## 1 Introduction

### 1.1 About

The elatex package is a toolbox of programming facilities geared primarily towards LaTeX class and package authors. It provides LaTeX frontends to some of the new primitives provided by e-TeX as well as some generic tools which are not strictly related to e-TeX but match the profile of this package. This package will not modify any part of the LaTeX kernel. Its name is not meant to imply that it patches LaTeX such that the kernel makes use of e-TeX facilities by default. The package is work in progress. At present, it provides facilities for macro definitions, expansion control, hook management, and macro patching.

### 1.2 License

Copyright © 2007 Philipp Lehman. This package is author-maintained. Permission is granted to copy, distribute and/or modify this software under the terms of the LaTeX Project Public License, version 1.3. ${ }^{1}$ This software is provided 'as is', without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

### 1.3 Contributions and feedback

I started to work on this package when I found myself implementing the same tools and shorthands I had employed in previous LaTeX packages for yet another package. For the most part, the facilities provided by elatex address my needs as a package author and future development is likely to be guided by these needs as well. Please note that I will not be able to address any feature requests. How-

[^0]ever，I am open to contributions by other class and package authors，provided that the contributed code is sufficiently generic，matches the profile of this pack－ age，and may be added to the package without requiring significant adaption．

## 1．4 Acknowledgments

The \ifblank test of this package is based on code by Donald Arseneau．

## 2 User commands

The facilities in this section are geared towards regular users as well as class and package authors．

## 2．1 Definitions

\newrobustcmd\｛ $\langle$ command $\rangle$［ $\langle\langle$ arguments $\rangle$ ］［ $\langle$ optarg default $\rangle$ ］\｛〈definition $\rangle\}$
The syntax and behavior of this command is similar to \newcommand except that the newly defined 〈command〉 is robust．This command differs from the \DeclareRobustCommand command from the LaTeX kernel in that it issues an error rather than just an informational message if the 〈command〉 is already de－ fined．Since it uses e－TeX＇s low－level protection mechanism rather than the cor－ responding high－level LaTeX facilities，it does not require an additional macro to implement the＇robustness＇．This command itself is also robust．
\renewrobustcmd\｛〈command $\rangle\}[\langle$ arguments $\rangle][\langle$ optarg default $\rangle]\{\langle$ definition $\rangle\}$
The syntax and behavior of this command is similar to }[\langle\) arguments $\rangle][\langle$ optarg default $\rangle]\{\langle$ definition $\rangle\}$
The syntax and behavior of this command is similar to \providecommand ex－ cept that the newly defined $\langle$ command $\rangle$ is robust．Note that this command only provides a robust definition if the $\langle$ command $\rangle$ is undefined．It will not make an already defined 〈command〉 robust．This command itself is robust．

## 2．2 Patching

\robustify\｛〈command $\rangle$ \}
Redefines a 〈command〉 such that it is robust without altering its syntax or def－ inition．If the 〈command〉 has been defined with \DeclareRobustCommand，this will be detected automatically．LaTeX＇s high－level protection mechanism is re－ placed by the corresponding low－level e－TeX facility in this case．This command is robust and may only be used in the document preamble．

## 3 Author commands

The facilities in this section are geared towards class and package authors．

## 3．1 Definitions

The facilities in this section are simple but frequently required shorthands which extend the scope of the \＠namedef and \＠nameuse macros from the LaTeX ker－ nel．
\csdef $\{\langle$ csname $\rangle\}\langle$ arguments $\rangle\{\langle$ definition $\rangle\}$
Similar to the TeX primitive \def except that it takes a control sequence name as its first argument．This command is robust and corresponds to \＠namedef．
$\backslash c s g d e f\{\langle$ csname $\rangle\}\langle$ arguments $\rangle\{\langle$ definition $\rangle\}$
Similar to the TeX primitive \gdef except that it takes a control sequence name as its first argument．This command is robust．
\csedef $\{\langle$ csname $\rangle\}\langle$ arguments $\rangle\{\langle$ definition $\rangle\}$
Similar to the TeX primitive \edef except that it takes a control sequence name as its first argument．This command is robust．
$\backslash c s x d e f\{\langle c s n a m e\rangle\}\langle$ arguments $\rangle\{\langle$ definition $\rangle\}$
Similar to the TeX primitive \xdef except that it takes a control sequence name as its first argument．This command is robust．

## \protected＠csedef\｛〈csname $\rangle$ \}〈arguments $\rangle\{\langle$ definition $\rangle\}$

Similar to \osedef except that LaTeX＇s protection mechanism is temporarily en－ abled．To put it in other words：this command is similar to the LaTeX kernel command \protected＠edef except that it takes a control sequence name as its first argument．This command is robust．
\protected＠csxdef\｛〈csname $\rangle\}\langle$ arguments $\rangle\{\langle$ definition $\rangle\}$
Similar to \csxdef except that LaTeX＇s protection mechanism is temporarily en－ abled．To put it in other words：this command is similar to the LaTeX kernel command \protected＠xdef except that it takes a control sequence name as its first argument．This command is robust．
\cslet $\{\langle$ csname $\rangle\}\{\langle$ command $\rangle\}$
Similar to the TeX primitive \let except that the first argument is a control sequence name．This command is robust．
$\backslash 1$ etcs $\{\langle$ command $\rangle\}\{\langle$ csname $\rangle\}$
Similar to the TeX primitive \let except that the second argument is a control sequence name．This command is robust．
\csletcs $\{\langle$ csname $\rangle\}\{\langle$ csname $\rangle\}$
Similar to the TeX primitive \let except that both arguments are control se－ quence names．This command is robust．
$\backslash c s u s e\{\langle$ csname $\rangle\}$
Takes a control sequence name as its argument and forms a control sequence token．This command differs from the \＠nameuse macro from the LaTeX kernel in that it expands to an empty string if the control sequence is undefined．

## 3．2 Arithmetic definitions

The facilities in this section permit calculations using macros rather than length registers and counters．
\numdef $\{\langle$ command $\rangle\}\{\langle$ integer expression $\rangle\}$
This command is similar to \edef except that the 〈integer expression〉 is pro－ cessed with \numexpr．The 〈integer expression〉 may be any arbitrary code which is valid in this context．The definition assigned to 〈command $\rangle$ will be the result of that calculation．If the $\langle$ command $\rangle$ is undefined，it will be initialized to＇ 0 ＇before the $\langle$ integer expression $\rangle$ is processed．
\numgdef $\{\langle$ command $\rangle\}\{\langle$ integer expression $\rangle\}$
Similar to \numdef except that the assignment is global．
\csnumdef\｛〈csname $\rangle\}\{\langle$ integer expression $\rangle\}$
Similar to \numdef except that it takes a control sequence name as its first argu－ ment．
\csnumgdef $\{\langle$ csname $\rangle\}\{\langle$ integer expression $\rangle\}$
Similar to \numgdef except that it takes a control sequence name as its first argument．
\dimdef $\{\langle$ command $\rangle\}\{\langle$ dimen expression $\rangle\}$
This command is similar to \edef except that the $\langle$ dimen expression $\rangle$ is processed with \dimexpr．The 〈dimen expression〉 may be any arbitrary code which is valid in this context．The definition assigned to $\langle$ command $\rangle$ will be the result of that calculation．If the $\langle$ command $\rangle$ is undefined，it will be initialized to＇0pt＇before the $\langle$ dimen expression $\rangle$ is processed．
\dimgdef $\{\langle$ command $\rangle\}\{\langle$ dimen expression $\rangle\}$
Similar to \dimdef except that the assignment is global．
\csdimdef\｛〈csname〉\}\{〈dimen expression $\rangle\}$
Similar to \dimdef except that it takes a control sequence name as its first argu－ ment．
$\backslash$ csdimgdef $\{\langle$ csname $\rangle\}\{\langle$ dimen expression $\rangle\}$
Similar to \dimgdef except that it takes a control sequence name as its first argument．

```
    \gluedef{\langlecommand\rangle}{\langleglue expression\rangle}
```

This command is similar to \edef except that the 〈glue expression〉 is processed with \glueexpr．The 〈glue expression〉 may be any arbitrary code which is valid in this context．The definition assigned to 〈command〉 will be the result of that calculation．If the 〈command〉 is undefined，it will be initialized to＇0pt plus Opt minus Opt＇before the $\langle g l u e ~ e x p r e s s i o n\rangle ~ i s ~ p r o c e s s e d . ~$
\gluegdef $\{\langle$ command $\rangle\}\{\langle$ glue expression $\rangle\}$
Similar to \gluedef except that the assignment is global．
\csgluedef $\{\langle$ csname $\rangle\}\{\langle$ glue expression $\rangle\}$
Similar to \gluedef except that it takes a control sequence name as its first argument．

## $\backslash c s g l u e g d e f\{\langle c s n a m e\rangle\}\{\langle$ glue expression $\rangle\}$

Similar to \gluegdef except that it takes a control sequence name as its first argument．

Imudef $\{\langle$ command $\rangle\}\{\langle$ muglue expression $\rangle\}$
This command is similar to \edef except that the $\langle$ muglue expression〉 is pro－ cessed with \muexpr．The $\langle$ muglue expression $\rangle$ may be any arbitrary code which is valid in this context．The definition assigned to $\langle$ command $\rangle$ will be the result of that calculation．If the $\langle$ command $\rangle$ is undefined，it will be initialized to＇ 0 mu ＇ before the $\langle$ muglue expression〉 is processed．
$\backslash m u g d e f\{\langle$ command $\rangle\}\{\langle$ muglue expression $\rangle\}$
Similar to \mudef except that the assignment is global．
\csmudef $\{\langle$ csname $\rangle\}\{\langle$ muglue expression $\rangle\}$
Similar to \mudef except that it takes a control sequence name as its first argu－ ment．
\csmugdef $\{\langle$ csname $\rangle\}\{\langle$ muglue expression $\rangle\}$
Similar to \mugdef except that it takes a control sequence name as its first argu－ ment．

## 3．3 Expansion control

The facilities in this section are useful to control expansion in an \edef or a similar context．

## \expandonce\｛〈command $\rangle$ \}

This command expands 〈command〉 once and prevents further expansion of the replacement text．
\csexpandonce\｛〈csname〉\}
Similar to \expandonce except that it takes a control sequence name as its argu－ ment．
\protecting\｛〈code $\rangle$ \}
This command applies LaTeX＇s protection mechanism，which normally requires prefixing each fragile command with $\backslash$ protect，to an entire chunk of arbitrary $\langle c o d e\rangle$ or text．Its behavior depends on the current state of \protect．Note that the braces around $\langle$ code $\rangle$ are mandatory even if it is a single token．

## 3．4 Hook management

The facilities in this section are intended for hook management．A＇hook＇in this context is a plain macro without any arguments and prefixes which is used to collect code to be executed later．These facilities may also be useful to patch simple macros by appending code to them．For more complex patching opera－ tions，see section 3．5．All commands in this section will initialize the hook if it is undefined．

## 3．4．1 Appending code to a hook

The facilities in this section append arbitrary code to a hook．
\appto\｛〈command $\rangle\}\{\langle$ code $\rangle\}$
This command appends arbitrary $\langle$ code $\rangle$ to a $\langle$ command $\rangle$ ．If the $\langle$ code $\rangle$ contains any parameter characters，they need not be doubled．This command is robust．
\gappto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \appto except that the assignment is global．This command may be used as a drop－in replacement for the \g＠addto＠macro command in the LaTeX kernel．
\eappto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
This command appends arbitrary $\langle$ code $\rangle$ to a $\langle$ command $\rangle$ ．The $\langle$ code $\rangle$ is expanded at definition－time．Only the new $\langle$ code $\rangle$ is expanded，the current definition of〈command〉 is not．This command is robust．
\xappto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \eappto except that the assignment is global．
\protected＠eappto\｛〈command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \eappto except that LaTeX＇s protection mechanism is temporarily en－ abled．
\protected＠xappto\｛〈command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \xappto except that LaTeX＇s protection mechanism is temporarily en－ abled．
\csappto\｛〈csname $\rangle\}\{\langle$ code $\rangle\}$
Similar to \appto except that it takes a control sequence name as its first argu－ ment．
\csgappto\｛〈csname $\rangle\}\{\langle$ code $\rangle\}$
Similar to \gappto except that it takes a control sequence name as its first argu－ ment．
\cseappto\｛〈csname〉\}\{〈code〉\}
Similar to \eappto except that it takes a control sequence name as its first argu－ ment．
\csxappto\｛〈csname〉\}\{〈code $\rangle\}$
Similar to \xappto except that it takes a control sequence name as its first argu－ ment．
$\backslash$ protected＠cseappto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \protected＠eappto except that it takes a control sequence name as its first argument．
\protected＠csxappto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \protected＠xappto except that it takes a control sequence name as its first argument．

## 3．4．2 Prepending code to a hook

The facilities in this section＇prepend＇arbitrary code to a hook，i．e．，the code is inserted at the beginning of the hook rather than being added at the end．
\preto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \appto except that the $\langle$ code $\rangle$ is＇prepended＇，i．e．，inserted at the be－ ginning of the hook rather than being added at the end．

## \gpreto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$

Similar to \preto except that the assignment is global．

```
\epreto{\langlecommand\rangle}{\langlecode\rangle}
```

Similar to \eappto except that the $\langle$ code $\rangle$ is＇prepended＇，i．e．，inserted at the beginning of the hook rather than being added at the end．
\xpreto\｛〈command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \epreto except that the assignment is global．
\protected＠epreto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \epreto except that LaTeX＇s protection mechanism is temporarily en－ abled．
\protected＠xpreto\｛〈command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \xpreto except that LaTeX＇s protection mechanism is temporarily en－ abled．
\cspreto\｛〈csname〉\}\{〈code〉\}
Similar to \preto except that it takes a control sequence name as its first argu－ ment．
\csgpreto\｛〈csname $\rangle\}\{\langle$ code $\rangle\}$
Similar to \gpreto except that it takes a control sequence name as its first argu－ ment．
\csepreto\｛ $\langle$ csname $\rangle\}\{\langle$ code $\rangle\}$
Similar to \epreto except that it takes a control sequence name as its first argu－ ment．
\csxpreto\｛〈csname〉\}\{〈code $\rangle\}$
Similar to \xpreto except that it takes a control sequence name as its first argu－ ment．
\protected＠csepreto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \protected＠epreto except that it takes a control sequence name as its first argument．
$\backslash$ protected＠csxpreto $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
Similar to \protected＠xpreto except that it takes a control sequence name as its first argument．

## 3．5 Patching

The facilities in this section are useful to hook into or modify existing code．All commands presented here preserve the number of arguments and the prefixes of the patched $\langle$ command $\rangle$ ．Note that the patching process involves detokenizing the $\langle$ command $\rangle$ and retokenizing it under the current category code regime after patching．The category code of＇＠＇is temporarily set to ir．If the definition of the $\langle$ command includes any tokens with non－standard category codes，the respec－ tive category codes must be adjusted prior to patching．If the code to be replaced or inserted refers to the parameters of the 〈command $\rangle$ to be patched，the param－
eter characters need not be doubled when invoking one of the commands below． Note that \outer commands may not be patched．
\patchcommand［ $\langle$ prefix $\rangle$ ］\｛〈command $\rangle\}\{\langle$ search $\rangle\}\{\langle$ replace $\rangle\}\{\langle$ success $\rangle\}\{\langle$ failure $\rangle\}$
This command extracts the definition of a 〈command〉，replaces $\langle$ search $\rangle$ with $\langle$ replace $\rangle$ ，and reassembles the 〈command $\rangle$ ．The pattern match is category code agnostic and matches the first occurence of the $\langle$ search $\rangle$ string in the definition of the $\langle$ command $\rangle$ to be patched．If an optional $\langle$ prefix $\rangle$ is specified，it replaces the prefixes of the $\langle$ command $\rangle$ ．An empty $\langle$ prefix $\rangle$ strips all prefixes from the $\langle$ command $\rangle$ ．This command executes $\langle$ success $\rangle$ if patching succeeds，and $\langle$ failure $\rangle$ otherwise．It is robust and may only be used in the document preamble．The assignment is local．
\ifpatchable\｛ $\langle$ command $\rangle\}\{\langle$ search $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$
This command executes $\langle$ true $\rangle$ if the $\langle$ command $\rangle$ is defined and the $\langle$ search $\rangle$ pattern is found in its definition，and $\langle$ false $\rangle$ otherwise．This command is robust and may only be used in the document preamble．
\apptocommand $\{\langle$ command $\rangle\}\{\langle$ code $\rangle\}$
This command appends $\langle c o d e\rangle$ to the definition of $\langle$ command $\rangle$ ．In contrast to the \appto command from section 3．4．I，this one may be used to patch a $\langle$ command $\rangle$ which takes an arbitrary number of arguments．The 〈code〉 may refer to the parameters of the 〈command〉 in this case．This command is robust and may only be used in the document preamble．The assignment is local．
\pretocommand\｛〈command $\rangle$ \}\{〈code $\rangle$ \}
This command is similar to \apptocommand except that the 〈code〉 is＇prepended＇， i．e．，inserted at the beginning of the definition of $\langle$ command $\rangle$ ．In contrast to the $\backslash$ preto command from section 3．4．I，this one may be used to patch a $\langle$ command $\rangle$ which takes an arbitrary number of arguments．The $\langle$ code $\rangle$ may refer to the parameters of the 〈command〉 in this case．This command is robust and may only be used in the document preamble．The assignment is local．

## 3．6 Tests

\ifdef $\{\langle$ command $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$
A LaTeX wrapper for the e－TeX primitive \ifdefined．This command expands to $\langle$ true $\rangle$ if the $\langle$ command $\rangle$ is defined，and to $\langle$ false $\rangle$ otherwise．Note that the〈command〉 is considered as defined even if its meaning is \relax．
\ifundef $\{\langle$ command $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$
Expands to $\langle$ true $\rangle$ if the $\langle$ command $\rangle$ is undefined，and to $\langle$ false $\rangle$ otherwise．Apart from reversing the logic of the test，this command also differs from $\backslash i f d e f$ in that the 〈command〉 is considered as undefined if its meaning is $\backslash$ relax．

## \ifcsdef $\{\langle$ csname $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$

A LaTeX wrapper for the e-TeX primitive \ifcsname. This command expands to $\langle$ true $\rangle$ if $\langle$ csname $\rangle$ is defined, and to $\langle$ false $\rangle$ otherwise. Note that $\langle$ csname $\rangle$ is considered as defined even if its meaning is \relax.

## \ifcsundef $\{\langle$ csname $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$

Expands to $\langle$ true $\rangle$ if $\langle$ csname $\rangle$ is undefined, and to $\langle f a l s e\rangle$ otherwise. Apart from reversing the logic of the test, this command also differs from \ifcsdef in that the $\langle$ csname $\rangle$ is considered as undefined if its meaning is $\backslash$ relax. This command may be used as a drop-in replacement for the \@ifundefined test in the LaTeX kernel.
\ifblank $\{\langle$ string $\rangle\}\{\langle$ true $\rangle\}\{\langle$ false $\rangle\}$
Expands to $\langle$ true $\rangle$ if the $\langle$ string $\rangle$ is blank (empty or spaces), and to $\langle$ false $\rangle$ otherwise. The $\langle$ string $\rangle$ is not expanded in the test.
