

Parallel typesetting for critical editions: the **eledpar** package*

Peter Wilson
Herries Press[†]
Maïeul Rouquette[‡]

Abstract

The **eledmac** package, which is based on the PLAIN T_EX set of EDMAC macros, has been used for some time for typesetting critical editions. The **eledpar** package is an extension to **eledmac** which enables texts and their critical apparatus to be typeset in parallel, either in two columns or on pairs of facing pages.

Note that before September 2012, **eledpar** was called **ledpar**. The changes from **ledmac/ledpar** to **eledmac/eledpar** is explained in **ledmac** documentation.

To report bugs, please go to **ledmac**'s GitHub page and click “New Issue”: <https://github.com/maieul/ledmac/issues/>. You must open an account with github.com to access my page ([maieul/ledmac](https://github.com/maieul/ledmac)). GitHub accounts are free for open-source users. You can report bug in English or in French.

You can subscribe to the **ledmac** email list in:
<https://lists.berlios.de/pipermail/ledmac-users/>

1 Introduction

The **EDMAC** macros [LW90] for typesetting critical editions of texts have been available for use with TeX for some years. Since **EDMAC** became available there had been a small but constant demand for a version of **EDMAC** that could be used with LaTe_X. The **elelmac** package was introduced in 2003 in an attempt to satisfy that request.

Some critical editions contain texts in more than one form, such as a set of verses in one language and their translations in another. In such cases there is a desire to be able to typeset the two texts, together with any critical apparatus, in parallel. The **elelpar** package is an extension to **elelmac** that enables two texts and their apparatus to be set in parallel, either in two columns or on pairs of facing pages.

The package has to try and coerce Te_X into paths it was not designed for. Use of the package, therefore, may produce some surprising results.

This manual contains a general description of how to use **elelpar** starting in section 2; the complete source code for the package, with extensive documentation (in sections 9 through 28); and an Index to the source code. As **elelpar** is an adjunct to **elelmac** I assume that you have read the **elelmac** manual. Also **elelpar** requires **elelmac** to be used, preferably at least version 0.10 (2011/08/22). You do not need to read the source code for this package in order to use it but doing so may help to answer any questions you might have. On a first reading, I suggest

that you should skip anything after the general documentation in sections 2 until 9, unless you are particularly interested in the innards of *eledpar*.

2 The *eledpar* package

A file may mix *numbered* and *unnumbered* text. Numbered text is printed with marginal line numbers and can include footnotes and endnotes that are referenced to those line numbers: this is how you'll want to print the text that you're editing. Unnumbered text is not printed with line numbers, and you can't use *eledmac*'s note commands with it: this is appropriate for introductions and other material added by the editor around the edited text.

The *eledpar* package lets you typeset two *numbered* texts in parallel. This can be done either as setting the ‘Leftside’ and ‘Rightside’ texts in two columns or on facing pages. In the paired pages case footnotes are placed at the bottom of the page on which they are called out — that is, footnotes belonging to the left are set at the foot of a left (even numbered) page, and those for right texts are at the bottom of the relevant right (odd numbered) page. However, in the columnar case, all footnotes are set at the bottom left of the page on which they are called out — they are not set below the relevant column. The line numbering schemes need not be the same for the two texts.

2.1 General

eledmac essentially puts each chunk of numbered text (the text within a `\pstart ... \pend`) into a box and then following the `\pend` extracts the text line by line from the box to number and print it. More precisely, the text is first put into the the box as though it was being typeset as normal onto a page and any notes are stored without being typeset. Then each typeset line is extracted from the box and any notes for that line are recalled. The line, with any notes, is then output for printing, possibly with a line number attached. Effectively, all the text is typeset and then afterwards all the notes are typeset.

eledpar similarly puts the left and right chunks into boxes but can't immediately output the text after a `\pend` — it has to wait until after both the left and right texts have been collected before it can start processing. This means that several boxes are required and possibly TeX has to store a lot of text in its memory; both the number of potential boxes and memory are limited. If TeX's memory is overfilled the recourse is to reduce the amount of text stored before printing.

It is possible to have multiple chunks in the left and right texts before printing them. The macro `\maxchunks{<num>}` specifies the maximum number of chunks within the left or right texts. This is initially set as:

`\maxchunks{5120}`

meaning that there can be up to 5120 chunks in the left text and up to 5120 chunks in the right text, requiring a total of 10240 boxes. If you need more chunks then you can increase `\maxchunks`. The `\maxchunks` must be called in the preamble.

`\maxchunks`

TeX has a limited number of boxes; if you get an error message along the lines of ‘no room for a new box’, then load the package etex, which needs pdflatex or xelatex. If you `\maxchunks` is too little you can get a `eledmac` error message along the lines: ‘Too many `\pstart` without printing. Some text will be lost.’ then you will have to either increase `\maxchunks` or use the parallel printing commands (`\Columns` or `\Pages`) more frequently.

When typesetting verse using `\syntax`, each line is treated as a chunk, so be warned that if you are setting parallel verses you might have to increase `\maxchunks` much more than it appears at first sight.

In general, `eledmac` is a TeX resource hog, and `eledpar` only makes things worse in this respect.

3 Parallel columns

`pairs` Numbered text that is to be set in columns must be within a `pairs` environment. Within the environment the text for the lefthand and righthand columns is placed within the `Leftside` and `Rightside` environments, respectively; these are described in more detail below in section 5.

`\Columns` The command `\Columns` typesets the texts in the previous pair of `Leftside` and `Rightside` environments. The general scheme for parallel columns looks like this:

```
\begin{pairs}
\begin{Leftside} ... \end{Leftside}
\begin{Rightside} ... \end{Rightside}
\Columns
\begin{Leftside} ... \end{Leftside}
...
\Columns
\end{pairs}
```

There is no required pagebreak before or after the columns.

`\Lcolwidth` `\Rcolwidth` The lengths `\Lcolwidth` and `\Rcolwidth` are the widths of the left and right columns, respectively. By default, these are:

```
\setlength{\Lcolwidth}{0.45\textwidth}
\setlength{\Rcolwidth}{0.45\textwidth}
```

They may be adjusted if one text tends to be ‘bulkier’ than the other.

`\columnrulewidth` `\columnseparator` The macro `\columnseparator` is called between each left/right pair of lines. By default it inserts a vertical rule of width `\columnrulewidth`. As this is initially defined to be 0pt the rule is invisible. For a visible rule between the columns you could try:

```
\setlength{\columnrulewidth}{0.4pt}
```

You can also modify `\columnseparator` if you want more control. When you use `\stanza`, the visible rule may shift when a verse has a hanging indent. To prevent shifting, use `\setstanzaindents` outside the `Leftside` or `Rightside` environment.

4 Facing pages

pages Numbered text that is to be set on facing pages must be within a **pages** environment. Within the environment the text for the lefthand and righthand pages is placed within the **Leftside** and **Rightside** environments, respectively.

\Pages The command **\Pages** typesets the texts in the previous pair of **Leftside** and **Rightside** environments. The general scheme for parallel pages looks like this:

```
\begin{pages}
\begin{Leftside} ... \end{Leftside}
\begin{Rightside} ... \end{Rightside}
\Pages
\begin{Leftside} ... \end{Leftside}
...
\Pages
\end{pages}
```

The **Leftside** text is set on lefthand (even numbered) pages and the **Rightside** text is set on righthand (odd numbered) pages. Each **\Pages** command starts a new even numbered page. After parallel typesetting is finished, a new page is started.

\Lcolwidth **\Rcolwidth** Within the **pages** environment the lengths **\Lcolwidth** and **\Rcolwidth** are the widths of the left and right pages, respectively. By default, these are set to the normal **textwidth** for the document, but can be changed within the environment if necessary.

\goalfraction When doing parallel pages **eledpar** has to guess where TeX is going to put pagebreaks and hopefully get there first in order to put the pair of texts on their proper pages. When it thinks that the fraction **\goalfraction** of a page has been filled, it finishes that page and starts on the other side's text. The definition is:

```
\newcommand*{\goalfraction}{0.9}
```

If you think you can get more on a page, increase this. On the other hand, if some left text overflows onto an odd numbered page or some right text onto an even page, try reducing it, for instance by:

```
\renewcommand*{\goalfraction}{0.8}
```

5 Left and right texts

Parallel texts are divided into **Leftside** and **Rightside**. The form of the contents of these two are independent of whether they will be set in columns or pages.

The left text is put within the **Leftside** environment and the right text likewise in the **Rightside** environment. The number of **Leftside** and **Rightside** environments must be the same.

Within these environments you can designate the line numbering scheme(s) to be used. The **eledmac** package originally used counters for specifying the numbering scheme; now both **eledmac**¹ and the **eledpar** package use macros instead.

Leftside
Rightside

```
\firstlinenum
\linenumincrement
\firstsublinenum
\sublinenumincrement
\firstlinenum*
\linenumincrement*
\firstsublinenum*
\sublinenumincrement*
```

¹when used with **ledpatch** v0.2 or greater.

Following `\firstlinenum{<num>}` the first line number will be $<num>$, and following `\linenumincrement{<num>}` only every $<num>$ th line will have a printed number. Using these macros inside the `Leftside` and `Rightside` environments gives you independent control over the left and right numbering schemes. The `\firstsublinenum` and `\sublinenumincrement` macros correspondingly set the numbering scheme for sublines. The starred versions change both left and right numbering schemes.

`\pstart` `\pend` In a serial (non-parallel) mode, each numbered paragraph, or chunk, is contained between the `\pstart` and `\pend` macros, and the paragraph is output when the `\pend` macro occurs. The situation is somewhat different with parallel typesetting as the left text (contained within `\pstart` and `\pend` groups within the `Leftside` environment) has to be set in parallel with the right text (contained within its own `\pstart` and `\pend` groups within the corresponding `Rightside` environment) the `\pend` macros cannot immediately initiate any typesetting — this has to be controlled by the `\Columns` or `\Pages` macros. Several chunks may be specified within a `Leftside` or `Rightside` environment. A multi-chunk text then looks like:

```
\begin{...side}
% \beginnumbering
\pstart first chunk \pend
\pstart second chunk \pend
...
\pstart last chunk \pend
% \endnumbering
\end{...side}
```

Numbering, via `\beginnumbering` and `\endnumbering`, may extend across several `Leftside` or `Rightside` environments. Remember, though, that the Left/Right sides are effectively independent of each other.

Generally speaking, controls like `\firstlinenum` or `\linenummargin` apply to sequential and left texts. To effect right texts only they have to be within a `Rightside` environment.

If you are using the `babel` package with different languages (via, say, `\selectlanguage`) for the left and right texts it is particularly important to select the appropriate language within the `Leftside` and `Rightside` environments. The initial language selected for the right text is the `babel` package's default. Also, it is the *last* `\selectlanguage` in a side that controls the language used in any notes for that side when they get printed. If you are using multilingual notes then it is probably safest to explicitly specify the language(s) for each note rather than relying on the language selection for the side. The right side language is also applied to the right side line numbers.

Corresponding left and right sides must have the same number of paragraph chunks — if there are four on the left there must be four on the right, even if some are empty. The start of each pair of left and right chunks are aligned horizontally on the page. The ends may come at different positions — if one chunk is shorter

than the other then blank lines are output on the shorter side until the end of the longer chunk is reached.

However, sometime if the left pstarts are much greater than right pstarts, or *vice-versa*, you can decide to shift the pstarts on the left and right side. That means the start of pstarts are not aligned horizontally on the page, the shift is offset at the end of each double pages. To enable this function, load eledp with the option `shiftedpstarts`.

6 Numbering text lines and paragraphs

`\begin{numbering}` Each section of numbered text must be preceded by `\begin{numbering}` and followed by `\end{numbering}`, like:

```
\begin{numbering}
<text>
\end{numbering}
```

These have to be separately specified within `Leftside` and `Rightside` environments.

The `\begin{numbering}` macro resets the line number to zero, reads an auxiliary file called `<jobname>.nn` (where `<jobname>` is the name of the main input file for this job, and `nn` is 1 for the first numbered section, 2 for the second section, and so on), and then creates a new version of this auxiliary file to collect information during this run. Separate auxiliary files are maintained for right hand texts and these are named `<jobname>.nnR`, using the ‘R’ to distinguish them from the left hand and serial (non-parallel) texts.

The command `\memorydump` effectively performs an `\end{numbering}` immediately followed by a `\begin{numbering}` while not restarting the numbering sequence. This has the effect of clearing TeX’s memory of previous texts and any associated notes, allowing longer apparent streams of parallel texts. The command should be applied to both left and right texts, and after making sure that all previous notes have been output. For example, along the lines of:

```
\begin{Leftside}
\begin{numbering}
...
\end{Leftside}
\begin{Rightside}
\begin{numbering}
...
\end{Rightside}
\Pages
\begin{Leftside}
\memorydump
...
\end{Leftside}
\begin{Rightside}
\memorydump
...
\end{Rightside}
```

`\Rlineflag` The value of `\Rlineflag` is appended to the line numbers of the right texts.

Its default definition is:

```
\newcommand*{\Rlineflag}{R}
```

This may be useful for parallel columns but for parallel pages it might be more appropriate to redefine it as:

```
\renewcommand*{\Rlineflag}{}
```

`\printlinesR`
`\leadsavedprintlines` The `\printlines` macro is ordinarily used to print the line number references for critical footnotes. For footnotes from right side texts a special version is supplied, called `\printlinesR`, which incorporates `\Rlineflag`. (The macro `\leadsavedprintlines` is a copy of the original `\printlines`, just in case ...). As provided, the package makes no use of `\printlinesR` but you may find it useful. For example, if you only use the B footnote series in righthand texts then you may wish to flag any line numbers in those footnotes with the value of `\Rlineflag`. You could do this by putting the following code in your preamble:

```
\let\oldBfootfmt\Bfootfmt
\renewcommand{\Bfootfmt}[3]{%
  \let\printlines\printlinesR
  \oldBfootfmt{#1}{#2}{#3}}
```

`\numberpstarttrue`
`\numberpstartfalse` It's possible to insert a number at every `\pstart` command. You must use the `\numberpstarttrue` command to have it. You can stop the numerotation with `\numberpstartfalse`. You can redefine the commands `\thepstartL` and `\thepstartR` to change style. The numbering restarts on each `\beginnumbering`

7 Verse

If you are typesetting verse with `eledmac` you can use the `\stanza` construct, and you can also use this in right or left parallel texts. In this case each verse line is a chunk which has two implications. (1) you can unexpectedly exceed the `\maxchunks` limit or the overall limit on the number of boxes, and (2) left and right verse lines are matched, which may not be desirable if one side requires more print lines for verse lines than the other does.

`astanza` `eledpar` provides an `astanza` environment which you can use instead of `\stanza` (simply replace `\stanza` by `\begin{astanza}` and add `\end{astanza}` after the ending `\&`). Within the `astanza` environment each verse line is treated as a paragraph, so there must be no blank lines in the environment otherwise there will be some extraneous vertical spacing.

If you get an error message along the lines of ‘Missing number, treated as zero `\sza@0@`’ it is because you have forgotten to use `\setstanzaindent` to set the stanza indents.

`\skipnumbering` The command `\skipnumbering` when inserted in a line of parallel text causes the numbering of that particular line to be skipped. This can be useful if you are putting some kind of marker (even if it is only a blank line) between stanzas.

Remember, parallel texts must be numbered and this provides a way to slip in an ‘unnumbered’ line.

The `\astanza` environment forms a chunk but you may want to have more than one stanza within the chunk. Here are a couple of ways of doing that with a blank line between each internal stanza, and with each stanza numbered. First some preliminary definitions:

```
\newcommand*{\stanzanum}[2][\stanzaindentbase]{%
  \hskip -#1\llap{\textbf{#2}}\hskip #1\ignorespaces}
\newcommand{\interstanza}{\par\mbox{}\skipnumbering}
```

And now for two stanzas in one. In this first example the line numbering repeats for each stanza.

```
\setstanzaindents{1,0,1,0,1,0,1,0,1,0,1}
\begin{pairs}
\begin{Leftside}
\firstlinenum{2}
\linenumincrement{1}
\beginnumbering
\begin{astanza}
\stanzanum{1} First in first stanza &
Second in first stanza &
Second in first stanza &
Third in first stanza &
Fourth in first stanza &
\interstanza
\setline{2}\stanzanum{2} First in second stanza &
Second in second stanza &
Second in second stanza &
Third in second stanza &
Fourth in second stanza \&
\end{astanza}
...
\end{Leftside}
\end{pairs}
```

And here is a slightly different way of doing the same thing, but with the line numbering being continuous.

```
\setstanzaindents{1,0,1,0,1,0,0,1,0,1,0,1}
\begin{pairs}
\begin{Leftside}
\firstlinenum{2}
\linenumincrement{1}
\beginnumbering
\begin{astanza}
\stanzanum{1} First in first stanza &
Second in first stanza &
Second in first stanza &
Third in first stanza &
```

```

        Fourth in first stanza &
\strut &
\stanzanum{2}\advanceline{-1} First in second stanza &
Second in second stanza &
Second in second stanza &
Third in second stanza &
Fourth in second stanza \&
\end{astanza}
...

```

\hangingsymbol Like in elemac, you could redefine the command \hangingsymbol to insert a character in each hanged line. If you use it, you must run L^AT_EX two time. Example for the french typographie

```
\renewcommand{\hangingsymbol}{[\,,]}
```

You can also use it to force hanging verse to be flush right:

```
\renewcommand{\hangingsymbol}{\protect\hfill}
```

When you use \lednomp make sure to use it on both sides in the corresponding verses to keep the pages in sync.

8 Parallel ledgroups

You can also make parallel ledgroups (see the documentation of elemac about ledgroups). To do it you have:

- To load elepar package with the parledgroup option, or to add \.
- To push each ledgroup between \pstart... \pend command.

See the following example:

```

\begin{pages}
\begin{Leftside}
\begin{numbering}
\pstart
\begin{ledgroup}
    ledgroup content
\end{ledgroup}
\pend
\pstart
\begin{ledgroup}
    ledgroup content
\end{ledgroup}
\pend
\end{numbering}
\end{Leftside}

```

```
\begin{Rightside}
\beginnumbering
\pstart
\begin{ledgroup}
    ledgroup content
\end{ledgroup}
\pend
\pstart
\begin{ledgroup}
    ledgroup content
\end{ledgroup}
\pend
\endnumbering
\end{Rightside}
\Pages
\end{pages}
```

You can add sectioning a sectioning command, following this scheme:

```
\begin{..side}
\beginnumbering
\pstart
\section{First ledgroup title}
\pend
\pstart
\begin{ledgroup}\skipnumbering
    ledgroup content
\end{ledgroup}
\pend
\pstart
\section{Second ledgroup title}
\pend
\pstart
\begin{ledgroup}\skipnumbering
    ledgroup content
\end{ledgroup}
\pend
\endnumbering
\end{..side}
```

8.1 Parallel ledgroups and **setspace** package

- . If you use the **setspace** package and want your notes in parallel ledgroups ledgroups to be single-spaced (not half-spaced or double-spaced), just add to your preamble:

```
\let\parledgroupnotespacing\singlespacing
```

In effect, to have correct spacing, don't change the font size of your notes.

9 Implementation overview

TeX is designed to process a single stream of text, which may include footnotes, tables, and so on. It just keeps converting its input into a stream typeset pages. It was not designed for typesetting two texts in parallel, where it has to alternate from one to the other. Further, TeX essentially processes its input one paragraph at a time — it is very difficult to get at the ‘internals’ of a paragraph such as the individual lines in case you want to number them or put some mark at the start or end of the lines.

`eledmac` solves the problem of line numbering by putting the paragraph in typeset form into a box, and then extracting the lines one by one from the box for TeX to put them onto the page with the appropriate page breaks. Most of the `eledmac` code is concerned with handling this box and its contents.

`eledpar`’s solution to the problem of parallel texts is to put the two texts into separate boxes, and then appropriately extract the pairs of lines from the boxes. This involves duplicating much of the original box code for an extra right text box. The other, smaller, part of the code is concerned with coordinating the line extractions from the boxes.

The package code is presented in roughly in the same order as in `eledmac`.

10 Preliminaries

Announce the name and version of the package, which is targetted for LaTeX2e. The package also requires the `eledmac` package.

```
1 {*code}
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{eledpar}[2014/04/14 v1.7.0 elelmac extension for parallel texts]
4
```

With the option ‘shiftedpstarts’ a long pstart on the left side (or in the right side) don’t make a blank on the corresponding pstart, but the blank is put on the bottom of the page. Consequently, the pstarts on the parallel pages are shifted, but the shifted stop at every end of pages. The `\shiftedverses` is kept for backward compatibility.

```
\ifshiftedpstarts
5 \newif\ifshiftedpstarts
6 \let\shiftedversestrue\shiftedpstartstrue
7 \let\shiftedversesfalse\shiftedpstartsfalse
8 \DeclareOption{shiftedverses}{\shiftedpstartstrue}
9 \DeclareOption{shiftedpstarts}{\shiftedpstartstrue}
10 \DeclareOption{parledgroup}{\parledgrouptrue}
11 \ProcessOptions
```

As noted above, much of the code is a duplication of the original `eledmac` code to handle the extra box(es) for the right hand side text, and sometimes for the left hand side as well. In order to distinguish I use ‘R’ or ‘L’ in the names of

macros for the right and left code. The specifics of ‘L’ and ‘R’ are normally hidden from the user by letting the `Leftside` and `Rightside` environments set things up appropriately.

```
\ifl@dpairing \ifl@dpairing is set TRUE if we are processing parallel texts and \ifl@dpaging
\ifl@dpaging is also set TRUE if we are doing parallel pages. \ifledRcol is set TRUE if we
\ifledRcol are doing the right hand text. \ifl@dpairing is defined in eledmac.

12  \l@dpairingfalse
13 \newif\ifl@dpaging
14  \l@dpagingfalse
15  \ledRcolfalse

\Lcolwidth The widths of the left and right parallel columns (or pages).
\Rcolwidth 16 \newdimen\Lcolwidth
17  \Lcolwidth=0.45\textwidth
18 \newdimen\Rcolwidth
19  \Rcolwidth=0.45\textwidth
20
```

10.1 Messages

All the error and warning messages are collected here as macros.

```
\led@err@TooManyPstarts
21 \newcommand*{\led@err@TooManyPstarts}{%
22  \eledmac@error{Too many \string\pstart\space without printing.
23          Some text will be lost}{\@ehc}{}}

d@err@BadLeftRightPstarts
24 \newcommand*{\led@err@BadLeftRightPstarts}[2]{%
25  \eledmac@error{The numbers of left (#1) and right (#2)
26          \string\pstart s do not match}{\@ehc}{}}

\led@err@LeftOnRightPage
\led@err@RightOnLeftPage 27 \newcommand*{\led@err@LeftOnRightPage}{%
28  \eledmac@error{The left page has ended on a right page}{\@ehc}{}}
29 \newcommand*{\led@err@RightOnLeftPage}{%
30  \eledmac@error{The right page has ended on a left page}{\@ehc}{}}
```

11 Sectioning commands

`\section@numR` This is the right side equivalent of `\section@num`.

Each section will read and write an associated ‘line-list file’, containing information used to do the numbering. Normally the file will be called `<jobname>.nn`, where `nn` is the section number. However, for right side texts the file is called `<jobname>.nnR`. The `\extensionchars` applies to the right side files just as it does to the normal files.

```

31 \newcount\section@numR
32   \section@numR=\z@

\ifpst@rtedL \ifpst@rtedL is set FALSE at the start of left side numbering, and similarly for
\ifpst@rtedR \ifpst@rtedR. \ifpst@rtedL is defined in elemac.
33   \pst@rtedLfalse
34 \newif\ifpst@rtedR

12 Line counting

12.1 Choosing the system of lineation

Sometimes you want line numbers that start at 1 at the top of each page; sometimes you want line numbers that start at 1 at each \pstart; other times you want line numbers that start at 1 at the start of each section and increase regardless of page breaks. `eledpar` lets you choose different schemes for the left and right texts.

```

\ifbypstart@R The \ifbypage@R and \ifbypstart@R flag specifie the current lineation system:
\bystart@Rtrue
\bystart@Rfalse
  \ifbypage@R
\bypage@Rtrue
\bypage@Rfalse

```

- line-of-page : `bypstart@R = false` and `bypage@R = true`.
- line-of-pstart : `bypstart@R = true` and `bypage@R = false`.

`eledpar` will use the line-of-section system unless instructed otherwise.

```
141 \newif\ifbypage@R
142 \newif\ifbypstart@R
143   \bypage@Rfalse
144   \bypstart@Rfalse
```

`\lineationR \lineationR{<word>}` is the macro used to select the lineation system for right texts. Its argument is a string: either `page`, `pstart` or `section`.

```
145 \newcommand*{\lineationR}[1]{%
146   \ifnumbering
147     \led@err@LineationInNumbered
148   \else
149     \def\@tempa{\#1}\def\@tempb{page}%
150     \ifx\@tempa\@tempb
151       \global\bypage@Rtrue
152       \global\bypstart@Rfalse
153     \else
154       \def\@tempb{pstart}%
155       \ifx\@tempa\@tempb
156         \global\bypage@Rfalse
157         \global\bypstart@Rtrue
158       \else
159         \def\@tempb{section}%
160         \ifx\@tempa\@tempb
161           \global\bypage@Rfalse
162           \global\bypstart@Rfalse
163         \else
164           \led@warn@BadLineation
165         \fi
166       \fi
167     \fi
168 }%
```

`\linenummargin` You call `\linenummargin{<word>}` to specify which margin you want your right text's line numbers in; it takes one argument, a string. You can put the line numbers in the same margin on every page using `left` or `right`; or you can use `inner` or `outer` to get them in the inner or outer margins. You can change this within a numbered section, but the change may not take effect just when you'd like; if it's done between paragraphs nothing surprising should happen.

For right texts the selection is recorded in the count `\line@marginR`, otherwise in the count `\line@margin`: 0 for left, 1 for right, 2 for outer, and 3 for inner.

```
169 \newcount\line@marginR
170 \renewcommand*{\linenummargin}[1]{%
171   \l@dgetline@margin{\#1}%
172   \ifnum\@l@dtempcntb>\m@ne
```

```

173     \ifledRcol
174         \global\line@marginR=\@l@dttempcntb
175     \else
176         \global\line@margin=\@l@dttempcntb
177     \fi
178 \fi}}
```

By default put right text numbers at the right.

```

179 \line@marginR=\@ne
180
```

\c@firstlinenumR The following counters tell elemac which right text lines should be printed with line numbers. `firstlinenum` is the number of the first line in each section that gets a number; `linenumincrement` is the difference between successive numbered lines. The initial values of these counters produce labels on lines 5, 10, 15, etc. `linenumincrement` must be at least 1.

```

181 \newcounter{firstlinenumR}
182   \setcounter{firstlinenumR}{5}
183 \newcounter{linenumincrementR}
184   \setcounter{linenumincrementR}{5}
```

\c@firstsublinenumR The following parameters are just like `firstlinenumR` and `linenumincrementR`, but for sub-line numbers. `sublinenumincrementR` must be at least 1.

```

185 \newcounter{firstsublinenumR}
186   \setcounter{firstsublinenumR}{5}
187 \newcounter{sublinenumincrementR}
188   \setcounter{sublinenumincrementR}{5}
189
```

\firstlinenum These are the user's macros for changing (sub) line numbers. They are defined in elemac v0.7, but just in case I have started by \providing them. The starred versions are specific to elepar.

\linenumincrement

\firstsublinenum

\sublinenumincrement

215
\linenumrepR \linenumrepR{\ctr} typesets the right line number (ctr), and similarly \sublinenumrepR
\sublinenumrepR for subline numbers.
216 \newcommand*\linenumrepR[1]{\@arabic{#1}}
217 \newcommand*\sublinenumrepR[1]{\@arabic{#1}}
218
\leftlinenumR \leftlinenumR and \rightlinenumR are the macros that are called to print the
\rightlinenumR right text's marginal line numbers. Much of the code for these is common and is
\l@dlinenumR maintained in \l@dlinenumR.
219 \newcommand*\leftlinenumR{%
220 \l@dlinenumR
221 \kern\linenumsep}
222 \newcommand*\rightlinenumR{%
223 \kern\linenumsep
224 \l@dlinenumR}
225 \newcommand*\l@dlinenumR{%
226 \numlabfont\linenumrepR{\line@numR}\Rlineflag%
227 \ifsublines@
228 \ifnum\subline@num>z@
229 \unskip\fullstop\sublinenumrepR{\subline@numR}%
230 \fi
231 \fi}
232

```

12.2 Line-number counters and lists

We need another set of counters and lists for the right text, corresponding to those in *eledmac* for regular or left text.

\line@numR The count \line@numR stores the line number that's used in the right text's marginal line numbering and in notes. The count \subline@numR stores a sub-line number that qualifies \line@numR. The count \absline@numR stores the absolute number of lines since the start of the right text section: that is, the number we've actually printed, no matter what numbers we attached to them.

```

233 \newcount\line@numR
234 \newcount\subline@numR

```

```
235 \newcount\absline@numR
236
```

\line@listR Now we can define the list macros that will be created from the line-list file. They are directly analogous to the left text ones. The full list of action codes and their meanings is given in the *eledmac* manual.

\actions@listR Here are the commands to create these lists:

```
237 \list@create{\line@listR}
238 \list@create{\insertlines@listR}
239 \list@create{\actionlines@listR}
240 \list@create{\actions@listR}
241
```

\linesinpar@listL In order to synchronise left and right chunks in parallel processing we need to know how many lines are in each left and right text chunk, and the maximum of these for each pair of chunks.

```
242 \list@create{\linesinpar@listL}
243 \list@create{\linesinpar@listR}
244 \list@create{\maxlinesinpar@list}
245
```

\page@numR The right text page number.

```
246 \newcount\page@numR
247
```

12.3 Reading the line-list file

\read@linelist \read@linelist{*file*} is the control sequence that's called by \beginnumbering (via \line@list@stuff) to open and process a line-list file; its argument is the name of the file.

```
248 \renewcommand*{\read@linelist}[1]{%
```

We do different things depending whether or not we are processing right text

```
249 \ifledRcol
250   \list@clear{\line@listR}%
251   \list@clear{\insertlines@listR}%
252   \list@clear{\actionlines@listR}%
253   \list@clear{\actions@listR}%
254   \list@clear{\linesinpar@listR}%
255   \list@clear{\linesonpage@listR}
256 \else
257   \list@clearing@reg
258   \list@clear{\linesinpar@listL}%
259   \list@clear{\linesonpage@listL}%
260 \fi
```

Make sure that the \maxlinesinpar@list is empty (otherwise things will be thrown out of kilter if there is any old stuff still hanging in there).

```
261 \list@clear{\maxlinesinpar@list}
```

Now get the file and interpret it.

```
262 \get@linelistfile{#1}%
263 \endgroup
```

When the reading is done, we're all through with the line-list file. All the information we needed from it will now be encoded in our list macros. Finally, we initialize the `\next@actionline` and `\next@action` macros, which specify where and what the next action to be taken is.

```
264 \ifledRcol
265   \global\page@numR=\m@ne
266   \ifx\actionlines@listR\empty
267     \gdef\next@actionlineR{1000000}%
268   \else
269     \gl@p\actionlines@listR\to\next@actionlineR
270     \gl@p\actions@listR\to\next@actionR
271   \fi
272 \else
273   \global\page@num=\m@ne
274   \ifx\actionlines@list\empty
275     \gdef\next@actionline{1000000}%
276   \else
277     \gl@p\actionlines@list\to\next@actionline
278     \gl@p\actions@list\to\next@action
279   \fi
280 \fi}
281
```

This version of `\read@linelist` creates list macros containing data for the entire section, so they could get rather large. The `\memorydump` macro is available if you run into macro memory limitations.

12.4 Commands within the line-list file

This section defines the commands that can appear within a line-list file, except for `\@lab` which is in a later section among the cross-referencing commands it is associated with.

The macros with `action` in their names contain all the code that modifies the action-code list.

`\@l@regR` `\@l` does everything related to the start of a new line of numbered text. Exactly what it does depends on whether right text is being processed.

```
282 \newcommand{\@l@regR}{%
283   \ifx\l@dchset@num\relax \else
284     \advance\absline@numR \cne
285     \set@line@action
286     \let\l@dchset@num\relax
287     \advance\absline@numR \m@ne
288     \advance\line@numR \m@ne% % do we need this?
289   \fi}
```

```

290  \advance\absline@numR \@ne
291  \ifx\next@page@numR\relax \else
292    \page@action

535   \else
536     \n@num@reg
537   \fi}
538

```

\@ref \@ref marks the start of a passage, for creation of a footnote reference. It takes \insert@countR two arguments:

- #1, the number of entries to add to \insertlines@list for this reference. This value for right text, here and within \edtext, which computes it and writes it to the line-list file, will be stored in the count \insert@countR.

```
539   \newcount\insert@countR
```

- #2, a sequence of other line-list-file commands, executed to determine the ending line-number. (This may also include other \@ref commands, corresponding to uses of \edtext within the first argument of another instance of \edtext.)

The first thing \@ref itself does is to add the specified number of items to the \insertlines@list list.

```

540 \renewcommand*{\@ref}[2]{%
541   \ifledRcol
```

```

542   \global\insert@countR=#1\relax
543   \loop\ifnum\insert@countR>\z@%
544     \xright@appenditem{\the\absline@numR}\to\insertlines@listR
545   \global\advance\insert@countR \m@ne
546   \repeat

```

Next, process the second argument to determine the page and line numbers for the end of this lemma. We temporarily equate `\@ref` to a different macro that just executes its argument, so that nested `\@ref` commands are just skipped this time. Some other macros need to be temporarily redefined to suppress their action.

```

547 \begingroup
548   \let\@ref=\dummy@ref
549   \let\page@action=\relax
550   \let\sub@action=\relax
551   \let\set@line@action=\relax
552   \let\@lab=\relax
553   #2
554   \global\endpage@num=\page@numR
555   \global\endline@num=\line@numR
556   \global\endsubline@num=\subline@numR
557 \endgroup

```

Now store all the information about the location of the lemma's start and end in `\line@list`.

```

558 \xright@appenditem%
559   {\the\page@numR|\the\line@numR|%
560   \ifsublines@ \the\subline@numR \else 0\fi|%
561   \the\endpage@num|\the\endline@num|%
562   \ifsublines@ \the\endsubline@num \else 0\fi}\to\line@listR

```

Finally, execute the second argument of `\@ref` again, to perform for real all the commands within it.

```

563 #2
564 \else

```

And when not in right text

```

565 \@ref@reg{#1}{#2}%
566 \fi}

```

`\@pend` `\@pend{<num>}` adds its argument to the `\linesinpar@listL` list, and analogously `\@pendR` for `\@pendR`. If needed, it resets line number. We start off with a `\providecommand` just in case an older version of `eledmac` is being used which does not define these macros.

```

567 \providecommand*\@pend}[1]{}
568 \renewcommand*\@pend}[1]{%
569   \ifbypstart@\global\line@num=0\fi%

581   \xright@appenditem{#1}\to\linesonpage@listR}
582

```

12.5 Writing to the line-list file

We've now defined all the counters, lists, and commands involved in reading the line-list file at the start of a section. Now we'll cover the commands that `eledmac` uses within the text of a section to write commands out to the line-list.

`\linenum@outR` The file for right texts will be opened on output stream `\linenum@outR`.

```
583 \newwrite\linenum@outR
```

`\iffirst@linenum@out@R` Once any file is opened on this stream, we keep it open forever, or else switch to
`\first@linenum@out@Rtrue` another file that we keep open.

```
584 \newif\iffirst@linenum@out@R
585 \first@linenum@out@Rtrue
```

`\line@list@stuffR` This is the right text version of the `\line@list@stuff{\langle file\rangle}` macro. It is called by `\beginnumberingR` and performs all the line-list operations needed at the start of a section. Its argument is the name of the line-list file.

```
586 \newcommand*\@line@list@stuffR[1]{%
587   \read@linelist{#1}%
588   \iffirst@linenum@out@R
589     \immediate\closeout\linenum@outR
590     \global\first@linenum@out@Rfalse
591     \immediate\openout\linenum@outR=#1
592   \else
593     \if@minipage%
594       \if@ledgroup%
595         \closeout\linenum@outR
596         \openout\linenum@outR=#1
597       \else
598         \immediate\closeout\linenum@outR
599         \immediate\openout\linenum@outR=#1\relax
600       \fi
601   \else
```

```

602      \closeout\linenum@outR%
603      \openout\linenum@outR=\#1\relax%
604      \fi
605  \fi}
606

```

\new@lineL The `\new@lineL` macro sends the `\@l` command to the left text line-list file, to mark the start of a new text line.

```

607 \newcommand*{\new@lineL}{%
608   \write\linenum@out{\string\@l[\the\c@page] [\thepage]}}

```

\new@lineR The `\new@lineR` macro sends the `\@l` command to the right text line-list file, to mark the start of a new text line.

```

609 \newcommand*{\new@lineR}{%
610   \write\linenum@outR{\string\@l[\the\c@page] [\thepage]}}

```

\flag@start We enclose a lemma marked by `\edtext` in `\flag@start` and `\flag@end`: these send the `\@ref` command to the line-list file.

```

611 \renewcommand*{\flag@start}{%
612   \ifledRcol
613     \edef\next{\write\linenum@outR{%
614       \string\@ref[\the\insert@countR][]}%
615     \next
616   \else
617     \edef\next{\write\linenum@out{%
618       \string\@ref[\the\insert@count][]}%
619     \next
620   \fi}
621 \renewcommand*{\flag@end}{%
622   \ifledRcol
623     \write\linenum@outR[]%
624   \else
625     \write\linenum@out[]%
626   \fi}

```

\startsub `\startsub` and `\endsub` turn sub-lineation on and off, by writing appropriate instructions to the line-list file.

```

627 \renewcommand*{\startsub}{\dimen0\lastskip
628   \ifdim\dimen0>0pt \unskip \fi
629   \ifledRcol \write\linenum@outR{\string\sub@on}%

649   \else     \write\linenum@out{\string\@set[#1]}%
650   \fi%
651 \fi}
```

\setlinenum You can use `\setlinenum{<num>}` before a `\pstart` to set the visible line-number to a specified positive value. It writes a `\l@d@set` command to the line-list file.

```
652 \renewcommand*{\setlinenum}[1]{%
653   \ifnum#1<\z@%
654   \led@warn@BadSetlinenum%
655   \else%
656   \ifledRcol \write\linenum@outR{\string\l@d@set[#1]}%
657   \else     \write\linenum@out{\string\l@d@set[#1]} \fi%
658 \fi}
659
```

\startlock You can use `\startlock` or `\endlock` in running text to start or end line number

\endlock locking at the current line. They decide whether line numbers or sub-line numbers are affected, depending on the current state of the sub-lineation flags.

```
660 \renewcommand*{\startlock}{%
661   \ifledRcol \write\linenum@outR{\string\lock@on}%
662   \else     \write\linenum@out{\string\lock@on}%
663   \fi}
664 \def\endlock{%
665   \ifledRcol \write\linenum@outR{\string\lock@off}%
666   \else     \write\linenum@out{\string\lock@off}%
667   \fi}
668
```

\skipnumbering In numbered text, `\skipnumbering` in a line will suspend the numbering for that particular line. That is, line numbers are unchanged and no line number will be printed.

```
669 \renewcommand*{\skipnumbering}{%
670   \ifledRcol \write\linenum@outR{\string\n@num}%
671           \advanceline{-1}%
672 }
```

```

672 \else
673   \skipnumbering@reg
674 \fi}
675

```

13 Marking text for notes

The `\edtext` (or `\critext`) macro is used to create all footnotes and endnotes, as well as to print the portion of the main text to which a given note or notes is keyed. The idea is to have that lemma appear only once in the `.tex` file: all instances of it in the main text and in the notes are copied from that one appearance.

`\critext` requires two arguments. At any point within numbered text, you use it by saying:

```
\critext{#1}{#2}
```

Similarly `\edtext` requires the same two arguments but you use it by saying:

```
\edtext{#1}{#2}
```

`\critext` Now we begin `\critext` itself.

We slightly modify the original to make accomodation for when right text is being processed.

```

676 \long\def\critext#1#2{\leavevmode

14 Parallel environments

The initial set up for parallel processing is deceptively simple.

- pairs** The **pairs** environment is for parallel columns and the **pages** environment for parallel pages.

```
chapterinpages 744 \newenvironment{pairs}{%
745   \l@dpairingtrue
746   \l@dpagingfalse
747 }{%
748   \l@dpairingfalse
749 }
```

The **pages** environment additionally sets the ‘column’ widths to the **\textwidth** (as known at the time the package is called). In this environment, there are two text in parallel on 2 pages. To prevent chapters starting on a lefthand page, the **\chapter** command is redefined to not clear pages.

```
750 \newenvironment{pages}{%
751   \let\oldchapter\chapter
752   \let\chapter\chapterinpages
753   \l@dpairingtrue
754   \l@dpagingtrue
755   \setlength{\Lcolwidth}{\textwidth}%
756   \setlength{\Rcolwidth}{\textwidth}%

15 Paragraph decomposition and reassembly

In order to be able to count the lines of text and affix line numbers, we add an extra stage of processing for each paragraph. We send the paragraph into a box register, rather than straight onto the vertical list, and when the paragraph ends

we slice the paragraph into its component lines; to each line we add any notes or line numbers, add a command to write to the line-list, and then at last send the line to the vertical list. This section contains all the code for this processing.

15.1 Boxes, counters, \pstart and \pend

\num@linesR Here are numbers and flags that are used internally in the course of the paragraph decomposition.
\one@lineR

\par@lineR When we first form the paragraph, it goes into a box register, \l@dLcolrawbox or \l@dRcolrawbox for right text, instead of onto the current vertical list. The \ifnumberedpar@ flag will be true while a paragraph is being processed in that way. \num@lines(R) will store the number of lines in the paragraph when it's complete. When we chop it up into lines, each line in turn goes into the \one@line or \one@lineR register, and \par@line(R) will be the number of that line within the paragraph.

```
809 \newcount\num@linesR
810 \newbox\one@lineR
811 \newcount\par@lineR
```

\pstartL \pstart starts the paragraph by clearing the \inserts@list list and other relevant variables, and then arranges for the subsequent text to go into the appropriate box. \pstart needs to appear at the start of every paragraph that's to be numbered.

Beware: everything that occurs between \pstart and \pend is happening within a group; definitions must be global if you want them to survive past the end of the paragraph.

We have to have specific left and right \pstart when parallel processing; among other things because of potential changes in the linewidth. The old counters are used to have the good reset of the pstart counters at the begining of the \Pages command.

15.5 Pstart number printing in side

The printing of the pstart number is like in elemac, with two differences :

- Some commands have versions suffixed by R or L.
- The `\affixpstart@num` and `\affixpstart@numR` commands are called in the `\Pages` command. Consequently, the `pstartL` and `pstartR` counters must be reset at the begining of this command.

```

1303 }

15.6 Add insertions to the vertical list

```
\inserts@listR \inserts@listR is the list macro that contains the inserts that we save up for
one right text paragraph.

1304 \list@create{\inserts@listR}

\add@insertsR The right text version.

\add@inserts@nextR 1305 \newcommand*{\add@insertsR}{%
1306   \global\let\add@inserts@nextR=\relax
1307   \ifx\inserts@listR\empty \else
1308     \ifx\next@insertR\empty
1309       \ifx\insertlines@listR\empty
1310         \global\noteschanged@true
1311         \gdef\next@insertR{100000}%
1312       \else
1313         \gl@p\insertlines@listR\to\next@insertR
1314       \fi
1315     \fi
1316     \ifnum\next@insertR=\absline@numR

1318       \@insertR
1319       \global\let@\insertR=\undefined
1320       \global\let\next@insertR=\empty
1321       \global\let\add@inserts@nextR=\add@insertsR
1322     \fi
1323   \fi
1324 \add@inserts@nextR}
1325
```

15.7 Penalties

\add@penaltiesL \add@penaltiesL is the last macro used by \do@lineL. It adds up the club, widow, and interline penalties, and puts a single penalty of the appropriate size back into the paragraph; these penalties get removed by the \vsplit operation. \displaywidowpenalty and \brokenpenalty are not restored, since we have no easy way to find out where we should insert them.

In the code below, which is a virtual copy of the original \add@penalties, \num@lines is the number of lines in the whole paragraph, and \par@line is the line we're working on at the moment. The count \cldtempcnta is used to calculate and accumulate the penalty; it is initially set to the value of \ballast@count, which has been worked out in \do@ballast. Finally, the penalty is checked to see that it doesn't go below -10000.

```
\newcommand*{\add@penaltiesR}{\cldtempcnta=\ballast@count
\ifnum\num@linesR>\cne
\global\advance\par@lineR \cne
```

```
\ifnum\par@lineR=\@ne
  \advance\@l@dtmpcnta by \clubpenalty
\fi
\@l@dtmpcntb=\par@lineR \advance\@l@dtmpcntb \@ne
\ifnum\@l@dtmpcntb=\num@linesR
  \advance\@l@dtmpcnta by \widowpenalty
\fi
\ifnum\par@lineR<\num@linesR
  \advance\@l@dtmpcnta by \interlinepenalty
\fi
\fi
\ifnum\@l@dtmpcnta=\z@
  \relax
\else
  \ifnum\@l@dtmpcnta>-10000
    \penalty\@l@dtmpcnta
  \else
    \penalty -10000
  \fi
\fi
\fi}
```

This is for a single chunk. However, as we are probably dealing with several chunks at a time, the above is nor really relevant. I think that it is likely with parallel text that there is no real need to add back any penalties; even if there was, they would have to match across the left and right lines. So, I end up with the following.

```
1326 \newcommand*{\add@penaltiesL}{}
1327 \newcommand*{\add@penaltiesR}{}
1328
```

15.8 Printing leftover notes

`\flush@notesR` The `\flush@notesR` macro is called after the entire right text has been sliced up and sent on to the vertical list.

```
1329 \newcommand*{\flush@notesR}{%
1330   \@xloop
1331   \ifx\inserts@listR\empty \else
1332     \gl@p\inserts@listR\to\@insertR
1333     \v@insertR
1334     \global\let\@insertR=\undefined
1335   \repeat}
1336
```

16 Footnotes

16.1 Normal footnote formatting

The `\printlines` macro prints the line numbers for a note—which, in the general case, is a rather complicated task. The seven parameters of the argument are the line numbers as stored in `\1@d@nums`, in the form described on page ???: the starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma.

```
\printlinesR This is the right text version of \printlines and takes account of \Rlineflag.
\ledsavedprintlines Just in case, \ledsavedprintlines is a copy of the original \printlines.

        Just a reminder of the arguments:
\printlinesR #1      |  #2 |  #3   |  #4   |  #5 |  #6   |  #7
\printlinesR start-page | line | subline | end-page | line | subline | font
1337 \def\printlinesR#1|#2|#3|#4|#5|#6|#7|{\begingroup
1338   \setprintlines{#1}{#2}{#3}{#4}{#5}{#6}{#7}{#8}{#9}{#10}{#11}{#12}{#13}{#14}{#15}{#16}
1339   \ifl0d@pnum #1\fullstop\fi
1340   \ifl0d@plinenum \linenumr@p{#2}\Rlineflag\else \symplinenum\fi
1341   \ifl0d@ssub \fullstop \sublinenumr@p{#3}\fi
1342   \ifl0d@dash \endashchar\fi
1343   \ifl0d@pnum #4\fullstop\fi
1344   \ifl0d@elin \linenumr@p{#5}\Rlineflag\fi
1345   \ifl0d@esl \ifl0d@elin \fullstop\fi \sublinenumr@p{#6}\fi
1346 \endgroup}
1347
1348 \let\ledsavedprintlines\printlines
1349
```

17 Cross referencing

`\labelref@listR` Set up a new list, `\labelref@listR`, to hold the page, line and sub-line numbers for each label in right text.

```
1350 \list@create{\labelref@listR}
1351
```

`\edlabel` The `\edlabel` command first writes a `\@lab` macro to the `\linenum@out` file. It then checks to see that the `\labelref@list` actually has something in it (if not, it creates a dummy entry), and pops the next value for the current label, storing it in `\label@refs`. Finally it defines the label to be `\empty` so that any future check will turn up the fact that it has been used.

```
1352 \renewcommand*{\edlabel}[1]{\@bsphack
1353   \ifledRcol
1354     \write\linenum@outR{\string\@lab}%
1355     \ifx\labelref@listR\empty

Lastly reset the modified category codes.

```

1608 \catcode`&=\next
1609

```

21 Naming macros

The LaTeX kernel provides `\@namedef` and `\@namuse` for defining and using macros that may have non-letters in their names. We need something similar here as we are going to need and use some numbered boxes and counters.

`\newnamebox` A set of macros for creating and using ‘named’ boxes; the macros are called after `\setnamebox` the regular box macros, but including the string ‘name’.

```

\unhnamebox 1610 \providecommand*\{\newnamebox}[1]{%
\unvnamebox 1611   \expandafter\newbox\csname #1\endcsname}
\namebox 1612 \providecommand*\{\setnamebox}[1]{%
 1613   \expandafter\setbox\csname #1\endcsname}
 1614 \providecommand*\{\unhnamebox}[1]{%
 1615   \expandafter\unhbox\csname #1\endcsname}
 1616 \providecommand*\{\unvnamebox}[1]{%
 1617   \expandafter\unvbox\csname #1\endcsname}
 1618 \providecommand*\{\namebox}[1]{%
 1619   \csname #1\endcsname}
 1620

```

`\newnamecount` Macros for creating and using ‘named’ counts.

```

\usenamecount 1621 \providecommand*\{\newnamecount}[1]{%
 1622   \expandafter\newcount\csname #1\endcsname}
 1623 \providecommand*\{\usenamecount}[1]{%
 1624   \csname #1\endcsname}
 1625

```

22 Counts and boxes for parallel texts

In sequential text, each chunk (that enclosed by `\pstart ... \pend`) is put into a box called `\raw@text` and then immediately printed, resulting in the box being emptied and ready for the next chunk. For parallel processing multiple boxes are needed as printing is delayed. We also need extra counters for various things.

`\maxchunks` The maximum number of chunk pairs before printing has to be called for. The default is 5120 chunk pairs.

```

1626 \newcount\l@dc@maxchunks
1627 \newcommand{\maxchunks}[1]{\l@dc@maxchunks=#1}
1628   \maxchunks{5120}
1629

```

\l@dnumstartsL The numbers of left and right chunks. \l@dnumstartsL is defined in elemac.
\l@dnumstartsR 1630 \newcount\l@dnumstartsR
1631

\l@pscL A couple of scratch counts for use in left and right texts, respectively.
\l@pscR 1632 \newcount\l@dpscL
1633 \newcount\l@dpscR
1634

\l@dsetuprawboxes This macro creates \maxchunks pairs of boxes for left and right chunks. The boxes are called \l@dLcolrawbox1, \l@dLcolrawbox2, etc.

```

1635 \newcommand*\l@dsetuprawboxes{%
1636   \l@dtmpcntb=\l@dc@maxchunks
1637   \loop\ifnum\l@dtmpcntb>\z@
1638     \newnamebox{l@dLcolrawbox}\the\l@dtmpcntb
1639     \newnamebox{l@dRcolrawbox}\the\l@dtmpcntb
1640     \advance\l@dtmpcntb \m@ne
1641   \repeat}
1642

```

\l@dsetupmaxlinecounts To be able to synchronise left and right texts we need to know the maximum number of text lines there are in each pair of chunks. \l@dsetupmaxlinecounts creates \maxchunks new counts called \l@dmaxlinesinpar1, etc., and \l@dzeromaxlinecounts zeroes all of them.

```

1643 \newcommand*\l@dsetupmaxlinecounts{%
1644   \l@dtmpcntb=\l@dc@maxchunks
1645   \loop\ifnum\l@dtmpcntb>\z@
1646     \newnamecount{l@dmaxlinesinpar}\the\l@dtmpcntb
1647     \advance\l@dtmpcntb \m@ne
1648   \repeat}
1649 \newcommand*\l@dzeromaxlinecounts{%
1650   \begingroup
1651   \l@dtmpcntb=\l@dc@maxchunks
1652   \loop\ifnum\l@dtmpcntb>\z@
1653     \global\useamecount{l@dmaxlinesinpar}\the\l@dtmpcntb=\z@
1654     \advance\l@dtmpcntb \m@ne
1655   \repeat
1656   \endgroup}
1657

```

Make sure that all these are set up. This has to be done after the user has had an opportunity to change \maxchunks.

```

1658 \AtBeginDocument{%
1659   \l@dsetuprawboxes

```

```

1660 \l@dsetupmaxlinecounts
1661 \l@dzeromaxlinecounts

1663 \l@dnumpstartsR=\z@
1664 \l@dpstcL=\z@
1665 \l@dpstcR=\z@}
1666

```

23 Fixing babel

With parallel texts there is the possibility that the two sides might use different languages via `babel`. On the other hand, `babel` might not be called at all (even though it might be already built into the format).

With the normal sequential text each line is initially typeset in the current language environment, and then it is output at which time its attachments are typeset (in the same language environment. In the parallel case lines are typeset in their current language but an attachment might be typeset outside the language environment of its line if the left and right side languages are different. To counter this, we have to make sure that the correct language is used at the proper times.

```

\ifl@dusedbabel A flag for checking if babel has been used as a package.
\l@dusedbabelfalse 1667 \newif\ifl@dusedbabel
\l@dusedbabeltrue 1668 \l@dusedbabelfalse

\ifl@dsamelang A flag for checking if the same babel language has been used for both the left and
\l@dsamelangfalse right texts.
\l@dsamelangtrue 1669 \newif\ifl@dsamelang
1670 \l@dsamelangtrue

\l@dchecklang I'm going to use \theledlanguageL and \theledlanguageR to hold the names of
the languages used for the left and right texts. This macro sets \ifl@dsamelang
TRUE if they are the same, otherwise it sets it FALSE.
1671 \newcommand*{\l@dchecklang}{%
1672 \l@dsamelangfalse
1673 \edef\@tempa{\theledlanguageL}\edef\@temp{\theledlanguageR}%
1674 \ifx\@tempa\@tempb
1675 \l@dsamelangtrue
1676 \fi}
1677

\l@dbbl@set@language In babel the macro \bbbl@set@language{\langle lang\rangle} does the work when the language
\langle lang\rangle is changed via \selectlanguage. Unfortunately for me, if it is given an
argument in the form of a control sequence it strips off the \ character rather than
expanding the command. I need a version that accepts an argument in the form
\lang without it stripping the \.
1678 \newcommand*{\l@dbbl@set@language}[1]{%
1679 \edef\languagename{\#1}%

```

```

1680   \select@language{\languagename}%
1681   \if@filesw
1682     \protected@write\@auxout{}{\string\select@language{\languagename}%
1683     \addtocontents{toc}{\string\select@language{\languagename}%
1684     \addtocontents{lof}{\string\select@language{\languagename}%
1685     \addtocontents{lot}{\string\select@language{\languagename}}%
1686   \fi}
1687

```

The rest of the setup has to be postponed until the end of the preamble when we know if `babel` has been used or not. However, for now assume that it has not been used.

```

\selectlanguage \selectlanguage is a babel command. \theledlanguageL and \theledlanguageR
\l@duselanguage are the names of the languages of the left and right texts. \l@duselanguage is
\theledlanguageL similar to \selectlanguage.
\theledlanguageR 1688 \providecommand{\selectlanguage}[1]{}
1689 \newcommand*\l@duselanguage[1] {}
1690 \gdef\theledlanguageL{}
1691 \gdef\theledlanguageR{}
1692

```

Now do the `babel` fix or `polyglossia`, if necessary.

```

1693 \AtBeginDocument{%
1694   \@ifundefined{pgf@main@language}{%

2288      }%
2289    \fi
2290  }

```

`up@correction@notespacing \parledgroup@correction@notespacing` is used before each printed line. If it's a line of notes in parallel ledgroup, the space `\parledgroup@notespacing@correction` is decreased, to make interline space correct. The decreased space is added to `\parledgroup@notespacing@correction@accumulated` and `\parledgroup@notespacing@correction@modulo`. If `\parledgroup@notespacing@correction@modulo` is equal or greater than `\baselineskip`:

- It is decreased by `\baselineskip`.
- The total of line number in the current page is decreased by one.

For example, suppose an normal interline of 24 pt and interline for note of 12 pt. That means that the two lines of notes take the place of one normal line. For every two lines of notes, the line total for the current place is decreased by one.

```

2291 {}}
2292 \newcommand{\parledgroup@correction@notespacing}[1]{%
2293   \csuse@ifledgroupnotes#1@}%
2294   \vspace{-\parledgroup@notespacing@correction}%

2307     \csdimgdef{parledgroup@beforenotes#1}{0pt}
2308 \fi
2309 }
```

28 The End

;/code;

Appendix A Some things to do when changing version

Appendix A.1 Migration to elepar 1.4.3

Version 1.4.3 corrects a bug added in version 0.12, which made hanging verse automatically flush right, despite the given value of the first element of the `\setstanzaindent` command.

If, however, you want to return to automatic flush-right margins for verses with hanging indents, you have to redefine the `\hangingsymbol` command.

```
\renewcommand{\hangingsymbol}{\protect\hfill}
```

See the two following examples:

With standard `\hangingsymbol`:

A very long verse should be sometime hanged. The position of the hanging verse is fixed.

With the modification of `\hangingsymbol`:

A very long verse should sometimes be hanging. And we can see that an hanging verse is flush right.

Change History

v0.1		\Columns 62
	General: First public release	1
v0.10		\Pages: Added \l@duselanguage to \Pages 66
	General: \edlabel commands on the right side are now correctly indicated. 1	
	\edlabel commands which start a paragraph are now put in the right place. 1	
v0.11		v0.3
	General: Change \do@lineL and \do@lineR to allow line num- bering by pstart (like in elemac 0.15). 40	
	Lineation can be by pstart (like in elemac 0.15). 16	General: Added \do@lineLhook and \do@lineRhook 40
	New management of hang- ingsymbol insertion, preventing undesirable insertions. 55	Reorganize for ledarab 1
	Prevent shift of column separator when a verse is hanged 55	\affixline@numR: Changed \affixline@numR to match new elemac 44
	\affixline@numR: Changed \affixline@numR to allow to disable line numbering (like in elemac 0.15). 44	\do@actions@nextR: Used \do@actions@fixedcode in \do@actionsR 42
	\Columns: Line numbering by pstart. 62	\do@lineL: Added \do@lineLhook to \do@lineL 40
	\get@nextboxR: Change \get@nextboxL and \get@nextboxR to allow to disable line numbering (like in elemac 0.15). 72	Simplified \do@lineL by using macros for some common code 40
	Pstart number can be printed in side 73	\do@lineR: Changed \do@lineR similarly to \do@lineL 41
v0.12		\Leftside: Added hooks into Left- side environment 34
	General: New new management of hangingsymbol insertion, pre- venting undesirable insertions. 55	\flag@end: Removed extraneous spaces from \flag@end 30
v0.2		\ifledRcol: Moved \ifl@dpairing to elemac 13
	General: Added section of babel re- lated code 59	\ifpst@rtedR: Moved \ifpst@rtedL to elemac 14
	Fix babel problems 1	\l@dlinenumR: Simplified \leftlinenumR and \rightlinenumR by introducing \l@dlinenumR 19
	\Columns: Added \l@dchecklang and \l@duselanguage to	\l@dnumpstartsR: Moved \l@dnumpstartsL to elemac . 58
		\ledsavedprintlines: Simpli- fied \printlinesR by using \setprintlines 50
		\ledstrutR: Added \ledstrutL and \ledstrutR 68
		\normalbfnoteX: Removed extraneous spaces from \normalbfnoteX 54
		\Pages: Added \ledstrutL to \Pages 66
		Added \ledstrutR to \Pages . 67

	\Rightsidehookend:	Added \Leftsidehook, \Leftsidehookend, \Rightsidehook and \Rightsidehookend	35	Possiblty to number the pstart with the commands \numberpstarttrue.	1
	\sublinenumrepR:	Added \linenumrepR and \sublinenumrepR	v0.9.1 19	\iffiledRcol: Moved \iffiledRcol and \ifnumberingR to elemac	13
v0.3.a	General: Minor fix	1	General: The numbering of the pstarts restarts on each \beginnumbering.	1
v0.3.b	General: Improved parallel page balancing	1	General: Debug : with \Columns, the hanging indentation now runs on the left columns and the hanging symbol is shown only when \stanza is used.	1
v0.3.c	General: Compatiblty with Poly- glossia	1	v0.9.3 General: \thepstartL and \thepstartR use now \bfseries and not \bf, which is deprecated and makes con- flicts with memoir class.	1
v0.3a	\line@marginR:	Don't just set \line@marginR in \linenummargin	17	v1.0 General: Compatibility with ele- mac. Change name to elempar. . 1	1
v0.3b	\Pages:	Added \l@dmindpagelines calculation for succeeding page pairs	67	Debug in lineation by pstart .. 16	
v0.4	General:	No more ledparpatch. All patches are now in the main file.	1	v1.0.1 General: Correction on \numberonlyfirstinline with lineation by pstart or by page.	1
v0.5	General:	Corrections about \section and other titles in numbered sections	1	v1.1 General: Shiftedverses becomes shiftedpstarts.	1
v0.6	General:	Be able to us \chapter in parallel pages.	1	\pstartR: Add \labelpstarttrue (from elemac).	36
v0.7	General:	Option 'shiftedverses' which make there is no blank between two parallel verses with inequal length.	1	v1.1.1 \pstartR: Correct \pstartR bug in- troduced by 1.1.	36
v0.8	General:	Possibility to have a sym- bol on each hanging of verses, like in the french typogra- phy. Redefine the commande \hangingsymbol to define the character.	1	v1.1.2 \affixside@noteR: Remove spuri- ous space between line number and line content	53
v0.9	General:	Possibility to number \pstart.	7	v1.2 General: Support for \led(section) commands in parallel texts. . . 1	1
				v1.2.1 \initnumbering@sectcountR: For the right section, the counter is defined only once.	15
				v1.3 General: Manage RTL language. . 32	

v1.3.2			
General: Debug with some classes.	1		
v1.3.3			
\l@dbfnote: Spurious space with footnote in right column.	54		
\l@dcsnote: Debug on the left notes of the right column.	52		
v1.3.4			
\l@dcsnote: Allow to use com- mands in sidenotes, like it was introduced by elemac 1.0.	52		
v1.3.5			
\normalbfnoteX: Allows one to redefine \thefootnoteX with alph when some packages are loaded.	54		
v1.4			
General: Added \do@insidelineLhook and \do@insidelineRhook	40		
v1.4.1			
\normalbfnoteX: Fix bug with nor- mal familiar footnotes when mixing RTL and LTR text.	54		
astanza: Enable the use of stan- zaindentsrepetition within as- stanza environment.	56		
v1.4.2			
\line@list@stuffR: Open / close immediatly the line-list file			
		when in minipage, except if the minipage is a ledgroup.	29
v1.4.3			
General: Corrects a false hanging verse when a verse is exactly the length of a line.	1		
\inserthangingsymbolR: Hang verse is now not automatically flush right.	55		
\pendL: Spurious spaces in \pendL.	38		
\pendR: Spurious spaces in \pstartR.	39		
\pstartR: Spurious spaces in \pstartL and \pstartR.	36		
v1.5.0			
General: Add, as in elemac, fea- tures to manage page breaks.	1		
\sublinenumincrement*: Add starred version of \firstlinenum, \linenumincrement, \firstsublinenum, \sublinenumincrement to change both Left and Right- side.	18		
v1.6.0			
General: Add tool and documenta- tion for parallel ledgroups	9		
v1.7.0			
General: Add, as in elemac, fea- tures to make crossrefs with pstart numbers.	1
