

Using Lua^AT_EX to typeset RTL texte with eledpar

Abstract

This files provides an example of use of eledpar and Lua^AT_EX to typeset an Right to Left text with its translation in parallel¹.

As you can see, the switch to RTL convention is made *before* the **pstart**. It must be also called inside **\eledsection**.

For an example with X_Y^AT_EX, look at parallel-column-two-languages.tex file.
