

eledmac

A presumptuous attempt to port EDMAC, TABMAC and EDSTANZA to LaTeX*

Peter Wilson
Herries Press[†]
Maïeul Rouquette[‡]

based on the original work by
John Lavagnino, Dominik Wujastyk, Herbert Breger and Wayne Sullivan

Abstract

EDMAC, a set of PLAIN TeX macros, was made at the beginning of 90's for typesetting critical editions in the traditional way, i.e., similar to the Oxford Classical Texts, Teubner, Arden Shakespeare and other series. A separate set of PLAIN TeX macros, TABMAC, provides for tabular material. Another set of PLAIN TeX macros, EDSTANZA, assists in typesetting verse.

The **eledmac** package makes the **EDMAC**, **TABMAC** and **EDSTANZA** facilities available to authors who would prefer to use LaTeX. The principal functions provided by the package are marginal line numbering and multiple series of foot- and endnotes keyed to line numbers.

In addition to the **EDMAC**, **TABMAC** and **EDSTANZA** functions the package also provides for index entries keyed to both page and line numbers. Multiple series of the familiar numbered footnotes are also available.

Other L^AT_EX packages for critical editions include EDNOTES, and poemscol for poetical works.

eledmac provides many tools and options. Normally, they are all documented in this file. However, to help people, a "examples" folder is provided, with example for some needs, but not for all.

To report bugs, please go to ledmac's GitHub page and click "New Issue": <https://github.com/maieul/ledmac/issues/>. You must open an account with github.com to access my page (maieul/ledmac). GitHub accounts are free for open-source users. You can report bugs in English or in French (better).

You can subscribe to the ledmac mail list in:
<http://geekographie.maieul.net/146>

*This file (**eledmac.dtx**) has version number v1.12.2, last revised 2014/08/07.

List of Figures

1 Introduction

The **EDMAC** macros [LW90] for typesetting critical editions of texts have been available for use with TeX since 90's. Since **EDMAC** was introduced there has been a small but constant demand for a version of **EDMAC** that could be used with LaTeX. The **eleddmac** package is an attempt to satisfy that request.

eleddmac would not have been possible without the amazing work by John Lavagnino and Dominik Wujastyk, the original authors of **EDMAC**. I, Peter Wilson, am very grateful for their encouragement and permission to use **EDMAC** as a base. The majority of both the code and this manual are by these two. The tabular material is based on the **TABMAC** code [Bre96], by permission of its author, Herbert Breger. The verse-related code is by courtesy of Wayne Sullivan, the author of **EDSTANZA** [Sul92], who has kindly supplied more than his original macros.

Since 2011's Maïeul Rouquette begun to maintain and extend `eledmac`. As plain TeX is used by little people, and L^AT_EX by more people `eledmac` and original EDMAC are more and more distant.

1.1 Overview

The `eledmac` package, together with LaTeX, provides several important facilities for formatting critical editions of texts in a traditional manner. Major features include:

- automatic stepped line numbering, by page or by section;
- sub-lineation within the main series of line numbers;
- variant readings automatically keyed to line numbers;
- caters for both prose and verse;
- multiple series of the footnotes and endnotes;
- block or columnar formatting of the footnotes;
- simple tabular material may be line numbered;
- indexing keyed to page and line numbers.

`eledmac` allows the scholar engaged in preparing a critical edition to focus attention wholly on the task of creating the critical text and evaluating the variant readings, text-critical notes and testimonia. L^AT_EX and `eledmac` will take care of the formatting and visual correlation of all the disparate types of information.

The original EDMAC can be used as a 'stand alone' processor or as part of a process. One example is its use as the formatting engine or 'back end' for the output of an automatic manuscript collation program. `COLLATE`, written by Peter Robinson, runs on the Apple Macintosh, can collate simultaneously up to a hundred manuscripts of any length, and provides facilities for the scholar to tailor the collation interactively. For further details of this and other related work, visit the EDMAC home page at <http://www.homepages.ucl.ac.uk/~ucgadkw/edmac/index.html>.

Apart from `eledmac` there are some other LaTeX packages for critical edition typesetting. As Peter Wilson is not an author, or even a prospective one, of any critical edition work he could not provide any opinions on what authors in this area might feel comfortable with or how well any of the packages meet their needs.

`EDNOTES` [Lüc03], by Uwe Lück and Christian Tapp, is another LaTeX package being developed for critical editions. Unlike `eledmac` which is based on EDMAC, `EDNOTES` takes a different (internal) approach and provides a different set of features. For example it provides additional facilities for overlapping lemmas and for handling tables. For more information there is a web site at <http://ednotes.sty.de.vu> or email to `ednotes.sty@web.de`.

The `poemscol` package [Bur01] by John Burt is designed for typesetting critical editions of collections of poems. I do not know how, or whether, `poemscol` and `eledmac` will work together.

Critical authors may find it useful to look at EDMAC, EDNOTES, elemac, and poemscol to see which best meets their needs.

At the time of writing Peter Wilson knows of two web sites, apart from the EDMAC home page, that have information on elemac, and other programs.

- Jerónimo Leal pointed me to <http://www.guit.sssup.it/latex/critical.html>. This also mentions another package for critical editions called MauroTeX (<http://www.maurolico.unipi.it/mtex/mtex.htm>). These sites are both in Italian.
- Dirk-Jan Dekker maintains <http://www.djdekker.net/ledmac> which is a FAQ for typesetting critical editions and elemac.

This manual contains a general description of how to use the LaTeX version of EDMAC, namely elemac(in sections 2 through 17.4); the complete source code for the package, with extensive documentation (in sections 18 and following) ; and an Index to the source code. We do not suggest that you need to read the source code for this package in order to use it; we provide this code primarily for reference, and many of our comments on it repeat material that is also found in the earlier sections. But no documentation, however thorough, can cover every question that comes up, and many can be answered quickly by consultation of the code. On a first reading, we suggest that you should read only the general documentation in sections 2, unless you are particularly interested in the innards of elemac.

1.2 History

1.2.1 EDMAC

The original version of EDMAC was TEXTED.TEX, written by John Lavagnino in late 1987 and early 1988 for formatting critical editions of English plays.

John passed these macros on to Dominik Wujastyk who, in September–October 1988, added the footnote paragraphing mechanism, margin swapping and other changes to suit his own purposes, making the style more like that traditionally used for classical texts in Latin and Greek (e.g., the Oxford Classical Texts series). He also wrote some extra documentation and sent the files out to several people. This version of the macros was the first to be called EDMAC.

The present version was developed in the summer of 1990, with the intent of adding necessary features, streamlining and documenting the code, and further generalizing it to make it easily adaptable to the needs of editors in different disciplines. John did most of the general reworking and documentation, with the financial assistance of the Division of the Humanities and Social Sciences, California Institute of Technology. Dominik adapted the code to the conventions of Frank Mittelbach's doc option, and added some documentation, multiple-column footnotes, cross-references, and crop marks.¹ A description by John and Dominik

¹This version of the macros was used to format the Sanskrit text in volume I of *Metarules of Pāṇinian Grammar* by Dominik Wujastyk (Groningen: Forsten, 1993).

of this version of **EDMAC** was published as ‘An overview of **EDMAC**: a PLAIN T_EX format for critical editions’, *TUGboat* 11 (1990), pp. 623–643.

From 1991 through 1994, the macros continued to evolve, and were tested at a number of sites. We are very grateful to all the members of the (now defunct) `edmac@mailbase.ac.uk` discussion group who helped us with smoothing out bugs and infelicities in the macros. Ron Whitney and our anonymous reviewer at the TUG were both of great help in ironing out last-minute wrinkles, while Ron made some important suggestions which may help to make future versions of **EDMAC** even more efficient. Wayne Sullivan, in particular, provided several important fixes and contributions, including adapting the Mittelbach/Schöpf ‘New Font Selection Scheme’ for use with PLAIN T_EX and **EDMAC**. Another project Wayne has worked on is a DVI post-processor which works with an **EDMAC** that has been slightly modified to output `\specials`. This combination enables you to recover to some extent the text of each line, as ASCII code, facilitating the creation of concordances, an *index verborum*, etc.

At the time of writing (1994), we are pleased to be able to say that **EDMAC** is being used for real-life book production of several interesting editions, such as the Latin texts of Euclid’s *Elements*,² an edition of the letters of Nicolaus Copernicus,³ Simon Bredon’s *Arithmetica*,⁴ a Latin translation by Plato of Tivoli of an Arabic astrolabe text,⁵ a Latin translation of part II of the Arabic *Algebra* by Abū Kāmil Shujā’ b. Aslam,⁶ the Latin *Rithmachia* of Werinher von Tegernsee,⁷ a middle-Dutch romance epic on the Crusades,⁸ a seventeenth-century Hungarian politico-philosophical tract,⁹ an anonymous Latin compilation from Hungary entitled *Sermones Compilati in Studio Gererali Quinquecensi in Regno Ungarie*,¹⁰ the collected letters and papers of Leibniz,¹¹ Theodosius’s *Spherics*, the German *Algorismus* of Sacrobosco, the Sanskrit text of the *Kāśikāvṛtti* of Vāmana and Jayāditya,¹² and the English texts of Thomas Middleton’s collected works.

²Gerhard Brey used **EDMAC** in the production of Hubert L. L. Busard and Menso Folkerts, *Robert of Chester’s (?) Redaction of Euclid’s Elements, the so-called Adelard II Version*, 2 vols., (Basel, Boston, Berlin: Birkhäuser, 1992).

³Being prepared at the German Copernicus Research Institute, Munich.

⁴Being prepared by Menso Folkerts *et al.*, at the Institut für Geschichte der Naturwissenschaften in Munich.

⁵Richard Lorch, Gerhard Brey *et al.*, at the same Institute.

⁶Richard Lorch, ‘Abū Kāmil on the Pentagon and Decagon’ in *Vestigia Mathematica*, ed. M. Folkerts and J. P. Hogendijk (Amsterdam, Atlanta: Rodopi, 1993).

⁷Menso Folkerts, ‘Die *Rithmachia* des Werinher von Tegernsee’, *ibid.*

⁸Geert H. M. Claassens, *De Middelnederlandse Kruisvaartromans*, (Amsterdam: Schiphower en Brinkman, 1993).

⁹Emil Hargittay, *Csáky István: Politica philosophiae Okoskodás-szerint való rendes életnek példája (1664–1674)* (Budapest: Argumentum Kiadó, 1992).

¹⁰Being produced, as was the previous book, by Gyula Mayer in Budapest.

¹¹Leibniz, *Sämtliche Schriften und Briefe*, series I, III, VII, being edited by Dr. H. Breger, Dr. N. Gädke and others, at the Leibniz-Archiv, Niedersächsische Landesbibliothek, Hannover. (see <http://www.nlb-hannover.de/Leibniz>)

¹²Being prepared at Poona and Lausanne Universities.

1.2.2 eledmac

Version 1.0 of TABMAC was released by Herbert Breger in October 1996. This added the capability for typesetting tabular material.

Version 0.01 of EDSTANZA was released by Wayne Sullivan in June 1992, to help a colleague with typesetting Irish verse.

In March 2003 Peter Wilson started an attempt to port EDMAC from TeX to LaTeX. The starting point was EDMAC version 3.16 as documented on 19 July 1994 (available from CTAN). In August 2003 the TABMAC functions were added; the starting point for these being version 1.0 of Ocober 1996. The EDSTANZA (v0.01) functions were added in February 2004. Sidenotes and regular footnotes in numbered text were added in April 2004.

This port was called *ledmac*.

Since July 2011, ledmac is maintained by Maïeul Rouquette.

Important changes were put in version 1.0, to make ledmac more easily extensible (see 4.3 p.18). These changes can trigger small problems with the old customization. That is why a new name was selected: *eledmac*. To migrate from ledmac to eledmac, please read Appendix Appendix A.1 (p.206).

1.2.3 List of works edited with (e)ledmac

A collaborative list of works edited with (e)ledmac is available on https://www.zotero.org/groups/critical_editions_typeset_with_edmac_ledmac_and_eledmac/items. Please add your own edition made with (e)ledmac.

2 The eledmac package

eledmac is a three-pass package like LaTeX itself. Although your textual apparatus and line numbers will be printed even on the first run, it takes two more passes through LaTeX to be sure that everything gets to its right place. Any changes you make to the input file may similarly require three passes to get everything to the right place, if the changes alter the number of lines or notes. eledmac will tell you that you need to make more runs, when it notices, but it does not expend the labor to check this thoroughly. If you have problems with a line or two misnumbered at the top of a page, try running LaTeX once or twice more.

A file may mix *numbered* and *unnumbered* text. Numbered text is printed with marginal line numbers and can include footnotes and endnotes that are referenced to those line numbers: this is how you'll want to print the text that you're editing. Unnumbered text is not printed with line numbers, and you can't use eledmac's note commands with it: this is appropriate for introductions and other material added by the editor around the edited text.

3 Numbering text lines and paragraphs

```
\begin{numbering} Each section of numbered text must be preceded by \begin{numbering} and fol-
\end{numbering}
```

lowed by `\endnumbering`, like:

```
\beginnumbering
<text>
\endnumbering
```

The `\beginnumbering` macro resets the line number to zero, reads an auxiliary file called `(jobname).nn` (where `(jobname)` is the name of the main input file for this job, and `nn` is 1 for the first numbered section, 2 for the second section, and so on), and then creates a new version of this auxiliary file to collect information during this run. The first instance of `\beginnumbering` also opens a file called `(jobname).end` to receive the text of the endnotes. `\endnumbering` closes the `(jobname).nn` file.

If the line numbering of a text is to be continuous from start to end, then the whole text will be typed between one pair of `\beginnumbering` and `\endnumbering` commands. But your text will most often contain chapter or other divisions marking sections that should be independently numbered, and these will be appropriate places to begin new numbered sections. `eledmac` has to read and store in memory a certain amount of information about the entire section when it encounters a `\beginnumbering` command, so it speeds up the processing and reduces memory use when a text is divided into a larger number of sections (at the expense of multiplying the number of external files that are generated).

`\pstart` Within a numbered section, each paragraph of numbered text must be marked
`\pend` using the `\pstart` and `\pend` commands:

```
\pstart
<paragraph of text>
\pend
```

Text that appears within a numbered section but isn't marked with `\pstart` and `\pend` will not be numbered.

The following example shows the proper section and paragraph markup, and the kind of output that would typically be generated:

```
\begin{numbering}
\pstart
This is a sample paragraph, with
lines numbered automatically.
\pend

\pstart
This paragraph too has its
lines automatically numbered.
\pend

The lines of this paragraph are
not numbered.

\pstart
And here the numbering begins
again.
\pend
\end{numbering}
```

- 1 This is a sample paragraph
 - 2 with lines numbered
 - 3 automatically.
 - 4 This paragraph too
 - 5 has its lines automatically
 - 6 numbered.
- The lines of this paragraph
are not numbered.
- 7 And here the numbering
 - 8 begins again.

Both `\pstart` and `\pend` can take a optional argument, in brackets. Its content will be printed before the beginning of the `\pstart` / after the end of the `\pend`.

This feature is not needed for normal use of `eledmac`, but it is needed when using verse (see 5 p. 24) or `eledpar` (see 17.3 p. 41).

A `\noindent` is automatically added before this argument.

`\autopar` You can use `\autopar` to avoid the nuisance of this paragraph markup and still have every paragraph automatically numbered. The scope of the `\autopar` command needs to be limited by keeping it within a group, as follows:

```
\begingroup
\begin{numbering}
\autopar
A paragraph of numbered text.
Another paragraph of numbered
text.

\end{numbering}
\endgroup
```

- 1 A paragraph of numbered
- 2 text.
- 3 Another paragraph of
- 4 numbered text.

`\autopar` fails, however, on paragraphs that start with a `{` or with any other command that starts a new group before it generates any text. Such paragraphs need to be started explicitly, before the new group is opened, using `\indent`, `\noindent`, or `\leavevmode`, or using `\pstart` itself.¹³

`\firstlinenum` By default, `eledmac` numbers every 5th line. There are two counters, `firstlinenum` and `linenumincrement`, that control this behaviour; they can be changed using `\firstlinenum{<num>}` and `\linenumincrement{<num>}`.

¹³For a detailed study of the reasons for this restriction, see Barbara Beeton, ‘Initiation rites’, *TUGboat* 12 (1991), pp. 257–258.

`\firstlinenum` specifies the first line that will have a printed number, and `\linenumincrement` is the difference between successive numbered lines. For example, to start printing numbers at the first line and to have every other line numbered:

```
\firstsublinenum
\sublinenumincrement
\numberpstarttrue
```

There are similar commands, `\firstsublinenum{<num>}` and `\sublinenumincrement{<num>}` for controlling sub-line numbering.

You can use the command `\numberpstartrue` to insert a number on every `\pstart`. To stop the numbering, you must use `\numberpstartfalse`. To reset the numbering of `\pstarts`, insert

```
\setcounter{pstart}{0}
```

```
\pausenumbering
\resumenumbering
```

`eledmac` stores a lot of information about line numbers and footnotes in memory as it goes through a numbered section. But at the end of such a section, it empties its memory out, so to speak. If your text has a very long numbered section it is possible that your LaTeX may reach its memory limit. There are two solutions to this. The first is to get a larger LaTeX with increased memory. The second solution is to split your long section into several smaller ones. The trouble with this is that your line numbering will start again at zero with each new section. To avoid this problem, we provide `\pausenumbering` and `\resumenumbering` which are just like `\endnumbering ... \beginnumbering`, except that they arrange for your line numbering to continue across the break. Use `\pausenumbering` only between numbered paragraphs:

```
\beginnumbering
\pstart
Paragraph of text.
\pend
\pausenumbering
\resumenumbering
\pstart
Another paragraph.
\pend
\endnumbering
```

1	Paragraph of
2	text.
3	Another paragraph.

We have defined these commands as two macros, in case you find it necessary to insert text between numbered sections without disturbing the line numbering. But if you are really just using these macros to save memory, you might as well say

```
\newcommand{\memorybreak}{\pausenumbering\resumenumbering}
```

and say `\memorybreak` between the relevant `\pend` and `\pstart`.

It's possible to insert a number at every `\pstart` command. You must use the `\numberpstarttrue` command to have it. You can stop the numbering with `\numberpstartfalse`. You can redefine the command `\thepstart` to change

```
\theplstart
```

style. On each `\beginnumbering` the numbering restarts.

With the `\sidepstartnumtrue` command, the number of `\pstart` will be printed in side. In this case, the line number will be not printed.

With the `\labelpstarttrue` command, a `\label` added just after a `\pstart` will refer to the number of this `pstart`.

3.1 Lineation commands

```
\numberlinefalse
\numberlinetrue
\lineation
\linenummargin
```

Line numbering can be disabled with `\numberlinefalse`. It can be enabled again with `\numberlinetrue`. Lines can be numbered either by page, by `pstart` or by section; you specify this using the `\lineation{<arg>}` macro, where `<arg>` is either `page`, `pstart` or `section`. You may only use this command at places where numbering is not in effect; you can't change the lineation system within a section. You can change it between sections: they don't all have to use the same lineation system. The package's standard setting is `\lineation{section}`. If the lineation is by `pstart`, the `pstart` number will be printed before the line number in the notes.

The command `\linenummargin{<location>}` specifies the margin where the line (or `pstart`) numbers will be printed. The permissible value for `<location>` is one out of the list `left`, `right`, `inner`, or `outer`, for example `\linenummargin{inner}`. The package's default setting is

`\linenummargin{left}`

to typeset the numbers in the left hand margin. You can change this whenever you're not in the middle of making a paragraph.

More precisely, the value of `\linenummargin` used is that in effect at the `\pend` of a numbered paragraph. Apart from an initial setting for `\linenummargin`, only change it after a `\pend`, whereupon it will apply to all following numbered paragraphs, until changed again (changing it between a `\pstart` and `\pend` pair will apply the change to all the current paragraph).

In most cases, you will not want a number printed for every single line of the text. Four L^AT_EX counters control the printing of marginal numbers and they can be set by the macros `\firstlinenum{<num>}`, etc. `\firstlinenum` specifies the number of the first line in a section to number, and `\linenumincrement` is the increment between numbered lines. `\firstsublinenum` and `\sublinenumincrement` do the same for sub-lines. Initially, all these are set to 5 (e.g., `\firstlinenum{5}`).

You can define `\linenumberlist` to specify a non-uniform distribution of printed line numbers. For example:

```
\def\linenumberlist{1,2,3,5,7,11,13,17,19,23,29}
```

to have numbers printed on prime-numbered lines only. There must be no spaces within the definition which consists of comma-separated decimal numbers. The numbers can be in any order but it is easier to read if you put them in numerical order. Either omitting the definition of `\linenumberlist` or following the vacuous definition

```
\def\linenumberlist{}
```

the standard numbering sequence is applied. The standard sequence is that specified by the combination of the `firstlinenum`, `linenumincrement`, `firstsublinenum` and `sublinenumincrement` counter values.

```
\leftlinenum
\rightlinenum
\linenumsep
\startsub
\endsub
\startlock
\endlock
\lockdisp
\setline{<num>}
\advanceline{<num>}
\setlinenum{<num>}
```

When a marginal line number is to be printed, there are a lot of ways to display it. You can redefine `\leftlinenum` and `\rightlinenum` to change the way marginal line numbers are printed in the left and right margins respectively; the initial versions print the number in font `\numlabfont` (described below) at a distance `\linenumsep` (initially set to one pica) from the text.

3.2 Changing the line numbers

Normally the line numbering starts at 1 for the first line of a section and steps up by one for each line thereafter. There are various common modifications of this system, however; the commands described here allow you to put such modifications into effect.

You insert the `\startsub` and `\endsub` commands in your text to turn sub-lineation on and off. In plays, for example, stage directions are often numbered with sub-line numbers: as line 10.1, 10.2, 10.3, rather than as 11, 12, and 13. Titles and headings are sometimes numbered with sub-line numbers as well.

When sub-lineation is in effect, the line number counter is frozen and the sub-line counter advances instead. If one of these commands appears in the middle of a line, it doesn't take effect until the next line; in other words, a line is counted as a line or sub-line depending on what it started out as, even if that changes in the middle.

The `\startlock` command, used in running text, locks the line number at its current value, until you say `\endlock`. It can tell for itself whether you are in a patch of line or sub-line numbering. One use for line-number locking is in printing poetry: there the line numbers should be those of verse lines rather than of printed lines, even when a verse line requires several printed lines.

When line-number locking is used, several printed lines may have the same line number, and you have to specify whether you want the number attached to the first printed line or the last, or whether you just want the number printed by them all. (This assumes that, on the basis of the settings of the previous parameters, it is necessary to display a line number for this line.) You specify your preference using `\lockdisp{<arg>}`; its argument is a word, either `first`, `last`, or `all`. The package initially sets this as `\lockdisp{first}`.

In some cases you may want to modify the line numbers that are automatically calculated: if you are printing only fragments of a work but want to print line numbers appropriate to a complete version, for example. The `\setline{<num>}` and `\advanceline{<num>}` commands may be used to change the current line's number (or the sub-line number, if sub-lineation is currently on). They change both the marginal line numbers and the line numbers passed to the notes. `\setline` takes one argument, the value to which you want the line number set; it must be 0 or greater. `\advanceline` takes one argument, an amount that should be added to the current line number; it may be positive or negative.

The `\setline` and `\advanceline` macros should only be used within a `\pstart...\\pend` group. The `\setlinenum{<num>}` command can be used outside such a group, for example between a `pend` and a `pstart`. It sets the line number to `<num>`. It has no effect if used within a `\pstart...\\pend` group.

`\linenumberstyle` Line numbers are normally printed as arabic numbers. You can use `\linenumberstyle{<style>}` to change the numbering style. `<style>` must be one of:

- `Alpha` Uppercase letters (A...Z).
- `alpha` Lowercase letters (a...z).
- `arabic` Arabic numerals (1, 2, ...)
- `Roman` Uppercase Roman numerals (I, II, ...)
- `roman` Lowercase Roman numerals (i, ii, ...)

Note that with the `Alpha` or `alpha` styles, ‘numbers’ must be between 1 and 26 inclusive.

Similarly `\sublinenumberstyle{<style>}` can be used to change the numbering style of sub-line numbers, which is normally arabic numerals.

`\skipnumbering` When inserted into a numbered line the macro `\skipnumbering` causes the numbering of that particular line to be skipped; that is, the line number is unchanged and no line number will be printed.

4 The apparatus

4.1 Commands

`\edtext` Within numbered paragraphs, all footnotes and endnotes are generated by the `\edtext` macro:

```
\edtext{<lemma>}{<commands>}
```

The `<lemma>` argument is the lemma in the main text: `\edtext` both prints this as part of the text, and makes it available to the `<commands>` you specify to generate notes.

For example:

<code>I saw my friend \edtext{Smith}{\Afootnote{Jones C, D.}} on Tuesday.</code>	<code>1 I saw my friend</code>
	<code>2 Smith on Tuesday.</code>
	<code><u>2</u> Smith] Jones C, D.</code>

The lemma `Smith` is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, `Jones C, D.` The footnote macro is supplied with the line number at which the lemma appears in the main text.

The `<lemma>` may contain further `\edtext` commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

<code>\edtext{I saw my friend \edtext{Smith}{\Afootnote{Jones C, D.}} on Tuesday.}{\Bfootnote{The date was July 16, 1954.}}</code>	<code>1 I saw my friend</code>
	<code>2 Smith on Tuesday.</code>
	<code><u>2</u> Smith] Jones C, D.</code>
	<code><u>1-2</u> I saw my friend Smith on Tuesday.] The date was July 16, 1954.</code>

However, `\edtext` cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; a `\edtext` that starts in the `<lemma>` argument of another `\edtext` must end there, too. (The `\lemma` and `\linenum` commands may be used to generate overlapping notes if necessary.)

Commands used in `\edtext`'s second argument The second argument of the `\edtext` macro, `<commands>`, may contain a series of subsidiary commands that generate various kinds of notes.

`\Afootnote` `\Bfootnote` `\Cfootnote` `\Dfootnote` `\Efootnote` Five separate series of the footnotes are maintained; each macro taking one argument like `\Afootnote{<text>}`. When all five are used, the A notes appear in a layer just below the main text, followed by the rest in turn, down to the E notes at the bottom. These are the main macros that you will use to construct the critical apparatus of your text. The package provides five layers of notes in the belief that this will be adequate for the most demanding editions. But it is not hard to add further layers of notes should they be required.

An optional argument can be added before the text of the footnote. Its value is a comma separated list of options. The available options are:

- `nonum` to disable line numbering for this note.
- `nosep` to disable the lemma separator for this note.

Example: `\Afootnote[nonum]{<text>}`.

The package also maintains five separate series of endnotes. Like footnotes each macro takes a single argument like `\Aendnote{<text>}`. Normally, none of them are printed: you must use the `\doendnotes` macro described below (p. 28) to call for their output at the appropriate point in your document.

By default, no paragraph can be made in the notes of critical apparatus. You can allow it by adding the options `parapparatus` when loading the package :

```
\usepackage[parapparatus]{eledmac}
```

`\lemma` If you want to change the lemma that gets passed to the notes, you can do this by using `\lemma{<alternative>}` within the second argument to `\edtext`, before the note commands. The most common use of this command is to abbreviate the lemma that's printed in the notes. For example:

```
\edtext{I saw my friend}
  \edtext{Smith}{\Afootnote{Jones
    C, D.} on Tuesday.}
  {\lemma{I \dots\ Tuesday.}
   \Bfootnote{The date was
    July 16, 1954.}}
  1 I saw my friend
  2 Smith on Tuesday.
  2 Smith] Jones C, D.
  1-2 I ... Tuesday.
  The date was July 16, 1954.
```

`\linenum` You can use `\linenum{<arg>}` to change the line numbers passed to the notes. The notes are actually given seven parameters: the page, line, and sub-line number for the start of the lemma; the same three numbers for the end of the lemma;

and the font specifier for the lemma. As the argument to `\linenum`, you specify those seven parameters in that order, separated by vertical bars (the `|` character). However, you can retain the value computed by elemac for any number by simply omitting it; and you can omit a sequence of vertical bars at the end of the argument. For example, `\linenum{|||23}` changes one number, the ending page number of the current lemma.

This command doesn't change the marginal line numbers in any way; it just changes the numbers passed to the footnotes. Its use comes in situations that `\edtext` has trouble dealing with for whatever reason. If you need notes for overlapping passages that aren't nested, for instance, you can use `\lemma` and `\linenum` to generate such notes despite the limitations of `\edtext`. If the `\lemma` argument to `\edtext` is extremely long, you may run out of memory; here again you can specify a note with an abbreviated lemma using `\lemma` and `\linenum`. The numbers used in `\linenum` need not be entered manually; you can use the '`x-`' symbolic cross-referencing commands below (p. 28) to compute them automatically.

Similarly, being able to manually change the lemma's font specifier in the notes might be important if you were using multiple scripts or languages. The form of the font specifier is three separate codes separated by `/` characters, giving the family, series, and shape codes as defined within NFSS.

Changing the names of these commands The commands for generating the apparatus have been given rather bland names, because editors in different fields have widely divergent notions of what sort of notes are required, where they should be printed, and what they should be called. But this doesn't mean you have to type `\Afootnote` when you'd rather say something you find more meaningful, like `\variant`. We recommend that you create a series of such aliases and use them instead of the names chosen here; all you have to do is put commands of this form at the start of your file:

```
\let\variant=\Afootnote
\let\explanatory=\Bfootnote
\let\trivial=\Aendnote
\let\testimonia=\Cfootnote
```

4.2 Alternate footnote formatting

If you just launch into elemac using the commands outlined above, you will get a standard layout for your text and notes. You may be happy to accept this at the very beginning, while you get the hang of things, but the standard layout is not particularly pretty, and you will certainly want to modify it in due course. The package provides ways of changing the fonts and layout of your text, but these are not aimed at being totally comprehensive. They are enough to deal with simple variations from the norm, and to exemplify how you might go on to make more significant changes.

```
\footparagraph
\foottwocol
\footthreecol
```

By default, all footnotes are formatted as a series of separate paragraphs in one column. Three other formats are also available for notes, and using these macros you can select a different format for a series of notes.

- `\footparagraph` formats all the footnotes of a series as a single paragraph;
- `\foottwocol` formats them as separate paragraphs, but in two columns;
- `\footthreecol`, in three columns.

Each of these macros takes one argument: a letter (between A and E) for the series of notes you want changed. So a text with three layers of notes might begin thus:

```
\footnormal{A}
\footthreecol{B}
\footparagraph{C}
```

This would make the A-notes ordinary, B-notes would be in three columns, and the bottom layer of notes would be formed into a paragraph on each page.

4.3 Display options

Since version 1.0, some commands can be used to change the display of the footnotes. All can have an optional argument [$\langle s \rangle$], which is the letter of the series — or a list of letters separated by comma — depending on which option is applied.

When a length, noted $\langle l \rangle$, is used, it can be stretchable: `a minus b minus c`. The final length m is calculated by L^AT_EX to have: $b - a \leq m \leq b + c$. If you use relative unity¹⁴, it will be relative to fontsize of the footnote.

4.3.1 Control line number printing

```
\numberonlyfirstinline
\numberonlyfirstintwo
\numberonlyfirstintwo
\symlinenum
\nonumberinfootnote
\pstartinfo
```

By default, the line number is printed in every note. If you want to print it only the first time for a value (i.e one time for line 1, one time for line 2 etc.), you can use `\numberonlyfirstinline[$\langle s \rangle$]`. Use `\numberonlyfirstinline[$\langle s \rangle$] [$\langle false \rangle$]` to cancel it ($\langle s \rangle$ can be empty if you want to disable it for every series).

Suppose you have a lemma on line 2 and a lemma between line 2 and line 3. With `\numberonlyfirstinline`, the second lemma is considered to be on the same line as the first lemma. But if you use both `\numberonlyfirstinline[$\langle s \rangle$]` and `\numberonlyfirstintwo[$\langle s \rangle$]`, the distinction is made. Use `\numberonlyfirstintwo[$\langle s \rangle$]` to cancel it ($\langle s \rangle$ can be empty if you want to disable it for every series).

For setting a particular symbol in place of the line number, you can use `\symlinenum[$\langle s \rangle$] { $\langle symbol \rangle$ }` in combination with `\numberonlyfirstinline[$\langle s \rangle$]`. From the second lemma of the same line, the symbol will be used instead of line number.

You can use `\nonumberinfootnote[$\langle s \rangle$]` if you don't want to have the line number in a footnote. To cancel it, use `\nonumberinfootnote[$\langle s \rangle$] [$\langle false \rangle$]`.

You can use `\pstartinfo[$\langle s \rangle$]` if you want to print the pstart number in

¹⁴Like `\em` which is the width of a M.

the footnote, before the line and subline number. Use `\pstartinfofootnote[⟨s⟩][⟨false⟩]` to cancel it (`⟨s⟩` can be empty if you want to disable it for every series). Note that when you change the lineation system, the option is automatically switched :

- If you use lineation by pstart, the option is enabled.
- If you use lineation by section or by page, the option is disabled.

`\onlypstartinfofootnote`

In combination with `\pstartinfofootnote`, you can use `\onlypstartinfofootnote[⟨s⟩]` if you want to print only the pstart number in the footnote, and not the line and subline number. Use `\onlypstartinfofootnote[⟨s⟩][⟨false⟩]` to cancel it (`⟨s⟩` can be empty if you want to disable it for every series).

`\beforenumberinfofootnote`

With `\beforenumberinfofootnote[⟨s⟩]{⟨l⟩}`, you can add some space before the line number in a footnote. If the line number is not printed, the space is not either. The default value is 0 pt.

`\afternumberinfofootnote`

With `\afternumberinfofootnote[⟨s⟩]{⟨l⟩}` you can add some space after the line number in a footnote. If the line number is not printed, the space is not either. The default value is 0.5 em.

`\nonbreakableafternumber`

By default, the space defined by `\afternumberinfofootnote` is breakable. With `\nonbreakableafternumber[⟨s⟩]` it becomes nonbreakable. Use `\nonbreakableafternumber[⟨s⟩][⟨false⟩]` to cancel it (`⟨s⟩` can be empty if you want to disable it for every series).

`\beforesymlinenum`

With `\beforesymlinenum[⟨s⟩]{⟨l⟩}` you can add some space before the line symbol in a footnote. The default value is value set by `\beforenumberinfofootnote`.

`\aftersymlinenum`

With `\aftersymlinenum[⟨s⟩]{⟨l⟩}` you can add some space before the line symbol in a footnote. The default value is value set by `\afternumberinfofootnote`.

`\inplaceofnumber`

If no number or symbolic line number is printed, you can add a space, with `\inplaceofnumber[⟨s⟩]{⟨l⟩}`. The default value is 1 em.

`\boxlinenum`

It could be useful to put the line number inside a fixed box: the content of the note will be printed after this box. You can use `\boxlinenum[⟨s⟩]{⟨l⟩}` to do that. To subsequently disable this feature, use `\boxlinenum` with length equal to 0 pt. One use of this feature is to print line number in a column, and the note in an other column:

```
\Xhangindent{1em}
\afternumberinfofootnote{0em}
\boxlinenum{1em}
```

`\boxsymlinenum`

`\boxsymlinenum[⟨s⟩]{⟨l⟩}` is the same as `\boxlinenum` but for the line number symbol.

4.3.2 Separator between the lemma and the note content

`\lemmaseparator`

By default, in a footnote, the separator between the lemma and thenote is a right bracket (`\rbracket`). You can use `\lemmaseparator[⟨s⟩]{⟨lemmaseparator⟩}` to change it. The optional argument can be used to specify in which series it is applied. Note that there is a non-breakable space between lemma and separator, but **breakable** space between separator and lemma.

```
\beforelemmaseparator
\afterlemmaseparator
\nolemmaseparator
\inplaceoflemmaseparator
```

Using `\beforelemmaseparator[⟨s⟩]{⟨l⟩}` you can add some space between lemma and separator. If your lemma separator is empty, this space won't be printed. The default value is 0 em.

Using `\afterlemmaseparator[⟨s⟩]{⟨l⟩}` you can add some space between separator and note. If your lemma separator is empty, this space won't be printed. The default value is 0.5 em.

You can suppress the lemma separator, using `\nolemmaseparator[⟨s⟩]`, which is simply a alias of `\lemmaseparator[⟨s⟩]{}`.

With `\inplaceoflemmaseparator[⟨s⟩]{⟨l⟩}` you can add a space if no lemma separator is printed. The default value is 1 em.

4.3.3 Font style

```
\Xnotenumfont
```

`\Xnotenumfont[⟨s⟩]{⟨command⟩}` is used to change the font style for line numbers in critical footnotes ; `⟨command⟩` must be one (or more) switching command, like `\bfseries`.

```
\Xendnotenumfont
```

`\Xendnotenumfont[⟨s⟩]{⟨command⟩}` is used to change the font style for line numbers in critical footnotes. `⟨command⟩` must be one (or more) switching command, like `\bfseries`.

```
\notenumfontX
```

`\notenumfontX[⟨s⟩]{⟨command⟩}` is used to change the font style for note numbers in familiar footnotes. `⟨command⟩` must be one (or more) switching command, like `\bfseries`.

```
\Xnotefontsize
```

`\Xnotefontsize[⟨s⟩]{⟨command⟩}` is used to define the font size of critical footnotes of the series. The default value is `\footnotesize`. The `⟨command⟩` must not be a size in pt, but a standard LaTeX size, like `\small`.

```
\notefontsizeX
```

`\notefontsizeX[⟨s⟩]{⟨command⟩}` is used to define the font size of critical footnotes of the series. The default value is `\footnotesize`. The `⟨command⟩` must not be a size in pt, but a standard LaTeX size, like `\small`.

```
\Xendnotefontsize
```

`\Xendnotefontsize[⟨s⟩]{⟨l⟩}` is used to define the font size of end critical footnotes of the series. The default value is `\footnotesize`. The `⟨command⟩` must not be a size in pt, but a standard LaTeX size, like `\small`.

4.3.4 Font of the lemma

```
\Xlemmadisablefontselection
```

By default, font of the lemma in footnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The `\Xlemmadisablefontselection[⟨s⟩]` command allows to disable it for a specific series.

```
\Xendlemmadisablefontselection
```

By default, font of the lemma in endnote is the same as font of the lemma in the main text. For example, if the lemma is in italic in the main text, it is also in italic in note. The command allows `\Xendlemmadisablefontselection[⟨s⟩]` to disable it for a specific series.

4.3.5 Styles of notes content

```
\Xhangindent
```

For critical notes NOT paragraphed you can define an indent with `\Xhangindent[⟨s⟩]{⟨l⟩}`,

which will be applied in the second line of notes. It can help to make distinction between a new note and a break in a note. The default value is 0 pt.

\hangindentX For familiar notes NOT paragraphed you can define an indent with \Xhangindent[⟨s⟩]{⟨l⟩}, which will be applied in the second line of notes. It can help to make a distinction between a new note and a break in a note.

4.3.6 Arbitrary code at the beginning of notes

The three next commands add an arbitrary code at the beginning of notes. As the name's space is local to the notes, you can use it to redefine some style inside the notes. For example, if you don't want the pstart number to be in bold, use :

```
\bhookXnote{\renewcommand{\thepstart}{\arabic{pstart}.}}
```

\bhookXnote \bhookXnote[⟨series⟩]{⟨code⟩} is to be used at the beginning of the critical footnotes.

\bhooknoteX \bhooknoteX[⟨series⟩]{⟨code⟩} is to be used at the beginning of the familiar footnotes.

\bhookXendnote \bhookXendnote[⟨series⟩]{⟨code⟩} is to be used at the beginning of the end-notes.

4.3.7 Options for notes in columns

For the following four macros, be careful that the columns are made from right to left.

\hsizetwocol \hsizetwocol[⟨s⟩]{⟨l⟩} is used to change width of a column when critical notes are displaying in two columns. Default value is .45 \hsize.

\hsizethreecol \hsizethreecol[⟨s⟩]{⟨l⟩} is used to change width of a column when critical notes are displaying in three columns. Default value is .3 \hsize.

\hsizetwocolX \hsizetwocolX[⟨s⟩]{⟨l⟩} is used to change width of a column when familiar notes are displaying in two columns. Default value is .45 \hsize.

\hsizethreecolX \hsizethreecolX[⟨s⟩]{⟨l⟩} is used to change width of a column when familiar notes are displaying in three columns. Default value is .3 \hsize.

4.3.8 Options for paragraphed footnotes

\afternote You can add some space after a note by using \afternote[⟨s⟩]{⟨l⟩}. The default value is 1em plus .4em minus .4em.

\parafootsep For paragraphed footnotes (see below), you can choose the separator between each note by \parafootsep[⟨s⟩]{⟨l⟩}. A common separator is a double pipe (\$||\$), which you can set by \parafootsep{\$||\$}.

\Xragged Text in paragraphed critical notes is justified, but you can use \Xragged[⟨s⟩]+L+ if you want it to be ragged left, or \Xragged[⟨s⟩]+R if you want it to be ragged right.

\raggedX Text in paragraphed footnotes is justified, but you can use \raggedX[⟨s⟩]+L+ if you want it to be ragged left, or \raggedX[⟨s⟩]+R if you want it to be ragged right.

4.3.9 Options for block of notes

\txtbeforeXnotes	You can add some text before critical notes with \textbeforeXnotes[<i>s</i>]{ <i>text</i> }.
\beforeXnotes	You can change the vertical space printed before the rule of the critical notes with \beforeXnotes[<i>s</i>]{ <i>l</i> }. The default value is 1.2em plus .6em minus .6em. Be careful, the standard L^AT_EX footnote rule, which is used by ele-mac, decreases 3pt. These 3pt are not changed by this command.
\beforenotesX	You can change the vertical space printed before the rule of the familiar notes with \beforenotesX[<i>s</i>]{ <i>l</i> }. The default value is 1.2em plus .6em minus .6em. Be careful, the standard L^AT_EX footnote rule, which is used by ele-mac, decreases 3pt. These 3pt are not changed by this command.
\afterXrule	You can change the vertical space printed after the rule of the critical notes with \afterXrule[<i>s</i>]{ <i>l</i> }. The default value is 0pt. Be careful, the standard L^AT_EX footnote rule, which is used by ele-mac, adds 2.6pt. These 2.6pt are not changed by this command.
\afterruleX	Be careful with this setting: it can place notes by the page number, at the bottom of the page. You can change the vertical space printed after the rule of the familiar notes with \beforenotesX[<i>s</i>]{ <i>l</i> }. The default value is 0pt. Be careful, the standard L^AT_EX footnote rule, which is used by ele-mac, adds 2.6pt. These 2.6pt are not changed by this command.
\preXnotes	Be careful with this setting: it can place notes by the page number, at the bottom of the page. You can set the space before the first series of critical notes printed on each page and set a different amount of space for subsequent the series on the page. You can do it with \preXnotes{ <i>l</i> }. Default value is 0pt. You can disable this feature by setting the length to 0pt.
\prenotesX	Be careful with this setting: it can place notes by the page number, at the bottom of the page. You can want the space before the first printed (in a page) series of familiar notes not to be the same as before other series. Default value is 0pt. You can do it with \prenotesX{ <i>l</i> }. You can disable this feature by setting the length to 0 pt.
\maxhXnotes	Be careful with this setting: it could make the notes be written on the bottom pages number. By default, one series of critical notes can take 80% of the page size, before being broken to the next page. If you want to change the size use \maxhXnotes[<i>s</i>]{ <i>l</i> }. Be careful : the length can't be flexible, and is relative to the the current font. For example, if you want the note to take, at most, 33 of the text height, do \maxhXnotes{.33\textheight}.
\maxnotesX	\maxnotesX[<i>s</i>]{ <i>l</i> } is the same as previous, but for familiar footnotes.
	Be careful with the two previous commands. Actually, for technical purposes, one paragraphed note is considered as one block. Consequently, it can't be broken between two pages, even if you used these commands. The debug is in the todolist.

4.4 Page layout

You should set up the page layout parameters, and in particular the `\baselineskip` of the footnotes (this is done for you if you use the standard `\notefontsetup`), before you call any of these macros because their action depends on these; too much or too little space will be allotted for the notes on the page if these macros use the wrong values.¹⁵

4.5 Fonts

One of the most important features of the appearance of the notes, and indeed of your whole document, will be the fonts used. We will first describe the commands that give you control over the use of fonts in the different structural elements of the document, especially within the notes, and then in subsequent sections specify how these commands are used.

For those who are setting up for a large job, here is a list of the complete set of `eledmac` macros relating to fonts that are intended for manipulation by the user: `\endashchar`, `\fullstop`, `\numlabfont`, and `\rbracket`.

- | | |
|---|---|
| <code>\numlabfont</code>
<code>\endashchar</code>
<code>\fullstop</code>
<code>\rbracket</code>

<code>\select@lemm.getFont</code> | <p>Line numbers for the main text are usually printed in a smaller font in the margin. The <code>\numlabfont</code> macro is provided as a standard name for that font: it is initially defined as</p> <pre>\newcommand{\numlabfont}{\normalfont\scriptsize}</pre> <p>You might wish to use a different font if, for example, you preferred to have these line numbers printed using old-style numerals.</p> <p>A relatively trivial matter relates to punctuation. In your footnotes, there will sometimes be spans of line numbers like this: 12–34, or lines with sub-line numbers like this: 55.6. The en-dash and the full stop are taken from the same font as the numbers, and it all works nicely. But what if you wanted to use old-style numbers, like 12 and 34? These look nice in an edition, but when you use the fonts provided by PLAIN TeX they are taken from a math font which does not have the en-dash or full stop in the same places as a text font. If you (or your macros) just typed <code>\\$oldstyle 12--34\$</code> or <code>\\$oldstyle 55.6\$</code> you would get ‘12>34’ and ‘55>6’. So we define <code>\endashchar</code> and <code>\fullstop</code>, which produce an en-dash and a full stop respectively from the normal document font, whatever font you are using for the numbers. These two macros are used in the macros which format the line numbers in the margins and footnotes, instead of explicit punctuation. We also define an <code>\rbracket</code> macro for the right square bracket printed at the end of the lemma in many styles of textual notes (including <code>eledmac</code>’s standard style). For polyglossia, when the lemma is RTL, the bracket automatically switches to a left bracket.</p> |
|---|---|

We will briefly discuss `\select@lemm.getFont` here because it is important to know about it now, although it is not one of the macros you would expect to change in the course of a simple job. Hence it is ‘protected’ by having the @-sign

¹⁵There is one tiny proviso about using paragraphed notes: you shouldn’t force any explicit line-breaks inside such notes: do not use `\par`, `\break`, or `\penalty=-10000`. If you must have a line-break for some obscure reason, just suggest the break very strongly: `\penalty=-9999` will do the trick. Page 108 explains why this restriction is necessary.

in its name.

When you use the `\edtext` macro to mark a word in your text as a lemma, that word will normally be printed again in your apparatus. If the word in the text happens to be in a font such as italic or bold you would probably expect it to appear in the apparatus in the same font. This becomes an absolute necessity if the font is actually a different script, such as Arabic or Cyrillic. `\select@lemmafont` does the work of decoding `eledmac`'s data about the fonts used to print the lemma in the main text and calling up those fonts for printing the lemma in the note.

`\select@lemmafont` is a macro that takes one long argument—the cluster of line numbers passed to the note commands. This cluster ends with a code indicating what fonts were in use at the start of the lemma. `\select@lemmafont` selects the appropriate font for the note using that font specifier.

`eledmac` uses `\select@lemmafont` in a standard footnote format macro called `\normalfootfmt`. The footnote formats for each of the layers A to E are `\let` equal to `\normalfootfmt`. So all the layers of the footnotes are formatted in the same way.

4.6 Create a new series

If you need more than 5 series of critical footnotes you can create extra series, using `\newseries` command. For example to create G and H series `\newseries{G,H}`.

5 Verse

In 1992 Wayne Sullivan¹⁶ wrote the `EDSTANZA` macros [Sul92] for typesetting verse in a critical edition. More specifically they were for handling poetry stanzas which use indentation to indicate rhyme or metre.

With Wayne Sullivan's permission the majority of this section has been taken from [Sul92]. Peter has made a few changes to enable his macros to be used in the LaTeX `ledmac`, and now in `eledmac`. package.

`\stanza`
`\&`

Use `\stanza` at the start of a stanza. Each line in a stanza is ended by an ampersand (`&`), and the stanza itself is ended by putting `\&` at the end of the last line.

Be careful: you must have NO space between the end of your verse and & or \&. In most cases, you will see no difference, but if your verse is exactly the same length as a line, then you will have an empty hanging verse.

Lines within a stanza may be indented. The indents are integer multiples of the length `\stanzaindentbase`, whose default value is 20pt.

In order to use the stanza macros, one must set the indentation values. First the value of `\stanzaindentbase` should be set, unless the default value 20pt is desired. Every stanza line indentation is a multiple of this.

To specify these multiples one invokes, for example
`\setstanzaindent{3,1,2,1,2}.`

¹⁶Department of Mathematics, University College, Dublin 4, Ireland

The numerical entries must be whole numbers, 0 or greater, separated by commas without embedded spaces. The first entry gives the hanging indentation to be used if the stanza line requires more than one print line.

If it is known that each stanza line will fit on more than one print line, then this first entry should be 0; T_EX does less work in this case, but no harm ensues if the hanging indentation is not 0 but is never used.

If you want the hanging verse to be flush right, you can use `\hanginsymbol`: see p. 26.

Enumeration is by stanza lines, not by print lines. In the above example the lines are indented one unit, two units, one unit, two units, with 3 units of hanging indentation in case a stanza line is too long to fit on one print line.

5.1 Repeating stanza indents

Since version 0.13, if the indentation is repeated every *n* verses of the stanza, you can define only the *n* first indentations, and say they are repeated, defining the value of the `stanzaindent repetition` counter at *n*. For example:

```
\setstanzaindents{5,1,0}
\setcounter{stanzaindent repetition}{2}
```

is like

```
\setstanzaindents{0,1,0,1,0,1,0,1,0,1,0}
```

Be careful: the feature change in eledmac 1.5.1. See Appendix A.2 p. 206.

If you don't use the `stanzaindent repetition` counter, make sure you have at least one more numerical entry in `\setstanzavalues` than the number of lines in the stanza.

If you want to disable this feature again, just put the counter to 0:

```
\setcounter{stanzaindent repetition}{0}
```

The macros make no restriction on the number of lines in a stanza. Stanza indentation values (and penalty values) obey T_EX's grouping conventions, so if one stanza among several has a different structure, its indentations (penalties) may be set within a group; the prior values will be restored when the group ends.

5.2 Stanza breaking

`\setstanzapenalties` When the stanzas run over several pages, it is often desirable that page breaks should arise between certain lines in the stanza, so a facility for including penalties after stanza lines is provided. If you are satisfied with the page breaks, you need not set the penalty values.

The command

```
\setstanzapenalties{1,5000,10100,5000,0}
```

results in a penalty of 5000 being placed after the first and third lines of the stanza, and a penalty of -100 after the second.

The first entry “1” is a control value. If it is zero, then no penalties are passed on to TeX, which is the default. Values between 0 and 10000 are penalty values; values between 10001 and 20000 have 10000 subtracted and the result is given as a negative penalty. The mechanism used for indentations and penalties requires unsigned values less than 32768. No penalty is placed after the last line, so the final ,0 in then example above could be omitted. The control sequence `\endstanzaextra` can be defined to include a penalty. A penalty of 10000 will prevent a page break; such a penalty is included automatically where there is stanza hanging indentation. A penalty of -10000 (corresponding to the entry value 20000 in this context) forces a page break. Values in between act as suggestions as to the desirability of a page break at a given line. There is a subtle interaction between penalties and *glue*, so it may take some adjustment of skips and penalties to achieve the best results.

5.3 Hanging symbol

It’s possible to insert a symbol in each line of hanging verse, as in French typography for ‘[’. To insert in elemac, redefine macro `\hangingsymbol` with this code:

```
\renewcommand{\hangingsymbol}{[\,]}
```

You can also use it to force hanging verse to be flush right:

```
\renewcommand{\hangingsymbol}{\protect\hfill}
```

5.4 Long verse and page break

If you want to prevent page breaks inside long verses, use the option `nopbinverse` when loading package, or use `\lednopbinversetrue`. Read 16 p. 38 for further details.

5.5 Various tools

`\ampersand` If you need to print an & symbol in a stanza, use the `\ampersand` macro, not `\&` which will end the stanza.

`\endstanzaextra` The macro `\endstanzaextra`, if it is defined, is called at the end of a stanza. You could define this, for example, to add extra space between stanzas (by default there is no extra space between stanzas); if you are using the `memoir` class, it provides a length `\stanzaskip` which may come in handy.

`\startstanzahook` Similarly, if `\startstanzahook` is defined, it is called by `\stanza` at the start. This can be defined to do something.

\flagstanza Putting \flagstanza[⟨len⟩]{⟨text⟩} at the start of a line in a stanza (or elsewhere) will typeset ⟨text⟩ at a distance ⟨len⟩ before the line. The default ⟨len⟩ is \stanzaindentbase.

For example, to put a verse number before the first line of a stanza you could proceed along the lines:

```
\newcounter{stanzanum}
\setcounter{stanzanum}{0}
\newcommand*{\startstanzahook}{\refstepcounter{stanzanum}}
\newcommand{\numberit}{\flagstanza{\thestanzanum}}
...
\stanza
\numberit First line...&
      rest of stanza\&

\stanza
\numberit First line, second stanza...
```

5.6 Hanging symbol

It's possible to insert a symbol on each line of hanging verse, as in French typography for ‘[’. To insert in eledmac, redefine macro \hangingsymbol with this code:

```
\renewcommand{\hangingsymbol}{[\,]}
```

5.7 Text before/after verses

It is possible to add text, like a subtitle, before or after verse:

- \stanza command can take a optional argument (in brackets). Its content will be printed before the stanza.
- & can be replaced by \newverse with two optional arguments (in brackets). The first will be printed after the current verse, the second before the next verse.
- \& can take a optional argument (in brackets). Its content will be printed after the stanza.

6 Grouping

In a `minipage` environment LaTeX changes \footnote numbering from arabic to alphabetic and puts the footnotes at the end of the minipage.

`minipage` You can put numbered text with critical footnotes in a minipage and the footnotes are set at the end of the minipage.

You can also put familiar footnotes (see section 11) in a minipage but unlike with \footnote the numbering scheme is unaltered.

`\ledgroup` Minipages, of course, aren't broken across pages. Footnotes in a `\ledgroup` environment are typeset at the end of the environment, as with minipages, but the environment includes normal page breaks. The environment makes no change to the `textwidth` so it appears as normal text; it just might be that footnotes appear in the middle of a page, with text above and below.

`\ledgroupsized` The `\ledgroupsized` environment is similar to `\ledgroup` except that you must specify a width for the environment, as with a minipage.
`\begin{ledgroupsized}[\langle pos \rangle]{\langle width \rangle}`.

The required `\langle width \rangle` argument is the text width for the environment. The optional `\langle pos \rangle` argument is for positioning numbered text within the normal `textwidth`. It may be one of the characters:

`l` (left) numbered text is flush left with respect to the normal `textwidth`. This is the default.

`c` (center) numbered text is in the center of the `textwidth`.

`r` (right) numbered text is flush right with respect to the normal `textwidth`.

Note that normal text, footnotes, and so forth are all flush left.

`\begin{ledgroupsized}{\textwidth}` is effectively the same as `\begin{ledgroup}`

7 Crop marks

The `eledmac` package does not provide crop marks. These are available with either the `memoir` class [Wil02] or the `crop` package.

8 Endnotes

`\doendnotes{\langle letter \rangle}` closes the `.end` file that contains the text of the endnotes, if it's open, and prints one series of endnotes, as specified by a series-letter argument, e.g., `\doendnotes{A}`. `\endprint` is the macro that's called to print each note. It uses `\select@lemmafont` to select fonts, just as the footnote macros do (see p. 96 above).

As endnotes may be printed at any point in the document they always start with the page number of where they were specified. The macro `\printnpnum{\langle num \rangle}` is used to print these numbers. Its default definition is:

`\newcommand*{\printnpnum}[1]{\p{#1}}`

If you aren't going to have any endnotes, you can say `\noendnotes` in your file, before the first `\begin{numbering}`, to suppress the generation of an unneeded `.end` file.

9 Cross referencing

The package provides a simple cross-referencing facility that allows you to mark places in the text with labels, and generate page and line number references to

those places elsewhere using those labels.

`\edlabel`

First you place a label in the text using the command `\edlabel{lab}`. *<lab>* can be almost anything you like, including letters, numbers, punctuation, or a combination—anything but spaces; you might say `\edlabel{toves-3}`, for example.¹⁷

`\edpageref`
`\lineref`
`\sublineref`
`\pstartref`

Elsewhere in the text, either before or after the `\edlabel`, you can refer to its location via `\edpageref{lab}`, or `\lineref{lab}`, `\sublineref{lab}`, or `\pstartref{lab}`. These commands will produce, respectively, the page, line, sub-line and pstart on which the `\edlabel{lab}` command occurred.

An `\edlabel` command may appear in the main text, or in the first argument of `\edtext`, but not in the apparatus itself. But `\edpageref`, `\lineref`, `\sublineref`, `\pstartref` commands can also be used in the apparatus to refer to `\edlabel`s in the text.

The `\edlabel` command works by writing macros to LaTeX .aux file. You will need to process your document through LaTeX twice in order for the references to be resolved.

You will be warned if you say `\edlabel{foo}` and `foo` has been used as a label before. The `ref` commands will return references to the last place in the file marked with this label. You will also be warned if a reference is made to an undefined label. (This will also happen the first time you process a document after adding a new `\edlabel` command: the auxiliary file will not have been updated yet.)

If you want to refer to a word inside an `\edtext{...}{...}` command, the `\edlabel` should be defined inside the first argument, e.g.,

```
The \edtext{creature\edlabel{elephant}} was quite
unafraid}{\Afootnote{Of the mouse, that is.}}
```

`\xpageref`
`\xlineref`
`\xsublineref`
`\xpstartref`

However, there are situations in which you'll want elemac to return a number without displaying any warning messages about undefined labels or the like: if you want to use the reference in a context where L^AT_EX is looking for a number, such a warning will lead to a complaint that the number is missing. This is the case for references used within the argument to `\linenum`, for example. For this situation, three variants of the reference commands, with the `x` prefix, are supplied: `\xpageref`, `\xlineref`, `\xsublineref` and `\xpstartref`. They have these limitations:

- They will not tell you if the label is undefined.
- They must be preceded in the file by at least one of the four other cross-reference commands—e.g., a `\edlabel{foo}` command, even if you never refer to that label—since those commands can all do the necessary processing of the .aux file, and the `\x...` ones cannot.
- When hyperref is loaded, the hyperref link won't be added. (Indeed, it's not a limitation, but a feature.)

¹⁷More precisely, you should stick to characters in the T_EX categories of ‘letter’ and ‘other’.

- \xxref The macros `\xxref` and `\edmakelabel` let you manipulate numbers and labels in ways which you may find helpful in tricky situations.
- The `\xxref{<lab1>}{<lab2>}` command generates a reference to a sequence of lines, for use in the second argument of `\edtext`. It takes two arguments, both of which are labels: e.g., `\xxref{mouse}{elephant}`. It calls `\linenum` (q.v., p. 16 above) and sets the beginning page, line, and sub-line numbers to those of the place where `\edlabel{mouse}` was placed, and the ending numbers to those where `\edlabel{elephant}` occurs.
- \edmakelabel Sometimes the `\edlabel` command cannot be used to specify exactly the page and line desired—for example, if you want to refer to a page and line number in another volume of your edition. In such cases, you can use the `\edmakelabel{<lab>}{<numbers>}` macro so that you can ‘roll your own’ label. For example, if you say `\edmakelabel{elephant}{10|25|0}` you will create a new label, and a later call to `\edpageref{elephant}` would print ‘10’ and `\lineref{elephant}` would print ‘25’. The sub-line number here is zero. It is usually best to collect your `\edmakelabel` statements near the top of your document, so that you can see them at a glance.
- \label The normal `\label`, `\ref` and `\pageref` macros may be used within numbered text, and operate in the familiar fashion.
- \ref
- \pageref
- \label
- \ref
- \pageref
- ## 10 Side notes
- The `\marginpar` command does not work in numbered text. Instead the package provides for non-floating sidenotes in either margin.
- `\ledinnernote{<text>}` will put `<text>` into the inner margin level with where the command was issued. Similarly, `\ledouternote{<text>}` puts `<text>` in the outer margin.
- `\ledsidenote{<text>}` will put `<text>` into the margin specified by the current setting of `\sidenotemargin{<location>}`. The permissible value for `<location>` is one out of the list `left`, `right`, `inner`, or `outer`, for example `\sidenotemargin{outer}`. The package’s default setting is `\sidenotemargin{right}`
- to typeset `\ledsidenotes` in the right hand margin. This is the opposite to the default margin for line numbers. The style for a `\ledsidenote` follows that for a `\ledleftnote` or a `\ledrightnote` depending on the margin it is put in.
- If two, say, `\ledleftnote`, commands are called in the same line the second `<text>` will obliterate the first. There is no problem though with having both a left and a right sidenote on the same line.
- The left sidenote text is put into a box of width `\ledlsnotewidth` and the right text into a box of width `\ledrsnotewidth`. These are initially set to the value of `\marginparwidth`.
- By default, Sidenotes are placed to align with the last line of the note to which it refers. If you want them to be placed to align with the first line of the note to which it refers, use `\leftnoteupfalse` (for left note) and/or `\rightnoteupfalse` (for right note).

\ledlsnotesep The texts are put a distance \ledlsnotesep (or \ledrsnotesep) into the left
 \ledrsnotesep (or right) margin. These lengths are initially set to the value of \linenumsep.

\ledlsnotefontsetup These macros specify how the sidenote texts are to be typeset. The initial
 \ledrsnotefontsetup definitions are:

```
\newcommand*{\ledlsnotefontsetup}{\raggedleft\footnotesize}%
\newcommand*{\ledrsnotefontsetup}{\raggedright\footnotesize}
```

These can of course be changed to suit.

\sidenotesep If you have two or more sidenotes for the same line, they are separated by a
 comma. But if you want to change this separator, you can redefine the macro
 \sidenotesep.

11 Familiar footnotes

The footmisc package [Fai03] by Robin Fairbairns has an option whereby sequential
 footnote marks in the text can be separated by commas^{3,4} like so. As a convenience
 eleedmac provides this automatically.

\multfootsep \multfootsep is used as the separator between footnote markers. Its default
 definition is:

```
\providecommand*{\multfootsep}{\textsuperscript{\normalfont ,}}
```

and can be changed if necessary.

\footnoteA As well as the standard LaTeX footnotes generated via \footnote, the pack-
 \footnoteB age also provides three series of additional footnotes called \footnoteA through
 \footnoteC \footnoteE. These have the familiar marker in the text, and the marked text at
 \footnoteD the foot of the page can be formated using any of the styles described for the
 \footnoteE critical footnotes. Note that the ‘regular’ footnotes have the series letter at the
 start of the name.

\footnormalX Each of the \foot...X macros takes one argument which is the series letter
 \footparagraphX (e.g., B). \footnormalX is the typical footnote format. With \footparagraphX
 \foottwocolX the series is typeset a one paragraph, with \foottwocolX the notes are in two
 \footthreecolX columns, and are in three columns with \footthreecolX.

\thefootnoteA As well as using the \foot...X macros to specify the general footnote arrange-
 \bodyfootmarkA ment for a series, each series uses a set of macros for styling the marks. The mark
 \footfootmarkA numbering scheme is defined by the \thefootnoteA macro; the default is:

```
\renewcommand*{\thefootnoteA}{\arabic{footnoteA}}
```

The appearance of the mark in the text is controlled by \bodyfootmarkA which
 is defined as:

```
\newcommand*{\bodyfootmarkA}{%
\hbox{\textsuperscript{\normalfont \nameuse{@thefnmarkA}}}}
```

The command \footfootmarkA controls the appearance of the mark at the start
 of the footnote text. It is defined as:

```
\newcommand*{\footfootmarkA}{\textsuperscript{\nameuse{@thefnmarkA}}}
```

There are similar command triples for the other series.

Additional footnote series can be easily defined: you just have to use `\newseries`, defined above (see 4.6 p.24).

11.1 Position of the familiar footnotes

`\fnpos` There is a historical incoherence in (e)ledmac. The familiar footnotes are before the critical footnotes in a normal page, but after in a minipage or in a ledgroup. However, it is possible to change the relative position of both types of footnotes. If you want to have familiar footnotes after critical footnotes in a normal page, use:

```
\fnpos{critical-familiar}
```

Or, if you want a minipage or ledgroup to have critical footnotes after familiar footnotes, use:

```
\mpfnpos{familiar-critical}
```

12 Indexing

`\edindex` LaTeX provides the `\index{<item>}` command for specifying that `<item>` and the current page number should be added to the raw index (`idx`) file. The `\edindex{<item>}` macro can be used in numbered text to specify that `<item>` and the current page & linenumber should be added to the raw index file.

If the `memoir` class or the `imakeidx` package is used then the macro takes an optional argument, which is the name of a raw index file. For example `\edindex[line]{item}` will use `line.idx` as the raw file instead of `\jobname.idx`.

The minimal version of `imakeidx` package to be used is the version 1.3a uploaded on CTAN on 2013/07/11.

Be careful with the order of package loading and index declaration. You must use this order:

1. Load `imakeidx`.
2. Load `eledmac`.
3. Declare the index with the macro `\makeindex` of `imakeidx`.

`\pagelinesep` The page & linenumber combination is written as `page\pagelinesep line`, where the default definition is `\newcommand{\pagelinesep}{-}` so that an item on page 3, line 5 will be noted as being at 3-5. You can renew `\pagelinesep` to get a different separator (but it just so happens that `-` is the default separator used by the `MAKEINDEX` program).

`\edindexlab` The `\edindex` process uses a `\label/\ref` mechanism to get the correct line number. It automatically generates labels of the form `\label{\edindexlab N}`, where `N` is a number, and the default definition of `\edindexlab` is:

```
\newcommand*{\edindexlab}{\$&}
```

in the hopes that this will not be used by any other labels (`\edindex`'s labels are like `\label{${}&27}`). You can change `\edindexlab` to something else if you need to.

13 Tabular material

LaTeX's normal `tabular` and `array` environments cannot be used where line numbering is being done; more precisely, they can be used but with odd results, so don't use them. However, `eledmac` provides some simple tabulation environments that can be line numbered. The environments can also be used in normal unnumbered text.

edarrayl There are six environments; the **edarray*** environments are for math and
edarrayc **edtabular*** for text entries. The final **l**, **c**, or **r** in the environment names indicate
edarrayr that the entries will be flushleft (**l**), centered (**c**) or flushright (**r**). There is
edtabularl no means of specifying different formats for each column, nor for specifying a
edtabularc fixed width for a column. The environments are centered with respect to the
edtabularr surrounding text.

$$\begin{edtabularc}{ccc}$$

 1 & 2 & 3 \\
 a & bb & ccc \\
 AAA & BB & C

1	2	3
a	bb	ccc
AAA	BB	C

Entries in the environments are the same as for the normal `array` and `tabular` environments but there must be no ending `\backslash` at the end of the last row. *There must be the same number of column designators (the &)* in each row. There is no equivalent to any line drawing commands (such as `\hline`). However, unlike the normal environments, the `ed... environments can cross page breaks.`

Macros like \edtext can be used as part of an entry

For example:

```
\begin{numbering}
\pstart
\begin{edtabularl}
\textbf{\Large I} & wish I was a little bug\edindex{bug} &
\textbf{\Large I} & eat my peas with honey\edindex{honey} \\
& With whiskers \edtext{round}{\Afootnote{around}} my tummy &
& I've done it all my life. \\
& I'd climb into a honey\edindex{honey} pot &
& It makes the peas taste funny \\
& And get my tummy gummy.\edindex{gummy} &
& But it keeps them on the knife.

\end{edtabularr}
\pend
\end{numbering}
```

produces the following parallel pair of verses.

1 I wish I was a little bug	I eat my peas with honey
2 With whiskers round my tummy	I've done it all my life.
3 I'd climb into a honey pot	It makes the peas taste funny
4 And get my tummy gummy.	But it keeps them on the knife.

\edtabcolsep The distance between the columns is controlled by the length \edtabcolsep.
\spreadmath{\langle math\rangle} typesets {\langle math\rangle} but the {\langle math\rangle} has no effect on
\spreadtext{\langle text\rangle} the calculation of column widths. \spreadtext{\langle text\rangle} is the analogous command
for use in edtabular environments.
\begin{edarrayl}
1 & 2 & 3 & 4 \\
& \spreadmath{F+G+C} & & \\
a & bb & ccc & dddd
\end{edarrayl}

1	2	3	4
			$F + G + C$
a	bb	ccc	ddd

\edrowfill The macro \edrowfill{\langle start\rangle}{\langle end\rangle}{\langle fill\rangle} fills columns number {\langle start\rangle} to {\langle end\rangle} inclusive with {\langle fill\rangle}. The {\langle fill\rangle} argument can be any horizontal ‘fill’. For example \hrulefill or \upbracefill.

Note that every row must have the same number of columns, even if some would not appear to be necessary.

The \edrowfill macro can be used in both tabular and array environments. The typeset appearance of the following code is shown below.

```
\begin{edtabularr}
1 & 2 & 3 & 4 & 5 \\
Q & & fd & h & qwertziohg \\
v & wptz & x & y & vb \\
g & nnn & \edrowfill{3}{5}{\upbracefill} & & \\
\edrowfill{1}{3}{\downbracefill} & & & pq & dgh \\
k & & & l & co & ghweropjklmnbcxys \\
1 & 2 & 3 & \edrowfill{4}{5}{\hrulefill} & &
\end{tabularr}
```

1	2	3	4	5
Q		fd	h	qwertziohg
v	wptz	x	y	vb
g	nnn			
				$\overbrace{pq \quad dgh}$
\downbracefill				
k		l	co	ghweropjklmnbcxys
1	2	3		
				$\overbrace{\rule{0pt}{4pt}}$

You can also define your own ‘fill’. For example:

```
\newcommand*{\upbracketfill}{%
\hrule height 4pt depth 0pt\hrulefill\hrule height 4pt depth 0pt}
```

is a fill like `\upbracefill` except it has the appearance of a (horizontal) bracket instead of a brace. It can be used like this:

```
\begin{edarrayc}
1 & 2 & 3 & 4 \\
a & \edrowfill{2}{3}{\upbracketfill} & & d \\
A & B & C & D
\end{edarrayc}
```

$$\begin{matrix} 1 & 2 & 3 & 4 \\ a & \underline{\hspace{2cm}} & d \\ A & B & C & D \end{matrix}$$

`\edatleft` `\edatleft[<math>]{<symbol>}{<halfheight>}` typesets the math `<symbol>` as `\left<symbol>` with the optional `<math>` centered before it. The `<symbol>` is twice `<halfheight>` tall. The `\edatright` macro is similar and it typesets `\right<symbol>` with `<math>` centered after it.

```
\begin{edarrayc}
& 1 & 2 & 3 & \\
& 4 & 5 & 6 & \\
\edatleft[left =]{\{}{1.5\baselineskip}
& 7 & 8 & 9 & \\
\edatright[= right]{\}}{1.5\baselineskip}
\end{edarrayc}
```

$$left = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix} = right$$

`\edbforetab` `\edbforetab{<text>}{<entry>}`, where `<entry>` is an entry in the leftmost column, typesets `<text>` left justified before the `<entry>`. Similarly `\edaftertab{<entry>}{<text>}`, where `<entry>` is an entry in the rightmost column, typesets `<text>` right justified after the `<entry>`.

For example:

```
\begin{edarrayl}
A & 1 & 2 & 3 \\
\edbforetab{Before}{B} & 1 & 3 & 6 \\
C & 1 & 4 & \edaftertab{8}{After} \\
D & 1 & 5 & 0
\end{edarrayl}
```

Before	$\begin{matrix} A & 1 & 2 & 3 \\ B & 1 & 3 & 6 \\ C & 1 & 4 & 8 \\ D & 1 & 5 & 0 \end{matrix}$	After
--------	--	-------

`\edvertline` The macro `\edvertline{<height>}` draws a vertical line `<height>` high (contrast
`\edvertdots` this with `\edatright` where the size argument is half the desired height).

```
\begin{edarrayr}
a & b & C & d & \\
v & w & x & y & \\
m & n & o & p & \\
k & & L & cvb & \edvertline{4pc}
\end{edarrayr}
```

<i>a</i>	<i>b</i>	<i>C</i>	<i>d</i>	
<i>v</i>	<i>w</i>	<i>x</i>	<i>y</i>	
<i>m</i>	<i>n</i>	<i>o</i>	<i>p</i>	
<i>k</i>		<i>L</i>	<i>cvb</i>	

The `\edvertdots` macro is similar to `\edvertline` except that it produces a vertical dotted instead of a solid line.

14 Sectioning commands

The standard sectioning command (`\chapter`, `\section` etc.) can be used inside a numbered text. But the line which contains it won't be numbered, and you can't add critical notes inside. In the past (between versions 1.1.0 and 1.12.0), these following commands were provided:

- `\ledchapter[<text>]{<critical text>}`
- `\ledchapter*`
- `\ledsection[<text>]{<critical text>}`
- `\ledsection*`
- `\ledsubsection[<text>]{<critical text>}`
- `\ledsubsection*`
- `\ledsubsubsection[<text>]{<critical text>}`
- `\ledsubsubsection*`

These commands are deprecated, and won't be maintained anymore, because of a bad conception. Since version 1.12.0, you have to use the following commands:

- `\eledchapter[<text>]{<critical text>}`
- `\eledchapter*`
- `\eledsection[<text>]{<critical text>}`

- `\uledsection*`
- `\uledsubsection[⟨text⟩]{⟨critical text⟩}`
- `\uledsubsection*`
- `\uledsubsubsection[⟨text⟩]{⟨critical text⟩}`
- `\uledsubsubsubsection*`

Which are equivalent to the L^AT_EX commands. Each individual command must be called alone in a `\pstart... \pend`:

```
\pstart
\uledsection*[xxxx\ledsidenote{section}]
\pend
\pstart
\uledsubsection*[xxxx\ledsidenote{sub}]
\pend
\pstart
normal text
\pend
```

At the first run, you will see only the text. It's normal. At the second run, you will see the formating. And consequently, at the third run, you will see the table of contents.

For technical reason, the page break before `\elechapter` can't be add automatically. You have to insert it manually via `\beforeeledchapter`, which must be called outside of a numbering section.

15 Quotation environments

The `quotation` and `quote` environment can be used so that same definition/note appears both inside and outside a numbered section. The typographical consequences will resemble the outside numbered sections, based on the styles of the `book` class. However, if you use a package that redefines these environments, these redefinitions won't be available inside the numbering section. You must open the quotation environments inside a `\start-\pend` block, not outside.

In some case, you don't want these environments be redefined in numbered section. You can load the package with the option `noquotation` to prevent this redefinition.

16 Page breaks

`Eledmac` and `eledpar` break pages automatically. However, you may sometimes want to either force page breaks or prevent them. The packages provide two macros:

- `\ledpb` adds a page break.
- `\lednomp` prevents a page break, by adding one line to the current page if needed.

These commands have effect only at the second run.

These two commands take effect at the beginning of line in which they are called. For example, if you call `\ledpb` at l. 444, the l. 443 will be at the p. *n*, and the l. 444 at the p. *n* + 1. However you can change the behavior, and decide they will have effect after the end of the line, adding `\ledpbsetting{after}` at the beginning of your file (better: in your preamble). With the previous example, the l. 444 will be at the p. *n* and the l. 445 will be at the p. *n* + 1.

```
\ledpbsetting
\lednompbinversetrue
```

If you are using `eledpar` to typeset parallel pages you must use `\lednomp` on both sides in the two corresponding lines. This is especially important when you are using stanzas; otherwise the pages will run out of sync. You can also decide to prevent page breaks between two lines of a long verse. To do this, use `nopbinverse` when loading package, or add `\lednompbinversetrue` in the beginning of your file (better: in your preamble). This feature works only with verse of 2 lines, not more. It works at the third run, or at fourth run with `eledpar`. By default, when a long verse runs normally between two pages, a page break will be placed at the beginning of the verse. However, if you have added `\ledpbsetting{after}`, the page break will be placed at the end of the long verse, and the page containing the long verse will have one extra line.

17 Miscellaneous

```
\extensionchars
```

When the package assembles the name of the auxiliary file for a section, it prefixes `\extensionchars` to the section number. This is initially defined to be empty, but you can add some characters to help distinguish these files if you like; what you use is likely to be system-dependent. If, for example, you said `\renewcommand{\extensionchars}{!1}`, then you would get temporary files called `jobname.!1`, `jobname.!2`, etc.

```
\ifledfinal
```

The package can take options. The option ‘final’, which is the default is for final typesetting; this sets `\ifledfinal` to TRUE. The other option, ‘draft’, may be useful during earlier stages and sets `\ifledfinal` to FALSE.

```
\showlemma
```

The lemma within the text is printed via `\showlemma{lemma}`. Normally, or with the ‘final’ option, the definition of `\showlemma` is:

```
\newcommand*{\showlemma}[1]{#1}
```

so it just produces its argument. With the ‘draft’ option it is defined as

```
\newcommand*{\showlemma}[1]{\textit{#1}}
```

so that its argument is typeset in an italic font, which may make it easier to check that all lemmas have been treated.

If you would prefer some other style, you could put something like this in the preamble:

```
\ifledfinal \else
```

```
\renewcommand{\showlemma}[1]{\textbf{#1}}% or simply ...[1]{#1}
\fi
```

17.1 Known and suspected limitations

In general, *eledmac*'s system for adding marginal line numbers breaks anything that makes direct use of the LaTeX insert system, which includes *marginpars*, footnotes and floats.

However, you can use both `\footnote` and the familiar footnote series notes in numbered text. A `\marginpar` in numbered text will throw away its contents and send a warning message to the terminal and log file, but will do no harm.

`\parshape` cannot be used within numbered text, except in a very restricted way.

`\ballast`

LaTeX is a three-pass system, but even after a document has been processed three times, there are some tricky situations in which the page breaks decided by TeX never settle down. At each successive run, *eledmac* may oscillate between two different sets of page decisions. To stop this happening, should it arise, Wayne Sullivan suggested the inclusion of the quantity `\ballast`. The amount of `\ballast` will be subtracted from the penalties which apply to the page breaks calculated on the *previous* run through TeX, thus reinforcing these breaks. So if you find your page breaks oscillating, say

```
\setcounter{ballast}{100}
```

or some such figure, and with any luck the page breaks will settle down. Luckily, this problem doesn't crop up at all often.

The restriction on explicit line-breaking in paragraphed footnotes, mentioned in a footnote 15, p. 23, and described in more detail on p. 108, really is a nuisance if that's something you need to do. There are some possible solutions, described by Michael Downes, but this area remains unsatisfactory.

LaTeX has a reputation for putting things in the wrong margin after a page break. The *eledmac* package does nothing to improve the situation — in fact it just makes it more obvious if numbered text crosses a page (or column) boundary and the numbers are meant to flip from side to side. Try and keep the numbers in the same margin all the time. Another aspect of TeX's page breaking mechanism is that when numbering lines by the page, the first few numbers after a page break may continue as though the lines were still on the previous page.

`\pageparbreak`

If you can't resist flipping the numbers or numbering by the page, then you might find that judicious use of `\pageparbreak` may help if numbering goes awry across a page (or column) break. It tries to force TeX into partitioning the current paragraph into two invisibly joined paragraphs with a page break between them. Insert the command between the last word on one page and the first word on the next page. If later you change something earlier in the document the natural page break may be in a different place, and you will have to adjust the location of `\pageparbreak` accordingly.

`\footfudgefiddle`

For paragraphed footnotes TeX has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom

of the text block. `\footfudgefiddle` can be increased from its default 64 (say to 68) to increase the estimate. You have to use `\renewcommand` for this, like:

```
\renewcommand{\footfudgefiddle}{68}
```

Help, suggestions and corrections will be gratefully received.

17.2 Use with other packages

Because of `eledmac`'s complexity it may not play well with other packages. In particular `eledmac` is sensitive to commands in the arguments to the `\edtext` and `*footnote` macros (this is discussed in more detail in section 22, and in particular the discussion about `\no@expands` and `\morenoexpands`). You will have to see what works or doesn't work in your particular case.

It is possible that `eledmac` and the `hyperref` package may work together. I have not tried this combination but past experience with `hyperref` suggests that cooperation is unlikely; `hyperref` changes many LaTeX internals and `eledmac` does things that are not normally seen in LaTeX.

If you want to use the option `bottom` of the `footmisc` package, you must load this package *before* the `eledmac` package.

`\morenoexpands`

You can define the macro `\morenoexpands` to modify macros that you call within `\edtext`. Because of the way `eledmac` numbers the lines the arguments to `\edtext` can be processed more than once and in some cases a macro should only be processed once. One example is the `\colorbox` macro from the `color` package, which you might use like this:

```
... \edtext{\colorbox{mycolor}{\lemma}}{\Afootnote{... \colorbox{...}}}
```

If you actually try this¹⁸ you will find LaTeX whining ‘Missing { inserted’, and then things start to fall apart. The trick in this case is to specify either:

```
\newcommand{\morenoexpands}{\let\colorbox=0}
```

or

```
\makeatletter
\newcommand{\morenoexpands}{\let\colorbox\@secondoftwo}
\makeatother
```

(`\@secondoftwo` is an internal LaTeX macro that takes two arguments and throws away the first one.) The first incantation lets `color` show in both the main text and footnotes whereas the second one shows `color` in the main text but kills it in the lemma and footnotes. On the other hand if you use `\textcolor` instead, like

```
... \edtext{\textcolor{mycolor}{\lemma}}{\Afootnote{... \textcolor{...}}}
```

¹⁸Reported by Dirk-Jan Dekker in the CTT thread ‘Incompatibility of “color” package’ on 2003/08/28.

there is no need to fiddle with `\morenoexpands` as the color will naturally be displayed in both the text and footnotes. To kill the color in the lemma and footnotes, though, you can do:

```
\makeatletter
\newcommand{\morenoexpands}{\let\textrmcolor{@secondoftwo}}
\makeatother
```

It took me a little while to discover all this. If you run into this sort of problem you may have to spend some time experimenting before hitting on a solution.

17.3 Parallel typesetting

Peter Wilson has developed the `Ledpar` package as an extension to `eledmac` specifically for parallel typesetting of critical texts. This also cooperates with the `babel` / `polyglossia` packages for typesetting in multiple languages. The package has been called `eledpar` since September 2012.

He also developed the `ledarab` package for handling parallel Arabic text in critical editions. However, this package is not maintained by Maïeul Rouquette. You should use the capabilities of a modern TeX processor, like Xe(La)TeX

17.4 Notes for EDMAC users

If you have never used `EDMAC`, ignore this section. If you have used `EDMAC` and are starting on a completely new document, ignore this section. Only read this section if you are converting an original `EDMAC` document to use `eledmac`.

The package still provides the original `\text` command, but it is (a) deprecated, and (b) its name has been changed¹⁹ to `\critext`; use the `\edtext` macro instead. However, if you do use `\critext` (the new name for `\text`), the following is a reminder.

`\critext` Within numbered paragraphs, footnotes and endnotes are generated by forms of the `\critext` macro:

```
\critext{\<lemma>}{\<commands>}/
```

The `\<lemma>` argument is the lemma in the main text: `\critext` both prints this as part of the text, and makes it available to the `\<commands>` you specify to generate notes. The `/` at the end terminates the command; it is part of the macro's definition so that spaces after the macro will be treated as significant.

For example:

<pre>I saw my friend \critext{Smith} \Afootnote{Jones C, D.}/ on Tuesday.</pre>	<pre>1 I saw my friend 2 Smith on Tuesday. <hr/> 2 Smith] Jones C, D.</pre>
---	---

The lemma `Smith` is printed as part of this sentence in the text, and is also made available to the footnote that specifies a variant, `Jones C, D.` The footnote

¹⁹A name like `\text` is likely to be defined by other LaTeX packages (it certainly is by the AMS packages) and it seems sensible to try and avoid clashes with other definitions.

macro is supplied with the line number at which the lemma appears in the main text.

The *<lemma>* may contain further `\critext` commands. Nesting makes it possible to print an explanatory note on a long passage together with notes on variants for individual words within the passage. For example:

<code>\critext{I saw my friend</code>	1 I saw my friend
<code> \critext{Smith}{\Afootnote{Jones</code>	2 Smith on Tuesday.
<code> C, D.}/ on Tuesday.}</code>	<u>2</u> Smith] Jones C, D.
<code> \Bfootnote{The date was</code>	<u>1-2</u> I saw my friend
<code> July 16, 1954.}</code>	Smith on Tuesday.] The
<code>/</code>	date was July 16, 1954.

However, `\critext` cannot handle overlapping but unnested notes—for example, one note covering lines 10–15, and another covering 12–18; a `\critext` that starts in the *<lemma>* argument of another `\critext` must end there, too. (The `\lemma` and `\linenum` commands may be used to generate overlapping notes if necessary.)

The second argument of the `\critext` macro, *<commands>*, is the same as the second argument to the `\edtext` macro.

It is possible to define aliases for `\critext`, which can be easier to type. You can make a single character substitute for `\critext` by saying this:

```
\catcode`<=\active
\let<=\critext
```

Then you might say `<{Smith}\variant{Jones}/`. This of course destroys the ability to use `<` in any new macro definitions, so long as it remains in effect; hence it should be used with care.

Changing the character at the end of the command requires more work:

```
\catcode`<=\active
\def\xtext#1#2>{\critext{#1}{#2}/}
\let<=\xtext
```

This allows you to say `<{Smith}\Afootnote{Jones}>`.

Aliases for `\critext` of the first kind shown here also can't be nested—that is, you can't use the alias in the text that forms the first argument to `\critext`. (See section 22 to find out why.) Aliases of the second kind may be nested without any problem.

If you really have to use `\critext` in any of the tabular or array environments, then `\edtext` must not be used in the same environment. If you use `\critext` in one of these environments then you have to issue the declaration `\usingcritext` beforehand. The declaration `\usingedtext` must be issued to revert to the default assumption that `\edtext` will be used.

18 Implementation overview

We present the `eledmac` code in roughly the order in which it's used during a run of `TeX`. The order is *exactly* that in which it's read when you load The `eledmac` package, because the same file is used to generate this manual and to generate the `LaTeX` package file. Most of what follows consists of macro definitions, but there are some commands that are executed immediately—especially at the start of the code. The documentation generally describes the code from the point of view of what happens when the macros are executed, though. As each macro is introduced, its name is printed in the margin.

We begin with the commands you use to start and stop line numbering in a section of text (Section 19). Next comes the machinery for writing and reading the auxiliary file for each section that helps us count lines, and for creating list macros encoding the information from that file (Section 21); this auxiliary file will be read at the start of each section, to create those list macros, and a new version of the file will be started to collect information from the body of the section.

Next are commands for marking sections of the text for footnotes (Section 22), followed by the macros that take each paragraph apart, attach the line numbers and insertions, and send the result to the vertical list (Section 23). The footnote commands (Section 24) and output routine (Section 28) finish the main part of the processing; cross-referencing (Section 29) and endnotes (Section 26) complete the story.

In what follows, macros with an @ in their name are more internal to the workings of `eledmac` than those made up just of ordinary letters, just as in `PLAIN TeX` (see *The TeXbook*, p. 344). You are meant to be able to make free with ordinary macros, but the '@' ones should be treated with more respect, and changed only if you are pretty sure of what you are doing.

19 Preliminaries

We try and use `1@d` in macro names to help avoid name clashes, but this is not a hard and fast rule. For example, if an original `EDMAC` macro includes `edmac` We will simply change that to `eledmac`.

Announce the name and version of the package, which is targetted for `LaTeX2e`.

```
1 {*code}
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{eledmac}[2014/08/07 v1.12.2 LaTeX port of EDMAC]%
```

Generally, these are the modifications to the original. `EDMAC` code:

- Replace as many `\def`'s by `\newcommand`'s as possible to avoid overwriting `LaTeX` macros.
- Replace user-level `TeX` counts by `LaTeX` counters.
- Use the `LaTeX` font handling mechanisms.

- Use LaTeX messaging and file facilities.

\ifledfinal
\ifparapparatus@
Use this to remember which option is used, set and execute the options with final as the default.

```

4 \newif\ifledfinal
5 \newif\ifparapparatus@
6 \newif\ifnoquotation@
7 \newif\iflednopbinverse
8 \newif\ifparledgroup
9 \newif\ifledsecnolinenumber
10 \parapparatus@false
11 \DeclareOption{noquotation}{\noquotation@true}
12 \DeclareOption{final}{\ledfinaltrue}
13 \DeclareOption{draft}{\ledfinalfalse}
14 \DeclareOption{parapparatus}{\parapparatus@true}
15 \DeclareOption{nopbinverse}{\lednopbinversetrue}
16 \DeclareOption{ledsecnolinumber}{\ledsecnolinumbertrue}
17 \ExecuteOptions{final}
```

Use the starred form of \ProcessOptions which executes options in the order listed in the source file: class options, then listed package options, so a package option can override a class option with the same name. This was suggested by Dan Luecking in the ctt thread *Class/package option processing*, on 27 February 2004.

```

18 \ProcessOptions*\relax
19
```

Loading package *xargs* to declare commands with optional arguments. *Etoolbox* is also used to make code clearer - for example, in dynamic command names (which can replace \csname etc.). Use *suffix* to declare commands with a starred version, *xstring* to work with strings and *ifluatex* to test if LuaTeX is running, and *ragged2e* to manage ragging for paragraphed notes.

```

20 \RequirePackage{xargs}
21 \RequirePackage{etoolbox}
22 \reserveinserts{32}
23 \RequirePackage{suffix}
24 \RequirePackage{xstring}
25 \RequirePackage{ifluatex}
26 \RequirePackage{ragged2e}
```

\if@RTL The \if@RTL is defined by the bidi package, which is sometimes loaded by *polyglossia*. But we define it if the bidi package is not loaded.

```
27 \ifcsdef{if@RTL}{}{\newif\if@RTL}
```

\showlemma \showlemma{\langle lemma\rangle} typesets the lemma text in the body. It depends on the option.

```

28 \ifledfinal
29   \newcommand*{\showlemma}[1]{#1}
30 \else
```

```

31 \newcommand*{\showlemma}[1]{\underline{#1}}
32 \fi
33

\linenumberlist The code for the \linenumberlist mechanism was given to Peter Wilson by
Wayne Sullivan on 2004/02/11.
    Initialize it as \empty
34 \let\linenumberlist=\empty
35

\@oldtempcnta In imitation of LATEX, we create a couple of scratch counters.
\@oldtempcntb LaTeX already defines \@tempcnta and \@tempcntb but Peter Wilson have
found in the past that it can be dangerous to use these (for example one of the
AMS packages did something nasty to the ccaption package's use of one of these).
36 \newcount\@oldtempcnta \newcount\@oldtempcntb

\ifl@dmemoir Define a flag for if the memoir class has been used.
37 \newif\ifl@dmemoir
38 \@ifclassloaded{memoir}{\l@dmemoirtrue}{\l@dmemoirfalse}
39

\ifl@imakeidx Define a flag for if the imakeidx package has been used.
40 \newif\ifl@imakeidx
41 \@ifpackageloaded{imakeidx}{\l@imakeidxtrue}{\l@imakeidxfalse}

```

19.1 Messages

All the messages are grouped here as macros. This saves TeX's memory when the same message is repeated and also lets them be edited easily.

```

\eledmac@warning Write a warning message.
42 \newcommand{\eledmac@warning}[1]{\PackageWarning{eledmac}{#1}}

\eledmac@error Write an error message.
43 \newcommand{\eledmac@error}[2]{\PackageError{eledmac}{#1}{#2}}

```

20 Sectioning commands

`\section@num` You use `\beginnumbering` and `\endnumbering` to begin and end a line-numbered section of the text; the pair of commands may be used as many times as you like within one document to start and end multiple, separately line-numbered sections. LaTeX will maintain and display a ‘section number’ as a count named `\section@num` that counts how many `\beginnumbering` and `\resumenumbering` commands have appeared; it needn’t be related to the logical divisions of your text.

`\extensionchars` Each section will read and write an associated ‘line-list file’, containing information used to do the numbering; the file will be called `<jobname>.nn`, where `nn` is the section number. However, you may direct that an extra string be added before the `nn` in that filename, in order to distinguish these temporary files from others: that string is called `\extensionchars`. Initially it’s empty, since different operating systems have greatly varying ideas about what characters are permitted in file names. So `\renewcommand{\extensionchars}{-}` gives temporary files called `jobname.-1`, `jobname.-2`, etc.

```
121 \newcount\section@num
122 \section@num=0
123 \let\extensionchars=\empty
```

`\ifnumbering` The `\ifnumbering` flag is set to `true` if we’re within a numbered section (that is, between `\beginnumbering` and `\endnumbering`). You can use `\ifnumbering` in your own code to check whether you’re in a numbered section, but don’t change the flag’s value.

```
124 \newif\ifnumbering
```

`\ifnumberingR` In preparation for the `eledpar` package, these are related to the ‘left’ text of parallel texts (when `\ifl@dpairing` is `TRUE`). They are explained in the `eledpar` manual.

`\l@dpairingtrue`

```
125 \newif\ifl@dpairing
\ifl@dpairing
\l@dpairingtrue
\l@dpairingfalse
\ifpst@rtedL 126 \l@dpairingfalse
\pst@rtedLtrue 127 \newif\ifpst@rtedL
\pst@rtedLfals 128 \pst@rtedLfals
\l@dnumpstartsL 129 \newcount\l@dnumpstartsL
```

`\ifledRcol` `\ifledRcol` is set to `true` in the `Rightside` environnement. It must be distinguished from `\ifledRcol@` which is set to `true` when a right line is processed, in `\Pages` or `\Columns`.

```
130 \newif\ifledRcol
131 \newif\ifledRcol@
```

The `\ifnumberingR` flag is set to `true` if we’re within a right text numbered section.

```
132 \newif\ifnumberingR
```

\beginnumbering \beginnumbering begins a section of numbered text. When it's executed we increment the section number, initialize our counters, send a message to your terminal, and call macros to start the lineation machinery and endnote files.

The initializations here are trickier than they look. \line@list@stuff will use all of the counters that are zeroed here when it assembles the line-list and other lists of information about the lineation. But it will do all of this locally and within a group, and when it's done the lists will remain but the counters will return to zero. Those same counters will then be used as we process the text of this section, but the assignments will be made globally. These initializations actually apply to both uses, though in all other respects there should be no direct interaction between the use of these counters and variables in the two processing steps.

For parallel processing :

- zero \l@dnumstartsL — the number of chunks to be processed.
- set \ifpst@rtedL to FALSE.

```

133 \newcommand*{\beginnumbering}{%
134   \ifnumbering

```

21 Line counting

21.1 Choosing the system of lineation

Sometimes you want line numbers that start at 1 at the top of each page; sometimes you want line numbers that start at 1 at each `\pstart`; other times you want line numbers that start at 1 at the start of each section and increase regardless of page breaks. `eledmac` can do it either way, and you can switch from one to the other within one work. But you have to choose one or the other for all line numbers and line references within each section. Here we will define internal codes for these systems and the macros you use to select them.

```
\ifbypstart@ The \ifbypage@ and \ifbypstart@ flag specific the current lineation system:
\bypstart@true
\bypstart@false
  \ifbypage@ • line-of-page: bypstart@ = false and bypage@ = true.
  \bypage@true
  \bypage@false • line-of-pstart: bypstart@ = true and bypage@ = false.
eledmac will use the line-of-section system unless instructed otherwise.
220 \newif\ifbypage@
221 \newif\ifbypstart@
```

²⁰Our thanks to Wayne Sullivan, who suggested the idea behind these macros.

\lineation \lineation{<word>} is the macro you use to select the lineation system. Its argument is a string: either page or section or pstart.

```

222 \newcommand*{\lineation}[1]{{%
223   \ifnumbering
224     \led@err@LineationInNumbered
225   \else

248   \fi}}

```

\linenummargin \linenummargin{<word>} You call \linenummargin{<word>} to specify which margin you want your line numbers in; it takes one argument, a string. You can put the line numbers in the same margin on every page using left or right; or you can use inner or outer to get them in the inner or outer margins. (These last two options assume that even-numbered pages will be on the left-hand side of every opening in your book.) You can change this within a numbered section, but the change may not take effect just when you'd like; if it's done between paragraphs nothing surprising should happen.

The selection is recorded in the count \line@margin: 0 for left, 1 for right, 2 for outer, and 3 for inner.

```

324   \else
325     \led@warn@BadSublockdisp
326   \fi}%
327 }
```

`\linenumberstyle` We provide a mechanism for using different representations of the line numbers,
`\linenumrep` not just the normal arabic.

`\linenumr@p` NOTE: In v0.7 `\linenumrep` and `\sublinenumrep` replaced the internal
`\linenumr@p` and `\sublinenumr@p`.

`\sublinenumrep` `\linenumberstyle` and `\sublinenumberstyle` are user level macros for setting the number representation (`\linenumrep` and `\sublinenumrep`) for line and sub-line numbers.

```

328 \newcommand*{\linenumberstyle}[1]{%
329   \def\linenumrep##1{\nameuse{@##1}{##1}}%
330 \newcommand*{\sublinenumberstyle}[1]{%
331   \def\sublinenumrep##1{\nameuse{@##1}{##1}}}

Initialise the number styles to arabic.

332 \linenumberstyle{arabic}
333   \let\linenumr@p\linenumrep
334 \sublinenumberstyle{arabic}
335   \let\sublinenumr@p\sublinenumrep
336

```

`\leftlinenum` and `\rightlinenum` are the macros that are called to print marginal line numbers on a page, for left- and right-hand margins respectively. They're made easy to access and change, since you may often want to change the styling in some way. These standard versions illustrate the general sort of thing that will be needed; they're based on the `\leftheadline` macro in *The TeXbook*, p. 416.

Whatever these macros output gets printed in a box that will be put into the appropriate margin without any space between it and the line of text. You'll generally want a kern between a line number and the text, and `\linenumsep` is provided as a standard way of storing its size. Line numbers are usually printed in a smaller font, and `\numlabfont` is provided as a standard name for that font. When called, these macros will be executed within a group, so font changes and the like will remain local.

`\ledlinenum` typesets the line (and subline) number.

The original `\numlabfont` specification is equivalent to the LaTeX `\scriptsize` for a 10pt document.

```

337 \newlength{\linenumsep}
338 \setlength{\linenumsep}{1pc}
339 \newcommand*{\numlabfont}{\normalfont\scriptsize}
340 \newcommand*{\ledlinenum}{%
341   \numlabfont\linenumrep{line@num}%
342   \ifsublines@
343     \ifnum\subline@num>0\relax
344       \unskip\fullstop\sublinenumrep{\subline@num}%
345     \fi
346   \fi}
347 \newcommand*{\leftlinenum}{%
348   \ledlinenum
349   \kern\linenumsep}
350 \newcommand*{\rightlinenum}{%
351   \kern\linenumsep
352   \ledlinenum}
353

```

21.2 List macros

Reminder: compare these with the LaTeX list macros in case they would be suitable instead.

We will make heavy use of lists of information, which will be built up and taken apart by the following macros; they are adapted from *The TeXbook*, pp. 378–379, which discusses their use in more detail.

These macros consume a large amount of the run-time of this code. We intend to replace them in a future version, and in anticipation of doing so have defined their interface in such a way that it is not sensitive to details of the underlying code.

- \list@create The \list@create macro creates a new list. In this version of elemac this macro doesn't do anything beyond initializing an empty list macro, but in future versions it may do more.
354 \newcommand*{\list@create}[1]{\global\let#1=\emptyset}
- \list@clear The \list@clear macro just initializes a list to the empty list; in this version of elemac it is no different from \list@create.
355 \newcommand*{\list@clear}[1]{\global\let#1=\emptyset}
- \xright@appenditem \xright@appenditem expands an item and appends it to the right end of a list macro. We want the expansion because we'll often be using this to store the current value of a counter. \xright@appenditem creates global control sequences, like \xdef, and uses two temporary token-list registers, \@toksa and \@toksb.
356 \newtoks\led@toksa \newtoks\led@toksb
357 \global\led@toksa={\{}\br/>358 \long\def\xright@appenditem#1{to#2{\%\br/>359 \global\led@toksb=\expandafter{\#2}\%\br/>360 \xdef#2{\the\led@toksb\the\led@toksa\expandafter{\#1}}%\br/>361 \global\led@toksb={\}}
- \xleft@appenditem \xleft@appenditem expands an item and appends it to the left end of a list macro; it is otherwise identical to \xright@appenditem.
362 \long\def\xleft@appenditem#1{to#2{\%\br/>363 \global\led@toksb=\expandafter{\#2}\%\br/>364 \xdef#2{\the\led@toksa\expandafter{\#1}\the\led@toksb}\%\br/>365 \global\led@toksb={\}}
- \gl@p The \gl@p macro removes the leftmost item from a list and places it in a control sequence. You say \gl@p\l\to\z (where \l is the list macro, and \z receives the left item). \l is assumed nonempty: say \ifx\l\empty to test for an empty \l. The control sequences created by \gl@p are all global.
366 \def\gl@p#1{to#2{\expandafter\gl@poff#1\gl@poff#1#2}\br/>367 \long\def\gl@poff{\#1#2\gl@poff#3#4{\gdef#4{\#1}\gdef#3{\#2}}}\br/>368

21.3 Line-number counters and lists

Footnote references using line numbers rather than symbols can't be generated in one pass, because we don't know the line numbers till we ship out the pages. It would be possible if footnotes were never keyed to more than one line; but some footnotes gloss passages that may run for several lines, and they must be tied to the first line of the passage glossed. And even one-line passages require two passes if we want line-per-page numbering rather than line-per-section numbering.

So we run LaTeX over the text several times, and each time save information about page and line numbers in a 'line-list file' to be used during the next pass. At the start of each section—whenever `\begin{numbering}` is executed—the line-list file for that section is read, and the information from it is encoded into a few list macros.

We need first to define the different line numbers that are involved in these macros, and the associated counters.

`\line@num` The count `\line@num` stores the line number that's used in marginal line numbering and in notes: counting either from the start of the page or from the start of the section, depending on your choice for this section. This may be qualified by `\subline@num`.

369 `\newcount\line@num`

`\subline@num` The count `\subline@num` stores a sub-line number that qualifies `\line@num`. For example, line 10 might have sub-line numbers 1, 2 and 3, which might be printed as lines 10.1, 10.2, 10.3.

370 `\newcount\subline@num`

`\ifsblines@` We maintain an associated flag, `\ifsblines@`, to tell us whether we're within a `\sublines@true` sub-line range or not.

`\sublines@false` You may wonder why we don't just use the value of `\subline@num` to determine this—treating anything greater than 0 as an indication that sub-lineation is on. We need a separate flag because sub-lineation can be used together with line-number locking in odd ways: several pieces of a logical line might be interrupted by pieces of sub-lineated text, and those sub-line numbers should not return to zero until the next change in the major line number. This is common in the typesetting of English Renaissance verse drama, in which stage directions are given sub-line numbers: a single line of verse may be interrupted by several stage directions.

371 `\newif\ifsblines@`

`\absline@num` The count `\absline@num` stores the absolute number of lines since the start of the section: that is, the number we've actually printed, no matter what numbers we attached to them. This value is never printed on an output page, though `\line@num` will often be equal to it. It is used internally to keep track of where notes are to appear and where new pages start: using this value rather than `\line@num` is a lot simpler, because it doesn't depend on the lineation system in use.

372 `\newcount\absline@num`

We'll be calling `\absline@num` numbers 'absolute' numbers, and `\line@num` and `\subline@num` numbers 'visible' numbers.

`\@clock` The counts `\@clock` and `\sub@clock` tell us the state of line-number and sub-line-number locking. 0 means we're not within a locked set of lines; 1 means we're at the first line in the set; 2, at some intermediate line; and 3, at the last line.

```
373 \newcount\@clock
374 \newcount\sub@clock
```

`\line@list` `\insertlines@list` `\actionlines@list` `\actions@list` Now we can define the list macros that will be created from the line-list file. We will maintain the following lists:

- `\line@list`: the page and line numbers for every lemma marked by `\edtext`. There are seven pieces of information, separated by vertical bars:

1. the starting page,
2. line, and
3. sub-line numbers, followed by the
4. ending page,
5. line, and
6. sub-line numbers, and then the
7. font specifier for the lemma.

These line numbers are all visible numbers. The font specifier is a set of four codes for font encoding, family, series, and shape, separated by / characters. Thus a lemma that started on page 23, line 35 and went on until page 24, line 3 (with no sub-line numbering), and was typeset in a normal roman font would have a line list entry like this:

23|35|0|24|3|0|OT1/cmr/m/n.

There is one item in this list for every lemma marked by `\edtext`, even if there are several notes to that lemma, or no notes at all. `\edtext` reads the data in this list, making it available for use in the text of notes.

- `\insertlines@list`: the line numbers of lines that have footnotes or other insertions. These are the absolute numbers where the corresponding lemmas begin. This list contains one entry for every footnote in the section; one lemma may contribute no footnotes or many footnotes. This list is used by `\add@inserts` within `\do@line`, to tell it where to insert notes.
- `\actionlines@list`: a list of absolute line numbers at which we are to perform special actions; these actions are specified by the `\actions@list` list defined below.
- `\actions@list`: action codes corresponding to the line numbers in `\actionlines@list`. These codes tell `eledmac` what action it's supposed to take at each of these lines. One action, the page-start action, is generated behind the scenes by `eledmac` itself; the others, for specifying sub-lineation, line-number locking, and line-number alteration, are generated only by explicit commands in your input file. The page-start and line-number-alteration actions require arguments, to specify the new values for the page or line numbers; instead of

storing those arguments in another list, we have chosen the action-code values so that they can encode both the action and the argument in these cases. Action codes greater than -1000 are page-start actions, and the code value is the page number; action codes less than -5000 specify line numbers, and the code value is a transformed version of the line number; action codes between these two values specify other actions which require no argument.

Here is the full list of action codes and their meanings:

Any number greater than -1000 is a page-start action: the line number associated with it is the first line on a page, and the action number is the page number. (The cutoff of -1000 is chosen because negative page-number values are used by some macro packages; we assume that page-number values less than -1000 are not common.) Page-start action codes are added to the list by the `\page@action` macro, which is (indirectly) triggered by the workings of the `\page@start` macro; that macro should always be called in the output routine, just before the page contents are assembled. `eledmac` calls it in `\pagecontents`.

The action code -1001 specifies the start of sub-lineation: meaning that, starting with the next line, we should be advancing `\subline@num` at each start-of-line command, rather than `\line@num`.

The action code -1002 specifies the end of sub-lineation. At the next start-of-line, we should clear the sub-line counter and start advancing the line number. The action codes for starting and ending sub-lineation are added to the list by the `\sub@action` macro, as called to implement the `\startsub` and `\endsub` macros.

The action code -1003 specifies the start of line number locking. After the number for the current line is computed, it will remain at that value through the next line that has an action code to end locking.

The action code -1004 specifies the end of line number locking.

The action code -1005 specifies the start of sub-line number locking. After the number for the current sub-line is computed, it will remain at that value through the next sub-line that has an action code to end locking.

The action code -1006 specifies the end of sub-line number locking.

The four action codes for line and sub-line number locking are added to the list by the `\do@lockon` and `\do@lockoff` macros, as called to implement the `\startlock` and `\endlock` macros.

An action code of -5000 or less sets the current visible line number (either the line number or the sub-line number, whichever is currently being advanced) to a specific positive value. The value of the code is $-(5000 + n)$, where n is the value (always ≥ 0) assigned to the current line number. Action codes of this type are added to the list by the `\set@line@action` macro, as called to implement the `\advanceline` and `\setline` macros: this action only occurs when the user has specified some change to the line numbers using those macros. Normally `eledmac` computes the visible line numbers

from the absolute line numbers with reference to the other action codes and the settings they invoke; it doesn't require an entry in the action-code list for every line.

Here are the commands to create these lists:

```
375   \list@create{\line@list}
376   \list@create{\insertlines@list}
377   \list@create{\actionlines@list}
378   \list@create{\actions@list}
379
```

\page@num We'll need some counts while we read the line-list, for the page number and the
 \endpage@num ending page, line, and sub-line numbers. Some of these will be used again later
 \endline@num on, when we are acting on the data in our list macros.
 \endsubline@num
 380 \newcount\page@num
 381 \newcount\endpage@num
 382 \newcount\endline@num
 383 \newcount\endsubline@num

\ifnoteschanged@ If the number of the footnotes in a section is different from what it was during
 \noteschanged@true the last run, or if this is the very first time you've run LaTeX, on this file, the
 \noteschanged@false information from the line-list used to place the notes will be wrong, and some
 notes will probably be misplaced. When this happens, we prefer to give a single
 error message for the whole section rather than messages at every point where we
 notice the problem, because we don't really know where in the section notes were
 added or removed, and the solution in any case is simply to run LaTeX two more
 times; there's no fix needed to the document. The \ifnoteschanged@ flag is set
 if such a change in the number of notes is discovered at any point.

```
384 \newif\ifnoteschanged@
```

\resetprevline@ Inside the apparatus, at each note, the line number is stored in a macro called
 \prevlineX, where X is the letter of the current series. This macro is called when
 using \numberonlyfirstinline. This macro must be reset at the same time as
 the line number. The \resetprevline@ does this resetting for every series.

```
385 \newcommand*\resetprevline@{%
386   \def\do##1{\global\csundef{prevline##1}}%
387   \dolistloop{\@series}%
388 }
```

\resetprevpage@num Inside the apparatus, at each note, the page number is stored in a macro called
 \prevpageX@num, where X is the letter of the current series. This macro is called
 when using \parafootsep. This macro must be reset at the beginning of each
 numbered section. The \resetprevpage@ command resets this macro for every
 series.

```
\resetprevpage@  

389 \newcommand*{\resetprevpage@num}{%  

390     \def\do##1{\ifcsdef{prevpage##1@num}{\global\csname prevpage##1@num\endcsname=0}{}%  

391     \dolistloop{\@series}}%  

392 }
```

21.4 Reading the line-list file

`\read@linelist` `\read@linelist{<file>}` is the control sequence that's called by `\beginnumbering` (via `\line@list@stuff`) to open and process a line-list file; its argument is the name of the file.

```
393 \newread\@inputcheck  

394 \newcommand*{\read@linelist}[1]{%  

395     \list@clearing@reg
```

When the file is there we start a new group and make some special definitions we'll need to process it: it's a sequence of TEX commands, but they require a few special settings. We make [and] become grouping characters: they're used that way in the line-list file, because we need to write them out one at a time rather than in balanced pairs, and it's easier to just use something other than real braces. @ must become a letter, since this is run in the ordinary LaTeX context. We ignore carriage returns, since if we're in horizontal mode they can get interpreted as spaces to be printed.

Our line, page, and line-locking counters were already zeroed by `\line@list@stuff` if this is being called from within `\beginnumbering`; sub-lineation will be turned off as well in that case. On the other hand, if this is being called from `\resumenumbering`, those things should still have the values they had when `\pausenumbering` was executed.

If the file is not there, we print an informative message.

Now, after these preliminaries, we start interpreting the file.

```
396 \get@linelistfile{#1}%  

397 \endgroup
```

When the reading is done, we're all through with the line-list file. All the information we needed from it will now be encoded in our list macros.

Finally, we initialize the `\next@actionline` and `\next@action` macros, which specify where and what the next action to be taken is.

```
398 \global\page@num=\m@ne  

399 \ifx\actionlines@list\empty  

400     \gdef\next@actionline{1000000}%  

401 \else  

402     \gl@p\actionlines@list\to\next@actionline  

403     \gl@p\actions@list\to\next@action  

404 \fi}  

405
```

`\list@clearing@reg` Clears the lists for `\read@linelist`

```

406 \newcommand*{\list@clearing@reg}{%
407   \list@clear{\line@list}%
408   \list@clear{\insertlines@list}%
409   \list@clear{\actionlines@list}%
410   \list@clear{\actions@list}%
411 \newcommand*{\get@linelistfile}[1]{%
412   \InputIfFileExists{#1}{%
413     \global\noteschanged@false
414     \begingroup
415       \catcode`\[=1 \catcode`\]=2
416       \makeatletter \catcode`\^M=9}%
417     \led@warn@NoLineFile{#1}%
418     \global\noteschanged@true
419     \begingroup}%
420 }
421

```

\get@linelistfile eledmac can take advantage of the LaTeX ‘safe file input’ macros to get the line-list file.

This version of \read@linelist creates list macros containing data for the entire section, so they could get rather large. It would be no more difficult to read the line-list file incrementally rather than all at once: we could read, at the start of each paragraph, only the commands relating to that paragraph. But this would require that we have two line-lists open at once, one for reading, one for writing, and on systems without version numbers we’d have to do some file renaming outside of LaTeX for that to work. We’ve retained this slower approach to avoid that sort of hacking about, but have provided the \pausenumbering and \resumenumbers macros to help you if you run into macro memory limitations (see p. 12 above).

21.5 Commands within the line-list file

This section defines the commands that can appear within a line-list file. They all have very short names because we are likely to be writing very large numbers of them out. One macro, \@nl, is especially short, since it will be written to the line-list file once for every line of text in a numbered section. (Another of these commands, \@lab, will be introduced in a later section, among the cross-referencing commands it is associated with.)

When these commands modify the various page and line counters, they deliberately do not say \global. This is because we want them to affect only the counter values within the current group when nested calls of \eref occur. (The code assumes throughout that the value of \globaldefs is zero.)

The macros with `action` in their names contain all the code that modifies the action-code list: again, this is so that they can be turned off easily for nested calls of \eref.

\@nl \@nl does everything related to the start of a new line of numbered text.
\@nl@reg

In order to get the `\setlinenum` to work Peter Wilson had to slip in some new code at the start of the macro, to get the timing of the actions correct. The problem was that his original naive implementation of `\setlinenum` had a unfortunate tendency to change the number of the last line of the *preceding* paragraph. The new code is sort of based on the page number handling and `\setline`. It seems that a lot of fiddling with the line number internals is required.

In November 2004 in order to accurately determine page numbers Peter Wilson added these to the macro. It is now:

```
\@nl{\<page counter number>}{\<printed page number>}
```

I don't (yet) use the printed number (i.e., the `\thepage`) but it may come in handy later. The macro `\fix@page` checks if a new page has started.

```
422 \newcommand{\@nl}[2]{%
423   \fix@page{#1}%
424   \@nl@reg}%
425 \newcommand*{\@nl@reg}{%
426   \ifx\l@dchset@num\relax \else
427     \advance\absline@num \@ne
428     \set@line@action
429     \let\l@dchset@num=\relax
430     \advance\absline@num \m@ne
431     \advance\line@num \m@ne
432   \fi}
```

First increment the absolute line-number, and perform deferred actions relating to page starts and sub-lines.

```
433   \advance\absline@num \@ne
434   \ifx\next@page@num\relax \else
435     \page@action
436     \let\next@page@num=\relax
437   \fi
438   \ifx\sub@change\relax \else
439     \ifnum\sub@change>\z@
440       \sublines@true
441     \else
442       \sublines@false
443     \fi
444     \sub@action
445     \let\sub@change=\relax
446   \fi
```

Fix the lock counters, if necessary. A value of 1 is advanced to 2; 3 advances to 0; other values are unchanged.

```
447   \ifcase\@clock
448     \or
449       \@clock \tw@
450     \or \or
451       \@clock \z@
452   \fi
453   \ifcase\sub@clock
```

```

454          \or
455          \sub@lock \tw@
456          \or \or
457          \sub@lock \z@
458      \fi

```

Now advance the visible line number, unless it's been locked.

```

459      \ifsublines@
460          \ifnum\sub@lock<\tw@
461              \advance\subline@num \cne
462          \fi
463      \else
464          \ifnum\@clock<\tw@
465              \advance\line@num \cne \subline@num \z@
466          \fi
467      \fi}
468

```

\last@page@num \fix@page basically replaces \cpage. It determines whether or not a new page \fix@page has been started, based on the page values held by \cnl.

```

469 \newcount\last@page@num
470 \last@page@num=-10000
471 \newcommand*\fix@page}[1]{%
472     \ifnum #1=\last@page@num
473     \else
474         \ifbypage@
475             \line@num=\z@ \subline@num=\z@
476         \fi
477         \page@num=#1\relax
478         \last@page@num=#1\relax
479         \def\next@page@num{#1}%
480         \listcsxadd{normal@page@break}{\the\absline@num}
481     \fi}
482

```

\cpend These don't do anything at this point, but will have been added to the auxiliary

\cpendR file(s) if the elepar package has been used. They are just here to stop elemac

\clopl from moaning if the elepar is used for one run and then not for the following one.

\clopr

```

483 \newcommand*\cpend}[1]{}
484 \newcommand*\cpendR}[1]{}
485 \newcommand*\clopl}[1]{}
486 \newcommand*\clopr}[1]{}
487

```

\sub@on The \sub@on and \sub@off macros turn sub-lineation on and off: but not directly,

\sub@off since such changes don't really take effect until the next line of text. Instead they set a flag that notifies \cnl of the necessary action.

```

488 \newcommand*\sub@on}{\ifsublines@

```

```

489      \let\sub@change=\relax
490  \else
491      \def\sub@changes{1}%
492  \fi}
493 \newcommand*{\sub@off}{\ifsblines@
494     \def\sub@changes{-1}%
495  \else
496      \let\sub@change=\relax
497  \fi}
498

```

\@adv The `\@adv{<num>}` macro advances the current visible line number by the amount specified as its argument. This is used to implement `\advanceline`.

```

499 \newcommand*{\@adv}[1]{\ifsblines@
500     \advance\sbline@num by #1\relax
501     \ifnum\sbline@num<\z@
502         \led@warn@BadAdvancelineSubline
503         \sbline@num \z@
504     \fi
505  \else
506      \advance\line@num by #1\relax
507      \ifnum\line@num<\z@
508          \led@warn@BadAdvancelineLine
509          \line@num \z@
510      \fi
511  \fi
512 \set@line@action}
513

```

\@set The `\@set{<num>}` macro sets the current visible line number to the value specified as its argument. This is used to implement `\setline`.

```

514 \newcommand*{\@set}[1]{\ifsblines@
515     \sbline@num=#1\relax
516  \else
517      \line@num=#1\relax
518  \fi
519 \set@line@action}
520

```

\l@d@set The `\l@d@set{<num>}` macro sets the line number for the next `\pstart...` to the value specified as its argument. This is used to implement `\setlinenum`.

\l@dchset@num `\l@dchset@num` is a flag to the `\@l` macro. If it is not `\relax` then a linenumber change is to be done.

```

521 \newcommand*{\l@d@set}[1]{%
522   \line@num=#1\relax
523   \advance\line@num \one
524   \def\l@dchset@num{#1}}
525 \let\l@dchset@num\relax
526

```

```

\page@action \page@action adds an entry to the action-code list to change the page number.
527 \newcommand*{\page@action}{%
528   \xright@appenditem{\the\absline@num}\to\actionlines@list
529   \xright@appenditem{\next@page@num}\to\actions@list}

\set@line@action \set@line@action adds an entry to the action-code list to change the visible line
number.
530 \newcommand*{\set@line@action}{%
531   \xright@appenditem{\the\absline@num}\to\actionlines@list
532   \ifsublines@%
533     \@\l@dtempcnta=-\subline@num
534   \else
535     \@\l@dtempcnta=-\line@num
536   \fi
537   \advance\@\l@dtempcnta by -5000
538   \xright@appenditem{\the\@\l@dtempcnta}\to\actions@list}

\sub@action \sub@action adds an entry to the action-code list to turn sub-lineation on or off,
according to the current value of the \ifsublines@ flag.
539 \newcommand*{\sub@action}{%
540   \xright@appenditem{\the\absline@num}\to\actionlines@list
541   \ifsublines@%

\n@num This macro implements the \skipnumbering command. It uses a new action code,
\cnum@reg namely 1007.

```

596 \newcommand*{\n@num}{\n@num@reg}
597 \newcommand*{\n@num@reg}{%
598   \xright@appenditem{\the\absline@num}\to\actionlines@list
599   \xright@appenditem{-1007}\to\actions@list}
600

```

\@ref \@ref marks the start of a passage, for creation of a footnote reference. It takes
\insert@count two arguments:

- #1, the number of entries to add to `\insertlines@list` for this reference. This value, here and within `\edtext`, which computes it and writes it to the line-list file, will be stored in the count `\insert@count`.

```
601      \newcount\insert@count
```

- #2, a sequence of other line-list-file commands, executed to determine the ending line-number. (This may also include other `\@ref` commands, corresponding to uses of `\edtext` within the first argument of another instance of `\edtext`.)

`\dummy@ref` When nesting of `\@ref` commands does occur, it's necessary to temporarily redefine `\@ref` within `\@ref`, so that we're only doing one of these at a time.

```
602 \newcommand*{\dummy@ref}[2]{#2}
```

`\@ref@reg` The first thing `\@ref` (i.e. `\@ref@reg`) itself does is to add the specified number of items to the `\insertlines@list` list.

```
603 \newcommand*{\@ref}[2]{%
604   \@ref@reg{#1}{#2}%
605   \newcommand*{\@ref@reg}[2]{%
606     \global\insert@count=#1\relax
607     \loop\ifnum\insert@count>\z@%
608       \xright@appenditem{\the\absline@num}\to\insertlines@list
609     \global\advance\insert@count \m@ne
610   \repeat
```

Next, process the second argument to determine the page and line numbers for the end of this lemma. We temporarily equate `\@ref` to a different macro that just executes its argument, so that nested `\@ref` commands are just skipped this time. Some other macros need to be temporarily redefined to suppress their action.

```

```

Finally, execute the second argument of `\@ref` again, to perform for real all the commands within it.

```
627 #2}
628
```

21.6 Writing to the line-list file

We've now defined all the counters, lists, and commands involved in reading the line-list file at the start of a section. Now we'll cover the commands that `uledmac` uses within the text of a section to write commands out to the line-list.

`\linenum@out` The file will be opened on output stream `\linenum@out`.
 629 `\newwrite\linenum@out`

`\iffirst@linenum@out@` Once any file is opened on this stream, we keep it open forever, or else switch to another file that we keep open. The reason is that we want the output routine to write the page number for every page to this file; otherwise we'd have to write it at the start of every line. But it's not very easy for the output routine to tell whether an output stream is open or not. There's no way to test the status of a particular output stream directly, and the asynchronous nature of output routines makes the status hard to determine by other means.
`\first@linenum@out@true`
`\first@linenum@out@false`

We can manage pretty well by means of the `\iffirst@linenum@out@` flag; its inelegant name suggests the nature of the problem that made its creation necessary. It's set to be `true` before any `\linenum@out` file is opened. When such a file is opened for the first time, it's done using `\immediate`, so that it will at once be safe for the output routine to write to it; we then set this flag to `false`.

```
630 \newif\iffirst@linenum@out@
631 \first@linenum@out@true
```

`\line@list@stuff` The `\line@list@stuff{<file>}` macro, which is called by `\beginnumbering`, performs all the line-list operations needed at the start of a section. Its argument is the name of the line-list file.

```
632 \newcommand*\line@list@stuff[1]{%
```

First, use the commands of the previous section to interpret the line-list file from the last run.

```
633 \read@linelist{#1}%
```

Now close the current output line-list file, if any, and open a new one. The first time we open a line-list file for output, we do it using `\immediate`, and clear the `\iffirst@linenum@out@` flag.

```
634 \iffirst@linenum@out@
635   \immediate\closeout\linenum@out%
636   \global\first@linenum@out@false%
637   \immediate\openout\linenum@out=#1\relax%
638 \else
```

If we get here, then this is not the first line-list we've seen, so we don't open or close the files immediately, except if we are in a minipage and this minipage is not a ledgroup.

```

639      \if@minipage%
640          \if@ledgroup%
641              \closeout\linenum@out%
642              \openout\linenum@out=\#1\relax%
643          \else%
644              \immediate\closeout\linenum@out%
645              \immediate\openout\linenum@out=\#1\relax%
646          \fi
647      \else%
648          \closeout\linenum@out%
649          \openout\linenum@out=\#1\relax%
650      \fi%
651  \fi}
652

```

`\new@line` The `\new@line` macro sends the `\@nl` command to the line-list file, to mark the start of a new text line, and its page number.

```

653 \newcommand*{\new@line}{%
654   \IfStrEq{\led@pb@setting}{after}%
655     {\xifinlistcs{\the\absline@num}{l@prev@nopb}%
656      {\xifinlistcs{\the\absline@num}{normal@page@break}%
657        {\numgdef{\@next@page}{\thepage+1}%
658          \write\linenum@out{\string\@nl[\@next@page][\@next@page]}%
659        }%
660        {\write\linenum@out{\string\@nl[\the\c@page][\thepage]}%
661      }%
662      {\write\linenum@out{\string\@nl[\the\c@page][\thepage]}%
663    }%
664   \IfStrEq{\led@pb@setting}{before}%
665     {\numdef{\@next@absline}{\the\absline@num+1}%
666      \xifinlistcs{\@next@absline}{l@prev@nopb}%
667        {\xifinlistcs{\the\absline@num}{normal@page@break}%
668          {\numgdef{\nc@page}{\c@page+1}%
669            \write\linenum@out{\string\@nl[\nc@page][\nc@page]}%
670          }%
671          {\write\linenum@out{\string\@nl[\the\c@page][\thepage]}%
672        }%
673        {\write\linenum@out{\string\@nl[\the\c@page][\thepage]}%
674      }%
675      {}%
676   \IfStrEqCase{\led@pb@setting}{{before}{\relax}{after}{\relax}}{%
677     \write\linenum@out{\string\@nl[\the\c@page][\thepage]}%
678   }

```

`\flag@start` We enclose a lemma marked by `\edtext` in `\flag@start` and `\flag@end`: these
`\flag@end` send the `\@ref` command to the line-list file. `\edtext` is responsible for setting

the value of `\insert@count` appropriately; it actually gets done by the various footnote macros.

```
679 \newcommand*{\flag@start}{%
680   \edef\next{\write\linenum@out{%
681     \string\@ref[\the\insert@count] []}%
682   \next}%
683 \newcommand*{\flag@end}{\write\linenum@out[]}}
```

- \page@start** Originally the commentary was: `\page@start` writes a command to the line-list file noting the current page number; when used within an output routine, this should be called so as to place its `\write` within the box that gets shipped out, and as close to the top of that box as possible.

However, in October 2004 Alexej Krukov discovered that when processing long paragraphs that included Russian, Greek and Latin texts `eledmac` would go into an infinite loop, emitting thousands of blank pages. This was caused by being unable to find an appropriate place in the output routine. A different algorithm is now used for getting page numbers.

```
684 \newcommand*{\page@start}{}%
685
```

- \startsub** `\startsub` and `\endsub` turn sub-lineation on and off, by writing appropriate instructions to the line-list file. When sub-lineation is in effect, the line number counter is frozen and the sub-line counter advances instead. If one of these commands appears in the middle of a line, it doesn't take effect until the next line; in other words, a line is counted as a line or sub-line depending on what it started out as, even if that changes in the middle.

We tinker with `\lastskip` because a command of either sort really needs to be attached to the last word preceding the change, not the first word that follows the change. This is because sub-lineation will often turn on and off in mid-line—stage directions, for example, often are mixed with dialogue in that way—and when a line is mixed we want to label it using the system that was in effect at its start. But when sub-lineation begins at the very start of a line we have a problem, if we don't put in this code.

```
686 \newcommand*{\startsub}{\dimen0\lastskip%
687   \ifdim\dimen0>0pt \unskip \fi%
688   \write\linenum@out{\string\sub@on}%
689   \ifdim\dimen0>0pt \hskip\dimen0 \fi}%
690 \def\endsub{\dimen0\lastskip%
691   \ifdim\dimen0>0pt \unskip \fi%
692   \write\linenum@out{\string\sub@off}%
693   \ifdim\dimen0>0pt \hskip\dimen0 \fi}%
694
```

- \advanceline** You can use `\advanceline{<num>}` in running text to advance the current visible line-number by a specified value, positive or negative.

```
695 \newcommand*{\advanceline}[1]{\write\linenum@out{\string\@adv[#1]}}
```

`\setline` You can use `\setline{<num>}` in running text (i.e., within `\pstart...\\pend`) to set the current visible line-number to a specified positive value.

```
696 \newcommand*{\setline}[1]{%
697   \ifnum#1<\z@%
698     \led@warn@BadSetline
699   \else
700     \write\linenum@out{\string\@set[#1]}%
701   \fi}
702
```

`\setlinenum` You can use `\setlinenum{<num>}` before a `\pstart` to set the visible line-number to a specified positive value. It writes a `\l@d@set` command to the line-list file.

```
703 \newcommand*{\setlinenum}[1]{%
704   \ifnum#1<\z@%
705     \led@warn@BadSetlinenum
706   \else
707     \write\linenum@out{\string\l@d@set[#1]}%
708   \fi}
709
```

`\startlock` You can use `\startlock` or `\endlock` in running text to start or end line number locking at the current line. They decide whether line numbers or sub-line numbers are affected, depending on the current state of the sub-lineation flags.

```
710 \newcommand*{\startlock}{\write\linenum@out{\string\lock@on}}
711 \def\endlock{\write\linenum@out{\string\lock@off}}
712
```

`\ifl@dskipnumber` In numbered text `\skipnumbering` will suspend the numbering for that particular line.

```
\l@dskipnumbertrue 713 \newif\ifl@dskipnumber
\l@dskipnumberfalse 714   \l@dskipnumberfalse
\skipnumbering@reg 715 \newcommand*{\skipnumbering}{\skipnumbering@reg}
716 \newcommand*{\skipnumbering@reg}{%
717   \write\linenum@out{\string\n@num}%
718   \advanceline{-1}}
719
```

22 Marking text for notes

The `\edtext` (or `\critext`) macro is used to create all footnotes and endnotes, as well as to print the portion of the main text to which a given note or notes is keyed. The idea is to have that lemma appear only once in the `.tex` file: all instances of it in the main text and in the notes are copied from that one appearance.

For convenience, I will use `*text` when I do not need to distinguish between `\edtext` and `\critext`. The `*text` macros take two arguments, the only difference between `\edtext` and `\critext` is how the second argument is delineated.

`\critext` requires two arguments. At any point within numbered text, you use it by saying:

```
\critext{#1}{#2}/
```

Similarly `\edtext` requires the same two arguments but you use it by saying:

```
\edtext{#1}{#2}
```

- #1 is the piece of the main text being glossed; it gets added to the main text, and is also used as a lemma for notes to it.
- #2 is a series of subsidiary macros that generate various kinds of notes. With `\critext` the `/` after #2 *must* appear: it marks the end of the macro. (*The TeXbook*, p. 204, points out that when additional text to be matched follows the arguments like this, spaces following the macro are not skipped, which is very desirable since this macro will never be used except within text. Having an explicit terminator also helps keep things straight when nested calls to `\critext` are used.) Braces around #2 are optional with `\critext` and required for `\edtext`.

The `*text` macro may be used (somewhat) recursively; that is, `*text` may be used within its own first argument. The code would be much simpler without this feature, but nested notes will commonly be necessary: it's quite likely that we'll have an explanatory note for a long passage and notes on variants for individual words within that passage. The situation we can't handle is overlapping notes that aren't nested: for example, one note covering lines 10–15, and another covering 12–18. You can handle such cases by using the `\lemma` and `\linenum` macros within #2: they alter the copy of the lemma and the line numbers that are passed to the notes, and hence allow you to overcome any limitations of this system, albeit with extra effort.

The recursive operation of `*text` will fail if you try to use a copy that is called something other than `*text`. In order to handle recursion, `*text` needs to redefine its own definition temporarily at one point, and that doesn't work if the macro you are calling is not actually named `*text`. There's no problem as long as `*text` is not invoked in the first argument. If you want to call `*text` something else, it is best to create instead a macro that expands to an invocation of `*text`, rather than copying `*text` and giving it a new name; otherwise you will need to add an appropriate definition for your new macro to `\morenoexpands`.

Side effects of our line-numbering code make it impossible to use the usual footnote macros directly within a paragraph whose lines are numbered (see comments to `\do@line`, p. 83). Instead, the appropriate note-generating command is appended to the list macro `\inserts@list`, and when `\pend` completes the paragraph it inserts all the notes at the proper places.

Note that we don't provide previous-note information, although it's often wanted; your own macros must handle that. We can't do it correctly without

keeping track of what kind of notes have gone past: it's not just a matter of remembering the line numbers associated with the previous invocation of `*text`, because that might have been for a different kind of note. It is preferable for your footnote macros to store and recall this kind of information if they need it.

An example where some ‘memory’ of line numbers might be required is where there are several variant readings per line of text, and you do not wish the line number to be repeated for each lemma in the notes. After the first occurrence of the line number, you might want the symbol ‘||’ instead of further occurrences, for instance. This can easily be done by a macro like `\printlines`, if it saves the last value of `\l@d@nums` that it saw, and then performs a simple conditional test to see whether to print a number or a ‘||’.

22.1 `\edtext` and `\critext` themselves

The various note-generating macros might want to request that commands be executed not at once, but in close connection with the start or end of the lemma. For example, footnote numbers in the text should be connected to the end of the lemma; or, instead of a single macro to create a note listing variants, you might want to use several macros in series to create individual variants, which would each add information to a private macro or token register, which in turn would be formatted and output when all of #2 for the lemma has been read.

`\end@lemmas` To accomodate this, we provide a list macro to which macros may add commands that should subsequently be executed at the end of the lemma when that lemma is added to the text of the paragraph. A macro should add its contribution to `\end@lemmas` by using `\xleft@appenditem`. (Anything that needs to be done at the *start* of the lemma may be handled using `\aftergroup`, since the commands specified within `\critext`'s second argument are executed within a group that ends just before the lemma is added to the main text.)

`\end@lemmas` is intended for the few things that need to be associated with the end of the lemma, like footnote numbers. Such numbers are not implemented in the current version, and indeed no use is currently made of `\end@lemmas` or of the `\aftergroup` trick. The general approach would be to define a macro to be used within the second argument of `\critext` that would add the appropriate command to `\end@lemmas`.

Commands that are added to this list should always take care not to do anything that adds possible line-breaks to the output; otherwise line numbering could be thrown off.

720 `\list@create{\end@lemmas}`

`\dummy@text` We now need to define a number of macros that allow us to weed out nested instances of `\critext`, and other problematic macros, from our lemma. This is similar to what we did in reading the line-list file using `\dummy@ref` and various redefinitions—and that's because nested `\critext` macros create nested `\@ref` entries in the line-list file.

Here's a macro that takes the same arguments as \critext but merely returns the first argument and ignores the second.

721 `\long\def\dummy@text#1#2/{#1}`

`\dummy@edtext` LaTeX users are not used to delimited arguments, so I provide a \edtext macro as well.

722 `\newcommand{\dummy@edtext}[2]{#1}`

We're going to need another macro that takes one argument and ignores it entirely. This is supplied by the LaTeX \gobble{*arg*}.

`\no@expands` We need to turn off macro expansion for certain sorts of macros we're likely to see
`\morenoexpands` within the lemma and within the notes.

The first class is font-changing macros. We suppress expansion for them by letting them become equal to zero.²¹ This is done because we want to pass into our notes the generic commands to change to roman or whatever, and not their expansions that will ask for a particular style at a specified size. The notes may well be in a smaller font, so the command should be expanded later, when the note's environment is in effect.

A second sort to turn off includes a few of the accent macros. Most are not a problem: an accent that's expanded to an \accent command may be harder to read but it works just the same. The ones that cause problems are: those that use alignments—TEX seems to get confused about the difference between alignment parameters and macro parameters; those that use temporary control sequences; and those that look carefully at what the current font is.

(The \copyright macro defined in PLAIN TEX has this sort of problem as well, but isn't used enough to bother with. That macro, and any other that causes trouble, will get by all right if you put a \protect in front of it in your file.)

We also need to eliminate all eledmac macros like \edlabel and \setline that write things to auxiliary files: that writing should be done only once. And we make \critext itself, if it appears within its own argument, do nothing but copy its first argument.

Finally, we execute \morenoexpands. The version of \morenoexpands defined here does nothing; but you may define a version of your own when you need to add more expansion suppressions as needed with your macros. That makes it possible to make such additions without needing to copy or modify the standard eledmac code. If you define your own \morenoexpands, you must be very careful about spaces: if the macro adds any spaces to the text when it runs, extra space will appear in the main text when \critext is used.

(A related problem, not addressed by these two macros, is that of characters whose category code is changed by any the macros used in the arguments to \critext. Since the category codes are set when the arguments are scanned,

²¹Since ‘control sequences equivalent to characters are not expandable’—*The TeXbook*, answer to Exercise 20.14.

macros that depend on changing them will not work. We have most often encountered this with characters that are made ‘active’ within text in some, but not all, of the languages used within the document. One way around the problem, if it takes this form, is to ensure that those characters are *always* active; within languages that make no special use of them, their associated control sequences should simply return the proper character.)

```

723 \newcommand*{\no@expands}{%
724   \let\select@@lemmafont=0%

\@tag Now, we define an empty \@tag command. It will be redefine by \edtext: its value is the first args. It will be used by the \Xfootnote commands.

```

735 \newcommand{\@tag}{}%
736 % \end{macrocode}
737 % \end{macro}
738 % \begin{macro}{\critext}
739 % Now we begin \cs{critext} itself. The definition requires a \verb"/" after
740 % the arguments: this eliminates the possibility of problems about
741 % knowing where \verb"#2" ends. This also changes the handling of spaces
742 % following an invocation of the macro: normally such spaces are
743 % skipped, but in this case they're significant because \verb"#2" is
744 % a 'delimited parameter'. Since \cs{critext} is always used in running
745 % text, it seems more appropriate to pay attention to spaces than to
746 % skip them.
747 %
748 % When executed, \cs{critext} first ensures that we're in
749 % horizontal mode.
750 % \begin{macrocode}
751 \long\def\critext#1#2/{\leavevmode

```

\@tag Our normal lemma is just argument #1; but that argument could have further invocations of \critext within it. We get a copy of the lemma without any \critext macros within it by temporarily redefining \critext to just copy its first argument and ignore the other, and then expand #1 into \@tag, our lemma.

This is done within a group that starts here, in order to get the original \critext restored; within this group we've also turned off the expansion of those control sequences commonly found within text that can cause trouble for us.

```

752 \begingroup
753   \global\renewcommand{\@tag}{\no@expands #1}%

```

\l@d@nums Prepare more data for the benefit of note-generating macros: the line references and font specifier for this lemma go to \l@d@nums.

754 \set@line

\insert@count will be altered by the note-generating macros: it counts the number of deferred footnotes or other insertions generated by this instance of \crittext.

755 \global\insert@count=0

Now process the note-generating macros in argument #2 (i.e., \Afootnote, \lemma, etc.). \ignorespaces is here to skip over any spaces that might appear at the start of #2; otherwise they wind up in the main text. Footnote and other macros that are used within #2 should all end with \ignorespaces as well, to skip any spaces between macros when several are used in series.

756 \ignorespaces #2\relax

Finally, we're ready to admit the first argument into the current paragraph.

It's important that we generate and output all the notes for this chunk of text *before* putting the text into the paragraph: notes that are referenced by line number should generally be tied to the start of the passage they gloss, not the end. That should all be done within the expansion of #2 above, or in \aftergroup commands within that expansion.

```
757 \@ifundefined{xpg@main@language}{%if not polyglossia

```

22.2 Substitute lemma

`\lemma` The `\lemma{<text>}` macro allows you to change the lemma that's passed on to the notes.

```
810 \newcommand*{\lemma}[1]{\global\renewcommand{\@tag}{\noexpand #1}}
```

22.3 Substitute line numbers

`\linenum` The `\linenum` macro can change any or all of the page and line numbers that are passed on to the notes.

As argument `\linenum` takes a set of seven parameters separated by vertical bars, in the format used internally for `\l@d@nums` (see p. 58): the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma. However, you can omit any parameters you don't want to change, and you can omit a string of vertical bars at the end of the argument. Hence `\linenum{18|4|0|18|7|1|0}` is an invocation that changes all the parameters, but `\linenum{|3}` only changes the starting line number, and leaves the rest unaltered.

We use `\\"` as an internal separator for the macro parameters.

```
811 \newcommand*{\linenum}[1]{%
812   \xdef\@tempa{\#1|||||\noexpand\\l@d@nums}%
813   \global\let\l@d@nums=\empty
814   \expandafter\line@set\@tempa\\\ignorespaces}
```

`\line@set` `\linenum` calls `\line@set` to do the actual work; it looks at the first number in the argument to `\linenum`, sets the corresponding value in `\l@d@nums`, and then calls itself to process the next number in the `\linenum` argument, if there are more numbers in `\l@d@nums` to process.

```
815 \def\line@set#1#2\\#3|#4\\{%
816   \gdef\@tempb{#1}%
817   \ifx\@tempb\empty
818     \l@d@add{#3}%
819   \else
820     \l@d@add{#1}%
821   \fi
822   \gdef\@tempb{#4}%
823   \ifx\@tempb\empty\else
824     \l@d@add{}\\line@set#2\\#4\\%
825   \fi}
```

`\l@d@add` `\line@set` uses `\l@d@add` to tack numbers or vertical bars onto the right hand end of `\l@d@nums`.

```
826 \newcommand{\l@d@add}[1]{\xdef\l@d@nums{\l@d@nums#1}}
827
```

23 Paragraph decomposition and reassembly

In order to be able to count the lines of text and affix line numbers, we add an extra stage of processing for each paragraph. We send the paragraph into a box register, rather than straight onto the vertical list, and when the paragraph ends we slice the paragraph into its component lines; to each line we add any notes or line numbers, add a command to write to the line-list, and then at last send the line to the vertical list. This section contains all the code for this processing.

23.1 Boxes, counters, \pstart and \pend

```
\raw@text
\ifnumberedpar@
\numberedpar@true
\numberedpar@false
```

Here are numbers and flags that are used internally in the course of the paragraph decomposition.

```
\num@lines
\one@line
\par@line
```

When we first form the paragraph, it goes into a box register, `\raw@text`, instead of onto the current vertical list. The `\ifnumberedpar@` flag will be `true` while a paragraph is being processed in that way. `\num@lines` will store the number of lines in the paragraph when it's complete. When we chop it up into lines, each line in turn goes into the `\one@line` register, and `\par@line` will be the number of that line within the paragraph.

```
828 \newbox\raw@text
829 \newif\ifnumberedpar@
830 \newcount\num@lines
831 \newbox\one@line
832 \newcount\par@line
```

```
\pstart
\numberpstarttrue
\numberpstartfalse
\labelpstarttrue
\labelpstartfalse
```

`\pstart` starts the paragraph by clearing the `\inserts@list` list and other relevant variables, and then arranges for the subsequent text to go into the `\raw@text` box. `\pstart` needs to appear at the start of every paragraph that's to be numbered; the `\autopar` command below may be used to insert these commands automatically.

```
\the\pstart
```

Beware: everything that occurs between `\pstart` and `\pend` is happening within a group; definitions must be global if you want them to survive past the end of the paragraph.

```
833
834 \newcounter{pstart}

```

We set all the usual interline penalties to zero and then immediately call \endgraf to end the paragraph; this ensures that there'll be no large interline penalties to prevent us from slicing the paragraph into pieces. These penalties revert to the values that you set when the group for the \vbox ends. Then we call \do@line to slice a line off the top of the paragraph, add a line number and footnotes, and restore it to the page; we keep doing this until there aren't any more lines left.

```

881 \l@dzopenalties%
882 \endgraf\global\num@lines=\prevgraf\egroup%
883 \global\par@line=0%

```

We check if lineation is by pstart: in this case, we reset line number, but only in the second line of the pstart, to prevent some trouble. We can't reset line number

at the beginning of `\pstart \setline` is parsed at the end of previous `\pend`, and so, we must do it at the end of first line of `pstart`.

```

884  \csnumdef{pstartline}{0}%

900  \ifstrempty{#1}{}{\noindent#1}%
901 }
902
```

`\l@dzeropenalties` A macro to zero penalties for `\pend`.

```

903 \newcommand*\l@dzeropenalties{%
904   \brokenpenalty \z@ \clubpenalty \z@
905   \displaywidowpenalty \z@ \interlinepenalty \z@ \predisplaypenalty \z@
906   \postdisplaypenalty \z@ \widowpenalty \z@}
```

`\autopar` In most cases it's only an annoyance to have to label the paragraphs to be numbered with `\pstart` and `\pend`. `\autopar` will do that automatically, allowing you to start a paragraph with its first word and no other preliminaries, and to end it with a blank line or a `\par` command. The command should be issued within a group, after `\beginnumbering` has been used to start the numbering; all paragraphs within the group will be affected.

A few situations can cause problems. One is a paragraph that begins with a begin-group character or command: `\pstart` will not get invoked until after such a group beginning is processed; as a result the character that ends the group will be mistaken for the end of the `\vbox` that `\pstart` creates, and the rest of the paragraph will not be numbered. Such paragraphs need to be started explicitly using `\indent`, `\noindent`, or `\leavevmode`—or `\pstart`, since you can still include your own `\pstart` and `\pend` commands even with `\autopar` on.

Prematurely ending the group within which `\autopar` is in effect will cause a similar problem. You must either leave a blank line or use `\par` to end the last paragraph before you end the group.

The functioning of this macro is more tricky than the usual `\everypar`: we don't want anything to go onto the vertical list at all, so we have to end the paragraph, erase any evidence that it ever existed, and start it again using `\pstart`. We remove the paragraph-indentation box using `\lastbox` and save the width, and then skip backwards over the `\parskip` that's been added for this paragraph. Then we start again with `\pstart`, restoring the indentation that we saved, and locally change `\par` so that it'll do our `\pend` for us.

```

908 \newif\ifautopar
909 \autoparfalse
910 \newcommand*{\autopar}{
911   \ifledRcol
912     \ifnumberingR \else
913     \led@err@AutoparNotNumbered
914     \beginnumberingR

```

`\do@linehook` Two hooks into `\do@line`. The first is called at the beginning of `\do@line`, the `\do@insidelinehook` second is called in the line box. The second can, for example, have a `\markboth` command inside, the first can't.

```

980 \newcommand*{\do@linehook}{}
981 \newcommand*{\do@insidelinehook}{}

```

`\l@emptyd@ta` Nulls the `\...d@ta`, which may later hold line numbers. Similarly for `\l@dcsnotetext`,
`\l@dld@ta` `\l@dcsnotetext@l`, `\l@dcsnotetext@r` for the texts of the sidenotes, left and
`\l@drd@ta` right notes.

```

\l@dcsnotetext 982 \newcommand*{\l@emptyd@ta}{%
\l@dcsnotetext@l 983 \gdef\l@dld@ta{}%
\l@dcsnotetext@r 984 \gdef\l@drd@ta{}%
985 \gdef\l@dcsnotetext@l{}%
986 \gdef\l@dcsnotetext@r{}%
987 \gdef\l@dcsnotetext{}%
988

```

`\l@dlsn@te` Zero width boxes of the left and right side notes, together with their kerns.
`\l@drsn@te` 989 `\newcommand{\l@dlsn@te}{%`
990 `\hb@xt@ \z@{\hss\box\l@dlp@rbox\kern\ledlsnotesep}}`
991 `\newcommand{\l@drsn@te}{%`
992 `\hb@xt@ \z@{\kern\ledrsnotesep\box\l@drp@rbox\hss}}`
993 }

`\ledllfill` These macros are called at the left (`\ledllfill`) and the right (`\ledrlfill`) of
`\ledrlfill` each numbered line. The initial definitions correspond to the original code for
`\do@line`.

```

994 \newcommand*{\ledllfill}{\hfil}
995 \newcommand*{\ledrlfill}{}
996

```

23.3 Line and page number computation

`\getline@num` The `\getline@num` macro determines the page and line numbers for the line we're about to send to the vertical list.

```

997 \newcommand*{\getline@num}{%
998     \global\advance\absline@num \one
999     \do@actions
1000     \do@ballast
1001     \ifnumberline
1002     \ifsblines@
1003         \ifnum\sub@lock<\tw@

```

```

1004     \global\advance\subline@num \z@ne
1005     \fi
1006 \else
1007     \ifnum\@clock<\tw@
1008     \global\advance\line@num \z@ne
1009     \global\subline@num \z@ne
1010   \fi
1011 \fi
1012 \fi
1013 }

```

\do@ballast The real work in the macro above is done in `\do@actions`, but before we plunge into that, let's get `\do@ballast` out of the way. This macro looks to see if there is an action to be performed on the *next* line, and if it is going to be a page break action, `\do@ballast` decreases the count `\ballast@count` counter by the amount of `ballast`. This means, in practice, that when `\add@penalties` assigns penalties at this point, T_EX will be given extra encouragement to break the page here (see p. 94).

\ballast@count First we set up the required counters; they are initially set to zero, and will remain so unless you say `\setcounter{ballast}{<some figure>}` in your document.

```

1014 \newcount\ballast@count
1015 \newcounter{ballast}
1016 \setcounter{ballast}{0}

```

And here is `\do@ballast` itself. It advances `\absline@num` within the protection of a group to make its check for what happens on the next line.

```

1017 \newcommand*{\do@ballast}{\global\ballast@count \z@ne
1018   \begingroup
1019     \advance\absline@num \z@ne
1020     \ifnum\next@actionline=\absline@num
1021       \ifnum\next@action>-1001\relax
1022         \global\advance\ballast@count by -\c@ballast
1023       \fi
1024     \fi
1025   \endgroup}

```

\do@actions The `\do@actions` macro looks at the list of actions to take at particular absolute line numbers, and does everything that's specified for the current line.

It may call itself recursively, and to do this efficiently (using T_EX's optimization for tail recursion), we define a control-sequence called `\do@actions@next` that is always the last thing that `\do@actions` does. If there could be more actions to process for this line, `\do@actions@next` is set equal to `\do@actions`; otherwise it's just `\relax`.

```

1026 \newcommand*{\do@actions}{%
1027   \global\let\do@actions@next=\relax
1028   \ifnum\absline@num<\next@actionline\else

```

First, page number changes, which will generally be the most common actions. If we're restarting lineation on each page, this is where it happens.

```

1029      \ifnum\next@action>-1001
1030          \global\page@num=\next@action
1031          \ifbypage@
1032              \global\line@num=\z@ \global\subline@num=\z@
1033              \resetprevline@
1034      \fi

```

Next, we handle commands that change the line-number values. (We subtract 5001 rather than 5000 here because the line number is going to be incremented automatically in `\getline@num`.)

```

1035      \else
1036          \ifnum\next@action<-4999
1037              \cldtempcnta=-\next@action
1038              \advance\cldtempcnta by -5001
1039              \ifsblines@
1040                  \global\subline@num=\cldtempcnta
1041              \else
1042                  \global\line@num=\cldtempcnta
1043              \fi

```

It's one of the fixed codes. We rescale the value in `\cldtempcnta` so that we can use a case statement.

```

1044      \else
1045          \cldtempcnta=-\next@action
1046          \advance\cldtempcnta by -1000
1047          \do@actions@fixedcode
1048      \fi
1049  \fi

```

Now we get information about the next action off the list, and then set `\do@actions@next` so that we'll call ourself recursively: the next action might also be for this line.

There's no warning if we find `\actionlines@list` empty, since that will always happen near the end of the section.

```

1050      \ifx\actionlines@list\empty
1051          \gdef\next@actionline{1000000}%
1052      \else
1053          \gl@p\actionlines@list\to\next@actionline
1054          \gl@p\actions@list\to\next@action
1055          \global\let\do@actions@next=\do@actions
1056      \fi
1057  \fi

```

Make the recursive call, if necessary.

```

1058 \do@actions@next}
1059

```

`\do@actions@fixedcode` This macro handles the fixed codes for `\do@actions`. It is one big case statement.

```

1060 \newcommand*{\do@actions@fixedcode}{%
1061   \ifcase\@l@dtmpcnta
1062     \or%                                % 1001

```

23.4 Line number printing

`\affixline@num` `\affixline@num` originally took a single argument, a series of commands for printing the line just split off by `\do@line`; it put that line back on the vertical list, and added a line number if necessary. It now just puts a left line number into `\l@dld@ta` or a right line number into `\l@drd@ta` if required.

To determine whether we need to affix a line number to this line, we compute the following:

$$\begin{aligned} n &= \text{int}((\text{linenum} - \text{firstlinenum}) / \text{linenumincrement}) \\ m &= \text{firstlinenum} + (n \times \text{linenumincrement}) \end{aligned}$$

(where `int` truncates a real number to an integer). `m` will be equal to `linenum` only if we're to paste a number on here. However, the formula breaks down for the first line to number (and any before that), so we check that case separately: if `\line@num ≤ \firstlinenum`, we compare the two directly instead of making these calculations.

We compute, in the scratch counter `\@1@dtempcpta`, the number of the next line that should be printed with a number (m in the above discussion), and move the current line number into the counter `\@1@dtempcntb` for comparison.

First, the case when we're within a sub-line range.

```
1089 \newcommand*{\affixline@num}{%
```

No number is attached if `\ifl@dskipnumber` is TRUE (and then it is set to its normal FALSE value). No number is attached if `\ifnumberline` is FALSE (the normal value is TRUE).

```
1090 \ifledgroupnotesL@{\else\ifnumberline
1091 \ifl@dskipnumber
1092   \global\l@dskipnumberfalse
1093 \else
1094   \ifsblines@
1095     \@l@dtempcntb=\subline@num
1096     \ifnum\subline@num>\c@firstsublinenum
1097       \@l@dtempcpta=\subline@num
1098       \advance\@l@dtempcpta by-\c@firstsublinenum
1099       \divide\@l@dtempcpta by\c@sublinenumincrement
1100       \multiply\@l@dtempcpta by\c@sublinenumincrement
1101       \advance\@l@dtempcpta by\c@firstsublinenum
1102   \else
1103     \@l@dtempcpta=\c@firstsublinenum
1104 \fi
```

That takes care of computing the values for comparison, but if line number locking is in effect we have to make a further check. If this check fails, then we disable the line-number display by setting the counters to arbitrary but unequal values.

```
1105 \ch@cksub@l@ck
```

Now the line number case, which works the same way.

```
1106 \else
1107   \@l@dtempcntb=\line@num
```

Check on the `\linenumberlist` If it's `\empty` use the standard algorithm.

```
1108 \ifx\linenumberlist\empty
1109   \ifnum\line@num>\c@firstlinenum
1110     \@l@dtempcpta=\line@num
1111     \advance\@l@dtempcpta by-\c@firstlinenum
1112     \divide\@l@dtempcpta by\c@linenumincrement
1113     \multiply\@l@dtempcpta by\c@linenumincrement
1114     \advance\@l@dtempcpta by\c@firstlinenum
1115   \else
1116     \@l@dtempcpta=\c@firstlinenum
1117   \fi
1118 \else
```

The `\linenumberlist` wasn't `\empty`, so here's Wayne's numbering mechanism. This takes place in TeX's mouth.

```
1119   \@l@dtempcpta=\line@num
```

```

1120     \edef\rem@inder{\linenumberlist,\number\line@num,}%
1121     \edef\sc@n@list{\def\noexpand\sc@n@list
1122       #####1,\number\@l@dtempcsta,#####2|{\def\noexpand\rem@inder{####2}}}}%
1123     \sc@n@list\expandafter\sc@n@list\rem@inder|%
1124     \ifx\rem@inder\empty\advance\@l@dtempcsta\@ne\fi
1125   \fi

```

A locking check for lines, just like the version for sub-line numbers above.

```

1126   \ch@ck@l@ck
1127 \fi

```

The following test is true if we need to print a line number.

```
1128 \ifnum\@l@dtempcsta=\@l@dtempcntb
```

If we got here, we're going to print a line number; so now we need to calculate a number that will tell us which side of the page will get the line number. We start from `\line@margin`, which asks for one side always if it's less than 2; and then if the side does depend on the page number, we simply add the page number to this side code—because the values of `\line@margin` have been devised so that this produces a number that's even for left-margin numbers and odd for right-margin numbers.

For LaTeX we have to consider two column documents as well. In this case I think we need to put the numbers at the outside of the column — the left of the first column and the right of the second. Do the `twocolumn` stuff before going on with the original code.

`\@l@dld@ta` A left line number is stored in `\@l@dld@ta` and a right one in `\@l@drd@ta`.

```

\@l@drd@ta 1129 \if@twocolumn
1130   \if@firstcolumn
1131     \gdef\@l@dld@ta{\llap{\leftlinenum}}%
1132   \else
1133     \gdef\@l@drd@ta{\rlap{\rightlinenum}}%
1134   \fi
1135 \else

```

Continuing the original code ...

```

1136   \gdef\@l@dtempcntb=\line@margin
1137   \ifnum\@l@dtempcntb>\@ne
1138     \advance\@l@dtempcntb \page@num
1139   \fi

```

Now print the line (#1) with its page number.

```

1140   \ifodd\@l@dtempcntb
1141     \gdef\@l@drd@ta{\rlap{\rightlinenum}}%
1142   \else
1143     \gdef\@l@dld@ta{\llap{\leftlinenum}}%
1144   \fi
1145 \fi
1146 \else

```

As no line number is to be appended, we just print the line as is.

```
1147 %% #1%
1148 \fi
```

Now fix the lock counters, if necessary. A value of 1 is advanced to 2; 3 advances to 0; other values are unchanged.

```
1149 \f@x@l@cks
1150 \fi
1151 \fi
1152 \fi
1153 }
1154
```

\ch@cksub@l@ck These macros handle line number locking for \affixline@num. \ch@cksub@l@ck \ch@ck@l@ck checks subline locking. If it fails, then we disable the line-number display by setting \f@x@l@cks the counters to arbitrary but unequal values.

```
1155 \newcommand*{\ch@cksub@l@ck}{%
1156   \ifcase\sub@lock
1157     \or
1158       \ifnum\sublock@disp=\@ne
1159         \z@ \z@ \z@
1160       \fi
1161     \or
1162       \ifnum\sublock@disp=\tw@ \else
1163         \z@ \z@ \z@
1164       \fi
1165     \or
1166       \ifnum\sublock@disp=\z@ 
1167         \z@ \z@ \z@
1168       \fi
1169   \fi}
```

Similarly for line numbers.

```
1170 \newcommand*{\ch@ck@l@ck}{%
1171   \ifcase@clock
1172     \or
1173       \ifnum\lock@disp=\@ne
1174         \z@ \z@ \z@
1175       \fi
1176     \or
1177       \ifnum\lock@disp=\tw@ \else
1178         \z@ \z@ \z@
1179       \fi
1180     \or
1181       \ifnum\lock@disp=\z@ 
1182         \z@ \z@ \z@
1183       \fi
1184   \fi}
```

Fix the lock counters. A value of 1 is advanced to 2; 3 advances to 0; other values are unchanged.

```

1185 \newcommand*{\f@x@l@cks}{%
1186   \ifcase\f@lock
1187   \or
1188     \global\f@lock=\tw@
1189   \or \or
1190     \global\f@lock=z@
1191   \fi
1192   \ifcase\f@sub@lock
1193   \or
1194     \global\f@sub@lock=\tw@
1195   \or \or
1196     \global\f@sub@lock=z@
1197   \fi}
1198

```

`\pageparbreak` Because of TeX's asynchronous page breaking mechanism we can never be sure juust where it will make a break and, naturally, it has already decided exactly how it will typeset any remainder of a paragraph that crosses the break. This is disconcerting when trying to number lines by the page or put line numbers in different margins. This macro tries to force an invisible paragraph break and a page break.

```

1199 \newcommand{\pageparbreak}{\pend\newpage\pstart\noindent}
1200

```

23.5 Pstart number printing in side

In side, the printing of pstart number is running like the printing of line number. There is only some differences:

- The pstarts counter is upgrade in the `\pend` command. Consequently, the `\affixpstart@num` command has not to upgrade it, unlike the `\affixline@num` which upgrades the lines counter.
- To print the pstart number only at the beginning of a pstart, and not in every line, a boolean test is made. The `\pstartnum` boolean is set to TRUE at every `\pend`. It's tried in the `\leftpstartnum` and `\rightpstartnum` commands. After the try, it is set to FALSE.

```

\leftpstartnum
\rightpstartnum 1201
\ifsidepstartnum 1202 \newif\ifsidepstartnum
1203 \newcommand*{\affixpstart@num}{%
1204   \ifsidepstartnum
1205     \if@twocolumn
1206       \if@firstcolumn
1207         \gdef\l@dld@ta{\llap{{\leftpstartnum}}}}

```

1211     \else
1212         \gdef\l@dtmpcntb=\line@margin
1213         \ifnum\l@dtmpcntb>\@ne
1214             \advance\l@dtmpcntb \page@num
1215         \fi
1216         \ifodd\l@dtmpcntb
1217             \gdef\l@drd@ta{\rlap{{\rightpstartnum}}}
1218         \else
1219             \gdef\l@drd@ta{\llap{{\leftpstartnum}}}
1220         \fi
1221     \fi
1222 \fi
1223 }
1224 %
1225 %
1226 \newif\ifpstartnum
1227 \pstartnumtrue
1228 \newcommand*{\leftpstartnum}{%
1229     \ifpstartnum\the\pstart
1230     \kern\linenumsep\fi
1231     \global\pstartnumfalse
1232 }
1233 \newcommand*{\rightpstartnum}{%
1234     \ifpstartnum
1235     \kern\linenumsep
1236     \the\pstart
1237     \fi
1238     \global\pstartnumfalse
1239 }
1240 }
```

23.6 Add insertions to the vertical list

`\inserts@list` `\inserts@list` is the list macro that contains the inserts that we save up for one paragraph.

```
1241 \list@create{\inserts@list}
```

`\add@inserts` `\add@inserts` is the penultimate macro used by `\do@line`; it takes insertions saved in a list macro and sends them onto the vertical list.

It may call itself recursively, and to do this efficiently (using TeX's optimization for tail recursion), we define a control-sequence called `\add@inserts@next` that is always the last thing that `\add@inserts` does. If there could be more inserts to process for this line, `\add@inserts@next` is set equal to `\add@inserts`; otherwise it's just `\relax`.

```
1242 \newcommand*{\add@inserts}{%
```

```
1243 \global\let\add@inserts@next=\relax
```

If `\inserts@list` is empty, there aren't any more notes or insertions for this paragraph, and we needn't waste our time.

```
1244 \ifx\inserts@list\empty \else
```

The `\next@insert` macro records the number of the line that receives the next footnote or other insert; it's empty when we start out, and just after we've affixed a note or insert.

```
1245 \ifx\next@insert\empty
1246   \ifx\insertlines@list\empty
1247     \global\noteschanged@true
1248     \gdef\next@insert{100000}%
1249   \else
1250     \gl@p\insertlines@list\to\next@insert
1251   \fi
1252 \fi
```

If the next insert's for this line, tack it on (and then erase the contents of the insert macro, as it could be quite large). In that case, we also set `\add@inserts@next` so that we'll call ourselves recursively: there might be another insert for this same line.

```
1253 \ifnum\next@insert=\absline@num
1254   \gl@p\inserts@list\to@\insert
1255   @insert
1256   \global\let@\insert=\undefined
1257   \global\let\next@insert=\empty
1258   \global\let\add@inserts@next=\add@inserts
1259 \fi
1260 \fi
```

Make the recursive call, if necessary.

```
1261 \add@inserts@next}
1262
```

23.7 Penalties

`\add@penalties` `\add@penalties` is the last macro used by `\do@line`. It adds up the club, widow, and interline penalties, and puts a single penalty of the appropriate size back into the paragraph; these penalties get removed by the `\vsplit` operation. `\displaywidowpenalty` and `\brokenpenalty` are not restored, since we have no easy way to find out where we should insert them.

In this code, `\num@lines` is the number of lines in the whole paragraph, and `\par@line` is the line we're working on at the moment. The count `\@l@dttempcnta` is used to calculate and accumulate the penalty; it is initially set to the value of `\ballast@count`, which has been worked out in `\do@ballast` above (p. 86). Finally, the penalty is checked to see that it doesn't go below `-10000`.

```
1263 \newcommand*\add@penalties{\@l@dttempcnta=\ballast@count
1264   \ifnum\num@lines>\@ne
```

```

1265   \global\advance\par@line \cne
1266   \ifnum\par@line=\cne
1267     \advance\@l@dtempcnta \clubpenalty
1268   \fi
1269   \c@l@dtempcntb=\par@line \advance\c@l@dtempcntb \cne
1270   \ifnum\c@l@dtempcntb=\num@lines
1271     \advance\@l@dtempcnta \widowpenalty
1272   \fi
1273   \ifnum\par@line<\num@lines
1274     \advance\@l@dtempcnta \interlinepenalty
1275   \fi
1276 \fi
1277   \ifnum\c@l@dtempcnta=\z@
1278     \relax
1279   \else
1280     \ifnum\c@l@dtempcnta>-10000
1281       \penalty\c@l@dtempcnta
1282     \else
1283       \penalty -10000
1284     \fi
1285   \fi
1286

```

23.8 Printing leftover notes

\flush@notes The `\flush@notes` macro is called after the entire paragraph has been sliced up and sent on to the vertical list. If the number of notes to this paragraph has increased since the last run of TEX, then there can be leftover notes that haven't yet been printed. An appropriate error message will be printed elsewhere; but it's best to go ahead and print these notes somewhere, even if it's not in quite the right place. What we do is dump them all out here, so that they should be printed on the same page as the last line of the paragraph. We can hope that's not too far from the proper location, to which they'll move on the next run.

```

1287 \newcommand*{\flush@notes}{%
1288   \c@xloop
1289   \ifx\inserts@list\empty \else
1290     \gl@p\inserts@list\to@\insert
1291     \c@insert
1292     \global\let\c@insert=\undefined
1293   \repeat}
1294

```

\c@xloop `\c@xloop` is a variant of the PLAIN TEX `\loop` macro, useful when it's hard to construct a positive test using the TEX `\if` commands—as in `\flush@notes` above. One says `\c@xloop ... \if ... \else ... \repeat`, and the action following `\else` is repeated as long as the `\if` test fails. (This macro will work wherever the PLAIN TEX `\loop` is used, too, so we could just call it `\loop`; but it seems preferable not to change the definitions of any of the standard macros.)

This variant of `\loop` was introduced by Alois Kabelschacht in *TUGboat 8* (1987), pp. 184–5.

```
1295 \def\@xloop#1\repeat{%
1296   \def\body{\#1\expandafter\body\fi}%
1297   \body}%
1298
```

24 Footnotes

The footnote macros are adapted from those in PLAIN TeX, but they differ in these respects: the outer-level commands must add other commands to a list macro rather than doing insertions immediately; there are five separate levels of the footnotes, not just one; and there are options to reformat footnotes into paragraphs or into multiple columns.

24.1 Fonts

Before getting into the details of formatting the notes, we set up some font macros. It is the notes that present the greatest challenge for our font-handling mechanism, because we need to be able to take fragments of our main text and print them in different forms: it is common to reduce the size, for example, without otherwise changing the fonts used.

`\select@lemm.getFont` This macro extracts the font specifier from the line and page number cluster, and issues the associated font-changing command, so that the lemma is printed in its original font.

```
1299 \def\select@lemm.getFont#1|#2|#3|#4|#5|#6|#7|{\select@0@lemm.getFont#7|}%
1300 \def\select@0@lemm.getFont#1/#2/#3/#4|{%
1301   {\fontencoding{\#1}\fontfamily{\#2}\fontseries{\#3}\fontshape{\#4}}%
1302   \selectfont}%
1303
```

24.2 Outer-level footnote commands

`\footnoteoptions@` The `\footnoteoption@[⟨side⟩]{⟨options⟩}{⟨value⟩}` change the value of on options of Xfootnote, to switch between true and false.

```
1304 \newcommandx*\footnoteoptions@[3][1=L,usedefault]{%
1305   \def\do##1{%
1306     \ifstrequal{##1}{L}{% In Leftside

1354 }

```

24.3 Normal footnote formatting

The processing of each note is done by four principal macros: the `\vfootnote` macro takes the text of the footnote and does the `\insert`; it calls on the `\footfmt` macro to select the right fonts, print the line number and lemma, and do any other formatting needed for that individual note. Within the output routine, the two other macros, `\footstart` and `\footgroup`, are called; the first prints extra vertical space and a footnote rule, if desired; the second does any reformatting of the whole set of the footnotes in this series for this page—such as paragraphing or division into columns—and then sends them to the page.

These four macros, and the other macros and parameters shown here, are distinguished by the ‘series letter’ that indicates which set of the footnotes we’re dealing with—A, B, C, D, or E. The series letter always precedes the string `foot` in macro and parameter names. Hence, for the A series, the four macros are called `\vAfootnote`, `\Afootfmt`, `\Afootstart`, and `\Afootgroup`.

`\normalvfootnote` We now begin a series of commands that do ‘normal’ footnote formatting: a format much like that implemented in PLAIN T_EX, in which each footnote is a separate paragraph.

`\normalvfootnote` takes the series letter as #1, and the entire text of the footnote is #2. It does the `\insert` for this note, calling on the `\footfmt` macro for this note series to format the text of the note.

```

1355 \notbool{parapparatus@}{\newcommand*{\newcommand}{\normalvfootnote}[2]{%
1356   \insert\csname #1footins\endcsname\bgroup

```

\ledsetnormalparstuff \normalfootfmt is a ‘normal’ macro to take the footnote line and page number information (see p. 58), and the desired text, and output what’s to be printed. Argument #1 contains the line and page number information and lemma font specifier; #2 is the lemma; #3 is the note’s text. This version is very rudimentary—it uses \printlines to print just the range of line numbers, followed by a square bracket, the lemma, and the note text; it’s intended to be copied and modified as necessary.

\par should always be redefined to \endgraf within the format macro (this is what \normal@pars does), to override tricky material in the main text to get the lines numbered automatically (as set up by \autopar, for example).

```

1378 \newcommand*{\ledsetnormalparstuff}{%

```

\endashchar The fonts that are used for printing notes might not have the character mapping we expect: for example, the Computer Modern font that contains old-style numerals \fullstop does not contain an en-dash or square brackets, and its period and comma are in odd locations. To allow use of the standard footnote macros with such fonts, we use the following macros for certain characters.

The \endashchar macro is simply an en-dash from the normal font and is immune to changes in the surrounding font. The same goes for the full stop. These two are used in \printlines. The right bracket macro is the same again; it crops up in \normalfootfmt and the other footnote macros for controlling the format of the footnotes.

With polyglossia, each critical note has a \footnote@lang which shows the language of the lemma, and which can be used to switch the bracket from right to left.

```

```

The \printlines macro prints the line numbers for a note—which, in the general case, is a rather complicated task. The seven parameters of the argument are the line numbers as stored in \l@d@nums, in the form described on page 58: the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma.

The original EDMAC code used several counters at this point, saying:

To simplify the logic, we use a lot of counters to tell us which numbers need to get printed (using 1 for yes, 0 for no, so that \ifodd tests for ‘yes’). The counter assignments are:

- \c@pnum for page numbers;
- \c@ssub for starting sub-line;
- \c@elin for ending line;
- \c@esl for ending sub-line; and
- \c@dash for the dash between the starting and ending groups.

There’s no counter for the line number because it’s always printed.

LaTeX tends to use a lot of counters and packages should try and minimise the number of new ones they create. In line with this Peter Wilson have reverted to traditional booleans.

```

1478   \ifl@d@pnum #4\fullstop\fi
1479   \ifl@d@elin \linenumrep{#5}\fi
1480   \ifl@d@esl \ifl@d@elin \fullstop\fi \sublinenumrep{#6}\fi
1481 \endgroup

```

`\normalfootstart` `\normalfootstart` is a standard footnote-starting macro, called in the output routine whenever there are footnotes of this series to be printed: it skips a bit and then draws a rule.

Any `footstart` macro must put onto the page something that takes up space exactly equal to the `\skip\footins` value for the associated series of notes. TEX makes page computations based on that `\skip` value, and the output pages will suffer from spacing problems if what you add takes up a different amount of space.

But if the skip `\preXnotes@` is greater than 0 pt, it's used instead of `\skip\footins` for the first printed series.

The `\leftskip` and `\rightskip` values are both zeroed here. Similarly, these skips are cancelled in the `vfootnote` macros for the various types of notes. Strictly speaking, this is necessary only if you are using paragraphed footnotes, but we have put it here and in the other `vfootnote` macros too so that the behavior of `eledmac` in this respect is general across all footnote types (you can change this). What this means is that any `\leftskip` and `\rightskip` you specify applies to the main text, but not the footnotes. The footnotes continue to be of width `\hsize`.

```

1482 \newcommand*{\normalfootstart}[1]{%
1483   \ifdim\equal{#1}{\preXnotes@}\{}%
1484   {}%

1517

```

24.4 Standard footnote definitions

\footnormal We can now define all the parameters for the five series of footnotes; initially they use the ‘normal’ footnote formatting, which is set up by calling \footnormal. You can switch to another type of formatting by using \footparagraph, \foottwocol, or \footthreecol.

Switching to a variation of ‘normal’ formatting requires changing the quantities defined in \footnormal. The best way to proceed would be to make a copy of this macro, with a different name, make your desired changes in that copy, and then invoke it, giving it the letter of the footnote series you wish to control.

(We have not defined baseline skip values like \abaselineskip, since this is one of the quantities set in \notefontsetup.)

What we want to do here is to say something like the following for each footnote series. (This is an example, not part of the actual *eledmac* code.)

```

\skip\Afootins=12pt plus5pt minus5pt
\count\Afootins=1000
\dimen\Afootins=0.8\vsiz
\let\vAfootnote=\normalvfootnote \let\Afootfmt=\normalfootfmt
\let\Afootstart=\normalfootstart \let\Afootgroup=\normalfootgroup
\let\Afootnoterule=\normalfootnoterule

```

Instead of repeating ourselves, we define a \footnormal macro that makes all these assignments for us, for any given series letter. This also makes it easy to change from any different system of formatting back to the *normal* setting.

\ledfootinsdim Have a constant value for the \dimen\footins

```
1518 \newcommand*{\ledfootinsdim}{0.8\vsiz} % kept for backward compatibility, shouldn't be used
```

\preXnotes@ If user redefines \preXnotes, via \preXnotes to a value greater than 0 pt, this \preXnotes skip will be added before first series notes instead of the notes skip.

```

1519 \newtoggle{\preXnotes@}
1520 \toggletrue{\preXnotes@}
1521 \newcommand{\preXnotes@}{0pt}
1522 \newcommand*{\preXnotes}[1]{\renewcommand{\preXnotes@}{#1}}

```

The same, but for familiar footnotes.

```

\preXnotes
\preXnotes@ 1523 \newtoggle{\prenotesX@}
1524 \toggletrue{\prenotesX@}
1525 \newcommand{\prenotesX@}{0pt}
1526 \newcommand*{\prenotesX}[1]{\renewcommand{\prenotesX@}{#1}}

```

Now we set up the `\footnormal` macro itself. It takes one argument: the footnote series letter.

```

1527 \newcommand*{\footnormal}[1]{%
1528   \csgdef{series@display#1}{normal}
1529   \expandafter\let\csname #1footstart\endcsname=\normalfootstart
1530   \expandafter\let\csname v#1footnote\endcsname=\normalvfootnote
1531   \expandafter\let\csname #1footfmt\endcsname=\normalfootfmt
1532   \expandafter\let\csname #1footgroup\endcsname=\normalfootgroup
1533   \expandafter\let\csname #1footnoterule\endcsname=%
1534   \normalfootnoterule
1535   \count\csname #1footins\endcsname=1000
1536   \dimen\csname #1footins\endcsname=\csuse{maxhXnotes@#1}
1537   \skip\csname #1footins\endcsname=\csuse{beforeXnotes@#1}

```

Now do the setup for minipage footnotes. We use as much as possible of the normal setup as we can (so the notes will have a similar layout).

```

1538   \expandafter\let\csname mpv#1footnote\endcsname=\mpnnormalvfootnote
1539   \expandafter\let\csname mp#1footgroup\endcsname=\mpnnormalfootgroup
1540   \count\csname mp#1footins\endcsname=1000
1541   \dimen\csname mp#1footins\endcsname=\csuse{maxhXnotes@#1}
1542   \skip\csname mp#1footins\endcsname=\csuse{beforeXnotes@#1}
1543 }
1544

```

Some of these values deserve comment: the `\dimen` setting allows 80% of the page to be occupied by notes; the `\skip` setting is deliberately flexible, since pages with lots of notes attached to many of the lines can be a bit hard for TeX to make.

24.5 Paragraphed footnotes

The paragraphed-footnote option reformats all the footnotes of one series for a page into a single paragraph; this is especially appropriate when the notes are numerous and brief. The code is based on *The TeXbook*, pp. 398–400, with alterations for our environment. This algorithm uses a considerable amount of save-stack space: a TeX of ordinary size may not be able to handle more than about 100 notes of this kind on a page.

`\footparagraph` The `\footparagraph` macro sets up everything for one series of the footnotes so that they'll be paragraphed; it takes the series letter as argument. We include the setting of `\count\footins` to 1000 for the footnote series just in case you are switching to paragraphed footnotes after having columnar ones, since they change this value (see below).

It is important to call `\footparagraph` only after `\hsize` has been set for the pages that use this series of notes; otherwise TeX will try to put too many or too few of these notes on each page. If you need to change the `\hsize` within the document, call `\footparagraph` again afterwards to take account of the new value. The argument of `\footparagraph` is the letter (A–E) denoting the series of notes to be paragraphed.

```

1545 \newcommand*{\footparagraph}[1]{%
1546   \csgdef{series@display#1}{paragraph}
1547   \expandafter\newcount\csname prevpage\endcsname
1548   \expandafter\let\csname #1footstart\endcsname=\parafootstart
1549   \expandafter\let\csname v#1footnote\endcsname=\para@vfootnote
1550   \expandafter\let\csname #1footfmt\endcsname=\parafootfmt
1551   \expandafter\let\csname #1footgroup\endcsname=\para@footgroup
1552   \count\csname #1footins\endcsname=1000
1553   \dimen\csname #1footins\endcsname=\csuse{maxhXnotes@#1}
1554   \skip\csname #1footins\endcsname=\csuse{beforeXnotes@#1}
1555   \para@footsetup{#1}

```

And the extra setup for minipages.

```

1556   \expandafter\let\csname mpv#1footnote\endcsname=\mppara@vfootnote
1557   \expandafter\let\csname mp#1footgroup\endcsname=\mppara@footgroup
1558   \count\csname mp#1footins\endcsname=1000
1559   \dimen\csname mp#1footins\endcsname=\csuse{maxhXnotes@#1}
1560   \skip\csname mp#1footins\endcsname=\csuse{beforeXnotes@#1}
1561 }

```

- \footfudgefiddle** For paragraphed footnotes T_EX has to estimate the amount of space required. If it underestimates this then the notes may get too long and run off the bottom of the text block. **\footfudgefiddle** can be increased from its default 64 (say to 70) to increase the estimate.

```
1562 \providecommand{\footfudgefiddle}{64}
```

- \para@footsetup** **\footparagraph** calls the **\para@footsetup** macro to calculate a special fudge factor, which is the ratio of the **\baselineskip** to the **\hsize**. We assume that the proper value of **\baselineskip** for the footnotes (normally 9 pt) has been set already, in **\notefontsetup**. The argument of the macro is again the note series letter.

Peter Wilson thinks that **\columnwidth** should be used here for LaTe_X, not **\hsize**. I've also included **\footfudgefiddle**.

```

1563 \newcommand*{\para@footsetup}[1]{{\csuse{Xnotefontsize@#1}}
1564   \dimen0=\baselineskip
1565   \multiply\dimen0 by 1024
1566   \divide\dimen0 by \columnwidth \multiply\dimen0 by \footfudgefiddle\relax
1567   \expandafter
1568   \xdef\csname #1footfudgefactor\endcsname{%
1569     \expandafter\strip@pt\dimen0 }))}
1570

```

EDMAC defines **\en@number** which does the same as the LaTe_X kernel **\strip@pt**, namely strip the characters pt from a dimen value. Eledmac use **\strip@pt**.

- \parafootstart** **\parafootstart** is the same as **\normalfootstart**, but we give it again to ensure that **\rightskip** and **\leftskip** are zeroed (this needs to be done before **\para@footgroup** in the output routine). You might have decided to change this for other kinds of note, but here it should stay as it is. The size of paragraphed

notes is calculated using a fudge factor which in turn is based on `\hsize`. So the paragraph of notes needs to be that wide.

The argument of the macro is again the note series letter.

```

1571 \newcommand*{\parafootstart}[1]{%
1572   \rightskip=0pt \leftskip=0pt \parindent=0pt
1573   \ifdim\equal{0pt}{\preXnotes@}{}
1574   {%
1575     \iftoggle{\preXnotes@}{%
1576       \togglegfalse{\preXnotes@}\skip\csname #1footins\endcsname=\csuse{\preXnotes@}}%
1577     {}%
1578   }%
1579   \vskip\skip\csname #1footins\endcsname%
1580   \csname #1footnoterule\endcsname%
1581   \vskip\csuse{afterXrule@#1}%
1582   \noindent\leavevmode}

```

`\para@vfootnote` `\para@vfootnote` is a version of the `\vfootnote` command that's used for paragraphed notes. It gets appended to the `\inserts@list` list by an outer-level footnote command like `\Afootnote`. The first argument is the note series letter; the second is the full text of the printed note itself, including line numbers, lemmata, and footnote text.

The initial model for this insertion is, of course, the `\insert\footins` definition in *The TeXbook*, p. 398. There, the footnotes are first collected up in hboxes, and these hboxes are later unpacked and stuck together into a paragraph.

However, Michael Downes has pointed out that because text in hboxes gets typeset in restricted horizontal mode, there are some undesirable side-effects if you later want to break such text across lines. In restricted horizontal mode, where TeX does not expect to have to break lines, it does not insert certain items like `\discretionarys`. If you later unbox these hboxes and stick them together, as the *TeXbook* macros do to make these footnotes, you lose the ability to hyphenate after an explicit hyphen. This can lead to overfull `\hboxes` when you would not expect to find them, and to the uninitiated it might be very hard to see why the problem had arisen.²²

Wayne Sullivan pointed out to us another subtle problem that arises from the same cause: TeX also leaves the `\language` whatsit nodes out of the horizontal list.²³ So changes from one language to another will not invoke the proper hyphenation rules in such footnotes. Since critical editions often do deal with several languages, especially in a footnotes, we really ought to get this bit of code right.

To get around these problems, Wayne suggested emendations to the *TeXbook* versions of these macros which are broadly the same as those described by Michael: the central idea (also suggested by Donald Knuth in a letter to Michael) is to avoid collecting the text in an `\hbox` in the first place, but instead to collect it in a `\vbox` whose width is (virtually) infinite. The text is therefore typeset in unrestricted horizontal mode, as a paragraph consisting of a single long line. Later, there is an

²²Michael Downes, ‘Line Breaking in `\unhboxed` Text’, *TUGboat* 11 (1990), pp. 605–612.

²³See *The TeXbook*, p. 455 (editions after January 1990).

extra level of unboxing to be done: we have to unpack the `\vbox`, as well as the `hboxes` inside it, but that's not too hard. For details, we refer you to Michael's article, where the issues are clearly explained.²⁴ Michael's unboxing macro is called `\unvxh`: `unvbox`, extract the last line, and `uhbox` it.

Doing things this way has an important consequence: as Michael pointed out, you really can't put an explicit line-break into a note built in a `\vbox` the way we are doing.²⁵ In other words, be very careful not to say `\break`, or `\penalty-10000`, or any equivalent inside your para-footnote. If you do, most of the note will probably disappear. You *are* allowed to make strong suggestions; in fact `\penalty-9999` will be quite okay. Just don't make the break mandatory. We haven't applied any of Michael's solutions here, since we feel that the problem is exiguous, and `eledmac` is quite baroque enough already. If you think you are having this problem, look up Michael's solutions.

One more thing; we set `\leftskip` and `\rightskip` to zero. This has the effect of neutralizing any such skips which may apply to the main text (cf. p. 103 above). We need to do this, since `footfudgefactor` is calculated on the assumption that the notes are `\hsize` wide.

So, finally, here is the modified foot-paragraph code, which sets the footnote in vertical mode so that language and discretionary nodes are included.

```

1583 \newcommand*{\para@vfootnote}[2]{%
1584   \insert\csname #1footins\endcsname
1585   \bgroup
1586     \csuse{bhookXnote@#1}
1587     \csuse{Xnotefontsize@#1}
1588     \footsplitskips
1589     \setbox0=\vbox{\hsize=\maxdimen
1590       \noindent\csname #1footfmt\endcsname#2[#1]}%
1591     \setbox0=\hbox{\unvxh0[#1]}%
1592     \dp0=0pt
1593     \ht0=\csname #1footfudgefactor\endcsname\wd0

```

Here we produce the contents of the footnote from box 0, and add a penalty of 0 between boxes in this insert.

```

1594   \if@RTL\noindent \leavevmode\fi\box0%
1595   \penalty0
1596 \egroup}
1597

```

The final penalty of 0 was added here at Wayne's suggestion to avoid a weird page-breaking problem, which occurs on those occasions when `TeX` attempts to split foot paragraphs. After trying out such a split (see *The TeXbook*, p. 124), `TeX` inserts a penalty of -10000 here, which nearly always forces the break at the end of the whole footnote paragraph (since individual notes can't be split) even when this leads to an overfull `vbox`. The change above results in a penalty of 0 instead which allows, but doesn't force, such breaks. This penalty of 0 is

²⁴Wayne supplied his own macros to do this, but since they were almost identical to Michael's, we have used the latter's `\unvxh` macro since it is publicly documented.

²⁵'Line Breaking', p. 610.

later removed, after page breaks have been decided, by the `\unpenalty` macro in `\makehboxofhboxes`. So it does not affect how the footnote paragraphs are typeset (the notes still have a penalty of -10 between them, which is added by `\parafootfmt`).

`\mppara@vfootnote` This version is for minipages.

```

1598 \newcommand*{\mppara@vfootnote}[2]{%
1599   \global\setbox\@nameuse{mp#1footins}\vbox{%
1600     \unvbox\@nameuse{mp#1footins}%
1601     \csuse{bhookXnote@#1}%
1602     \csuse{Xnotefontsize@#1}%
1603     \footsskip%
1604     \setbox0=\vbox{\hsize=\maxdimen%
1605       \noindent\color@begingroup\csname #1footfmt\endcsname #2[#1]\color@endgroup}%
1606     \setbox0=\hbox{\unvxh0[#1]}%
1607     \dp0=\z@%
1608     \ht0=\csname #1footfudgefactor\endcsname\wd0%
1609     \box0%
1610     \penalty0%
1611 }%
1612

```

`\unvxh` Here is (modified) Michael's definition of `\unvxh`, used above. Michael's macro also takes care to remove some unwanted penalties and glue that TeX automatically attaches to the end of paragraphs. When TeX finishes a paragraph, it throws away any remaining glue, and then tacks on the following items: a `\penalty` of 10000, a `\parfillskip` and a `\rightskip` (*The TeXbook*, pp. 99–100). `\unvxh` cancels these unwanted paragraph-final items using `\unskip` and `\unpenalty`.

```

1613 \newcommandx*{\unvxh}[2][2=Z]{% 2th is optional for retro-compatibility
1614   \setbox0=\vbox{\unvbox#1}%
1615   \global\setbox1=\lastbox}%
1616   \unhbox1%
1617   \unskip      % remove \rightskip,
1618   \unskip      % remove \parfillskip,
1619   \unpenalty    % remove \penalty of 10000,
1620   \hskip\csuse{afternote@#2}} % but add the glue to go between the notes
1621

```

`\parafootfmt` `\parafootfmt` is `\normalfootfmt` adapted to do the special stuff needed for paragraphed notes—leaving out the `\endgraf` at the end, sticking in special penalties and kern, and leaving out the `\footstrut`. The first argument is the line and page number information, the second is the lemma, the third is the text of the footnote, and the fourth is the series (optional, for backward compatibility).

```

1622 \newcommandx*{\parafootfmt}[4][4=Z]{%
1623   \insertparafootsep{#4}%
1624   \ledsetnormalparstuff%
1625   \printlinefootnote{#1}{#4}%
1626   {\notoggle{Xlemmadisablefontselection@#4}{\select@lemmafont#1|#2}{#2}}%

```

```

1627 \iftoggle{nosep@}{\hskip\csuse{inplaceoflemmaseparator@#4}}{\ifcsempty{lemmaseparator@#4}
1628   {\hskip\csuse{inplaceoflemmaseparator@#4}}%
1629   {\nobreak\hskip\csuse{beforelemmaseparator@#4}\csuse{lemmaseparator@#4}\hskip\csuse{ai
1630   }}}}%
1631 #3\penalty-10 }

```

Note that in the above definition, the penalty of -10 encourages a line break between notes, so that notes have a slight tendency to begin on new lines. The `\insertparafootsep` command is used to insert the `\parafootsep@series` between each note in the *same* page.

`\para@footgroup` This footgroup code is modelled on the macros in *The TeXbook*, p. 399. The only difference is the `\unpenalty` in `\makehboxofhboxes`, which is there to remove the penalty of 0 which was added to the end of each footnote by `\para@vfootnote`.

The call to `\notefontsetup` is to ensure that the correct `\baselineskip` for the footnotes is used. The argument is the note series letter.

```

1632 \newcommand*{\para@footgroup}[1]{%
1633   \unvbox\csname #1footins\endcsname
1634   \ifcsstring{Xragged@#1}{L}{\RaggedLeft}{}%

24.6 Columnar footnotes

`\rigidbalance` We will now define macros for three-column notes and two-column notes. Both `\dosplits` sets of macros will use `\rigidbalance`, which splits a box (#1) into a number `\splitoff` (#2) of columns, each with a space (#3) between the top baseline and the top of `\@h` the `\vbox`. The `\rigidbalance` macro is taken from *The TeXbook*, p. 397, with a `\@k` slight change to the syntax of the arguments so that they don't depend on white space. Note also the extra unboxing in `\splitoff`, which allows the new `\vbox` to have its natural height as it goes into the alignment.

The LaTeX `\line` macro has no relationship to the TeX `\line`. The LaTeX equivalent is `\@@line`.

```

1689 \newcount\@k \newdimen\@h
1690 \newcommand*{\rigidbalance}[3]{\setbox0=\box#1 \@k=#2 \@h=#3

```

```

1691  \@@line{\splittopskip=\@h \vbadness=\@M \hfilneg
1692  \valign{##\vfil\cr\dosplits}}
1693
1694 \newcommand*{\dosplits}{\ifnum\@k>0 \noalign{\hfil}\splitoff
1695  \global\advance\@k-1\cr\dosplits\fi}
1696
1697 \newcommand*{\splitoff}{\dimen0=\ht0
1698  \divide\dimen0 by\@k \advance\dimen0 by\@h
1699  \setbox2 \vsplit0 to \dimen0
1700  \unvbox2 }
1701

```

Three columns

\footthreecol You say \footthreecol{A} to have the A series of the footnotes typeset in three columns. It is important to call this only after \hsize has been set for the document.

```

1702 \newcommand*{\footthreecol}[1]{%
1703  \csgdef{series@display#1}{threecol}
1704  \expandafter\let\csname v#1footnote\endcsname=\threecolvfootnote
1705  \expandafter\let\csname #1footfmt\endcsname=\threecolfootfmt
1706  \expandafter\let\csname #1footgroup\endcsname=\threecolfootgroup
1707  \threecolfootsetup{#1}

```

The additional setup for minipages.

```

1708 \expandafter\let\csname mpv#1footnote\endcsname=\mpnormalvfootnote
1709 \expandafter\let\csname mp#1footgroup\endcsname=\mpthreecolfootgroup
1710 \mpthreecolfootsetup{#1}
1711 }
1712

```

The \footstart and \footnoterule macros for these notes assume the normal values (p. 102 above).

\threecolfootsetup The \threecolfootsetup macro calculates and sets some numbers for three-column footnotes.

We set the \count of the foot insert to 333. Each footnote can be thought of as contributing only one third of its height to the page, since the footnote insertion has been made as a long narrow column, which then gets trisected by the \rigidbalance routine (inside \threecolfootgroup). These new, shorter columns are saved in a box, and then that box is *put back* into the footnote insert, replacing the original collection of the footnotes. This new box is, therefore, only about a third of the height of the original one.

The \dimen value for this note series has to change in the inverse way: it needs to be three times the actual limit on the amount of space these notes are allowed to fill on the page, because when TeX is accumulating material for the page and checking that limit, it doesn't apply the \count scaling.

```

1713 \newcommand*{\threecolfootsetup}[1]{%
1714  \count\csname #1footins\endcsname 333

```

```
1715 \multiply\dimen\csname #1footins\endcsname \thr@@}
```

\mpthreecolfootsetup The setup for minipages.

```
1716 \newcommand*{\mpthreecolfootsetup}[1]{%
1717 \count\csname mp#1footins\endcsname 333
1718 \multiply\dimen\csname mp#1footins\endcsname \thr@@}
1719
```

\threecolvfootnote \threecolvfootnote is the \vfootnote command for three-column notes. The call to \notefontsetup ensures that the \splittopskip and \splitmaxdepth take their values from the right \strutbox: the one used in a footnotes. Note especially the importance of temporarily reducing the \hsize to 0.3 of its normal value. This determines the widths of the individual columns. So if the normal \hsize is, say, 10cm, then each column will be $0.3 \times 10 = 3$ cm wide, leaving a gap of 1 cm spread equally between columns (i.e., .5 cm between each).

The arguments are 1) the note series letter and 2) the full text of the note (including numbers, lemma and text).

```
1720 \notbool{parapparatus@}{\newcommand*{\newcommand}{\threecolvfootnote}[2]{%
1721 \insert\csname #1footins\endcsname\bgroup
1722 \csuse{Xnotefontsize@#1}
1723 \footsplitskips
1724 \csname #1footfmt\endcsname #2[#1]\egroup}
```

\threecolfootfmt \threecolfootfmt is the command that formats one note. It uses \raggedright, which will usually be preferable with such short lines. Setting the \parindent to zero means that, within each individual note, the lines begin flush left.

The arguments are 1) the line numbers, 2) the lemma and 3) the text of the -footnote command 4) optional (for backward compatibility): the series.

```
1725 \notbool{parapparatus@}{\newcommandx*{\newcommandx}{\threecolfootfmt}[4][4=Z]{%

1738 }%}
1739 #3\strut\par\allowbreak}
```

\threecolfootgroup And here is the footgroup macro that's called within the output routine to regroup the notes into three columns. Once again, the call to \notefontsetup is there to ensure that it is the right \splittopskip—the one used in footnotes—which is used to provide the third argument for \rigidbalance. This third argument (\@h) is the topskip for the box containing the text of the footnotes,

and does the job of making sure the top lines of the columns line up horizontally. In *The TeXbook*, p. 398, Donald Knuth suggests retrieving the output of `\rigidbalance`, putting it back into the insertion box, and then printing the box. Here, we just print the `\line` which comes out of `\rigidbalance` directly, without any re-boxing.

```

25 Familiar footnotes

25.1 Generality

The original EDMAC provided users with five series of critical footnotes (`\Afootnote` `\Bfootnote` `\Cfootnote` `\Dfootnote` `\Efootnote`), and LaTeX provides a single numbered footnote. The `eledmac` package uses the EDMAC mechanism to provide five series of numbered footnotes.

First, though, the `footmisc` package has an option whereby two or more consecutive `\footnotes` have their marks separated by commas. This seems such a useful ability that it is provided automatically by `eledmac`.

`\multiplefootnotemarker` These macros may have been defined by the `memoir` class, are provided by the `footmisc` package and perhaps by other footnote packages.

```

```

1834 \providecommand*\m@mmf@prepare}{%
1835   \kern-\multiplefootnotemarker
1836   \kern\multiplefootnotemarker\relax

```

`\m@mmf@check` This may have been defined in the `memoir` class. If it recognises the last kern as `\multiplefootnotemarker` it typesets `\multfootsep`.

```

1837 \providecommand*\m@mmf@check}{%
1838   \ifdim\lastkern=\multiplefootnotemarker\relax
1839     \edef\x@sf{\the\spacefactor}%
1840     \unkern
1841     \multfootsep
1842     \spacefactor\x@sf\relax
1843   \fi}

```

1844

We have to modify `\@footnotetext` and `\@footnotemark`. However, if `memoir` is used the modifications have already been made.

1845 `\@ifclassloaded{memoir}{}{%`

`\@footnotetext` Add `\m@mmf@prepare` at the end of `\@footnotetext`.

```
1846 \let\l@dold@footnotetext\@footnotetext
1847 \renewcommand{\@footnotetext}[1]{%
1848   \l@dold@footnotetext{\#1}%
1849   \m@mmf@prepare}
```

`\@footnotemark` Modify `\@footnotemark` to cater for adjacent `\footnotes`.

```
1850 \renewcommand*{\@footnotemark}{%
1851   \leavevmode
1852   \ifhmode
1853     \edef\x@sf{\the\spacefactor}%
1854     \m@mmf@check
1855     \nobreak
1856   \fi
1857   \@makefnmark
1858   \m@mmf@prepare
1859   \ifhmode\spacefactor\x@sf\fi
1860   \relax}
```

Finished the modifications for the non-memoir case.

```
1861 }
1862
```

`\l@doldold@footnotetext` In order to enable the regular `\footnotes` in numbered text we have to play around `\@footnotetext` with its `\@footnotetext`, using different forms for when in numbered or regular text.

```
1863 \let\l@doldold@footnotetext\@footnotetext
1864 \renewcommand{\@footnotetext}[1]{%
1865   \ifnumberedpar@
1866     \edtext{}{\l@dbfnote{\#1}}%
1867   \else
1868     \l@doldold@footnotetext{\#1}%
1869   \fi}
```

`\l@dbfnote` `\l@dbfnote` adds the footnote to the insert list, and `\v{l@dbfnote}` calls the original `\v{l@dbfnote}` `\@footnotetext`.

```
1870 \newcommand{\l@dbfnote}[1]{%
1871   \ifnumberedpar@
1872   \gdef\@tag{\#1}%
1873   \xright@appenditem{\noexpand\v{l@dbfnote}{\csexpandonce{@tag}}}{\@thefnmark}%
1874   \to\inserts@list
1875   \global\advance\insert@count \one
1876   \fi\ignorespaces}
```

```

1877 \newcommand{\vl@dbfnote}[2]{%
1878   \def\@thefnmark{#2}%
1879   \l@boldold@footnotetext{#1}}

```

25.2 Footnote formats

Some of the code for the various formats is remarkably similar to that in section 24.3.

The following macros generally set things up for the ‘standard’ footnote format.

`\prebodyfootmark` Two convenience macros for use by `\...@footnotemark...` macros.

```

\postbodyfootmark 1880 \newcommand*{\prebodyfootmark}{%
1881   \leavevmode
1882   \ifhmode
1883     \edef\x@sf{\the\spacefactor}%
1884     \m@mmf@check
1885     \nobreak
1886   \fi}
1887 \newcommand{\postbodyfootmark}{%
1888   \m@mmf@prepare
1889   \ifhmode\spacefactor\x@sf\fi\relax}
1890

```

`\normal@footnotemarkX` `\normal@footnotemarkX{<series>}` sets up the typesetting of the marker at the point where the footnote is called for.

```

1891 \newcommand*{\normal@footnotemarkX}[1]{%
1892   \prebodyfootmark
1893   \nameuse{bodyfootmark#1}%
1894   \postbodyfootmark}
1895

```

`\normalbodyfootmarkX` The `\normalbodyfootmarkX{<series>}` *really* typesets the in-text marker. The style is the normal superscript.

```

1896 \newcommand*{\normalbodyfootmarkX}[1]{%
1897   \hbox{\textsuperscript{\normalfont\nameuse{@thefnmark#1}}}}

```

`\normalvfootnoteX` `\normalvfootnoteX{<series>}{<text>}` does the `\insert` for the `<series>` and calls the series’ `\footfmt...` to format the `<text>`.

```

1898 \newcommand*{\normalvfootnoteX}[2]{%
1899   \insert\nameuse{footins#1}\bgroup
1900   \csuse{bhooknoteX@#1}
1901   \csuse{notefontsizeX@#1}
1902   \footsskip
1903   \spaceskip=\z@skip \xspaceskip=\z@skip
1904   \csuse{\csuse{footnote@dir}\if@RTL\else\noindent\leavevmode\fi\nameuse{footfmt#1}{#1}}}
1905

```

`\mpnormalvfootnoteX` The minipage version.

```

1906 \newcommand*{\mpnormalvfootnoteX}[2]{%
1907   \global\setbox\@nameuse{mpfootins#1}\vbox{%

26 Endnotes

\l@d@end Endnotes of all varieties are saved up in a file, typically named *<jobname>.end*.
 \ifl@dend@ \l@d@end is the output stream number for this file, and \ifl@dend@ is a flag that's
 \l@dend@true true when the file is open.
 \l@dend@false 2278 \newwrite\l@d@end
 2279 \newif\ifl@dend@

\l@dend@open \l@dend@open and \l@dend@close are the macros that are used to open and close
 \l@dend@close the endnote file. Note that all our writing to this file is \immediate: all page and
 line numbers for the endnotes are generated by the same mechanism we use for
 the footnotes, so that there's no need to defer any writing to catch information
 from the output routine.
 2280 \newcommand{\l@dend@open}[1]{\global\l@dend@true\immediate\openout\l@d@end=#1\relax}
 2281 \newcommand{\l@dend@close}{\global\l@dend@false\immediate\closeout\l@d@end}
 2282

\l@dend@stuff \l@dend@stuff is used by \beginnumbering to do everything that's necessary for
 the endnotes at the start of each section: it opens the \l@d@end file, if necessary,
 and writes the section number to the endnote file.
 2283 \newcommand{\l@dend@stuff}{%
 2284 \ifl@dend@\relax\else
 2285 \l@dend@open{\jobname.end}%
 2286 \fi
 2287 \immediate\write\l@d@end{\string\l@d@section{\the\section@num}}}
 2288

\endprint The \endprint here is nearly identical in its functioning to \normalfootfmt.
 @gobblethree The endnote file also contains \l@d@section commands, which supply the
 \l@d@section section numbers from the main text; standard eledmac does nothing with this

information, but it's there if you want to write custom macros to do something with it.

```
2289 \def\endprint#1#2#3#4{{\csuse{bhookXendnote@#4}\csuse{Xendnotefontsize@#4}{\csuse{Xendnotenumfont@#4}{%
2290     \enspace\nottoggle{Xendlemmadisablefontselection@#4}{\select@lemmafont#1|#2}{#2}}\enskip#3\par%
2291 \providecommand*\gobblethree}[3]{}
2292
2293 \let\l@d@section=\gobble
2294
```

\setprintendlines The `\printendlines` macro is similar to `\printlines` but is for printing endnotes rather than footnotes.

The principal difference between foot- and endnotes is that footnotes are printed on the page where they are specified but endnotes are printed at a different point in the document. We need an indication of the source of an endnote; `\setprintendlines` provides this by always printing the page number. The coding is slightly simpler than `\setprintlines`.

First of all, we print the second page number only if the ending page number is different from the starting page number.

```
2295 \newcommand*\setprintendlines}[6]{%
2296   \l@d@pnumfalse \l@d@dashfalse
2297   \ifnum#4=#1 \else
2298     \l@d@pnumtrue
2299     \l@d@dashtrue
2300   \fi
```

We print the ending line number if: (1) we're printing the ending page number, or (2) it's different from the starting line number.

```
2301   \ifl@d@pnum \l@d@elintrue \else \l@d@elinfalse \fi
2302   \ifnum#2=#5 \else
2303     \l@d@elintrue
2304     \l@d@dashtrue
2305   \fi
```

We print the starting sub-line if it's nonzero.

```
2306   \l@d@ssubfalse
2307   \ifnum#3=0 \else
2308     \l@d@ssubtrue
2309   \fi
```

We print the ending sub-line if it's nonzero and: (1) it's different from the starting sub-line number, or (2) the ending line number is being printed.

```
2310   \l@d@eslfalse
2311   \ifnum#6=0 \else
2312     \ifnum#6=#3
2313       \ifl@d@elin \l@d@esltrue \else \l@d@eslfalse \fi
2314     \else
2315       \l@d@esltrue
2316       \l@d@dashtrue
2317     \fi
2318 \fi}
```

\printendlines Now we're ready to print it all.

```
2319 \def\printendlines#1|#2|#3|#4|#5|#6|#7|{\begingroup
2320   \setprintendlines{#1}{#2}{#3}{#4}{#5}{#6}{%
```

The only subtlety left here is when to print a period between numbers. But the only instance in which this is tricky is for the ending sub-line number: it could be coming after the starting sub-line number (in which case we want only the dash) or after an ending line number (in which case we need to insert a period).

```
2321   \printnpnum{#1} \linenumrep{#2}%
2322   \ifl@d@ssub \fullstop \sublinenumrep{#3}\fi
2323   \ifl@d@dash \endashchar\fi
2324   \ifl@d@pnum \printnpnum{#4}\fi
2325   \ifl@d@elin \linenumrep{#5}\fi
2326   \ifl@d@esl \ifl@d@elin \fullstop\fi \sublinenumrep{#6}\fi
2327 \endgroup}
2328
```

\printnpnum A macro to print a page number in an endnote.

```
2329 \newcommand*{\printnpnum}[1]{p.#1} }
2330
```

\doendnotes \doendnotes is the command you use to print one series of endnotes; it takes one argument: the series letter of the note series you want to print.

```
2331 \newcommand*{\doendnotes}[1]{\l@dend@close
2332   \begingroup
2333     \makeatletter
2334     \expandafter\let\csname #1end\endcsname=\endprint
2335     \input\jobname.end
2336   \endgroup}
```

\noendnotes You can say \noendnotes before the first \beginnumbering in your file if you will not use any of the endnote commands: this will suppress the creation of an .end file. If you do have some lingering endnote commands in your file, the notes will be written to your terminal and to the log file.

```
2337 \newcommand*{\noendnotes}{\global\let\l@dend@stuff=\relax
2338           \global\chardef\l@d@end=16 }
```

27 Generate series

In this section, X means the name of the series (A, B etc.)

\series \series\series creates one more newseries. It's the public command, which just loops on the private command \newseries@.

```
2339 \newcommand{\newseries}[1]{%
2340   \def\do##1{\newseries@{##1}}%
2341   \docs@list{#1}
2342 }
```

\@series The \series macro is an etoolbox list, which contains the name of all series.

```
2343 \newcommand{\@series}{}%
```

The command \newseries@\series creates a new series of the footnote.

```
\newseries@
2344 \newcommand{\newseries@}[1]{

2452 % \begin{macrocode}
2453  \csgdef{series@displayX#1}{}
2454  \footnormalX{#1}

```

27.6 The endnotes

The \Xendnote macro functions to write one endnote to the .end file. We change \newlinechar so that in the file every space becomes the start of a new line; this generally ensures that a long note doesn't exceed restrictions on the length of lines in files.

```

2455
2456  \global\expandafter\newcommand\csname #1endnote\endcsname[2]{{\newlinechar='40

```

```

2457     \newcommand{\content}{##1}%
2458         \immediate\write\l@d@end{\expandafter\string\csname #1\endcsname%
2459         {\ifnumberedpar@\l@d@num{fi}%
2460         {\ifnumberedpar@\csexpandonce{@tag}\fi}{\csexpandonce{content}}{##1}}}\ignoresp
2461     }

```

\Xendnote commands called \Xend commands on to the endnote file; these are analogous to the various footfmt commands above, and they take the same arguments. When we process this file, we'll want to pick out the notes of one series and ignore all the rest. To do that, we equate the `end` command for the series we want to \endprint, and leave the rest equated to \gobblethree, which just skips over its three arguments.²⁶

```

2462
2463     \global\csletcs{\end}{\gobblethree}
2464 \% \end{macrocode}
2465 % We need to be able to modify \Eledmac's footnote macros and restore their

28 Output routine

Now we begin the output routine and associated things.

\pageno \pageno is a page number, starting at 1, and \advancepageno increments the number.

```

2725 \countdef{pageno=0 \pageno=1
2726 \newcommand*{\advancepageno}{\ifnum\pageno<\z@ \global\advance\pageno\m@ne
2727 \else\global\advance\pageno\@ne\fi}
2728

```

The next portion is probably the trickiest part of moving from TeX to LaTeX. The original code is below, but we need something very different.

This is a new output routine, with changes to handle printing all our footnotes. Those changes have not been added directly, but are in macros that get called here: that should make it easier to see what would need to be taken over to a different output routine. We continue to use the \pagebody, \makeheadline,

\makefootline, and \dosupereject macros of PLAIN \TeX ; for those macros, and the original version of \output, see *The TeXbook*, p. 364.

```
\output{\edmac@output}
\def\edmac@output{\shipout\vbox{\normal@pars
    \vbox{\makeheadline\pagebody\makefootline}%
}%
\advancepageno
\ifnum\outputpenalty>-\@MM\else\dosupereject\fi}

\def\pagecontents{\page@start
\ifvoid\topins\else\unvbox\topins\fi
\dimen@\dp\@cclv \unvbox\@cclv % open up \box255
\do@feet
\ifr@ggedbottom \kern-\dimen@ \vfil \fi}

```

\do@feet ships out all the footnotes. Standard EDMAC has only five feet, but there is nothing in principal to prevent you from creating an arachnoid or centipedal edition; straightforward modifications of EDMAC are all that's required. However, the myriapodal edition is ruled out by eTeX limitations: the number of insertion classes is limited to 2^{16} .

With luck we might only have to change \makemcol and \reinserts. The kernel definition of these, and perhaps some other things, is:

```
\gdef \makemcol {%
\ifvoid\footins
\setbox\outputbox \box\@cclv
\else
\setbox\outputbox \vbox {%
\boxmaxdepth \maxdepth
\tempdima\dp\@cclv
\unvbox \@cclv
\vskip \skip\footins
\color@begingroup
\normalcolor
\footnoterule
\unvbox \footins
\color@endgroup
}%
\fi
\xdef\@freelist{\@freelist\@midlist}%
\global \let \@midlist \empty
\@combinefloats
\ifvbox\@kludgeins
\makespecialcolbox
\else
\setbox\outputbox \vbox to\colht {%
\texttop
\dimen@ \dp\@outputbox
```

```

    \unvbox\@outputbox
    \vskip -\dimen@
    \textbottom
}%
\fi
\global \maxdepth \maxdepth
}

\gdef \reinserts{%
\ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
\ifvbox\@kludgeins\insert\@kludgeins{\unvbox\@kludgeins}\fi
}

```

Now we start actually changing things.

\m@m@makecolfloats These macros are defined in the `memoir` class and form part of the definition of
\m@m@makecoltext \makecol.

```

\m@m@makecolintro 2729 \providecommand{\m@m@makecolfloats}{%
2730   \xdef\@freelist{\@freelist\@midlist}%
2731   \global \let \@midlist \empty
2732   \combinefloats}
2733 \providecommand{\m@m@makecoltext}{%
2734   \ifvbox\@kludgeins
2735     \makespecialcolbox
2736   \else
2737     \setbox\@outputbox \vbox to\@colht {%
2738       \texttop
2739       \dimen@\dp\@outputbox
2740       \unvbox\@outputbox
2741       \vskip -\dimen@
2742       \textbottom}%
2743   \fi}
2744 \providecommand{\m@m@makecolintro}{}}
2745

```

\l@d@makecol This is a partitioned version of the ‘standard’ \makecol, with the initial code put into another macro.

```

2746 \gdef\l@d@makecol{%
2747   \l@ddofootinsert
2748   \m@m@makecolfloats
2749   \m@m@makecoltext
2750   \global \maxdepth \maxdepth}
2751

```

\ifFN@bottom The \ifFN@bottom macro is defined by the `footmisc` package. If this package is not loaded, we define it.

```

2752 \AtBeginDocument{\ifpackageloaded{footmisc}{}{\newif\ifFN@bottom}}

```

\l@ddofootinsert This macro essentially holds the initial portion of the kernel \makecol code.

```

2753 \newcommand*\l@ddofootinsert{%
2754 %% \page@start
2755 \ifvoid\footins
2756   \setbox\outputbox \box\cclv
2757 \else
2758   \setbox\outputbox \vbox {%
2759     \boxmaxdepth \maxdepth
2760     \tempdima\dp\cclv
2761     \unvbox \cclv
2762     \ifFN@bottom\vfill\fi\vskip \skip\footins%%% If the option bottom of loadmisc package is loaded
2763     \color@begingroup
2764       \normalcolor
2765       \footnoterule
2766       \unvbox \footins
2767     \color@endgroup
2768   }%
2769 \fi

```

That's the end of the copy of the kernel code. We finally call a macro to handle all the additional EDMAC feet.

```

2770 \l@ddoxtrafeet
2771 }
2772

```

\doxtrafeet \doxtrafeet is the code extending \makecol to cater for the extra elemac feet. We have two classes of extra footnotes. By default, we order the footnote inserts so that the regular footnotes are first, then class 1 (familiar footnotes) and finally class 2 (critical footnotes).

```

2773 \newcommand*\l@ddoxtrafeet{%
2774 \IfStrEq{familiar-critical}{\fnpos}
2775   {\doxtrafeeti\doxtrafeetii}%
2776   {%
2777     \IfStrEq{critical-familiar}{\fnpos}%
2778       {\doxtrafeetii\doxtrafeeti}%
2779       {\doxtrafeeti\doxtrafeetii}%
2780   }%
2781 }%
2782

```

\doxtrafeetii \doxtrafeetii is the code extending \makecol to cater for the extra critical feet (class 2 feet). NOTE: the code is likely to be 'featurefull'.

```

2783 \newcommand*\doxtrafeetii{%
2784 \setbox\outputbox \vbox{%
2785   \unvbox\outputbox
2786   \opxtrafeetii}}

```

\opxtrafeetii The extra critical feet to be added to the output.

```

2787 \newcommand*{\@opxtrafeetii}{%
2788   \def\do##1{\ifvoid\csuse{##1footins}\else\csuse{##1footstart}{##1}\csuse{##1footgroup}{##1}%
2789   \dolistloop{\@series}}}

\l@ddodoreinxtrafeet \l@ddodoreinxtrafeet is the code for catering for the extra footnotes within
\@reinserts. The implementation may well have to change. We use the same
classes and ordering as in \l@ddoxtrafeet.

2790 \newcommand*{\l@ddodoreinxtrafeet}{%
2791   \doreinxtrafeeti
2792   \doreinxtrafeetii}
2793

\doreinxtrafeetii \doreinxtrafeetii is the code for catering for the class 2 extra critical footnotes
within \@reinserts. The implementation may well have to change.

2794 \newcommand*{\doreinxtrafeetii}{%

2796   \dolistloop{\@series}}
2797 }
2798

\l@od@reinserts And here is the modified version of \@reinserts.

2799 \gdef \l@od@reinserts{%
2800   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
2801   \l@ddodoreinxtrafeet
2802   \ifvbox\@kludgeins\insert\@kludgeins{\unvbox\@kludgeins}\fi
2803 }
2804

The memoir class does not use the ‘standard’ versions of \makecol and
\@reinserts, due to its sidebar insert. We had better add that code if memoir
is used. (It can be awkward dealing with \if code within \if code, so don’t
use \ifl@dmemoir here.)

2805 \@ifclassloaded{memoir}{%
  memoir is loaded so we use memoir’s built in hooks.

2806   \g@addto@macro{\m@mdoextrafeet}{\l@ddoxtrafeet}%
2807   \g@addto@macro{\m@mdodoreinxtrafeet}{\l@ddodoreinxtrafeet}%
2808 }{%
  memoir has not been loaded, so redefine \makecol and \reinserts.

2809   \gdef\@makecol{\l@od@makecol}%
2810   \gdef\@reinserts{\l@od@reinserts}%
2811 }
2812

\addfootins \addfootins is for backward compatibility, but should’nt be used anymore.

2813 \newcommand*{\addfootins}[1]{%
2814   \eledmac@warning{addfootins is deprecated, use newseries instead}%
2815   \footnormal{#1}}

```

```

29 Cross referencing

Peter Wilson have rewritten portions of the code in this section so that the LaTeX .aux file is used. This will also handle \included files.

Further, I have renamed some of the original EDMAC macros so that they do not clash with the LaTeX label/ref commands (EDMAC and LaTeX use very different mechanisms). In particular, the original EDMAC \label and \pageref have been renamed as \edlabel and \edpageref respectively.

You can mark a place in the text using a command of the form \edlabel{foo}, and later refer to it using the label foo by saying \edpageref{foo}, or \lineref{foo} or \sublineref{foo}. These reference commands will produce, respectively, the page, line and sub-line on which the \edlabel{foo} command occurred.

The reference macros warn you if a reference is made to an undefined label. If foo has been used as a label before, the \edlabel{foo} command will issue

a complaint; subsequent `\edpageref` and `\lineref` commands will refer to the latest occurrence of `\label{foo}`.

`\labelref@list` Set up a new list, `\labelref@list`, to hold the page, line and sub-line numbers for each label.

```
2884 \list@create{\labelref@list}
```

`\zz@@@` A convenience macro to zero two labeling counters in one go.

```
2885 %% \newcommand*{\zz@@@}{000|000|000} % set three counters to zero in one go
2886 \newcommand*{\zz@@@}{000|000} % set two counters to zero in one go
2887
```

`\edlabel` The `\edlabel` command first writes a `\@lab` macro to the `\linenum@out` file. It then checks to see that the `\labelref@list` actually has something in it (if not, it creates a dummy entry), and pops the next value for the current label, storing it in `\label@refs`. Finally it defines the label to be `\empty` so that any future check will turn up the fact that it has been used.²⁷

This version of the original EDMAC `\label` uses `\@bsphack` and `\@esphack` to eliminate extra space problems and also the LaTeX write methods for the `.aux` file.

Jesse Billett²⁸ found that the original code could be off by several pages. This version, hopefully cures that, and also allows for non-arabic page numbering.

```
2888 \newcommand*{\edlabel}[1]{\@bsphack
2889   \write\linenum@out{\string\@lab}%
2890   \ifx\labelref@list\empty
2891     \xdef\label@refs{\zz@@@}%
2892   \else
2893     \gl@p\labelref@list\to\label@refs
2894   \ifvmode
2895     \advance\label@refs
2896   \fi
2897   \fi
2898 % \edef\next{\write\@aux{\string\l@dmake@labels\label@refs{\#1}}}%
2899 % \next}
```

Use code from the kernel `\label` command to write the correct page number (it seems possible that the original EDMAC's `\page@num` scheme might also have had problems in this area). Also define an hypertarget if `hyperref` package is loaded.

```
2900 \protected@write\@auxout{}%
2901   {\string\l@dmake@labels\space\thepage|\label@refs|\the\c@pstart{\#1}}%
2902 \ifcsdef{hypertarget}{\hypertarget{\#1}{}}{}%
2903 \@esphack}
2904
```

²⁷The remaining macros in this section were kindly revised by Wayne Sullivan, who substantially improved their efficiency and flexibility.

²⁸(jdb43@cam.ac.uk) via the ctt thread 'ledmac cross referencing', 25 August 2003.

\advancelabel@refs
 \labelrefsparseline
 \labelrefsparsesubline In cases where `\edlabel` is the first element in a paragraph, we have a problem with line counts, because line counts change only at the first horizontal box of the paragraph. Hence, we need to test `\edlabel` if it occurs at the start of a paragraph. To do so, we use `\ifvmode`. If the test is true, we must advance by one unit the amount of text we write into the `.aux` file. We do so using `\advancelabel@refs` command.

```

2905 \newcounter{line}%
2906 \newcounter{subline}%
2907 \newcommand{\advancelabel@refs}{%
2908   \setcounter{line}{\expandafter\labelrefsparseline\label@refs}%
2909   \stepcounter{line}%
2910   \ifsublines{%
2911     \setcounter{subline}{\expandafter\labelrefsparsesubline\label@refs}%
2912     \stepcounter{subline}{1}%
2913     \def\label@refs{\theline|\thesubline}%
2914   }{\else%
2915     \def\label@refs{\theline|0}%
2916   }%
2917 }
2918 \def\labelrefsparseline#1|#2{#1}
2919 \def\labelrefsparsesubline#1|#2{#2}
```

\l@dmake@labels The `\l@dmake@labels` macro gets executed when the labels file is read. For each label it defines a macro, whose name is made up partly from the label you supplied, that contains the page, line and sub-line numbers. But first it checks to see whether the label has already been used (and complains if it has).

The initial use of `\newcommand` is to catch if `\l@dmake@labels` has been previously defined (by a class or package).

```

2920 \newcommand*\l@dmake@labels{}%
2921 \def\l@dmake@labels#1|#2|#3|#4|#5{%
2922   \expandafter\ifx\csname the@label#5\endcsname \relax\else
2923     \led@warn@DuplicateLabel{#5}%
2924   \fi
2925   \expandafter\gdef\csname the@label#5\endcsname{#1|#2|#3|#4}%
2926   \ignorespaces}%
2927 }
```

LaTeX reads the `.aux` file at both the beginning and end of the document, so we have to switch off duplicate label checking after the first time the file is read.

```

2928 \AtBeginDocument{%
2929   \def\l@dmake@labels#1|#2|#3|#4|#5{}%
2930 }
2931 }
```

\@lab The `\@lab` command, which appears in the `\linenum@out` file, appends the current values of page, line and sub-line to the `\labelref@list`. These values are defined by the earlier `\@page`, `\@nl`, and the `\sub@on` and `\sub@off` commands appearing in the `\linenum@out` file.

LaTeX uses the `page` counter for page numbers. However, it appears that this is not the right place to grab the page number. That task is now done in the `\edlabel` macro. This version of `\@lab` appends just the current line and sub-line numbers to `\labelref@list`.

```
2932 \newcommand*{\@lab}{\xright@appenditem
2933   {\linenumrep{\line@num}|%
2934    \ifsublines@ \sublinenumrep{\subline@num}\else 0\fi}\to\labelref@list}
2935 }
```

`\wrap@edcrossref` `\wrap@edcrossref` is called around all elemac crossref command, except those which start by x. It adds the hyperlink.

```
2936 \newcommand{\wrap@edcrossref}[2]{%
2937   \ifdef{\hyperlink}{%
2938     {\hyperlink{#1}{#2}}{%
2939       {#2}}{%
2940 }}
```

`\edpageref` If the specified label exists, `\edpageref` gives its page number. For this reference command, as for the other two, a special version with prefix x is provided for use in places where the command is to be scanned as a number, as in `\linenum`. These special versions have two limitations: they don't print error messages if the reference is unknown, and they can't appear as the first label or reference command in the file; you must ensure that a `\edlabel` or a normal reference command appears first, or these x-commands will always return zeros. LaTeX already defines a `\pageref`, so changing the name to `\edpageref`.

```
2941 \newcommand*{\edpageref}[1]{\l@def@undefined{#1}\wrap@edcrossref{#1}{\l@dgetref@num{1}{#1}}}
2942 \newcommand*{\xpageref}[1]{\l@def@num{1}{#1}}
2943 }
```

`\lineref` If the specified label exists, `\lineref` gives its line number.

```
2944 \newcommand*{\lineref}[1]{\l@def@undefined{#1}\wrap@edcrossref{#1}{\l@dgetref@num{2}{#1}}}
2945 \newcommand*{\xlineref}[1]{\l@dgetref@num{2}{#1}}
2946 }
```

`\sublineref` If the specified label exists, `\sublineref` gives its sub-line number.

```
2947 \newcommand*{\sublineref}[1]{\l@def@undefined{#1}\wrap@edcrossref{#1}{\l@dgetref@num{3}{#1}}}
2948 \newcommand*{\xsublineref}[1]{\l@dgetref@num{3}{#1}}
2949 }
```

`\pstarteref` If the specified label exists, `\pstarteref` gives its pstart number.

```
2950 \newcommand*{\pstartref}[1]{\l@def@undefined{#1}\wrap@edcrossref{#1}{\l@dgetref@num{4}{#1}}}
2951 \newcommand*{\xpstartref}[1]{\l@dgetref@num{4}{#1}}
2952 }
```

The next three macros are used by the referencing commands above, and do the job of extracting the right numbers from the label macro that contains the page, line, and sub-line number.

`\l@dref@undefined` The `\l@dref@undefined` macro is called when you refer to a label with the normal referencing macros. Its argument is a label, and it just checks that the label has been defined.

```
2953 \newcommand*{\l@dref@undefined}[1]{%
2954   \expandafter\ifx\csname the@label#1\endcsname\relax
2955     \l@d@warn@RefUndefined{#1}%
2956   \fi}
2957
```

`\l@dgetref@num` Next, `\l@dgetref@num` fetches the number we want. It has two arguments: the first is simply a digit, specifying whether to fetch a page (1), line (2) or sub-line (3) number. (This switching is done by calling `\l@dlabel@parse`.) The second argument is the label-macro, which because of the `\@lab` macro above is defined to be a string of the type 123|456|789.

```
2958 \newcommand*{\l@dgetref@num}[2]{%
2959   \expandafter
2960   \ifx\csname the@label#2\endcsname \relax
2961     000%
2962   \else
2963     \expandafter\expandafter\expandafter
2964     \l@dlabel@parse\csname the@label#2\endcsname|#1%
2965   \fi}
2966
```

`\l@dlabel@parse` Notice that we slipped another | delimiter into the penultimate line of `\l@dgetref@num`, to keep the ‘switch-number’ separate from the reference numbers. This | is used as another parameter delimiter by `\l@dlabel@parse`, which extracts the appropriate number from its first arguments. The |-delimited arguments consist of the expanded label-macro (three reference numbers), followed by the switch-number (1, 2, or 3) which defines which of the earlier three numbers to pick out. (It was earlier given as the first argument of `\l@dgetref@num`.)

```
2967 \newcommand*{\l@dlabel@parse}{}%
2968 \def\l@dlabel@parse#1|#2|#3|#4|#5{%
2969   \ifcase #5%
2970   \or #1%
2971   \or #2%
2972   \or #3%
2973   \or #4%
2974   \fi}
```

`\xxref` The `\xxref` command takes two arguments, both of which are labels, e.g., `\xxref{mouse}{elephant}`. It first does some checking to make sure that the labels do exist (if one doesn’t, those numbers are set to zero). Then it calls `\linenum` and sets the beginning page, line, and sub-line numbers to those of the place where `\label{mouse}` was placed, and the ending numbers to those at `\label{elephant}`. The point of this is to be able to manufacture footnote line references to passages which can’t be specified in the normal way as the first

argument to `\critection` for one reason or another. Using `\xxref` in the second argument of `\critection` lets you set things up at least semi-automatically.

```
2975 \newcommand*{\xxref}[2]{%
2976   {%
2977     \expandafter\ifx\csname the@label#1\endcsname \relax%
2978       \expandafter\let\csname the@@label#1\endcsname\zz@@@%
2979     \else%
2980       \expandafter\def\csname the@@label#1\endcsname{\l@dgetref@num{1}{#1}|\l@dgetref@num{2}{#1}|\l@d%
2981     \fi%
2982     \expandafter\ifx\csname the@label#2\endcsname \relax%
2983       \expandafter\let\csname the@@label#2\endcsname\zz@@@%
2984     \else%
2985       \expandafter\def\csname the@@label#2\endcsname{\l@dgetref@num{1}{#2}|\l@dgetref@num{2}{#2}|\l@d%
2986     \fi%
2987     \linenum{\csname the@@label#1\endcsname|%
2988     \csname the@@label#2\endcsname}}}
2989 
```

`\edmakelabel` Sometimes the `\edlabel` command cannot be used to specify exactly the page and line desired; you can use the `\edmakelabel` macro make your own label. For example, if you say ‘`\edmakelabel{elephant}{10|25|0}`’ you will have created a new label, and a later call to `\edpageref{elephant}` would print ‘10’ and `\lineref{elephant}` would print ‘25’. The sub-line number here is zero. `\edmakelabel` takes a label, followed by a page and a line number(s) as arguments. LaTeX defines a `\makelabel` macro which is used in lists. I’ve changed the name to `\edmakelabel`.

```
2990 \newcommand*{\edmakelabel}[2]{\expandafter\xdef\csname the@label#1\endcsname{#2}}
2991 
```

(If you are only going to refer to such a label using `\xxref`, then you can omit entries in the same way as with `\linenum` (see pp. 79 and 58), since `\xxref` makes a call to `\linenum` in order to do its work.)

30 Side notes

Regular `\marginpars` do not work inside numbered text — they don’t produce any note but do put an extra unnumbered blank line into the text.

`\l@dold@xympar` Changing `\xympar` a little at least ensures that `\marginpars` in numbered text
`\xympar` do not disturb the flow.

```
2992 \let\l@dold@xympar\@xympar
2993 \renewcommand{\@xympar}{%
2994   \ifnumberedpar@
2995     \l@ed@warn@NoMarginpars
2996     \@esphack
2997   \else
2998     \l@dold@xympar
2999   \fi}
```

3000

We provide side notes as replacement for `\marginpar` in numbered text.

`\sidenote@margin` These are the sidenote equivalents to `\line@margin` and `\linenummargin` for specifying which margin. The default is the right margin (opposite to the default for line numbers). `\l@getssidenote@margin` returns the number associated to side note margin:

`left` : 0

`right` : 1

`outer` : 2

`inner` : 3

```

3001 \newcount\sidenote@margin

\vl@dlsnote Put the left/right text into boxes, but just save the moveable text. **\l@dcsnotetext**,
\vl@drsnote **\l@dcsnotetext@l** and **\l@dcsnotetext@r** are etoolbox lists which will store the
\vl@dcsnote content of side notes. We store the content in lists, because we need to loop later
on them, in case many sidenote co-exist for the same line. That is there some
special test to do, in order to:

- Store the content of **\leadsidenote** to **\l@dcsnotetext** in any cases.
- Store the content of **\rightsidenote** to:

- `\l@dcsnotetext` if `\ledsidenote` is to be put on right.
- `\l@dcsnotetext@r` if `\ledsidenote` is to be put on left.
- Store the content of `\leftsidenote` to:
 - `\l@dcsnotetext` if `\ledsidenote` is to be put on left.
 - `\l@dcsnotetext@l` if `\ledsidenote` is to be put on right.

31 Minipages and such

We can put footnotes into minipages. The preparatory code has been set up earlier, all that remains is to ensure that it is available inside a minipage box. This requires some alteration to the kernel code, specifically the `\@iiminipage` and `\endminipage` macros. We'll arrange this so that additional series can be easily added.

`\l@dfbeginmini` These will be the hooks in `\@iiminipage` and `\endminipage`. They can be extended
`\l@dfendmini` to handle other things if necessary.

```

33 Macro as environment

The following is borrowed, and renamed, from the `amsmath` package. See also the CTT thread ‘eeq and amstex’, 1995/08/31, started by Keith Reckdahl and ended definitively by David M. Jones.

Several of the [math] macros scan their body twice. This means we must collect all text in the body of an environment form before calling the macro.

`\@emptytoks` This is actually defined in the `amsgen` package.

```
3527 \newtoks\@emptytoks
3528
```

The rest is from `amsmath`.

`\l@denvbody` A token register to contain the body.

```
3529 \newtoks\l@denvbody
3530
```

`\addtol@denvbody \addtol@denvbody{arg}` adds `arg` to the token register `\l@denvbody`.

```
3531 \newcommand{\addtol@denvbody}[1]{%
3532   \global\l@denvbody\expandafter{\the\l@denvbody#1}}
3533
```

`\l@dcollect@body` The macro `\l@dcollect@body` starts the scan for the `\end{...}` command of the current environment. It takes a macro name as argument. This macro is supposed to take the whole body of the environment as its argument. For example, given `cenv#1{...}` as a macro that processes #1, then the environment form, `\begin{env}` would call `\l@dcollect@body\cenv`.

```
3534 \newcommand{\l@dcollect@body}[1]{%
3535   \l@denvbody{\expandafter#1\expandafter{\the\l@denvbody}}%
3536   \edef\processl@denvbody{\the\l@denvbody\noexpand\end{\currenvir}}%
3537   \l@denvbody\@emptytoks \def\l@dbegin@stack{b}%
3538   \begingroup
3539     \expandafter\let\csname\currenvir\endcsname\l@dcollect@@body
3540     \edef\processl@denvbody{\expandafter\noexpand\csname\currenvir\endcsname}%
3541     \processl@denvbody}
3542
```

`\l@dpush@begins` When adding a piece of the current environment’s contents to `\l@denvbody`, we scan it to check for additional `\begin` tokens, and add a ‘b’ to the stack for any that we find.

```
3543 \def\l@dpush@begins#1\begin#2{%
3544   \ifx\end#2\else b\expandafter\l@dpush@begins\fi}
```

`\l@dcollect@@body` `\l@dcollect@@body` takes two arguments: the first will consist of all text up to the next `\end` command, and the second will be the `\end` command’s argument. If there are any extra `\begin` commands in the body text, a marker is pushed onto a

stack by the `\l@dpush@begins` function. Empty state for this stack means we have reached the `\end` that matches our original `\begin`. Otherwise we need to include the `\end` and its argument in the material we are adding to the environment body accumulator.

```

3546 \def\l@dcollect@body#1\end#2{%
3547   \edef\l@dbegin@stack{\l@dpush@begins#1\begin\end
3548   \expandafter\gobble\l@dbegin@stack}%
3549   \ifx\empty\l@dbegin@stack
3550     \endgroup
3551   \checkend{#2}%
3552   \addtol@denvbody{#1}%
3553 \else
3554   \addtol@denvbody{#1\end{#2}}%
3555 \fi
3556 \processl@denvbody % A little tricky! Note the grouping
3557 }
3558

```

There was a question on CTT about how to use `\collect@body` for a macro taking an argument. The following is part of that thread.

From: Heiko Oberdiek <oberdiek@uni-freiburg.de>
 Newsgroups: comp.text.tex
 Subject: Re: Using `\collect@body` with commands that take >1 argument
 Date: Fri, 08 Aug 2003 09:03:20 +0200

eed132@psu.edu (Evan) wrote:

 > \newenvironment{redbox}{\collect@body \redbox}{}

You will get an error message: Command `\redbox` already defined.
 Thus you must rename either the command `\redbox` or the environment name.

> \begin{coloredbox}{blue}
 > Yadda yadda yadda... this is on a blue background...
 > \end{coloredbox}
 > and can't figure out how to make the `\collect@body` take this.

 > \collect@body \colorbox{red}
 > \collect@body {\colorbox{red}}

The argument of `\collect@body` has to be one token exactly.

```
\documentclass{article}
\usepackage{color}
\usepackage{amsmath}

\newcommand{\redbox}[1]{\colorbox{red}{#1}}
\makeatletter
\newenvironment{coloredbox}[1]{%
  \def\next@\{\colorbox{#1}\}%
  \collect@body\next@
}{}{}

% ignore spaces at begin and end of environment
\newenvironment{coloredboxII}[1]{%
  \def\next@\{\mycoloredbox{#1}\}%
  \collect@body\next@
}{}{}

\newcommand{\mycoloredbox}[2]{%
  \colorbox{#1}{\ignorespaces#2\unskip}%
}

% support of optional color model argument
\newcommand\coloredboxIII\endcsname{%
\def\coloredboxIII#1{%
  \colorbox{#1}%
}
\def\@coloredboxIII#1#2{%
  \def\next@\{\mycoloredboxIII{#1}{#2}\}%
  \collect@body\next@
}
\newcommand{\mycoloredboxIII}[3]{%
  \colorbox{#1}{\ignorespaces#2\unskip}%
}
}

\makeatother

\begin{document}
Black text before
\begin{coloredbox}{blue}
Hello World
\end{coloredbox}
Black text after

Black text before
\begin{coloredboxII}{blue}
Hello World
\end{coloredboxII}
Black text after
```

```

Black text before
\begin{coloredboxIII}[rgb]{0,0,1}
Hello World
\end{coloredboxIII}
Black text after

\end{document}

Yours sincerely
Heiko <oberdiek@uni-freiburg.de>

```

34 Verse

This is principally Wayne Sullivan's code and commentary from EDSTANZA [Sul92].

The macro `\hangingsymbol` is used to insert a symbol on each hanging of verses. For example, in french typographie the symbol is '['. We obtain it by the next code:

```
\renewcommand{\hangingsymbol}{[,]}
```

The `\ifinstanza` boolean is used to be sure that we are in a stanza part.

```

\hangingsymbol
\ifinstanza 3559 \newcommand*\hangingsymbol{}%
3560 \newif\ifinstanza
3561 \instanzafalse

```

`\inserthangingsymbol` The boolean `\ifinserthangingsymbol` is set to TRUE when `\@clock` is greater than 1, i.e. when we are not in the first line of a verse. The switch of `\ifinserthangingsymbol` is made in `\do@line` before the printing of line but after the line number calculation.

```

3562 \newif\ifinserthangingsymbol
3563 \newcommand{\inserthangingsymbol}{%
3564 \ifinserthangingsymbol%
3565   \ifinstanza%
3566     \hangingsymbol%
3567   \fi%
3568 \fi%
3569 }

```

`\ampersand` Within a stanza the `\&` macro is going to be usurped. We need an alias in case an & needs to be typeset in a stanza. Define it rather than letting it in case some other package has already defined it.

```

3570 \newcommand*\ampersand{\char`\&}
3571

```

\stanza@count Before we can define the main macros we need to save and reset some category codes. To save the current values we use \next and \body from the \loop macro.

```
3572 \chardef\body=\catcode`\@  
3573 \catcode`\@=11  
3574 \chardef\next=\catcode`\&  
3575 \catcode`\&=\active  
3576
```

A count register is allocated for counting lines in a stanza; also allocated is a dimension register which is used to specify the base value for line indentation; all stanza indentations are multiples of this value. The default value of \stanzaindentbase is 20pt.

```
3577 \newcount\stanza@count  
3578 \newlength{\stanzaindentbase}  
3579 \setlength{\stanzaindentbase}{20pt}  
3580
```

\strip@szacnt The indentations of stanza lines are non-negative integer multiples of the unit called \stanzaindentbase. To make it easier for the user to specify these numbers, some list macros are defined. These take numerical values in a list separated by commas and assign the values to special control sequences using \mathchardef. Though this does limit the range from 0 to 32767, it should suffice for most applications, including *penalties*, which will be discussed below.

```
3581 \def\strip@szacnt#1,#2{\def\@tempb{#1}\def\@tempa{#2|}}  
3582 \newcommand*\setstanzavalues[2]{\def\@tempa{#2,,|}%  
3583 \stanza@count\z@  
3584 \def\next{\expandafter\strip@szacnt\@tempa  
3585 \ifx\@tempb\empty\let\next\relax\else  
3586 \expandafter\mathchardef\csname #1@\number\stanza@count  
3587 @endcsname\@tempb\relax  
3588 \advance\stanza@count\@ne\fi\next}%  
3589 \next}  
3590
```

\setstanzaindents In the original \setstanzavalues{sza}{...} had to be called to set the indents, and similarly \setstanzavalues{szp}{...} to set the penalties. These two macros are a convenience to give the user one less thing to worry about (mis-spelling the first argument). Since version 0.13, the stanzaindent repetition counter can be used when the indentation is repeated every n verses. The \managestanza@modulo is a command which modifies the counter stanza@modulo. The command adds 1 to stanza@modulo, but if stanza@modulo is equal to the stanzaindent repetition counter, the command restarts it.

```
3591 \newcommand*\setstanzaindents[1]{\setstanzavalues{sza}{#1}}  
3592 \newcommand*\setstanzapenalties[1]{\setstanzavalues{szp}{#1}}  
3593  
3594 \newcounter{stanzaindent repetition}  
3595 \newcount\stanza@modulo  
3596
```

```

3597 \newcommand*{\managestanza@modulo}[0]{
3598     \advance\stanza@modulo@ne
3599     \ifnum\stanza@modulo>\value{stanzaindentsrepetition}
3600         \stanza@modulo@ne
3601     \fi
3602 }

```

\stanza@line Now we arrive at the main works. **\stanza@line** sets the indentation for the line and starts a numbered paragraph—each line is treated as a paragraph. **\sza@penalty** **\stanza@hang** sets the hanging indentation to be used if the stanza line requires more than one print line. If it is known that each stanza line will fit on one print line, it is advisable to set the hanging indentation to zero. **\sza@penalty** places the specified penalty following each stanza line. By default, this facility is turned off so that no penalty is included. However, the user may initiate these penalties to indicate good and bad places in the stanza for page breaking.

```

3603 \newcommandx{\stanza@line}[1][1]{%
3604     \ifnum\value{stanzaindentsrepetition}=0
3605         \parindent=\csname sza@\number\stanza@count
3606             @\endcsname\stanzaindentbase
3607     \else
3608         \parindent=\csname sza@\number\stanza@modulo
3609             @\endcsname\stanzaindentbase
3610         \managestanza@modulo
3611     \fi
3612     \pstart[#1]\stanza@hang\ignorespaces}
3613 \xdef\stanza@hang{\noexpand\leavevmode\noexpand\startlock
3614     \hangindent\expandafter
3615     \noexpand\csname sza@\number\endcsname\stanzaindentbase
3616     \hangafter\@ne}
3617 \def\sza@penalty{\count@\csname szp@\number\stanza@count @\endcsname
3618     \ifnum\count@>\@M\advance\count@-\@M\penalty-\else
3619     \penalty\fi\count@}

```

\startstanzahook Now we have the components of the **\stanza** macro, which appears at the start of a group of lines. This macro initializes the count and checks to see if hanging indentation and penalties are to be included. Hanging indentation suspends the line count, so that the enumeration is by verse line rather than by print line. If the print line count is desired, invoke **\let\startlock=\relax** and do the same for **\endlock**. Here and above we have used **\xdef** to make the stored macros take up a bit less space, but it also makes them more obscure to the reader. Lines of the stanza are delimited by ampersands &. The last line of the stanza must end with **\&**. For convenience the macro **\endstanzaextra** is included. The user may use this to add vertical space or penalties between stanzas.

As a further convenience, the macro **\startstanzahook** is called at the beginning of a stanza. This can be defined to do something useful.

```

3620 \let\startstanzahook\relax
3621 \let\endstanzaextra\relax
3622 \xdef\@startstanza[#1]{%

```

```

```

\flagstanza Use `\flagstanza[len]{text}` at the start of a line to put `text` a distance `len` before the start of the line. The default for `len` is `\stanzaindentbase`.

```

3658 \newcommand*{\flagstanza}[2][\stanzaindentbase]{%
3659   \hspace{-#1}\llap{#2}\hspace{#1}\ignorespaces}
3660

```

The ampersand `&` is used to mark the end of each stanza line, except the last, which is marked with `\&`. This means that `\halign` may not be used directly within a stanza line. This does not affect macros involving alignments defined outside `\stanzaline \&`. Since these macros usurp the control sequence `\&`, the replacement `\ampersand` is defined to be used if this symbol is needed in a stanza. Also we reset the modified category codes and initialize the penalty default.

```

3661 \catcode`\&=\next

```

```

3662  \catcode`@=\body
3663 %%  \let\ampersand=&
3664  \setstanzavalues{szp}{0}
3665

```

35 Arrays and tables

This is based on the work by Herbert Breger in developing `tabmac.tex`.

```

%%%%%%%%%%%%%%%
% This is file tabmac.tex 1.0.
% You find here macros for tabular structures compatible with
% Edmac (authored by Lavagnino/Wujastyk). The use of the macros is
% explained in German language in file tabanlei.dvi. The macros were
% developed for Edmac 2.3, but this file has been adjusted to Edmac 3.16.
%
% ATTENTION: This file uses some Edmac control sequences (like
% \text, \Afootnote etc.) and redefines \morenoexpands. If you yourself
% redefined some Edmac control sequences, be careful: some adjustements
% might be necessary.
% October 1996
%
% My kind thanks to Nora G^?deke for valuable support. Any hints and
% comments are welcome, please contact Herbert Breger,
% Leibniz-Archiv, Waterloastr. 8, D -- 30169 Hannover, Germany
% Tel.: 511 - 1267 327
%%%%%%%%%%%%%%

```

The original `tabmac.tex` file was void of comments or any explanatory text other than the above notice. The algorithm is Breger's. I have made some cosmetic changes to the original code and reimplemented some things so they are more LaTeX-like. All the commentary is mine, as are any mistakes or errors.

`\l@dtabnoexpands` An extended and modified version of the original additional no expansions..

```

3666 \newcommand*\l@dtabnoexpands{%
3667  \let\rtab=0%
3668  \let\ctab=0%
3669  \let\ltab=0%

3681 \let\edrowfill=0%
3682 }
3683

```

`\l@dampcount` `\l@dampcount` is a counter for the & column dividers and `\l@dcollcount` is a `\l@dcollcount` counter for the columns. These were `\Undcount` and `\stellencount` respectively.

```

3684 \newcount\l@dampcount
3685 \l@dampcount=1\relax
3686 \newcount\l@dcollcount
3687 \l@dcollcount=0\relax
3688

```

`\hilfsbox` Some (temporary) helper items.
`\hilfsskip` 3689 `\newbox\hilfsbox`
`\Hilfsbox` 3690 `\newskip\hilfsskip`
`\hilfscount` 3691 `\newbox\Hilfsbox`
3692 `\newcount\hilfscount`
3693

30 columns should be adequate (compared to the original 60). These are the column widths. (Originally these were German spelled numbers e.g., `\eins`, `\zwei`, etc).

```

 Date: 13 Aug 2003 13:51:14 GMT

Alexis Eisenhofer <alexis@eisenhofer.de> wrote:
 > Can anyone provide me with the LaTex command for a vertical dotted line?

How dotted? Here's the basic rune.

```
\newbox\linedotbox
\setbox\linedotbox=\vbox{...}
\leaders\copy\linedotbox\vskip2in
```

For just dots, this works:

```
\setbox\linedotbox=\vbox{\hbox{\normalfont.}\kern2pt}
```

For dashes, something like

```
\setbox\linedotbox=\vbox{\leaders\vrule\vskip2pt\vskip2pt}
```

is what you want. (Adjust the '2pt' values to taste. The first one is the length of the dashes, the second is the length of the gaps.)

For dots in mid-paragraph, you need to say something like

```
\lower10pt\vbox{\leaders\copy\linedotbox\vskip2in}
```

which is scungy but works.

-- [mdw]

\edfilldimen A length. (was \klamdimen)

```

4404 }

```

36.2 New commands : \eledxxx

The new system of \eledxxxx commands to section text work like this:

1. When one of these commands is called, elemac writes to an auxiliary files:
 - The section level.
 - The section title.
 - The side (when elepar is used).
 - The pstart where the command is called.
 - If we have starred version or not.
2. elemac adds the title of the section to pstart, as normal content. This is to enable critical notes.
3. When L^AT_EX is run a other time, this file is read. That:

- Adds the pstart number to a list of pstarts where a sectioning command is used.
- Defines a command, the name of which contains the pstart number, and which calls the normal L^AT_EX sectioning command.

4. This last command is called when the pstart is effectively printed.

\beforeeledchapter For technical reasons, not yet solved, page-breaking before chapters can't be made automatically by eledmac. Users have to use \beforeeledchapter.

```
4405 \ifl@dmemoir
4406   \newcommand\beforeeledchapter{\clearforchapter}
4407 \else
4408   \newcommand\beforeeledchapter{\if@openright\cleardoublepage\else\clearpage\fi}
4409 \fi
```

\if@eled@sectioning The boolean \if@eled@sectioning is set to true when a sectioning command is called by a \eledxxx command, and set to false after. It is used to enable/disable line number printing.

```
4410 \newif\if@eled@sectioning
```

\print@leftmargin@eledsection \print@leftmargin@eledsection and \print@rightmargin@eledsection are added by eledmac inside the code of sectioning command, in order to affix lines numbers. They include tests for RTL languages.

```

\chapter \M@sect
 \Cmem@old@ssect
 \makechapterhead
 \makechapterhead
 \makeschapterhead
 \@sect
 \@ssect

We have to patch L^AT_EX, book and memoir sectioning commands in order to:

- Disable \edtext inside.
- Disable page breaking (for \chapter).
- Add line numbers and sidenotes.

Unfortunately, Maïeul Rouquette was not able to try if memoir is loaded. That is why elemac tries to define for both standard class and memoir class.

37 Page breaking or no page breaking depending of specific lines

By default, page breaks are automatic. However, the user can define lines which will force page breaks, or prevent page breaks around one specific line. On the first run, the line-list file records the line number of where the page break is being changed (either forced, or prevented). On the next run, page breaks occur either before or after this line, depending on how the user sets the command. The default setting is after the line.

`\normal@page@break` `\normal@page@break` is an etoolbox list which contains the absolute line number of the last line, for each page.

```
4773 \def\normal@page@break{}
```

`\prev@pb` The `\l@prev@pb` macro is a etoolbox list, which contains the lines in which page breaks occur (before or after). The `\l@prev@nopb` macro is a etoolbox list, which contains the lines with NO page break before or after.

```
4774 \def\l@prev@pb{%
4775 \def\l@prev@nopb{}}
```

`\ledpb` The `\ledpb` macro writes the call to `\led@pb` in line-list file. The `\ledpbnum` macro writes the call to `\led@pbnum` in line-list file. The `\lednompb` macro writes the call to `\led@nopb` in line-list file. The `\lednopbnum` macro writes the call to `\led@nopbnum` in line-list file.

```
4776 \newcommand{\ledpb}{\write\linenum@out{\string\led@pb}}
4777 \newcommand{\ledpbnum}[1]{\write\linenum@out{\string\led@pbnum{#1}}}
4778 \newcommand{\lednompb}{\write\linenum@out{\string\led@nopb}}
4779 \newcommand{\lednopbnum}[1]{\write\linenum@out{\string\led@nopbnum{#1}}}
```

\led@pb The \led@pb adds the absolute line number in the \prev@pb list. The \led@pbnum adds the argument in the \prev@pb list. The \led@nopb adds the absolute line number in the \prev@nopb list. The \led@nopbnum adds the argument in the \prev@nopb list.

```
4780 \newcommand{\led@pb}{\listcsxadd{l@prev@pb}{\the\absline@num}}
4781 \newcommand{\led@pbnum}[1]{\listcsxadd{l@prev@pb}{#1}}
4782 \newcommand{\led@nopb}{\listcsxadd{l@prev@nopb}{\the\absline@num}}
4783 \newcommand{\led@nopbnum}[1]{\listcsxadd{l@prev@nopb}{#1}}
```

\ledpbsetting The \ledpbsetting macro only changes the value of \led@pb@macro, for which the default value is before.

```
4784 \def\led@pb@setting{before}
4785 \newcommand{\ledpbsetting}[1]{\gdef\led@pb@setting{#1}}
```

\led@check@pb The \led@check@pb and \led@check@nopb are called before or after each line.
\led@check@nopb They check if a page break must occur, depending on the current line and on the content of \l@pb.

```
4786 \newcommand{\led@check@pb}{\xifinlistcs{\the\absline@num}{l@prev@pb}{\pagebreak[4]}{}}
4787 \newcommand{\led@check@nopb}{%
4788   \IfStrEq{\led@pb@setting}{before}{%

38 Long verse: prevents being separated by a page break

\iflednopbinverse The \iflednopbinverse boolean is set to false by default. If set to true, elemac will automatically prevent page breaks inside verse. The declaration is made at the beginning of the file, because it is used as a package option.

\check@pb@in@verse The \check@pb@in@verse checks if a verse is broken in two page. If true, it adds:

- The absolute line number of the first line of the verse -1 in the \led@pb list, if the page break must occur before the verse.
- The absolute line number of the first line of the verse -1 in the \led@nopb list, if the page break must occur after the verse.

```

4807 \newcommand{\check@pb@in@verse}{%

Appendix A Some things to do when changing version

Appendix A.1 Migration from ledmac to elemac

In elemac, some changes were made in the code to allow for easy customization. This can cause problems for people who have made their own customizations. The next sections explain how to correct this.

If you created your own series using `\addfootins` and `\addfootinsX`, you should instead use the `\newseries` command (see 4.6 p.24). You must delete your `\Xfootnote` command.

If you customized the `\XXXXXXfmt` command, you should see if commands for display options (4.3 p.18) and options in `\Xfootnote` (4.1 p.16) can't do the same things. If not, you can add a new ticket in Github to request a new function it²⁹.

If for some reason you don't want to make the modifications to use elemac new functions, you can continue to use your own `\XXXXXXfmt` command, but you must replace:

```
\renewcommand*{XXXXfmt}{[3]}
```

with

```
\renewcommandx*{XXXXfmt}{[4] [4=Z]}
```

If you don't do that, you will see a spurious [X], where X is series letter.

If you used a `\protect` command inside a `\footnote` command inside a numbered section, you must change the `\protect` to `\noexpand`. If you don't, the command after the `\protect` won't be displayed.

Appendix A.2 Migration to elemac 1.5.1

The version 1.5.1 corrects a bug with `stanzaindentsrepetition` (cf. p. 25). This bug had two consequences:

1. `stanzaindentsrepetition` didn't work when its value was greater than 2.
2. `stanzaindentsrepetition` worked wrong when its value was equal to 2.

So, if you used `stanzaindentsrepetition` with value equal to 2, you must change your `\setstanzaindents`. Explanation:

```
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,1,0}
```

²⁹<https://github.com/maieul/ledmac/issues>

This code, in a version older than 1.5.1, made that the first verse had an indent of 0, the secund verse of 1, the third verse of 0, the fourth verse of 1 etc.

But instead the code should have assigned the reverse: the first verse had an indent of 1, the secund verse of 0, the third verse of 1, the fourth verse of 0 etc.

So version 1.5.1 corrected this bug. If you want to keep the older presentation, you must change:

```
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,1,0}
```

by:

```
\setcounter{stanzaindentsrepetition}{2}
\setstanzaindents{5,0,1}
```

Appendix A.3 Migration to eledmac 1.12.0

The migration to eledmac 1.12.0 is easy:

- You must delete all the auxiliary files, and so one, make the normal three runs.
- If you have modified `\l@reg`, which is not advisable, you must rename it to `\@nl@reg`.

The version 1.12.0 adds new best way to manage section title inside numbered text. Please read § 14 (p. 36).

Change History

v0.1.		\l@dd@makecol: Rewrote \makecol, calling it \l@dd@makecol 142
	General: First public release	1
v0.2.		\l@ddodoreinxtrafeet: Re- named \dodoreinxtrafeet to \l@ddodoreinxtrafeet 144
	General: Added tabmac code, and extended indexing	1
	\uledmac@error: Added \uledmac@error and replaced error messages ..	45
	\ifl@dmemoir: Added \ifl@dmemoir for memoir class having been used	45
	\morenoexpands: Added \l@dtabnoexpands to \no@expands	76
v0.2.1.		\m@m@makecolintro: Added \m@m@makecolfloats, \m@m@makecoltext and \m@m@makecolintro ... 142
	\@lab: Removed page setting from \@lab	149
	General: Added text about normal labeling	30
	Bug fixes and match with mem- patch v1.8	1
	Major changes to insert code when memoir is loaded 144	
	\doxtrafeet: Renamed \doxtrafeet to \l@ddoxtrafeet	143
	\edlabel: Tweaked \edlabel to get correct page numbers ... 147	
	\l@dd@makecol: Rewrote \makecol, calling it \l@dd@makecol 142	
	\l@ddodoreinxtrafeet: Re- named \dodoreinxtrafeet to \l@ddodoreinxtrafeet 144	
	\l@ddofootinsert: Renamed \dofootinsert as \l@ddofootinsert 143	
	\m@m@makecolintro: Added \m@m@makecolfloats, \m@m@makecoltext and \m@m@makecolintro ... 142	
	\morenoexpands: Removed some \lets from \no@expands. These were in EDMAC but I feel that they should not have been as they disabled page/line refs in a footnotes	76
	\zz@@@: Minor change to \zz@@@ . 147	
v0.2.2.		\l@dd@makecol: Improved paragraph foot- notes
		notes
		1
	New Dekker example	1
	\footfudgefiddle: Added \footfudgefiddle	106
	\l@dd@section: Used \providemode	

for \gobblethree to avoid clash with the amsfonts package	129	\if@ledgroup: Added ledgroup environment	159
\line@list@stuff: Added initial write of page number in \line@list@stuff	69	\ifparapparatus@: Added final/draft options	44
\para@footsetup: Added \footfudgefiddle to \para@footsetup	106	\l@feetendmini: Added \l@feetbeginmini, \l@feetendmini and all their supporting code	157
\para@footsetupX: Added \footfudgefiddle to \para@footsetupX	125	\mpnnormalfootgroup: Added \mpnnormalfootgroup	103
v0.3.		\mpnnormalvfootnote: Added \mpnnormalvfootnote	98
\@lab: Replaced \the\line@num by \linenumr@p\line@num in \@lab, and similar for sub-lines	149	\showlemma: Added \showlemma	44
\@nl@reg: Added a bunch of code to \@nl for handling \setlinenum	63	v0.4.1.	
General: Includes edstanza and more	1	\@opxtrafeetii: Added \opxtrafeetii	143
\ledlinenum: Added \linenumr@p and \sublinenum@rep to \leftlinenum and \rightlinenum	55	General: Added code for changing \docclearpage	145
\linenumberlist: Added \linenumberlist mechanism	45	Let edmac take advantage of memoir's indexing	162
\printendlines: Added \linenumr@p and \sublinenumr@p to \printendlines	130	Not released. Minor editorial improvements and code tweaks	1
\printlines: Added \linenumr@p and \sublinenumr@p to \printlines	102	Only change \footnotetext and \footnotemark if memoir not used	117
\sublinenumr@p: Added \linenumberstyle and \sublinenumberstyle	54	\doxtrafeetii: Changed \doxtrafeetii code for easier extensions	143
v0.3.1.		v0.5.	
General: Not released. Added remarks about the parallel package	1	\@footnotetext: Enabled regular \footnote in numbered text	117
v0.4.		\@xypar: Eliminated \marginpar disturbance	151
\@iiminipage: Modified kernel \iiminipage and \endminipage to cater for critical footnotes	158	General: Added left and right side notes	152
General: Added \showlemma to \edtext (and \critext)	77	Added sidenotes, familiar footnotes in numbered text	1
Added minipage, etc., support	1	v0.5.1.	
\ledgroupsized: Added ledgroupsized environment	160	General: Added moveable side note	152
\footnormal: Added minipage footnote setup to \footnormal	105	Fixed right line numbers killed in v0.5	1
		\affixline@num: Changed \affixline@num to cater for sidenotes	89
		\ledgroupsized: Only change \hsize in ledgroupsized environment otherwise page number can be in wrong place	160
		\l@getssidenote@margin: Added \sidenotemargin and \sidenote@margin	152

v0.6.

\@lopR: Added \pend, \pendR,
 \lopL and \lopR in anticipa-
 tion of parallel processing 64
 \onl@reg: Added \fix@page to
 \onl 63
 Extended \onl to include the
 page number 63
 General: Fixed long paragraphs
 looping 1
 Fixed minor typos 1
 Prepared for elepar package . . 1
 \fix@page: Added \last@page@num
 and \fix@page 64
 \new@line: Extended \new@line to
 output page numbers 70
 \page@start: Made \page@start a
 no-op 71
 \vl@dbfnote: Changed \l@dbfnote
 and \vl@dbfnote as originals
 could give incorrect markers in
 the footnotes 117

v0.7.

\onl@reg: Added \onl@reg 63
 \cref@reg: Added \cref@reg 68
 General: elemac having been avail-
 able for 2 years, deleted the
 commented out original edmac
 texts 1
 Maïeul Rouquette new main-
 tainer 1
 Made macros of all messages . 45
 Replaced all \interfootnotelinepenalty
 etc., by just \interfootnotelinepenalty
 1
 Tidying up for elepar and
 ledarab packages 1
 \affixline@num: Added skipnu-
 mering to \affixline@num 89
 \do@actions@fixedcode: Added
 \do@actions@fixedcode 88
 \do@actions@next: Added number
 skipping to \do@actions 86
 \do@insidelinehook: Added
 \do@linehook for use in
 \do@line 85
 \endnumbering: Changed
 \endnumbering for elepar 50
 \f@x@l@cks: Added \ch@cks@l@ck,
 \ch@ck@l@ck and \f@x@l@cks 91

\footssplitskips: Added
 \footssplitskips for use in
 many footnote styles 98
 \get@linelistfile: Added
 \get@linelistfile 62
 \ifledRcol@: Added \l@dnumpstartsL,
 \ifl@dpairing and \ifpst@rted
 for/from elepar 48
 \initnumbering@reg: Added
 \initnumbering@reg 49
 \l@dcstotext@r: Added
 \l@demptyd@ta 85
 \l@ddofootinsert: Deleted
 \page@start from \l@ddofootinsert
 143
 \l@dgepline@margin: Added
 \l@dgepline@margin 52
 \l@getlock@disp: Added
 \l@getlock@disp 54
 \l@get sidenote@margin: Added
 \l@get sidenote@margin 152
 \l@drsn@te: Added \l@drsn@te
 and \l@drsn@te for use in
 \do@line 85
 \l@unboxmpfoot: Added
 \l@unboxmpfoot containing
 some common code 159
 \l@zeropenalties: Added
 \l@zeropenalties 82
 \ledlinenum: Added \ledlinenum
 for use by \leftlinenum and
 \rightlinenum 55
 \line@list@stuff: Deleted
 \page@start from \line@list@stuff
 69
 \list@clearing@reg: Added
 \list@clearing@reg 61
 \n@num@reg: Added \n@num 67
 \normalbfnoteX: Removed
 extraneous space from
 \normalbfnoteX 120
 \resumenumbering: Changed
 \resumenumbering for elepar 51
 \setprintendlines: Added
 \setprintendlines for use by
 \printendlines 129
 \setprintlines: Added \setprintlines
 for use by \printlines 101
 \skipnumbering@reg: Added
 \skipnumbering and supports 72

\sublinenumincrement:	Added	v0.12.1.
	\firstlinenum, \linenumincrement, \firstsublinenum and \linenumincrement 53	General: Don't number \pstarts of stanza. 1
\sublinenumr@p:	Using \linenumrep instead of \linenumr@p 54	The numbering of \pstarts restarts on each \beginnumbering. 1
	Using \sublinenumrep instead of \sublinenumr@p 54	
\vnumfootnoteX:	Removed extraneous space from \vnumfootnoteX 120	
v0.8.		
	General: Bug on endnotes fixed: in a // text, all endnotes will print and be placed at the ends of columns () 1	
v0.8.1.	General: Bug on \edtext ; \critex ; \lemma fixed: we can now us non switching commands 1	
v0.9.	General: No more ledpatch. All patches are now in the main file. 1	
v0.9.1.	General: Fix some bugs linked to in tegrating ledpatch on the main file. 1	
v0.10.	General: Corrections to \section and other titles in numbered sections 1	
v0.11.	General: Makes it possible to add a symbol on each verse's hang ing, as in French typogra phy. Redefines the command \hangingsymbol to define the character. 1	
v0.12.	General: For compatibility with eledpar, possibility to use \autopar on the right side. 1	
	Possibility to number \pstart. 12	
	Possibility to number the pstart with the commands \numberpstarttrue. 1	
\ifiledRcol@:	Added \ifiledRcol and \ifnumberingR for/from eledpar 48	
v0.13.		
	General: New stanzaindent repetition counter to repeat stanza in dents every n verses. 25	
	New stanzaindent repetition counter: to repeat stanza in dents every n verses. 1	
\managestanza@modulo:	New stan zaindent repetition counter to repeat stanza indents every n verses. 170	
v0.13.1.		
	General: \thepstartL and \thepstartR use now \bfseries and not \bf, which is deprecated and makes con flicts with memoir class. 1	
v0.14.		
	General: Tweaked \edlabel to get correct line number if the com mand is first element of a para graph. 1	
\edlabel:	Tweaked \edlabel to get correct line number if the command is first element of a paragraph. 147	
v0.15.		
	General: Line numbering can be re set at each pstart. 51	
	Possiblty to print \pstart num ber in side. 13	
\affixline@num:	Line numbering can be disabled. 89	
\ifinserthangingsymbol:	New management of hangingsymbol insertion, preventing undesir able insertions. 169	
\printlines:	Line numbering can be reset at each pstart. 102	
v0.17.		
\ifinserthangingsymbol:	New new management of hang ingsymbol insertion, preventing undesirable insertions. 169	

v1.0.		v1.4.	
General: \lemma can contain commands.	16	General: Compatibility of \edtext (and \critext) with the right-to-left direction (with Polyglossia).	77
Debug in lineation command	13	Compatibility with LuaTeX of RTL notes.	44
New generic commands to customize footnote display.	18	\newseries@: Remembers the language of the lemma, in order to create a correct direction for the footnote separator.	132
Options nonum and nosep in \Xfootnote.	16	\normalfootfmt: Direction of footnotes with polyglossia.	99
Options of \Xfootnotes.	96	\rbracket: Switch the right bracket to a left bracket when the lemma is RTL (needs polyglossia or LuaTeX).	99
Possibility to have commands in sidenotes.	30		
Some compatibility break with elemac. Change of name: elemac.	1		
\morenoexpands: Change to be compatible with new features	76		
v1.0.1.		v1.4.1.	
General: Correction on \numberonlyfirstintline with lineation by pstart or by page.	18	\endquote: New option noquotation.	191
v1.1.		\labelrefsparsesubline: Fix bug with \edlabel.	148
General: Add \labelpstarttrue.	13	v1.4.2.	
Add \numberonlyfirstinttwoLines	18	General: Debug with some special classes.	1
Add \pstartinfoFootnote and \onlypstartinfoFootnote	18	v1.4.3.	
New hook to add arbitrary code at the beginning of the notes	21	General: Add \nonbreakableafternumber.	19
New options for block of notes.	22	Spurious space after familiar footnotes.	1
New package option: parapparatus.	1	v1.4.4.	
New tools to change order of series	134	General: Label inside familiar footnotes.	1
\ledfootinsdim: Deprecated \ledfootinsdim	104	v1.4.5.	
\preXnotes: New skip \preXnotes@	104	General: Bug with komascript + elepar + chapter.	1
v1.1.0.		v1.4.6.	
General: Sectioning commands.	36	General: Bug with memoir class introduced by 1.4.5.	1
v1.2.		v1.4.7.	
\endquote: Compatibility of \ledchapter with the memoir class.	191	\endquote: Compatibility of sectioning commands with \autopar.	191
\preXnotes: Debug in familiar footnotes (but introduced by v1.1).	104	v1.4.8.	
v1.3.		General: Corrects a bug with parallel texts introduced by 1.1.	1
\endquote: Quotation and quote environment inside the numbering sections.	191	v1.4.9.	
		\normalbfnoteX: Allow to redefine \thefootnoteX with alph when some packages are loaded.	120

v1.5.	General: Correct indexing when the call is made in critical notes.	161	\endquote: Correction of sectioning commands in parallel texts.	191
	\do@insidelinehook: Added \do@insidelinehook for use in \do@line	85	\get@index@command: Debug \get@index@command and compatibility with hyperref package.	162
	\edindex: Compatibility with imakeidx package, and possibility to use multiple index with \edindex.	162	\newhookcommand@series@reload: Debug \beforenotesX and \maxnotesX which didn't work.	137
	\ifFN@bottom: Use the bottom option of footmisc package.	142	\prevpage@num: Correct \parafootsep when using with ledgroup.	111
v1.5.1.	\managestanza@modulo: Correct stanzaidentsrepetition counter	170	v1.8.1.	General: Debug endnotes when more than one series is used (change the position where tools for endnotes are defined).
	\normalvfootnoteX: Fix bug with normal familiar footnotes when mixing RTL and LTR text.	118	v1.8.2.	General: Debug compatibility problem with hebrew option of babel package.
v1.5.2.	\line@list@stuff: Open / close immediatly the line-list file when in minipage, except if the minipage is a ledgroup.	69	v1.8.3.	General: Fixes spurious spaces added by v1.7.0.
v1.6.0.	\falseverse: Add \falseverse macro.	171	v1.9.0.	\doxtrafeet: Add \fnpos to choice the order of footnotes.
v1.6.1.	General: Corrects a false hanging verse when a verse is exactly the length of a line.	1	\l@dfetendmini: Add \mpfnpos to choice the order of footnotes in minipage / ledgroup.	157
	\ifinserthangingsymbol: Hang verse is now not automatically flush right.	169	v1.10.0.	General: Add \pstartref and \xpstartref to refer to a pstart number (extension of \edlabel).
	\l@dunhbox@line: Move the call to \inserthangingsymbol to allow use \hfill inside.	83	v1.10.1.	\endquote: Correction of sectioning commands in parallel texts.
	\pend: Spurious space in \pend.	81	v1.10.2.	General: Compatibility with cleveref.
	\pstart: Spurious space in \pstart.	80	v1.10.3.	General: Compatibility of stanza with v1.8a of babel-greek.
v1.7.0.	General: New features for managing page breaks.	37	v1.10.4.	General: Debug of cross-referencing.
v1.8.0.	General: Compatibility with parled-group option of elepar package.	1		General: Debug of critical notes in edtabular environment.
	If imakeidx and hyperref are loaded, adds hyperref in the index.	161		

v1.10.5.	
General: Debug of \pausenumbering.	1
Debug of \xxref.	1
v1.10.6.	
General: Debug of interaction between \autopar and \pausenumbering.	1
v1.11.0.	
General: Add hooks to disable the font selection for lemma in footnote.	20
v1.11.1.	
General: Correct a bug when a critical note starts with plus or minus.	1
v1.12.0.	
\@nl@reg: To ensure compatibility with \musixtex, \@l becomes \@l. Consequently, \@l@reg becomes \@nl@reg.	62
\@wredindex: Use correctly default index when imakeidx is loaded.	164
General: Add \ledinernote and \ledouternote commands. . .	30
Add hyperlink to crossref (needs hyperref package).	28
Compatibility with musixtex. . .	1
Debug elemac sectioning command after using \resumenumerating.	1
New hooks: \afterXrule and \afterruleX	22
New options to ragg paragraphed notes.	21
New sectioning commands. . .	36
Optional arguments for \pstart and \pend.	11
\endquote: \ledxxx sectioning commands are deprecated and replaced by \elecxxx commands.	191
\ifelemac@check@imakeidx@: Ensure that imakeidx is loaded before elemac	161
\ifledRcol@: Add \ifledRcol@ for elepar	48
\initnumbering@reg: \beginnumbering is defined only on elemac, not on elepar.	49
\l@dcsnote: \l@dlsnote, \l@drsnote and \l@dcsnote defined only one time, in elemac, including needs for elepar case.	153
\l@getssidenote@margin: \sidenotemargin is now directly defined in elemac to be able to manage elepar.	152
\l@dunhbox@line: \do@line is splitted in more little commands.	84
\newhookcommand@series@reload:	
Debug \beforenotesX and \maxnotesX which didn't work when called after \footparagraphX.	137
Debug \beforeXnotes and \maxhXnotes which didn't work when called after \footparagraph.	137
\pend: New optional argument for \pend, to execute code after it.	81
\pstart: New optional argument for \pstart, to execute code before it.	80
\stanza: & can have an optional argument: content to be printed after.	171
\Stanza can have an optional argument: content to be printed before.	171
