Part I.

Preliminaries

1. Licence, Requirements and README

The CHEMMACROS bundle underlies the L^AT_EX project public license (lppl) version 1.3 or later. (<http://www.latex-project.org/lppl.txt>)

`CHEMMACROS` uses the packages `expl3`, `xparse`¹, `l3keys2e`² and `xfrac`³, which are part of the bundles `l3kernel`⁴ and `l3packages`⁵. `expl3` is part of `l3kernel`, and `xparse`, `l3keys2e` and `xfrac` are part of `l3packages`.

Obviously, the packages `CHEMFOMULA` and `GHSYSTEM` are loaded as they are part of this bundle.

`CHEMMACROS` also uses the packages `siunitx`⁶, `mathtools`⁷, `bm`⁸ and `environ`⁹ as well as `tikz`¹⁰ and the `TikZ` libraries `calc` and `arrows`.

Package option `bpchem` (section 4) needs the package `bpchem`¹¹, package option `xspace` needs the package `xspace`¹² and package option `method = mhchem` needs the package `mhchem`¹³.

`CHEMMACROS` has been bundled with the new `CHEMFOMULA` and `GHSYSTEM` packages. `CHEMFOMULA` provides an alternative to `mhchem`. This leads to some internal changes in `CHEMMACROS`. On the same time the documentation has been redesigned.

You might remember that `CHEMMACROS`' options all belong to different modules, see section 5 for further information. These are typeset in the left margin when the option is first mentioned. In section 21 all options and the module the belong to are listed. Throughout the document options are typeset `green` and modules `red`.

`CHEMFOMULA` uses the packages `CHEMMACROS` and `nicefrac`¹⁴. `CHEMFOMULA` has no own package options but passes all options on to `CHEMMACROS`.

`GHSYSTEM` uses the packages `CHEMMACROS`, `tabu`¹⁵, `longtable`¹⁶, `ifpdf`¹⁷ and `graphicx`¹⁸. `GHSYSTEM` has no own package options but passes all options on to `CHEMMACROS`.

2. Motivation

`CHEMMACROS` started some years ago as a growing list of custom macros that I frequently used. I cannot completely recall when and why I decided to release them as a package. Well – here we go and you might find it useful, too, I hope.

I would guess that nearly every chemist using `LATEX 2ε` is aware of the great `mhchem` package. `CHEMFOMULA` is *not* a replacement for `mhchem` but an alternative. I thought about writing it for a while. Some minor points in `mhchem` always bothered me, but they hardly seemed enough for a new package. They weren't even enough for a feature request to the `mhchem` author. What convinced me at last was the fun and the challenge.

`CHEMFOMULA` works very similar to `mhchem` but is more strict as to how compounds, stoichiometric factors and arrows are input. In the same time `CHEMFOMULA` offers some possibilities to customize the output that `mhchem` does not. If you are content with the way `mhchem` works there is probably no need to use `CHEMFOMULA`. Maybe you are curious anyway.

As a chemist you are probably aware of the fact that the UNITED NATIONS have developed the “Globally Harmonized System of Classification and Labelling of Chemicals” (GHS) as a global replacement for the various different systems in different countries. While it has not been implemented by all countries yet¹⁹, it is only a matter of time. The package `GHSYSTEM` now enables you to typeset all the hazard and precautionary statements and pictograms in a very easy way.

¹ CTAN: `xparse` ² CTAN: `l3keys2e` ³ CTAN: `xfrac` ⁴ CTAN: `l3kernel` ⁵ CTAN: `l3packages` ⁶ CTAN: `siunitx` ⁷ CTAN: `mathtools` ⁸ CTAN: `bm` ⁹ CTAN: `environ` ¹⁰ CTAN: `pgf` ¹¹ CTAN: `bpchem` ¹² CTAN: `xspace`
¹³ CTAN: `mhchem` ¹⁴ CTAN: `nicefrac` ¹⁵ CTAN: `tabu` ¹⁶ CTAN: `longtable` ¹⁷ CTAN: `ifpdf` ¹⁸ CTAN: `graphicx`

¹⁹ http://www.unece.org/trans/danger/publi/ghs/implementation_e.html

3. Loading the Bundle

Loading `CHEMMACROS` with

```
1 \usepackage{chemmacros} % `chemmacros', `formula' and `ghs' are loaded
```

will also load `CHEMFORMULA` and `GHSYSTEM`. However, you can prevent `CHEMMACROS` from loading `GHSYSTEM`:

```
1 \usepackage[ghs=false]{chemmacros} % `chemmacros' and `formula' are loaded
```

Loading `CHEMFORMULA` or `GHSYSTEM` explicitly is possible and will also load `CHEMMACROS` if it hasn't been loaded yet, and will therefore implicitly load the other package, too.

```
1 \usepackage{chemformula} % `chemmacros', `formula' and `ghs' are loaded  
2 or  
3 \usepackage[ghs=false]{chemformula} % `chemmacros' and `formula' are loaded
```

However, it is recommended to simply use `\usepackage{chemmacros}` and setup the required options with `\chemsetup` (also see section 5).

4. Package Options

`CHEMMACROS` has several package options. They all are used as key/value pairs like

```
1 \usepackage[option1 = <value1>, option2 = <value2>]{chemmacros}
```

Some also can be used without value (`\usepackage[option1]{chemmacros}`), which means that the underlined value is used.

Both `CHEMFORMULA` and `GHSYSTEM` don't have package options of their own. If you load them explicitly you can give them `CHEMMACROS`' options instead and they will pass them on to `CHEMMACROS`.

- option** `bpchem` = true/false This option loads the package bpchem and adjusts the layout of the `\NMR` command to the bpchem commands `\HNMR` and `\CNMR`. (default: false)
- option** `circled` = formal/all/none `CHEMMACROS` uses two different kinds of charges²⁰, which indicate the usage of real (+/-) and formal (⊕/⊖) charges. The option `formal` distinguishes between them, option `none` displays them all without circle, option `all` circles all (default: `formal`)

option `circletype` = `chem/math` This option switches between two kinds of circled charge symbols:
`\fplus` \oplus and `\oplus` \oplus . (default: `chem`)

option `detect-bold` = `true/false` This option determines whether or not macros like `\pKa` recognize a bold font series. **bold pK_A text** or **bold pK_A text**. (default: `false`)

option `EZ` = `chemmacros/cool` The command `\E` is defined by the package `cool`²¹ as well as by `CHEM-MACROS`. With this option you can choose, which definition is used, see page 8. (default: `chemmacros`)

option `german` = `true/false` This option changes the commands `\pKa`, `\sld` and `\lqd` (default: `false`).
 This option has the alias `ngerman`.

option `ghs` = `true/false` Disable the use of the `GHSYSTEM` package. Setting `ghs` = `false` will prevent `CHEMMACROS` from loading `GHSYSTEM`. (default: `true`)

option `method` = `chemformula/mhchem` You can choose the method which `CHEMMACROS` will use for the reaction environments (see section 16) and the typesetting of the particles (see section 6). (default: `chemformula`). This option can only be chosen in the preamble.

option `strict` = `true/false` Setting `strict` = `true` will turn all warning messages into errors messages. (default: `false`)

option `synchronize` = `true/false` The setting `true` will tell `CHEMMACROS` to adapt the font settings of `CHEMFOMULA` if that method has been chosen (default: `false`). In order to demonstrate this feature this document is set with `synchronize` = `true` and the `CHEMFOMULA` setting `\chemsetup[chemformula]{font-spec={[Color=darkgray]Latin Modern Sans}}`.

option `version` = `1/2/bundle` This option restores the old definitions of some commands, so documents set with `v1.*` will still compile correctly. (default: `bundle`). Actually 2 and bundle are only aliases. This option can only be chosen in the preamble.

option `xspace` = `true/false` With this option most commands are defined with a `\xspace`. (default: `true`)

5. Setup

Various of `CHEMMACROS'`, `CHEMFOMULA's` and `GHSYSTEM'` commands have key/value pairs with which they can be customized. Most times they can be used as (optional) argument of the commands themselves. They also can most times be used with the `\chemsetup` command.

```
\chemsetup[<module>]{<key> = <value>} or  

\chemsetup{<module>/<key> = <value>}
```

²⁰ Thanks to Christoph Schäfer, who pointed out to me, that v1.1 handled the charges too sloppy! ²¹ CTAN: [cool](#)

The keys each belong to a module, which defines for which commands they are intended for. If a key is presented, you'll see the module to which it belongs in the left margin. You have two ways to use keys with the `\chemsetup`, as you can see above.

The package options can also be seen as keys belonging to the module `option`. This means they can also be used with the `\chemsetup` command (except for the option `version = 1/2/3`).

```
1 \chemsetup[option]{circled=none}\mch\ \pch\ \fmch\ \fpch\ \el\ \prt \\
2 \chemsetup[option]{circled=formal}\mch\ \pch\ \fmch\ \fpch\ \el\ \prt \\
3 \chemsetup[option]{circletype=math}\mch\ \pch\ \fmch\ \fpch\ \el\ \prt \\
4 \chemsetup{option/circletype=chem,option/circled=all}\mch\ \pch\ \fmch\ \fpch\ \el\ \\
    \prt \\
5 \chemsetup{option/circletype=math}\mch\ \pch\ \fmch\ \fpch\ \el\ \prt

- + - + e- p+
- + ⊖ ⊕ e- p+
- + ⊖ ⊕ e- p+
⊖ ⊕ ⊖ ⊕ e⊖ p⊕
⊖ ⊕ ⊖ ⊕ e⊖ p⊕
```

Keys *not* belonging to a module *cannot* be used with `\chemsetup`!

All options of `CHEMFORMULA` belong to the module `chemformula` and all of `GHSYSTEM`' options belong to the module `ghs`.

Part II. chemmacros

6. Particles, Ions and Symbols

Some simple macros for displaying often needed particles and a symbol. Please note, that they're displayed differently depending on the package options used, see section 4. These commands can be used in text as well as in math mode.

`\Hpl` H⁺ (proton)

`\Hyd` OH⁻ (hydroxide)

`\Hto` H₃O⁺ (oxonium ion) (H three O)

`\water` H₂O

`\el` e⁻ (electron)

`\prt` p⁺ (proton)

`\ntr` n⁰ (neutron)

`\Nu` Nu⁻ (nucleophile)

`\El` E^+ (electrophile)

`\ba` ba^- (base)

`\fplus` \oplus

`\fminus` \ominus

`\transitionstatesymbol` \neq (uses *TikZ*)

`\standardstate` Θ . This symbol is only provided by `CHEMMACROS`, if the package `chemstyle`²² is not loaded; the idea is borrowed from there²³.

There is another command which allows to typeset radicals with charges and subscripts.

`\R[<sign>]{<subscript>}`

```
1 \R[+]{tert} \R[-]{sek} \R{prim} Rtert+ Rsek- Rprim
```

The two particles `\Nu` and `\ba` can be modified. To do that you use the option

`particle elpair = false/dots/dash.`

It only has any effect, if the package `chemfig`²⁴ is loaded, since it uses its command `\Lewis`.

```
1 % needs package `chemfig'
2 \ba[elpair] \Nu[elpair=dash] ba:- Nu-
3
4 \chemsetup[particle]{elpair} ba:- Nu:-
5 \ba \Nu
```

7. Stereo Descriptors, Nomenclature, Latin Phrases

7.1. IUPAC Names

Similar to the `bpchem` package `CHEMMACROS` provides a command²⁵ to typeset IUPAC names. Why is that useful? IUPAC names can get very long. So long indeed that they span over more than two lines, especially in two-column documents. This means they must be allowed to be broken more than one time. This is what the following command does.

`\iupac{<IUPAC name>}` Inside this command use `\|` and `\-` to indicate a breaking point or a breaking dash. Use `\^` as a shortcut for `\textsuperscript`²⁶.

²² CTAN: `chemstyle` ²³ many thanks to the package author Joseph Wright. ²⁴ CTAN: `chemfig` ²⁵ The idea and the implementation is borrowed from `bpchem` by Bjørn Pedersen. ²⁶ Actually `\^` uses a `CHEMFOMULA` command instead.

```

1 \begin{minipage}{.4\linewidth}
2   \iupac{Tetra\|cyclo[2.2.2.1^{\{1,4\}}]\-un\|decane-2\‐dodecyl\‐5\‐(hepta\|decyl\|iso\|
3     dodecyl\|thio\|ester)}
4 \end{minipage}

```

Tetracyclo[2.2.2.1^{1,4}]-undecane-2-do-decyl-5-(heptadecylisododecylthioes-ter)

The `\iupac` command is more of a semantic command. Most times you can achieve (nearly) the same thing by using `\-` instead of `\|`, `-` instead of `\-` and `\textsuperscript` instead of `\^`.

7.2. Stereo Descriptors and Nomenclature

The macros in this section are intended to make the writing of IUPAC names more convenient.

Cahn-Ingold-Prelog

`\Rcip` (*R*)

`\Scip` (*S*)

`\cip{<conf>}` e.g.: `\cip{R,S}` (*R,S*)

Fischer

`\Dfi` *D*

`\Lfi` *L*

cis/trans, zusammen/entgegen, syn/anti & tert Please notice, that the commands `\cis` and `\trans` are defined by the `bpchem` package as well. If you load that package, they are redefined by `CHEMMACROS`. With `bpchem` they *always* get a `\xspace`, with `CHEMMACROS` *never*.

`\cis` *cis*

`\trans` *trans*

`\Z` (*Z*)

`\E` (*E*) (`\E` is also defined by the package `cool`. By using the package option `EZ = cool` instead of `\E` and `\Z` `CHEMMACROS` defines `\Ent` and `\Zus`.)

`\syn` *syn*

`\anti` *anti*

`\tert` *tert*

ortho/meta/para

\ortho *o*

\meta *m*

\para *p*

absolute configuration (uses TikZ)

\Rconf[<letter>] \Rconf: (R) \Rconf[]: (C)

\Sconf[<letter>] \Sconf: (S) \Sconf[]: (C)

Examples:

```
1 \iupac{\Dfi{-Wein}\|s\"aure} = \\ 
2 \iupac{\cip{2S,3S}{-Wein}\|s\"aure} \\ 
3 \iupac{\Dfi{--}{$-$}{-Threose}} = \\ 
4 \iupac{\cip{2S,3R}{--}{$-$}{-2,3,4}{-Tri\|hydroxy\|butanal}} \\ 
5 \iupac{\cis{-2}{-Butene}} = \\ 
6 \iupac{(Z){-2}{-Butene}}, \\ 
7 \iupac{\cip{2E,4Z}{-Hexa\|diene}} \\ 
8 \iupac{\meta{-Xylol}} = \\ 
9 \iupac{1,3{-Di\|methyl\|benzene}}
```

d-Weinsäure =

(2S,3S)-Weinsäure

d-(-)-Threose =

(2S,3R)-(-)-2,3,4-Trihydroxybutanal

cis-2-Butene =

(Z)-2-Butene,

(2E,4Z)-Hexadiene

m-Xylol =

1,3-Dimethylbenzene

7.3. Latin Phrases

At last there are two commands for common latin phrases.

\insitu *in situ*

\abinitio *ab initio*

If the package chemstyle has been loaded, too²⁷, they are defined using chemstyle's \latin command. This means that then the appearance depends on chemstyle's option abremph:

²⁷ chemstyle defines other similar commands like *et al.*, *in vacuo*.

```

1  \insitu, \abinitio\\
2  \cstsetup{abbremph=false}          in situ, ab initio
3  \insitu, \abinitio                in situ, ab initio

```

If chemstyle hasn't been loaded, they're always in *italics*.

8. Units for the Usage With siunitx

In chemistry some non-SI units are very common. siunitx provides the command `\DeclareSIUnit{<command>}{<unit>}` to add arbitrary units. **CHEMMACROS** uses that command to provide some units. Like all siunitx units they're only valid inside `\SI{<num>}{<unit>}` and `\si{<unit>}`.

`\atmosphere` atm

`\atm` atm

`\calory` cal

`\cal` cal

`\cmc` cm³ The units `\cmc`, `\molar`, and `\Molar` are defined by the package chemstyle as well. **CHEMMACROS** only defines them, if chemstyle is not loaded.

`\molar` mol dm⁻³

`\moLar` mol L⁻¹

`\Molar` M

`\MolMass` g mol⁻¹

`\normal` N

`\torr` torr

By the way: `\mmHg` mmHg already is defined by siunitx and chemstyle

9. Acid/Base

Easy representation of pH, pK_A ... (the command `\pKa` depends on the package option `german`, see section 4.)

`\pH` pH

`\pOH` pOH

`\Ka` K_A

`\Kb` K_B

\Kw K_W
\pKa[<num>] \pKa: pK_A , \pKa[1]: pK_{A1}
\pKb[<num>] \pKb: pK_B , \pKb[1]: pK_{B1}
\p{<anything>} e.g. \p{\Kw} pK_W

```

1  \Ka \Kb \pKa \pKa[1] \pKb \pKb[1] \\
2  \chemsetup[option]{german=true}
3  \Ka \Kb \pKa \pKa[1] \pKb \pKb[1]

```

$$K_A K_B pK_A pK_{A1} pK_B pK_{B1}$$

$$K_S K_B pK_S pK_{S1} pK_B pK_{B1}$$

10. Oxidation Numbers, Real and Formal Charges

CHEMMACROS distinguishes between real ($+/-$) and formal (\oplus/\ominus) charge symbols, also see section 4. All commands using formal charge symbols start with a f.

10.1. Ion Charges

Simple displaying of (real) charges:

\pch[<number>] positive charge (plus + charge)
\mch[<number>] negative charge (minus - charge)

```

1  \pch, Na\pch, Ca\pch[2] \\
2  \mch, F\mch, S\mch[2]

```

$$+, \text{Na}^+, \text{Ca}^{2+}$$

$$-, \text{F}^-, \text{S}^{2-}$$

The same for formal charges:

\fpch[<number>] positive charge
\fmch[<number>] negative charge

```

1  \fpch\ \fmch\ \fpch[3] \fmch[3]

```

$$\oplus \ominus 3\oplus 3\ominus$$

There is a key which influences the behaviour of the charges.

charges append = true/false if set true, the charge is appended together with an empty group.

This is how the key influences the behaviour:

```

1  \chemsetup[charges]{append=false}
2  \ce{H\pch\aq} \ce{H\aq\pch}
3
4  \chemsetup[charges]{append=true}
5  \ce{H\pch\aq} \ce{H\aq\pch}

```

$$\text{H}_{(\text{aq})}^+ \text{H}_{(\text{aq})}^+$$

$$\text{H}_{(\text{aq})}^+ \text{H}_{(\text{aq})}^+$$

In most cases this behaviour will be unwanted. However, in some cases it might be useful, for example together with the `\ox` command (see next section):

```
1 \chemsetup[charges]{append=false}          I +  
2 \ce{\ox{1,H}\pch\aq}                      H(aq)  
3  
4 \chemsetup[charges]{append=true}           I +  
5 \ce{\ox{1,H}\pch\aq}                      H(aq)
```

10.2. Oxidation Numbers

Typesetting oxidation numbers:

`\ox[<keyval>]{<number>,<atom>}` places `<number>` above `<atom>`; `<number>` has to be a (rational) number!

```
1 \ox{+1,Na}, \ox{2,Ca}, \ox{-2,S}, \ox{-1,F}  
I II -II-I  
Na, Ca, S, F
```

There are a number of keys, that can be used to modify the `\ox` command.

- ox `parse` = `true/false` when `false` an arbitrary entry can be used for `<number>`.
- ox `roman` = `true/false` switches from roman to arabic numbers.
- ox `pos` = `top/super/side`; `top` places `<number>` above `<atom>`, `super` to the upper right as superscript and `side` to the right and inside brackets.
- ox `explicit-sign` = `true/false` shows the `+` for positiv numbers and the `±` for 0.
- ox `decimal-marker` = `comma/point` choice for the decimal marker for formal oxidation numbers like $\overset{1.2}{X}$.

```
1 \ox[roman=false]{2,Ca} \ox{2,Ca} \\          II  
2 \ox[pos=super]{3,Fe}-Oxide \\                Ca Ca  
3 \ox[pos=side]{3,Fe}-Oxide \\                 FeIII-Oxide  
4 \ox[parse=false]{?,Mn}                         Fe(III)-Oxide  
                                         ?  
                                         Mn
```

The `pos = super` variant also can be set with the shortcut `\ox*`:

```
1 \ox{3,Fe} \ox*{3,Fe}                         III  
                                         Fe FeIII
```

Using the `explicit-sign` key will always show the sign of the oxidation number:

```

1 \chemsetup[ox]{explicit-sign = true}
2 \ox{+1,Na}, \ox{2,Ca}, \ox{-2,S}, \ch{"\ox{0,F}" {}2}
+I Na, +II Ca, -II±0 S, F2

```

```

1 Compare \ox{-1,\ch{O2^2-}} to \ch{"\ox{-1,0}" 2^2-}
Compare O2-1 to O2-1

```

Sometimes one might want to use formal oxidation numbers like 0.5 or $\frac{1}{3}$:

```

1 \ox{.5,\ch{Br2}} \ch{"\ox{1/3,I}" 3+} Br2I30.5 1/3

```

The fraction uses the `sfrac` command of the `xfrac` package. For this purpose the instance `chemmacros-ox-fraction` is defined.

```

1 \DeclareInstance{xfrac}{chemmacros-ox-fraction}{text}
2 {
3   scale-factor      = 1.2 ,
4   denominator-bot-sep = -.5ex ,
5   numerator-top-sep = -.3ex ,
6   slash-left-kern   = -.2em ,
7   slash-right-kern  = -.2em ,
8   slash-symbol-font = lmr
9 }

```

Of course you can redefine it so that it suits your needs as the output often strongly depends on the used font.

10.3. Partial Charges and Similar Stuff

The next ones probably are seldomly needed but nevertheless useful:

`\delp` $\delta+$ (delta + plus)

`\delm` $\delta-$ (delta + minus)

`\fddelp` $\delta\oplus$

`\fdfdelm` $\delta\ominus$

These macros for example can be used with the `\ox` command or with the `chemfig` package:

```

1  \chemsetup{
2      option/circled = all,
3      ox/parse       = false
4  }
5  \ce{\ox{\delp,H}-\ox{\delm,C1}} \hspace*{1cm}
6  \chemfig{\chemabove[3pt]{\lewis{246,Br}}{\delm}-\chemabove[3pt]{H}{\delp}}

```

$\overset{\delta\oplus}{\text{H}} - \overset{\delta\ominus}{\text{Cl}}$ $\overset{\delta\ominus}{\text{Br}} \underset{\delta\oplus}{\text{---}} \text{H}$

The following macros are useful together with `chemfig`, too.

`\scrp` +(scriptstyle + plus)

`\scrm` -(scriptstyle + minus)

`\fscrp` \oplus

`\fscrm` \ominus

`\fsscrp` \oplus (using `\scriptscriptstyle`)

`\fsscrm` \ominus

```

1  \setatomsep{1.8em}\chemfig{CH_3-\chemabove{C}{\scrp}(-[6]C|H_3)-\vphantom{H_3}CH_3}
2
3  \chemfig{\fmch{}|0-\chemabove{N}{\fscrp}(-[1]0|\fmch)-[7]0|\fmch}

```

$\begin{array}{c} \text{CH}_3 - \overset{+}{\text{C}} - \text{CH}_3 \\ | \\ \text{CH}_3 \\ \ominus \text{O} - \overset{+}{\text{N}}' \overset{\ominus}{\text{O}} \\ \quad \quad \quad \ominus \end{array}$

11. Reaction Mechanisms

With the command

`\mech[<type>]`

one can specify the most common reaction mechanisms. `<type>` can have one of the following values:

- `\mech` (empty, no opt. argument) nucleophilic substitution S_N
- `\mech[1]` unimolecular nucleophilic substitution S_{N1}
- `\mech[2]` bimolecular nucleophilic substitution S_{N2}
- `\mech[se]` electrophilic substitution S_E

- `\mech[1e]` unimolecular electrophilic substitution S_E1
- `\mech[2e]` bimolecular electrophilic substitution S_E2
- `\mech[ar]` electrophilic aromatic substitution Ar-S_E
- `\mech[e]` elimination E
- `\mech[e1]` unimolecular elimination E1
- `\mech[e2]` bimolecular elimination E2
- `\mech[cb]` unimolecular elimination “conjugated base”, i. e. via carbanion E1_{cb}

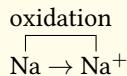

12. Redox Reactions

`CHEMMACROS` provides two commands²⁸, to visualize the transfer of electrons in redox reactions. Both commands are using `TikZ`.

```
\OX{<name>,<atom>}
\redox(<name1>,<name2>)[<tikz>][<num>]{<text>}
```

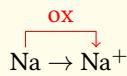

`\OX` places `<atom>` into a node, which is named with `<name>`. If you have set two `\OX`, they can be connected with a line using `\redox`. To do so the names of the two nodes that are to be connected are written in the round braces. Since `\redox` draws a tikzpicture with options `remember picture, overlay`, the document needs to be *compiled at least two times*.

```
1 \OX{a,Na} $\rightarrow$ \OX{b,Na}\pch\redox(a,b){oxidation}
```

This line can be customized using `TikZ` keys in `[<tikz>]`:

```
1 \OX{a,Na} $\rightarrow$ \OX{b,Na}\pch\redox(a,b)[->,red]{ox}
```

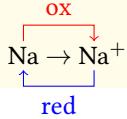

With the argument `[<num>]` the length of the vertical parts of the line can be adjusted. The default length is `.6em`. This length is multiplied with `<num>`. If you use a negative value the line is placed *below* the text.

²⁸ Thanks to Peter Cao who suggested this feature.

```

1 \OX{a,Na} $\rightarrow$ \OX{b,Na}\pch
2 \redox(a,b)[->,red]{ox}
3 \redox(a,b)[-<,blue][-1]{red}

```

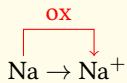

The default length of the vertical lines can be customized with the option

redox **dist** = <dim> A TeX dimension. Default = .6em

```

1 \chemsetup{redox/dist=1em}
2 \OX{a,Na} $ \rightarrow $ \OX{b,Na}\pch\redox(a,b)[->,red]{ox}

```

Additionally the option

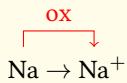

redox **sep** = <dim> Default = .2em

can be used to change the distance between the atom and the beginning of the line.

```

1 \chemsetup{redox/sep=.5em}
2 \OX{a,Na} $ \rightarrow $ \OX{b,Na}\pch\redox(a,b)[->,red]{ox}

```

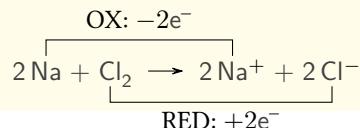

Examples:

```

1 \ch{ 2 "\OX{o1,Na}" + "\OX{r1,Cl}" } 2 -> 2 "\OX{o2,Na}" \pch{} + 2 "\OX{r2,Cl}" \
      mch }
2 \redox(o1,o2){\small OX: $-2e^-$}
3 \redox(r1,r2)[]{-1}{\small RED: $+2e^-$}

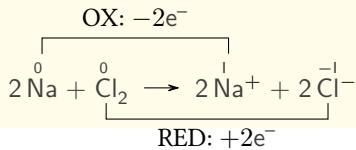

```

```

1 \ch{ 2 "\OX{o1,\ox{0,Na}}" + "\OX{r1,\ox{0,Cl}}" }2 -> 2 "\OX{o2,\ox{+1,Na}}" \pch
{} + 2 "\OX{r2,\ox{-1,Cl}}" \mch
2 \redox(o1,o2){\small OX: $- 2\el$}
3 \redox(r1,r2)[][-1]{\small RED: $+ 2\el$}

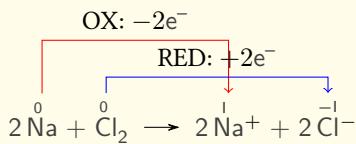

```

```

1 \ch{ 2 "\OX{o1,\ox{0,Na}}" + "\OX{r1,\ox{0,Cl}}" }2 -> 2 "\OX{o2,\ox{+1,Na}}" \pch
{} + 2 "\OX{r2,\ox{-1,Cl}}" \mch
2 \redox(o1,o2)[draw=red,->][3.33]{\small OX: $- 2\el$}
3 \redox(r1,r2)[draw=blue,->]{\small RED: $+ 2\el$}

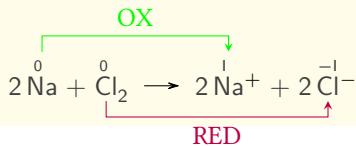

```

```

1 \ch{ 2 "\OX{o1,\ox{0,Na}}" + "\OX{r1,\ox{0,Cl}}" }2 -> 2 "\OX{o2,\ox{+1,Na}}" \pch
{} + 2 "\OX{r2,\ox{-1,Cl}}" \mch
2 \redox(o1,o2)[green,-stealth]{\small OX}
3 \redox(r1,r2)[purple,-stealth][-1]{\small RED}

```

13. (Standard) State, Thermodynamics

13.1. Thermodynamic Variables

The following commands use siunits:

```
\Enthalpy[<keyval>](<subscript>){<value>}
\Entropy[<keyval>](<subscript>){<value>}
\Gibbs[<keyval>](<subscript>){<value>}
```

Their usage is pretty much self-explaining:

```

1  \Enthalpy{123} \\
2  \Entropy{123} \\
3  \Gibbs{123}

```

$$\Delta H^\circ = 123 \text{ kJ mol}^{-1}$$

$$S^\circ = 123 \text{ J K}^{-1} \text{ mol}^{-1}$$

$$\Delta G^\circ = 123 \text{ kJ mol}^{-1}$$

The argument (`<subscript>`) adds a subscript for specification: `\Enthalpy(r){123}` $\Delta_r H^\circ = 123 \text{ kJ mol}^{-1}$.

There are several keys to customize the commands.

- `-none-` `exponent = <anything>`
- `-none-` `delta = <anything>/false`
- `-none-` `subscript = left/right`
- `-none-` `unit = <unit>`

The default values depend on the command.

```

1  \Enthalpy[unit=\kilo\joule]{-285} \\
2  \Gibbs[delta=false]{0} \\
3  \Entropy[delta=\Delta, exponent=]{56.7}

```

$$\Delta H^\circ = -285 \text{ kJ}$$

$$G^\circ = 0 \text{ kJ mol}^{-1}$$

$$\Delta S = 56.7 \text{ J K}^{-1} \text{ mol}^{-1}$$

The unit is set corresponding to the rules of siunitx and depends on its settings:

```

1  \Enthalpy{-1234.56e3} \\
2  \sisetup{per-mode=symbol, exponent-product=\cdot, output-decimal-marker={,}, group-four-digits=true} \\
3  \Enthalpy{-1234.56e3}

```

$$\Delta H^\circ = -1234.56 \times 10^3 \text{ kJ mol}^{-1}$$

$$\Delta H^\circ = -1234.56 \cdot 10^3 \text{ kJ/mol}$$

13.1.1. Create New Variables

You can use the command

`\setnewstate[<keyval>]{<name>}{<symbol>}{<unit>}`

to create new corresponding commands:

```

1  \setnewstate{Helmholtz}{A}{\kilo\joule\per\mole}
2  \setnewstate[subscript-left=false, exponent=]{ElPot}{E}{\volt}
3  \Helmholtz{123.4} \\
4  \ElPot{-1.1} \\
5  \ElPot[exponent=0]($\ch{Sn}|\ch{Sn^{2+}}||\ch{Pb^{2+}}|\ch{Pb}){0.01}

\Delta A^\circ = 123.4 \text{ kJ mol}^{-1}
\Delta E = -1.1 \text{ V}
\Delta E_{\text{Sn}|\text{Sn}^{2+}||\text{Pb}^{2+}|\text{Pb}}^0 = 0.01 \text{ V}

```

The command has some keys with which the default behaviour of the new command can be set.

```
exponent = <anything>
delta = <anything>/false
-none- subscript-left = true/false
subscript = <anything>
```

13.1.2. Redefine Variables

With

```
\renewstate[<keyval>]{<name>}{<symbol>}{<unit>}
```

you can redefine the already existing commands:

```
1 \renewstate{Enthalpy}{h}{\joule}           Δ_f h° = 12.5 J
2 \Enthalpy(f){12.5}
```

The command is analogous to `\setnewstate`, i. e. it has the same keys.

So – for following thermodynamic conventions – one could define a molar and an absolute variable:

```
1 \setnewstate[exponent=]{enthalpy}{h}{\kilo\joule\per\mole}% molar
2 \renewstate[exponent=]{Enthalpy}{H}{\kilo\joule}% absolute
3 \enthalpy{-12.3} \Enthalpy{-12.3}
```

$$\Delta h = -12.3 \text{ kJ mol}^{-1} \quad \Delta H = -12.3 \text{ kJ}$$

13.2. State

The commands presented in section 13.1 internally all use the command²⁹

```
\State[<keyval>]{<symbol>}{<subscript>}
```

It can be used to write the thermodynamic variables without value and unit.

Examples:

```
1 \State{A}, \State{G}{f}, \State[subscript-left=false]{E}{\ch{Na}}, \State[exponent=\SI{1000}{\celsius}]{H}
      ΔA°, Δ_f G°, ΔE_Na°, ΔH^{1000 °C}
```

Again there are some keys to customize the command:

```
state exponent = <anything>
state subscript-left = true/false
state delta = <anything>/false
```

²⁹ Please note that {<subscript>} is an *optional* argument.

14. Spectroscopy

If substances are examined whether they are what they're supposed to, one often needs NMR spectroscopy. Measured results then are written in a way like: $^1\text{H-NMR}$ (400 MHz, CDCl_3): $\delta = 1.59\dots$. **CHEMMACROS** provides a command which simplifies writing this down (uses `siunitx`).

```
\NMR{<num>,<elem>}(<num>,<unit>)[<solvent>]
```

```
\NMR*{<num>,<elem>}(<num>,<unit>)[<solvent>]
```

All arguments are optional! Without arguments we get³⁰:

```
1 \NMR \\  
2 \NMR*
```

$^1\text{H-NMR}: \delta$
 $^1\text{H-NMR}$

With the first argument you can specify the kind of NMR:

```
1 \NMR{13,C}
```

$^{13}\text{C-NMR}: \delta$

With the second argument the frequency (in MHz) can be specified:

```
1 \NMR(400)
```

$^1\text{H-NMR}$ (400 MHz): δ

You also can change the unit:

```
1 \NMR(4e8,\hertz)
```

$^1\text{H-NMR}$ (4×10^8 Hz): δ

Please note that the setup of `siunitx` also has an impact on this command:

```
1 \sisetup{exponent-product=\cdot}\NMR(4e8,\hertz)
```

$^1\text{H-NMR}$ ($4 \cdot 10^8$ Hz): δ

And finally with the third argument the solvent can be specified:

```
1 \NMR[CDCl3]
```

$^1\text{H-NMR}$ (CDCl_3): δ

With the keys

```
nmr    unit = <unit> Default = \mega\hertz
```

nmr **nucleus** = {<num>, <elem>} Default = {1, H}

the default unit and the default nucleus can be changed.

Examples:

```

1   {\chemsetup[nmr]{nucleus={13,C}}\NMR(100) \NMR*(100) } \\
2   \NMR*[19,F][CFC13] \NMR*[19,F](285)[CFC13] \\
3   \NMR(400)[CDC13] = \num{1.59} (q, 1H, \textit{j} = \SI{11.6}{\hertz}, H-4)

```

^{13}C -NMR (100 MHz): δ ^{13}C -NMR (100 MHz)
 ^{19}F -NMR (CFCl_3) ^{19}F -NMR (285 MHz, CFCl_3)
 ^1H -NMR (400 MHz, CDCl_3): δ = 1.59 (q, 1H, J = 11.6 Hz, H-4)

15. Commands for mhchem

`mhchem` isn't loaded automatically any more but only if you've specified `method = mhchem` in the preamble. In the default settings `CHEMMACROS` uses `CHEMFORMULA` instead.

`CHEMMACROS` provides only one command specifically for mhchem³¹. It is meant to place text below of compounds.

\mhName[<keyval>]{<formula>}{<text>}

For example:

1 \ce{4 C2H5Cl + Pb / Na -> \mhName{Pb(C2H5)4}{former antiknock additive} + NaCl}

$$4 \text{C}_2\text{H}_5\text{Cl} + \text{Pb/Na} \longrightarrow \text{Pb}(\text{C}_2\text{H}_5)_4 \text{ (former antiknock additive)} + \text{NaCl}$$

There are several keys to customize `\mhName`.

mhName **align** = <alignment command> the alignment of the text in the box it is placed in, default = **\centering**

mhName **format** = <anything> the format of the text

`mhName` `fontsize` = the fontsize of the text, default = \tiny

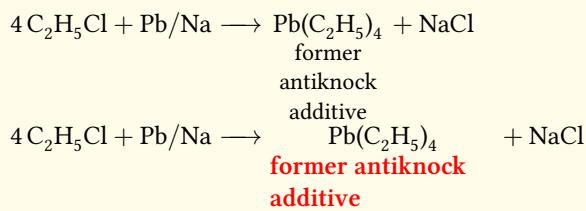

mhName **width** = <dim>/auto the width of the box the text is placed in, default = auto

```

1 \ce{4 C2H5Cl + Pb / Na -> \mhName[fontsize=\footnotesize]{Pb(C2H5)4}{former
    antiknock additive} + NaCl}\\
2 \chemsetup[mhName]{align=\raggedright, fontsize=\small, format=\bfseries\color{red},
    width=3cm}
3 \ce{4 C2H5Cl + Pb / Na -> \mhName{Pb(C2H5)4}{former antiknock additive} + NaCl}

```

³⁰ All arguments can be combined freely, the command can also be used in math mode. ³¹ **CHEMFORMULA** provides its own possibility.

16. Reaction Environments

16.1. Defined by CHEMMACROS

You can use these environments for numbered...

```
\begin{reaction} <formula or mhchem code> \end{reaction}
```

```
\begin{reactions} <formula or mhchem code> \end{reactions}
```

...and their starred versions for unnumbered reactions.

```
\begin{reaction*} <formula or mhchem code> \end{reaction*}
```

```
\begin{reactions*} <formula or mhchem code> \end{reactions*}
```

With them you can create (un)numbered reaction equations similar to mathematical equations.

The environments `reaction/reaction*` use the `equation/equation*` environments and the environments `reactions/reactions*` use the `align/align*` environments to display the reactions.

| | |
|--|---|
| <pre>1 Reaction with counter: 2 \begin{reaction} 3 A -> B 4 \end{reaction}</pre> | <p>Reaction with counter:</p> $A \longrightarrow B \quad \{1\}$ |
|--|---|

| | |
|---|--|
| <pre>1 Reaction without counter: 2 \begin{reaction*} 3 C -> D 4 \end{reaction*}</pre> | <p>Reaction without counter:</p> $C \longrightarrow D$ |
|---|--|

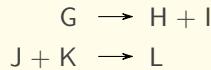

| | |
|---|--|
| <pre>1 Several aligned reactions with counter: 2 \begin{reactions} 3 A &-> B + C \\ 4 D + E &-> F 5 \end{reactions}</pre> | <p>Several aligned reactions with counter:</p> $A \longrightarrow B + C \quad \{2\}$ $D + E \longrightarrow F \quad \{3\}$ |
|---|--|

```

1 Several aligned reactions without counter:
2 \begin{reactions*}
3   G &-> H + I \\
4   J + K &-> L
5 \end{reactions*}

```

Several aligned reactions without counter:

If you want to change the layout of the counter tags, you can use `\renewtagform{<tagname>}[<format>]{<right delim>}{<left delim>}`³².

```

1 \renewtagform{reaction}[R \textbf{textbf}]{[]}{}
2 \begin{reaction}
3   H2O + CO2 <=> H2CO3
4 \end{reaction}

```

[R 4]

16.2. Own Reactions

You can create new types of reactions with the command:

`\newreaction[<keyval>]{<name>}{<math name>}`

`<name>` will be the name of the new environment. `<math name>` is the used math environment.
The command has two keys.

`-none-` `star = true/false`

`-none-` `arg = true/false`

There is `star`, which will also define a starred version of the new environment, if the starred math environment exists. If it doesn't exist, this will cause an error.

Then there is `arg`, which is used to define an environment with a mandatory argument. Of course this only works, if the used math environment has a mandatory argument.

The predefined environments are defined via

`\newreaction[star]{reaction}{equation}` and

`\reaction[star]{reactions}{align}`.

Let's suppose, you'd like to have the alignment behaviour of the `alignat` environment for `CHEM-
FORMULA/mhchem` reactions. You could do the following:

`\newreaction[star,arg]{reactionsat}{alignat}`

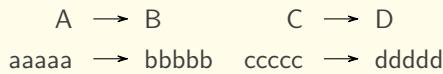

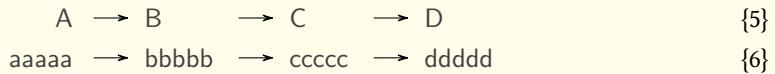

With this the `reactionsat` environment is defined.

³² Provided by the `mathtools` package

```

1  \newreaction[star,arg]{reactionsat}{alignat}
2  \begin{reactionsat}{3}
3    A      &-> B      &&-> C      &&-> D \\
4    aaaaa &-> bbbbb &&-> ccccc &&-> dddd
5  \end{reactionsat}
6  \begin{reactionsat*}{2}
7    A      &-> B      & C           &-> D \\
8    aaaaa &-> bbbbb &\quad{} ccccc &-> dddd
9  \end{reactionsat*}

```

16.3. List of Reactions

CHEMMACROS also provides a command to display a list of the reactions created with the `reaction` environment.

```
\listofreactions
```

```
1  \listofreactions
```

List of reactions

| | |
|--|----|
| Reaction {1} | 22 |
| Reaction {2} | 22 |
| Reaction {3} | 22 |
| Reaction {4} | 23 |
| Reaction {5} | 24 |
| Reaction {6} | 24 |
| Reaction {7}: Autoprotolyse | 25 |
| Reaction {8}: Synthese von Alkanen | 47 |

The Output of this list can be modified by two options:

`reaction list-name` = <name of the list> Let's you set the name of the list manually. Default = `List of reactions`

`reaction list-entry` = <prefix to each entry> Let's you set a prefix to each list entry. Default = `Reaction`

Both default option values recognize the package option `german`.

Instead of using the option `list-name` you also could redefine `\reactionlistname`.

The list lists all reactions with a number and disregards reactions without number. All reaction environments without star have an optional argument which let's you add a description (or caption) for the entry in the list.

```

1 \begin{reaction}[Autoprotolyse]
2   2 H2O <=> H3O+ + OH-
3 \end{reaction}                                2 H2O ⇌ H3O+ + OH- {7}

```

17. Phases

These commands are intended to indicate the phase of a compound.

\sld[<anything>] (s)

\lqd[<anything>] (l)

\gas (g)

\aq (aq)

Please notice, that the commands \solid and \liquid are now called \sld and \lqd, respectively. Also notice that they *don't* have an optional argument inside \ch!

```

1 \ch{C\sld{} + 2 H2O\lqd{} -> CO2\gas{} + 2 H2\gas} \\
2 To make it complete: NaCl\aq.
C(s) + 2 H2O(l) → CO2(g) + 2 H2(g)
To make it complete: NaCl(aq).

```

With the package option german (see section 4) or by using the optional arguments you get the german versions:

```

1 {\chemsetup[option]{german=true}
2 \ch{C\sld{} + 2 H2O\lqd{} -> CO2\gas{} + 2 H2\gas} } \\
3 \ce{C \sld[f] + 2 H2O\lqd[f1] -> CO2\gas{} + 2 H2\gas}

C(f) + 2 H2O(fl) → CO2(g) + 2 H2(g)
C(f) + 2 H2O(fl) → CO2(g) + 2 H2(g)

```

If you looked closely, you have probably noticed that the german \lqd isn't identical to \lqd[f1] but to \lqd[f\l]. This makes the subscript more readable.

Of course it doesn't matter which command with optional argument you use. Both of them just write a subscript with braces. \sld[f] is identical to \lqd[f].

One can think of other uses, too:

```
1 C\sl{d}[graphite] C(graphite)
```

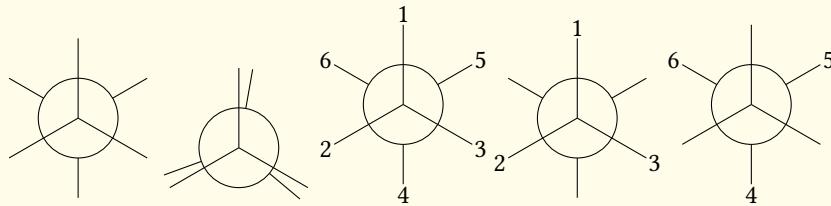

18. Newman Projections

CHEMMACROS provides the command

```
\newman[<keyval>](<angle>){<1>,<2>,<3>,<4>,<5>,<6>}
```

which allows you to create newman projections (uses *TikZ*). With <angle> the back atoms are rotated counter clockwise with respect to the front atoms.

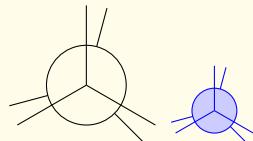

```
1 \newman{} \newman(170){}
2 \newman{1,2,3,4,5,6} \newman{1,2,3} \newman{,,4,5,6}
```

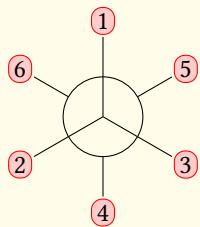

Several keys allow customization:

- newman `angle` = <angle> default angle
- newman `scale` = <factor> scale the whole projection
- newman `ring` = <tikz> customize the ring with *TikZ* keys
- newman `atoms` = <tikz> customize the nodes within which the atoms are set
- newman `back-atoms` = <tikz> explicitly customize the back atoms

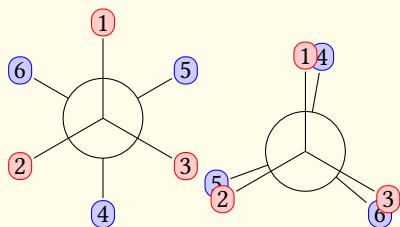

```
1 \chemsetup[newman]{angle=45} \newman{}
2 \newman[scale=.75,ring={draw=blue,fill=blue!20}]{}{}
```

```
1 \chemsetup[newman]{atoms={draw=red,fill=red!20,inner sep=2pt,rounded corners}}
2 \newman{1,2,3,4,5,6}
```

```
1 \chemsetup[newman]{
2   atoms = {draw=red,fill=red!20,inner sep=2pt,rounded corners},
3   back-atoms = {draw=blue,fill=blue!20,inner sep=2pt,rounded corners}
4 }
5 \newman{1,2,3,4,5,6} \newman(170){1,2,3,4,5,6}
```

19. s, p, and Hybrid Orbitals

CHEMMACROS provides the following command to create orbitals:

```
\orbital[<keyval>]{<type>}
```

There are the following types available for <type>:

s

p

sp

sp²

sp³

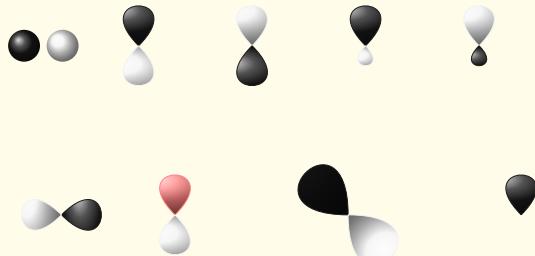

```
1 \orbital{s} \orbital{p} \orbital{sp} \orbital{sp2} \orbital{sp3}
```

Depending on the type you have different keys to modify the orbitals:

- orbital** `phase = +/-` changes the phase of the orbital (all types)
- orbital** `scale = <factor>` changes the size of the orbital (all types)
- orbital** `color = <color>` changes the color of the orbital (all types)
- orbital** `angle = <angle>` rotates the orbitals with a p contribution counter clockwise (all types except s)
- orbital** `half = true/false` displays only half an orbital (only p)

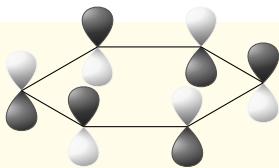

```
1 \orbital{s} \orbital[phase=-]{s}
2 \orbital{p} \orbital[phase=-]{p}
3 \orbital{sp3} \orbital[phase=-]{sp3}
4
5 \orbital[angle=0]{p} \orbital[color=red!50]{p} \orbital[angle=135, scale=1.5]{p} \
    \orbital[half]{p}
```

Additionally there are two keys, with which the *TikZ* behaviour can be changed.

- orbital** `overlay = true/false` the orbital “doesn't need space”; it is displayed with the *TikZ* option `overlay`.
- orbital** `opacity = <num>` the orbital becomes transparent; `<value>` can have values between 1 (fully opaque) to 0 (invisible).

```
1 \vspace{1cm}\hspace{1cm}
2 \chemsetup[orbital]{
3     overlay,
4     p/color = black!70
5 }
6 \setbondoffset{0pt}
7 \chemfig{? \orbital{p}-[,1.3]{\orbital[phase=-]{p}}-[:30,1.1]\orbital{p}-[:150,.9]{\orbital[phase=-]{p}}-[-4,1.3]\orbital{p}-[:-150,1.1]{\orbital[phase=-]{p}}?}
8 \vspace{1cm}
```

```
1  \vspace{2cm}\hspace{2cm}
2  \setbondoffset{0pt}
3  \chemsetup[orbital]{
4      overlay ,
5      opacity = .75 ,
6      p/scale = 1.6 ,
7      s/color = blue!50 ,
8      s/scale = 1.6
9  }
10 \chemfig{\orbital{s}-[:-20]{\orbital[scale=2]{p}}{\orbital[half,angle=0]{p}}{\orbital[angle=170,half]{p}}{\orbital[angle=-150,half]{p}}(-[:-150]\orbital{s})-\orbital{s}}
11 \vspace{2cm}
```

20. CHEMFORMULA support

CHEMFORMULA and CHEMMACROS are designed to work together closely. This is not perfect, though. There are even some restrictions. If you want to avoid them simply use `method = mhchem` and forget about this section and the next part.

You don't need to use `\mch` and related commands inside `\ch`. Indeed, you shouldn't use them as they might mess with the subscript and superscript alignment. The CHEMMACROS option circled is obeyed by `\ch`.

```

1 \chemsetup[option]{circled=all}      H⊕ + OH⊖ ⇌ H2O
2 \ch{H+ + OH- <=> H2O}

```

The commands `\sld` and `\lqd` don't have an optional argument inside `\ch`.

```

1 \ch{Ba^{2+}\aq{} + SO_4^{2-}\aq{} -> BaSO_4\sld{}\ v} \\
2 \ch{Ba^{2+} \aq{} + SO_4^{2-} \aq{} -> BaSO_4\sld{}\ v}

Ba_{(aq)}^{2+} + SO_4^{2-}_{(aq)} \rightarrow BaSO_4(s)\downarrow
Ba^{2+}_{(aq)} + SO_4^{2-}_{(aq)} \rightarrow BaSO_4(s)\downarrow

```

The option `synchronize` recognizes the format and font selections made for `CHEMFORMULA`.

21. Key Overview

In the table below all keys provided by `CHEMMACROS` for customization are listed. All keys that belong to a module can be set with

`\chemsetup[<module>]{<keyval>} or
\chemsetup{<module>/<keyval>}.`

Some keys can be set without value. Then the underlined value is used.

| key | module | values | default | |
|---------------------------|-----------------------|----------------------------|------------|-------------------------|
| package options: | | | | |
| <code>bpchem</code> | <code>option</code> | <u>true/false</u> | false | page 4 |
| <code>circled</code> | <code>option</code> | <u>formal/all/none</u> | formal | page 4 |
| <code>circletype</code> | <code>option</code> | <u>chem/math</u> | chem | page 5 |
| <code>detect-bold</code> | <code>option</code> | <u>true/false</u> | false | page 5 |
| <code>EZ</code> | <code>option</code> | <u>chemmacros/cool</u> | chemmacros | page 5 |
| <code>german</code> | <code>option</code> | <u>true/false</u> | false | page 5 |
| <code>ghs</code> | <code>option</code> | <u>true/false</u> | true | page 5 |
| <code>method</code> | <code>option</code> | <u>chemformula/formula</u> | formula | page 5 |
| <code>strict</code> | <code>option</code> | <u>true/false</u> | false | page 5 |
| <code>synchronize</code> | <code>option</code> | <u>true/false</u> | false | page 5 |
| <code>version</code> | <code>option</code> | <u>1/2/bundle</u> | bundle | page 5 |
| <code>xspace</code> | <code>option</code> | <u>true/false</u> | true | page 5 |
| \ba, \Nu: | | | | |
| <code>elpair</code> | <code>particle</code> | <u>dots/dash/false</u> | false | page 7 |
| \pch, \mch, \fpch, \fmch: | | | | |
| <code>append</code> | <code>charges</code> | <u>true/false</u> | false | page 11 |
| \ox: | | | | |
| <code>parse</code> | <code>ox</code> | <u>true/false</u> | true | page 12 |
| <code>roman</code> | <code>ox</code> | <u>true/false</u> | true | page 12 |
| <code>pos</code> | <code>ox</code> | <u>top/super/side</u> | top | page 12 |

| key | module | values | default | |
|-----------------------------------|----------------|-----------------------|-------------------|---------|
| explicit-sign | ox | true/false | false | page 12 |
| decimal-marker | ox | comma/point | point | page 12 |
| \OX, \redox: | | | | |
| dist | redox | <dim> | .6em | page 16 |
| sep | redox | <dim> | .2em | page 16 |
| \Enthalpy, \Entropy, \Gibbs: | | | | |
| exponent | | <anything> | \standardstate | page 18 |
| delta | | <anything>/false | | page 18 |
| subscript | | left/right | | page 18 |
| unit | | <unit> | | page 18 |
| \setnewstate, \renewstate: | | | | |
| exponent | | <anything> | \standardstate | page 18 |
| delta | | <anything>/false | | page 18 |
| subscript | | <anything> | | page 18 |
| subscript-left | | true/false | | page 19 |
| \State: | | | | |
| exponent | state | <anything> | \standardstate | page 19 |
| delta | state | <anything>/false | | page 19 |
| subscript-left | state | true/false | | page 19 |
| \NMR: | | | | |
| unit | nmr | <unit> | \mega\hertz | page 20 |
| nucleus | nmr | {<num>,<atom symbol>} | {1,H} | page 21 |

| angle | orbital/<type> | <angle> | 90 | page 28 |
| half | orbital/p | true/false | false | page 28 |
| overlay | orbital | true/false | false | page 28 |
| opacity | ornital | <num> | 1 | page 28 |

Part III.

chemformula

22. Setup

All of `CHEMFORMULA`'s options belong to the module `chemformula`. This means they can be setup with

```
1 \chemsetup[chemformula]{<options>} or
2 \chemsetup{chemformula/<option1>,chemformula/<option2>}
```

23. The Basic Principle

`CHEMFORMULA` offers one main command.

```
\ch[<options>]{<input>}
```

The usage will seem very familiar to you if you're familiar with mhchem:

| | |
|-----------------------------|--|
| 1 \ch{H2O} \\ | H ₂ O |
| 2 \ch{Sb2O3} \\ | Sb ₂ O ₃ |
| 3 \ch{H+} \\ | H ⁺ |
| 4 \ch{CrO4^2-} \\ | CrO ₄ ²⁻ |
| 5 \ch{AgCl2-} \\ | AgCl ₂ ⁻ |
| 6 \ch{[AgCl2]-} \\ | [AgCl ₂] ⁻ |
| 7 \ch{Y^{99}+} \\ | Y ⁹⁹⁺ |
| 8 \ch{Y^{99+}} \\ | Y ⁹⁹⁺ |
| 9 \ch{H2_{(aq)}} \\ | H _{2(aq)} |
| 10 \ch{NO3-} \\ | NO ₃ ⁻ |
| 11 \ch{(NH4)2S} \\ | (NH ₄) ₂ S |
| 12 \ch{{}^{227}_{90}Th+} \\ | ²²⁷ ₉₀ Th ⁺ |
| 13 \$V_{\ch{H2O}}\$ \\ | V _{H₂O} |
| 14 \ch{Ce^IV} \\ | Ce ^{IV} |
| 15 \ch{KCr(SO4)2 * 12 H2O} | KCr(SO ₄) ₂ · 12 H ₂ O |

However, there are differences. The most notable one: `CHEMFORMULA` distinguishes between different types of input. These different parts *have* to be separated with blanks:

```
\ch{part1 part2 part3 part4}
```

A blank in the input *never* is a blank in the output. This rule of the blank strictly holds and disregarding it can have unexpected results and even lead to errors.

Another notable difference: `CHEMFORMULA` tries to avoid math mode whenever possible:

```

1 \ch{A + B ->[a] C} \\
2 \ch{A + B ->[a] C}

```

$$\begin{array}{c} A + B \xrightarrow{a} C \\ A + B \xrightarrow{a} C \end{array}$$

This means that `\ch{2H2O}` is recognized as a *single* part, which in this case is recognized as a compound.

```

1 \ch{2H2O} \\
2 \ch{2 H2O}

```

$$\begin{array}{c} {}_2\text{H}_2\text{O} \\ 2\text{H}_2\text{O} \end{array}$$

This also means, that a part cannot contain a blank since this will automatically divide it into two parts. If you need an extra blank in the output you need to use `\~`. However, since commands in most cases gobble a space after them a input like `\ch{\command ABC}` will be treated as a single part. If you want or need to divide them you need to add an empty group: `\ch{\command{} ABC}`. The different input types are described in the following sections.

There are some options to customize the output of the `\ch` command. They can either be applied locally using the optional argument or can be set globally using the setup command. All options of `CHEMFORMULA` belong to the module `chemformula`.

```
\chemsetup[chemformula]{<options>}
```

24. Stoichiometric Factors

A stoichiometric factor may only contain of numbers and the signs `.`, `-`, `/`

```

1 \ch{2} \\
2 \ch{12}
3
4 % decimals:
5 \ch{3.5} \\
6 \ch{5,75}
7
8 % fractions:
9 \ch{3/2} \\
10 \ch{1_1/2}

```

$$\begin{array}{ll} 2 & 2 \\ 12 & 12 \\ 3.5 & 3.5 \\ 5.75 & 5.75 \\ \frac{3}{2} & \frac{3}{2} \\ 1\frac{1}{2} & 1\frac{1}{2} \end{array}$$

You have to be a little bit careful with the right syntax but I believe it is rather intuitive.

```
1 this won't work but will result in an error: \ch{1/1_1}
```

There are a few possibilities to customize the output.

`decimal-marker` = `<marker>` the symbol to indicate the decimal. Default = `.`

`frac-style` = `math/xfrac/nicefrac` determines how fractions are displayed. Default = `math`
`stoich-space` = `<dim>` The space that is placed after the stoichiometric factor. Default = `.1667em`

```
1 \ch[decimal-marker={,}]{3.5} \ch[decimal-marker={$\cdot$}]{3,5}
3,5 3·5
```

The option `frac-style` = `xfrac` uses the `\sfrac` command of the `xfrac` package. The output strongly depends on the font you use.

```
1 \ch[frac-style=xfrac]{3/2} \ch[frac-style=xfrac]{1_1/2}
½ 1½
```

`CHEMFORMULA` defines the instance `formula-text-fraç` which you can redefine to your needs. See the `xfrac` documentation for further information. The default definition is this:

```
1 \DeclareInstance{xfrac}{chemformula-text-fraç}{text}
2 {
3   slash-left-kern = -.15em ,
4   slash-right-kern = -.15em
5 }
```

This document uses the font Linux Libertine and the following definition:

```
1 \DeclareInstance{xfrac}{chemformula-text-fraç}{text}
2 {
3   scale-factor      = 1 ,
4   denominator-bot-sep = -.2ex ,
5   denominator-format = \scriptsize #1 ,
6   numerator-top-sep = -.2ex ,
7   numerator-format = \scriptsize #1
8 }
```

The option `frac-style` = `nicefrac` uses the `\nicefrac` command of the `nicefrac` package.

```
1 \ch[frac-style=nicefrac]{3/2} \ch[frac-style=nicefrac]{1_1/2}
½ 1½
```

The option `stoich-space` allows you to customize the space between stoichiometric factor and the group following after it.

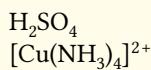

```
1 \ch{2 H2O} \\
2 \ch[stoich-space=.2em]{2 H2O}
```

25. Compounds

CHEMFORMULA determines compounds as the type that “doesn't fit in anywhere else”. This point will become more clear when you know what the other types are.

```
1 \ch{H2SO4} \\
2 \ch{[Cu(NH3)4]^2+}
```

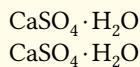

25.1. Adducts

CHEMFORMULA has two identifiers which will create adducts.

`\ch{A.B}`

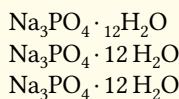

`\ch{A*B}`

```
1 \ch{CaSO4.H2O} \\
2 \ch{CaSO4*H2O}
```

Since numbers in a compound always are treated as subscripts (see section 25.2) you sometimes need to introduce stoichiometric factors for the right output:

```
1 \ch{Na3PO4*12H2O} \\
2 \ch{Na3PO4* 12 H2O} \\
3 \ch{Na3PO4 * 12 H2O}
```

25.2. Subscripts

All numbers in a compound are treated as subscripts.

```
1 \ch{H2SO4}
```

If you want a letter to be a subscript you can use the math syntax:

```
1 \ch{A_nB_m}
```

The subscript recognizes groups. You can also use math inside it.

```
1 \ch{A_{\$n\$}B_{\$m\$}} \\
2 \ch{NaCl_{(aq)}}
```

25.3. Commands

Commands are allowed in a compound:

```
1 \ch{\textbf{A2}B3} \ch{A2\color{red}B3} A2B3 A2B3
```

However, if the commands demand numbers as argument, e. g. space commands or chemmacros³³ \ox command the direct use will fail. This is because the numbers are treated as subscripts *before* the command expands.

```
1 \ch{A\hspace{2mm}B} will raise an error because \hspace sees something like this
: \hspace{$_2$mm}.
```

See section 27.1 for a way around this.

25.4. Charges and Other Superscripts

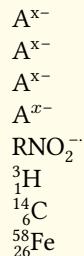

If a compound *ends* with a plus or minus sign it will be treated as charge sign and typeset as superscript. In other places a plus is treated as a triple bond and a dash will be used as a single bond, see section 25.5.

```
1 \ch{A+B} \ch{AB+} \\
2 \ch{A-B} \ch{AB-}
```

For longer charge groups or other superscripts you can use the math syntax. It recognizes groups and you can use math inside them. Inside these groups neither + nor - are treated as bonds. If a dot . is inside a superscript it is treated as indicator for a radical.

```
1 \ch{A^{x-}} \\
2 \ch{A^{x-}} \\
3 \ch{A^{x-}} \\
4 \ch{A^{x-$}} \\
5 \ch{RNO2^{-}} \\
6 \ch{^{31}H} \\
7 \ch{^{14}C} \\
8 \ch{^{58}_{26}\text{Fe}}
```

³³ CTAN: [chemmacros](#)

Ions and ion composites with more than one charge can be typeset quite as easy:

```
1 \ch{SO4^2-} \ch{Ca^2+ SO4^2-}
```

25.5. Bonds

There are three kinds of bonds:

```
1 single: \ch{CH3-CH3} \\
2 double: \ch{CH2=CH2} \\
3 triple: \ch{CH+CH}
```

25.6. Customization

These options allow you to customize the output of the compounds:

subscript-vshift = <dim> Extra vertical shift of the subscripts. Default = 0pt

subscript-style = text/math Style that is used to typeset the subscripts. Default = text

charge-hshift = <dim> Shift of superscripts when following a subscript. Default = .3ex

charge-style = text/math Style that is used to typeset the superscripts. Default = text

adduct-space = <dim> Space to the left and the right of the adduct point. Default = .1333em

bond-length = <dim> The length of the bonds. Default is the length of an endash as measured by `\settowidth{<len>}{\textendash}`.

Maybe you have noticed that charges of certain ions are a little bit shifted to the right:

```
1 \ch{SO4^2-} \ch{NH4+} \ch{Na+}
```

They are shifted if they *follow* a subscript. The amount of the shift can be set with the option **charge-hshift**.

```
1 \chemsetup[chemformula]{charge-hshift=0pt}
2 \ch{SO4^2-} \ch{NH4+} \ch{Na+} \\
3 \chemsetup[chemformula]{charge-hshift=1ex}
4 \ch{SO4^2-} \ch{NH4+} \ch{Na+}
```

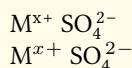

If you don't want the charges to be typeset in text mode you can switch to math mode:

```

1 \ch{M^x+} \ch{SO4^2-} \\
2 \chemsetup[chemformula]{charge-style = math}
3 \ch{M^x+} \ch{SO4^2-}

```

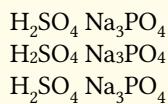

The option `subscript-vshift` can be used to adjust the vertical shift of the subscripts:

```

1 \ch{H2SO4} \ch{Na3PO4} \\
2 \chemsetup[chemformula]{subscript-vshift=.5ex}
3 \ch{H2SO4} \ch{Na3PO4} \\
4 \chemsetup[chemformula]{subscript-vshift=-.2ex}
5 \ch{H2SO4} \ch{Na3PO4}

```

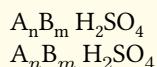

You can choose the mode subscripts are typeset in the same way as it is possible for the charges:

```

1 \ch{A_nB_m} \ch{H2SO4} \\
2 \chemsetup[chemformula]{subscript-style = math}
3 \ch{A_nB_m} \ch{H2SO4}

```

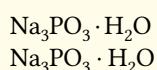

The option `adduct-space` sets the space left and right to the adduct symbol \cdot .

```

1 \ch{Na3PO3*H2O} \\
2 \chemsetup[chemformula]{adduct-space=.2em}
3 \ch{Na3PO3*H2O}

```

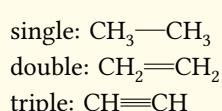

Changing the length of the bonds:

```

1 \chemsetup[chemformula]{bond-length=4mm}%
2 single: \ch{CH3-CH3} \\
3 double: \ch{CH2=CH2} \\
4 triple: \ch{CH+CH}

```

26. Special Input Types

There are some “special type” input groups. These are groups which consist of only one token, namely of the following ones:

`\ch{ + }` + creates the plus sign between compounds with space around it:

`\ch{2 Na + Cl2}` $2\text{Na} + \text{Cl}_2$

`\ch{ v }` ↓ sign for precipitate: `\ch{BaSO4 v}` $\text{BaSO}_4\downarrow$

`\ch{ ^ }` ↑ sign for escaping gas³⁴: `\ch{H2 ^}` $\text{H}_2\uparrow$

The space left and right of the plus sign can be set with this option:

`plus-space = <dim>` Default = .3em

```
1  \ch{A + B}\\"          A + B  
2  \ch[plus-space=4pt]{A + B}      A + B
```

27. Escaped Input

In some cases it may be desirable to prevent `CHEMFORMULA` from parsing the input. This can be done in two ways.

27.1. Text

If you put something between " " or ' ' then the input will be treated as normal text, except that spaces are not allowed and have to be input with ~.

`\ch{ "<escaped text>" }`

`\ch{ '<escaped text>' }`

```
1  \ch{"\ox{2,Ca}" 0} \\  
2  \ch{"\ldots\," Na + "\ldots\," Cl2 -> "\ldots\," NaCl} \\  
3  \ch{'A~->~B'}  
  
II  
CaO  
...Na + ...Cl2 → ...NaCl  
A->B
```

In many cases you won't need to escape the input. But when you get into trouble when using a command inside `\ch` try hiding it.

³⁴ Is this the correct English term? Please correct me if it isn't.

27.2. Math

If you especially want to input math you just enclose it with \$ \$. This output is different from the escaped text as it is followed by a space.

```
\ch{ $<escaped math>$ }
```

```
1  escaped text: \ch{"$x$" H2O} \\
2  escaped math: \ch{$x$ H2O} \\
3  \ch{$2n$ Na + $n$ Cl2 -> $2n$ NaCl}
```

escaped text: $x\text{H}_2\text{O}$
escaped math: $x\text{H}_2\text{O}$
 $2n\text{Na} + n\text{Cl}_2 \longrightarrow 2n\text{NaCl}$

The space that is inserted after a math group can be edited:

```
math-space = <dim> Default = .1667em
```

```
1  \ch{$2n$ Na + $n$ Cl2 -> $2n$ NaCl} \\
2  \chemsetup[chemformula]{math-space=.2em}
3  \ch{$2n$ Na + $n$ Cl2 -> $2n$ NaCl} \\
4  \ch{$A->B$}
```

$2n\text{Na} + n\text{Cl}_2 \longrightarrow 2n\text{NaCl}$
 $2n\text{Na} + n\text{Cl}_2 \longrightarrow 2n\text{NaCl}$
 $A \rightarrow B$

28. Arrows

28.1. Arrow types

Arrows are input in the same intuitive way they are with mhchem. There are six different types:

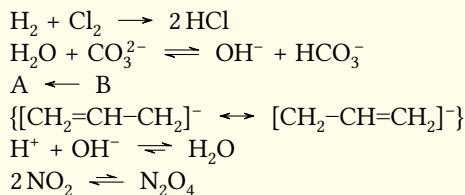

```
\ch{ -> } → standard right arrow
\ch{ <- } ← standard left arrow
\ch{ <-> } ↔ mesomeric arrow
\ch{ <=> } ⇌ equilibrium arrow
\ch{ <>> } ⇌ unbalanced equilibrium arrow to the right
\ch{ <>= } ⇌ unbalanced equilibrium arrow to the left
```

All these arrows are drawn with *TikZ*.

```

1 \ch{H2 + Cl2 -> 2 HCl} \\
2 \ch{H2O + CO3^2- <-> OH- + HCO3-} \\
3 \ch{A <- B} \\
4 \ch{[\{[CH2=CH-CH2]- <-> [CH2-CH=CH2]-\}]} \\
5 \ch{H+ + OH- <=> H2O} \\
6 \ch{2 NO2 <=> N2O4}

```

28.2. Labels

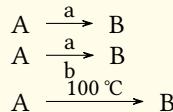

The arrows take two optional arguments to label them.

```
\ch{ ->[<above>][<below>] }
```

```

1 \ch{A ->[a] B} \\
2 \ch{A ->[a][b] B} \\
3 \ch{A ->[\SI{100}{\celsius}] B}

```

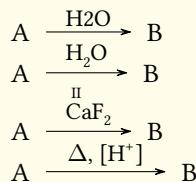

The label text can be parsed separately from the arrow. The recipe is easy: leave blanks.

```

1 \ch{A ->[H2O] B} \\
2 \ch{A ->[ H2O ] B} \\
3 \ch{A ->[ "\ox{2,Ca}" F2 ] B} \\
4 \ch{A ->[$\Delta$,~[H+]] B}

```

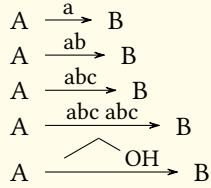

If you leave the blanks `CHEMFORMULA` treats the groups inside the square brackets as separated input types. The arrow reads its arguments *afterwards*. As you can see the arrows “grow” with the length of the labels. What stays constant is the part that protrudes the labels.

```

1 \ch{A ->[a] B} \\
2 \ch{A ->[ab] B} \\
3 \ch{A ->[abc] B} \\
4 \ch{A ->[abc~abc] B} \\
5 % needs the 'chemfig' package:
6 \setatomsep{15pt}
7 \ch{A ->[ "\chemfig{-[:-30]-[:-30]OH}" ] B}

```

28.3. Customization

These are the options which enable you to customize the arrows:

`arrow-offset` = <dim> This is the length that an arrow protrudes a label on both sides. This means an empty arrow's length is two times `arrow-offset`. Default = 1.5ex

`arrow-yshift` = <dim> Shifts an arrow up (positive value) or down (negative value). Default = 0pt

`arrow-ratio` = <factor> The ratio of the arrow lengths of the unbalanced equilibrium. .4 would mean that the length of the shorter arrow is $0.4 \times$ the length of the longer arrow. Default = .6

`arrow-tips` = <type> This specifies the arrow tips. In principle all of `TikZ`' arrows could be used. However, this option requires <type> to be an arrow tip itself *and* to have a left <type> and right <type> to be defined. This means if you don't define any arrow tips yourself you can only choose between `cf` and `to`. Default = `cf`

`arrow-style` = <tikz> `TikZ` keys for free customization of the arrows.

`compound-sep` = <dim> The space between compounds and the arrows. Default = 1ex

`label-offset` = <dim> The space between the labels and the arrows. Default = 2pt

`label-style` = The relative font size of the labels. Default = `\footnotesize`

The following code shows the effect of the different options on the <=>> arrow:

```

1 standard: \ch{A <=>>[x][y] B} \\
2 longer: \ch[arrow-offset=12pt]{A <=>>[x][y] B} \\
3 higher: \ch[arrow-yshift=2pt]{A <=>>[x][y] B} \\
4 more balanced: \ch[arrow-ratio=.8]{A <=>>[x][y] B} \\
5 other arrow tips: \ch[arrow-tips=to]{A <=>>[x][y] B} \\
6 labels further away: \ch[label-offset=4pt]{A <=>>[x][y] B} \\
7 larger distance to compounds: \ch[compound-sep=2ex]{A <=>>[x][y] B} \\
8 other TikZ: \ch[arrow-style={thick,red}]{A <=>>[x][y] B} \\
9 smaller labels: \ch[label-style=\tiny]{A <=>>[x][y] B}

```

standard: A \xrightarrow{y}^x B
 longer: A $\xrightarrow{\overbrace{y}^x}$ B
 higher: A $\xrightarrow[x]{y}$ B
 more balanced: A $\xrightarrow[y]{x}$ B
 other arrow tips: A $\xrightarrow[\overbrace{y}^x]$ B
 labels further away: A $\xrightleftharpoons[y]{x}$ B
 larger distance to compounds: A $\xrightleftharpoons[\overbrace{y}^x]{x}$ B
 other TikZ: A $\xrightarrow[\textcolor{red}{y}]{\textcolor{red}{x}}$ B
 smaller labels: A $\xrightleftharpoons[y]{x}$ B

If you define own pgfarrow³⁵ or the suiting aliases so that you have the arrow tips <type>, left <type> and right <type> available you can use them with the option `arrow-tips`:

```

1 % 'left hook' and 'right hook' are already defined in the tikzlibrary 'arrows'
2 \pgfarrowsdeclarealias{hook}{hook}{hooks}{hooks}%
3 % 'left hook reversed' and 'right hook reversed' are already defined in the
   tikzlibrary 'arrows'
4 \pgfarrowsdeclarealias{hook reversed}{hook reversed}{hooks reversed}{hooks reversed}%
5 %
5 \ch[arrow-tips=hook]{A -> B <=> C} \\
6 \ch[arrow-tips=hook reversed]{A -> B <=> C}

A  $\longrightarrow$  B  $\longleftarrow$  C
A  $\longrightarrow\!\!\!-\!\!\!$  B  $\longleftarrow\!\!\!-\!\!\!$  C

```

29. Names

29.1. Syntax

`CHEMFORMULA` has a built-in syntax to write text under a compound. In a way it works very similar to the arrows.

```
\ch{ !(<name>)( <formula> ) }
```

If an exclamation mark is followed by a pair of parentheses `CHEMFORMULA` will parse it this way:

```

1 \ch{ !(ethanol)( CH2CH2OH )}          CH2CH2OH
                                         ethanol

```

The same what's true for the arrows arguments holds for these arguments: if you leave blanks the different parts will be treated according to their input type before the text is set below the formula.

³⁵ See the pgfmanual for details.

```

1  \ch{!(water)(H2O)} \quad
2  \ch{!(`\textcolor{blue}{water}`)( H2O )} \quad
3  \ch{!( $2n-1$ )( H2O )} \quad
4  \ch{!( H2O )( H2O )} \quad
5  \ch{!(oxonium)( H3O+ )}

```

If for some reason you want to insert an exclamation mark *without* it creating a name you only have to make sure it isn't followed by parentheses.

```

1  \ch{H2O~(!)} \\
2  \ch{A!{}()}

```

29.2. Customization

`CHEMFORMULA` provides two options to customize the output of the names:

`name-format` = <commands> The format of the name. This can be arbitrary input. Default = `\scriptsize\centering`

`name-width` = <dim>/auto The width of the box where the label is put into. auto will detect the width of the name and set the box to this width. Default = auto

```

1  \ch{!(acid)( H2SO4 ) -> B} \\
2  \ch[name-format=\sffamily\small]{!(acid)( H2SO4 ) -> B} \\
3  \ch[name-format=\scriptsize N:~]{!(acid)( H2SO4 ) -> B} \\
4  \ch[name-width=3em,name-format=\scriptsize\raggedright]{!(acid)( H2SO4 ) -> B}

H2SO4 → B
acid
H2SO4 → B
acid
H2SO4 → B
N: acid
H2SO4 → B
acid

```

30. Format and Font

In the standard setting `CHEMFORMULA` doesn't make any default changes to the font of the formula output. Let's take a look at a nonsense input which shows all features:

```

1 \newcommand*\sample{\ch{H2C-C+C-CH=CH+ + CrO4^2- <=>[x][y] 2.5 Cl^- + 3_1/2 Na*OH
   _{(aq)} + !(name)( A^n ) "\LaTeXe"}
2 \sample
H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 

```

Now we're going to change different aspects of the font a look what happens:

```

1 \sffamily Hallo \sample \\
2 \ttfamily Hallo \sample \normalfont \\
3 \bfseries Hallo \sample \normalfont \\
4 \itshape Hallo \sample

Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name

```

As you can see most features adapt to the surrounding font.

If you want to change the default format you need to use this option:

format = <anything> Adds arbitrary code before the output of **\ch**.

```

1 \definecolor{newblue}{rgb}{.1,.1,.5}\chemsetup[chemformula]{format=\color{newblue}\sffamily}
2 \sffamily Hallo \sample \\
3 \ttfamily Hallo \sample \normalfont \\
4 \bfseries Hallo \sample \normalfont \\
5 \itshape Hallo \sample

Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name
Hallo H2C-C≡C-CH=CH+ + CrO42-  $\xrightleftharpoons[\text{y}]{\text{x}}$  2.5 Cl- + 3½ Na·OH(aq) + An  $\text{\LaTeXe}$ 
name

```

You can also specifically change the fontfamily, fontseries and fontshape of the output.

font-family = <family> Changes the fontfamily of the output with **\fontfamily{<family>} \selectfont**.

`font-series` = <series> Changes the fontseries of the output with `\fontseries{<series>}\\selectfont`.

`font-shape` = <shape> Changes the fontshape of the output with `\fontshape{<shape>}\\selectfont`

```

1  \chemsetup[chemformula]{font-series=bx}
2  Hallo \sample \\
3  \sffamily Hallo \sample \normalfont \\
4  \chemsetup[chemformula]{font-family=lmr,font-series=m} Hallo \sample \normalfont \\
5  \itshape Hallo \sample

Hallo H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
Hallo H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
Hallo H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na · OH(aq) + An LATEX 2ε
                                              name
Hallo H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na · OH(aq) + An LATEX 2ε
                                              name

```

If you're using X_{EL}ATEX or Lua_{EL}ATEX and have loaded `fontspec`³⁶ you have the possibility to set the font with it:

`font-spec` = {} or with options

`font-spec` = {[<options>]}

```

1  \chemsetup[chemformula]{font-spec={Linux Biolinum O}} \sample \\
2  \chemsetup[chemformula]{font-spec={[Color=darkgray]Augie}} \sample \\
3  \chemsetup[chemformula]{font-spec={Tipbrush Script}} \sample \\
4  \chemsetup[chemformula]{font-spec={Latin Modern Sans}} \sample \\
5  \bfseries \sample \normalfont \\
6  \chemsetup[chemformula]{font-spec={Feathergraphy Decoration}} \sample

H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name
H2C—C≡C—CH=CH+ + CrO42-  $\xrightarrow{\frac{x}{y}}$  2.5 Cl- + 3½ Na·OH(aq) + An LATEX 2ε
                                              name

```

³⁶ CTAN: [fontspec](#)

31. Usage In Math Equations

The `\ch` command can be used inside math equations. It recognizes `\&` and `\rightarrow` and passes them on. However, you can't use the optional arguments of `\&` inside `\ch`.

```
1  \begin{align}
2    \ch[arrow-tips=to]{}
3      H2O & ->[a] H2SO4 \\
4      Cl2 & ->[x][y] CH4
5    }
6  \end{align}
7  \begin{align*}
8    \ch{
9      RNO2 & & & & & & \\
10     & & & & & & \\
11     & & & & & & \\
12   }
13 \end{align*}
```

$$\text{H}_2\text{O} \xrightarrow{\text{a}} \text{H}_2\text{SO}_4 \quad (1)$$
$$\text{Cl}_2 \xrightarrow{\frac{x}{y}} \text{CH}_4 \quad (2)$$
$$\text{RNO}_2 \xrightleftharpoons{+ e^-} \text{RNO}_2^-$$
$$\text{RNO}_2^- \xrightleftharpoons{+ e^-} \text{RNO}_2^{2-}$$

32. Further Examples

This section just presents some examples of a possible usage.

```
1  \begin{reaction}[Synthese von Alkanen]
2    !(Synthesegas)( $n$ CO + $(2n+1)$ H2 ) ->[\SI{200}{\celsius}][ [ CoNi ] ] C_{\$n\$}H_{\$2n+2\$} + $n$ H2O
3  \end{reaction}
```

$$n \text{CO} + (2n + 1) \text{H}_2 \xrightarrow[\text{Synthesegas}]{\text{[CoNi]}} \text{C}_n\text{H}_{2n+2} + n \text{H}_2\text{O} \quad \{8\}$$

```
1  \begin{reactions*}
2    "a)" && CH4 + Cl2 -> CH3Cl + HCl && "{$\small \text{Chlormethan/Methylchlorid}$"} \\
3    "b)" && CH3Cl + Cl2 -> CH2Cl2 + HCl && "{$\small \text{Dichlormethan/Methylenchlorid}$"} \\
4    "c)" && CH2Cl2 + Cl2 -> CHCl3 + HCl && "{$\small \text{Trichlormethan/Chloroform}$"} \\
5    "d)" && CHCl3 + Cl2 -> CCl4 + HCl && "{$\small \text{Tetrachlormethan/Tetrachlorkohlenstoff}$"} \\
6  \end{reactions*}
```

- a) $\text{CH}_4 + \text{Cl}_2 \rightarrow \text{CH}_3\text{Cl} + \text{HCl}$ Chlormethan/Methylchlorid
- b) $\text{CH}_3\text{Cl} + \text{Cl}_2 \rightarrow \text{CH}_2\text{Cl}_2 + \text{HCl}$ Dichlormethan/Methylenchlorid
- c) $\text{CH}_2\text{Cl}_2 + \text{Cl}_2 \rightarrow \text{CHCl}_3 + \text{HCl}$ Trichlormethan/Chloroform
- d) $\text{CHCl}_3 + \text{Cl}_2 \rightarrow \text{CCl}_4 + \text{HCl}$ Tetrachlormethan/Tetrachlorkohlenstoff

```

1 \chemsetup[ox]{parse=false}\ch{"\ox{\delm,C}" -{} " \ox{\delp,M}" \qquad ( <-> "\ox{\delp,C}" -{} "\ox{\delm,Br}" )} \\

   &&"\Enthalpy{-23.0}" \\
6 \end{reactions*}

```

Part IV.

ghsystem

33. Setup

All of `GHSYSTEM`' options belong to the module `ghsystem`. This means they can be setup with

```
1  \chemsetup[ghsystem]{<options>} or
2  \chemsetup{ghsystem/<option1>,ghsystem/<option2>}
```

34. Get Hazard and Precautionary Statements

34.1. Simple Statements

The general usage is simple: you use the command

```
\ghs[<options>]{<type>}<number>
\ghs*[<options>]{<type>}<number>
```

There are three types available: h, euh and p. The `{<type>}` argument is case insensitive, so just type them in as you like.

```
1  \ghs{h}{200} \\
2  \ghs{H}{224} \\
3  \ghs{euh}{001} \\
4  \ghs{Euh}{202} \\
5  \ghs{p}{201}
```

H200: Unstable explosives.
H224: Extremely flammable liquid and vapour.
EUH001: Explosive when dry.
EUH202: Cyanoacrylate. Danger. Bonds skin and eyes in seconds. Keep out of the reach of children.
P201: Obtain special instructions before use.

The starred version hides the identifier and only gives the statement. If you want to hide the statement itself instead you can use the option:

```
hide = true/false
```

There is an option to customize the output, too.

```
space = <space command> Space between <type> and <number>.
```

```
1  \ghs{h}{200} \\
2  \ghs[space=\,]{h}{200} \\
3  \ghs*[h]{200} \\
4  \ghs[hide]{h}{200}
```

H200: Unstable explosives.
H200: Unstable explosives.
Unstable explosives.
H200

34.2. Statements with Placeholders

Some of the statements contain placeholders. They can be one of the following:

- *<state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard>*
- *<state specific effect if known>*
- *<or state all organs affected, if known>*
- *<name of sensitising substance>*

Except the last one which needs to be filled in, they are hidden per default. They can be made visible with the option

`fill-in = true/false` Show placeholders. Default = false

```
1 \ghs{h}{340} \\  
2 \ghs[fill-in]{h}{340} \\  
3 \ghs{h}{360} \\  
4 \ghs[fill-in]{h}{360} \\  
5 \ghs{h}{370} \\  
6 \ghs[fill-in]{h}{370} \\  
7 \ghs{euh}{208} \\  
8 \ghs[fill-in]{euh}{208}
```

H340: May cause genetic defects.

H340: May cause genetic defects. *<state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard>*

H360: May damage fertility or the unborn child.

H360: May damage fertility or the unborn child. *<state specific effect if known> <state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard>*

H370: Causes damage to organs.

H370: Causes damage to organs *<or state all organs affected, if known>.* *<state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard>*

EUH208: Contains *<name of sensitising substance>*. May produce an allergic reaction.

EUH208: Contains *<name of sensitising substance>*. May produce an allergic reaction.

These placeholders can be replaced with one of these options:

`exposure = <text>` exposure placeholder

`effect = <text>` effect placeholder

`organs = <text>` organ placeholder

`substance = <text>` substance placeholder

```

1  \ghs[exposure=This is how you get exposed.]{h}{340} \\
2  \ghs[effect=These are the effects.]{h}{360} \\
3  \ghs[organs=to this organ]{h}{370} \\
4  \ghs[substance=substance]{euh}{208}

```

H340: May cause genetic defects. This is how you get exposed.
H360: May damage fertility or the unborn child. These are the effects.
H370: Causes damage to this organ.
EUH208: Contains substance. May produce an allergic reaction.

34.3. Statements with Gaps

Some of the statements have gaps that can be filled.

```

1  \ghs{p}{301} \\
2  \ghs{p}{401} \\
3  \ghs{p}{411} \\
4  \ghs{p}{413}

```

P301: IF SWALLOWED:
P401: Store ...
P411: Store at temperatures not exceeding °C/°F.
P413: Store bulk masses greater than kg/lbs at temperatures not exceeding °C/°F.

These gaps can be filled using these options:

```

text = <text>

dots = <text>

C-temperature = <num>

F-temperature = <num>

kg-mass = <num>

lbs-mass = <num>

```

```

1  \ghs[dots=contact physician!]{p}{301} \\
2  \ghs[text=here]{p}{401} \\
3  \ghs[C-temperature=50, F-temperature=122]{p}{411} \\
4  \ghs[kg-mass=5.0, lbs-mass=11, C-temperature=50, F-temperature=122]{p}{413}

```

P301: IF SWALLOWED:
P401: Store ...
P411: Store at temperatures not exceeding 50 °C/122 °F.
P413: Store bulk masses greater than 5.0 kg/11 lbs at temperatures not exceeding 50 °C/122 °F.

34.4. Combined Statements

There are some combinations of statements. They are input with a + between the numbers:

```
1 \għs{p}{235+410} \\
2 \għs{p}{301+330+331}
```

P235 + P410: Keep cool. Protect from sunlight.
P301 + P330 + P331: IF SWALLOWED: rinse mouth. Do NOT induce vomiting.

Note that you can only get combinations that officially exist. *You can't combine freely.*

35. Pictograms

35.1. The Pictures

The GHS defines a number of pictograms:

The command

```
\ghspic[<options>]{<name>}
```

loads them. [Table 2](#) shows all available pictograms and their names.

```
1 \ghspic{skull}
```

If you don't like the default size you can change it using this option:

```
scale = <factor> Scales the pictogram. Default = 1
```

The pictures are actually quite large. The default setting scales them by a factor of $\frac{1}{20}$.

```
1 \ghspic[scale=2]{skull}
```

If you want to use some specific `\includegraphics` options, e. g. if you want to rotate the pictogram for some reason, use this option:

```
includegraphics = {<includegraphics keyvals>}
```

```
1 \ghspic[includegraphics={angle=90}]{skull}
```

Table 2: All available GHS pictograms.

| name | pictogram | name | pictogram |
|-----------------|-----------|-----------------|-----------|
| explos | | explos-1 | |
| explos-2 | | explos-3 | |
| explos-4 | | explos-5 | |
| explos-6 | | | |
| flame | | flame-2-white | |
| flame-2-black | | flame-3-white | |
| flame-3-black | | flame-4-1 | |
| flame-4-2 | | flame-4-3-white | |
| flame-4-3-black | | flame-5-2-white | |
| flame-5-2-black | | | |
| flame-0 | | flame-0-5-1 | |

| name | pictogram | name | pictogram |
|----------------|-----------|----------------|-----------|
| bottle | | bottle-2-black | |
| bottle-2-white | | | |
| acid | | acid-8 | |
| skull | | skull-2 | |
| skull-6 | | | |
| exclam | | | |
| health | | | |
| aqpol | | | |

35.2. Picture Type Depending on Engine

As you probably know you can't use every picture type with every compiler engine. `PDFTEX` in DVI mode needs eps pictures while `PDFTEX` in PDF mode, `XETEX` and `LuaTEX` convert eps pictures into pdf files, given they have the rights to write in the directory the pictures are saved in.

However, the latter can include jpg and png without any problems, while `PDFTEX` in DVI mode can't.

To resolve this `GHSYSTEM` tests which engine is used and if `PDFTEX` which mode is used and then chooses either eps or png for the pictograms. You are free to choose the picture type yourself with the option

```
pic-type = eps/jpg/png
```

36. Available Languages

Right now the H and P statements are only available in English or German. The package adapts the package option `german` but does not (yet) recognize language settings by `babel`³⁷ or `polyglossia`³⁸.

You can also choose the language explicitly.

³⁷ CTAN: `babel` ³⁸ CTAN: `polyglossia`

```
language = english/german
```

```
1  \għs{h}{201}          H201: Explosive; mass explosion hazard.  
2  
3  \chemsetup[ghsystem]{language=german}    H201: Explosiv, Gefahr der Massenexplosion.  
4  \għs{h}{201}
```

I will add other languages some time in future. This may take a while, though. If you would be willing to contribute and write the statements of another language please feel free to contact me³⁹. I would provide you with a template file, a pdf containing the official translations, and help to all your questions.

37. List of All Statements

If for some reason you want to list all sentences you can use

```
\għslistall[<options>]
```

This command has a number of options to customize the table, which is created with the `longtable` environment of the `longtable` package.

```
table-head-number = <text> Default = Identifier  
table-head-text = <text> Default = Statement  
table-next-page = <text> Default = continues on next page  
table-caption = <text> As <text> in \caption[<text>]. Default = All H, EUH, and P Statements.  
table-caption-short = <text> As <short> in \caption[<short>]{<text>}.  
table-label = <text> The label to refer to the table with \ref and similar commands. Default = tab:ghs-hp-statements  
table-row-sep = <dim> The separation of the table rows. A TeX dimension. Default = 3pt  
table-rules = default/booktabs/none The style of the horizontal rules in the table. default uses \hline, booktabs uses \toprule, \midrule or \bottomrule, resp. This option needs the booktabs40 package which you have to load yourself then. Default = default  
table-top-head-rule = default/booktabs/none Change top rule explicitly. Default = default  
table-head-rule = default/booktabs/none Change rule below head explicitly. Default = default  
table-foot-rule = default/booktabs/none Change foot rule explicitly. Default = default
```

³⁹ contact@mychemistry.eu ⁴⁰ CTAN: [booktabs](#)

`table-last-foot-rule` = `default/booktabs/none` Change last foot rule explicitly. Default = `default`

The code below shows how Table 3 was created:

```
1 \glslistall[fill-in,table-rules=booktabs]
```

Table 3: All H, EUH, and P Statements.

| Identifier | Statement |
|------------|--|
| H200 | Unstable explosives. |
| H201 | Explosive; mass explosion hazard. |
| H202 | Explosive, severe projection hazard. |
| H203 | Explosive; fire, blast or projection hazard. |
| H204 | Fire or projection hazard. |
| H205 | May mass explode in fire. |
| H220 | Extremely flammable gas. |
| H221 | Flammable gas. |
| H222 | Extremely flammable aerosol. |
| H223 | Flammable aerosol. |
| H224 | Extremely flammable liquid and vapour. |
| H225 | Highly flammable liquid and vapour. |
| H226 | Flammable liquid and vapour. |
| H228 | Flammable solid. |
| H240 | Heating may cause an explosion. |
| H241 | Heating may cause a fire or explosion. |
| H242 | Heating may cause a fire. |
| H250 | Catches fire spontaneously if exposed to air. |
| H251 | Self-heating: may catch fire. |
| H252 | Self-heating in large quantities; may catch fire. |
| H260 | In contact with water releases flammable gases which may ignite spontaneously. |
| H261 | In contact with water releases flammable gases. |
| H270 | May cause or intensify fire; oxidiser. |
| H271 | May cause fire or explosion; strong oxidiser. |
| H272 | May intensify fire; oxidiser. |
| H280 | Contains gas under pressure; may explode if heated. |

continues on next page

| Identifier | Statement |
|-------------------|---|
| H281 | Contains refrigerated gas; may cause cryogenic burns or injury. |
| H290 | May be corrosive to metals. |
| H300 | Fatal if swallowed. |
| H301 | Toxic if swallowed. |
| H302 | Harmful if swallowed. |
| H304 | May be fatal if swallowed and enters airways. |
| H310 | Fatal in contact with skin. |
| H311 | Toxic in contact with skin. |
| H312 | Harmful in contact with skin. |
| H314 | Causes severe skin burns and eye damage. |
| H315 | Causes skin irritation. |
| H317 | May cause an allergic skin reaction. |
| H318 | Causes serious eye damage. |
| H319 | Causes serious eye irritation. |
| H330 | Fatal if inhaled. |
| H331 | Toxic if inhaled. |
| H332 | Harmful if inhaled. |
| H334 | May cause allergy or asthma symptoms or breathing difficulties if inhaled. |
| H335 | May cause respiratory irritation. |
| H336 | May cause drowsiness or dizziness. |
| H340 | May cause genetic defects. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H341 | Suspected of causing genetic defects. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H350 | May cause cancer. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H351 | Suspected of causing cancer. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H360 | May damage fertility or the unborn child. <i><state specific effect if known> <state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H361 | Suspected of damaging fertility or the unborn child. <i><state specific effect if known> <state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H362 | May cause harm to breast-fed children. |

|-------------------|--|
| H370 | Causes damage to organs <i><or state all organs affected, if known></i> . <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H371 | May cause damage to organs <i><or state all organs affected, if known></i> . <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H372 | Causes damage to organs <i><or state all organs affected, if known></i> through prolonged or repeated exposure. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H373 | May cause damage to organs <i><or state all organs affected, if known></i> through prolonged or repeated exposure. <i><state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard></i> |
| H400 | Very toxic to aquatic life. |
| H410 | Very toxic to aquatic life with long lasting effects. |
| H411 | Toxic to aquatic life with long lasting effects. |
| H412 | Harmful to aquatic life with long lasting effects. |
| H413 | May cause long lasting harmful effects to aquatic life. |
| H350i | May cause cancer by inhalation. |
| H360F | May damage fertility. |
| H360D | May damage the unborn child. |
| H361f | Suspected of damaging fertility. |
| H361d | Suspected of damaging the unborn child. |
| H360FD | May damage fertility. May damage the unborn child. |
| H361fd | Suspected of damaging fertility. Suspected of damaging the unborn child. |
| H360Fd | May damage fertility. Suspected of damaging the unborn child. |
| H360Df | May damage the unborn child. Suspected of damaging fertility. |
| EUH001 | Explosive when dry. |
| EUH006 | Explosive with or without contact with air. |
| EUH014 | Reacts violently with water. |
| EUH018 | In use may form flammable/explosive vapour-air mixture. |
| EUH019 | May form explosive peroxides. |
| EUH044 | Risk of explosion if heated under confinement. |
| EUH029 | Contact with water liberates toxic gas. |
| EUH031 | Contact with acids liberates toxic gas. |
| EUH032 | Contact with acids liberates very toxic gas. |

| Identifier | Statement |
|-------------------|---|
| EUH066 | Repeated exposure may cause skin dryness or cracking. |
| EUH070 | Toxic by eye contact. |
| EUH071 | Corrosive to the respiratory tract. |
| EUH059 | Hazardous to the ozone layer. |
| EUH201 | Contains lead. Should not be used on surfaces liable to be chewed or sucked by children. |
| EUH201A | Warning! contains lead. |
| EUH202 | Cyanoacrylate. Danger. Bonds skin and eyes in seconds. Keep out of the reach of children. |
| EUH203 | Contains chromium(VI). May produce an allergic reaction. |
| EUH204 | Contains isocyanates. May produce an allergic reaction. |
| EUH205 | Contains epoxy constituents. May produce an allergic reaction. |
| EUH206 | Warning! Do not use together with other products. May release dangerous gases (chlorine). |
| EUH207 | Warning! Contains cadmium. Dangerous fumes are formed during use. See information supplied by the manufacturer. Comply with the safety instructions. |
| EUH208 | Contains <i><name of sensitising substance></i> . May produce an allergic reaction. |
| EUH209 | Can become highly flammable in use. |
| EUH209A | Can become flammable in use. |
| EUH210 | Safety data sheet available on request. |
| EUH401 | To avoid risks to human health and the environment, comply with the instructions for use. |
| P101 | If medical advice is needed, have product container or label at hand. |
| P102 | Keep out of reach of children. |
| P103 | Read label before use. |
| P201 | Obtain special instructions before use. |
| P202 | Do not handle until all safety precautions have been read and understood. |
| P210 | Keep away from heat/sparks/open flames/hot surfaces. — No smoking. |
| P211 | Do not spray on an open flame or other ignition source. |
| P220 | Keep/Store away from clothing/.../combustible materials. |
| P221 | Take any precaution to avoid mixing with combustibles ... |
| P222 | Do not allow contact with air. |
| P223 | Keep away from any possible contact with water, because of violent reaction and possible flash fire. |

| P230 | Keep wetted with ... |
| P231 | Handle under inert gas. |
| P232 | Protect from moisture. |
| P233 | Keep container tightly closed. |
| P234 | Keep only in original container. |
| P235 | Keep cool. |
| P240 | Ground/bond container and receiving equipment. |
| P241 | Use explosion-proof electrical/ventilating/lighting/... equipment. |
| P242 | Use only non-sparking tools. |
| P243 | Take precautionary measures against static discharge. |
| P244 | Keep reduction valves free from grease and oil. |
| P250 | Do not subject to grinding/shock/.../friction. |
| P251 | Pressurized container: Do not pierce or burn, even after use. |
| P260 | Do not breathe dust/fume/gas/mist/vapours/spray. |
| P261 | Avoid breathing dust/fume/gas/mist/vapours/spray. |
| P262 | Do not get in eyes, on skin, or on clothing. |
| P263 | Avoid contact during pregnancy/while nursing. |
| P264 | Wash ... thoroughly after handling. |
| P270 | Do not eat, drink or smoke when using this product. |
| P271 | Use only outdoors or in a well-ventilated area. |
| P272 | Contaminated work clothing should not be allowed out of the workplace. |
| P273 | Avoid release to the environment. |
| P280 | Wear protective gloves/protective clothing/eye protection/face protection. |
| P281 | Use personal protective equipment as required. |
| P282 | Wear cold insulating gloves/face shield/eye protection. |
| P283 | Wear fire/flame resistant/retardant clothing. |
| P284 | Wear respiratory protection. |
| P285 | In case of inadequate ventilation wear respiratory protection. |
| P231 + P231 | Handle under inert gas. Protect from moisture. |
| P235 + P410 | Keep cool. Protect from sunlight. |

Suggestions and Bug Reports

Feedback on `CHEMMACROS`, `CHEMFORMLA` and `GHSYSTEM` is highly appreciated and welcome! If you have suggestions for macros, missing features etc., please don't hesitate to contact me. If you recognize any errors, be it chemical ones, wrong documentation and the like, I'd be grateful about a short email⁴¹.

If you find any bugs, it would be best, if you'd send me a minimal example, with which I can reproduce the bug. You can also submit an issue on <https://bitbucket.org/cgnieder/chemmacros/> instead.

Many thanks to all the people, who already provided me with feedback!

⁴¹ contact@mychemistry.eu

Index

Section titles are indicated **bold**, packages sans serif, commands `\brown`, keys `green` and modules (only `CHEMMACROS`) `red`.
