging Facilities

The L<sup>A</sup>T<sub>E</sub>X implementation redefines the plain T<sub>E</sub>X logging macros (see Section 3.2.1) to use the L<sup>A</sup>T<sub>E</sub>X \PackageInfo, \PackageWarning, and \PackageError macros.

```
1521 \renewcommand\markdownInfo[1]{\PackageInfo{markdown}{#1}}%  
1522 \renewcommand\markdownWarning[1]{\PackageWarning{markdown}{#1}}%  
1523 \renewcommand\markdownError[2]{\PackageError{markdown}{#1}{#2 .}}%
```

#### 3.3.2 Typesetting Markdown

The \markdownInputPlainTeX macro is used to store the original plain T<sub>E</sub>X implementation of the \markdownInput macro. The \markdownInput is then redefined to accept an optional argument with options recognized by the L<sup>A</sup>T<sub>E</sub>X interface (see Section 2.3.2).

```
1524 \let\markdownInputPlainTeX\markdownInput  
1525 \renewcommand\markdownInput[2][]{%  
1526   \begingroup  
1527     \markdownSetup{#1}%  
1528     \markdownInputPlainTeX{#2}%  
1529   \endgroup}%
```

The `markdown`, and `markdown*` L<sup>A</sup>T<sub>E</sub>X environments are implemented using the \markdownReadAndConvert macro.

```
1530 \renewenvironment{markdown}{%  
1531   \markdownReadAndConvert@markdown{} \relax  
1532 \renewenvironment{markdown*}[1]{%  
1533   \markdownSetup{#1}%  
1534   \markdownReadAndConvert@markdown*} \relax  
1535 \begingroup
```

Locally swap the category code of the backslash symbol with the pipe symbol, and of the left (`\{`) and right brace (`\}`) with the less-than (`<`) and greater-than (`>`) signs. This

is required in order that all the special symbols that appear in the first argument of the `markdownReadAndConvert` macro have the category code *other*.

```

1536 \catcode`|=0\catcode`\<=1\catcode`\>=2%
1537 \catcode`\\=12\catcode`{|=12\catcode`|}=12%
1538 |gdef|markdownReadAndConvert@markdown#1<%
1539     |markdownReadAndConvert<\end{markdown#1}>%
1540                     <\end<markdown#1>>>%
1541 |endgroup

```

### 3.3.3 Options

The supplied package options are processed using the `\markdownSetup` macro.

```

1542 \DeclareOption*{%
1543     \expandafter\markdownSetup\expandafter{\CurrentOption}}%
1544 \ProcessOptions\relax

```

The following configuration should be considered placeholder.

```

1545 \RequirePackage{url}
1546 \RequirePackage{graphicx}

```

If the `\markdownOptionTightLists` macro expands to `false`, do not load the `paralist` package.

```

1547 \RequirePackage{ifthen}
1548 \ifx\markdownOptionTightLists\undefined
1549     \RequirePackage{paralist}
1550 \else
1551     \ifthenelse{\equal{\markdownOptionTightLists}{false}}{}{
1552         \RequirePackage{paralist}}
1553 \fi
1554 \RequirePackage{fancyvrb}
1555 \markdownSetup{rendererPrototypes={
1556     lineBreak = {\\},
1557     codeSpan = {\texttt{#1}},
1558     link = {\#1\footnote{\ifx\empty\empty\empty\else#3\empty\empty\fi\texttt{<\url{#2}\texttt{>}}},
1559     \fi\texttt{<\url{#2}\texttt{>}}},
1560     image = {\begin{figure}
1561         \begin{center}%
1562             \includegraphics{#2}%
1563         \end{center}%
1564         \ifx\empty\empty\empty\else
1565             \caption{#3}%
1566         \fi
1567         \label{fig:#1}%
1568     \end{figure}},
1569     ulBegin = {\begin{itemize}},
1570     ulBeginTight = {\begin{compactitem}},
1571     ulItem = {\item},

```

```

1572 ulEnd = {\end{itemize}},
1573 ulEndTight = {\end{compactitem}},
1574 olBegin = {\begin{enumerate}},
1575 olBeginTight = {\begin{compactenum}},
1576 olItem = {item},
1577 olItemWithNumber = {\item[#1]},
1578 olEnd = {\end{enumerate}},
1579 olEndTight = {\end{compactenum}},
1580 dlBegin = {\begin{description}},
1581 dlBeginTight = {\begin{compactdesc}},
1582 dlItem = {\item[#1]},
1583 dlEnd = {\end{description}},
1584 dlEndTight = {\end{compactdesc}},
1585 emphasis = {\emph{#1}},
1586 strongEmphasis = {%
1587   \ifx\alert\undefined
1588     \textbf{\emph{#1}}%
1589   \else % Beamer support
1590     \alert{\emph{#1}}
1591   \fi,
1592   blockQuoteBegin = {\begin{quotation}},
1593   blockQuoteEnd = {\end{quotation}},
1594   inputVerbatim = {\VerbatimInput{#1}},
1595   horizontalRule = {\noindent\rule[0.5ex]{\linewidth}{1pt}},
1596   footnote = {\footnote{#1}}%
1597 }
1598 \ifx\chapter\undefined
1599   \markdownSetup{rendererPrototypes={
1600     headingOne = {\section{#1}},
1601     headingTwo = {\subsection{#1}},
1602     headingThree = {\subsubsection{#1}},
1603     headingFour = {\paragraph{#1}},
1604     headingFive = {\ subparagraph{#1}}}}%
1605 \else
1606   \markdownSetup{rendererPrototypes={
1607     headingOne = {\chapter{#1}},
1608     headingTwo = {\section{#1}},
1609     headingThree = {\subsection{#1}},
1610     headingFour = {\subsubsection{#1}},
1611     headingFive = {\paragraph{#1}},
1612     headingSix = {\ subparagraph{#1}}}}%
1613 \fi

```

### 3.3.4 Miscellanea

Unlike base  $\text{\LaTeX}$ , which only allows for a single registered function per a callback (see [1, Section 8.1]), the  $\text{\TeX}2\varepsilon$  format disables the

`callback.register` method and exposes the `luatexbase.add_to_callback` and `luatexbase.remove_from_callback` methods that enable the user code to hook several functions on a single callback (see [4, Section 73.4]).

To make our code function with the  $\text{\LaTeX}2\epsilon$  format, we need to redefine the `\markdownLuaRegisterIBCallback` and `\markdownLuaUnregisterIBCallback` macros accordingly.

```
1614 \renewcommand\markdownLuaRegisterIBCallback[1]{%
1615   luatexbase.add_to_callback("process_input_buffer", #1, %
1616   "The markdown input processor")}
1617 \renewcommand\markdownLuaUnregisterIBCallback{%
1618   luatexbase.remove_from_callback("process_input_buffer", %
1619   "The markdown input processor")}
```

When buffering user input, we should disable the bytes with the high bit set, since these are made active by the `inputenc` package. We will do this by redefining the `\markdownMakeOther` macro accordingly. The code is courtesy of Scott Pakin, the creator of the `filecontents` package.

```
1620 \newcommand\markdownMakeOther{%
1621   \count0=128\relax
1622   \loop
1623     \catcode\count0=11\relax
1624     \advance\count0 by 1\relax
1625   \ifnum\count0<256\repeat}%
```

### 3.4 ConTeXt Implementation

The ConTeXt implementation makes use of the fact that, apart from some subtle differences, the Mark II and Mark IV ConTeXt formats *seem* to implement (the documentation is scarce) the majority of the plain TeX format required by the plain TeX implementation. As a consequence, we can directly reuse the existing plain TeX implementation after supplying the missing plain TeX macros.

```
1626 \def\dospecials{\do\ \do\\\do{\{}{\do\}\do\$\\do\&%
1627   \do\#\do\^{\do\_\do\%\do\~}}%
```

When there is no Lua support, then just load the plain TeX implementation.

```
1628 \ifx\directlua\undefined
1629   \input markdown
1630 \else
```

When there is Lua support, check if we can set the `process_input_buffer` LuaTeX callback.

```
1631 \directlua{%
1632   local function unescape(str)
1633     return (str:gsub("|", string.char(92))) end
1634   local old_callback = callback.find("process_input_buffer")
1635   callback.register("process_input_buffer", function() end)
```

```
1636     local new_callback = callback.find("process_input_buffer")
```

If we can not, we are probably using ConTeXt Mark IV. In ConTeXt Mark IV, the `process_input_buffer` callback is currently frozen (inaccessible from the user code) and, due to the lack of available documentation, it is unclear to me how to emulate it. Therefore, we will just force the plain TeX implementation to use the `\write18` bridge (see Section 3.2.4) by locally undefining the `\directlua` primitive.

```
1637     if new_callback == false then
1638         tex.print(unescape([[|let|markdownDirectLua|directlua
1639                         |let|directlua|undefined
1640                         |input markdown
1641                         |let|directlua|markdownDirectLua
1642                         |let|markdownDirectLua|undefined]]))
```

If we can, then just load the plain TeX implementation.

```
1643     else
1644         callback.register("process_input_buffer", old_callback)
1645         tex.print(unescape("|\input markdown"))
1646     end}%
1647 \fi
```

### 3.4.1 Logging Facilities

The ConTeXt implementation redefines the plain TeX logging macros (see Section 3.2.1) to use the ConTeXt `\writestatus` macro.

```
1648 \def\markdownInfo#1{\writestatus{markdown}{#1.}}%
1649 \def\markdownWarning#1{\writestatus{markdown\space warn}{#1.}}%
```

### 3.4.2 Typesetting Markdown

The `\startmarkdown` and `\stopmarkdown` macros are implemented using the `\markdownReadAndConvert` macro.

```
1650 \begingroup
```

Locally swap the category code of the backslash symbol with the pipe symbol. This is required in order that all the special symbols that appear in the first argument of the `\markdownReadAndConvert` macro have the category code *other*.

```
1651 \catcode`\|=0%
1652 \catcode`\\=12%
1653 \gdef\startmarkdown{%
1654   \markdownReadAndConvert{\stopmarkdown}%
1655   {\stopmarkdown}%
1656 } \endgroup
```

### 3.4.3 Options

The following configuration should be considered placeholder.

```
1657 \def\markdownRendererLineBreakPrototype{\blank}%
