## 1 History

This package began life as a  $\text{\LaTeX}$  interface to select system-installed Mac OS X fonts in Jonathan Kew's  $\text{Xe\TeX}$ , the first widely-used Unicode extension to  $\text{\TeX}$ . Over time,  $\text{Xe\TeX}$  was extended to support OpenType fonts and then was ported into a cross-platform program to run also on Windows and Linux.

More recently,  $\text{Lua\TeX}$  is fast becoming the  $\text{\TeX}$  engine of the day; it supports Unicode encodings and OpenType fonts and opens up the internals of  $\text{\TeX}$  via the Lua programming language. Hans Hagen's  $\text{Con\TeXt Mk. IV}$  is a re-write of his powerful typesetting system, taking full advantage of  $\text{Lua\TeX}$ 's features including font support; a kernel of his work in this area has been extracted to be useful for other  $\text{\TeX}$  macro systems as well, and this has enabled `fontspec` to be adapted for  $\text{\LaTeX}$  when run with the  $\text{Lua\TeX}$  engine.

## 2 Introduction

The `fontspec` package allows users of either  $\text{Xe\TeX}$  or  $\text{Lua\TeX}$  to load OpenType fonts in a  $\text{\LaTeX}$  document. No font installation is necessary, and font features can be selected and used as desired throughout the document.

Without `fontspec`, it is necessary to write cumbersome font definition files for  $\text{\LaTeX}$ , since  $\text{\LaTeX}$ 's font selection scheme (known as the '`NFSS`') has a lot going on behind the scenes to allow easy commands like `\emph` or `\bfseries`. With an uncountable number of fonts now available for use, however, it becomes less desirable to have to write these font definition (`.fd`) files for every font one wishes to use.

Because `fontspec` is designed to work in a variety of modes, this user documentation is split into separate sections that are designed to be relatively independent. Nonetheless, the basic functionality all behaves in the same way, so previous users of `fontspec` under  $\text{Xe\TeX}$  should have little or no difficulty switching over to  $\text{Lua\TeX}$ .

This manual can get rather in-depth, as there are a lot of details to cover. See the example documents `fontspec-xetex.tex` and `fontspec-luatex.tex` for a complete minimal example with each engine.

### 2.1 About this manual

This document is typeset with `pdflatex` using pre-compiled examples that have been generated by either  $\text{Xe\TeX}$  or  $\text{Lua\TeX}$ . You may regenerate the examples by removing the `doc-files`/ subdirectory and typesetting the manual with the following invocation:

```
pdflatex -shell-escape fontspec.dtx
```

Note that many of the examples use fonts that are not included in  $\text{\TeX} \text{ Live}$  or  $\text{MiK}\text{\TeX}$ , and some of them are non-free fonts that must be purchased.

I'd like to reduce the number of non-free fonts used in this manual. If you know any freely available fonts that could be used as alternative to any of the fonts in this document, please suggest them to me. Finally, if any aspect of the documentation is unclear or you would like to suggest more examples that could be made, get in touch. (Contributions especially welcome.)

### 2.2 Acknowledgements

This package could not have been possible without the early and continued support the author of  $\text{Xe\TeX}$ , Jonathan Kew. When I started this package, he steered me many times in the right direction.

I've had great feedback over the years on feature requests, documentation queries, bug reports, font suggestions, and so on from lots of people all around the world. Many thanks to you all.

Thanks to David Perry and Markus Böhning for numerous documentation improvements and David Perry again for contributing the text for one of the sections of this manual.

Special thanks to Khaled Hosny, who had been the driving force behind the support for Lua<sup>L</sup>T<sub>E</sub>X, ultimately leading to version 2.0 of the package.

### 3 Package loading and options

For basic use, no package options are required:

```
\usepackage{fontspec}
```

Package options will be introduced below; some preliminary details are discussed first:

**xunicode** Ross Moore's xunicode package is now automatically loaded for users of both Xe<sup>L</sup>T<sub>E</sub>X and Lua<sup>L</sup>T<sub>E</sub>X. This package provides backwards compatibility with L<sup>A</sup>T<sub>E</sub>X's methods for accessing extra characters and accents (for example, \%, \\$, \textbullet, \"u, and so on), plus many more Unicode characters.

**Xe<sup>L</sup>T<sub>E</sub>X users only** The xltextra package adds some minor extra features to Xe<sup>L</sup>T<sub>E</sub>X, including, via the metalogo package, the \XeTeX macro to typeset the Xe<sup>L</sup>T<sub>E</sub>X logo. While this package was previously recommended, it serves a much smaller rôle nowadays and generally will not be required. Please consult its documentation to assess whether its features are warranted before loading it.

**Lua<sup>L</sup>T<sub>E</sub>X users only** In order to load fonts by their name rather than by their filename (e.g., 'Latin Modern Roman' instead of 'ec-lmr10'), you may need to run the script luafontload-tool, which is distributed with the luafontload package. Note that if you do not execute this script beforehand, the first time you attempt to typeset the process will pause for (up to) several minutes. (But only the first time.) Please see the luafontload documentation for more information.

**babel** *The babel package is not really supported!* Especially Vietnamese, Greek, and Hebrew at least might not work correctly, as far as I can tell. There's a better chance with Cyrillic and Latin-based languages, however—fontspec ensures at least that fonts should load correctly. The polyglossia package is recommended instead as a modern replacement for babel.

#### 3.1 Maths fonts adjustments

By default, fontspec adjusts L<sup>A</sup>T<sub>E</sub>X's default maths setup in order to maintain the correct Computer Modern symbols when the roman font changes. However, it will attempt to avoid doing this if another maths font package is loaded (such as mathpazo or the unicode-math package).

If you find that fontspec is incorrectly changing the maths font when it should be leaving well enough alone, apply the [no-math] package option to manually suppress its maths font.

---

Example 1: Loading the default, sans serif, and monospaced fonts.

---

```
\setmainfont{TeX Gyre Bonum}
\setsansfont{Latin Modern Sans}[Scale=MatchLowercase]
\setmonofont{Inconsolata}[Scale=MatchLowercase]
```

Pack my box with five dozen liquor jugs	\rmfamily Pack my box with five dozen liquor jugs\par
Pack my box with five dozen liquor jugs	\sffamily Pack my box with five dozen liquor jugs\par
Pack my box with five dozen liquor jugs	\ttfamily Pack my box with five dozen liquor jugs

---

## 3.2 Configuration

If you wish to customise any part of the `fontspec` interface, this should be done by creating your own `fontspec.cfg` file, which will be automatically loaded if it is found by XeTeX or LuaTeX. A `fontspec.cfg` file is distributed with `fontspec` with a small number of defaults set up within it.

To customise `fontspec` to your liking, use the standard `.cfg` file as a starting point or write your own from scratch, then either place it in the same folder as the main document for isolated cases, or in a location that XeTeX or LuaTeX searches by default; e.g. in MacTeX: `~/Library/texmf/tex/latex/`.

The package option `[no-config]` will suppress the loading of the `fontspec.cfg` file under all circumstances.

## 3.3 Warnings

This package can give many warnings that can be harmless if you know what you're doing. Use the `[quiet]` package option to write these warnings to the transcript (`.log`) file instead.

Use the `[silent]` package option to completely suppress these warnings if you don't even want the `.log` file cluttered up.

# Part I

## General font selection

This section concerns the variety of commands that can be used to select fonts.

```
\fontspec{<font name>}[<font features>]
\setmainfont{<font name>}[<font features>]
\setsansfont{<font name>}[<font features>]
\setmonofont{<font name>}[<font features>]
\newfontfamily<cmd>{<font name>}[<font features>]
```

These are the main font-selecting commands of this package. The `\fontspec` command selects a font for one-time use; all others should be used to define the standard fonts used in a document, as shown in Example 1. Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The `Scale` font feature will be discussed further in [Section 7 on page 18](#), including methods for automatic scaling.

The font features argument accepts comma separated `<font feature>=<option>` lists; these are described in later:

- For general font features, see [Section 7 on page 18](#)
- For OpenType fonts, see [Part II on page 22](#)
- For  $\text{\XeTeX}$ -only general font features, see [Part IV on page 39](#)
- For  $\text{\LaTeX}$ -only general font features, see [Part III on page 37](#)
- For features for  $\text{\AAT}$  fonts in  $\text{\XeTeX}$ , see [Section 12 on page 41](#)

## 4 Font selection

In both  $\text{\LaTeX}$  and  $\text{\XeTeX}$ , fonts can be selected either by ‘font name’ or by ‘file name’.

### 4.1 By font name

Fonts known to  $\text{\LaTeX}$  or  $\text{\XeTeX}$  may be loaded by their standard names as you’d speak them out loud, such as *Times New Roman* or *Adobe Garamond*. ‘Known to’ in this case generally means ‘exists in a standard fonts location’ such as `~/Library/Fonts` on Mac OS X, or `C:\Windows\Fonts` on Windows.

The simplest example might be something like

```
\setmainfont{Cambria}[ ... ]
```

in which the bold and italic fonts will be found automatically (if they exist) and are immediately accessible with the usual `\textit` and `\textbf` commands.

TODO: add explanation for how to find out what the ‘font name’ is.

### 4.2 By file name

$\text{\XeTeX}$  and  $\text{\LaTeX}$  also allow fonts to be loaded by file name instead of font name. When you have a very large collection of fonts, you will sometimes not wish to have them all installed in your system’s font directories. In this case, it is more convenient to load them from a different location on your disk. This technique is also necessary in  $\text{\XeTeX}$  when loading OpenType fonts that are present within your  $\text{\TeX}$  distribution, such as `/usr/local/texlive/2013/texmf-dist/fonts/opentype/public`. Fonts in such locations are visible to  $\text{\XeTeX}$  but cannot be loaded by font name, only file name;  $\text{\LaTeX}$  does not have this restriction.

When selecting fonts by file name, any font that can be found in the default search paths may be used directly (including in the current directory) without having to explicitly define the location of the font file on disk.

Fonts selected by filename must include bold and italic variants explicitly.

```
\setmainfont{texgyrepagella-regular.otf}[
    BoldFont      = texgyrepagella-bold.otf ,
    ItalicFont   = texgyrepagella-italic.otf ,
    BoldItalicFont = texgyrepagella-bolditalic.otf ]
```

`fontspec` knows that the font is to be selected by file name by the presence of the `.otf` extension. An alternative is to specify the extension separately, as shown following:

```
\setmainfont{texgyrepagella-regular}[
    Extension     = .otf ,
    BoldFont      = texgyrepagella-bold ,
    ... ]
```

If desired, an abbreviation can be applied to the font names based on the mandatory ‘font name’ argument:

```
\setmainfont{texgyrepagella}[
    Extension      = .otf ,
    UprightFont   = *-regular ,
    BoldFont       = *-bold ,
    ... ]
```

In this case ‘texgyrepagella’ is no longer the name of an actual font, but is used to construct the font names for each shape; the \* is replaced by ‘texgyrepagella’. Note in this case that `UprightFont` is required for constructing the font name of the normal font to use.

To load a font that is not in one of the default search paths, its location in the filesystem must be specified with the `Path` feature:

```
\setmainfont{texgyrepagella}[
    Path          = /Users/will/Fonts/ ,
    UprightFont   = *-regular ,
    BoldFont       = *-bold ,
    ... ]
```

Note that `XeTEX` and `LuaTEX` are able to load the font without giving an extension, but `fontspec` must know to search for the file; this can be indicated by declaring the font exists in an ‘ExternalLocation’:

```
\setmainfont{texgyrepagella-regular}[
    ExternalLocation ,
    BoldFont       = texgyrepagella-bold ,
    ... ]
```

To be honest, `Path` and `ExternalLocation` are actually the same feature with different names. The former can be given without an argument and the latter can be given with one; the different names are just for clarity.

## 5 New commands to select font families

```
\newfontfamily\<font-switch>\{\<font name>\}\[\<font features>\]
\newfontface\<font-switch>\{\<font name>\}\[\<font features>\]
```

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling `\fontspec` for every use. While the `\fontspec` command does not define a new font instance after the first call, the feature options must still be parsed and processed.

`\newfontfamily`

For this reason, new commands can be created for loading a particular font family with the `\newfontfamily` command, demonstrated in Example 2. This macro should be used to create commands that would be used in the same way as `\rmfamily`, for example. If you would like to create a command that only changes the font inside its argument (i.e., the same behaviour as `\emph`) define it using regular `LATEX` commands:

```
\newcommand\textnote[1]{\notefont #1}
\textnote{This is a note.}
```

`\newfontface`

Note that the double braces are intentional; the inner pair are used to delimit the scope of the font change.

Sometimes only a specific font face is desired, without accompanying italic or bold variants being automatically selected. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. `\newfontface` is used for this purpose, shown in Example 3, which is repeated in [Section 12.4 on page 41](#).

---

Example 2: Defining new font families.

---

This is a *note*. \newfontfamily\notefont{Kurier}

\notefont This is a \emph{note}.

---

---

Example 3: Defining a single font face.

---

\newfontface\fancy{Hoefler Text Italic}%  
[Contextuals={WordInitial,WordFinal}]  
\fancy where is all the vegemite  
% \emph, \textbf, etc., all don't work

---

Comment for advanced users: The commands defined by \newfontface and \newfontfamily include their encoding information, so even if the document is set to use a legacy TeX encoding, such commands will still work correctly. For example,

```
\documentclass{article}  
\usepackage{fontspec}  
\newfontfamily\unicodefont{Lucida Grande}  
\usepackage{mathpazo}  
\usepackage[T1]{fontenc}  
\begin{document}  
A legacy \TeX\ font. {\unicodefont A unicode font.}  
\end{document}
```

## 5.1 More control over font shape selection

```
BoldFont = <font name>  
ItalicFont = <font name>  
BoldItalicFont = <font name>  
SlantedFont = <font name>  
BoldSlantedFont = <font name>  
SmallCapsFont = <font name>
```

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose among. The BoldFont and ItalicFont features are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font. See Example 4.

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the BoldItalicFont feature is provided.

### 5.1.1 Input shorthands

For those cases that the base font name is repeated, you can replace it with an asterisk. (This has been shown previously in [Section 4.2 on page 6](#).) For example, some space can be saved instead of writing 'Baskerville SemiBold':

```
\setmainfont{Baskerville}[BoldFont={* SemiBold}]
```

---

Example 4: Explicit selection of the bold font.

---

```
\fontspec{Helvetica Neue UltraLight}%
          [BoldFont={Helvetica Neue}]
Helvetica Neue UltraLight Italic           Helvetica Neue UltraLight      \\
Helvetica Neue             {\itshape     Helvetica Neue UltraLight Italic} \\
Helvetica Neue Italic        {\bfseries   Helvetica Neue } } \\
                                {\bfseries\itshape   Helvetica Neue Italic} \\
```

---

As a matter of fact, this feature can also be used for the upright font too:

```
\setmainfont{Baskerville}[UprightFont={* SemiBold},BoldFont={* Bold}]
```

### 5.1.2 Small caps and slanted font shapes

For the rare situations where a font family will have slanted *and* italic shapes, these may be specified separately using the analogous features `SlantedFont` and `BoldSlantedFont`. Without these, however, the L<sup>A</sup>T<sub>E</sub>X font switches for slanted (`\textsl`, `\slshape`) will default to the italic shape.

Old-fashioned font families used to distribute their small caps glyphs in separate fonts due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the `SmallCapsFont` of the family you are specifying:

```
\fontspec{Minion MM Roman}[
  SmallCapsFont={Minion MM Small Caps & Oldstyle Figures}
]
Roman 123 \\ \textsc{Small caps 456}
```

In fact, you may specify the small caps font for each individual bold and italic shape as in

```
\fontspec{ <upright> }[
  UprightFeatures = { SmallCapsFont={ <sc> } } ,
  BoldFeatures    = { SmallCapsFont={ <bf sc> } } ,
  ItalicFeatures  = { SmallCapsFont={ <it sc> } } ,
  BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } } ,
]
Roman 123 \\ \textsc{Small caps 456}
```

For most modern fonts that have small caps as a font feature, this level of control isn't generally necessary, but you may still occasionally find font families in which the small caps are in a separate font.

All of the bold, italic, and small caps fonts can be loaded with different font features from the main font. See [Section 6.5](#) for details. When an OpenType font is selected for `SmallCapsFont`, the small caps font feature is *not* automatically enabled. In this case, users should write instead, if necessary,

```
\fontspec{...}[
  SmallCapsFont={...},
  SmallCapsFeatures={Letters=SmallCaps},
]
```

## 5.2 Specifically choosing the NFSS family

In  $\text{\LaTeX}$ 's NFSS, font families are defined with names such as 'ppl' (Palatino), 'cmr' (Computer Modern Roman), and so on, which are selected with the `\fontfamily` command:

```
\fontfamily{ppl}\selectfont
```

In `fontspec`, the family names are auto-generated based on the fontname of the font; for example, writing `\fontspec{Times New Roman}` for the first time would generate an internal font family name of 'TimesNewRoman(1)'.

In certain cases it is desirable to be able to choose this internal font family name so it can be re-used elsewhere for interacting with other packages that use the  $\text{\LaTeX}$ 's font selection interface; an example might be

```
\usepackage{fancyvrb}
\fvset{fontfamily=myverbatimfont}
```

To select a font for use in this way in `fontspec` use the NFSSFamily feature:<sup>1</sup>

```
\newfontfamily\verbatimfont[NFSSFamily=myverbatimfont]{Inconsolata}
```

It is then possible to write commands such as:

```
\fontfamily{myverbatimfont}\selectfont
```

which is essentially the same as writing `\verbatimfont`, or to go back to the original example:

```
\fvset{fontfamily=myverbatimfont}
```

Only use this feature when necessary; the in-built font switching commands that `fontspec` generates (such as `\verbatimfont` in the example above) are recommended in all other cases.

If you don't wish to explicitly set the NFSS family but you would like to know what it is, an alternative mechanism for package writers is introduced as part of the `fontspec` programming interface; see the function `\fontspec_set_family:Nnn` for details ([Section 16 on page 47](#)).

## 5.3 Choosing additional NFSS font faces

$\text{\LaTeX}$ 's font selection scheme is more flexible than the `fontspec` interface discussed up until this point. It assigns to each font face a *family* (discussed above), a *series* such as bold or light or condensed, and a *shape* such as italic or slanted or small caps. The `fontspec` features such as `BoldFont` and so on all assign faces for the default series and shapes of the NFSS, but it's not uncommon to have font families that have multiple weights and shapes and so on.

If you set up a regular font family with the 'standard four' (upright, bold, italic, and bold italic) shapes and then want to use, say, a light font for a certain document element, many users will be perfectly happy to use `\newfontface\langle switch\rangle` and use the resulting font `\langle switch\rangle`. In other cases, however, it is more convenient or even necessary to load additional fonts using additional NFSS specifiers.

```
FontFace = {\langle series\rangle}{\langle shape\rangle} { Font = \langle font name\rangle , \langle features\rangle }
FontFace = {\langle series\rangle}{\langle shape\rangle}{\langle font name\rangle}
```

The font thus specified will inherit the font features of the main font, with optional addition `\langle features\rangle` as requested. (Note that the optional `\langle features\rangle` argument is still surrounded with curly braces.) Multiple `FontFace` commands may be used in a single declaration to specify multiple fonts. As an example:

---

<sup>1</sup>Thanks to Luca Fascione for the example and motivation for finally implementing this feature.

```
\setmainfont{font1.otf}[
  FontFace = {c}{n}{ font2.otf } ,
  FontFace = {c}{m}{ Font = font3.otf , Color = red }
]
```

Writing `\fontseries{c}\selectfont` will result in `font2` being selected, which then followed by `\fontshape{m}\selectfont` will result in `font3` being selected (in red). A font face that is defined in terms of a different series but a normal shape will attempt to find a matching small caps feature and define that face as well if appropriate. Conversely, a font faced defined in terms of a different font will not.

There are some standards for choosing shape and series codes; the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> font selection guide<sup>2</sup> lists series `m` for medium, `b` for bold, `bx` for bold extended, `sb` for semi-bold, and `c` for condensed. A far more comprehensive listing is included in Appendix A of Philipp Lehman's 'The Font Installation Guide'<sup>3</sup> covering 14 separate weights and 12 separate widths.

The `FontFace` command also interacts properly with the `SizeFeatures` command as follows: (nonsense set of font selection choices)

```
FontFace = {c}{n}[
  Font = Times ,
  SizeFeatures = {
    { Size = -10 , Font=Georgia } ,
    { Size = 10-15} , % default "Font = Times"
    { Size = 15- , Font=Cochin } ,
  },
]
```

Note that if the first `Font` feature is omitted then each size needs its own inner `Font` declaration.

## 5.4 Math(s) fonts

When `\setmainfont`, `\setsansfont` and `\setmonofont` are used in the preamble, they also define the fonts to be used in maths mode inside the `\mathrm`-type commands. This only occurs in the preamble because L<sup>A</sup>T<sub>E</sub>X freezes the maths fonts after this stage of the processing. The `fontspec` package must also be loaded after any maths font packages (*e.g.*, `euler`) to be successful. (Actually, it is *only* `euler` that is the problem.<sup>4</sup>)

Note that `fontspec` will not change the font for general mathematics; only the upright and bold shapes will be affected. To change the font used for the mathematical symbols, see either the `mathspec` package or the `unicode-math` package.

Note that you may find that loading some maths packages won't be as smooth as you expect since `fontspec` (and X<sub>E</sub>T<sub>E</sub>X in general) breaks many of the assumptions of T<sub>E</sub>X as to where maths characters and accents can be found. Contact me if you have troubles, but I can't guarantee to be able to fix any incompatibilities. The Lucida and Euler maths fonts should be fine; for all others keep an eye out for problems.

```
\setmathrm{<font name>}[<font features>]
\setmathsf{<font name>}[<font features>]
\setmathtt{<font name>}[<font features>]
\setboldmathrm{<font name>}[<font features>]
```

<sup>2</sup>`texdoc fntguide`

<sup>3</sup>`texdoc fontinstallationguide`

<sup>4</sup>Speaking of `euler`, if you want to use its `[mathbf]` option, it won't work, and you'll need to put this after `fontspec` is loaded instead: `\AtBeginDocument{\DeclareMathAlphabet\mathbf{U}{eur}{b}{n}}`

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use the commands above (in the same way as our other `\fontspec`-like commands) to explicitly state which fonts to use inside such commands as `\mathrm`. Additionally, the `\setboldmathrm` command allows you define the font used for `\mathrm` when in bold maths mode (which is activated with, among others, `\boldmath`).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage{mathpazo}
\usepackage{fontspec,xunicode}
\setmainfont{Optima}
\setmathrm{Optima}
\setboldmathrm[BoldFont={Optima ExtraBlack}]{Optima Bold}
```

## 5.5 Miscellaneous font selecting details

**The optional argument — from v2.4** For the first decade of `fontspec`'s life, optional font features were selected with a bracketed argument before the font name, as in:

```
\setmainfont[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
]{myfont.otf}
```

This always looked like ugly syntax to me, and the order of these arguments has now been reversed:

```
\setmainfont{myfont.otf}[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
]
```

I hope this doesn't cause any problems.

1. Backwards compatibility has been preserved. (In fact, you could even write

```
\fontspec[Ligatures=Rare]{myfont.otf}[Color=red]
```

if you really felt like it and both sets of features would be applied.)

2. Following standard `xparse` behaviour, there must be no space before the opening bracket; writing

```
\fontspec{myfont.otf}_[Color=red]
```

will result in `[Color=red]` not being recognised an argument and therefore it will be typeset as text. When breaking over lines, write either of:

<code>\fontspec{myfont.otf}%</code>	<code>\fontspec{myfont.otf}[\code&gt;</code>
<code>[Color=red]</code>	<code>Color=Red]</code>

**Spaces** `\fontspec` and `\addfontfeatures` ignore trailing spaces as if it were a 'naked' control sequence; e.g., '`M. \fontspec{...} N`' and '`M. \fontspec{...}N`' are the same.

---

Example 5: A demonstration of the `\defaultfontfeatures` command.

---

```
\fontspec{TeX Gyre Adventor}
Some default text 0123456789 \\
\defaultfontfeatures{
    Numbers=OldStyle, Color=888888
}
\fontspec{TeX Gyre Adventor}
Now grey, with old-style figures:
0123456789
```

Some default text 0123456789  
Now grey, with old-style figures: 0123456789

---

**Italic small caps** Note that this package redefines the `\itshape` and `\scshape` commands in order to allow them to select italic small caps in conjunction.

**Emphasis and nested emphasis** You may specify the behaviour of the `\emph` command by setting the `\emshape` command. *E.g.*, for bold emphasis:

```
\renewcommand\emshape{\bfseries}
```

Nested emphasis is controlled by the `\eminnershape` command. For example, for `\emph{\emph{\dots}}` to produce small caps:

```
\renewcommand\eminnershape{\scshape}
```

This functionality is provided by the `fixltx2e` package, which is automatically loaded by `fontspec`.

## 6 Selecting font features

The commands discussed so far such as `\fontspec` each take an optional argument for accessing the font features of the requested font. Commands are provided to set default features to be applied for all fonts, and even to change the features that a font is presently loaded with. Different font shapes can be loaded with separate features, and different features can even be selected for different sizes that the font appears in. This section discusses these options.

### 6.1 Default settings

```
\defaultfontfeatures{<font features>}
```

It is sometimes useful to define font features that are applied to every subsequent font selection command. This may be defined with the `\defaultfontfeatures` command, shown in Example 5. New calls of `\defaultfontfeatures` overwrite previous ones, and defaults can be reset by calling the command with an empty argument.

```
\defaultfontfeatures[<font name>]{<font features>}
```

Default font features can be specified on a per-font and per-face basis by using the optional argument to `\defaultfontfeatures` as shown.<sup>5</sup>

```
\defaultfontfeatures[TeX Gyre Adventor]{Color=blue}
\setmainfont{TeX Gyre Adventor}% will be blue
```

---

<sup>5</sup>Internally, `<font name>` has all spaces removed and is converted to lowercase.

Multiple fonts may be affected by using a comma separated list of font names.

```
\defaultfontfeatures[<\font-switch>]{<font features>}
```

**New in v2.4.** Defaults can also be applied to symbolic families such as those created with the `\newfontfamily` command and for `\rmfamily`, `\sfamily`, and `\ttfamily`:

```
\defaultfontfeatures[\rmfamily,\sfamily]{Ligatures=TeX}
\setmainfont{TeX Gyre Adventor}% will use standard TeX ligatures
```

The line above to set TeX-like ligatures is now activated by `default` in `fontspec.cfg`. To reset default font features, simply call the command with an empty argument:

```
\defaultfontfeatures[\rmfamily,\sfamily]{}
\setmainfont{TeX Gyre Adventor}% will no longer use standard TeX ligatures
```

```
\defaultfontfeatures+{<font features>}
\defaultfontfeatures+[<font name>]{<font features>}
```

**New in v2.4.** Using the + form of the command appends the `<font features>` to any already-selected defaults.

## 6.2 Default settings from a file

In addition to the defaults that may be specified in the document as described above, when a font is first loaded, a configuration file is searched for with the name '`<fontname>.fontspec`'.<sup>6</sup>

The contents of this file can be used to specify default font features without having to have this information present within each document. `<fontname>` is stripped of spaces and file extensions are omitted; for example, the line above for TeX Gyre Adventor could be placed in a file called `TeXGyreAdventor.fontspec`, or for specifying options for `texgyreadventor-regular.otf` (when loading by filename), the configuration file would be `texgyreadventor-regular.fontspec`.

This mechanism can be used to define custom names or aliases for your font collections. If you create a file `my-charis.fontspec` containing, say,

```
\defaultfontfeatures[my-charis]
{
  Extension = .ttf ,
  UprightFont = CharisSILR,
  BoldFont = CharisSILB,
  ItalicFont = CharisSILI,
  BoldItalicFont = CharisSILBI,
  % <any other desired options>
}
```

you can load that family with `\fontspec{my-charis}` and similar. The optional argument to `\defaultfontfeatures` must match the filename else the options won't take effect.

Finally, note that options for font faces can also be defined in this way. To continue the example above, here we colour the different faces:

```
\defaultfontfeatures[CharisSILR]{Color=blue}
\defaultfontfeatures[CharisSILB]{Color=red}
```

And such configuration lines can be stored within their own `.fontspec` files; in this way, `fontspec` is designed to handle 'nested' configuration options as well.

<sup>6</sup>Located in the current folder or within a standard `texmf` location.

---

Example 6: A demonstration of the `\addfontfeatures` command. Note the caveat listed in the text regarding such usage.

---

'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'

Year	People	Miles	Boats
1842	999	75	13
1923	111	54	56

```
\fontspec[TeX Gyre Adventor]%
    [Numbers={Proportional,OldStyle}]
`In 1842, 999 people sailed 97 miles in
13 boats. In 1923, 111 people sailed 54
miles in 56 boats.' \bigskip

{\addfontfeatures{Numbers={Monospaced,Lining}}
\begin{tabular}{@{} cccc @{}}
& & & \\
Year & People & Miles & Boats \\
\hline 1842 & 999 & 75 & 13 \\
& 1923 & 111 & 54 & 56 \\
\end{tabular}}
```

---

### 6.3 Changing the currently selected features

```
\addfontfeatures{<font features>}
```

This command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in Example 6. Note however that the behaviour in this regard will be unreliable (subject to the font itself) if you attempt to *change* an already selected feature. *E.g.*, this sort of thing can cause troubles:

```
\addfontfeature{Numbers=OldStyle}...
\addfontfeature{Numbers=Lining}...
123
```

With both features active, how will the font render '123'? Depends on the font. In the distant future this functionality will be re-written to avoid this issue (giving 'Numbers=OldStyle' the smarts to know to explicitly de-activate any previous instances of 'Numbers=Lining', and vice-versa, but as I hope you can imagine this requires a fair degree of elbow grease which I haven't had available for some time now.

`\addfontfeature`

This command may also be executed under the alias `\addfontfeature`.

### 6.4 Priority of feature selection

Features defined with `\addfontfeatures` override features specified by `\fontspec`, which in turn override features specified by `\defaultfontfeatures`. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (.log) file displaying the font name and the features requested.

---

Example 7: Features for, say, just italics.

---

```
ATTENTION ALL MARTINI DRINKERS \fontspec{Hoefler Text} \itshape \scshape
ATTENTION ALL MARTINI DRINKERS Attention All Martini Drinkers \\
ATTENTION ALL MARTINI DRINKERS \addfontfeature{ItalicFeatures={Alternate = 1}}
ATTENTION ALL MARTINI DRINKERS Attention All Martini Drinkers \\
```

---

---

Example 8: Multiple Master-like features in AAT fonts.

---

Skia	\fontspec[BoldFont={Skia},
Skia 'Bold'	BoldFeatures={Weight=2}]{Skia}
	Skia \\ \bfseries Skia 'Bold'

---

## 6.5 Different features for different font shapes

```
BoldFeatures={<features>}
ItalicFeatures={<features>}
BoldItalicFeatures={<features>}
SlantedFeatures={<features>}
BoldSlantedFeatures={<features>}
SmallCapsFeatures={<features>}
```

It is entirely possible that separate fonts in a family will require separate options; e.g., Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional `\fontspec` argument are applied to *all* shapes of the family. Using `Upright-`, `SmallCaps-`, `Bold-`, `Italic-`, and `BoldItalicFeatures`, separate font features may be defined to their respective shapes *in addition* to, and with precedence over, the ‘global’ font features. See Example 7.

Combined with the options for selecting arbitrary *fonts* for the different shapes, these separate feature options allow the selection of arbitrary weights in the Skia typeface, as shown in Example 8.

Note that because most fonts include their small caps glyphs within the main font, features specified with `SmallCapsFeatures` are applied *in addition* to any other shape-specific features as defined above, and hence `SmallCapsFeatures` can be nested within `ItalicFeatures` and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the somewhat ludicrous Example 9.

## 6.6 Different features for different font sizes

```
SizeFeatures = {
  ...
  { Size = <size range>, <font features> },
  { Size = <size range>, Font = <font name>, <font features> },
  ...
}
```

The `SizeFeature` feature is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font

---

Example 9: An example of setting the SmallCapsFeatures separately for each font shape.

---

	<pre>\fontspec{TeX Gyre Termes}[</pre>
Upright SMALL CAPS	<pre>    UprightFeatures={Color = 220022,</pre>
<i>Italic ITALIC SMALL CAPS</i>	<pre>        SmallCapsFeatures = {Color=115511}},</pre>
<b>Bold BOLD SMALL CAPS</b>	<pre>    ItalicFeatures={Color = 2244FF,</pre>
<i>Bold Italic BOLD ITALIC SMALL CAPS</i>	<pre>        SmallCapsFeatures = {Color=112299}},</pre>
	<pre>    BoldFeatures={Color = FF4422,</pre>
	<pre>        SmallCapsFeatures = {Color=992211}},</pre>
	<pre>    BoldItalicFeatures={Color = 888844,</pre>
	<pre>        SmallCapsFeatures = {Color=444422}},</pre>
	<pre>    ]</pre>
Upright SMALL CAPS	<pre>Upright {\scshape Small Caps}\\"</pre>
<i>Italic ITALIC SMALL CAPS</i>	<pre>\itshape Italic {\scshape Italic Small Caps}\\"</pre>
<b>Bold BOLD SMALL CAPS</b>	<pre>\upshape\bfseries Bold {\scshape Bold Small Caps}\\"</pre>
<i>Bold Italic BOLD ITALIC SMALL CAPS</i>	<pre>\itshape Bold Italic {\scshape Bold Italic Small Caps}</pre>

---

---

Example 10: An example of specifying different font features for different sizes of font with SizeFeatures.

---

	<pre>\fontspec{TeX Gyre Chorus}[</pre>
	<pre>    SizeFeatures={</pre>
<i>Small</i>	<pre>        {Size={-8}, Font=TeX Gyre Bonum Italic, Color=AA0000},</pre>
<i>Normal size</i>	<pre>        {Size={8-14}, Color=00AA00},</pre>
	<pre>        {Size={14-}, Color=0000AA}} ]</pre>
<i>Large</i>	<pre>{\scriptsize Small\par} Normal size\par {\Large Large\par}</pre>

---

family as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the `Size` option to declare the size range, and optionally `Font` to change the font based on size. Other (regular) `fontspec` features that are added are used on top of the font features that would be used anyway. A demonstration to clarify these details is shown in Example 10. A less trivial example is shown in the context of optical font sizes in [Section 7.6 on page 21](#).

To be precise, the `Size` sub-feature accepts arguments in the form shown in [Table 1 on the following page](#). Braces around the size range are optional. For an exact font size (`Size=X`) font sizes chosen near that size will ‘snap’. For example, for size definitions at exactly 11pt and 14pt, if a 12pt font is requested *actually* the 11pt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

If additional features are only required for a single size, the other sizes must still be specified. As in:

```
SizeFeatures={  
    {Size=-10,Numbers=Uppercase},  
    {Size=10-}}
```

Otherwise, the font sizes greater than 10 won’t be defined at all!

Table 1: Syntax for specifying the size to apply custom font features.

Input	Font size, s
Size = X-	$s \geq X$
Size = -Y	$s < Y$
Size = X-Y	$X \leq s < Y$
Size = X	$s = X$

---

Example 11: Selecting colour with transparency. N.B. due to a conflict between fontspec and the preview package, this example currently does not show any transparency!

```
\fontsize{48}{48}
\fontspec[TeX Gyre Bonum Bold]
{\addfontfeature{Color=FF000099}W}\kern-0.5ex
{\addfontfeature{Color=0000FF99}S}\kern-0.4ex
{\addfontfeature{Color=DDBB2299}P}\kern-0.4ex
{\addfontfeature{Color=00BB3399}R}
```

---

**Interaction with other features** For SizeFeatures to work with ItalicFeatures, BoldFeatures, etc., and SmallCapsFeatures, a strict hierarchy is required:

```
UprightFeatures =
{
  SizeFeatures =
  {
    {
      Size = -10,
      Font = ..., % if necessary
      SmallCapsFeatures = {...},
      ... % other features for this size range
    },
    ... % other size ranges
  }
}
```

Suggestions on simplifying this interface welcome.

## 7 Font independent options

Features introduced in this section may be used with any font.

### 7.1 Colour

Color (or Colour), also shown in [Section 6.1 on page 13](#) and elsewhere, uses font specifications to set the colour of the text. The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.) Transparency is supported by Lua<sup>L</sup>ATE<sub>X</sub>; X<sup>E</sup>ATE<sub>X</sub> with the xdvipdfmx driver does not support this feature.

If you load the xcolor package, you may use any named colour instead of writing the colours in hexadecimal.

---

Example 12: Automatically calculated scale values.

---

The perfect match is hard to find.  
LOGOFONT

```
\setmainfont{Georgia}
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
The perfect match {\lc is hard to find.} \\
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
L O G O \uc F O N T
```

---

```
\usepackage{xcolor}
...
\fontspec[Color=red]{Verdana} ...
\definecolor{Foo}{rgb}{0.3,0.4,0.5}
\fontspec[Color=Foo]{Verdana} ...
```

The color package is *not* supported; use xcolor instead.

You may specify the transparency with a named colour using the `Opacity` feature which takes an decimal from zero to one corresponding to transparent to opaque respectively:

```
\fontspec[Color=red,Opacity=0.7]{Verdana} ...
```

It is still possible to specify a colour in six-char hexadecimal form while defining opacity in this way, if you like.

## 7.2 Scale

Scale = <i>number</i>
Scale = MatchLowercase
Scale = MatchUppercase

In its explicit form, Scale takes a single numeric argument for linearly scaling the font, as demonstrated in Example 1. It is now possible to measure the correct dimensions of the fonts loaded and calculate values to scale them automatically.

As well as a numerical argument, the Scale feature also accepts options `MatchLowercase` and `MatchUppercase`, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively; these features are shown in Example 12.

The amount of scaling used in each instance is reported in the `.log` file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

Note that when `Scale=MatchLowercase` is used with `\setmainfont`, the new ‘main’ font of the document will be scaled to match the old default. This may be undesirable in some cases, so to achieve ‘natural’ scaling for the main font but automatically scale all other fonts selected, you may write

```
\defaultfontfeatures{ Scale = MatchLowercase }
\defaultfontfeatures[\rmfamily]{ Scale = 1 }
```

One or both of these lines may be placed into a local `fontspec.cfg` file (see Section 3.2 on page 5) for this behaviour to be effected in your own documents automatically. (Also see Section 6.1 on page 13 for more information on setting font defaults.)

---

Example 13: Scaling the default interword space. An exaggerated value has been chosen to emphasise the effects here.

---

Some text for our example to take up some space, and to demonstrate the default interword space.

Sometextforourexampletotakeupsomespace, and todemonstrate the default interword space.

```
\fontspec{TeX Gyre Termes}
Some text for our example to take
up some space, and to demonstrate
the default interword space.
\bigskip
```

```
\addfontfeature{ WordSpace = 0.3 }
Some text for our example to take
up some space, and to demonstrate
the default interword space.
```

---

Example 14: Scaling the default post-punctuation space.

---

```
\nonfrenchspacing
\fontspec{TeX Gyre Schola}
Letters, Words. Sentences.          \par
\fontspec{TeX Gyre Schola}[PunctuationSpace=2]
Letters, Words. Sentences.          \par
\fontspec{TeX Gyre Schola}[PunctuationSpace=0]
Letters, Words. Sentences.
```

### 7.3 Interword space

While the space between words can be varied on an individual basis with the  $\text{\TeX}$  primitive  $\backslash spaceskip$  command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically, and generally will not need to be adjusted. For those times when the precise details are important, the `WordSpace` feature is provided, which takes either a single scaling factor to scale the default value, or a triplet of comma-separated values to scale the nominal value, the stretch, and the shrink of the interword space by, respectively. (`WordSpace={x}` is the same as `WordSpace={x,x,x}`.)

### 7.4 Post-punctuation space

If `\frenchspacing` is *not* in effect,  $\text{\TeX}$  will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The `PunctuationSpace` feature takes a scaling factor by which to adjust the nominal value chosen for the font; this is demonstrated in Example 14. Note that `PunctuationSpace=0` is *not* equivalent to `\frenchspacing`, although the difference will only be apparent when a line of text is under-full.

Example 15: Explicitly choosing the hyphenation character.

## EXAMPLE HYPHENATION

## EXAMPLE HYPHEN+ ATION

Example 16: A demonstration of automatic optical size selection.

```
\fontspec{Latin Modern Roman}
Automatic optical size
\scalebox{0.4}{\Huge
Automatic optical size}
```

## 7.5 The hyphenation character

The letter used for hyphenation may be chosen with the `HyphenChar` feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string `None`, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

This package redefines L<sup>A</sup>T<sub>E</sub>X's \ - macro such that it adjusts along with the above changes.

## 7.6 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by Xe<sup>T</sup>E<sub>X</sub> and Lua<sup>T</sup>E<sub>X</sub> automatically determined by the current font size as in Example 16, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes.

The `OpticalSize` option may be used to specify a different optical size. With `OpticalSize` set to zero, no optical size font substitution is performed, as shown in Example 17.

The `SizeFeatures` feature (Section 6.6 on page 16) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like:

```
\fontspec[Latin Modern Roman][
  UprightFeatures = { SizeFeatures = {
    {Size=-10,      OpticalSize=8 },
    {Size= 10-14,   OpticalSize=10},
    {Size= 14-18,   OpticalSize=14},
    {Size= 18-,     OpticalSize=18}}}
]
```

---

Example 17: Optical size substitution is suppressed when set to zero.

---

Latin Modern optical sizes	\fontspec{Latin Modern Roman 5 Regular}[OpticalSize=0] Latin Modern optical sizes \\
Latin Modern optical sizes	\fontspec{Latin Modern Roman 8 Regular}[OpticalSize=0] Latin Modern optical sizes \\
Latin Modern optical sizes	\fontspec{Latin Modern Roman 12 Regular}[OpticalSize=0] Latin Modern optical sizes \\
Latin Modern optical sizes	\fontspec{Latin Modern Roman 17 Regular}[OpticalSize=0] Latin Modern optical sizes

---

## Part II

# OpenType

### 8 Introduction

OpenType fonts (and other ‘smart’ font technologies such as AAT and Graphite) can change the appearance of text in many different ways. These changes are referred to as features. When the user applies a feature — for example, small capitals — to a run of text, the code inside the font makes appropriate adjustments and small capitals appear in place of lowercase letters. However, the use of such features does not affect the underlying text. In our small caps example, the lowercase letters are still stored in the document; only the appearance has been changed by the OpenType feature. This makes it possible to search and copy text without difficulty. If the user selected a different font that does not support small caps, the ‘plain’ lowercase letters would appear instead.

Some OpenType features are required to support particular scripts, and these features are often applied automatically. The scripts used in India, for example, often require that characters be reshaped and reordered after they are typed by the user, in order to display them in the traditional ways that readers expect. Other features can be applied to support a particular language. The Junicode font for medievalists uses by default the Old English shape of the letter thorn, while in modern Icelandic thorn has a more rounded shape. If a user tags some text as being in Icelandic, Junicode will automatically change to the Icelandic shape through an OpenType feature that localizes the shapes of letters.

A very large group of OpenType features is designed to support high quality typography in Latin, Greek, Cyrillic and other standard scripts. Examples of some font features have already been shown in previous sections; the complete set of OpenType font features supported by `fontspec` is described below in [Section 9](#).

The OpenType specification provides four-letter codes (e.g., `smcp` for small capitals) for each feature. The four-letter codes are given below along with the `fontspec` names for various features, for the benefit of people who are already familiar with OpenType. You can ignore the codes if they don’t mean anything to you.

#### 8.1 How to select font features

Font features are selected by a series of  $\langle feature \rangle = \langle option \rangle$  selections. Features are (usually) grouped logically; for example, all font features relating to ligatures are accessed by writing

Table 2: Options for the OpenType font feature ‘Ligatures’.

Feature	Option	Tag
Ligatures =	Required	* rlig
	NoRequired	rlig ( <i>deactivate</i> )
	Common	* liga
	NoCommon	liga ( <i>deactivate</i> )
	Contextual	* clig
	NoContextual	clig ( <i>deactivate</i> )
	Rare/Discretionary	dlig
	Historic	hlig
	TeX	tlig/trep

\* This feature is activated by default.

`Ligatures={...}` with the appropriate argument(s), which could be `TeX`, `Rare`, etc., as shown below in [Section 9.1](#).

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; `Numbers={OldStyle,Lining}` doesn’t make much sense because the two options are mutually exclusive, and  $\text{\XeTeX}$  will simply use the last option that is specified (in this case using `Lining` over `OldStyle`).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in [Section 3.3 on page 5](#) these warnings can be suppressed by selecting the `[quiet]` package option.

## 9 Complete listing of OpenType font features

### 9.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or aesthetic reasons. The list of options, of which multiple may be selected at one time, is shown in [Table 2](#). A demonstration with the Linux Libertine fonts<sup>7</sup> is shown in [Example 18](#).

Note the additional features accessed with `Ligatures=TeX`. These are not actually real OpenType features, but additions provided by `luatofloat` (i.e., `LuaTeX` only) to emulate `TEX`’s behaviour for ASCII input of curly quotes and punctuation. In  $\text{\XeTeX}$  this is achieved with the `Mapping` feature (see [Section 11.1 on page 39](#)) but for consistency `Ligatures=TeX` will perform the same function as `Mapping=tex-text`.

### 9.2 Letters

The `Letters` feature specifies how the letters in the current font will look. OpenType fonts may contain the following options: `Uppercase`, `SmallCaps`, `PetiteCaps`, `UppercaseSmallCaps`, `UppercasePetiteCaps`, and `Unicase`.

Petite caps are smaller than small caps. `SmallCaps` and `PetiteCaps` turn lowercase letters into the smaller caps letters, whereas the `Uppercase...` options turn the *capital* letters into the smaller caps (good, e.g., for applying to already uppercase acronyms like ‘NASA’). This

---

strict → strict  
wurtzite → wurtȝite  
firefly → firefly

---

```
\def\test#1#2{%
  #2 $\to$ {\addfontfeature{#1} #2} \\
  \fontspec{Linux Libertine O}
  \test{Ligatures=Historic}{strict}
  \test{Ligatures=Rare}{wurtzite}
  \test{Ligatures=NoCommon}{firefly}
```

Table 3: Options for the OpenType font feature ‘Letters’.

Feature	Option	Tag
Letters	= Uppercase	case
	SmallCaps	smcp
	PetiteCaps	pcap
	UppercaseSmallCaps	c2sc
	UppercasePetiteCaps	c2pc
	Unicase	unic

difference is shown in Example 19. ‘Unicase’ is a weird hybrid of upper and lower case letters.

Note that the Uppercase option will (probably) not actually map letters to uppercase.<sup>8</sup> It is designed to select various uppercase forms for glyphs such as accents and dashes, such as shown in Example 20; note the raised position of the hyphen to better match the surrounding letters.

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see [Section 9.12 on page 32](#)).

### 9.3 Numbers

The Numbers feature defines how numbers will look in the selected font, accepting options shown in [Table 4](#).

The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in [Section 6.3 on page 15](#). The Monospaced

---

<sup>8</sup>If you want automatic uppercase letters, look to L<sup>A</sup>T<sub>E</sub>X’s \MakeUppercase command.

---

	\addfontfeature{Letters=Uppercase}
	UPPER-CASE example

---

Table 4: Options for the OpenType font feature ‘Numbers’.

Feature	Option	Tag
Numbers	= Uppercase/Lining	lnum
	Lowercase/OldStyle	onum
	Proportional	pnum
	Monospaced	tnum
	SlashedZero	zero
	Arabic	anum

option is useful for tabular material when digits need to be vertically aligned.

The SlashedZero option replaces the default zero with a slashed version to prevent confusion with an uppercase ‘O’, shown in Example 21.

The Arabic option (with tag anum) maps regular numerals to their Arabic script or Persian equivalents based on the current Language setting (see [Section 9.18 on page 35](#)), shown in Example 22 using the Persian Modern font, which is included in TeX Live and MiKTeX. This option is based on a LuaTeX feature of the luatofont package, not an OpenType feature. (Thus, this feature is unavailable in XeTeX.)

## 9.4 Contextuals

This feature refers to substitutions of glyphs that vary ‘contextually’ by their relative position in a word or string of characters; features such as contextual swashes are accessed via the options shown in [Table 5](#).

Historic forms are accessed in OpenType fonts via the feature Style=Historic; this is generally *not* contextual in OpenType, which is why it is not included in this feature.

## 9.5 Vertical Position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option will only raise characters that are used in some languages directly after a

\fontspec{LibreCaslonText-Regular.otf}[VerticalPosition=Denominator]
  Denominator: 12345
\fontspec{LibreCaslonText-Regular.otf}[VerticalPosition=ScientificInferior]
  Scientific Inferior: 12345
```

---

Table 7: Options for the OpenType font feature ‘Fractions’.

Feature	Option	Tag
Fractions	= On	frac
	Alternate	afrc

number. The `ScientificInferior` feature will move glyphs further below the baseline than the `Inferior` feature. These are shown in Example 23

Numerator and Denominator should only be used for creating arbitrary fractions (see next section).

The `realscripts` package (which is also loaded by `xltextra` for Xe<sup>T</sup>E<sub>X</sub>) redefines the `\textsubscript` and `\textsuperscript` commands to use the above font features automatically, including for use in footnote labels. If this is the only feature of `xltextra` you wish to use, consider loading `realscripts` on its own instead.

## 9.6 Fractions

For OpenType fonts use a regular text slash to create fractions, but the `Fraction` feature must be explicitly activated. Some (Asian fonts predominantly) also provide for the `Alternate` feature. These are both shown in Example 24.

---

Example 24: The Fractions feature.

---

```

---

## 9.7 Stylistic Set variations

This feature selects a ‘Stylistic Set’ variation, which usually corresponds to an alternate glyph style for a range of characters (usually an alphabet or subset thereof). This feature is specified numerically. These correspond to OpenType features `ss01`, `ss02`, etc.

Two demonstrations from the Junicode font<sup>9</sup> are shown in Example 25 and Example 26; thanks to Adam Buchbinder for the suggestion.

Multiple stylistic sets may be selected simultaneously by writing, e.g., `StylisticSet={1,2,3}`.

The `StylisticSet` feature is a synonym of the `Variant` feature for AAT fonts. See Section 13 on page 45 for a way to assign names to stylistic sets, which should be done on a per-font basis.

## 9.8 Character Variants

Similar to the ‘Stylistic Sets’ above, ‘Character Variations’ are selected numerically to adjust the output of (usually) a single character for the particular font. These correspond to the OpenType features `cv01` to `cv99`.

For each character that can be varied, it is possible to select among possible options for that particular glyph. For example, in Example 27 a variety of glyphs for the character ‘v’ are selected, in which 5 corresponds to the character ‘v’ for this font feature, and the trailing `:⟨n⟩` corresponds to which variety to choose. Georg Duffner’s open source Garamond revival font<sup>10</sup> is used in this example. Character variants are specifically designed not to conflict with each other, so you can enable them individually per character as shown in Example 28. (Unlike stylistic alternates, say.)

Note that the indexing starts from zero, which is compatible with XeTeX but *incompatible* with `luatex`, which starts from one.

## 9.9 Alternates

The `Alternate` feature (for the raw OpenType feature `salt`) is used to access alternate font glyphs when variations exist in the font, such as in Example 29. It uses a numerical selection,

VerticalKana	vkna

starting from zero, that will be different for each font. Note that the `Style=Alternate` option is equivalent to `Alternate=0` to access the default case.

Note that the indexing starts from zero, which is compatible with plain XeTeX but *incompatible* with luatex, which starts from one.

See [Section 13 on page 45](#) for a way to assign names to alternates, which must be done on a per-font basis.

## 9.10 Style

‘Ruby’ refers to a small optical size, used in Japanese typography for annotations. For fonts with multiple `salt` OpenType features, use the `fontspec` `Alternate` feature instead.

Example 30 and Example 31 both contain glyph substitutions with similar characteristics. Note the occasional inconsistency with which font features are labelled; a long-tailed ‘Q’ could turn up anywhere!

In other features, larger breadths of changes can be seen, covering the style of an entire alphabet. See Example 32 and Example 33; in the latter, the `Italic` option affects the Latin text and the `Ruby` option the Japanese.

Note the difference here between the default and the horizontal style kana in Example 34: the horizontal style is slightly wider.

Feature	Option	Tag
Kerning =	Uppercase	cpsp
	On	* kern
	Off	kern ( <i>deactivate</i> )

\* This feature is activated by default.

## 9.11 Diacritics

Specifies how combining diacritics should be placed. These will usually be controlled automatically according to the Script setting.

## 9.12 Kerning

Specifies how inter-glyph spacing should behave. Well-made fonts include information for how differing amounts of space should be inserted between separate character pairs. This kerning space is inserted automatically but in rare circumstances you may wish to turn it off.

As briefly mentioned previously at the end of [Section 9.2 on page 23](#), the Uppercase option will add a small amount of tracking between uppercase letters, seen in Example 35, which uses the Romande fonts<sup>11</sup> (thanks to Clea F. Rees for the suggestion). The Uppercase option acts separately to the regular kerning controlled by the On/Off options.

---

<sup>11</sup><http://arkandis.tuxfamily.org/adffonts.html>

---

Example 35: Adding extra kerning for uppercase letters. (The difference is usually very small.)

---

## 9.13 Font transformations

In rare situations users may want to mechanically distort the shapes of the glyphs in the current font such as shown in Example 36. Please don't overuse these features; they are *not* a good alternative to having the real shapes.

If values are omitted, their defaults are as shown above.

If you want the bold shape to be faked automatically, or the italic shape to be slanted automatically, use the `AutoFakeBold` and `AutoFakeSlant` features. For example, the following two invocations are equivalent:

```
\fontspec[AutoFakeBold=1.5]{Charis SIL}
\fontspec[BoldFeatures={FakeBold=1.5}]{Charis SIL}
```

If both of the `AutoFake...` features are used, then the bold italic font will also be faked.

The `FakeBold` and `AutoFakeBold` features are only available with the XeTeX engine and will be ignored in LuaTeX.

## 9.14 Annotation

Some fonts are equipped with an extensive range of numbers and numerals in different forms. These are accessed with the `Annotation` feature (OpenType feature `nalt`), selected numerically as shown in Example 37.

Note that the indexing starts from zero, which is compatible with XeTeX but *incompatible* with `luatfload`, which starts from one.

Table 11: Options for the OpenType font feature ‘CJKShape’.

Feature	Option	Tag
CJKShape =	Traditional	trad
	Simplified	smp1

{\addfontfeature{CJKShape=Traditional}}
\text }
{\addfontfeature{CJKShape=NLC}}
\text }
{\addfontfeature{CJKShape=Expert}}
\text }
```

## 9.15 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs available in order to be able to display these glyphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

## 9.16 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by

Table 12: Options for the OpenType font feature ‘CharacterWidth’.

Feature	Option	Tag

{\addfontfeature{CharacterWidth=Third}
---123456787654321---} \\
{\addfontfeature{CharacterWidth=Quarter}
---12345678900987654321---}
```

---

ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms seen in Example 40.

## 9.17 Vertical typesetting

TODO!

## 9.18 OpenType scripts and languages

Fonts that include glyphs for various scripts and languages may contain different font features for the different character sets and languages they support, and different font features may behave differently depending on the script or language chosen. When multilingual fonts are used, it is important to select which language they are being used for, and more importantly what script is being used.

The ‘script’ refers to the alphabet in use; for example, both English and French use the Latin script. Similarly, the Arabic script can be used to write in both the Arabic and Persian languages.

The Script and Language features are used to designate this information. The possible options are tabulated in [Table 13 on page 37](#) and [Table 14 on page 38](#), respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

---

cáp só mõi	

---

Because these font features can change which features are able to be selected for the font, they are automatically selected by `fontspec` before all others and, if XeTeX is being used, will specifically select the OpenType renderer for this font, as described in [Section 11.3 on page 40](#).

### 9.18.1 Script and Language examples

In the examples shown in Example 41, the Code2000 font<sup>12</sup> is used to typeset various input texts with and without the OpenType Script applied for various alphabets. The text is only rendered correctly in the second case; many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

### 9.18.2 Defining new scripts and languages

```
\newfontscript  
\newfontlanguage
```

While the scripts and languages listed in [Table 13](#) and [Table 14](#) are intended to be comprehensive, there may be some missing; alternatively, you might wish to use different names to access scripts/languages that are already listed. Adding scripts and languages can be performed with the `\newfontscript` and `\newfontlanguage` commands. For example,

```
\newfontscript{Arabic}{arab}  
\newfontlanguage{Zulu}{ZUL}
```

The first argument is the `fontspec` name, the second the OpenType tag. The advantage to using these commands rather than `\newfontfeature` (see [Section 13 on page 45](#)) is the error-checking that is performed when the script or language is requested.

---

## Part III

# LuaTeX-only font features

### 10 OpenType font feature files

An OpenType font feature file is a plain text file describing OpenType layout feature of a font in a human-readable format. The syntax of OpenType feature files is defined by Adobe<sup>13</sup>.

Feature files can be used to add or customize OpenType features of a font on the fly without editing the font file itself.

Adding a new OpenType feature is as creating a plain text file defining the new feature and then loading it by passing its name or path to `FeatureFile`, then OpenType features defined in the file can be activated as usual.

For example, when adding one of the default features like `kern` or `liga`, no special activation is needed. On the other hand, an optional feature like `onum` or `smcp` will be activated when old style numbers or small capitals are activated, respectively. However, OpenType feature in the feature file can have any and that can be used to selectively activate the feature; for example defining a ligature feature called `mlig` and then activating it using `RawFeature` option without activating other ligatures in the font.

Figure 1 shows an example feature file. The first two lines set the script and language under which the defined features will be available, which the default language in both default and Latin scripts, respectively.

Then it defines a `liga` feature, which is a glyph substitution feature. The names starting with backslash are glyph names that is to be substituted and while the leading backslash is optional, it is used to escape glyph names when they interfere with preserved keywords. It should also be noted that glyph names are font specific and the same glyph can be named differently in different fonts.

Glyph positioning features like kerning can be defined in a similar way, but instead

<sup>13</sup>[http://www.adobe.com/devnet/opentype/afdko/topic\\_feature\\_file\\_syntax.html](http://www.adobe.com/devnet/opentype/afdko/topic_feature_file_syntax.html)

languagesystem latn dflt;

# Ligatures
feature liga {
    sub \f \i by \fi;
    sub \f \l by \fl;
} liga;

# Kerning
feature kern {
    pos \A \Y -200;
    pos \a \y -80;
} kern;
```

---

Example 42: X<sub>E</sub>T<sub>E</sub>X’s Mapping feature.

---

“!A small amount of—text!”	\fontspec{Cochin}[Mapping=tex-text] ``!`A small amount of---text!''
----------------------------	--

---

of the keyword `sub(stitute)` the keyword `pos(ition)` is used instead. Figure 1 shows an example of adding kerning between AY and ay<sup>14</sup>.

Lines starting with # are comments and will be ignored.

An OpenType feature file can have any number of features and can have a mix of substitution and positioning features, please refer to the full feature file specification for further documentation.

## Part IV

# Fonts and features with X<sub>E</sub>T<sub>E</sub>X

## 11 X<sub>E</sub>T<sub>E</sub>X-only font features

The features described here are available for any font selected by `fontspec`.

### 11.1 Mapping

Mapping enables a X<sub>E</sub>T<sub>E</sub>X text-mapping scheme, shown in Example 42.

Using the `tex-text` mapping is also equivalent to writing `Ligatures=TeX`. The use of the latter syntax is recommended for better compatibility with LuaT<sub>E</sub>X documents.

---

<sup>14</sup> The kerning is expressed in font design units which are fractions of em depending on the *units per em* value of the font, usually 1000 for PostScript fonts and 2048 for TrueType fonts.

---

Example 43: The LetterSpace feature.

---

```
\fontspec{Didot}
\addfontfeature{LetterSpace=0.0}
USE TRACKING FOR DISPLAY CAPS TEXT \\ 
\addfontfeature{LetterSpace=2.0}
USE TRACKING FOR DISPLAY CAPS TEXT
```

---

## 11.2 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the `LetterSpace`, which takes a numeric argument, shown in Example 43.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of ‘1.0’ will add 0.1 pt between each letter.

This functionality *should not be used for lowercase text*, which is spacing correctly to begin with, but it can be very useful, in small amounts, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature ([Section 9.2 on page 23](#)).

## 11.3 Different font technologies: AAT and OpenType

X<sub>E</sub>T<sub>E</sub>X supports two rendering technologies for typesetting, selected with the `Renderer` font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, OpenType, is an open source OpenType interpreter.<sup>15</sup> It provides greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the OpenType renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, OpenType provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see [Section 9.18 on page 35](#) for the description of these features. *Because these font features can change which features are able to be selected for the font instance, they are selected by `fontspec` before all others and will automatically and without warning select the OpenType renderer.*

## 11.4 Optical font sizes

Multiple Master fonts are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see ?? on page ?? for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font’s optical size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through L<sub>T</sub>E<sub>X</sub>, and the optical size for a Multiple Master font must always be specified explicitly.

```
\fontspec{Minion MM Roman}[OpticalSize=11]
MM optical size test \\
```

<sup>15</sup>v2.4: This was called ‘ICU’ in previous versions of X<sub>E</sub>T<sub>E</sub>X and `fontspec`. Backwards compatibility is preserved.

```
\fontspec{Minion MM Roman}[OpticalSize=47]
  MM optical size test          \\
\fontspec{Minion MM Roman}[OpticalSize=71]
  MM optical size test          \\
```

## 12 Mac OS X's AAT fonts

*Warning! X<sub>E</sub>T<sub>E</sub>X's implementation on Mac OS X is currently in a state of flux and the information contained below may well be wrong from 2013 onwards. There is a good chance that the features described in this section will not be available any more as X<sub>E</sub>T<sub>E</sub>X's completes its transition to a cross-platform-only application.*

Mac OS X's font technology began life before the ubiquitous-OpenType era and revolved around the Apple-invented 'AAT' font format. This format had some advantages (and other disadvantages) but it never became widely popular in the font world.

Nonetheless, this is the font format that was first supported by X<sub>E</sub>T<sub>E</sub>X (due to its pedigree on Mac OS X in the first place) and was the first font format supported by `fontspec`. A number of fonts distributed with Mac OS X are still in the AAT format, such as 'Skia'.

### 12.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or aesthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old T<sub>E</sub>X trick of splitting up a ligature with an empty brace pair does not work in X<sub>E</sub>T<sub>E</sub>X; you must use a 0 pt kern or \hbox (e.g., \null) to split the characters up if you do not want a ligature to be performed (the usual examples for when this might be desired are words like 'shelffull').

### 12.2 Letters

The Letters feature specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

### 12.3 Numbers

The Numbers feature defines how numbers will look in the selected font. For AAT fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced (the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in [Section 6.3 on page 15](#).

### 12.4 Contextuals

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here. The options for AAT fonts are WordInitial, WordFinal (Example 44), LineInitial, LineFinal, and Inner (Example 45, also called 'non-final' sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

---

Example 44: Contextual glyph for the beginnings and ends of words.

---

[Contextuals=WordInitial,WordFinal] *where is all the veg-*  
emite

\newfontface\fancy{Hoefler Text Italic}  
[Contextuals={WordInitial,WordFinal}]  
\fancy where is all the vegemite

---

Example 45: A contextual feature for the ‘long s’ can be convenient as the character does not need to be marked up explicitly.

---

‘Inner’ fwashes can *sometimes*  
contain the archaic long s.

\fontspec{Hoefler Text}[Contextuals=Inner]  
‘Inner’ swashes can \emph{sometimes} \\  
contain the archaic long~s.

---

## 12.5 Vertical position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number. These are shown in Example 46.

The realscripts package (also loaded by xltextra) redefines the \textsubscript and \textsuperscript commands to use the above font features, including for use in footnote labels.

## 12.6 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned On or Off in both AAT and OpenType fonts.

In AAT fonts, the ‘fraction slash’ or solidus character, is to be used to create fractions. When Fractions are turned On, then only pre-drawn fractions will be used. See Example 47.

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters.

Some (Asian fonts predominantly) also provide for the Alternate feature shown in Example 48.

---

Example 46: Vertical position for AAT fonts.

---

Normal superior inferior  
1<sup>st</sup> 2<sup>nd</sup> 3<sup>rd</sup> 4<sup>th</sup> 0<sup>th</sup> 8abcde

\fontspec{Skia}  
Normal  
\fontspec{Skia}[VerticalPosition=Superior]  
Superior  
\fontspec{Skia}[VerticalPosition=Inferior]  
Inferior \\  
\fontspec{Skia}[VerticalPosition=Ordinal]  
1st 2nd 3rd 4th 0th 8abcde

---

---

Example 47: Fractions in AAT fonts. The `^^^^2044` glyph is the ‘fraction slash’ that may be typed in Mac OS X with `OPT+SHIFT+1`; not shown literally here due to font constraints.

---

```
\fontspec[Fractions=On]{Skia}
1{^^^^2044}2 \quad 5{^^^^2044}6 \\ % fraction slash
1/2 \quad 5/6   % regular slash
\fontspec[Fractions=Diagonal]{Skia}
13579{^^^^2044}24680 \\ % fraction slash
13579/24680    % regular slash
```

---

---

Example 48: Alternate design of pre-composed fractions.

---

```
\fontspec{Hiragino Maru Gothic Pro}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ \addfontfeature{Fractions=Alternate}
\frac{1}{2} \quad \frac{1}{4} \quad \frac{5}{6} \quad 13579/24680 \quad 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680
```

---

## 12.7 Variants

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don’t mind my fancy Example 49 : ) I’m just looping through the nine (!) variants of Zapfino.

See [Section 13 on page 45](#) for a way to assign names to variants, which should be done on a per-font basis.

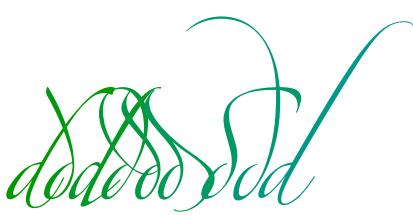

## 12.8 Alternates

Selection of Alternates *again* must be done numerically; see Example 50. See [Section 13 on page 45](#) for a way to assign names to alternates, which should be done on a per-font basis.

---

Example 49: Nine variants of Zapfino.

---

```
\newcounter{var}
\whiledo{\value{var}<9}{%
  \edef\1{%
    \noexpand\fontspec[Variant=\thevar,
    Color=0099\thevar\thevar]{Zapfino}}\1%
  \makebox[0.75\width]{\d}%
  \stepcounter{var}}
\hspace*{2cm}
```

---

---

Example 50: Alternate shape selection must be numerical.

---

*Sphinx Of Black Quartz, JUDGE Mr Vow*  
*Sphinx Of Black Quartz, JUDGE M'r Vow*

```
\fontspec{Hoefler Text Italic}[Alternate=0]
Sphinx Of Black Quartz, {\scshape Judge My Vow} \\
\fontspec{Hoefler Text Italic}[Alternate=1]
Sphinx Of Black Quartz, {\scshape Judge My Vow}
```

---

---

Example 51: Vertical typesetting.

---

共産主義者は

共  
産  
主  
義  
者

```
\fontspec{Hiragino Mincho Pro}
\verttext

\fontspec{Hiragino Mincho Pro}[Renderer=AAT,Vertical=RotatedGlyphs]
\rotatebox{-90}{\verttext}% requires the graphicx package
```

---

## 12.9 Style

The options of the `Style` feature are defined in `AAT` as one of the following: `Display`, `Engraved`, `IlluminatedCaps`, `Italic`, `Ruby`,<sup>16</sup> `TallCaps`, or `TitlingCaps`.

Typical examples for these features are shown in [Section 9.10](#).

## 12.10 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs in order to be able to display these glyphs correctly in whichever form is appropriate. Both `AAT` and OpenType fonts support the following CJKShape options: `Traditional`, `Simplified`, `JIS1978`, `JIS1983`, `JIS1990`, and `Expert`. OpenType also supports the `NLC` option.

## 12.11 Character width

See [Section 9.16 on page 34](#) for relevant examples; the features are the same between OpenType and `AAT` fonts. `AAT` also allows `CharacterWidth=Default` to return to the original font settings.

## 12.12 Vertical typesetting

TODO: improve!

`XeTeX` provides for vertical typesetting simply with the ability to rotate the individual glyphs as a font is used for typesetting, as shown in Example 51.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the `XeTeX` documentation.

---

<sup>16</sup>‘Ruby’ refers to a small optical size, used in Japanese typography for annotations.

---

Example 52: Various annotation forms.

---

```
\fontspec{Hei Regular}
1 2 3 4 5 6 7 8 9
\fontspec{Hei Regular}[Annotation=Circle]
1 2 3 4 5 6 7 8 9
\fontspec{Hei Regular}[Annotation=Parenthesis]
1 2 3 4 5 6 7 8 9
\fontspec{Hei Regular}[Annotation=Period]
1. 2. 3. 4. 5. 6. 7. 8. 9. 1 2 3 4 5 6 7 8 9
```

---

## 12.13 Diacritics

Diacritics are marks, such as the acute accent or the tilde, applied to letters; they usually indicate a change in pronunciation. In Arabic scripts, diacritics are used to indicate vowels. You may either choose to Show, Hide or Decompose them in AAT fonts. The Hide option is for scripts such as Arabic which may be displayed either with or without vowel markings. E.g., `\fontspec[Diacritics=Hide]{...}`

Some older fonts distributed with Mac OS X included ‘0/’ etc. as shorthand for writing ‘Ø’ under the label of the Diacritics feature. If you come across such fonts, you’ll want to turn this feature off (imagine typing hello/goodbye and getting ‘helløgoodbye’ instead!) by decomposing the two characters in the diacritic into the ones you actually want. I recommend using the proper L<sup>A</sup>T<sub>E</sub>X input conventions for obtaining such characters instead.

## 12.14 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature (see Example 52) with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and DoubleCircle.

# Part V

## Programming interface

This is the beginning of some work to provide some hooks that use `fontspec` for various macro programming purposes.

## 13 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I’ve left something out, so please let me know.

New AAT features may be created with this command:

```
\newAATfeature{<feature>}{<option>}{{<feature code>}}{<selector code>}
```

Use the X<sub>E</sub>T<sub>E</sub>X file `AAT-info.tex` to obtain the code numbers. See Example 53.

New OpenType features may be created with this command:

```
\newopentypefeature{<feature>}{<option>}{{<feature tag>}}
```

---

Example 53: Assigning new AAT features.

---

This is XeTeX by Jonathan Kew.  
This is XeTeX by Jonathan Kew.

---

---

Example 54: Assigning new arbitrary features.

---

*sockdolager rubdown*  
sockdolager rubdown  
*sockdolager rubdown*  
sockdolager rubdown

```
\newfontfeature{AvoidD}{Special=Avoid d-collisions}
\newfontfeature{NoAvoidD}{Special!=Avoid d-collisions}
\fontspec{Zapfino}[AvoidD,Variant=1]
    sockdolager rubdown
\fontspec{Zapfino}[NoAvoidD,Variant=1]
    sockdolager rubdown
```

---

The synonym `\newICUfeature` is deprecated.

Here's what it would look like in practise:

```
\newopentypefeature{Style}{NoLocalForms}{-locl}
```

In case the above commands do not accommodate the desired font feature (perhaps a new XeTeX feature that `fontspec` hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

```
\newfontfeature{<name>}{<input string>}
```

For example, Zapfino contains the feature 'Avoid d-collisions'. To access it with this package, you could do some like that shown in Example 54. (For some reason this feature doesn't appear to be working although `fontspec` is doing the right thing. To be investigated.)

The advantage to using the `\newAATfeature` and `\newopentypefeature` commands instead of `\newfontfeature` is that they check if the selected font actually contains the desired font feature at load time. By contrast, `\newfontfeature` will not give a warning for improper input.

## 14 Going behind `fontspec`'s back

Expert users may wish not to use `fontspec`'s feature handling at all, while still taking advantage of its L<sup>A</sup>T<sub>E</sub>X font selection conveniences. The `RawFeature` font feature allows literal XeTeX font feature selection when you happen to have the OpenType feature tag memorised.

Multiple features can either be included in a single declaration:

```
[RawFeature=+smcp;+onum]
```

or with multiple declarations:

```
[RawFeature=+smcp, RawFeature=+onum]
```

---

Example 55: Using raw font features directly.

---

PAGELLA SMALL CAPS    \fontspec{texgyrepagella-regular.otf}[RawFeature=+smcp]  
                            Pagella small caps

---

---

Example 56: Renaming font features.

---

Roman Letters *AndSwash* \aliasfontfeature{ItalicFeatures}{IF}  
Roman Letters \itshape And Swash \fontspec{Hoefler Text}[IF = {Alternate=1}]

---

---

Example 57: Renaming font feature options.

---

S<sub>cientific</sub> I<sub>nferior</sub>: 12345 \aliasfontfeature{VerticalPosition}{Vert\_Pos}  
Scientific Inferior: 12345 \aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci\_Inf}  
\fontspec{LinLibertine\_R.otf}[Vert\_Pos=Sci\_Inf]

---

## 15 Renaming existing features & options

\aliasfontfeature If you don't like the name of a particular font feature, it may be aliased to another with the `\aliasfontfeature{<existing name>}{'<new name>}'` command, such as shown in Example 56.  
Spaces in feature (and option names, see below) are allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

\aliasfontfeatureoption If you wish to change the name of a font feature option, it can be aliased to another with the command `\aliasfontfeatureoption{<font feature>}{'<existing name>'}{'<new name>}'`, such as shown in Example 57.

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Color specification. For this type of thing, the `\newfontfeature` command should be used to declare a new, e.g., PurpleColor feature:

```
\newfontfeature{PurpleColor}{color=550099BB}
```

Except that this example was written before support for named colours was implemented. But you get the idea.

## 16 Programming details

In some cases, it is useful to know what the  $\text{\LaTeX}$  font family of a specific `\fontspec` font is. After a `\fontspec`-like command, this is stored inside the `\l_fontsname_t1` macro. Otherwise,  $\text{\LaTeX}$ 's own `\f@family` macro can be useful here, too. The raw  $\text{\TeX}$  font that is defined is stored temporarily in `\l_fontsname`.

The following commands in `\Expl3` syntax may be used for writing code that interfaces with `\fontspec`-loaded fonts. All of the following conditionals also exist with T and F as well as TF suffixes.

\fontspec_if_fontsname_font:TF	Test whether the currently selected font has been loaded by <code>\fontspec</code> .
\fontspec_if_aat_feature:nnTF	Test whether the currently selected font contains the AAT feature (#1,#2).
\fontspec_if_opentype:TF	Test whether the currently selected font is an OpenType font. Always true for $\text{\LaTeX}$ fonts.

\fontspec_if_feature:nTF	Test whether the currently selected font contains the raw OpenType feature #1. E.g.: \fontspec_if_feature:nTF {pnum} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_feature:nnnTF	Test whether the currently selected font with raw OpenType script tag #1 and raw OpenType language tag #2 contains the raw OpenType feature tag #3. E.g.: \fontspec_if_feature:nTF {latn} {ROM} {pnum} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_script:nTF	Test whether the currently selected font contains the raw OpenType script #1. E.g.: \fontspec_if_script:nTF {latn} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nTF	Test whether the currently selected font contains the raw OpenType language tag #1. E.g.: \fontspec_if_language:nTF {ROM} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nnTF	Test whether the currently selected font contains the raw OpenType language tag #2 in script #1. E.g.: \fontspec_if_language:nnTF {cyrl} {SRB} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_current_script:nTF	Test whether the currently loaded font is using the specified raw OpenType script tag #1.
\fontspec_if_current_language:nTF	Test whether the currently loaded font is using the specified raw OpenType language tag #1.
\fontspec_set_family:Nnn	#1 : L <sup>A</sup> T <sub>E</sub> X family #2 : fontspec features #3 : font name Defines a new NFSS family from given <i>features</i> and <i>font</i> , and stores the family name in the variable <i>family</i> . This font family can then be selected with standard L <sup>A</sup> T <sub>E</sub> X commands \fontfamily{\i{family}}\selectfont. See the standard fontspec user commands for applications of this function.
\fontspec_set_fontface>NNnn	#1 : primitive font #2 : L <sup>A</sup> T <sub>E</sub> X family #3 : fontspec features #4 : font name Variant of the above in which the primitive T <sub>E</sub> X font command is stored in the variable <i>primitive font</i> . If a family is loaded (with bold and italic shapes) the primitive font command will only select the regular face. This feature is designed for L <sup>A</sup> T <sub>E</sub> X programmers who need to perform subsequent font-related tests on the <i>primitive font</i> .

## Part VI

# The patching/improvement of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> and other packages

Derived originally from xltextra, this package contains patches to various L<sup>A</sup>T<sub>E</sub>X components and third-party packages to improve the default behaviour.

## 17 Inner emphasis

fixltx2e's method for checking for "inner" emphasis is a little fragile in X<sub>E</sub>T<sub>E</sub>X, because font slant information might be missing from the font. Therefore, we use L<sub>A</sub>T<sub>E</sub>X's NFSS information, which is more likely to be correct.

## 18 Unicode footnote symbols

By default L<sub>A</sub>T<sub>E</sub>X defines symbolic footnote characters in terms of commands that don't resolve well; better results can be achieved by using specific Unicode characters or proper LICRs with the xunicode package.

This problem is solved by defining \@fnsymbol in a similar manner to the fixltx2e package.

## 19 Verbatim

Many verbatim mechanisms assume the existence of a 'visible space' character that exists in the ASCII space slot of the typewriter font. This character is known in Unicode as U+2423: BOX OPEN, which looks like this: '⠄'.

When a Unicode typewriter font is used, L<sub>A</sub>T<sub>E</sub>X no longer prints visible spaces for the verbatim\* environment and \verb\* command. This problem is fixed by using the correct Unicode glyph, and the following packages are patched to do the same: listings, fancyvrb, moreverb, and verbatim.

In the case that the typewriter font does not contain '⠄', the Latin Modern Mono font is used as a fallback.

## 20 Discretionary hyphenation: \-

L<sub>A</sub>T<sub>E</sub>X defines the macro \- to insert discretionary hyphenation points. However, it is hard-coded in L<sub>A</sub>T<sub>E</sub>X to use the hyphen - character. Since fontspec makes it easy to change the hyphenation character on a per font basis, it would be nice if \- adjusted automatically — and now it does.

## 21 Commands for old-style and lining numbers

\oldstylenums \liningnums L<sub>A</sub>T<sub>E</sub>X's definition of \oldstylenums relies on strange font encodings. We provide a fontspec-compatible alternative and while we're at it also throw in the reverse option as well. Use \oldstylenums{\text} to explicitly use old-style (or lowercase) numbers in \text, and the reverse for \liningnums{\text}.

# Part VII

## **fontspec.sty and friends**

Herein lie the implementation details of this package. Welcome! It was my first.

### 22 ‘Header’ code

We will eventually load the correct version of the code according to which engine we’re running. As we’ll see later, there are some minor differences between what we have to do in  $\text{\LaTeX}$  and  $\text{\LUA\TeX}$ .

The `expl3` module is `fontspec`.

```
1 <@>=fontspec>
2 <*>fontspec&!xetex&!luatex>
```

But for now, this is the shared code.

```
3 \RequirePackage{expl3}[2011/09/05]
4 \RequirePackage{xparse}
5 \ExplSyntaxOn
```

Quick fix for lualatex-math:

```
6 \cs_if_exist:NF \lua_now_x:n
7 { \cs_set_eq:NN \lua_now_x:n \directlua }
```

Check engine and load specific modules. For  $\text{\LUA\TeX}$ , load only `luatofload` which loads `luatexbase` and `lualibs` too.

```
8 \msg_new:nnn {fontspec} {cannot-use-pdfTeX}
9 {
10  The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX~ to~ function.
11  \\\\
12  You~ must~ change~ your~ typesetting~ engine~ to~,~ 
13  e.g.,~ "xelatex"~ or~ "lualatex"\\
14  instead~ of~ plain~ "latex"~ or~ "pdflatex".
15 }
16 \xetex_if_engine:F
17 {
18  \luatex_if_engine:TF
19  {
20   \RequirePackage{luatofload}[2013/05/20]
21   \RequireLuaModule{fontspec}
22  }
23  {
24   \msg_fatal:nn {fontspec} {cannot-use-pdfTeX}
25  }
26 }
```

#### 22.1 `expl3` tools

#### 22.2 Bits and pieces

##### Conditionals

**firsttime** As \keys\_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the ‘firsttime’ conditional (initialised true).

```

27 \bool_new:N \l_@@_firsttime_bool

253   \msg_redirect_module:nnn { fontspec } { info } { none }
254 }
255 \ExecuteOptions{config,math}
256 \ProcessOptions*

```

## 22.5 Packages

New for  $\text{Lua}\text{\TeX}$ , we load a new package called ‘`fontspec-patches`’ designed to incorporate the hidden but useful parts of the old `xltextra` package.

```
257 \RequirePackage{fontspec-patches}
258 \luatex_if_engine:T { \RequirePackage{fontspec-luatex} \endinput }
259 \xetex_if_engine:T { \RequirePackage{fontspec-xetex} \endinput }
260 </fontspec&!xetex&!luatex>
```

## 23 The main package code

That was the driver, and now the fun starts.

```
261 <*fontspec & (xetex | luatex)>
262 \ExplSyntaxOn
```

### 23.1 Encodings

Frank Mittelbach has recommended using the ‘EUx’ family of font encodings to experiment with Unicode. Now that  $\text{Xe}\text{\TeX}$  can find fonts in the `texmf` tree, the Latin Modern OpenType fonts can be used as the defaults. See the `euenc` collection of files for how this is implemented.

```
263 <xetex>\tl_set:Nn \g_fontspec_encoding_tl {EU1}
264 <luatex>\tl_set:Nn \g_fontspec_encoding_tl {EU2}
265 \tl_set:Nn \rmdefault {lmr}
266 \tl_set:Nn \sfdefault {lmss}
267 \tl_set:Nn \ttdefault {lmst}
268 \RequirePackage[\g_fontspec_encoding_tl]{fontenc}
269 \tl_set_eq:NN \UTFencname \g_fontspec_encoding_tl % for xunicode
```

Dealing with a couple of the problems introduced by `babel`:

```
270 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
271 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
272 \AtBeginDocument
273 {
274   \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
275   \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
276 }
```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

**xunicode** Now we load `xunicode`, working around its internal  $\text{Xe}\text{\TeX}$  check when under  $\text{Lua}\text{\TeX}$ .

```
277 <xetex>\RequirePackage{xunicode}
278 <*luatex>
279 \cs_set_eq:NN \fontspec_tmp: \XeTeXpicfile
280 \cs_set:Npn \XeTeXpicfile {}
281 \RequirePackage{xunicode}
282 \cs_set_eq:NN \XeTeXpicfile \fontspec_tmp:
283 </luatex>
```

## 23.2 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the ‘top level’ definitions of the commands are contained herein; they all use or define macros which are defined or used later on in [Section 23.5 on page 68](#).

### 23.2.1 Font selection

\fontspec	This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font. Then this new font family is selected.
284	\DeclareDocumentCommand \fontspec { O{} m O{} }
285	{
286	\fontencoding {\g_fontspec_encoding_tl}
287	\fontspec_set_family:Nnn \f@family {\#1,\#3}{\#2}
288	\selectfont
289	\ignorespaces
290	}
\setmainfont	The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced). I end them with \normalfont so that if they’re used in the document, the change registers immediately.
291	\DeclareDocumentCommand \setmainfont { O{} m O{} }
292	{
293	\fontspec_set_family:Nnn \rmdefault {\#1,\#3}{\#2}
294	\normalfont
295	\ignorespaces
296	}
297	\DeclareDocumentCommand \setsansfont { O{} m O{} }
298	{
299	\fontspec_set_family:Nnn \sfdefault {\#1,\#3}{\#2}
300	\normalfont
301	\ignorespaces
302	}
303	\DeclareDocumentCommand \setmonofont { O{} m O{} }
304	{

321 }
322 \DeclareDocumentCommand \setmathsf { O{} m O{} }
323 {
324   \fontspec_set_family:Nnn \g_@@_mathsf_t1 {#1,#3}{#2}
325 }
326 \DeclareDocumentCommand \setmathtt { O{} m O{} }
327 {
328   \fontspec_set_family:Nnn \g_@@_mathtt_t1 {#1,#3}{#2}
329 }
330 \@onlypreamble\setmathrm
331 \@onlypreamble\setboldmathrm
332 \@onlypreamble\setmathsf
333 \@onlypreamble\setmathtt

```

If the commands above are not executed, then `\rmdefault` (*etc.*) will be used.

```

334 \tl_set:Nn \g_@@_mathrm_t1 {\rmdefault}
335 \tl_set:Nn \g_@@_mathsf_t1 {\sfdefault}
336 \tl_set:Nn \g_@@_mathtt_t1 {\ttdefault}

```

`\newfontfamily` This macro takes the arguments of `\fontspec` with a prepended *<instance cmd>*. This command is used when a specific font instance needs to be referred to repetitively (*e.g.*, in a section heading) since continuously calling `\fontspec_select:nn` is inefficient because it must parse the option arguments every time.

`\fontspec_select:nn` defines a font family and saves its name in `\l_fontspec_family_tl`. This family is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified.

```

337 \DeclareDocumentCommand \newfontfamily { m O{} m O{} }
338 {
339   \fontspec_set_family:cnn { g_@@_ \cs_to_str:N #1 _family } {#2,#4} {#3}
340   \use:x
341   {
342     \exp_not:N \ DeclareRobustCommand \exp_not:N #1
343     {
344       \exp_not:N \fontencoding {\g_fontspec_encoding_tl}
345       \exp_not:N \fontfamily { \use:c {g_@@_ \cs_to_str:N #1 _family} } \exp_not:N \selectfont
346     }
347   }
348 }

```

`\newfontface` uses the fact that if the argument to `BoldFont`, etc., is empty (*i.e.*, `BoldFont={}`), then no bold font is searched for.

```

349 \DeclareDocumentCommand \newfontface { m O{} m O{} }
350 {
351   \newfontfamily #1 [ BoldFont={},ItalicFont={},SmallCapsFont={},#2,#4 ] {#3}
352 }

```

### 23.2.2 Font feature selection

\defaultfontfeatures This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent \fontspec, et al., commands. It stores its value in \g\_fontsname\_default\_fontopts\_tl (initialised empty), which is concatenated with the individual macro choices in the [...] macro.

```

353 \clist_new:N \g_@@_default_fontopts_clist
354 \prop_new:N \g_@@_fontopts_prop

355 \DeclareDocumentCommand \defaultfontfeatures { t+ o m }
356 {
357   \IfNoValueTF {#2}
358   { \@@_set_default_features:nn {#1} {#3} }
359   { \@@_set_font_default_features:nnn {#1} {#2} {#3} }
360   \ignorespaces
361 }
362 \cs_new:Nn \@@_set_default_features:nn

394   \clist_map_inline:Nn \l_@@_extensions_clist
```

```

395 { \tl_remove_once:Nn #1 {##1} }
396 }
397

```

\addfontfeatures In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level \fontspec command.

The default options are *not* applied (which is why \g\_fontsdefault\_fontopts\_tl is emptied inside the group; this is allowed as \l\_fontsfamily\_tl is globally defined in \fontspec\_select:nn), so this means that the only added features to the font are strictly those specified by this command.

\addfontfeature is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```

398 \bool_new:N \l_@@_disable_defaults_bool
399 \DeclareDocumentCommand \addfontfeatures {m}
400 {
401   \fontspec_if_fontspec_font:TF
402   {
403     \group_begin:
404     \prop_get:cN {g_@@_ \f@family _prop} {options} \l_@@_options_tl
405     \prop_get:cN {g_@@_ \f@family _prop} {fontname} \l_@@_fontname_tl
406     \bool_set_true:N \l_@@_disable_defaults_bool

417   }
418   \ignorespaces
419 }
420 \cs_set_eq:NN \addfontfeature \addfontfeatures

```

### 23.2.3 Defining new font features

\newfontfeature \newfontfeature takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

```

421 \DeclareDocumentCommand \newfontfeature {mm}
422 {
423   \keys_define:nn { fontspec }
424   {
425     #1 .code:n =
426     {
427       \@@_update_featstr:n {#2}
428     }

```

```

429     }
430 }

\newAATfeature This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better
431 \DeclareDocumentCommand \newAATfeature {mmmm}
432 {
433   \keys_if_exist:nnF { fontspec } {#1}
434   { \@@_define_font_feature:n {#1} }
435   \keys_if_choice_exist:nnnT {fontspec} {#1} {#2}
436   { \@@_warning:nxx {feature-option-overwrite} {#1} {#2} }
437   \@@_define_feature_option:nnnn {#1}{#2}{#3}{#4}{}
438 }

\newopentypefeature This command assigns a new OpenType feature by its abbreviation (#2) to a new name (#1).
\newICUfeature Better than \newfontfeature because it checks if the feature exists in the font it's being used
for.
439 \DeclareDocumentCommand \newopentypefeature {mmm}
440 {
441   \keys_if_exist:nnF { fontspec / options } {#1}

528 }
529 \DeclareFontsExtensions{.otf,.ttf,.OTF,.TTF,.ttc,.TTC,.dfont}

```

### 23.3 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

```

\fontspec_if_fontspec_font:TF Test whether the currently selected font has been loaded by fontspec.
530 \prg_new_conditional:Nnn \fontspec_if_fontspec_font: {TF,T,F}
531 {
532   \cs_if_exist:cTF {g_@@_ \f@family _prop} \prg_return_true: \prg_return_false:
533 }

\fontspec_if_aat_feature:nnTF Conditional to test if the currently selected font contains the AAT feature (#1,#2).
534 \prg_new_conditional:Nnn \fontspec_if_aat_feature:nn {TF,T,F}
535 {
536   \fontspec_if_fontspec_font:TF
537   {
538     \prop_get:cnN {g_@@_ \f@family _prop} {fontdef} \l_@@_fontdef_tl
539     \@@_font_set:Nnn \l_fontspec_font {\l_@@_fontdef_tl} {\f@size pt}
540     \bool_if:NTF \l_@@_atsui_bool
541     {
542       \fontspec_make_AAT_feature_string:nnTF {#1}{#2}
543       \prg_return_true: \prg_return_false:
544     }
545     {
546       \prg_return_false:
547     }

```

```

548     }
549     {
550     \prg_return_false:
551   }
552 }

\fontspec_if_opentype:TF Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts.
553 \prg_new_conditional:Nnn \fontspec_if_opentype: {TF,T,F}
554 {
555   \fontspec_if_fonts_spec_font:TF
556   {
557     \prop_get:cnN {g_@@_ \f@family _prop} {fontdef} \l_@@_fontdef_tl

\fontspec_set_family:Nnn #1 : family
#2 : fontspec features
#3 : font name
Defines a new font family from given features and font, and stores the name in the variable family. See the standard fontspec user commands for applications of this function.
We want to store the actual name of the font family within the family variable because the actual LATEX family name is automatically generated by fontspec and it's easier to keep it that way.
Please use \fontspec_set_family:Nnn instead of \fontspec_select:nn, which may change in the future.
696 \cs_new:Nn \fontspec_set_family:Nnn

748 \fi:
749 }

```

## 23.5 Internal macros

The macros from here in are used internally by all those defined above. They are not designed to remain consistent between versions.

\fontspec\_select:n This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l\_fontspec\_family\_t1. The TeX '\font' command is (globally) stored in \l\_fontspec\_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- `\l_fontsname_t1` is used as the generic name of the font being defined.
- `\l_@@_fontid_t1` is the unique identifier of the font with all its features.
- `\l_fontsname_up_t1` is the font specifically to be used as the upright font.
- `\l_@@_basename_t1` is the (immutable) original argument used for `*-replacing`.
- `\l_fontsname` is the plain TeX font of the upright font requested.

```

```

### 23.5.1 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_automfont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

```

\@@_find_automfonts:
942 \cs_new:Nn \@@_find_automfonts:

### 23.5.2 Fonts

\@@\_set\_font\_type: Now check if the font is to be rendered with `atsui` or Harfbuzz. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in `\l_fontsname` is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```

\@@\_set\_autofont:Nnn #1 : Font name tl  
#2 : Base font name  
#3 : Font name modifier

This function looks for font with *<name>* and *<modifier>* #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like /B to look for a bold font, for example.

We can't match external fonts in this way (in X<sub>E</sub>T<sub>E</sub>X anyway; todo: test with LuaTeX). If *<font name tl>* is not empty, then it's already been specified by the user so abort. If *<Base font name>* is not given, we also abort for obvious reasons.

If *<font name tl>* is empty, then proceed. If not found, *<font name tl>* remains empty. Otherwise, we have a match.

```

1037 }

```

\@@\_make\_font\_shapes:Nnnnn #1 : Font name  
#2 : Font series  
#3 : Font shape  
#4 : Font features  
#5 : Size features

This macro eventually uses \DeclareFontShape to define the font shape in question.

The optional first argument is used when making the font shapes for bold, italic, and bold italic fonts using X<sub>E</sub>T<sub>E</sub>X's auto-recognition with #2 as /B, /I, and /BI font name suffixes. If no such font is found, it falls back to the original font name, in which case this macro doesn't proceed and the font shape is not created for the NFSS.

Next, the small caps are defined. [...] is used to define the appropriate string for activating small caps in the font, if they exist. If we are defining small caps for the upright shape, then the small caps shape default is used. For an *italic* font, however, the shape parameter is overloaded and we must call italic small caps by their own identifier. See [Section 23.7 on page 111](#) for the code that enables this usage.

```

1038 \cs_new:Nn \@@_make_font_shapes:Nnnnn
1039 {
1040   \group_begin:
1041     \@@_load_fontname:n {#1}
1042     \@@_declare_shape:nnxx {#2} {#3} { \l_@@_fontopts_clist, #4 } {#5}
1043   \group_end:
1044 }
1045
1046 \cs_new:Nn \@@_load_fontname:n
1047 {
1048   \tl_set:Nx \l_fontsname_t1 {#1}
1049   \@@_load_external_fontrights:N \l_fontsname_t1

```

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@\_set\_slanted: code will overwrite this anyway if necessary.

```

1148 \cs_new:Nn \@@_declare_shape_slanted:nn
1149 {
1150   \bool_if:nT

```

```

```

c\_make\_AAT\_feature\_string:nTF This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 82).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But XeTeX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in \l\_fontspec\_feature\_string\_tl.

```

```

\fontspec\_iv\_str\_to\_num:Nn This macro takes a four character string and converts it to the numerical representation  
 \fontspec\_v\_str\_to\_num:Nn

required for Xe<sub>E</sub>T<sub>E</sub>X OpenType script/language/feature purposes. The output is stored in `\l_fontsdesc_strnum_int`.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string, delimited by a space; this input is padded with `\@emptys` and anything beyond four chars is snipped. The `\@emptys` then are used to reconstruct the spaces in the string to number calculation.

The variant `\fontsdesc_v_str_to_num:n` is used when looking at features, which are passed around with prepended plus and minus signs (e.g., `+liga`, `-dlig`); it simply strips off the first char of the input before calling the normal `\fontsdesc_iv_str_to_num:n`.

```

1415 \cs_set:Nn \fontsdesc_iv_str_to_num:Nn
1416 {
1417   \fontsdesc_iv_str_to_num:w #1 \q_nil #2 \c_empty_tl \c_empty_tl \q_nil

1553   }
1554 }
1555 \tl_clear:N \l_@@_extension_tl
```

### 23.6.2 Pre-parsed features

After the font name(s) have been sorted out, now need to extract any renderer/font configuration features that need to be processed before all other font features.

**Renderer** This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and even whether certain features are available.

```

1556 \keys_define:nn {fontspec-renderer}
1557 {
1558   Renderer .choice_code:n =
1559   {
1560     \int_compare:nTF {\l_keys_choice_int <= 3} {
1561 (*xetexx)
1562       \tl_set:Nv \l_fonts_renderer_tl
1563       { g_fonts_renderer_tag_ \l_keys_choice_tl }
1564 (/xetexx)
1565 (*luatex)
1566       \@@_warning:nx {only-xetex-feature} {Renderer=AAT/OpenType/Graphite}
1567 (/luatex)
1568     }
1569     {
1570 (*xetexx)
1571       \@@_warning:nx {only-luatex-feature} {Renderer=Full/Basic}
```

```

1572 </xetexx>
1573 <*luatex>
1574     \tl_set:Nv \l_fonts_mode_tl
1575         { g_fonts_mode_tag_ \l_keys_choice_tl }
1576 </luatex>
1577     }
1578 }
1579 ,
1580 Renderer .generate_choices:n = {AAT,ICU,OpenType,Graphite,Full,Basic}
1581 }
1582 \tl_set:cn {g_fonts_renderer_tag_AAT} {/AAT}
1583 \tl_set:cn {g_fonts_renderer_tag_ICU} {/OT}
1584 \tl_set:cn {g_fonts_renderer_tag_OpenType} {/OT}
1585 \tl_set:cn {g_fonts_renderer_tag_Graphite} {/GR}
1586 \tl_set:cn {g_fonts_mode_tag_Full} {node}
1587 \tl_set:cn {g_fonts_mode_tag_Basic} {base}

```

**OpenType script/language** See later for the resolutions from fonts features to OpenType definitions.

```

1588 \@@_keys_define_code:nnn {fontspec-preparse} {Script}
1589 {
1590 <xetexx> \keys_set:nn {fontspec-renderer} {Renderer=OpenType}
1591 \tl_set:Nn \l_@@_script_name_tl {\#1}
1592 }

```

Exactly the same:

```

1593 \@@_keys_define_code:nnn {fontspec-preparse} {Language}
1594 {
1595 <xetexx> \keys_set:nn {fontspec-renderer} {Renderer=OpenType}
1596 \tl_set:Nn \l_@@_lang_name_tl {\#1}
1597 }

```

### 23.6.3 Bold/italic choosing options

The Bold, Italic, and BoldItalic features are for defining explicitly the bold and italic fonts used in a font family.

**Bold (NFSS) Series** By default, fontspec uses the default bold series, \bfdefault. We want to be able to make this extensible.

```

1598 \seq_new:N \g_@@_bf_series_seq
1599 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSeries}
1600 {
1601 \tl_gset:Nx \g_@@_curr_series_tl { #1 }
1602 \seq_gput_right:Nx \g_@@_bf_series_seq { #1 }
1603 }

```

**Fonts** Upright:

```

1604 \@@_keys_define_code:nnn {fontspec-preparse-external} {UrightFont}
1605 {
1606 \fontspec_complete_fontname:Nn \l_fonts_fontname_up_tl {\#1}

1632 <debug>\typeout{Setting~bold~font"\l_@@_curr_bfname_t1"~with~series"\g_@@_curr_series_t1"}
1633
1634 \prop_put:NxV \l_@@_nfss_prop
1635  {BoldFont-\g_@@_curr_series_t1} \l_@@_curr_bfname_t1
1636
1637 }
1638 }

1639 \prop_new:N \l_@@_nfss_prop

    Same for italic:

1640 \@@_keys_define_code:nnn {fontspec-preparse-external} {ItalicFont}
1641  {
1642  \tl_if_empty:nTF {\#1}
1643  {
1644  \bool_set_true:N \l_@@_noit_bool
1645  }
1646  {
1647  \bool_set_false:N \l_@@_noit_bool
1648  \fontspec_complete_fontname:Nn \l_fontspec_fontname_it_t1 {\#1}
1649  }
1650 }

    Simpler for bold+italic & slanted:

1651 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldItalicFont}
1652  {
1653  \fontspec_complete_fontname:Nn \l_fontspec_fontname_bfit_t1 {\#1}
1654  }

```

```

1655 \@@_keys_define_code:nnn {fontspec-preparse-external} {SlantedFont}
1656 {
1657   \fontspec_complete_fontname:Nn \l_fontspec_fontname_sl_t1 {#1}
1658 }
1659 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSlantedFont}
1660 {
1661   \fontspec_complete_fontname:Nn \l_fontspec_fontname_bfsl_t1 {#1}
1662 }

Small caps isn't pre-parsed because it can vary with others above:

1663 \@@_keys_define_code:nnn {fontspec} {SmallCapsFont}
1664 {
1665   \tl_if_empty:nTF {#1}
1666   {
1667     \bool_set_true:N \l_@@_nosc_bool
1668   }
1669   {
1670     \bool_set_false:N \l_@@_nosc_bool
1671     \fontspec_complete_fontname:Nn \l_fontspec_fontname_sc_t1 {#1}
1672   }
1673 }

```

\fontspec\_complete\_fontname:Nn This macro defines #1 as the input with any \* tokens of its input replaced by the font name. This lets us define supplementary fonts in full ("Baskerville Semibold") or in abbreviation ("\* Semibold").

```

1674 \cs_set:Nn \fontspec_complete_fontname:Nn
1675 {
1676   \tl_set:Nx #1 {#2}
1677   \tl_replace_all:Nnx #1 {*} {\l_@@_basename_tl}
1678 <luatex> \tl_remove_all:Nn #1 {~}
1679 }
1680 \cs_generate_variant:Nn \tl_replace_all:Nnn {Nnx}

```

## Features

```

1681 \@@_keys_define_code:nnn {fontspec-preparse} {UprightFeatures}
1682 {
1683   \clist_set:Nn \l_@@_fontfeat_up_clist {#1}
1684 }
1685 \@@_keys_define_code:nnn {fontspec-preparse} {BoldFeatures}
1686 {
1687   \clist_set:Nn \l_@@_fontfeat_bf_clist {#1}
1688
1689 % \prop_put:NxV \l_@@_nfss_prop
1690 %   {BoldFont-\g_@@_curr_series_tl} \l_@@_curr_bfname_tl
1691 }
1692 \@@_keys_define_code:nnn {fontspec-preparse} {ItalicFeatures}
1693 {
1694   \clist_set:Nn \l_@@_fontfeat_it_clist {#1}
1695 }
1696 \@@_keys_define_code:nnn {fontspec-preparse} {BoldItalicFeatures}
1697 {
1698   \clist_set:Nn \l_@@_fontfeat_bfit_clist {#1}

```

```

1699 }
1700 \@@_keys_define_code:nnn {fontspec-preparse} {SlantedFeatures}
1701 {
1702   \clist_set:Nn \l_@@_fontfeat_sl_clist {\#1}
1703 }
1704 \@@_keys_define_code:nnn {fontspec-preparse} {BoldSlantedFeatures}
1705 {
1706   \clist_set:Nn \l_@@_fontfeat_bfsl_clist {\#1}
1707 }

Note that small caps features can vary by shape, so these in fact aren't pre-parsed.

1708 \@@_keys_define_code:nnn {fontspec} {SmallCapsFeatures}
1709 {
1710   \bool_if:NF \l_@@_firsttime_bool

1719 }
1720 \@@_keys_define_code:nnn {fontspec-preparse-nested} {SizeFeatures}
1721 {
1722   \clist_set:Nn \l_@@_sizefeat_clist {\#1}
1723   \tl_if_empty:NT \l_@@_this_font_tl
1724   { \tl_set:Nn \l_@@_this_font_tl { -- } } % needs to be non-empty as a flag
1725 }
1726 \@@_keys_define_code:nnn {fontspec-preparse-nested} {Font}
1727 {
1728   \tl_set:Nn \l_@@_this_font_tl {\#1}
1729 }
1730 \@@_keys_define_code:nnn {fontspec} {SizeFeatures}
1731 {
1732   % dummy
1733 }
1734 \@@_keys_define_code:nnn {fontspec} {Font}
1735 {
1736   % dummy
1737 }

1738 \@@_keys_define_code:nnn {fontspec-sizing} {Size}
1739 {
1740   \tl_set:Nn \l_@@_size_tl {\#1}
1741 }
1742 \@@_keys_define_code:nnn {fontspec-sizing} {Font}
1743 {
1744   \fontspec_complete_fontname:Nn \l_@@_sizedfont_tl {\#1}
1745 }

```

### 23.6.4 Font-independent features

These features can be applied to any font.

**NFSS family** Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default fontspec auto-generates one based on the font name.)

```
1746 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSFamily}
1747 {
1748   \tl_set:Nx \l_@@_nfss_fam_tl { #1 }
1749   \cs_undefine:c {g_@@_UID_\l_@@_fontid_tl}
1750   \tl_if_exist:NT \l_fontsname_tl
1751   { \cs_undefine:c {g_@@_\l_fontsname_tl _prop} }
1752 }
```

**NFSS series/shape** This option looks similar in name but has a very different function.

```
1753 \cs_generate_variant:Nn \prop_put:Nnn {Nxx}
1754 \prop_new:N \l_@@_nfssfont_prop
1755 \@@_keys_define_code:nnn {fontspec} {FontFace}
1756 {
1757   \tl_set:No \l_@@_arg_tl { \use_iii:nnn #1 }
1758   \tl_set_eq:NN \l_@@_this_feat_tl \l_@@_arg_tl
1759   \tl_clear:N \l_@@_this_font_tl
1760   \int_compare:nT { \clist_count:N \l_@@_arg_tl = 1 }
1761   {
1762     \typeout{FontFace~ parsing:~ one~ clist~ item}
1763   
```

1764 ⟨/debug⟩

```
1765     \tl_if_in:NnF \l_@@_arg_tl {=}
1766   {
1767     \typeout{FontFace~ parsing:~ no~ equals~ =>~ font~ name~ only}
1768   
```

1769 ⟨/debug⟩

```
1770     \tl_set_eq:NN \l_@@_this_font_tl \l_@@_arg_tl
1771     \tl_clear:N \l_@@_this_feat_tl
1772   }
1773 }
```

1774

```
1775 \@@_add_nfssfont:oooo
1776 { \use_i:nnn #1 } { \use_ii:nnn #1 } { \l_@@_this_font_tl } { \l_@@_this_feat_tl }
1777 }
```

\@@\_add\_nfssfont:nnnn #1 : series  
#2 : shape  
#3 : fontname  
#4 : fontspec features

```
1778 \cs_new:Nn \@@_add_nfssfont:nnnn
1779 {
1780   \tl_set:Nx \l_@@_this_font_tl {#3}
1781
1782   \tl_if_empty:xTF {#4}
1783   { \clist_set:Nn \l_@@_sizefeat_clist {Size={-}} }
```

```

1784 { \keys_set_known:nN {fontspec-preparse-nested} {#4} \l_@@_tmp_t1 }
1785
1786 \tl_if_empty:NF \l_@@_this_font_t1
1787 {
1788   \prop_put:Nxx \l_@@_nfssfont_prop {#1/#2}
1789   { {#1}{#2}{\l_@@_this_font_t1}{#4}{\l_@@_sizefeat_clist} }
1790 }
1791 }
1792 \cs_generate_variant:Nn \@@_add_nfssfont:nnnn {ooo}
1793 \cs_generate_variant:Nn \@@_add_nfssfont:nnnn {oooo}
1794 \cs_generate_variant:Nn \tl_if_empty:nTF {x}

```

**Scale** If the input isn't one of the pre-defined string options, then it's gotta be numerical.  
`\fontspec_calc_scale:n` does all the work in the auto-scaling cases.

```

1795 \@@_keys_define_code:nnn {fontspec} {Scale}
1796 {
1797   \str_case:nnn {#1}
1798   {
1799     {MatchLowercase} { \@@_calc_scale:n {5} }
1800     {MatchUppercase} { \@@_calc_scale:n {8} }
1801   }
1802   { \tl_set:Nx \l_@@_scale_t1 {#1} }
1803   \tl_set:Nx \l_@@_scale_t1 { s*[\l_@@_scale_t1] }
1804 }

```

`\@@_calc_scale:n` This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in Xe<sup>T</sup>E<sub>X</sub>).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```

1805 \cs_new:Nn \@@_calc_scale:n
1806 {
1807   \group_begin:
1808   \rmfamily
1809   \@@_set_font_dimen:NnN \l_@@_tmpa_dim {#1} \font
1810   \@@_set_font_dimen:NnN \l_@@_tmpb_dim {#1} \l_fontsfont
1811   \tl_gset:Nx \l_@@_scale_t1
1812   {
1813     \fp_eval:n { \dim_to_fp:n {\l_@@_tmpa_dim} /
1814                 \dim_to_fp:n {\l_@@_tmpb_dim} }
1815   }
1816   \@@_info:n {set-scale}
1817   \group_end:
1818 }

```

`\@@_set_font_dimen:NnN` This function sets the dimension #1 (for font #3) to 'fontdimen' #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect 'zero' value (as `\fontdimen8` might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an 'X' or an 'x'.

```

1819 \cs_new:Nn \@@_set_font_dimen:NnN
1820 {
1821   \dim_set:Nn #1 { \fontdimen #2 #3 }
1822   \dim_compare:nNnT #1 = {0pt}
1823   {
1824     \settoheight #1
1825     {
1826       \str_if_eq:nnTF {#3} {\font} \rmfamily #3
1827       \int_case:nnn #2
1828       {
1829         {5} {x} % x-height
1830         {8} {X} % cap-height
1831       } {?} % "else" clause; never reached.
1832     }
1833   }
1834 }
```

**Inter-word space** These options set the relevant \fontdimens for the font being loaded.

```

1835 \@@_keys_define_code:nnn {fontspec} {WordSpace}
1836 {
1837   \bool_if:NF \l_@@_firsttime_bool
1838   { \fontspec_parse_wordspace:w #1,,, \q_stop }
1839 }
```

\\_fontspec\\_parse\\_wordspace:w This macro determines if the input to WordSpace is of the form {X} or {X,Y,Z} and executes the font scaling. If the former input, it executes {X,X,X}.

```

1840 \cs_set:Npn \fontspec_parse_wordspace:w #1,#2,#3,#4 \q_stop
1841 {
1842   \tl_if_empty:nTF {#4}
1843   {
1844     \tl_set:Nn \l_@@_wordspace_adjust_tl
1845     {
1846       \fontdimen 2 \font = #1 \fontdimen 2 \font
1847       \fontdimen 3 \font = #1 \fontdimen 3 \font
1848       \fontdimen 4 \font = #1 \fontdimen 4 \font
1849     }
1850   }
1851   {
1852     \tl_set:Nn \l_@@_wordspace_adjust_tl
1853     {
1854       \fontdimen 2 \font = #1 \fontdimen 2 \font
1855       \fontdimen 3 \font = #2 \fontdimen 3 \font
1856       \fontdimen 4 \font = #3 \fontdimen 4 \font
1857     }
1858   }
1859 }
```

**Punctuation space** Scaling factor for the nominal \fontdimen#7.

```

1860 \@@_keys_define_code:nnn {fontspec} {PunctuationSpace}
1861 {
1862   \str_case_x:nnn {#1}
```

```

1863  {
1864  {WordSpace}
1865  {
1866  \tl_set:Nn \l_@@_punctspace_adjust_tl
1867  { \fontdimen 7 \font = 0 \fontdimen 2 \font }
1868  }
1869  {TwiceWordSpace}
1870  {
1871  \tl_set:Nn \l_@@_punctspace_adjust_tl
1872  { \fontdimen 7 \font = 1 \fontdimen 2 \font }
1873  }
1874  }
1875  {
1876  \tl_set:Nn \l_@@_punctspace_adjust_tl
1877  { \fontdimen 7 \font = #1 \fontdimen 7 \font }
1878  }
1879 }

```

### Secret hook into the font-adjustment code

```

1880 \@@_keys_define_code:nnn {fontspec} {FontAdjustment}
1881 {
1882 \tl_put_right:Nx \l_@@_postadjust_tl {#1}
1883 }

```

### Letterspacing

```

1884 \@@_keys_define_code:nnn {fontspec} {LetterSpace}
1885 {
1886 \@@_update_featstr:n {letterspace=#1}
1887 }

```

**Hyphenation character** This feature takes one of three arguments: ‘None’, *<glyph>*, or *<slot>*. If the input isn’t the first, and it’s one character, then it’s the second; otherwise, it’s the third.

```

1888 \@@_keys_define_code:nnn {fontspec} {HyphenChar}
1889 {
1890 \str_if_eq:nnTF {#1} {None}
1891 {

```

### 23.6.6 Font transformations

These are to be specified to apply directly to a font shape:

```

2015 \keys_define:nn {fontspec}
2016 {
2017     FakeSlant .code:n =
2018     {
2019         \@@_update_featstr:n{slant=#1}
2020     },
2021     FakeSlant .default:n = {0.2}
2022 }
2023 \keys_define:nn {fontspec}
2024 {
2025     FakeStretch .code:n =
2026     {
2027         \@@_update_featstr:n{extend=#1}
2028     },
2029     FakeStretch .default:n = {1.2}
2030 }
2031 <*xetexx>
2032 \keys_define:nn {fontspec}
2033 {
2034     FakeBold .code:n =
2035     {
2036         \@@_update_featstr:n {embolden=#1}
2037     },
2038     FakeBold .default:n = {1.5}
2039 }
2040 </xetexx>
2041 <*luatex>
2042 \keys_define:nn {fontspec}
2043 {
2044     FakeBold .code:n = { \@@_warning:n {fakebold-only-xetex} }
2045 }

```

```
2046 
```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create ‘fake’ shapes.

The behaviour is currently that only if both AutoFakeSlant *and* AutoFakeBold are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```
2047 \keys_define:nn {fontspec}
2048 {
2049   AutoFakeSlant .code:n =
2050   {
2051     \bool_if:NT \l_@@_firsttime_bool
2052     {
2053       \tl_set:Nn \l_fontspeek_fake_slant_tl {#1}
2054       \clist_put_right:Nn \l_@@_fontfeat_it_clist {FakeSlant=#1}
2055       \tl_set_eq:NN \l_fontspeek_fontname_it_tl \l_fontspeek_fontname_tl
2056       \bool_set_false:N \l_@@_noit_bool
2057
2058       \tl_if_empty:NF \l_fontspeek_fake_embolden_tl
2059       {
2060         \clist_put_right:Nx \l_@@_fontfeat_bfit_clist
2061           {FakeBold=\l_fontspeek_fake_embolden_tl}
2062         \clist_put_right:Nx \l_@@_fontfeat_bfit_clist {FakeSlant=#1}
2063         \tl_set_eq:NN \l_fontspeek_fontname_bfit_tl \l_fontspeek_fontname_tl
2064       }
2065     }
2066   },
2067   AutoFakeSlant .default:n = {0.2}
2068 }
```

Same but reversed:

```
2069 \keys_define:nn {fontspec}
2070 {
2071   AutoFakeBold .code:n =
2072   {
2073     \bool_if:NT \l_@@_firsttime_bool
2074     {
2075       \tl_set:Nn \l_fontspeek_fake_embolden_tl {#1}
2076       \clist_put_right:Nn \l_@@_fontfeat_bf_clist {FakeBold=#1}
2077       \tl_set_eq:NN \l_fontspeek_fontname_bf_tl \l_fontspeek_fontname_tl
2078       \bool_set_false:N \l_@@_nobf_bool
2079
2080       \tl_if_empty:NF \l_fontspeek_fake_slant_tl
2081       {
2082         \clist_put_right:Nx \l_@@_fontfeat_bfit_clist
2083           {FakeSlant=\l_fontspeek_fake_slant_tl}
2084         \clist_put_right:Nx \l_@@_fontfeat_bfit_clist {FakeBold=#1}
2085         \tl_set_eq:NN \l_fontspeek_fontname_bfit_tl \l_fontspeek_fontname_tl
2086       }
2087     }
2088   },
```

```

2089 AutoFakeBold .default:n = {1.5}
2090 }

```

### 23.6.7 Ligatures

The call to the nested keyval family must be wrapped in braces to hide the parent list (this later requires the use of global definitions (`\xdef`) in [...]). Both AAT and OpenType names are offered to chose Rare/Discretionary ligatures.

```

2091 \@@_define_font_feature:n{Ligatures}
2092 \@@_define_feature_option:nnnnn{Ligatures}{Required}      {1}{0}{+rlig}
2093 \@@_define_feature_option:nnnnn{Ligatures}{NoRequired}    {1}{1}{-rlig}
2094 \@@_define_feature_option:nnnnn{Ligatures}{Common}        {1}{2}{+liga}
2095 \@@_define_feature_option:nnnnn{Ligatures}{NoCommon}      {1}{3}{-liga}
2096 \@@_define_feature_option:nnnnn{Ligatures}{Rare}          {1}{4}{+dlig}
2097 \@@_define_feature_option:nnnnn{Ligatures}{NoRare}        {1}{5}{-dlig}
2098 \@@_define_feature_option:nnnnn{Ligatures}{Discretionary} {1}{4}{+dlig}
2099 \@@_define_feature_option:nnnnn{Ligatures}{NoDiscretionary}{1}{5}{-dlig}
2100 \@@_define_feature_option:nnnnn{Ligatures}{Contextual}     {}{} {+clig}
2101 \@@_define_feature_option:nnnnn{Ligatures}{NoContextual}   {}{} {-clig}
2102 \@@_define_feature_option:nnnnn{Ligatures}{Historic}       {}{} {+hlig}
2103 \@@_define_feature_option:nnnnn{Ligatures}{NoHistoric}     {}{} {-hlig}

2105 \@@_define_feature_option:nnnnn{Ligatures}{NoLogos}        {1}{7}{}
2106 \@@_define_feature_option:nnnnn{Ligatures}{Rebus}          {1}{8}{}
2107 \@@_define_feature_option:nnnnn{Ligatures}{NoRebus}        {1}{9}{}
2108 \@@_define_feature_option:nnnnn{Ligatures}{Diphthong}      {1}{10}{}
2109 \@@_define_feature_option:nnnnn{Ligatures}{NoDiphthong}    {1}{11}{}
2110 \@@_define_feature_option:nnnnn{Ligatures}{Squared}        {1}{12}{}
2111 \@@_define_feature_option:nnnnn{Ligatures}{NoSquared}      {1}{13}{}
2112 \@@_define_feature_option:nnnnn{Ligatures}{AbbrevSquared}  {1}{14}{}
2113 \@@_define_feature_option:nnnnn{Ligatures}{NoAbbrevSquared}{1}{15}{}
2114 \@@_define_feature_option:nnnnn{Ligatures}{Icelandic}      {1}{32}{}
2115 \@@_define_feature_option:nnnnn{Ligatures}{NoIcelandic}    {1}{33}{}

```

Emulate CM extra ligatures.

```

2116 \keys_define:nn {fontspec}
2117 {
2118   Ligatures / TeX .code:n =
2119   {
2120     \xetexx
2121     \@@_update_featstr:n { mapping = tex-text }
2122   \xetexx
2123   \luatex
2124     \@@_update_featstr:n { +tlig; +trep }
2125   \luatex
2126   }
2127 }

```

### 23.6.8 Letters

```

2128 \@@_define_font_feature:n{Letters}
2129 \@@_define_feature_option:nnnnn{Letters}{Normal}           {3}{0}{}

```

```

2130 \@@_define_feature_option:nnnnn{Letters}{Uppercase}      {3}{1}{+case}
2131 \@@_define_feature_option:nnnnn{Letters}{Lowercase}      {3}{2}{}
2132 \@@_define_feature_option:nnnnn{Letters}{SmallCaps}       {3}{3}{+smcp}
2133 \@@_define_feature_option:nnnnn{Letters}{PetiteCaps}       {} {} {+pcap}
2134 \@@_define_feature_option:nnnnn{Letters}{UppercaseSmallCaps} {} {} {+c2sc}
2135 \@@_define_feature_option:nnnnn{Letters}{UppercasePetiteCaps} {} {} {+c2pc}
2136 \@@_define_feature_option:nnnnn{Letters}{InitialCaps}       {3}{4}{}
2137 \@@_define_feature_option:nnnnn{Letters}{Unicase}          {} {} {+unic}
2138 \@@_define_feature_option:nnnnn{Letters}{Random}           {} {} {+rand}

```

### 23.6.9 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

```

2139 \@@_define_font_feature:n{Numbers}
2140 \@@_define_feature_option:nnnnn{Numbers}{Monospaced}   {6} {0}{+tnum}
2141 \@@_define_feature_option:nnnnn{Numbers}{Proportional} {6} {1}{+pnum}
2142 \@@_define_feature_option:nnnnn{Numbers}{Lowercase}     {21}{0}{+onum}
2143 \@@_define_feature_option:nnnnn{Numbers}{OldStyle}      {21}{0}{+onum}
2144 \@@_define_feature_option:nnnnn{Numbers}{Uppercase}      {21}{1}{+lnum}
2145 \@@_define_feature_option:nnnnn{Numbers}{Lining}        {21}{1}{+lnum}
2146 \@@_define_feature_option:nnnnn{Numbers}{SlashedZero}    {14}{5}{+zero}
2147 \@@_define_feature_option:nnnnn{Numbers}{NoSlashedZero}{14}{4}{-zero}

```

luatotload provides a custom anum feature for replacing Latin (AKA Arabic) numbers with Arabic (AKA Indic-Arabic). The same feature maps to Farsi (Persian) numbers if font language is Farsi.

```

2148 \luatex_if_engine:T
2149 {
2150   \@@_define_feature_option:nnnnn{Numbers}{Arabic}{}{}{+anum}
2151 }

```

### 23.6.10 Contextuals

```

2152 \@@_define_font_feature:n {Contextuals}
2153 \@@_define_feature_option:nnnnn{Contextuals}{Swash}      {} {} {+cswh}
2154 \@@_define_feature_option:nnnnn{Contextuals}{NoSwash}    {} {} {-cswh}
2155 \@@_define_feature_option:nnnnn{Contextuals}{Alternate}  {} {} {+calt}
2156 \@@_define_feature_option:nnnnn{Contextuals}{NoAlternate} {} {} {-calt}
2157 \@@_define_feature_option:nnnnn{Contextuals}{WordInitial} {8}{0}{+init}

```

**Turkish** Turns out that many fonts use 'TUR' as their Turkish language tag rather than the specified 'TRK'. So we check for both:

```

2547 \keys_define:nn {fontspec}
2548 {
2549   Language / Turkish .code:n =
2550   {
2551     \fontspec_check_lang:nTF {TRK}
2552     {
2553       \int_set:Nn \l_fontspec_language_int {\l_fontspec_strnum_int}
2554       \tl_set:Nn \l_fontspec_lang_tl {TRK}
2555     }
2556   {
2557     \fontspec_check_lang:nTF {TUR}
2558     {
2559       \int_set:Nn \l_fontspec_language_int {\l_fontspec_strnum_int}
2560       \tl_set:Nn \l_fontspec_lang_tl {TUR}
2561     }
2562   {
2563     \@@_warning:nx {language-not-exist} {Turkish}
2564     \keys_set:nn {fontspec} {Language=Default}
2565   }
2566 }
2567 }
2568 }

```

## Default

```

2569 \@@_keys_define_code:nnn {fontspec}{ Language / Default }
2570 {
2571   \tl_set:Nn \l_fontspec_lang_tl {DFLT}
2572   \int_zero:N \l_fontspec_language_int
2573 }

```

### 23.6.23 Raw feature string

This allows savvy X<sub>E</sub>T<sub>L</sub>X-ers to input font features manually if they have already memorised the OpenType abbreviations and don't mind not having error checking.

```

2574 \@@_keys_define_code:nnn {fontspec} {RawFeature}
2575 {
2576   \@@_update_featstr:n {\#1}
2577 }

```

## 23.7 Italic small caps

The following code for utilising italic small caps sensibly is inspired from Philip Lehman's *The Font Installation Guide*. Note that `\upshape` needs to be used *twice* to get from italic small caps to regular upright (it always goes to small caps, then regular upright).

`\sishape` First, the commands for actually selecting italic small caps are defined. I use `si` as the NFSS shape for italic small caps, but I have seen `itsc` and `s1sc` also used. `\sdefault` may be redefined to one of these if required for compatibility.

```

2578 \providecommand*\sdefault{si}
2579 \DeclareRobustCommand{\sishape}
2580 {

```

```

2581 \not@math@alphabet\sishape\relax
2582 \fontshape\sidefault\selectfont
2583 }
2584 \DeclareTextFontCommand{\textsi}{\sishape}

\fontspec_blend_shape:nnn This is the macro which enables the overload on the \.. shape commands. It takes three such arguments. In essence, the macro selects the first argument, unless the second argument is already selected, in which case it selects the third.
2585 \cs_new:Nn \fontspec_blend_shape:nnn
2586 {

```

## 23.8 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever \setmainfont and friends was run.

\fontspec\_setup\_maths: Everything here is performed \AtBeginDocument in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```

2615 \@ifpackageloaded{euler}
2616 {
2617   \bool_set_true:N \g_@@_pkg_euler_loaded_bool
2618 }
2619 {
2620   \bool_set_false:N \g_@@_pkg_euler_loaded_bool
2621 }
2622 \cs_set:Nn \fontspec_setup_maths:
2623 {
2624   \ifpackageloaded{euler}
2625   {
2626     \bool_if:NTF \g_@@_pkg_euler_loaded_bool
2627     { \bool_set_true:N \g_@@_math_euler_bool }
2628     { \@@_error:n {euler-too-late} }
2629   }
2630 }
2631 \ifpackageloaded{lucbmath}{\bool_set_true:N \g_@@_math_lucida_bool}{}
2632 \ifpackageloaded{lucidabr}{\bool_set_true:N \g_@@_math_lucida_bool}{}
2633 \ifpackageloaded{lucimatx}{\bool_set_true:N \g_@@_math_lucida_bool}{}

```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, cmr, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L<sup>A</sup>T<sub>E</sub>X's operators maths font to still go back to the legacy cmr font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a \hat accent in EulerFractur, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```

2634 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
2635 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
2636 \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}
2637 \DeclareMathAccent{\grave}{\mathalpha}{legacymaths}{18}
2638 \DeclareMathAccent{\ddot}{\mathalpha}{legacymaths}{127}
2639 \DeclareMathAccent{\tilde}{\mathalpha}{legacymaths}{126}
2640 \DeclareMathAccent{\bar}{\mathalpha}{legacymaths}{22}
2641 \DeclareMathAccent{\breve}{\mathalpha}{legacymaths}{21}
2642 \DeclareMathAccent{\check}{\mathalpha}{legacymaths}{20}
2643 \DeclareMathAccent{\hat}{\mathalpha}{legacymaths}{94} % too bad, euler
2644 \DeclareMathAccent{\dot}{\mathalpha}{legacymaths}{95}
2645 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

**\colon: what's going on?** Okay, so : and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% fontmath.ltx:
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{":3A}
\DeclareMathSymbol{:}{\mathrel}{operators}{":3A}

% amsmath.sty:
\renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}{\nonscript
\mkern-\thinmuskip:}\mskip6mu plus1mu\relax}

% euler.sty:

```

```

\DeclareMathSymbol{:\!}\mathrel {EulerFraktur}"3A}

% lucbmath.sty:
\DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}
\ifx\colon@tempb
  \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
\fi
\DeclareMathSymbol{:\!}{\mathrel}{operators}{58}

(3A_16 = 58_10) So I think, based on this summary, that it is fair to tell fontspec to 'replace'
the operators font with legacymaths for this symbol, except when amsmath is loaded since
we want to keep its definition.

2646 \group_begin:
2647   \mathchardef@tempa="603A \relax
2648   \ifx\colon@tempa
2649     \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
2650   \fi
2651 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

2652 \bool_if:NF \g_@@_math_euler_bool
2653 {
2654   \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
2655   \DeclareMathSymbol{:\!}{\mathrel}{legacymaths}{58}
2656   \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
2657   \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

2658 \bool_if:NF \g_@@_math_lucida_bool
2659 {
2660   \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{`0}
2661   \DeclareMathSymbol{1}{\mathalpha}{legacymaths}{`1}

2677   \DeclareMathSymbol{\Upsilon}{\mathalpha}{legacymaths}{`7}
2678   \DeclareMathSymbol{\Phi}{\mathalpha}{legacymaths}{`8}
2679   \DeclareMathSymbol{\Psi}{\mathalpha}{legacymaths}{`9}
2680   \DeclareMathSymbol{\Omega}{\mathalpha}{legacymaths}{`10}

```

```

2681   \DeclareMathSymbol{+}{\mathbin}{legacymaths}{43}
2682   \DeclareMathSymbol{=}{\mathrel}{legacymaths}{61}
2683   \DeclareMathDelimiter{()}{\mathopen}{legacymaths}{40}{largesymbols}{0}
2684   \DeclareMathDelimiter{}{\mathclose}{legacymaths}{41}{largesymbols}{1}
2685   \DeclareMathDelimiter{[]}{{\mathopen}{legacymaths}{91}{largesymbols}{2}}
2686   \DeclareMathDelimiter{}{{\mathclose}{legacymaths}{93}{largesymbols}{3}}
2687   \DeclareMathDelimiter{/}{\mathord}{legacymaths}{47}{largesymbols}{14}
2688   \DeclareMathSymbol{\mathdollar}{\mathord}{legacymaths}{36}
2689 }
2690 }

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_@@_mathrm_t1 (...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm (...)` commands in the preamble.

Since L<sup>A</sup>T<sub>E</sub>X only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_t1`.

```

2691 \DeclareSymbolFont{operators}\g_fontsencoding_t1\g_@@_mathrm_t1\mddefault\updefault
2692 \SetSymbolFont{operators}{normal}\g_fontsencoding_t1\g_@@_mathrm_t1\mddefault\updefault
2693 \DeclareSymbolFontAlphabet\mathrm{operators}
2694 \SetMathAlphabet\mathit{normal}\g_fontsencoding_t1\g_@@_mathrm_t1\mddefault\itdefault
2695 \SetMathAlphabet\mathbf{normal}\g_fontsencoding_t1\g_@@_mathrm_t1\bfdefault\updefault
2696 \SetMathAlphabet\mathsf{normal}\g_fontsencoding_t1\g_@@_mathsf_t1\mddefault\updefault
2697 \SetMathAlphabet\mathtt{normal}\g_fontsencoding_t1\g_@@_mathtt_t1\mddefault\updefault
2698 \SetSymbolFont{operators}{bold}\g_fontsencoding_t1\g_@@_mathrm_t1\bfdefault\updefault
2699 \tl_if_empty:NTF \g_@@_bfmathrm_t1
2700 {
2701   \SetMathAlphabet\mathit{bold}\g_fontsencoding_t1\g_@@_mathrm_t1\bfdefault\itdefault
2702 }
2703 {
2704   \SetMathAlphabet\mathrm{bold}\g_fontsencoding_t1\g_@@_bfmathrm_t1\mddefault\updefault
2705   \SetMathAlphabet\mathbf{bold}\g_fontsencoding_t1\g_@@_bfmathrm_t1\bfdefault\updefault
2706   \SetMathAlphabet\mathit{bold}\g_fontsencoding_t1\g_@@_bfmathrm_t1\mddefault\itdefault
2707 }
2708 \SetMathAlphabet\mathsf{bold}\g_fontsencoding_t1\g_@@_mathsf_t1\bfdefault\updefault
2709 \SetMathAlphabet\mathtt{bold}\g_fontsencoding_t1\g_@@_mathtt_t1\bfdefault\updefault
2710 }

```

`\fontspec_maybe_setup_maths:` We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L<sup>A</sup>T<sub>E</sub>X Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the TeX Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gammama=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

```

40  }{}{}
41 }
42 \def\x1x@defaulthyphenchar{\`-}

```

### 23.14 Verbatims

Many thanks to Apostolos Syropoulos for discovering this problem and writing the redefinition of L<sup>A</sup>T<sub>E</sub>X's `\verb+` environment and `\verb*` command.

`\fontspec_visible_space`: Print U+2434: OPEN BOX, which is used to visibly display a space character.

```

43 \cs_new:Nn \fontspec_visible_space:
44 {
45 \font_glyph_if_exist:NnTF \font {"2423}
46 { \char"2423\scan_stop: }
47 { \fontspec_visible_space_fallback: }
48 }

```

`\fontspec_visible_space:@fallback`: If the current font doesn't have U+2434: OPEN BOX, use Latin Modern Mono instead.

```

49 \cs_new:Nn \fontspec_visible_space_fallback:
50 {
51 {
52 \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
53 \textvisiblespace
54 }
55 }

```

`\fontspec_print_visible_spaces`: Helper macro to turn spaces (^20) active and print visible space instead.

```

56 \group_begin:
57 \char_set_catcode_active:n{"20}%
58 \cs_gset:Npn \fontspec_print_visible_spaces:{%
59 \char_set_catcode_active:n{"20}%
60 \cs_set_eq:NN ^\fontspec_visible_space:%
61 }%
62 \group_end:

```

`\verb` Redefine `\verb` to use `\fontspec_print_visible_spaces`:

```

\verb*
63 \def\verb
64 {
65 \relax\ifmmode\hbox\else\leavevmode\null\fi
66 \bgroup
67 \verb@eol@error \let\do\@makeother \dospecials
68 \verbatim@font\@noligs
69 \@ifstar\@sverb\@verb
70 }
71 \def\@sverb{\fontspec_print_visible_spaces:\@sverb}

```

It's better to put small things into \AtBeginDocument, so here we go:

```
72 \AtBeginDocument
73 {
74   \fontspec_patch_verbatim:
75   \fontspec_patch_moreverb:
76   \fontspec_patch_fancyvrb:
77   \fontspec_patch_listings:
78 }
```

verbatim\* With the verbatim package.

```
79 \cs_set:Npn \fontspec_patch_verbatim:
80 {
81   \@ifpackageloaded{verbatim}
82   {
83     \cs_set:cpn {verbatim*}
84     {
85       \group_begin: \verbatim \fontspec_print_visible_spaces: \verbatim@start
86     }
87   }
88 }
```

This is for vanilla L<sup>A</sup>T<sub>E</sub>X.

```
89 \cs_set:cpn {verbatim*}
90 {
91   \@verbatim \fontspec_print_visible_spaces: \sxverbatim
92 }
93 }
94 }
```

listingcont\* This is for moreverb. The main listing\* environment inherits this definition.

```
95 \cs_set:Npn \fontspec_patch_moreverb:
96 {
97   \@ifpackageloaded{moreverb}{
98     \cs_set:cpn {listingcont*}
99     {
100       \cs_set:Npn \verbatim@processline
101       {
102         \the\listing@line \global\advance\listing@line\c_one
103         \the\verbatim@line\par
104       }
105       \@verbatim \fontspec_print_visible_spaces: \verbatim@start
106     }
107   }{}
108 }
```

listings and fancyvrb make things nice and easy:

```
109 \cs_set:Npn \fontspec_patch_fancyvrb:
110 {
111   \@ifpackageloaded{fancyvrb}
112   {
113     \cs_set_eq:NN \FancyVerbSpace \fontspec_visible_space:
114   }{}
115 }
```

```
116 \cs_set:Npn \fontspec_patch_listings:
117 {
118   \@ifpackageloaded{listings}
119   {
120     \cs_set_eq:NN \lst@visiblespace \fontspec_visible_space:
121   }{}
122 }
```

### 23.15 \oldstylenums

\oldstylenums This command obviously needs a redefinition. And we may as well provide the reverse command.

```
123 \RenewDocumentCommand \oldstylenums {m}
124 {
125   { \addfontfeature{Numbers=OldStyle} #1 }
126 }
127 \NewDocumentCommand \liningnums {m}
128 {
129   { \addfontfeature{Numbers=Lining} #1 }
130 }
```

131 ⟨/patches⟩

## Part X
