ltdirchk.dtx

1 L^AT_EX System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, TeX will try to load the expansion of `<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, /.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\TeXversion` `\TeXversion` is now set automatically by the initialisation tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation

is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:

- 2 for any version, v , $v < 3.0$
- 3 for any version, v , $3.0 \leq v \leq 3.14$
- $\langle\text{undefined}\rangle$ otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with $\wedge\wedge J$ appearing instead of line breaks:

```
! LaTeX Error: \rubbish undefined.^\wedge\wedge JSee the LaTeX manual or LaTeX Companion  
for explanation.^\wedge JType H <return> for immediate help.  
...  
  
1.3 \renewcommand{\rubbish}  
{}?  
?
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
! LaTeX Error: \rubbish undefined.  
  
See the LaTeX manual or LaTeX Companion for explanation.  
Type H <return> for immediate help.  
!.  
...  
  
1.3 \renewcommand{\rubbish}  
{}?  
?
```

Note that this has an extra line `! .` which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

2.1 INITEX

```
1 {*dircheck}  
2 {*initex}  
3 {initex}\ifnum\catcode`\'f=1  
4 {initex} \errmessage  
5 {initex} {LaTeX must be made using an initex with no format preloaded}
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

```

6 <initex>\fi
7 \catcode`\f=1
8 \catcode`\j=2

```

If `LuaTeX` is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of `LuaTeX` do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```

9 \ifx\directlua\undefined
10 \else
11   \ifx\luatexversion\undefined

```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```

12     \directlua{tex.enableprimitives("",%
13                 tex.extraprimitives('etex', 'pdftex', 'umath'))}

```

In current formats enable primitives with unprefixed names. the `latexrelease` guards allow the primitives to be defined with a `\luatex` prefix if older formats are specified.

```

14 </initex>
15 </dircheck>
16 <*initex, latexrelease>
17 <|latexrelease>\ifx\directlua\undefined\else
18 <|latexrelease>\IncludeInRelease{2015/10/01}{\luatexluafunction}
19 <|latexrelease>                                {LuaTeX (prefixed names)}%
20     \directlua{tex.enableprimitives("",%
21                 tex.extraprimitives("omega", "aleph", "luatex"))}
22 <|latexrelease>\EndIncludeInRelease
23 <|latexrelease>\IncludeInRelease{0000/00/00}{\luatexluafunction}
24 <|latexrelease>                                {LuaTeX (prefixed names)}%
25 <|latexrelease>\directlua{
26 <|latexrelease>  tex.enableprimitives(
27 <|latexrelease>    "luatex",
28 <|latexrelease>    tex.extraprimitives("core", "omega", "aleph", "luatex")
29 <|latexrelease>  )
30 <|latexrelease>  local i
31 <|latexrelease>  local t = { }
32 <|latexrelease>  for _,i in pairs(tex.extraprimitives("luatex")) do
33 <|latexrelease>    if not string.match(i,"^U") then
34 <|latexrelease>      if not string.match(i, "^luatex") then
35 <|latexrelease>        table.insert(t,i)
36 <|latexrelease>      end
37 <|latexrelease>    else
38 <|latexrelease>      if string.match(i,"^Uchar$") then
39 <|latexrelease>        table.insert(t,i)
40 <|latexrelease>      end
41 <|latexrelease>    end
42 <|latexrelease>  end
43 <|latexrelease>  for _,i in pairs(t) do
44 <|latexrelease>    tex.print(
45 <|latexrelease>      "\noexpand\\let\noexpand\\\" .. i
46 <|latexrelease>      .. "\noexpand\\undefined"
47 <|latexrelease>    )
48 <|latexrelease>  end
49 <|latexrelease>}
50 <|latexrelease>\EndIncludeInRelease

```

```

51 <{latexrelease}>\fi
52 </initex, latexrelease>
53 <*dircheck>
54 <*initex>
55   \fi
56 \fi

```

A test can now be made for eTeX.

```

57 <initex>\ifx\TeXversion\undefined
58 <initex>  \errmessage
59 <initex>    {LaTeX requires e-Tex}
60 <initex>  \expandafter\endinput
61 <initex>\fi

```

That distraction over, back to the basics of a format.

```

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between START and END is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

113 (*docstrip)
114 \openin15=texsys.cfg
115 \ifeof15
116 \typeout{** Writing a default texsys.cfg}

3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\@TeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You are allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir` `\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, TeX will try to load the expansion of

`(dir)<filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, /. One exception to this rule is that the input path should always contain the empty directory {} as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

You should not need to set this macro in `texsys.cfg`. L^AT_EX tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
130 %\def\@currdir{./}
131 %\let\input@path\@undefined
```

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
132 % \def\@currdir{./}
133 % \def\input@path{%
134 %   {/usr/local/lib/tex/inputs/distrib/}%
135 %   {/usr/local/lib/tex/inputs/contrib/}%
136 %   {/usr/local/lib/tex/inputs/local/}%
137 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\@currdir{./}
139 % \let\input@path\@undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
140 % \def\@currdir{./}
141 % \def\input@path{%
142 %   {c:/tex/inputs/distrib/}%
143 %   {c:/tex/inputs/contrib/}%
144 %   {c:/tex/inputs/local/}%
145 % }
```

3.6 VMS (DECUS TEX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\@currdir{[]}
147 % \let\input@path\@undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
148 % \def\@currdir{[]}
149 % \def\input@path{%
150 %   {tex_inputs:}%
151 %   {SOMEDISK:[SOME.TEX.DIRECTORY]}%
152 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\@currdir{:
154 % \let\input@path\@undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with :, and they should contain *no* spaces.

```
155 % \def\@currdir{:
156 % \def\input@path{%
157 %   {Hard-Disk:Applications:TeX:TeX-inputs:}%
158 %   {Hard-Disk:Applications:TeX:My-inputs:}%
159 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form <area>name. For maximum compatibility with macro sets, you want `name.ext` to be mapped to <ext>name. and <area>name.ext to be mapped to <area.ext>name. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. <>name is the desired ‘current directory’ syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%
161 %   \@dcr{#1}#2..\@nil%
162 % \def\@dcr#1#2.#3.#4\@nil{%
163 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 %
164 %
165 % \def\@currdir{\@dir{}}
166 % \def\input@path{%
167 %   {\@dir{area.one}}%
168 %   {\@dir{area.two}}%
169 % }
```

END

```
170 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```
171 \else
172 \typeout{** Using the existing texsys.cfg}
173 \closein{15}
174 \input texsys.cfg
175 \fi
176 \end{docstrip}
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
177 \dircheck \input texsys.cfg
```

4 Setting `\@currdir`

`\@currdir` This is a local definition of `\IfFileExists`. It tries to relocate `texsys.aux`. If `\IfFileExists` succeeds, then the `\@currdir` syntax has been determined. If all the tests fail then `\@currdir` will be set to `\@empty`, and `ltxcheck` will warn of this when it checks the format.

```
178 \begingroup
179 \count@=time
180 \divide\count@ 60
181 \count2=-\count@
182 \multiply\count2 60
183 \advance\count2 \time
```

`\today` The current date and time stamp.

```
184 \edef\today{%
185   \the\year/\two@digits{\the\month}/\two@digits{\the\day}:
186   \two@digits{\the\count@}:\two@digits{\the\count2}}
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
187 \immediate\openout{15}=texsys.aux
188 \immediate\write{15}{\today^J}
189 \immediate\closeout{15} %
```

#1 is the file to try, #2 is what to do on success, #3 on failure. Note that this definition is overwritten later on again!

```
190 \def\IfFileExists#1#2#3{%
191   \openin\@inputcheck{#1} %
192   \ifeof\@inputcheck
193     #3\relax
194   \else
195     \read\@inputcheck to \reserved@a
196     \ifx\reserved@a\today
197       \typeout{#1 found}#2\relax
198     \else
199       \typeout{BAD: old file \reserved@a (should be \today)}%
200       #3\relax
201     \fi
202   \fi
203   \closein\@inputcheck}
```

```
204 \endlinechar=-1  
If \currdir has not been pre-defined in texsys.cfg then test for UNIX,  
VMS and Oz-TeX-Mac. syntax.
```

```
205 \ifx\@currdir\@undefined  
206   \IfFileExists{./texsys.aux}{\gdef\@currdir{./}}%  
207   {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%  
208     {\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}{}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, `texsys.cfg` may be edited and the format re-made.

```
209 \ifx\@currdir\@undefined  
210   \global\let\@currdir\@empty  
211   \typeout{^^J^^J%  
212     !! No syntax for the current directory could be found^^J%  
213   }%  
214 \fi
```

Otherwise `\currdir` was defined in `texsys.cfg`. In this case check that the syntax specified works on this system. (In case a complete L^AT_EX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending `texsys.cfg` and try again.

```
215 \else  
216   \IfFileExists{\@currdir texsys.aux}{}{  
217     \edef\reserved@a{\errhelp{  
218       texsys.cfg specifies the current directory syntax to be^^J%  
219       \meaning\@currdir^^J%  
220       but this does not work on this system.^^J%  
221       Remove texsys.cfg and restart.}}\reserved@a  
222   \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@end}
```

The version of `\currdir` in `texsys.cfg` looks OK.

```
223 \fi  
  
224 \immediate\closeout15 %  
225 \endgroup  
  
226 \typeout{^^J^^J%  
227   \noexpand\@currdir set to:  
228   \expandafter\strip@prefix\meaning\@currdir.^^J%  
229 }
```

Stop here if the file is being used unstripped.

```
230 {*docstrip}  
231 \relax\endinput  
232 
```

5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found

to be very reliable. The first-time installer of L^AT_EX 2 _{ε} can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through L^AT_EX 2 _{ε} . This will check, amongst other things, whether `texsys.cfg` will need to be edited and the format remade.

`\input@path` Now set up the `\input@path`.

`\input@path` should either be undefined, or a list of directories as described in the introduction.

```

233   \typeout{^^J%
234     Assuming \noexpand\openin and \noexpand\input^^J%
235     \ifx\input@path\@undefined
236       have the same search path.^^J%
237     \else
238       have different search paths.^^J%
239       LaTeX will use the path specified by \noexpand\input@path:^^J%
240     \fi
241   }
```

6 Filename Parsing

`\filename@parse` Split a filename into its components.

```

242 \ifx\filename@parse\@undefined
243   \def\reserved@a{./}\ifx\@currdir\reserved@a
\filename@parse was not specified in texsys.cfg, but \@currdir looks like
UNIX...
244   \typeout{^^JDefining UNIX/DOS style filename parser.^^J}

246     \let\filename@area\empty
247     \expandafter\filename@path#1\\}
```

Search for the last /.

```

248   \def\filename@path#1/#2\\{%
249     \ifx\\#2\\%
250       \def\reserved@a{\filename@simple#1.\\}%
251     \else
252       \edef\filename@area{\filename@area#1}%
253       \def\reserved@a{\filename@path#2\\}%
254     \fi
255   \reserved@a}
```

`\filename@parse` was not specified in `texsys.cfg`, but `\@currdir` looks like

VMS...

```

257   \typeout{^^JDefining VMS style filename parser.^^J}
258   \def\filename@parse#1{%
259     \let\filename@area\empty
260     \expandafter\filename@path#1]\\}
```

Search for the last].

```
261   \def\filename@path#1]#2\\{\%
262     \ifx\\#2\\%
263       \def\reserved@a{\filename@simple#1.\\}%
264     \else
265       \edef\filename@area{\filename@area#1}%
266       \def\reserved@a{\filename@path#2\\}%
267     \fi
268     \reserved@a}
269 \else\def\reserved@a:{}\ifx@\currdir\reserved@a
```

\filename@parse was not specified in `texsys.cfg`, but \@currdir looks like Macintosh...

```
270   \typeout{^^JDefining Mac style filename parser.^^J}
271   \def\filename@parse#1{%
272     \let\filename@area\empty
273     \expandafter\filename@path#1:\\}
```

Search for the last ::.

```
274   \def\filename@path#1:#2\\{\%
275     \ifx\\#2\\%
276       \def\reserved@a{\filename@simple#1.\\}%
277     \else
278       \edef\filename@area{\filename@area#1:}%
279       \def\reserved@a{\filename@path#2\\}%
280     \fi
281     \reserved@a}
```

```
282 \else
\filename@parse was not specified in texsys.cfg. So just make a simple parser
that always sets \filename@area to empty.
```

```
283   \typeout{^^JDefining generic filename parser.^^J}
284   \def\filename@parse#1{%
285     \let\filename@area\empty
286     \expandafter\filename@simple#1.\\}
287 \fi\fi\fi
```

\filename@simple is used by all three versions. Finally we can split off the extension.

```
288   \def\filename@simple#1.#2\\{\%
289     \ifx\\#2\\%
290       \let\filename@ext\relax
291     \else
292       \edef\filename@ext{\filename@dot#2\\}%
293     \fi
294     \edef\filename@base{\#1}}
```

Remove a final dot, added earlier.

```
295   \def\filename@dot#1.\\{\#1}
296 \else
```

Otherwise, \filename@parse was specified in `texsys.cfg`.

```
297   \typeout{^^J^^J%
298     \noexpand\filename@parse was defined in texsys.cfg:^^J%}
```

```

299      \expandafter\strip@prefix\meaning\filename@parse.^^J%
300    }
301 \fi

```

7 T_EX Versions

`\@TeXversion` T_EX versions older than than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg T_EX3.14 would be detected as T_EX3, but L^AT_EX only needs to take account of T_EX's older than 3, or between 3 and 3.14.

```

302 \ifx\@TeXversion\undefined
303   \ifx\@undefined\inputlineno
304     \def\@TeXversion{2}
305   \else
306     {\catcode`\^^J=\active
307       \def\reserved@a#1#2\@{\if#1$string^3\fi}
308       \edef\reserved@a{\expandafter\reserved@a$string^^J\@}
309       \ifx\reserved@a\empty\else\gdef\@TeXversion{3}\fi}
310   \fi
311 \fi
312 </dircheck>

```

8 ltxcheck.tex

After the format has been made, and article.cls moved with the other files to the ‘standard input directory’ as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

File b

ltplain.dtx

9 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros'. That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep     \magstephalf  
\mathhexbox  
\vglue      \vgl@  
\hglue      \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1 {*2ekernel}  
2 \catcode`{\=1 % left brace is begin-group character  
3 \catcode`}=2 % right brace is end-group character  
4 \catcode`\$=3 % dollar sign is math shift  
5 \catcode`\&=4 % ampersand is alignment tab  
6 \catcode`\#=6 % hash mark is macro parameter character  
7 \catcode`\^=7 % circumflex and uparrow are for superscripts  
8 \catcode`\_=8 % underline and downarrow are for subscripts  
9 \catcode`\^I=10 % ascii tab is a blank space  
10 \chardef\active=13 \catcode`\^=\active % tilde is active  
11 \catcode`\^L=\active \def^L{\par}% ascii form-feed is \par  
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following \catcode values:

```
\catcode`\^@=9 % ascii null is ignored  
\catcode`\^M=5 % ascii return is end-line  
\catcode`\|=0 % backslash is TeX escape character  
\catcode`\%=14 % percent sign is comment character  
\catcode`\ =10 % ascii space is blank space  
\catcode`\^?=15 % ascii delete is invalid  
\catcode`\A=11 ... \catcode`\Z=11 % uppercase letters  
\catcode`\a=11 ... \catcode`\z=11 % lowercase letters  
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do{\{\do\}\do\$\\do\&%  
14 \do\#\do\^\do\_\\do\%\do\~}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

15 \catcode`@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

\@ne Small constants are defined using \chardef.

\tw@ 16 \chardef\@ne=1

\thr@@ 17 \chardef\tw@=2

\sixt@@n 18 \chardef\thr@@=3

\@cclv 19 \chardef\sixt@@n=16

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

The following counters are reserved:

0 to 9 page numbering

10 count allocation

11 dimen allocation

12 skip allocation

13 muskip allocation

14 box allocation

15 toks allocation

16 read file allocation

17 write file allocation

18 math family allocation

19 language allocation

20 insert allocation

21 the most recently allocated number

22 constant -1

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, `\count` 10 always contains the number of the highest-numbered counter that has been allocated, `\count` 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a `\count`, `\dimen`, `\skip`, and `\box` all with the same number; `\count` 20 contains the lowest-numbered insert that has been allocated. Of course, `\box255` is reserved for `\output`; `\count255`, `\dimen255`, and `\skip255` can be used freely.

It is recommended that macro designers always use `\global` assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-`\global` assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```

26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...

```

<code>\insc@unt</code>	The insertion counter and most recent allocation.
<code>\allocationnumber</code>	<pre> 37 \countdef\insc@unt=20 38 \countdef\allocationnumber=21 </pre>
<code>\m@ne</code>	The constant -1 .
	<pre> 39 \countdef\m@ne=22 \m@ne=-1 </pre>
<code>\wlog</code>	Write on log file (only)
	<pre> 40 \def\wlog{\immediate\write\m@ne} </pre>
<code>\count@</code>	Here are abbreviations for the names of scratch registers that don't need to be allocated.
<code>\dimen@</code>	
<code>\dimen@i</code>	<pre> 41 \countdef\count@=255 </pre>
<code>\dimen@ii</code>	<pre> 42 \dimendef\dimen@=0 </pre>
<code>\skip@</code>	<pre> 43 \dimendef\dimen@i=1 % global only </pre>
<code>\toks@</code>	<pre> 44 \dimendef\dimen@ii=2 45 \skipdef\skip@=0 46 \toksdef\toks@=0 </pre>
<code>\newcount</code>	Now, we define <code>\newcount</code> , <code>\newbox</code> , etc. so that you can say <code>\newcount\foo</code> and
<code>\newdimen</code>	<code>\foo</code> will be defined (with <code>\countdef</code>) to be the next counter.
<code>\newskip</code>	To find out which counter <code>\foo</code> is, you can look at <code>\allocationnumber</code> .
<code>\newmuskip</code>	Since there's no <code>\boxdef</code> command, <code>\chardef</code> is used to define a <code>\newbox</code> ,
<code>\newbox</code>	<code>\newinsert</code> , <code>\newfam</code> , and so on.
<code>\newtoks</code>	
<code>\newread</code>	
<code>\newwrite</code>	File b: <code>ltplain.dtx</code> Date: 2017/04/10 Version v2.3c
<code>\newfam</code>	
<code>\newlanguage</code>	

LATEX change: remove `\outer` from `\newcount` and `\newdimen` (FMi) This is necessary to use `\newcount` inside `\if... later on`. Also remove from `\newskip`, `\newbox` `\newwrite` and `\newfam` (DPC) to save later redefinition.

```

377 \def\obeyspaces{\catcode` \active}
378 {\obeyspaces\global\let =\space}

\loop We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that
\iterate breaks something :-). It turned out to need an extra \relax: see pr/642 (\loop
\repeat could do one iteration too much in certain cases).
379 \long\def \loop #1\repeat{%
380 \def\iterate{\#1\relax % Extra \relax
381 \expandafter\iterate\fi
382 }%
383 \iterate
384 \let\iterate\relax
385 }

This setting of \repeat is needed to make \loop... \if... \repeat skippable
within another \if.....
386 \let\repeat=\fi

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

```
\leavevmode begins a paragraph, if necessary
421 \def\leavevmode{\unhbox\vvoidbx}

\mathhexbox
422 \def\mathhexbox#1#2#3{\mbox{$\mathchar"##2#3$}}

\ialign
423 \def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign

\oalign
\o@align 424 \def\oalign#1{\leavevmode\vtop{\baselineskip\z@skip \lineskip.25ex%
\ooalign 425 \ialign{##\crrc#1\crrc}}}
426 \def\o@align{\lineskiplimit\z@ \oalign}
427 \def\ooalign{\lineskiplimit-\maxdimen \oalign}

\sh@ft The definition of this macro in plain.tex was improved in about 1997; but as a
result its usage was changed and its new definition is not appropriate for LATEX.
Since the version given here has been in use by LATEX for many years it does
not seem prudent to remove it now. As far as we can tell it has only been used to
define \b and \d but this cannot be certain.
428 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
429 \kern-.0156\dimen@} % compensate for slant in lowered accents

\ltx@sh@ft This is the LATEX version of the second incarnation of the plain macro \sh@ft,
which takes a dimension as its argument. It shifts a pseudo-accent horizontally
by an amount proportional to the product of its argument and the slant-per-point
(fontdimen 1).
430 \def\ltx@sh@ft #1{%
431 \dimen@ #1%
432 \kern \strip@pt
433 \fontdimen1\font \dimen@
434 } % kern by #1 times the current slant

LATEX change: the text commands such as \d, \b, \c, \copyright, \TeX are
now defined elsewhere.
LATEX change: Make \t work in a moving argument. Now defined elsewhere.

\hrulefill LATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them
\dotfill work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). LATEX
change: \leavevmode added at beginning of \dotfill and \hrulefill so that
they work as expected in vertical mode.
435 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}

The box in \dotfill originally contained (in plain.tex):
\mkern 1.5mu .\mkern 1.5mu;
the width of .44em differs from this by .04pt which is probably an acceptable
difference within leaders.
436 \def\dotfill{%
437 \leavevmode
438 \cleaders\hb@xt@.44em{\hss.\hss}\hfill
439 \kern\z@}
```

INITEX sets `\sfcode x=1000` for all x, except that `\sfcode'X=999` for upper-case letters. The following changes are needed:

440 `\sfcode`]=0 \sfcode`'=0 \sfcode`]=0`

The `\nonfrenchspacing` macro will make further changes to `\sfcode` values.

Definitions related to output

`\magnification` doesn't work in L<sup>A</sup>T<sub>E</sub>X.

```
\def\magnification{\afterassignment\m@g\count@}
\def\m@g{\mag\count@
\hsize6.5truein\vsize8.9truein\dimen\footins8truein}
```

`\showoverfull` The following commands are used in debugging:

441 `\def\showoverfull{\tracingonline@ne}`

`\showoutput`

```
\loggingoutput 442 \gdef\loggingoutput{\tracingoutput@ne
443 \showboxbreadth\maxdimen\showboxdepth\maxdimen\errorstopmode}
444 \gdef\showoutput{\loggingoutput\showoverfull}
445 </2ekernel>
```

`\tracingall`

`\loggingall`

```

## ltvers.dtx

### 10 Version Identification

First we identify the date and version number of this release of L<sup>A</sup>T<sub>E</sub>X, and set `\everyjob` so that it is printed at the start of every L<sup>A</sup>T<sub>E</sub>X run.

```
\fmtname
\fmtversion
\latexreleaseversion
\patch@level
```

A `\patch@level` of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

If we put code updates into the kernel that are supposed to go into the next release we set the `\patch@level` to -1 and the `\fmtversion` / `\latexreleaseversion` to the date of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

If the `\patch@level` is already at -1 we do nothing here and use the `\fmtversion` date for any new `\IncludeInRelease` line when we add further code.

Finally, if we do make a public release we either just set the `\patch@level` to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the `\IncludeInRelease` statements that used the “guessed” date.

```
1 {*2ekernel}
2 \def\fmtname{LaTeX2e}
3 \edef\fmtversion
4 {*}2ekernel}
5 <texrelease>\edef\latexreleaseversion
6 {*2ekernel | texrelease}
7 {2019-10-01}
8 {*}2ekernel}
9 {*}2ekernel}
10 \def\patch@level{-3}
```

```
\development@branch@name
```

For more fine grain control there is the possibility to name the current development branch. This is only used when the `\patch@level` is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

```
11 \edef\development@branch@name{\development \the\year-\the\month-\the\day}
```

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```
12 \iffalse
13 \def\reserved@a{\#1/#2/#3\@nil{%
14 \count@\year
15 \advance\count@-#1\relax
16 \multiply\count@ by 12\relax
17 \advance\count@\month
18 \advance\count@-#2\relax}
19 \expandafter\reserved@a\fmtversion\@nil
```

\count@ is now the age of this file in months. Take a generous definition of ‘year’ so this message is not generated too often.

```

## ltdefns.dtx

### 11 Definitions

This section contains commands used in defining other macros.

1 `(*2ekernel)`

#### 11.1 Initex initialisations

`\two@digits` Prefix a number less than 10 with ‘0’.

2 `\def\two@digits#1{\ifnum#1<10 0\fi\number#1}`

`\typeout` Display something on the terminal.

3 `\def\typeout#1{\begingroup\set@display@protect`  
4     `\immediate\write\@unused{#1}\endgroup}`

`\newlinechar` A char to be used as new-line in output to files.

5 `\newlinechar`\\^J`

#### 11.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@@foo`. The following primitives are handled in this way:

`\@@par`

6 `\let\@@par=\par`  
7 `%\let\@@input=\input      %%% moved earlier`  
8 `%\let\@@end=\end          %%%`

`\@@hyph` Save original primitive definition.

9 `\let\@@hyph=-`

`\@@italiccorr` Save the original italic correction.

10 `\let\@@italiccorr=/`

`\@height` The following definitions save token space. E.g., using `\@height` instead of `height`

`\@depth` saves 5 tokens at the cost in time of one macro expansion.

`\@width` 11 `\def\@height{height} \def\@depth{depth} \def\@width{width}`

`\@minus` 12 `\def\@minus{minus}`

`\@plus` 13 `\def\@plus{plus}`

`\hb@xt@` The next one is another 100 tokens worth.

14 `\def\hb@xt@{\hbox to}`

15 `\message{hacks,}`

### 11.3 Command definitions

This section defines the following commands:

|                   |                                                                            |                                                                                                                                                                                                                                                           |
|-------------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \@namedef         | { <i>NAME</i> }                                                            |                                                                                                                                                                                                                                                           |
|                   |                                                                            | Expands to \def{\ <i>NAME</i> }, except name can contain any characters.                                                                                                                                                                                  |
| \@nameuse         | { <i>NAME</i> }                                                            |                                                                                                                                                                                                                                                           |
|                   |                                                                            | Expands to \{ <i>NAME</i> \}.                                                                                                                                                                                                                             |
| \@ifnextchar      | X{\ <i>YES</i> }H{\ <i>NO</i> }                                            |                                                                                                                                                                                                                                                           |
|                   |                                                                            | Expands to <i>YES</i> if next character is an ‘X’, and to <i>NO</i> otherwise. (Uses \reserved@a–\reserved@c.) NOTE: GOBBLES ANY SPACE FOLLOWING IT.                                                                                                      |
| \@ifstar          | { <i>YES</i> }{{ <i>NO</i> }}                                              |                                                                                                                                                                                                                                                           |
|                   |                                                                            | Gobbles following spaces and then tests if next the character is a ‘*’. If it is, then it gobbles the ‘*’ and expands to <i>YES</i> , otherwise it expands to <i>NO</i> .                                                                                 |
| \@dblarg          | { <i>CMD</i> }{{ <i>ARG</i> }}                                             |                                                                                                                                                                                                                                                           |
|                   |                                                                            | Expands to \{ <i>CMD</i> \}[\ <i>ARG</i> ]\{ <i>ARG</i> \}. Use \@dblarg\CS when \CS takes arguments [ARG1]{ARG2}, where default is ARG1 = ARG2.                                                                                                          |
| \@ifundefined     | { <i>NAME</i> }{{ <i>YES</i> }{{ <i>NO</i> }}}                             |                                                                                                                                                                                                                                                           |
|                   |                                                                            | : If \NAME is undefined then it executes <i>YES</i> , otherwise it executes <i>NO</i> . More precisely, true if \NAME either undefined or = \relax.                                                                                                       |
| \@ifdefinable     | \NAME{{ <i>YES</i> }}                                                      | Executes <i>YES</i> if the user is allowed to define \NAME, otherwise it gives an error. The user can define \NAME if \@ifundefined{\NAME} is true, ‘NAME’ ≠ ‘relax’ and the first three letters of ‘NAME’ are not ‘end’, and if \endNAME is not defined. |
| \newcommand       | *{\{ <i>FOO</i> \}}[ <i>i</i> ]{ <i>TEXT</i> }                             | User command to define \FOO to be a macro with <i>i</i> arguments ( <i>i</i> = 0 if missing) having the definition <i>TEXT</i> . Produces an error if \FOO already defined.                                                                               |
| \renewcommand     | *{\{ <i>FOO</i> \}}[ <i>i</i> ]{ <i>TEXT</i> }                             | Normally the command is defined to be \long (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as \long and a blank line in any argument to the command would generate an error.                          |
| \newenvironment   | Same as \newcommand, except it checks if \FOO already defined.             |                                                                                                                                                                                                                                                           |
|                   | *{\{ <i>FOO</i> \}}[ <i>i</i> ]{ <i>DEF1</i> }{{ <i>DEF2</i> }}            |                                                                                                                                                                                                                                                           |
|                   | equivalent to:                                                             |                                                                                                                                                                                                                                                           |

|               | 70 \csname\string#1\endcsname                                                                                                                                                                                                                                                                                             |
|               | 71 \tw@                                                                                                                                                                                                                                                                                                                   |
|               | 72 {#2}%                                                                                                                                                                                                                                                                                                                  |
|               | 73 {#4}}}}                                                                                                                                                                                                                                                                                                                |
| \@testopt     | This macro encapsulates the most common call to \ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [ need not be a single token but can be any sequence of commands that 'expects' to be followed by [. |

If this command were only used in `\newcommand` definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```
74 \long\def\@testopt#1#2{%
75 \kernel@ifnextchar[{#1}{#1[{#2]}]}
```

- `\@protected@testopt` Robust version of `\@testopt`. The extra argument (#1) must be a single token. If protection is needed the call expands to `\protect` applied to this token, and the 2nd and 3rd arguments are discarded (by `\@x@protect`). Otherwise `\@testopt` is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the `\ifx` test.

```
76 \def\@protected@testopt#1{%
77 \ifx\protect\@typeset@protect
78 \expandafter\@testopt
79 \else
80 \@x@protect#1%
81 \fi}
```

- `\@yargdef` These generate a primitive argument specification, from a L<sup>A</sup>T<sub>E</sub>X [*digit*] form;  
`\@yargd@f` in fact *digit* can be anything such that `\number` *digit* is single digit.

Reorganised slightly so that `\renewcommand{\reserved@a}[1]{foo}` works.  
I am not sure this is worth it, as a following `\newcommand` would over-write the definition of `\reserved@a`.

Recall that L<sup>A</sup>T<sub>E</sub>X2.09 goes into an infinite loop with

```
\renewcommand[1]{\@tempa}{foo}
(DPC 6 October 93).
```

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using #2 = `\tw@` as the flag to surround the first argument with []). But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) `\number` was added later in 1999.

It is not clear why these are still `\long`.

```
82 \long \def \@yargdef #1#2#3{%
83 \ifx#2\tw@
84 \def\reserved@b##1{[##1]}%
85 \else
86 \let\reserved@b\@gobble
87 \fi
88 \expandafter
89 \@yargd@f \expandafter{\number #3}#1%
90 }

91 \long \def \@yargd@f#1#2{%

151 \expandafter\@gobbletwo\string#2\endcsname
152 {\let#1#2}{}}

\providetcommand \providetcommand takes the same arguments as \newcommand, but discards them
if #1 is already defined, Otherwise it just acts like \newcommand. This imple-
mentation currently leaves any discarded definition in \reserved@a (and possibly

```

`\reserved@a`) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

```
153 \def\providecommand{\@star@or@long\provide@command}
```

`\provide@command`

```
154 \def\provide@command#1{%
155 \begingroup
156 \escapechar`m@ne\xdef\@gtempa{\string#1}%
157 \endgroup
158 \expandafter\@ifundefined\@gtempa
159 {\def\reserved@a{\new@command#1}%
160 {\def\reserved@a{\renew@command\reserved@a}%
161 \reserved@a}%
162 }
```

`\CheckCommand` `\CheckCommand` takes the same arguments as `\newcommand`. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: `\newcommand\xxx[2][a]{(#1)(#2)}` then `\CheckCommand\xxx[2][b]{(#1)(#2)}` would *not* generate a warning, but, for instance `\CheckCommand\xxx[2]{(#1)(#2)}` would.

```
162 \def\CheckCommand{\@star@or@long\check@command}
```

`\CheckCommand` is only available in the preamble part of the document.

```
163 \onlypreamble\CheckCommand
```

`\check@command`

```
164 \def\check@command#1#2{\@check@c#1{#2}}
165 \onlypreamble\check@command
```

`@check@c` `\CheckCommand` itself just grabs all the arguments we need, without actually looking for [ optional argument forms. Now define `\reserved@a`. If `\reserved@a` is then defined, compare it with the “`\#1`” otherwise compare `\reserved@a` with `#1`.

```
166 \long\def\@check@c#1#2#3{%
167 \expandafter\let\csname\string\reserved@a\endcsname\relax
168 \renew@command\reserved@a#2{#3}%
169 \@ifundefined{\string\reserved@a}%
170 {\@check@eq#1\reserved@a}%
171 {\expandafter\@check@eq
172 \csname\string#1\expandafter\endcsname
173 \csname\string\reserved@a\endcsname}%
174 }
```

`@check@eq` Complain if `#1` and `#2` are not `\ifx` equal.

```
175 \def\@check@eq#1#2{%
176 \ifx#1#2\else
177 \@latex@warning@no@line
178 {Command \noexpand#1 has
179 changed.\MessageBreak
180 Check if current package is valid}%
181 \fi}
182 \onlypreamble\@check@eq
```

```

\@gobble The \@gobble macro is used to get rid of its argument.
\@gobbletwo 183 \long\def \@gobble #1{}
\@gobblefour 184 \long\def \@gobbletwo #1#2{}
185 \long\def \@gobblefour #1#2#3#4{}

\@firstofone Some argument-grabbers.
\@firstoftwo 186 \long\def\@firstofone#1{#1}
\@secondoftwo 187 \long\def\@firstoftwo#1#2{#1}
188 \long\def\@secondoftwo#1#2{#2}

\@iden \@iden is another name for \@firstofone for compatibility reasons.
189 \let\@iden\@firstofone

\@thirdofthree Another grabber now used in the encoding specific section.
190 \long\def\@thirdofthree#1#2#3{#3}

\@expandtwoargs A macro to totally expand two arguments to another macro
191 \def\@expandtwoargs#1#2#3{%
192 \edef\reserved@a{\noexpand#1{#2}{#3}}\reserved@a}

\@backslashchar A category code 12 backslash.
193 \edef\@backslashchar{\expandafter\@gobble\string\\}

```

## 11.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L<sup>A</sup>T<sub>E</sub>X's commands. Whilst typesetting documents, L<sup>A</sup>T<sub>E</sub>X makes use of many of T<sub>E</sub>X's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L<sup>A</sup>T<sub>E</sub>X, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an \edef, \message, \mark, or other command which evaluates its argument fully.

The method L<sup>A</sup>T<sub>E</sub>X uses for making fragile commands robust is to precede them with \protect. This can have one of five possible values:

- \relax, for normal typesetting. So \protect\foo will execute \foo.
- \string, for writing to the screen. So \protect\foo will write \foo.
- \noexpand, for writing to a file. So \protect\foo will write \foo followed by a space.
- \unexpandable@protect, for writing a moving argument to a file. So \protect\foo will write \protect\foo followed by a space. This value is also used inside \edefs, \marks and other commands which evaluate their arguments fully. More precisely, whenever the content of an \edef or \xdef

etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\proetected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

```
\@unexpandable@protect
194 \def\@unexpandable@protect{\noexpand\protect\noexpand}
```

`\DeclareRobustCommand`  
`\declare@robustcommand` This is a package-writers command, which has the same syntax as `\newcommand`, but which declares a protected command. It does this by having

```
\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>,
and then use \newcommand\foo<space>.
```

Since the internal command is `\foo<space>`, when it is written to an auxiliary file, it will appear as `\foo`.

We have to be a bit cleverer if we're defining a short command, such as `\_`, in order to make sure that the auxiliary file does not include a space after the command, since `\_ a` and `\_a` aren't the same. In this case we define `\_` to be:

```
\x@protect_@\protect_<space>
```

which expands to:

```
\ifx\protect\@typeset@protect\else
 \@x@protect@_
\fi
\protect_<space>
```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `\_<space>`, and otherwise `\@x@protect@` gobbles everything up and expands to `\protect\_`.

*Note:* setting `\protect` to any value other than `\relax` whilst in ‘typesetting’ mode will cause commands to go into an infinite loop! In particular, setting `\protect` to `\@empty` will cause `\_` to loop forever. It will also break lots of other things, such as protected `\ifmmode`s inside `\haligns`. If you really really have to do such a thing, then please set `\@typeset@protect` to be `\@empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```
195 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
196 \def\declare@robustcommand#1{%
197 \ifx#1\@undefined\else\ifx#1\relax\else

241 \xdef
242 }
243 \def\restore@protect{\let\protect\@@protect}

\protect The normal meaning of \protect
244 \set@typeset@protect

```

\MakeRobust This macro makes an existing fragile macro robust, but only if it hasn't been robust in the past, i.e., it checks for the existence of the macro \<name>\_ and if that exists it assumes that \<name> is already robust. In that case either undefine the inner macro first or use \DeclareRobustCommand to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between \long macros and others and also take into account that sometimes the top-level is deliberately done manually (like with \begin).

The macro firstly checks if the control sequence in question exists at all.

```

245 </2ekernel>
246 <latexrelease>\IncludeInRelease{2019/10/01}{\MakeRobust}{\MakeRobust}%
247 <*2ekernel | latexrelease>
248 \def\MakeRobust#1{%
249 \@ifundefined{\expandafter\gobble\string#1}{%
250 \@latex@error{The control sequence `\\string#1' is undefined!}%
251 \MessageBreak There is nothing here to make robust}%
252 \eha
253 }%

```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely \foo\_. If it is already defined do nothing, otherwise set \foo\_ equal to \foo and redefine \foo so that it acts like a macro defined with \DeclareRobustCommand.

303 <*2ekernel>

```

\kernel@make@fragile 304 The opposite of \MakeRobust except that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if latexrelease requests a rollback of the kernel. For this reason we pretend that this command existed in all earlier versions of L<sup>A</sup>T<sub>E</sub>X i.e., we are not rolling it back since we need it precisely then. But we have to get it into the latexrelease file so that a roll forward is possible too.

```

## 11.5 Internal defining commands

These commands are used internally to define other L<sup>A</sup>T<sub>E</sub>X commands.

\@ifundefined Check if first arg is undefined or \relax and execute second or third arg depending,

```
321 </2ekernel>
322 <latexrelease>\IncludeInRelease{2018-04-01}{\@ifundefined}
323 <latexrelease>{Leave commands undefined in \@ifundefined}%
324 (*2ekernel | latexrelease)
```

Version using \ifcsname to avoid defining undefined tokens to \relax. Defined here to simplify using unmatched \fi.

```
325 \def\@ifundefined#1{%
326 \ifcsname#1\endcsname\@ifundefined@i\else\@ifundefined@ii\fi{#1}}
327 \long\def\@ifundefined@i#1\fi#2{\fi
328 \expandafter\ifx\csname #2\endcsname\relax
329 \@ifundefined@ii
330 \fi
331 \@secondoftwo}
332 \long\def\@ifundefined@ii\fi#1#2#3{\fi #2}
```

Now test of engine.

```
333 \ifx\numexpr\@undefined
```

Classic version (should not be needed as etex is assumed).

```
334 \def\@ifundefined#1{%
335 \expandafter\ifx\csname#1\endcsname\relax
336 \expandafter\@firstoftwo
337 \else
338 \expandafter\@secondoftwo
339 \fi}
340 \else\ifx\directlua\@undefined
```

Use the \ifcsname defined above.

```
341 \else
```

Optimised version for LuaTeX, using \lastnamedcs

```
342 \def\@ifundefined#1{%
343 \ifcsname#1\endcsname
344 \expandafter\ifx\lastnamedcs\relax\else\@ifundefined@i\fi
345 \fi

| \@ifnextchar       | \@ifnextchar peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.<br>364 \long\def\@ifnextchar#1#2#3{%  365   \let\reserved@d=#1%  366   \def\reserved@a{#2}%  367   \def\reserved@b{#3}%  368   \futurelet\@let@token\@ifnch}                                                                                                                                                                                                                                                                                                                                                                        |
| \kernel@ifnextchar | This macro is the kernel version of \@ifnextchar which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an fd file is loaded in a random place then the optional argument to \ProvidesFile could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the amsmath package one day, but...<br>Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.<br>369 \let\kernel@ifnextchar\@ifnextchar |
| \@ifnch            | \@ifnch is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls xifnch.<br>370 \def\@ifnch{%  371   \ifx\@let@token\@sptoken  372     \let\reserved@c\@xifnch  373   \else  374     \ifx\@let@token\reserved@d  375       \let\reserved@c\reserved@a  376     \else  377       \let\reserved@c\reserved@b  378     \fi  379   \fi  380   \reserved@c}                                                                                                                                                                                                                                                                   |
| \@sptoken          | The following code makes \@sptoken a space token. It is important here that the control sequence \: consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a \let may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of \: as math medium space.<br>381 \def\: {\let\@sptoken= } \: % this makes \@sptoken a space token                                                                                                                                                                                                                       |
| \@xifnch           | In the following definition of \@xifnch, \: is again used to get a space token as delimiter into the definition.<br>382 \def\:{\@xifnch} \expandafter\def\:{ {\futurelet\@let@token\@ifnch}}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| \@ifstar           | The new implementation below avoids passing the <i>true code</i> Through one more \def than the <i>false code</i> , which previously meant that # had to be written as ##### in one argument, but ## in the other. The * is gobbled by \@firstoftwo.<br>383 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}                                                                                                                                                                                                                                                                                                                                                                                          |

```

\@dblarg
\@dblarg 384 \long\def\@dblarg#1{\kernel@ifnextchar[{\#1}{\@dblarg{#1}}}
385 \long\def\@dblarg#1#2[#1[{\#2}]{#2}]

\@sanitize The command \@sanitize changes the catcode of all special characters except
for braces to ‘other’. It can be used for commands like \index that want to write
their arguments verbatim. Needless to say, this command should only be executed
within a group, or chaos will ensue.
386 \def\@sanitize{\@makeother\ \@makeother\\@\makeother\$@\makeother\&%
387 @makeother\#\@\makeother\^@\makeother_@\makeother\%\@\makeother\~}

\@onelvel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12
tokens: it could be used in \DeclareRobustCommand.
 If it is to be used on default float specifiers, this should be done when they are
defined.
388 \def \@onelvel@sanitize #1{%
389 \edef #1{\expandafter\strip@prefix
390 \meaning #1}%
391 }

\makeatletter Make internal control sequences accessible or inaccessible.
\makeatother 392 \DeclareRobustCommand\makeatletter{\catcode`@11\relax}
393 \DeclareRobustCommand\makeatother{\catcode`@12\relax}

```

## 12 Discretionary Hyphenation

\-

\@dischypf Moved here to be after the definition of \DeclareRobustCommand.  
The primitive \- command adds a discretionary hyphen using the current font’s \hyphenchar. Monospace fonts are usually declared with \hyphenchar set to -1 to suppress hyphenation.

L<sup>A</sup>T<sub>E</sub>X, from L<sup>A</sup>T<sub>E</sub>X2.09 in 1986 defined \- by

```
\def\-\{\discretionary{-}{ }{ }\}
```

The following comment was added when these commands were first set up, 19 April 1986:

the \- command is redefined to allow it to work in the \ttfamily type style, where automatic hyphenation is suppressed by setting \hyphenchar to -1. The original primitive T<sub>E</sub>X definition is saved as \@@hyph just in case anyone needs it.

L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> , between 1993 and 2017, had a comment at this point saying that the definition “would probably change” because the definition always uses -. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older L<sup>A</sup>T<sub>E</sub>X definition accessible via latexrelease as usual.

```
394 </2ekernel>
395 <latexrelease>\IncludeInRelease{2017/04/15}{\-}{Use \hyphenchar in \-}%
```

```

Temporary definition of \@latex@info, final definition is later.

## ltalloc.dtx

### 13 Counters

This section deals with counter and other variable allocation.

1 `(*2ekernel)`

The following are from plain TeX:

`\z@` A zero dimen or number. It's more efficient to write `\parindent\z@` than `\parindent 0pt`.

`\@ne` The number 1.

`\m@ne` The number -1.

`\tw@` The number 2.

`\sixt@@n` The number 16.

`\@m` The number 1000.

`\@MM` The number 20000.

`\@xxxii` The constant 32.

2 `\chardef\@xxxii=32`

`\@Mi` Constants 10001–10004.

`\@Mii` 3 `\mathchardef\@Mi=10001`

## ltcntrl.dtx

### 14 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

```
1 {*2ekernel}
2 \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
 while TEST do BODY od
 where TEST is a TeX \ifnum or \ifdim test, respectively.
 They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
 while SWITCH do BODY od
 Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to
A1,A2,
... ,An .
Executes BODY n times, with NAME = Ai on the i-th
iteration.
Optimized for the normal case of n = 1. Works for n=0.

\@tfour NAME := LIST \do {BODY}
if, before expansion, LIST = T1 ... Tn where each Ti is a
token or {...}, then executes BODY n times, with NAME = Ti
on the i-th iteration. Works for n=0.
```

NOTES: 1. These macros use no `\@temp` sequences.  
2. These macros do not work if the body contains anything that looks syntactically to TeX like an improperly balanced `\if` `\else` `\fi`.

```
\@whilenum TEST \do {BODY} ==
BEGIN
 if TEST
 then BODY
 \@iwhilenum{TEST \relax BODY}
END

## 15 Error handling and tracing

This section defines L<sup>A</sup>T<sub>E</sub>X's error commands.

1 {\*2ekernel}

The ‘2ekernel’ code ensures that a \usepackage{autoerr} is essentially ignored if a ‘full’ format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion

### 15.1 General commands

|                 |                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \MessageBreak   | This command prints a new-line inside a message, followed by a continuation line begun with \omsg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \message@break.                                                                                                                                                                                       |
|                 | 3 \let\MessageBreak\relax                                                                                                                                                                                                                                                                                                                                                                    |
| \GenericInfo    | This takes two arguments: a continuation and a message, and sends the result to the log file.                                                                                                                                                                                                                                                                                                |
|                 | 4 \DeclareRobustCommand{\GenericInfo}[2]{%<br>5     \begingroup<br>6         \def\MessageBreak{^J#1}%<br>7         \set@display@protect<br>8         \immediate\write\m@ne{#2\on@line.}%<br>9     \endgroup<br>10 }                                                                                                                                                                          |
| \GenericWarning | This takes two arguments: a continuation and a message, and sends the result to the screen.                                                                                                                                                                                                                                                                                                  |
|                 | 11 \DeclareRobustCommand{\GenericWarning}[2]{%<br>12     \begingroup<br>13         \def\MessageBreak{^J#1}%<br>14         \set@display@protect<br>15         \immediate\write\@unused{^J#2\on@line.^J}%<br>16     \endgroup<br>17 }                                                                                                                                                          |
| \GenericError   | This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing h to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient. |
|                 | 18 \bgroup<br>19 \lccode`\@`\\ %                                                                                                                                                                                                                                                                                                                                                             |

27 \egroup%

```

Unfortunately TeX versions older than 3.141 have a bug which means that `^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old TeX's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

! .

To appear on the terminal, but if you do not like it, you can always upgrade your TeX! In order for your format to use this version, you must define the macro `\@TeXversion` to be the version number, e.g., 3.14 of the underlying TeX. See the comments in `ltdircheck.dtx`.

```

28 \dimen@\ifx\@TeXversion\undefined4\else\@TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%

```

First the 'standard case'.

```

83 \fi}%

```

```

\PackageError
\PackageWarning
\PackageWarningNoLine
 \PackageInfo
 \ClassError
 \ClassWarning
\ClassWarningNoLine
 \ClassInfo

```

These commands are intended for use by package and class writers, to give information to authors. The syntax is:

```

\PackageError{(package)}{(error)}{(help)}
\PackageWarning{(package)}{(warning)}
\PackageWarningNoLine{(package)}{(warning)}
\PackageInfo{(package)}{(info)}

```

and similarly for classes. The **Error** commands print the *(error)* message, and present the interactive prompt; if the author types **h**, then the *(help)* information is displayed. The **Warning** commands produce a warning but do not present the interactive prompt. The **WarningNoLine** commands do the same, but don't print the input line number. The **Info** commands write the message to the log file. Within the messages, the command **\MessageBreak** can be used to break a line, **\protect** can be used to protect command names, and **\space** is a space, for example:

```

\newcommand{\foo}{FOO}
\PackageWarning{ethel}{%
 Your hovercraft is full of eels,\MessageBreak
 and \protect\foo\space is \foo}

```

produces:

```

Package ethel warning: Your hovercraft is full of eels,
(ethel) and \foo is FOO on input line 54.

```

```

| \@notprerr    | A command that can be used only in the preamble appears after the command \begin{document}.                                                                              |
|               | 231 \gdef\@notprerr{% 232   \@latex@error{Can be used only in preamble}\@eha}                                                                                            |
| \@inmatherr   | Issued by commands that don't work correctly within math (like \item). There is no real error recovery happening, e.g., the user might get additional errors afterwards. |
|               | 233 \gdef\@inmatherr#1{% 234   \relax 235   \ifmmode 236     \@latex@error{Command \protect#1 invalid in math mode}\@ehc 237   \fi}                                      |
| \@invalidchar | An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.                                                             |
|               | 238 \%def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}                                                                                                   |

As well as the above error commands some error messages are directly coded to save space. The messages already present in L<sup>A</sup>T<sub>E</sub>X2.09 include:

Environment --- undefined

Issued by \begin for undefined environment.

Tab overflow

Occurs in \= when maximum number of tabs exceeded.

\< in mid line

Occurs in \< when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or \marginpar occurring in inner vertical mode.

### 15.3 Tracing

The `trace` package implements the commands `\traceon` and `\traceoff` that work similar to `\tracingall` but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros `\conditionally@traceoff` and `\conditionally@traceon`.

For the kernel code the `trace` package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to `\traceon` we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between `trace` being loaded or not.

```
\conditionally@traceon These are only dummy definitions. For details see the trace package.
\conditionally@traceoff 239 \let\conditionally@traceon\@empty
240 \let\conditionally@traceoff\@empty
241 </2ekernel>
```

## ltpar.dtx

### 16 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` when ever their function needs to be changed for a long time.

#### 16.1 Implementation

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
  - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{\langle VAL \rangle}` command. It's function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `\langle VAL \rangle`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original TeX `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

1. Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace

where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.

2. Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```
1 {*2ekernel}
2 \message{par,}
```

`\@setpar` Initiate a long-term change to `\par`.

`\@par` 3 `\def\@setpar#1{\def\par{\#1}\def\@par{\#1}}`

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```
4 \def\@par{\let\par\@@par\par}
```

`\@restorepar` Restore from a short-term change to `\par`.

```
5 \def\@restorepar{\def\par{\@par}}
```

```
6
```

### 17 Spacing

This section deals with spacing, and line- and page-breaking.

#### 17.1 User Commands

```
\nopagebreak [i] : i = 0,...,4.
 Default argument = 4. Puts a penalty into the vertical list output as follows:
0 : penalty = 0
1 : penalty = \@lowpenalty
2 : penalty = \@medpenalty
3 : penalty = \@highpenalty
4 : penalty = 10000
\pagebreak [i] : same as except negatives of its penalty
\linebreak [i] : analog of the above
\nolinebreak [i] : analog of the above
\samepage : inhibits page breaking most places by setting the following penalties to 10000:
 \interlinepenalty
 \postdisplaypenalty
 \interdisplaylinepenalty
 \@beginparpenalty
 \@endparpenalty
 \@itempenalty
 \@secpenalty
 \interfootnotelinepenalty
\ : initially defined to be \newline
 \\[length] : initially defined to be \vspace{length}\\newline
Note: * adds a \vadjust{\penalty 10000}
 OBSOLETE COMMANDS (which never made it into the manual):
 \obeycr : defines \CR_i == \\relax
 \restorecr : restores \CR_i to its usual meaning.
```

#### 17.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is

the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
\item \label{item:xxx} Item text.
\end{enumerate}
```

### 17.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `\\\*`.
- Reimplement `\\\`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\\`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskip`s include test for zero skip (rather than other tests or no test).

- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.
- Resolve the inconsistency between `\hskip` and `\hskip*`.
- Remove unnecessary `\unskip`s.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix TeX itself.

#### 17.4 The code

```

\ The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

1. efficient execution of plain \\;
2. efficient execution of \\[...];
3. memory use;
4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use \reserved@e and \reserved@f here (other reserved macros are somewhat disastrous).

These changes made \newline even less robust than it had been, so now it is explicitly robust, like \\.

\normalcr The internal definition of the ‘normal’ definition of \\.

```

52 \DeclareRobustCommand\\{%
53 \let \reserved@e \relax
54 \let \reserved@f \relax
55 \@ifstar{\let \reserved@e \vadjust \let \reserved@f \nobreak
56 \xnewline}%
57 \xnewline}
58 \expandafter\let\expandafter\@normalcr
59 \csname\expandafter\gobble\string\\ \endcsname

```

\newline A simple form of the ‘normal’ definition of \\.

```
60 \DeclareRobustCommand\nline{\@normalcr\relax}
```

| \@bsphack                                                        | \@bsphack and \@esphack used by macros such as \index and \begin{@float} ... \end{@float} that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with \@bsphack and end with \@esphack. The macro in question should not create any text, nor change the mode. |
|                                                                  | Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)                                                                                                                                                                                       |
|                                                                  | These are generalised hacks which attempt to do sensible things when ‘invisible commands’ appear in vmode too.                                                                                                                                                                                                                 |
|                                                                  | They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following \addvspace, etc sees the correct glue in \lastskip.                                                                                                                    |
|                                                                  | In fact, these improved versions should be used for other cases of ‘whatsits, thingies etc’ which should be invisible. They are only for commands, not environments (see notes on \@Esphack).                                                                                                                                  |
|                                                                  | BTW, anyone know why the standard hacks are surrounded by \ifmmode\else rather than simply \ifhmode?                                                                                                                                                                                                                           |

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
\def \@bsphack{%
 \relax \ifvmode
 \@savsk \lastskip
 \ifdim \lastskip=\z@
 \else
 \vskip -\lastskip
 \fi
 \else
 \ifhmode
 \@savsk \lastskip
 \@savsf \spacefactor
 \fi
 \fi
}
```

I think that, in vmode, it is the safest to put in a `\nobreak` immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
\def \@esphack{%
 \relax \ifvmode
 \nobreak
 \ifdim \@savsk=\z@
 \else
 \vskip\@savsk
 \fi
 \else
 \ifhmode
 \spacefactor \@savsf
 \ifdim \@savsk>\z@
 \ignorespaces
 \fi
 \fi
 \fi
}
```

For the moment we are going to ignore the vertical versions until they are correct.

```
80 \def\@bsphack{%
81 \relax
82 \ifhmode
83 \@savsk\lastskip
84 \@savsf\spacefactor
85 \fi}
```

- `\@esphack` Companion to `\@bsphack`. If this command is not properly paired with `\@bsphack` one might end up with a low-level TeX error: “BAD spacefactor”. One possible cause is calling `\@bsphack` in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling `\@esphack`. Even if no error is generated that is wrong, because `\@esphack` will then use the saved values for `\@savsk` and `\@savsf` from some earlier invocation of `\@bsphack` which will have nothing to do with the current situation.

```

144 {*}2ekernel}

\@Ephack A variant of \@esphack that sets the @ignore switch to true (as \@esphack used
to do previously). This is currently used only for floats and similar environments.

```

\@vbsphack Another variant which is useful for invisible things which should not live in vmode  
(this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero  
so that the \ignorespaces is put in later. It is not used at present.

```

\def \@vbsphack{ %
 \relax \ifvmode
 \leavevmode
 \@savsk 1sp
 \@savsf \spacefactor
 \else
 \ifhmode
 \@savsk \lastskip

```

```

 \@savsf \spacefactor
 \fi
 \fi
}

```

## 17.5 Vertical spacing

L<sup>A</sup>T<sub>E</sub>X supports the plain T<sub>E</sub>X commands `\smallskip`, `\medskip` and `\bigskip`. However, it redefines them using `\vspace` instead of `\vskip`.

Extra vertical space is added by the command `\addvspace{<skip>}`, which adds a vertical skip of `<skip>` to the document. The sequence `\addvspace{<s1>} \addvspace{<s2>}` is equivalent to `\addvspace{<maximum of s1, s2>}`.

`\addvspace` should be used only in vertical mode, and gives an error if it's not. The `\addvspace` command does *not* add vertical space if `@minipage` is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the `\addpenalty{<penalty>}` command. It works properly when `\addpenalty` and `\addvspace` commands are mixed.

The `@nobreak` switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```

\addvspace{SKIP} ==
BEGIN
 if vmode
 then if @minipage
 else if \lastskip =0
 then \vskip SKIP
 else if \lastskip < SKIP
 then \vskip -\lastskip
 \vskip SKIP
 else if SKIP < 0 and \lastskip >= 0
 then \vskip -\lastskip
 \vskip \lastskip + SKIP
 fi fi fi fi
 else useful error message (CAR).
 fi
END

```

`\@xaddvskip` Internal macro for `\vspace` handling the case that space has previously been added.

```

174 \def\@xaddvskip{%

## 17.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a ‘-’, it still leaves vmode and sets the spacefactor; so use it carefully!

```

297 \DeclareRobustCommand{\nobreakdashes}{%
298 \leavevmode
299 \toks@{}%
300 \def\reserved@a##1{\toks@\expandafter{\the\toks@-}%
301 \futurelet@\let@token \reserved@b}%
302 \def\reserved@b {\ifx@\let@token -%
303 \expandafter\reserved@a
304 \else
305 \setbox\z@\hbox{\the\toks@\nobreak}%
306 \unhbox\z@
307 \spacefactor\sfcode`-
308 \fi}%
309 \futurelet@\let@token \reserved@b
310 }

```

\nobreakspace  
  \@xobeysp This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active ~ to expand to it since this is the documented behaviour of ~. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L<sup>A</sup>T<sub>E</sub>X internal commands.

The braces in the definition of ~ are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep \@xobeysp as it is widely used; so here it is let to the non-robust command \nobreakspace .

```

311 \DeclareRobustCommand{\nobreakspace}{%
312 \leavevmode\nobreak\ }
313 \catcode `~=13
314 \def~{\nobreakspace{}}
315 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

```

\, Used in paragraph mode produces a \thinspace. It has the ordinary definition in math mode. Useful for quotes inside quotes, as in “‘\,‘Foo’, he said.’”

```

316 \DeclareRobustCommand{\,}{%
317 \relax\ifmmode\mskip\thinmuskip\else\thinspace\fi
318 }

```

\@ Placed before a ‘.’, makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

## ltfiles.dtx

### 19 File Handling

The following user commands are defined in this part:

|                    |                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| \document          | (ie \begin{document})                                                                                                                |
|                    | Reads in the .AUX files and \catcode's @ to 12.                                                                                      |
| \nofiles           | Suppresses all file output by setting \@filesw false.                                                                                |
| \includeonly       | \{(NAME1, ... ,NAMEn)\}                                                                                                              |
|                    | Causes only parts NAME1, ... ,NAMEn to be read by their \include commands.                                                           |
| \include           | Works by setting partsw true and setting \@partlist to NAME1, ... ,NAMEn.                                                            |
|                    | \{(NAME)\}                                                                                                                           |
| \input             | Does an \input NAME unless \@partsw is true and NAME is not in \@partlist.                                                           |
|                    | If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.                                     |
|                    | \{(NAME)\}                                                                                                                           |
|                    | The same as TeX's \input, except it allows optional braces around the file name.                                                     |
|                    | In L <sup>A</sup> T <sub>E</sub> X 2 <sub>E</sub> , it also avoids the primitive 'missing file' error, if the file can not be found. |
| \IfFileExists      | \{(NAME)\}\{<then>\}\{<else>\}                                                                                                       |
| \InputIfFileExists | If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .                                                |
|                    | \{(NAME)\}\{<then>\}\{<else>\}                                                                                                       |
|                    | If the file exists on the system, execute <i>then</i> and input <i>NAME</i> otherwise execute <i>else</i> .                          |

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

38 \process@table
39 \let\glb@currsize\empty % Force math initialization.
40 \normalsize
41 \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L<sup>A</sup>T<sub>E</sub>X2.0x and plain T<sub>E</sub>X.)

```

42 \ifx\normalsfcodes\empty
43 \ifnum\sfcodes`.=\@m
44 \let\normalsfcodes\frenchspacing
45 \else
46 \let\normalsfcodes\nonfrenchspacing
47 \fi
48 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this spoint.

```

49 \ifx\document@default\language\m@ne
50 \chardef\document@default\language\language
51 \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```

52 \@noskipsecfalse
53 \let \erefundefined \relax

```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

54 \let\AtBeginDocument\@firstofone
55 \@begindocumenthook

```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```

65 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
66 \global\@maxdepth\maxdepth
67 \global\let\@begindocumenthook\@undefined
68 \ifx\@listfiles\@undefined
69 \global\let\@filelist\relax
70 \global\let\@addtofilelist\@gobble
71 \fi

```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```

63 \gdef\do##1{\global\let ##1\@notprerr}%
64 \@preamblecmds

```

The next line saves tokens and also allows `\@nодокумент` to be used directly to trap preamble errors.

```
65 \global\let \@nодокумент \relax
```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```
66 \global\let\do\noexpand
```

Use of `\AtBeginDocument` hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

**\normalsfcodes** The setting of `\@empty` is just a flag. This command may be defined in a class or package file. If it is still `\@empty` at `\begin{document}` it will be defined to be `\frenchspacing` or `\nonfrenchspacing`, depending on which of those appears to be in effect at that point.

```
126 \let\normalsfcodes\@empty
```

**\nofiles** Set `\@fileswfalse` which suppresses the places where L<sup>A</sup>T<sub>E</sub>X makes `\immediate` writes. The `\makeindex` and `\maketoc` are disabled. `\protected@write` is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a `\whatsit` node is still created, and so spacing is not affected by the `\nofiles` command; to ensure this more generally, the `\if@nobreak` test is needed.

```

127 \def\nofiles{%
128 \@fileswfalse
129 \typeout{No auxiliary output files.^J}%
130 \long\def\protected@write##1##2##3{%

155 \onlypreamble\includeonly

```

`\include` In the definition of `\include`, `\def\reserved@b` changed to `\edef\reserved@b` to be consistent with the `\edef` in `\includeonly`. (Suggested by Rainer Schöpf & Frank Mittelbach. Change made 20 Jul 88.)

Changed definition of `\include` to allow space at end of file name — otherwise, typing `\include{foo }` would cause L<sup>A</sup>T<sub>E</sub>X to overwrite `foo.tex`. Change made 24 May 89, suggested by Rainer Schöpf and Frank Mittelbach

Made `\include` check for being used inside an `\include`'d file, as this will not work and cause surprising results.

## 19.1 Safe Input Macros

\@curr@file File name handling is done by generating a csname from the provided file name (which means that UTF-8 octets gets turned into strings as this is what happens if they appear in a csname due to the code in `utf8.def`). By setting \escapchar to -1 we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes. Somes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

|                 | 371 \def\listfiles{%  372   \let\listfiles\relax  373   \def\@listfiles##1##2##3##4##5##6##7##8##9@@{%  374     \def\reserved@d{\{}%  375     \atfor\reserved@c:=##1##2##3##4##5##6##7##8\do{%  376       \ifx\reserved@c\reserved@d  377         \edef\filename@area{ \filename@area}%  378       \fi}%  379   \def\@dofilelist{%  380     \typeout{^^J *File List*}%  381     \@for\currname:=\@filelist\do{%  382       \filename@parse\currname  383       \edef\reserved@a{%  384         \filename@base.%  385         \ifx\filename@ext\relax tex\else\filename@ext\fi}%  386       \expandafter\let\expandafter\reserved@b  387         \csname ver@\reserved@a\endcsname  388       \expandafter\expandafter\expandafter\@listfiles\expandafter  389         \filename@area\filename@base\\\\\\\\\\\\\\\\\\\\\\@%  390       \typeout{%  391         \filename@area\reserved@a  392         \ifx\reserved@b\relax\else\@spaces\reserved@b\fi}%  393     \typeout{ *****^J}}}  394 } |

The \@filelist will be de-activated if \listfiles does not appear in the preamble. \begin{document} contains code equivalent to the following:

```
\AtBeginDocument{%
 \ifx\@listfiles\@undefined
 \let\@filelist\relax
 \let\@addtofilelist\gobble
 \fi}
 394 \onlypreamble\listfiles

\@dofilelist
 395 \let\@dofilelist\relax
 396 </2ekernel>
```

# File 1

## ltoutenc.dtx

### 20 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OLM, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input{omlenc.def}
\input{t1enc.def}
\input{ot1enc.def}
\input{omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{\command}{{\encoding}}
[{\number}][{\default}]{\commands}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{{\@xxxii 1}}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{\command}{{\encoding}}
[{\number}][{\default}]{\commands}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{\command}{{\encoding}}{\slot}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{\command}{\encoding}{\slot}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{\command}
{\encoding}{\argument}{\slot}
```

This command declares a composite letter, for example in the T1 encoding `\'a` is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{\command}
{\encoding}{\argument}{\text}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@.ht\z@\advance\dimen@-1ex%
 \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{\encoding}{\command}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{\encoding}{\command}{\text}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{\'a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\'{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{\(command)}{\(definition)}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\ProvideTextCommand` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{\(command)}{\(definition)}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{\(command)}{\(encoding)}
\DeclareTextAccentDefault{\(command)}{\(encoding)}
```

are short for:

```
\DeclareTextCommandDefault{\(command)}
 {\UseTextSymbol{\(encoding)}{\(command)}}
\DeclareTextCommandDefault[1]{\(command)}
 {\UseTextAccent{\(encoding)}{\(command)}{\#1}}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

## 20.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L<sup>A</sup>T<sub>E</sub>X will still find the encoding specific definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L<sup>A</sup>T<sub>E</sub>X to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \\$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
 {\UseTextSymbol{TS1}\textdollaroldstyle}
```

## 20.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

## 20.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

|                       |                                                                                                                                                                                                 |

| <code>2ekernel</code> | for the kernel commands.                                                                                                                                                                        |

## 20.4 Definitions for the kernel

### 20.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in .def files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 {*2ekernel}
2 \message{font encodings,}

Far too many macros in one block here!
```

If you say:

```
\DeclareTextCommand{\foo}{T1}...
```

then `\foo` is defined to be `\T1-cmd \foo \T1\foo`, where `\T1\foo` is *one* control sequence, not two! We then call `\newcommand` to define `\T1\foo`.

```
3 \def\DeclareTextCommand{%
4 \dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
6 \dec@text@cmd\providecommand}
7 \def\dec@text@cmd#1#2#3{%
8 \expandafter\def\expandafter#2%
9 \expandafter{%
10 \csname#3-cmd\expandafter\endcsname
11 \expandafter#2%
12 \csname#3\string#2\endcsname
13 }%
14 \let\ifdefinable\rc@ifdefinable
15 \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\ifdefinable` (following its disabling in `\dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17 \let\ifdefinable\rc@ifdefinable
18 \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21 \dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \onlypreamble\DeclareTextCommand
24 \onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is `T1`, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `$X_\copyright$` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from `T1` to `OT1`, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26 \ifx\protect\@typeset@protect
27 \c@inmathwarn#1%
28 \else
29 \noexpand#1\expandafter\@gobble
30 \fi}
31 \def\@changed@cmd#1#2{%
32 \ifx\protect\@typeset@protect
33 \c@inmathwarn#1%
34 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35 \expandafter\ifx\csname ?\string#1\endcsname\relax
36 \expandafter\def\csname ?\string#1\endcsname{%
37 \TextSymbolUnavailable#1%
38 }%
39 \fi
40 \global\expandafter\let
41 \csname\cf@encoding\string#1\expandafter\endcsname
42 \csname ?\string#1\endcsname
43 \fi
44 \csname\cf@encoding\string#1%
45 \expandafter\endcsname
46 \else
47 \noexpand#1%
48 \fi}
49 \gdef\TextSymbolUnavailable#1{%

```

```

50 \@latex@error{%
51 Command \protect#1 unavailable in encoding \cf@encoding%
52 }\@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```

53 \def\@inmathwarn#1{%
54 \ifmmode
55 \@latex@warning{Command \protect#1 invalid in math mode}%
56 \fi}

```

`\DeclareTextCommandDefault`  
`\ProvideTextCommandDefault`

These define commands with encoding ?.

Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```

57 \def\DeclareTextCommandDefault#1{%
58 \DeclareTextCommand#1?}
59 \def\ProvideTextCommandDefault#1{%
60 \ProvideTextCommand#1?}
61 \@onlypreamble\DeclareTextCommandDefault
62 %\@onlypreamble\ProvideTextCommandDefault

```

They require `\?-cmd` to be initialized as `\@changed@cmd`.

```
63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd
```

`\DeclareTextAccent`

This is just a disguise for defining a `TEX accent` command.

```

64 \def\DeclareTextAccent#1#2#3{%
65 \DeclareTextCommand#1{#2}{\add@accent{#3}}}
66 \@onlypreamble\DeclareTextAccent

```

`\add@accent`

To save space this code is shared between all text accents that are set using the `\accent` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

```
67 \def\add@accent#1#2{\hmode@bgroup
```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
68 \let\hmode@start@before@group\@firstofone
69 \setbox\@tempboxa\hbox{\#2%
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\`A` gets the spacefactor of `A` (i.e., 999) rather than the default value of 1000.

```
70 \global\mathchardef\accent@spacefactor\spacefactor}%
71 \accent#1 #2\egroup\spacefactor\accent@spacefactor}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
72 \let\accent@spacefactor\relax
```

```
\hmode@bgroup
```

```
73 \def\hmode@bgroup{\leavevmode\bgroup}
```

`\DeclareTextCompositeCommand`  
`\DeclareTextComposite`  
`\@text@composite`  
`\@text@composite@x`  
`\@strip@args`

Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `\@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}
```

where `...` is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```
74 </2ekernel>
75 <latexrelease>\IncludeInRelease[2017/04/15]{\DeclareTextCompositeCommand}

111 <latexrelease> \def\expandafter\noexpand
112 <latexrelease> \csname#2\string#1\endcsname####1{%
113 <latexrelease> \noexpand\text@composite
114 <latexrelease> \expandafter\noexpand\csname#2\string#1\endcsname
115 <latexrelease> ####1\noexpand\empty\noexpand\text@composite
116 <latexrelease> {##1}}%
117 <latexrelease> \expandafter\reserved@b\expandafter{\reserved@a{##1}}%
118 <latexrelease> \fi
119 <latexrelease> \expandafter\def\csname\expandafter\string\csname
120 <latexrelease> #2\endcsname\string#1-\string#3\empty\endcsname{#4}}
121 <latexrelease>\EndIncludeInRelease
122 {*2ekernel}
123 \onlypreamble\DeclareTextCompositeCommand

```

This all works because:

```
\text@composite T1\foo A\empty\text@composite {...}
```

expands to \\T1\\foo-A if \\T1\\foo-A has been defined, and {...} otherwise.

Note that \text@composite grabs the first token of the argument and puts just that in the csname. This is so that \'{\textit{e}} will work—it checks whether \\T1\\'-\textit{e} is defined (which presumably it isn't) and so expands to {\accent 1 \textit{e}}.

This trick won't always work, for example \'{{\itshape e}} will expand to (with spaces added for clarity):

```
\csname\string T1\ - \string {\itshape e}\ \empty\endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use \csname lookups as a fast way of accessing composites.

This has an unfortunate ‘misfeature’ though, which is that in the T1 encoding, \'{{aa}} produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the \empty is used in \text@composite so that accents will work even when the argument is empty. If you say \'{} then this looks up \\T1\\'-\empty, which ought to be \relax, and so all is well. If we didn't include the \empty, then \'{} would expand to:

```
\csname\string T1\ - \string \endcsname
```

so the \endcsname would be \string'ed and the whole of the rest of the document would be put inside the \csname. This would not be good.

```

124 \def\text@composite#1#2#3\text@composite{%
125 \expandafter\text@composite@x
126 \csname\string#1-\string#2\endcsname}

```

Originally the `\@text@composite@x` macro had two arguments and if #1 was not `\relax` it was executed, otherwise #2 was executed. All this happened within the `\ifx` code so that neither #1 nor #2 could have picked up any additional arguments from the input stream. This has now been changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
127 \def\@text@composite@x#1{%
128 \ifx#1\relax
129 \expandafter\@secondoftwo
130 \else
131 \expandafter\@firstoftwo
132 \fi
133 #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
134 \catcode\z@=11\relax
135 \def\DeclareTextComposite#1#2#3#4{%
136 \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
137 \bgroup
138 \lccode\z@#4%
139 \lowercase{%
140 \egroup
141 \reserved@a ^~@}}
142 \catcode\z@=15\relax
143 \onlypreamble\DeclareTextComposite
144 </2ekernel>
145 <*2ekernel | latexrelease>
146 <latexrelease>\IncludeInRelease{2019/10/01}%
147 <latexrelease> {\UseTextAccent}{Make commands robust}%

```

`\UseTextAccent` `\UseTextSymbol` `\@use@text@encoding` These fragile commands access glyphs from different encodings. They use grotty low-level calls to the font selection scheme for speed, and in order to make sure that `\UseTextSymbol` doesn't do anything which you're not allowed to do between an `\accent` and its glyph.

For a detailed discussion of this reimplementation and its deficiencies, see [pr/3160](#).

181 \@@enc@update}

```

`\hmode@start@before@group` The `\hmode@start@before@group` starts hmode and should be immediately followed by an explicit `{...}`. Its purpose is to ensure that hmode is started before this group is opened. Inside `\add@accent` and `\UseTextAccent` it is redefined to remove this group so that it doesn't conflict with the `\accent` primitive.

For a detailed discussion see pr/3160.

```
182 \let\hmode@start@before@group\leavevemode
```

`\DeclareTextSymbolDefault` Some syntactic sugar. Again, these should probably be optimized for speed.

```

183 \def\DeclareTextSymbolDefault#1#2{%
184 \DeclareTextCommandDefault{#1}{\UseTextSymbol{#2}{#1}}}
185 \def\DeclareTextAccentDefault#1#2{%
186 \DeclareTextCommandDefault{#1}{\UseTextAccent{#2}{#1}}}
187 \onlypreamble\DeclareTextSymbolDefault
188 \onlypreamble\DeclareTextAccentDefault

```

`\UndeclareTextCommand` This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
189 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without e<sub>T</sub>E<sub>X</sub> we can't do anything about that).

```
190 \expandafter\ifx\csname#2\string#1\endcsname\relax
191 \else
```

Else: throw away that declaration.

```
192 \global\expandafter\let\csname#2\string#1\endcsname
193 \undefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command `\foo` would look similar to `\T1-cmd \foo \T1\foo` (three tokens).

Of course, instead of `\T1` one could see a different encoding name; which one depends the encoding for which `\foo` was declared last.

Now assume we have just removed the declaration for `\foo` in `\T1` and the top-level of `\foo` expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset `\foo` within `\T1` instead of getting the default definition for `\foo`. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by `?`.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like `\?-cmd \foo \?\\foo` which is done by the following (readable?) code:

```

194 \expandafter\expandafter\expandafter
195 \ifx\expandafter\@thirdofthree#1\@undefined
196 \expandafter\gdef\expandafter#1\expandafter
197 {\csname ?-cmd\expandafter\endcsname\expandafter
198 #1\csname?\string#1\endcsname}%
199 \fi
200 \fi
201 }
202 \onlypreamble\UndeclareTextCommand

```

#### 20.4.2 Hyphenation

|                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 20.4.3 Miscellania

- a The `\a` command is used to access the accent commands even when they have been redefined (for example by the `tabbing` environment). Its internal name is `\@tabacckludge`.

The `\string` within the `\csname` guards against something like ' being active at the point of use.

```
221 \def\@tabacckludge#1{\expandafter\@changed@cmd
222 \csname\string#1\endcsname\relax}
223 \let\@tabacckludge
```

#### 20.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the T<sub>E</sub>X Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```
224 \DeclareTextAccentDefault{\"}{OT1}
225 \DeclareTextAccentDefault{\'}{OT1}
226 \DeclareTextAccentDefault{\.{}}{OT1}
227 \DeclareTextAccentDefault{\=}{OT1}
228 \DeclareTextAccentDefault{\H}{OT1}
229 \DeclareTextAccentDefault{\^}{OT1}
230 \DeclareTextAccentDefault{\`}{OT1}
231 \DeclareTextAccentDefault{\b}{OT1}
232 \DeclareTextAccentDefault{\c}{OT1}
233 \DeclareTextAccentDefault{\d}{OT1}
234 \DeclareTextAccentDefault{\r}{OT1}
235 \DeclareTextAccentDefault{\u}{OT1}
236 \DeclareTextAccentDefault{\v}{OT1}
237 \DeclareTextAccentDefault{\~}{OT1}
```

Some symbols from OT1:

```
238 \% \DeclareTextSymbolDefault{\AA}{OT1}
239 \DeclareTextSymbolDefault{\AE}{OT1}
240 \DeclareTextSymbolDefault{\L}{OT1}
241 \DeclareTextSymbolDefault{\OE}{OT1}
242 \DeclareTextSymbolDefault{\O}{OT1}
243 \% \DeclareTextSymbolDefault{\aa}{OT1}
244 \DeclareTextSymbolDefault{\ae}{OT1}
245 \DeclareTextSymbolDefault{\i}{OT1}
246 \DeclareTextSymbolDefault{\j}{OT1}

247 \DeclareTextSymbolDefault{\ij}{OT1}
```

```

248 \DeclareTextSymbolDefault{\IJ}{OT1}
249 \DeclareTextSymbolDefault{\l}{OT1}
250 \DeclareTextSymbolDefault{\oe}{OT1}
251 \DeclareTextSymbolDefault{\o}{OT1}
252 \DeclareTextSymbolDefault{\ss}{OT1}
253 \DeclareTextSymbolDefault{\textdollar}{OT1}
254 \DeclareTextSymbolDefault{\textemdash}{OT1}
255 \DeclareTextSymbolDefault{\textendash}{OT1}
256 \DeclareTextSymbolDefault{\textexclamdown}{OT1}
257 %\DeclareTextSymbolDefault{\texthyphenchar}{OT1}
258 %\DeclareTextSymbolDefault{\texthyphen}{OT1}
259 \DeclareTextSymbolDefault{\textquestiondown}{OT1}
260 \DeclareTextSymbolDefault{\textquotedblleft}{OT1}
261 \DeclareTextSymbolDefault{\textquotedblright}{OT1}
262 \DeclareTextSymbolDefault{\textquoteright}{OT1}
263 \DeclareTextSymbolDefault{\textquoteright}{OT1}
264 \DeclareTextSymbolDefault{\textsterling}{OT1}

```

Some symbols from OMS:

```

265 \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
266 \DeclareTextSymbolDefault{\textbackslash}{OMS}
267 \DeclareTextSymbolDefault{\textbar}{OMS}
268 \DeclareTextSymbolDefault{\textbardbl}{OMS}
269 \DeclareTextSymbolDefault{\textbraceleft}{OMS}
270 \DeclareTextSymbolDefault{\textbraceright}{OMS}
271 \DeclareTextSymbolDefault{\textbullet}{OMS}
272 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
273 \DeclareTextSymbolDefault{\textdagger}{OMS}
274 \DeclareTextSymbolDefault{\textparagraph}{OMS}
275 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
276 \DeclareTextSymbolDefault{\textsection}{OMS}
277 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

278 \DeclareTextSymbolDefault{\textless}{OML}
279 \DeclareTextSymbolDefault{\textgreater}{OML}
280 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining \copyright changed, it used to use \expandafter to add braces at the appropriate points.

```

281 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
282 % \expandafter\def\expandafter
283 % \copyright\expandafter{\expandafter{\copyright}}
284 \DeclareTextCommandDefault{\textasciicircum}{\^{}}
285 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
286 \DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
287 \DeclareTextCommandDefault{\textunderscore}{%
288 \leavevmode \kern.06em\vbox{\hrule\@width.3em}}
289 \DeclareTextCommandDefault{\textvisiblespace}{%
290 \mbox{\kern.06em\hrule\@height.3ex}%
291 \vbox{\hrule\@width.3em}%
292 \hbox{\hrule\@height.3ex}}

```

Using `\fontdimen3` in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

293 \DeclareTextCommandDefault{\textellipsis}{%
294 .\kern\fontdimen3\font
295 .\kern\fontdimen3\font
296 .\kern\fontdimen3\font

297 \% \ DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
298 \ DeclareTextCommandDefault{\textregistered}{\textcircled{%
299 \check@mathfonts\fontsize@size\z@\math@fontsfalse\selectfont R}}
300 \ DeclareTextCommandDefault{\texttrademark}{TM}
301 \ DeclareTextCommandDefault{\SS}{\SS}

302 \ DeclareTextCommandDefault{\textordfeminine}{a}
303 \ DeclareTextCommandDefault{\textordmasculine}{o}

```

#### 20.4.5 Math material

Some commands can be used in both text and math mode:

```

304 \ DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}
305 \ DeclareRobustCommand{\{}{\ifmmode\lbrace\else\textbraceleft\fi}
306 \ DeclareRobustCommand{\}}{\ifmmode\rbrace\else\textbraceright\fi}
307 \ DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textparagraph\fi}
308 \ DeclareRobustCommand{\S}{\ifmmode\mathsection\else\textsection\fi}
309 \ DeclareRobustCommand{\dag}{\ifmmode{\textdagger}\else\textdagger\fi}
310 \ DeclareRobustCommand{\ddag}{\ifmmode{\textdaggerdbl}\else\textdaggerdbl\fi}

```

For historical reasons `\copyright` needs {} around the definition in maths.

```

311 \ DeclareRobustCommand{_}{%
312 \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
313 \ DeclareRobustCommand{\copyright}{%
314 \ifmmode\nfss@text{\textcopyright}\else\textcopyright\fi}
315 \ DeclareRobustCommand{\pounds}{%
316 \ifmmode\mathsterling\else\textsterling\fi}
317 \ DeclareRobustCommand{\dots}{%
318 \ifmmode\mathellipsis\else\textellipsis\fi}
319 \let\ldots\dots

```

Default definition of the commabelow accent.

```

320 </2ekernel>
321 <latexrelease>\IncludeInRelease{2015/10/01}{\textcommabelow}{comma accent}%
322 (*2ekernel | latexrelease)
323 \ DeclareTextCommandDefault{\textcommabelow[1]}{%
324 {\hmode@bgroup\oalign{\null#1\crcr\hidewidth\raise-.31ex
325 \hbox{\check@mathfonts\fontsize@size\z@

347 <latexrelease>\expandafter
348 <latexrelease> \let\csname\string\T1\string\c-r\endcsname\@undefined
349 <latexrelease>\EndIncludeInRelease

 Default definition of the commaabove accent(E.G.)..

350 <latexrelease>\IncludeInRelease{2016/02/01}{\textcommaabove}{comma above}%
351 {*2ekernel | latexrelease}
352 \DeclareTextCommandDefault{textcommaabove}[1]{%
353 \hmode@bgroup
354 \oalign{\hskip0pt{%
355 \hidewidth
356 \raise.7ex\hbox{%
357 \check@mathfonts\fontsize\ssf@size\z@\math@fontsfalse\selectfont}%
358 }%
359 \hidewidth\crcr
360 \null\#1\crcr
361 }%
362 \egroup
363 }
364 <latexrelease>\EndIncludeInRelease
365 {/2ekernel | latexrelease}
366 <latexrelease>\IncludeInRelease{0000/00/00}{\textcommaabove}{comma above}%
367 <latexrelease>\let\textcommaabove\@undefined
368 <latexrelease>\expandafter
369 <latexrelease> \let\csname\string\OT1\string\c-g\endcsname\@undefined
370 <latexrelease>\expandafter
371 <latexrelease> \let\csname\string\T1\string\c-g\endcsname\@undefined
372 <latexrelease>\EndIncludeInRelease

```

## 20.5 Definitions for the OT1 encoding

The definitions for the ‘TEX text’ (OT1) encoding.

Declare the encoding.

```

373 {*OT1}
374 \DeclareFontEncoding{OT1}{}{}
```

Declare the accents.

```

375 \DeclareTextAccent{"}{OT1}{127}
376 \DeclareTextAccent{'}{OT1}{19}
377 \DeclareTextAccent{.}{OT1}{95}
```

```

378 \DeclareTextAccent{\=}{OT1}{22}
379 \DeclareTextAccent{\^}{OT1}{94}
380 \DeclareTextAccent{\`}{OT1}{18}
381 \DeclareTextAccent{\~}{OT1}{126}
382 \DeclareTextAccent{\H}{OT1}{125}
383 \DeclareTextAccent{\u}{OT1}{21}
384 \DeclareTextAccent{\v}{OT1}{20}
385 \DeclareTextAccent{\r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\o@align` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```

386 \DeclareTextCommand{\b}{OT1}[1]
387 {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
388 \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
389 \DeclareTextCommand{\c}{OT1}[1]
390 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
391 \else\o@align{\unhbox\z@\crcr\hidewidth\char24\hidewidth}\fi}
392 \DeclareTextCommand{\d}{OT1}[1]
393 {\hmode@bgroup
394 \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

395 \DeclareTextSymbol{\AE}{OT1}{29}
396 \DeclareTextSymbol{\OE}{OT1}{30}
397 \DeclareTextSymbol{\O}{OT1}{31}
398 \DeclareTextSymbol{\ae}{OT1}{26}
399 \DeclareTextSymbol{\i}{OT1}{16}
400 \DeclareTextSymbol{\j}{OT1}{17}
401 \DeclareTextSymbol{\oe}{OT1}{27}
402 \DeclareTextSymbol{\o}{OT1}{28}
403 \DeclareTextSymbol{\ss}{OT1}{25}
404 \DeclareTextSymbol{\textemdash}{OT1}{124}
405 \DeclareTextSymbol{\textendash}{OT1}{123}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

406 \% \DeclareTextSymbol{\textexclamdown}{OT1}{60}
407 \% \DeclareTextSymbol{\textquestiondown}{OT1}{62}
408 \DeclareTextCommand{\textexclamdown}{OT1}{!`}
409 \DeclareTextCommand{\textquestiondown}{OT1}{?`}
410 \% \DeclareTextSymbol{\texthyphenchar}{OT1}{`-}
411 \% \DeclareTextSymbol{\texthyphen}{OT1}{`-}
412 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
413 \DeclareTextSymbol{\textquotedblright}{OT1}{`}
414 \DeclareTextSymbol{\textquotleft}{OT1}{`}
415 \DeclareTextSymbol{\textquotright}{OT1}{`}

```

Some symbols which are faked from others:

```

416 \% \DeclareTextCommand{\aa}{OT1}
417 \% {{\accent23a}}
418 \DeclareTextCommand{\L}{OT1}
419 {\leavevmode\setbox\z@\hbox{L}\hb@xt@wd\z@{\hss\xxxii L}}
420 \DeclareTextCommand{\l}{OT1}
421 {\hmode@bgroup\xxxii l\egroup}

```

```

422 % \DeclareTextCommand{\AA}{OT1}
423 % {\leavevmode\setbox\z@\hbox{h}\dimen@{\ht\z@}\advance\dimen@-1ex%
424 % \rlap{\raise.67\dimen@{\hbox{\char23}}}\AA}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of \DeclareTextCompositeCommand.

```

425 \DeclareTextCompositeCommand{\r}{OT1}{A}
426 {\leavevmode\setbox\z@\hbox{!}\dimen@{\ht\z@}\advance\dimen@-1ex%
427 \rlap{\raise.67\dimen@{\hbox{\char23}}}\AA}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.

```

428 \DeclareTextCommand{\ij}{OT1}{%
429 \nobreak\hskip\z@skip i\kern-0.02em j\nobreak\hskip\z@skip}
430 \DeclareTextCommand{\IJ}{OT1}{%
431 \nobreak\hskip\z@skip I\kern-0.02em J\nobreak\hskip\z@skip}

```

In the OT1 encoding, £ and \$ share a slot.

```

432 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
433 \ifdim \fontdimen@ne\font >\z@
434 \slshape
435 \else
436 \upshape
437 \fi
438 \char`\$\egroup}

439 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
440 \ifdim \fontdimen@ne\font >\z@
441 \itshape
442 \else
443 \fontshape{ui}\selectfont
444 \fi
445 \char`\$\egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L<sup>A</sup>T<sub>E</sub>X internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

446 \DeclareTextComposite{\.\.}{OT1}{i}{\i}
447 \DeclareTextComposite{\.\.}{OT1}{i}{\i}
448 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'\i}
449 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'\i}
450 \DeclareTextCompositeCommand{\^}{OT1}{i}{\^{\i}}
451 \DeclareTextCompositeCommand{\\"}{OT1}{i}{\"{\i}}

```

T1 encoding is given more extensive set of overloads for \c. But here we just adjust \c{g}.

```

452 \ifx\textcommaabove\undefined\else
453 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
454 \fi
455
```

## 20.6 Definitions for the T1 encoding

The definitions for the ‘Extended TeX text’ (T1) encoding.

Declare the encoding.

```
456 {*T1}
457 \DeclareFontEncoding{T1}{}{}
```

Declare the accents.

```
458 \DeclareTextAccent{\`}{T1}{0}
459 \DeclareTextAccent{\'}{T1}{1}
460 \DeclareTextAccent{\^}{T1}{2}
461 \DeclareTextAccent{\~}{T1}{3}
462 \DeclareTextAccent{\"}{T1}{4}
463 \DeclareTextAccent{\H}{T1}{5}
464 \DeclareTextAccent{\r}{T1}{6}
465 \DeclareTextAccent{\v}{T1}{7}
466 \DeclareTextAccent{\u}{T1}{8}
467 \DeclareTextAccent{\=}{T1}{9}
468 \DeclareTextAccent{\.}{T1}{10}
```

Some accents have to be built by hand. Note that `\o@align` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```
469 \DeclareTextCommand{\b}{T1}[1]
470 {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
471 \vbox to .2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
472 \DeclareTextCommand{\c}{T1}[1]
473 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent11 #1%
474 \else{\oalign{\unhbox\z@\crcr
475 \hidewidth\char11\hidewidth}}\fi}
476 \DeclareTextCommand{\d}{T1}[1]
477 {\hmode@bgroup

724 \char 13 % "0D

```

```

725 }%
726 \egroup}
727
```

## 20.8 Definitions for the OML encoding

The definitions for the ‘TEX math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard LATEX text symbols.

Declare the encoding.

```

728 {*OML}
729 \DeclareFontEncoding{OML}{}{}

```

Declare the symbols.

```

730 \DeclareTextSymbol{\textless}{OML}{`<}
731 \DeclareTextSymbol{\textgreater}{OML}{`>}
732 \DeclareTextAccent{\t}{OML}{127} % "7F
733
```

## 20.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘TEX text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The IATEX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;

Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```

734 {*OT4}
735 \DeclareFontEncoding{OT4}{}{}
736 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```

737 \DeclareTextAccent{"}{OT4}{127}
738 \DeclareTextAccent{'}{OT4}{19}
739 \DeclareTextAccent{.}{OT4}{95}
740 \DeclareTextAccent{=}{OT4}{22}
741 \DeclareTextAccent{^}{OT4}{94}
742 \DeclareTextAccent{'}{OT4}{18}
743 \DeclareTextAccent{`}{OT4}{126}
744 \DeclareTextAccent{H}{OT4}{125}
745 \DeclareTextAccent{u}{OT4}{21}
746 \DeclareTextAccent{v}{OT4}{20}
747 \DeclareTextAccent{r}{OT4}{23}

```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```

748 \DeclareTextCommand{\k}{OT4}[1]{%
749 \TextSymbolUnavailable{\k{#1}}#1}

```

In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```
750 \DeclareTextCommand{\b}{OT4}[1]
```

```

751 {\hmode@bgroup\o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
752 \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
753 \DeclareTextCommand{\c}{OT4}[1]
754 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
755 \else{\ooalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}}\fi}
756 \DeclareTextCommand{\d}{OT4}[1]
757 {\hmode@bgroup
758 \o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}. \hidewidth}\egroup}

```

Declare the text symbols.

```

759 \DeclareTextSymbol{\AE}{OT4}{29}
760 \DeclareTextSymbol{\OE}{OT4}{30}
761 \DeclareTextSymbol{\O}{OT4}{31}
762 \DeclareTextSymbol{\L}{OT4}{138}

```

```
”08 = 8
837 \DeclareTextAccent{\capitalbreve}{TS1}{8}
838 \DeclareTextAccent{\capitalmacron}{TS1}{9}
839 \DeclareTextAccent{\capitaldotaccent}{TS1}{10}
```

Tie accents.

The tie accent was borrowed from the cmmi font. The tc fonts now provide four tie accents, the first two are done in the classical way with assymetric glyphs hanging out of their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

” =

```
840 \DeclareTextAccent{\t}{TS1}{26}
841 \DeclareTextAccent{\capitaltie}{TS1}{27}

## 20.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here Cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted form the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L<sup>A</sup>T<sub>E</sub>X LICR commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

```
960 (*TU)
```

In the base interface the Unicode encoding is always known as TU But we parameterise the encoding name to allow for modelling differences in Unicode support by different fonts.

```
961 \providetcommand\UnicodeEncodingName{TU}
```

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

```

## 21 Package files

This file now also contains some packages that provide access to the more specialised encodings.

### 21.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding `FOO`, the package looks to see if the encoding `FOO` has already been declared. If it has not, the file `fooenc.def` is loaded. The default encoding is set to be `FOO`.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
1437 {*package}
```

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```

1438 \def\update@uclc@with@cyrillic{%
1439 \expandafter\def\expandafter\@uclclist\expandafter
1440 {\@uclclist
1441 \cyra\CYRA\cyrabhch\CYRABHCH\cyrabhchdsc\CYRABHCHDSC\cyrabhdze

1464 \CYRYO\cyyru\CYRYU\cyrz\CYRZ\cyyrzds\CYRZDSC\cyyrzh\CYRZH
1465 \cyyrzhdsc\CYRZHDSC}%
1466 \let\update@uclc@with@cyrillic\relax
1467 }

```

Here we process each option:

```

1468 \DeclareOption*{%
1469 \let\encodingdefault\CurrentOption
1470 \edef\reserved@f{%
1471 \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}%
1472 \reserved@f
1473 \InputIfFileExists\reserved@f
1474 {}{\PackageError{fontenc}%
1475 {Encoding file `\'\reserved@f' not found.%}
1476 \MessageBreak
1477 You might have misspelt the name of the encoding}%
1478 {Necessary code for this encoding was not
1479 loaded.\MessageBreak
1480 Thus calling the encoding later on will
1481 produce further error messages.}%
1482 \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the \uclclist:

```

1483 \expandafter\in@\expandafter{\CurrentOption}%
1484 {T2A,T2B,T2C,X2,LCY,OT2}%
1485 \ifin@

```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the \uclclist gets unnecessarily big, slowing down the processing at runtime.

```

1486 \expandafter\in@\expandafter\cyra\expandafter
1487 {\uclclist}%
1488 \ifin@
1489 \else
1490 \update@uclc@with@cyrillic
1491 \fi
1492 \fi
1493 }
1494 \ProcessOptions*

```

```
1495 \fontencoding\encodingdefault\selectfont
```

To save some space we get rid of the macro extending the `\@uclclist` (might have happened already).

```
1496 \let\update@uclc@with@cyrillic\relax
```

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```
1497 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1498 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1499 \global\let\@ifl@ter@0\@ifl@ter
1500 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@0}
1501 {/package}
```

## 21.2 The textcomp package

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

```
1502 {*TS1sty}
```

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

**#5** those TS1 symbols that are also in the ISO-Adobe character set; without `textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-T<sub>E</sub>X world provide only this subset.

**#4** = #5 + `\texteuro`. Most newer fonts provide this.

**#3** = #4 + `\textomega`. Can also be described as  $TS1 \cap (ISO-Adobe \cup MacRoman)$ . (Except for the missing "currency".)

**#2** = #3 + `\textestimated` + `\textcurrency`. Can also be described as  $TS1 \cap Adobe-Western-2$ . This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

**#1** = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

**#0** = full TS1

And here a summary to go in the transcript file:

```
1503 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
1504 \space\space 5 = only ISO-Adobe without}
```

```

1505 \string\textcurrency\MessageBreak
1506 \space\space 4 = 5 + \string\texteuro\MessageBreak
1507 \space\space 3 = 4 + \string\textohm\MessageBreak
1508 \space\space 2 = 3 + \noexpand\textestimated+
1509 \string\textcurrency\MessageBreak
1510 \space\space 1 = TS1 - \noexpand\textcircled-
1511 \string\t\MessageBreak
1512 \space\space 0 = TS1 (full)\MessageBreak
1513 Font families with sub-encoding setting implement\MessageBreak
1514 only a restricted character set as indicated.\MessageBreak
1515 Family '?' is the default used for unknown fonts.\MessageBreak
1516 See the documentation for details@gobble}

```

**\DeclareEncodingSubset** An encoding subset to which a font family belongs is declared by the command **\DeclareEncodingSubset** that takes the major encoding as the first argument (e.g., **TS1**), the family name as the second argument (e.g., **cmr**), and the subset encoding id as a third, (e.g., **0** for **cmr**).

The default encoding subset to use when nothing is known about the current font family is named **?**.

```

1517 \def\DeclareEncodingSubset#1#2#3{%
1518 \c@ifundefined{#1:#2}{%
1519 {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
1520 {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
1521 \c@namedef{#1:#2}{#3}%
1522 \onlypreamble\DeclareEncodingSubset

```

The options for the package are the following:

**safe** for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

**euro** enables the "safe" symbols plus the **\texteuro** command. Most newer fonts provide this.

**full** enables all **TS1** commands; useful only with fonts like EC or CM bright.

**almostfull** same as "full", except that **\textcircled** and **\t** are *not* redefined from their defaults to avoid that commands like **\copyright** suddenly no longer work.

**force** ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

**\iftc@forced** Switch used to implement the **force** option

```
1523 \newif\iftc@forced \tc@forcedfalse
```

This is implemented by defining the default subset:

```

1524 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
1525 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
1526 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
1527 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}

```

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

```
1528 \DeclareOption{force}{\tc@forcedtrue}
```

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

```
1529 \def\tc@errorwarn{\PackageError}
1530 \DeclareOption{warn}{\gdef\tc@errorwarn{\PackageWarning{#1}{#2}}}
1531 \ExecuteOptions{almostfull}
1532 \ProcessOptions\relax
```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute #1{#2}#5 otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
1533 \iftc@forced
```

If the “force” option was given we always use the default for testing against.

```
1534 \def\CheckEncodingSubset#1#2#3#4#5{%
1535 \ifnum #4>%
1536 0\csname #2:?\endcsname
1537 \relax
1538 \expandafter\@firstoftwo
1539 \else
1540 \expandafter\@secondoftwo
1541 \fi
1542 {#1{#2}}{#3}%
1543 #5%
1544 }
```

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\⟨arg2⟩:{current-family}` and if so use that value to test against, otherwise use the default to test against.

```
1545 \else
1546 \def\CheckEncodingSubset#1#2#3#4#5{%
1547 \ifnum #4>%
1548 \expandafter\ifx\csname #2:\f@family\endcsname\relax
1549 0\csname #2:?\endcsname
1550 \else
```

```

1551 \csname #2:\f@family\endcsname
1552 \fi
1553 \relax
1554 \expandafter\@firstoftwo
1555 \else
1556 \expandafter\@secondoftwo
1557 \fi
1558 {#1{#2}}{#3}%
1559 #5%
1560 }
1561 \fi

\tc@subst
1562 \def\tc@subst#1{%
1563 \tc@errorwarn{textcomp}%
% should be latex error if general
% symbol \string#1 not provided by\MessageBreak
% font family \f@family\space
% in TS1 encoding.\MessageBreak Default family used instead}\@eha
1564 \bgroup\fontfamily{textcompsubstdefault}\selectfont#1\egroup
1565 }
1566
1567
1568 }

\textcompsubstdefault
1569 \def\textcompsubstdefault{cmr}

\tc@error \tc@error is going to be used in arg #3 of \CheckEncodingSubset when a symbol
is not available in a certain font family. It gets pass the encoding it normally lives
in (arg one) and the name of the symbol or accent that has a problem.

1570 % error commands take argument:
1571 % #1 symbol to be used
1572 \def\tc@error#1{%
1573 \PackageError{textcomp}%
% should be latex error if general
% accent \string#1 not provided by\MessageBreak
% font family \f@family\space
% in TS1 encoding}\@eha
1574
1575
1576
1577 }

\tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of
\CheckEncodingSubset when a symbol is not available in a certain font family.
Here we produce an Euro symbol by combining a “C” with a “=”.

1578 \def\tc@fake@euro#1{%

1773 \DeclareTextCommandDefault{\textsurd}{%
1774 {\tc@check@symbol2{textsurd}}

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1775 \DeclareTextCommandDefault{\textcircled}%
1776 {\CheckEncodingSubset\UseTextAccent{TS1}}%

```

```

1777 {\UseTextAccent{OMS}}1\textcircled}
1778 \DeclareTextCommandDefault{\t}
1779 {\CheckEncodingSubset\UseTextAccent{TS1}%
1780 {\UseTextAccent{OML}}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimised for this encoding (and not for the default encoding, see section 20.2).

```
1781 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L<sup>A</sup>T<sub>E</sub>X which will prevent the usage of the TS1 versions (see section 20.1 above). So we better get rid of them:

```

1782 \UndeclareTextCommand{\textsterling}{OT1}
1783 \UndeclareTextCommand{\textdollar} {OT1}

```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```

1784 \%UndeclareTextCommand{\textsterling}{OT4}
1785 \%UndeclareTextCommand{\textdollar} {OT4}

```

From the T1 encoding there are two candidates for removal: %<sub>o</sub> and %<sub>oo</sub> since these are both constructed from % followed by a tiny ‘o’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in %■ rather than %<sub>o</sub> while the real glyph (at least for \textperthousand) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for \textperthousand but keeping the one for \textpertenthousand. This will have the effect that with Computer Modern fonts everything will come out (although %<sub>o</sub> and %<sub>oo</sub> are not taken from the same physical font) and with PostScript fonts %<sub>o</sub> will come out correctly while %<sub>oo</sub> will most likely look like %■ — which is probably an improvement over just getting a single ‘■’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ \textpertenthousand.

```

1786 \UndeclareTextCommand{\textperthousand}{T1}
1787 \%UndeclareTextCommand{\textpertenthousand}{T1}

```

### 21.2.1 Supporting oldstyle digits

```

1788 \DeclareRobustCommand\oldstylenums[1]{%
1789 \begingroup
1790 \ifmmode
1791 \mathgroup\symletters #1%
1792 \else
1793 \CheckEncodingSubset\@use@text@encoding{TS1}%
1794 {\PackageWarning{textcomp}%
1795 {Oldstyle digits unavailable for
1796 family \f@family.\MessageBreak
1797 Lining digits used instead}%
1798 \tw@{#1}%
1799 \fi
1800 \endgroup
1801 }

```

### 21.2.2 Subset encoding defaults

For many font families commonly used in the TeX world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

1802 `\iftc@forced \else`

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```
1803 \DeclareEncodingSubset{TS1}{cmr} {0}
1804 \DeclareEncodingSubset{TS1}{cmss} {0}
1805 \DeclareEncodingSubset{TS1}{cmtt} {0}
1806 \DeclareEncodingSubset{TS1}{cmvtt} {0}
1807 \DeclareEncodingSubset{TS1}{cmbr} {0}
1808 \DeclareEncodingSubset{TS1}{cmt1} {0}
1809 \DeclareEncodingSubset{TS1}{ccr} {0}
```

PSNFSS fonts:

```

1851 \DeclareEncodingSubset{TS1}{hlh} {3}
1852 \DeclareEncodingSubset{TS1}{hls} {3}
1853 \DeclareEncodingSubset{TS1}{hlst} {3}
```

The remaining settings for Lucida are conservative: the following fonts contain the `\textohm` character but not the `\texteuro`, i.e., belong to neither subset 4 nor subset 3. If you want to use the `\textohm` with these fonts copy these definition to `textcomp.cfg` and change the subset to 3. However in that case make sure that you do not use the `\texteuro`.

```
1854 \DeclareEncodingSubset{TS1}{hlct} {5}
1855 \DeclareEncodingSubset{TS1}{hlx} {5}
1856 \DeclareEncodingSubset{TS1}{hlce} {5}
1857 \DeclareEncodingSubset{TS1}{hlcn} {5}
1858 \DeclareEncodingSubset{TS1}{hlcw} {5}
1859 \DeclareEncodingSubset{TS1}{hlcf} {5}
```

Other commercial families...

```

## ltcounts.dtx

### 22 Counters and Lengths

Commands for defining and using counters. This file defines:

\newcounter To define a new counter.  
\setcounter To set the value of counters.  
\addtocounter Increase the counter #1 by the number #2.  
\stepcounter Increase a counter by one.  
\refstepcounter Increase a counter by one, also setting the value used by \label.  
\value For accessing the value of the counter as a TeX number (as opposed to \the<counter> which expands to the *printed* representation of <counter>)  
  \arabic{<counter>}: 1, 2, 3, ...  
  \roman{<counter>}: i, ii, iii, ...  
  \Roman{<counter>}: I, II, III, ...  
  \alph{<counter>}: a, b, c, ...  
  \Alpha{<counter>}: A, B, C, ...  
  \fnsymbol{<counter>}: \*, †, ‡, ...  
\counterwithin{<counter>}{<within-counter>}: Resets <counter> whenever <within-counter> is stepped. Also redefines \the<counter> command to produce \the<within-counter>. \arabic{<counter>}. Star form omits redefining the print representation.  
\counterwithout{<counter>}{<within-counter>}: Removes <counter> from the reset list of <within-counter>. Also redefines \the<counter> command to produce \arabic{<counter>}. Star form omits redefining the print representation.

1 (\*2ekernel)

#### 22.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

\c@foo Contains the counter's numerical value. It is defined by \newcount\foocount.  
\thefoo Macro that expands to the printed value of \foocount. For example, if sections are numbered within chapters, and section headings look like  
Section II-3. The Nature of Counters  
then \thesection might be defined by:  
\def\thesection  
  {\@Roman{\c@chapter}-\@arabic{\c@section}}  
\p@foo Macro that expands to a printed 'reference prefix' of counter foo. Any \ref to a value created by counter foo will produce the expansion of \p@foo\thefoo when the \label command is executed. See file ltxref.dtx for an extension of this mechanism.  
\cl@foo List of counters to be reset when foo stepped. Has format \@elt{counterA}\@elt{counterB}\@elt{counterC}.

### NOTE:

`\thefoo` and `\p@foo` must be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentreference` so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `{<foo>}` (with empty reset list), defines `\p@foo` and `\thefoo` to be null. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter{<foo>}{<val>}` : Globally sets `\foocounter` equal to `<val>`.

```
2 \def\setcounter#1#2{%
3 \@ifundefined{c@#1}%
4 {\@nocounterr{#1}}%
5 {\global\csname c@#1\endcsname#2\relax}}
```

`\addtocounter{<foo>}{<val>}` Globally increments `\foocounter` by `<val>`.

```
6 \def\addtocounter#1#2{%
7 \@ifundefined{c@#1}%
8 {\@nocounterr{#1}}%
9 {\global\advance\csname c@#1\endcsname #2\relax}}
```

`\newcounter{<newctr>}[<oldctr>]` Defines `<newctr>` to be a counter, which is reset when counter `<oldctr>` is stepped. If `<newctr>` already defined produces ‘`c@newctr` already defined’ error.

```
10 \def\newcounter#1{%
11 \expandafter\@ifdefinable \csname c@#1\endcsname
12 {\@definecounter{#1}}%
13 \@ifnextchar[{}]{}}
```

`\value{<ctr>}` produces the value of counter `<ctr>`, for use with a `\setcounter` or `\addtocounter` command.

```
14 \def\value#1{\csname c@#1\endcsname}
```

`\@newctr`

```
15 \def\@newctr#1[#2]{%
16 \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}
```

`\stepcounter{<stepcounter>}` Globally increments counter `\c@FOO` and resets all subsidiary counters.

```
17 \def\stepcounter#1{%
```

```

18 \addtocounter{#1}\@ne
19 \begingroup
20 \let\@elt\@stpeit
21 \csname cl@#1\endcsname
22 \endgroup}

\@stpeit Rather than resetting the “within” counter to zero we set it to -1 and then run
\stepcounter that moves it to 0 and also initiates resetting the next level down.

| \@fnsymbol  | Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.                                                                                                                                                                                                                                                                                                                                                                                                    |
|             | This macro is another example of an ever recurring problem in TeX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an \edef or \write where an \ifmmode test would be executed prematurely. Hence in the implementation below, \@fnsymbol is not robust in itself but the parts doing the actual typesetting are.                        |
|             | In the case of \@fnsymbol we make use of the robust command \TextOrMath which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a \relax token if run under regular TeX, which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use eTeX as engine for LATEX (as recommended) this unfortunate side effect is not present. |

| 149         | *2ekernel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| \TextOrMath | When using regular TeX, we make this command robust so that it always selects the correct branch in an \ifmmode switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic \IeC from inputenc but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell.                                                                              |

However, users of e<sub>T</sub><sub>E</sub>X will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running e<sub>T</sub><sub>E</sub>X but making sure not to permanently turn `\protected` into `\relax`.

```
150 </2ekernel>
151 <latexrelease>\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
152 {*2ekernel | latexrelease}
153 \begingroup\expandafter\expandafter\expandafter\endgroup
154 \expandafter\ifx\csname protected\endcsname\relax
```

In case of ordinary T<sub>E</sub>X we define `\TextOrMath` as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
155 \DeclareRobustCommand\TextOrMath{%
156 \ifmmode \expandafter\@secondoftwo
157 \else \expandafter\@firstoftwo \fi}
158 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
159 \else
```

For e<sub>T</sub><sub>E</sub>X the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
160 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
161 \ifmmode \expandafter\@secondoftwo
162 \else \expandafter\@firstoftwo \fi}
163 \edef\TextOrMath#1#2{%
164 \expandafter\noexpand\csname TextOrMath\space\endcsname
165 {#1}{#2}}
166 \fi
167 </2ekernel | latexrelease>
168 <latexrelease>\EndIncludeInRelease
169 <latexrelease>\IncludeInRelease{0000/00/00}{\TextOrMath}{\TextOrMath}%
170 <latexrelease>\let\TextOrMath\@undefined
171 <latexrelease>\EndIncludeInRelease
172 {*2ekernel}

173 </2ekernel>
```

## File o

# ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of the L<sup>A</sup>T<sub>E</sub>X ‘New’ Font Selection Scheme.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

## 24 Preliminary macros

We define a number of macros that will be used later.

\@nomath \@nomath is used by most macros that will have no effect in math mode. It issues a warning message.

```
1 {*2ekernel}
2 \def\@nomath#1{\relax\ifmmode
3 \@font@warning{Command \noexpand#1invalid in math mode}\fi}
```

\no@alphabet@error The macro \no@alphabet@error is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The \relax at the beginning is necessary to prevent T<sub>E</sub>X from scanning too far in certain situations.

```
4 \gdef\no@alphabet@error#1{\relax \ifmmode
5 \@latex@error{Math\space alphabet\space identifier\space
6 \noexpand#1is\space undefined\space in\space math\space
7 version\space ‘\math@version’}%
8 {Your\space requested\space math\space alphabet\space
9 is\space undefined\space in\space the\space current\space
10 math\space version.^^JCheck\space the\space spelling\space
11 or\space use\space the\space \noexpand\SetMathAlphabet\space
12 command.}
13 \fi}
```

\new@mathgroup \mathgroup We also give a new name to \newfam and \fam to avoid verbal confusion (see the introduction).<sup>2</sup>

```
14 \% \def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@n}
15 \let\mathgroup\fam
16 \% \let\newfam\new@mathgroup
17 \@onlypreamble\new@mathgroup
```

<sup>2</sup>For the same reason it seems advisable to \let\fam and \newfam equal to \relax, but this is commented out to retain compatibility to existing style files.

## 25 Macros for setting up the tables

```
\DeclareFontShape The macro \DeclareFontShape takes 6 arguments:
18 \def\DeclareFontShape{\begingroup
First we restore the catcodes of all characters used in the syntax.
19 \nfss@catcodes
We use \expandafter \endgroup to restore catcode in case something goes wrong
with the argument parsing (suggested by Tim Van Zandt)

\DeclareFontShape
20 \expandafter\endgroup
21 \DeclareFontShape@}
22 \def\DeclareFontShape@#1#2#3#4#5#6{
23 \expandafter\ifx\csname #1#2\endcsname\relax
24 \@latex@error{Font family '#1#2' unknown}\@eha
25 \else
26 \expandafter
27 \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand
28 \csname #5\endcsname}
29 \def\reserved@a{#6}
30 \global
31 \expandafter\let\csname#5\expandafter\endcsname
32 \ifx\reserved@a\empty
33 \empty
34 \else
35 \reserved@a
36 \fi
37 \fi
38 }

\DeclareFixedFont Define a direct font switch that avoids all overhead.
39 \def\DeclareFixedFont#1#2#3#4#5#6{
40 \begingroup
41 \math@fontsfase
42 \everymath@size{
43 \fontsize{#6}\z@
44 \usefont{#2}{#3}{#4}{#5}
45 \global\expandafter\let\expandafter#1\the\font
46 \endgroup
47 }

\do@subst@correction
48 \def\do@subst@correction{
49 \xdef\subst@correction{
50 \font@name
51 \global\expandafter\font
52 \csname \curr@fontshape/\f@size\endcsname
53 \noexpand\fontname\font
54 }\relax}
Calling \subst@correction after the current group means calling it after we have
loaded the substitution font which is done inside a group.
55 \aftergroup\subst@correction
56 }
```

```
\DeclareFontFamily
```

```
57 \def\DeclareFontFamily#1#2#3{%
58 % \@tempswafalse
59 % \def\reserved@b{#1}%
60 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%
61 % \ifx\reserved@b\reserved@c \@tempswatrue\fi}%
62 % \cdp@list
63 % \if@tempswa
64 \@ifundefined{T@#1}%
65 {%
66 \@latex@error{Encoding scheme '#1' unknown}\@eha
67 }%
68 }
```

Now we have to define the macro  $\langle \#1 \rangle + \langle \#2 \rangle$  to contain #3. But since most of the time #3 will be empty we use `\let` in a tricky way rather than a simple `\def` since this will save internal memory. We store the argument #3 in a temporary macro `\reserved@a`.

```
69 \def\reserved@a{#3}%

```

We compare `\reserved@a` with `\@empty`. If these two are the same we `\let` the ‘extra’ macro equal to `\@empty` which is not the same as doing a `\let` to `\reserved@a` — the latter would blow one extra memory location rather than reusing the one from `\@empty`.

```
70 \global
71 \expandafter\let\csname #1+#2\expandafter\endcsname
72 \ifx \reserved@a\@empty
73 \@empty
74 \else \reserved@a
75 \fi
76 }
77 }
```

`\cdp@list` We initialize the code page list to be empty.

```
78 \let\cdp@list\@empty
79 \onlypreamble\cdp@list
```

```
\cdp@elt
```

```
80 \let\cdp@elt\relax
81 \onlypreamble\cdp@elt
```

```
\DeclareFontEncoding
```

```
82 \def\DeclareFontEncoding{%
```

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```
83 \begingroup
84 \nfss@catcodes
85 \expandafter\endgroup
86 \DeclareFontEncoding@}
87 \onlypreamble\DeclareFontEncoding
```

```

88 \def\DeclareFontEncoding#1#2#3{%
89 \expandafter
90 \ifx\csname T@#1\endcsname\relax
91 \def\cdp@elt{\noexpand\cdp@elt}%
92 \xdef\cdp@list{\cdp@list\cdp@elt{#1}%
93 {\default@family}{\default@series}%
94 {\default@shape}}%

```

To support encoding dependent commands (like accents) we initialise the command `\(encoding)-cmd` to be `\@changed@cmd`. (See `ltoutenc.dtx` for details.)

```

95 \expandafter\let\csname#1-cmd\endcsname\@changed@cmd
96 \else
97 \font@info{Redeclaring font encoding #1}%
98 \fi
99 \global\@namedef{T@#1}{#2}%
100 \global\@namedef{M@#1}{\default@M#3}%

```

Keep a record of the last encoding being declared:

```

101 \xdef\LastDeclaredEncoding{#1}%
102 }
103 \onlypreamble\DeclareFontEncoding@

```

`\LastDeclaredEncoding` The last encoding being declared by `\DeclareFontEncoding`.  
`104 \def\LastDeclaredEncoding{}`

#### `\DeclareFontSubstitution`

```

105 \def\DeclareFontSubstitution#1#2#3#4{%
106 \expandafter
107 \ifx\csname T@#1\endcsname\relax
108 \latex@error{Encoding scheme '#1' unknown}\@eha
109 \else
110 \begingroup

```

We loop through the `\cdp@list` and rebuild it anew in `\toks@` thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in `\reserved@a` since it might just be `\LastDeclaredEncoding` that is passed as #1.

```

111 \edef\reserved@a{#1}%
112 \toks@{%
113 \def\cdp@elt##1##2##3##4{%
114 \def\reserved@b{##1}%
115 \ifx\reserved@a\reserved@b

```

Here we use the new defaults but we use `##1` (i.e., the encoding name already stored previously) since we know that it is expanded.

```

116 \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
117 \else

```

If `\reserved@a` and `\reserved@b` differ then we simply copy from the old list to the new.

```

118 \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
119 \fi}%
120 \cdp@list

```

```

121 \xdef\cdp@list{\the\toks@}%
122 \endgroup
123 \global
124 \cnamedef{D@#1}{%
125 \def\default@family{#2}%
126 \def\default@series{#3}%
127 \def\default@shape{#4}%
128 }%
129 \fi
130 }
131 \onlypreamble\DeclareFontSubstitution

\DeclareFontEncodingDefaults
132 \def\DeclareFontEncodingDefaults#1#2{%
133 \ifx\relax#1\else
134 \ifx\default@T\empty\else
135 \font@info{Overwriting encoding scheme text defaults}%
136 \fi
137 \gdef\default@T{#1}%
138 \fi
139 \ifx\relax#2\else
140 \ifx\default@M\empty\else
141 \font@info{Overwriting encoding scheme math defaults}%
142 \fi
143 \gdef\default@M{#2}%
144 \fi
145 }
146 \onlypreamble\DeclareFontEncodingDefaults

\default@T
\default@M
147 \let\default@T\empty
148 \let\default@M\empty

\DeclarePreloadSizes
149 \def\DeclarePreloadSizes#1#2#3#4#5{%
150 \ifundefined{T@#1}%
151 {\@latex@error{Encoding scheme '#1' unknown}\@eha}%
152 }%

```

Don't know at the moment what this group here does!

```

153 \begingroup

```

We define a macro `\reserved@f3` that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the token , (comma).

```

154 \def\reserved@f##1, {%

```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the TeXbook: if the argument is empty the `\if` will select the first clause and `\let \reserved@f` equal to `\relax`. (We use the > character here since it cannot appear in font file names.)

```

155 \if>##1>%

```

---

<sup>3</sup>We cannot use `\tempa` since it is needed in `\pickup@font`.

```

156 \let\reserved@f\relax
157 \else
158 \xdef\font@name{\csname#1/#2/#3/#4##1\endcsname}%
159 \pickup@font

```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```

160 \global\expandafter\let\font@name\relax
161 \fi

```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the ‘extra’ macro for this font.

```

162 \reserved@f}%

```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```

163 \reserved@f#5,%
164 \endgroup
165 }%
166 }
167 \onlypreamble\DeclarePreloadSizes

```

`\ifmath@fonts` We need a switch to decide if we have to switch math fonts. For this purpose we provide `\ifmath@fonts` that can be set to true or false by the `\S@...` macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```

168 \newif\ifmath@fonts \math@fontstrue

```

`\DeclareMathSizes` `\DeclareMathSizes` takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right `\S@...` macro.

```

169 \def\DeclareMathSizes{%
170 \@ifstar{\@DeclareMathSizes\math@fontstrue}{%

214 \onlypreamble\QDeclareMathSizes

```

## 26 Selecting a new font

### 26.1 Macros for the user

\fontencoding \f@encoding As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros \f@family, \f@series, and \f@shape, resp. We use \edef's so that the arguments can also be macros.

```

215 \QDeclareRobustCommand\fontencoding[1]{%
216 \expandafter\ifx\csname T@\#1\endcsname\relax
217 \Q@latex@error{Encoding scheme '#1' unknown}\Qeha
218 \else
219 \edef\f@encoding{\#1}%
220 \ifx\cf@encoding\f@encoding

```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a \selectfont in-between we can save processing by making sure that \enc@update is \relax.

```

221 \let\enc@update\relax
222 \else
```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```

223 \let\enc@update\@enc@update
224 \fi
225 \fi
226 }
```

`\@enc@update`

```
227 \def\@enc@update{%
```

When `\@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```

228 \expandafter
229 \let
230 \csname\cf@encoding -cmd\endcsname
231 \@changed@cmd
```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```

232 \expandafter
233 \let
234 \csname\f@encoding-cmd\endcsname
235 \@current@cmd
```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```

236 \default@T
237 \csname T@\f@encoding\endcsname
```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```

238 \csname D@\f@encoding\endcsname
239 \let\enc@update\relax
240 \let\cf@encoding\f@encoding
241 }
```

`\enc@update` The default action in `\selectfont` is to do nothing.

```
242 \let\enc@update\relax
```

`\fontfamily`

```

243 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{\#1}}
244 \DeclareRobustCommand\fontseries[1]{\edef\f@series{\#1}}
245 \DeclareRobustCommand\fontshape [1]{\edef\f@shape{\#1}}
```

`\fontshape` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

```

246 \DeclareRobustCommand\usefont[4]{\fontencoding{\#1}\fontfamily{\#2}%
247 \fontseries{\#3}\fontshape{\#4}\selectfont
248 \ignorespaces}
```

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\linespread</code>    | The command <code>\linespread</code> changes the current <code>\baselinestretch</code> by calling <code>\set@fontsize</code> . The values for <code>\f@size</code> and <code>\f@baselineskip</code> will be left unchanged.                                                                                                                                                                                                                                                                                                                                   |
|                             | 249 <code>\DeclareRobustCommand\linespread[1]</code><br>250 <code>{\set@fontsize{\#1}\f@size\f@baselineskip}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>\fontsize</code>      | We also define a macro that allows to specify a size. In this case, however, we also need the value of <code>\baselineskip</code> . As the first argument to <code>\set@fontsize</code> we pass the current value of <code>\baselinestretch</code> . This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using <code>\renewcommand</code> . If we would pass the internal <code>\f@linespread</code> such a change would be effectively overwritten by a size change. |
|                             | 251 <code>\DeclareRobustCommand\fontsize[2]</code><br>252 <code>{\set@fontsize\baselinestretch{\#1}{\#2}}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>\f@linespread</code>  | This macro holds the current internal value for <code>\baselinestretch</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <code>\mathversion</code>   | <code>\mathversion</code> takes the math <i>version</i> name as argument, defines <code>\math@version</code> appropriately and switches to the font selected forcing a call to <code>\glb@settings</code> if the <i>version</i> is known to the system.                                                                                                                                                                                                                                                                                                       |
| <code>\math@version</code>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                             | 269 <code>\DeclareRobustCommand\mathversion[1]</code><br>270 <code>{\@nomath\mathversion}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

```

271 \expandafter\ifx\csname mv@\#1\endcsname\relax
272 \@latex@error{Math version '#1' is not defined}\@eha\else
273 \edef\math@version{\#1}%

```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting `\glb@currsize` to an invalid value since this will trigger the setup when the formula starts.

```
274 \gdef\glb@currsize{}%
```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```

275 \aftergroup\glb@settings
276 \fi}

```

If `TEX` would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in `LATEX` the use of `$` (as the primitive `TEX` command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a `$` couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct `TEX` function must be hidden.

Anyway, since we don't have this and won't have it in `LATEX 2 $\varepsilon$`  we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

|                                   |                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>\frozen@everymath</code>    | New internal names for <code>\everymath</code> and <code>\everydisplay</code> .                          |
| <code>\frozen@everydisplay</code> | <pre> 277 \let\frozen@everymath\everymath 278 \let\frozen@everydisplay\everydisplay </pre>               |
| <code>\everymath</code>           | Now we provide now user hooks that will be called in the frozen internals.                               |
| <code>\everydisplay</code>        | <pre> 279 \newtoks\everymath 280 \newtoks\everydisplay </pre>                                            |
| <code>\frozen@everymath</code>    | Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.     |
|                                   | <pre> 281 \frozen@everymath = {\check@mathfonts 282                         \the\everymath} </pre>       |
| <code>\frozen@everydisplay</code> | Ditto for the display hook.                                                                              |
|                                   | <pre> 283 \frozen@everydisplay = {\check@mathfonts 284                         \the\everydisplay} </pre> |
| <code>\curr@math@size</code>      | This holds locally the current math size.                                                                |
|                                   | <pre> 285 \let\curr@math@size\empty </pre>                                                               |

## 26.2 Macros for loading fonts

- \pickup@font The macro \pickup@font which is used in \selectfont is very simple: if the font name is undefined (i.e. not known yet) it calls \define@newfont to load it.
- ```
286 \def\pickup@font{%
287     \expandafter \ifx \font@name \relax
288         \define@newfont
289     \fi}
```
- \split@name \pickup@font assumes that \font@name is set but it is sometimes called when \f@family, \f@series, \f@shape, or \f@size may have the wrong settings (see, e.g., the definition of \getanddefine@fonts). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define \split@name which takes the font name as a list of characters of \catcode 12 (without the backslash at the beginning) delimited by the special control sequence \nil. This is not very complicated: we first ensure that / has the right \catcode
- ```
290 {\catcode`\/=12
```
- and define \split@name so that it will define our private \f@encoding, \f@family, \f@series, \f@shape, and \f@size macros.
- ```
291 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
292                                         \def\f@family{#2}%
293                                         \def\f@series{#3}%
294                                         \def\f@shape{#4}%
295                                         \def\f@size{#5}}}
```
- \curr@fontshape Abbreviation which may get removed again for speed.
- ```
296 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}
```
- \define@newfont Now we can tackle the problem of defining a new font.
- ```
297 \def\define@newfont{%
```
- We have already mentioned that the token list that \split@name will get as argument must not start with a backslash. To reach this goal we will set the \escapechar to -1 so that the \string primitive will not generate an escape character. To keep this change local we open a group. We use \begingroup for this purpose since \define@newfont might be called in math mode, and an empty \bgroup...\egroup would add an empty Ord atom to the math list and thus affect the spacing.
- Also locally redefine \typeout so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.
- ```
298 \begingroup
299 \let\typeout\@font@info
300 \escapechar\m@ne
```
- Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four \expandafter’s so that \font@name is expanded first, then \string, and finally \split@name.
- ```
301   \expandafter\expandafter\expandafter
302     \split@name\expandafter\string\font@name\@nil
```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```
303 %     \expandafter\ifx
304 %         \csname\curr@fontshape\endcsname \relax
305 %             \try@load@fontshape % try always
306 %         \fi
307     \expandafter\ifx
308         \csname\curr@fontshape\endcsname \relax
309     \wrong@fontshape\else
```

To allow substitution we call the `curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```
310 %     \csname\curr@fontshape\endcsname
311     \extract@font\fi
```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```
312 \endgroup}
313 \def\try@load@fontshape{%
314     \expandafter
315     \ifx\csname\f@encoding+\f@family\endcsname\relax
316         \@font@info{Trying to load font information for
317             \f@encoding+\f@family}%
318     \global\expandafter\let
319         \csname\f@encoding+\f@family\endcsname\empty
```

We predefine this combination to be `\empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```
318     \global\expandafter\let
319         \csname\f@encoding+\f@family\endcsname\empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
320     \nfss@catcodes
321     \let\nfss@catcodes\relax
```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```
322     \edef\reserved@a{%
323         \lowercase{%
324             \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}}}
325     \reserved@a\relax
326     {\@input{\f@encoding\f@family.fd}}%
327 \fi}
```

- `\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```
328 \def\nfss@catcodes{%
```

We start by making @ a letter and ignoring all blanks and newlines.

```
329     \makeatletter
330     \catcode`\ 9%
331     \catcode`\^I9%
332     \catcode`\^M9%
```

Then we set up \, {, }, # and % in case an .fd file is loaded during a verbatim environment.

```
333     \catcode`\\z@
334     \catcode`\{\@ne
335     \catcode`\}\tw@
336     \catcode`\#%
337     \catcode`\^%
338     \catcode`\%14%
```

The we make sure that the important syntax parts have the right `\catcode`.

```
339     \@makeother\<%
340     \@makeother\>%
341     \@makeother\*%
342     \@makeother\.%%
343     \@makeother\-%%
344     \@makeother\/%%
345     \@makeother\[%%
346     \@makeother\]%
347     \@makeother\%
348     \@makeother\%
349     \@makeother\%"%
350 }
```

`\DeclareErrorFont` Declare the last resort shape! We assume that in this fontshape there is a 10pt font but it doesn't really matter. We only loose one macro name if the assumption is false. But at least the font should be there!

```
351 </2ekernel>
352 {*2ekernel | latexrelease}
353 <latexrelease>\IncludeInRelease{2019/10/01}%

383 <latexrelease>}
384 <latexrelease>\EndIncludeInRelease
385 <*2ekernel>
386 \onlypreamble\DeclareErrorFont

```

\wrong@fontshape Before we come to the macro `\extract@font` we have to take care of unknown `\curr@fontshape` combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails TeX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

387 </2ekernel>
388 <latexrelease>\IncludeInRelease{2015/01/01}{\wrong@fontshape}%
389 <latexrelease>          {Font substitution in preamble}%
390 <*2ekernel | latexrelease>
391 \def\wrong@fontshape{%
392   \csname D@\f@encoding\endcsname % install defaults if in math

```

We remember the wanted `\curr@fontshape` combination which we will need in a moment.

```

393   \edef\reserved@a{\csname\curr@fontshape\endcsname}%
394   \ifx\last@fontshape\reserved@a
395     \errmessage{Corrupted NFSS tables}%
396     \error@fontshape
397   \else

```

Then we warn the user about the mess and set the shape to its default.

```
398   \let\f@shape\default@shape
```

If the combination is not known, try the default *series*.

```
399   \expandafter\ifx\csname\curr@fontshape\endcsname\relax
400     \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
401      \expandafter
402          \ifx\csname\curr@fontshape\endcsname\relax
403              \let\f@family\default@family
```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all .fd files involved in substitution are loaded at \begin{document}.

```
404      \begingroup
405          \try@load@fontshape
406      \endgroup
407      \fi \fi
408  \fi
```

At this point a valid \curr@fontshape combination must have been found. We inform the user about this fact.

The \expandafter\string here stops TeX adding the space that it usually puts after command names in messages. The similar construction with \undefined just produces ‘undefined’, but saves a few tokens.

\@wrong@font@char is locally redefined in \UseTextSymbol from its normal (empty) definition, to report the symbol generating the font switch.

```
409      \@font@warning{Font shape ‘\expandafter\string\reserved@a’
410          \expandafter\@gobble\string\@undefined\MessageBreak
411          using ‘\curr@fontshape’ instead\@wrong@font@char}%
412      \global\let\last@fontshape\reserved@a
```

We change \@defaultsubs to produce a warning at the end of the document.

The macro \@defaultsubs is initially \relax but gets changed here if some default font substitution happens. It is then executed in \enddocument.

```
413      \gdef\@defaultsubs{%
414          \@font@warning{Some font shapes were not available, defaults
415          substituted.\@gobbletwo}}%
```

If we substitute a \curr@fontshape combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally \let the macro corresponding to the wanted combination equal to its substitution. This requires the use of four \expandafter’s since \csname...\endcsname has to be expanded before \reserved@a (i.e. the requested combination), and this must happen before the \let is executed.

```
416      \global\expandafter\expandafter\expandafter\let
417          \expandafter\reserved@a
418          \csname\curr@fontshape\endcsname
```

Now we can redefine \font@name accordingly. This *must* be done globally since it might occur in the group opened by \define@newfont. If we would this definition were local the closing \endgroup there would restore the old meaning of \font@name and then switch to the wrong font at the end of \selectfont although the correct font was loaded.

```
419      \xdef\font@name{%
420          \csname\curr@fontshape\f@size\endcsname}%
```

The last thing this macro does is to call `\pickup@font` again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```

421     \pickup@font}
422 </2ekernel | latexrelease>
423 <latexrelease>\EndIncludeInRelease
424 <latexrelease>\IncludeInRelease{0000/00/00}{\wrong@fontshape}%

453 <latexrelease>        \xdef\font@name{%
454 <latexrelease>            \csname\curr@fontshape/\f@size\endcsname}%
455 <latexrelease>        \pickup@font}
456 <latexrelease>\EndIncludeInRelease
457 <2ekernel>

```

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
458 \let\@wrong@font@char\empty
```

`\@defaultsubs` See above.

```
459 \let\@defaultsubs\relax
```

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the T_EXbook, p. 382).

```
460 \def\strip@prefix#1>{}
```

27 Assigning math fonts to *versions*

\install@mathalphabet This is just another name for \gdef but we can redefine it if necessary later on.
461 \let\install@mathalphabet\gdef

\math@fonts
462 \let\math@fonts\empty

\select@group \select@group has four arguments: the new *math alphabet identifier* (a control sequence), the *math group number*, the extra macro for math mode and the \curr@fontshape definition macro name. We first check if we are in math mode.

463 \% \def\select@group#1#2#3{\relax\ifmmode
We do these things locally using \begingroup instead of \bgroup to avoid the appearance of an empty Ord atom on the math list.
464 \% \begingroup
We set the math fonts for the *family* in question by calling \getanddefine@fonts in the correct environment.
465 \% \escapechar\m@ne
466 \% \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
We globally select the math fonts...
467 \% \globaldefs\one \math@fonts
... and close the group to restore \globaldefs and \escapechar.
468 \% \endgroup
As long as no *size* or *version* change occurs the *math alphabet identifier* should simply switch to the installed *math group* instead of calling \select@group unnecessarily. So we globally redefine the first argument (the new *math alphabet identifier*) to expand into a \mathgroup switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro.
The original code for the end of \select@group was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the *math alphabet identifier* and then calling the new definition to switch to the wanted *math group*. Now we define the *math alphabet identifier* as a call to the \use@mathgroup command.

```
469 \% \xdef#1{\noexpand\use@mathgroup\noexpand#2%  
470 \% {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro \mv@*version* so that it calls \getanddefine@fonts directly in future as well.

We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```
471 %     \expandafter\extract@alph@from@version
472 %         \csname mv@\math@version\expandafter\endcsname
473 %     \expandafter{\number\csname c@mv@\math@version\endcsname}%
474 %     #1%
475 %     \stepcounter{mv@\math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
476 %\expandafter #1\fi}
```

`\extract@alph@from@version` We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

```
477 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```
\install@mathalphabet<math alphabet identifier> #3{%
  Definitions for }#3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```
478 \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (`##1`), the following tokens in its third argument (`##3`), and the replacement text for the math alphabet identifier #3 in its second argument. (`##2`). This is then recorded for later use in a temporary macro `\reserved@b`.

```
479 \def\reserved@b{##2}{%
```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (`##1` and `##3`) and the yet to build new definitions for the math alphabet identifier #3.

```
480 \def\reserved@c####1{\gdef#1{##1####1##3}}%
```

Then we execute our auxiliary macro.

```
481 \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>
  <math group number><math extra part>
  <curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
482 \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
483      \reserved@c{%
484          \getanddefine@fonts{#2}##2%
485          \install@mathalphabet#3{%
486              \relax\ifmmode \else \non@alpherr#3\fi
487              \use@mathgroup##1{#2}}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
488      \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
489          \use@mathgroup##1{#2}}}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
490      \expandafter\reserved@a\reserved@b\@nil
491      }
```

`\math@bgroup` `\math@egroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begin{group}` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
492 \let\math@bgroup\bgroup
493 \def\math@egroup#1{\egroup}
```

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mthscale.sty`.

```
494 \gdef\calculate@math@sizes{%
495     \@font@info{Calculating\space math\space sizes\space for\space
496         size\space <\f@size>}}%
497     \dimen@\f@size \p@
498     \tempdima \defaultscriptratio \dimen@
499     \dimen@ \defaultscriptscriptratio \dimen@
500     \expandafter\xdef\csname S@\f@size\endcsname{%
501         \gdef\noexpand\sf@size{\f@size}%
502         \gdef\noexpand\sf@size{\strip@pt\tempdima}%
503         \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
504         \noexpand\math@fonttrue}}
```

`\defaultscriptratio` The default ratio for math sizes is:

`\defaultscriptscriptratio` 1 to `\defaultscriptratio` to `\defaultscriptscriptratio`.

By default this is 1 to .7 to .5.

```
505 \def\defaultscriptratio{.7}
506 \def\defaultscriptscriptratio{.5}
```

`\noaccents@` If we don’t have a definition for `\noaccents@` we provide a dummy.

```
507 \ifx\noaccents@\undefined
508     \let\noaccents@\empty
509 \fi
```

`\showhyphens` The `\showhyphens` command must be redefined since the version in `plain.tex` uses `\tenrm`. We have also made some further adjustments for its use in L^AT_EX.

```
510 </2ekernel>
511 <latexrelease>\IncludeInRelease{2017/01/01}{\showhyphens}%
512 <latexrelease>                                {XeTeX support for \showhyphens}%
513 <*2ekernel | latexrelease>
514 \ifx\XeTeXcharclass\undefined
```

Version for engines other than Xe^TE_X.

```

522     \color@endgroup}%
523 \else
```

Xe^TE_X version. When using system fonts Xe^TE_X reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that \tracingonline is locally zero.

```
524 \DeclareRobustCommand\showhyphens[1]{%
525   \setbox0\vbox{%
526     \usefont{TU}{lmr}{m}{n}%

ltfsstrc.dtx

28 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the **tracefnt** package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the **tracefnt** package is loaded.

debugshow In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the **tracefnt** package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

29 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 {*driver}
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 
```

30 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 <*package>
12 %\NeedsTeXFormat{LaTeX2e}
13 %\ProvidesPackage{tracefnt}[??/?/? v?.??
14 %                                         Standard LaTeX package (font tracing)]
15 </package>
```

The `debug` module makes use of commands contained in a special package file named `trace.sty`.⁴

```
16 <+debug> \input trace.sty
```

31 Handling Options

\tracingfonts Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 <*2ekernel>
18 \def\tracingfonts{%
19   \@font@warning{Command \noexpand\tracingfonts
20     not provided.\MessageBreak
21     Use the ‘tracefnt’ package.\MessageBreak Command found:}%
22   \count@}
23 </2ekernel>
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24 <*package,trace,debug>
25 \newcount\tracingfonts
26 \tracingfonts=0
27 </package,trace,debug>
```

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28 <*package>
29 \DeclareOption{errorshow}{%
30   \def\@font@info#1{%
31     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}{}%
```

⁴This package is not in distribution at the moment (and probably doesn't work any longer). Think of this part of the code as being historical artefacts.

```

32           {LaTeX Font Info: \space\space\space#1} }%
33 \def\@font@warning#1{%
34     \GenericInfo{(Font)}\@spaces\@spaces\@spaces\space\space}%
35         {LaTeX Font Warning: #1} }%
36 }

37 \DeclareOption{warningshow}{%
38     \def\@font@info#1{%
39         \GenericInfo{Font}\@spaces\@spaces\@spaces\space\space}%
40             {LaTeX Font Info: \space\space\space#1} }%
41     \def\@font@warning#1{%
42         \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
43             {LaTeX Font Warning: #1} }%
44 }

45 \DeclareOption{infoshow}{%
46     \def\@font@info#1{%
47         \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
48             {LaTeX Font Info: \space\space\space#1} }%
49     \def\@font@warning#1{%
50         \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%
51             {LaTeX Font Warning: #1} }%
52 }

53 \DeclareOption{loading}{%
54     \tracingfonts\tw@
55 }

56 \DeclareOption{debugshow}{%
57     \ExecuteOptions{infoshow}%
58     \tracingfonts\thr@@
59 }

60 \DeclareOption{pausing}{%
61     \def\@font@warning#1{%
62         \GenericError
63             {(Font)}\@spaces\@spaces\@spaces\space\space}%
64             {LaTeX Font Warning: #1} }%
65             {See the LaTeX Companion for details.} }%
66             {I'll stop for every LaTeX Font Warning because
67                 you requested\MessageBreak the 'pausing' option
68                 to the tracefnt package.} }%
69 }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 </package>

```

We also need a default definition inside the kernel:

```

73 <*2ekernel>
74 \def\@font@info#1{%
75     \GenericInfo{Font}\@spaces\@spaces\@spaces\space\space}%
76         {LaTeX Font Info: \space\space\space#1} }%
77 \def\@font@warning#1{%
78     \GenericWarning{Font}\@spaces\@spaces\@spaces\space\space}%

```

```

79          {LaTeX Font Warning: #1} }%
80 </2ekernel>

```

32 Macros common to fam.tex and tracefnt.sty

In the first versions of `tracefnt.dtx` some macros of `fam.dtx`⁵ were redefined to include the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `ltfss.dtx`.

32.1 General font loading

`\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```

81 (*2ekernel | package)
82 \def\extract@font{%
83   \get@external@font

```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```
84   \global\expandafter\font\font@name\external@font\relax
```

When tracing we typeout the internal and external font name.

```

85 (*trace)
86   \ifnum \tracingfonts >@ne
87     @font@info{External font '\external@font'
88       loaded as\MessageBreak \font@name}\fi
89 
```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```
90   \font@name \relax
```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```

91   \csname \f@encoding+\f@family\endcsname
92   \csname\curr@fontshape\endcsname
93   \relax
94 }
95 
```

The `\relax` at the end needs to be explained. This is inserted to prevent TeX from scanning too far when it is executing the replacement text of the loading code macros.

`\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```

96 (*2ekernel)
97 \def\get@external@font{%

```

⁵This file is currently not distributed in documented form. Its code is part of `ltfss.dtx`.

We don't know the external font name at the beginning.

```
98   \let\external@font\empty
99   \edef\font@info{\expandafter\expandafter\expandafter\string
100     \csname \curr@fontshape \endcsname}%
101   \try@size@range
```

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It "knows about" `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```
102  \ifx\external@font\empty
103    \try@size@substitution
104    \ifx\external@font\empty
105      \@latex@error{Font \expandafter \string\font@name\space
106        not found}\@eha
107      \error@fontshape
108      \get@external@font
109    \fi\fi
110 }
111 </2ekernel>
```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```
112 <*2ekernel | package>
113 \DeclareRobustCommand\selectfont
114   {%
```

When `debug` is specified we actually want something like 'undebug'. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```
115 <+debug> \pushtracing
116 <+debug> \ifnum\tracingfonts<4 \tracingoff
117 <+debug> \else \tracingon\p@selectfont \fi
```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```
118   \ifx\f@linespread\baselinestretch \else
119     \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```
120   \xdef\font@name{%
121     \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro `\pickup@font` which will load the font if necessary.

```
122   \pickup@font
```

Then we select the font.

```
123   \font@name
```

If `\tracingfonts` is greater than 2 we also show the font switch. We do this before `\glb@settings` is called since this macro might redefine `\font@name`.

```
124 <*trace>
```

```

125      \ifnum \tracingfonts>\tw@
126          \@font@info{Switching to \font@name}\fi
127 
```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
128      \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
129      \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

130 <+debug> \poptracing
131 }
```

`\set@fontsize` The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```

132 \def\set@fontsize#1#2#3{%
133     \defaultunits\@tempdimb#2pt\relax\@nnil
134     \edef\f@size{\strip@pt\@tempdimb}%
135     \defaultunits\@tempskipa#3pt\relax\@nnil
136     \edef\f@baselineskip{\the\@tempskipa}%
137     \edef\f@linespread{#1}%

```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
138     \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
139     \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```

140     \baselineskip\f@baselineskip\relax
141     \baselineskip\f@linespread\baselineskip
142     \normalbaselineskip\baselineskip

```

then to set up a new `\strutbox`

```

143     \setbox\strutbox\hbox{%
144         \vrule\@height.7\baselineskip
145             \@depth.3\baselineskip
146             \@width\z@}%

```

We end with a bit of tracing information.

```

147 <+trace>
148     \ifnum \tracingfonts>\tw@
149         \ifx\f@linespread\empty
150             \let\reserved@a\empty
151         \else
152             \def\reserved@a{\f@linespread x}%
153         \fi
154         \@font@info{Changing size to \f@size/\reserved@a
155             \f@baselineskip}%
156         \aftergroup\type@restoreinfo \fi
157 
```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```
158      \let\size@update\relax}%
159 }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let!`

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
160 \let\size@update\relax
```

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```
161 (*trace)
162   \def\type@restoreinfo{%
163     \ifx\f@linespread\empty
164       \let\reserved@a\empty
165     \else
166       \def\reserved@a{\f@linespread x}%
167     \fi
168     \font@info{Restoring size to
169                 \f@size/\reserved@a\f@baselineskip}}
170 }/trace}
```

`\glb@settings` The macro `\glb@settings` globally selects all math fonts for the current size if necessary.

```
171 \def\glb@settings{%
```

When `\glb@settings` gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to `\math@fonts`. But this happens only if the `math@fonts` switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the `S@...` macro is not defined we have to first calculate the three sizes.

```
172   \expandafter\ifx\csname S@\f@size\endcsname\relax
173     \calculate@math@sizes
174   \fi
```

The effect of this is that `\calculate@math@sizes` may or may not define the `S@...` macro. In the first case the next time the same size is requested this macro is used, otherwise `\calculate@math@sizes` is called again. This also sets the `math@fonts` switch. If it is true we must switch the math fonts.

```
175   \csname S@\f@size\endcsname
176   \ifmath@fonts
177 (*trace)
178     \ifnum \tracingfonts>\tw@
179       \font@info{Setting up math fonts for
180                 \f@size/\f@baselineskip}\fi
181 }/trace}
```

Inside a group we execute the macro for the current math *version*. This sets `\math@fonts` to a list of `\textfont...` assignments. `\getanddefine@fonts` (which may be called at this point) needs the `\escapechar` parameter to be set to `-1`.

```
182      \begingroup
183          \escapechar\m@ne
184          \csname mv@\math@version \endcsname
```

Then we set `\globaldefs` to 1 so that all following changes are done globally. The math font assignments recorded in `\math@fonts` are executed and `\glb@currsize` is set equal to `\f@size`. This signals that the fonts for math in this size are set up.

```
185      \globaldefs\@ne
186      \math@fonts
187      \let \glb@currsize \f@size
188      \endgroup
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\@ne` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```
189      \the\every@math@size
```

Otherwise we announce that the math fonts are not set up for this size.

```
190 {*trace}
191     \else
192         \ifnum \tracingfonts>\tw@
193             \font@info{No math setup for
194                 \f@size/\f@baselineskip}\fi
195 {/trace}
196     \fi
197 }
198 {/2ekernel | package}
```

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```
199 {/2ekernel}
200 \def\baselinestretch{1}
```

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should be global updates, local changes will have weird effects.

```
201 \newtoks\every@math@size
202 \every@math@size={}
203 {/2ekernel}
```

32.2 Math fonts setup

32.2.1 Outline of algorithm for math font sizes

T_EX uses the the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in

an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{ \small for all $b$ and $c\in Z$}$
```

Here the inner formulae b and $c \in Z$ are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

1. At any point in the document the global variable `\gbl@currsize` contains the point size for which the math fonts currently are set up.
2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsize`.
 - (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\gbl@settings` is executed again in the outer formula, so that the old setup is automatically restored.
 - (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

32.2.2 Code for math font size setting

\check@mathfonts In the \check@mathfonts macros we implement the steps 2 to 4 except that instead of a switch the macro \init@restore@glb@settings is used.

```

204 (*2ekernel | package)
205 \def\check@mathfonts{%
206   \ifx \glb@currsize \f@size
207   {*trace}
208     \ifnum \tracingfonts>\thr@@

249          \glb@settings
250      \fi
251  \endgroup
252 }

```

32.2.3 Other code for math

\use@mathgroup The `\use@mathgroup` macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```

253 \def\use@mathgroup#1#2{\relax\ifmmode
254 <*trace>
255   \ifnum \tracingfonts>\tw@
256     \count@#2\relax
257     \@font@info{Using \noexpand\mathgroup
258       (\the\count@) #2}\fi
259 </trace>

```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place `#1` (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want *math alphabet identifier* but will expand into `\empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

260   \math@bgroup
261     \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
262       #1\fi
263     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn't called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually an macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```
264   \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in *AMS-T_EX* macros for placing accents.

\math@egroup If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup` we change the `\math@egroup` command a bit to display the current *math group number* after it closes the scope of *math alphabet* with `\endgroup`.

```

265 <*trace>
266   \ifx\math@bgroup\bgroup
267     \def\math@egroup{\#1\egroup}

```

```

268      \ifnum \tracingfonts>\tw@%
269      @font@info{Restoring \noexpand\mathgroup%
270          (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271      }\fi}
272  \fi
273 
```

\getanddefine@fonts \getanddefine@fonts has two arguments: the *(math group number)* and the *family/series/shape* name as a control sequence.

```

274 \def\getanddefine@fonts#1#2{%
First we turn of tracing when \tracingfonts is less than 4.
275 <+debug> \pushtracing
276 <+debug> \ifnum\tracingfonts<4 \tracingoff
277 <+debug> \else \tracingon\getanddefine@fonts \fi

278 {*trace}
279   \ifnum \tracingfonts>\tw@%
280   \count@#1\relax
281     @font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
282             \string#2 \tf@size/\sf@size/\ssf@size}\fi
283 
```

We append the current \tf@size to #2 to obtain the font name.⁶ Again, font@name is defined globally, for the reasons explained in the description of \wrong@fontshape.

```

284 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%
Then we call \pickup@font to load it if necessary. We remember the internal
name as \textfont@name.
285 \pickup@font \let\textfont@name\font@name
Same game for \scriptfont and \scriptscriptfont:
286 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
287 \pickup@font \let\scriptfont@name\font@name
288 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
289 \pickup@font
Then we append the new \textfont... assignments to the \math@fonts.
290 \edef\math@fonts{\math@fonts%
291           \textfont#1\textfont@name
292           \scriptfont#1\scriptfont@name
293           \scriptscriptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

294 <+debug> \poptracing
295   }
296 
```

⁶One might ask why this expansion does not generate a macro name that starts with an additional \ character. The solution is that \escapechar is set to -1 before \getanddefine@fonts is called.

33 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces its argument.

```
297 {*2ekernel}
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
299   \ifx\reserved@a\@nil \expandafter\@gobble
300   \else \expandafter\@firstofone\fi}
```

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nnil`.

```
301 \def\remove@to@nnil#1\@nil{}
302 \def\remove@angles#1>\set@simple@size@args
303 \def\remove@star#1*{#1}
```

`\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
304 \def\extract@sizefn#1#2\@nil{%
305   \if>#2>\set@size@funct@args#1\@nil
306     \let\sizefn@info\@empty
307   \else\expandafter\set@size@funct@args\remove@star#2\@nil
308     \def\sizefn@info{#1}\fi
309 }
```

`\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nil{%
  \set@simple@size@args#3<#4\@nil
  \execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nil
```

#1 will contain all characters before `<12*>`, #2 will be empty, #3 will be exactly `cmss12`, and #3 will be `17>cmss17`. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument argument set to empty and its mandatory argument set to `cmss12` by `\set@simple@size@args`. As we discussed earlier, the effect of the default size function is to load the given external font (`cmss12`) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list `\font@info`. And the simple definition of `\extract@fontinfo` we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define `\extract@fontinfo` as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \ifnot@nil{#3}{%
    {\set@simple@size@args#3<#4\@nnil
     \execute@size@function{#2}}%
  }{}}
```

How does this work? We call `\extract@fontinfo` via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending `<12*>\@nil<\@nnil`. If the size ('12' in this case) appears in `\font@info` everything works as explained above, the only difference being that argument #4 of `\extract@fontinfo` additionally gets the tokens `<12*>\@nil<\@nnil`. However, if the size is not found everything up to the final `<12*>` is in argument #1, #3 gets `\@nil`, and #2 and #4 are empty. The macro `\ifnot@nil` will discard the calls to `\set@simple@size@args` and `\execute@size@function`, and hence `\font@info` will continue to be equal to `\@empty`. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in `\set@simple@size@args` below.

The macros are hidden inside other control sequences so that we have to build `\extract@fontinfo` in several steps.

So here's the actual definition of `\extract@font` in `\try@simple@size`.

310 % % this could be replaced by `\try@size@range` making the subst slower!

311 `\def\try@simple@size{%`

`\reserved@a` is made an abbreviation for the head of the definition of the macro `\extract@fontinfo`.

312 `\def\reserved@a{\def\extract@fontinfo####1}{%`

Now we can define `\extract@fontinfo`. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the * character.

313 `\expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%`

314 `\ifnot@nil{##2}{%`

```

315      {\set@simple@size@args##2##3\@nnil
316          \execute@size@function\sizefn@info
317      }{%

```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```

318      \expandafter\expandafter
319      \expandafter\extract@fontinfo\expandafter\font@info
320      \expandafter<\f@size>\@nil<\@nnil
321 }

```

- `\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character `<`. By starting the definition as follows,

```
322 \def\set@simple@size@args#1<{%
```

parameter `#1` is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character `<` cannot appear in `#1`) by calling `\remove@angles` for empty `#1` and `\extract@sizefn` otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by `\remove@to@nnil`. Note also the use of Kabelschacht's method.

```

323      \if<#1<%
324          \expandafter\remove@angles
325      \else
326          \extract@sizefn#1*\@nil
327          \expandafter\remove@to@nnil
328      \fi}

```

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macors for extraction of size range specification.

- `\extract@rangefontinfo` `\extract@rangefontinfo` goes through a font shape definition in the input until it recognizes the tokens `<\@nil->`. It looks for font ranges with font size functions. Its operation is rather simple: it discards everything up to the next size specification and passes this on to `\is@range` for inspection. The specification (parameter `#2` is inserted again, in case it is needed later).

```

329 \def\extract@rangefontinfo#1<#2>{%
330     \is@range#2->\@nil#2>}

```

- `\is@range` `\is@range` is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls `\extract@rangefontinfo` to continue the search. Otherwise it calls `\check@range` to check the requested size against the specified range.

From the way `\is@range` is called inside `\extract@rangefontinfo` we see that `#2` is the character `>` if the size specification found is a simple one (as it does not contain a `-` character). This is checked easily enough and `\extract@rangefontinfo` called again. Note that the extra tokens inserted after the `\@nil` in the call to `\is@range` appear at the beginning of the first argument to `\extract@rangefontinfo` and are hence ignored.

```

331 \def\is@range#1-#2\@nil{%
332   \if>#2\expandafter\check@singl\else
333     \expandafter\check@range\fi}

```

\check@range \check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil \font@info is exhausted and we can stop searching.

```

334 \def\check@range#1-#2>#3<#4\@nnil{%
335   \ifnot@nil{#3}{%

```

If #3 wasn't \@nil we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```

336   \def\reserved@f{\extract@range\fontinfo<#4\@nnil}%

```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If \upper@bound is zero after the assignment we set it to \maxdimen (upper open range). We need to use a *(dimen)* register for the scan since we may have a decimal number as the boundary.

```

337   \upper@bound0#2\p@
338   \ifdim\upper@bound=\z@\ \upper@bound\maxdimen\fi

```

Now we check the upper boundary against \f@size. If it is larger or equal than \f@size this range is no good and we have to recurse.

```

339   \ifdim \f@size \p@<\upper@bound

```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If \f@size is smaller than the boundary we have to recurse.

```

340   \lower@bound0#1\p@
341   \ifdim \f@size \p@<\lower@bound
342     \else

```

If both tests are passed we can try executing the size function.

```

343   \set@simple@size@args#3<#4\@nnil
344   \execute@size@function\sizefn@info

```

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.

```

345   \ifx\external@font\@empty
346   \else
347     \let\reserved@f\@empty
348   \fi
349   \fi
350   \fi
351   \reserved@f}%

```

\lower@bound We use two dimen registers \lower@bound and \upper@bound to store the lower and upper endpoints of the range we found.

```

352 \newdimen\lower@bound
353 \newdimen\upper@bound

```

\check@single \check@single takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

354 \def\check@single#1>#2<#3\@nil{%

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

355 \def\reserved@f{\extract@rangefontinfo<#3\@nil}%

Now we check the the size against \f@size. If it is not equal \f@size it is no good and we have to recurse.

356 \ifdim \f@size \p@=#1\p@

Otherwise if this test is passed we can try executing the size function.

357 \set@simple@size@args#2<#3\@nil
358 \execute@size@function\sizefn@info

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.

359 \ifx\external@font\@empty
360 \else
361 \let\reserved@f\@empty
362 \fi
363 \fi
364 \reserved@f}

\set@size@funct@args This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token \@nil.

365 \def\set@size@funct@args{\@ifnextchar[%
366 \set@size@funct@args@{\set@size@funct@args@[]}}
367 \def\set@size@funct@args@[#1]#2\@nil{
368 \def\mandatory@arg{#2}
369 \def\optional@arg{#1}
370 }/2ekernel}

\DeclareSizeFunction This function defines a new size function hiding the internal from the designer. The body of the size function may use \optional@arg and \mandatory@arg denoting the optional and mandatory argument that may follow the size specification <...>.

371 /*2ekernel*/
372 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
373 @onlypreamble\DeclareSizeFunction
374 }/2ekernel

\execute@size@function This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a \relax).

375 /*2ekernel | package*/
376 \def\execute@size@function#1{
377 /*trace*/
378 \@ifundefined{s@fct@#1}{
379 \errmessage{Undefined font size function #1}}

```

380           \s@fct@}%
381           {\csname s@fct@#1\endcsname}%
382 
```

```

383 </trace>
384 {-trace}     \csname s@fct@#1\endcsname
384 }
385 
```

```
/2ekernel | package)
```

\try@size@range This macro tries to find a suitable range for requested size (specified by `\f@size`) in `\font@info`. All the relevant action is done in `\extract@rangefontinfo`. All that needs to be done is to stuff in the token list in `\font@info` so that `\extract@rangefontinfo` can inspect it. Note the `<-*\@nil><` token at the end to stop scanning.

```

386 {*2ekernel}
387 \def\try@size@range{%
388   \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
389 }
```

\try@size@substitution This is the last thing that can be tried. If the desired `\f@size` is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```
390 \gdef\try@size@substitution{%
```

First we do some initializations. `\@tempdimb` will hold the difference between the wanted size and the best solution found so far, so we initialise it with `\maxdimen`. The macro `\best@size` will hold the best size found, nothing found is indicated by the empty value.

```

391   \@tempdimb \maxdimen
392   \let \best@size \empty
```

Now we loop over the specification

```

393   \expandafter \try@simples \font@info <\number\@M>\@nil<\@nnil
394 }
```

\font@submax The macro `\font@submax` records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at `\end{document}`. The macro `\fontsubfuzz` contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```

395 \def\font@submax{0pt}
396 \def\fontsubfuzz{.4pt}
397 
```

```
/2ekernel}
```

```
398 {+package}\def\fontsubfuzz{0pt}
```

\try@simples `\try@simples` goes through a font shape definition in the input until it recognizes the tokens `<*\@nil><`. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```

399 {*2ekernel}
400 \gdef\try@simples#1<#2>{%
401   \tryif@simple#2->\tryif@simple}
```

\tryis@simple `\tryis@simple` is similar to `\is@range`. If it sees a simple size, it checks it against the value of `\f@size` and sets `\lower@font@size` or `\higher@font@size`. In the latter case, it stops the iteration. By adding `<\number\@M>` at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
402 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for `\reserved@f` first:

```
403   \let \reserved@f \try@simples
404   \if>#2%
```

If so, it compares it to the value of `\f@size`. This is done using a dimen register since there may be fractional numbers.

```
405     \dimen@ #1\p@
406     \ifdim \dimen@<\OM\p@
```

If `\dimen@` is `\OM\p@` we have reached the end of the fontspec (hopefully) otherwise we compare the value with `\f@size` and compute in `\@tempdimc` the absolute value of the difference between the two values.

```
407     \ifdim \f@size\p@<\dimen@
408       \@tempdimc \dimen@
409       \advance\@tempdimc -\f@size\p@
410     \else
411       \@tempdimc \f@size\p@
412       \advance\@tempdimc -\dimen@
413     \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in `\@tempdimc` is smaller) we have found a size which is a better approximation so we make it the `\best@size` and adjust `\@tempdimb`.

```
414     \ifdim \@tempdimc<\@tempdimb
415       \@tempdimb \@tempdimc
416       \def \best@size{#1}%
417     \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called `\subst@size`.

```
418   \else
```

`\subst@size` This macro substitutes the size recorded in `\best@size` for the unavailable size `\f@size`. `\font@submax` records the maximum difference between desired size and selected size in the whole run.

```
419 % \%subst@size          %% coded inline
420 % \%def\subst@size{%
421   \ifx \external@font\empty
422     \ifx \best@size\empty
423     \else
424       \ifdim \@tempdimb>\font@submax \relax
425         \xdef \font@submax {\the\@tempdimb}%
426       \fi
427       \let \f@user@size \f@size
428       \let \f@size \best@size
429       \ifdim \@tempdimb>\fontsubfuzz\relax
430         \font@warning{Font\space shape\space
431           '\curr@fontshape'\space in\space size\space
432           <\f@user@size>\space not\space available\MessageBreak
433           size\space <\f@size>\space substituted}%
```

```

434      \fi
435      \try@simple@size
436      \do@subst@correction
437      \fi
438 \fi
439 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

440      \let \reserved@f \remove@to@nnil
441      \fi
442 \fi

```

If it's a range iterate also.

```
443 \reserved@f}
```

33.1 Sizefunctions

In the following we define some useful size functions.

- \s@fct@** This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

444 \DeclareSizeFunction{}{\empty@sfcnt\@font@warning}
445 \DeclareSizeFunction{s}{\empty@sfcnt\@font@info}

446 \def\empty@sfcnt#1{%
447     \@tempdimb \f@size\p@
448     \ifx\optional@arg\empty
449     \else
450         \@tempdimb \optional@arg\@tempdimb
451         #1{Font\space shape\space ‘\curr@fontshape’\space
452             will\space be\MessageBreak
453             scaled\space to\space size\space \the\@tempdimb}%
454     \fi
455     \edef\external@font{\mandatory@arg\space at\the\@tempdimb}}

```

- \s@fct@gen** This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

456 \DeclareSizeFunction{gen}{\gen@sfcnt\@font@warning}
457 \DeclareSizeFunction{sgen}{\gen@sfcnt\@font@info}

458 \def\gen@sfcnt{%
459     \edef\mandatory@arg{\mandatory@arg\f@size}%
460     \empty@sfcnt}

```

- \s@fct@genb** This size function is similar to `gen`, but for fonts where the size is encoded in the font name in centipoins, as in the DC fonts version 1.2. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

461 \DeclareSizeFunction{genb}{\genb@sfcnt@\font@warning}
462 \DeclareSizeFunction{sgenb}{\genb@sfcnt@\font@info}
463 \def\genb@sfcnt{%
464   \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@0}%
465   \empty@sfcnt}

```

\genb@x The auxiliary macros \genb@x and \genb@y are used to convert the \f@size into centipoins.

```

466 \def\genb@x#1.#2.#3@@{\two@digits{#1}\genb@y#200@@}
467 \def\genb@y#1#2#3@@{#1#2}

```

\s@fct@sub This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.

```

468 \DeclareSizeFunction{sub}{\sub@sfcnt@\font@warning}
469 \DeclareSizeFunction{ssub}{\sub@sfcnt@\font@info}
470 \def\sub@sfcnt#1{%
471   \edef\mandatory@arg{\f@encoding/\mandatory@arg}%

```

Next action is split the arg into its individual components and allow for a late font shape load.

```

472   \begingroup
473     \expandafter\split@name\mandatory@arg/\@nil
474     \try@load@fontshape
475   \endgroup

```

Then we record the current \f@size since it may get clobbered.

```

476 \let\f@user@size\f@size

```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to \error@fontshape.

```

477 \expandafter
478 \ifx\csname\mandatory@arg\endcsname\relax
479   \errmessage{No\space declaration\space for\space
480     shape\space \mandatory@arg}%
481   \error@fontshape
482 \else

```

Otherwise we warn the user about the substitution taking place.

```

483   #1{Font\space shape\space ‘\curr@fontshape’\space in\space
484     size\space <\f@size>\space not\space available\MessageBreak
485     Font\space shape\space ‘\mandatory@arg’\space tried\space
486     instead}%
487   \expandafter\split@name\mandatory@arg/\@nil
488 \fi

```

Then we restart the font specification scan by calling \get@external@font.

```

489 \edef\f@size{\f@user@size}%
490 \get@external@font

```

Finally \do@subst@correction is called to get the font name right.

```

491 \do@subst@correction
492 }

```

\s@fct@subf The **subf** size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
493 \DeclareSizeFunction{subf}{\subf@sfcnt@\font@warning}
494 \DeclareSizeFunction{ssubf}{\subf@sfcnt@\font@info}
495 \def\subf@sfcnt#1{%
496     #1{Font\space shape\space '\curr@fontshape'\space in\space
497         size\space \f@size\space not\space available\MessageBreak
498         external\space font\space '\mandatory@arg'\space used}%
499     \empty@sfcnt#1%
500 }
```

\s@fct@fixed The **fixed** size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```
501 \DeclareSizeFunction{fixed}{\fixed@sfcnt@\font@warning}
502 \DeclareSizeFunction{sfixed}{\fixed@sfcnt@\font@info}
503 \def\fixed@sfcnt#1{%
504     \ifx\optional@arg\empty
505         \let\external@font\mandatory@arg
506     \else
507         \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
508     \fi
509     #1{External\space font\space '\external@font'\space loaded\space
510         for\space size\MessageBreak
511         <\f@size>}%
512 }
513 </2ekernel>
```

File q

ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was “current” only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via `latexrelease` package so that backward compatibility remains ensured for very old documents.

```

File r

ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

34 Interface Commands

\in@ \in is a utility macro with two arguments. It determines whether its first argument occurs in its second and sets the switch \ifin@ accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```
1 {*2ekernel}
2 \def\in@#1#2%
3 {%
4   \begingroup
5   \def\in@##1#1{}%
6   \toks@\expandafter{\in@#2{}{}#1}%
7   \edef\in@{\the\toks@}%
8   \expandafter\endgroup
9   \ifx\in@{\empty}
10    \in@false
11  \else
12    \in@true
13  \fi
14 }
15 \newif\ifin@
```

Before the \begin{document} command several *(math versions)* and *(math alphabet identifiers)* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

$$\begin{aligned} \text{\version@elt}\langle\textit{version}_1\rangle\text{\version@elt}\langle\textit{version}_2\rangle\dots \\ \qquad\qquad\qquad\text{\version@elt}\langle\textit{version}_n\rangle \end{aligned}$$

- the list of all math alphabet identifiers. Here every entry has the form:

$$\begin{aligned} &\text{\group@elt}\langle\textit{math group number}\rangle \\ &\quad\{\{\langle\textit{default family}\rangle\}\{\langle\textit{default series}\rangle\}\{\langle\textit{default shape}\rangle\}\}. \end{aligned}$$

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

```
\set@alpha<the alphabet identifier itself>
\reserved@c<math version><font info>
...
\@nil
```

where ** is either `\reserved@e` (if the combination is not defined yet) or

```
{<family>}{<series>}{<shape>}}
```

`\version@list` We initialize the version list to be empty.

```
16 \let\version@list=\@empty
17 \onlypreamble\version@list
```

`\version@elt`

```
18 \let\version@elt\relax
19 \onlypreamble\version@elt
```

`\new@mathversion` The macro `\new@mathversion` is called with the version control sequence as its argument.

```
20 \%def\new@mathversion#1{%
```

The first thing this macro does is to check if the version identifier is already present in `\version@list`. We enclose `\version@list` in braces since it might be empty (if no *version* is defined yet). But this means that we need a suitable number of `\expandafter` primitives.

```
21 \% \expandafter\in@\expandafter#1\expandafter{\version@list}%
22 \% \ifin@
```

If so it prints an error message. The `\next` macro is used to get rid of the four characters `\mv@` that would otherwise appear at the begin of the version name in the error message.

```
23 \%     \@latex@error{Math version
24 \%             '\expandafter@gobblefour\string#1'
25 \%             already defined}\@eha
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to `\version@list`. This is very easy: we define `\version@elt` (which is the delimiter in `\version@list`) to protect itself and the following token from being expanded and simply redefine `\version@list`.

```
26 \% \else
27 \%     \global\expandafter\newcount\csname c@\expandafter
28 \%                                         \gobble\string#1\endcsname
29 \%     \global\csname c@\expandafter
30 \%                                         \gobble\string#1\endcsname\@ne
31 \%     \def\version@elt{\noexpand\version@elt\noexpand}%
32 \%     \edef\version@list{\version@list\version@elt#1}%
```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use `\reserved@c` as delimiter, and that there appears the control sequence `\reserved@e` that must not be expanded. Therefore we take suitable precautions.

```
33 %     \def\reserved@c{\noexpand\reserved@c\noexpand}%
34 %     \let\reserved@e\relax
```

We will now go through the `\alpha@list` to process every *<math alphabet identifier>* in turn. Since this list has `\group@elt` as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
35 %     \def\group@elt##1##2##3{%
```

The first of these arguments is the *<math alphabet identifier>*. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
36 %     \edef##1{\expandafter\remove@nil##1%
37 %             \reserved@c
38 %             #1%
39 %             \reserved@e
40 %             \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined *<math alphabet identifier>*. And that's all for now.

```
41 %     \alpha@list
42 %   \fi}
```

`\alpha@list` As we explained above every entry in `\alpha@list` has the form

```
\alpha@elt
<alphabet identifier><internal group number><default font assignments>...
```

We initialize it to `\empty`.

```
43 \let\alpha@list\empty
44 \onlypreamble\alpha@list
```

`\alpha@elt`

```
45 \let\alpha@elt\relax
46 \onlypreamble\alpha@elt
```

`\newgroup` Start the group (fam) allocation at 0. (Doesn't belong here.)

```
47 \count18=-1
```

`\stepcounter`

`\select@group` We surround `\select@group` with braces so that functions using it can be used directly after `_` or `^`. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if `\math@bgroup` is not `\bgroup`) we need to get rid of the extra group.

```

755   \fi
756 #1}
757 \onlypreamble\DeclareMathDelimiter

```

\@xxDeclareMathDelimiter This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```
758 \def\@xxDeclareMathDelimiter#1#2#3#4{%
```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```

759   \begingroup
760     \let\mathalpha\mathord
761     \ifnum7=\mathchar@type{#2}%
762       \endgroup

```

If this branch is taken we have old syntax (5 arguments).

```

763       \expandafter\@firstofone
764     \else

```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```

765   \endgroup
766   \DeclareMathSymbol{#1}{#2}{#3}{#4}%

```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

```

1024   \expandafter\DeclareSymbolFontAlphabet@
1025   \csname \expandafter\gobble\string#1\space\endcsname{#2}#1}
1026 \onlypreamble\DeclareSymbolFontAlphabet

```

\DeclareSymbolFontAlphabet@

```
1027 \def\DeclareSymbolFontAlphabet@#1#2#3{%
```

We use the switch `\if@tempswa` to decide if we can declare this symbol font alphabet.

```

1028     \if@tempswatrue
First check if #2 is known to be a symbol font
1029     \expandafter\in@\csname sym#2\expandafter\endcsname
1030     \expandafter{\group@list}%
1031 \ifin@
```

Check if #1 is defined as a math alphabet defined via `\DeclareMathAlphabet`:

```

1032     \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
1033 \ifin@
```

If so remove it from the `\alpha@list` and from all math version macros.

```

1034     \font@info{Redeclaring math alphabet \string#3}%
1035     \toks@{}%
1036     \def\alpha@elt##1##2##3{%
1037         \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
1038     \alpha@list
1039     \xdef\alpha@list{\the\toks@}%

```

Now we loop over all versions and remove the math alphabet:

```

1040     \def\version@elt##1{%
1041         \begingroup
1042         \toks@{}%
1043         \def\getanddefine@fonts####1####2{%
1044             \addto@hook\toks@{\getanddefine@fonts####1####2}}%
1045         \def\install@mathalphabet####1####2{%
1046             \ifx####1#1\else
1047                 \addto@hook\toks@{\install@mathalphabet
1048                         ####1{####2}}\fi}%
1049             ##1%
1050             \xdef##1{\the\toks@}%
1051         \endgroup
1052         }%
1053     \version@list
1054 \else
```

If #3 is not defined as a math alphabet check if it is defined at all:

```

1055     \expandafter\ifx
1056     \csname\expandafter\gobble\string#1\space\endcsname
1057     \relax
```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```

1058     \else
1059     \edef\reserved@a{%
1060         \noexpand\in@\{\string\use@mathgroup\{\meaning#1}\}%
1061         \reserved@a
1062         \ifin@%
1063             \font@info{Redeclaring math alphabet \string#3}%
1064         \else
```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```

1065     \if@tempswafalse
```

```

1066          \@latex@error{Command ‘\string#3’ already defined}\@eha
1067          \fi
1068          \fi
1069          \fi
1070      \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

1071      \tempswafalse
1072      \@latex@error{Unknown symbol font ‘#2’}\@eha
1073      \fi
1074      \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The *<math-settings>* are the one for the encoding that is used in the font shape where `\sym<name>` is pointing to. This means that we have to get it from the information stored in `\group@list`. Thus we loop through that list after defining `\group@elt` in a suitable way.

```

1075      \def\group@elt##1##2{%
1076          \expandafter\ifx\csname sym#2\endcsname##1%
1077          \expandafter\reserved@a\string##2\@nil
1078          \fi}%
1079      \def\reserved@a##1##2##3\@nil{%
1080          \def\reserved@a{##2}%
1081          \group@list
1082          \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
1083          \edef#1{\the\toks@
1084              \noexpand\use@mathgroup
1085              \expandafter\noexpand\csname M@\reserved@a\endcsname
1086              \csname sym#2\endcsname}%
1087          \def#3{\protect#1}%
1088          \fi
1089      }
1090  \onlypreamble\DeclareSymbolFontAlphabet@
1091  </2ekernel>

```

File s

ltfssini.dtx

This file contains the top level L^AT_EX interface to the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

35 NFSS Initialisation

Finally, there are six commands that are to be used in L^AT_EX and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

```
1 {*2ekernel}
```

35.1 Providing math *versions*

L^AT_EX provides two *versions*. We call them *normal* and *bold*, respectively.

```
2 \DeclareMathVersion{normal}
3 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

First the changes to another *family*:

```
4 \DeclareRobustCommand\rmfamily
5   {\not@math@alphabet\rmfamily\mathrm
6    \fontfamily\rmdefault\selectfont}
7 \DeclareRobustCommand\sffamily
8   {\not@math@alphabet\sffamily\mathsf
9    \fontfamily\sfdefault\selectfont}
10 \DeclareRobustCommand\ttfamily
11   {\not@math@alphabet\ttfamily\mathtt
12    \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 \DeclareRobustCommand\bfseries
14   {\not@math@alphabet\bfseries\mathbf
15    \fontseries\bfdefault\selectfont}
16 \DeclareRobustCommand\mdseries
17   {\not@math@alphabet\mdseries\relax
18    \fontseries\mddefault\selectfont}
19 \DeclareRobustCommand\upshape
20   {\not@math@alphabet\upshape\relax
21    \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \DeclareRobustCommand\slshape
23   {\not@math@alphabet\slshape\relax
24    \fontshape\sldefault\selectfont}
25 \DeclareRobustCommand\scshape
26   {\not@math@alphabet\scshape\relax
27    \fontshape\scdefault\selectfont}
```

```

28 \DeclareRobustCommand\itshape
29     {\not@math@alphabet\itshape\mathit
30      \fontshape\itdefault\selectfont}

```

\em We also have to define the *emphasize* font change command (i.e. \em). This command will look if the current font is sloped (i.e. has a positive \fontdimen1) and will then select either \upshape or \itshape.

```

31 </2ekernel>
32 <latexrelease>\IncludeInRelease{2015/01/01}{\eminnershape}{\eminnershape}%
33 <*2ekernel | latexrelease>
34 \DeclareRobustCommand\em
35     {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
36      \eminnershape \else \itshape \fi}%
37 \def\eminnershape{\upshape}%
38 </2ekernel | latexrelease>
39 <latexrelease>\EndIncludeInRelease

43 <latexrelease>           \upshape \else \itshape \fi}%
44 <latexrelease>\let\eminnershape\@undefined
45 <latexrelease>\EndIncludeInRelease
46 <*2ekernel>

```

\not@math@alphabet This function generates an error message when it is called in math mode. The same function should be defined in `newlfont.sty`.

```

47 \def\not@math@alphabet#1#2{%
48   \relax
49   \ifmmode
50     \@latex@error{Command \noexpand#1 invalid in math mode}%
51     {%
52       Please
53       \ifx#2\relax
54         define a new math alphabet^{#1}%
55         if you want to use a special font in math mode%
56       \else
57         use the math alphabet \noexpand#2 instead of
58         the #1 command%
59       \fi
60       .
61     }%
62   \fi}

```

We have to a \noexpand below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

```

57   use the math alphabet \noexpand#2 instead of
58   the #1 command%
59   \fi
60   .
61 }%
62 \fi}

```

Finally we provide two abbreviations to switch to the L^AT_EX *versions*.

```

63 \DeclareRobustCommand\boldmath{\@nomath\boldmath
64   \mathversion{bold}}
65 \DeclareRobustCommand\unboldmath{\@nomath\unboldmath
66   \mathversion{normal}}

```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\glb@settings`.

```
67 \def\math@version{normal}
```

35.2 Miscellaneous

`\newfont` We start by defining a few macros that are part of standard L^AT_EX's user interface.
`\symbol` The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```
68 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}
```

```
69 \DeclareRobustCommand\symbol[1]{\char #1\relax}
```

`\@setfontsize` This abbreviation is used by L^AT_EX's user level size changing commands, such as `\large`.

```
70 \def\@setfontsize#1#2#3{\@nomath#1%
```

For the benefit of people relying on keeping the name of the current font command saved in `\@currsize` we define it. To ensure that `\@setfontsize` keeps being robust we omit this assignment during times where `\protect` differs from `\@typeset@protect`.

```
71     \ifx\protect\@typeset@protect
```

```
72         \let\@currsize#1%
```

```
73     \fi
```

```
74     \fontsize{#2}{#3}\selectfont
```

For compatibility we also define `\@setsizes` the 209 command

```
75 (*compat)
```

```
76 \def\@setsizes#1#2#3#4{\@setfontsize#1{#4}{#2}}
```

```
77 </compat>
```

`\oldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
78 \DeclareRobustCommand\oldstylenums[1]{%
```

```
79   \begingroup
```

Provide spacing using the interword space of the current font.

```
80   \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard L^AT_EX fonts even though they only contain substitutions).

```
81   \usefont{OML}{\rmdefault}{\f@series}{it}%
```

```
82   \mathgroup\symletters #1%
```

```
83   \endgroup
```

```
84 }
```

`\hexnumber@` To set up L^AT_EX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple `\ifcase`.

```
85 \def\hexnumber@#1{\ifcase\number#1
```

```

86 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
87 9\or A\or B\or C\or D\or E\or F\fi}

```

- \nfss@text In its simplest form \nfss@text is an \mbox. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the **amstex** style option one will get a sub style called **amstext** which will redefine the \nfss@text macro to produce correct text in all sizes.

We have to use \def instead of the shorter \let since \mbox is undefined when we reach this point.

```
88 \def\nfss@text#1{{\mbox{#1}}}
```

- \copyright The definition of \copyright was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

```

89 %\DeclareRobustCommand\copyright
90 %    {\oalign{\hfil
91 %        \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
92 %        \mathhexbox20D}}

```

- \normalfont \reset@font \p@reset@font The macro \reset@font is used in L^AT_EX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L^AT_EX version above but nevertheless are able to run all kind of mixtures.

The user interface name for \reset@font is \normalfont:

```

93 \DeclareRobustCommand\normalfont
94         {\usefont\encodingdefault
95             \familydefault
96             \seriesdefault
97             \shapedefault
98             \relax}
99 \let\reset@font\normalfont

```

We left out the special L^AT_EX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

100 \def\not@base#1{\@latex@error
101   {Command \noexpand#1 not provided in base LATEX2e}%
102   {Load the latexsym or the amsfonts package to
103    define this symbol}}
104 \def\mho{\not@base\mho}
105 \def\Join{\not@base\Join}
106 \def\Box{\not@base\Box}
107 \def\Diamond{\not@base\Diamond}
108 \def\leadsto{\not@base\leadsto}
109 \def\sqsubset{\not@base\sqsubset}
110 \def\sqsupset{\not@base\sqsupset}
111 \def\lhd{\not@base\lhd}

```

```

112 \def\unlhd{\not@base\unlhd}
113 \def\rhd{\not@base\rhd}
114 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

115 \DeclareErrorFont{OT1}{cmr}{m}{n}{10} %% don't modify this setting
116                                     %% overwrite it in fontdef.cfg
117                                     %% if necessary

```

We also set some default values for `\f@family` etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by `\DeclareErrorFont`.

```

118 \fontfamily{cmr}
119 \fontseries{m}
120 \fontshape{n}
121 \fontsize{10}{10}

```

We now load the customizable parts of NFSS.

```

122 \InputIfFileExists{fonttext.cfg}
123     {\typeout{=====
124         ^^^J%
125             Local config file fonttext.cfg used^J%
126             ^^^J%
127             =====}%
128         \def\@addtolist##1{\xdef\@filelist{\@filelist,##1}}%
129     }
130     {\input{fonttext.ltx}}
131 \let\@addtolist\@gobble

```

Ditto for math although I don't think that we will get a lot of customisation :-)

```

132 \InputIfFileExists{fontmath.cfg}
133     {\typeout{=====
134         ^^^J%
135             Local config file fontmath.cfg used^J%
136             ^^^J%
137             =====}%
138         \def\@addtolist##1{\xdef\@filelist{\@filelist,##1}}%
139     }
140     {\input{fontmath.ltx}}
141 \let\@addtolist\@gobble

```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```

142 \InputIfFileExists{preload.cfg}
143     {\typeout{=====
144         ^^^J%
145             Local config file preload.cfg used^J%
146             ^^^J%
147             =====}%

```

```
148          \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
149          }
150          {\input{preload.ltx}}
151 \let\@addtofilelist\@gobble

\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they
\@accii can be restored by a minipage inside a tabbing environment.
\@acciii 152 \let\@acci\` \let\@accii\` \let\@acciii\=
\cal Here were the two old alphabet identifiers.
\mit 153 ⟨/2ekernel⟩
```

File t

fontdef.dtx

[2019/08/27 v3.0c LaTeX Kernel (j-lateXrelease font setup)]

36 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

37 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If L^AT_EX 2_< finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised L^AT_EX versions. Thus, before sending in a bug report please try your test file with a L^AT_EX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all L^AT_EX installations behave in the same way.

T1	Cork T <small>E</small> X text encoding
OT1	old T <small>E</small> X text encoding
U	unknown encoding
OML	old T <small>E</small> X math letters encoding
OMS	old T <small>E</small> X math symbols encoding
OMX	old T <small>E</small> X math extension symbols encoding
TU	Unicode

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the TEX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official TEX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all LATEX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

38 The docstrip modules

The following modules are used to direct docstrip in generating external files:

driver	produce a documentation driver file
text	produce the file fonttext.ltx
math	produce the file fontmath.ltx
cfgtext	produce a dummy fonttext.cfg file
cfgmath	produce a dummy fontmath.cfg file

A typical docstrip command file would then have entries like:

```
\generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}}{text}}
```

39 A driver for this document

The next bit of code contains the documentation driver file for TEX, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 {*driver}
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
```

```

4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 </driver>

```

40 The fonttext.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```

8 (*text)
9 \typeout{== Don't modify this file, use a .cfg file instead ==^^J}

```

40.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `ltoutenc.dtx`.

By convention, text encoding specific declarations, including the declaration `\DeclareFontEncoding`, are kept in separate file of the form `<enc>enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```

10 \input {omlenc.def}
11 \input {tienc.def}
12 \input {otlenc.def}      % <- should come after T1 for speed
13 \input {omsenc.def}

14 \ifx\Umathchar\@undefined

```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```

15 \fontencoding{OT1}
16 \else
  Unicode.
17 \input {tuenc.def}
18 \fontencoding{TU}
19 \DeclareFontSubstitution{TU}{lmr}{m}{n}
20 \begingroup
21 \nfss@catcodes
22 \input {tulmr.fd}
23 \input {tulmss.fd}
24 \input {tulmtt.fd}
25 \endgroup
26 \DeclareFontSubstitution{TU}{lmr}{m}{n}

```

End of Unicode branch.

27 \fi

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

28 \DeclareFontEncodingDefaults{}{}

Then we define the default substitution for every encoding. This release of L^AT_EX 2 _{ε} assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

29 \DeclareFontSubstitution{T1}{cmr}{m}{n}
30 \DeclareFontSubstitution{OT1}{cmr}{m}{n}

For every encoding declaration, L^AT_EX 2 _{ε} will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. L^AT_EX 2 _{ε} will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these .fd files since L^AT_EX 2 _{ε} will not read .fd files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the fd files.

31 \begingroup
32 \nfss@catcodes
33 \input {t1cmr.fd}
34 \input {ot1cmr.fd}
35 \endgroup

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every T_EX installation, while the amount of main memory is not a limiting factor at most installations.)

36 \begingroup
37 \nfss@catcodes
38 \input {ot1cmss.fd}
39 \input {ot1cmtt.fd}
40 \endgroup

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a `.fd` file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
41 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

40.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

```
\encodingdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and
\rmdefault \ttfamily.
\sfdefault 42 \ifx\Umathchar\@undefined
\ttdefault 43 \newcommand\encodingdefault{OT1}
           44 \newcommand\rmdefault{cmr}
           45 \newcommand\sfdefault{cmss}
           46 \newcommand\ttdefault{cmtt}
           47 \else
           48 \newcommand\encodingdefault{TU}
           49 \newcommand\rmdefault{lmr}
           50 \fontfamily{\rmdefault}
           51 \newcommand\sfdefault{lmss}
           52 \newcommand\ttdefault{lmtt}
           53 \fi
           54 </text>
55 <latexrelease>\IncludeInRelease{2017/01/01}%
56 <latexrelease>          {\encodingdefault}{TU encoding default}%
57 <latexrelease>\ifx\Umathchar\@undefined
58 <latexrelease>\renewcommand\encodingdefault{OT1}
59 <latexrelease>\fontencoding{\encodingdefault}
60 <latexrelease>\renewcommand\rmdefault{cmr}
61 <latexrelease>\fontfamily{\rmdefault}
62 <latexrelease>\renewcommand\sfdefault{cmss}
63 <latexrelease>\renewcommand\ttdefault{cmtt}
64 <latexrelease>\else
65 <latexrelease>\renewcommand\encodingdefault{TU}
66 <latexrelease>%done in everyjob\fontencoding{\encodingdefault}
67 <latexrelease>\renewcommand\rmdefault{lmr}
68 <latexrelease>\fontfamily{\rmdefault}
69 <latexrelease>\renewcommand\sfdefault{lmss}
70 <latexrelease>\renewcommand\ttdefault{lmtt}
71 <latexrelease>\fi
72 <latexrelease>\EndIncludeInRelease
73 <latexrelease>\IncludeInRelease{0000/00/00}%

```

```

74 <latexrelease> {\encodingdefault}{TU encoding default}%
75 <latexrelease>\fontencoding{OT1}
76 <latexrelease>\renewcommand\encodingdefault{OT1}
77 <latexrelease>\fontencoding{\encodingdefault}
78 <latexrelease>\renewcommand\rmdefault{cmr}
79 <latexrelease>\fontfamily{\rmdefault}
80 <latexrelease>\renewcommand\sfdefault{cmss}
81 <latexrelease>\renewcommand\ttdefault{cmtt}
82 <latexrelease>\EndIncludeInRelease
83 (*text)

\bfdefault Series changing commands are influenced by the following hooks.
\mddefault
84 \newcommand\bfdefault{bx}
85 \newcommand\mddefault{m}

\itdefault Shape changing commands use the following hooks.
\sldefault
86 \newcommand\itdefault{it}
\scdefault
87 \newcommand\sldefault{sl}
\updefault
88 \newcommand\scdefault{sc}
89 \newcommand\updefault{n}

\familiydefault Finally we have the hooks that describe the behaviour of the \normalfont command. To stay portable, the definition of \encodingdefault should not be changed and should match the setting above for \fontencoding. All other values can be set according to your taste.
\seriesdefault
90 \newcommand\familiydefault{\rmdefault}
\shapedefault
91 \newcommand\seriesdefault{\mddefault}
\updefault
92 \newcommand\shapedefault{\updefault}

This finishes the low-level setup in fonttext.ltx.
93 
```

41 The fontmath.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```

94 (*math)
95 \typeout{== Don't modify this file, use a .cfg file instead ==^J}

```

41.1 The font encodings used

```

96 \DeclareFontEncoding{OML}{}{}
97 \DeclareFontEncoding{OMS}{}{}
98 \DeclareFontEncoding{OMX}{}{}

```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up \noaccents@ providing for AMS-LATEX. This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from \breve) are obtained from some other font that has them.

```
99 \DeclareFontEncoding{U}{}{\noaccents@}
```

The encodings for math are next:

```
100 \DeclareFontSubstitution{OML}{cmm}{m}{it}
```

```

101 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
102 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
103 \DeclareFontSubstitution{U}{cmr}{m}{n}
104 \begingroup
105 \nfss@catcodes
106 \input {omlcmm.fd}
107 \input {oms cmsy.fd}
108 \input {omx cmex.fd}
109 \input {ucmr.fd}
110 \endgroup

```

41.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by L^AT_EX. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. `operators` with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

111 \DeclareSymbolFont{operators} {OT1}{cmr} {m}{n}
112 \DeclareSymbolFont{letters} {OML}{cmm} {m}{it}
113 \DeclareSymbolFont{symbols} {OMS}{cmsy}{m}{n}
114 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}

115 \SetSymbolFont{operators}{bold}{OT1}{cmr}{bx}{n}
116 \SetSymbolFont{letters} {bold}{OML}{cmm}{b}{it}
117 \SetSymbolFont{symbols} {bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

118 \DeclareSymbolFontAlphabet{\mathrm}{operators}
119 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
120 \DeclareSymbolFontAlphabet{\mathcal}{symbols}
121 \DeclareMathAlphabet{\mathbf}{OT1}{cmr}{bx}{n}
122 \DeclareMathAlphabet{\mathsf}{OT1}{cmss}{m}{n}
123 \DeclareMathAlphabet{\mathit}{OT1}{cmr}{m}{it}
124 \DeclareMathAlphabet{\mathtt}{OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

125 \SetMathAlphabet{\mathsf}{bold}{OT1}{cmss}{bx}{n}
126 \SetMathAlphabet{\mathit}{bold}{OT1}{cmr}{bx}{it}

```

41.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

127 \DeclareMathSizes{5}{5}{5}{5}
128 \DeclareMathSizes{6}{6}{5}{5}
129 \DeclareMathSizes{7}{7}{5}{5}
130 \DeclareMathSizes{8}{8}{6}{5}
131 \DeclareMathSizes{9}{9}{6}{5}
132 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
133 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
134 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
135 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
136 \DeclareMathSizes{\@xviipt}{\@xviipt}{\@xiipt}{\@xpt}
137 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xiipt}
138 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xviipt}
```

41.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by IniT_EX. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

41.3.1 The letters

```

139 \DeclareMathSymbol{a}{\mathalpha}{letters}{`a}
140 \DeclareMathSymbol{b}{\mathalpha}{letters}{`b}
141 \DeclareMathSymbol{c}{\mathalpha}{letters}{`c}
142 \DeclareMathSymbol{d}{\mathalpha}{letters}{`d}
143 \DeclareMathSymbol{e}{\mathalpha}{letters}{`e}
144 \DeclareMathSymbol{f}{\mathalpha}{letters}{`f}
145 \DeclareMathSymbol{g}{\mathalpha}{letters}{`g}
146 \DeclareMathSymbol{h}{\mathalpha}{letters}{`h}
147 \DeclareMathSymbol{i}{\mathalpha}{letters}{`i}
148 \DeclareMathSymbol{j}{\mathalpha}{letters}{`j}
149 \DeclareMathSymbol{k}{\mathalpha}{letters}{`k}
150 \DeclareMathSymbol{l}{\mathalpha}{letters}{`l}
151 \DeclareMathSymbol{m}{\mathalpha}{letters}{`m}
152 \DeclareMathSymbol{n}{\mathalpha}{letters}{`n}
153 \DeclareMathSymbol{o}{\mathalpha}{letters}{`o}
154 \DeclareMathSymbol{p}{\mathalpha}{letters}{`p}
155 \DeclareMathSymbol{q}{\mathalpha}{letters}{`q}
156 \DeclareMathSymbol{r}{\mathalpha}{letters}{`r}
157 \DeclareMathSymbol{s}{\mathalpha}{letters}{`s}
158 \DeclareMathSymbol{t}{\mathalpha}{letters}{`t}
159 \DeclareMathSymbol{u}{\mathalpha}{letters}{`u}
160 \DeclareMathSymbol{v}{\mathalpha}{letters}{`v}
161 \DeclareMathSymbol{w}{\mathalpha}{letters}{`w}
162 \DeclareMathSymbol{x}{\mathalpha}{letters}{`x}
163 \DeclareMathSymbol{y}{\mathalpha}{letters}{`y}
164 \DeclareMathSymbol{z}{\mathalpha}{letters}{`z}
165 \DeclareMathSymbol{A}{\mathalpha}{letters}{`A}
166 \DeclareMathSymbol{B}{\mathalpha}{letters}{`B}
```

```

167 \DeclareMathSymbol{C}{\mathalpha}{letters}{`C}
168 \DeclareMathSymbol{D}{\mathalpha}{letters}{`D}
169 \DeclareMathSymbol{E}{\mathalpha}{letters}{`E}
170 \DeclareMathSymbol{F}{\mathalpha}{letters}{`F}
171 \DeclareMathSymbol{G}{\mathalpha}{letters}{`G}
172 \DeclareMathSymbol{H}{\mathalpha}{letters}{`H}
173 \DeclareMathSymbol{I}{\mathalpha}{letters}{`I}
174 \DeclareMathSymbol{J}{\mathalpha}{letters}{`J}
175 \DeclareMathSymbol{K}{\mathalpha}{letters}{`K}
176 \DeclareMathSymbol{L}{\mathalpha}{letters}{`L}
177 \DeclareMathSymbol{M}{\mathalpha}{letters}{`M}
178 \DeclareMathSymbol{N}{\mathalpha}{letters}{`N}
179 \DeclareMathSymbol{O}{\mathalpha}{letters}{`O}
180 \DeclareMathSymbol{P}{\mathalpha}{letters}{`P}
181 \DeclareMathSymbol{Q}{\mathalpha}{letters}{`Q}
182 \DeclareMathSymbol{R}{\mathalpha}{letters}{`R}
183 \DeclareMathSymbol{S}{\mathalpha}{letters}{`S}
184 \DeclareMathSymbol{T}{\mathalpha}{letters}{`T}
185 \DeclareMathSymbol{U}{\mathalpha}{letters}{`U}
186 \DeclareMathSymbol{V}{\mathalpha}{letters}{`V}
187 \DeclareMathSymbol{W}{\mathalpha}{letters}{`W}
188 \DeclareMathSymbol{X}{\mathalpha}{letters}{`X}
189 \DeclareMathSymbol{Y}{\mathalpha}{letters}{`Y}
190 \DeclareMathSymbol{Z}{\mathalpha}{letters}{`Z}

```

41.3.2 The digits

```

191 \DeclareMathSymbol{0}{\mathalpha}{operators}{`0}
192 \DeclareMathSymbol{1}{\mathalpha}{operators}{`1}
193 \DeclareMathSymbol{2}{\mathalpha}{operators}{`2}
194 \DeclareMathSymbol{3}{\mathalpha}{operators}{`3}
195 \DeclareMathSymbol{4}{\mathalpha}{operators}{`4}
196 \DeclareMathSymbol{5}{\mathalpha}{operators}{`5}
197 \DeclareMathSymbol{6}{\mathalpha}{operators}{`6}
198 \DeclareMathSymbol{7}{\mathalpha}{operators}{`7}
199 \DeclareMathSymbol{8}{\mathalpha}{operators}{`8}
200 \DeclareMathSymbol{9}{\mathalpha}{operators}{`9}

```

41.3.3 Punctuation, brace, etc. keys

```

201 \DeclareMathSymbol{!}{\mathclose}{operators}{`21}
202 \DeclareMathSymbol{*}{\mathbin}{symbols}{`03} % \ast
203 \DeclareMathSymbol{+}{\mathbin}{operators}{`2B}
204 \DeclareMathSymbol{,}{\mathpunct}{letters}{`3B}
205 \DeclareMathSymbol{-}{\mathbin}{symbols}{`00}
206 \DeclareMathSymbol{.}{\mathord}{letters}{`3A}
207 \DeclareMathSymbol{:}{\mathrel}{operators}{`3A}
208 \DeclareMathSymbol{;}{\mathpunct}{operators}{`3B}
209 \DeclareMathSymbol{=}{\mathrel}{operators}{`3D}
210 \DeclareMathSymbol{?}{\mathclose}{operators}{`3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

211 \% \DeclareMathSymbol{()}{\mathopen}{operators}{`28}
212 \% \DeclareMathSymbol{}{\mathclose}{operators}{`29}
213 \% \DeclareMathSymbol{/}{\mathord}{letters}{`3D}

```

```

214 \%\\DeclareMathSymbol{[]}{\\mathopen}{operators}{\"5B}
215 \%\\DeclareMathSymbol{}{\\mathclose}{operators}{\"5D}
216 \%\\DeclareMathSymbol{|}{\\mathord}{symbols}{\"6A}
217 \%\\DeclareMathSymbol{<}{\\mathrel}{letters}{\"3C}
218 \%\\DeclareMathSymbol{>}{\\mathrel}{letters}{\"3E}

```

Should all of the following being activated by default? Probably not.

```

219 \%\\DeclareMathSymbol{`}{}{\\mathopen}{symbols}{\"66}
220 \%\\DeclareMathSymbol{`}{\\mathclose}{symbols}{\"67}
221 \%\\DeclareMathSymbol{``}{\\mathord}{symbols}{\"6E} % \\backslash
222 \\mathcode`\\ =\"8000 % \\space
223 \\mathcode`'=\"8000 % ^\\prime
224 \\mathcode`_=\"8000 % \\_

```

41.3.4 Delimitercodes for characters

[to be completed]

Finally, $\text{\rm Init}\text{\TeX}$ sets all \rm \delcode values to -1, except \rm \delcode' .=0

```

225 \\DeclareMathDelimiter{()}{\\mathopen}{operators}{\"28}{largesymbols}{\"00}
226 \\DeclareMathDelimiter{}{\\mathclose}{operators}{\"29}{largesymbols}{\"01}
227 \\DeclareMathDelimiter{[]}{\\mathopen}{operators}{\"5B}{largesymbols}{\"02}
228 \\DeclareMathDelimiter{}{\\mathclose}{operators}{\"5D}{largesymbols}{\"03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain $\text{\rm T}\text{\TeX}$. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```

229 \\DeclareMathDelimiter{<}{\\mathopen}{symbols}{\"68}{largesymbols}{\"0A}
230 \\DeclareMathDelimiter{>}{\\mathclose}{symbols}{\"69}{largesymbols}{\"0B}
231 \\DeclareMathSymbol{<}{\\mathrel}{letters}{\"3C}
232 \\DeclareMathSymbol{>}{\\mathrel}{letters}{\"3E}

```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```

233 \\DeclareMathDelimiter{/}{\\mathord}{operators}{\"2F}{largesymbols}{\"0E}
234 \\DeclareMathSymbol{/}{\\mathord}{letters}{\"3D}
235 \\DeclareMathDelimiter{|}{\\mathord}{symbols}{\"6A}{largesymbols}{\"0C}
236 \\expandafter\\DeclareMathDelimiter\\@backslashchar
237 \\mathord{symbols}{\"6E}{largesymbols}{\"0F}

```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

41.4 Symbols accessed via control sequences

41.4.1 Greek letters

```

238 \\DeclareMathSymbol{\\alpha}{\\mathord}{letters}{\"0B}
239 \\DeclareMathSymbol{\\beta}{\\mathord}{letters}{\"0C}
240 \\DeclareMathSymbol{\\gamma}{\\mathord}{letters}{\"0D}
241 \\DeclareMathSymbol{\\delta}{\\mathord}{letters}{\"0E}
242 \\DeclareMathSymbol{\\epsilon}{\\mathord}{letters}{\"0F}
243 \\DeclareMathSymbol{\\zeta}{\\mathord}{letters}{\"10}
244 \\DeclareMathSymbol{\\eta}{\\mathord}{letters}{\"11}
245 \\DeclareMathSymbol{\\theta}{\\mathord}{letters}{\"12}
246 \\DeclareMathSymbol{\\iota}{\\mathord}{letters}{\"13}

```

```

247 \DeclareMathSymbol{\kappa}{\mathord}{letters}{14}
248 \DeclareMathSymbol{\lambda}{\mathord}{letters}{15}
249 \DeclareMathSymbol{\mu}{\mathord}{letters}{16}
250 \DeclareMathSymbol{\nu}{\mathord}{letters}{17}

```

Here cometh much profligate robustification of math constructs. Warning: some of these commands may become non-robust if an AMS package is loaded.

Further potential problems: some math font packages may make unfortunate assumptions about some of these definitions that are not true of the robust versions we need.

```

415 \DeclareRobustCommand

433                           % has the same height as +

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet`.... This might be the case when packages are implementing shorthands for math, e.g. `=>` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

```

\lgroup There are three plain TeX delimiters which are not fully supported by NFSS,
\rgroup since they partly point into a bold cmr font. Allocating a full symbol font, just
\bracevert to have three delimiters seems a bit too much given the limited space available.
 For this reason only the extensible sizes are supported. If this is not desired one
 can use, without losing portability, define `\mathbf` and `\mathtt` as font symbol
 alphabet (setting up `cmr/bx/n` and `cmtt/m/n` as symbol fonts first) and modify
 the delimiter declarations to point with their small variant to those symbol fonts.
 (This is done in `oldlfont.dtx` so look there for examples.)

```

565 \DeclareMathDelimiter{\lgroup} % extensible ( with sharper tips
566   {\mathopen}{\largesymbols}{3A}{\largesymbols}{3A}
567 \DeclareMathDelimiter{\rgroup} % extensible ) with sharper tips

588   {\hbox{$\left#1\vbox{to17.5p@\right.\n@space$}}}}
589 </math | latexrelease>
590 <latexrelease>\EndIncludeInRelease
591 <latexrelease>\IncludeInRelease{0000/00/00}%
592 <latexrelease>          {\Big}{Start LR-mode}%
593 <latexrelease>\def{\big#1{\hbox{$\left#1\vbox{to8.5p@\right.\n@space$}}}}
594 <latexrelease>\def{\Big#1{\hbox{$\left#1\vbox{to11.5p@\right.\n@space$}}}}
595 <latexrelease>\def{\bigg#1{\hbox{$\left#1\vbox{to14.5p@\right.\n@space$}}}}
596 <latexrelease>\def{\Bigg#1{\hbox{$\left#1\vbox{to17.5p@\right.\n@space$}}}}
597 <latexrelease>\EndIncludeInRelease
598 {*math}
599 \def\n@space{\nulldelimiterspace\z@\math}

```

41.6.2 The log-like functions

<code>\operator@font</code>	The <code>\operator@font</code> determines the symbol font used for log-like functions.
	600 \def\operator@font{\mathgroup\symoperators}

41.6.3 Parameters

```
601 \thinmuskip=3mu  
602 \medmuskip=4mu plus 2mu minus 4mu  
603 \thickmuskip=5mu plus 5mu
```

This finishes the low-level setup in `fontmath.ltx`.

```
604 </math>
```

42 Default cfg files

We provide default `cfg` files here to ensure that on installations that search large file trees we do not pick up some strange customisation files from somewhere.

```
605 {*cfgtext | cfgmath | cfgprel}  
606 %%  
607 %%  
608 %%  
609 %% Load the standard setup:  
610 %%  
611 <+cfgtext>\input{fonttext.ltx}  
612 <+cfgmath>\input{fontmath.ltx}  
613 <+cfgprel>\input{preload.ltx}  
614 %%  
615 %% Small changes could go here; see documentation in cfgguide.tex for  
616 %% allowed modifications.  
617 %%  
618 %% In particular it is not allowed to misuse this configuration file  
619 %% to modify internal LaTeX commands!  
620 %%  
621 %% If you use this file as the basis for configuration please change  
622 %% the \ProvidesFile lines to clearly identify your modification, e.g.,  
623 %%  
624 <+cfgtext>%\ProvidesFile{fonttext.cfg}[2001/06/01  
625 <+cfgmath>%\ProvidesFile{fontmath.cfg}[2001/06/01  
626 <+cfgprel>%\ProvidesFile{preload.cfg}[2001/06/01  
627 %%                                         Customised local font setup]  
628 %%  
629 %%  
630 </cfgtext | cfgmath | cfgprel>
```

File u

preload.dtx

43 Overview

This file contains a number of possible settings for preloading fonts during installation of NFSS2 (which is used by L^AT_EX 2_<). It will be used to generate the following files:

preload.min	minimal subset of fonts necessary to run NFSS2
preload.ori	preload of CM fonts similar to the old <code>1fonts.tex</code>
preload.ltx	The standard selection of preloads
cmpreloa.xpt	preload of CM fonts for 10pt document size
cmpreloa.xip	preload of CM fonts for 11pt document size
cmpreloa.xii	preload of CM fonts for 12pt document size
dcpreloa.xpt	preload of DC fonts for 10pt size
dcpreloa.xip	preload of DC fonts for 11pt size
dcpreloa.xii	preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

44 Customization

You can customize the preloaded fonts in your L^AT_EX 2_< system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by *all* L^AT_EX systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L^AT_EX 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

45 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

driver	produce a documentation driver file
preload	produce a preload... file
cm	for OT1 encoded Computer Modern
dc	for T1 encoded Computer Modern
min	produce minimal subset
xpt	produce 10pt preloads
xipt	produce 11pt preloads
xiipt	produce 12pt preloads
ori	produce preloads similar to old <code>lfonts.tex</code>
tex	produce preload.ltx

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

46 A driver for this document

The next bit of code contains the documentation driver file for `TeX`, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5   \DocInput{preload.dtx}
6 \end{document}
7 </driver>
```

47 The code

We begin by loading the math extension font (`cmex10`) and the `LATEX` line and circle fonts. It is necessary to do this explicitly since these are used by `lplain.tex` and `latex.tex`. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 <-tex>%*****
```

```

12 <-tex>% Start any modification below this point **
13 <-tex>%*****

File v

ltfntcmd.dtx

Abstract

The commands defined in this file `ltfntcmd` are part of the kernel code for L^AT_EX 2_&/NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

48 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the T_EX system and for several reasons it is better to avoid them on the user level whenever possible. In L^AT_EX3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text..`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.⁷ The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

⁷Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

<i>Command</i>	<i>Corresponds to</i>	<i>Action</i>
\textnormal{...}	\normalfont	Typeset argument in normal family
\textrm{...}	\rmfamily	Typeset argument in roman family
\textsf{...}	\sffamily	Typeset argument in sans serif family
\texttt{...}	\ttfamily	Typeset argument in typewriter family
\textmd{...}	\mdseries	Typeset argument in medium series
\textbf{...}	\bfseries	Typeset argument in bold series
\textup{...}	\upshape	Typeset argument in normal shape
\textit{...}	\itshape	Typeset argument in <i>italic</i> shape
\textsl{...}	\slshape	Typeset argument in <i>slanted</i> shape
\textsc{...}	\scshape	Typeset argument in <i>SMALL CAPS</i> shape
\emph{...}	\em	Typeset argument <i>emphasized</i>

Table 1: Font-change commands with arguments

The font change commands provided here all start with \text.. to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L^AT_EX by adding a \nocorr command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
\texttt{itemize} environment and NFSS
declarations.
\end{bfitemize}
```

This gives:

- This environment produces boldface items.
- It is defined in terms of L^AT_EX's itemize environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with $\backslash\!/$.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a $\backslash\!/$ in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of $\backslash\!/$ in `amstex.sty` is used as this version can cause space to be removed immediately before the $\backslash\!/$.

49 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text...` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automatically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```

1 {*2ekernel}
2 \def \DeclareTextFontCommand #1#2{%
3   \DeclareRobustCommand#1[1]{%
4     \ifmmode
5       \nfss@text{#2##1}%

```

```

6      \else
7          \hmode@bgroup
8          \text@command{##1}%
9          #2\check@icl ##1\check@icr
10         \expandafter
11         \egroup
12     \fi
13             }%
14 }

\textrm Now we define the \text<family> commands in terms of the above; \texttttt does
\textrmst not look very nice!
\textrmtt 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
\textrmnormal 16 \DeclareTextFontCommand{\textrmst}{\sffamily}
\textrmttt 17 \DeclareTextFontCommand{\textrmtt}{\ttfamily}
\textrmnormal 18 \DeclareTextFontCommand{\textrmnormal}{\normalfont}

\textrmbf For the series attribute:
\textrmmd 19 \DeclareTextFontCommand{\textrm}{\bfseries}
20 \DeclareTextFontCommand{\textrmst}{\mdseries}

\textrmit And for the shapes:
\textrmstl 21 \DeclareTextFontCommand{\textrmit}{\itshape}
\textrmstc 22 \DeclareTextFontCommand{\textrmstl}{\slshape}
\textrmup 23 \DeclareTextFontCommand{\textrmstc}{\scshape}
24 \DeclareTextFontCommand{\textrmup}{\upshape}

\textrm Finally we have the \em font change declaration of LATEX. The corresponding
\textrm definition with argument is
25 \DeclareTextFontCommand{\textrm}{\em}

\nocorr This is just a label, so it does nothing; it should also be unexpandable.
26 \let \nocorr \relax

\check@icl We define these defaults in case some error causes them to be expanded at the
\check@icr wrong time.
27 \let \check@icl \@empty
28 \let \check@icr \@empty

\textrm@command This checks for a \nocorr as the first token in its argument and also for one in
\check@nocorr@ any other position not protected within braces (the latter is treated as if it were
\textrm@command at the end of the argument).
Is this the correct action in the ‘empty’ case? It is efficient but typographically
it is, strictly, incorrect!
29 \def \textrm@command #1{%
30   \def \reserved@a {#1}%
31   \ifx \reserved@a \empty
32     \let \check@icl \empty
33     \let \check@icr \empty

40     \else
41         \check@nocorr@ #1\nocorr\@nil
42     \fi
43 \fi
44 }
45 \def \check@nocorr@ #1#2\nocorr#3\@nil {%

```

The two checks are initialised here to their values in the normal case.

```

46 \let \check@icl \maybe@ic
47 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi}%
48 \def \reserved@a {\nocorr}%
49 \def \reserved@b {#1}%
50 \def \reserved@c {#3}%
51 \ifx \reserved@a \reserved@b
52     \ifx \reserved@c \@empty

```

In this case there is a \nocorr at the start but not at the end, so \check@icl should be empty.

```

53     \let \check@icl \@empty
54 \else

```

Otherwise there is a \nocorr both at the start and elsewhere, so no italic corrections should be added.

```

55     \let \check@icl \@empty
56     \let \check@icr \@empty
57     \fi
58 \else
59     \ifx \reserved@c \@empty

```

In this case there is no \nocorr anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

60 \else

```

In this case there is no \nocorr at the start but there is one elsewhere, so no \aftergroup is needed.

```

61     \let \check@icr \@empty
62     \fi
63 \fi
64 }

```

\ifmaybe@ic Switch used solely within \maybe@ic not interfering with other switches.
65 \newif\ifmaybe@ic

\maybe@ic These macros implement the italic correction.

```

\maybe@ic@ 66 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
67 \def \maybe@ic@ {%

```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```
68  \ifdim \fontdimen@ne\font>\z@
69  \else
70  \maybe@ictrue
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```
71  \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
72  \nocorrlist
```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```
73  \do \t@st@ic
```

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```
74  \ifmaybe@ic \sw@slant \fi
75  \fi
76 }
```

\t@st@ic The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```
77 \def \t@st@ic {%
78  \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
79  \ifx\reserved@b\@let@token
```

If they are the same we record the fact and jump out of the loop.

```
80  \maybe@icfalse
81  \@break@tfor
82  \fi
83 }
```

\sw@slant The definition of the mysterious `\sw@slant` command is as follows.

\fix@penalty `84 \def \sw@slant {%`

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `\~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```
85  \ifdim \lastskip=\z@
86  \fix@penalty
```

```

87  \else
88    \skip@ \lastskip
89    \unskip
90    \fix@penalty
91    \hskip \skip@
92 \fi
93 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@\lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L^AT_EX code?

```

94 \def \fix@penalty {%
95   \ifnum \lastpenalty=\z@
96     \@@italiccorr
97   \else
98     \count@ \lastpenalty
99     \unpenalty
100    \@@italiccorr
101    \penalty \count@
102 \fi
103 }

```

`\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```
104 \def \nocorrlist {..}
```

`\nfss@text` This command will by default behave like a L^AT_EX `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```

105 \ifx \nfss@text \undefined
106   \def \nfss@text {\leavevmode\hbox}
107 \fi

```

`\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{\langle font-change decls\rangle} {\langle math-alphabet\rangle}`

Here `\fn` is the font-declaration command being defined, `\langle font-change decls\rangle` is the declaration it will expand to in text-mode, and `\langle math-alphabet\rangle` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```
\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
```

```
\DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
```

```
108 \def \DeclareOldFontCommand #1#2#3{%
109   \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
110 }
```

\@fontswitch These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```
\@@math@egroup 111 \def \@fontswitch #1#2{%
112   \ifmmode
113     \let \math@bgroup \relax
114     \def \math@egroup {\let \math@bgroup \@@math@bgroup
115                           \let \math@egroup \@@math@egroup}%

```

We need to have a `\relax` in the following line in case the #2 is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
116   #2\relax
117   \else
118     #1%
119   \fi
120 }
121 \let \@@math@bgroup \math@bgroup
122 \let \@@math@egroup \math@egroup
```

These commands are available only in the preamble.

```
123 \onlypreamble \DeclareTextFontCommand
124 \onlypreamble \DeclareOldFontCommand
```

50 Initialization

\normalsize This is defined to produce an error.

```
125 \def\normalsize{%
126   \@latex@error {The font size command \protect\normalsize\space
127                 is not defined:\MessageBreak
128                 there is probably something wrong with
129                 the class file}\@eha
130 }
131 </2ekernel>
```

File w

ltpageno.dtx

51 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering`

The user sets the pagenumber style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1 {*2ekernel}
2 \message{page nos.,}
3 \countdef\c@page=0 \c@page=1
4 \def\cl@page{}
5 \def\pagenumbering#1{%
6   \global\c@page \cne \gdef\thepage{\csname \#1\endcsname
7   \c@page}}
8 
```

File x

ltxref.dtx

52 Cross Referencing

The user writes `\label{<foo>}` to define the following cross-references:

`\ref{<foo>}`: value of most recently incremented referencable counter. in the current environment. (Chapter, section, theorem and enumeration counters counters are referencable, footnote counters are not.)

`\pageref{<foo>}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so
`\begin{theorem} \label{foo} ... \end{theorem} \label{bar}`
defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

52.1 Cross Referencing

```
1 (*2ekernel)
2 \message{x-ref,}
```

This is implemented as follows. A referencable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}\eval(\p@cnt\theCNT)`. The command `\label{FOO}` then writes the following on file `\@auxout` :
`\newlabel{FOO}{\eval(\@currentlabel)\eval(\thepage)}`

```
\ref{FOO} ==
BEGIN
  if \r@foo undefined
    then  @refundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else  \car \eval(\r@FOO)\nil
  fi
END
```

```
\pageref{foo} =
BEGIN
  if \r@foo undefined
    then  @refundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else  \cdr \eval(\r@FOO)\nil
  fi
END
```

`\labelformat` A reference via `\ref` produces by default the data associated with the corresponding `\label` command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as “equation (*number*)”, one has to code “`equation (\ref{key})`”. With `\labelformat` there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```
\labelformat{section}{section^{\#1}}
\labelformat{equation}{equation^{(\#1)}}
```

`\Ref` A side effect of using `\labelformat` is that, depending on the defined formatting, it becomes impossible to use `\ref` at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command `\Ref` that behave like `\ref` except that it uppercases the first token of the generated string.

To make `\Ref` work properly the very first token in the second argument of `\labelformat` has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write `\labelformat{figure}{\'{a}bra^{\thefigure}}` or use `\labelformat{figure}{\'abra^{\thefigure}}` which avoids the brace problem.

`\G@refundefinedtrue`
`\@refundefined` This does not save on name-space (since `\G@refundefinedfalse` was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, `\G@refundefinedtrue` does *not* correspond to an `\if` command, and there is no matching `\else`. It would be more natural to call the command `\G@refundefined` (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a `\ref`-like command that mimicked the definition of `\ref`, calling `\G@refundefinedtrue`. Inspection of the TeX archives revealed several such packages, and so this command has been named `\...true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7   \gdef\@refundefined{%
8     \@latex@warning@no@line{There were undefined references}}}
9 \let\@refundefined\relax
```

`\ref` Referencing a `\label`. RmS 91/10/25: added a few extra `\reset@font`, as suggested by Bernd Raichle
`\pageref`
`\@setref`

```

RmS 92/08/14: made \ref and \pageref robust
RmS 93/09/08: Added setting of refundefined switch.

10 \def\@setref#1#2#3{%
11   \ifx#1\relax
12   \protect\G@refundefinedtrue
13   \nfss@text{\reset@font\bfseries ??}%
14   \@latex@warning{Reference '#3' on page \thepage \space
15   undefined}%
16 \else
17   \expandafter#2#1\null
18 \fi}
19 \def\ref#1{\expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}}
20 \def\pageref#1{\expandafter\@setref\csname r@#1\endcsname
21                               \@secondoftwo{#1}}

```

\newlabel This command will be written to the .aux file to pass label information from one run to another.

\@newl@bel The internal form of \newlabel and \bibcite. Note that this macro does it's work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```

22 \def\@newl@bel#1#2#3{%
23   \@ifundefined{#1@#2}%
24   \relax
25   {\gdef \multiplelabels {%
26     \@latex@warning@no@line{There were multiply-defined labels}}%
27     \@latex@warning@no@line{Label '#2' multiply defined}}%
28   \global\@namedef{#1@#2}{#3}}
29 \def\newlabel{\@newl@bel r}
30 \@onlypreamble\@newl@bel

```

\if@multiplelabels This is redefined to produce a warning if at least one label is defined more than once. It is executed by the \enddocument command.

```
31 \let \multiplelabels \relax
```

\label The commands \label and \refstepcounter have been changed to allow \protect'ed commands to work properly. For example,

```
\def\thechapter{\protect\foo{\arabic{chapter}}.\roman{section}}
```

will cause a \label{bar} command to define \ref{bar} to expand to something like \foo{4.d}. Change made 20 Jul 88.

```

32 \def\label#1{\@bsphack
33   \protected@write\auxout{}{%
34     {\string\newlabel{#1}{\@currentlabel}{\thepage}}}}%
35   \@esphack
36 </2ekernel>
37 (*2ekernel | latexrelease)
38 <latexrelease>\IncludeInRelease{2019/10/01}%
39 <latexrelease>           {\refstepcounter}{Add \labelformat and \Ref}%

```

`\refstepcounter` Step the counter and allow for labels to point to its current value.

```
40 \def\refstepcounter#1{\stepcounter{#1}%
41     \protected@edef\@currentlabel
```

By generating the second csname first the `\p@...` command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the....`. With the original kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

```
42     {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
43 }
```

`\labelformat` A shortcut to set the `\p@...` macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

```
44 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
```

`\Ref` This macro expands the result of `\ref` and then uppercases the first token. Only useful if the label was generated via `\labelformat` and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., `\"a` instead of a UTF-8 character like ä) one has to surround everything that needs uppercasing in a brace group in the definition of `\labelformat`.⁸

```
45 \DeclareRobustCommand\Ref[1]{\protected@edef\@tempa{\ref{#1}}%
46     \expandafter\MakeUppercase\@tempa}

47 </2ekernel | latexrelease>
48 <latexrelease>\EndIncludeInRelease
49 <latexrelease>\IncludeInRelease{0000/00/00}%
50 <latexrelease>          {\refstepcounter}{Add \labelformat and \Ref}%
51 <latexrelease>
52 <latexrelease>\def\refstepcounter#1{\stepcounter{#1}%
53 <latexrelease>    \protected@edef\@currentlabel
54 <latexrelease>        {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
55 <latexrelease>}
56 <latexrelease>\let\labelformat\@undefined
57 <latexrelease>\let\Ref\@undefined
58 <latexrelease>
59 <latexrelease>\EndIncludeInRelease
60 <2ekernel>
```

`\@currentlabel` Default for `\label` commands that come before any environment.

```
61 \def\@currentlabel{}

62 </2ekernel>
```

⁸There is one problem with this approach: the braces are kept in a normal `\ref` which might spoil kerning. Perhaps one day this needs redoing.

ltmiscen.dtx

53 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`. The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 /*2ekernel*/
2 \message{environments,}
```

53.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@end` is defined to be the `\end` command of TeX82.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end TeX in the middle.

```
\enddocument ==

19      \makeatletter \@input\jobname.aux
20      \fi
21      \@dofilelist

```

First we check for font size substitution bigger than `\fontsubfuzz`. The `\relax` is necessary because this is a macro not a register.

```
22      \ifdim \font@submax >\fontsubfuzz\relax
```

In case you wonder about the `\@gobbletwo` inside the message below, this is a horrible hack to remove the tokens `\on@line.` that are added by `\@font@warning` at the end.

```

23      \@font@warning{Size substitutions with differences\MessageBreak
24          up to \font@submax\space have occurred.\@gobbletwo}%
25      \fi

```

The macro `\@defaultsubs` is initially `\relax` but gets redefined to produce a warning if there have been some default font substitutions.

```
26      \@defaultsubs
```

The macro `\@refundefined` is initially `\relax` but gets redefined to produce a warning if there are undefined refs.

```
27      \@refundefined
```

If a label is defined more than once, `\@tempswa` will always be true and thus produce a “Label(s) may ...” warning. But since a rerun will not solve that problem (unless one uses a package like `variorref` that generates labels on the fly), we suppress this message.

```

28      \if@filesw
29      \ifx \@multiplelabels \relax
30      \if@tempswa
31          \@latex@warning@no@line{Label(s) may have changed.
32          Rerun to get cross-references right}%
33      \fi
34      \else
35          \@multiplelabels
36      \fi
37      \fi
38      \endgroup
39      \deadcycles\z@\@end}

```

`\@testdef`

```

40 \def\@testdef #1#2#3{%
41     \def\reserved@a{#3}\expandafter \ifx \csname #1#2\endcsname
42 \reserved@a \else \@tempswatrue \fi}

```

Reading data from auxiliary files (like `.toc` normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by `TEX` during that process.

However, especially the `.toc` file might be read in L-R mode (in cases the `\tableofcontents` attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used `\nofiles` to preserve it).

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```
43 {/2ekernel}
44 (*2ekernel | latexrelease)
45 {latexrelease}\IncludeInRelease{2018/12/01}%
46 {latexrelease} {\protected@file@percent}{Mask line endings}%
47 \protected\def\protected@file@percent{}
```

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```
48 \begingroup
49 \catcode`%=12
```

`latexrelease` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```
50 \catcode`\^^A=9
51 \long\gdef\add@percent@to@temptokena
52     #1\protected@file@percent#2\add@percent@to@temptokena
```

When we call this macro in `\@writefile` we stick in `\@empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```
53     {\ifx!#2!\@temptokena\expandafter{\#1}\else
54         \@temptokena\expandafter{\#1%``A
```

Can't be on the same line as the % — see above.

109 %     \csname #1\endcsname}%
110 %  \@ignorefalse
111 %  \begingroup\@endpefalse\reserved@a}

```

\end While \begin was made robust simply by using \DeclareRobustCommand we need to be a bit more subtle with \end as there are packages out there that try to look into the top-level contents of \end{foo} (that is at the expansion of \endfoo) to see if it contains certain macros. This is done by hitting \end{foo} with three \expandafters, the first to get

```
\csname endfoo\endcsname      \@checkend{foo}%
etc.
```

the second to expand the \csname, i.e., to get to

```
\endfoo      \@checkend{foo}%
etc.
```

and the third to finally get to the top-level content of \endfoo, i.e.

```
<top-level content of \endfoo> \@checkend{foo}%
etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of \end should either produce \protect\end_ (when not doing typesetting) or it should produce \end_ (without the \protect) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as \end_ (which is the original fragile definition of \end) when you expand either of them twice, i.e.,

```
\endfoo      \@checkend{foo}%
etc.
```

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use \romannumeral to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many \expandafters inside that are all going to be executed when \romannumeral is hit by a single \expandafter.

```

112 \edef\end
113   {\unexpanded{%
114     \romannumeral
115       \ifx\protect\@typeset@protect

53.3 Verbatim

```
186 \message{verbatim,}
```

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode`'d to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '...' as its argument, and sets it verbatim in `\ttfamily` font.

The `*-variants` of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

```

```

\asciispace The character in slot 32, in typewriter fonts (historically) a visible space but in other fonts a real space or something else

```

247 \DeclareRobustCommand\asciispace{\char 32 }

```

\verbvisible This defines how to get a visible space in \verb* and friends. In classic \TeX this is just the slot 32, but in TU encoded fonts we switch fonts and take the character from cmtt.

```

248 \ifx\Umathcode\undefined
249   \let\verbvisible\asciispace
250 \else
251   \DeclareRobustCommand\verbvisible
252     {\leavevmode{\usefont{OT1}{cmtt}{m}{n}\asciispace}} % xetex/luatex version
253 \fi

```

\@setupverbvisible In pdft \TeX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In Xe \TeX or Lua \TeX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of \verbvisible and if it is \asciispace we assume that the char32 can be used (e.g., in pdft \TeX). We then redefine \xobeysp so that after running \@vobeyspaces we get characters from slot 32 for each active space.

```

254 \def\@setupverbvisible{%
255   \ifx\verbvisible\asciispace
256     \let\xobeysp\asciispace
257   \else

```

Otherwise we measure the width of a character in the mon-spaced current font and place a \verbvisible into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing \verbvisible one could use, for example, the \textvisible of the current typewriter font.

```

258   \setbox\z@\hbox{x}%
259   \setbox\@verbvisiblebox\hbox to\wd\z@{\hss\verbvisible\hss}%
260   \def\xobeysp{\leavevmode\copy\@verbvisiblebox}%
261 \fi
262 }

```

\@verbvisiblespacebox The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

263 \newbox\@verbvisiblespacebox

\@sverb Definitions of \@sverb and \@verb changed so \verb+ foo+ does not lose leading blanks when it comes at the beginning of a line. Change made 24 May 89. Suggested by Frank Mittelbach and Rainer Schöpf.

```
264 \def\@sverb#1{%
265   \catcode`#1\active

ltmath.dtx

54 Math setup

This file contains a lot of the original plain T_EX code, as well as the L_AT_EX environments for math. It still needs sorting out.

```
1 {*2ekernel}
2 \message{math definitions,}
```

54.1 Math commands based on plain T_EX

54.1.1 The log-like functions

\log The standard operators:

```
3 \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4 \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5 \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6 \DeclareRobustCommand\lim{\mathop{\operator@font lim}\nolimits}
7 \DeclareRobustCommand\limsup{\mathop{\operator@font lim\,,sup}\nolimits}
8 \DeclareRobustCommand\liminf{\mathop{\operator@font lim\,,inf}\nolimits}
9 \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}\nolimits}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}\nolimits}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}\nolimits}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}\nolimits}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}\nolimits}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}\nolimits}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}\nolimits}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}
```

\bmod And some operators have to be done by hand:

```
35 \DeclareRobustCommand\bmod{%
36   \nonscript\mskip-\medmuskip\mkern5mu%
```

```

37  \mathbin{\operator@font mod}\penalty900\mkern5mu%
38  \nonscript\mskip-\medmuskip}

\pmod
39 \DeclareRobustCommand\pmod[1]{%
40  \allowbreak\mkern18mu(\{\operator@font mod\},\,,#1)}

```

54.1.2 Biggggg

\big Variants on \big and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigr{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\bigrf{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Bigrf{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}
52 \DeclareRobustCommand\Biggr{\mathclose\Bigg}

```

54.1.3 The UNSORTED Rest

The other math commands are lifted from plain TeX.

54.3 External options to the standard document classes

54.3.1 Left equation numbering

\@eqnnum To put the equation number on the left side of an equation we have to use a little trick. The number is shifted \displaywidth to the left inside a box of

(approximately) zero width. This fails when the equation is too wide, the equation number may overprint the equation itself.

```

374 <*leqno>
375 \renewcommand{\eqnnumf}{\hb@xt@.01\p@{}%
376           \rlap{\normalfont\normalcolor
377           \hskip -\displaywidth(\theequation)}}
378 </leqno>
```

54.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L^AT_EX 2 _{ε} 's displayed math environments.

\mathindent The amount of indentation of the equations is stored in a register.

```

379 <*fleqn>
380 \newdimen\mathindent
```

The setting of \mathindent has to be deferred until the class file has been processed, because \leftmargini is still 0pt wide at the moment *fleqn.clo* is read in.

```
381 \AtEndOfClass{\mathindent\leftmargini}
```

\[Begin display math;

55 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{\LABEL}{COMMANDS} ... \endlist
```

which can be invoked by the user as the list environment. The *LABEL* argument specifies item labeling. *COMMANDS* contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by *ITEMLABEL*. If the argument is missing, then the *LABEL* argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{ITEMLABEL}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{\ARG} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s *COMMANDS* argument.

A `\usecounter{foo}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place—i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{\relax}`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

55.1 List and Trivlist

The following variables are used inside a list environment:

`\@totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\@listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklabel` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that T_EX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `\@inlabel = true`, it holds the labels to be put out by `\everypar`.

`\@noperitem` A switch set by `\list` when `\@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\@noparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`\@nmbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` `\def`'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list`'s COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual `\TeX` or `\LaTeX` commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

55.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in vmode).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

55.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

55.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label $\leq \labelwidth$, then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

55.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ..., `\@listvi` is called, depending upon the current level of the list. The `\@list ...` commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset.

122 }
```

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is
`\@doendpe`

redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

```
123 \def\@endparenv{%

184     \global\inlabelfalse

```

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in `raggedright` setting.

If `\noindent` was used after `\item` want to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

185   {\setbox\z@\lastbox
186     \ifvoid\z@

191 \fi

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of \clubpenalty it is local so will have no effect if the item starts in a group.

Only resetting \nobreak when it is true is now essential since now it is sometimes set locally.

```

192      \if@nobreak

55.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumii}
\def\labelenumii{(\theenumii)}
```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspacing` and `\@enumdepth`.

```
\enumerate ==
BEGIN
if \@enumdepth > 3
then errormessage: “Too deeply nested”.

File B

ltboxes.dtx

56 L^AT_EX Box commands

- \makebox \makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width ⟨wid⟩, positioned by ⟨pos⟩.
The possible ⟨pos⟩ are:
s stretched,
l flushleft,
r flushright,
c (default) centred.
If ⟨wid⟩ is missing, then ⟨pos⟩ is also missing and ⟨obj⟩ is put in an \hbox of its natural width.
- \makebox(⟨x⟩,⟨y⟩)[⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width $x * \unitlength$ and height $y * \unitlength$. ⟨pos⟩ arguments are **s**, **l**, **r** or **c** (default) for stretched, flushleft, flushright or centred, and **t** or **b** for top, bottom – or combinations like **tr** or **rb**. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the *bottom* of the text as documented. If you want to align on the *baseline* use \makebox(,)[b]{\raisebox{0pt}[\height][0pt]{xyz}} or \makebox(,)[b]{\smash{xyz}}
- \mbox \mbox{⟨obj⟩} The same as \makebox{⟨obj⟩}, but is more efficient as no checking for optional arguments is done.
- \newsavebox \newsavebox{⟨cmd⟩} : If ⟨cmd⟩ is undefined, then defines it to be a T_EX box register.
- \savebox \savebox{⟨cmd⟩} ... : ⟨cmd⟩ is defined to be a T_EX box register, and the '...' are any \makebox arguments. It is like \makebox, except it doesn't produce text but saves the value in \box ⟨cmd⟩.
- \sbox \sbox{⟨cmd⟩}{⟨obj⟩} is an efficient abbreviation for \savebox{⟨cmd⟩}{⟨obj⟩}.
- \lrbox \begin{lrbox}{⟨cmd⟩}{⟨text⟩}\end{lrbox} is equivalent to \sbox{⟨cmd⟩}{⟨text⟩} except that any white space at the beginning and end of ⟨text⟩ is ignored.
- \framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text – except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.
- \fbox \fbox{⟨obj⟩} is an abbreviation for \framebox{⟨obj⟩}.
- \parbox \parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩} : Makes a box with \hsize ⟨width⟩, positioned by ⟨pos⟩ as follows: c : \vcenter (placed in \$...\$ if not in math mode) b : \vbox t : \vtop default value is c. Sets \hsize := ⟨width⟩ and calls \parboxrestore, which does the following: Restores the original definitions of:

```

\par
\\
\-
\'
\` 
\= 

Resets the following parameters:
\parindent      = 0pt
\parskip       = 0pt           added 20 Jan 87
\linewidth     = \hsize
\@totalleftmargin = 0pt
\leftskip      = 0pt
\rightskip     = 0pt
\@rightskip    = 0pt
\parfillskip   = 0pt plus 1fil
\lineskip      = \normallineskip
\baselineskip  = \normalbaselineskip
Calls \sloppy
Note: \arrayparboxrestore same as \parboxrestore but it doesn't restore \\.

minipage : Similar to \parbox, except it also makes this look like a page by
setting
    \textwidth == \columnwidth == box width
    changes footnotes by redefining:
\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext
    resets the following list environment parameters:
\@listdepth == \@mplistdepth
where \@mplistdepth is initialized to zero,
    and executes \minipagerestore to allow the document style to reset any
other parameters it desires. It sets @minipage true, and resets \everypar to set it
false. This switch keeps \addvspace from putting space at the top of a minipage.
    Change added 24 May 89: \minipage sets @minipage globally; \endminipage
resets it false.
\rule  \rule[<raised>]{<width>}{<height>} : Makes a <width> * <height> rule, raised
<raised>.
\underline \underline{<text>} : Makes an underlined hbox with <text> in it.
\raisebox \raisebox{<distance>}{<height>}[<depth>]{<box>} :
Raises <box> up by <distance> length (down if <distance> negative). Makes TeX
think that the new box extends <height> above the line and <depth> below, for a
total vertical length of <height>+<depth>. Default values of <height> & <depth> =
actual height and depth of box in new position.

\c@arrayparboxrestore Restore various paragraph parameters.
The rational for allowing two normally global flags to be set locally here was
stated originally by Donald Arsenu and extended by Chris Rowley. It is because
these flags are only set globally to true by section commands, and these should

```

never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

`\@finalstrut` This macro adds a special strut the *depth* of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect `\prevdepth` to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns. .

The `\nobreak` was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```
400 \def\@finalstrut#1{%
401   \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}
```

56.1 Some low-level constructs

The following commands are basically inherited from plain TeX.

`\leftline` These macros place text on a full line either centred or left or right adjusted.
`\rightline` 402 `\def\@cline{\hb@xt@\hsize}`
`\centerline` 403 `\DeclareRobustCommand\leftline[1]{\@cline{\#1\hss}}`
`\@crlin` 404 `\DeclareRobustCommand\rightline[1]{\@cline{\hss\#1}}`
`\centerline` 405 `\DeclareRobustCommand\centerline[1]{\@cline{\hss\#1\hss}}`

`\rlap` These macros place text to the left or right of the current reference point without taking up space.
`\llap` 406 `\DeclareRobustCommand\rlap[1]{\hb@xt@\z@{\#1\hss}}`
407 `\DeclareRobustCommand\llap[1]{\hb@xt@\z@{\hss\#1}}`

408 `</2ekernel>`

57 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L^AT_EX 2.09 version, not the extended version described in *The L^AT_EX Companion*. Use the `array` package to obtain the extended version.

57.1 tabbing

`\dimen\@firsttab + i` = distance of tab stop i from left margin
`0 <= i <= 15 (?)`.

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts at the prevailing left margin.

`\@maxtab` = number of highest defined tab register
probably = `\@firsttab + 12`
`\@nxttabmar` = tab stop number of next line’s left margin
`\@curtabmar` = tab stop number of current line’s left margin
`\@curtab` = number of the current tab. At start of line,
it equals `\@curtabmar`
`\@hightab` = largest tab number currently defined.
`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin
skip, and excluding contents of current field
`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\`` command between the
current position and the field that is
“left-shifted”.

UTILITY MACROS

`\@stopfield` : closes the current field
`\@addfield` : adds the current field to the current line.
`\@contfield` : continues the current field
`\@startfield` : begins the next field
`\@stopline` : closes the current line and outputs it
`\@startline` : starts the next line
`\@ifatmargin` : an `\if` that is true iff the current line.

has width zero

- \a The accents \` , \` , and \= that have been redefined inside a tabbing environment can be called by typing \` , \` , and \=. The macro \a is defined in *ltoutenc.dtx*.

The ‘2ekernel’ code ensures that a \usepackage{autotabg} is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

57.2 array and tabular environments

ARRAY PARAMETERS:

- \arraycolsep
 - : half the width separating columns in an array environment
- \tabcolsep
 - : half the width separating columns in a tabular environment
- \arrayrulewidth
 - : width of rules
- \doublerulesep

```

: space between adjacent rules in array or tabular
\arraystretch
: line spacing in array and tabular environments is done by
  placing a strut in every row of height and depth
  \arraystretch times the height and depth of the strut
  produced by an ordinary \strut command.

```

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

```

l,r,c : indicate where entry is to be placed.
|      : for vertical rule
@{EXP} : inserts the text EXP in every column.
          \arraycolsep or \tabcolsep spacing is suppressed.
*{N}{PRE} : equivalent to writing N copies of PRE in the preamble.
          PRE may contain *{N'}{EXP'} expressions.
p{LEN} : makes entry in parbox of width LEN.

```

SPECIAL ARRAY COMMANDS:

```

\multicolumn{N}{FORMAT}{ITEM} : replaces the next N column
  items by ITEM, formatted according to FORMAT.
  FORMAT should contain at most one l,r or c.
  If it contains none, then ITEM is ignored.

\vline : draws a vertical line the height of the current row. May
  appear in an array element entry.

\hline : draws a horizontal line between rows. Must appear either
  before the first entry (to appear above the first row) or
  right after a \\ command. If followed by another \hline,
  then adds a \vskip of \doublerulesep.

\cline{i-j} : draws horizontal lines between rows covering columns
  i through j, inclusive. Multiple commands may follow
  one another to provide lines covering several disjoint
  columns

\extracolsep{WIDTH} : for use inside an @ in the preamble. Causes
  a WIDTH space to be added between columns for the rest
  of the columns. This is in addition to the ordinary
  intercolumn space.

```

170 \def\@array[#1]#2{%
171   \if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi
172   \bgroup
```

This next bit of code sets up the strut and then builds the halign and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the \carstrut below is expanded and contains an \ifmmode then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```
173   \setbox\@arstrutbox\hbox{%
174     \vrule \@height\arraystretch\ht\strutbox
175     \@depth\arraystretch \dp\strutbox
176     \@width\z@\%
177     \mkpream{#2}%
178   \edef\@preamble{%
179     \ialign \noexpand\@halignto
180     \bgroup \carstrut \@preamble \tabskip\z@skip \cr}%

```

That is the end of setting up the preamble; now we reset things before executing the halign built-up in \@preamble. The restorations could be done by introducing an extra group, thus saving tokens.

```
181 \let\@startpbox\@@startpbox \let\@endpbox\@@endpbox
182 \let\tabularnewline\%
183 \let\par\empty
184 \let\sharp##%
185 \set@typeset@protect
186 \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there may be some characters left which TeX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the \halign expects vertical mode thus issues a \par but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

END

The command \def\caddamp{} was removed from \multicolumn on 6 Dec
86 because it caused embedded array environments not to work. I think that it
was included originally to prevent an error message if the 2nd argument to the
\multicolumn command had two column specifiers.

8 Feb 89 — \hbox{} added after \cpreamble to correct bug that occurred if
\multicolumn preceded \\[D] with D > 0, caused by \\[] command doing an
\unskip, which removed \tabcolsep glue inserted by \multicolumn.

```

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

\vline
  342 \def\vline{\vrule \width \arrayrulewidth}

\cline \cline The old LATEX2.09 implementation of \cline used up quite a lot of memory and
two precious count registers. This new (1995/09/14) implementation does not use
any count registers. It is coded in a way that depends heavily on the definition of
\multispan so that command has been moved here from the file ltplain.dtx.
  These counters are no longer declared.

  \newcount\@cla
  \newcount\@clb
  343 \def\cline#1{\@cline#1\@nil}
  344 \def\@cline#1-#2\@nil{%
  345   \omit

```

Use the counter from `\multispan`.

```
346  \@multicnt#1%
347  \advance\@multispan\m@ne
348  \ifnum\@multicnt=\@ne\@firstofone{\&\omit}\fi
349  \@multicnt#2%
350  \advance\@multicnt-#1%
351  \advance\@multispan\@ne
```

The original had `\unskip` at this point, but how could a skip get here ???

```
352  \leaders\hrule\@height\arrayrulewidth\hfill
353  \cr
```

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

```
354  \noalign{\vskip-\arrayrulewidth}}
```

`\mscount` The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

`\multispan` Modify `\multispan` slightly from its plain TeX definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multiput`.

```
\@multispan
  \sp@n 355 \def\multispan{\omit\@multispan}
        356 \def\@multispan#1{%
        357   \@multicnt#1\relax

ltpictur.dtx

58 Picture Mode

Picture mode commands. In addition to the commands available in L^AT_EX2.09, This section adds the new \qbezier command for drawing curves.

\qbezier [N] (AX,AY) (BX,BY) (CX,CY) plots a quadratic Bezier curve from (AX,AY) to (CX,CY), with (BX,BY) as the third Bezier point, using $N + 1$ points equally spaced parametrically. If $N = 0$ (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax + 1 points are drawn. A “point” is a square of side \@wholewidth.

\bezier In addition, to be compatible with the old **bezier** package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

\unitlength	= value of dimension argument
\@wholewidth	= current line width
\@halfwidth	= half of current line width
\@linefnt	= font for drawing lines
\@circlefnt	= font for drawing circles

\linethickness{DIM} : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by \thinlines and \thicklines

```
\picture(XSIZE,YSIZE)(XORG,YORG)
BEGIN
  \@picht := YSIZE * \unitlength
  box \@picbox :=
    \hbox@xt@ XSIZE * \unitlength
    {\hskip -XORG * \unitlength
     \lower YORG * \unitlength

CIRCLES AND OVALS

USER COMMANDS:

\circle{D} : Produces the circle with the diameter as close as possible to $D * \unitlength$. **\put(X,Y){\circle{D}}** puts the circle with its center at (X,Y).

\oval(X,Y) : Makes an oval as round as possible that fits in the rectangle of width $X * \unitlength$ and height $Y * \unitlength$. The reference point is the center.

\oval(X,Y)[POS] : Save as **\oval(X,Y)** except it draws only the half or quadrant of the oval indicated by POS. E.G., **\oval(X,Y)[t]** draws just the top half and **\oval(X,Y)[br]** draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified **\oval(X,Y)** command.

\@ovvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical rule. The width of the box will be **\@tempdima**. DELTA1 and DELTA2 are added to the character number in **\@tempcnta** to get the characters for the top and bottom quarter circle pieces.

\@ovhorz : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval. The width of the box will be **\@ovxx**.

\@getcirc {DIAM} : Sets **\@tempcnta** to the character number of the top-right quarter circle with the largest diameter less than or equal to DIAM. Sets **\@tempboxa** to an hbox containing that character. Sets **\@tempdima** to **\wd \@tempboxa**, which is the distance from the circle's left outside edge to its right inside edge. (These characters are like those described in the

TeXbook, pp. 389-90.)

59 Theorem Environments

The user creates his own theorem-like environments with the command

`\newtheorem{<name>}{<text>}[<counter>]` or
`\newtheorem{<name>}[<oldname>]{<text>}`

This defines the environment `<name>` to be just as one would expect a theorem environment to be, except that it prints `<text>` instead of “Theorem”.

If `<oldname>` is given, then environments `<name>` and `<oldname>` use the same counter, so using a `<name>` environment advances the number of the next `<name>` environment, and vice-versa.

If `<counter>` is given, then environment `<name>` is numbered within `<counter>`.

E.g., if `<counter>` = `subsection`, then the first `<name>` in subsection 7.2 is numbered `<text>` 7.2.1.

The way `<name>` environments are numbered can be changed by redefining `\the<name>`.

DOCUMENT STYLE PARAMETERS

`\@thmcnter{COUNTER}` : A command such that

`\edef\theCOUNTER{\@thmcnter{COUNTER}}`

defines `\theCOUNTER` to produce a number for a theorem environment.

The default is:

`BEGIN \noexpand\arabic{COUNTER} END`

`\@thmcntersep` : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, `\@thmcntersep` should be `\def`'ed to `'-`. Its default is `'.`.

`\@begintheorem{NAME}{NUMBER}` : A command that begins a theorem

environment for a ‘theorem’ named ‘NAME NUMBER’ – e.g., `\@begintheorem{Lemma}{3.7}` starts Lemma 3.7.

`\@opargbegintheorem{NAME}{NUMBER}{OPARG}` :

A command that begins a theorem

environment for a ‘theorem’ named ‘NAME NUMBER’ with optional

argument OPARG – e.g., `\@begintheorem{Lemma}{3.7}{Jones}` starts ‘Lemma 3.7 (Jones):’.

`\@endtheorem` : A command that ends a theorem environment.

`\newtheorem{NAME}{TEXT}[COUNTER] ==`

```

```

END

```
\newtheorem \newtheorem ought really be allowed only in the preamble Which would be good
document style, and allow some main memory to be saved by declaring these
commands to be \onlypreamble. Unfortunately the LATEX book indicates that
\newtheorem may be used anywhere in the document...

ltsect.dtx

60 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L^AT_EX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 {*2ekernel}
2 \message{title,}
```

60.1 The Title

```
\title The user defines the title and author by the declarations \title{\langle name\rangle},
\author \author{\langle name\rangle}
\date Similarly the date is declared with \date{\langle date\rangle}.
\thanks Inside these, the \thanks{\langle footnote text\rangle} command may be used to make
\and acknowledgements, notice of address, etc. in a footnote. If there are multiple
authors, they have to be separated with the \and command.
\maketitle And finally, the \maketitle command produces the actual title, using the
information previously saved with the other commands.

3 </2ekernel>
4 {*2ekernel | latexrelease}

60.2 Sectioning

- \@secpenalty
- 36 \newcount\@secpenalty
 37 \@secpenalty = -300
- \if@noskipsec Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the preamble and to false in \document. This was done to trap lists and related text in the preamble but it does not catch everything.
 38 \newif\if@noskipsec \@noskipsectrue
- \@startsection The \@startsection{\name}{\level}{\indent}{\beforeskip}{\afterskip}{\style}*[\althead]{\heading} command is the mother of all the user level sectioning commands. The part after the *, including the * is optional.
- name:** e.g., 'subsection'
- level:** a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

beforeskip: Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

afterskip: if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If '*' is missing, then increment the counter. If it is present, then there should be no [*altheading*] argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

Warning: The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
          \paragraph{...}
        \endgroup}
```

147 \let\subparagraphmark@gobble
148 \message{contents,}
```

60.3 Table of Contents etc.

60.3.1 Convention

\tf@*foo* = file number for output for table foo. The file is opened only if @filesw = true.

60.3.2 Commands

A `\l@{type}{\{entry\}}{\{page\}}` Macro needs to be defined by document style for making an entry of type `<type>` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

Note: When the `\protect` command is used in the `<entry>` or `<text>` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops . This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional ‘short version’ argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{\{ext\}}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.{\{ext\}}` file and sets up to write the new `.{\{ext\}}` file.

```

\@starttoc{EXT} ==
BEGIN
  \begingroup
    \makeatletter
    read file \jobname.EXT
    IF @filesw = true
      THEN open \jobname.EXT as file \tf@EXT
    FI
    @nobreak :=G FALSE %% added 24 May 89
  \endgroup
END

149 \def\@starttoc#1{%
150   \begingroup
151     \makeatletter
152     \cinput{\jobname.#1}%
153     \if@filesw
154       \expandafter\newwrite\csname tf@#1\endcsname
155       \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156     \fi
157     \nobreakfalse
158   \endgroup}

```

`\addcontentsline` The `\addcontentsline{\{table\}}{\{type\}}{\{entry\}}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{\{type\}}{\{entry\}}{\{page\}}` to the `.{\{table\}}` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```

159 </2ekernel>
160 <*2ekernel | latexrelease>
161 <latexrelease>\IncludeInRelease{2018/12/01}%
162 <latexrelease>           {\addcontentsline}{Mask line endings}%

```

```

163 \def\addcontentsline#1#2#3{%
164   \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}%

```

We add `\protected@file@percent` at the end which is turned om `\@writefile` into a percent character to mask the newline after the closing argument brace.

```

165   \protected@file@percent}}%
166 </2ekernel | latexrelease>
167 <latexrelease>\EndIncludeInRelease
168 <latexrelease>\IncludeInRelease{0000/00/00}%
169 <latexrelease>          {\addcontentsline}{Mask line endings}%
170 <latexrelease>\def\addcontentsline#1#2#3{%
171 <latexrelease>  \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}}
172 <latexrelease>\EndIncludeInRelease
173 {*2ekernel}

```

\addtocontents The `\addtocontents{<table>}{<text>}` command adds `<text>` to the `.<table>` file, with no page number.

```

174 \long\def\addtocontents#1#2{%
175   \protected@write\@auxout{%
176     {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%
177     {\string\@writefile{#1}{#2}}}}

```

\contentsline The `\contentsline{<type>}{<entry>}{<page>}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```

\contentsline{subsection}
{\makebox[30pt][r]{1.4.3} Gnats and Gnus}{22}

```

The `\protect` command causes command sequences to be written without expanding them.

```
178 \def\contentsline#1{\csname l@#1\endcsname}
```

`\@dottedtocline{<level>}{<indent>}{<numwidth>} {<title>}{<page>}`: Macro to produce a table of contents line with the following parameters:

level If `<level>` > `\c@tocdepth`, then no line produced.

indent Total indentation from the left margin.

numwidth Width of box for number if the `<title>` has a `\numberline` command.

As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

`pnumwidth` Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be \def'd to a number like 2 or 1.7

199   \par}%
200 \fi}
```

\noprotrusion This command, if placed directly to the right (or left) of a word, will prevent prevent protrusion of that word into the margin. It is used in the toc entry lines as they shouldn't protrude. It is implemented as to kerns that cancel each other but being there hide the word so that protrusion is not added. Note that a zero kern or an empty box would not work as the protrusion mechanism will skip over those.

ltfloat.dtx

61 Floats

The different types of floats are identified by a *<type>* name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each *<type>* has associated a positive *<type number>*, which is a power of two. E.g., figures might be have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a *<placement specifier>*, which is a list of the possible locations, each denoted by a letter as follows:

- h : here — at the current location in the text.
- t : top — at the top of a text page.
- b : bottom — at the bottom of a text page.
- p : page — on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

61.1 Floating Environments

```
1 {*2ekernel}
2 \message{floats,}
```

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
\c@topnumber      : Number of floats allowed at the top of a column.
\topfraction     : Fraction of column that can be devoted to floats.
\cdbltopnumber, \dbltopfraction
                  : Same as above, but for double-column floats.
\c@bottomnumber, \bottomfraction
                  : Same as above for bottom of page.
\c@totalnumber   : Number of floats allowed in a single column,
                  including in-text floats.
{textfraction}   : Minimum fraction of column that must contain text.
{floatpagefraction}: Minimum fraction of page that must be taken
                   up by float page.
{dblfloatpagefraction}
                  : Same as above, for double-column floats.
```

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.
`\ftype@TYPE` : The type number for floats of type TYPE.
`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.
For example, `\ext@figure` = 'lof'.
`\fnum@TYPE` : A macro to generate the figure number for a caption.
For example, `\fnum@TYPE` == Figure `\thefigure`.
`\makcaption{NUM}{TEXT}` :
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption.
It can assume it's in a `\parbox` of the appropriate width.
`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.
E.g., `\figure == \@float{figure}`, `\endfigure == \end@float`.
`\@float{TYPE}[PLACEMENT] ==`
BEGIN
if hmode then `\bsphack`
`\@floatpenalty := -10002`
else `\@floatpenalty := -10003`
fi
`\@capttype ==L TYPE`
`\dblflset`
`\fps ==L PLACEMENT`
`\onelevel@sanitize \fps`
add default PLACEMENT if at most ! in PLACEMENT ==
`\fpsadddefault`
if inner
then LaTeX Error: 'Not in outer paragraph mode.'
`\@floatpenalty := 0`
else if `\freelist` nonempty
then `\currbox :=L head of \freelist`
`\freelist :=G tail of \freelist`
`\count\currbox :=G 32*\ftype@TYPE +`
bits determined by PLACEMENT
else `\@floatpenalty := 0`
LaTeX Error: 'Too many unprocessed floats'
fi

```

fi
\@currbox :=G \color@vbox
\normalcolor
\vbox{
%% 15 Dec 87 -
%% removed \boxmaxdepth :=L 0pt
%% that made box 0 depth because it screwed
%% things up. Instead, added \vskip0pt at
end
\hsize = \columnwidth
\@parboxrestore
\@floatboxreset
END

\caption ==
BEGIN
\refstepcounter{@captive}
\@dblarg{\@caption{\@captive}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
\par
\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
\begingroup
\@parboxrestore
\@normalsize
\@makecaption{\fnum@TYPE}{TEXT}
\par
\endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'. The environment is ended by `\end@dblfloat`. E.g., `\figure*` == `\@dblfloat{figure}`, `\endfigure*` == `\end@dblfloat`.

```
\@dblfloat{TYPE}[PLACEMENT] ==
```

```

    Identical to \@float{TYPE}[PLACEMENT] except \hsize and
\linewidth
    are set to \textwidth.

\@floatpenalty
    3 \newcount\@floatpenalty

    18   \begingroup

The paragraph setting parameters are normalised at this point, however
\@parboxrestore resets \everypar which is not correct in this context so
\@setminipage is called if needed.

The float mechanism, like minipage, sets the flag @minipage true before executing the user-supplied text. Many LATEX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates TEX's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of \everypar, but the call to \@parboxrestore removes that redefinition, so it is re-inserted if needed. If the flag is already false then the \caption was not the first entry in the float, and so some other paragraph has already activated the special \everypar. In this case no further action is needed.

\fps@dbl Note that all double floats have default fps ‘tp’.

\@setfps This sets the fps, dealing with error conditions by adding the default.

\@xfloat The first part of this sets the count register that stores all the information about
the type and fps of the float.
      We assume here that the default specifiers already contain no active characters.
      It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

```

\@floatboxreset The rational for allowing these normally global flags to be set locally here, via \parboxrestore, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \setnobreak; otherwise this command will be redundant.

304 <latexrelease> \fpbot \@dblfpbot
305 <latexrelease>}%
306 <latexrelease>\EndIncludeInRelease
307 <*2ekernel>
```

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the \output routine. Marginal notes are distinguished from floats by having a negative placement specification. The command \marginpar [LTEXT]{RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

```
\marginparwidth : Width of marginal notes.
\marginparsep  : Distance between marginal note and text.
                  the page layout to determine how to move the marginal
                  note into the margin. E.g., \leftmarginskip ==
                  \hskip -\marginparwidth \hskip -\marginparsep .
```

```
\marginparpush : Minimum vertical separation between \marginpar's
```

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==

 341     \minipagetrue
 342     \outer@nobreak
 343   }%
 344   \color@endbox
 345 }

```

\marginparreset The rational for allowing these normally global flags to be set locally here, via \parboxrestore was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \set@nobreak; otherwise this command will be redundant.

```

346 \def \marginparreset {%
347     \reset@font
348     \normalsize

```

61.2 Footnotes

\footnote{NOTE} : User command to insert a footnote.

\footnote[*NUM*]{*NOTE*} : User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered *, **, etc. within pages, then \footnote[2]{...} produces footnote '**'. This command does not step the footnote counter.

\footnotemark[*NUM*] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[*NUM*]{*TEXT*} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

\footnotesize : Size-changing command for footnotes.

\footnotesep : The height of a strut placed at the beginning of every footnote.

\skip\footins : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height **\footnotesep** which is at the beginning of the first footnote.

\footnoterule : Macro to draw the rule separating footnotes from text. It is executed right after a **\vspace** of **\skip\footins**. It should take zero vertical space—i.e., it should skip to compensate for any positive space it occupies. (See PLAIN.TEX.)

\interfootnotelinepenalty : Interline penalty for footnotes.

\thefootnote : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an **\@addtoreset** command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

\@thefnmark : Holds the current footnote's mark—e.g., **\dag** or '1' or 'a'.

\mpfnnumber : A macro that generates the numbers for **\footnote** and **\footnotemark** commands. It == **\thefootnote** outside a minipage environment, but can be changed inside to generate numbers for **\footnote**'s.

\@makefnmark : A macro to generate the footnote marker from **\@thefnmark**. The default definition was **\hbox{\$^{\@thefnmark}\$}**.

This is now replaced by
 $\text{textsuperscript}{\@thefnmark}$

\@makefntext{NOTE} :
 Must produce the actual footnote, using **\@thefnmark** as the mark of the footnote and NOTE as the text. It is called when effectively inside a **\parbox**, with **\hsize = \columnwidth**.
 For example, it might be as simple as
 $\$^{\@thefnmark}\$ \text{ NOTE}$

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

- (a) they use the counter `mpfootnote`
 - (b) the footnotes they produce go at the bottom of the minipage.
- The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\@thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

ltbibl.dtx

63 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the `\bibliography` command. With BIBTEX, the following commands will be used.

`\bibliography{<file1,<file2, ... ,<filen>}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle{<style>}` : Writes a `\bibstyle` entry on the `.aux` file.

The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.

`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

Entries are cited by the command `\cite{<name>}`.

`\nocite{<citations>}` puts information on the `.aux` file that causes BIBTEX to include the `{<citations>}` list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells BIBTEX to put the whole of a collection of references into the bibliography.

1 (*2ekernel)
2 \message{bibliography,}

PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command,

where entry FOOi is defined by `\bibitem[LABELi]{FOOi}`. The switch `@tempswa` is true if the optional NOTE argument

is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
BEGIN [LABELS
      IF @tempswa = T THEN , NOTE FI
      ]
END
```

\@biblabel : A macro to produce the label in the bibliography entry. For \bibitem[LABEL]{NAME}, the label is generated by \@biblabel{LABEL}. It has the default definition \@biblabel{LABEL} -> [LABEL].

CONVENTION

\b@FOO : The name or number of the reference created by \cite{FOO} E.g., if \cite{FOO} -> [17] , then \b@FOO -> 17.

```

```

Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the \cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

43     \fi}}
44
45 \nocite (Added 14 Jun 85)
46
47 This puts information on the .aux file that causes BIBTEX to include the
48 citation list in the bibliography, but puts nothing in the text.
49 RmS 93/08/06: Made loop for \nocite like that for \citet, to get rid of
50 leading spaces.
51
52 \def\nocite#1{\@bsphack
53
54 With the implementation designed already in LATEX 2.09 the \nocite command
55 will not work before \begin{document} since it tries to write to the .aux file
56 which is not open before that point. As a result the “reference” will appear on
57 the terminal and nothing else will happen.
58
59 This would be easy to fix, but then a document using the fix will silently fail
60 on an older release of LATEX, missing all citations done with \nocite. Thus we do
61 only generate an error message and leave the fix for a LATEX 2 $\varepsilon$  successor.
62
63 \ifx\@onlypreamble\document
64
65 Since we are after \begin{document} we can do the citations:
66
67 \for\citeb:=#1\do{%
68   \edef\citeb{\expandafter\firstofone\citeb}%
69   \if@files w\immediate\write\auxout{\string\citation{\citeb}}\fi
70   \ifundefined{b@\citeb}{\G@refundefinedtrue
71     \G@latex@warning{Citation ‘\citeb’ undefined}}{}%
72   \else
73 
```

But before `\begin{document}` we raise an error message:

```
47     @latex@error{Cannot be used in preamble}@\eha
```

Without the compatibility problems we could fix the problem as follows:

```
48     % \AtBeginDocument{\nocite{#1}}
49     \fi
50     \@esphack}
```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence ‘`\b@*`’ to something other than `\relax`. As a result `\cite{*}` will not warn either (but that never worked with BIBTeX in the first place).

```
51 \expandafter\let\csname b@*\endcsname\empty
```

63.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

`\@cite`

```
52 \def\@cite#1#2{{#1\if@tempswa , #2\fi}}
```

`\@cite@ofmt` This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@\@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```
53 \let\@cite@ofmt\hbox
```

`\@biblabel`

```
54 \def\@biblabel#1{#1}
```

```
55 \end{2ekernel}
```

64 Page styles and related commands

64.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

64.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

64.3 marking conventions

L^AT_EX extends T_EX's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T_EX's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T_EX's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the `\pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 (*2ekernel)

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle

PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside       : boolean. T if two-sided printing
\oddsidemargin : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of
even-numbered
                  pages.
\headheight    : height of head
\headsep       : separation between head and text
\footskip      : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight    : height of text on page, excluding head and foot
\textwidth     : width of printing on page
\columnsep     : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth   : IF @twocolumn = T
                  THEN  $(\textwidth - \columnsep)/2$ 
                  ELSE \textwidth
                  It is set by the \twocolumn and
```

`\onecolumn` commands.
`\@textbottom` : Command executed at bottom of vbox holding text
of page (including figures). The `\raggedbottom` command almost `\let`'s this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.
`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and
`\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

<code>\floatsep</code>	: Space left between floats.
<code>\textfloatsep</code>	: Space between last top float or first bottom float and the text.
<code>\topfigrule</code>	: Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the <code>\textfloatsep</code> skip separating the floats from the text. Must occupy zero vertical space. (See <code>\footnoterule</code> .)
<code>\botfigrule</code>	: Same as <code>\topfigrule</code> , but put after the <code>\textfloatsep</code> skip separating text from the floats at bottom of page.
<code>\intextsep</code>	: Space left on top and bottom of an in-text float.
<code>\dblfloatsep</code>	: Space between double-column floats.
<code>\dbltextfloatsep</code>	: Space between top double-column floats and text.
<code>\dblfigrule</code>	: Similar to <code>\topfigrule</code> , but for double-column floats.
<code>\@fptop</code>	: Glue to go at top of float column – must be 0pt + stretch
<code>\@fpsep</code>	: Glue to go between floats in a float column.
<code>\@fpbot</code>	: Glue to go at bottom of float column – must be 0pt + stretch
<code>\@dblftop, \@dblfpsep, \@dblfpbot</code>	: Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

\@oddhead : IF @twoside = T
THEN macro to generate head of
odd-numbered pages.
ELSE macro to generate head of all pages.
\@evenhead : IF @twoside = T
THEN macro to generate head of
even-numbered pages.
\@oddfoot : IF @twoside = T
THEN macro to generate foot of
odd-numbered pages.
ELSE macro to generate foot of all pages.
\@evenfoot : IF @twoside = T
THEN macro to generate foot of
even-numbered pages.
@specialpage : boolean. T if current page is to have a special format.
\@specialstyle : If its value is foo then
IF @specialpage = T
THEN the command \ps@foo is executed to
temporarily reset the page style parameters
before composing the current page.
This command should execute only \def's
and
\edef's, making only local definitions.

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro \@floatplacement.
When \@floatplacement is called,

\@colht is the height of the page or column being built. I.e.:
* For single-column page it equals \textheight.
* For double-column page it equals \textheight - height
of double-column floats on page.

Note that some are set globally and some locally:

\@topnum :=G Maximum number of floats allowed on the top of a column.
\@toproom :=G Maximum amount of top of column devoted to floats—
excluding \textfloatsep separation below the floats
and \floatsep separation between them. For
two-column output, should be computed as a function
of \@colht.
\@botnum, \@botroom
: Analogous to above.

```

\@colnum  :=G Maximum number of floats allowed in a column,
              including in-text floats.
\@textmin :=L Minimum amount of text (excluding footnotes) that
              must appear on a text page.
%% 27 Sep 85 : made local to
%% \@addtocurcol and \@addtonextcol
It is now also used locally in processing double
floats.
\@fpmin   :=L Minimum height of floats in a float column.

```

The macro `\dblfloatplacement` sets the following parameters.

```

\@dbltopnum :=G Maximum number of double-column floats allowed
at
              the top of a two-column page.
\@dbltoproom :=G Maximum height of double-column floats allowed at
                 top of two-column page.
\@fpmin      :=L Minimum height of floats in a float column.
It should also perform the following local assignments where necessary
– i.e., where the new value differs from the old one:
\@fptop     :=L \@dblfpptop
\@fpsep     :=L \@dblfpsep
\@fpbot     :=L \@dblfpbot

```

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output

routine was called, using the following code.

penalty	reason
-10000	\pagebreak \newpage
-10001	\clearpage (\penalty -10000 \vbox{} \penalty -10001)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list:
 (i) a penalty of -10004,
 (ii) a null \vbox
 (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a \newpage or \clearpage, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

\@outputpage : Produces an output page with the contents of box \@outputbox as the text part.
 Also sets \@colht :=G \textheight.

The page style is determined as follows.

```
IF  @thispagestyle = true
  THEN  use \thispagestyle style
  ELSE  use ordinary page style.
```

\@tryfcolumn\FLIST : Tries to form a float column composed of floats from \FLIST (if nonempty) with the following parameters:

```
\@colht : height of box
\@fpmmin : minimum height of floats in the box
\@fpsep : interfloat space
\@ftp top : glue at top of box
\@fpbot : glue at bottom of box.
```

If it succeeds, then it does the following:

```
* \@outputbox :=L the composed float box.
* @fcollmade :=G true
* \FLIST :=G \FLIST - floats put in box
* \@freelist :=G \@freelist + floats put in box
```

If it fails, then:

```
* @fcollmade :=G false
```

NOTE: BIT MUST BE A SINGLE TOKEN!

\@makefcolumn \FLIST : Same as \@tryfcolumn except that it fails to make a float column only if \FLIST is empty. Otherwise, it makes a float column containing at least the first box in \FLIST, disregarding \@fpmin.

\@startcolumn :

Calls \@tryfcolumn\@deferlist. If \@tryfcolumn returns with (globally set) @fcolmade = false, then:

- * Globally sets \@toplist and \@botlist to floats from \@deferlist to go at top and bottom of column, deleting them from \@deferlist. It does this using \@colht as the total height, the page style parameters \@floatsep and \@textfloatsep, and the float placement parameters \@topnum, \@toproom, \@botnum, \@botroom, \@colnum and \@textfraction.
- * Globally sets \@colroom to \@colht minus the height of the added floats.

\@startdblcolumn :

Calls \@tryfcolumn\@dbldeferlist{8}. If \@tryfcolumn returns with (globally set) @fcolmade = false, then:

- * Globally sets \@dbltoplist to floats from \@dbldeferlist to go at top and bottom of column, deleting them from \@dbldeferlist. It does this using \@textheight as the total height, and the parameters \@dblfloatsep, etc.
- * Globally sets \@colht to \@textheight minus the height of the added floats.

\@combinefloats : Combines the text from box

\@outputbox with the floats from \@toplist and

\@botlist,

putting the new box in \@outputbox. It uses \@floatsep and \@textfloatsep for the appropriate separations. It puts the elements of \TOPLIST and \BOTLIST onto \@freelist, and makes those lists null.

\@makecol : Makes the contents of \box255 plus the accumulated footnotes, plus the floats in \@toplist and \@botlist, into a single column of height \@colht (unless the page height has been locally changed), which it puts into box \@outputbox. It puts boxes in \@midlist back onto \@freelist and restores \@maxdepth.

\@opcol : Outputs a column whose text is in box \@outputbox
If @twocolumn = false, then it calls \@outputpage, sets \@colht :=G \@textheight, and calls \@floatplacement.

If `@twocolumn` = true, then:
 If `@firstcolumn` = true, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G` false.
 If `@firstcolumn` = false, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
  \write -1{} % Part of hack to make sure no
  \vbox{}       % \write's get lost.
  \penalty -10001
END

\cleardoublepage == BEGIN \clearpage
  if @twoside = true and c@page is even
    then \hbox{} \newpage fi
END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting
  and puts BOX in a parbox of width \textwidth across the top.
  Useful for full-width titles for double-column pages.
SURPRISE: The stretch from \dbltextfloatsep will be inserted
  between the BOX and the top of the two columns.

```

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.
- * A TYPE, which is a power of two--e.g., figures might be

type 1 floats, tables type 2 floats, programs type 4 floats, etc.
The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
	etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```
\@elt \boxa ... \@elt \boxN
where \boxI is defined by
\newinsert\boxI
```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEEMPTY}{EMPTY} == %% NOTE: ASSUME
\@elt = \relax
BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
  if n = 0
    then EMPTY
    else \CS :=L \B1
         \LIST :=G \@elt \B2 ... \@elt \Bn
         NONEEMPTY
  fi
END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all I of bit $\log_2 \NUM$ of the float specifiers of all the floats in `\LIST`.
I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit $\log_2 \NUM$ of its float specifier equal to 1.

Note: $\log_2 [(\text{\count} I)/32]$ is the bit number corresponding to the type of float I. To see if there is any float in \LIST having the same type as float I, you run \@bitor with

$\text{\NUM} = [(\text{\count} I)/32] * 32.$

```
\@bitor\NUM\LIST ==
BEGIN
    @test :=G false
    { \@elt \CTR ==  if \NUM <> 0 then
        if \count\CTR / \NUM is odd
            then @test := true      fi fi
        \LIST
    }
END
```

\@cons\LIST\NUM : Globally sets \LIST := \LIST * \@elt \NUM

```
\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
        \LIST :=G \LIST \@elt \NUM
    }
```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

\@freelist	: List of empty boxes for placing new floats.
\@toplist	: List of floats to go at top of current column.
\@midlist	: List of floats in middle of current column.
\@botlist	: List of floats to go at bottom of current column.
\@deferlist	: List of floats to go after current column.
\@dbltoplist	: List of double-col. floats to go at top of current page.
\@dbldeferlist	: List of double-column floats to go on subsequent pages.

FLOAT-PLACEMENT ALGORITHMS

\@addtobot : Tries to put insert \@currbox on \@botlist.

Called only when:

- * \ht BOX < \@colroom
- * type of \@currbox not on \@deferlist
- * \@colnum > 0
- * @insert = false

If it succeeds, then:

- * sets @insert true
- * decrements \@botroom by \ht BOX
- * decrements \@botnum and \@colnum by 1

```

        * decrements \@colroom by \ht BOX + either
\floatsep
        or \textfloatsep, as appropriate.
        * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
\@botlist.
Called only under same conditions as \@addtobot.
If it succeeds, then:
        * sets @insert true
        * decrements \@toproom or \@botroom by \ht
BOX
        * decrements \@colnum and either \@topnum or
\@botnum by 1
        * decrements \@colroom by \ht BOX +
\floatsep
        or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting
@insert true if it succeeds, false otherwise.
It will add \@currbox to top only if bit 0 of
\count \@currbox is 0, and to the bottom only if
bit 0 = 0 or an earlier float of the same type is
put on the bottom.
If the float is put in the text, then
\penalty\interlinepenalty is put
right after the float, before the following \vskip,
and \outputpenalty :=L 0.

\@addtonextcol : Tries to add \@currbox to the next column, setting
@insert true if it succeeds, false otherwise.

\@addtoblcol : Tries to add \@currbox to the next double-column page,
adding it to \@dbltoplist if it succeeds and
\@dbldeferalist if it fails.

\@addmarginpar ==
BEGIN
if \@currlist nonempty
    then remove \@marbox from \@currlist
        add \@marbox and \@currbox to \@freelist
        %% NOTE: \@currbox = left box

```

\AtBeginDvi We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

```

86 \newbox\@begindvibox
87 \DeclareRobustCommand \AtBeginDvi [1]{%
88   \global \setbox \@begindvibox
89   \vbox{\unvbox \@begindvibox #1}%
90 }

```

\@maxdepth This is not the right place to set this; it needs to be set in a class/style file when **\maxdepth** is set.

Also, many settings to **\maxdepth** should be to **\@maxdepth**, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

\paperheight New **\paper...** registers.

```

93 \newdimen\paperheight
94 \newdimen\paperwidth

```

\if@insert Local switches first:

```

95 \newif \if@insert

```

\if@fcolmade These should definitely be global:

```

96 \newif \if@fcolmade
97 \newif \if@specialpage \@specialpagefalse

```

\if@reversemarginpar

```

\if@mparswitch
\col@number

```

These should be global but are not always set globally in other files.

```
98 \newif \if@firstcolumn \if@firstcolumntrue  
99 \newif \if@twocolumn \if@twocolumnfalse
```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```

```

The **\vfil** at the end of the macro before the break penalty will normally result in the page being run short, even with **\flushbottom** in effect (in contrast to the behavior of **\pagebreak**). However, if there is some explicit stretch on the page, say, a **\vfill**, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of **\prevdepth** is no longer taken into account by TeX. So we back up by that amount (or by **\maxdepth** if it is really huge), to mimic the normal behavior without the **\newpage**.

```

240  \f@trace{dbltopnum set to -1 (= \the \c@dbltopnum) (topnewpage)}%
241  {/trace}

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by \output, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra \c@emptycol will be invoked in the second column by the conditional code guarded by the \if@cfirstcolumn test.

I now think that the cut-off point here should be 3\baselineskip, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

242  \ifdim \@colht<2.5\baselineskip
243    \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
244      too tall on page \thepage}%
245    \emptycol
246    \if@firstcolumn
247    \else
248      \emptycol
249    \fi
250  \else
251    \global \vsize \@colht
252    \global \colroom \@colht
253    \floatplacement
254  \fi
255 }
```

\output
\@specialoutput This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of \par to the output routine. This avoids problems when the output routine is called within a list where \par may be a no-op.

```

256 \output {%
257   \let \par \@@par
258   \ifnum \outputpenalty<-\@M
259     \@specialoutput
260   \else
261     \makecol
262     \opcol
```

Moved to \opcol: \floatplacement.

```
263   \startcolumn
```

This loop could be replaced by an \expandafter tail recursion in \startcolumn.

```

264   \whilesw \if@fcolmade \fi
265   {%
266   (*trace)
267     \f1@trace{PAGE: float \if@twocolumn column \else page \fi
268     completed}%
269   (/trace)
270   \opcol\startcolumn}%
271 \fi
272 \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of \colroom.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the \output itself; in the second column there will still not be enough room left so \emptycol will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within \output may not get executed with the correct value of \if@firstcolumn.

```

273      \ifdim \colroom<1.5\baselineskip
274          \ifdim \colroom<\textheight
275              \@latex@warning@no@line {Text page \thepage\space
276                  contains only floats}%

CHANGES TO \specialoutput:
* \penalty\z@ changed to \penalty\interlinepenalty so \samepage
  works properly with figure and table environments.
(Changed 23 Oct 86)

* Definition of \specialoutput changed 26 Feb 88 so \pageht and
  \pagedp aren't changed for a marginal note.
(Change suggested by Chris Rowley.)
```

```

294 \gdef\specialoutput{%
295     \ifnum \outputpenalty>-\@Mii
296         \doclearpage
297     \else
298         \ifnum \outputpenalty<-\@Mii
299             \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
300             \global \setbox\holdpg \vbox {\unvbox\ccly}%
301     \else
```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen

when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```
302      \global \setbox\@holdpg \vbox{%
303          \unvbox\@holdpg
304          \unvbox\@cclv
```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by TeX.

```
305          \setbox\@tempboxa \lastbox
306          \unskip
307          }%
```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```
308      \@pagedp \dp\@holdpg
309      \@pageht \ht\@holdpg
310      \unvbox \@holdpg
311      \next\currbox\currlist{%
312          \ifnum \count\currbox>\z@
```

Putting the whole size into `\@pageht` (see above).

```
313          \advance \@pageht \@pagedp
314          \ifvoid\footins \else
315              \advance \@pageht \ht\footins
316              \advance \@pageht \skip\footins
317              \advance \@pageht \dp\footins
318          \fi
319          \ifvbox \@kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
320          \ifdim \wd\@kludgeins=\z@
321              \advance \@pageht \ht\@kludgeins
322 (*trace)
323              \f@trace {Extra size added: \the \ht\@kludgeins}%
324 (/trace)
325          \fi
326          \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
327          \reinserts
328          \addtocurcol
329      \else
330          \reinserts
331          \addmarginpar
332      \fi
333  }\@latexbug
```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```

334     \ifnum \outputpenalty<\z@
335         \if@nobreak
336             \nobreak
337         \else
338             \addpenalty \interlinepenalty
339         \fi
340     \fi
341 \fi
342 \fi
343 }
344 </2ekernel | fltrace>

```

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area.
`\f@depth` (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

`\@doclearpage` This is a very much an emergency action, just dumping everything; footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwidth{\box}` at suitable places. That is at places where a box is taken off the deferlist.

\@opcol Several changes in detail here.

```

465 {*2ekernel | fltrace}
466 \def \@opcol {%
467   \if@twocolumn
468     \@outputdblcol
469   \else
470     \@outputpage
471   {*trace}
472     \f@l@trace{PAGE: one column (float? see above) page completed}%
473 }
```

Not needed since it comes after \@outputpage:

```

474 %   \global \@colht\textheight
475   \fi
```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

476   \global \z@\global \z@ \global \textfloatsheight \z@
477   \floatplacement
478 }
479 
```

\@makecol We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

480 {*2ekernel}
481 \gdef \@makecol {%
482   \ifvoid\footins
483     \setbox\@outputbox \box\cclv
484   \else
485     \setbox\@outputbox \vbox {%
```

This \boxmaxdepth setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use \maxdepth otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

486       \boxmaxdepth \maxdepth
487 %       \tempdima\dp\cclv
488       \unvbox \cclv
489 %       \vskip-\tempdima
490       \vskip \skip\footins
491       \color@begingroup
492         \normalcolor
493         \footnoterule
494         \unvbox \footins
495       \color@endgroup
496     }%
497   \fi
```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```

498   \let\@elt\relax
499   \xdef\@freelist{\@freelist\@midlist}%
500
501   \global \let \@midlist \empty
      \@combinefloats

```

The variations start here in case `\enlargethispage` has been used.

```

502   \ifvbox\@kludgeins
503     \@makespecialcolbox
504   \else

```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\maxdepth`) the correct value?

The `\vskip -\dimen@` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```

505   \setbox\@outputbox \vbox to\@colht {%
506 %     \boxmaxdepth \maxdepth %??
507     \@texttop
508     \dimen@ \dp\@outputbox
509     \unvbox \@outputbox
510     \vskip -\dimen@
511     \@textbottom
512   }%
513 \fi
514 \global \maxdepth \maxdepth
515 }

```

\@reinserts This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```

516 \gdef \@reinserts{%
517   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518   \ifvbox\@kludgeins\insert\@kludgeins
519     {\unvbox\@kludgeins}\fi
520 }
521 
```

\@makespecialcolbox This implements certain variations in page-makeup.

```
522 {*2ekernel | ftrace}
```

```

523 \gdef \makespecialcolbox {%
524 (*trace)
525   \f1@trace{Kludgeins ht \the\ht}@kludgeins\space
526           dp \the\dp@kludgeins\space
527           wd \the\wd@kludgeins}%
528 }/trace}

```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

529   \setbox\@outputbox \vbox {%
530     \texttop
531     \dimen@ \dp\@outputbox
532     \unvbox\@outputbox
533     \vskip-\dimen@
534   }%
535   \tempdima \colht
536   \ifdim \wd\@kludgeins>\z@

```

Note that in this case (the ***-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the TeX level!).

This needs TeX3 otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both the flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

There should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

537   \advance \tempdima -\ht\@outputbox
538   \advance \tempdima \pageshrink
539 (*trace)
540   \f1@trace {Natural ht of col: \the \ht\@outputbox}%
541   \f1@trace {\string \colht: \the \colht}%
542   \f1@trace {Pageshrink added: \the \pageshrink}%
543   \f1@trace {Hence, space added: \the \tempdima}%
544 }/trace}
545   \setbox\@outputbox \vbox to \colht {%
546 %     \boxmaxdepth \maxdepth
547     \unvbox\@outputbox
548     \vskip \tempdima
549     \textbottom
550   }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore,

at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

551     \else
552         \advance \@tempdima -\ht\@kludgeins
553 <*trace>
554     \f@trace {Natural ht of col: \the \ht\@outputbox}%
555     \f@trace {\string \@colht: \the \@colht}%
556     \f@trace {Extra size added: -\the \ht \@kludgeins}%
557     \f@trace {Hence, height of inner box: \the \@tempdima}%
558     \f@trace {Max? pageshrink available: \the \pageshrink}%
559 </trace>
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

560     \setbox \@outputbox \vbox to \@colht {%
561         \vbox to \@tempdima {%
562             \unvbox\@outputbox
563             \textbottom}%
564         \vss}%
565     \fi
```

Finally we need to explicitly make the insert box void.

```

566     {\setbox \@tempboxa \box \@kludgeins}%
567 <*trace>
568     \f@trace {kludgeins box made void}%
569 </trace>
570 }
571 </2ekernel | fltrace>
```

`\@texttop` These do nothing as a default.
`\@textbottom` `*2ekernel`
`572 \let \@texttop \relax`
`573 \let \@textbottom \relax`

`\@resetactivechars` RmS 93/09/06: added hook to protect against certain active characters in the output routine. Default checks are for active space and end-of-line.

```

\@outputpage \@shipoutsetup \@writesetup The \color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This is because it must have the value \relax before macros coming from other uses of \aftergroup within this box are expanded.

Putting this into the \aftergroup token list does not affect the definition used in expanding the \writes because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an \aftergroup within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
590 </2ekernel>
591 <latexrelease>\IncludeInRelease{2017/04/15}%
592 <latexrelease> {\@outputpage}{Reset language for hyphenation}%
593 (*2ekernel | latexrelease)
594 \def\@outputpage{%
```

The \endgroup is put in by \aftergroup.

```
595 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command \@writesetup.

```
596 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset \language to the value current at \begin{document}. In particular this ensures that a pagebreak in \verb+verbatim+ does not prevent hyphenation in the page head.

```
597 \language\document@default@\language
```

The \catcode`\ = 10 was removed as it was considered useless (presumably because nothing gets tokenised during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
598 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
599 \global\let\@@if@newlist\if@newlist
600 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyp
\let'\@acci\let`@\accii\let=\@acci
\let\\@\normalcr
\let\par\@@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normalineskip
\baselineskip\normalbaselineskip
\sloppy
```

```
601 \parboxrestore
... to here was in the command \writestop.
602 \shipout \vbox{%
603   \set@typeset@protect
604 } \aftergroup \endgroup
```

Correct? or just restore by ending the group?

```
605 \aftergroup \set@typeset@protect
```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command `\shipoutsetup`.

```
606 \if@specialpage
607   \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
608 \fi
609 \if@twoside
610   \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfoot
611     \let\@themargin\oddsidemargin
612   \else \let\@thehead\@evenhead
613     \let\@thefoot\@evenfoot \let\@themargin\evensidemargin
614   \fi
615 \fi
```

The rest was always inside the box.

RmS 91/08/15: added this line:

```
616 \reset@font
```

RmS 93/08/06 Added `\lineskiplimit=0pt` to guard against it being nonzero:
e.g. by `\offinterlineskip` being in effect.

There are probably lots of other things that may need resetting.

617 `\normalsize`

Reset the space factors.

618 `\normalsfcodes`

Reset these here (previously reset separately for head and foot)

619 `\let\label\@gobble`

620 `\let\index\@gobble`

621 `\let\glossary\@gobble`

622 `\baselineskip\z@skip \lineskip\z@skip \lineskiplimit\z@`

... to here was in the command `\@shipoutsetup`.

623 `\@begindvi`

624 `\vskip \topmargin`

625 `\moveright\@themargin \vbox {%`

626 `\setbox\@tempboxa \vbox to\headheight{%`

627 `\vfil`

628 `\color@hbox`

629 `\normalcolor`

630 `\hb@xt@\textwidth{\@thehead}%`

631 `\color@endbox`

22 Feb 87

632 `}%`

633 `\dp\@tempboxa \z@`

634 `\box\@tempboxa`

635 `\vskip \headsep`

636 `\box\@outputbox`

637 `\baselineskip \footskip`

638 `\color@hbox`

639 `\normalcolor`

640 `\hb@xt@\textwidth{\@thefoot}%`

641 `\color@endbox`

642 `}%`

643 `}%`

`\endgroup` now inserted by `\aftergroup`

Restore `\if@newlist`

644 `\global\let\if@newlist\@if@newlist`

645 `\global \colht \textheight`

646 `\stepcounter{page}<!--%</code>`

It is now clear that this does something useful, thanks to Piet van Oostrum. It is needed because a float page is made without using TeX's page-builder; thus the output routine is never called so the marks are not updated.

647 `\let\firstmark\botmark`

\@begindvi This unboxes stuff that must appear before anything else in the .dvi file, then
           returns that box register to the free list and cancels itself.
           The stuff in the box should not add any typeset material to the page.

710 \def \@begindvi{%
711   \unvbox \@begindvibox
712   \global\let \@begindvi \empty
713 }

\@combinefloats The \boxmaxdepth setting here was not made local to a box so was dangerous. It
\@cflt is needed only within the box made by \@cflt (and not normally even there), so
\@cflb it has been moved there; this also agrees with the original pseudocode.

714 \def \@combinefloats {%
715 %   \boxmaxdepth \maxdepth

762   \global\let \@dbltoplist \@empty
763   \setbox\@outputbox \vbox to\textheight

```

The setting of `\boxmaxdepth` here has no effect since the `\@outputbox` should already have depth zero. Even so, it would have no effect on the layout of the page.

```

764   {%\boxmaxdepth\maxdepth %% probably not needed, CAR
765     \unvbox\@tempboxa\vskip-\dblfloatsep

```

Here we need different typesetting if the top float comes from `\@topnewpage`.

```

766   \ifnum \@dbltopnum>\m@ne
767     \dblfigrule
768   \fi
769   \vskip \dbltextfloatsep

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdfTeX and LuaTeX. We therefore unbox `\@outputbox` here (which only contains a single `\hbox`) so that this case has the same boxing level as a normal twocolumn page without top floats.

```

770   \unvbox\@outputbox
771   }%
772 \fi
773 }
774 </2ekernel>

```

`\@startcolumn` We could combine (most of) these two into `\@startcol <list>`. Note that `\@xstartcol` was only used once (i.e. in `\@startcolumn`); it has therefore been removed. This is not quite as efficient but it now has the same structure as `\@startdblcolumn`.

The empty-list test has been moved to `\@tryfcolumn`.

```

CHANGE TO \addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1815     \if@firstcolumn \@tempcnta\m@ne \fi
1816   \else
1817     \if@mparswitch
1818       \ifodd\c@page \else\@tempcnta\m@ne \fi
1819     \fi
1820     \if@reversemargin \@tempcnta -\@tempcnta \fi
1821   \fi
1822   \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1823   \tempdima\@parbottom
1824   \advance\tempdima -\@pageht
1825   \advance\tempdima\ht\@marbox
1826   \ifdim\tempdima >\z@
1827     \@latex@warning{no@line {Marginpar on page \thepage\space moved}%
1828   \else
1829     \tempdima\z@
1830   \fi
1831   \global\@parbottom\@pageht
1832   \global\advance\@parbottom\tempdima
1833   \global\advance\@parbottom\dp\@marbox
1834   \global\advance\@parbottom\marginparpush
1835   \advance\tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1836   \global\setbox\@marbox
1837     \vbox {\vskip \tempdima
1838       \box\@marbox}%
1839   \global\ht\@marbox \z@
1840   \global\dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

1841   \kern -\pagedp
1842   \nointerlineskip
1843   \hb@xt@\columnwidth
1844     {\ifnum\@tempcnta >\z@
1845       \hskip\columnwidth \hskip\marginparsep
1846     \else
1847       \hskip -\marginparsep \hskip -\marginparwidth
1848     \fi
1849     \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

\nobreak      %% No longer needed. CAR92/12
\vskip -\tempdima %% No longer needed. CAR92/12
1850 \nointerlineskip
1851 \hbox{\vrule \height\z@ \width\z@ \depth\pagedp}}

```

65.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2e.

```
\enlargethispage{<dim>}
```

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to \enlargethispage but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with \pagebreak) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a \clearpage: please give keep them clear of such places.

\@kludgeins The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1852 \newinsert \@kludgeins
1853 \global\dimen@\kludgeins \maxdimen
1854 \global\count@\kludgeins 1000
```

\enlargethispage The user command.

```
\enlargethispage* 1855 \gdef \enlargethispage {%
 1856   \@ifstar
 1857   {%
 1858     (*trace)
 1859       \f@trace{Enlarging page height * }%
 1860   }/{trace}
 1861   \enlargepage{\hbox{\kern\p@}}%
 1862   {%
 1863     (*trace)
 1864       \f@trace{Enlarging page height exactly---}%
 1865   }/{trace}
 1866   \enlargepage\empty%
 1867 }
```

\enlargepage This actually inserts the insert, after checking for extreme values of the change.

```
1868 \gdef\enlargepage#1#2{%
1869 (*trace)
1870   \f@trace{@spaces@spaces by #2}%
1871 }/{trace}
1872   @tempskipa#2\relax
1873   \ifdim \tempskipa>.5\maxdimen
```

```

1874      \@latexerr{Suggested\space extra\space height\space
1875          (\the\@tempskipa)\space dangerously\space
1876          large}\@eha
1877      \else
1878          \ifdim \vsize<.5\maxdimen
1879      (*trace)
1880          \f1@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
1881  
```

```
1882      \@bsphack
1883          \insert\@kludgeins{\#1\vskip-\@tempskipa}%
1884      \@esphack

```

This next bit is for tracing only:

```

1885 (*trace)
1886     \ifvmode \par
1887         \f1@trace {Kludgeins added--pagegoal after: \the \pagegoal}%
1888     \fi
1889 
```

```
1890     \else
1891         \@latexerr{Page\space height\space already\space
1892             too\space large}\@eha
1893     \fi
1894     \fi
1895 }
1896 
```

65.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in L^AT_EX2e.

```
\suppressfloats
```

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinhg are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```
\f@trace Set-up tracing for floats independent of other tracing as it produces mega-output.
\f@tracefloatoff Default is no tracing.

1985 }

```

Manipulation of float placement and type; both their strings and the corresponding count registers.

\@fpstype First a new count register to go with \currtype.

\@reqcolroom Then a new skip register, for information needed to remove the \maxsep conservatism: it is possible that this could use a temporary register.

\@textfloatsheight Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of \addtocurcol which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

1986 \newcount \@fpstype
1987 \newdimen \@reqcolroom
1988 \newdimen \@textfloatsheight
1989 
```

\@fpsadddefault Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

\def \@fpsadddefault {%
  \temptokena \expandafter\expandafter\expandafter
  {\csname fp@\currtype \endcsname}%
  \edef \reserved@a {\the\temptokena}%
  \onelevel@sanitize \reserved@a
  \edef \fps {\@fps\reserved@a}%
}

1990 {*2ekernel | ftrace}
1991 \def \@fpsadddefault {%
1992 (*trace)
1993   \f@trace{fps changed from: \fps}%
1994 
```

```

1995   \edef \fps {\csname fp@\currtype \endcsname}%
1996   \@latex@warning {%
1997     No positions in optional float specifier.\MessageBreak
1998     Default added (so using ‘\fps’)}%
1999 }

```

\@setfloattypecounts Sets counters \fpstype and \currtype.

BANG == bit4 of \count\currbox = 0.

```

2000 \def \@setfloattypecounts {%
2001   \currtype \count\currbox

2069 }

```

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.
It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \addtoblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value \textfraction does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. \twocolumn floatplacement was wrong: dbl not needed, ord needed.
3. \c@floatplacement was not called after \startdblcol or \topnewpage. This has been changed; it is clearly a bug fix.
4. The use \topnewpage when \dblfigrule is non-trivial produced a rule in the wrong place. This has been fixed by not using \dblfigrule when processing the ‘float’ from \topnewpage.
5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just h or !h should be deprecated.
6. \c@dblmaxsep was ‘the maximum of \dblfloatsep and \dbltexfloatsep’. But it was never used! Now gone completely, like \c@maxsep.

7. After an h float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice `\intextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The ! option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:
`\twocolumn[\maketitle more text]`
One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user’s viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the multicol package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?

17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the vskip to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the vskip adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.
It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\opcol{%
  % Why is this done first?
  \global \z@\@parbottom \z@
  \if@twocolumn
    \outputdblcol
  \else
    \outputpage
    % This is not needed since it is done at the end of
    % |\outputpage|:
    \global \colht \textheight
  \fi}
```

Only tracing has been added to these.

2195 \langle latexrelease | fltrace \rangle \EndIncludeInRelease

2196

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with \c@textbottom adding nothing.

Thus again it is essential for \c@textbottom to have depth 0pt.

```

2197 \langle latexrelease | fltrace \rangle \IncludeInRelease{2015/01/01}%
2198 \langle latexrelease | fltrace \rangle {\c@outputdblcol}{2 column marks}%
2199 
```

*2ekernel | fltrace | latexrelease)

This is just a change to the single command \c@outputdblcol so that it saves mark information for the first column and restores it in the second column.

```

2200 \def \c@outputdblcol{%
2201   \if@c@firstcolumn
2202     \global \c@firstcolumnfalse

```

Save the left column

```

2203   \global \setbox \c@leftcolumn \copy \c@outputbox
2204 
```

fltrace \f@l@trace{PAGE: first column boxed}%

Remember the marks from the first column

```

2205   \splitmaxdepth \maxdimen
2206   \vbadness \maxdimen

```

In case of `\enlargethispage` we will have infinite negative glue at the bottom of the page (coming from `\vss`) and that will earn us an error message if we `\vsplit` to get at the marks. So we need to remove the last glue (if any) at the end of `\@outputbox` as we are only interested in marks that change doesn't matter.

```
2207      \setbox\@outputbox\vbox{\unvbox\@outputbox\unskip}%
2208      \setbox\@outputbox\vsplit\@outputbox to\maxdimen
```

One minor difference from the current `fixmarks` package, pass the marks through a token register to stop any # tokens causing an error in a `\def`.

```
2209      \toks@\expandafter{\topmark}%
2210      \xdef\@firstcoltopmark{\the\toks@}%
2211      \toks@\expandafter{\splitfirstmark}%
2212      \xdef\@firstcolfirstmark{\the\toks@}%
```

This test does not work if truly empty marks have been inserted, but L^AT_EX marks should always have (at least) two brace groups. (Except before the first mark is used, when the marks are empty, but that is OK here.)

```
2213      \ifx\@firstcolfirstmark\empty

65.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It

also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

\c@topnumber This counter holds the maximum number of floats that can appear at the top of a text page or column.

```
2288 {*2ekernel}
2289 \newcount\c@topnumber
2290 \setcounter{topnumber}{2}
```

\topfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```
2291 \newcommand\topfraction{.7}
```

\c@bottomnumber This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

```
2292 \newcount\c@bottomnumber
2293 \setcounter{bottomnumber}{1}
```

\bottomfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

```
2294 \newcommand\bottomfraction{.3}
```

\c@totalnumber This counter holds the maximum number of floats that can appear on any text page or column.

```
2295 \newcount\c@totalnumber
2296 \setcounter{totalnumber}{3}
```

\textfraction This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

```
2297 \newcommand\textfraction{.2}
```

\floatpagefraction This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.

```
2298 \newcommand\floatpagefraction{.5}
```

\c@dbltopnumber This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

```
2299 \newcount\c@dbltopnumber
2300 \setcounter{dbltopnumber}{2}
```

\dbltopfraction This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

```
2301 \newcommand\dbltopfraction{.7}
```

\dblfloatpagefraction This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.

```
2302 \newcommand\dblfloatpagefraction{.5}
```

Floats on a text page

\floatsep	When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.
\textfloatsep	\floatsep is the space between adjacent floats that are placed at the top or bottom of the text page or column.
\intextsep	\textfloatsep is the space between the main text and floats at the top or bottom of the page or column.
	\intextsep is the space between in-text floats and the text.
2303 \newskip\floatsep	
2304 \newskip\textfloatsep	
2305 \newskip\intextsep	
2306 \setlength\floatsep {12\p@ \oplus 2\p@ \ominus 2\p@}	
2307 \setlength\textfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}	
2308 \setlength\intextsep {12\p@ \oplus 2\p@ \ominus 2\p@}	
\dblfloatsep	When double-column floats (floating objects that span the whole \textwidth) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep. They are rubber lengths.
\dbltextfloatsep	\dblfloatsep is the space between adjacent double-column floats placed at the top of the text page.
	\dbltextfloatsep is the space between the main text and double-column floats at the top of the page.
2309 \newskip\dblfloatsep	
2310 \newskip\dbltextfloatsep	
2311 \setlength\dblfloatsep {12\p@ \oplus 2\p@ \ominus 2\p@}	
2312 \setlength\dbltextfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}	

Floats on their own page or column

\@fptop	When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.
\@fpsep	
\@fpbot	

At the top of the page \@fptop is inserted; typically this supplies some stretchable whitespace. At the bottom of the page \@fpbot is inserted. Between adjacent floats \@fpsep is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil so as to fill the remaining empty space.

2313 \newskip\fptop
2314 \newskip\fpsep
2315 \newskip\fpbot
2316 \setlength\fptop{0\p@ \oplus 1fil}
2317 \setlength\fpsep{8\p@ \oplus 2fil}
2318 \setlength\fpbot{0\p@ \oplus 1fil}

\@dblfpptop	Double-column ‘float pages’ in two-column mode use similar parameters.
\@dblfpsep	
\@dblfpbot	

```
2319 \newskip\@dblfpptop
2320 \newskip\@dblfpsep
2321 \newskip\@dblfpbot
2322 \setlength\@dblfpptop{0\p@ \oplus 1fill}
2323 \setlength\@dblfpsep{8\p@ \oplus 2fill}
2324 \setlength\@dblfpbot{0\p@ \oplus 1fill}

\topfigrule The macros can be used to put in rules between floats and text; whatever they
\botfigrule insert should be vertical mode material which takes up zero space.
\dblfigrule 2325 \let\topfigrule=\relax
2326 \let\botfigrule=\relax
2327 \let\dblfigrule=\relax
2328 </2ekernel>
```

File L

ltclass.dtx

66 Introduction

This file implements the following declarations, which replace `\documentstyle` in L^AT_EX 2_E documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between L^AT_EX 2_E and L^AT_EX 2.09 is that L^AT_EX 2_E packages may have options. Note that options to classes/packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

67 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The `<main-option-list>` is a list of options which can modify the formatting of elements which are defined in the `<class>` file as well as in all following `\usepackage` declarations (see below). The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with L^AT_EX 2.09 documents. It is similar to `\documentclass`, but it causes all options in `<main-option-list>` that the `<class>` does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in L^AT_EX 2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors L^AT_EX generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in `<package-list>` are called with the same options.

Each `<package>` file defines new elements (or modifies those defined in the `<class>`), and thus extends the range of documents which can be processed. The `<package-option-list>` is a list of options which can modify the formatting of elements defined in the `<package>` file. The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

filecontents

As well as processing the options given in the *<package-option-list>*, each package processes the *<main-option-list>*. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The package can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of TeX. Finally, you can use `nopreamble` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

67.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

68 Class and Package interface

68.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{\langle name \rangle}[\langle version \rangle]` command. The `\langle version \rangle` should begin with a date in the format YYYY/MM/DD.

68.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{\langle name \rangle}[\langle version \rangle]` command. The `\langle version \rangle` should begin with a date in the format YYYY/MM/DD.

68.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[\langle options \rangle]{\langle name \rangle}[\langle version \rangle]`.

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{\langle options \rangle}{\langle package \rangle}`.

This adds the `\langle options \rangle` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
\RequirePackage[baz]{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{\langle name \rangle}[\langle version \rangle]`:

This is similar to `\LoadClass`, but it always calls class `\langle name \rangle` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`.

`\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

To find out if a package has already been loaded, use

```
\@ifpackageloaded{(package)}{(true)}{(false)}
```

To find out if a package has already been loaded with a version equal to or more recent than `<version>`, use

```
\@ifpackagelater{(package)}{(version)}{(true)}{(false)}
```

To find out if a package has already been loaded with at least the options `<options>`, use `\@ifpackagewith{(package)}{(options)}{(true)}{(false)}`.

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

68.4 Declaring new options

Options for classes and packages are built using the same macros.

To define a builtin option, use `\DeclareOption{(name)}{(code)}`.

To define the default action to perform for local options which have not been declared, use `\DeclareOption*{(code)}`.

Note: there should be no use of

`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.

Possible uses for `\DeclareOption*` include:

```
\DeclareOption*{}
```

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

```
\DeclareOption*{\@unkownoptionerror}
```

Complain about unknown local options. (The initial setting for package files.)

```
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}
```

Handle the the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building ‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
{}%
{\OptionNotUsed}}
```

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

68.5 Safe Input Macros

<code>\InputIfFileExists</code>	<code>\InputIfFileExists{\file}{\then}{\else}</code>
	Inputs <code>\file</code> if it exists. Immediately before the input, <code>\then</code> is executed. Otherwise <code>\else</code> is executed.
<code>\IfExists</code>	As above, but does not input the file.
	One thing you might like to put in the <code>\else</code> clause is
<code>\@missingfileerror</code>	This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,
<code>\input</code>	This has been redefined from the L ^A T _E X2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .
<code>\listfiles</code>	Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

69 Implementation

	1 (*2ekernel)
<code>\if@compatibility</code>	The flag for compatibility mode. 2 <code>\newif\if@compatibility</code>
<code>\@documentclasshook</code>	The hook called after the first <code>\documentclass</code> command. By default this checks to see if <code>\@normalsize</code> is undefined, and if so, sets it to <code>\normalsize</code> . 3 <code>\def\@documentclasshook{%</code> 4 <code>\ifx\@normalsize\@undefined</code> 5 <code>\let\@normalsize\normalsize</code> 6 <code>\fi</code> 7 <code>}</code>
<code>\@declaredoptions</code>	This list is automatically built by <code>\DeclareOption</code> . It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the corresponding <code>\ds@{option}</code> commands are executed. All local <code>{option}</code> s which are not declared will be processed in the order defined by the optional argument of <code>\documentclass</code> or <code>\usepackage</code> . 8 <code>\let\@declaredoptions\@empty</code>
<code>\@classoptionslist</code>	List of options of the main class. 9 <code>\let\@classoptionslist\relax</code> 10 <code>\@onlypreamble\@classoptionslist</code>

\@unusedoptionlist	List of options of the main class that haven't been declared or loaded as class option files.
	11 \let\@unusedoptionlist\@empty
	12 \@onlypreamble\@unusedoptionlist
\CurrentOption	Name of current package or option.
	13 \let\CurrentOption\@empty
\@currname	Name of current package or option.
	14 \let\@currname\@empty
\@currext	The current file extension.
	15 \global\let\@currext=\@empty
\@clsextension	The two possible values of \@currext.
\@pkgextension	16 \def\@clsextension{cls}
	17 \def\@pkgextension{sty}
	18 \@onlypreamble\@clsextension
	19 \@onlypreamble\@pkgextension
\@pushfilename	Commands to push and pop the file name and extension.
\@popfilename	#1 current name.
\@currnamestack	#2 current extension.
	#3 current catcode of @.
	#4 Rest of the stack.
	20 \def\@pushfilename{%

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

70 Package/class rollback mechanism

```
789 </2ekernel>
```

	790 (*2ekernel latexreleasefirst)
\pkgcls@debug	For testing we have a few extra lines of code that by default do nothing but one can set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be dropped.
	791 (*tracer rollback) 792 \%\\let\\pkgcls@debug\\typeout 793 \\let\\pkgcls@debug\\@gobble 794 //tracer rollback)
\requestedLaTeXdate	The macro (!) \requestedLaTeXdate holds the globally requested rollback date (via latexrelease) or zero if no such request was made. 795 \\def\\requestedLaTeXdate{0}
\pkgcls@targetdate \pkgcls@targetlabel \pkgcls@innerdate	If a rollback for a package or class is requested then \pkgcls@targetdate holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of \requestedLaTeXdate) and \pkgcls@targetlabel will be empty. If there was a request for a named version then \pkgcls@targetlabel holds the verion name and \pkgcls@targetdate is set to 1. \pkgcls@targetdate=0 is used to indicate that there was no rollback request. While loading an old release \pkgcls@targetdate is also reset to zero so that \DeclareRelease declarations are bypassed. In contrast \pkgcls@innerdate will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain TeX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.
	796 \\ifx\\pkgcls@targetdate\\undefined 797 \\newcount\\pkgcls@targetdate 798 \\fi 799 \\let\\pkgcls@targetlabel\\empty 800 \\def\\pkgcls@innerdate{\\maxdimen}
\pkgcls@candidate \pkgcls@releasedate	When looping through the \DeclareRelease declarations we record if the release is the best candidate we have seen so far. This is recorded in \pkgcls@candidate and we update it whenever we see a better one. In \pkgcls@releasedate we keep track of the release date of that candidate. 801 \\let\\pkgcls@candidate\\empty 802 \\let\\pkgcls@releasedate\\empty
\load@onefilewithoptions \@onefilewithoptions	the best place to add the rollback code is at the point where \@onefilewithoptions is called to load a single class or package. To make things easy we save the old definition as \load@onefilewithoptions and then provide a new interface. Important: as this code is also unconditionally placed into latexrelease we can only do this name change once otherwise both macros will contain the same code. 803 \\ifx\\load@onefilewithoptions\\undefined 804 \\let\\load@onefilewithoptions\\@onefilewithoptions 805 \\def\\@onefilewithoptions#1[#2] [#3]\\#4{%
	First a bit of tracing normally disabled. 806 (*tracer rollback)

```

807  \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
808  \pkgcls@debug{@spaces 1: #1}%
809  \pkgcls@debug{@spaces 2: #2}%
810  \pkgcls@debug{@spaces 3: #3}%
811  \pkgcls@debug{@spaces 4: #4}%
812 
```

Two of the arguments are needed later on in error/warning messages so we save them.

```

813  \def\pkgcls@name{#1}%
814  \def\pkgcls@arg {#3}%

```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```
815  \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```
816  \let\pkgcls@candidate@\empty
```

If we had a rollback request then #3 may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```

817  \begingroup
818  \edef\reserved@a{%
819    \endgroup
820    \unexpanded{\load@onefilewithoptions#1[#2]}%
821    [\pkgcls@mindate]%
822    \unexpanded{#4}%
823    \reserved@a
824  }
825 \fi

```

`\pkgcls@parse@date@arg`

The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `\textralatexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn't start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	\pkgcls@targetdate	\pkgcls@targetlabel	\pkgcls@mindate
$\langle empty \rangle$	$\langle global-rollbackdate-as-number \rangle$	$\langle empty \rangle$	$\langle empty \rangle$
$\langle date \rangle$	$\langle global-rollbackdate-as-number \rangle$	$\langle empty \rangle$	$\langle date \rangle$
$=\langle date \rangle$	$\langle date-as-number \rangle$	$\langle empty \rangle$	$\langle empty \rangle$
$=\langle version \rangle$	1	$\langle version \rangle$	$\langle empty \rangle$
$\langle other \rangle$	$\langle global-rollbackdate-as-number \rangle$	$\langle empty \rangle$	$\langle other \rangle$

where $\langle global-rollbackdate-as-number \rangle$ is a date request given via `latexrelease` or if there wasn't one 0.

```
826 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
827   \ifx\@nil#1\@nil
828     \pkgcls@targetdate\requestedLaTeXdate\relax
829     \let\pkgcls@targetlabel\@empty
830     \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
831   \else
832     \pkgcls@parse@date@arg@#1=\@nil\relax
833   \fi
834 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@`:

```
835 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
836   \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
837   \ifx\@nil#1\@nil
838     \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```
839   \ifnum \pkgcls@targetdate=0%
840     \pkgcls@targetdate\@ne
841     \def\pkgcls@innerdate{\maxdimen}%
842     \pkgcls@parse@date@arg@version#2%
843   \else
844     \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
845   \fi
846   \let\pkgcls@mindate\@empty
847 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of \pkgcls@targetdate):

```
848     \requestedLaTeXdate\relax
849     \let\pkgcls@targetlabel\empty
850     \def\pkgcls@innerdate{\maxdimen}%
851     \def\pkgcls@mindate{#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```
852     \ifnum \pkgcls@targetdate > \z@%
853         \ifnum \@parse@version#1//00@nil > \pkgcls@targetdate
854             \Olatex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
855                 A minimal date of #1 has been specified for
856                 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
857                 But this is in conflict
858                 with a rollback request to \requestedpatchdate}
859         \fi
860     \fi
861 \fi
862 }
```

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

```
863 \def\pkgcls@parse@date@arg@version#1=%
864   \def\pkgcls@targetlabel{#1}}
```

\DeclareRelease First argument is the "name" of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be *<pkg/cls-name>-<date>.⟨extension⟩* but this is not enforced and through this argument one can overwrite it.

```
865 \def\DeclareRelease#1#2#3{%
866   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
867 (*tracerollback)
868   \pkgcls@debug{---\string\DeclareRelease:}%
869   \pkgcls@debug{\@spaces 1: #1}%
870   \pkgcls@debug{\@spaces 2: #2}%
871   \pkgcls@debug{\@spaces 3: #3}%
872 }/tracerollback)
```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a "beta" release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```
873   \ifx\@nil#2\@nil
874     \ifnum\pkgcls@targetdate=\@ne % named request
875       \def\reserved@a{#1}%
876       \ifx\pkgcls@targetlabel\reserved@a
877         \pkgcls@use@this@release{#3}{}%
878 (*tracerollback)
879       \else
880         \pkgcls@debug{Label doesn't match}%
```

```

881 </tracer rollback>
882         \fi
883 <*tracer rollback>
884         \else
885             \pkgcls@debug{Date request: ignored}%
886 </tracer rollback>
887         \fi
888     \else

```

If the value of `\pkgcls@targetdate` is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```
889     \ifnum\pkgcls@targetdate>\@ne % a real request
```

So we parse the date of this release to check if it is before or after the request date.

```
890     \ifnum\@parse@version#2//00\@nil
891         >\pkgcls@targetdate
```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exists. So we make a complained to the user.

```

892     \ifx\pkgcls@candidate\@empty
893         \pkgcls@rollbackdate@error{#2}%
894         \pkgcls@use@this@release{#3}{#2}%
895     \else
896         \pkgcls@use@this@release\pkgcls@candidate
897             \pkgcls@releasedate
898     \fi
899     \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

900     \def\pkgcls@candidate{#3}%
901     \def\pkgcls@releasedate{#2}%
902 <*tracer rollback>
903         \pkgcls@debug{New candidate: #3}%
904 </tracer rollback>
905     \fi
906     \else
```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

907     \def\reserved@a{#1}%
908     \ifx\pkgcls@targetlabel\reserved@a
909         \pkgcls@use@this@release{#3}{#2}%
910 <*tracer rollback>
911     \else
912         \pkgcls@debug{Label doesn't match}%
913 </tracer rollback>
914     \fi
915     \fi
```

```
916     \fi
917   \fi
918 }
```

\pkgcls@use@this@release If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
919 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
920   \pkgcls@show@selection{#1}{#2}%
```

We then set the \pkgcls@targetdate to zero so that any \DeclareRelease or \DeclareCurrentRelease in the file we now load are bypassed¹⁰ and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue \endinput. Note that the \relax before that is essential to ensure that the \endinput is only happening after the file has been fully processed, otherwise it would act after the first line of the @@input!

```
921   \pkgcls@targetdate\z@
922   @@input #1\relax
923   \endinput
924 }
```

\pkgcls@show@selection This command records what selection was made. As that is needed in two places (and it is rather lengthly) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```
925 \def\pkgcls@show@selection#1#2{%
926 {*tracerollback}
927   \pkgcls@debug{Result: use #1}%
928 (/tracerollback)
929   \GenericInfo
930   {\@spaces\@spaces\space}{Rollback for
931     \@cls@pkg\space'\@currname' requested ->
932     \ifnum\pkgcls@targetdate>\@ne
933       date
934       \ifnum\requestedLaTeXdate=\pkgcls@targetdate
935         \requestedpatchdate
936       \else
937         \expandafter\@gobble\pkgcls@arg
938       \fi.\MessageBreak
```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```
939   Best approximation is
940   \else
941     version '\pkgcls@targetlabel'.\MessageBreak
942   This corresponds to
```

¹⁰The older release may also have such declarations inside if it was a simply copy of the .sty or .cls file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

```

943     \fi
944     \ifx\@nil#2\@nil
945         a special release%
946     \else
947         the release introduced on #2%
948     \fi
949     \gobble}%
950 }

```

\pkgcls@rollbackdate@error This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is is inlined.

```

951 \def\pkgcls@rollbackdate@error#1{%
952   \@latex@error{Suspicious rollback date given}%
953   {The '\@cls@pkg\space'\@currname' claims that it
954   came into existence on #1 which\MessageBreak
955   is after your requested rollback date --- so
956   something is wrong here.\MessageBreak
957   Continue and we use the earliest known release.}}

```

\DeclareCurrentRelease This declares the date (and possible name) of the current version of a package or class.

```
958 \def\DeclareCurrentRelease#1#2{%
```

First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```

959   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
960   {*tracerollback}
961     \pkgcls@debug{---DeclareCurrentRelease}%
962     \pkgcls@debug{ 1: #1}%
963     \pkgcls@debug{ 2: #2}%
964   (/tracerollback)

```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```

965   \ifnum\pkgcls@targetdate>\z@ % a date request
966     \ifnum\@parse@version#2//00\@nil
967       >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a \DeclareCurrentRelease but no declared older releases (so basically the use of the declaration is a bit dubious).

```

968
969     \ifx\pkgcls@candidate\empty
970       \pkgcls@rollbackdate@error{#2}%
971     \else
972       \pkgcls@use@this@release\pkgcls@candidate
973           \pkgcls@releasedate
974     \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

975      \else
976          \pkgcls@show@selection{current version}{#2}%
977      \fi
978  \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

979      \def\reserved@af{#1}%
980      \ifx\pkgcls@targetlabel\reserved@a
981          \pkgcls@show@selection{current version}{#2}%
982      \else
983          \@latex@error{Requested version '\pkgcls@targetlabel' for
984              '@cls@pkg\space' '@currname' is unknown}@\ehc
985      \fi
986  \fi
987 \fi
988 }
```

\IfTargetDateBefore This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

989 \DeclareRobustCommand\IfTargetDateBefore[1]{%
990   \ifnum\pkgcls@innerdate <%
991     \expandafter\@parse@version\expandafter0#1//00\@nil
992     \typeout{Exclude code introduced on #1}%
993     \expandafter\@firstoftwo
994   \else
995     \typeout{Include code introduced on #1}%
996     \expandafter\@secondoftwo
997   \fi
998 }
```

999 ⟨/2ekernel | latexreleasefirst⟩

71 After Preamble

Finally we declare a package that allows all the commands declared above to be **\onlypreamble** to be used after **\begin{document}**.

```

1000 {*afterpreamble}
1001 \NeedsTeXFormat{LaTeX2e}
1002 \ProvidesPackage{pkgindoc}
1003     [1994/10/20 v1.1 Package Interface in Document (DPC)]
1004 \def\reserved@a#1\do@classoptionslist#2\do\filec@ntents#3\relax{%
1005   \gdef\@preamblecmds{#1#3}}
1006 \expandafter\reserved@a\@preamblecmds\relax
1007 ⟨/afterpreamble⟩
```

File M

lthyphen.dtx

This file contains the code for loading hyphenation patterns into L^AT_EX. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L^AT_EX system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the `DOCSTRIP` program, or one can run this file directly through L^AT_EX 2 _{ε} .

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T_EX's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 (*default)
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}%
10    \language=0
11    \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT_EX run is terminated by invoking `\@@end` (which is the L^AT_EX 2 _{ε} name for T_EX's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13           installed.^^J%
14           If you don't understand this error message you need
15           to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17           US english.^^J \space Think of getting some or the
18           latex2e setup will never succeed}\@@end}
19 
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
\language=0
\input hyphen % (or \input ushyphen1 if the file has been renamed)
```

```
\language=1
\input ghyp31
\language=0
\lefthyphenmin=2
\righthyphenmin=3
\endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

File N

ltxluatex.dtx

72 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_EX 2_ε kernel level plus as a loadable file which can be used with plain TeX and L^AT_EX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following \count registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
\e@alloc@whatsit@count User whatsits (default 261)
\e@alloc@bytecode@count Lua bytecodes (default 262)
\e@alloc@luachunk@count Lua chunks (default 263)
```

(\count 256 is used for \newmarks allocation and \count 257 is used for \newXeTeXintercharclass with XeTeX, with code defined in `ltfinal.dtx`). With any L^AT_EX 2_ε kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_EX 2_ε kernel did not provide any functionality for the extended allocation area).

73 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_EX format, however also extracted to the file `ltxluatex.tex` which may be used with older L^AT_EX formats, and with plain TeX.

\newattribute	\newattribute{\langle attribute \rangle}
	Defines a named \attribute, indexed from 1 (<i>i.e.</i> \attribute0 is never defined). Attributes initially have the marker value -"7FFFFFFF ('unset') set by the engine.
\newcatcodetable	\newcatcodetable{\langle catcodetable \rangle}
	Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).
\newluafunction	\newluafunction{\langle function \rangle}
	Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so \luafunction0 is not available).
\newwhatsit	\newwhatsit{\langle whatsit \rangle}
	Defines a custom \whatsit, indexed from 1.
\newluabytecode	\newluabytecode{\langle bytecode \rangle}

<code>\newluachunkname</code>	Allocates a number for Lua bytecode register, indexed from 1. <code>newluachunkname{\langle chunkname\rangle}</code>
<code>\catcodetable@initex</code>	Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the register (without backslash) into the <code>lua.name</code> table to be used in stack traces.
<code>\catcodetable@string</code>	Predefined category code tables with the obvious assignments. Note that the <code>latex</code> and <code>atletter</code> tables set the full Unicode range to the codes predefined by the kernel.
<code>\catcodetable@latex</code>	
<code>\catcodetable@atletter</code>	
<code>\setattribute{\langle attribute\rangle}{\langle value\rangle}</code>	
<code>\unsetattribute{\langle attribute\rangle}</code>	
<code>\unsetattribute</code>	Set and unset attributes in a manner analogous to <code>\setlength</code> . Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.

74 Plain T_EX interface

The `ltluatex` interface may be used with plain T_EX using `\input{ltluatex}`. This inputs `ltluatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `ltluatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `ltluatex` code but implements a compatibility layer providing the interface of the original package.

75 Lua functionality

75.1 Allocators in Lua

<code>new_attribute</code>	<code>luatexbase.new_attribute(\langle attribute\rangle)</code>
	Returns an allocation number for the <code>\langle attribute\rangle</code> , indexed from 1. The attribute will be initialised with the marker value <code>-"7FFFFFFF</code> ('unset'). The attribute allocation sequence is shared with the T _E X code but this function does <i>not</i> define a token using <code>\attributedef</code> . The attribute name is recorded in the <code>attributes</code> table. A metatable is provided so that the table syntax can be used consistently for attributes declared in T _E X or Lua.
<code>new_whatsit</code>	<code>luatexbase.new_whatsit(\langle whatsit\rangle)</code>
	Returns an allocation number for the custom <code>\langle whatsit\rangle</code> , indexed from 1.
<code>new_bytecode</code>	<code>luatexbase.new_bytecode(\langle bytecode\rangle)</code>
	Returns an allocation number for a bytecode register, indexed from 1. The optional <code>\langle name\rangle</code> argument is just used for logging.
<code>new_chunkname</code>	<code>luatexbase.new_chunkname(\langle chunkname\rangle)</code>
	Returns an allocation number for a Lua chunk name for use with <code>\directlua</code> and <code>\latelua</code> , indexed from 1. The number is returned and also <code>\langle name\rangle</code> argument is added to the <code>lua.name</code> array at that index.
<code>new_luafunction</code>	<code>luatexbase.new_luafunction(\langle functionname\rangle)</code>
	Returns an allocation number for a lua function for use with <code>\luafunction</code> , <code>\lateluafunction</code> , and <code>\luadef</code> , indexed from 1. The optional <code>\langle functionname\rangle</code> argument is just used for logging.

These functions all require access to a named \TeX count register to manage their allocations. The standard names are those defined above for access from \TeX , e.g. “e@alloc@attribute@count”, but these can be adjusted by defining the variable $\langle type \rangle_count_name$ before loading `ltxluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltxluatex")
```

would use a \TeX `\count` (`\countdef`'d token) called `attributetracker` in place of “e@alloc@attribute@count”.

75.2 Lua access to \TeX register numbers

`registernumber luatexbase.registernumber(<name>)`

Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by \TeX . This package provides a function to look up the relevant number using $\text{Lua}\text{\TeX}$'s internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumber("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{\#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@@n}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with $\text{Lua}\text{\TeX}$ then the following would be produced in the log and terminal output.

```

undefinedrubbish: \relax
    bad input
space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"1B
    11
sixt@@n: \char"10
    16
myattr: \attribute12
    12

```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

75.3 Module utilities

`provides_module` `luatexbase.provides_module(<info>)`
This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

`module_info` `luatexbase.module_info(<module>, <text>)`
`module_warning` `luatexbase.module_warning(<module>, <text>)`
`module_error` `luatexbase.module_error(<module>, <text>)`
These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

75.4 Callback management

`add_to_callback` `luatexbase.add_to_callback(<callback>, <function>, <description>)` Registers the `<function>` into the `<callback>` with a textual `<description>` of the function. Functions are inserted into the callback in the order loaded.
`remove_from_callback` `luatexbase.remove_from_callback(<callback>, <description>)` Removes the call-

	back function with <i><description></i> from the <i><callback></i> . The removed function and its description are returned as the results of this function.
in_callback	<code>luatexbase.in_callback(<callback>, <description>)</code> Checks if the <i><description></i> matches one of the functions added to the list for the <i><callback></i> , returning a boolean value.
disable_callback	<code>luatexbase.disable_callback(<callback>)</code> Sets the <i><callback></i> to <code>false</code> as described in the LuaTeX manual for the underlying <code>callback.register</code> built-in. Callbacks will only be set to false (and thus be skipped entirely) if there are no functions registered using the callback.
callback_descriptions	A list of the descriptions of functions registered to the specified callback is returned. <code>{}</code> is returned if there are no functions registered.
create_callback	<code>luatexbase.create_callback(<name>, metatype, <default>)</code> Defines a user defined callback. The last argument is a default function or <code>false</code> .
call_callback	<code>luatexbase.call_callback(<name>, ...)</code> Calls a user defined callback with the supplied arguments.

76 Implementation

```

1 {*2ekernel | tex | latexrelease}
2 {2ekernel | latexrelease}\ifx\directlua\@undefined\else

```

76.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```

3 \wlog{*****}
4 \wlog{* LuaTeX version too old for ltluatex support *}
5 \wlog{*****}
6 \expandafter\endinput
10 \fi

```

76.2 Older L^AT_EX/Plain T_EX setup

```
11 {*}tex}
```

Older L^AT_EX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```

12 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
13 \ifx\@alloc\@undefined

```

In pre-2014 L^AT_EX, or plain T_EX, load `etex.{sty,src}`.

```

14 \ifx\documentclass\@undefined
15   \ifx\loccount\@undefined
16     \input{etex.src}%
17   \fi
18   \catcode`\@=11 %

```

```

19      \outer\expandafter\def\csname newfam\endcsname
20                      {\alloc@8\fam\chardef\et@xmaxfam}
21 \else
22   \RequirePackage{etex}
23   \expandafter\def\csname newfam\endcsname
24     {\alloc@8\fam\chardef\et@xmaxfam}
25   \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
26 \fi

```

76.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX.

2015-07-13 higher range in luatex.

```

27 \edef \et@xmaxregs {\ifx\directlua\undefined 32768\else 65536\fi}
luatex/xetex also allow more math fam.
28 \edef \et@xmaxfam {\ifx\Umathchar\undefined\sixt@@n\else\@cclvi\fi}
29 \count 270=\et@xmaxregs % locally allocates \count registers
30 \count 271=\et@xmaxregs % ditto for \dimen registers
31 \count 272=\et@xmaxregs % ditto for \skip registers
32 \count 273=\et@xmaxregs % ditto for \muskip registers
33 \count 274=\et@xmaxregs % ditto for \box registers
34 \count 275=\et@xmaxregs % ditto for \toks registers
35 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/LaTeX differences in lltluatex.)

```
36 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}
```

End of proposed changes to `etex.src`

76.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

37 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
38           \csname globcount\endcsname
39 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
40           \csname globdimen\endcsname
41 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
42           \csname globskip\endcsname
43 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
44           \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

45 \chardef \e@alloc@top=65535
46 \let \e@alloc@chardef \chardef
47 \def \e@alloc#1#2#3#4#5#6{%
48   \global\advance#3\@ne
49   \e@ch@ck{#3}{#4}{#5}{#1}%

```

76.3 Attributes

<code>\newattribute</code>	As is generally the case for the LuaT _E X registers we start here from 1. Notably, some code assumes that <code>\attribute0</code> is never used so this is important in this case.
	<pre> 74 \ifx\@alloc@attribute@count\@undefined 75 \countdef\@alloc@attribute@count=258 76 \fi 77 \def\newattribute#1{% 78 \@alloc@attribute\attributedef 79 \@alloc@attribute@count\m@ne\@alloc@top#1% 80 } 81 \@alloc@attribute@count=\z@ </pre>
<code>\setattribute</code>	Handy utilities.
<code>\unsetattribute</code>	<pre> 82 \def\setattribute#1#2{#1=\numexpr#2\relax} 83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax} </pre>

76.4 Category code tables

<code>\newcatcodetable</code>	Category code tables are allocated with a limit half of that used by LuaT _E X for everything else. At the end of allocation there needs to be an initialisation step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.
-------------------------------	--

```

84 \ifx\@alloc@ccodetable@count\@undefined

```

76.5 Named Lua functions

\newluafunction Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\@alloc@luafunction@count\@undefined
174   \countdef\@alloc@luafunction@count=260
175 \fi
176 \def\newluafunction{%
177   \@alloc@luafunction\@alloc@chardef
178   \@alloc@luafunction@count\m@ne\@alloc@top
179 }

```

```
180 \e@alloc@luafunction@count=\z@
```

76.6 Custom whatsits

\newwhatsit These are only settable from Lua but for consistency are definable here.

```
181 \ifx\e@alloc@whatsit@count\@undefined
182   \countdef\e@alloc@whatsit@count=261
183 \fi
184 \def\newwhatsit#1{%
185   \e@alloc@whatsit\e@alloc@chardef
186   \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
187 }
188 \e@alloc@whatsit@count=\z@
```

76.7 Lua bytecode registers

\newluabytecode These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytecode@count\@undefined
190   \countdef\e@alloc@bytecode@count=262
191 \fi
192 \def\newluabytecode#1{%
193   \e@alloc@luabytecode\e@alloc@chardef
194   \e@alloc@bytecode@count\m@ne\e@alloc@top#1%
195 }
196 \e@alloc@bytecode@count=\z@
```

76.8 Lua chunk registers

\newluachunkname As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
197 \ifx\e@alloc@luachunk@count\@undefined
198   \countdef\e@alloc@luachunk@count=263
199 \fi
200 \def\newluachunkname#1{%
201   \e@alloc@luachunk\e@alloc@chardef
202   \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
203   {\escapechar\m@ne
204   \directlua{lua.name[\the\allocationnumber]="\string#1"}%
205 }
206 \e@alloc@luachunk@count=\z@
```

76.9 Lua loader

Load the Lua code at the start of every job. For the conversion of `TEX` into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```
207 {2ekernel}\everyjob\expandafter{%
208 {2ekernel} \the\everyjob
209 \begingroup
210   \attributedef\attributezero=0 %
211   \chardef\charzero=0 %
```

Note name change required on older luatex, for hash table access.

```
212     \countdef    \CountZero      =0 %
213     \dimendef   \dimenzero     =0 %
214     \mathchardef \mathcharzero  =0 %
215     \muskipdef  \muskipzero   =0 %
216     \skipdef    \skipzero     =0 %
217     \toksdef    \tokszero    =0 %

76.10 Lua module preliminaries

274 (*lua)

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```

275 luatexbase      = luatexbase or { }
276 local luatexbase = luatexbase

```

Some Lua best practice: use local versions of functions where possible.

```

277 local string_gsub      = string.gsub
278 local tex_count         = tex.count
279 local tex_setattribute = tex.setattribute
280 local tex_setcount       = tex.setcount
281 local texio_write_nl    = texio.write_nl

282 local luatexbase_warning
283 local luatexbase_error

```

76.11 Lua module utilities

76.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
284 local modules = modules or { }
```

provides_module Local function to write to the log.

```

285 local function luatexbase_log(text)
286   texio_write_nl("log", text)
287 end

```

Modelled on \ProvidesPackage, we store much the same information but with a little more structure.

```

288 local function provides_module(info)
289   if not (info and info.name) then
290     luatexbase_error("Missing module name for provides_module")
291   end
292   local function spaced(text)
293     return text and (" " .. text) or ""

```

```

294   end
295   luatexbase_log(
296     "Lua module: " .. info.name
297     .. spaced(info.date)
298     .. spaced(info.version)
299     .. spaced(info.description)
300   )
301   modules[info.name] = info
302 end
303 luatexbase.provides_module = provides_module

```

76.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from TeX. For errors we have to make some changes. Here we give the text of the error in the L^AT_EX format then force an error from Lua to halt the run. Splitting the message text is done using \n which takes the place of \MessageBreak.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```

304 local function msg_format(mod, msg_type, text)
305   local leader = ""
306   local cont
307   local first_head
308   if mod == "LaTeX" then
309     cont = string.gsub(leader, ".", " ")
310     first_head = leader .. "LaTeX: "
311   else
312     first_head = leader .. "Module " .. msg_type
313     cont = "(" .. mod .. ")"
314     .. string.gsub(first_head, ".", " ")
315     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":" ..
316   end
317   if msg_type == "Error" then
318     first_head = "\n" .. first_head
319   end
320   if string.sub(text,-1) ~= "\n" then
321     text = text .. " "
322   end
323   return first_head .. " "
324   .. string.gsub(
325     text
326   .. "on input line "
327     .. tex.inputlineno, "\n", "\n" .. cont .. " "
328   )
329   .. "\n"
330 end

module_info Write messages.
module_warning 331 local function module_info(mod, text)
module_error 332   texio_write_nl("log", msg_format(mod, "Info", text))
333 end
334 luatexbase.module_info = module_info

```

```

335 local function module_warning(mod, text)
336   texio_write_nl("term and log", msg_format(mod, "Warning", text))
337 end
338 luatexbase.module_warning = module_warning
339 local function module_error(mod, text)
340   error(msg_format(mod, "Error", text))
341 end
342 luatexbase.module_error = module_error

```

Dedicated versions for the rest of the code here.

```

343 function luatexbase_warning(text)
344   module_warning("luatexbase", text)
345 end
346 function luatexbase_error(text)
347   module_error("luatexbase", text)
348 end

```

76.12 Accessing register numbers from Lua

Collect up the data from the TeX level into a Lua table: from version 0.80, LuaTeX makes that easy.

```

349 local luaregisterbasetable = { }
350 local registermap = {
351   attributezero = "assign_attr"      ,
352   charzero     = "char_given"       ,
353   CountZero    = "assign_int"       ,
354   dimenzero    = "assign_dimen"     ,
355   mathcharzero = "math_given"       ,
356   muskipzero   = "assign_mu_skip"  ,
357   skipzero     = "assign_skip"      ,
358   tokszero    = "assign_toks"      ,
359 }
360 local createtoken
361 if tex.luatexversion > 81 then
362   createtoken = token.create
363 elseif tex.luatexversion > 79 then
364   createtoken = newtoken.create
365 end
366 local hashtokens    = tex.hashtokens()
367 local luatexversion = tex.luatexversion
368 for i,j in pairs (registermap) do
369   if luatexversion < 80 then
370     luaregisterbasetable[hashtokens[i][1]] =
371       hashtokens[i][2]
372   else
373     luaregisterbasetable[j] = createtoken(i).mode
374   end
375 end

```

- registernumber** Working out the correct return value can be done in two ways. For older LuaTeX releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaTeX's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

376 local registernumber
377 if luatexversion < 80 then
378     function registernumber(name)
379         local nt = hashtokens[name]
380         if(nt and luaregisterbasetable[nt[1]]) then
381             return nt[2] - luaregisterbasetable[nt[1]]
382         else
383             return false
384         end
385     end
386 else
387     function registernumber(name)
388         local nt = createtoken(name)
389         if(luaregisterbasetable[nt.cmdname]) then
390             return nt.mode - luaregisterbasetable[nt.cmdname]
391         else
392             return false
393         end
394     end
395 end
396 luatexbase.registernumber = registernumber

```

76.13 Attribute allocation

`new_attribute` As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

397 local attributes=setmetatable(
398 {}, 
399 {
400 __index = function(t,key)
401 return registernumber(key) or nil
402 end}
403 )
404 luatexbase.attributes = attributes

405 local attribute_count_name =
406             attribute_count_name or "e@alloc@attribute@count"
407 local function new_attribute(name)
408     tex_setcount("global", attribute_count_name,
409                 tex_count[attribute_count_name] + 1)
410     if tex_count[attribute_count_name] > 65534 then
411         luatexbase_error("No room for a new \\attribute")
412     end
413     attributes[name]= tex_count[attribute_count_name]
414     luatexbase_log("Lua-only attribute " .. name .. " = " ..
415                     tex_count[attribute_count_name])
416     return tex_count[attribute_count_name]
417 end
418 luatexbase.new_attribute = new_attribute

```

76.14 Custom whatsit allocation

`new_whatsit` Much the same as for attribute allocation in Lua.

```
419 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
```

```

420 local function new_whatsit(name)
421   tex_setcount("global", whatsit_count_name,
422               tex_count[whatsit_count_name] + 1)
423   if tex_count[whatsit_count_name] > 65534 then
424     luatexbase_error("No room for a new custom whatsit")
425   end
426   luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
427                  tex_count[whatsit_count_name])
428   return tex_count[whatsit_count_name]
429 end
430 luatexbase.new_whatsit = new_whatsit

```

76.15 Bytecode register allocation

`new_bytecode` Much the same as for attribute allocation in Lua. The optional `(name)` argument is used in the log if given.

```

431 local bytecode_count_name =
432           bytecode_count_name or "e@alloc@bytecode@count"
433 local function new_bytecode(name)
434   tex_setcount("global", bytecode_count_name,
435               tex_count[bytecode_count_name] + 1)
436   if tex_count[bytecode_count_name] > 65534 then
437     luatexbase_error("No room for a new bytecode register")
438   end
439   luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
440                  tex_count[bytecode_count_name])
441   return tex_count[bytecode_count_name]
442 end
443 luatexbase.new_bytecode = new_bytecode

```

76.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```

444 local chunkname_count_name =
445           chunkname_count_name or "e@alloc@luachunk@count"
446 local function new_chunkname(name)
447   tex_setcount("global", chunkname_count_name,
448               tex_count[chunkname_count_name] + 1)
449   local chunkname_count = tex_count[chunkname_count_name]
450   chunkname_count = chunkname_count + 1
451   if chunkname_count > 65534 then
452     luatexbase_error("No room for a new chunkname")
453   end
454   lua.name[chunkname_count]=name
455   luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
456                  chunkname_count .. "\n")
457   return chunkname_count
458 end
459 luatexbase.new_chunkname = new_chunkname

```

76.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional *<name>* argument is used in the log if given.

```
460 local luafunction_count_name =
461           luafunction_count_name or "e@alloc@luafunction@count"
462 local function new_luafunction(name)
463   tex_setcount("global", luafunction_count_name,
464               tex_count[luafunction_count_name] + 1)
465   if tex_count[luafunction_count_name] > 65534 then
466     luatexbase_error("No room for a new luafunction register")
467   end
468   luatexbase_log("Lua function " .. (name or "") .. " = " ..
469                 tex_count[luafunction_count_name])
470   return tex_count[luafunction_count_name]
471 end
472 luatexbase.new_luafunction = new_luafunction
```

76.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

76.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
473 local callbacklist = callbacklist or {}
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
474 local list, data, exclusive, simple = 1, 2, 3, 4
475 local types = {
476   list      = list,
477   data      = data,
478   exclusive = exclusive,
479   simple    = simple,
480 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye
```

in plain LuaTeX. (Some undocumented callbacks are omitted as they are to be removed.)

```
481 local callbacktypes = callbacktypes or {
```

Section 8.2: file discovery callbacks.

```
482   find_read_file      = exclusive,
483   find_write_file     = exclusive,
484   find_font_file      = data,
485   find_output_file    = data,
486   find_format_file    = data,
487   find_vf_file        = data,
488   find_map_file       = data,
489   find_enc_file       = data,
490   find_pk_file        = data,
491   find_data_file      = data,
492   find_opentype_file  = data,
493   find_truetype_file  = data,
494   find_type1_file     = data,
495   find_image_file     = data,
```

```
496   open_read_file      = exclusive,
497   read_font_file      = exclusive,
498   read_vf_file        = exclusive,
499   read_map_file       = exclusive,
500   read_enc_file       = exclusive,
501   read_pk_file        = exclusive,
502   read_data_file      = exclusive,
503   read_truetype_file  = exclusive,
504   read_type1_file     = exclusive,
505   read_opentype_file  = exclusive,
```

Not currently used by luatex but included for completeness. may be used by a font handler.

```
506   find_cidmap_file   = data,
507   read_cidmap_file   = exclusive,
```

Section 8.3: data processing callbacks.

```
508   process_input_buffer = data,
509   process_output_buffer = data,
510   process_jobname      = data,
```

Section 8.4: node list processing callbacks.

```
511   contribute_filter   = simple,
512   buildpage_filter    = simple,
513   build_page_insert   = exclusive,

534   stop_page_number   = simple,
535   show_error_hook    = simple,
536   show_warning_message= simple,
537   show_error_message = simple,
538   show_lua_error_hook= simple,
539   start_file          = simple,
540   stop_file           = simple,
541   call_edit           = simple,
542   finish_synctex     = simple,
543   wrapup_run          = simple,

```

Section 8.6: PDF-related callbacks.

```

544   finish_pdffile      = data,
545   finish_pdfpage      = data,
546   page_objnum_provider= simple,
547   process_pdf_image_content= simple,

```

Section 8.7: font-related callbacks.

```

548   define_font          = exclusive,
549   glyph_not_found      = exclusive,
550   glyph_stream_provider= exclusive,
551   make_extensible      = exclusive,
552   font_descriptor_objnum_provider= exclusive,
553 }
554 luatexbase.callbacktypes=callbacktypes

```

`callback.register` Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

555 local callback_register = callback_register or callback.register
556 function callback.register()
557   luatexbase_error("Attempt to use callback.register() directly\n")
558 end

```

76.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

simple is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

Handler for **data** callbacks.

```
559 local function data_handler(name)
560   return function(data, ...)
561     for _,i in ipairs(callbacklist[name]) do
562       data = i.func(data,...)
563     end
564   return data
565 end
566 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
567 local function exclusive_handler(name)
568   return function(...)
569     return callbacklist[name][1].func(...)
570   end
571 end
```

Handler for **list** callbacks.

```
572 local function list_handler(name)
573   return function(head, ...)
574     local ret
575     local alltrue = true
576     for _,i in ipairs(callbacklist[name]) do
577       ret = i.func(head, ...)
578       if ret == false then
579         luatexbase_warning(
580           "Function '" .. i.description .. "' returned false\n"
```

```

581           .. "in callback '" .. name .. "'"
582       )
583       break
584   end
585   if ret ~= true then
586       alltrue = false
587       head = ret
588   end
589 end
590 return alltrue and true or head
591 end
592 end

Handler for simple callbacks.

593 local function simple_handler(name)
594     return function(...)
595         for _,i in ipairs(callbacklist[name]) do
596             i.func(...)
597         end
598     end
599 end

Keep a handlers table for indexed access.

600 local handlers = {
601     [data]      = data_handler,
602     [exclusive] = exclusive_handler,
603     [list]       = list_handler,
604     [simple]    = simple_handler,
605 }

```

76.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```
606 local user_callbacks_defaults = { }
```

`create_callback` The allocator itself.

```

607 local function create_callback(name, ctype, default)
608     if not name or name == ""
609     or not ctype or ctype == ""
610     then
611         luatexbase_error("Unable to create callback:\n" ..
612                           "valid callback name and type required")
613     end
614     if callbacktypes[name] then
615         luatexbase_error("Unable to create callback '" .. name ..
616                           "':\ncallback is already defined")
617     end
618     if default ~= false and type (default) ~= "function" then
619         luatexbase_error("Unable to create callback '" .. name ..
620                           "':\ndefault is not a function")
621     end
622     user_callbacks_defaults[name] = default

```

```

623   callbacktypes[name] = types[ctype]
624 end
625 luatexbase.create_callback = create_callback

call_callback Call a user defined callback. First check arguments.
626 local function call_callback(name,...)
627   if not name or name == "" then
628     luatexbase_error("Unable to create callback:\n" ..
629                       "valid callback name required")
630   end
631   if user_callbacks_defaults[name] == nil then
632     luatexbase_error("Unable to call callback '" .. name
633                           .. "' :\nunknown or empty")
634   end
635   local l = callbacklist[name]
636   local f
637   if not l then
638     f = user_callbacks_defaults[name]
639     if l == false then
640       return nil
641     end
642   else
643     f = handlers[callbacktypes[name]](name)
644   end
645   return f...
646 end
647 luatexbase.call_callback=call_callback

add_to_callback Add a function to a callback. First check arguments.
648 local function add_to_callback(name, func, description)
649   if not name or name == "" then
650     luatexbase_error("Unable to register callback:\n" ..
651                       "valid callback name required")
652   end
653   if not callbacktypes[name] or
654     type(func) ~= "function" or
655     not description or
656     description == "" then
657     luatexbase_error(
658       "Unable to register callback.\n\n"
659       .. "Correct usage:\n"
660       .. "add_to_callback(<callback>, <function>, <description>)"
661     )
662   end
Then test if this callback is already in use. If not, initialise its list and register the
proper handler.
663   local l = callbacklist[name]
664   if l == nil then
665     l = { }
666     callbacklist[name] = l
If it is not a user defined callback use the primitive callback register.
667     if user_callbacks_defaults[name] == nil then
668       callback_register(name, handlers[callbacktypes[name]](name))

```

```
669     end
670 end
```

Actually register the function and give an error if more than one exclusive one is registered.

```
671 local f = {
672     func      = func,
673     description = description,
674 }
675 local priority = #l + 1
676 if callbacktypes[name] == exclusive then
677     if #l == 1 then
678         luatexbase_error(
679             "Cannot add second callback to exclusive function\n" ..
680             name .. ""))
681     end
682 end
683 table.insert(l, priority, f)
```

Keep user informed.

```
684 luatexbase_log(
685     "Inserting '" .. description .. "' at position "
686     .. priority .. " in '" .. name .. "'."
687 )
688 end
689 luatexbase.add_to_callback = add_to_callback
```

`remove_from_callback` Remove a function from a callback. First check arguments.

```
690 local function remove_from_callback(name, description)
691     if not name or name == "" then
692         luatexbase_error("Unable to remove function from callback:\n" ..
693                         "valid callback name required")
694     end
695     if not callbacktypes[name] or
696         not description or
697         description == "" then
698         luatexbase_error(
699             "Unable to remove function from callback.\n\n"
700             .. "Correct usage:\n"
701             .. "remove_from_callback(<callback>, <description>)"
702         )
703     end
704     local l = callbacklist[name]
705     if not l then
706         luatexbase_error(
707             "No callback list for '" .. name .. "'\n")
708     end
```

Loop over the callback's function list until we find a matching entry. Remove it and check if the list is empty: if so, unregister the callback handler.

```
709 local index = false
710 for i,j in ipairs(l) do
711     if j.description == description then
712         index = i
713         break
```

```

714     end
715   end
716   if not index then
717     luatexbase_error(
718       "No callback \" .. description .. \" registered for \" ..
719       name .. \"\n")
720   end
721   local cb = l[index]
722   table.remove(l, index)
723   luatexbase_log(
724     "Removing \" .. description .. \" from \" .. name .. \"."
725   )
726   if #l == 0 then
727     callbacklist[name] = nil
728     callback_register(name, nil)
729   end
730   return cb.func,cb.description
731 end
732 luatexbase.remove_from_callback = remove_from_callback

in_callback Look for a function description in a callback.
733 local function in_callback(name, description)
734   if not name
735     or name == ""
736     or not callbacklist[name]
737     or not callbacktypes[name]
738     or not description then
739       return false
740     end
741     for _, i in pairs(callbacklist[name]) do
742       if i.description == description then
743         return true
744       end
745     end
746   return false
747 end
748 luatexbase.in_callback = in_callback

disable_callback As we subvert the engine interface we need to provide a way to access this functionality.
749 local function disable_callback(name)
750   if(callbacklist[name] == nil) then
751     callback_register(name, false)
752   else
753     luatexbase_error("Callback list for \" .. name .. \" not empty")
754   end
755 end
756 luatexbase.disable_callback = disable_callback

callback_descriptions List the descriptions of functions registered for the given callback.
757 local function callback_descriptions (name)
758   local d = {}
759   if not name
760     or name == ""

```

```

761     or not callbacklist[name]
762     or not callbacktypes[name]
763     then
764     return d
765   else
766     for k, i in pairs(callbacklist[name]) do
767       d[k]= i.description
768     end
769   end
770   return d
771 end
772 luatexbase.callback_descriptions =callback_descriptions

```

uninstall Unlike at the T_EX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

773 local function uninstall()
774   module_info(
775     "luatexbase",
776     "Uninstalling kernel luatexbase code"
777   )
778   callback.register = callback_register
779   luatexbase = nil
780 end
781 luatexbase.uninstall = uninstall

```

```

782 
```

Reset the catcode of @.

```

783 <tex>\catcode`@=\etacatcode\relax

```

77.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeT_EX follows the standard T_EX route of building patterns into the format. LuaT_EX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

```

155 <latexrelease>\EndIncludeInRelease
156 {*2ekernel}

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
157 \lccode`-'='`-% default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
158 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```

159 \def\reserved@a#1#2{%
160   \tempcnta#1\relax
161   \tempcntb#2\relax
162   \reserved@b
163 }
164 \def\reserved@b{%
165   \ifnum\tempcnta>\tempcntb\else
166     \reserved@c\tempcnta
167     \advance\tempcnta\@ne
168     \expandafter\reserved@b
169   \fi
170 }
```

Depending on the TEX version, we might not be allowed to do this for non-ASCII characters.

```

171 \def\reserved@c#1{%
172   \count@=#1\advance\count@ by -"20
173   \uccode#1=\count@
174   \lccode#1=#1
175 }
176 \reserved@a{\a}{\z}
177 \reserved@a{"A0}{ "BC}
178 \reserved@a{"E0}{ "FF}
```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```

179 \def\reserved@c#1{%
180   \count@=#1\advance\count@ by "20
181   \uccode#1=#1
182   \lccode#1=\count@
183   \sfcode#1=999
184 }
185 \reserved@a{\A}{\Z}
186 \reserved@a{"80}{ "9C}
187 \reserved@a{"C0}{ "DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

188 \uccode`^Y=\I % dotless i
189 \lccode`^Y=\^Y % dotless i
190 \uccode`^Z=\J % dotless j, ae in OT1
191 \lccode`^Z=\^Z % dotless j, ae in OT1
192 \lccode`^9d=\i % dotted I
193 \uccode`^9d=\^9d % dotted I
194 \lccode`^9e=\^9e % d-bar
195 \uccode`^9e=\^d0 % d-bar
```

Finally here is one that helps hyphenation in the OT1 encoding.

```
196 \lccode`^=[\^[\ % oe in OT1
```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```
197 \lccode`- ='`- % default hyphen char
198 \lccode 127=127 % alternate hyphen char
199 \lccode 23 =23 % textcompwordmark in T1
```

End of the conditional to select either Unicode or T1 encoding defaults.

```
200 \fi
```

This is as good a place as any to active a few XeTeX-specific settings

```
201 \ifx\XeTeXuseglyphmetrics\undefined
202 \else
203   \XeTeXuseglyphmetrics=1 %
204   \XeTeXdashbreakstate=1 %
205 \fi
```

77.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```
206 \InputIfFileExists{hyphen.cfg}
207   {\typeout{=====
208   Local configuration file hyphen.cfg used^^J%
209   =====}%
210   \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\#1}%
211   }
212   {\input{hyphen.ltx}}
213 \let\@addtofilelist\@gobble
```

```
\l@nohyphenation
```

```

226 <latexrelease>\let\document@default@language\undefined
227 <latexrelease>\EndIncludeInRelease
228 {*2ekernel}
```

77.5 Font loading

Fonts loaded during the formatting process might already have changed the `\font@submax` from `Opt` to something higher. If so, we put out a bold warning.

```
229 \ifdim \font@submax >\z@  
230   \@font@warning{Size substitutions with differences\MessageBreak  
231       up to \font@submax\space have occurred.\MessageBreak  
232       \MessageBreak  
233       Please check the transcript file  
234       carefully\MessageBreak  
235       and redo the format generation if necessary!  
236       \@gobbletwo}%">  
237   \errhelp{Only stopped, to give you time to  
238       read the above message.}  
239   \errmessage{}  
240 \def\font@submax{Opt}  
241 \fi
```

We reset the macro. Otherwise every user will get a warning on every job.

```
240 \def\font@submax{Opt}  
241 \fi
```

77.6 Input encoding

Starting with the 2018 L^AT_EX release default the `inputencoding` to UTF-8. Unless the format is being used with luatex, xetex, encTeX or mltex.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```
242 </2ekernel>  
243 <*2ekernel | latexrelease>
```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```
244 <|latexrelease>\IncludeInRelease{2018/04/01}%  
245 <|latexrelease>           {UTFviii@invalid}{UTF-8 default}%
```

Skip this section in Unicode TeX, or if MLTeX and EncTeX are enabled.

```

392   \atempcntb#2\relax
393   \reserved@b
394 }
395 \def\reserved@b{%
396   \ifnum\@tempcnta>\@tempcntb\else
397     \reserved@c\@tempcnta
398     \advance\@tempcnta\@ne
399     \expandafter\reserved@b
400   \fi
401 }

```

Set the special catcodes (although some of these are useless, since an error will have occurred if the catcodes have changed). Note that $\wedge J$ has catcode ‘other’

for use in warning messages.

```
402 \catcode`\ =10
403 \catcode`\#=6
404 \catcode`\$=3
405 \catcode`\%=14
406 \catcode`\&=4
407 \catcode`\|=0
408 \catcode`\^=7
409 \catcode`\_=8
410 \catcode`\{=1
411 \catcode`\}=2
412 \catcode`\~=13
413 \catcode`\@=11
414 \catcode`\^^I=10
415 \catcode`\^^J=12
416 \catcode`\^^L=13
417 \catcode`\^^M=5
```

Set the ‘other’ catcodes.

```
418 \def\reserved@c#1{\catcode#1=12\relax}
419 \reserved@c{`}
420 \reserved@c{`}
421 \reserved@a{`}{{`?}}
422 \reserved@c{`}
423 \reserved@c{`}
424 \reserved@c{`}
425 \reserved@c{`|`}
```

Set the ‘letter’ catcodes.

```
426 \def\reserved@c#1{\catcode#1=11\relax}
427 \reserved@a{`A}{{`Z}}
428 \reserved@a{`a}{{`z}}
```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab (^I), nl (^J), ff (^L) and cr (^M).

77.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their \uccode and \lccode values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the \TeX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (Xe \TeX and Lua \TeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```
429 \ifnum 0%
430   \ifx\Umathcode\@undefined\else 1\fi
431   \ifx\XeTeXmathcode\@undefined\else 1\fi
432   >\z@
433 \else
434 \def\reserved@c#1{%
435   \count@=#1\advance\count@ by -"20
436   \uccode#1=\count@
437   \lccode#1=#1
438 }
```

```

439 \reserved@a{`\a}{`\z}
440 \reserved@a{"A0}{`BC}
441 \reserved@a{"E0}{`FF}

442 \def\reserved@c#1{%
443   \count@=#1\advance\count@ by "20
444   \uccode#1=#1
445   \lccode#1=\count@
446   \sfcode#1=999
447 }
448 \reserved@a{'\A}{`\Z}
449 \reserved@a{"80}{`9C}
450 \reserved@a{"C0}{`DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

451 \uccode`\^Y='I      % dotless i
452 \lccode`\^Y='^Y    % dotless i
453 \uccode`\^Z='J      % dotless j, ae in OT1
454 \lccode`\^Z='^Z    % dotless j, ae in OT1
455 \lccode`\^9d='i     % dotted I
456 \uccode`\^9d='^9d  % dotted I
457 \lccode`\^9e='^9e  % d-bar
458 \uccode`\^9e='^d0  % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

459 \lccode`\^=[`^[
460 \fi % End of reset block for 8-bit engines

```

\MakeUppercase And whilst we're doing things with uc/lc tables, here are two commands to upper-
\MakeUppercase and lower-case a string.

\@uclclist Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```

461 \DeclareRobustCommand{\MakeUppercase}[1]{%
462   \def\i{I}\def\j{J}%
463   \def\reserved@a##1##2{\let##1##2\reserved@a}%
464   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
465   \protected@edef\reserved@a{\uppercase{\#1}}%
466   \reserved@a
467 }
468 \DeclareRobustCommand{\MakeLowercase}[1]{%
469   \def\reserved@a##1##2{\let##2##1\reserved@a}%
470   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
471   \protected@edef\reserved@a{\lowercase{\#1}}%
472   \reserved@a
473 }
474 \def\@uclclist{\oe\OE\o\O\ae\AE
475           \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\th\TH}

```

The above code works, but has the nasty side-effect that if you say something like:

```
\markboth{\MakeUppercase\contentsname}
         {\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\protect\MakeUppercase Table of Contents}
      {\protect\MakeUppercase Table of Contents}
```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```
476 \protected@edef\MakeUppercase#1{\MakeUppercase{#1}}
477 \protected@edef\MakeLowercase#1{\MakeLowercase{#1}}
```

77.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```
478 %\IfFileExists{ltpatch.ltx}
479 % {\typeout{=====
480 %             Applying patch file ltpatch.ltx^^J%
481 % ======}
482 % \def\fmtversion@topatch{unknown}
483 % \input{ltpatch.ltx}
484 % \ifx\fmtversion\fmtversion@topatch
485 %     \ifx\patch@level@\undefined
486 %         \typeout{^^J^^J^^J%
487 %             !!!!!!!Patch file 'ltpatch.ltx' not suitable for this^^J%
488 %             !! Patch file 'ltpatch.ltx' not suitable for this^^J%
489 %             !! version of LaTeX.^^J^^J%
490 %             !! Please check if initex found an old patch file:^^J%
491 %             !! --- if so, rename it or delete it, and redo the^^J%
492 %             !! initex run.^^J%
493 %             !!!!!!!Patch file 'ltpatch.ltx' not suitable for this^^J%
494 %         \batchmode \Q\end
495 %     \else
```

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

```
496 % \def\fmtversion@topatch{0}%
497 % \ifx\fmtversion@topatch\patch@level\else
498 %     \def\reserved@a\typeout##1##2\reserved@a{%
499 %         \typeout{##1 patch level \patch@level}##2}
500 %     \everyjob\expandafter\expandafter\expandafter{%
501 %         \expandafter\reserved@a\the\everyjob\reserved@a}
502 %     \let\reserved@a\relax
503 %     \the\everyjob
504 % \fi
```

```

505 %      \fi
506 %    \else
507 %      \typeout{^^J^^J^^J%
508 %      !!!!!!!Patch file 'ltpatch.ltx' (for version <\fmtversion@topatch>)^^J%
509 %      !! Patch file 'ltpatch.ltx' (for version <\fmtversion@topatch>)^^J%
510 %      !! is not suitable for version <\fmtversion> of LaTeX.^^J^^J%
511 %      !! Please check if initex found an old patch file:^^J%
512 %      !! --- if so, rename it or delete it, and redo the^J%
513 %      !!     initex run.^^J%
514 %      !!!!!!!batchmode \@@end
515 %      \fi
516 %    \let\fmtversion@topatch\relax
517 %
518 }

```

77.9 Freeing Memory

\reserved@a And just to make sure nobody relies on those definitions of \reserved@b and friends. These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```

519 \let\reserved@a\@filelist
520 \let\reserved@b=\@undefined
521 \let\reserved@c=\@undefined
522 \let\reserved@d=\@undefined
523 \let\reserved@e=\@undefined
524 \let\reserved@f=\@undefined

\toks
525 \toks0{}
526 \toks2{}
527 \toks4{}
528 \toks6{}
529 \toks8{}

```

\errhelp Empty the error help message, which may have some rubbish:

```
530 \errhelp{}
```

77.10 Initialise file list

\@providesfile Initialise for use in the document. During initex a modified version has been used which leaves debugging information for `latexbug.tex`.

```

531 \def\@providesfile#1[#2]{%
532   \wlog{File: #1 #2}%
533   \expandafter\xdef\csname ver@#1\endcsname{#2}%
534 }
```

\@filelist \@addtofilelist Reset \@filelist so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to \reserved@a where it will be overwritten as soon as almost any L^AT_EX command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
535 \let\@filelist\@gobble
536 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

77.11 Dumping the format

Finally we make @ into a letter, ensure the format will be in the ‘normal’ error mode, and dump everything into the format file.

```
537 \makeatother
538 \errorstopmode
539 \dump
540 </2ekernel>
```

Change History

1985-11-04 ltmath.dtx LaTeX2.09		1989-04-29 ltfssbas.dtx v1.0h
General: produce warning message if line extends into margin.		General: Documented problem with <code>\halign</code> , and <code>\noalign</code>
Doesn't warn about formula overprinting equation number.	300	<code>\mathversion</code> : Test if version defined added.
1989-04-10 ltfssbas.dtx v1.0a		1989-04-29 ltfssbas.dtx v1.0i
General: Starting with version numbers! <code>\ifmmode</code> added in <code>\math@group</code>	161	General: Removed the <code>\halign</code> <code>\noalign</code> correction (wasn't bugfree)
1989-04-10 ltfssbas.dtx v1.0b		1989-04-29 ltfssini.dtx v1.0f
General: <code>\preload@sizes</code> added. <code>\wrong@fontshape</code> changed to define substitution font/shape macro.	161	General: Corrections to L ^A T _E X tabular env. added.
1989-04-10 ltfssini.dtx v1.0a		1989-05-01 ltfssbas.dtx v1.0j
General: Starting with version numbers <code>\newif</code> for <code>\@tempwa</code> added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) <code>\math@famname</code> changed to <code>\math@version</code>	235	General: Default for <code>\baselinestretch</code> added.
1989-04-14 ltfssbas.dtx v1.0c		1989-05-22 ltfssbas.dtx v1.0k
General: More documentation added.	161	General: Lines longer than 72 characters folded.
1989-04-15 ltfssini.dtx v1.0b		1989-05-22 ltfssini.dtx v1.0g
General: <code>\mathfontset</code> renamed to <code>\mathversion</code>	235	General: Lines shortened to 72 characters
1989-04-19 ltfssbas.dtx v1.0d		1989-09-14 ltfssbas.dtx v1.0m
General: Even more doc.	161	General: Global replacement: <code>\group</code> to <code>\mathgroup</code>
1989-04-21 ltfssbas.dtx v1.0e		<code>\mathversion</code> : Corrected typo: <code>\endcsname</code> to <code>\endcsname</code>
General: Documentation is fun! Parameters of <code>\define@mathalphabet</code> changed.	161	1989-11-07 ltfssini.dtx v1.0i
1989-04-21 ltfssini.dtx v1.0c		General: All family, series, and shape names abbreviated.
General: Changed to conform to fam.tex.	235	1989-11-08 ltfssbas.dtx v1.0o
1989-04-23 ltfssbas.dtx v1.0f		General: First parameter of <code>\define@mathalphabet</code> and <code>\define@mathgroup</code> changed from string to control sequence.
General: % in <code>\getanddefinefonts</code> added.	161	1989-11-14 ltfssbas.dtx v1.0p
1989-04-26 ltfssini.dtx v1.0d		<code>\math@version</code> : Math version prefix 'mv@' added.
General: <code>\xpt</code> added.	235	1989-11-19 ltfssbas.dtx v1.0q
1989-04-27 ltfssbas.dtx v1.0g		<code>\define@newfont</code> : Group added.
General: Documentation revised.	161	<code>\wrong@fontshape</code> : Instead of calling <code>\family\default@family</code> , etc. we directly set <code>\f@family</code> , etc.
1989-04-27 ltfssini.dtx v1.0e		1989-11-22 ltfssbas.dtx v1.0r
General: Definitions of L ^A T _E X symbols corrected.	235	<code>\math@version</code> : <code>\def</code> → <code>\edef</code> for <code>\math@version</code>
		1989-11-25 ltfssbas.dtx v1.0s
		General: All <code>\edef\font@name</code> changed to <code>\xdef\font@name</code> .

Necessary after introduction of \begingroup/\endgroup in v1.0q.	161	1990-01-21 ltfssrc.dtx v1.2b \use@mathgroup: Macro added to allow cleaner interface.	193
extra// → + in \extra@def. .	161	1990-01-23 ltfssbas.dtx v1.2c General: \no@version@warning renamed to	
1989-11-26 ltfssbas.dtx v1.0t \select@group: \bgroup/\egroup changed to \begingroup/\endgroup to avoid empty Ord atom on math list.	177	\no@alphabet@error.	161
1989-12-02 ltfssini.dtx v1.1b General: \rmmath renamed to \mathrm	235	Macro \no@alphabet@help added	161
1989-12-03 ltfssini.dtx v1.1c General: Some internal macros renamed to make them inaccessible.	235	\no@alphabet@error: Changed to error call	161
1989-12-05 ltfssbas.dtx v1.0u \addto@hook: \addto@hook added.	181	1990-01-25 ltfssini.dtx v1.1e \nfss@text: Macro added.	238
1989-12-05 ltfssrc.dtx v1.0u fam.dtx \every@math@size: Hook \every@size added.	190	1990-01-27 ltfssbas.dtx v1.2d \DeclarePreloadSizes: Font identifier set to \relax.	166
1989-12-13 ltfssrc.dtx v1.0f \use@mathgroup: \expandafter added before final \fi.	193	1990-01-28 ltfssbas.dtx v1.2e \mathgroup: \newfam let to \new@mathgroup.	161
1989-12-16 ltfssbas.dtx v1.1a \select@group: \relax in front added.	177	1990-01-28 ltfssbas.dtx v1.2f \define@newfont: Added call to \curr@fontshape macro to allow substitution.	172
Now four arguments.	177	\wrong@fontshape: Warning message slightly changed.	174
Redefinition of alphabet now simpler.	177	1990-01-28 ltfssini.dtx v1.2b \em: Call to \cnonmath added.	236
Usage of '=' macro added.	177	1990-02-08 ltfssini.dtx v1.1g General: Protected the commands \family, \series, \shape, \size, \selectfont, and \mathversion.	235
1989-12-16 ltfssrc.dtx v1.1a \selectfont: Changed order of calls.	187	1990-02-16 ltfssbas.dtx v1.2g General: Support for changes of \baselineskip without changing the size.	161
\use@mathgroup: Redefinition of alphabet now simpler.	193	\math@version: \cnonmath added.	169
Usage of '=' macro added.	193	1990-02-16 ltfssrc.dtx v1.0i \selectfont: Changed \f@size to \lcl@currsize (see fam file).	187
1990-01-18 ltfssrc.dtx v1.0h General: \tracingfonts meaning changed.	183	1990-02-18 ltfssrc.dtx v1.0j General: Redefine unprotected version \p@selectfont instead of \selectfont.	187
1990-01-20 ltfssbas.dtx v1.2a \math@bgroup: Def. placed in this file.	179	1990-03-14 ltfssrc.dtx v1.0k General: Added code for TeX3.	183
\math@egroup: Def. placed in this file.	179	\extract@font: Added code for TeX3.	186
\select@group: Def for alph id changed.	177	\selectfont: Added code for TeX3.	187
1990-01-21 ltfssbas.dtx v1.2b \select@group: Code moved to \use@mathgroup.	177	1990-03-30 ltfssbas.dtx v1.2h \math@egroup: Changed to have one arg.	179

1990-03-30 lfsstrc.dtx v1.2h	\use@mathgroup: Third argument removed (see \math@egroup).	193	1990-08-27 lfsstrc.dtx 1.0r	\type@restoreinfo: Some extra tracing info.	189
1990-04-01 ltfssbas.dtx v1.2i	General: Code added from tracefnt.dtx.	161	1990-08-27 lfsstrc.dtx v1.0r	\getanddefine@fonts: Correcting missing name after \tracingon.	194
	Support for TeX3.	161		\tracingon.	194
1990-04-01 lfsstrc.dtx v1.0l	General: Part of code moved to fam.dtx.	183	1991-03-28 lfssini.dtx v1.1m	\copyright: Extra braces added.	238
	\tracingfonts: Check if \tracingfonts already defined.	184	1991-03-30 lfssini.dtx v1.2g	\newfont: Definition added.	237
1990-04-01 lfsstrc.dtx v1.0o	\tracingfonts: Check if \tracingfonts defined removed again.	184		\symbol: Definition added.	237
1990-04-02 lfssini.dtx v1.1i	General: \input of files now handled by docstrip.	235	1991-07-24 ltmiscn.dtx LaTeX2.09	\@verbatim: Added \penalty\interlinepenalty to definition of \par so that \samepage works	286
1990-04-05 lfsstrc.dtx v1.0m	\selectfont: Call \tracingon only if \tracingfonts greater than 3.	187	1991-08-14 lmath.dtx LaTeX2.09	\cases: (RmS) inserted extra braces around entry for NFSS	296
	\selectfont: \tracingon with new syntax.	187	1991-08-14 lpictur.dtx LaTeX2.09	General: (RmS) inserted extra braces around entry for NFSS	358
1990-05-05 lfsstrc.dtx v1.0n	1990-06-23 lfssini.dtx v1.1k		1991-08-14 ltthm.dtx LaTeX2.09	\@endtheorem: Moved \itshape after \item to make it work with NFSS	381
	\nfss@text: Changed to \mbox.	238	1991-08-26 lfssini.dtx v1.1n	\p@reset@font: Macro introduced	238
1990-06-24 ltfssbas.dtx v1.2j	\DeclarePreloadSizes: Missing percent added.	165	1991-08-26 ltmiscn.dtx LaTeX2.09	\@verbatim: \@@par added	287
	\selectfont: \tracingon with new syntax.	187	1991-08-26 lpictur.dtx LaTeX2.09	\endpicture: (RmS & FMi) extra boxing level around \picbox to guard against unboxing in math mode (proposed by John Hobby)	357
1990-06-24 lfsstrc.dtx v1.0o	\baselinestretch: Moved to tracefnt.dtx.	190	1991-08-26 lplain.dtx LaTeX209	\tracingall: Added \errorcontextlines=\maxdimen, suggested by J. Schrod	29
	\getanddefine@fonts: \Adding tracing code.	194		\showhyphens: Macro added.	179
1990-06-30 ltfssbas.dtx v1.2l	\Macro moved from fam.dtx.	194	1991-09-29 ltboxes.dtx LaTeX2.09	\ompfootnotetext: (RmS) added \reset@font	330
	Adding debug code.	194	1991-09-29 ltfloat.dtx LaTeX2.09	\@footnotetext: (RmS) added \reset@font	411
	\use@mathgroup: Tracing code added.	193	1991-09-29 ltmath.dtx LaTeX2.09	\@footnotetext: (RmS) added \reset@font	411
1990-06-30 lfsstrc.dtx v1.0p	\use@mathgroup: Added \relax after math group number.	193	1991-09-29 ltsect.dtx LaTeX2.09	\eqnnum: RmS: \reset@font added.	299
	\getanddefine@fonts: Group number added to tracing.	194		\dottedtocline: (RmS) added \reset@font for page number	392
1990-07-07 lfsstrc.dtx v1.0q	\math@egroup: Tracing code added.	193			
	\use@mathgroup: Group number added to tracing.	193			

1991-10-17	ltcntrl.dtx	LaTeX209			1992-01-10	ltbibl.dtx	LaTeX2.09	
	\@tfor:	(RmS) \xdef replaced by \def (See FMi's array.doc)	58		\@bibitem:	Changed \c@enumiv to \value of \@listctr	416	
1991-10-25	ltbibl.dtx	LaTeX2.09			1992-01-10	htmath.dtx	LaTeX2.09	
	\@citex:	added \reset@font, suggested by Bernd Raichle.	416		equation:	RmS: put \hbox around \c@eqnnum to typeset the equation number in text mode (as in the eqnarray env.)	299	
1991-11-01	ltfloat.dtx	LaTeX2.09			1992-01-10	ltthm.dtx	LaTeX2.09	
	\footnote:	(RmS) Added \let\protect\noexpand in \footnote, \footnotemark, and \footnotetext, since \xdef is used	411		\@othm:	(RmS) Check for existence of theorem environment	380	
1991-11-04	ltlists.dtx	LaTeX2.09			1992-01-14	ltbibl.dtx	LaTeX2.09	
	\makelabel:	(RmS) added default definition for \makelabel, to produce an error message.	317		\@biblabel:	removed \hfill	418	
1991-11-04	ltplain.dtx	RmS			1992-01-14	ltsect.dtx	0.0	
	General:	Removed \itemitem since never needed/useful with L ^A T _E X.	27		\@starttoc:	(RmS) added \immediate to \openout as all \write commands are also executed \immediate	390	
1991-11-06	ltbibl.dtx	LaTeX2.09			1992-02-26	ltbibl.dtx	LaTeX2.09	
	\@citex:	added code to remove a leading blank	416		\@lbibitem:	Added \hfill to restore left-alignment of bibliography labels in alpha style	416	
1991-11-13	ltbibl.dtx	LaTeX2.09			1992-03-18	ltdefns.dtx	LaTeX209	
	\@bibitem:	Changed counter enumi to enumiv, as it says in the comment above	416		General:	(RMS) changed input channel from 0 to \inputcheck to avoid conflicts with other channels allocated by \newread	36	
1991-11-21	ltfssini.dtx	v1.10			1992-03-18	ltfloat.dtx	LaTeX2.09	
	\p@reset@font:	Added extra braces for robustness.	238		\@xmpar:	(RmS) added \global\ignorefalse	407	
	Changed to protected version of macro.	238			\end@float:	(RmS) changed \esphack to \C{Esphack}	401	
1991-11-22	ltfloat.dtx	LaTeX2.09			1992-03-18	ltlists.dtx	0.0	
	\footnote:	(RmS) Added \let\protect\noexpand in \xfootnote, \xfootnotemark, and \xfootnotetext	411		General:	RmS: added \c@nbrlistfalse	314	
1991-11-22	ltlists.dtx	LaTeX2.09			1992-03-18	ltmisen.dtx	LaTeX2.09	
	\@item:	(RmS) Changed second call to \makelabel to \unhbox\@tempboxa. Avoids problems with side effects in \makelabel and is more efficient.	317		\begin:	Changed \c@ignoretrue to \c@ignorefalse (as documented)	282	
1991-11-27	ltfssbas.dtx	v1.3a			1992-03-21	ltfssini.dtx	v1.2d	
	General:	All \family, \shape etc. renamed to \fontfamily etc.	161		General:	Renamed \text to \nfss@text to make it internal.	235	
1991-11-27	ltfssini.dtx	v1.2a			1992-05-12	ltfssbas.dtx	v1.3c	
	General:	All \family, \shape etc. renamed to \fontfamily etc.	235		\extract@alph@from@version:	Macro added.	178	
1992-01-06	ltfssini.dtx	v1.2c			\select@group:	Added call to \ex- tract@alph@from@version.	177	
	General:	added slitex code	235		1992-07-26	ltfssbas.dtx	v1.9a	

\define@newfont:	171	\@secCntformat	386
\math@fonts:	177	1992-09-18 ltlists.dtx LaTeX2.09	
\select@group:	177, 178	General: (RmS) Added warning if	
\split@name: Added splitting into		\item is used in math mode	315

\@sect: (FMi) replaced explicit		\DeclareSizeFunction: Added all	
setting of \@svsec by call to		args to avoid blanks problems	199

1993-04-09 lterror.dtx v1.0e		message of \SetSymbolFont. 217
\@latexerr: Mention The Companion	64	1993-09-02 ltfsstrc.dtx v2.1i
1993-04-11 lterror.dtx v1.0f		General: Corrected name of sgen size function. 183
\@latexerr: Remove setting of errorcontextlines	64	1993-09-03 ltmiscen.dtx LaTeX2.09
1993-05-05 lftntcmd.dtx v2.0b		\verbatim@nolig@list: Replaced \noligs by extensible list . 290
General: Removed all LaTeX related cmds	264	1993-09-07 ltmiscen.dtx LaTeX2.09
1993-05-16 ltfsbas.dtx v2.0e		\verb@balance@group: (RmS)
\showhyphens: Use \reset@font	179	Changed definition of \verb so that it detects a missing second delimiter. 290
1993-07-16 ltfsstrc.dtx v2.1h		1993-09-08 ltmiscen.dtx LaTeX2.09
General: Changed layout of info messages	183	\enddocument: Added warning in case of undefined references. 278
1993-07-17 ltoutenc.dtx 1.0d		1993-09-15 ltfsbas.dtx v2.0g
General: changed \catencoding @ .	103	\DeclareFontEncoding: Corrected: \default@T to \default@M. . 164
1993-08-03 ltmiscen.dtx LaTeX2.09		1993-09-15 ltfsstrc.dtx v2.1j
\enddocument: Changed redefinition of \global to redefinition of \setckpt.	278	General: Corrected spelling of \noexpand. 183
1993-08-05 ltpictur.dtx LaTeX2.09		1993-09-19 lterror.dtx LaTeX2.09
\circle: (RMS) Added error message if \circle is used in math mode.	373	\@invalidchar: (RmS) Error message for invalid input characters. 66
1993-08-05 ltsect.dtx LaTeX2.09		1993-11-02 ltmath.dtx LaTeX2.09
\@sect: (RmS) Made sure that \protect works correctly in expansion of \the counter	386	General: RmS: Corrected description of \eqnse, moved \eqnse accordingly and removed extra \tabskip assignment. 300
1993-08-05 ltspace.dtx LaTeX2e		1993-11-03 ltmath.dtx LaTeX2e
\@hskip: (RmS) Removed superfluous \leavevmode in \@hskip and \@spacer, as suggested by CAR.	84	General: RmS: Initialized \everycr to empty 300
1993-08-05 ltab.dtx latex2e		1993-11-03 ltpictur.dtx LaTeX2.09
\tabular*: Replaced \expandafter\def by \@namedef.	344	General: (RmS) changed \halign to \ialign to initialize \tabskip and \everycr 358
1993-08-06 ltbibl.dtx LaTeX2.09		1993-11-11 ltfsini.dtx v2.1a
\@citex: Moved writing to .aux file in loop over citation keys so that leading blanks are removed there as well.	416	\normalfont: Macro added 238
1993-08-13 ltoutenc.dtx 1.0f		1993-11-11 ltfsstrc.dtx v2.2a
General: Protected against active @ sign.	103	General: Option concept added for LaTeX2e 183
1993-08-13 preload.dtx v2.0c		1993-11-14 ltclass.dtx v0.2a
General: Added \relax at end of font names.	261	\@current: Name changed from \currextension 499
1993-08-16 ltoutenc.dtx 1.0g		\@fileswithoptions: Moved resetting of \default@ds, \ds@ and \declaredoptions here, from the end of \ProcessOptions. 509
General: Needs space after \string	103	\@reset@ptions: macro added 510
1993-08-18 ltfsdcl.dtx v2.0e		\AtEndDocument: Included extension in the generated
\new@mathversion: Exchanged names of encodings in warning		

macro name for package and class hooks.	511	1993-11-22 ltclass.dtx v0.2f \@fileswithoptions: Made the default [] not [\@unknowversion]
\documentstyle: Added \RequirePackage	505	Made the initial version [] not [\@unknowversion]
\NeedsTeXFormat: made more robust for alternative syntax for other formats.	506	\@ifclasslater: Added //00 so parsing never produces a runaway argument.
\ProcessOptions*: Optimise ‘empty option’ code.	503	General: \@unknowversion removed
Stop adding the global option list inside class files.	503	1993-11-22 ltdefns.dtx LaTeX2e \@minus: Macro added
1993-11-15 ltclass.dtx v0.2b	505	\@plus: Macro added
\documentstyle: Modified to match \ProcessOption* . . .	505	\CheckCommand: Macro added
\ProcessOptions*: Star form added.	503	\providecommand: Macro added
1993-11-17 ltclass.dtx v0.2c	510	1993-11-22 lterror.dtx LaTeX2e \c@errorcontextlines: Macro added
\@fileswith@ptions: Macro added	511	1993-11-22 lffiles.dtx LaTeX2e \listfiles: Removed checking for \@unknowversion
\@badrequireerror: Macro added	510	1993-11-22 llength.dtx LaTeX2e \@settodim: Macro added
\@fileswithoptions: Added trap for two \LoadClass commands.	510	\@settopoint: Macro added
\@twoloadclasserror: Macro added	512	\settodepth: Macro added
\CurrentOption: Name changed from \curroption	499	\settoheight: Macro added
\DeclareOption*: Error checking added	503	1993-11-22 ltlogos.dtx LaTeX2e \LaTeXe: Macro added
\NeedsTeXFormat: Name changed from \NeedsFormat	506	1993-11-23 ltclass.dtx v0.2g \useoption: Name changed from \executeoption
\ProcessOptions*: restoring \@fileswith@ptions added.	503	General: Various macros now moved to latex.tex.
1993-11-18 ltclass.dtx v0.2d	505	Warnings and errors now directly coded.
\documentstyle: Modified \RequirePackage stuff.	505	1993-11-23 ltdefns.dtx LaTeX2e \argdef: Macro added
\ExecuteOptions: Use \CurrentOption not \reserved@a	505	\@ifundefined: Redefined to remove a trailing \fi

\usepackage: Fixed error handling	506		
1993-12-13 ltdirchk.dtx v0.2a General: on the 'docstrip' pass, do not check openin path	10		

1993-12-16 ltspace.dtx LaTeX2e \@bsphack: Corrected optimisation :-)	75	initializing mark until the problem is solved.	421
1993-12-16 lttab.dtx latex2e \@xhline: Measure from middle of vertical rules	353	1993-12-18 ltoutenc.dtx 1.3b General: Fixed typos with \ProvidesPackage lines. Added the \NeedsTeXFormat line. Added the last argument to \DeclareEncoding. Moved the use of the encodings to after their declaration.	103
1993-12-17 ltclass.dtx v0.2q \@documentclasshook: Macro added	498	Replaced the missing last argument to \DeclareFontEncoding.	115, 118
\@fileswithoptions: Add \@compatibility hook	508	1993-12-18 ltoutenc.dtx 1.3c General: Rewrote for the new syntax of \EncodingSpecific.	115, 118
\documentstyle: Match Alan's new code.	505	Split \EncodingSpecificAccent up into \EncodingSpecific and \DeclareAccent.	104
1993-12-17 ltoutenc.dtx 1.3 General: Added this section	104	1993-12-18 ltoutenc.dtx v1.3a General: Replaced OT3 by XXX	100
Removed all the hackery for use in \DeclareFontEncoding, and redid everything using \DeclareTextFoo.	115, 118	1993-12-18 ltoutenc.dtx v1.3b General: Corrected typos.	100
Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate \ProvidesPackage commands. Added XXXenc.	103	Replaced the missing last argument to \DeclareFontEncoding.	100
1993-12-17 ltoutenc.dtx v1.3 General: Added \EncodingSpecificAccent, \EncodingSpecificAccent-edLetter and \EncodingSpecificCommand.	100	1993-12-18 ltoutenc.dtx v1.3c General: A new syntax, separating accent-definitions from encoding-specific definitions, and allowing encoding-specific \chardef, \let, etc.	100
Made Rokicki's encoding a proper encoding scheme rather than a variant of OT1.	100	Rewrote for the new syntax of \EncodingSpecific.	100
1993-12-17 ltoutput.dtx v1.0j \@opcol: Hook removed	445	1993-12-18 ltoutenc.dtx v1.3d General: Some T1 stuff had drifted into the OT1 file.	100
\@specialoutput: Page room test added	440	1993-12-18 ltpage.dtx LaTeX2e \sloppy: Added \emergencystretch	421
\@topnewpage: check for vspace too small added	437	1993-12-19 ltclass.dtx v0.2r \endfilecontents: Different message when ignoring a file	512
Page room test added	439	1993-12-19 ltfnntcmd.dtx v3.0b General: \@pdef command added	264
\@writesetup: —and then removed	449	Added by ASAJ.	271
\f@l@tracemessage: tracefloatvals made a document command	479	Made \@newfontswitch produce an error if command already exists, and added \@renewfontswitch, ASAJ	264
1993-12-17 ltpage.dtx LaTeX2e \mark: Removed init \mark at begin document, since it doesn't work.	421	Other tidying	264
\rightmark: Stopgap solution to mark \leftmark and \rightmark work without		Some more tidying done	264

Untidying added, so this is now a TEMPORARY version.	264	\math@version: New math font setup	169
Wording changes by CAR.	271	1994-01-17 ltfsini.dtx v2.1e \not@math@alphabet: Message changed	236
\DeclareOldFontCommand: Corrected and tidied	271	1994-01-17 ltfsstrc.dtx v2.3a General: New math font setup	183
\DeclareTextFontCommand: Corrected and tidied	266	\check@mathfonts: New math font setup	192
1993-12-19 ltspace.dtx LaTeX2e \@bsphack: There seem to be problems with selfmade birthday presents	76	\glb@currsize: New math font setup	189
1993-12-20 ltdefns.dtx LaTeX2e \@reargdef: Kept old version of \@reargdef, for array.sty	40	\restglb@settings: New math font setup	192
1993-12-20 ltfiles.dtx v0.9m \@obsoletefile: Added this command, removed @oldfilewarning	98	1994-01-18 ltbibl.dtx LaTeX2e \bibliography: Use \input@ so include files are listed.	417
1994-01-05 fontdef.dtx v2.1d General: Removed nf prefix from file names.	243	1994-01-18 ltclass.dtx v0.2t \ifclassloaded: Fix typo \@pkgetension	499
1994-01-13 ltmath.dtx v0.9o \@eqncr: correcting 0.9i	301	1994-01-18 ltfiles.dtx v0.9p \@iffileonpath: Macro added	96
General: correcting 0.9i	300	\@input: do not use a different definition for \input@path	98
1994-01-14 ltdirchk.dtx v0.2d \IfFileExists: Close the texsys.aux output stream	10	\@input@: Macro added	98
1994-01-15 ltfiles.dtx v0.9o \document: move \preamblecmds after document hook	91	\IfFileExists@: New Definition	95
1994-01-17 ltclass.dtx v0.2s \@fileswithoptions: Modify to reduce parameter stack usage	508, 509	\include: Use \input@ so include files are listed.	93
General: Added many more \onlypreamble commands	498	\InputIfFileExists: New Definition	97
Wrapped long lines to column 72	498	1994-01-18 ltssini.dtx v2.1f \not@math@alphabet: Message corrected	236
1994-01-17 ltfiles.dtx LaTeX2e \listfiles: New Version, adds '.tex' if needed, and lines up columns	99	1994-01-18 ltmiscen.dtx v0.9p \verbatim: Add \global\@inlabelfalse	286
1994-01-17 ltfsbas.dtx v2.1a General: New math font setup	161	Only add \penalty if in hmode	287
\curr@math@size: New math font setup	170	1994-01-19 fontdef.dtx v2.1e General: Added missing setting for symbols in bold version.	247
\everydisplay: New math font setup	170	1994-01-19 ltdirchk.dtx v0.2e \IfFileExists: name changed from \test	9
\everymath: New math font setup	170	\input@path: No longer check that an empty group is in the path	11
\frozen@everydisplay: New math font setup	170	\strip@prefix: name changed from \strip@meaning, to match NFSS.	5
\frozen@everymath: New math font setup	170	1994-01-19 ltmath.dtx v1.0n classes \mathindent: Deferred setting of \mathindent	302
		1994-01-20 ltdirchk.dtx v0.2f General: \copytexsys and the texsys.new file removed	9
		Modify all of ltxcheck	13

\IfFileExists: \@copytexsys removed	10	1994-01-31 ltntcmd.dtx v3.1b General: \@normalsize no longer defined	264
1994-01-21 ltclass.dtx v0.2u \documentstyle: compatibility file now latex209.def.	505	1994-02-01 ltpage.dtx LaTeX2e \pagestyle: (DPC) Modify to get nicer error message	419
1994-01-21 ltdirchk.dtx v0.2g General: Improve documentation, reorganise docstrip module . . . 1		\thispagestyle: (DPC) Modify to get nicer error message	420
\filename@parse: Minor changes, and add Mac version (:) 11		1994-02-02 ltclass.dtx v0.2x \@fileswithoptions: Only run the hook and options check if the file was loaded.	510
\today: Name changed from \stamp, to save memory 9		1994-02-03 ltoutput.dtx v1.0k \@makespecialcolbox: correct mistakes in the documentation	448
1994-01-21 ltfloat.dtx LaTeX2e \@xfloat: Added missing percent characters.	398	1994-02-07 ltclass.dtx v0.2y \@fileswithoptions: Run \@compatibility on the first class to start (not the first to finish)	508
1994-01-21 ltmiscen.dtx v0.9s \verbatim@font: Removed unnecessary category code hackery.	288	\@ifclasswith: Add extra ,s so 'two' is not matched with 'twocolumn'	501
1994-01-24 ltdirchk.dtx v0.2h \IfFileExists: Stop testing once texsys.aux has been found . . . 10		\ProcessOptions*: Add extra ,s so 'two' is not matched with 'twocolumn'	504
1994-01-24 ltpage.dtx LaTeX2e \pagestyle: (DPC) Complain if pagestyle is undefined.	419	1994-02-07 ltfsbas.dtx v2.1c \DeclareFontEncoding: revert catcode settings earlier 163	
1994-01-25 ltdirchk.dtx v0.2i General: Protect against looping on \@@input and \@@end.	2	\DeclareFontShape: revert catcode settings earlier 162	
1994-01-25 ltfsbas.dtx v2.1b \math@version: Corrections for math setup	170	1994-02-08 ltoutput.dtx v1.0k \@makespecialcolbox: boxmaxdepth setting added . . 447	
1994-01-25 ltmath.dtx LaTeX2e \bordermatrix: Removed \p@renwd.	296	boxmaxdepth setting removed . . 447	
1994-01-26 ltfsstrc.dtx v2.3c \check@mathfonts: Correct trace info placement	192	General: Documentation and tasks tidied.	422
\restglb@settings: Correct trace info placement	192	1994-02-10 ltclass.dtx v0.2z \@documentclasshook: Changed the name from \@compatibility to \@documentclasshook, and added the check for whether \@normalsize has been defined. ASA.J.	498
1994-01-27 ltntcmd.dtx v3.1a \nocorrlist: Only ., used as default for cm fonts	270	\@fileswithoptions: Renamed \@compatibility to \@documentclasshook. ASA.J. 508	
1994-01-29 ltclass.dtx v0.2v \@unprocessedoptions: Macro added.	511	1994-02-10 ltfsbas.dtx v2.1d \addto@hook: Made \addto@hook long.	181
\@fileswithoptions: All options raise error if no \ProcessOptions appears . . . 510			
1994-01-31 ltclass.dtx v0.2w \g@addto@macro: Use toks register to avoid 'hash' problems . . . 511			
1994-01-31 ltfiles.dtx v0.9t \document: set \@normalsize or \normalsize if necessary 90			

1994-02-10 ltfsscmp.dtx v2.1d		Long lines wrapped to 72 columns	87
\scan@@fontshape: scan away stuff after pt	206	1994-03-07 ltfinal.dtx v0.1a	
1994-02-22 ltfssini.dtx v2.1g		General: Add code from the old dump.dtx	565
General: Correct error message .	238	Initial version, split from latex.dtx	553
1994-02-24 ltfsbas.dtx v2.1e		move code here from lhyphen.dtx	558
\DeclareFontShape: Separate restoration of catcodes for fd cmds	162	Remove oldcomments environment	553
\define@newfont: Separate restoration of catcodes for fd cmds	172	use \InputIfFileExists not \IfFileExists	558
\nfss@catcodes: Separate restoration of catcodes for fd cmds	172	1994-03-07 ltfloat.dtx v1.0a	
1994-02-25 ltdirchk.dtx v0.2j		\@endfloatbox: (DPC) Extra group for colour	403
General: Remove need for drv file .	1	\@footnotetext: (DPC) Extra group for colour	411
1994-03-01 ltdirchk.dtx v0.2k		\@xfloat: (DPC) Extra group for colour	399
General: Add unstripped module, so that dircheck.dtx may be used with initex	1	1994-03-07 lthyphen.dtx v0.1c	
1994-03-02 ltboxes.dtx v0.1e		General: move the 2ekernel code to ltfinal.dtx	526
General: Add 2ekernel module .	321	1994-03-07 ltlenth.dtx v1.0a	
Remove need for drv file .	321	\@settodim: (DPC) Extra group for colour	160
1994-03-02 ltclass.dtx v0.3a		1994-03-07 llists.dtx v1.0a	
General: Remove need for driver file	498	General: Initial version, split from latex.dtx	306
1994-03-03 ltboxes.dtx v0.1f		Long lines wrapped to 72 columns	306
\@irsbox: Replaced a missing \else	331	1994-03-07 ltpage.dtx v1.0a	
1994-03-04 ltfloat.dtx v1.0a		General: Initial version, split from ltherest.dtx	419

1994-04-18 ltfinal.dtx v0.1b General: Initialise \textheight, \textwidth and page style	555	\mpfootnotetext: Extra \endgraf for colour	330
1994-04-18 ltfloat.dtx v1.0d \@footnotetext: (DPC) Remove Colour support	411	\endminipage: Extra \egroup for colour	329
\savemarbox: (DPC) Remove Colour support	406	1994-04-21 ltfinal.dtx v0.1c General: Added comments, set the catcodes of 128–255.	553
1994-04-18 ltssbas.dtx v2.1i General: Macro \no@alphabet@help removed again	161	1994-04-22 ltssini.dtx v2.1g \not@math@alphabet: Message changed again	236
\calculate@math@sizes: Changed message to log only	179	1994-04-23 ltfinal.dtx v0.1d General: Check that \font@submax is still zero	553
		1994-04-24 ltoutput.dtx v1.0m \reset@fps: Number 2 changed to \tw@	483
		Warning changed	483

\@specialoutput: Message changed to give more info and 'top' removed	440	1994-04-28 lplain.dtx v1.0g General: Turn off overfull box tracing in log	24
\@topnewpage: Message changed to give more info	439	1994-04-29 ltclass.dtx v1.0a General: Change version number to 1 (no other change)	498
Warning message removed as it will be generated later	438	1994-04-29 ltmiscen.dtx v1.0f \@verbatim: \leavevmode added Change to \everypar added	287
General: Changed \@normalsize to \normalsize.	422	1994-04-29 htoutenc.dtx 1.4a General: Removed \EncodingSpecific. Renamed all the commands. Added \DeclareTextGlyph and \UndeclareTextCommand.	104
Corrected unverbed commands in documentation.	422	Removed Rokicki's OT1 variant encoding. Moved the driver to the top.	103
Removed some long lines and other aesthetic changes.	422	1994-04-30 hfntcmd.dtx v3.3b General: Documentation up-dated and tidied	264
Warning messages changed/corrected.	422	Prefix frag@ changed to frag in \@protecteddef	264
1994-04-24 ltpictur.dtx v0.1b General: Removed surplus spaces after \hbox to in several cases	355	Title changed	264
1994-04-25 ltclass.dtx v0.3h General: Removed spurious extra '.'s at the end of error messages	498	Warning changed to info message in \@protecteddef	264
1994-04-25 ltfloat.dtx v1.0e \@largefloatcheck: Changed warning message to give more info	403	1994-04-30 htoutput.dtx v1.0n \@activechar@info: \@activechar@warning changed to \@activechar@info	448
Command added	403	\@combinedblfloats: Removed rule in topnewpage case	454
General: Changed warning messages	394	\@emptycol: Empty column action added: \@emptycol	437
Removed obsolete tracing code	394	\@f1setnum: Rogue space removed	483
1994-04-27 lfsstrc.dtx v2.3e General: Corrected item that was forgotten in last change.	183	\@specialoutput: Cut-off point changed to 2\baselineskip	440
1994-04-28 lterror.dtx v1.0j \@inmatherr: Macro added	66	Empty column action added: \@emptycol	440
1994-04-28 lterror.dtx v1.1c \@inmatherr: Replaced \noexpand with \protect.	66	Extra empty column added for twocolumn case	440
1994-04-28 lfssdcl.dtx v2.1e General: Removed all \uppercase in hex num parsing macros	209	Extra empty column added for twocolumn case (wrong, see below)	440
1994-04-28 ltlists.dtx v1.0c General: Replaced \@ltxnomath by \@inmatherr	315	\@topnewpage: Added setting of \col@number	437
1994-04-28 ltpictur.dtx v0.1c General: bezier curves added	374	Cut-off point changed to 3\baselineskip	439
\multiput: (DPC) Ignore spaces between)(.	357	Empty column action added: \@emptycol	439
(DPC) Macro added	357	Message changed for Frank	439
\picture: (DPC) Ignore spaces before (.	356		

General: \@activechar@warning changed to an info message	422	Set all the catcodes	553
Added \col@number.	422	General: Set the catcode of control-J.	562
Documentation tidied.	422	1994-05-02 ltmiscen.dtx v1.0g General: Changed 91 to 1991 and moved some bits	277
Empty column action added.	422	Fixed bug from \dblfigrule with \atopnewpage.	1994-05-02 ltoutput.dtx v1.0o General: Added
Full of floats action improved.	422	\col@number: Added \col@number	1994-05-03 ltbibl.dtx v1.0b \resethfps: Code shortened
\col@number: Added setting of \col@number	434	General: Code of \resethfps shortened.	483
1994-05-01 lterror.dtx v1.0k \@latexerr: (CAR) Added draft \@latexinfo.	64	1994-05-03 lterror.dtx v1.0k \nocite: Make \nocite issue a warning for an undefined citation key.	422
1994-05-01 ltoutenc.dtx 1.4a General: Added the \a command.	111	1994-05-03 ltfinal.dtx v0.1f General: Set the catcode of control-J to be ‘other’, for use in messages.	553
Added the \SaveAtCatcode and \RestoreAtCatcode commands.	115	1994-05-03 ltfloat.dtx v1.0f General: (CAR) Added \largefloatcheck	394
Removed the uc/lc table settings, since the T1 uc/lc table is now the default.	123	Removed unnecessary braces from arguments of \ifnextchar	394
Rewrote for the new syntax.	115, 118	\end@dblfloat: \largefloatcheck added	402
1994-05-01 ltoutenc.dtx v1.4a General: Removed Rokicki’s encoding.	100	\end@float: (CAR) Added \largefloatcheck	401
Renamed the commands, removed the \EncodingSpecific command. Turned all slots into decimal. Added \a.	100	1994-05-03 ltfsdcl.dtx v2.1f General: Renamed \@DeclarMathDelimiter to \DeclarMathDelimiter	209
1994-05-02 ltcntrl.dtx v1.0l \@break@tfor: Macro added (from ltfiles.dtx)	58	1994-05-03 llists.dtx v1.0d \@item: \hskip changed to \kern	316
1994-05-02 ltdefs.dtx v1.1f \renewcommand: Removed surplus \space in error	40	General: Removed superfluous braces	315
\renewenvironment: Removed surplus \space in error	41	1994-05-03 ltmiscen.dtx v1.0h \centercr: \badcrerr replaced by \nolnerr	285
1994-05-02 ltfiles.dtx v1.0f \iffileonpath: \@break@loop renamed to \@break@tfor	96	1994-05-03 ltab.dtx v1.0d \endpbox: Use \finalstrut based on depth of \arstrutbox	354
\obsoletefile: Make \onlypreamble	98	1994-05-04 ltclass.dtx v1.0b \NeedsTeXFormat: Changed wording of the warning	507
1994-05-02 ltfinal.dtx v0.1e General: Added setting the ‘letter’ catcodes.	563	1994-05-04 lterror.dtx v1.0m \badcrerr: Error message removed	66
Added setting the ‘other’ catcodes.	563	1994-05-05 ltbibl.dtx v1.0c \citex: Set switch for warning and end of run.	416
Added setting the special catcodes.	562		
Made slot 127 illegal	563		

\nocite: Do not write page number in \nocite warning message.	417	\@iiminipage: Use new \color@setgroup concept.	329
Set switch for warning and end of run.	417	\@mpfootnotetext: Use new \color@setgroup concept.	330
1994-05-05 ltfinal.dtx v0.1g		Use new \normalcolor and \@finalstrut.	330
General: Added empty errhelp.	553	General: Superfluous braces removed from several commands	321
\errhelp: Set error help empty.	566	\color@setgroup: macro added for colour support	323
1994-05-05 lftntcmd.dtx v3.3c		\endminipage: Use new \color@setgroup concept.	329
\@math@egroup: Corrected \@fontswitch and added saved versions	271	1994-05-11 ltclass.dtx v1.0c	
General: Corrected \@fontswitch	264	\endfilecontents: Add checks for form feed and tab	512
1994-05-05 ltmiscen.dtx v1.0i		1994-05-11 ldirchk.dtx v1.0e	
General: Removed braces from ifnextchar and ifstar arguments	277	General: Add \ProvidesFile as used in fd files.	4
1994-05-07 lttab.dtx v1.0c		1994-05-11 lterror.dtx v1.0o	
\@maxtab: Changed \@firsttab to \chardef	337	\@latexerr: (ASAJ) Removed one of the extra blank lines to \@latexerr.	64
Changed \@maxtab to \chardef	337	1994-05-11 ltlogos.dtx v1.0o	
General: Removed definition of \+	333	\LaTeX: Use \DeclareProtectedCommand. ASAJ.	86
Removed surplus braces from \@ifnextchar constructs	333	\LaTeXe: Use \DeclareProtectedCommand. ASAJ.	86
1994-05-08 lftntcmd.dtx v3.3d		1994-05-11 ltoutenc.dtx 1.5a	
General: Removed \@undefinedfonterror	264	General: Made T1 and OT1 generate packages rather than def files. Renamed the ‘package’ module to ‘teststy’.	103
\ normalsize: Removed \@undefinedfonterror	271	1994-05-11 ltoutenc.dtx v1.5a	
1994-05-09 lftntcmd.dtx v3.3f		General: Reimplemented \DeclareTextCommand using \@changed@cmd and \DeclareProtectedCommand.	104
General: Replaced all \next by \@let@token and undo change 3.3e, whatever that was.	264	Renamed the commands again. Made the encoding part of the command syntax. Added the \DeclareTextCommand interface. Used \DeclareProtectedCommand.	100
1994-05-10 ltdefns.dtx v1.0n		\DeclareTextAccent: Reimplemented using \DeclareTextCommand.	106
General: (ASAJ) Added \DeclareProtectedCommand.	35	1994-05-11 ltspace.dtx v1.0o	
Added \DeclareProtectedCommand	43	\,: Use \DeclareRobustCommand. ASAJ.	83
Removed braces around \@ifundefined argument. ASAJ.	40	\hspace: Use \DeclareRobustCommand.	
\makeatother: Added \makeatletter and \makeatother ASAJ.	50		
1994-05-10 lterror.dtx v1.0n			
\@latexerr: (ASAJ) Added extra blank lines to \@latexerr.	64		
1994-05-10 ltmiscen.dtx v1.0j			
\@sverb: Slight change in error message text.	289		
1994-05-11 ltboxes.dtx v1.0f			
\@begin@tempboxa: Use new \color@setgroup concept.	322		

ASA.J.	84	1994-05-12 ltfsrc.dtx v2.3f
1994-05-12 ltboxes.dtx v1.0g		\selectfont: Use

undefined command	209	message to
Allow \relax'ed cmds to be		\DeclareProtectedCommand. . . 35
declared	209	Added logging message to
1994-05-12 ltfssini.dtx v2.1i		\DeclareProtectedCommand. . . 43
General: Moved \fontencoding to		1994-05-13 ltdefns.dtx v1.0s
fam.dtx	235	General: (ASA.J) Added
Moved \fontfamily to fam.dtx	235	\@backslashchar. 35
Moved \fontseries to fam.dtx	235	(ASA.J) Coded \@ifdefinable
Moved \fontshape to fam.dtx	235	more efficiently. 35
Moved \fontsize to fam.dtx .	235	Coded more efficiently, thanks
Moved \mathversion to		to FMI. 40
fam.dtx	235	1994-05-13 ltfiles.dtx LaTeXe
Moved \selectfont to		\listfiles: Stop \listfiles
tracefnt.dtx	235	being run twice 99

1994-05-13 ltfiles.dtx v1.0g		1994-05-14 ltfsbas.dtx v2.1m	
\document: Added execution of \every@size 90		\enc@update: Macro added 168	
1994-05-13 ltfinal.dtx v0.1h		1994-05-14 ltfsbas.dtx v2.1n	
General: Added package otlenc, and defined \@acci, \@acci and \@acci. 553		General: Set defaults for all \f@... 169	
1994-05-13 ltfinal.dtx v1.0h		\DeclareErrorFont: Don't set \f@encoding 173	
General: Added output enc stuff . 565		\DeclareFontEncoding: Log if encoding is redeclared 164	
1994-05-13 ltfloat.dtx v1.0g		Only init enc change cmd when new encoding 164	
\@footnotetext: (DPC) Add new style colour support: \normalcolor 411		1994-05-14 ltfsini.dtx v2.1k	
(DPC) Use \@finalstrut 411		General: Init error font just before checking for fontdef.cfg 239	
\@xfloat: (DPC) Use \normalcolor 399		\p@reset@font: Remove surplus braces 238	
1994-05-13 lftntcmd.dtx v3.3g		1994-05-14 ltfsstrc.dtx v2.3h	
General: Replaced \@protecteddef by \DeclareRobustCommand . 264		\selectfont: Added \enc@update 188	
1994-05-13 ltfsbas.dtx v2.1k		1994-05-14 ltoutenc.dtx 1.5d	
General: Remove File identification 'typeout' 161		General: Moved the driver to the top. 103	
1994-05-13 ltfsbas.dtx v2.1l		1994-05-14 ltoutenc.dtx v1.5c	
\DeclareFontEncoding: Init encoding change command . 164		General: Added the fontenc package 140	
\define@newfont: Use \@input@ for fd files 172		Added the fontenc package. . 100	
1994-05-13 ltfsdcl.dtx v2.1h		Fixed a bug which caused an infinite loop if \f@encoding was incorrectly set. 100, 104	
General: Removed file identification typeout 209		Moved fontsmp to its own dtx file. 100	
1994-05-13 ltfsini.dtx v2.1j		1994-05-14 ltoutenc.dtx v1.5d	
General: Removed file identification typeout 235		General: Rewrote \DeclareTextCommand to define its argument to use the current encoding by default, rather than the encoding provided to \DeclareTextCommand. . 100, 104	
1994-05-13 ltfsstrc.dtx v2.3g		Tidied up the documentation.. 100	
General: Removed typeouts as \ProvidesPackage writes to log. 183		1994-05-14 ltoutenc.dtx v1.5e	
1994-05-13 ltoutenc.dtx v1.5b		General: Replaced \ENC@cmd by \ENC-cmd. 100	
General: Added \{, \} and \\$. . 100		1994-05-15 ltfsbas.dtx v2.1o	
Renamed \DeclareProtectedCommand to \DeclareRobustCommand. . 100		General: encoding cmd changed to enc-cmd 161	
Replaces \space by ' ' in \csname. 100		1994-05-16 fontdef.dtx v2.1g	
1994-05-13 ltpictur.dtx v0.1d		General: Removed \DeclareFontEncoding for ot1 and t1 and input .def files instead 243	
General: Removed surplus braces from \@if.. constructions .. 355		1994-05-16 ltaalloc.dtx v1.1a	
1994-05-13 lttab.dtx v1.0d		General: (ASAJ) Split from ltinit.dtx. 53	
\@contfield: Colour support . 339			
\@startfield: Colour support .. 338			
\@stopfield: Colour support .. 338			
\@a: moved to ltoutenc 337			
1994-05-14 fontdef.dtx v2.1f			
General: Removed .def files. 243			

1994-05-16 ltcntrl.dtx v1.0a		1994-05-16 ltoutput.dtx v1.0q
General: (ASAJ) Split from ltinit.dtx.	55	\@writestop: Changed setting of accents (FMi): with the new encoding setup they can use \let. It could also use the new internal commands?
1994-05-16 ltdefns.dtx v1.1a		450
General: (ASAJ) Split from ltinit.dtx.	35	General: Changed setting of accents (FMi).
1994-05-16 lterror.dtx v1.1a		422
General: (ASAJ) Completely new error interface.	59	1994-05-16 ltpar.dtx v1.1a
(ASAJ) Split from ltinit.dtx. .	59	General: (ASAJ) Split from ltinit.dtx.
1994-05-16 ltfinal.dtx v1.0i		68
General: moved output enc stuff to lfonts	565	1994-05-16 lplain.dtx v1.0h
1994-05-16 ltfssbas.dtx v2.1p		General: Comment out encoding specific commands
\fontsize: Pass \baselinestretch not \f@linespread	169	28
\linespread: Remove surplus braces	169	Remove \acci and friends again
1994-05-16 ltfssini.dtx v2.1m		28
\@acciii: Define saved versions of accents	240	Remove unnecessary def for \item
1994-05-16 ltlogos.dtx v1.1a		27
General: (ASAJ) Split from ltinit.dtx.	86	\loop: Use Kabelschacht method
1994-05-16 ltmath.dtx v1.0k		26
\ensuremath: Use \DeclareRobustCommand and add extra braces in math mode	301	\m@th: Remove unnecessary space
1994-05-16 ltoutenc.dtx 1.5h		27
General: \pounds was still using u rather than ui shape.	115	1994-05-16 lspace.dtx v1.1a
1994-05-16 ltoutenc.dtx v1.5f		General: (ASAJ) Split from ltinit.dtx.
General: enc files now have uc encoding name parts (FMi) .	100	70
Revert code so that the encoding given is used in \DeclareTextCommand (FMi)	100	1994-05-17 ltclass.dtx v1.0e
1994-05-16 ltoutenc.dtx v1.5g		\useoption: Execute option after removing from list, not before
General: Made fontenc.sty use the new mixed-case encoding files.	100	505
Removed the lowercasing of the filename.	140	1994-05-17 ltdefns.dtx 1.1b
1994-05-16 ltoutenc.dtx v1.5h		General: (ASAJ) Added the \protect@... commands. . .
General: Added \NG, \ng, \TH, \th, \DH, \dh, \DJ and \dj. . . .	100	44
Added \r (ring accent) and \k (ogonek) accents.	100	1994-05-17 ltdefns.dtx v1.1b
Fixed a bug with \pounds. . . .	100	General: (ASAJ) Added definitions for protect.
Removed \P from the OT1 definitions file.	100	35
1994-05-16 ltoutenc.dtx v1.5i		(ASAJ) Removed warnings and logging to lterror.dtx.
General: Fixed a bug with \d. . .	100	35
		Added the discussion of protected commands, defined the values that \protect should have.
		43
		1994-05-17 ltdefns.dtx v1.1c
		General: (ASAJ) Redid definitions for protect.
		35
		1994-05-17 lterror.dtx v1.1b
		General: (ASAJ) Moved error stuff from ltdefns.dtx.
		59
		1994-05-17 ltfssini.dtx v2.1n
		\copyright: Really add extra braces
		238
		\nfss@text: Added braces to allow use in subscripts
		238
		1994-05-17 ltmath.dtx v1.0i
		General: Replaced \let by \gdef, for indirect definition.
		297

1994-05-17 ltoutenc.dtx v1.5j		1994-05-19 lplain.dtx v0.1k ltfinal
General: Added braces to \pounds so it works as a subscript. . . .	100	\showoutput: used \maxdimen not 99999
1994-05-18 ltdefns.dtx 1.1c		29
General: (ASAJ) Renamed the commands, and removed one which is no longer needed. . . .	44	\showoverfull: used \one not 1
1994-05-18 ltdefns.dtx v1.1c		29
General: Redid the discussion and definitions, in line with the proposed new setting of \protect in the output routine.	43	1994-05-19 ltxref.dtx v1.1a
1994-05-18 ltfinal.dtx v0.1j		General: Extract file ltxref from ltcntlen.
General: Corrected the lccode for d-bar.	553	273
1994-05-18 ltlogos.dtx v1.1b		1994-05-20 ltdefns.dtx v1.1e
General: (ASAJ) Added the T _E X logo.	86	General: Changed command name from \checkcommand to \CheckCommand.
(ASAJ) Made the L _T E _X 2 _ε logo use the text font ‘2’ rather than the math font ‘2’.	86	35
1994-05-18 ltoutenc.dtx v1.5k		\CheckCommand: Changed name from \checkcommand to \CheckCommand.
General: Made dotted-i produce 'i'.	100	42
Removed braces from \pounds and \dollar.	100	1994-05-20 lterror.dtx v1.1c
Replaced \defaultencoding with \encodingdefault.	100	General: (ASAJ) Added \@latex@info@no@line.
1994-05-19 ltbibl.dtx v1.1a		59
General: Initial version of ltbibl.dtx, split from ltidxbib.dtx	415	(ASAJ) Added missing full stops.
1994-05-19 ltcnts.dtx v1.1a		59
General: Extracted file from ltcntlen.	153	(ASAJ) Fixed a bug with \@inmatherr.
1994-05-19 ltdefns.dtx v1.1d		59
General: (RmS) Added definitions for \namedef and \nameuse again.	35	1994-05-20 ltfloat.dtx v1.0h
1994-05-19 ltfinal.dtx v0.1k		\@endfloatbox: Restore outer value of @nobreak switch.
General: Removed \makeat... . . .	553	403
1994-05-19 ltidxglo.dtx v1.1a		\outer@nobreak: Macro added: default is to do nothing.
General: Initial version of ltidxglo.dtx, split from ltidxbib.dtx	413	403
1994-05-19 ltlength.dtx v1.1a		1994-05-20 ltntcmd.dtx v3.3h
General: Extract file ltlength from ltcntlen.	160	General: Use new error commands
1994-05-19 ltpageno.dtx v1.1a		264
General: Extract file ltpageno from ltcntlen.	272	1994-05-20 ltfsbas.dtx v2.1q
		General: Use new error commands
		161
		1994-05-20 ltfsstrc.dtx v2.3i
		General: Use new error command names
		183
		1994-05-20 ltmiscen.dtx v1.0l
		\@writefile: Added correct setting of \protect.
		281
		1994-05-20 ltmiscen.dtx v1.0m
		General: Use new warning commands
		277
		1994-05-20 ltoutput.dtx v1.0s
		\@writesetup: Added setting of \protect during \shipout.
		449
		General: Added setting of \protect during \shipout.
		422
		1994-05-20 ltpage.dtx v1.0d
		\markright: Changed setting for \protect.
		420
		1994-05-20 ltsect.dtx v1.0c
		General: Correct setting of \protect.
		391

\addcontentsline: Correct setting of \protect.	390	(DPC) New version using long command name.	59
1994-05-21 ltbibl.dtx v1.1b General: Use new warning commands	415	1994-05-22 ltfloat.dtx v1.0i General: Use new warning commands	394
1994-05-21 lterror.dtx v1.1d General: (ASAJ) Made the error commands robust.	59	1994-05-22 ltoutput.dtx v1.0t General: Changed warnings and infos to new commands.	422
1994-05-21 ltfiles.dtx v1.0h General: Use new error commands	87	1994-05-22 ltpictur.dtx v0.1e General: Use new warning cmd ..	355
1994-05-21 ltlists.dtx v1.0f General: Use new error commands	305	1994-05-23 ltclass.dtx v1.0h \NeedsTeXFormat: Don't stop completely when format is wrong	507
1994-05-21 ltmiscen.dtx v1.0n General: Use new error commands	277	\usepackage: Remove argument if possible	506
1994-05-21 ltsect.dtx v1.0d General: Use new error commands	382	1994-05-23 ltdirchk.dtx v1.0f General: Document \TeXversion 1	1
1994-05-21 ltab.dtx v1.0f General: Use new error commands	333	1994-05-23 lfsstrc.dtx v2.3j General: Removed def of \f@warn@break	200
1994-05-21 ltxref.dtx v1.1b General: Use new warning commands	273	1994-05-23 ltoutput.dtx v1.0u \@activechar@info: Added \MessageBreak	448
1994-05-22 ltclass.dtx v1.0f General: Use new warning and error commands	494	\@writesetup: Changed resetting of \protect after shipout to use \aftergroup	449
1994-05-22 ltdefns.dtx v1.1f General: Use new warning and error cmd ..	35	General: Added \MessageBreak. . Changed resetting of \protect after shipout.	422
1994-05-22 lterror.dtx v1.1e General: (ASAJ) Replaced bgroup by begingroup in error messages, to stop extra mathords creeping into math mode.	59	1994-05-24 lterror.dtx v1.2e \@latex@info@no@line: Macro added	62
1994-05-22 lterror.dtx v1.2a General: (ASAJ) Made \GenericError, \GenericWarning and \GenericInfo robust.	59	1994-05-24 lterror.dtx v1.2f General: (DPC) wrap long lines ..	59
(ASAJ) Replaced \@generic@message and \@generic@error by \GenericError, \GenericWarning and \GenericInfo.	59	1994-05-24 ltfnitcmd.dtx v3.3i General: Tidying and typos fixed	264
(ASAJ) Replaced \\ and tilde by \MessageBreak and \space.	59	1994-05-24 ltmiscen.dtx v1.0q \currenvline: Use \empty as outer default	284
(ASAJ) Replaces \string by \protect in some messages. .	59	1994-05-25 ltdirchk.dtx v1.0g \filename@parse: Mac parser had " typo for :	12
1994-05-22 lterror.dtx v1.2d \GenericError: (DPC) Alternative version added for old TeXs ..	59	1994-05-25 ltfnitcmd.dtx v3.3j General: Insertion of \aftergroups to implement \nocorr moved to the end of the group	264
		\check@icr: Macros added	267
		\check@nocorr@: Insertion of \aftergroups moved and defaults set up for efficiency ..	267
		\DeclareTextFontCommand: \expandafter inserted ..	266

Insertion of \aftergroups moved	266	1994-06-09 ltfinal.dtx v1.0n General: For TeX2, do not set codes for higher half of character table.	557, 563
1994-05-25 ltoutput.dtx v1.0v General: Extra documentation. . .	422	1994-06-09 ltntcmd.dtx v3.3k General: Tidying and typos fixed in documentation	264
1994-05-25 ltsect.dtx v1.0e \@dottedtocline: Put braces around argument 4 (the actual toc entry) to avoid font (and possibly other) changes leaking out to the leaders.	392	1994-06-18 ltntcmd.dtx v3.3l General: Added check for empty text	264
1994-05-25 ltthm.dtx v1.0c General: Modify documentation .	378	\check@nocorr@: Added check for empty text	267
1994-05-25 ltvers.dtx v1.0d General: Remove PRELIMINARY TEST RELEASE from startup banner (spring is here) . . .	32	1994-06-22 ltntcmd.dtx v3.3m General: Removed space from \nfss@text	264
1994-05-25 ltxref.dtx v1.1c General: Modify documentation .	273	Renamed \check@nocorr	264
1994-05-26 ltfiles.dtx LaTeX2e \@missingfileerror: Modify message format	98	\check@nocorr@: Renamed \check@nocorr to \text@command to improve \long error message	267
1994-05-26 ltlogos.dtx v1.1c General: Remove \SLiTeX logo .	86	\DeclareTextFontCommand: Removed space from \nfss@text	266
1994-05-26 ltmiscen.dtx v1.0r General: \literal removed . . .	291	1994-06-22 ltmath.dtx v1.2t classes \mathindent: Set \mathindent at the end of the class instead of at begin document	302
1994-05-26 ltplain.dtx v1.1m \iterate: (CAR) added \long . \underbar: (CAR/FMi) changed to use box \tw@	26 27	1994-07-20 ltlogos.dtx v1.1e \LaTeX: Save a few tokens	86
1994-05-26 ltplain.dtx v1.1p \underbar: (DPC) changed to use \sbox	27	\LaTeXe: Save a few tokens	86
1994-05-29 ltfsdcl.dtx v2.1j General: Use new error commands	209	1994-07-20 ltpage.dtx v1.0h \sloppy: Save a few tokens	421
1994-05-31 ltfinal.dtx v1.0n General: Renamed lthyphen.* to lthyphen.*	553	1994-09-16 ltfsbas.dtx v2.1s \nfss@catcodes: Reset [and] as well, just in case	173
1994-06-01 ltboxes.dtx v1.0i \@frameb@x: Macro added. . . .	326	1994-10-07 ltoutenc.dtx v1.5l General: Moved the ogonek accent.	100
\@iframebox: New version, so \width is correct in \framebox	326	1994-10-11 ldirchk.dtx v1.0h \@TeXversion: Check for TeX3.14	13
\fbox: New version, using \@frameb@x	325	General: Modify all of ltxcheck again	13
\framebox: New version, so \width is correct in \framebox	325	1994-10-12 ltsect.dtx v1.0f General: Doc. typos	382
1994-06-01 ltlogos.dtx v1.1d \TeX: Add \m@th to force math size calculations	86	1994-10-14 fontdef.dtx v2.2a General: New coding	241
1994-06-01 ltoutput.dtx v1.0w General: Tidied up typesetting. .	422	1994-10-14 ltssini.dtx v2.2a General: New coding for cfg files .	235
1994-06-08 ltfinal.dtx v1.0m General: Add patch file system .	565	1994-10-14 ltmiscen.dtx v1.0s General: Move math to other file	277
		1994-10-14 ltplain.dtx v1.1a General: Moved code to other files.	14

2015-02-21 ltvers.dtx v1.0r		
General: Removed autoload code	32	
2015-02-21 ltvers.dtx v1.0w		
\IncludeInRelease: set \@currname empty here (in case \IncludeInRelease input early)	33	
2015-02-22 ltfsscmp.dtx v3.0e		
General: Moved all code into latexrelease - obsolete commands are no longer automatically part of the kernel	205	
2015-03-02 ltplain.dtx v2.0f		
\e@mathgroup@top: macro added	18	
\newlanguage: allow 255 math groups in Unicode engines	17	

2015-08-06 lplain.dtx v2.0i	\extrafloats: Add \string in case argument is not an unexpandable primitive	20	2015-10-02 l luatex.dtx v1.0b	General: Fix backing out of TeX code	538
2015-08-23 ltdirchk.dtx v1.2	General: Do not use luatex prefix	3	2015-10-02 l luatex.dtx v1.0c	General: Allow backing out of Lua code	538
2015-08-23 ltvers.dtx v1.0v	General: Allow negative patchlevel for pre-release	33	2015-10-02 l luatex.dtx v1.0e	uninstall: Function added	552
2015-08-30 lplain.dtx v2.1a	\newinsert: new \newinsert implementation	21	2015-10-03 l luatex.dtx v1.0f	provides_module: use luatexbase_log	539
2015-09-205 loutput.dtx v1.3a	General: extended \@freelist	433	2015-10-27 lplain.dtx v2.1b	\extrafloats: Use global assignment when switching to extended range	19
2015-09-24 l luatex.dtx v1.0a	call_callback: Function added	549	2015-11-07 lspace.dtx v1.3f	\@esphack: Only space if there is no space at the end of the hlist latex/4443	77
	callback_register: Function modified	546	2015-11-14 l luatex.dtx v1.0g	General: Track LuaTeX changes for (new)token.create	541
	callback_descriptions: Function added	551	2015-11-18 lplain.dtx v2.2a	\newlanguage: Extended stream allocation in luatex (0.85)	17
	\catcodetable@atletter: Macro added	535	2015-11-19 lplain.dtx v2.2b	\newlanguage: Only extend allocation of write streams (see luatex list)	17
	\catcodetable@initex: Macro added	535	2015-11-27 l luatex.dtx v1.0h	callback_descriptions: Match test in in-callback latex/4445	551
	\catcodetable@latex: Macro added	535		in_callback: Guard against undefined list latex/4445	551
	\catcodetable@string: Macro added	535	2015-11-29 l luatex.dtx v1.0i	General: Declare this as local before used in the module error definitions (PHG)	539
	add_to_callback: Function added	549		call_callback: Check name is not nil in error message (PHG)	549
	remove_from_callback: Function added	550		create_callback: Check name is not nil in error message (PHG)	548
	new_attribute: Function added	542	2015-12-02 l luatex.dtx v1.0j	General: Adjust hashtokens to store the result of tex.hashtokens(), not the function (PHG)	541
	disable_callback: Function added	551		Assorted typos fixed (PHG)	532
	in_callback: Function added	551		Declaration/use of first_head fixed (PHG)	540
	\newattribute: Macro added	534		Remove nonlocal iteration variables (PHG)	532
	\newcatcodetable: Macro added	534			
	\newluabytocode: Macro added	537			
	\newluachunkname: Macro added	537			
	\newluafunction: Macro added	536			
	\newwhatsit: Macro added	537			
	module_error: Function added	540			
	module_info: Function added	540			
	module_warning: Function added	540			
	modules: Function modified	539			
	create_callback: Function added	548			
	provides_module: Function added	539			
2015-10-02 ltdirchk.dtx v1.2a	luatexbase: Table added	539			
	General: Allow backing out of unprefix names	3			

	Remove unreachable code after calls to error() (PHG)	532	2016-02-18 ltfssdcl.dtx v3.0r \@DeclarMathDelimiter: Check for delimiter not \delimiter 227
2015-12-02	ltluatex.dtx v1.0k General: resolve name and i.description (PHG)	547	\@DeclarMathAccent: Check for mathaccent not \mathaccemt 223
	call_callback: Give more specific error messages (PHG)	549	\@DeclarMathRadical: Check for radical not \radical 231
	add_to_callback: Give more specific error messages (PHG) 549		\@DeclarMathSymbol: Check for mathchar not \mathchar 225
	remove_from_callback: adjust initialisation of cb local (PHG)	550	2016-03-13 ltluatex.dtx v1.0n General: contribute_filter added . 545
	Give more specific error messages (PHG)	550	insert_local_par added 545
	create_callback: Give more specific error messages (PHG) 548		2016-03-29 ltpictur.dtx v1.1l \oval: add setting of line tests . 372
2015-12-10	ltfinal.dtx v2.0i General: Use new common Unicode data loaders	555	initialise tests 371
2015-12-18	ltluatex.dtx v1.0l General: Load Unicode data from source	535	\ovhorz: use glue not leaders if horizontal line not required . 372
2016-01-04	ltfinal.dtx v2.0j General: Do not set up inter character classes for XeTeX	555	\ovvert: use glue not leaders if vertical line not required 372
	\e@alloc@intercharclass@top: Start allocation at one not three	553	\if@ovhline: macro added (latex/4452) 371
2016-01-05	ltfinal.dtx v2.0k \e@alloc@intercharclass@top: Remove duplicated code	553	\if@ovvline: macro added (latex/4452) 371
2016-01-05	ltfinal.dtx v2.0l General: Correct latexrelease guards	555	2016-04-22 ltfinal.dtx v2.0q \e@alloc@intercharclass@top: XeTeX 0.99996 has 4096 char classes not 256 553
	Ensure old definitions for inter-character class toks are available using latexrelease	555	2016-06-19 htoutenc.dtx v1.99m General: OT1 definition (was duplicate T1 definition) 117
	Missing brace	555	2016-06-20 ltclass.dtx v1.1j \ifclasslater: don't declare as @onlypreamble 500
2016-01-05	ltfinal.dtx v2.0m General: Undefine XeTeX classes when using patching an older kernel	555	2016-07-29 ltplain.dtx v2.2c \extrafloats: use \global \chardef 20
2016-01-05	ltfinal.dtx v2.0p General: Only apply XeTeX change if XeTeX is in use	555	\newinsert: fix for tlb-newinsert-001 21
2016-02-11	ltluatex.dtx v1.0m General: pdf_stream_filter_callback removed	546	2016-10-02 ltclass.dtx v1.2a \ifclasswith: Ignore spaces while checking for option clash 501
	process_rule, [hv]pack_quality append_to_vlist_filter added	545	\ExecuteOptions: Ignore spaces in argument 505
	read_cidmap_file added	545	2016-10-15 ltdirchk.dtx v1.2b General: Require eT _{EX} 4
	show_warning_message added	546	2016-10-15 lterror.dtx v1.2p General: Require eT _{EX} 59
	token_filter removed	545	2016-10-15 ltfinal.dtx v2.0r General: Require eT _{EX} 553
			2016-10-15 ltfinal.dtx v2.0s General: Tidy up status of char 127 553
			2016-10-15 ltfssini.dtx v3.1b General: Require eT _{EX} 235

2016-10-15 ltplain.dtx v2.2d	new_chunkname: Parameterise count used in tracking	543
General: Require eTeX	14	
2016-10-16 ltplain.dtx v2.3a	new_whatsit: Parameterise count used in tracking	542
\newlanguage: Allow languages up to 16383 in luatex	17	
2016-10-19 ltcounds.dtx v1.1j	\TextOrMath: Test directly for \protected	158
2016-11-06 ltplain.dtx v2.3b	General: Drop \outer entirely	14
2016-11-09 ltclass.dtx v2.1b	\@fileswithoptions: Improve \ifx tests PR/4497	508
2016-11-17 lltuatem.dtx v1.0p	General: call_edit added	546
2016-12-03 fontdef.dtx v3.0a	General: (DPC) Default to TU encoding for Unicode TeX engines	243
	\shapedefault: (DPC) Default to TU encoding for Unicode TeX engines	246
2016-12-04 ltoutenc.dtx v2.0a	General: Added TU encoding	130
2017-01-01 ltoutput.dtx v1.3b	General: make fpmin negative so ignored even if float height is negative	488
2017-01-10 ltfssbas.dtx v3.2a	\showhyphens: Add version of \showhyphens that works with XeTeX.	179
2017-01-23 ltoutenc.dtx v2.0b	General: Added TU specific commands in ASCII range pr/4500	130
2017-01-24 ltoutenc.dtx v2.0c	General: Declare TU composites for i and j	130
	Make \textasteriskcentered U+2217 not U+204E	130
	TeX ligature syntax for xetex and luatex reversed	130
2017-01-24 ltoutenc.dtx v2.0d	General: Declare macron composites for YyGg	130
2017-02-12 ltoutenc.dtx v2.0e	General: Declare fallback code for \textasteriskcentered	130
2017-02-18 lltuatem.dtx v1.1c	\new_attribute: Parameterise count used in tracking	542
	\new_bytocode: Parameterise count used in tracking	543
	\new_chunkname: Parameterise count used in tracking	543
	General: add \empty to guard against 3rd argument being empty	117
	declare composites with empty base for hat and tilde, use same slots for \textasciicircum and \textasciitilde	130
	declare straight quotes using new \remove@tlig command	130
	General: Fix typo introduced at 2.0f	130
	General: introduce \DeclareUnicodeAccent	130
	\DeclareTextCompositeCommand: add check whether the accent command is defined for this encoding	107
	\@ifclasslater: add \@parse@version@dash to support yyyy-mm-dd as well as yyyy/mm/dd	500
	\l@nohyphenation: ensure \l@nohyphenation is defined.	558
	\@verbatim: Use \language not \hyphenchar	287
	\verb: Use \language to stop hyphenation	290
	\l@nohyphenation: ensure \l@nohyphenation is defined.	558
	\@writeshow: Reset \language	449
	\l@nohyphenation: ensure \l@nohyphenation is defined.	558
	\l@nohyphenation: ensure \l@nohyphenation is defined.	558
	\@dischyp: Define \dischyp after \-	50
	\@arrayparboxrestore: Reset \lineskip	328

2017-04-05 ltoutenc.dtx v2.0i \DeclareTextCompositeCommand: Declare accent command if not already declared when declaring a composite.	107	2018-04-08 ltclass.dtx v1.2h \@onefilewithoptions: Pass expanded date 519
2017-04-10 ltpplain.dtx v2.3c \newlanguage: Correction to code to skip write18 in luatex	17	2018-04-08 ltfinal.dtx v2.1d General: Delay full UTF-8 handling to \everyjob 560
2017-04-11 ltoutput.dtx v2.4a \newpage: account for the depth of the last row of the page	436	2018-04-11 ltcounds.dtx v1.1l \counterwithin: Correct default (issue/38) 156
2017-12-17 ltoutput.dtx v1.4b \@addtonextcol: fix doc guards .	467	2018-05-02 lthuataex.dtx v1.1g General: find_sfd_file removed ... finish_syntex_callback added .. glyph_not_found added read_sfd_file removed
2018-01-06 ltdefns.dtx 1.5c \@ifundefined: Avoid defining undefined commands to \relax 48		2018-05-08 ltclass.dtx v1.2i \pkgcls@parse@date@arg: Make suspicious rollback a warning not error: github issue 43 ... 521
2018-02-18 ltclass.dtx v1.2d \@ifclasslater: Added 0 up front to make bad data come out as 0. 500		2018-05-11 ltfinal.dtx v2.18 General: Make invalid UTF-8 also safe, for legacy filesystem encodings 560
General: Introduce rollback concept 518		2018-05-29 ltclass.dtx v1.2j \endfilecontents: use \csname not \undefined 515
2018-03-08 ltcounds.dtx v1.1k \@ifbothcounters: Interface added 156		2018-08-11 ltoutenc.dtx v2.0j General: Provide \guillemetleft and \guillemetright . 119, 125, 133
\@removefromreset: Interface added 155		2018-08-18 lthuataex.dtx v1.1h General: append_to_vlist_filter is exclusive 545
