Part I

Getting started

1 History

This package began life as a \LaTeX interface to select system-installed Mac OS X fonts in Jonathan Kew's Xe\TeX , the first widely-used Unicode extension to \TeX . Over time, Xe\TeX was extended to support OpenType fonts and then was ported into a cross-platform program to run also on Windows and Linux.

More recently, Lua\TeX is fast becoming the \TeX engine of the day; it supports Unicode encodings and OpenType fonts and opens up the internals of \TeX via the Lua programming language. Hans Hagen's Con\TeXt Mk. IV is a re-write of his powerful typesetting system, taking full advantage of Lua\TeX 's features including font support; a kernel of his work in this area has been extracted to be useful for other \TeX macro systems as well, and this has enabled `fontspec` to be adapted for \LaTeX when run with the Lua\TeX engine.

2 Introduction

The `fontspec` package allows users of either Xe\TeX or Lua\TeX to load OpenType fonts in a \LaTeX document. No font installation is necessary, and font features can be selected and used as desired throughout the document.

Without `fontspec`, it is necessary to write cumbersome font definition files for \LaTeX , since \LaTeX 's font selection scheme (known as the 'nfss') has a lot going on behind the scenes to allow easy commands like `\emph` or `\bfseries`. With an uncountable number of fonts now available for use, however, it becomes less desirable to have to write these font definition (`.fd`) files for every font one wishes to use.

Because `fontspec` is designed to work in a variety of modes, this user documentation is split into separate sections that are designed to be relatively independent. Nonetheless, the basic functionality all behaves in the same way, so previous users of `fontspec` under Xe\TeX should have little or no difficulty switching over to Lua\TeX .

This manual can get rather in-depth, as there are a lot of details to cover. See the documents `fontspec-example.tex` for a complete minimal example to get started quickly.

2.1 Acknowledgements

This package could not have been possible without the early and continued support the author of Xe\TeX , Jonathan Kew. When I started this package, he steered me many times in the right direction.

I've had great feedback over the years on feature requests, documentation queries, bug reports, font suggestions, and so on from lots of people all around the world. Many thanks to you all.

Thanks to David Perry and Markus Böhning for numerous documentation improvements and David Perry again for contributing the text for one of the sections

of this manual.

Special thanks to Khaled Hosny, who was the driving force behind the support for Lua \TeX , ultimately leading to version 2.0 of the package.

3 Package loading and options

For basic use, no package options are required:

```
\usepackage{fontspec}
```

Package options will be introduced below; some preliminary details are discussed first.

3.1 Font encodings

The 2016 release of fontspec initiated some changes for font encodings and the loading of xunicode. The 2017 release rolls out those changes as default.

The now-default tuenc package option switches the NFSS font encoding to TU. TU is a new Unicode font encoding, intended for both X \TeX and Lua \TeX engines, and automatically contains support for symbols covered by \TeX 's traditional T1 and TS1 font encodings (for example, \%, \textbullet, \u, and so on). As a result, with this package option, Ross Moore's xunicode package is **not** loaded. Some new, experimental, features are now provided to customise some encoding details; see Part V on page 54 for further details.

Pre-2017 behaviour can be achieved with the euenc package option. This selects the EU1 or EU2 encoding (X \TeX /Lua \TeX , resp.) and loads the xunicode package. Package authors and users who have referred explicitly to the encoding names EU1 or EU2 should update their code or documents. (See internal variable names described in Section 27 on page 68 for how to do this properly.)

3.2 Maths fonts adjustments

By default, fontspec adjusts \TeX 's default maths setup in order to maintain the correct Computer Modern symbols when the roman font changes. However, it will attempt to avoid doing this if another maths font package is loaded (such as mathpazo or the unicode-math package).

If you find that fontspec is incorrectly changing the maths font when it shouldn't be, apply the no-math package option to manually suppress its behaviour here.

3.3 Configuration

If you wish to customise any part of the fontspec interface, this should be done by creating your own `fontspec.cfg` file, which will be automatically loaded if it is found by X \TeX or Lua \TeX . A `fontspec.cfg` file is distributed with fontspec with a small number of defaults set up within it.

To customise fontspec to your liking, use the standard `.cfg` file as a starting point or write your own from scratch, then either place it in the same folder as the main document for isolated cases, or in a location that X \TeX or Lua \TeX searches by default; e.g. in Mac \TeX : `~/Library/texmf/tex/latex/`.

The package option `no-config` will suppress the loading of the `fontspec.cfg` file under all circumstances.

3.4 Warnings

This package can give some warnings that can be harmless if you know what you're doing. Use the `quiet` package option to write these warnings to the transcript (`.log`) file instead.

Use the `silent` package option to completely suppress these warnings if you don't even want the `.log` file cluttered up.

4 Interaction with L^AT_EX 2_E and other packages

This section documents some areas of adjustment that `fontspec` makes to improve default behaviour with L^AT_EX 2_E and third-party packages.

4.1 Verbatim

Many verbatim mechanisms assume the existence of a ‘visible space’ character that exists in the ASCII space slot of the typewriter font. This character is known in Unicode as U+2423: BOX OPEN, which looks like this: ‘`\u2423`’.

When a Unicode typewriter font is used, L^AT_EX no longer prints visible spaces for the `verbatim*` environment and `\verb*` command. This problem is fixed by using the correct Unicode glyph, and the following packages are patched to do the same: `listings`, `fancyvrb`, `moreverb`, and `verbatim`.

In the case that the typewriter font does not contain ‘`\u2423`’, the Latin Modern Mono font is used as a fallback.

4.2 Discretionary hyphenation: \-

- L^AT_EX defines the macro `\-` to insert discretionary hyphenation points. However, it is hard-coded in L^AT_EX to use the hyphen – character. Since `fontspec` provides features to change the hyphenation character on a per font basis, the definition of `\-` is changed to adapt accordingly.

4.3 Commands for old-style and lining numbers

`\oldstylenums` L^AT_EX's definition of `\oldstylenums` relies on strange font encodings. We provide a `fontspec`-compatible alternative and while we're at it also throw in the reverse option as well. Use `\oldstylenums{\langle text \rangle}` to explicitly use old-style (or lowercase) numbers in `\langle text \rangle`, and the reverse for `\liningnums{\langle text \rangle}`.

4.4 Italic small caps

`\itshape` Note that this package redefines the `\itshape`, `\slshape`, and `\scshape` commands in order to allow them to select italic small caps in conjunction. With these changes, writing `\itshape\scshape` will lead to italic small caps, and `\upshape` subsequently

then moves back to small caps only. `\upshape` again returns from small caps to upright regular. (And similarly for `\s1shape`. In addition, once italic small caps are selected then `\s1shape` will switch to slanted small caps, and vice versa.)

4.5 Emphasis and nested emphasis

`\eminnershape` LATEX 2E allows you to specify the behaviour of `\emph` nested within `\emph` by setting the `\eminnershape` command. For example,

```
\renewcommand\eminnershape{\upshape\scshape}
```

will produce small caps within `\emph{\emph{...}}`.

`\emfontdeclare` The `fotspec` package takes this idea one step further to allow arbitrary font changes (e.g., boldness) and arbitrary levels of nesting within emphasis. This is performed using the `\emfontdeclare` command, which takes a comma-separated list of font switches corresponding to increasing levels of emphasis. Two examples:

1. `\emfontdeclare{\itshape,\upshape\scshape,\itshape}` will lead to ‘italics’, ‘small caps’ then ‘italic small caps’ as the level of emphasis increases, as long as italic small caps are defined for the font. Note that `\upshape` is required because the font changes are cascading.
2. `\emfontdeclare{\bfseries,\fontseries{h}\selectfont,\fontseries{x}\selectfont}` could lead to (if fonts are set up correctly) ‘bold’, ‘heavy’, and ‘extra bold’.

The implementation of these feature tries to be ‘smart’ and guess what level of emphasis to use in the case of manual font changing. This is reliable only if you use series- and/or shape- changing commands in `\emfontdeclare`. For example:

```
\emfontdeclare{\itshape,\upshape\scshape,\itshape}  
...  
\scshape small caps \emph{hello}
```

Here, the emphasised text ‘hello’ will be printed in italic small caps since `\emph` can detect that the current font shape is already in the second ‘mode’ of emphasis.

`\emreset` Finally, if you have so much nested emphasis that `\emfontdeclare` runs out of options, it will insert `\emreset` (by default just `\upshape`) and start again from the beginning.

Part II

General font selection

This section concerns the variety of commands that can be used to select fonts.

```
\fontspec{<font name>} [<font features>]  
\setmainfont{<font name>} [<font features>]  
\setsansfont{<font name>} [<font features>]  
\setmonofont{<font name>} [<font features>]  
\newfontfamily<cmd>{<font name>} [<font features>]
```

These are the main font-selecting commands of this package. The `\fontspec` command selects a font for one-time use; all others should be used to define the standard fonts used in a document, as shown in Example 1. Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The `Scale` font feature will be discussed further in [Section 14 on page 26](#), including methods for automatic scaling.

Note that while these commands all look and behave largely identically, the default setup for font loading automatically adds the `Ligatures=TeX` feature for the `\setmainfont` and `\setsansfont` commands. These defaults (and further customisations possible) are discussed in [Section 8 on page 20](#).

The font features argument accepts comma separated `=<option>` lists; these are described later:

- For general font features, see [Section 14 on page 26](#)
- For OpenType fonts, see [Part IV on page 33](#)
- For X_ET_EX-only general font features, see [Part VII on page 60](#)
- For LuaT_EX-only general font features, see [Part VI on page 58](#)
- For features for AAT fonts in X_ET_EX, see [Section 22 on page 61](#)

5 Font selection

In both LuaT_EX and X_ET_EX, fonts can be selected either by ‘font name’ or by ‘file name’, but there are some differences in how each engine finds and selects fonts — don’t be too surprised if a font invocation in one engine needs correction to work in the other.

Example 1: Loading the default, sans serif, and monospaced fonts.

```
\setmainfont{texgyrebonum-regular.otf}  
\setsansfont{lmsans10-regular.otf}[Scale=MatchLowercase]  
\setmonofont{Inconsolata.otf}[Scale=MatchLowercase]
```

Pack my box with five dozen liquor jugs
Pack my box with five dozen liquor jugs
Pack my box with five dozen liquor jugs

```
\rmfamily Pack my box with five dozen liquor jugs\par  
\sffamily Pack my box with five dozen liquor jugs\par  
\ttfamily Pack my box with five dozen liquor jugs
```

5.1 By font name

Fonts known to Lua \TeX or X \TeX may be loaded by their standard names as you'd speak them out loud, such as *Times New Roman* or *Adobe Garamond*. 'Known to' in this case generally means 'exists in a standard fonts location' such as `~/Library/Fonts` on Mac OS X, or `C:\Windows\Fonts` on Windows. In Lua \TeX , fonts found in the `TEXMF` tree can also be loaded by name.

The simplest example might be something like

```
\setmainfont{Cambria}[ ... ]
```

in which the bold and italic fonts will be found automatically (if they exist) and are immediately accessible with the usual `\textit` and `\textbf` commands.

The 'font name' can be found in various ways, such as by looking in the name listed in a application like *Font Book* on Mac OS X. Alternatively, $\text{\TeX}Live$ contains the `otfinfo` command line program, which can query this information; for example:

```
otfinfo -a `kpsewhich lmroman10-regular.otf`
```

results in 'LM Roman 10'.

Lua \TeX users only In order to load fonts by their name rather than by their file-name (e.g., 'Latin Modern Roman' instead of 'ec-lmr10'), you may need to run the script `luaotfload-tool`, which is distributed with the `luaotfload` package. Note that if you do not execute this script beforehand, the first time you attempt to typeset the process will pause for (up to) several minutes. (But only the first time.) Please see the `luaotfload` documentation for more information.

5.2 By file name

X \TeX and Lua \TeX also allow fonts to be loaded by file name instead of font name. When you have a very large collection of fonts, you will sometimes not wish to have them all installed in your system's font directories. In this case, it is more convenient to load them from a different location on your disk. This technique is also necessary in X \TeX when loading OpenType fonts that are present within your \TeX distribution, such as `/usr/local/texlive/2013/texmf-dist/fonts/opentype/public`. Fonts in such locations are visible to X \TeX but cannot be loaded by font name, only file name; Lua \TeX does not have this restriction.

When selecting fonts by file name, any font that can be found in the default search paths may be used directly (including in the current directory) without having to explicitly define the location of the font file on disk.

Fonts selected by filename must include bold and italic variants explicitly.

```
\setmainfont{texgyrepagella-regular.otf}[
    BoldFont      = texgyrepagella-bold.otf ,
    ItalicFont    = texgyrepagella-italic.otf ,
    BoldItalicFont = texgyrepagella-bolditalic.otf ]
```

`fontspec` knows that the font is to be selected by file name by the presence of the '`.otf`' extension. An alternative is to specify the extension separately, as shown following:

```
\setmainfont{texgyrepagella-regular}[
    Extension      = .otf ,
    BoldFont       = texgyrepagella-bold ,
    ... ]
```

If desired, an abbreviation can be applied to the font names based on the mandatory ‘font name’ argument:

```
\setmainfont{texgyrepagella}[
    Extension      = .otf ,
    UprightFont    = *-regular ,
    BoldFont       = *-bold ,
    ... ]
```

In this case ‘texgyrepagella’ is no longer the name of an actual font, but is used to construct the font names for each shape; the * is replaced by ‘texgyrepagella’. Note in this case that `UprightFont` is required for constructing the font name of the normal font to use.

To load a font that is not in one of the default search paths, its location in the filesystem must be specified with the `Path` feature:

```
\setmainfont{texgyrepagella}[
    Path          = /Users/will/Fonts/ ,
    UprightFont   = *-regular ,
    BoldFont      = *-bold ,
    ... ]
```

Note that X_ET_EX and LuaT_EX are able to load the font without giving an extension, but `fontspec` must know to search for the file; this can be indicated by using the `Path` feature without an argument:

```
\setmainfont{texgyrepagella-regular}[
    Path, BoldFont = texgyrepagella-bold,
    ... ]
```

My preference is to always be explicit and include the extension; this also allows `fontspec` to automatically identify that the font should be loaded by filename.

In previous versions of the package, the `Path` feature was also provided under the alias `ExternalLocation`, but this latter name is now deprecated and should not be used for new documents.

5.3 Querying whether a font ‘exists’

```
\IfFontExistsTF{\langle font name \rangle}{\langle true branch \rangle}{\langle false branch \rangle}
```

The conditional `\IfFontExistsTF` is provided to test whether the `\langle font name \rangle` exists or is loadable. If it is, the `\langle true branch \rangle` code is executed; otherwise, the `\langle false branch \rangle` code is.

This command can be slow since the engine may resort to scanning the filesystem for a missing font. Nonetheless, it has been a popular request for users who wish to define ‘fallback fonts’ for their documents for greater portability.

In this command, the syntax for the ** is a restricted/simplified version of the font loading syntax used for `\fontspec` and so on. Fonts to be loaded by filename are detected by the presence of an appropriate extension (`.otf`, etc.), and paths should be included inline. E.g.:

```
\IfFontExistsTF{cmr10}{T}{F}
\IfFontExistsTF{Times New Roman}{T}{F}
\IfFontExistsTF{texgyrepagella-regular.otf}{T}{F}
\IfFontExistsTF{/Users/will/Library/Fonts/CODE2000.TTF}{T}{F}
```

The `\IfFontExistsTF` command is a synonym for the programming interface function `\fontspec_font_if_exist:nTF` ([Section 27 on page 68](#)).

6 Commands to select font families

<code>\newfontfamily\langle font-switch\rangle{\langle font name\rangle} [\langle font features\rangle]</code>
<code>\newfontface\langle font-switch\rangle{\langle font name\rangle} [\langle font features\rangle]</code>

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling `\fontspec` for every use. While the `\fontspec` command does not define a new font instance after the first call, the feature options must still be parsed and processed.

`\newfontfamily`

For this reason, new commands can be created for loading a particular font family with the `\newfontfamily` command, demonstrated in Example 2. This macro should be used to create commands that would be used in the same way as `\rmfamily`, for example. If you would like to create a command that only changes the font inside its argument (i.e., the same behaviour as `\emph`) define it using regular L^AT_EX commands:

```
\newcommand\textnote[1]{{\notefont #1}}
\textnote{This is a note.}
```

Note that the double braces are intentional; the inner pair are used to delimit the scope of the font change.

`\newfontface`

Sometimes only a specific font face is desired, without accompanying italic or bold variants being automatically selected. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. `\newfontface` is used for this purpose, shown in Example 3, which is repeated in [Section 22.4 on page 62](#).

Comment for advanced users: The commands defined by `\newfontface` and `\newfontfamily` include their encoding information, so even if the document is set to use a legacy T_EX encoding, such commands will still work correctly. For example,

Example 2: Defining new font families.

<code>This is a note.</code>	<code>\newfontfamily\notefont{Kurier}</code> <code>\notefont This is a \emph{note}.</code>
------------------------------	---

Example 3: Defining a single font face.

```
\newfontface\fancy{Hoefler Text Italic}%
[Contextuals={WordInitial,WordFinal}]
\fancy where is all the vegemite
% \emph, \textbf, etc., all don't work
```

```
\documentclass{article}
\usepackage{fontspec}
\newfontfamily\unicodefont{Lucida Grande}
\usepackage{mathpazo}
\usepackage[T1]{fontenc}
\begin{document}
A legacy \TeX\ font. {\unicodefont A unicode font.}
\end{document}
```

6.1 More control over font shape selection

```
BoldFont = <font name>
ItalicFont = <font name>
BoldItalicFont = <font name>
SlantedFont = <font name>
BoldSlantedFont = <font name>
SmallCapsFont = <font name>
```

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose among. The `BoldFont` and `ItalicFont` features are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font. See Example 4.

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the `BoldItalicFont` feature is provided.

Example 4: Explicit selection of the bold font.

```
\fontspec{Helvetica Neue UltraLight}%
[BoldFont={Helvetica Neue}]
                    Helvetica Neue UltraLight          \\
{\itshape      Helvetica Neue UltraLight Italic} \\
{\bfseries    Helvetica Neue}           } \\
{\bfseries\itshape  Helvetica Neue Italic} \\
```

6.1.1 Small caps and slanted font shapes

When a font family has both slanted *and* italic shapes, these may be specified separately using the analogous features `SlantedFont` and `BoldSlantedFont`. Without these, however, the L^AT_EX font switches for slanted (`\textsl`, `\slshape`) will default to the italic shape.

Pre-OpenType, it was common for font families to be distributed with small caps glyphs in separate fonts, due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the `SmallCapsFont` of the family you are specifying:

```
\setmainfont{Minion MM Roman}[
    SmallCapsFont={Minion MM Small Caps & Oldstyle Figures}
]
Roman 123 \\\textsc{Small caps 456}
```

In fact, you should specify the small caps font for each individual bold and italic shape as in

```
\setmainfont{ <upright>}[
    UprightFeatures = { SmallCapsFont={ <sc> } } ,
    BoldFeatures = { SmallCapsFont={ <bf sc> } } ,
    ItalicFeatures = { SmallCapsFont={ <it sc> } } ,
    BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } } ,
]
Roman 123 \\\textsc{Small caps 456}
```

For most modern fonts that have small caps as a font feature, this level of control isn't generally necessary.

All of the bold, italic, and small caps fonts can be loaded with different font features from the main font. See [Section 11](#) for details. When an OpenType font is selected for `SmallCapsFont`, the small caps font feature is *not* automatically enabled. In this case, users should write instead, if necessary,

```
\setmainfont{...}[
    SmallCapsFont={...},
    SmallCapsFeatures={Letters=SmallCaps},
]
```

6.2 Specifically choosing the NFSS family

In L^AT_EX's NFSS, font families are defined with names such as '`ppl`' (Palatino), '`lmr`' (Latin Modern Roman), and so on, which are selected with the `\fontfamily` command:

```
\fontfamily{ppl}\selectfont
```

In `fontspec`, the family names are auto-generated based on the fontname of the font; for example, writing `\fontspec{Times New Roman}` for the first time would generate an internal font family name of '`TimesNewRoman(1)`'. Please note that should not rely on the name that is generated.

In certain cases it is desirable to be able to choose this internal font family name so it can be re-used elsewhere for interacting with other packages that use the \LaTeX 's font selection interface; an example might be

```
\usepackage{fancyvrb}
\fvset{fontfamily=myverbatimfont}
```

To select a font for use in this way in `fontspec` use the `NFSSFamily` feature:¹

```
\newfontfamily\verbatimfont [NFSSFamily=myverbatimfont]{Inconsolata}
```

It is then possible to write commands such as:

```
\fontfamily{myverbatimfont}\selectfont
```

which is essentially the same as writing `\verbatimfont`, or to go back to the original example:

```
\fvset{fontfamily=myverbatimfont}
```

Only use this feature when necessary; the in-built font switching commands that `fontspec` generates (such as `\verbatimfont` in the example above) are recommended in all other cases.

If you don't wish to explicitly set the `NFSS` family but you would like to know what it is, an alternative mechanism for package writers is introduced as part of the `fontspec` programming interface; see the function `\fontspec_set_family:Nnn` for details ([Section 27 on page 68](#)).

6.3 Choosing additional NFSS font faces

\LaTeX 's font selection scheme (`NFSS`) is more flexible than the `fontspec` interface discussed up until this point. It assigns to each font face a *family* (discussed above), a *series* such as bold or light or condensed, and a *shape* such as italic or slanted or small caps. The `fontspec` features such as `BoldFont` and so on all assign faces for the default series and shapes of the `NFSS`, but it's not uncommon to have font families that have multiple weights and shapes and so on.

If you set up a regular font family with the 'standard four' (upright, bold, italic, and bold italic) shapes and then want to use, say, a light font for a certain document element, many users will be perfectly happy to use `\newfontface\langle switch\rangle` and use the resulting font `\langle switch\rangle`. In other cases, however, it is more convenient or even necessary to load additional fonts using additional `NFSS` specifiers.

```
FontFace = {\langle series\rangle}{\langle shape\rangle} { Font = \langle font name\rangle , \langle features\rangle }
FontFace = {\langle series\rangle}{\langle shape\rangle}{\langle font name\rangle}
```

The font thus specified will inherit the font features of the main font, with optional additional `\langle features\rangle` as requested. (Note that the optional `\langle features\rangle` argument is still surrounded with curly braces.) Multiple `FontFace` commands may be used in a single declaration to specify multiple fonts. As an example:

¹Thanks to Luca Fascione for the example and motivation for finally implementing this feature.

```
\setmainfont{font1.otf}[
    FontFace = {c}{\updefault}{ font2.otf } ,
    FontFace = {c}{m}{ Font = font3.otf , Color = red }
]
```

Writing `\fontseries{c}\selectfont` will result in `font2` being selected, which then followed by `\fontshape{m}\selectfont` will result in `font3` being selected (in red). A font face that is defined in terms of a different series but an upright shape (`\updefault`, as shown above) will attempt to find a matching small caps feature and define that face as well. Conversely, a font face defined in terms of a non-standard font shape will not.

There are some standards for choosing shape and series codes; the $\text{\LaTeX} 2\varepsilon$ font selection guide² lists series `m` for medium, `b` for bold, `bx` for bold extended, `sb` for semi-bold, and `c` for condensed. A far more comprehensive listing is included in Appendix A of Philipp Lehman's 'The Font Installation Guide'³ covering 14 separate weights and 12 separate widths.

The `FontFace` command also interacts properly with the `SizeFeatures` command as follows: (nonsense set of font selection choices)

```
FontFace = {c}{n}{
    Font = Times ,
    SizeFeatures = {
        { Size = -10 , Font = Georgia } ,
        { Size = 10-15} , % default "Font = Times"
        { Size = 15- , Font = Cochin } ,
    },
}
```

Note that if the first `Font` feature is omitted then each size needs its own `Font` declaration.

6.4 Math(s) fonts

When `\setmainfont`, `\setsansfont` and `\setmonofont` are used in the preamble, they also define the fonts to be used in maths mode inside the `\mathrm`-type commands. This only occurs in the preamble because \LaTeX freezes the maths fonts after this stage of the processing. The `fontspec` package must also be loaded after any maths font packages (*e.g.*, `euler`) to be successful. (Actually, it is *only* `euler` that is the problem.⁴)

Note that `fontspec` will not change the font for general mathematics; only the upright and bold shapes will be affected. To change the font used for the mathematical symbols, see either the `mathspec` package or the `unicode-math` package.

Note that you may find that loading some maths packages won't be as smooth as you expect since `fontspec` (and \XeTeX in general) breaks many of the assumptions of \TeX as to where maths characters and accents can be found. Contact me if you have

²`texdoc fntguide`

³`texdoc fontinstallationguide`

⁴Speaking of `euler`, if you want to use its `[mathbf]` option, it won't work, and you'll need to put this after `fontspec` is loaded instead: `\AtBeginDocument{\DeclareMathAlphabet{\mathbf}{U}{eur}{b}{n}}`

troubles, but I can't guarantee to be able to fix any incompatibilities. The Lucida and Euler maths fonts should be fine; for all others keep an eye out for problems.

```
\setmathrm{\langle font name \rangle} [\langle font features \rangle]  
\setmathsf{\langle font name \rangle} [\langle font features \rangle]  
\setmathtt{\langle font name \rangle} [\langle font features \rangle]  
\setboldmathrm{\langle font name \rangle} [\langle font features \rangle]
```

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use the commands above (in the same way as our other `\fontspec`-like commands) to explicitly state which fonts to use inside such commands as `\mathrm`. Additionally, the `\setboldmathrm` command allows you define the font used for `\mathrm` when in bold maths mode (which is activated with, among others, `\boldmath`).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage{mathpazo}  
\usepackage{fontspec}  
\setmainfont{Optima}  
\setmathrm{Optima}  
\setboldmathrm[BoldFont={Optima ExtraBlack}]{Optima Bold}
```

These commands are compatible with the `unicode-math` package. Having said that, `unicode-math` also defines a more general way of defining fonts to use in maths mode, so you can ignore this subsection if you're already using that package.

7 Miscellaneous font selecting details

The optional argument — from v2.4 For the first decade of `fontspec`'s life, optional font features were selected with a bracketed argument before the font name, as in:

```
\setmainfont[  
    lots and lots ,  
    and more and more ,  
    an excessive number really ,  
    of font features could go here  
]{myfont.otf}
```

This always looked like ugly syntax to me, because the most important detail — the name of the font — was tucked away at the end. The order of these arguments has now been reversed:

```
\setmainfont{myfont.otf}[  
    lots and lots ,  
    and more and more ,  
    an excessive number really ,  
    of font features could go here  
]
```

I hope this doesn't cause any problems.

1. Backwards compatibility has been preserved, so either input method works.
2. In fact, you can write

```
\fontspec[Ligatures=Rare]{myfont.otf}[Color=red]
```

if you really felt like it and both sets of features would be applied.

3. Following standard *xparse* behaviour, there must be no space before the opening bracket; writing

```
\fontspec{myfont.otf}_[Color=red]
```

will result in [Color=red] not being recognised an argument and therefore it will be typeset as text. When breaking over lines, write either of:

```
\fontspec{myfont.otf}%
[Color=red]
```

```
\fontspec{myfont.otf}[
Color=Red]
```

Spaces \fontspec and \addfontfeatures ignore trailing spaces as if it were a 'naked' control sequence; e.g., 'M. \fontspec{...} N' and 'M. \fontspec{...}N' are the same.

Part III

Selecting font features

The commands discussed so far such as `\fontspec` each take an optional argument for accessing the font features of the requested font. Commands are provided to set default features to be applied for all fonts, and even to change the features that a font is presently loaded with. Different font shapes can be loaded with separate features, and different features can even be selected for different sizes that the font appears in. This part discusses these options.

8 Default settings

```
\defaultfontfeatures{\langle font features \rangle}
```

It is sometimes useful to define font features that are applied to every subsequent font selection command. This may be defined with the `\defaultfontfeatures` command, shown in Example 5. New calls of `\defaultfontfeatures` overwrite previous ones, and defaults can be reset by calling the command with an empty argument.

```
\defaultfontfeatures[\langle font name \rangle]{\langle font features \rangle}
```

Default font features can be specified on a per-font and per-face basis by using the optional argument to `\defaultfontfeatures` as shown.

```
\defaultfontfeatures[texgyreadventor-regular.otf]{Color=blue}  
\setmainfont{texgyreadventor-regular.otf} % will be blue
```

Multiple fonts may be affected by using a comma separated list of font names.

```
\defaultfontfeatures[(\fontswitch)]{\langle font features \rangle}
```

New in v2.4. Defaults can also be applied to symbolic families such as those created with the `\newfontfamily` command and for `\rmfamily`, `\sffamily`, and `\ttfamily`:

```
\defaultfontfeatures[\rmfamily,\sffamily]{Ligatures=TeX}  
\setmainfont{texgyreadventor-regular.otf} % will use standard TeX ligatures
```

Example 5: A demonstration of the `\defaultfontfeatures` command.

Some default text 0123456789
Now grey, with old-style figures: 0123456789

```
\fontspec{texgyreadventor-regular.otf}  
Some default text 0123456789 \\  
\defaultfontfeatures{  
    Numbers=OldStyle, Color=888888  
}  
\fontspec{texgyreadventor-regular.otf}  
Now grey, with old-style figures:  
0123456789
```

The line above to set TeX-like ligatures is now activated by *default* in `fontspec.cfg`. To reset default font features, simply call the command with an empty argument:

```
\defaultfontfeatures[\rmfamily,\sffamily]{}  
\setmainfont{texgyreadventor-regular.otf} % will no longer use standard TeX ligatures
```

```
\defaultfontfeatures+{\langle font features\rangle}  
\defaultfontfeatures+[\langle font name\rangle]{\langle font features\rangle}
```

New in v2.4. Using the + form of the command appends the *⟨font features⟩* to any already-selected defaults.

9 Default settings from a file

In addition to the defaults that may be specified in the document as described above, when a font is first loaded, a configuration file is searched for with the name '*⟨fontname⟩.fontspec*'⁵

The contents of this file can be used to specify default font features without having to have this information present within each document. *⟨fontname⟩* is stripped of spaces and file extensions are omitted; for example, the line above for TeX Gyre Adventor could be placed in a file called `TeXGyreAdventor.fontspec`, or for specifying options for `texgyreadventor-regular.otf` (when loading by filename), the configuration file would be `texgyreadventor-regular.fontspec`. (N.B. the lettercase of the names should match.)

This mechanism can be used to define custom names or aliases for your font collections. If you create a file `MyCharis.fontspec` containing, say,

```
\defaultfontfeatures[My Charis]  
{  
    Extension = .ttf ,  
    UprightFont = CharisSILR,  
    BoldFont = CharisSILB,  
    ItalicFont = CharisSILI,  
    BoldItalicFont = CharisSILBI,  
    % <any other desired options>  
}
```

you can load that custom family with `\fontspec{My Charis}` and similar. The optional argument to `\defaultfontfeatures` must match that requested by the font loading command (`\fontspec`, etc.), else the options won't take effect.

Finally, note that options for font faces can also be defined in this way. To continue the example above, here we colour the different faces:

```
\defaultfontfeatures[CharisSILR]{Color=blue}  
\defaultfontfeatures[CharisSILB]{Color=red}
```

And such configuration lines can be stored either inline inside `My Charis.fontspec` or within their own `.fontspec` files; in this way, `fontspec` is designed to handle 'nested' configuration options as well.

⁵Located in the current folder or within a standard `texmf` location.

10 Working with the currently selected features

```
\IfFontFeatureActiveTF{\langle font feature \rangle}{\langle true code \rangle}{\langle false code \rangle}
```

This command queries the currently selected font face and executes the appropriate branch based on whether the *\langle font feature \rangle* as specified by *fontspec* is currently active.

For example, the following will print ‘True’:

```
\setmainfont{texgyrepagella-regular.otf}[Numbers=OldStyle]
\IfFontFeatureActiveTF{Numbers=OldStyle}{True}{False}
```

Note that there is no way for *fontspec* to know what the default features of a font will be. For example, by default the *texgyrepagella* fonts use lining numbers. But in the following example, querying for lining numbers returns false since they have not been explicitly requested:

```
\setmainfont{texgyrepagella-regular.otf}
\IfFontFeatureActiveTF{Numbers=Lining}{True}{False}
```

Please note: At time of writing this function only supports OpenType fonts; AAT/Graphite fonts under the X_ET_EX engine are not supported.

```
\addfontfeatures{\langle font features \rangle}
```

This command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in Example 6. If you attempt to *change* an already-selected feature, *fontspec* will try to deactivate any features that clash with the new ones. *E.g.*, the following two invocations are mutually exclusive:

```
\addfontfeature{Numbers=OldStyle}...
\addfontfeature{Numbers=Lining}...
123
```

Since *Numbers=Lining* comes last, it takes precedence and deactivates the call *Numbers=OldStyle*.

\addfontfeature This command may also be executed under the alias *\addfontfeature*.

10.1 Priority of feature selection

Features defined with *\addfontfeatures* override features specified by *\fontspec*, which in turn override features specified by *\defaultfontfeatures*. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (.log) file displaying the font name and the features requested.

Example 6: A demonstration of the `\addfontfeatures` command.

'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'

Year	People	Miles	Boats
1842	999	75	13
1923	111	54	56

```
\fontspec{texgyreadventor-regular.otf}%
  [Numbers={Proportional,OldStyle}]
`In 1842, 999 people sailed 97 miles in
  13 boats. In 1923, 111 people sailed 54
  miles in 56 boats.' \bigskip

{\addfontfeatures{Numbers={Monospaced,Lining}}
\begin{tabular}{@{} cccc @{}}
& Year & People & Miles & Boats \\
\hline
  1842 & 999 & 75 & 13 & \\
  1923 & 111 & 54 & 56 &
\end{tabular}}
```

11 Different features for different font shapes

`BoldFeatures={<features>}
ItalicFeatures={<features>}
BoldItalicFeatures={<features>}
SlantedFeatures={<features>}
BoldSlantedFeatures={<features>}
SmallCapsFeatures={<features>}`

It is entirely possible that separate fonts in a family will require separate options; *e.g.*, Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional `\fontspec` argument are applied to *all* shapes of the family. Using Upright-, SmallCaps-, Bold-, Italic-, and BoldItalicFeatures, separate font features may be defined to their respective shapes *in addition* to, and with precedence over, the ‘global’ font features. See Example 7.

Note that because most fonts include their small caps glyphs within the main font, features specified with SmallCapsFeatures are applied *in addition* to any other shape-specific features as defined above, and hence SmallCapsFeatures can be nested within ItalicFeatures and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the somewhat ludic

Example 7: Features for, say, just italics.

```
\fontspec{EBGaramond12-Regular.otf}%
  [ItalicFont=EBGaramond12-Italic.otf]
  \itshape Don't Ask Victoria! \\
  \addfontfeature{ItalicFeatures={Style=Swash}}
  Don't Ask Victoria! \\
```

crous Example 8.

12 Selecting fonts from TrueType Collections (TTC files)

TrueType Collections are multiple fonts contained within a single file. Each font within a collection must be explicitly chosen using the `FontIndex` command. Since TrueType Collections are often used to contain the italic/bold shapes in a family, `fontspec` automatically selects the italic, bold, and bold italic fontfaces from the same file. For example, to load the macOS system font Optima:

```
\setmainfont{Optima.ttc}[
  Path = /System/Library/Fonts/ ,
  UprightFeatures = {FontIndex=0} ,
  BoldFeatures = {FontIndex=1} ,
  ItalicFeatures = {FontIndex=2} ,
  BoldItalicFeatures = {FontIndex=3} ,
]
```

Support for TrueType Collections has only been tested in X_ET_EX, but should also work with an up-to-date version of LuaT_EX and the `luatofloat` package.

13 Different features for different font sizes

```
SizeFeatures = {
  ...
  { Size = <size range>, <font features> } ,
  { Size = <size range>, Font = <font name>, <font features> } ,
  ...
}
```

The `SizeFeature` feature is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font family as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the `Size` option to declare the size range, and optionally `Font` to change the font based on size. Other (regular) `fontspec` features that are added are used on top of the font features that would be used anyway. A demonstration to clarify these details is shown in Example 9. A less trivial example is shown in the context of optical font sizes in [Section 14.6 on page 30](#).

To be precise, the `Size` sub-feature accepts arguments in the form shown in [Table 1 on page 26](#). Braces around the size range are optional. For an exact font size (`Size=X`) font sizes chosen near that size will ‘snap’. For example, for size definitions at exactly 11pt and 14pt, if a 12pt font is requested *actually* the 11pt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

Example 8: An example of setting the SmallCapsFeatures separately for each font shape.

```
\fontspec{texgyretermes}[  
    Extension = {.otf},  
    UprightFont = {*-regular}, ItalicFont = {*-italic},  
    BoldFont = {*-bold}, BoldItalicFont = {*-bolditalic},  
    UprightFeatures={Color = 220022,  
        SmallCapsFeatures = {Color=115511}},  
    ItalicFeatures={Color = 2244FF,  
        SmallCapsFeatures = {Color=112299}},  
    BoldFeatures={Color = FF4422,  
        SmallCapsFeatures = {Color=992211}},  
    BoldItalicFeatures={Color = 888844,  
        SmallCapsFeatures = {Color=444422}},  
]  
Upright SMALL CAPS Upright {\scshape Small Caps}\  
Italic ITALIC SMALL CAPS \itshape Italic {\scshape Italic Small Caps}\  
Bold BOLD SMALL CAPS \upshape\bfseries Bold {\scshape Bold Small Caps}\  
Bold Italic BOLD ITALIC SMALL CAPS \itshape Bold Italic {\scshape Bold Italic Small Caps}
```

Example 9: An example of specifying different font features for different sizes of font with Size-Features.

```
\fontspec{texgyrechorus-mediumitalic.otf}[  
    SizeFeatures={  
        {Size={-8}, Font=texgyrebonum-italic.otf, Color=AAoooo},  
        {Size={8-14}, Color=ooAAoo},  
        {Size={14-}, Color=ooooAA}} ]  
Small {\scriptsize Small\par} Normal size Normal size\par Large {\Large Large\par}
```

If additional features are only required for a single size, the other sizes must still be specified. As in:

```
SizeFeatures={  
  {Size=-10,Numbers=Uppercase},  
  {Size=10-}}
```

Otherwise, the font sizes greater than 10 won't be defined at all!

Interaction with other features For `SizeFeatures` to work with `ItalicFeatures`, `BoldFeatures`, etc., and `SmallCapsFeatures`, a strict hierarchy is required:

```
UprightFeatures =  
{  
  SizeFeatures =  
  {  
    {  
      Size = -10,  
      Font = ..., % if necessary  
      SmallCapsFeatures = {...},  
      ... % other features for this size range  
    },  
    ... % other size ranges  
  }  
}
```

Suggestions on simplifying this interface welcome.

14 Font independent options

Features introduced in this section may be used with any font.

14.1 Colour

`Color` (or `Colour`) uses font specifications to set the colour of the text. You should think of this as the literal glyphs of the font being coloured in a certain way. Notably, this mechanism is different to that of the `color/xcolor/hyperref/etc.` packages, and in fact using `fontspec` commands to set colour will prevent your text from changing colour using those packages at all! For example, if you set the colour in a `\setmainfont`

Table 1: Syntax for specifying the size to apply custom font features.

Input	Font size, s
<code>Size = X-</code>	$s \geq X$
<code>Size = -Y</code>	$s < Y$
<code>Size = X-Y</code>	$X \leq s < Y$
<code>Size = X</code>	$s = X$

command, `\color{...}` and related commands, including hyperlink colouring, will no longer have any effect on text in this font.) Therefore, `fontspec`'s colour commands are best used to set explicit colours in specific situations, and the `xcolor` package is recommended for more general colour functionality.

The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.) Transparency is supported by `Lua \TeX` ; `X \TeX` with the `xdvipdfmx` driver does not support this feature.

If you load the `xcolor` package, you may use any named colour instead of writing the colours in hexadecimal.

```
\usepackage{xcolor}
...
\fontspec[Color=red]{Verdana} ...
\definecolor{Foo}{rgb}{0.3,0.4,0.5}
\fontspec[Color=Foo]{Verdana} ...
```

The `color` package is *not* supported; use `xcolor` instead.

You may specify the transparency with a named colour using the `Opacity` feature which takes a decimal from zero to one corresponding to transparent to opaque respectively:

```
\fontspec[Color=red,Opacity=0.7]{Verdana} ...
```

It is still possible to specify a colour in six-char hexadecimal form while defining opacity in this way, if you like.

14.2 Scale

```
Scale = <number>
Scale = MatchLowercase
Scale = MatchUppercase
```

In its explicit form, `Scale` takes a single numeric argument for linearly scaling the font, as demonstrated in Example 1. It is now possible to measure the correct dimensions of the fonts loaded and calculate values to scale them automatically.

As well as a numerical argument, the `Scale` feature also accepts options `MatchLowercase` and `MatchUppercase`, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively; these features are shown in Example 11.

Example 10: Selecting colour with transparency.

```
\fontsize{48}{48}
\fontspec{texgyrebonum-bold.otf}
{\addfontfeature{Color=FFoooo99}W}\kern-0.4ex
{\addfontfeature{Color=ooooFF99}S}\kern-0.4ex
{\addfontfeature{Color=DDBB2299}P}\kern-0.5ex
{\addfontfeature{Color=ooBB3399}R}
```

Example 11: Automatically calculated scale values.

The perfect match is hard to find.
LOGOFONT

```
\setmainfont{Georgia}
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
The perfect match f\lc is hard to find.}\\
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
L O G O \uc F O N T
```

The amount of scaling used in each instance is reported in the .log file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

Note that when Scale=MatchLowercase is used with \setmainfont, the new ‘main’ font of the document will be scaled to match the old default. This may be undesirable in some cases, so to achieve ‘natural’ scaling for the main font but automatically scale all other fonts selected, you may write

```
\defaultfontfeatures{ Scale = MatchLowercase }
\defaultfontfeatures[\rmfamily]{ Scale = 1 }
```

One or both of these lines may be placed into a local `fontspec.cfg` file (see [Section 3.3 on page 7](#)) for this behaviour to be effected in your own documents automatically. (Also see [Section 8 on page 20](#) for more information on setting font defaults.)

14.3 Interword space

While the space between words can be varied on an individual basis with the \TeX primitive `\spaceskip` command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically, and generally will not need to be adjusted. For those times when the precise details are important, the `WordSpace` feature is provided, which takes either a single scaling factor to scale the default value, or a triplet of comma-separated values to scale the nominal value, the stretch, and the shrink of the interword space by, respectively. (`WordSpace={x}` is the same as `WordSpace={x,x,x}`.)

Note that \TeX ’s optimisations in how it loads fonts means that you cannot use this feature in `\addfontfeatures`.

14.4 Post-punctuation space

If `\frenchspacing` is *not* in effect, \TeX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The `PunctuationSpace` feature takes a scaling factor by which to adjust the nominal value chosen for the font; this is demonstrated in Example 13. Note that `PunctuationSpace=o` is *not* equivalent to `\frenchspacing`, although the difference will only be apparent when a line of text is under-full.

Example 12: Scaling the default interword space. An exaggerated value has been chosen to emphasise the effects here.

Some text for our example to take up some space, and to demonstrate the default interword space.

Some text for our example to take up some space, and to demonstrate the default interword space.

```
\fontspec{texgyretermes-regular.otf}
Some text for our example to take
up some space, and to demonstrate
the default interword space.
\bigskip
```

```
\fontspec{texgyretermes-regular.otf}%
[WordSpace = 0.3]
Some text for our example to take
up some space, and to demonstrate
the default interword space.
```

Example 13: Scaling the default post-punctuation space.

Letters, Words. Sentences.

Letters, Words. Sentences. \par
```

Letters, Words. Sentences.

```
\fontspec{texgyreschola-regular.otf}[PunctuationSpace=2]
Letters, Words. Sentences. \par
```

Letters, Words. Sentences.

```
\fontspec{texgyreschola-regular.otf}[PunctuationSpace=0]
Letters, Words. Sentences.
```

Note that TeX's optimisations in how it loads fonts means that you cannot use this feature in `\addfontfeatures`.

14.5 The hyphenation character

The letter used for hyphenation may be chosen with the `HyphenChar` feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string `None`, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

This package redefines L^AT_EX's \- macro such that it adjusts along with the above changes.

Note that TeX's optimisations in how it loads fonts means that you cannot use this feature in `\addfontfeatures`.

14.6 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by X_ET_EX and LuaT_EX *automatically* determined by the current font size as in Example 15, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes.

The `OpticalSize` option may be used to specify a different optical size. With `OpticalSize` set to zero, no optical size font substitution is performed, as shown in Example 16.

The `SizeFeatures` feature (Section 13 on page 24) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like:

```
\fontspec[Latin Modern Roman][
  UprightFeatures = { SizeFeatures = {
    {Size=-10,      OpticalSize=8 },
    {Size= 10-14,   OpticalSize=10},
    {Size= 14-18,   OpticalSize=14} }]
```

Example 14: Explicitly choosing the hyphenation character.

EXAMPLE HYPHEN+ ATION	<pre>\fontspec{Linux Libertine O}[HyphenChar=None] \text \fontspec{Linux Libertine O}[HyphenChar={+}] \text</pre>
-----------------------------	---

Example 15: A demonstration of automatic optical size selection.

Automatic optical size	\fontspec{Latin Modern Roman}
Automatic optical size	Automatic optical size
Automatic optical size	\scalebox{o.4}{\Huge
	Automatic optical size}

Example 16: Optical size substitution is suppressed when set to zero.

Latin Modern optical sizes	\fontspec{Latin Modern Roman 5 Regular}[OpticalSize=0]
Latin Modern optical sizes	Latin Modern optical sizes
Latin Modern optical sizes	\fontspec{Latin Modern Roman 8 Regular}[OpticalSize=0]
Latin Modern optical sizes	Latin Modern optical sizes
Latin Modern optical sizes	\fontspec{Latin Modern Roman 12 Regular}[OpticalSize=0]
Latin Modern optical sizes	Latin Modern optical sizes
Latin Modern optical sizes	\fontspec{Latin Modern Roman 17 Regular}[OpticalSize=0]
	Latin Modern optical sizes

```
{Size=    18-, OpticalSize=18}}}  
]
```

14.7 Font transformations

In rare situations users may want to mechanically distort the shapes of the glyphs in the current font such as shown in Example 17. Please don't overuse these features; they are *not* a good alternative to having the real shapes.

If values are omitted, their defaults are as shown above.

If you want the bold shape to be faked automatically, or the italic shape to be slanted automatically, use the AutoFakeBold and AutoFakeSlant features. For example, the following two invocations are equivalent:

```
\fontspec[AutoFakeBold=1.5]{Charis SIL}  
\fontspec[BoldFeatures={FakeBold=1.5}]{Charis SIL}
```

Example 17: Artificial font transformations.

ABCxyz	ABCxyz	\fontspec{Charis SIL} \emph{ABCxyz} \quad
ABCxyz	ABCxyz	\fontspec{Charis SIL}[FakeSlant=0.2] ABCxyz
ABCxyz	ABCxyz	\fontspec{Charis SIL} ABCxyz \quad
ABCxyz	ABCxyz	\fontspec{Charis SIL}[FakeStretch=1.2] ABCxyz
ABCxyz	ABCxyz	\fontspec{Charis SIL} \textbf{ABCxyz} \quad
ABCxyz	ABCxyz	\fontspec{Charis SIL}[FakeBold=1.5] ABCxyz

If both of the `AutoFake...` features are used, then the bold italic font will also be faked.

The `FakeBold` and `AutoFakeBold` features are only available with the X_ET_EX engine and will be ignored in Lu_AT_EX.

14.8 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the `LetterSpace`, which takes a numeric argument, shown in Example 18.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of ‘1.0’ will add 0.1 pt between each letter.

This functionality is not generally used for lowercase text in modern typesetting but does have historic precedent in a variety of situations. In particular, small amounts of letter spacing can be very useful, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature (Section 16.2 on page 35).

Example 18: The `LetterSpace` feature.

```
\fontspec{Didot}
\addfontfeature{LetterSpace=0.0}
USE TRACKING FOR DISPLAY CAPS TEXT \\
\addfontfeature{LetterSpace=2.0}
USE TRACKING FOR DISPLAY CAPS TEXT
```

Part IV

OpenType

15 Introduction

OpenType fonts (and other ‘smart’ font technologies such as AAT and Graphite) can change the appearance of text in many different ways. These changes are referred to as font features. When the user applies a feature — for example, small capitals — to a run of text, the code inside the font makes appropriate substitutions and small capitals appear in place of lowercase letters. However, the use of such features does not affect the underlying text. In our small caps example, the lowercase letters are still stored in the document; only the appearance has been changed by the OpenType feature. This makes it possible to search and copy text without difficulty. If the user selected a different font that does not support small caps, the ‘plain’ lowercase letters would appear instead.

Some OpenType features are required to support particular scripts, and these features are often applied automatically. The Indic scripts, for example, often require that characters be reshaped and reordered after they are typed by the user, in order to display them in the traditional ways that readers expect. Other features can be applied to support a particular language. The Junicode font for medievalists uses by default the Old English shape of the letter thorn, while in modern Icelandic thorn has a more rounded shape. If a user tags some text as being in Icelandic, Junicode will automatically change to the Icelandic shape through an OpenType feature that localises the shapes of letters.

There are a large group of OpenType features, designed to support high quality typography a multitude of languages and writing scripts. Examples of some font features have already been shown in previous sections; the complete set of OpenType font features supported by `fontspec` is described below in [Section 16](#).

The OpenType specification provides four-letter codes (e.g., `smcp` for small capitals) for each feature. The four-letter codes are given below along with the `fontspec` names for various features, for the benefit of people who are already familiar with OpenType. You can ignore the codes if they don’t mean anything to you.

15.1 How to select font features

Font features are selected by a series of `<feature>=<option>` selections. Features are (usually) grouped logically; for example, all font features relating to ligatures are accessed by writing `Ligatures={...}` with the appropriate argument(s), which could be `TeX`, `Rare`, etc., as shown below in [16.1.1](#).

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; `Numbers={OldStyle,Lining}` doesn’t make much sense because the two options are mutually exclusive, and `XETEX` will simply use the last option that is specified (in this case using `Lining` over `OldStyle`).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in [Section 3.4 on page 8](#) these warnings can be

suppressed by selecting the [quiet] package option.

15.2 How do I know what font features are supported by my fonts?

Although I've long desired to have a feature within fontspec to display the OpenType features within a font, it's never been high on my priority list. One reason for that is the existence of the document `opentype-info.tex`, which is available on CTAN or typing `kpsewhich opentype-info.tex` in a Terminal window. Make a copy of this file and place it somewhere convenient. Then open it in your regular TeX editor and change the font name to the font you'd like to query; after running through plain XE^TEX, the output PDF will look something like this:

OpenType Layout features found in '[Asana-Math.otf]'

```
script = 'DFLT'
    language = <default>
        features = 'onum' 'salt' 'kern'

script = 'cher'
    language = <default>
        features = 'onum' 'salt' 'kern'

script = 'grek'
    language = <default>
        features = 'onum' 'salt' 'kern'

script = 'latn'
    language = <default>
        features = 'onum' 'salt' 'kern'

script = 'math'
    language = <default>
        features = 'dtls' 'onum' 'salt' 'sssty' 'kern'
```

I intentionally picked a font that by design needs few font features; 'regular' text fonts such as Latin Modern Roman contain many more, and I didn't want to clutter up the document too much. You'll then need to cross-check the OpenType feature tags with the 'logical' names used by fontspec.

otfinfo Alternatively, and more simply, you can use the command line tool `otfinfo`, which is distributed with TeXLive. Simply type in a Terminal window, say:

```
otfinfo -f `kpsewhich lmromandunh10-oblique.otf`
```

which results in:

aalt	Access All Alternates
cpsp	Capital Spacing
dlig	Discretionary Ligatures
frac	Fractions

kern	Kerning
liga	Standard Ligatures
lnum	Lining Figures
onum	Oldstyle Figures
pnum	Proportional Figures
size	Optical Size
tnum	Tabular Figures
zero	Slashed Zero

16 OpenType font features

There are a finite set of OpenType font features, and `fontspec` provides an interface to around half of them. Full documentation will be presented in the following sections, including how to enable and disable individual features, and how they interact.

A brief reference is provided ([Table 2 on the next page](#)) but note that this is an incomplete listing — only the ‘enable’ keys are shown, and where alternative interfaces are provided for convenience only the first is shown. (E.g., `Numbers=OldStyle` is the same as `Numbers=Lowercase`.)

For completeness, the complete list of OpenType features *not* provided with a `fontspec` interface is shown in [Table 3 on page 37](#). Features omitted are partially by design and partially by oversight; for example, the `aalt` feature is largely useless in \TeX since it is designed for providing a `textscgui` interface for selecting ‘all alternates’ of a glyph. Others, such as optical bounds for example, simply haven’t yet been considered due to a lack of fonts available for testing. Suggestions welcome for how/where to add these missing features to the package.

16.1 Tag-based features

16.1.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or aesthetic reasons. The list of options, of which multiple may be selected at one time, is shown in [Table 4](#). A demonstration with the Linux Libertine fonts⁶ is shown in Example 19.

Note the additional features accessed with `Ligatures=TeX`. These are not actually real OpenType features, but additions provided by `luatofloat` (i.e., \LaTeX only) to emulate \TeX ’s behaviour for ASCII input of curly quotes and punctuation. In \XeTeX this is achieved with the `Mapping` feature (see [Section 21.1 on page 60](#)) but for consistency `Ligatures=TeX` will perform the same function as `Mapping=tex-text`.

16.2 Letters

The `Letters` feature specifies how the letters in the current font will look. OpenType fonts may contain the following options: `Uppercase`, `SmallCaps`, `PetiteCaps`, `UppercaseSmallCaps`, `UppercasePetiteCaps`, and `Unicase`.

⁶<http://www.linuxlibertine.org/>

Table 2: Summary of OpenType features in fontspec, alphabetic by feature tag.

UppercasePetiteCaps	c2pc †	
Unicase	unic †	
ResetAll		

† These feature options can be disabled with ..Off variants, and reset to default state (neither explicitly on nor off) with ..Reset.

Petite caps are smaller than small caps. `SmallCaps` and `PetiteCaps` turn lowercase letters into the smaller caps letters, whereas the `Uppercase...` options turn the *capital* letters into the smaller caps (good, *e.g.*, for applying to already uppercase acronyms like 'NASA'). This difference is shown in Example 20. 'Unicase' is a weird hybrid of upper and lower case letters.

Note that the `Uppercase` option will (probably) not actually map letters to uppercase.⁷ It is designed to select various uppercase forms for glyphs such as accents and dashes, such as shown in Example 21; note the raised position of the hyphen to better match the surrounding letters.

The Kerning feature also contains an `Uppercase` option, which adds a small amount of spacing in between letters (see [Section 16.5 on page 44](#)).

16.2.1 Numbers

The Numbers feature defines how numbers will look in the selected font, accepting options shown in [Table 6](#).

The synonyms `Uppercase` and `Lowercase` are equivalent to `Lining` and `Old-Style`, respectively. The differences have been shown previously in [Section 10 on page 22](#). The `Monospaced` option is useful for tabular material when digits need to be vertically aligned.

The `SlashedZero` option replaces the default zero with a slashed version to prevent confusion with an uppercase 'O', shown in Example 22.

The `Arabic` option (with tag `anum`) maps regular numerals to their Arabic script or Persian equivalents based on the current Language setting (see [Section 16.9 on page 49](#)). This option is based on a LuaTeX feature of the `luatotfload` package, not an OpenType feature. (Thus, this feature is unavailable in XeTeX.)

16.2.2 Contextuals

This feature refers to substitutions of glyphs that vary 'contextually' by their relative position in a word or string of characters; features such as contextual swashes are accessed via the options shown in [Table 7](#).

Historic forms are accessed in OpenType fonts via the feature `Style=Historic`; this is generally *not* contextual in OpenType, which is why it is not included in this feature.

Example 20: Small caps from lowercase or uppercase letters.

```
THIS SENTENCE NO VERB \fontspec{texgyreadventor-regular.otf}[Letters=SmallCaps]
THIS SENTENCE no verb THIS SENTENCE no verb \\\

Table 8: Options for the OpenType font feature ‘VerticalPosition’.

Feature	Option	Tag
VerticalPosition =	Superior	sups †
	Inferior	subs †
	Numerator	numr †
	Denominator	dnom †
	ScientificInferior	sinf †
	Ordinal	ordn †
ResetAll		

† These feature options can be disabled with `.Off` variants, and reset to default state (neither explicitly on nor off) with `.Reset`.

16.2.3 Vertical Position

The `VerticalPosition` feature is used to access things like subscript (`Inferior`) and superscript (`Superior`) numbers and letters (and a small amount of punctuation, sometimes). The `Ordinal` option will only raise characters that are used in some languages directly after a number. The `ScientificInferior` feature will move glyphs further below the baseline than the `Inferior` feature. These are shown in Example 23

`Numerator` and `Denominator` should only be used for creating arbitrary fractions (see next section).

The `realscripts` package (which is also loaded by `xltextra` for XeTeX) redefines the `\textsubscript` and `\textsuperscript` commands to use the above font features automatically, including for use in footnote labels. If this is the only feature of `xltextra` you wish to use, consider loading `realscripts` on its own instead.

16.2.4 Fractions

For OpenType fonts use a regular text slash to create fractions, but the `Fraction` feature must be explicitly activated. Some (Asian fonts predominantly) also provide for the `Alternate` feature. These are both shown in Example 24.

⁷If you want automatic uppercase letters, look to L^AT_EX’s `\MakeUppercase` command.

Example 23: The `VerticalPosition` feature.

16.3 Style

'Ruby' refers to a small optical size, used in Japanese typography for annotations. For fonts with multiple salt OpenType features, use the fontspec Alternate feature instead.

Example 25 and Example 26 both contain glyph substitutions with similar characteristics. Note the occasional inconsistency with which font features are labelled; a long-tailed 'Q' could turn up anywhere!

In other features, larger breadths of changes can be seen, covering the style of an entire alphabet. See Example 27 and Example 28; in the latter, the Italic option affects the Latin text and the Ruby option the Japanese.

Note the difference here between the default and the horizontal style kana in Example 29: the horizontal style is slightly wider.

Example 25: Example of the Alternate option of the Style feature.

M Q W	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{5}{6}$	$\frac{13579}{24680}$

16.4 Diacritics

Specifies how combining diacritics should be placed. These will usually be controlled automatically according to the Script setting.

16.5 Kerning

Specifies how inter-glyph spacing should behave. Well-made fonts include information for how differing amounts of space should be inserted between separate character pairs. This kerning space is inserted automatically but in rare circumstances you may wish to turn it off.

As briefly mentioned previously at the end of [Section 16.2 on page 35](#), the Uppercase option will add a small amount of tracking between uppercase letters, seen in Example 30, which uses the Romande fonts⁸ (thanks to Clea F. Rees for the suggestion). The Uppercase option acts separately to the regular kerning controlled by the On/Off options.

16.6 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms seen in Example 32.

NLC		nlck

† These feature options can be disabled with ..Off variants, and reset to default state (neither explicitly on nor off) with ..Reset.

16.6.1 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs available in order to be able to display these glyphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

16.7 Vertical typesetting

OpenType provides a plethora of features for accommodating the varieties of possibilities needed for vertical typesetting (CJK and others). No capabilities for achieving such vertical typesetting are provided by fontspec, however; please get in touch if there are improvements that could be made.

16.8 Numeric features

16.8.1 Stylistic Set variations — ssNN

This feature selects a ‘Stylistic Set’ variation, which usually corresponds to an alternate glyph style for a range of characters (usually an alphabet or subset thereof). This feature is specified numerically. These correspond to OpenType features `ss01`, `ss02`, etc.

Two demonstrations from the Junicode font⁹ are shown in Example 34 and Example 35; thanks to Adam Buchbinder for the suggestion.

Multiple stylistic sets may be selected simultaneously by writing, e.g., `StylisticSet={1,2,3}`.

The `StylisticSet` feature is a synonym of the `Variant` feature for AAT fonts. See Section 23 on page 66 for a way to assign names to stylistic sets, which should be done on a per-font basis.

16.8.2 Character Variants — cvNN

Similar to the ‘Stylistic Sets’ above, ‘Character Variations’ are selected numerically to adjust the output of (usually) a single character for the particular font. These correspond to the OpenType features `cvo1` to `cv99`.

ENLARGED Minuscules.	\addfontfeature{StylisticSet=6}
ENLARGED Minuscules.	ENLARGED Minuscules. \\

For each character that can be varied, it is possible to select among possible options for that particular glyph. For example, in Example 36 a variety of glyphs for the character 'v' are selected, in which 5 corresponds to the character 'v' for this font feature, and the trailing :*n* corresponds to which variety to choose. Georg Duffner's open source Garamond revival font¹⁰ is used in this example. Character variants are specifically designed not to conflict with each other, so you can enable them individually per character as shown in Example 37. (Unlike stylistic alternates, say.)

Note that the indexing starts from zero.

16.8.3 Alternates — `salt`

The Alternate feature, alias StylisticAlternates, is used to access alternate font glyphs when variations exist in the font, such as in Example 38. It uses a numerical selection, starting from zero, that will be different for each font. Note that the `Style=Alternate` option is equivalent to `Alternate=0` to access the default case.

Note that the indexing starts from zero. With the LuaTeX engine, `Alternate=Random` selects a random alternate.

See Section 23 on page 66 for a way to assign names to alternates if desired.

16.8.4 Annotation — `nalt`

Some fonts are equipped with an extensive range of numbers and numerals in different forms. These are accessed with the Annotation feature (OpenType feature `nalt`), selected numerically as shown in Example 39. Note that the indexing starts from zero.

16.8.5 Ornament — `ornm`

Ornaments are selected with the Ornament feature (OpenType feature `ornm`), selected numerically such as for the Annotation feature. If you know of an Open Source font that supports this feature, let me know and I'll add an example.

16.9 OpenType scripts and languages

Fonts that include glyphs for various scripts and languages may contain different font features for the different character sets and languages they support, and different font features may behave differently depending on the script or language chosen. When multilingual fonts are used, it is important to select which language they are being used for, and more importantly what script is being used.

The 'script' refers to the alphabet in use; for example, both English and French use the Latin script. Similarly, the Arabic script can be used to write in both the Arabic and Persian languages.

The Script and Language features are used to designate this information. The possible options are tabulated in Table 16 on page 52 and Table 17 on page 53, respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Because these font features can change which features are able to be selected for the font, they are automatically selected by `fontspec` before all others and, if XeTeX is

```

being used, will specifically select the OpenType renderer for this font, as described in [Section 21.2 on page 60](#).

See Section 24 on page 67 for methods to create new Script or Language options if required.

16.9.1 Script and Language examples

In the examples shown in Example 40, the Code2000 font¹¹ is used to typeset various input texts with and without the OpenType Script applied for various alphabets. The text is only rendered correctly in the second case; many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

Part V

Commands for accents and symbols (‘encodings’)

The functionality described in this section is experimental.

In the pre-Unicode era, significant work was required by \LaTeX to ensure that input characters in the source could be interpreted correctly depending on file encoding, and that glyphs in the output were selected correctly depending on the font encoding. With Unicode, we have the luxury of a single file and font encoding that is used for both input and output.

While this may provide some illusion that we could get away simply with typing Unicode text and receive correct output, this is not always the case. For a start, hyphenation in particular is language-specific, so tags should be used when switch between languages in a document. The `babel` and `polyglossia` packages both provide features for this.

Multilingual documents will often use different fonts for different languages, not just for style, but for the more pragmatic reason that fonts do not all contain the same glyphs. (In fact, only test fonts such as `Code2000` provide anywhere near the full Unicode coverage.) Indeed, certain fonts may be perfect for a certain application but miss a handful of necessary diacritics or accented letters. In these cases, `fontspec` can leverage the font encoding technology built into \LaTeX_2 to provide on a per-font basis either provide fallback options or error messages when a desired accent or symbol is not available. However, at present these features can only be provided for input using \LaTeX commands rather than Unicode input; for example, typing `\`e` instead of `è` or `\textcopyright` instead of `©` in the source file.

The most widely-used encoding in \LaTeX_2 was `T1` with companion ‘`TS1`’ symbols provided by the `textcomp` package. These encodings provided glyphs to typeset text in a variety of western European languages. As with most legacy \LaTeX_2 input methods, accents and symbols were input using encoding-dependent commands such as `\`e` as described above. As of 2017, in \LaTeX_2 on \XeLaTeX and \LuaTeX , the default encoding is `TU`, which uses Unicode for input and output. The `TU` encoding provides appropriate encoding-dependent definitions for input commands to match the coverage of the `T1+TS1` encodings. Wider coverage is not provided by default since (a) each font will provide different glyph coverage, and (b) it is expected that most users will be writing with direct Unicode input.

For those users who do need finer-grained control, `fontspec` provides an interface for a more extensible system.

17 A new Unicode-based encoding from scratch

Let’s say you need to provide support for a document originally written with fonts in the `OT2` encoding, which contains encoding-dependent commands for Cyrillic letters. An example from the `OT2` encoding definition file (`ot2enc.def`) reads:

```

57 \DeclareTextSymbol{\CYRIE}{OT2}{5}
58 \DeclareTextSymbol{\CYRDJE}{OT2}{6}
59 \DeclareTextSymbol{\CYRTSHE}{OT2}{7}
60 \DeclareTextSymbol{\cyrnje}{OT2}{8}
61 \DeclareTextSymbol{\cyrlje}{OT2}{9}
62 \DeclareTextSymbol{\cyrdzhe}{OT2}{10}

```

To recreate this encoding in a form suitable for `fontspec`, create a new file named, say, `fontrange-cyr.def` and populate it with

```

...
\DeclareTextSymbol{\CYRIE} {\LastDeclaredEncoding}"o404}
\DeclareTextSymbol{\CYRDJE} {\LastDeclaredEncoding}"o402}
\DeclareTextSymbol{\CYRTSHE} {\LastDeclaredEncoding}"o40B}
\DeclareTextSymbol{\cyrnje} {\LastDeclaredEncoding}"o45A}
\DeclareTextSymbol{\cyrlje} {\LastDeclaredEncoding}"o459}
\DeclareTextSymbol{\cyrdzhe}{\LastDeclaredEncoding}"o45F}
...

```

The numbers "o404, "o402, ..., are the Unicode slots (in hexadecimal) of each glyph respectively. The `fontspec` package provides a number of shorthands to simplify this style of input; in this case, you could also write

```

\EncodingSymbol{\CYRIE}"o404}
...

```

To use this encoding in a `fontspec` font, you would first add this to your preamble:

```

\DeclareUnicodeEncoding{unicyr}{
  \input{fontrange-cyr.def}
}

```

Then follow it up with a font loading call such as

```
\setmainfont{...}[NFSSencoding=unicyr]
```

The first argument `unicyr` is the name of the ‘encoding’ to use in the font family. (There’s nothing special about the name chosen but it must be unique.) The second argument to `\DeclareUnicodeEncoding` also allows adjustments to be made for per-font changes. We’ll cover this use case in the next section.

18 Adjusting a pre-existing encoding

There are three reasons to adjust a pre-existing encoding: to add, to remove, and to redefine some symbols, letters, and/or accents.

When adding symbols, etc., simply write

```

\DeclareUnicodeEncoding{unicyr}{
  \input{tuenc.def}
  \input{fontrange-cyr.def}
  \EncodingSymbol{\textruble}"20BD}
}

```

Of course if you consistently add a number of symbols to an encoding it would be a good idea to create a new `fontrange-XX.def` file to suit your needs.

When removing symbols, use the `\UndeclareSymbol{\(cmd)}` command. For example, if you are loading a font that you know is missing, say, the interrobang (not that unusual a situation), you might write:

```
\DeclareUnicodeEncoding{nobang}{
    \input{tuenc.def}
    \UndeclareSymbol{textinterrobang}
}
```

Provided that you use the command `\textinterrobang` to typeset this symbol, it will appear in fonts with the default encoding, while in any font loaded with the nobang encoding an attempt to access the symbol will either use the default fallback definition or return an error, depending on the symbol being undeclared.

The third use case is to redefine a symbol or accent. The most common use case in this scenario is to adjust a specific accent command to either fine-tune its placement or to ‘fake’ it entirely. For example, the underdot diacritic is used in typeset Sanskrit, but it is not necessarily included as an accent symbol in all fonts. By default the underdot is defined in TU as:

```
\EncodingAccent{\d}{\o323}
```

For fonts with a missing (or poorly-spaced) “`\o323` accent glyph, the ‘traditional’ TEX fake accent construction could be used instead:

```
\DeclareUnicodeEncoding{fakeacc}{
    \input{tuenc.def}
    \EncodingCommand{\d}[1]{%
        \hmode@bgroup
        \o@lign{\relax#\crr\hidewidth\ltx@sh@ft{-1ex}. \hidewidth}%
        \egroup
    }
}
```

This would be set up in a document as such:

```
\newfontfamily\sanskitfont{CharisSIL}
\newfontfamily\titlefont{Posterama}[NFSSEncoding=fakeacc]
```

Then later in the document, no additional work is needed:

```
...{\titlefont kalita\d m}... % <- uses fake accent
...{\sanskitfont kalita\d m}... % <- uses real accent
```

To reiterate from above, typing this input with Unicode text (‘`kalitam`’) will *bypass* this encoding mechanism and you will receive only what is contained literally within the font.

19 Summary of commands

The $\text{\LaTeX}\ 2\varepsilon$ kernel provides the following font encoding commands suitable for Unicode encodings:

```
\DeclareTextCommand{\command}{\encoding}[\num][\default]{\code}
\DeclareUnicodeAccent{\command}{\encoding}{\slot}
\DeclareTextSymbol{\command}{\encoding}{\slot}
\DeclareTextComposite{\command}{\encoding}{\letter}{\slot}
\DeclareTextCompositeCommand{\command}{\encoding}{\letter}{\code}
\UndeclareTextCommand{\command}{\encoding}
```

See fntguide.pdf for full documentation of these. As shown above, the following shorthands are provided by fonts spec to simplify the process of defining Unicode font range encodings:

```
\EncodingCommand{\command}[\num][\default]{\code}
\EncodingAccent{\command}{\code}
\EncodingSymbol{\command}{\code}
\EncodingComposite{\command}{\letter}{\slot}
\EncodingCompositeCommand{\command}{\letter}{\code}
\UndeclareSymbol{\command}
\UndeclareComposite{\command}{\letter}
```

Despite its name, \UndeclareSymbol can be used for commands defined by all three of \EncodingCommand, \EncodingAccent, and \EncodingSymbol.

Part VI

LuaTeX-only font features

20 Custom font features

Pre-2016, it was possible to load an OpenType font feature file to define new OpenType features for a selected font. This facility was particularly useful to implement custom substitutions, for example. As of TeXLive 2016, LuaTeX/luaotfload no longer supports this feature, but provides its own internal mechanisms for an equivalent interface.

Any documents using ‘feature file’ options will need to transition to the new interface. Figure 1 shows an example. Please refer to the LuaTeX/luaotfload documentation for more details.

Figure 1: An example of custom font features.

```
\documentclass{article}
\usepackage{fontspec}
\directlua{
    fonts.handlers.otf.addfeature {
        name = "oneb",
        {
            type = "substitution",
            data = {
                ["1"] = "one.ss01",
            },
        },
        "feature oneb for vollkorn font",
    }
}
\setmainfont{Vollkorn-Regular.otf}[RawFeature=+oneb]
\begin{document}

\end{document}
```

Part VII

Fonts and features with X_ET_EX

21 X_ET_EX-only font features

The features described here are available for any font selected by `fontspec`.

21.1 Mapping

Mapping enables a X_ET_EX text-mapping scheme, shown in Example 41.

Using the `tex-text` mapping is also equivalent to writing `Ligatures=TeX`. The use of the latter syntax is recommended for better compatibility with Lua_TE_X documents.

21.2 Different font technologies: AAT and OpenType

X_ET_EX supports two rendering technologies for typesetting, selected with the `Renderer` font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, OpenType, is an open source OpenType interpreter.¹² It provides greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the OpenType renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, OpenType provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see Section 16.9 on page 49 for the description of these features. *Because these font features can change which features are able to be selected for the font instance, they are selected by `fontspec` before all others and will automatically and without warning select the OpenType renderer.*

21.3 Optical font sizes

Multiple Master fonts are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see ?? on page ?? for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font's optical size can be specified over a continuous range.

¹²v2.4: This was called 'TCU' in previous versions of X_ET_EX and `fontspec`. Backwards compatibility is preserved.

Example 41: X_ET_EX's Mapping feature.

“!A small amount of—text!” \fontspec{Cochin}[Mapping=tex-text]
``!`A small amount of---text!''

Unfortunately, this flexibility makes it harder to create an automatic interface through L^AT_EX, and the optical size for a Multiple Master font must always be specified explicitly.

```
\fontspec{Minion MM Roman}[OpticalSize=11]
    MM optical size test          \\
\fontspec{Minion MM Roman}[OpticalSize=47]
    MM optical size test          \\
\fontspec{Minion MM Roman}[OpticalSize=71]
    MM optical size test          \\
```

22 Mac OS X's AAT fonts

Warning! X_ZT_EX's implementation on Mac OS X is currently in a state of flux and the information contained below may well be wrong from 2013 onwards. There is a good chance that the features described in this section will not be available any more as X_ZT_EX's completes its transition to a cross-platform-only application.

Mac OS X's font technology began life before the ubiquitous-OpenType era and revolved around the Apple-invented 'AAT' font format. This format had some advantages (and other disadvantages) but it never became widely popular in the font world.

Nonetheless, this is the font format that was first supported by X_ZT_EX (due to its pedigree on Mac OS X in the first place) and was the first font format supported by fontspec. A number of fonts distributed with Mac OS X are still in the AAT format, such as 'Skia'.

22.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old T_EX trick of splitting up a ligature with an empty brace pair does not work in X_ZT_EX; you must use a `opt kern` or `\hbox` (e.g., `\null`) to split the characters up if you do not want a ligature to be performed (the usual examples for when this might be desired are words like 'shelffull').

22.2 Letters

The Letters feature specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

22.3 Numbers

The Numbers feature defines how numbers will look in the selected font. For AAT fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced

(the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in [Section 10 on page 22](#).

22.4 Contextuals

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here. The options for AAT fonts are WordInitial, WordFinal (Example 42), LineInitial, LineFinal, and Inner (Example 43, also called ‘non-final’ sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

22.5 Vertical position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number. These are shown in Example 44.

The realscripts package (also loaded by xltextra) redefines the \textsubscript and \textsuperscript commands to use the above font features, including for use in footnote labels.

22.6 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned On or Off in both AAT and OpenType fonts.

In AAT fonts, the ‘fraction slash’ or solidus character, is to be used to create fractions. When Fractions are turned On, then only pre-drawn fractions will be used. See Example 45.

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters.

Some (Asian fonts predominantly) also provide for the Alternate feature shown in Example 46.

22.7 Variants

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don’t mind my fancy Example 47 :) I’m just looping through the nine (!) variants of Zapfino.

Example 42: Contextual glyph for the beginnings and ends of words.

```
\newfontface\fancy{Hoefler Text Italic}[%  
    Contextuals={WordInitial,WordFinal}]  
~where is all the ~vegemite  
\fancy where is all the vegemite
```

Example 43: A contextual feature for the ‘long s’ can be convenient as the character does not need to be marked up explicitly.

‘Inner’ fwashes can *sometimes* contain the archaic long s.

```
\fontspec{Hoefler Text}[Contextuals=Inner]
`Inner' swashes can \emph{sometimes} \\
contain the archaic long-s.
```

Example 44: Vertical position for AAT fonts.

Normal superior inferior
1st 2nd 3rd 4th 0th 8^{abcde}

```
\fontspec{Skia}
Normal
\fontspec{Skia}[VerticalPosition=Superior]
Superior
\fontspec{Skia}[VerticalPosition=Inferior]
Inferior \\
\fontspec{Skia}[VerticalPosition=Ordinal]
1st 2nd 3rd 4th 0th 8abcde
```

Example 45: Fractions in AAT fonts. The $\frac{1}{2}$ glyph is the ‘fraction slash’ that may be typed in Mac OS X with OPT+SHIFT+1; not shown literally here due to font constraints.

$\frac{1}{2}$ $\frac{5}{6}$
 $\frac{13579}{24680}$ $\frac{13579}{24680}$

```
\fontspec[Fractions=On]{Skia}
1{^\frac{1}{2}}2 \quad 5{^\frac{5}{6}}6 \\ % fraction slash
1/2 \quad 5/6 % regular slash
\fontspec[Fractions=Diagonal]{Skia}
13579{^\frac{13579}{24680}}24680 \\ % fraction slash
\quad 13579/24680 % regular slash
```

Example 46: Alternate design of pre-composed fractions.

$\frac{1}{2}$ $\frac{1}{4}$ $\frac{5}{6}$ $\frac{13579}{24680}$ $\frac{13579}{24680}$

```
\fontspec{Hiragino Maru Gothic Pro}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
\addfontfeature{Fractions=Alternate}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680
```

Example 47: Nine variants of Zapfino.

```
\newcounter{var}
\whiledo{\value{var}<9}{%
  \edef\i{%
    \noexpand\fontspec[Variant=\thevar,
    Color=0099\thevar\thevar]{Zapfino}}\i%
  \makebox[0.75\width]{d}%
  \stepcounter{var}}
\hspace*{2cm}
```

See [Section 23 on page 66](#) for a way to assign names to variants, which should be done on a per-font basis.

22.8 Alternates

Selection of Alternates *again* must be done numerically; see Example 48. See [Section 23 on page 66](#) for a way to assign names to alternates, which should be done on a per-font basis.

22.9 Style

The options of the Style feature are defined in AAT as one of the following: Display, Engraved, IlluminatedCaps, Italic, Ruby,¹³ TallCaps, or TitlingCaps.

Typical examples for these features are shown in [Section 16.3](#).

22.10 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs in order to be able to display these glyphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

¹³‘Ruby’ refers to a small optical size, used in Japanese typography for annotations.

Example 48: Alternate shape selection must be numerical.

```
\fontspec{Hoefler Text Italic}[Alternate=0]
Sphinx Of Black Quartz, {\scshape Judge My Vow} \\
\fontspec{Hoefler Text Italic}[Alternate=1]
Sphinx Of Black Quartz, {\scshape Judge My Vow}
```

22.11 Character width

See [Section 16.6 on page 44](#) for relevant examples; the features are the same between OpenType and AAT fonts. AAT also allows `CharacterWidth=Default` to return to the original font settings.

22.12 Vertical typesetting

X_ET_EX provides for vertical typesetting simply with the ability to rotate the individual glyphs as a font is used for typesetting, as shown in [Example 49](#).

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the X_ET_EX documentation.

22.13 Diacritics

Diacritics are marks, such as the acute accent or the tilde, applied to letters; they usually indicate a change in pronunciation. In Arabic scripts, diacritics are used to indicate vowels. You may either choose to Show, Hide or Decompose them in AAT fonts. The Hide option is for scripts such as Arabic which may be displayed either with or without vowel markings. E.g., `\fontspec[Diacritics=Hide]{...}`

Some older fonts distributed with Mac OS X included 'Ø/' etc. as shorthand for writing 'Ø' under the label of the Diacritics feature. If you come across such fonts, you'll want to turn this feature off (imagine typing hello/goodbye and getting 'helløgood-bye' instead!) by decomposing the two characters in the diacritic into the ones you actually want. I recommend using the proper L_ET_EX input conventions for obtaining such characters instead.

22.14 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and Double-Circle.

Example 49: Vertical typesetting.

共産主義者は

```
共          \fontspec{Hiragino Mincho Pro}
産          \verttext
主          \fontspec{Hiragino Mincho Pro}[Renderer=AAT,Vertical=RotatedGlyphs]
義          \rotatebox{-90}{\verttext}% requires the graphicx package
```

Part VIII

Customisation and programming interface

This is the beginning of some work to provide some hooks that use fontspec for various macro programming purposes.

23 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

\newAATfeature New AAT features may be created with this command:

```
\newAATfeature{<feature>}{<option>}{{<feature code>}}{<selector code>}
```

Use the X_ET_EX file AAT-info.tex to obtain the code numbers. See Example 50.

\newopentypefeature New OpenType features may be created with this command:

```
\newopentypefeature{<feature>}{<option>}{{<feature tag>}}
```

The synonym \newICUfeature is deprecated.

Here's what it would look like in practise:

```
\newopentypefeature{Style}{NoLocalForms}{-locl}
```

\newfontfeature In case the above commands do not accommodate the desired font feature (perhaps a new X_ET_EX feature that fontspec hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

```
\newfontfeature{<name>}{{<input string>}}
```

For example, Zapfino used to contain an AAT feature 'Avoid d-collisions'. To access it with this package, you could do some like the following:

```
\newfontfeature{AvoidD} {Special= Avoid d-collisions}
\newfontfeature{NoAvoidD}{Special!=!Avoid d-collisions}
\fontspec{Zapfino}[AvoidD,Variant=1]
  sockdolager rubdown \\
\fontspec{Zapfino}[NoAvoidD,Variant=1]
  sockdolager rubdown
```

The advantage to using the \newAATfeature and \newopentypefeature commands instead of \newfontfeature is that they check if the selected font actually

Example 50: Assigning new AAT features.

```
\newAATfeature{Alternate}{HoeflerSwash}{17}{1}
\fontspec{Hoefler Text Italic}[Alternate=HoeflerSwash]
  This is XeTeX by Jonathan Kew.
```

This is X_ET_EX by Jonathan Kew.

contains the desired font feature at load time. By contrast, `\newfontfeature` will not give a warning for improper input.

24 Defining new scripts and languages

`\newfontscript`
`\newfontlanguage` While the scripts and languages listed in [Table 16](#) and [Table 17](#) are intended to be comprehensive, there may be some missing; alternatively, you might wish to use different names to access scripts/languages that are already listed. Adding scripts and languages can be performed with the `\newfontscript` and `\newfontlanguage` commands. For example,

```
\newfontscript{Arabic}{arab}
\newfontlanguage{Zulu}{ZUL}
```

The first argument is the fontspec name, the second the OpenType tag. The advantage to using these commands rather than `\newfontfeature` (see [Section 23 on the preceding page](#)) is the error-checking that is performed when the script or language is requested.

25 Going behind fontspec's back

Expert users may wish not to use fontspec's feature handling at all, while still taking advantage of its L^AT_EX font selection conveniences. The `RawFeature` font feature allows font feature selection using a literal feature selection string if you happen to have the OpenType feature tag memorised.

Multiple features can either be included in a single declaration:

```
[RawFeature=+smcp ; +onum]
```

or with multiple declarations:

```
[RawFeature=+smcp, RawFeature=+onum]
```

26 Renaming existing features & options

`\aliasfontfeature` If you don't like the name of a particular font feature, it may be aliased to another with the `\aliasfontfeature{<existing name>}{'<new name>}'` command, such as shown in [Example 52](#).

Spaces in feature (and option names, see below) *are* allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

If you wish to change the name of a font feature option, it can be aliased to another

Example 51: Using raw font features directly.

PAGELLA SMALL CAPS `\fontspec{texgyrepagella-regular.otf}[RawFeature=+smcp]`
Pagella small caps

Example 52: Renaming font features.

Roman Letters *And Swash* \aliasfontfeature{ItalicFeatures}{IF}
 \fontspec{Hoefler Text}[IF = {Alternate=1}]
 Roman Letters \itshape And Swash

Example 53: Renaming font feature options.

S_{cientific I_{nferior}}: 12345 \aliasfontfeature{VerticalPosition}{Vert Pos}
 \aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf}
 \fontspec{LinLibertine_R.otf}[Vert Pos=Sci Inf]
 Scientific Inferior: 12345

with the command `\aliasfontfeatureoption{<fontfeature>}{<existing name>}{<new name>}`, such as shown in Example 53.

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Color specification. For this type of thing, the `\newfontfeature` command should be used to declare a new, *e.g.*, PurpleColor feature:

```
\newfontfeature{PurpleColor}{color=550099BB}
```

Except that this example was written before support for named colours was implemented. But you get the idea.

27 Programming interface

27.1 Variables

`\l_fonts杵eck_family_tl`
`\l_fonts杵eck_font`
`\g_fonts杵eck_encoding_tl`

In some cases, it is useful to know what the L^AT_EX font family of a specific `\fontspec` font is. After a `\fontspec`-like command, this is stored inside the `\l_fonts杵eck_family_tl` macro. Otherwise, L^AT_EX's own `\f@family` macro can be useful here, too. The raw T_EX font that is defined from the 'base' font in the family is stored in `\l_fonts杵eck_font`.

Package authors who need to load fonts with legacy L^AT_EX NFSS commands may also need to know what the default font encoding is. Since this has changed from EU1/EU2 to TU, it is best to use the variables `\g_fonts杵eck_encoding_tl` or `\UTFencname` instead.

27.2 Functions for loading new fonts and families

`\fontspec_set_family:Nnn #1 : LATEX family`

#2 : fontspec features
#3 : font name
Defines a new NFSS family from given *features* and *font*, and stores the family name in the variable *family*. This font family can then be selected with standard L^AT_EX commands `\fontfamily{family}\selectfont`. See the standard fontspec user commands for applications of this function.

`\fontspec_set_fontface:Nnnn` #1 : primitive font
#2 : L^AT_EX family
#3 : fontspec features
#4 : font name
Variant of the above in which the primitive T_EX font command is stored in the variable *primitive font*. If a family is loaded (with bold and italic shapes) the primitive font command will only select the regular face. This feature is designed for L^AT_EX programmers who need to perform subsequent font-related tests on the *primitive font*.

27.3 Conditionals

The following functions in expl3 syntax may be used for writing code that interfaces with fontspec-loaded fonts. The following conditionals are all provided in TF, T, and F forms.

27.3.1 Querying font families

`\fontspec_font_if_exist:nTF` Test whether the ‘font name’ (#1) exists or is loadable. The syntax of #1 is a restricted/simplified version of fontspec’s usual font loading syntax; fonts to be loaded by filename are detected by the presence of an appropriate extension (.otf, etc.), and paths should be included inline. E.g.:

```
\fontspec_font_if_exist:nTF {cmr10}{T}{F}
\fontspec_font_if_exist:nTF {Times~ New~ Roman}{T}{F}
\fontspec_font_if_exist:nTF {texgyrepagella-regular.otf}{T}{F}
\fontspec_font_if_exist:nTF {/Users/will/Library/Fonts/CODE2000.TTF}{T}{F}
```

The synonym `\IfFontExistsTF` is provided for ‘document authors’.

`\fontspec_if_fontspec_font:TF` Test whether the currently selected font has been loaded by fontspec.
`\fontspec_if_opentype:TF` Test whether the currently selected font is an OpenType font. Always true for L^AT_EX fonts.
`\fontspec_if_small_caps:TF` Test whether the currently selected font has a ‘small caps’ face to be selected with `\scshape` or similar. Note that testing whether the font has the Letters=SmallCaps font feature is sufficient but not necessary for this command to return true, since small caps can also be loaded from separate font files. The logic of this command is complicated by the fact that fontspec will merge shapes together (for italic small caps, etc.).

27.3.2 Availability of features

\fontspec_if_aat_feature:nnTF	Test whether the currently selected font contains the AAT feature (#1,#2).
\fontspec_if_feature:nTF	Test whether the currently selected font contains the raw OpenType feature #1. E.g.: \fontspec_if_feature:nTF {pnum} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_feature:nnnTF	Test whether the currently selected font with raw OpenType script tag #1 and raw OpenType language tag #2 contains the raw OpenType feature tag #3. E.g.: \fontspec_if_feature:nnnTF {latn} {cyrl} {croatian} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_script:nTF	Test whether the currently selected font contains the raw OpenType script #1. E.g.: \fontspec_if_script:nTF {latn} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nTF	Test whether the currently selected font contains the raw OpenType language tag #1. E.g.: \fontspec_if_language:nTF {ROM} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nnTF	Test whether the currently selected font contains the raw OpenType language tag #2 in script #1. E.g.: \fontspec_if_language:nnTF {cyrl} {SRB} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.

27.3.3 Currently selected features

\ntspec_if_current_feature:nTF	Test whether the currently loaded font is using the specified raw OpenType feature tag #1. The tag string #1 should be prefixed with + to query an active feature, and with a - (hyphen) to query a disabled feature.
\ontspec_if_current_script:nTF	Test whether the currently loaded font is using the specified raw OpenType script tag #1.
\tspec_if_current_language:nTF	Test whether the currently loaded font is using the specified raw OpenType language tag #1.

Part IX

Implementation

28 Loading

The `expl3` module is `fontspec`.

```
1 (@@=fontspec)
```

Check engine and load specific modules. For LuaTeX, load `luatofload`.

```
2 (*load)
3 \sys_if_engine_luatex:T
4 { \RequirePackage{luatofload}
5   \directlua{require("fontspec")}
6   \RequirePackageWithOptions{fontspec-luatex} \endinput }
7 \sys_if_engine_xetex:T
8 { \RequirePackageWithOptions{fontspec-xetex} \endinput }
```

If not one of the above, error:

```
9 \msg_new:nnn {fontspec} {cannot-use-pdfTeX}
10 {
11   The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX.\\\\
12   You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~ "xelatex"~ or~ "lu-
     alatex" instead~ of~ plain~ "latex"~ or~ "pdflatex".
13 }
14 \msg_fatal:nn {fontspec} {cannot-use-pdfTeX}
15 \endinput
16 (/load)
```

29 Declaration of variables and functions

```
17 (*fontspec)
```

Booleans

firsttime As `\keys_set:nn` is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the ‘`firsttime`’ conditional.

```
18 \bool_new:N \l_@@_firsttime_bool
19 \bool_new:N \l_@@_nobf_bool
20 \bool_new:N \l_@@_noit_bool
21 \bool_new:N \l_@@_nosc_bool
```

These strange set functions are to simplify returning code from LuaTeX:

```
22 \bool_new:N \l_@@_check_bool
23 \cs_new:Npn \FontspecSetCheckBoolTrue { \bool_set_true:N \l_@@_check_bool }
24 \cs_new:Npn \FontspecSetCheckBoolFalse { \bool_set_false:N \l_@@_check_bool }
```

```

25 \bool_new:N \l_@@_tfm_bool
26 \bool_new:N \l_@@_atsui_bool
27 \bool_new:N \l_@@_ot_bool
28 \bool_new:N \l_@@_mm_bool
29 \bool_new:N \l_@@_graphite_bool

```

For dealing with legacy maths:

```

30 \bool_new:N \g_@@_math_euler_bool
31 \bool_new:N \g_@@_math_lucida_bool
32 \bool_new:N \g_@@_pkg_euler_loaded_bool

```

For package options:

```

33 \bool_new:N \g_@@_cfg_bool
34 \bool_new:N \g_@@_math_bool
35 \bool_new:N \g_@@_euenc_bool

36 \bool_new:N \l_@@_disable_defaults_bool
37 \bool_new:N \l_@@_alias_bool
38 \bool_new:N \l_@@_external_bool
39 \bool_new:N \l_@@_never_check_bool
40 \bool_new:N \l_@@_defining_encoding_bool
41 \bool_new:N \l_@@_script_exist_bool

```

Counters

```

42 \int_new:N \l_@@_script_int
43 \int_new:N \l_@@_language_int
44 \int_new:N \l_@@_strnum_int
45 \int_new:N \l_@@_tmp_int
46 \int_new:N \l_@@_em_int
47 \int_new:N \l_@@_emdef_int

```

Floating point

```

48 \fp_new:N \l_@@_tmpa_fp
49 \fp_new:N \l_@@_tmpb_fp

```

Dimensions

```

50 \dim_new:N \l_@@_tmpa_dim
51 \dim_new:N \l_@@_tmpb_dim
52 \dim_new:N \l_@@_tmpc_dim
53 \seq_new:N \g_@@_bf_series_seq

```

Comma lists

```

54 \clist_new:N \g_@@_default_fontopts_clist
55 \clist_new:N \g_@@_all_keyval_modules_clist
56 \clist_set:Nn \l_@@_sizefeat_clist {Size={-}}

```

Property lists

```

57 \prop_new:N \g_@@_fontopts_prop
58 \prop_new:N \l_@@_nfss_prop
59 \prop_new:N \l_@@_nfssfont_prop

```

31.2 Encodings

Soon to be the default, with a just-in-case check:

```
375 \bool_if:NF \g_@@_euenc_bool
```

```

376  {
377      \file_if_exist:nTF {tuenc.def}
378      {
379          \cs_if_exist:cF {T@TU}
380          {
381              \@@_warning:n {tu-clash}
382              \DeclareFontEncoding{TU}{}{}
383              \DeclareFontSubstitution{TU}{lmr}{m}{n}
384          }
385      }
386      {
387          \@@_warning:n {tu-missing}
388          \bool_set_true:N \g_@@_euenc_bool
389      }
390  }
391 \bool_if:NTF \g_@@_euenc_bool
392  {
393 <xetex>    \tl_set:Nn \g_fontsencoding_tl {EU1}
394 <luatex>   \tl_set:Nn \g_fontsencoding_tl {EU2}
395  }
396  { \tl_set:Nn \g_fontsencoding_tl { TU } }

397 \tl_set:Nn \rmdefault {lmr}
398 \tl_set:Nn \sfdefault {lmss}
399 \tl_set:Nn \ttdefault {lmtt}
400 \RequirePackage[\g_fontsencoding_tl]{fontenc}
401 \tl_set_eq:NN \UTFencname \g_fontsencoding_tl % for xunicode if needed

```

To overcome the encoding changing the current font size, but only if a class has been loaded first:

```
402 \tl_if_in:NnT \@filelist {.cls} { \normalsize }
```

Dealing with a couple of the problems introduced by babel:

```

403 \tl_set_eq:NN \cyrilllicencoding \g_fontsencoding_tl
404 \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
405 \AtBeginDocument
406  {
407      \tl_set_eq:NN \cyrilllicencoding \g_fontsencoding_tl
408      \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
409  }

```

That latin encoding definition is repeated to suppress font warnings. Something to do with \select@language ending up in the .aux file which is read at the beginning of the document.

```

410 \bool_if:NT \g_@@_euenc_bool
411  {
412 <luatex>   \cs_set_eq:NN \fontsencoding_tmp: \XeTeXpicfile
413 <luatex>   \cs_set:Npn \XeTeXpicfile {}
414   \RequirePackage{xunicode}
415 <luatex>   \cs_set_eq:NN \XeTeXpicfile \fontsencoding_tmp:
416  }

```

33 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the ‘top level’ definitions of the commands are contained herein; they all use or define macros which are defined or used later on in [Section 35.1 on page 94](#).

33.0.1 Font selection

- \fontspec This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font. Then this new font family is selected.
- ```
454 \NewDocumentCommand \fontspec { O{} m O{} }
455 {
456 \fontspec_set_family:Nnn \f@family {#1,#3} {#2}
457 \fontencoding { \l_@@_nfss_enc_tl }
458 \selectfont
459 \ignorespaces
460 }
```
- \setmainfont The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced). I end them with \normalfont so that if they’re used in the document, the change registers immediately.
- ```
461 \DeclareDocumentCommand \setmainfont { O{} m O{} }
462 {
463   \fontspec_set_family:Nnn \g_@@_rmfamily_family {#1,#3} {#2}

\setromanfont This is the old name for \setmainfont, retained ad infinitum for backwards compatibility. It was deprecated in 2010.
509 \cs_set_eq:NN \setromanfont \setmainfont

\setmathrm These commands are analogous to \setmainfont and others, but for selecting the font used for \mathrm, etc. They can only be used in the preamble of the document.
\setmathsf
\setboldmathrm \setboldmathrm is used for specifying which fonts should be used in \boldmath.

\setmathtt
510 \DeclareDocumentCommand \setmathrm { O{} m O{} }
511 {
512 \fontspec_set_family:Nnn \g_@@_mathrm_tl {#1} {#2}
513 }
514
515 \DeclareDocumentCommand \setboldmathrm { O{} m O{} }
516 {
517 \fontspec_set_family:Nnn \g_@@_bfmathrm_tl {#1} {#2}
518 }
519
520 \DeclareDocumentCommand \setmathsf { O{} m O{} }
521 {
522 \fontspec_set_family:Nnn \g_@@_mathsf_tl {#1} {#2}
523 }
524
525 \DeclareDocumentCommand \setmathtt { O{} m O{} }
526 {
527 \fontspec_set_family:Nnn \g_@@_mathtt_tl {#1} {#2}
528 }

```

```

529 \@onlypreamble\setmathrm
530 \@onlypreamble\setboldmathrm
531 \@onlypreamble\setmathsf
532 \@onlypreamble\setmathtt

```

If the commands above are not executed, then `\rmdefault` (*etc.*) will be used.

```

533 \tl_set:Nn \g_@@_mathrm_tl {\rmdefault}
534 \tl_set:Nn \g_@@_mathsf_tl {\sfdefault}
535 \tl_set:Nn \g_@@_mathtt_tl {\ttdefault}

```

- `\newfontfamily` This macro takes the arguments of `\fontspec` with a prepended `<instance cmd>`. This command is used when a specific font instance needs to be referred to repetitively (*e.g.*, in a section heading) since continuously calling `\fontspec_select:nn` is inefficient because it must parse the option arguments every time.

`\fontspec_select:nn` defines a font family and saves its name in `\l_fontspec_family_tl`. This family is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified.

```

536 \DeclareDocumentCommand \newfontfamily { m O{} m O{} }
537 {
538 \fontspec_set_family:cnn { g_@@_ \cs_to_str:N #1 _family } {#2,#4} {#3}
539 \use:x
540 {
541 \exp_not:N \DeclareRobustCommand \exp_not:N #1
542 {
543 \exp_not:N \fontfamily { \use:c {g_@@_ \cs_to_str:N #1 _family} }
544 \exp_not:N \fontencoding { \l_@@_nfss_enc_tl }
545 \exp_not:N \selectfont
546 }
547 }
548 }

```

- `\newfontface` `\newfontface` uses the fact that if the argument to `BoldFont`, etc., is empty (*i.e.*, `BoldFont={}`), then no bold font is searched for.

```

549 \DeclareDocumentCommand \newfontface { m O{} m O{} }
550 {
551 \newfontfamily #1 [BoldFont={},ItalicFont={},SmallCapsFont={},#2,#4] {#3}
552 }

```

### 33.0.2 Font feature selection

- `\defaultfontfeatures` This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent `\fontspec`, et al., commands. It stores its value in `\g_fontspec_default_fontopts_tl` (initialised empty), which is concatenated with the individual macro choices in the [...] macro.

```

553 \DeclareDocumentCommand \defaultfontfeatures { t+ o m }
554 {
555 \IfNoValueTF {#2}
556 {
557 \g_@@_set_default_features:nn {#1} {#3}
558 \g_@@_set_font_default_features:nnn {#1} {#2} {#3}
559 }
560 \ignorespaces

```

```

559 }
560 \cs_new:Nn \@@_set_default_features:n
561 {
562 \IfBooleanTF {#1} \clist_put_right:Nn \clist_set:Nn
563 \g_@@_default_fontopts_clist {#2}
564 }

```

The optional argument specifies a font identifier. Branch for either (a) single token input such as `\rmdefault`, or (b) otherwise assume its a fontname. In that case, strip spaces and file extensions and lower-case to ensure consistency.

```

565 \cs_new:Nn \@@_set_font_default_features:nnn
566 {
567 \clist_map_inline:nn {#2}
568 {
569 \tl_if_single:nTF {##1}
570 { \tl_set:No \l_@@_tmp_tl { \cs:w g_@@_ \cs_to_str:N ##1 _family\cs_end: } }
571 { \@@_sanitise_fontname:Nn \l_@@_tmp_tl {##1} }
572
573 \IfBooleanTF {#1}
574 {
575 \prop_get:NVNF \g_@@_fontopts_prop \l_@@_tmp_tl \l_@@_tmpb_tl
576 { \tl_clear:N \l_@@_tmpb_tl }
577 \tl_put_right:Nn \l_@@_tmpb_tl {#3,}
578 \prop_gput:NVV \g_@@_fontopts_prop \l_@@_tmp_tl \l_@@_tmpb_tl
579 }
580 {
581 \tl_if_empty:nTF {#3}
582 { \prop_gremove:NV \g_@@_fontopts_prop \l_@@_tmp_tl }
583 { \prop_put:NVn \g_@@_fontopts_prop \l_@@_tmp_tl {#3,} }
584 }
585 }
586 }

```

`\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\g_fontsdefault_fontopts_tl` is emptied inside the group; this is allowed as `\l_fontsdefault_family_tl` is globally defined in `\@@_select_font_family:nn`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```

587 \DeclareDocumentCommand \addfontfeatures {m}
588 {
589 <debug> \typeout{^J::::::::::::::::::: ^J: addfontfeatures}
590 \fontspec_if_fontspec_font:TF
591 }

```

## 34 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

|                               |                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------|

\fontsfont_set_family:Nnn #1 : family
#2 : fontsfont features
#3 : font name
 Defines a new font family from given features and font, and stores the name
 in the variable family. See the standard fontsfont user commands for applications of
 this function.

 We want to store the actual name of the font family within the family variable
 because the actual LATEX family name is automatically generated by fontsfont and it's
 easier to keep it that way.

 Please use \fontsfont_set_family:Nnn instead of \@@_select_font_family:nn,
 which may change in the future.

## 35 Internals

### 35.1 The main function for setting fonts

\@@\_select\_font\_family:nn This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l\_fontsname\_t1. The TeX '\font' command is (globally) stored in \l\_fontsname.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- \l\_fontsname is used as the generic name of the font being defined.

- `\l_@@_fontid_tl` is the unique identifier of the font with all its features.
- `\l_@@_fontname_up_tl` is the font specifically to be used as the upright font.
- `\l_@@_basename_tl` is the (immutable) original argument used for \*-replacing.
- `\l_fontsname_font` is the plain TeX font of the upright font requested.

```

`\fontsname_select:nn` This old name has been used by 3rd party packages so for compatibility:

```
974 \cs_set_eq:NN \fontsname_select:nn \@@_select_font_family:n
```

`\@@_sanitise_fontname:Nn` Assigns font name #2 to token list variable #1 and strips extension(s) from it in the case of an external font. We strip spaces for luatex for consistency with luatofloat, although I'm not sure this is necessary any more. At one stage this also lowercased

the name, but this step has been removed unless someone can remind me why it was necessary.

```

975 \cs_new:Nn \@@_sanitise_fontname:Nn

 erly
1072 }

```

`\@@_construct_font_call:nn` Constructs the complete font invocation. #1 : Base name  
#2 : Extension  
#3 : TTC Index  
#4 : Renderer  
#5 : Optical size  
#6 : Font features

We check if *<Font features>* are empty and if so don’t add in the separator colon.

```

1073 \cs_set:Nn \@@_construct_font_call:nnnnnn
1074 {
 1075 " \@@_fontname_wrap:n { #1 #2 #3 } #4 #5
1076 \str_if_eq_x:nnF {#6}{} {:#6} "
1077 }

```

In practice, we don’t use the six-argument version, since most arguments are constructed on-the-fly:

```

1078 \cs_set:Nn \@@_construct_font_call:nn
1079 {
1080 \@@_construct_font_call:nnnnnn
1081 {#1}
1082 \l_@@_extension_tl
1083 \l_@@_ttc_index_tl
1084 \l_fontsname_renderer_tl
1085 \l_@@_optical_size_tl
1086 {#2}

```

```

1087 }

nt_is_file:, \@@_font_is_name: The \@@_fontname_wrap:n command takes the font name and either passes it
through unchanged or wraps it in the syntax for loading a font 'by filename'. XETEX's
syntax is followed since luatfload provides compatibility.
1088 \cs_new:Nn \@@_font_is_name:

## 35.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if \bfdefault is redefined to b, all bold shapes defined by this package will also be assigned to b.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_automofont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

```
\@@_find_automofonts:
1209 \cs_new:Nn \@@_find_automofonts:

1264 }
1265 }

```

### 35.2.1 Fonts

\@@\_set\_font\_type: Now check if the font is to be rendered with ATSUI or Harfbuzz. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in \l\_fontsfont is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```

1266 \cs_new:Nn \@@_set_font_type:
1267 {
1268 \debug \typeout{:: @@_set_font_type:}
1269 (*xetexx)
1270 \bool_set_false:N \l_@@_tfm_bool
1271 \bool_set_false:N \l_@@_atsui_bool
1272 \bool_set_false:N \l_@@_ot_bool
1273 \bool_set_false:N \l_@@_mm_bool
1274 \bool_set_false:N \l_@@_graphite_bool
1275 \ifcase\XeTeXfonttype\l_fontsfont
1276 \bool_set_true:N \l_@@_tfm_bool
1277 \or
1278 \bool_set_true:N \l_@@_atsui_bool
1279 \ifnum\XeTeXcountvariations\l_fontsfont > \c_zero
1280 \bool_set_true:N \l_@@_mm_bool
1281 \fi
1282 \or
1283 \bool_set_true:N \l_@@_ot_bool
1284 \fi

```

If automatic, the `\l_fonts_spec_renderer_tl` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

```

1285 \tl_if_empty:NT \l_fonts_spec_renderer_tl
1286 {
1287 \bool_if:NTF \l_@@_atsui_bool
1288 { \tl_set:Nn \l_fonts_spec_renderer_tl {/AAT} }
1289 {
1290 \bool_if:NT \l_@@_ot_bool
1291 { \tl_set:Nn \l_fonts_spec_renderer_tl {/OT} }
1292 }
1293 }
1294 ⟨/xetexx⟩
1295 ⟨*luatex⟩
1296 \bool_set_true:N \l_@@_ot_bool
1297 ⟨/luatex⟩
1298 }
```

```
\@@_set_autofont:Nnn #1 : Font name tl
#2 : Base font name
#3 : Font name modifier
```

This function looks for font with `name` and `modifier` #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like /B to look for a bold font, for example.

We can't match external fonts in this way (in X<sub>E</sub>T<sub>E</sub>X anyway; todo: test with LuaTeX). If `font name tl` is not empty, then it's already been specified by the user so abort. If `Base font name` is not given, we also abort for obvious reasons.

If `font name tl` is empty, then proceed. If not found, `font name tl` remains empty. Otherwise, we have a match.

```

\@@\_declare\_shape\_slanted:nn This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@\_set\_slanted: code will overwrite this anyway if necessary.

```

### 35.4 Miscellaneous

\@@\_iv\_str\_to\_num:Nn This macro takes a four character string and converts it to the numerical representation required for X<sub>E</sub>T<sub>E</sub>X OpenType script/language/feature purposes. The output is stored in #1.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \empty s and anything beyond four chars is snipped. The \empty s then are used to reconstruct the spaces in the string to number calculation.

```

1577 \cs_set:Nn \@@_iv_str_to_num:Nn
1578 {
1579 \@@_iv_str_to_num:w #1 \q_nil #2 \c_empty_tl \c_empty_tl \q_nil

### 36.1 Adding features when loading fonts

When remove clashing features,

1. remove the feature being added (to avoid duplicates);
2. remove the inverse of the feature (to avoid cancellation);
3. finally remove all clashing features.

```
1627 \cs_new:Nn \@@_make_OT_feature:nnn

1900 }
1901 { \@@_warning:nx {aat-feature-not-exist-in-font} {#1,#2} }
1902 }
1903 }
```

`_make_AAT_feature_string:nTF` This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page [109](#)).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But X<sub>E</sub>T<sub>E</sub>X doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in `\l_fontsname_{feature_string_t1}`.

```

1933 }
```

## 38 Font loading (keyval) definitions

This is the tedious section where we correlate all possible (eventually) font feature requests with their X<sub>E</sub>T<sub>X</sub> representations.

```
1935 \clist_set:Nn \g_@@_all_keyval_modules_clist
1936 {
1937 fontspec, fontspec-opentype, fontspec-aat,
1938 fontspec-preparse, fontspec-preparse-external, fontspec-preparse-nested,
1939 fontspec-renderer
1940 }
1941 \cs_new:Nn \@@_keys_define_code:nnn
1942 {
1943 \keys_define:nn {#1} { #2 .code:n = {#3} }
1944 }
```

For catching features that cannot be used in \addfontfeatures:

```
1945 \cs_new:Nn \@@_aff_error:n
1946 {
1947 \@@_keys_define_code:nnn {fontspec-addfeatures} {#1}
1948 { \@@_error:nx {not-in-addfontfeatures} {#1} }
1949 }
```

### 38.0.1 Pre-parsing naming information

These features are extracted from the font feature list before all others.

- Path For fonts that aren't installed in the system. If no argument is given, the font is located with kpsewhich; it's either in the current directory or the T<sub>E</sub>X tree. Otherwise, the argument given defines the file path of the font.

```
1950 \@@_keys_define_code:nnn {fontspec-preparse-external} {Path}
1951 {
1952 \bool_set_true:N \l_@@_nobf_bool
1953 \bool_set_true:N \l_@@_noit_bool
1954 \bool_set_true:N \l_@@_external_bool
1955 \tl_set:Nn \l_@@_font_path_tl {#1}
1956 \@@_font_is_file:
1957 (*xetexx)
1958 \keys_set:nn {fontspec-renderer} {Renderer=OpenType}
1959 (/xetexx)
1960 }
1961 \aliasfontfeature{Path}{ExternalLocation}
1962 \@@_keys_define_code:nnn {fontspec} {Path} {}
```

**Extension** For fonts that aren't installed in the system. Specifies the font extension to use.

```
1963 \@@_keys_define_code:nnn {fontspec-preparse-external} {Extension}
1964 {
1965 \tl_set:Nn \l_@@_extension_tl {#1}
1966 \bool_if:NF \l_@@_external_bool
1967 {
```

```

1968 \keys_set:nn {fontspec-preparse-external} {Path}
1969 }
1970 }
1971 \tl_clear:N \l_@@_extension_tl
1972 \@@_keys_define_code:nnn {fontspec} {Extension} {}

```

### 38.0.2 Pre-parsed features

After the font name(s) have been sorted out, now need to extract any renderer/font configuration features that need to be processed before all other font features.

**Renderer** This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and even whether certain features are available.

```

1973 \keys_define:nn {fontspec-renderer}
1974 {
1975 Renderer .choices:nn =
1976 {AAT,ICU,OpenType,Graphite,Full,Basic}
1977 {
1978 \int_compare:nTF {\l_keys_choice_int <= 4} {
1979 (*xetexx)
1980 \tl_set:Nv \l_fonts_spec_renderer_tl
1981 { g_fonts_spec_renderer_tag_ \l_keys_choice_tl }
1982 \tl_gset:Nx \g_@@_single_feat_tl { \l_fonts_spec_renderer_tl }
1983 (/xetexx)
1984 (*luatex)
1985 \@@_warning:nx {only-xetex-feature} {Renderer=AAT/OpenType/Graphite}
1986 (/luatex)
1987 }
1988 {
1989 (*xetexx)
1990 \@@_warning:nx {only-luatex-feature} {Renderer=Full/Basic}
1991 (/xetexx)
1992 (*luatex)
1993 \tl_set:Nv \l_fonts_spec_mode_tl
1994 { g_fonts_spec_mode_tag_ \l_keys_choice_tl }
1995 \tl_gset:Nx \g_@@_single_feat_tl { mode=\l_fonts_spec_mode_tl }
1996 (/luatex)
1997 }
1998 }
1999 }
2000 \tl_set:cn {g_fonts_spec_renderer_tag_AAT} {/AAT}
2001 \tl_set:cn {g_fonts_spec_renderer_tag_ICU} {/OT}
2002 \tl_set:cn {g_fonts_spec_renderer_tag_OpenType} {/OT}
2003 \tl_set:cn {g_fonts_spec_renderer_tag_Graphite} {/GR}
2004 \tl_set:cn {g_fonts_spec_mode_tag_Full} {node}
2005 \tl_set:cn {g_fonts_spec_mode_tag_Basic} {base}

```

**OpenType script/language** See later for the resolutions from fontspec features to OpenType definitions.

```

2006 \@@_keys_define_code:nnn {fontspec-preparse} {Script}
2007 {
2008 <xetexx> \keys_set:nn {fontspec-renderer} {Renderer=OpenType}
2009 \tl_set:Nn \l_@@_script_name_tl {\#1}
2010 }

```

Exactly the same:

```

2011 \@@_keys_define_code:nnn {fontspec-preparse} {Language}
2012 {
2013 <xetexx> \keys_set:nn {fontspec-renderer} {Renderer=OpenType}
2014 \tl_set:Nn \l_@@_lang_name_tl {\#1}
2015 }

```

### TTC font index

```

2016 \@@_keys_define_code:nnn {fontspec-preparse} {FontIndex}
2017 {
2018 \str_if_eq_x:nnF { \str_lower_case:f {\l_@@_extension_tl} } {.ttc}
2019 { \@@_warning:n {font-index-needs-ttc} }
2020 <xetexx> \tl_set:Nn \l_@@_ttc_index_tl {\#1}
2021 <luatex> \tl_set:Nn \l_@@_ttc_index_tl {\#1}
2022 }
2023 \@@_keys_define_code:nnn {fontspec} {FontIndex}
2024 {
2025 <xetexx> \tl_set:Nn \l_@@_ttc_index_tl {\#1}
2026 <luatex> \tl_set:Nn \l_@@_ttc_index_tl {\#1}
2027 }

```

### 38.0.3 Bold/italic choosing options

The `Bold`, `Italic`, and `BoldItalic` features are for defining explicitly the bold and italic fonts used in a font family.

**Bold (NFSS) Series** By default, `fontspec` uses the default bold series, `\bfdefault`. We want to be able to make this extensible.

```

2028 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSeries}
2029 {
2030 \tl_gset:Nx \g_@@_curr_series_tl { #1 }
2031 \seq_gput_right:Nx \g_@@_bf_series_seq { #1 }
2032 }

```

**Fonts Upright:**

```

2033 \@@_keys_define_code:nnn {fontspec-preparse-external} {UprightFont}
2034 {
2035 \fontspec_complete_fontname:Nn \l_@@_fontname_up_tl {\#1}
2036 }
2037 \@@_keys_define_code:nnn {fontspec-preparse-external} {FontName}
2038 {
2039 \fontspec_complete_fontname:Nn \l_@@_fontname_up_tl {\#1}
2040 }

```

Bold:

```
2041 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldFont}
2042 {
2043 \tl_if_empty:nTF {#1}
2044 {
2045 \bool_set_true:N \l_@@_nobf_bool
2046 }
2047 {
2048 \bool_set_false:N \l_@@_nobf_bool
2049 \fontspec_complete_fontname:Nn \l_@@_curr_bfname_tl {#1}
2050
2051 \seq_if_empty:NT \g_@@_bf_series_seq
2052 {
2053 \tl_gset:Nx \g_@@_curr_series_tl {\bfdefault}
2054 \seq_put_right:Nx \g_@@_bf_series_seq {\bfdefault}
2055 }
2056 \tl_if_eq:oxT \g_@@_curr_series_tl {\bfdefault}
2057 { \tl_set_eq:NN \l_@@_fontname_bf_tl \l_@@_curr_bfname_tl }
2058
2059 <debug>\typeout{Setting~bold~font~"\l_@@_curr_bfname_tl"~with~series~"\g_@@_curr_series_tl"}
2060
2061 \prop_put:NxV \l_@@_nfss_prop
2062 {BoldFont-\g_@@_curr_series_tl} \l_@@_curr_bfname_tl
2063
2064 }
2065 }
```

Same for italic:

```
2066 \@@_keys_define_code:nnn {fontspec-preparse-external} {ItalicFont}
2067 {
2068 \tl_if_empty:nTF {#1}
2069 {
2070 \bool_set_true:N \l_@@_noit_bool
2071 }
2072 {
2073 \bool_set_false:N \l_@@_noit_bool
2074 \fontspec_complete_fontname:Nn \l_@@_fontname_it_tl {#1}
2075 }
2076 }
```

Simpler for bold+italic & slanted:

```
2077 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldItalicFont}
2078 {
2079 \fontspec_complete_fontname:Nn \l_@@_fontname_bfit_tl {#1}
2080 }
2081 \@@_keys_define_code:nnn {fontspec-preparse-external} {SlantedFont}
2082 {
2083 \fontspec_complete_fontname:Nn \l_@@_fontname_sl_tl {#1}
2084 }
2085 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSlantedFont}
2086 {
2087 \fontspec_complete_fontname:Nn \l_@@_fontname_bfsl_tl {#1}
```

```

2088 }

Small caps isn't pre-parsed because it can vary with others above:
2089 \@@_keys_define_code:nnn {fontspec} {SmallCapsFont}
2090 {
2091 \tl_if_empty:nTF {#1}
2092 {
2093 \bool_set_true:N \l_@@_nosc_bool
2094 }
2095 {
2096 \bool_set_false:N \l_@@_nosc_bool
2097 \fontspec_complete_fontname:Nn \l_@@_fontname_sc_tl {#1}
2098 }
2099 }

```

## Features

```

2100 \@@_keys_define_code:nnn {fontspec-preparse} {UprightFeatures}
2101 {
2102 \clist_set:Nn \l_@@_fontfeat_up_clist {#1}
2103 }
2104 \@@_keys_define_code:nnn {fontspec-preparse} {BoldFeatures}
2105 {
2106 \clist_set:Nn \l_@@_fontfeat_bf_clist {#1}
2107
2108% \prop_put:NxV \l_@@_nfss_prop
2109% {BoldFont-\g_@@_curr_series_tl} \l_@@_curr_bfname_tl
2110 }
2111 \@@_keys_define_code:nnn {fontspec-preparse} {ItalicFeatures}
2112 {
2113 \clist_set:Nn \l_@@_fontfeat_it_clist {#1}
2114 }
2115 \@@_keys_define_code:nnn {fontspec-preparse} {BoldItalicFeatures}
2116 {
2117 \clist_set:Nn \l_@@_fontfeat_bfit_clist {#1}
2118 }
2119 \@@_keys_define_code:nnn {fontspec-preparse} {SlantedFeatures}
2120 {
2121 \clist_set:Nn \l_@@_fontfeat_sl_clist {#1}
2122 }
2123 \@@_keys_define_code:nnn {fontspec-preparse} {BoldSlantedFeatures}
2124 {
2125 \clist_set:Nn \l_@@_fontfeat_bfsl_clist {#1}
2126 }

```

Note that small caps features can vary by shape, so these in fact *aren't* pre-parsed.

```

2127 \@@_keys_define_code:nnn {fontspec} {SmallCapsFeatures}
2128 {
2129 \bool_if:NF \l_@@_firsttime_bool
2130 {

2164 }

```

### 38.0.4 Font-independent features

These features can be applied to any font.

**NFSS encoding** For the very brave.

```

2165 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSEncoding}
2166 {
2167 \tl_gset:Nx \l_@@_nfss_enc_tl { #1 }
2168 }

```

**NFSS family** Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default fontspec auto-generates one based on the font name.)

```

2169 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSFamily}
2170 {
2171 \tl_set:Nx \l_@@_nfss_fam_tl { #1 }
2172 \cs_undefine:c {g_@@_UID_\l_@@_fontid_tl}

```

```

2173 \tl_if_exist:N \l_fonts_spec_family_tl
2174 { \cs_undefine:c {g_@@_\l_fonts_spec_family_tl _prop} }
2175 }

```

**NFSS series/shape** This option looks similar in name but has a very different function.

```

2176 \@@_keys_define_code:nnn {fontspec} {FontFace}
2177 {
2178 \tl_set:No \l_@@_arg_tl { \use_iii:nnn #1 }
2179 \tl_set_eq:NN \l_@@_this_feat_tl \l_@@_arg_tl
2180 \tl_clear:N \l_@@_this_font_tl
2181 \int_compare:nT { \clist_count:N \l_@@_arg_tl = 1 }
2182 {
2183 (*debug)
2184 \typeout{FontFace~ parsing:~ one~clist~ item}
2185 (/debug)
2186 \tl_if_in:NnF \l_@@_arg_tl {=}
2187 {
2188 (*debug)
2189 \typeout{FontFace~ parsing:~ no~ equals~ =>~ font~ name~ only}
2190 (/debug)
2191 \tl_set_eq:NN \l_@@_this_font_tl \l_@@_arg_tl
2192 \tl_clear:N \l_@@_this_feat_tl
2193 }
2194 }
2195
2196 \@@_add_nfssfont:nnnn
2197 { \use_i:nnn #1 } { \use_ii:nnn #1 } { \l_@@_this_font_tl } { \l_@@_this_feat_tl }
2198 }

```

**Scale** If the input isn't one of the pre-defined string options, then it's gotta be numerical. \fonts\_spec\_calc\_scale:n does all the work in the auto-scaling cases.

```

2199 \@@_keys_define_code:nnn {fontspec} {Scale}
2200 {
2201 \str_case:nnF {#1}
2202 {
2203 {MatchLowercase} { \@@_calc_scale:n {5} }
2204 {MatchUppercase} { \@@_calc_scale:n {8} }
2205 }
2206 { \tl_set:Nx \l_@@_scale_tl {#1} }
2207 \tl_set:Nx \l_@@_scale_tl { s*[\l_@@_scale_tl] }
2208 }

```

\@@\_calc\_scale:n This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X<sub>E</sub>T<sub>X</sub>).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```

2209 \cs_new:Nn \@@_calc_scale:n
2210 {
2211 \group_begin:
2212 \rmfamily
2213 \@@_set_font_dimen:NnN \l_@@_tmpa_dim {#1} \font
2214 \@@_set_font_dimen:NnN \l_@@_tmpb_dim {#1} \l_fontsfont
2215 \tl_gset:Nx \l_@@_scale_tl
2216 {
2217 \fp_eval:n { \dim_to_fp:n {\l_@@_tmpa_dim} /
2218 \dim_to_fp:n {\l_@@_tmpb_dim} }
2219 }
2220 \@@_info:n {set-scale}
2221 \group_end:
2222 }
```

\@@\_set\_font\_dimen:NnN This function sets the dimension #1 (for font #3) to 'fontdimen' #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect 'zero' value (as \fontdimen8 might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an 'X' or an 'x'.

```

2223 \cs_new:Nn \@@_set_font_dimen:NnN
2224 {
2225 \dim_set:Nn #1 { \fontdimen #2 #3 }
2226 \dim_compare:nNnT #1 = {opt}
2227 {
2228 \settoheight #1
2229 {
2230 \str_if_eq:nnTF {#3} {\font} \rmfamily #3
2231 \int_case:nnF #2
2232 {
2233 {5} {x} % x-height
2234 {8} {X} % cap-height
2235 } {?} % "else" clause; never reached.
2236 }
2237 }
2238 }
```

**Inter-word space** These options set the relevant \fontdimens for the font being loaded.

```

2239 \@@_keys_define_code:nnn {fontsfont} {WordSpace}
2240 {
2241 \bool_if:NF \l_@@_firsttime_bool
2242 { \fontsfont_parse_wordspace:w #1,,, \q_stop }
2243 }
2244 \@@_aff_error:n {WordSpace}
```

\\_fontsfont\_parse\_wordspace:w This macro determines if the input to WordSpace is of the form {X} or {X,Y,Z} and executes the font scaling. If the former input, it executes {X,X,X}.

```

2245 \cs_set:Npn \fontsfont_parse_wordspace:w #1,#2,#3,#4 \q_stop
2246 {
2247 \tl_if_empty:nTF {#4}
```

```

2248 {
2249 \tl_set:Nn \l_@@_wordspace_adjust_tl
2250 {
2251 \fontdimen 2 \font = #1 \fontdimen 2 \font
2252 \fontdimen 3 \font = #1 \fontdimen 3 \font
2253 \fontdimen 4 \font = #1 \fontdimen 4 \font
2254 }
2255 }
2256 {
2257 \tl_set:Nn \l_@@_wordspace_adjust_tl
2258 {
2259 \fontdimen 2 \font = #1 \fontdimen 2 \font

2418 }
2419
```

### 38.0.6 Font transformations

These are to be specified to apply directly to a font shape:

```

2420 \keys_define:nn {fontspec}
2421 {
2422 FakeSlant .code:n =
2423 {
2424 \update_featstr:n{slant=#1}
2425 },
2426 FakeSlant .default:n = {0.2}
2427 }
2428 \keys_define:nn {fontspec}

```

```

2429 {
2430 FakeStretch .code:n =
2431 {
2432 \@@_update_featstr:n{extend=#1}
2433 },
2434 FakeStretch .default:n = {1.2}
2435 }
2436 (*xetexx)
2437 \keys_define:nn {fontspec}
2438 {
2439 FakeBold .code:n =
2440 {
2441 \@@_update_featstr:n {embolden=#1}
2442 },
2443 FakeBold .default:n = {1.5}
2444 }
2445 (/xetexx)
2446 (*luatex)
2447 \keys_define:nn {fontspec}
2448 {
2449 FakeBold .code:n = { \@@_warning:n {fakebold-only-xetex} }
2450 }
2451 (/luatex)

```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create ‘fake’ shapes.

The behaviour is currently that only if both AutoFakeSlant *and* AutoFakeBold are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```

2452 \keys_define:nn {fontspec}
2453 {
2454 AutoFakeSlant .code:n =
2455 {
2456 \bool_if:NT \l_@@_firsttime_bool
2457 {
2458 \tl_set:Nn \l_@@_fake_slant_tl {#1}
2459 \clist_put_right:Nn \l_@@_fontfeat_it_clist {FakeSlant=#1}
2460 \tl_set_eq:NN \l_@@_fontname_it_tl \l_fontsname_tl
2461 \bool_set_false:N \l_@@_noit_bool
2462
2463 \tl_if_empty:NF \l_@@_fake_embolden_tl
2464 {
2465 \clist_put_right:Nx \l_@@_fontfeat_bfit_clist
2466 {FakeBold=\l_@@_fake_embolden_tl}
2467 \clist_put_right:Nx \l_@@_fontfeat_bfit_clist {FakeSlant=#1}
2468 \tl_set_eq:NN \l_@@_fontname_bfit_tl \l_fontsname_tl
2469 }
2470 }
2471 },

```

```

2472 AutoFakeSlant .default:n = {0.2}
2473 }

Same but reversed:

2474 \keys_define:nn {fontspec}
2475 {
2476 AutoFakeBold .code:n =
2477 {
2478 \bool_if:NT \l_@@_firsttime_bool
2479 {
2480 \tl_set:Nn \l_@@_fake_embolden_tl {\#1}
2481 \clist_put_right:Nn \l_@@_fontfeat_bf_clist {FakeBold=\#1}
2482 \tl_set_eq:NN \l_@@_fontname_bf_tl \l_fontsname_tl
2483 \bool_set_false:N \l_@@_nobf_bool
2484
2485 \tl_if_empty:NF \l_@@_fake_slant_tl
2486 {
2487 \clist_put_right:Nx \l_@@_fontfeat_bfit_clist
2488 {FakeSlant=\l_@@_fake_slant_tl}
2489 \clist_put_right:Nx \l_@@_fontfeat_bfit_clist {FakeBold=\#1}
2490 \tl_set_eq:NN \l_@@_fontname_bfit_tl \l_fontsname_tl
2491 }
2492 }
2493 },
2494 AutoFakeBold .default:n = {1.5}
2495 }

```

### 38.0.7 Raw feature string

This allows savvy X<sub>E</sub>T<sub>E</sub>X-ers to input font features manually if they have already memorised the OpenType abbreviations and don't mind not having error checking.

```

2496 \@@_keys_define_code:nnn {fontspec} {RawFeature}

2740 {
2741 \@@_make_OT_feature:nnn {nalt} {+nalt=#1} {}
2742 }
2743 }

```

### 38.3.5 Ornament

```

2744 \@@_define_opentype_feature_group:n {Ornament}
2745 \keys_define:nn {fontspec-opentype}
2746 {
2747 Ornament .default:n = {o} ,
2748 Ornament / unknown .code:n =
2749 {
2750 \@@_make_OT_feature:nnn {ornm} {+ornm=#1} {}
2751 }
2752 }

```

## 38.4 Script and Language

### 38.4.1 Script

```

2753 \keys_define:nn { fontspec-opentype } { Script .choice: }
2754 \cs_new:Nn \fontspec_new_script:nn
2755 {
2756 \keys_define:nn { fontspec-opentype } { Script / #1 .code:n =
2757 \bool_set_false:N \l_@@_script_exist_bool
2758 \clist_map_inline:nn {#2}

```

```

2759 {
2760 \@@_check_script:nTF {####1}
2761 {
2762 \tl_set:Nn \l_fonts_spec_script_tl {####1}
2763 \int_set:Nn \l_@@script_int {\l_@@strnum_int}
2764 \bool_set_true:N \l_@@script_exist_bool
2765 \tl_gset:Nx \g_@@single_feat_tl { script=####1 }
2766 \clist_map_break:
2767 }
2768 {
2769 }
2770 \bool_if:NF \l_@@script_exist_bool
2771 {
2772 \str_if_eq:nnTF {#1} {Latin}
2773 {
2774 \@@_warning:nx {script-not-exist} {#1}
2775 }
2776 {
2777 \@@_check_script:nTF {latn}
2778 {
2779 \@@_warning:nx {script-not-exist-latn} {#1}
2780 \tl_set:Nn \l_fonts_spec_script_tl {latn}
2781 \int_set:Nn \l_@@script_int {\l_@@strnum_int}
2782 }
2783 {
2784 \@@_warning:nx {script-not-exist} {#1}
2785 }
2786 }
2787 }
2788 }
2789 }
```

### 38.4.2 Language

```

2790 \keys_define:nn { fontspec-opentype } { Language .choice: }
2791 \cs_new:Nn \fontspec_new_lang:nn
2792 {
2793 \keys_define:nn { fontspec-opentype } { Language / #1 .code:n =
2794 \@@_check_lang:nTF {#2}
2795 {
2796 \tl_set:Nn \l_fonts_spec_lang_tl {#2}
2797 \int_set:Nn \l_@@language_int {\l_@@strnum_int}
2798 \tl_gset:Nx \g_@@single_feat_tl { language=#2 }
2799 }
2800 {
2801 \@@_warning:nx {language-not-exist} {#1}
2802 \keys_set:nn { fontspec-opentype } { Language = Default }
2803 }
2804 }
2805 }
```

### Default

```

2806 \@@_keys_define_code:nnn {fontspec-opentype}{ Language / Default }
```

```

2807 {
2808 \tl_set:Nn \l_fonts表白_lang_tl {DFLT}
2809 \int_zero:N \l_@@_language_int
2810 \tl_gset:Nn \g_@@_single_feat_tl { language=DFLT }
2811 }

```

**Turkish** Turns out that many fonts use ‘TUR’ as their Turkish language tag rather than the specified ‘TRK’. So we check for both:

```

2812 \keys_define:nn {fontspec-opentype}
2813 {
2814 Language / Turkish .code:n =
2815 {
2816 \@@_check_lang:nTF {TRK}
2817 {
2818 \int_set:Nn \l_@@_language_int {\l_@@_strnum_int}
2819 \tl_set:Nn \l_fonts表白_lang_tl {TRK}
2820 \tl_gset:Nn \g_@@_single_feat_tl { language=TRK }
2821 }
2822 {
2823 \@@_check_lang:nTF {TUR}
2824 {
2825 \int_set:Nn \l_@@_language_int {\l_@@_strnum_int}
2826 \tl_set:Nn \l_fonts表白_lang_tl {TUR}
2827 \tl_gset:Nn \g_@@_single_feat_tl { language=TUR }
2828 }
2829 {
2830 \@@_warning:nx {language-not-exist} {Turkish}
2831 \keys_set:nn {fontspec-opentype} {Language=Default}
2832 }
2833 }
2834 }
2835 }

```

### 38.5 Backwards compatibility

Backwards compatibility:

```

2836 \cs_new:Nn \@@_ot_compat:nn
2837 {
2838 \aliasfontfeatureoption {#1} {#20ff} {No#2}
2839 }
2840 \@@_ot_compat:nn {Ligatures} {Rare}
2841 \@@_ot_compat:nn {Ligatures} {Required}
2842 \@@_ot_compat:nn {Ligatures} {Common}

3344 \@@_define_aat_feature:nnnn

```

### 38.8.3 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

```
3345 \@_define_aat_feature_group:n {Numbers}
3346 \@_define_aat_feature:nnnn {Numbers} {Monospaced} {6} {o}
3347 \@_define_aat_feature:nnnn {Numbers} {Proportional} {6} {i}
3348 \@_define_aat_feature:nnnn {Numbers} {Lowercase} {21} {o}
3349 \@_define_aat_feature:nnnn {Numbers} {OldStyle} {21} {o}
3350 \@_define_aat_feature:nnnn {Numbers} {Uppercase} {21} {i}
3351 \@_define_aat_feature:nnnn {Numbers} {Lining} {21} {i}
3352 \@_define_aat_feature:nnnn {Numbers} {SlashedZero} {14} {5}
3353 \@_define_aat_feature:nnnn {Numbers} {NoSlashedZero} {14} {4}
```

### 38.8.4 Contextuals

```
3354 \@_define_aat_feature_group:n {Contextuals}
3355 \@_define_aat_feature:nnnn {Contextuals} {WordInitial} {8} {o}
3356 \@_define_aat_feature:nnnn {Contextuals} {NoWordInitial} {8} {i}
3357 \@_define_aat_feature:nnnn {Contextuals} {WordFinal} {8} {2}
3358 \@_define_aat_feature:nnnn {Contextuals} {NoWordFinal} {8} {3}
3359 \@_define_aat_feature:nnnn {Contextuals} {LineInitial} {8} {4}
3360 \@_define_aat_feature:nnnn {Contextuals} {NoLineInitial} {8} {5}
3361 \@_define_aat_feature:nnnn {Contextuals} {LineFinal} {8} {6}
3362 \@_define_aat_feature:nnnn {Contextuals} {NoLineFinal} {8} {7}
3363 \@_define_aat_feature:nnnn {Contextuals} {Inner} {8} {8}
3364 \@_define_aat_feature:nnnn {Contextuals} {NoInner} {8} {9}
```

### 38.8.5 Diacritics

```
3365 \@_define_aat_feature_group:n {Diacritics}
3366 \@_define_aat_feature:nnnn {Diacritics} {Show} {9} {o}
3367 \@_define_aat_feature:nnnn {Diacritics} {Hide} {9} {i}
3368 \@_define_aat_feature:nnnn {Diacritics} {Decompose} {9} {2}
```

### 38.8.6 Vertical position

```
3369 \@_define_aat_feature_group:n {VerticalPosition}

## 40 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

`\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means `\fontspec` must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```

3525 \@ifpackageloaded{euler}
3526 {
3527 \bool_set_true:N \g_@@_pkg_euler_loaded_bool
3528 }
3529 {
3530 \bool_set_false:N \g_@@_pkg_euler_loaded_bool
3531 }
3532 \cs_set:Nn \fontspec_setup_maths:
3533 {
3534 \@ifpackageloaded{euler}
3535 {
3536 \bool_if:NTF \g_@@_pkg_euler_loaded_bool
3537 { \bool_set_true:N \g_@@_math_euler_bool }
3538 { \@@_error:n {euler-too-late} }
3539 }
3540 {}}

```

```

3541 \@ifpackageloaded{lucbmath}{\bool_set_true:N \g_@@_math_lucida_bool}{}%
3542 \ifpackageloaded{lucidabr}{\bool_set_true:N \g_@@_math_lucida_bool}{}%
3543 \ifpackageloaded{lucimatx}{\bool_set_true:N \g_@@_math_lucida_bool}{}%

```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L<sup>A</sup>T<sub>E</sub>X's operators maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a `\hat` accent in EulerFractur, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```

3544 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}%
3545 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}%
3546 \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}%
3547 \DeclareMathAccent{\grave}{\mathalpha}{legacymaths}{18}%
3548 \DeclareMathAccent{\ddot}{\mathalpha}{legacymaths}{127}%
3549 \DeclareMathAccent{\tilde}{\mathalpha}{legacymaths}{126}%
3550 \DeclareMathAccent{\bar}{\mathalpha}{legacymaths}{22}%
3551 \DeclareMathAccent{\breve}{\mathalpha}{legacymaths}{21}%
3552 \DeclareMathAccent{\check}{\mathalpha}{legacymaths}{20}%
3553 \DeclareMathAccent{\hat}{\mathalpha}{legacymaths}{94} % too bad, euler
3554 \DeclareMathAccent{\dot}{\mathalpha}{legacymaths}{95}%
3555 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}%

```

**\colon: what's going on?** Okay, so `:` and `\colon` in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{3A}%
% \DeclareMathSymbol{:}{\mathrel}{operators}{3A}%
%
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
% \mkern-\thinmuskip{:}\mskip6muplus1mu\relax}%
%
% % euler.sty:
% \DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{3A}%
%
% % lucbmath.sty:
% \DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}%
% \ifx\colon@tempb
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}%
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}%

```

( $3A_{.16} = 58_{.10}$ ) So I think, based on this summary, that it is fair to tell `fontspec` to 'replace' the operators font with `legacymaths` for this symbol, except when `amsmath` is loaded since we want to keep its definition.

```

3556 \group_begin:
3557 \mathchardef\@tempa="603A \relax
3558 \ifx\colon\@tempa
3559 \DeclareMathSymbol{\colon}{\mathpunct}{legacy}{58}
3560 \fi
3561 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

3562 \bool_if:NF \g_@@_math_euler_bool
3563 {
3564 \DeclareMathSymbol{!}{\mathclose}{legacy}{33}
3565 \DeclareMathSymbol{:}{\mathrel}{legacy}{58}
3566 \DeclareMathSymbol{;}{\mathpunct}{legacy}{59}
3567 \DeclareMathSymbol{?}{\mathclose}{legacy}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

3568 \bool_if:NF \g_@@_math_lucida_bool
3569 {
3570 \DeclareMathSymbol{o}{\mathalpha}{legacy}{`o}
3571 \DeclareMathSymbol{i}{\mathalpha}{legacy}{`i}

3598 \DeclareMathSymbol{\mathdollar}{\mathord}{legacy}{`36}
3599 }
3600 }

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined us-

ing the `\g_@@_mathrm_tl(...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm(...)` commands in the preamble.

Since L<sup>A</sup>T<sub>E</sub>X only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_tl`.

```

3601 \DeclareSymbolFont{operators}{\g_fontsencoding_tl}{\g_@@_mathrm_tl}{\mddefault}{\updefault}
3602 \SetSymbolFont{operators}{normal}{\g_fontsencoding_tl}{\g_@@_mathrm_tl}{\mddefault}{\updefault}

3616 \SetMathAlphabet{\mathit}{bold}{\g_fontsencoding_tl}{\g_@@_bfmathrm_tl}{\mddefault}{\itdefault}
3617 }
3618 \SetMathAlphabet{\mathsf}{bold}{\g_fontsencoding_tl}{\g_@@_mathsf_tl}{\bfdefault}{\updefault}
3619 \SetMathAlphabet{\mathtt}{bold}{\g_fontsencoding_tl}{\g_@@_mathtt_tl}{\bfdefault}{\updefault}
3620 }
```

`\fonts我没有设置数学字体:` We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L<sup>A</sup>T<sub>E</sub>X Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the T<sub>E</sub>X Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

## 41 Closing code

### 41.1 Compatibility

\zf@enc Old interfaces. These are needed by, at least, the `mathspec` package.

```

\zf@family 3660 \tl_set:Nn \zf@enc { \g_fontspec_encoding_tl }
\zf@basefont 3661 \cs_set:Npn \zf@fontspec #1 #2
\zf@fontspec 3662 {
 3663 \@@_select_font_family:nn {#1} {#2}
 3664 \tl_set:Nn \zf@family { \l_fontspec_family_tl }
 3665 \tl_set:Nn \zf@basefont { \l_fontspec_font }
 3666 }

```

### 41.2 Finishing up

Now we just want to set up loading the `.cfg` file, if it exists.

```

3667 \bool_if:NT \g_@@_cfg_bool
3668 {
3669 \InputIfFileExists{fontspec.cfg}
3670 {}
3671 {\typeout{No~ fontspec.cfg~ file~ found;~ no~ configuration~ loaded.}}
3672 }

```

## 42 Patching code

```
3673 (*fontspec)
```

## 42.1 Italic small caps and so on

\sishape These commands for actually selecting italic small caps have been defined for many years; I'm inclined to drop them. They're probably used very infrequently; I personally prefer just writing \textit{\textsc{...}} instead.

```
3674 \providecommand*\itscdefault{\itdefault\scdefault}
3675 \providecommand*\slscdefault{\sldefault\scdefault}
3676 \DeclareRobustCommand{\sishape}
3677 {
3678 \not@math@\alphabet\sishape\relax
3679 \fontshape{\itscdefault}\selectfont
3680 }
3681 \DeclareTextFontCommand{\textsi}{\sishape}
```

$\text{\TeX}'s 'shape' font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:$

```
3682 \cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }
3683 \tl_const:cn { \@@_shape_merge:nn \itdefault \scdefault } {\itscdefault}
3684 \tl_const:cn { \@@_shape_merge:nn \sldefault \scdefault } {\slscdefault}
3685 \tl_const:cn { \@@_shape_merge:nn \scdefault \itdefault } {\itscdefault}
3686 \tl_const:cn { \@@_shape_merge:nn \scdefault \sldefault } {\slscdefault}
3687 \tl_const:cn { \@@_shape_merge:nn \slscdefault \itdefault } {\itscdefault}
3688 \tl_const:cn { \@@_shape_merge:nn \itscdefault \sldefault } {\slscdefault}
3689 \tl_const:cn { \@@_shape_merge:nn \itscdefault \updefault } {\scdefault}
3690 \tl_const:cn { \@@_shape_merge:nn \slscdefault \updefault } {\scdefault}
```

\fontspec\_merge\_shape:n These macros enable the overload on the \..shape commands. First, a shape 'new+current' (prefix) or 'current+new' (suffix) is tried. If not found, fall back on the 'new' shape.

```
3691 \cs_new:Nn \fontspec_merge_shape:n
3692 {
3693 \@@_if_merge_shape:nTF {#1}
3694 { \fontshape { \tl_use:c { \@@_shape_merge:nn { \f@shape } {#1} } } \se-
 lectfont }
3695 { \fontshape {#1} \selectfont }
3696 }
```

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```
3697 \prg_new_conditional:Nnn \@@_if_merge_shape:n {TF}
3698 {
3699 \bool_if:nTF
3700 {
3701 \tl_if_exist_p:c { \@@_shape_merge:nn { \f@shape } {#1} } &&
3702 \cs_if_exist_p:c
3703 {
3704 \f@encoding/\f@family/\f@series/
3705 \tl_use:c { \@@_shape_merge:nn { \f@shape } {#1} }
3706 }
3707 }
3708 \prg_return_true: \prg_return_false:
3709 }
```

```

\itshape The original \.. shape commands are redefined to use the merge shape macro.

\scshape 3710 \DeclareRobustCommand \itshape
\upshape 3711 {
\slshape 3712 \not@math@alphabet\itshape\mathit
3713 \fontspec_merge_shape:n\itdefault
3714 }
3715 \DeclareRobustCommand \slshape
3716 {
3717 \not@math@alphabet\slshape\relax
3718 \fontspec_merge_shape:n\sldefault
3719 }
3720 \DeclareRobustCommand \scshape
3721 {
3722 \not@math@alphabet\scshape\relax
3723 \fontspec_merge_shape:n\scdefault
3724 }
3725 \DeclareRobustCommand \upshape
3726 {
3727 \not@math@alphabet\upshape\relax
3728 \fontspec_merge_shape:n\updefault
3729 }

```

## 42.2 Emphasis

```

\em Redefinition of {\em ...} and \emph{...} to allow nesting of emphases.

\emph 3730 \cs_new_protected:Npn \emfontdeclare #1
\emshape 3731 {
\eminnershape 3732 \prop_clear:N \g_@@_em_prop
\emfontdeclare 3733 \int_zero:N \l_@@_emdef_int
3734 \group_begin:
3735 \normalfont
3736 \clist_map_inline:nn {\emreset,#1}
3737 {
3738 \##1
3739 \prop_gput_if_new:NxV \g_@@_em_prop { \f@series/\f@shape } { \l_@@_emdef_int }
3740 \prop_gput:Nxn \g_@@_em_prop { switch-\int_use:N \l_@@_emdef_int } { ##1 }
3741 \int_incr:N \l_@@_emdef_int
3742 }
3743 \group_end:
3744 }

3745 \DeclareRobustCommand \em
3746 {
3747 \nomath\em
3748
3749 \prop_get:NxNT \g_@@_em_prop { \f@series/\f@shape } \l_@@_em_tmp_tl
3750 { \int_set:Nn \l_@@_em_int { \l_@@_em_tmp_tl } }
3751
3752 \int_incr:N \l_@@_em_int
3753
3754 \prop_get:NxNTF \g_@@_em_prop { switch-\int_use:N \l_@@_em_int } \l_@@_em_switch_tl

```

```

3755 { \l_@@_em_switch_tl }
3756 {
3757 \int_zero:N \l_@@_em_int
3758 \emreset
3759 }
3760
3761 }

```

#### Document commands:

```

3762 \DeclareTextFontCommand{\emph}{\em}
3763 \cs_set:Npn \emreset { \upshape }
3764 \cs_set:Npn \emshape { \itshape }
3765 \cs_set:Npn \eminnershape { \upshape }
3766 \emfontdeclare{ \emshape, \eminnershape }

```

Ensure nesting resets when necessary:

```
3767 \cs_set:Npn \reset@font { \normalfont \int_zero:N \l_fonts_spec_em_int }
```

Programmer's interface for setting nesting level:

```
3768 \cs_new:Nn \fonts_spec_set_em_level:n { \int_set:Nn \l_@@_em_int {#1} }
```

## 42.3 \-

- \- This macro is courtesy of Frank Mittelbach and the L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> source code.

```

3769 \DeclareRobustCommand{\-}
3770 {
3771 \discretionary
3772 {
3773 \char_ifnum\hyphenchar\font<\z@
3774 \xlx@defaulthyphenchar
3775 \else
3776 \hyphenchar\font
3777 \fi
3778 }{}{}
3779 }
3780 \def\xlx@defaulthyphenchar{\`-}

```

## 42.4 Verbatims

Many thanks to Apostolos Syropoulos for discovering this problem and writing the redefinition of L<sup>A</sup>T<sub>E</sub>X's verbatim environment and \verb\* command.

\fontspec\_visible\_space: Print U+2423: OPEN BOX, which is used to visibly display a space character.

```

3781 \cs_new:Nn \fontspec_visible_space:
3782 {
3783 \@@_primitive_font_glyph_if_exist:NnTF \font {"2423}
3784 { \char"2423\scan_stop: }
3785 { \fontspec_visible_space_fallback: }
3786 }

```

\fontspec\_visible\_space\_fallback: If the current font doesn't have U+2423: OPEN BOX, use Latin Modern Mono instead.

```
3787 \cs_new:Nn \fontspec_visible_space_fallback:
```

```

3788 {
3789 {
3790 \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
3791 \textvisiblespace
3792 }
3793 }

```

`\fontspec_print_visible_spaces:` Helper macro to turn spaces (`^~20`) active and print visible space instead.

```

3794 \group_begin:
3795 \char_set_catcode_active:n{"20}%
3796 \cs_gset:Npn\fontspec_print_visible_spaces:{%
3797 \char_set_catcode_active:n{"20}%
3798 \cs_set_eq:NN^~20\fontspec_visible_space:%
3799 }%
3800 \group_end:

\verb Redefine \verb to use \fontspec_print_visible_spaces.:
\verb* 3801 \def\verb
3802 {
3803 \relax\ifmmode\hbox\else\leavevmode\null\fi
3804 \bgroup
3805 \verb@eol@error \let\do\@makeother \dospecials
3806 \verbatim@font\@noligs
3807 \@ifstar\@sverb\@verb
3808 }
3809 \def\@sverb{\fontspec_print_visible_spaces:\@sverb}

```

It's better to put small things into `\AtBeginDocument`, so here we go:

```

3810 \AtBeginDocument
3811 {
3812 \fontspec_patch_verbatim:
3813 \fontspec_patch_moreverb:
3814 \fontspec_patch_fancyvrb:
3815 \fontspec_patch_listings:
3816 }

```

`\verb*` With the `verbatim` package.

```

3817 \cs_set:Npn \fontspec_patch_verbatim:
3818 {
3819 \@ifpackageloaded{verbatim}
3820 {
3821 \cs_set:cpn {verbatim*}
3822 {
3823 \group_begin: \verbatim \fontspec_print_visible_spaces: \verbatim@start
3824 }
3825 }

```

This is for vanilla L<sup>A</sup>T<sub>E</sub>X.

```

3826 {
3827 \cs_set:cpn {verbatim*}
3828 {
3829 \verbatim \fontspec_print_visible_spaces: \@sxverbatim

```

```

3830 }
3831 }
3832 }

```

`listingcont*` This is for moreverb. The main `listing*` environment inherits this definition.

```

3833 \cs_set:Npn \fontspec_patch_moreverb:
3834 {
3835 \@ifpackageloaded{moreverb}{
3836 \cs_set:cpn {listingcont*}
3837 {
3838 \cs_set:Npn \verbatim@processline
3839 {
3840 \the\listing@line \global\advance\listing@line\c_one
3841 \the\verbatim@line\par
3842 }
3843 \verbatim \fontspec_print_visible_spaces: \verbatim@start
3844 }
3845 }{}
3846 }

```

`listings` and `fancvrb` make things nice and easy:

```

3847 \cs_set:Npn \fontspec_patch_fancyvrb:
3848 {
3849 \ifpackageloaded{fancyvrb}
3850 {
3851 \cs_set_eq:NN \FancyVerbSpace \fontspec_visible_space:
3852 }{}
3853 }

3854 \cs_set:Npn \fontspec_patch_listings:
3855 {
3856 \ifpackageloaded{listings}
3857 {
3858 \cs_set_eq:NN \lst@visiblespace \fontspec_visible_space:
3859 }{}
3860 }

```

## 42.5 \oldstylenums

`\oldstylenums` This command obviously needs a redefinition. And we may as well provide the reverse `\liningnums` command.

```

3861 \RenewDocumentCommand \oldstylenums {m}
3862 {
3863 { \addfontfeature{Numbers=OldStyle} #1 }
3864 }
3865 \NewDocumentCommand \liningnums {m}
3866 {
3867 { \addfontfeature{Numbers=Lining} #1 }
3868 }
3869
```

# Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.

| Symbols                               |                                                                                                                                                                    |
