Chapter 1

Some easy usages of crossreftools

Let us refer the usual way: Chapter 3

The counter for `\foochapterlabel` is chapter or chapter. It is used on page 11. The value for the misspelled label name is [UNDEFINED], whereas the correct value is 3.

The result is \square

1.1 Extracting usual reference information

Extracting content with `\crtextractref`

- reference: 3
- page: 11

If the `\hyperref` package is loaded, further properties are retrievable:

- name: This is foo
- hyperanchor: chapter.3
- unused:

The 5th (and usually empty) label property introduced by `hyperref` is unused as of version v6.85a of that package – [UNDEFINED] will return nothing here, i.e. the expansion is empty.

This works only if there is usual hyper anchor for the counter: equation.

1.2 Extracting the cleveref names

- The lower case cross reference name for `\fooequationlabel` is eq., this time using `\crtcurnamebylabel`; the upper case name is Equation.
- Extracting content with `\crtextractcref`
 - counter: chapter
 - number: 3
 - result:
 - reference: 3
 - page: 11

The macro `\crtextractcref` is expandable! Using the stored value for counter: chapter!

See Equation 2 and section 3.3.

Chapter 2

Placing more generic labels

Let us place a label without a counter

See Let us plant a label not being connected to a counter: or Let us place a label without a counter on page 8

Chapter 3

This is foo

3.6 Foo

$$E = mc^2 \tag{3.1}$$

$$E = mc^2 \tag{3.2}$$

3.7 Another foo bar section

$$a^2 + b^2 = c^2 \tag{3.3}$$
