

biblatex-publist

Jürgen Spitzmüller*

Version 0.3, 23/10/2012

Abstract

The biblatex-publist package provides a *biblatex bibliography style file* (*.bbx) for publication lists, i.e. a bibliography containing one's own publications. The style file draws on biblatex's *authoryear* style, but provides some extra features needed for publication lists, such as the omission of the own name from author or editor data. The package requires at least version 2.0 of the biblatex package.¹

1 Aim of the package

The biblatex-publist package ships a *biblatex bibliography style file* (*.bbx) for a specific task: academic publication lists. Such lists, usually part of the academic CV, contain all or selected publications of a specific author, usually sorted by genre and year. Even though publication lists are actually nothing else than (specific) bibliographies, they diverge from those in some respects. Most notably, it is widespread practice to omit your own name in your publication list and only list your co-authors, if there are any. If you want to follow this practice, a normal bibliography style does not produce the desired result.

Given the fact that maintaining a publication list is a routine task in an academian's life, it is surprising how few specified solutions exist to generate such lists (particularly from Bib_T_E_X data). For traditional Bib_T_E_X, Nicolas Markey has written a specific Bib_T_E_X style file, *publist.bst*², which helps a lot if you want to produce a publication list with Bib_T_E_X. For biblatex, however, no equivalent solution exists yet. The biblatex-publist package is the result of the aim of emulating the features of *publist.bst* with biblatex's means. It draws on Nicolas Markey's conceptual ideas, and it is in an early stage of development, being tested only for the specific needs of the author. Of course, bug reports, comments and ideas are welcome.

2 Loading the package

2.1 Standard usage

The standard way of using the package is to load the style file via

```
\usepackage[bibstyle=publist,  
omitname=<surname>]{biblatex}
```

The *omitname* option should always be passed. It tells the style file, by surname, which person it should suppress in the author/editor list (usually you). That is to say: For all of your publications where you are the sole author or editor, the author/editor name will be omitted completely, as in:

2012. Some recent trends in gardening. In: *Gardening Practice* 56, pp. 34–86.

If there are co-authors/co-editors, your name will be filtered out and the collaborators added in parentheses, as in:

1987 (with John Doe and Mary Hall). Are there new trends in gardening? In: *Gardening Practice* 24, pp. 10–15.

2.2 Further options

Currently, there are the following further options (next to the options provided by the *biblatex* package itself³):

omitfirstname = <first name>

If you need to disambiguate your name, you can additionally specify your first name.

boldyear [=true|false] default: *true*.

By default, the year is printed in bold. To prevent this, pass the option *boldyear=false* to *biblatex*.

marginyear [=true|false] default: *false*.

With this option set to true, the publication year will be printed in the margin once a new year starts. The option also has the effect that all marginpars are printed “reversed”, i. e. on the left side in one-sided documents (via *\reversemarginpar*).

The appearance of the *marginyear* is controlled by the *\plmarginyear* macro, which has the following default definition:

```
\providecommand*\plmarginyear[1]{%  
  \raggedleft\small\textbf{#1}%  
}
```

If you want to change the appearance, just redefine this macro via *\renewcommand**.

³Please refer to the *biblatex* manual [1] for those.

3 Localization

Since the package draws on `biblatex`, it supports localization. Currently, the following languages are supported: English, French and German.⁴ The following additional localization keys (`\bibstrings`) are added by the package:

- *with*: the preposition “with” that precedes the list of co-authors.
- *parttranslationof*: the expression “partial translation of” for entries referring to partially translated work via `biblatex`’s “related entries” feature (see sec. 4.2).

4 Further Extensions

The following extensions of standard `biblatex` features are provided.

4.1 Review bibliography type

Although a *review* entry type is provided by `biblatex`, this type is treated as an alias for *article*. The `biblatex-publist` package uses this entry type for a specific purpose: Foreign reviews of your own work. It therefore defines a new bibliography environment *reviews* with a specific look (particularly as far as the author names are concerned) and its own numbering; furthermore, it redefines the *review* bibliography driver. The purpose of this is that you can add other people’s reviews of your work to your publication list, while these titles are clearly marked and do not interfere with the overall numbering (see sec. 5 for an example).

4.2 Partial translations

A new “related entry” type *parttranslationof* is provided. This is an addition to the *translationof* related entry type `biblatex` itself provides. Please refer to the `biblatex` manual [1] on what “related entries” are and how to use them.

5 An example

Publication lists are usually categorized by genre (monographs, articles, book chapters, etc.). For this task, we use `\refsections`. Other possibilities were not tested and might fail.

The suggested procedure is to maintain separate bib files for each category, say *mymonographs.bib*, *myarticles.bib*, *myproceedings.bib*.⁵ Then a typical file would look like in Listing 1.

⁴Please send suggestions for other languages to the package author.

⁵But see sec. 6 for an alternative.

Listing 1: Example document

```
\documentclass{article}
\usepackage[T1]{fontenc}
\usepackage[latin9]{inputenc}

\usepackage{csquotes}% not required, but recommended
\usepackage[bibstyle=publist,omitname=Doe]
    {biblatex}

\addbibresource{%
    mymonographs.bib,
    myarticles.bib,
    myproceedings.bib
}

\begin{document}

\title{John Doe's publications}
\date{\today}
\maketitle

\section{Monographs}
\begin{refsection}[mymonographs]
\nocite{*}
\printbibliography[heading=none]
\end{refsection}

\section{Proceedings}
\begin{refsection}[myproceedings]
\nocite{*}
\printbibliography[heading=none]
\end{refsection}

\section{Articles}
\begin{refsection}[myarticles]
\nocite{*}
\printbibliography[heading=none]
\end{refsection}

\end{document}
```

If you want to add other people’s reviews of your work, add a section such as:

```
\subsubsection*{Reviews of my thesis}
\begin{refsection}[mythesis-reviews]
\renewcommand\bibfont{\small}
\nocite{*}
\printbibliography[heading=none,env=reviews]
\end{refsection}
```

Note that the `\printbibliography` option `env=reviews` is crucial if you want to use the specifics `biblatex-publist` defines for reviews (see sec. 4.1).

6 Filtering

If you have a bibliographic database consisting not only of your own publications, you can extract yours with the bibliography filter *mine*, which has to be passed to `\printbibliography`, as in:

```
\begin{refsection}[mybibliography]
\nocite{*}
\printbibliography[heading=none,filter=mine]
\end{refsection}
```

Of course, you can also use other filter possibilities provided by `biblatex`, such as filtering by type or by keyword. So if you want to extract all of your articles from a larger database with entries of diverse type and authors, specify:

```
\printbibliography[heading=none,filter=mine,type=article]
```

7 Change Log

V. 0.3 (2012-10-23):

- Bug fix: Add missing “and” if omitted name was last minus one.
- Bug fix: Fix output with “et al.” if omitted name is first and *liststop* is 1.
- Set *maxnames* default to 4.
- Add filter possibility (see sec. 6).
- Add French localization.
- Some corrections to the manual.

V. 0.2 (2012-10-21): Initial release to CTAN.
