

# The **cellprops** package

## CSS-like cell and table properties\*

Julien “\_FrnchFrgg\_” RIVAUD†

Released 2018/06/12

## 1 **cellprops** documentation

This package reworks the internals of `tabular`, `array`, and similar constructs, and adds a `\cellprops` command accepting CSS-like selectors and properties.

It depends on `mdwtab`, `xcolor` and of course `expl3` and `xparse`.

### 1.1 Example

The code:

```
\[
  \cellprops{
    td { padding: 1ex; }
    td:nth-child(4) { color: red; }
    tr:nth-child(2) { color: red; }
    tr:nth-child(1) td:nth-child(4) { color: inherit; }
    td:nth-child(even) { background-color: black!5!white; }
    tr:nth-child(2n+1) { background-color: yellow!30!white; }
    tr:nth-child(odd) td:nth-child(even) {
      background-color: black!20!yellow!20!white;
    }
  }
  \begin{array}{Tlccc}
  \hline
  This is text & A_2 & A_3 & A_4 \\
  \hline
  B1 & This is maths & B_3 & \\
  C1 & C_2 & X & Y \\
  D1 & D_2 & DX & v \\
  E & F & \int_a^b f(t) dt & v \\
  \hline
  \end{array}\]
```

---

\*This file describes v1.2, last revised 2018/06/12.

†E-mail: [frnchfrgg@free.fr](mailto:frnchfrgg@free.fr)

produces:

This is text	$A_2$	$A_3$	$A_4$
B1	<i>This is maths</i>	$B_3$	
C1	$C_2$	$X$	$Y$
D1	$D_2$	$DX$	$v$
E	$F$	$\int_a^b f(t)dt$	$v$

## 1.2 Usage guide

```

<usage>:      '\cellprops{ [ <selectors> {<properties> }* }* }'
<selectors>:   <selector> [, <selectors> ]
<selector>:   [<environment> , ] <element1>
<element1>:   'table' | 'tr'[<pseudo-class>] [ , <element2>] | <element2>
<element2>:   'td'[<pseudo-class>]
<pseudo-class>: :nth-child(<nth>)
<nth>:         <number> | 'odd' | 'even' | <number>'n+'<number>
<properties>: [ <property> ';' ]*
<property>:   'padding: ' <dimension> [ , <dimension> ]* |
               'padding-top: ' <dimension> |
               'padding-left: ' <dimension> |
               'padding-bottom: ' <dimension> |
               'padding-right: ' <dimension> |
               'min-height: ' <dimension> |
               'min-depth: ' <dimension> |
               'min-width: ' <dimension> |
               'text-align: ' ( 'left' | 'right' | 'center' ) |
               'math-mode: ' ( 'text' | 'math' | 'auto' ) |
               'color: ' ( <xcolor-expression> | 'inherit' ) |
               'background-color: ' ( <xcolor-expression> | 'transparent' )

```

Most of these properties are straight-forward. Some explanations:  
Here are the supported column types:

- **n**: The most basic cell type, hbox, honoring all properties.
- **l**, **c**, and **r**: Same as **n** but with forced `text-align`.
- **M**<coltype>: Same as <coltype> but enforces `math-mode: math`. The net effect is that **Mc** will create a centered column whose contents are in non-display math mode.
- **T**<coltype>: Same as <coltype> but enforces `math-mode: text`.

- `p{<width>}, m<width>` and `b<width>`: parbox cell with the corresponding vertical alignment (`\vtop`, `\vcenter` or `\vbox`).
- `*{<count>}{{<coltypes>}}`: same as in `array` or `mdwtab`.
- `>{<prefix>}` and `<{<suffix>}`: same as in `array` or `mdwtab`.
- You can try to use constructs of `array` or `mdwtab`, but they might alter the function of `cellprops`. Most should be fine though.

The intended usage is to use `n`-type columns and set the properties with CSS, but `LATEX`-like columns in the preamble are often less verbose.

Details for some properties:

- `math-mode`: `auto` means that the cell will be in math mode in environments `array`, `matrix`, ..., and in text mode in environments like `tabular`, ...
- `background-color` is only painted on the cell, and `transparent` actually means `inherit` except that if all values encountered are `inherit/transparent` no background is painted at all. That means that (currently) you cannot paint a row in some color and rely on transparency to have it bleed through a cell background.
- There are no columns in the CSS object model so you have to use `td:nth-child()` to select a column. Currently, cells spanning several columns actually increase the child count by the number of column they span, so that `nth-child` can still be used to select columns. This is not consistent with the CSS specification.
- Any `:nth-child(An+B)` or `:nth-child(An)` or `:nth-child(B)` is supported, with arbitrary  $A$  and  $B$ . The performance will slowly degrade the more different  $A$  are active (but if in a `TEX` group, they will become inactive again when leaving the group). A *big difference* with the CSS specification is that currently  $n$  is not enforced non-negative. In particular `:nth-child(2n+8)` *will* match for the second element. This also prevents tricks like `:nth-child(-n+3)`. I am investigating how to handle those without slowing down the general case.

### 1.3 Compatibility

This package has been tested compatible with `diagbox`, `spreadtab`, `colcell`. Compatibility with `longtable` has been specifically taken care of, provided `cellprops` is loaded afterwards.

### 1.4 TODO

Add `border` properties. Test with different table-oriented packages, and add a test suite with compatibility tests. Improve the documentation, and test more `LATEX` table constructs and preamble column types. Enforce  $n \geq 0$  in `:nth-child` selectors to match the CSS specification.

## 2 cellprops implementation

```
1  {*package}
2  <@=cellprops>
3  \ProvidesExplPackage
4  {\ExplFileName}{\ExplFileDate}{\ExplFileVersion}{\ExplFileDescription}
5
6  \RequirePackage{xparse}
7  \RequirePackage{xcolor}
```

### 2.1 Loading and fixing mdwtab

There is a bug in the command `\colpop` of `mdwtab`: instead of just popping one name in the stack of column sets currently used, it empties it completely because one `\expandafter` is missing. This is proof that not many package authors really use this API as recommended by Mark WOODING... We thus load `mdwtab` and fix `\colpop`.

```
8  \RequirePackage{mdwtab}
9  \cs_set_nopar:Npn \tab@pop #1 { \tl_set:Nx #1 { \tl_tail:N #1 } }
10
11
```

### 2.2 Parsing CSS properties

Properties are parsed once at setting time, by expandable parsers that leave definitions in the input stream. All these resulting definitions are saved in a token list that will be expanded when we need the values. The goal is to have multiple token lists for multiple contexts, yet not to do the full parsing dance once per cell.

```
\l_cellprops_property_value_<name>_tl
    \cellprops_generic_setter:nnn
\__cellprops_get_property:n
\__cellprops_get_property:nN
12 \cs_set:Nn \__cellprops_generic_setter:nnn {
13     \exp_not:N \tl_set:Nn
14     \exp_not:c { \l_cellprops_property_value_#2_tl }
15     {#1 {#3}}
16 }
17
18 \cs_set_nopar:Nn \__cellprops_get_property:n {
19     \tl_use:c { \l_cellprops_property_value_#1_tl }
20 }
21
22 \cs_set_protected_nopar:Nn \__cellprops_get_property:nN {
23     \tl_if_exist:cTF { \l_cellprops_property_value_#1_tl } {
24         \tl_set_eq:Nc #2 { \l_cellprops_property_value_#1_tl }
25     }{
26         \tl_clear:N #2
27     }
28 }
```

(End definition for `\l_cellprops_property_value_<name>_tl` and others.)

\\_\\_cellprops\\_property\\_type\\_<name>:nn    The control sequence \\_\\_cellprops\\_property\\_type\\_<name>:nn holds the setter for the property <name>. It can be set by the following helper:

```

29  \cs_set_protected:Nn \_\_cellprops\_define\_properties:nn {
30      \clist_map_inline:nn {#2} {
31          \cs_set:cpn { __cellprops_property_type_##1:nn } {#1}
32      }
33  }
```

(End definition for \\_\\_cellprops\\_property\\_type\\_<name>:nn and \\_\\_cellprops\\_define\\_properties:nn.)

\\_\\_cellprops\\_use\\_setter:nn    Sometimes we need to use a setter right away rather than save its action somewhere. The following helper does that with an x-expansion.

```

34  \cs_set_protected:Nn \_\_cellprops_use_setter:nn {
35      \use:x {
36          \use:c {__cellprops_property_type_#1:nn} {#1} {#2}
37      }
38  }
```

(End definition for \\_\\_cellprops\\_use\\_setter:nn.)

```

39  \cs_set_protected:Nn \_\_cellprops_parse_properties:Nn {
40      \tl_clear:N #1
41      \seq_set_split:Nnn \l_tmpa_seq {;} {#2}

171         }
172         \__cellprops_parse_css:w #3 \q_stop
173     }
174 }
175
176
177 \seq_new:N \l__cellprops_parse_selector_seq
178 \tl_new:N \l__cellprops_parse_desc_tl
179
180 \str_const:Nn \c__cellprops_parse_nthchild_str { :nth-child( }
181 \prop_new:N \c__cellprops_parse_replace_prop

```

```

182 \prop_put:Nnn \c__cellprops_parse_replace_prop { :first-child } { :nth-child(1) }
183
184 \cs_new_protected:Nn \__cellprops_parse_selector:Nn {
185     \str_set:Nx \l_tmpa_str {\#2}

```

Replace some aliases with their meaning:

```

186     \prop_map_inline:Nn \c__cellprops_parse_replace_prop {
187         \use:x {
188             \exp_not:n { \tl_replace_all:Nnn \l_tmpa_str }
189             { \tl_to_str:n { ##1 } } { \tl_to_str:n { ##2 } }
190         }
191     }

```

Replace all spaces by `\q_stop` to defeat the space removal feature of `\seq_set_split:Nnn`.

```

192     \tl_replace_all:Nnn \l_tmpa_str {~} {\q_stop}
193     \exp_args:NNV
194     \seq_set_split:Nnn \l_tmpa_seq \c__cellprops_parse_nthchild_str \l_tmpa_str
195     \seq_pop_left:NN \l_tmpa_seq \l_tmpa_tl

```

And replace them back.

```

196     \tl_replace_all:Nnn \l_tmpa_tl {\q_stop} {~}
197     \seq_clear:N \l__cellprops_parse_selector_seq
198     \seq_put_right:NV \l__cellprops_parse_selector_seq \l_tmpa_tl
199     \seq_map_inline:Nn \l_tmpa_seq {
200         \tl_set:Nn \l_tmpa_tl { ##1 }

```

And replace them back again.

```
201     \tl_replace_all:Nnn \l_tmpa_tl {\q_stop} {~}
```

Now replace the first closing parenthesis by `\q_stop\prg_do_nothing:` to use `\q_stop` as a delimiter for `\seq_set_split:Nnn` and thus split at most once. Note that here the space trimming feature is desired for the left part, but not just at the right of the parenthesis, so `\prg_do_nothing:` will act as a guard and will be removed afterwards.

```

202     \tl_replace_once:Nnn \l_tmpa_tl { ) } { \q_stop\prg_do_nothing: }
203     \seq_set_split:NnV \l_tmpa_seq { \q_stop } \l_tmpa_tl
204     \seq_pop_right:NN \l_tmpa_seq \l__cellprops_parse_desc_tl
205     \tl_replace_once:Nnn \l__cellprops_parse_desc_tl { \prg_do_nothing: } {}
206     \seq_get_left:NNT \l_tmpa_seq \l_tmpa_tl {

The color inheritance is handled with `\l__cellprops_inherit_color_tl`, `\l__cellprops_color_tl` and `\l__cellprops_bgcolor_tl`. The role of `\__cellprops_update_color:Nn` is to set the inherit fallback to the already existing value of #1 then set #1 to the CSS value, which can be the inherit variable.
