3.5 JK Flip Flop	45
3.6 Other Options	46
3.7 The Node Names	46
3.8 Examples	47
4 Adding new components	48
5 List of all optional arguments for <code>pst-circ</code>	51
References	53

The package `pst-circ` is a collection of graphical elements based on PStricks that can be used to facilitate display of electronic circuit elements. For example, an equivalent circuit of a voltage source, its source impedance, and a connected load can easily be constructed along with arrows indicating current flow and potential differences. The emphasis is upon the circuit elements and the details of the exact placement are hidden as much as possible so the author can focus on the circuitry without the distraction of sorting out the underlying vector graphics.

`pst-circ` loads by default the following packages: `pst-node`, `multido`, `pst-xkey`, and, of course `pstricks`. All should be already part of your local T_EX installation. If not, or in case of having older versions, go to <http://www.CTAN.org/> and load the newest version.

1 The basic system

1.1 Parameters

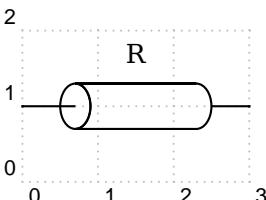

There are specific parameters defined to change easily the behaviour of the `pst-circ` objects you are drawing. You'll find a list in Section 5 on p. 51.

1.2 Macros

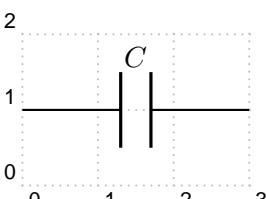

Dipole macros

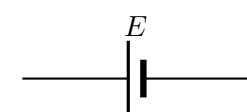

```
\begin{pspicture}[showgrid=true](3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\resistor(A)(B}{$R$}
\end{pspicture}
```

```
\begin{pspicture}[showgrid=true](3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\RFLline(A)(B){R}
\end{pspicture}
```

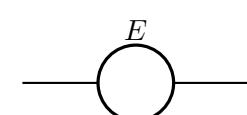

```
\begin{pspicture}[showgrid=true](3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\capacitor(A)(B}{$C$}
\end{pspicture}
```

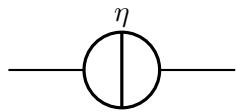

```
\begin{pspicture}(3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\battery(A)(B}{$E$}
\end{pspicture}
```

```
\begin{pspicture}(3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\coil(A)(B}{$L$}
\end{pspicture}
```

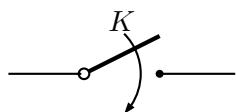

```
\begin{pspicture}(3,2)
1 \pnode(0,1){A}
3 \pnode(3,1){B}
\Ucc(A)(B}{$E$}
\end{pspicture}
```

```

3 \pnode(3,1){B}
4 \SQUID(A)(B){$S$}
5 \end{pspicture}

```

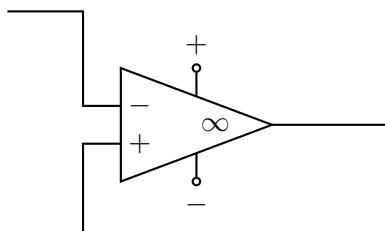

Tripole macros

Obviously, tripoles are not node connections. So `pst-circ` tries its best to adjust the position of the tripoles regarding the three nodes. Internally, the connections are done by the `\ncangle` `pst-node` macro. However, the auto-positionning and the auto-connections are not always well chosen, so don't try to use tripoles macros in strange situations!

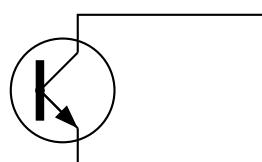

```

1 \begin{pspicture}(5,3)
2 \pnode(0,0){A}
3 \pnode(0,3){B}
4 \pnode(5,1.5){C}
5 \O A(B)(A)(C)
6 \end{pspicture}
```

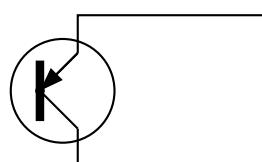

```

\potentiometer[labeloffset=0pt](A)(B)(C){$P$}
\end{pspicture}
```

Quadrupole macros

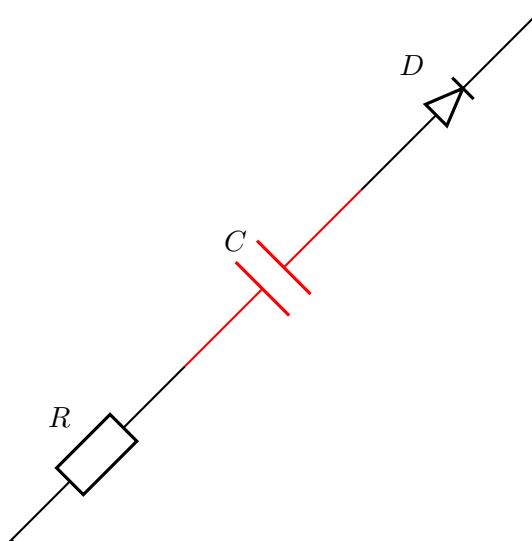

```
\begin{pspicture}(5,5)
1 \pnode(0,5){A}
2 \pnode(0,0){B}
3 \pnode(5,5){C}
4 \pnode(5,0){D}
5 \transformer(A)(B)(C)(D){$\mathcal{T}$}
\end{pspicture}
```

```
\begin{pspicture}(5,3)
1 \pnode(0,2.5){A}
2 \pnode(0,0.5){B}
3 \pnode(4,2.5){C}
4 \pnode(4,0.5){D}
5 \optoCoupler(A)(B)(C)(D){$OC\$}
\end{pspicture}
```

Multidipole

`\multidipole` is a macro that allows multiple dipoles to be drawn between two specified nodes. `\multidipole` takes as many arguments as you want. Note the dot that is after the last dipole.

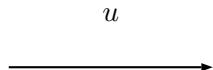

```
\begin{pspicture}(7,7)
1 \pnode(0,0){A}
2 \pnode(7,7){B}
3 \multidipole(A)(B)\resistor{$R$}%
4 \capacitor[linecolor=red]{$C$}%
5 \diode{$D$}{}
\end{pspicture}
```

Important: for the time being, `\multidipole` takes optional arguments but does not restore original values. We recommend not using it.

Wire

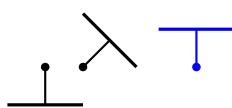

```

1 \begin{pspicture}(3,2)
2   \pnode(0,1){A}
3   \pnode(3,1){B}
4   \wire(A)(B)
5 \end{pspicture}
```

Potential

```

1 \begin{pspicture}(3,2)
2   \pnode(0,1){A}
3   \pnode(3,1){B}
4   \tension(A)(B){$u$}
5 \end{pspicture}
```

ground

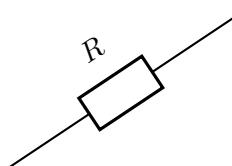

```

1 \begin{pspicture}(3,2)
2   \pnode(0.5,1){A}
3   \pnode(1,1){B}
4   \pnode(2.5,1){C}
5   \ground(A)
6   \ground[135](B)
7   \ground[linecolor=blue]{180}(C)
8 \end{pspicture}
```

1.3 Parameters**Label parameters**

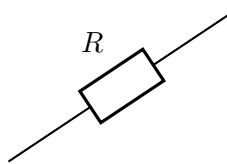

```

1 \begin{pspicture}(3,1)
2   \pnode(0,.5){A}
3   \pnode(3,.5){B}
4   \resistor[labeloffset=0](A)(B}{$R$}
5 \end{pspicture}
```

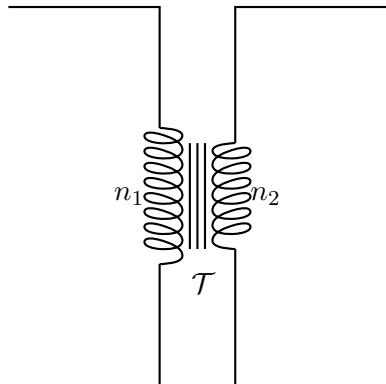

```

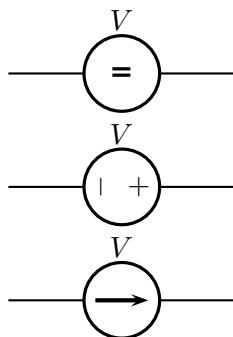

1 \begin{pspicture}(3,2)
2   \pnode(0,0){A}
3   \pnode(3,2){B}
4   \resistor[labelangle=:U](A)(B}{$R$}
5 \end{pspicture}
```

```
\begin{pspicture}(3,2)
1 \pnode(0,0){A}
2 \pnode(3,2){B}
3 \resistor[labelangle=0](A)(B){$R$}
4 \end{pspicture}
```

```
\begin{pspicture}(5,5)
1 \pnode(0,5){A}
2 \pnode(0,0){B}
3 \pnode(5,5){C}
4 \pnode(5,0){D}
5 \transformer[primarylabel=$n_1$,
secondarylabel=$n_2$](A)(B)(C)(D){$\mathcal{T}$}
6 \end{pspicture}
```

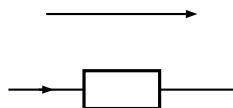

```
\begin{pspicture}(3,4.5)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \Ucc[labelInside=1](A)(B){$V$}
4 \pnode(0,2){A}
5 \pnode(3,2){B}
6 \Ucc[labelInside=2](A)(B){$V$}
7 \pnode(0,3.5){A}
8 \pnode(3,3.5){B}
9 \Ucc[labelInside=3](A)(B){$V$}
10 \end{pspicture}
```

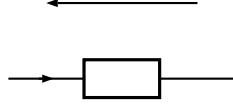

Current intensity and electrical potential parameters

If the intensity parameter is set to true, an arrow is drawn on the wire connecting one of the nodes to the dipole. If the tension parameter is set to true, an arrow is drawn parallel to the dipole.

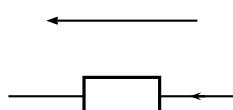

The way those arrows are drawn is set by `dipoleconvention` and `directconvention` parameters. `dipoleconvention` can take two values : generator or receptor. `directconvention` is a boolean.

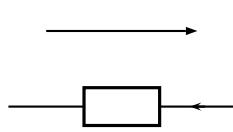

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensity,tension](A)(B){}
4 \end{pspicture}
```

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensity,tension,
dipoleconvention=generator](A)(B){}
4 \end{pspicture}
```

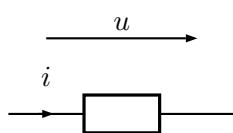

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensity,tension,
4   directconvention=false](A)(B){}
5 \end{pspicture}
```

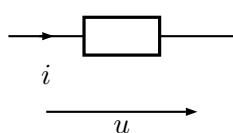

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensity,tension,
4   dipoleconvention=generator,directconvention=false](A)(B){}
5 \end{pspicture}
```

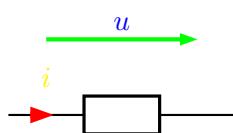

If `intensitylabel` is set to an non empty argument, then `intensity` is automatically set to true. If `tensionlabel` is set to an non empty argument, then `tension` is automatically set to true.

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensitylabel=$i$,tensionlabel=$u$](A)(B){}
4 \end{pspicture}
```

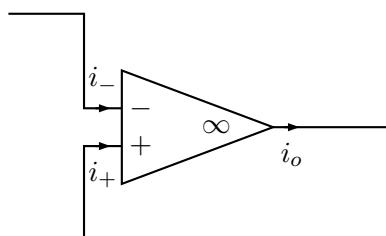

```
\begin{pspicture}(3,2)
1 \pnode(0,1.5){A}
2 \pnode(3,1.5){B}
3 \resistor[intensitylabel=$i$,
4   intensitylabeloffset=-0.5,
5   tensionlabel=$u$,
6   tensionlabeloffset=-1.2,
7   tensionoffset=-1](A)(B){}
8 \end{pspicture}
```

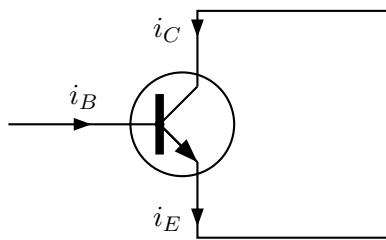

```
\begin{pspicture}(3,2)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor[intensitylabel=$i$,
4   intensitywidth=3\pslinewidth,
5   intensitycolor=red,intensitylabelcolor=yellow,
6   tensionlabel=$u$,
7   tensionwidth=2\pslinewidth,
8   tensioncolor=green,tensionlabelcolor=blue](A)(B){}
9 \end{pspicture}
```

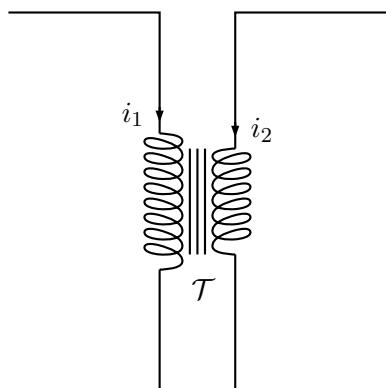

Some specific intensity parameters are available for tripoles and quadrupoles.

```
\begin{pspicture}(5,3)
1 \pnode(0,0){A}
2 \pnode(0,3){B}
3 \pnode(5,1.5){C}
4 \OA[0Aipluslabel=$i_+$,
5   OAiminuslabel=$i_-$,
6   OAioutlabel=$i_o$](B)(A)(C)
7 \end{pspicture}
```

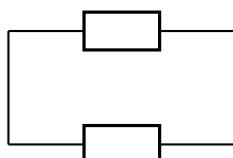

```
\begin{pspicture}(5,3)
1 \pnode(0,1.5){A}
2 \pnode(5,0){B}
3 \pnode(5,3){C}
4 \transistor[basesep=2cm,transistorbaselabel=$i_B$,
5   transistorcollectorlabel=$i_C$,
6   transistoriemitterlabel=$i_E$](A)(B)(C)
7 \end{pspicture}
```

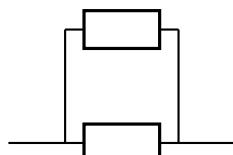

```
\begin{pspicture}(5,5)
1 \pnode(0,5){A}
2 \pnode(0,0){B}
3 \pnode(5,5){C}
4 \pnode(5,0){D}
5 \transformer[transformeriprimarylabel=$i_1$,
6   transformerisecondarylabel=$i_2$](A)(B)(C)(D){$\mathcal{T}$}
7 \end{pspicture}
```

Parallel parameters

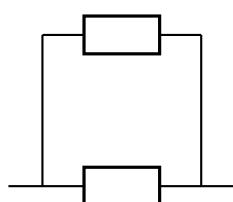

If the `parallel` parameter is set to `true`, the dipole is drawn parallel to the line connecting the nodes.

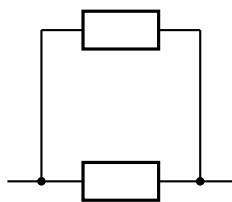

```
\begin{pspicture}(3,3)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor(A)(B){}
4 \resistor[parallel](A)(B){}
5 \end{pspicture}
```

```
\begin{pspicture}(3,3)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor(A)(B){}
4 \resistor[parallel,parallelsep=.5](A)(B){}
5 \end{pspicture}
```

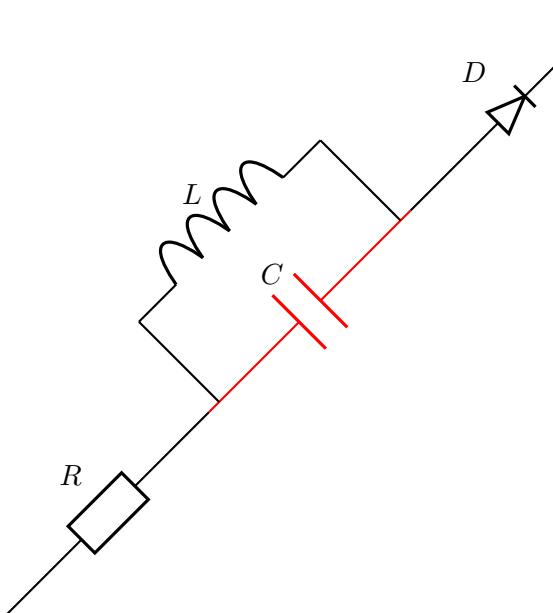

```
\begin{pspicture}(3,3)
1 \pnode(0,.5){A}
2 \pnode(3,.5){B}
3 \resistor(A)(B){}
4 \resistor[parallel,parallelsep=.3,
5   parallelarm=2](A)(B){}
6 \end{pspicture}
```

```

1 \begin{pspicture}(3,3)
2 \pnode(0,.5){A}
3 \pnode(3,.5){B}
4 \resistor(A)(B){}
5 \resistor[parallel,parallelsep=.3,
6   parallelarm=2,parallelnode](A)(B){}
7 \end{pspicture}

```

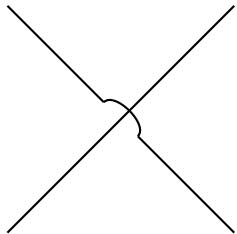

```

1 \begin{pspicture}(8,8)
2 \pnode(0,0){A}
3 \pnode(8,8){B}
4 \multidipole(A)(B)\resistor{$R$}%
5 \capacitor[linecolor=red]{$C$}%
6 \coil[parallel,parallelsep=.1]{$L$}%
7 \diode{$D$}.
8 \end{pspicture}

```

Note: When used with `\multidipole`, the `parallel` parameter must not be set for the first dipole.

Wire intersections

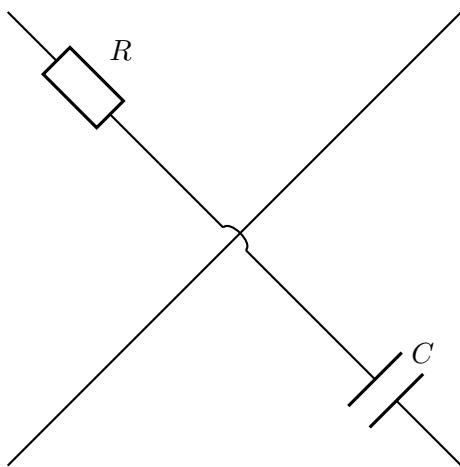

```

1 \begin{pspicture}(3,3)
2 \pnode(0,0){A}
3 \pnode(3,3){B}
4 \pnode(0,3){C}
5 \pnode(3,0){D}
6 \wire(A)(B)
7 \wire[intersect,intersectA=A,intersectB=B](C)(D)
8 \end{pspicture}

```

Wire intersect parameters work also with `\multidipole`.

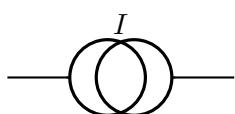

```

1 \begin{pspicture}(7,7)
2   \pnode(0,0){A}
3   \pnode(6,6){B}
4   \pnode(0,6){C}
5   \pnode(6,0){D}
6   \wire(A)(B)
7   \multidipole(C)(D)\resistor{$R$}%
8     \wire[intersect,intersectA=A,intersectB=B]%
9       \capacitor{$C$}.
10 \end{pspicture}

```

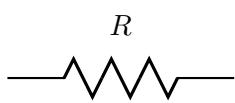

Dipole style parameters

```

1 \begin{pspicture}(3,2)
2   \pnode(0,1){A}
3   \pnode(3,1){B}
4   \Icc[dipolestyle=twoCircles](A)(B){$I$}
5 \end{pspicture}

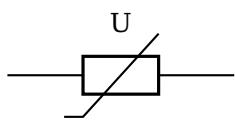

```

```

1 \begin{pspicture}(3,2)
2   \pnode(0,1){A}
3   \pnode(3,1){B}

4 \coil[dipolestyle=elektor](A)(B){$L$}
5 \end{pspicture}

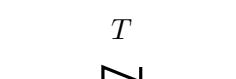

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \coil[dipolestyle=elektorcurved](A)(B){$L$}
5 \end{pspicture}

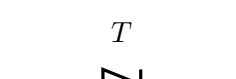

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \diode[dipolestyle=thyristor](A)(B){$T$}
5 \end{pspicture}

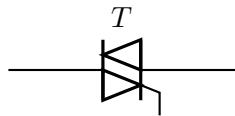

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \diode[dipolestyle=GTO](A)(B){$T$}
5 \end{pspicture}

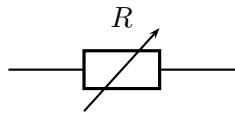

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \diode[dipolestyle=triac](A)(B){$T$}
5 \end{pspicture}

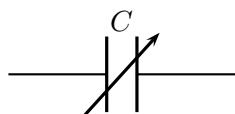

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \resistor[variable](A)(B){$R$}
5 \end{pspicture}

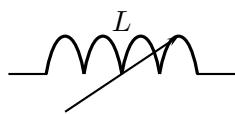

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \capacitor[variable](A)(B){$C$}
5 \end{pspicture}

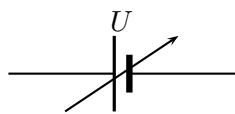

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \coil[variable](A)(B){$L$}
5 \end{pspicture}

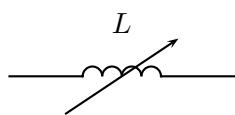

```

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \battery[variable](A)(B){$U$}
5 \end{pspicture}

```

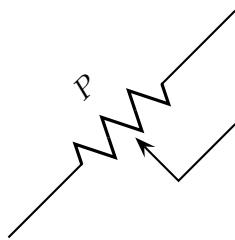

```

1 \begin{pspicture}(3,2)
2 \pnode(0,1){A}
3 \pnode(3,1){B}
4 \coil[dipolestyle=elektor,variable](A)(B){$L$}
5 \end{pspicture}

```

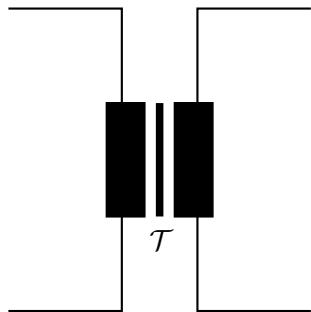

In the following example the parameter `dipolestyle` is used for a tripole and quadrupole, because the coils are drawn as rectangles and the resistor as a zigzag.

```

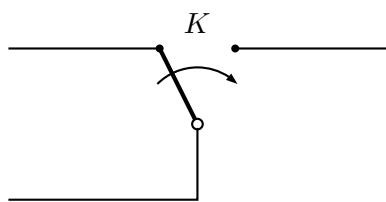

1 \begin{pspicture}(3,3)
2 \pnode(0,0){A}
3 \pnode(3,3){B}
4 \pnode(3,1.5){C}
5 \potentiometer[dipolestyle=zigzag,%
6   labelangle=:U](A)(B)(C){$P$}
7 \end{pspicture}

```

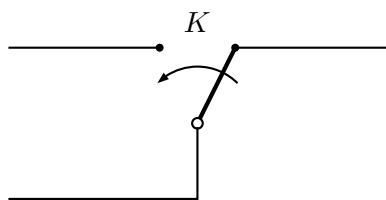

```

9 \resistor[labeloffset=.8](basis|plus)(basis){$R_1$}
10 \transistor[basesep=2cm](basis){emitter}{kollektor}
11 \wire[arrows=-*](schalter)(basis)
12 % \wire(basis)([nodesep=2] basis)
13 \wire(TBaseNode)(basis)
14 \switch(schalter|masse){schalter}{S}
15 \lamp(kollektor|plus){kollektor}{L}
16 \resistor(kollektor|plus)(basis|plus){$R_2$}
17 \wire(emitter)(emitter|masse)
18 \wire(emitter|masse)(basis|masse)
19 \capacitor(basis)(basis|masse){$C_1$}
20 \wire[arrows=**-](basis|masse)(schalter|masse)
21 \wire[arrows=**-o](schalter|masse)(masse)
22 \end{pspicture}

```

2 Microwave symbols

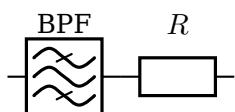

Since for microwave signal, the direction in which the signal spreads is very important. There are dipoleinput or tripoleinput or quadripoleinput and arrowinput parameters. The value of these parameters are left or right for the first one and true or false for second one.

```

1 \ifPst@inputarrow
2   \ifx\psk@Dinput\pst@Dinput@right
3     \pcline[arrows=-C](#2)(dipole@1)
4     \pcline[arrows=->,arrowinset=0](#3)(dipole@2)
5   \else
6     \pcline[arrows=->,arrowinset=0](#2)(dipole@1)
7     \pcline[arrows=C-](dipole@2)(#3)
8   \fi
9 \else
10  \pcline[arrows=-C](#2)(dipole@1)
11  \pcline[arrows=C-](dipole@2)(#3)
12 \fi
13 \pcline[fillstyle=none,linestyle=none](#2)(#3)

```

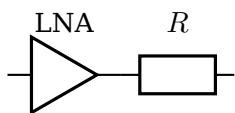

The last line is to correct some problems when I use colors (see example2) To add color in components (Monopole, tripole and Quadripole), there is a new argument. \multidipole also works:

```

\begin{pspicture}(4,2)
\pnode(0.5,1){A}
\pnode(3.5,1){B}
\multidipole(A)(B)\filter{BPF}%
\resistor{$R$}.
\end{pspicture}

```

```

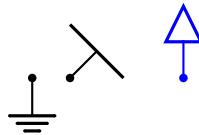

\begin{pspicture}(4,2)
\pnode(0.5,1){A}
\pnode(3.5,1){B}
\multidipole(A)(B)\amplifier{LNA}%
\resistor{$R$}.
\end{pspicture}

```

2.1 New monopole components

New ground

groundstyle: ads | old | triangle

```

\begin{pspicture}(3,2)
\pnode(0.5,1){A}
\pnode(1,1){B}
\pnode(2.5,1){C}
\newground(A)
\newground[groundstyle=old]{135}(B)
\newground[linetcolor=blue,groundstyle=triangle]{180}(C)
\end{pspicture}

```

Antenna

antennastyle: two | three | triangle

```

1 \begin{pspicture}(3,2)
2 \pnode(1,0.5){A}
3 \antenna[antennastyle=three](A)
4 \end{pspicture}
```

```

1 \begin{pspicture}(3,2)
2 \pnode(1,0.5){A}
3 \antenna(A)
4 \end{pspicture}
```

```

1 \begin{pspicture}(3,2)
2 \pnode(1,0.5){A}
3 \antenna[antennastyle=triangle](A)
4 \end{pspicture}
```

2.2 New monopole macro-components

Oscillator

output: top | right | bottom | left

inputarrow: false| true

L0style: - | crystal

f_{LO}

```

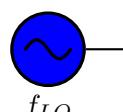

1 \begin{pspicture}(3,2)
2 \pnode(1,1){A}

Ku-band Transceiver

3 Flip Flops – logical elements

The syntax for all logical base circuits is

```
\logic [Options] (x0, y0) {label}
```

where the options and the origin are optional. If they are missing, then the default options, described in the next section and the default origin (0,0) is used. The origin specifies the lower left corner of the logical circuit.

xLkeywordlogicType

```
1 \logic{Demo}
2 \logic[logicType=and]{Demo}
3 \logic(0,0){Demo}
4 \logic[logicType=and](0,0){Demo}
```

The above four „different“ calls of the \logic macro give the same output, because they are equivalent.

3.1 The Options

<i>name</i>	<i>type</i>	<i>default</i>
logicShowNode	boolean	false
logicShowDot	boolean	false
logicNodestyle	command	\footnotesize
logicSymbolstyle	command	\large
logicSymbolpos	value	0.5
logicLabelstyle	command	\small
logicType	string	and
logicChangeLR	boolean	false
logicWidth	length	1.5
logicHeight	length	2.5
logicWireLength	length	0.5
logicNInput	number	2
logicJInput	number	2
logicKInput	number	2

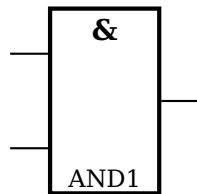

3.2 Basic Logical Circuits

At least the basic objects require a unique label name, otherwise it is not sure, that all nodes will work well. The label may contain any alphanumerical character and most of all symbols. But it is save using only combinations of letters and digits. For example:

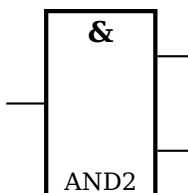

```
And0
a0
a123
12
NOT123a
```

A_1 is not a good choice, the underscore may cause some problems.

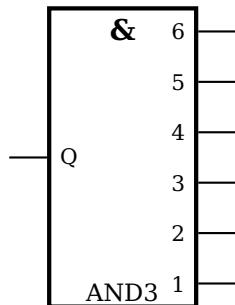

And

```
\begin{pspicture}(-1,0)(3,3)
\logic{AND1}
\end{pspicture}
```

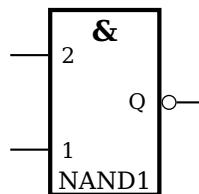

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicChangeLR]{AND2}
\end{pspicture}
```

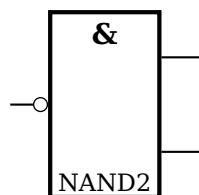

```
\begin{pspicture}(-0.5,0)(4,5)
\logic[logicShowNode,
      logicWidth=2,
      logicHeight=4,
      logicNInput=6,
      logicChangeLR](1,1){AND3}
\end{pspicture}
```

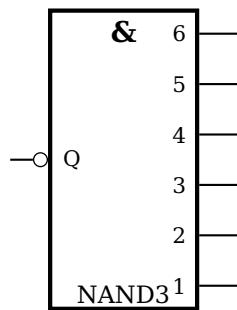

NotAnd

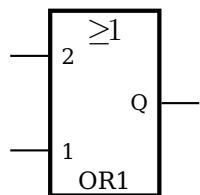

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nand,
      logicShowNode]{NAND1}
\end{pspicture}
```

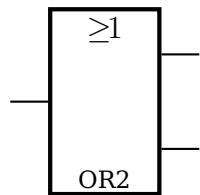

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nand,
      logicChangeLR]{NAND2}
\end{pspicture}
```

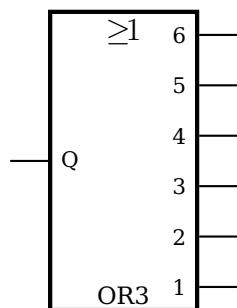

```
\begin{pspicture}(4,5)
\logic[logicType=nand,
logicShowNode,
logicWidth=2,
logicHeight=4,
logicNInput=6,
logicChangeLR](1,1){NAND3}
\end{pspicture}
```

Or

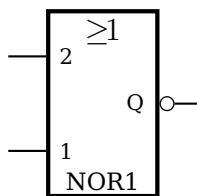

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=or,
logicShowNode]{OR1}
\end{pspicture}
```

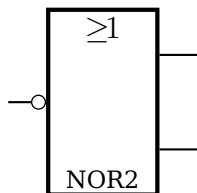

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=or,
logicChangeLR]{OR2}
\end{pspicture}
```

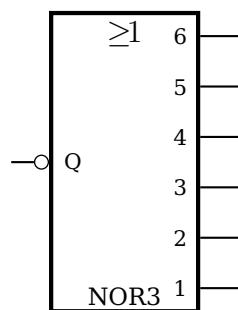

```
\begin{pspicture}(4,5)
\logic[logicType=or,
logicShowNode,
logicWidth=2,
logicHeight=4,
logicNInput=6,
logicChangeLR](1,1){OR3}
\end{pspicture}
```

Not Or

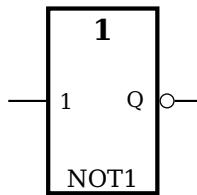

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nor,
logicShowNode]{NOR1}
\end{pspicture}
```

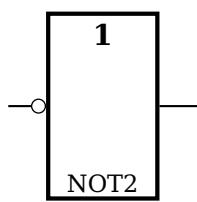

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nor,
logicChangeLR]{NOR2}
\end{pspicture}
```

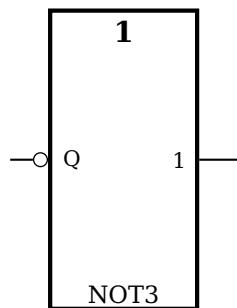

```
\begin{pspicture}(4,5)
\logic[logicType=nor,
logicShowNode,
logicWidth=2,
logicHeight=4,
logicNInput=6,
logicChangeLR](1,1){NOR3}
\end{pspicture}
```

Not

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=not,
logicShowNode]{NOT1}
\end{pspicture}
```

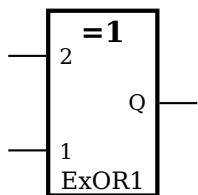

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=not,
logicChangeLR]{NOT2}
\end{pspicture}
```

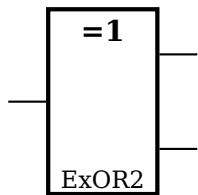

```
\begin{pspicture}{4,5}
\logic[logicType=not,
logicShowNode,
logicWidth=2,
logicHeight=4,
logicChangeLR](1,1){NOT3}
\end{pspicture}
```

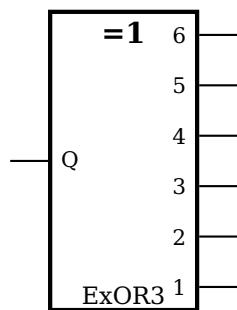

Exclusive OR

```
\begin{pspicture}{-0.5,0)(3,3)
\logic[logicType=exor,
logicShowNode]{ExOR1}
\end{pspicture}
```

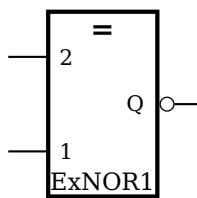

```
\begin{pspicture}{-0.5,0)(3,3)
\logic[logicType=exor,
logicChangeLR]{ExOR2}
\end{pspicture}
```

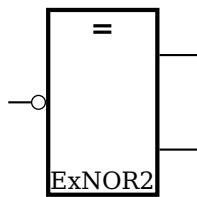

```
\begin{pspicture}{4,5}
\logic[logicType=exor,
logicShowNode,
logicNInput=6,
logicWidth=2,
logicHeight=4,
logicChangeLR](1,1){ExOR3}
\end{pspicture}
```

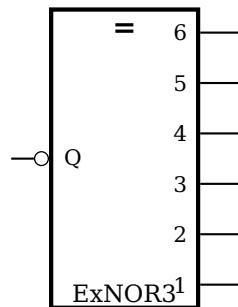

Exclusive NOR

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exnor,
logicShowNode]{ExNOR1}
\end{pspicture}
```

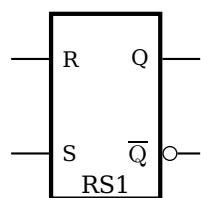

```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exnor,
logicChangeLR]{ExNOR2}
\end{pspicture}
```

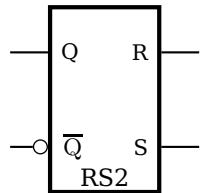

```
\begin{pspicture}(4,5)
\logic[logicType=exnor,
logicShowNode,
logicNInput=6,
logicWidth=2,
logicHeight=4,
logicChangeLR](1,1){ExNOR3}
\end{pspicture}
```

3.3 RS Flip Flop

```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,
logicType=RS]{RS1}
\end{pspicture}
```

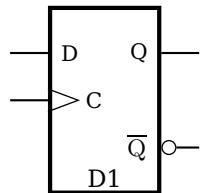

```

1 \begin{pspicture}(-1,-1)(3,3)
2 \logic[logicShowNode,
3   logicType=RS,
4   logicChangeLR]{RS2}
5 \end{pspicture}

```

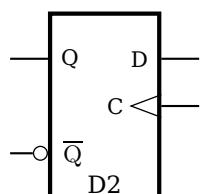

3.4 D Flip Flop

```

1 \begin{pspicture}(-1,-1)(3,3)
2 \logic[logicShowNode,
3   logicType=D]{D1}
4 \end{pspicture}

```

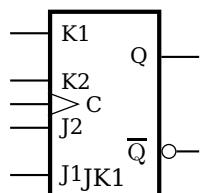

```

1 \begin{pspicture}(-1,-1)(3,3)
2 \logic[logicShowNode=true,
3   logicType=D,
4   logicChangeLR]{D2}
5 \end{pspicture}

```

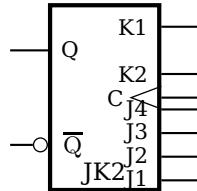

3.5 JK Flip Flop

```

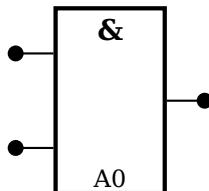

1 \begin{pspicture}(-1,-1)(3,3)
2 \logic[logicShowNode,
3   logicType=JK,
4   logicKInput=2,
5   logicJInput=2]{J1JK1}
6 \end{pspicture}

```

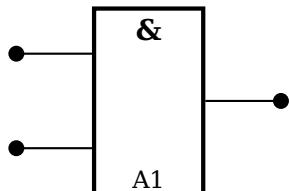

```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,logicType=JK,
      logicKInput=2, logicJInput=4,
      logicChangeLR]{JK2}
\end{pspicture}
```

3.6 Other Options

```
\begin{pspicture}(-0.5,0)(3,2.5)
\logic[logicShowDot]{A0}
\end{pspicture}
```

```
\begin{pspicture}(-1,0)(3,2.5)
\logic[logicWireLength=1,
      logicShowDot]{A1}
\end{pspicture}
```

The unit of `logicWireLength` is the same than the actual one for `pstricks`, set by the `unit` option.

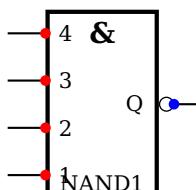

3.7 The Node Names

Every logic circuit is defined with its name, which should be a unique one. If we have the following NAND circuit, then `pst-circ` defines the nodes

```
NAND11, NAND12, NAND13, NAND14, NAND1Q
```

If there exists an inverted output, like for alle Flip Flops, then the negated one gets the appendix `neg` to the node name. For example:

```
NAND1Q, NAND1Qneg
```

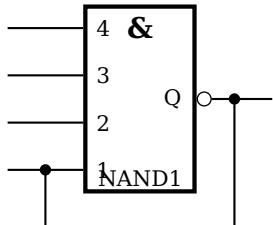

```
\begin{pspicture}(-0.5,0)(2.5,3)
\logic[logicShowNode=true,%  
      logicLabelstyle=\footnotesize,%  
      logicType=nand,%  
      logicNInput=4]{NAND1}
\multido{\n=1+1}{4}{%  
  \pscircle*[linecolor=red](NAND1\n){2pt}%
}  
 \pscircle*[linecolor=blue](NAND1Q){2pt}
\end{pspicture}
```

Now it is possible to draw a line from the output to the input

```
\ncbar[angleA=0,angleB=180]{<Node A>}{<Node B>}
```

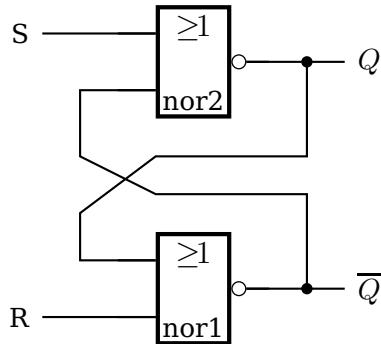

It may be easier to print a grid since the drawing phase and then comment it out if all is finished.

```

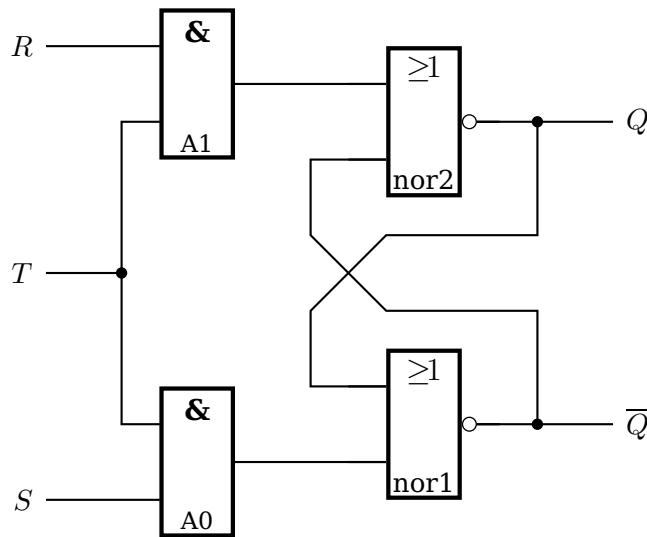

1 \begin{pspicture}(-1,-1)(2.5,3)
2 \logic[logicShowNode=true,%
3   logicLabelstyle=\footnotesize,%
4   logicType=nand,%
5   logicWireLength=1,%
6   logicNInput=4]{NAND1}
7 \pnode(-0.5,0|NAND1){tempA}
8 \pnode(2,0|NAND1Q){tempB}
9 \end{pspicture}
10 \ncbar[angleA=-90,angleB=0,arm=0.75,%
11   arrows=**-, dotsize=0.15]{tempA}{tempB}
```

3.8 Examples

```

1 \begin{pspicture}(-1,0)(5,5)
2 \psset{logicType=nor, logicLabelstyle=\normalsize,%
3   logicWidth=1, logicHeight=1.5, dotsize=0.15}
4 \logic(1.5,0){nor1}
5 \logic(1.5,3){nor2}
6 \psline(nor2O)(4,0|nor2O)
7 \uput[0](4,0|nor2O){$Q\$}
8 \psline(nor1O)(4,0|nor1O)
9 \uput[0](4,0|nor1O){$\overline{Q}\$"}
10 \psline{*-(3.50,0|nor2O)(3.5,2.5)(1.5,2.5)
11   (0.5,1.75)(0.5,0|nor12)(nor12)
12 \psline{*-(3.50,0|nor1O)(3.5,2)(1.5,2)
13   (0.5,2.5)(0.5,0|nor21)(nor21)
14 \psline(0,0|nor11)(nor11)\uput[180](0,0|nor11){R}
15 \psline(0,0|nor22)(nor22)\uput[180](0,0|nor22){S}
16 \end{pspicture}
```

```

1 \begin{pspicture}(-4,0)(5,7)
2   \psset{logicWidth=1, logicHeight=2, dotsize=0.15}
3   \logic[logicWireLength=0](-2,0){A0}
4   \logic[logicWireLength=0](-2,5){A1}
5   \ncbar[angleA=-180,angleB=-180,arm=0.5]{A11}{A02}
6   \psline[dotsize=0.15]{-*}(-3.5,3.5)(-2.5,3.5)
7   \uput[180](-3.5,3.5){$T\$}
8   \psline(-3.5,0.5)(A01)\uput[180](-3.5,0.5){$S\$}
9   \psline(-3.5,6.5)(A12)\uput[180](-3.5,6.5){$R\$}
10  \psset{logicType=nor, logicLabelstyle=\normalsize}
11  \logic(1,0.5){nor1}
12  \logic(1,4.5){nor2}
13  \psline(nor2Q)(4,0|nor2Q)
14  \uput[0](4,0|nor2Q){$Q\$}
15  \psline(nor1Q)(4,0|nor1Q)
16  \uput[0](4,0|nor1Q){$\overline{Q}\$"}
17  \psline{*-}(3,0|nor2Q)(3,4)(1,4)(0,3)(0,0|nor12)(nor12)
18  \psline{*-}(3,0|nor1Q)(3,3)(1,3)(0,4)(0,0|nor21)(nor21)
19  \psline(A0Q)(nor11)
20  \psline(A1Q)(nor22)
21 \end{pspicture}

```

4 Adding new components

Adding new components is not simple. As a matter of fact, because of the complex mechanism of `\multidipole`, there are multiple steps. Nevertheless, it can take some time...

If you want to modify the code, you need to know the following things. For a dipole, you first need to define the following items:

```

1 \def\component_name{@ifnextchar[{ \pst@component_name}{\pst@component_name[]}}
2 %
3 \def\pst@component/_name[#1](#2)(#3)#4{%
4   \pst@draw@dipole{#1}{#2}{#3}{#4}\pst@draw@component_name
5   }\ignorespaces
6 %

```

```

7 \def\pst@multidipole@component_name{\ifnextchar[{\pst@multidipole@component_name@}
8   %
9   {\pst@multidipole@component_name@[]}}
10 %
11 \def\pst@multidipole@component_name@[#1]#2{%
12   \expandafter\def\csname pst@circ@tmp@\number\pst@circ@count@iii\endcsname{#2}%
13   {\psset{#1}%
14   \ifPst@circ@parallel\aftergroup\advance\aftergroup\pst@circ@count@i\aftergroup\%
15     \m@ne\fi}%
16   \pst@circ@count@ii=\pst@circ@count@i%
17   \advance\pst@circ@count@ii\@ne%
18   \toks0\expandafter{\pst@multidipole@output}%
19   \edef\pst@multidipole@output{%
20     \the\toks0%
21     \pst@multidipole@def@coor%
22     \noexpand\component_name[#1]%
23     (! X@\the\pst@circ@count@i\space Y@\the\pst@circ@count@i)%
24     (! X@\the\pst@circ@count@ii\space Y@\the\pst@circ@count@ii)%
25     {\noexpand\csname pst@circ@tmp@\number\pst@circ@count@iii\endcsname}%
26   }%
27   \pst@multidipole@
28 }
29 %
30 \def\pst@draw@component_name{%
31   % The PSTricks code for your component
32   % The center of the component is at (0,0)
33   \pnode{component_left_end}{dipole@1}
34   \pnode{component_right_end}{dipole@2}}

```

Then, you have to make some changes in the `\multidipole` core code... In the definition of `\pst@multidipole`, look for the last `\ifx` test

```

1 %
2 % Extract from \pst@multidipole
3 \else\ifx\circledipole#4\let\next\pst@multidipole@circledipole
4 \else\ifx\LED #4\let\next\pst@multidipole@LED
5 \else % Put your modification here
6 \let\next\ignorespaces
7 \fi\fi\fi
8 % Extract form \pst@multidipole
9 %

```

and add (marked with `%%%`)

```

1 %
2 % Extract from \pst@multidipole
3 \else\ifx\circledipole #4\let\next\pst@multidipole@circledipole
4 \else\ifx\LED #4\let\next\pst@multidipole@LED
5 \else\ifx\component_name#4\let\next\pst@multidipole@component_name%%%%
6 \else\let\next\ignorespaces
7 \fi\fi\fi\fi
8 % Extract form \pst@multidipole
9 %

```

Do the same in `\pst@multidipole@`

```

1 %
2 % Extract from \pst@multidipole@

```

```
3 \else\ifx\circledipole#1\let\next\pst@multidipole@circledipole
4 \else\ifx\LED    #1\let\next\pst@multidipole@LED
5 \else\ifx\component_name#1\let\next\pst@multidipole@component_name%%
6 \else\let\next\ignorespaces\pst@multidipole@output
7 \fi\fi\fi\fi
8 % Extract form \pst@multidipole@
9 % ...
```

and that's it! All you have to do then is send your modified `pst-circ.tex` to me and it will become part of the official release of `pst-circ`.

5 List of all optional arguments for *pst-circ*

Note: the default for booleans is always false.
