1 History

This package began life as a \LaTeX interface to select system-installed Mac OS X fonts in Jonathan Kew's \XeTeX , the first widely-used Unicode extension to \TeX . Over time, \XeTeX was extended to support OpenType fonts and then was ported into a cross-platform program to run also on Windows and Linux.

More recently, \LuaTeX is fast becoming the \TeX engine of the day; it supports Unicode encodings and OpenType fonts and opens up the internals of \TeX via the Lua programming language. Hans Hagen's \ConTeXt Mk. IV is a re-write of his powerful typesetting system, taking full advantage of \LuaTeX 's features including font support; a kernel of his work in this area has been extracted to be useful for other \TeX macro systems as well, and this has enabled `fontspec` to be adapted for \LaTeX when run with the \LuaTeX engine.

2 Introduction

The `fontspec` package allows users of either \XeTeX or \LuaTeX to load OpenType fonts in a \LaTeX document. No font installation is necessary, and font features can be selected and used as desired throughout the document.

Without `fontspec`, it is necessary to write cumbersome font definition files for \LaTeX , since \LaTeX 's font selection scheme (known as the '`\nss`') has a lot going on behind the scenes to allow easy commands like `\emph` or `\bfseries`. With an uncountable number of fonts now available for use, however, it becomes less desirable to have to write these font definition (`.fd`) files for every font one wishes to use.

Because `fontspec` is designed to work in a variety of modes, this user documentation is split into separate sections that are designed to be relatively independent. Nonetheless, the basic functionality all behaves in the same way, so previous users of `fontspec` under \XeTeX should have little or no difficulty switching over to \LuaTeX .

This manual can get rather in-depth, as there are a lot of details to cover. See the example documents `fontspec-xetex.tex` and `fontspec-luatex.tex` for a complete minimal example with each engine.

2.1 About this manual

This document is typeset with `pdflatex` using pre-compiled examples that have been generated by either \XeTeX or \LuaTeX . You may regenerate the examples by removing the `doc-files`/ subdirectory and typesetting the manual with the following invocation:

```
pdflatex -shell-escape fontspec.dtx
```

Note that many of the examples use fonts that are not included in \TeX Live or MiK \TeX , and some of them are non-free fonts that must be purchased.

I'd like to reduce the number of non-free fonts used in this manual. If you know any freely available fonts that could be used as alternative to any of the fonts in this document, please suggest them to me. Finally, if any aspect of the documentation is unclear or you would like to suggest more examples that could be made, get in touch. (Contributions especially welcome.)

2.2 Acknowledgements

This package couldn't be possible without the early and continued support the author of \XeTeX , Jonathan Kew. When I started this package, he steered me many times in the right direction.

I've had great feedback over the years on feature requests, documentation queries, bug reports, font suggestions, and so on from lots of people all around the world. Many thanks to you all.

Thanks to David Perry and Markus Böhning for numerous documentation improvements and David Perry again for contributing the text for one of the sections of this manual.

Special thanks to Khaled Hosny, who had been the driving force behind the support for Lua^LT_EX, ultimately leading to version 2.0 of the package.

3 Package loading and options

For basic use, no package options are required:

```
\usepackage{fontspec}
```

Package options will be introduced below; some preliminary details are discussed first:

xunicode Ross Moore's xunicode package is now automatically loaded for users of both Xe^LT_EX and Lua^LT_EX. This package provides backwards compatibility with L^AT_EX's methods for accessing extra characters and accents (for example, \%, \\$, \textbullet, \"u, and so on), plus many more Unicode characters.

Xe^LT_EX users only The xltextra package adds some minor extra features to Xe^LT_EX, including, via the metalogo package, the \XeTeX macro to typeset the Xe^LT_EX logo. While this package was previously recommended, it serves a much smaller rôle nowadays and generally will not be required. Please consult its documentation to assess whether its features are warranted before loading it.

Lua^LT_EX users only In order to load fonts by their name rather than by their filename (e.g., 'Latin Modern Roman' instead of 'ec-lmr10'), you may need to run the script luafontload-tool, which is distributed with the luafontload package. Note that if you do not execute this script beforehand, the first time you attempt to typeset the process will pause for (up to) several minutes. (But only the first time.) Please see the luafontload documentation for more information.

babel *The babel package is not really supported!* Especially Vietnamese, Greek, and Hebrew at least might not work correctly, as far as I can tell. There's a better chance with Cyrillic and Latin-based languages, however—fontspec ensures at least that fonts should load correctly. The polyglossia package is recommended instead as a modern replacement for babel.

3.1 Maths fonts adjustments

By default, fontspec adjusts L^AT_EX's default maths setup in order to maintain the correct Computer Modern symbols when the roman font changes. However, it will attempt to avoid doing this if another maths font package is loaded (such as mathpazo or the unicode-math package).

If you find that fontspec is incorrectly changing the maths font when it should be leaving well enough alone, apply the [no-math] package option to manually suppress its maths font.

3.2 Configuration

If you wish to customise any part of the fontspec interface (see later in this manual, [Section 15 on page 43](#) and [Section 17](#)), this should be done by creating your own `fontspec.cfg` file, which will be automatically loaded if it is found by X_ET_EX or LuaT_EX. Either place it in the same folder as the main document for isolated cases, or in a location that X_ET_EX or LuaT_EX searches by default; e.g. in MacT_EX: `~/Library/texmf/tex/latex/`. The package option `[no-config]` will suppress this behaviour under all circumstances.

3.3 Warnings

This package can give many warnings that can be harmless if you know what you're doing. Use the `[quiet]` package option to write these warnings to the transcript (`.log`) file instead.

Use the `[silent]` package option to completely suppress these warnings if you don't even want the `.log` file cluttered up.

Part I

General font selection

This section concerns the variety of commands that can be used to select fonts.

```
\fontspec [<font features>] {<font name>}
\setmainfont [<font features>] {<font name>}
\setsansfont [<font features>] {<font name>}
\setmonofont [<font features>] {<font name>}
\newfontfamily <cmd> [<font features>] {<font name>}
```

These are the main font-selecting commands of this package. The `\fontspec` command selects a font for one-time use; all others should be used to define the standard fonts used in a document. They will be described later in this section.

The font features argument accepts comma separated `=<option>` lists; these are described in later:

- For general font features, see [Section 8 on page 15](#)
- For OpenType fonts, see [Part II on page 19](#)
- For X_ET_EX-only general font features, see [Part IV on page 36](#)
- For LuaT_EX-only general font features, see [Part III on page 34](#)
- For features for AAT fonts in X_ET_EX, see [Section 13 on page 38](#)

4 Font selection

In both LuaT_EX and X_ET_EX, fonts can be selected either by 'font name' or by 'file name'.

4.1 By font name

Fonts known to LuaT_EX or X_ET_EX may be loaded by their standard names as you'd speak them out loud, such as *Times New Roman* or *Adobe Garamond*. 'Known to' in this case generally means 'exists in a standard fonts location' such as `~/Library/Fonts` on Mac OS X, or `C:\Windows\Fonts` on Windows.

The simplest example might be something like

```
\fontspec[ ... ]{Cambria}
```

in which the bold and italic fonts will be found automatically (if they exist) and are immediately accessible with the usual `\textit` and `\textbf` commands.

TODO: add explanation for how to find out what the ‘font name’ is.

4.2 By file name

X_ET_EX and LuaT_EX also allow fonts to be loaded by file name instead of font name. When you have a very large collection of fonts, you will sometimes not wish to have them all installed in your system’s font directories. In this case, it is more convenient to load them from a different location on your disk. This technique is also necessary in X_ET_EX when loading OpenType fonts that are present within your T_EX distribution, such as `/usr/local/texlive/2013/texmf-dist/fonts/opentype/public`. Fonts in such locations are visible to X_ET_EX but cannot be loaded by font name, only file name; LuaT_EX does not have this restriction.

When selecting fonts by file name, any font that can be found in the default search paths may be used directly (including in the current directory) without having to explicitly define the location of the font file on disk.

X_ET_EX & Mac users only: Note that X_ET_EX can only select fonts in this way with the `xdvipdfmx` driver, but X_ET_EX with the `xdv2pdf` driver can only select system-installed fonts by font name and not file name. The `xdvipdfmx` driver is default for X_ET_EX, so this is only a problem if you wish to explicitly use the `xdv2pdf` driver.

Fonts selected by filename must include bold and italic variants explicitly.

```
\fontspec
  [ BoldFont      = texgyrepagella-bold.otf ,
    ItalicFont    = texgyrepagella-italic.otf ,
    BoldItalicFont = texgyrepagella-bolditalic.otf ]
  {texgyrepagella-regular.otf}
```

`fontspec` knows that the font is to be selected by file name by the presence of the ‘.otf’ extension. An alternative is to specify the extension separately, as shown following:

```
\fontspec
  [ Extension     = .otf ,
    BoldFont      = texgyrepagella-bold ,
    ...
  {texgyrepagella-regular}
```

If desired, an abbreviation can be applied to the font names based on the mandatory ‘font name’ argument:

```
\fontspec
  [ Extension     = .otf ,
    UprightFont   = *-regular ,
    BoldFont      = *-bold ,
    ...
  {texgyrepagella}
```

In this case ‘texgyrepagella’ is no longer the name of an actual font, but is used to construct the font names for each shape; the * is replaced by ‘texgyrepagella’. Note in this case that `UprightFont` is required for constructing the font name of the normal font to use.

To load a font that is not in one of the default search paths, its location in the filesystem must be specified with the `Path` feature:

Example 1: Loading the default, sans serif, and monospaced fonts.

```
\setmainfont{TeX Gyre Bonum}
\setsansfont[Scale=MatchLowercase]{Latin Modern Sans}
\setmonofont[Scale=MatchLowercase]{Inconsolata}
```

```
Pack my box with five dozen liquor jugs \rmfamily Pack my box with five dozen liquor jugs\par
Pack my box with five dozen liquor jugs \sffamily Pack my box with five dozen liquor jugs\par
Pack my box with five dozen liquor jugs \ttfamily Pack my box with five dozen liquor jugs
```

```
\fontspec
  [ Path          = /Users/will/Fonts/ ,
    UprightFont   = *-regular ,
    BoldFont      = *-bold ,
    ... ]
  {texgyrepagella}
```

Note that $X_{\text{\LaTeX}}$ and \LuaTeX are able to load the font without giving an extension, but `fontspec` must know to search for the file; this can be indicated by declaring the font exists in an ‘ExternalLocation’:

```
\fontspec
  [ ExternalLocation ,
    BoldFont      = texgyrepagella-bold ,
    ... ]
  {texgyrepagella-regular}
```

To be honest, `Path` and `ExternalLocation` are actually the same feature with different names. The former can be given without an argument and the latter can be given with one; the different names are just for clarity.

5 Default font families

```
\setmainfont [\langle font features \rangle] {\langle font name \rangle}
\setsansfont [\langle font features \rangle] {\langle font name \rangle}
\setmonofont [\langle font features \rangle] {\langle font name \rangle}
```

These commands are used to select the default font families for the entire document. They take the same arguments as `\fontspec`. See Example 1. Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The `Scale` font feature will be discussed further in [Section 8 on page 15](#), including methods for automatic scaling.

6 New commands to select font families

```
\newfontfamily \langle font-switch \rangle [\langle font features \rangle] {\langle font name \rangle}
\newfontface \langle font-switch \rangle [\langle font features \rangle] {\langle font name \rangle}
```

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling `\fontspec` for every use. While the `\fontspec`

Example 2: Defining new font families.

This is a *note*. \newfontfamily\notefont{Kurier}

\notefont This is a \emph{note}.

Example 3: Defining a single font face.

\newfontface\fancy
[Contextuals={WordInitial,WordFinal}]
{Hoefler Text Italic}
where is all the vegemite \fancy where is all the vegemite
% \emph, \textbf, etc., all don't work

command does not define a new font instance after the first call, the feature options must still be parsed and processed.

\newfontfamily

For this reason, new commands can be created for loading a particular font family with the \newfontfamily command, demonstrated in Example 2. This macro should be used to create commands that would be used in the same way as \rmfamily, for example. If you would like to create a command that only changes the font inside its argument (i.e., the same behaviour as \emph) define it using regular L^AT_EX commands:

```
\newcommand\textnote[1]{\notefont #1}  
\textnote{This is a note.}
```

Note that the double braces are intentional; the inner pair are used to delimit the scope of the font change.

\newfontface

Sometimes only a specific font face is desired, without accompanying italic or bold variants being automatically selected. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. \newfontface is used for this purpose, shown in Example 3, which is repeated in [Section 13.4 on page 38](#).

Comment for advanced users: The commands defined by \newfontface and \newfontfamily include their encoding information, so even if the document is set to use a legacy T_EX encoding, such commands will still work correctly. For example,

```
\documentclass{article}  
\usepackage{fontspec}  
\newfontfamily\unicodefont{Lucida Grande}  
\usepackage{mathpazo}  
\usepackage[T1]{fontenc}  
\begin{document}  
A legacy \TeX\ font. {\unicodefont A unicode font.}  
\end{document}
```

6.1 More control over font shape selection

<code>BoldFont = ItalicFont = BoldItalicFont = SlantedFont = BoldSlantedFont = SmallCapsFont = </code>

Example 4: Explicit selection of the bold font.

```
\fontspec[BoldFont={Helvetica Neue}]{Helvetica Neue UltraLight}
Helvetica Neue UltraLight
Helvetica Neue UltraLight Italic
Helvetica Neue UltraLight Italic
Helvetica Neue
Helvetica Neue Italic
{\itshape Helvetica Neue UltraLight Italic} \\
{\bfseries Helvetica Neue} \\
{\bfseries\itshape Helvetica Neue Italic}
```

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose among. The `BoldFont` and `ItalicFont` features are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font. See Example 4.

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the `BoldItalicFont` feature is provided.

6.1.1 Input shorthands

For those cases that the base font name is repeated, you can replace it with an asterisk. (This has been shown previously in [Section 4.2 on page 6](#).) For example, some space can be saved instead of writing 'Baskerville SemiBold':

```
\fontspec[BoldFont={* SemiBold}]{Baskerville}
```

As a matter of fact, this feature can also be used for the upright font too:

```
\fontspec[UprightFont={* SemiBold},
BoldFont={* Bold}]{Baskerville}
```

6.1.2 Small caps and slanted font shapes

For the rare situations where a font family will have slanted *and* italic shapes, these may be specified separately using the analogous features `SlantedFont` and `BoldSlantedFont`. Without these, however, the L^AT_EX font switches for slanted (`\textsl`, `\slshape`) will default to the italic shape.

Old-fashioned font families used to distribute their small caps glyphs in separate fonts due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the `SmallCapsFont` of the family you are specifying:

```
\fontspec[
  SmallCapsFont={Minion MM Small Caps & Oldstyle Figures}
  ]{Minion MM Roman}
Roman 123 \\ \textsc{Small caps 456}
```

In fact, you may specify the small caps font for each individual bold and italic shape as in

```
\fontspec[
  UprightFeatures = { SmallCapsFont={ <sc> } } ,
  BoldFeatures   = { SmallCapsFont={ <bf sc> } } ,
  ItalicFeatures = { SmallCapsFont={ <it sc> } } ,
  BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } } ,
```

```
]{ <upright> }
Roman 123 \\ \textsc{Small caps 456}
```

For most modern fonts that have small caps as a font feature, this level of control isn't generally necessary, but you may still occasionally find font families in which the small caps are in a separate font.

All of the bold, italic, and small caps fonts can be loaded with different font features from the main font. See [Section 7.4](#) for details. When an OpenType font is selected for `SmallCapsFont`, the small caps font feature is *not* automatically enabled. In this case, users should write instead

```
\fontspec[
  SmallCapsFont={...},
  SmallCapsFeatures={Letters=SmallCaps},
  ]{...}
```

6.2 Math(s) fonts

When `\setmainfont`, `\setsansfont` and `\setmonofont` are used in the preamble, they also define the fonts to be used in maths mode inside the `\mathrm`-type commands. This only occurs in the preamble because L^AT_EX freezes the maths fonts after this stage of the processing. The `fontspec` package must also be loaded after any maths font packages (*e.g.*, `euler`) to be successful. (Actually, it is *only* `euler` that is the problem.¹)

Note that `fontspec` will not change the font for general mathematics; only the upright and bold shapes will be affected. To change the font used for the mathematical symbols, see either the `mathspec` package or the `unicode-math` package.

Note that you may find that loading some maths packages won't be as smooth as you expect since `fontspec` (and X^AT_EX in general) breaks many of the assumptions of T_EX as to where maths characters and accents can be found. Contact me if you have troubles, but I can't guarantee to be able to fix any incompatibilities. The Lucida and Euler maths fonts should be fine; for all others keep an eye out for problems.

```
\setmathrm [{font features}] {font name}
\setmathsf [{font features}] {font name}
\setmathtt [{font features}] {font name}
\setboldmathrm [{font features}] {font name}
```

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use the commands above (in the same way as our other `\fontspec`-like commands) to explicitly state which fonts to use inside such commands as `\mathrm`. Additionally, the `\setboldmathrm` command allows you define the font used for `\mathrm` when in bold maths mode (which is activated with, among others, `\boldmath`).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage{mathpazo}
\usepackage{fontspec,xunicode}
\setmainfont{Optima}
\setmathrm{Optima}
\setboldmathrm[BoldFont={Optima ExtraBlack}]{Optima Bold}
```

¹Speaking of `euler`, if you want to use its `[mathbf]` option, it won't work, and you'll need to put this after `fontspec` is loaded instead: `\AtBeginDocument{\DeclareMathAlphabet\mathbf{U}{eur}{b}{n}}`

Example 5: A demonstration of the `\defaultfontfeatures` command.

```
\fontspec{TeX Gyre Adventor}
Some default text 0123456789 \\ 
\defaultfontfeatures{
    Numbers=OldStyle, Color=888888
}
\fontspec{TeX Gyre Adventor}
Now grey, with old-style figures:
0123456789
```

Some default text 0123456789
Now grey, with old-style figures: 0123456789

6.3 Miscellaneous font selecting details

Spaces `\fontspec` and `\addfontfeatures` ignore trailing spaces as if it were a ‘naked’ control sequence; e.g., ‘M. `\fontspec{...}` N’ and ‘M. `\fontspec{...}N`’ are the same.

Italic small caps Note that this package redefines the `\itshape` and `\scshape` commands in order to allow them to select italic small caps in conjunction.

Emphasis and nested emphasis You may specify the behaviour of the `\emph` command by setting the `\emshape` command. E.g., for bold emphasis:

```
\renewcommand\emshape{\bfseries}
Nested emphasis is controlled by the \eminnershape command. For example, for \emph{\emph{...}} to produce small caps:
```

`\renewcommand\eminnershape{\scshape}`

7 Selecting font features

The commands discussed so far such as `\fontspec` each take an optional argument for accessing the font features of the requested font. Commands are provided to set default features to be applied for all fonts, and even to change the features that a font is presently loaded with. Different font shapes can be loaded with separate features, and different features can even be selected for different sizes that the font appears in. This section discusses these options.

7.1 Default settings

```
\defaultfontfeatures{<font features>}
```

It is desirable to define options that are applied to every subsequent font selection command: a default feature set, so to speak. This may be defined with the `\defaultfontfeatures` command, shown in Example 5. New calls of `\defaultfontfeatures` overwrite previous ones.

```
\defaultfontfeatures[<font name>] {<font features>}
```

New in v2.3. Default font features can be specified on a per-font and per-face basis by using the optional argument to `\defaultfontfeatures` as shown.²

²Internally, `` has all spaces removed and is converted to lowercase.

```
\defaultfontfeatures[TeX Gyre Adventor]{Color=blue}
\setmainfont{TeX Gyre Adventor}% will be blue
```

Additionally, when a font is first loaded, a configuration file is searched for with the name '*<fontname>.fontspec*'.³ The contents of this file can be used to specify default font features without having to have this information present within each document. *<fontname>* is stripped of spaces and file extensions are omitted; for example, the line above for TeX Gyre Adventor could be placed in a file called `TeXGyreAdventor.fontspec`, or for specifying options for `texgyreadventor-regular.otf` (when loading by filename), the configuration file would be `texgyreadventor-regular.fontspec`.

This mechanism can be used to define custom names or aliases for your font collections. If you create a file `my-charis.fontspec` containing, say,

```
\defaultfontfeatures[my-charis]
{
  Extension = .ttf ,
  UprightFont = CharisSILR,
  BoldFont = CharisSILB,
  ItalicFont = CharisSILI,
  BoldItalicFont = CharisSILBI,
  % <any other desired options>
}
```

you can load that family with `\fontspec{my-charis}` and similar. The optional argument to `\defaultfontfeatures` must match the filename else the options won't take effect.

Finally, note that options for font faces can also be defined in this way. To continue the example above, here we colour the different faces:

```
\defaultfontfeatures[CharisSILR]{Color=blue}
\defaultfontfeatures[CharisSILB]{Color=red}
```

And such configuration lines can be stored within their own `.fontspec` files; in this way, `fontspec` is designed to handle 'nested' configuration options as well.

7.2 Changing the currently selected features

```
\addfontfeatures{<font features>}
```

This command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in Example 6. Note however that the behaviour in this regard will be unreliable (subject to the font itself) if you attempt to *change* an already selected feature. *E.g.*, this sort of thing can cause troubles:

```
\addfontfeature{Numbers=OldStyle}...
\addfontfeature{Numbers=Lining}...
123
```

With both features active, how will the font render '123'? Depends on the font. In the distant future this functionality will be re-written to avoid this issue (giving 'Numbers=OldStyle' the smarts to know to explicitly de-activate any previous instances of 'Numbers=Lining', and vice-versa, but as I hope you can imagine this requires a fair degree of elbow grease which I haven't had available for some time now.

`\addfontfeature` This command may also be executed under the alias `\addfontfeature`.

³Located in the current folder or within a standard `texmf` location.

Example 6: A demonstration of the `\addfontfeatures` command. Note the caveat listed in the text regarding such usage.

				<pre>\fontspec[Numbers={Proportional,OldStyle}]{TeX Gyre Adventor} 'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.' \bigskip</pre>
'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'	Year	People	Miles	Boats
1842	999	75	13	
1923	111	54	56	

Example 7: Features for, say, just italics.

```
\fontspec{Hoefler Text} \itshape \scshape
ATTENTION ALL MARTINI DRINKERS
ATTENTION ALL MARTINI DRINKERS \addfontfeature{ItalicFeatures={Alternate = 1}}
Attention All Martini Drinkers \\
```

7.3 Priority of feature selection

Features defined with `\addfontfeatures` override features specified by `\fontspec`, which in turn override features specified by `\defaultfontfeatures`. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (`.log`) file displaying the font name and the features requested.

7.4 Different features for different font shapes

`BoldFeatures{<features>}`
`ItalicFeatures{<features>}`
`BoldItalicFeatures{<features>}`
`SlantedFeatures{<features>}`
`BoldSlantedFeatures{<features>}`
`SmallCapsFeatures{<features>}`

It is entirely possible that separate fonts in a family will require separate options; *e.g.*, Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional `\fontspec` argument are applied to *all* shapes of the family. Using `Upright-`, `SmallCaps-`, `Bold-`, `Italic-`, and `BoldItalicFeatures`, separate font features may be defined to their respective shapes *in addition to*, and with precedence over, the ‘global’ font features. See Example 7.

Combined with the options for selecting arbitrary *fonts* for the different shapes, these

Example 8: Multiple Master-like features in AAT fonts.

Skia Skia 'Bold'	<code>\fontspec[BoldFont={Skia}, BoldFeatures={Weight=2}]{Skia} Skia \\ \bfseries Skia 'Bold'</code>
----------------------------	--

Example 9: An example of setting the SmallCapsFeatures separately for each font shape.

<code>\fontspec[</code> Upright Small Caps <i>Italic Italic Small Caps</i> Bold Bold Small Caps <i>Bold Italic Bold Italic Small Caps</i>	<code>UprightFeatures={Color = 220022, SmallCapsFeatures = {Color=115511}}, ItalicFeatures={Color = 2244FF, SmallCapsFeatures = {Color=112299}}, BoldFeatures={Color = FF4422, SmallCapsFeatures = {Color=992211}}, BoldItalicFeatures={Color = 888844, SmallCapsFeatures = {Color=444422}},]{TeX Gyre Termes}</code> <code>Upright {\scshape Small Caps} \\</code> <code>\itshape Italic {\scshape Italic Small Caps} \\</code> <code>\upshape\bfseries Bold {\scshape Bold Small Caps} \\</code> <code>\itshape Bold Italic {\scshape Bold Italic Small Caps}</code>
---	---

separate feature options allow the selection of arbitrary weights in the Skia typeface, as shown in Example 8.

Note that because most fonts include their small caps glyphs within the main font, features specified with SmallCapsFeatures are applied *in addition* to any other shape-specific features as defined above, and hence SmallCapsFeatures can be nested within ItalicFeatures and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the somewhat ludicrous Example 9.

7.5 Different features for different font sizes

```
SizeFeatures = {  
    ...  
    { Size = <size range>, <font features> },  
    { Size = <size range>, Font = <font name>, <font features> },  
    ...  
}
```

The SizeFeature feature is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font family as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the Size option to declare the size range, and optionally Font to change the font based on size. Other (regular) fontspec features that are added are used on top of the font features that would be used anyway. A demonstration to clarify these details is shown in Example 10. A less trivial example is shown in the context of optical font

Example 10: An example of specifying different font features for different sizes of font with `SizeFeatures`.

```
\fontspec[ SizeFeatures={  
    {Size={-8}, Font=TeX Gyre Bonum Italic, Color=AA0000},  
    {Size={8-14}, Color=00AA00},  
    {Size={14-}, Color=0000AA}} ]{TeX Gyre Chorus}  
  
Small          { \scriptsize Small\par }  
Normal size   { Normal size\par }  
  
Large          { \Large Large\par }
```

Table 1: Syntax for specifying the size to apply custom font features.

Input	Font size, s
<code>Size = X-</code>	$s \geq X$
<code>Size = -Y</code>	$s < Y$
<code>Size = X-Y</code>	$X \leq s < Y$
<code>Size = X</code>	$s = X$

sizes in [Section 8.6 on page 18](#).

To be precise, the `Size` sub-feature accepts arguments in the form shown in [Table 1](#). Braces around the size range are optional. For an exact font size (`Size=X`) font sizes chosen near that size will ‘snap’. For example, for size definitions at exactly 11pt and 14pt, if a 12pt font is requested *actually* the 11pt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

If additional features are only required for a single size, the other sizes must still be specified. As in:

```
SizeFeatures={  
    {Size=-10,Numbers=Uppercase},  
    {Size=10-}}
```

Otherwise, the font sizes greater than 10 won’t be defined!

8 Font independent options

Features introduced in this section may be used with any font.

8.1 Colour

`Color` (or `Colour`), also shown in [Section 7.1 on page 11](#) and elsewhere, uses font specifications to set the colour of the text. The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.) Transparency is supported by `LuaLATEX` and by `XELATEX` with the `xdv2pdf` driver (Mac OS X only); `XELATEX` with the `xvipdfmx` driver does not support this feature.

If you load the `xcolor` package, you may use any named colour instead of writing the colours in hexadecimal.

Example 11: Selecting colour with transparency.

```
\fontsize{48}{48}
\fontspec[TeX Gyre Bonum Bold]
{\addfontfeature{Color=FF000099}W}\kern-1ex
{\addfontfeature{Color=0000FF99}S}\kern-0.8ex
{\addfontfeature{Color=DDBB2299}P}\kern-0.8ex
{\addfontfeature{Color=00BB3399}R}
```

Example 12: Automatically calculated scale values.

The perfect match is hard to find. \setmainfont{Georgia}
LOGOFONT \newfontfamily\lc[Scale=MatchLowercase]{Verdana}

```
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
```

The perfect match {\lc is hard to find.}\\"

```
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
```

L O G O F O N T

```
\usepackage{xcolor}
...
\fontspec[Color=red]{Verdana} ...
\definecolor{Foo}{rgb}{0.3,0.4,0.5}
\fontspec[Color=Foo]{Verdana} ...
```

The color package is *not* supported; use xcolor instead.

You may specify the transparency with a named colour using the `Opacity` feature which takes an decimal from zero to one corresponding to transparent to opaque respectively:

```
\fontspec[Color=red,Opacity=0.7]{Verdana} ...
```

It is still possible to specify a colour in six-char hexadecimal form while defining opacity in this way, if you like.

8.2 Scale

Scale = <i>number</i>
Scale = MatchLowercase
Scale = MatchUppercase

In its explicit form, `Scale` takes a single numeric argument for linearly scaling the font, as demonstrated in [Section 5 on page 7](#). It is now possible to measure the correct dimensions of the fonts loaded and calculate values to scale them automatically.

As well as a numerical argument, the `Scale` feature also accepts options `MatchLowercase` and `MatchUppercase`, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively; these features are shown in Example 12.

The amount of scaling used in each instance is reported in the `.log` file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

Example 13: Scaling the default interword space. An exaggerated value has been chosen to emphasise the effects here.

Some text for our example to take up some space, and to demonstrate the default interword space.

Sometextforourexampletotakeupsomespace, and todemonstrate the default interword space.

```
\fontspec{TeX Gyre Termes}
Some text for our example to take
up some space, and to demonstrate
the default interword space.
\bigskip
```

```
\addfontfeature{ WordSpace = 0.3 }
Some text for our example to take
up some space, and to demonstrate
the default interword space.
```

Example 14: Scaling the default post-punctuation space.

```
\nonfrenchspacing
\fontspec{TeX Gyre Schola}
Letters, Words. Sentences. \par
\fontspec[PunctuationSpace=2]{TeX Gyre Schola}
Letters, Words. Sentences. \par
\fontspec[PunctuationSpace=0]{TeX Gyre Schola}
Letters, Words. Sentences.
```

8.3 Interword space

While the space between words can be varied on an individual basis with the \TeX primitive $\backslash spaceskip$ command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically, and generally will not need to be adjusted. For those times when the precise details are important, the `WordSpace` feature is provided, which takes either a single scaling factor to scale the default value, or a triplet of comma-separated values to scale the nominal value, the stretch, and the shrink of the interword space by, respectively. (`WordSpace={x}` is the same as `WordSpace={x,x,x}`.)

8.4 Post-punctuation space

If `\frenchspacing` is *not* in effect, \TeX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The `PunctuationSpace` feature takes a scaling factor by which to adjust the nominal value chosen for the font; this is demonstrated in Example 14. Note that `PunctuationSpace=0` is *not* equivalent to `\frenchspacing`, although the difference will only be apparent when a line of text is under-full.

Example 15: Explicitly choosing the hyphenation character.

EXAMPLE HYPHENATION

Example 16: A demonstration of automatic optical size selection.

```
\fontspec{Latin Modern Roman}
Automatic optical size
\scalebox{0.4}{\Huge
Automatic optical size}
```

8.5 The hyphenation character

The letter used for hyphenation may be chosen with the `HyphenChar` feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string `None`, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

This package redefines L^AT_EX's \ - macro such that it adjusts along with the above changes.

8.6 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by Xe^TE_X and Lua^TE_X automatically determined by the current font size as in Example 16, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes.

The `OpticalSize` option may be used to specify a different optical size. With `OpticalSize` set to zero, no optical size font substitution is performed, as shown in Example 17.

The `SizeFeatures` feature (Section 7.5 on page 14) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like:

```
\fontspec[  
  SizeFeatures={  
    {Size=-10,      OpticalSize=8 },  
    {Size= 10-14,   OpticalSize=10},  
    {Size= 14-18,   OpticalSize=14},  
    {Size= 18-,     OpticalSize=18} }]  
  ]{Latin Modern Roman}
```

Example 17: Optical size substitution is suppressed when set to zero.

Part II

OpenType

9 Introduction

OpenType fonts (and other ‘smart’ font technologies such as AAT and Graphite) can change the appearance of text in many different ways. These changes are referred to as features. When the user applies a feature — for example, small capitals — to a run of text, the code inside the font makes appropriate adjustments and small capitals appear in place of lowercase letters. However, the use of such features does not affect the underlying text. In our small caps example, the lowercase letters are still stored in the document; only the appearance has been changed by the OpenType feature. This makes it possible to search and copy text without difficulty. If the user selected a different font that does not support small caps, the ‘plain’ lowercase letters would appear instead.

Some OpenType features are required to support particular scripts, and these features are often applied automatically. The scripts used in India, for example, often require that characters be reshaped and reordered after they are typed by the user, in order to display them in the traditional ways that readers expect. Other features can be applied to support a particular language. The Junicode font for medievalists uses by default the Old English shape of the letter thorn, while in modern Icelandic thorn has a more rounded shape. If a user tags some text as being in Icelandic, Junicode will automatically change to the Icelandic shape through an OpenType feature that localizes the shapes of letters.

A very large group of OpenType features is designed to support high quality typography in Latin, Greek, Cyrillic and other standard scripts. Examples of some font features have already been shown in previous sections; the complete set of OpenType font features supported by `fontspec` is described below in [Section 10](#).

The OpenType specification provides four-letter codes (e.g., `smcp` for small capitals) for each feature. The four-letter codes are given below along with the `fontspec` names for various features, for the benefit of people who are already familiar with OpenType. You can ignore the codes if they don’t mean anything to you.

9.1 How to select font features

Font features are selected by a series of $\langle feature \rangle = \langle option \rangle$ selections. Features are (usually) grouped logically; for example, all font features relating to ligatures are accessed by writing

Table 2: Options for the OpenType font feature ‘Ligatures’.

Feature	Option	Tag
Ligatures =	Required	* rlig
	NoRequired	rlig (<i>deactivate</i>)
	Common	* liga
	NoCommon	liga (<i>deactivate</i>)
	Contextual	* clig
	NoContextual	clig (<i>deactivate</i>)
	Rare/Discretionary	dlig
	Historic	hlig
	TeX	tlig/trep

* This feature is activated by default.

`Ligatures={...}` with the appropriate argument(s), which could be `TeX`, `Rare`, etc., as shown below in [Section 10.1](#).

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; `Numbers={OldStyle,Lining}` doesn’t make much sense because the two options are mutually exclusive, and \XeTeX will simply use the last option that is specified (in this case using `Lining` over `OldStyle`).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in [Section 3.3 on page 5](#) these warnings can be suppressed by selecting the `[quiet]` package option.

10 Complete listing of OpenType font features

10.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or aesthetic reasons. The list of options, of which multiple may be selected at one time, is shown in [Table 2](#). A demonstration with the Linux Libertine fonts⁴ is shown in [Example 18](#).

Note the additional features accessed with `Ligatures=TeX`. These are not actually real OpenType features, but additions provided by `luatofloat` (i.e., `LuaTeX` only) to emulate `TEX`’s behaviour for ASCII input of curly quotes and punctuation. In \XeTeX this is achieved with the `Mapping` feature (see [Section 12.1 on page 36](#)) but for consistency `Ligatures=TeX` will perform the same function as `Mapping=tex-text`.

10.2 Letters

The `Letters` feature specifies how the letters in the current font will look. OpenType fonts may contain the following options: `Uppercase`, `SmallCaps`, `PetiteCaps`, `UppercaseSmallCaps`, `UppercasePetiteCaps`, and `Unicase`.

Petite caps are smaller than small caps. `SmallCaps` and `PetiteCaps` turn lowercase letters into the smaller caps letters, whereas the `Uppercase...` options turn the *capital* letters into the smaller caps (good, e.g., for applying to already uppercase acronyms like ‘NASA’). This

⁴<http://www.linuxlibertine.org/>

Example 18: An example of the Ligatures feature.

strict → strict	\def\test#1#2{%
wurtzite → wurtzite	#2 \$\\to\$ {\addfontfeature{\#1} \#2}\\}
firefly → firefly	\fontspec[Linux Libertine]{\test{Ligatures=Historic}{strict}}

\fontspec[Linux Libertine]{\test{Ligatures=Rare}{wurtzite}}

\fontspec[Linux Libertine]{\test{Ligatures=NoCommon}{firefly}}

Table 3: Options for the OpenType font feature ‘Letters’.

Feature	Option	Tag
Letters	= Uppercase	case
	SmallCaps	smcp
	PetiteCaps	pcap
	UppercaseSmallCaps	c2sc
	UppercasePetiteCaps	c2pc
	Unicase	unic

difference is shown in Example 19. ‘Unicase’ is a weird hybrid of upper and lower case letters.

Note that the Uppercase option will (probably) not actually map letters to uppercase.⁵ It is designed to select various uppercase forms for glyphs such as accents and dashes, such as shown in Example 20; note the raised position of the hyphen to better match the surrounding letters.

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see [Section 10.12 on page 29](#)).

10.3 Numbers

The Numbers feature defines how numbers will look in the selected font, accepting options shown in [Table 4](#).

The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in [Section 7.2 on page 12](#). The Monospaced

⁵If you want automatic uppercase letters, look to LATEX’s \MakeUppercase command.

Example 19: Small caps from lowercase or uppercase letters.

THIS SENTENCE NO VERB	\fontspec[Letters=SmallCaps]{TeX Gyre Adventor}
THIS SENTENCE no verb	\fontspec[Letters=UppercaseSmallCaps]{TeX Gyre Adventor}

Example 20: An example of the Uppercase option of the Letters feature.

UPPER-CASE example	\fontspec{Linux Libertine}
UPPER-CASE example	UPPER-CASE example \\
	\addfontfeature{Letters=Uppercase}
	UPPER-CASE example

Table 4: Options for the OpenType font feature ‘Numbers’.

Feature	Option	Tag
Numbers	= Uppercase/Lining	lnum
	Lowercase/OldStyle	onum
	Proportional	pnum
	Monospaced	tnum
	SlashedZero	zero
	Arabic	anum

option is useful for tabular material when digits need to be vertically aligned.

The SlashedZero option replaces the default zero with a slashed version to prevent confusion with an uppercase ‘O’, shown in Example 21.

The Arabic option (with tag anum) maps regular numerals to their Arabic script or Persian equivalents based on the current Language setting (see [Section 10.18 on page 32](#)), shown in Example 22 using the Persian Modern font, which is included in TeX Live and MiKTeX. This option is based on a LuaTeX feature of the luatofont package, not an OpenType feature. (Thus, this feature is unavailable in XeTeX.)

10.4 Contextuals

This feature refers to substitutions of glyphs that vary ‘contextually’ by their relative position in a word or string of characters; features such as contextual swashes are accessed via the options shown in [Table 5](#). See Example 23 for an, er, example.

Historic forms are accessed in OpenType fonts via the feature Style=Historic; this is generally *not* contextual in OpenType, which is why it is not included here.

10.5 Vertical Position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option will only raise characters that are used in some languages directly after a

Example 21: The effect of the SlashedZero option.

Scientific Inferior: 12345 \\

\fontspec[VerticalPosition=Ordinal]{Warnock Pro}
'Ordinals': 1st 2nd 3rd 4th 0th 'Ordinals': 1st 2nd 3rd 4th 0th
```

Table 7: Options for the OpenType font feature ‘Fractions’.

Feature	Option	Tag
Fractions	= On	frac
	Alternate	afrc

number. The `ScientificInferior` feature will move glyphs further below the baseline than the `Inferior` feature. These are shown in Example 24

`Numerator` and `Denominator` should only be used for creating arbitrary fractions (see next section).

The `realscripts` package (which is also loaded by `xltextra` for Xe^TE_X) redefines the `\textsubscript` and `\textsuperscript` commands to use the above font features automatically, including for use in footnote labels. If this is the only feature of `xltextra` you wish to use, consider loading `realscripts` on its own instead.

10.6 Fractions

For OpenType fonts use a regular text slash to create fractions, but the `Fraction` feature must be explicitly activated. Some (Asian fonts predominantly) also provide for the `Alternate` feature. These are both shown in Example 25.

Example 25: The `Fractions` feature.

```
\fontspec{Hiragino Maru Gothic Pro W4}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
\addfontfeature{Fractions=On}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
\addfontfeature{Fractions=Alternate}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
```

ENLARGED Minuscules.	\addfontfeature{StylisticSet=6}
ENLARGED Minuscules.	ENLARGED Minuscules. \\

10.7 Stylistic Set variations

This feature selects a ‘Stylistic Set’ variation, which usually corresponds to an alternate glyph style for a range of characters (usually an alphabet or subset thereof). This feature is specified numerically. These correspond to OpenType features ss01, ss02, etc.

Two demonstrations from the Junicode font⁶ are shown in Example 26 and Example 27; thanks to Adam Buchbinder for the suggestion.

Multiple stylistic sets may be selected simultaneously by writing, e.g., StylisticSet={1,2,3}.

The StylisticSet feature is a synonym of the Variant feature for AAT fonts. See Section 15 on page 43 for a way to assign names to stylistic sets, which should be done on a per-font basis.

10.8 Character Variants

Similar to the ‘Stylistic Sets’ above, ‘Character Variations’ are selected numerically to adjust the output of (usually) a single character for the particular font. These correspond to the OpenType features cv01 to cv99.

For each character that can be varied, it is possible to select among possible options for that particular glyph. For example, in Example 28 a variety of glyphs for the character ‘v’ are selected, in which 5 corresponds to the character ‘v’ for this font feature, and the trailing :⟨n⟩ corresponds to which variety to choose. Georg Duffner’s open source Garamond revival font⁷ is used in this example. Character variants are specifically designed not to conflict with each other, so you can enable them individually per character as shown in Example 29. (Unlike stylistic alternates, say.)

Note that the indexing starts from zero, which is compatible with XeTeX but *incompatible* with luaotfload, which starts from one.

10.9 Alternates

The Alternate feature (for the raw OpenType feature salt) is used to access alternate font glyphs when variations exist in the font, such as in Example 30. It uses a numerical selection,

⁶<http://junicode.sf.net>

starting from zero, that will be different for each font. Note that the `Style=Alternate` option is equivalent to `Alternate=0` to access the default case.

Note that the indexing starts from zero, which is compatible with plain XeTeX but *incompatible* with luatex, which starts from one.

See [Section 15 on page 43](#) for a way to assign names to alternates, which must be done on a per-font basis.

10.10 Style

‘Ruby’ refers to a small optical size, used in Japanese typography for annotations. For fonts with multiple `salt` OpenType features, use the `fontspec` `Alternate` feature instead.

Example 31 and Example 32 both contain glyph substitutions with similar characteristics. Note the occasional inconsistency with which font features are labelled; a long-tailed ‘Q’ could turn up anywhere!

In other features, larger breadths of changes can be seen, covering the style of an entire alphabet. See Example 33 and Example 34; in the latter, the `Italic` option affects the Latin text and the `Ruby` option the Japanese.

Note the difference here between the default and the horizontal style kana in Example 35: the horizontal style is slightly wider.

Example 31: Example of the Alternate option of the Style feature.

Table 10: Options for the OpenType font feature ‘Kerning’.

Feature	Option	Tag
Kerning =	Uppercase	cpsp
	On	* kern
	Off	kern (<i>deactivate</i>)

* This feature is activated by default.

10.11 Diacritics

Specifies how combining diacritics should be placed. These will usually be controlled automatically according to the Script setting.

10.12 Kerning

Specifies how inter-glyph spacing should behave. Well-made fonts include information for how differing amounts of space should be inserted between separate character pairs. This kerning space is inserted automatically but in rare circumstances you may wish to turn it off.

As briefly mentioned previously at the end of [Section 10.2 on page 20](#), the Uppercase option will add a small amount of tracking between uppercase letters, seen in Example 36, which uses the Romande fonts⁸ (thanks to Clea F. Rees for the suggestion). The Uppercase option acts separately to the regular kerning controlled by the On/Off options.

⁸<http://arkandis.tuxfamily.org/adffonts.html>

Example 36: Adding extra kerning for uppercase letters. (The difference is usually very small.)

1. 2. 3. 4. 5. 6. 7. 8. 9.	\x0\x1\x2\x3\x4\x5\x6\x7\x8\x9

10.13 Font transformations

In rare situations users may want to mechanically distort the shapes of the glyphs in the current font such as shown in Example 37. Please don't overuse these features; they are *not* a good alternative to having the real shapes.

If values are omitted, their defaults are as shown above.

If you want the bold shape to be faked automatically, or the italic shape to be slanted automatically, use the `AutoFakeBold` and `AutoFakeSlant` features. For example, the following two invocations are equivalent:

```
\fontspec[AutoFakeBold=1.5]{Charis SIL}
\fontspec[BoldFeatures={FakeBold=1.5}]{Charis SIL}
```

If both of the `AutoFake...` features are used, then the bold italic font will also be faked.

The `FakeBold` and `AutoFakeBold` features are only available with the XeTeX engine and will be ignored in LuaTeX.

10.14 Annotation

Some fonts are equipped with an extensive range of numbers and numerals in different forms. These are accessed with the `Annotation` feature (OpenType feature `nalt`), selected numerically as shown in Example 38.

Note that the indexing starts from zero, which is compatible with XeTeX but *incompatible* with `luatfload`, which starts from one.

Table 11: Options for the OpenType font feature ‘CJKShape’.

Feature	Option	Tag
CJKShape =	Traditional	trad
	Simplified	smp1

\fontspec{Hiragino Mincho Pro} 嘴噉軀 妍并訝 \addfontfeature{CJKShape=Traditional} \text } \\ \addfontfeature{CJKShape=NLC} \text } \\ \addfontfeature{CJKShape=Expert} \text }
嘴噉軀 妍并訝 嘴噉軀 妍并訝 嘴噉軀 妍并訝

10.15 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs available in order to be able to display these glyphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

10.16 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by

```

ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms seen in Example 41.

10.17 Vertical typesetting

TODO!

10.18 OpenType scripts and languages

Fonts that include glyphs for various scripts and languages may contain different font features for the different character sets and languages they support, and different font features may behave differently depending on the script or language chosen. When multilingual fonts are used, it is important to select which language they are being used for, and more importantly what script is being used.

The ‘script’ refers to the alphabet in use; for example, both English and French use the Latin script. Similarly, the Arabic script can be used to write in both the Arabic and Persian languages.

The Script and Language features are used to designate this information. The possible options are tabulated in [Table 13 on page 34](#) and [Table 14 on page 35](#), respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Example 42: An example of various Scripts and Languages.

العَرْبِي	\arabictext
हिन्दी	\devanagaritext
ଲେଖ	\bengalitext
ମୁଦ୍ୟାଦା-ସୂୟକ ନିରେଣନ	\gujaratitext
ମୁଦ୍ୟାଦା-ସୂୟକ ନିରେଣନ	\malayalamtext
ତମାଙ୍ଗାଦା ପାଠବୀର୍ଯ୍ୟ	\gurmukhitext
ତମାଙ୍ଗାଦା ପାଠବୀର୍ଯ୍ୟ	\tamiltext
ଆର୍ଦ୍ଦା ସର୍ବ ଜୁଗାଦା ସର୍ବ	\hebrewtext
தமிழ் தடோ	\doulos SIL
தமிழ் தடோ	\vietnamesetext
תַּהְתָּרָא	
captô	
cáp số mõi	

Because these font features can change which features are able to be selected for the font, they are automatically selected by `fontspec` before all others and, if XeTeX is being used, will specifically select the ICU renderer for this font, as described in [Section 12.3 on page 37](#).

10.18.1 Script and Language examples

In the examples shown in Example 42, the Code2000 font⁹ is used to typeset various input texts with and without the OpenType Script applied for various alphabets. The text is only rendered correctly in the second case; many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

10.18.2 Defining new scripts and languages

```
\newfontscript  
\newfontlanguage
```

While the scripts and languages listed in [Table 13](#) and [Table 14](#) are intended to be comprehensive, there may be some missing; alternatively, you might wish to use different names to access scripts/languages that are already listed. Adding scripts and languages can be performed with the `\newfontscript` and `\newfontlanguage` commands. For example,

```
\newfontscript{Arabic}{arab}  
\newfontlanguage{Zulu}{ZUL}
```

The first argument is the `fontspec` name, the second the OpenType tag. The advantage to using these commands rather than `\newfontfeature` (see [Section 15 on page 43](#)) is the error-checking that is performed when the script or language is requested.

⁹<http://www.code2000.net/>

Part III

LuaTeX-only font features

11 OpenType font feature files

An OpenType font feature file is a plain text file describing OpenType layout feature of a font in a human-readable format. The syntax of OpenType feature files is defined by Adobe¹⁰.

Feature files can be used to add or customize OpenType features of a font on the fly without editing the font file itself.

Adding a new OpenType feature is as creating a plain text file defining the new feature and then loading it by passing its name or path to `FeatureFile`, then OpenType features defined in the file can be activated as usual.

For example, when adding one of the default features like `kern` or `liga`, no special activation is needed. On the other hand, an optional feature like `onum` or `smcp` will be activated when old style numbers or small capitals are activated, respectively. However, OpenType feature in the feature file can have any and that can be used to selectively activate the feature; for example defining a ligature feature called `mlig` and then activating it using `RawFeature` option without activating other ligatures in the font.

Figure 1 shows an example feature file. The first two lines set the script and language under which the defined features will be available, which the default language in both default and Latin scripts, respectively.

Then it defines a `liga` feature, which is a glyph substitution feature. The names starting with backslash are glyph names that is to be substituted and while the leading backslash is optional, it is used to escape glyph names when they interfere with preserved keywords. It should also be noted that glyph names are font specific and the same glyph can be named differently in different fonts.

Glyph positioning features like kerning can be defined in a similar way, but instead

of the keyword `sub(stitute)` the keyword `pos(ition)` is used instead. Figure 1 shows an example of adding kerning between AY and ay¹¹.

Lines starting with # are comments and will be ignored.

An OpenType feature file can have any number of features and can have a mix of substitution and positioning features, please refer to the full feature file specification for further documentation.

Part IV

Fonts and features with X_ET_EX

12 X_ET_EX-only font features

The features described here are available for any font selected by `fontspec`.

12.1 Mapping

Mapping enables a X_ET_EX text-mapping scheme, shown in Example 43.

Using the `tex-text` mapping is also equivalent to writing `Ligatures=TeX`. The use of the latter syntax is recommended for better compatibility with Lua_ET_EX documents.

¹¹ The kerning is expressed in font design units which are fractions of em depending on the *units per em* value of the font, usually 1000 for PostScript fonts and 2048 for TrueType fonts.

Example 44: The LetterSpace feature.

```
\fontspec{Didot}
\addfontfeature{LetterSpace=0.0}
USE TRACKING FOR DISPLAY CAPS TEXT \\ 
\addfontfeature{LetterSpace=2.0}
USE TRACKING FOR DISPLAY CAPS TEXT
```

12.2 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the `LetterSpace`, which takes a numeric argument, shown in Example 44.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of ‘1.0’ will add 0.1 pt between each letter.

This functionality *should not be used for lowercase text*, which is spacing correctly to begin with, but it can be very useful, in small amounts, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature (Section 10.2 on page 20).

12.3 Different font technologies: AAT and ICU

X_ET_EX supports two rendering technologies for typesetting, selected with the `Renderer` font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, ICU, is an open source OpenType interpreter. It provides much greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the ICU renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, ICU provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see Section 10.18 on page 32 for the description of these features. *Because these font features can change which features are able to be selected for the font instance, they are selected by `fontspec` before all others and will automatically and without warning select the ICU renderer.*

12.4 Optical font sizes

Multiple Master fonts are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see Section 14 on page 42 for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font’s optical size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through L_TE_X, and the optical size for a Multiple Master font must always be specified explicitly.

```
\fontspec[OpticalSize=11]{Minion MM Roman}
    MM optical size test \\ 
\fontspec[OpticalSize=47]{Minion MM Roman}
    MM optical size test \\
```

```
\fontspec[OpticalSize=71]{Minion MM Roman}
MM optical size test \\
```

13 Mac OS X's AAT fonts

Warning! X_ET_EX's implementation on Mac OS X is currently in a state of flux and the information contained below may well be wrong from 2013 onwards. There is a good chance that the features described in this section will not be available any more as X_ET_EX's completes its transition to a cross-platform-only application.

Mac OS X's font technology began life before the ubiquitous-OpenType era and revolved around the Apple-invented 'AAT' font format. This format had some advantages (and other disadvantages) but it never became widely popular in the font world.

Nonetheless, this is the font format that was first supported by X_ET_EX (due to its pedigree on Mac OS X in the first place) and was the first font format supported by fontspec. A number of fonts distributed with Mac OS X are still in the AAT format, such as 'Skia'. Documents that use these fonts should be compiled with X_EL_AT_EX using the xdv2pdf driver, as opposed to the default xdvipdfmx. E.g.,

```
xelatex -output-driver="xdv2pdf" filename.tex
```

Mac OS X also supports Multiple Master fonts, which are discussed in [Section 14](#).

13.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or aesthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old T_EX trick of splitting up a ligature with an empty brace pair does not work in X_ET_EX; you must use a 0 pt kern or \hbox (e.g., \null) to split the characters up if you do not want a ligature to be performed (the usual examples for when this might be desired are words like 'shelffull').

13.2 Letters

The Letters feature specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

13.3 Numbers

The Numbers feature defines how numbers will look in the selected font. For AAT fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced (the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in [Section 7.2 on page 12](#).

13.4 Contextuals

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here. The options for AAT fonts are WordInitial, WordFinal (Example 45), LineInitial, LineFinal, and Inner (Example 46, also called 'non-final' sometimes).

Example 45: Contextual glyph for the beginnings and ends of words.

```
\newfontface\fancy
[Contextuals={WordInitial,WordFinal}]
{Hoefler Text Italic}
where is all the vegemite
\fancy where is all the vegemite
```

Example 46: A contextual feature for the ‘long s’ can be convenient as the character does not need to be marked up explicitly.

```
'Inner' fswashes can sometimes
contain the archaic long s. \fontspec[Contextuals=Inner]{Hoefler Text}
'Inner' swashes can \emph{sometimes} \\
contain the archaic long^s.
```

As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

13.5 Vertical position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number. These are shown in Example 47.

The realscripts package (also loaded by xltextra) redefines the \textsubscript and \textsuperscript commands to use the above font features, including for use in footnote labels.

13.6 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned On or Off in both AAT and OpenType fonts.

In AAT fonts, the ‘fraction slash’ or solidus character, is to be used to create fractions. When Fractions are turned On, then only pre-drawn fractions will be used. See Example 48.

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters.

Example 47: Vertical position for AAT fonts.

```
\fontspec{Skia}
Normal
\fontspec[VerticalPosition=Superior]{Skia}
Superior
\fontspec[VerticalPosition=Inferior]{Skia}
Inferior \\
\fontspec[VerticalPosition=Ordinal]{Skia}
1st 2nd 3rd 4th 0th 8abcde
```

Example 48: Fractions in AAT fonts. The `^^^^2044` glyph is the ‘fraction slash’ that may be typed in Mac OS X with `OPT+SHIFT+1`; not shown literally here due to font constraints.

$\frac{1}{2}$	$\frac{5}{6}$	<code>\fontspec[Fractions=On]{Skia}</code>
$\frac{1}{2}$	$\frac{5}{6}$	<code>1{^^^^2044}2 \quad 5{^^^^2044}6 \\ % fraction slash</code>
$\frac{13579}{24680}$		<code>1/2 \quad 5/6 % regular slash</code>
$\frac{13579}{24680}$	<code>\fontspec[Fractions=Diagonal]{Skia}</code>	
	<code>13579{^^^^2044}24680 \\ % fraction slash</code>	
	<code>\quad 13579/24680 % regular slash</code>	

Example 49: Alternate design of pre-composed fractions.

$\frac{1}{2}$	$\frac{1}{4}$	$\frac{5}{6}$	$\frac{13579}{24680}$	<code>\fontspec[Hiragino Maru Gothic Pro]</code>
$\frac{1}{2}$	$\frac{1}{4}$	$\frac{5}{6}$	$\frac{13579}{24680}$	<code>1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ \addfontfeature{Fractions=Alternate}</code>
				<code>1/2 \quad 1/4 \quad 5/6 \quad 13579/24680</code>

Some (Asian fonts predominantly) also provide for the Alternate feature shown in Example 49.

13.7 Variants

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don’t mind my fancy Example 50 :) I’m just looping through the nine (!) variants of Zapfino.

See [Section 15 on page 43](#) for a way to assign names to variants, which should be done on a per-font basis.

13.8 Alternates

Selection of Alternates *again* must be done numerically; see Example 51. See [Section 15 on page 43](#) for a way to assign names to alternates, which should be done on a per-font basis.

Example 50: Nine variants of Zapfino.

```
\newcounter{var}\newcounter{trans}
\whiledo{\value{var}<9}{%
  \stepcounter{trans}%
  \edef\1{%
    \noexpand\fontspec[Variant=\thevar,
      Color=005599\thetrans\thetrans]{Zapfino}}\1%
  \makebox[0.75\width]{\d}%
  \stepcounter{var}}
```

Example 51: Alternate shape selection must be numerical.

```
Sphinx Of Black Quartz, JUDGE Mr Vow
Sphinx Of Black Quartz, JUDGE M'r Vow
\fontspec[Alternate=0]{Hoefler Text Italic}
  Sphinx Of Black Quartz, {\scshape Judge My Vow} \\
\fontspec[Alternate=1]{Hoefler Text Italic}
  Sphinx Of Black Quartz, {\scshape Judge My Vow}
```

Example 52: Vertical typesetting.

共産主義者は

```
共産主義者は
\fontspec{Hiragino Mincho Pro}
\verttext
\fontspec[Renderer=AAT,Vertical=RotatedGlyphs]{Hiragino Mincho Pro}
\rotatebox{-90}{\verttext}% requires the graphicx package
```

13.9 Style

The options of the `Style` feature are defined in `AAT` as one of the following: `Display`, `Engraved`, `IlluminatedCaps`, `Italic`, `Ruby`,¹² `TallCaps`, or `TitlingCaps`.

Typical examples for these features are shown in [Section 10.10](#).

13.10 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs in order to be able to display these glyphs correctly in whichever form is appropriate. Both `AAT` and OpenType fonts support the following CJKShape options: `Traditional`, `Simplified`, `JIS1978`, `JIS1983`, `JIS1990`, and `Expert`. OpenType also supports the `NLC` option.

13.11 Character width

See [Section 10.16 on page 31](#) for relevant examples; the features are the same between OpenType and `AAT` fonts. `AAT` also allows `CharacterWidth=Default` to return to the original font settings.

13.12 Vertical typesetting

TODO: improve!

`XeTeX` provides for vertical typesetting simply with the ability to rotate the individual glyphs as a font is used for typesetting, as shown in Example 52.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the `XeTeX` documentation.

¹²‘Ruby’ refers to a small optical size, used in Japanese typography for annotations.

Example 53: Various annotation forms.

```
\fontspec{Hei Regular}
1 2 3 4 5 6 7 8 9
\fontspec[Annotation=Circle]{Hei Regular}
1 2 3 4 5 6 7 8 9
\fontspec[Annotation=Parenthesis]{Hei Regular}
1 2 3 4 5 6 7 8 9
\fontspec[Annotation=Period]{Hei Regular}
1. 2. 3. 4. 5. 6. 7. 8. 9. 1 2 3 4 5 6 7 8 9
```

Example 54: Continuously variable font parameters. These fonts are unfortunately quite rare.

Really light and extended Skia Really fat and condensed Skia	\fontspec[Weight=0.5,Width=3]{Skia} Really light and extended Skia \fontspec[Weight=2,Width=0.5]{Skia} Really fat and condensed Skia
--	--

13.13 Diacritics

Diacritics are marks, such as the acute accent or the tilde, applied to letters; they usually indicate a change in pronunciation. In Arabic scripts, diacritics are used to indicate vowels. You may either choose to Show, Hide or Decompose them in AAT fonts. The Hide option is for scripts such as Arabic which may be displayed either with or without vowel markings. E.g.,
\fontspec[Diacritics=Hide]{...}

Some older fonts distributed with Mac OS X included ‘Ø’ etc. as shorthand for writing ‘Ø’ under the label of the Diacritics feature. If you come across such fonts, you’ll want to turn this feature off (imagine typing hello/goodbye and getting ‘hellogoodbye’ instead!) by decomposing the two characters in the diacritic into the ones you actually want. I recommend using the proper L^AT_EX input conventions for obtaining such characters instead.

13.14 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature (see Example 53) with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and DoubleCircle.

14 AAT & Multiple Master font axes

Multiple Master and AAT font specifications both provide continuous variation along font parameters. For example, they don’t have just regular and bold weights, they can have any bold weight you like between the two extremes. Note these features can only be used when your document is compiled using the xdv2pdf driver for Mac OS X.

Weight, Width, and OpticalSize are supported by this package. Skia, which is distributed with Mac OS X, has two of these variable parameters, allowing for the demonstration in Example 54. Variations along a multiple master font’s optical size axis has been shown previously in [Section 8.6 on page 18](#).

Example 55: Assigning new AAT features.

This is XeTeX by Jonathan Kew.

```
\newAATfeature{Alternate}{HoeflerSwash}{17}{1}
\fontspec[Alternate=HoeflerSwash]{Hoefler Text Italic}
This is XeTeX by Jonathan Kew.
```

Example 56: Assigning new arbitrary features.

```
\newfontfeature{AvoidD}{Special=Avoid d-collisions}
\newfontfeature{NoAvoidD}{Special!=Avoid d-collisions}
\fontspec[AvoidD,Variant=1]{Zapfino}
    sockdolager rubdown      \\
\fontspec[NoAvoidD,Variant=1]{Zapfino}
    sockdolager rubdown
```

Part V

Programming interface

This is the beginning of some work to provide some hooks that use fontspec for various macro programming purposes.

15 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

\newAATfeature New AAT features may be created with this command:

\newAATfeature{ <feature> }{ <option> }{ <feature code> }{ <selector code> }

Use the `XTEX` file `AAT-info.tex` to obtain the code numbers. See Example 55.

New OpenType features may be created with this command:

\newICUfeature{<feature>}{<option>}{<feature tag>}

The synonym \newopentypefeature is provided for Lua^LA_TE_X users.

Here's what it would look like in practise:

```
\newopentypefeature{Style}{NoLocalForms}{-loc}
```

In case the above commands do not accommodate the desired font feature (perhaps a new \TeX feature that `fontspec` hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

\newfontfeature{<name>}{<input string>}

For example, Zapfino contains the feature ‘Avoid d-collisions’. To access it with this package, you could do some like that shown in Example 56

The advantage to using the `\newAATfeature` and `\newICUfeature` commands instead of `\newfontfeature` is that they check if the selected font actually contains the desired font feature at load time. By contrast, `\newfontfeature` will not give a warning for improper input.

Example 57: Using raw font features directly.

PAGELLA SMALL CAPS	\fontspec[RawFeature=+smcp]{TeX Gyre Pagella}
	Pagella small caps

Example 58: Renaming font features.

Roman Letters <i>And Swash</i>	\aliasfontfeature{ItalicFeatures}{IF}
	\fontspec[IF = {Alternate=1}]{Hoefler Text}
	Roman Letters \itshape And Swash

16 Going behind `fontspec`'s back

Expert users may wish not to use `fontspec`'s feature handling at all, while still taking advantage of its L^AT_EX font selection conveniences. The `RawFeature` font feature allows literal X_LT_EX font feature selection when you happen to have the OpenType feature tag memorised.

Multiple features can either be included in a single declaration:

[`RawFeature=+smcp;+onum`]

or with multiple declarations:

[`RawFeature=+smcp, RawFeature=+onum`]

17 Renaming existing features & options

`\aliasfontfeature` If you don't like the name of a particular font feature, it may be aliased to another with the `\aliasfontfeature{<existing name>}{<new name>}` command, such as shown in Example 58.

`\aliasfontfeatureoption` Spaces in feature (and option names, see below) are allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

If you wish to change the name of a font feature option, it can be aliased to another with the command `\aliasfontfeatureoption{}{{<existing name>}{<new name>}}`, such as shown in Example 59.

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Color specification. For this type of thing, the `\newfontfeature` command should be used to declare a new, e.g., `PurpleColor` feature:

`\newfontfeature{PurpleColor}{color=550099BB}`

Example 59: Renaming font feature options.

S _{cientific I_{nferior}} : 12345	\aliasfontfeature{VerticalPosition}{Vert Pos}
	\aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf}
	\fontspec[Vert Pos=Sci Inf]{Linux Libertine}
	Scientific Inferior: 12345

Except that this example was written before support for named colours was implemented. But you get the idea.

18 Programming details

In some cases, it is useful to know what the \LaTeX font family of a specific `fontspec` font is. After a `\fontspec`-like command, this is stored inside the `\l_fontspec_family_t1` macro. Otherwise, \LaTeX 's own `\f@family` macro can be useful here, too. The raw \TeX font that is defined is stored temporarily in `\l_fontspec_font`.

The following commands in `expl3` syntax may be used for writing codes that interface with `fontspec`-loaded fonts. All of the following conditionals also exist with `T` and `F` as well as `TF` suffixes.

<code>\fontspec_if_fontspec_font:TF</code>	Test whether the currently selected font has been loaded by <code>fontspec</code> .
<code>\fontspec_if_aat_feature:nnTF</code>	Test whether the currently selected font contains the <code>AAT</code> feature (#1,#2).
<code>\fontspec_if_opentype:TF</code>	Test whether the currently selected font is an OpenType font. Always true for <code>LuaTeX</code> fonts.
<code>\fontspec_if_feature:nTF</code>	Test whether the currently selected font contains the raw OpenType feature #1. E.g.: <code>\fontspec_if_feature:nTF {pnum} {True} {False}</code> . Returns false if the font is not loaded by <code>fontspec</code> or is not an OpenType font.
<code>\fontspec_if_feature:nnnTF</code>	Test whether the currently selected font with raw OpenType script tag #1 and raw OpenType language tag #2 contains the raw OpenType feature tag #3. E.g.: <code>\fontspec_if_feature:nTF {latn} {ROM} {pnum} {TTF}</code> . Returns false if the font is not loaded by <code>fontspec</code> or is not an OpenType font.
<code>\fontspec_if_script:nTF</code>	Test whether the currently selected font contains the raw OpenType script #1. E.g.: <code>\fontspec_if_script:nTF {latn} {True} {False}</code> . Returns false if the font is not loaded by <code>fontspec</code> or is not an OpenType font.
<code>\fontspec_if_language:nTF</code>	Test whether the currently selected font contains the raw OpenType language tag #1. E.g.: <code>\fontspec_if_language:nTF {ROM} {True} {False}</code> . Returns false if the font is not loaded by <code>fontspec</code> or is not an OpenType font.
<code>\fontspec_if_language:nnTF</code>	Test whether the currently selected font contains the raw OpenType language tag #2 in script #1. E.g.: <code>\fontspec_if_language:nnTF {cyr1} {SRB} {True} {False}</code> . Returns false if the font is not loaded by <code>fontspec</code> or is not an OpenType font.
<code>\fontspec_if_current_script:nTF</code>	Test whether the currently loaded font is using the specified raw OpenType script tag #1.
<code>\fontspec_if_current_language:nTF</code>	Test whether the currently loaded font is using the specified raw OpenType language tag #1.
<code>\fontspec_set_family:Nnn</code>	#1 : \LaTeX family #2 : <code>fontspec</code> features #3 : font name Defines a new NFSS family from given <code><features></code> and <code></code> , and stores the family name in the variable <code><family></code> . This font family can then be selected with standard \LaTeX commands <code>\fontfamily{<family>} \selectfont</code> . See the standard <code>fontspec</code> user commands for applications of this function.

```
\fontspec_set_fontface:NNnn #1 : primitive font
#2 : LATEX family
#3 : fontspec features
#4 : font name
```

Variant of the above in which the primitive TeX font command is stored in the variable *<primitive font>*. If a family is loaded (with bold and italic shapes) the primitive font command will only select the regular face. This feature is designed for L^AT_EX programmers who need to perform subsequent font-related tests on the *<primitive font>*.

Part VI

The patching/improvement of L^AT_EX 2_E and other packages

Derived originally from xltextra, this package contains patches to various L^AT_EX components and third-party packages to improve the default behaviour.

19 Inner emphasis

fixltx2e's method for checking for "inner" emphasis is a little fragile in X_ET_EX, because font slant information might be missing from the font. Therefore, we use L^AT_EX's NFSS information, which is more likely to be correct.

20 Unicode footnote symbols

By default L^AT_EX defines symbolic footnote characters in terms of commands that don't resolve well; better results can be achieved by using specific Unicode characters or proper LICRs with the xunicode package.

This problem has been solved by loading the fixltx2e package.

21 Verbatim

Many verbatim mechanisms assume the existence of a 'visible space' character that exists in the ASCII space slot of the typewriter font. This character is known in Unicode as U+2434: BOX OPEN, which looks like this: '_'.

When a Unicode typewriter font is used, L^AT_EX no longer prints visible spaces for the verbatim* environment and \verb* command. This problem is fixed by using the correct Unicode glyph, and the following packages are patched to do the same: listings, fancyvrb, moreverb, and verbatim.

In the case that the typewriter font does not contain '_', the Latin Modern Mono font is used as a fallback.

22 Discretionary hyphenation: \-

L^AT_EX defines the macro \- to insert discretionary hyphenation points. However, it is hard-coded in L^AT_EX to use the hyphen - character. Since fontspec makes it easy to change the

hyphenation character on a per font basis, it would be nice if \- adjusted automatically — and now it does.

23 Commands for old-style and lining numbers

\oldstylenums
\liningnums LATEX's definition of \oldstylenums relies on strange font encodings. We provide a fontspect-compatible alternative and while we're at it also throw in the reverse option as well. Use \oldstylenums{\text} to explicitly use old-style (or lowercase) numbers in \text, and the reverse for \liningnums{\text}.

Part VII

fontspec.sty and friends

Herein lie the implementation details of this package. Welcome! It was my first.

24 ‘Header’ code

We will eventually load the correct version of the code according to which engine we’re running. As we’ll see later, there are some minor differences between what we have to do in Xe^TE_X and Lua^TE_X.

The expl3 module is fontspec.

```
1 <@@=fontspec>
2 <*fontspec&!xetex&!luatex>
```

But for now, this is the shared code.

```
3 \RequirePackage{expl3}[2011/09/05]
4 \RequirePackage{xparse}
5 \ExplSyntaxOn
```

Check engine and load specific modules. For Lua^TE_X, load only luatfload which loads luatexbase and lualibs too.

```
6 \msg_new:nnn {fontspec} {cannot-use-pdftex}
7 {
8   The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LaTeX~ to~ function.
9   \\
10  You~ must~ change~ your~ typesetting~ engine~ to,~

253 \ExecuteOptions{config,math}
254 \ProcessOptions*

```

24.5 Packages

New for LuaTeX, we load a new package called ‘fontspec-patches’ designed to incorporate the hidden but useful parts of the old *xltextra* package.

```

255 \RequirePackage{fontspec-patches}
256 \luatex_if_engine:T { \RequirePackage{fontspec-luatex} \endinput }
257 \xetex_if_engine:T { \RequirePackage{fontspec-xetex} \endinput }

```

```
258 ⟨/fontspec&!xetex&!luatex⟩
```

25 The main package code

That was the driver, and now the fun starts.

```
259 ⟨*fontspec & (xetex | luatex)⟩  
260 \ExplSyntaxOn
```

25.1 Encodings

Frank Mittelbach has recommended using the ‘EUx’ family of font encodings to experiment with Unicode. Now that X_ET_EX can find fonts in the `texmf` tree, the Latin Modern OpenType fonts can be used as the defaults. See the `euenc` collection of files for how this is implemented.

```
261 ⟨xetex⟩\tl_set:Nn \g_fontspec_encoding_tl {EU1}  
262 ⟨luatex⟩\tl_set:Nn \g_fontspec_encoding_tl {EU2}  
263 \tl_set:Nn \rmdefault {lmr}  
264 \tl_set:Nn \sfdefault {lmss}  
265 \tl_set:Nn \ttdefault {lmtt}  
266 \RequirePackage[\g_fontspec_encoding_tl]{fontenc}  
267 \tl_set_eq:NN \UTFencname \g_fontspec_encoding_tl % for xunicode
```

Dealing with a couple of the problems introduced by `babel`:

```
268 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl  
269 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl  
270 \tl_put_right:Nn \document  
271 {  
272   \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl  
273   \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl  
274 }
```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

xunicode Now we load `xunicode`, working around its internal X_ET_EX check when under LuaT_EX.

```
275 ⟨xetex⟩\RequirePackage{xunicode}  
276 ⟨*luatex⟩  
277 \cs_set_eq:NN \fontspec_tmp: \XeTeXpicfile  
278 \cs_set:Npn \XeTeXpicfile {}  
279 \RequirePackage{xunicode}  
280 \cs_set_eq:NN \XeTeXpicfile \fontspec_tmp:  
281 ⟨/luatex⟩
```

25.2 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the ‘top level’ definitions of the commands are contained herein; they all use or define macros which are defined or used later on in [Section 25.5 on page 65](#).

25.2.1 Font selection

\fontspec This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font. Then this new font family is selected.

```
282 \DeclareDocumentCommand \fontspec { O{} m }
283 {
284   \fontencoding {\g_fontspec_encoding_t1}
285   \fontspec_set_family:Nnn \f@family {#1}{#2}
286   \selectfont
287   \ignorespaces
288 }
```

\setmainfont \setsansfont \setmonofont The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced). I end them with \normalfont so that if they’re used in the document, the change registers immediately.

```
289 \DeclareDocumentCommand \setmainfont { O{} m }
290 {
291   \fontspec_set_family:Nnn \rmdefault {#1}{#2}
292   \normalfont
293 }
294 \DeclareDocumentCommand \setsansfont { O{} m }
295 {
296   \fontspec_set_family:Nnn \sfdefault {#1}{#2}
297   \normalfont
298 }
299 \DeclareDocumentCommand \setmonofont { O{} m }
300 {
301   \fontspec_set_family:Nnn \ttdefault {#1}{#2}
302   \normalfont
303 }
```

\setromanfont This is the old name for \setmainfont, retained for backwards compatibility.

```
304 \cs_set_eq:NN \setromanfont \setmainfont
```

\setmathrm \setmathsf \setboldmathrm These commands are analogous to \setromanfont and others, but for selecting the font used for \mathrm, etc. They can only be used in the preamble of the document. \setboldmathrm is used for specifying which fonts should be used in \boldmath.

```
305 \tl_new:N \g_fontspec_mathrm_tl
306 \tl_new:N \g_fontspec_bfmathrm_tl
307 \tl_new:N \g_fontspec_mathsfs_tl
308 \tl_new:N \g_fontspec_mathtt_tl
309 \DeclareDocumentCommand \setmathrm { O{} m }
310 {
311   \fontspec_set_family:Nnn \g_fontspec_mathrm_tl {#1}{#2}
312 }
313 \DeclareDocumentCommand \setboldmathrm { O{} m }
314 {
315   \fontspec_set_family:Nnn \g_fontspec_bfmathrm_tl {#1}{#2}
316 }
317 \DeclareDocumentCommand \setmathsf { O{} m }
318 {
```

```

319 \fontspec_set_family:Nnn \g_fontspec_mathsf_tl {#1}{#2}
320 }
321 \DeclareDocumentCommand \setmathtt { O{} m }
322 {
323 \fontspec_set_family:Nnn \g_fontspec_mathtt_tl {#1}{#2}
324 }
325 \@onlypreamble\setmathrm
326 \@onlypreamble\setboldmathrm
327 \@onlypreamble\setmathsf
328 \@onlypreamble\setmathtt

If the commands above are not executed, then \rmdefault (etc.) will be used.

329 \tl_set:Nn \g_fontspec_mathrm_tl {\rmdefault}
330 \tl_set:Nn \g_fontspec_mathsf_tl {\sfdefault}
331 \tl_set:Nn \g_fontspec_mathtt_tl {\ttdefault}

\newfontfamily \newfontface This macro takes the arguments of \fontspec with a prepended instance cmd (code for middle optional argument generated by Scott Pakin's newcommand.py). This command is used when a specific font instance needs to be referred to repetitively (e.g., in a section heading) since continuously calling \fontspec_select:nn is inefficient because it must parse the option arguments every time.

\fontspec_select:nn defines a font family and saves its name in \l_fontspec_family_tl. This family is then used in a typical NFSS \fontfamily declaration, saved in the macro name specified.

332 \DeclareDocumentCommand \newfontfamily { m O{} m }
333 {
334 \fontspec_select:nn{#2}{#3}
335 \use:x
336 {
337 \exp_not:N \DeclareRobustCommand \exp_not:N #1
338 {
339 \exp_not:N \fontencoding {\g_fontspec_encoding_tl}
340 \exp_not:N \fontfamily {\l_fontspec_family_tl} \exp_not:N \selectfont
341 }
342 }
343 }

\newfontface uses an undocumented feature of the BoldFont feature; if its argument is empty (i.e., BoldFont={}), then no bold font is searched for.

344 \DeclareDocumentCommand \newfontface { m O{} m }
345 {
346 \newfontfamily #1 [ BoldFont={},ItalicFont={},SmallCapsFont={},#2 ] {#3}
347 }

```

25.2.2 Font feature selection

```
\defaultfontfeatures This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent \fontspec, et al., commands. It stores its value in \g_fontspec_default_fontopts_tl (initialised empty), which is concatenated with the individual macro choices in the [...] macro.

348 \tl_new:N \g_fontspec_default_fontopts_tl
349 \prop_new:N \g_@@_fontopts_prop
```

```

350 \DeclareDocumentCommand \defaultfontfeatures { o m }
351 {
352   \IfNoValueTF {#1}
353   { \@@_set_default_features:n {#2} }
354   { \@@_set_font_default_features:nn {#1} {#2} }
355 }
356 \cs_new:Nn \@@_set_default_features:n
357 {
358   \tl_set:Nn \g_fontsdefault_fontopts_tl {#1,}
359 }

```

The optional argument specifies a font identifier. Strip spaces and file extensions and lowercase to ensure consistency.

```

360 \cs_new:Nn \@@_set_font_default_features:nn
361 {
362   \@@_sanitise_fontname:Nn \l_@@_tmp_tl {#1}
363   \tl_if_empty:nTF {#2}
364   { \prop_gremove:NV \g_@@_fontopts_prop \l_@@_tmp_tl }
365   { \prop_gput:NVn \g_@@_fontopts_prop \l_@@_tmp_tl {#2} }
366 }
367 \cs_new:Nn \@@_sanitise_fontname:Nn
368 {
369   \use:x { \tl_to_lowercase:n { \tl_set:Nx \exp_not:N #1 {#2} } }
370   \tl_remove_all:Nn #1 {~}
371   \clist_map_inline:Nn \l_fonts_extensions_clist
372   { \tl_remove_once:Nn #1 {##1} }
373 }

```

`\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\g_fontsdefault_fontopts_tl` is emptied inside the group; this is allowed as `\l_fontsfamily_tl` is globally defined in `\fontspec_select:nn`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```

374 \DeclareDocumentCommand \addfontfeatures {m}
375 {
376   \ifcsname zf@family@fontdef\f@family\endcsname
377   \group_begin:
378     \tl_clear:N \g_fontsdefault_fontopts_tl
379     \use:x
380     {
381       \exp_not:N\fontspec_select:nn
382       {\csname zf@family@options\f@family\endcsname,#1}
383       {\csname zf@family@fontname\f@family\endcsname}
384     }
385   \group_end:

```

```

386     \fontfamily\l_fontsspec_family_tl\selectfont
387 \else
388     \fontspec_warning:n {addfontfeatures-ignored}
389 \fi
390 \ignorespaces
391 }
392 \cs_set_eq:NN \addfontfeature \addfontfeatures

```

25.2.3 Defining new font features

\newfontfeature \newfontfeature takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

```

393 \DeclareDocumentCommand \newfontfeature {mm}
394 {
395   \keys_define:nn { fontspec }
396   {
397     #1 .code:n =
398     {
399       \fontspec_update_fontid:n {+zf-#1}
400       \fontspec_update_featstr:n {#2}
401     }
402   }
403 }

```

\newAATfeature This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better than \newfontfeature because it checks if the feature exists in the font it's being used for.

```

404 \DeclareDocumentCommand \newAATfeature {mmmm}
405 {
406   \keys_if_exist:nnF { fontspec } {#1}
407   { \fontspec_define_font_feature:n {#1} }
408   \keys_if_choice_exist:nnnT {fontspec} {#1} {#2}
409   { \fontspec_warning:nxx {feature-option-overwrite}{#1}{#2} }
410   \fontspec_define_feature_option:nnnnn{#1}{#2}{#3}{#4}{}
411 }

```

\newICUfeature This command assigns a new OpenType feature by its abbreviation (#2) to a new name (#1). Better than \newfontfeature because it checks if the feature exists in the font it's being used for.

```

412 \DeclareDocumentCommand \newICUfeature {mmm}
413 {
414   \keys_if_exist:nnF { fontspec / options } {#1}
415   { \fontspec_define_font_feature:n{#1} }
416   \keys_if_choice_exist:nnnT {fontspec} {#1} {#2}
417   { \fontspec_warning:nxx {feature-option-overwrite}{#1}{#2} }
418   \fontspec_define_feature_option:nnnnn{#1}{#2}{#3}{#4}{}
419 }
420 \cs_set_eq:NN \newopentypefeature \newICUfeature

```

\aliasfontfeature User commands for renaming font features and font feature options.

```

421 \DeclareDocumentCommand \aliasfontfeature {mm}
422 {
423   \keys_if_exist:nnTF {fontspec} {#1}

```

```

424     {
425         \keys_define:nn {fontspec}
426             { #2 .code:n = { \keys_set:nn {fontspec} { #1 = {##1} } } }
427     }
428     {
429         \keys_if_exist:nnTF {fontspec-preparse} {#1}
430         {
431             \keys_define:nn {fontspec-preparse}
432                 { #2 .code:n = { \keys_set:nn {fontspec-preparse} { #1 = {##1} } } }
433         }
434         {
435             \keys_if_exist:nnTF {fontspec-preparse-external} {#1}
436             {
437                 \keys_define:nn {fontspec-preparse-external}
438                     {
439                         #2 .code:n =
440                             { \keys_set:nn {fontspec-preparse-external} { #1 = {##1} } }
441                     }
442             }
443             {
444                 \fontspec_warning:nx {rename-feature-not-exist} {#1}
445             }
446         }
447     }
448 }
449 \DeclareDocumentCommand \aliasfontfeatureoption {mmm}
450   { \keys_define:nn { fontspec / #1 } { #3 .meta:n = {#2} } }

\newfontscript Mostly used internally, but also possibly useful for users, to define new OpenType ‘scripts’, mapping logical names to OpenType script tags. Iterates though the scripts in the selected font to check that it’s a valid feature choice, and then prepends the (X)TeX \font feature string with the appropriate script selection tag.
451 \DeclareDocumentCommand \newfontscript {mm}
452 {
453   \fontspec_new_script:nn {#1} {#2}
454   \fontspec_new_script:nn {#2} {#2}
455 }

456 \keys_define:nn { fontspec } { Script .choice: }
457 \cs_new:Nn \fontspec_new_script:nn
458 {
459   \keys_define:nn { fontspec } { Script / #1 .code:n =
460       \fontspec_check_script:nTF {#2}
461       {
462           \fontspec_update_fontid:n {+script=#1}
463           \tl_set:Nn \l_fontspec_script_tl {#2}
464           \int_set:Nn \l_fontspec_script_int {\l_fontspec_strnum_int}
465       }
466   {
467       \fontspec_check_script:nTF {latn}
468       {
469           \fontspec_warning:nx {script-not-exist-latn} {#1}

```

```

470      \keys_set:nn {fontspec} {Script=Latin}
471    }
472  {
473    \fontspec_warning:nx {script-not-exist} {#1}
474  }
475 }
476 }
477 }

\newfontlanguage Mostly used internally, but also possibly useful for users, to define new OpenType ‘languages’, mapping logical names to OpenType language tags. Iterates though the languages in the selected font to check that it’s a valid feature choice, and then prepends the (X)TeX \font feature string with the appropriate language selection tag.
478 \DeclareDocumentCommand \newfontlanguage {mm}
479 {
480   \fontspec_new_lang:nn {#1} {#2}
481   \fontspec_new_lang:nn {#2} {#2}
482 }

483 \keys_define:nn { fontspec } { Language .choice: }
484 \cs_new:Nn \fontspec_new_lang:nn
485 {
486   \keys_define:nn { fontspec } { Language / #1 .code:n =
487     \fontspec_check_lang:nTF {#2}
488   {
489     \fontspec_update_fontid:n {+lang=#1}
490     \tl_set:Nn \l_fontspec_lang_tl {#2}

25.3 Programmer’s interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven’t fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I’ll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

\fontspec_if_fontsfont:TF	Test whether the currently selected font has been loaded by fontspec.
505	\prg_new_conditional:Nnn \fontspec_if_fontsfont: {TF,T,F}
506	{
507	\cs_if_exist:cTF {g_fontspec_ \f@family _prop} \prg_return_true: \prg_return_false:
508	}
\fontspec_if_aat_feature:nTF	Conditional to test if the currently selected font contains the AAT feature (#1,#2).
509	\prg_new_conditional:Nnn \fontspec_if_aat_feature:nn {TF,T,F}
510	{
511	\fontspec_if_fontsfont:TF
512	{
513	\fontspec_font_set:Nnn \l_fontspec_font {\use:c{zf@family@fontdef\f@family}} {\f@size pt}
514	\bool_if:NTF \l_fontspec_atsui_bool
515	{
516	\fontspec_make_AAT_feature_string:nTF {#1}{#2}
517	\prg_return_true: \prg_return_false:
518	}
519	{
520	\prg_return_false:
521	}
522	}
523	{
524	\prg_return_false:
525	}
526	}
\fontspec_if_opentype:TF	Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts.
527	\prg_new_conditional:Nnn \fontspec_if_opentype: {TF,T,F}
528	{
529	\fontspec_if_fontsfont:TF
530	{
531	\fontspec_font_set:Nnn \l_fontspec_font {\csname zf@family@fontdef\f@family\endcsname} {\f@size}
532	\fontspec_set_font_type:
533	\bool_if:NTF \l_fontspec_icu_bool \prg_return_true: \prg_return_false:
534	}
535	{
536	\prg_return_false:
537	}
538	}
\fontspec_if_feature:nTF	Test whether the currently selected font contains the raw OpenType feature #1. E.g.: \fontspec_if_feature:nTF {pnum} {True} {False} Returns false if the font is not loaded by fontspec or is not an OpenType font.
539	\prg_new_conditional:Nnn \fontspec_if_feature:n {TF,T,F}
540	{
541	\fontspec_if_fontsfont:TF
542	{
543	\fontspec_font_set:Nnn \l_fontspec_font {\csname zf@family@fontdef\f@family\endcsname} {\f@size}

```

544     \fontspec_set_font_type:
545     \bool_if:NTF \l_fontspec_icu_bool

651   { \prg_return_false: }
652 }

```

\ontspec_set_family:Nnn #1 : family
#2 : fontspeople features
#3 : font name

Defines a new fontspeople family from given *features* and *font*, and stores the name in the variable *family*. See the standard fontspeople user commands for applications of this function.

We want to store the actual name of the font family within the *family* variable because the actual L^AT_EX family name is automatically generated by fontspeople and it's easier to keep it that way.

Please use \ontspec_set_family:Nnn instead of \ontspec_select:nn, which may change in the future.

```

653 \cs_new:Nn \ontspec_set_family:Nnn

703 }
```

25.5 Internal macros

The macros from here in are used internally by all those defined above. They are not designed to remain consistent between versions.

\fontspec_select:nn This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l_fontspec_family_t1. The TeX '\font' command is (globally) stored in \l_fontspec_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

```
704 \cs_set:Nn \fontspec_select:nn
705 {
706   \group_begin:
707   \font_suppress_not_found_error:
708   \fontspec_init:
```

\l_fontspec_fontname_t1 is used as the generic name of the font being defined. \l_fontspec_fontid_t1 is the unique identifier of the font with all its features. \l_fontspec_fontname_up_t1 is the font specifically to be used as the upright font.

```
709 \tl_set:Nx \l_fontspec_fontname_t1 {\#2}
710 \luatex \tl_remove_all:Nn \l_fontspec_fontname_t1 {~}
711 \tl_set_eq:NN \l_fontspec_fontid_t1 \l_fontspec_fontname_t1
712 \tl_set_eq:NN \l_fontspec_fontname_up_t1 \l_fontspec_fontname_t1
```

Load a possible .fontspec font configuration file. This file could set font-specific options for the font about to be loaded.

```
713 \@@_load_external_fontoptions:N \l_fontspec_fontname_t1
```

Convert the requested features to font definition strings. First the features are parsed for information about font loading (whether it's a named font or external font, etc.), and then information is extracted for the names of the other shape fonts.

```
714 \fontspec_parse_features:nN {\#1} \l_fontspec_fontname_t1
```

Finally save the 'confirmed' font definition.

```
715 \fontspec_font_set:Nnn \l_fontspec_font {\fontspec_fullname:n {\l_fontspec_fontname_up_t1}} {\f@
716 \font_if_null:NT \l_fontspec_font { \fontspec_error:nx {font-not-found} {\l_fontspec_fontname_up_t1}}
717 \fontspec_set_font_type:
718 \fontspec_font_gset:Nnn \l_fontspec_font {\fontspec_fullname:n {\l_fontspec_fontname_up_t1}} {\f@
719 \l_fontspec_font % this is necessary for LuaLaTeX to check the scripts properly
```

Then the mapping from user features to low-level features occurs. This is performed with \fontspec_get_features:n, in which \keys_set:nn retrieves the requested font features and processes them. As \keys_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the 'firstrime' conditional.

```
720 \fontspec_set_scriptlang:
721 \fontspec_get_features:n {}
722 \bool_set_false:N \l_fontspec_firstrime_bool
```

Check if the family is unique and, if so, save its information. (\addfontfeature and other macros use this data.) Then the font family and its shapes are defined in the NFSS.

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if \bfdefault is redefined to b, all bold shapes defined by this package will also be assigned to b.

```
723 \fontspec_save_family:nT {\#2}
724 {
```

937   }
938 }

```

25.5.1 Fonts

\fontspec_set_font_type: Now check if the font is to be rendered with `atsui` or `icu`. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in `\l_fonts_spec_font` is an `AAT` font or an OpenType font or a font with feature axes (either `AAT` or Multiple Master), respectively.

```

939 \cs_new:Nn \fontspec_set_font_type:
940 ⟨*xetexx⟩
941 {
942     \bool_set_false:N \l_fonts_spec_tfm_bool
943     \bool_set_false:N \l_fonts_spec_atsui_bool
944     \bool_set_false:N \l_fonts_spec_icu_bool
945     \bool_set_false:N \l_fonts_spec_mm_bool
946     \bool_set_false:N \l_fonts_spec_graphite_bool
947     \ifcase\XeTeXfonttype\l_fonts_spec_font
948         \bool_set_true:N \l_fonts_spec_tfm_bool
949     \or
950         \bool_set_true:N \l_fonts_spec_atsui_bool
951         \ifnum\XeTeXcountvariations\l_fonts_spec_font > \c_zero
952             \bool_set_true:N \l_fonts_spec_mm_bool
953         \fi
954     \or
955         \bool_set_true:N \l_fonts_spec_icu_bool
956     \fi

```

If automatic, the `\l_fonts_spec_renderer_t1` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

```

957 \tl_if_empty:NT \l_fonts_spec_renderer_t1
958 {
959     \bool_if:NTF \l_fonts_spec_atsui_bool

964     }
965 }
966 ⟨/xetexx⟩
968 ⟨*luatex⟩
969 {
970     \bool_set_true:N \l_fonts_spec_icu_bool
971 }
972 ⟨/luatex⟩

```

```

ec_make_auto_font_shapes:nnnnn #1 : Font name prefix (in the 5-arg case)
#2 : Font name
#3 : Font series
#4 : Font shape
#5 : Font features

```

This macro eventually uses `\DeclareFontShape` to define the font shape in question.

The optional first argument is used when making the font shapes for bold, italic, and bold italic fonts using X_ET_EX's auto-recognition with #2 as /B, /I, and /BI font name suffixes. If no such font is found, it falls back to the original font name, in which case this macro doesn't proceed and the font shape is not created for the NFSS.

Next, the small caps are defined. [...] is used to define the appropriate string for activating small caps in the font, if they exist. If we are defining small caps for the upright shape, then the small caps shape default is used. For an *italic* font, however, the shape parameter is overloaded and we must call italic small caps by their own identifier. See [Section 25.7 on page 107](#) for the code that enables this usage.

```

1118 }
```

\l_fontsname_pre_feat_sclist These are the features always applied to a font selection before other features.

```

1119 \tl_set:Nn \l_fontsname_pre_feat_sclist
1120 <*xetexx>
1121 {
1122   \bool_if:NT \l_fontsname_icu_bool
1123   {
1124     \tl_if_empty:NF \l_fontsname_script_tl
1125     {
1126       script = \l_fontsname_script_tl ;
1127       language = \l_fontsname_lang_tl ;
1128     }
1129   }
1130 }
1131 </xetexx>
1132 <*luatex>
1133 {
1134   mode = \l_fontsname_mode_tl ;
1135   \tl_if_empty:NF \l_fontsname_script_tl
1136   {
1137     script = \l_fontsname_script_tl ;
1138     language = \l_fontsname_lang_tl ;
1139   }
1140 }
1141 </luatex>
```

\fontsname_update_fontid:n This macro is used to build up a complex family name based on its features.

The *firsttime* boolean is set true in \fontsname_select:nn only the first time \fontsname_update_featstr:n is called, so that the family name is only created once.

```

1142 \cs_new:Nn \fontsname_update_fontid:n
1143 {
1144   \bool_if:NT \l_fontsname_firsttime_bool
1145   {
1146     \tl_gput_right:Nx \l_fontsname_fontid_tl {#1}
```

```

1147    }
1148 }
```

25.5.2 Features

\fontspec_get_features:n This macro is a wrapper for \keys_set:nn which expands and adds a default specification to the original passed options. It begins by initialising the commands used to hold font-feature specific strings. Its argument is any additional features to prepend to the default.

```

1149 \cs_set:Nn \fontspec_get_features:n
1150 {
1151   \sclist_clear:N \l_fontspec_rawfeatures_sclist
1152   \tl_clear:N \l_fontspec_scale_tl
1153   \tl_set_eq:NN \l_fontspec_opacity_tl \g_fontspec_opacity_tl
1154   \tl_set_eq:NN \l_fontspec_hexcol_tl \g_fontspec_hexcol_tl
1155   \tl_clear:N \l_fontspec_postadjust_tl
1156
1157   \keys_set_known:nxN {fontspec-renderer} {\l_fontspec_fontfeat_clist,#1}
1158     \l_fontspec_keys_leftover_clist
1159   \keys_set:nx {fontspec} {\l_fontspec_keys_leftover_clist}

Finish the colour specification. Do not set the colour if not explicitly spec'd else \color (using specials) will not work.

1160   \str_if_eq_x:nnF { \l_fontspec_hexcol_tl \l_fontspec_opacity_tl }
1161           { \g_fontspec_hexcol_tl \g_fontspec_opacity_tl }
1162   {
1163     \fontspec_update_featstr:n{color=\l_fontspec_hexcol_tl\l_fontspec_opacity_tl}
1164   }
1165 }
```

\fontspec_init: Initialisations that either need to occur globally: (all setting of these variables is done locally inside a group)

```

1166 \tl_clear:N \l_fontspec_fontname_bf_tl

1302             { \fontspec_make_numbered_feature:nn {#3}{#4} }
1303     }
1304 }

```

`\fontspec_make_AAT_feature_string:nnTF` This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 78).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But XeTeX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in `\l_fontspec_feature_string_t1`.

```

1305 \prg_new_conditional:Nnn \fontspec_make_AAT_feature_string:nn {TF,T,F}
1306 {
1307     \tl_set:Nx \l_tmpa_tl { \XeTeXfeaturename \l_fontspec_font #1 }

1332     \prg_return_true:
1333 }
1334 }
1335 }

```

\fontspec_iv_str_to_num:Nn This macro takes a four character string and converts it to the numerical representation required for XeTeX OpenType script/language/feature purposes. The output is stored in \l_fontspec_strnum_int.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \emptys and anything beyond four chars is snipped. The \emptys then are used to reconstruct the spaces in the string to number calculation.

The variant \fontspec_v_str_to_num:n is used when looking at features, which are passed around with prepended plus and minus signs (e.g., +liga, -dlig); it simply strips off the first char of the input before calling the normal \fontspec_iv_str_to_num:n.

```

1336 \cs_set:Nn \fontspec_iv_str_to_num:Nn
1337 {
1338     \fontspec_iv_str_to_num:w #1 \q_nil #2 \c_empty_tl \c_empty_tl \q_nil

```

25.6 keyval definitions

This is the tedious section where we correlate all possible (eventually) font feature requests with their \TeX representations.

```

1452 \cs_new:Nn \@@_keys_define_code:nnn
1453 {
1454   \keys_define:nn {#1} { #2 .code:n = {#3} }
1455 }

```

25.6.1 Pre-parsing naming information

These features are extracted from the font feature list before all others.

ExternalLocation For fonts that aren't installed in the system. If no argument is given, the font is located with `kpsewhich`; it's either in the current directory or the \TeX tree. Otherwise, the argument given defines the file path of the font.

```

1456 \bool_new:N \l_fonts_external_bool
1457 \@@_keys_define_code:nnn {fontspec-preparse-external} {ExternalLocation}
1458 {
1459   \bool_set_true:N \l_fonts_no_nf_bool
1460   \bool_set_true:N \l_fonts_no_it_bool
1461   \bool_set_true:N \l_fonts_external_bool
1462   \cs_gset:Npn \fontspec_namewrap:n ##1 { [ #1 ##1 ] }
1463 ⟨*xetexx⟩
1464   \keys_set:nn {fontspec-renderer} {Renderer=ICU}
1465 ⟨/xetexx⟩
1466 }
1467 \aliasfontfeature{ExternalLocation}{Path}

```

Extension For fonts that aren't installed in the system. Specifies the font extension to use.

```

1468 \@@_keys_define_code:nnn {fontspec-preparse-external} {Extension}
1469 {
1470   \tl_set:Nn \l_fonts_extension_tl {#1}
1471   \bool_if:NF \l_fonts_external_bool
1472   {
1473     \keys_set:nn {fontspec-preparse-external} {ExternalLocation}
1474   }
1475 }
1476 \tl_clear:N \l_fonts_extension_tl

```

25.6.2 Pre-parsed features

After the font name(s) have been sorted out, now need to extract any renderer/font configuration features that need to be processed before all other font features.

Renderer This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and even whether certain features are available.

```
1477 \keys_define:nn {fontspec-renderer}
1478 {
1479   Renderer .choice_code:n =
1480   {
1481     \fontspec_update_fontid:n {+rend:\l_keys_choice_tl}
1482     \int_compare:nTF {\l_keys_choice_int <= 3} {
1483       (*xetexx)
1484         \tl_set:Nv \l_fontspec_renderer_tl
1485         { g_fontspec_renderer_tag_ \l_keys_choice_tl }
1486     (/xetexx)
1487     (*luatex)
1488       \fontspec_warning:nx {only-xetex-feature} {Renderer=AAT/ICU/Graphite}
1489     (/luatex)
1490   }
1491   {
1492     (*xetexx)
1493       \fontspec_warning:nx {only-luatex-feature} {Renderer=Full/Basic}
1494     (/xetexx)
1495     (*luatex)
1496       \tl_set:Nv \l_fontspec_mode_tl
1497       { g_fontspec_mode_tag_ \l_keys_choice_tl }
1498   (/luatex)
1499 }
1500 }
1501 ,
1502 Renderer .generate_choices:n = {AAT,ICU,Graphite,Full,Basic}
1503 }
1504 \tl_set:cn {g_fontspec_renderer_tag_AAT} {/AAT}
1505 \tl_set:cn {g_fontspec_renderer_tag_ICU} {/ICU}
1506 \tl_set:cn {g_fontspec_renderer_tag_Graphite} {/GR}
1507 \tl_set:cn {g_fontspec_mode_tag_Full} {node}
1508 \tl_set:cn {g_fontspec_mode_tag_Basic} {base}
```

OpenType script/language See later for the resolutions from fontspec features to OpenType definitions.

```
1509 @@_keys_define_code:nnn {fontspec-preparse} {Script}
1510 {
1511   (*xetexx) \keys_set:nn {fontspec-renderer} {Renderer=ICU}
1512   \tl_set:Nn \l_fontspec_script_name_tl {\#1}
1513   \fontspec_update_fontid:n {+script:\#1}
1514 }
```

Exactly the same:

```
1515 @@_keys_define_code:nnn {fontspec-preparse} {Language}
```

```

1516 {
1517 <xetex> \keys_set:nn {fontspec-renderer} {Renderer=ICU}
1518 \tl_set:Nn \l_fontspec_lang_name_tl {\#1}
1519 \fontspec_update_fontid:n {+language:\#1}
1520 }

```

25.6.3 Bold/italic choosing options

The `Bold`, `Italic`, and `BoldItalic` features are for defining explicitly the bold and italic fonts used in a font family.

Fonts Upright:

```

1521 \@@_keys_define_code:nnn {fontspec-preparse-external} {UprightFont}
1522 {
1523 \fontspec_complete_fontname:Nn \l_fontspec_fontname_up_tl {\#1}
1524 \fontspec_update_fontid:n {up:\#1}
1525 }

```

Bold:

```

1526 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldFont}
1527 {
1528 \tl_if_empty:nTF {\#1}
1529 {
1530 \bool_set_true:N \l_fontspec_nobf_bool
1531 \fontspec_update_fontid:n {nobf}
1532 }
1533 {
1534 \bool_set_false:N \l_fontspec_nobf_bool
1535 \fontspec_complete_fontname:Nn \l_fontspec_fontname_bf_tl {\#1}
1536 \fontspec_update_fontid:n {bf:\#1}
1537 }
1538 }

```

Same for italic:

```

1539 \@@_keys_define_code:nnn {fontspec-preparse-external} {ItalicFont}
1540 {
1541 \tl_if_empty:nTF {\#1}
1542 {
1543 \bool_set_true:N \l_fontspec_noit_bool
1544 \fontspec_update_fontid:n {noit}
1545 }
1546 {
1547 \bool_set_false:N \l_fontspec_noit_bool
1548 \fontspec_complete_fontname:Nn \l_fontspec_fontname_it_tl {\#1}
1549 \fontspec_update_fontid:n {it:\#1}
1550 }
1551 }

```

Simpler for bold+italic & slanted:

```

1552 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldItalicFont}
1553 {
1554 \fontspec_complete_fontname:Nn \l_fontspec_fontname_bfit_tl {\#1}
1555 \fontspec_update_fontid:n {bfit:\#1}

```

```

1556 }
1557 \@@_keys_define_code:nnn {fontspec-preparse-external} {SlantedFont}
1558 {
1559   \fontspec_complete_fontname:Nn \l_fontspec_fontname_sl_t1 {\#1}
1560   \fontspec_update_fontid:n {sl:#1}
1561 }
1562 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSlantedFont}
1563 {
1564   \fontspec_complete_fontname:Nn \l_fontspec_fontname_bfsl_t1 {\#1}
1565   \fontspec_update_fontid:n {bfsl:#1}
1566 }

Small caps isn't pre-parsed because it can vary with others above:
1567 \@@_keys_define_code:nnn {fontspec} {SmallCapsFont}
1568 {
1569   \tl_if_empty:nTF {\#1}
1570   {
1571     \bool_set_true:N \l_fontspec_nosc_bool
1572     \fontspec_update_fontid:n {nosc}
1573   }
1574   {
1575     \bool_set_true:N \l_fontspec_nosc_bool
1576     \fontspec_complete_fontname:Nn \l_fontspec_fontname_sc_t1 {\#1}
1577     \fontspec_update_fontid:n {sc:#1}
1578   }
1579 }

\fontspec_complete_fontname:Nn This macro defines #1 as the input with any * tokens of its input replaced by the font name. This lets us define supplementary fonts in full ("Baskerville Semibold") or in abbreviation ("* Semibold").
1580 \cs_set:Nn \fontspec_complete_fontname:Nn
1581 {
1582   \tl_set:Nn #1 {\#2}
1583   \tl_replace_all:Nnx #1 {*} {\l_fontspec_fontname_t1}
1584 \luatex \tl_remove_all:Nn #1 {~}
1585 }
1586 \cs_generate_variant:Nn \tl_replace_all:Nnn {Nnx}

Features Can't use \clist_set:Nn below, yet, because it would strip the leading comma and we use that implicitly to concatenate options.
1587 \@@_keys_define_code:nnn {fontspec-preparse} {UprightFeatures}
1588 {
1589   \tl_set:Nn \l_fontspec_fontfeat_up_clist { , #1}
1590   \fontspec_update_fontid:n {rmfeat:#1}
1591 }
1592 \@@_keys_define_code:nnn {fontspec-preparse} {BoldFeatures}
1593 {
1594   \tl_set:Nn \l_fontspec_fontfeat_bf_clist { , #1}
1595   \fontspec_update_fontid:n {bffeat:#1}
1596 }
1597 \@@_keys_define_code:nnn {fontspec-preparse} {ItalicFeatures}
1598 {

```

```

1599 \tl_set:Nn \l_fonts_spec_fontfeat_it_clist {, #1}
1600 \fontspec_update_fontid:n {itfeat:#1}
1601 }
1602 \@@_keys_define_code:nnn {fontspec-preparse} {BoldItalicFeatures}
1603 {
1604 \tl_set:Nn \l_fonts_spec_fontfeat_bfit_clist {, #1}
1605 \fontspec_update_fontid:n {bfitfeat:#1}
1606 }
1607 \@@_keys_define_code:nnn {fontspec-preparse} {SlantedFeatures}
1608 {
1609 \tl_set:Nn \l_fonts_spec_fontfeat_sl_clist {, #1}
1610 \fontspec_update_fontid:n {slfeat:#1}
1611 }
1612 \@@_keys_define_code:nnn {fontspec-preparse} {BoldSlantedFeatures}
1613 {
1614 \tl_set:Nn \l_fonts_spec_fontfeat_bfsl_clist {, #1}
1615 \fontspec_update_fontid:n {bfslfeat:#1}
1616 }

Note that small caps features can vary by shape, so these in fact aren't pre-parsed.

1617 \@@_keys_define_code:nnn {fontspec} {SmallCapsFeatures}
1618 {
1619 \bool_if:NF \l_fonts_spec_firsttime_bool
1620 {
1621 \tl_set:Nn \l_fonts_spec_fontfeat_sc_clist {, #1}
1622 }
1623 \fontspec_update_fontid:n {scfeat:#1}
1624 }

paragraphFeatures varying by size TODO: sizezfeatures and italicfont (etc) don't play
nice

1625 \@@_keys_define_code:nnn {fontspec-preparse} {SizeFeatures}
1626 {
1627 \tl_set:Nn \l_fonts_spec_sizefeat_clist {#1}
1628 \fontspec_update_fontid:n {sizefeat:#1}
1629 }

1630 \@@_keys_define_code:nnn {fontspec-sizing} {Size}
1631 {
1632 \tl_set:Nn \l_fonts_spec_size_tl {#1}
1633 }
1634 \@@_keys_define_code:nnn {fontspec-sizing} {Font}
1635 {
1636 \fontspec_complete_fontname:Nn \l_fonts_spec_sizedfont_t1 {#1}
1637 }

```

25.6.4 Font-independent features

These features can be applied to any font.

Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical.
`\fontspec_calc_scale:n` does all the work in the auto-scaling cases.

```
1638 \@@_keys_define_code:nnn {fontspec} {Scale}
```

```

1639 {
1640   \str_case:nnn {#1}
1641   {
1642     {MatchLowercase} { \fontspec_calc_scale:n {5} }
1643     {MatchUppercase} { \fontspec_calc_scale:n {8} }
1644   }
1645   { \tl_set:Nx \l_fontspec_scale_tl {#1} }
1646   \fontspec_update_fontid:n {+scale:\l_fontspec_scale_tl}
1647   \tl_set:Nx \l_fontspec_scale_tl { s*[\l_fontspec_scale_tl] }
1648 }

```

\fontspec_calc_scale:n This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in Xe^TE_X).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```

1649 \cs_new:Nn \fontspec_calc_scale:n
1650 {
1651   \group_begin:
1652   \rmfamily
1653   \fontspec_set_font_dimen:NnN \l_fontspec_tmpa_dim {#1} \font
1654   \fontspec_set_font_dimen:NnN \l_fontspec_tmpb_dim {#1} \l_fontspec_font
1655   \fp_set_from_dim:Nn \l_fontspec_tmpa_fp { \l_fontspec_tmpa_dim }
1656   \fp_set_from_dim:Nn \l_fontspec_tmpb_fp { \l_fontspec_tmpb_dim }
1657   \fp_div:Nn \l_fontspec_tmpa_fp { \l_fontspec_tmpb_fp }
1658   \tl_gset:Nx \l_fontspec_scale_tl { \fp_use:N \l_fontspec_tmpa_fp }
1659   \fontspec_info:n {set-scale}
1660   \group_end:
1661 }

```

\fontspec_set_font_dimen:NnN This function sets the dimension #1 (for font #3) to ‘fontdimen’ #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect ‘zero’ value (as \fontdimen8 might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an ‘X’ or an ‘x’.

```

1662 \cs_new:Nn \fontspec_set_font_dimen:NnN
1663 {
1664   \dim_set:Nn #1 { \fontdimen #2 #3 }
1665   \dim_compare:nNnT #1 = {0pt}
1666   {
1667     \settoheight #1
1668     {
1669       \str_if_eq:nnTF {#3} {\font} \rmfamily #3
1670       \int_case:nnn #2
1671       {
1672         {5} {x} % x-height
1673         {8} {X} % cap-height
1674       } {?} % "else" clause; never reached.
1675     }
1676   }
1677 }

```

Inter-word space These options set the relevant \fontdimens for the font being loaded.

```
1678 @_keys_define_code:nnn {fontspec} {WordSpace}
1679 {
1680   \fontspec_update_fontid:n {+wordspace:#1}
1681   \bool_if:NF \l_fontsfirsttime_bool
1682   { \fontsparse_wordspace:w #1,,, \q_stop }
1683 }
```

_fontsparse_wordspace:w This macro determines if the input to WordSpace is of the form {X} or {X,Y,Z} and executes the font scaling. If the former input, it executes {X,X,X}.

```
1684 \cs_set:Npn \fontsparse_wordspace:w #1,#2,#3,#4 \q_stop
1685 {
1686   \tl_if_empty:nTF {#4}
1687   {
1688     \tl_put_right:Nn \fontsfirstadjust_tl
1689     {
1690       \fontdimen 2 \font = #1 \fontdimen 2 \font
1691       \fontdimen 3 \font = #1 \fontdimen 3 \font
1692       \fontdimen 4 \font = #1 \fontdimen 4 \font
1693     }
1694   }
1695   {
1696     \tl_put_right:Nn \fontsfirstadjust_tl
1697     {

```

25.6.6 Font transformations

These are to be specified to apply directly to a font shape:

```
1857 \keys_define:nn {fontspec}
1858 {
1859   FakeSlant .code:n =
1860   {
1861     \fontspec_update_fontid:n {+slant:#1}
1862     \fontspec_update_featstr:n{slant=#1}
1863   },
1864   FakeSlant .default:n = {0.2}
1865 }
1866 \keys_define:nn {fontspec}
1867 {
1868   FakeStretch .code:n =
1869   {
1870     \fontspec_update_fontid:n {+extend:#1}
1871     \fontspec_update_featstr:n{extend=#1}
1872   },
1873   FakeStretch .default:n = {1.2}
1874 }
1875 (*xetexx)
1876 \keys_define:nn {fontspec}
1877 {
1878   FakeBold .code:n =
1879   {
1880     \fontspec_update_fontid:n {+embolden:#1}
1881     \fontspec_update_featstr:n{embolden=#1}
1882   },
1883   FakeBold .default:n = {1.5}
1884 }
1885 (/xetexx)
1886 (*lualatex)
1887 \keys_define:nn {fontspec}
1888 {
1889   FakeBold .code:n = { \fontspec_warning:n {fakebold-only-xetex} }
1890 }
1891 (/lualatex)
```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create ‘fake’ shapes.

The behaviour is currently that only if both AutoFakeSlant and AutoFakeBold are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```
1892 \keys_define:nn {fontspec}
1893 {
1894   AutoFakeSlant .code:n =
1895   {
1896     \bool_if:NT \l_fontspec_firsttime_bool
1897     {
```

```

1898   \tl_set:Nn \l_fonts_spec_fake_slant_tl {#1}
1899   \clist_put_right:Nn \l_fonts_spec_fontfeat_it_clist {FakeSlant=#1}
1900   \tl_set_eq:NN \l_fonts_spec_fontname_it_tl \l_fonts_spec_fontname_tl
1901   \bool_set_false:N \l_fonts_spec_noit_bool
1902
1903   \fontspec_update_fontid:n {fakeit:#1}
1904
1905   \tl_if_empty:NF \l_fonts_spec_fake_embolden_tl
1906   {
1907     \clist_put_right:Nx \l_fonts_spec_fontfeat_bfit_clist
1908     {FakeBold=\l_fonts_spec_fake_embolden_tl}
1909     \clist_put_right:Nx \l_fonts_spec_fontfeat_bfit_clist {FakeSlant=#1}
1910     \tl_set_eq:NN \l_fonts_spec_fontname_bfit_tl \l_fonts_spec_fontname_tl
1911   }
1912 }
1913 },
1914 AutoFakeSlant .default:n = {0.2}
1915 }

```

Same but reversed:

```

1916 \keys_define:nn {fontspec}
1917 {
1918   AutoFakeBold .code:n =
1919   {
1920     \bool_if:NT \l_fonts_spec_firsttime_bool
1921     {
1922       \tl_set:Nn \l_fonts_spec_fake_embolden_tl {#1}
1923       \clist_put_right:Nn \l_fonts_spec_fontfeat_bf_clist {FakeBold=#1}
1924       \tl_set_eq:NN \l_fonts_spec_fontname_bf_tl \l_fonts_spec_fontname_tl
1925       \bool_set_false:N \l_fonts_spec_nobf_bool
1926
1927       \fontspec_update_fontid:n {fakebf:#1}
1928
1929       \tl_if_empty:NF \l_fonts_spec_fake_slant_tl
1930       {
1931         \clist_put_right:Nx \l_fonts_spec_fontfeat_bfit_clist
1932         {FakeSlant=\l_fonts_spec_fake_slant_tl}
1933         \clist_put_right:Nx \l_fonts_spec_fontfeat_bfit_clist {FakeBold=#1}
1934         \tl_set_eq:NN \l_fonts_spec_fontname_bfit_tl \l_fonts_spec_fontname_tl
1935       }
1936     }
1937   },
1938   AutoFakeBold .default:n = {1.5}
1939 }

```

25.6.7 Ligatures

The call to the nested keyval family must be wrapped in braces to hide the parent list (this later requires the use of global definitions (`\xdef`) in [...]). Both AAT and OpenType names are offered to chose Rare/Discretionary ligatures.

```

1940 \fontspec_define_font_feature:n{Ligatures}
1941 \fontspec_define_feature_option:nnnnn{Ligatures}{Required} {1}{0}{+rlig}

```

```

1942 \fontspec_define_feature_option:nnnnn{Ligatures}{NoRequired}      {1}{1}{-rlig}
1943 \fontspec_define_feature_option:nnnnn{Ligatures}{Common}        {1}{2}{+liga}
1944 \fontspec_define_feature_option:nnnnn{Ligatures}{NoCommon}       {1}{3}{-liga}
1945 \fontspec_define_feature_option:nnnnn{Ligatures}{Rare}          {1}{4}{+dlig}
1946 \fontspec_define_feature_option:nnnnn{Ligatures}{NoRare}         {1}{5}{-dlig}
1947 \fontspec_define_feature_option:nnnnn{Ligatures}{Discretionary} {1}{4}{+dlig}
1948 \fontspec_define_feature_option:nnnnn{Ligatures}{NoDiscretionary}{1}{5}{-dlig}
1949 \fontspec_define_feature_option:nnnnn{Ligatures}{Contextual}     {}{} {+clig}
1950 \fontspec_define_feature_option:nnnnn{Ligatures}{NoContextual}   {}{} {-clig}
1951 \fontspec_define_feature_option:nnnnn{Ligatures}{Historic}        {}{} {+hlig}
1952 \fontspec_define_feature_option:nnnnn{Ligatures}{NoHistoric}      {}{} {-hlig}
1953 \fontspec_define_feature_option:nnnnn{Ligatures}{Logos}           {1}{6} {}
1954 \fontspec_define_feature_option:nnnnn{Ligatures}{NoLogos}         {1}{7} {}
1955 \fontspec_define_feature_option:nnnnn{Ligatures}{Rebus}           {1}{8} {}
1956 \fontspec_define_feature_option:nnnnn{Ligatures}{NoRebus}          {1}{9} {}
1957 \fontspec_define_feature_option:nnnnn{Ligatures}{Diphthong}        {1}{10}{}
1958 \fontspec_define_feature_option:nnnnn{Ligatures}{NoDiphthong}      {1}{11}{}
1959 \fontspec_define_feature_option:nnnnn{Ligatures}{Squared}          {1}{12}{}
1960 \fontspec_define_feature_option:nnnnn{Ligatures}{NoSquared}        {1}{13}{}
1961 \fontspec_define_feature_option:nnnnn{Ligatures}{AbbrevSquared}    {1}{14}{}
1962 \fontspec_define_feature_option:nnnnn{Ligatures}{NoAbbrevSquared}{1}{15}{}
1963 \fontspec_define_feature_option:nnnnn{Ligatures}{Icelandic}        {1}{32}{}
1964 \fontspec_define_feature_option:nnnnn{Ligatures}{NoIcelandic}      {1}{33}{}

Emulate CM extra ligatures.

1965 \keys_define:nn {fontspec}
1966 {
1967   Ligatures / TeX .code:n =
1968   {
1969     \fontspec_update_fontid:n {+map:tex-text}

1985 \fontspec_define_feature_option:nnnnn{Letters}{Random}              {} {} {+rand}

```

25.6.9 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

```
1986 \fontspec_define_font_feature:n{Numbers}
1987 \fontspec_define_feature_option:nnnnn{Numbers}{Monospaced} {6} {0}{+tnum}
1988 \fontspec_define_feature_option:nnnnn{Numbers}{Proportional} {6} {1}{+pnum}
1989 \fontspec_define_feature_option:nnnnn{Numbers}{Lowercase} {21}{0}{+onum}
1990 \fontspec_define_feature_option:nnnnn{Numbers}{OldStyle} {21}{0}{+onum}
1991 \fontspec_define_feature_option:nnnnn{Numbers}{Uppercase} {21}{1}{+lnum}
1992 \fontspec_define_feature_option:nnnnn{Numbers}{Lining} {21}{1}{+lnum}
1993 \fontspec_define_feature_option:nnnnn{Numbers}{SlashedZero} {14}{5}{+zero}
1994 \fontspec_define_feature_option:nnnnn{Numbers}{NoSlashedZero}{14}{4}{-zero}
```

luatex provides a custom anum feature for replacing Latin (AKA Arabic) numbers with Arabic (AKA Indic-Arabic). The same feature maps to Farsi (Persian) numbers if font language is Farsi.

```
1995 \luatex_if_engine:T
1996 {
1997   \fontspec_define_feature_option:nnnnn{Numbers}{Arabic}{}{}{+anum}
1998 }
```

25.6.10 Contextuals

```
1999 \fontspec_define_font_feature:n {Contextuals}
2000 \fontspec_define_feature_option:nnnnn{Contextuals}{Swash} {} {} {+cswh}

2438 }

```

25.6.24 Raw feature string

This allows savvy X_ET_EX-ers to input font features manually if they have already memorised the OpenType abbreviations and don’t mind not having error checking.

```

2439 @@_keys_define_code:nnn {fontspec} {RawFeature}
2440 {
2441   \fontspec_update_fontid:n {+Raw:#1}
2442   \fontspec_update_featstr:n{#1}
2443 }

```

25.7 Italic small caps

The following code for utilising italic small caps sensibly is inspired from Philip Lehman's *The Font Installation Guide*. Note that `\upshape` needs to be used *twice* to get from italic small caps to regular upright (it always goes to small caps, then regular upright).

`\sishape` First, the commands for actually selecting italic small caps are defined. I use `si` as the NFSS shape for italic small caps, but I have seen `itsc` and `s1sc` also used. `\sidefault` may be redefined to one of these if required for compatibility.

```
2444 \providecommand*\{\sidefault\}{si}
2445 \DeclareRobustCommand{\sishape}
2446 {
2447   \not@math@alphabet\sishape\relax
2448   \fontshape\sidefault\selectfont
2449 }
2450 \DeclareTextFontCommand{\textsi}{\sishape}
```

`\fontspec_blend_shape:nnn` This is the macro which enables the overload on the `\..shape` commands. It takes three such arguments. In essence, the macro selects the first argument, unless the second argument is already selected, in which case it selects the third.

```
2451 \cs_new:Nn \fontspec_blend_shape:nnn
2452 {
2453   \bool_if:nTF
2454   {
2455     \str_if_eq_x_p:nn {\f@shape} {#2} &&
2456     \cs_if_exist_p:c {\f@encoding/\f@family/\f@series/#3}
2457   }
2458   { \fontshape{#3}\selectfont }
2459   { \fontshape{#1}\selectfont }
2460 }
```

`\itshape` Here the original `\..shape` commands are redefined to use the merge shape macro.

```
2461 \DeclareRobustCommand \itshape
2462 {
2463   \not@math@alphabet\itshape\mathit
2464   \fontspec_blend_shape:nnn\itdefault\scdefault\sidefault
2465 }
2466 \DeclareRobustCommand \slshape
2467 {
2468   \not@math@alphabet\slshape\relax
2469   \fontspec_blend_shape:nnn\sldefault\scdefault\sidefault
2470 }
2471 \DeclareRobustCommand \scshape
2472 {
2473   \not@math@alphabet\scshape\relax
2474   \fontspec_blend_shape:nnn\scdefault\itdefault\sidefault
2475 }
2476 \DeclareRobustCommand \upshape
2477 {
2478   \not@math@alphabet\upshape\relax
2479   \fontspec_blend_shape:nnn\updefault\sidefault\scdefault
2480 }
```

25.8 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

- `\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
2481 \@ifpackageloaded{euler}
2482 {
2483   \bool_set_true:N \g_fontspec_package_euler_loaded_bool
2484 }
2485 {
2486   \bool_set_false:N \g_fontspec_package_euler_loaded_bool
2487 }
2488 \cs_set:Nn \fontspec_setup_maths:
2489 {
2490   \@ifpackageloaded{euler}
2491   {
2492     \bool_if:NTF \g_fontspec_package_euler_loaded_bool
2493     { \bool_set_true:N \g_fontspec_math_euler_bool }
2494     { \fontspec_error:n {euler-too-late} }
2495   }
2496   {}
2497   \@ifpackageloaded{lucbmath}{\bool_set_true:N \g_fontspec_math_lucida_bool}{}
2498   \@ifpackageloaded{lucidabr}{\bool_set_true:N \g_fontspec_math_lucida_bool}{}
2499   \@ifpackageloaded{lucimatx}{\bool_set_true:N \g_fontspec_math_lucida_bool}{}
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L^AT_EX's operators maths font to still go back to the legacy `cml` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a `\hat` accent in EulerFractur, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```
2500 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
2501 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
2502 \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}
2503 \DeclareMathAccent{\grave}{\mathalpha}{legacymaths}{18}
2504 \DeclareMathAccent{\ddot}{\mathalpha}{legacymaths}{127}
2505 \DeclareMathAccent{\tilde}{\mathalpha}{legacymaths}{126}
2506 \DeclareMathAccent{\bar}{\mathalpha}{legacymaths}{22}
2507 \DeclareMathAccent{\breve}{\mathalpha}{legacymaths}{21}
2508 \DeclareMathAccent{\check}{\mathalpha}{legacymaths}{20}
2509 \DeclareMathAccent{\hat}{\mathalpha}{legacymaths}{94} % too bad, euler
2510 \DeclareMathAccent{\dot}{\mathalpha}{legacymaths}{95}
2511 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}
```

\colon: what's going on? Okay, so : and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```
% fontmath.ltx:
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{3A}
\DeclareMathSymbol{:}{\mathrel}{operators}{3A}

% amsmath.sty:
\renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
\mkern-\thinmuskip:\mskip6mu plus1mu\relax}

% euler.sty:
\DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{3A}

% lucbmath.sty:
\DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}
\ifx\colon@tempb
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
\fi
\DeclareMathSymbol{:}{\mathrel}{operators}{58}
```

(3A_16 = 58_10) So I think, based on this summary, that it is fair to tell fonts杵 to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```
2512 \group_begin:
2513   \mathchardef\tempa="603A \relax
2514   \ifx\colon\tempa
2515     \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
2516   \fi
2517 \group_end:
```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```
2518 \bool_if:N \g_fonts杵_math_euler_bool
2519 {
2520   \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
2521   \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
2522   \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
2523   \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}
```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```
2524 \bool_if:N \g_fonts杵_math_lucida_bool
2525 {
2526   \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{`0}

2551 \DeclareMathDelimiter{{}{\mathopen}}{legacymaths}{91}{largesymbols}{2}
2552 \DeclareMathDelimiter{{}{\mathclose}}{legacymaths}{93}{largesymbols}{3}
2553 \DeclareMathDelimiter{/}{\mathord}{legacymaths}{47}{largesymbols}{14}
2554 \DeclareMathSymbol{\mathdollar}{\mathord}{legacymaths}{36}
2555 }
2556 }

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_fonts杵_mathrm_t1(...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm(...)` commands in the preamble.

Since L^AT_EX only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_fonts杵_bfmathrm_t1`.

```

2557 \DeclareSymbolFont{operators}\g_fonts杵_encoding_t1\g_fonts杵_mathrm_t1\mddefault\updefault
2558 \SetSymbolFont{operators}{normal}\g_fonts杵_encoding_t1\g_fonts杵_mathrm_t1\mddefault\updefault

2577 }

```

`\fonts杵_maybe_setup_maths:` We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L^AT_EX Font Catalogue': <http://www.ctan.org/tex-archive/fonts/>

//www.tug.dk/FontCatalogue/mathfonts.html. I'm sure there are more I've missed. Do the TeX Gyre fonts have maths support yet?
Untested: would \unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_fonts_spec_math_bool\fi be a better test? This needs more cooperation with euler and lucida, I think.

```

29 \font_glyph_if_exist:NnTF \font {"2423}

```

30 { \char"2423\scan_stop: }
31 { \fontspec_visible_space_fallback: }
32 }

\fontspec_visible_space:@fallback If the current font doesn't have U+2434: OPEN BOX, use Latin Modern Mono instead.
33 \cs_new:Nn \fontspec_visible_space_fallback:
34 {
35 {
36 \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
37 \textvisiblespace
38 }
39 }

\fontspec_print_visible_spaces: Helper macro to turn spaces (^20) active and print visible space instead.
40 \group_begin:
41 \char_set_catcode_active:n{"20}%
42 \cs_gset:Npn \fontspec_print_visible_spaces:{%
43 \char_set_catcode_active:n{"20}%
44 \cs_set_eq:NN ^20 \fontspec_visible_space:%
45 }%
46 \group_end:

\verb Redefine \verb to use \fontspec_print_visible_spaces:.
\verb* 47 \def\verb
48 {
49 \relax\ifmmode\hbox\else\leavevmode\null\fi
50 \bgroup
51 \verb@eol@error \let\do\@makeother \dospecials
52 \verbatim@font\@noligs
53 \@ifstar\@sverb\@verb
54 }
55 \def\@sverb{\fontspec_print_visible_spaces:\@sverb}

It's better to put small things into \AtBeginDocument, so here we go:
56 \AtBeginDocument
57 {
58 \fontspec_patch_verbatim:
59 \fontspec_patch_moreverb:
60 \fontspec_patch_fancyvrb:
61 \fontspec_patch_listings:
62 }

\verbatim* With the verbatim package.
63 \cs_set:Npn \fontspec_patch_verbatim:
64 {
65 \ifpackageloaded{verbatim}
66 {
67 \cs_set:cpn {verbatim*}
68 {
69 \group_begin: \verbatim \fontspec_print_visible_spaces: \verbatim@start
70 }
71 }

```

This is for vanilla L^AT_EX.

```
72  {
73    \cs_set:cpn {verbatim*}
74    {
75      @verbatim \fontspec_print_visible_spaces: \sxverbatim
76    }
77  }
```

listingcont* This is for moreverb. The main listing* environment inherits this definition.

```
79 \cs_set:Npn \fontspec_patch_moreverb:
80 {
81   \@ifpackageloaded{moreverb} {
82     \cs_set:cpn {listingcont*}
83     {
84       \cs_set:Npn \verbatim@processline
85       {
86         \the\listing@line \global\advance\listing@line\c_one
87         \the\verbatim@line\par
88       }
89       \fontspec_print_visible_spaces: \verbatim@start
90     }
91   }{}
92 }
```

listings and fancyvrb make things nice and easy:

```
93 \cs_set:Npn \fontspec_patch_fancyvrb:
94 {
95   \@ifpackageloaded{fancyvrb} {
96     {
97       \cs_set_eq:NN \FancyVerbSpace \fontspec_visible_space:
98     }{}
99 }

100 \cs_set:Npn \fontspec_patch_listings:
101 {
102   \@ifpackageloaded{listings} {
103     {
104       \cs_set_eq:NN \lst@visiblespace \fontspec_visible_space:
105     }{}
106 }
```

25.15 \oldstylenums

\oldstylenums This command obviously needs a redefinition. And we may as well provide the reverse command.

```
107 \RenewDocumentCommand \oldstylenums {m}
108 {
109   { \addfontfeature{Numbers=OldStyle} #1 }
110 }
111 \NewDocumentCommand \liningnums {m}
112 {
```

```
113 { \addfontfeature{Numbers=Lining} #1 }
114 }
115 </patches>
```

Part X

fontspec.cfg

```
1 <*cfg>
2
3 %%%
4 %% FOR BACKWARDS COMPATIBILITY WITH PREVIOUS VERSIONS %%
5
6 % Please note that most of the entries here from fontspec v1.x are
7 % no longer present. Please advise of any serious problems this causes.
8
9 \aliasfontfeatureoption{Ligatures}{Historic}{Historical}
10 \let\newfontinstance\newfontfamily
11
12 </cfg>
```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
