# The collectbox package

Martin Scharrer martin@scharrer-online.de

http://www.ctan.org/pkg/collectbox

v0.3 from 2011/08/06

#### Abstract

This package provides macros to collect and process an macro argument (i.e. something which looks like a macro argument) as horizontal box instead as a real macro argument. These "arguments" will be stored like when using \savebox, \sbox or the lrbox environment and allow verbatim or other special code. Instead of explicit braces also implicit braces in the form of \bgroup and \egroup are supported. This allows to split the begin and end over different macros or to place them in the begin and end code of an environment. The provided macros are mainly intended to be used inside other macros or environments.

Disclaimer: This is an beta release of this package and the code might still change in future releases.

### 1 Quick overview

The following macros are provided for users (document authors) and LTEX package authors/programmers and described in the following sections. The \* and  $[\langle \dots \rangle]$  arguments are as always optional. The  $\{\langle box\ content \rangle\}$  can also be written as  $\{bgroup \langle box\ content \rangle\}$  egroup and be split across macro boundaries.

```
\collectbox*[\langle code\ at\ begin\rangle] \{\langle code\rangle\} [\langle code\ at\ end\rangle] \{\langle box\ content\rangle\} \\ \collectboxto\{\langle box\ register\rangle\} \{\langle code\rangle\} \{\langle box\ content\rangle\} \\ \collectboxcheckenv\{\langle name\rangle\}
```

```
\label{eq:collectboxQ} $$ \operatorname{code}(\operatorname{code}(\operatorname{code})) {\operatorname{code}(\operatorname{code})} {\operatorname{code}(\operatorname{code})} {\operatorname{code}(\operatorname{code})} {\operatorname{code}(\operatorname{code})} {\operatorname{code}(\operatorname{code}(\operatorname{code}))} {\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}
```

## 2 Dependencies, Compatibility and Installation

This package does not depend on any other LTEX package or class. It should be compatible with all versions of LTEX(DVI-LTEX, pdfLTEX, XeLTEX and LualLTEX). Colored content will be correctly handled.

This package should be (soon) part of the standard distributions TeXLive and MikTeX and can be installed over the provided package manager (i.e. with TeXLive: tlmgr install collectcell). This package can be also manually unpacked from collectbox.dtx by compiling the file collectbox.ins with LTeX or TeX. This documentation can be created by compiling collectbox.dtx using pdfLTeX in DVI or PDF mode. The unpackaged package file collectbox.sty should be copied to a newly created directory named \$TEXMF/tex/latex/collectbox/ under Linux or %TEXMF%\tex\latex\collectbox\ under MS Windows where \$TEXMF and %TEXMF% represents the local TeX tree. The documentation and README file can be copied to \$TEXMF/doc/latex/collectbox/. Some TeX distributions require to update the list of files in the TeX tree, e.g. by running texmf \$TEXMF afterwards. MikTeX users can use the graphical interface of the package manager.

### 3 User Interface

The following macros are provided on the user level.

#### 3.1 Macros to collect boxes

```
\label{eq:collectbox} $$ \collectbox{$\langle code \rangle$} {\langle box\ content \rangle$} $$ \collectbox{$\langle code \rangle$} \bgroup{$\langle box\ content \rangle$} $$
```

In its basic form this macro is written as  $\verb|collectbox|{|}\langle code\rangle|$  and collects the following 'group' in explicit ( $\{\ ...\ \}$ ) or implicit ( $\verb|bgroup\ ...\ \egroup$ ) braces as box (here represented as  $\{\langle box\ content\rangle\}$ ). Afterwards the user provided  $\langle code\rangle$  is executed. This code is processed inside an internal group and has access to the just collected content using  $\ensuremath{|BOXCONTENT|}$  and other macros described further below. Usually the code does some calculations and/or modifications on the collected box and then typesets it using  $\ensuremath{|BOXCONTENT|}$ .

An example is

\collectbox{\fbox{\BOXCONTENT}}}{\verb+verbatim stuff \space\empty+}
which results in

```
verbatim stuff \space\empty
```

```
\label{localization} $$ \operatorname{collectbox} {\langle code \rangle} {\langle box\ content \rangle} $$ \operatorname{collectbox} {\langle code \rangle} \operatorname{bgroup} {\langle box\ content \rangle} $$
```

Because very often the \BOXCONTENT is simply fed as argument to a macro at the end of the  $\langle code \rangle$  a star version exists which adds {\BOXCONTENT} automatically to the end of the code.

An above example can be therefore simplified as:

```
\collectbox*{\fbox}{\verb+verbatim stuff \space\empty+}
```

which results in:

```
verbatim stuff \space\empty
```

Using this macro a **\fbox** variant can be defined which reads its content as real box and not as macro argument:

```
\newcommand{\Fbox}{\collectbox*{\fbox}}
```

```
\label{lem:collectbox} $$ \operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{code}(\operatorname{
```

Finally two optional arguments exists which allow the placement of further code at the beginning and end of the collected box. This code is part of the box and is expanded before the main  $\langle code \rangle$  which is expanded after the box is fully collected. In other words \collectbox[ $\langle code \ at \ begin \rangle$ ] { $\langle code \ at \ end \rangle$ } [ $\langle code \ at \ end \rangle$ ] { $\langle box \ content \rangle$ } is basically the same as \collectbox{ $\langle code \rangle$ }{ $\langle code \ at \ begin \rangle$ }. $\langle box \ content \rangle$ }, with the difference that the first form allows an user defined macro to set the begin and end code while the box content is provided by the user. Note that there is also some internal code  $\langle . \rangle$  between  $\langle code \ at \ begin \rangle$  and  $\langle box \ content \rangle$  as well as between  $\langle box \ content \rangle$  and  $\langle code \ at \ end \rangle$ .

**Example:** \fbox like macro which reads its "argument" as box and sets it green first:

#### \collectedbox

This macro represents the box register defined by  $\mbox{newsavebox}$  which holds the collected box. It can be used with the Lagrange macro  $\mbox{usebox}{\langle box register \rangle}$  or with plain TeX macros like  $\mbox{box}$ ,  $\mbox{copy}$ ,  $\mbox{unhbox}$  or  $\mbox{unhcopy}$ .

#### **\BOXCONTENT**

This macro is short for  $\sp \collectedbox \$  and will place the collected box into the document. It can be used multiple times inside  $\langle code \rangle$ .

```
\width
\height
\depth
\totalheight
```

These macros represent the dimension of the collected box and can be used inside  $\langle code \rangle$ . Here \height is the height of the box above the baseline and \depth the lengths how far the box is going below the baseline. Both values added together are provides as \totalheight. The box width is given by \width.

```
\label{localectboxto} $$ \operatorname{\langle box\ register\rangle} [\langle code\ at\ begin\rangle] {\langle code\rangle} [\langle code\ at\ end\rangle] {\langle box\ content\rangle} $$ \operatorname{\langle box\ register\rangle} [\langle code\ at\ begin\rangle] {\langle code\rangle} [\langle code\ at\ end\rangle] $$ \error content\rangle $$
```

This macro collects its last "argument" as horizontal box and stores into into the user provided  $\langle box\ register \rangle$ . The  $\langle code\ at\ begin \rangle$  and  $\langle code\ at\ end \rangle$  are executed at begin and end of the  $\langle box\ content \rangle$  as part of the box. Afterwards the user provided  $\langle code \rangle$  is executed. In contrast to  $\langle collectbox\ no$  group is added for both the box register assignment or the code and also none of the above auxiliary macros for the box dimensions and content can be used. The collected box can be typeset using  $\langle box\ register \rangle$  and its width, height and depth dimensions can be accessed using the TeX primitives  $\langle dox\ register \rangle$ ,  $\langle dox\ register \rangle$ .

Appropriate grouping must be added manually if the overall code should be kept local. Proper places to open and close the group is somewhere before the \collectboxto macro and in the \code\rangle after the box was used, respectively. The box register must be declared beforehand using \newsavebox (FTEX) or \newbox(TEX). The provided box register \collectedbox can be used here but will be overwritten by further usages of most of the macros of this package. The FTEX code also provides \@tempboxa for temporary usages.

This macro can be used to create macros which collect more than one argument as box. For this two box registers are required and the  $\langle code \rangle$  of the first \collectboxto usage must call it second time. The second  $\langle code \rangle$  then typesets the two boxes.

### 3.2 Support for environments

```
\collectboxcheckenv{\langle name \rangle}
```

This macro allows macros which use **\collectbox** to also be used as an environment. For this **\collectboxcheckenv** must be used before **\collectbox** with the macro name as argument. It then detects if the macro is used by itself or is called by **\begin**{ $\langle name \rangle$ } and adjusts the internal configuration accordantly. In macro-mode it does not change anything, but in environment-mode a **\begingroup** is used to keep the configuration changes local. The corresponding **\end(name)** macro need to close then both the box group using **\egroup** and then close the outer group **\engroup**. A suitable version is automatically defined if this macro doesn't exists yet. In environment-mode starting and trailing spaces are ignored which is also the normal behaviour of similar environments like minipage.

**Example:** Defines \foobar macro which can also be used as foobar environment.

```
\newcommand*{\foobar}{%
    \collectboxcheckenv{foobar}%
    \collectbox*{\fbox}%
}
```

## 4 Programmers Interface

For the package author/programmer and more advanced users the following internal macros are provided. If used inside a document file they must be wrapped inside \makeatletter and \makeatother (outside the macro which uses them).

```
\collectbox{@{}(code\ at\ begin)}{(code)}{(code\ at\ end)}{(box\ content)}
```

This macro is the internal form of \collectbox with the optional arguments replaced by mandatory ones. The \collectbox macro itself uses it after checking for and reading the optional arguments. If this macro is to be used in other macros this overhead can be avoided by using the internal form directly. Not used optional arguments can be simply kept empty. The star version is not supported but can be easily substituted by manually placing the {\box\conventure} at the end of  $\langle code \rangle$ .

The above example can therefore be written in the faster processed form:

```
\collectbox{\langle code \rangle}{\langle box\ content \rangle}
```

This macro is a short version of **\collectbox** and only accepts one argument  $\langle code \rangle$  besides the later  $\langle box\ content \rangle$ . It is intended for quick version for macros which do not need to insert code at begin or after the box content.

```
\verb|\collectboxto@{<| code at begin|} + {<| code|} + {<| code at end|} + {<| box content|} + {<| code at end|} + {<| code at e
```

This macro is the internal form of \collectboxto with the optional arguments replaced by mandatory ones. The \collectboxto macro itself uses it after checking for and reading the optional arguments. If this macro is to be used in other macros this overhead can be avoided by using the internal form directly. Not used optional arguments can be simply kept empty.

```
\verb|\collectboxto|{\langle box\ register\rangle}|{\langle code\rangle}|{\langle box\ content\rangle}|
```

This macro is a short version of **\collectboxto** and only accepts one  $\langle code \rangle$  argument. It is intended for quick version for macros which do not need to insert code at begin or after the box content.

```
\verb|\nocollectbox@{<| code at begin|} {<| code| } {<| code at end|} }
```

Turns a following brace group into basically  $\host down delta begin \content \code at end \code at begin \content \code at end \code at begin \content \code at begin \code at end \code at begin \code at begin \code at end \code at begin \code a$
