

Implementation of FOREST, a PGF/TikZ-based package for drawing linguistic trees

v2.1.2

Sašo Živanović*

December 31, 2016

This file contains the documented source of FOREST. If you are searching for the manual, follow this link to [forest-doc.pdf](#).

The latest release of the package, including the sources, can be found on [CTAN](#). For all versions of the package, including any non-yet-released work in progress, visit [FOREST's GitHub repo](#). Contributions are welcome.

A disclaimer: the code could've been much cleaner and better-documented ...

3 Patches

This macro implements a fairly safe patching mechanism: the code is only patched if the original hasn't changed. If it did change, a warning message is printed. (This produces a spurious warning when the new version of the code fixes something else too, but what the heck.)

```

133 \def\forest@patch#1#2#3#4#5{%
134   % #1 = cs to be patched
135   % #2 = purpose of the patch
136   % #3 = macro arguments
137   % #4 = original code
138   % #5 = patched code
139   \csdef{forest@original@#1}#3{#4}%
140   \csdef{forest@patched@#1}#3{#5}%
141   \ifcsequal{#1}{forest@original@#1}{%
142     \csletcs{#1}{forest@patched@#1}%

```

```

143 }{%
144   \ifcsequal{#1}{forest@patched@#1}{% all is good, the patch is in!
145   }{%
146     \PackageWarning{forest}{Failed patching '\expandafter\string\cname #1\endcsname'. Purpose of the patch
147     }{%
148   }%
149 }

```

Patches for PGF 3.0.0 — required version is [2013/12/13].

```

150 \forest@patch{pgfgettransform}{fix a leaking space}{#1}{%
151   \edef#1{\pgf@pt@aa}{\pgf@pt@ab}{\pgf@pt@ba}{\pgf@pt@bb}{\the\pgf@pt@x}{\the\pgf@pt@y}}
152 }{%
153   \edef#1{\pgf@pt@aa}{\pgf@pt@ab}{\pgf@pt@ba}{\pgf@pt@bb}{\the\pgf@pt@x}{\the\pgf@pt@y}}%
154 }

```

4 Utilities

This is handy.

```

4.2 Testing for numbers and dimensions

Test if the argument is an integer (only base 10) that can be assigned to a T_EX count register. This is supposed to be a fast, not complete test, as anything not recognized as an integer will be passed on to `pgfmath` (by the code that uses these macros).

We support `+s`, `-s` and spaces before the number. We don't support count registers.

Dilemma? Should `0abc` be interpreted as T_EX style (decimal) or PGF style (octal)? We go for T_EX style.

The return value will hide in T_EX-style `\if-macro \forest@isnum` and counter `\forest@isnum@count`.

```

700 \def\forest@eon{ }
701 \newif\ifforest@isnum@minus
702 \newif\ifforest@isnum
703 \def\forest@isnum#1{%
704 \forest@isnum@minusfalse
705 \let\forest@isnum@next\forest@isnum@finish

```

Expand in advance, like `pgfmath` does.

```
706 \edef\forest@isnum@temp{#1}%
```

Add two end-of-value markers. The first one might be eaten by count assignment: that's why there are two and they expand to a space.

```

707 \expandafter\forest@isnum@a\forest@isnum@temp\forest@eon\forest@eon\forest@END
708 \ifforest@isnum

4.3 forestmath

We imitate pgfmath a lot, but we remember the type of the result so that we can use TEX's primitives when possible.

```

881 \def\forestmath@type@generic{ } % generic (token list)
882 \def\forestmath@type@count{n} % integer
883 \def\forestmath@type@dimen{d} % a dimension: <decimal> pt
884 \def\forestmath@type@unitless{P} % <decimal> (a unitless dimension) (P because pgfmath returns such numbers)
885 \def\forestmath@type@textasc{t} % text (ascending)
886 \def\forestmath@type@textdesc{T} % text (descending)
887 \def\forestmath@type@none{} % internal (for requests - means whatever)
888 \def\forestmath@result{}
889 \let\forestmath@resulttype\forestmath@type@generic

```

`\forest@tryprocess` takes four “arguments”. The first is a true/false switch telling whether to return the full result array in case we have a `.process` expression. The second is a `forestmath` expression, delimited by `\forest@spacegen`: if it starts with a `>`, we take it to be a `.process` expression, evaluate it using `\forest@process`, and execute the third argument; if it doesn't, we execute the fourth argument.

```

```

Forestmath versions of `pgfmath` macros. They accept `process` and `pgfmath` expressions, as described above. In the case of a `pgfmath` expression, they use `\forest@isnum` and `\forest@isdim` for to see if they can avoid `pgfmath` evaluation. (These checks are generally faster than `pgfmath`'s fast track.)

```

1191 }

```

4.4 Sorting

Macro `\forest@sort` is the user interface to sorting.

The user should prepare the data in an arbitrarily encoded array,¹ and provide the sorting macro (given in #1) and the array let macro (given in #2): these are the only ways in which sorting algorithms access the data. Both user-given macros should take two parameters, which expand to array indices. The comparison macro should compare the given array items and call `\forest@sort@cmp@gt`, `\forest@sort@cmp@lt` or `\forest@sort@cmp@eq` to signal that the first item is greater than, less than, or equal to the second item. The let macro should “copy” the contents of the second item onto the first item.

The sorting direction is given in #3: it can be one of `\forest@sort@ascending` and `\forest@sort@descending`. #4 and #5 must expand to the lower and upper (both inclusive) indices of the array to be sorted.

`\forest@sort` is just a wrapper for the central sorting macro `\forest@@sort`, storing the comparison macro, the array let macro and the direction. The central sorting macro and the algorithm-specific macros take only two arguments: the array bounds.

```

1192 \def\forest@sort#1#2#3#4#5{%

```

¹In forest, arrays are encoded as families of macros. An array-macro name consists of the (optional, but recommended) prefix, the index, and the (optional) suffix (e.g. `\forest@42x`). Prefix establishes the “namespace”, while using more than one suffix simulates an array of named tuples. The length of the array is stored in macro `\<prefix>n`.

```

1193 \let\forest@sort@cmp#1\relax
1194 \let\forest@sort@let#2\relax
1195 \let\forest@sort@direction#3\relax
1196 \forest@sort@{#4}{#5}%
1197 }

```

The central sorting macro. Here it is decided which sorting algorithm will be used: for arrays at least `\forest@quicksort@minarraylength` long, quicksort is used; otherwise, insertion sort.

```

1198 \def\forest@quicksort@minarraylength{10000}
1199 \def\forest@sort#1#2{%

Below, several helpers for writing comparison macros are provided. They take two (pairs of) control sequence names and compare their contents.

Compare numbers.

```

1317 \def\forest@sort@cmpnumcs#1#2{%
1318   \ifnum\csname#1\endcsname>\csname#2\endcsname\relax
1319     \forest@sort@cmp@gt
1320   \else
1321     \ifnum\csname#1\endcsname<\csname#2\endcsname\relax
1322       \forest@sort@cmp@lt
1323     \else
1324       \forest@sort@cmp@eq
1325     \fi
1326   \fi
1327 }

```

Compare dimensions.

```

1328 \def\forest@sort@cmpdimcs#1#2{%
1329   \ifdim\csname#1\endcsname>\csname#2\endcsname\relax
1330     \forest@sort@cmp@gt
1331   \else
1332     \ifdim\csname#1\endcsname<\csname#2\endcsname\relax
1333       \forest@sort@cmp@lt
1334     \else
1335       \forest@sort@cmp@eq
1336     \fi
1337   \fi
1338 }

```

Compare points (pairs of dimension) (#1,#2) and (#3,#4).

```

1339 \def\forest@sort@cmptwodimcs#1#2#3#4{%
1340   \ifdim\csname#1\endcsname>\csname#3\endcsname\relax
1341     \forest@sort@cmp@gt
1342   \else
1343     \ifdim\csname#1\endcsname<\csname#3\endcsname\relax

```

```

1344     \forest@sort@cmp@lt
1345 \else
1346     \ifdim\csname#2\endcsname>\csname#4\endcsname\relax
1347     \forest@sort@cmp@gt
1348 \else
1349     \ifdim\csname#2\endcsname<\csname#4\endcsname\relax
1350     \forest@sort@cmp@lt
1351 \else
1352     \forest@sort@cmp@eq
1353 \fi
1354 \fi
1355 \fi
1356 \fi
1357 }

```

The following macro reverses an array. The arguments: #1 is the array let macro; #2 is the start index (inclusive), and #3 is the end index (exclusive).

```

1358 \def\forest@reversearray#1#2#3{%
1359 \let\forest@sort@let#1%
1360 \c@pgf@countc=#2
1361 \c@pgf@countd=#3
1362 \advance\c@pgf@countd -1
1363 \safeloop
1364 \ifnum\c@pgf@countc<\c@pgf@countd\relax
1365 \forest@sort@exch{\the\c@pgf@countc}{\the\c@pgf@countd}%
1366 \advance\c@pgf@countc 1
1367 \advance\c@pgf@countd -1
1368 \saferepeat
1369 }

```

5 The bracket representation parser

5.1 The user interface macros

Settings.

```

1370 \def\bracketset#1{\pgfkeys{/bracket}{#1}}%
1371 \bracketset{%
1372 /bracket/.is family,
1373 /handlers/.let/.style={\pgfkeyscurrentpath/.code={\let#1#1}},
1374 opening bracket/.let=\bracket@openingBracket,
1375 closing bracket/.let=\bracket@closingBracket,
1376 action character/.let=\bracket@actionCharacter,
1377 opening bracket=[,
1378 closing bracket=],
1379 action character,
1380 new node/.code n args={3}{% #1=preamble, #2=node spec, #3=cs receiving the id
1381 \forest@node@new#3%
1382 \forest@set{#3}{given options}{\forest@contentto=\unexpanded{#2}}%
1383 \ifblank{#1}{}{%
1384 \forestrset{preamble}{#1}%
1385 }%
1386 },
1387 set afterthought/.code 2 args={% #1=node id, #2=afterthought
1388 \ifblank{#2}{}{\forest@appto{#1}{given options}{,afterthought={#2}}}%
1389 }
1390 }

```

`\bracketParse` is the macro that should be called to parse a balanced bracket representation. It takes two parameters: #1 is the code that will be run after parsing the bracket; #2 is a control sequence

that will receive the id of the root of the created tree structure. (The bracket representation should follow (after optional spaces), but is not a formal parameter of the macro.)

```
1391 \newtoks\bracket@content
1392 \newtoks\bracket@afterthought
1393 \def\bracketParse#1#2={%
1394   \def\bracketEndParsingHook{#1}%
1395   \def\bracket@saveRootNodeTo{#2}%
```

Content and afterthought will be appended to these macros. (The `\bracket@afterthought` toks register is abused for storing the preamble as well — that’s ok, the preamble comes before any afterthoughts.)

```
1396 \bracket@content={}%
1397 \bracket@afterthought={}%
```

The parser can be in three states: in content (0), in afterthought (1), or starting (2). While in the content/afterthought state, the parser appends all non-control tokens to the content/afterthought macro.

```
1398 \let\bracket@state\bracket@state@starting
1399 \bracket@ignorespacestrue
```

By default, don’t expand anything.

```
1400 \bracket@expandtokensfalse
```

We initialize several control sequences that are used to store some nodes while parsing.

```
1401 \def\bracket@parentNode{0}%
1402 \def\bracket@rootNode{0}%
1403 \def\bracket@newNode{0}%
1404 \def\bracket@afterthoughtNode{0}%
```

Finally, we start the parser.

```
1405 \bracket@Parse
1406 }
```

The other macro that an end user (actually a power user) can use, is actually just a synonym for `\bracket@Parse`. It should be used to resume parsing when the action code has finished its work.

```
1407 \def\bracketResume{\bracket@Parse}%
```

5.2 Parsing

We first check if the next token is a space. Spaces need special treatment because they are eaten by both the `\romannumeral` trick and T_EXs (undelimited) argument parsing algorithm. If a space is found, remember that, eat it up, and restart the parsing.

```
1408 \def\bracket@Parse{%
1409   \futurelet\bracket@next@token\bracket@Parse@checkForSpace
1410 }
1411 \def\bracket@Parse@checkForSpace{%
1412   \expandafter\ifx\space\bracket@next@token\@escapeif{%
1413     \ifbracket@ignorespaces\else
1414       \bracket@haveSpacetrue
1415       \fi
1416     \expandafter\bracket@Parse\romannumeral-‘0%
1417   }\else\@escapeif{%
1418     \bracket@Parse@maybeexpand
1419   }\fi
1420 }
```

We either fully expand the next token (using a popular T_EXnical trick ...) or don’t expand it at all, depending on the state of `\ifbracket@expandtokens`.

```
1421 \newif\ifbracket@expandtokens
1422 \def\bracket@Parse@maybeexpand{%
1423   \ifbracket@expandtokens\@escapeif{%
1424     \expandafter\bracket@Parse@peekAhead\romannumeral-‘0%
1425   }\else\@escapeif{%
1426     \bracket@Parse@peekAhead
```

```
1427 }\fi
1428 }
```

We then look ahead to see what's coming.

```
1429 \def\bracket@Parse@peekAhead{%
1430 \futurelet\bracket@next@token\bracket@Parse@checkForTeXGroup
1431 }
```

If the next token is a begin-group token, we append the whole group to the content or afterthought macro, depending on the state.

```
1432 \def\bracket@Parse@checkForTeXGroup{%
1433 \ifx\bracket@next@token\bgroup%
1434 \escapeif{\bracket@Parse@appendGroup}%
1435 \else
1436 \escapeif{\bracket@Parse@token}%
1437 \fi
1438 }
```

This is easy: if a control token is found, run the appropriate macro; otherwise, append the token to the content or afterthought macro, depending on the state.

```
1439 \long\def\bracket@Parse@token#1{%
1440 \ifx#1\bracket@openingBracket
1441 \escapeif{\bracket@Parse@openingBracketFound}%
1442 \else
1443 \escapeif{%
1444 \ifx#1\bracket@closingBracket
1445 \escapeif{\bracket@Parse@closingBracketFound}%
1446 \else
1447 \escapeif{%
1448 \ifx#1\bracket@actionCharacter
1449 \escapeif{\futurelet\bracket@next@token\bracket@Parse@actionCharacterFound}%
1450 \else
1451 \escapeif{\bracket@Parse@appendToken#1}%
1452 \fi
1453 }%
1454 \fi
1455 }%
1456 \fi
1457 }
```

Append the token or group to the content or afterthought macro. If a space was found previously, append it as well.

```
1458 \newif\ifbracket@haveSpace
1459 \newif\ifbracket@ignorespaces
1460 \def\bracket@Parse@appendSpace{%
1461 \ifbracket@haveSpace

```

5.3 The tree-structure interface

This macro creates a new node and sets its content (and preamble, if it's a root node). Bracket user must define a 3-arg key `/bracket/new node=<preamble><node specification><node cs>`. User's key must define `<node cs>` to be a macro holding the node's id.

```

1587 \def\bracket@createNode{%
1588 \ifnum\bracket@rootNode=0
1589 % root node
1590 \bracketset{new node/.expanded=%
1591 {\the\bracket@afterthought}}%
1592 {\the\bracket@content}}%
1593 \noexpand\bracket@newNode
1594 }%
1595 \bracket@afterthought={}%
1596 \let\bracket@rootNode\bracket@newNode
1597 \expandafter\let\bracket@saveRootNodeTo\bracket@newNode
1598 \else
1599 % other nodes
1600 \bracketset{new node/.expanded=%
1601 {}}%
1602 {\the\bracket@content}}%
1603 \noexpand\bracket@newNode
1604 }%
1605 \fi
1606 \bracket@content={}%
1607 }

```

This macro sets the afterthought. Bracket user must define a 2-arg key `/bracket/set_afterthought=<node id><afterthought>`.

```

1608 \def\bracket@addAfterthought{%

```

```

1609 \bracketset{%
1610   set afterthought/.expanded={\bracket@afterthoughtNode}{\the\bracket@afterthought}%
1611 }%
1612 \bracket@afterthought={}%
1613 }

```

6 Nodes

Nodes have numeric ids. The node option values of node n are saved in the `\pgfkeys` tree in path `/forest/@node/n`.

6.1 Option setting and retrieval

Macros for retrieving/setting node options of the current node.

The short-form step mechanism. The complication is that we want to be able to collect tikz and pgf options here, and it is impossible(?) to know in advance what keys are valid there. So we rather check whether the given keyname is a sequence of short steps; if not, we pass the key on.

8.2 Packing

Method `pack` should be called to calculate the positions of descendant nodes; the positions are stored in attributes `l` and `s` of these nodes, in a level/sibling coordinate system with origin at the parent's anchor.

```

```

Get the child's (cached) edge, translate it by the child's position, and add it to the path holding all edges. Also add the edge from parent to the child to the path. This gets complicated when the child and/or parent anchor is empty, i.e. automatic border: we can get self-intersecting paths. So we store all the parent-child edges to a safe place first, compute all the possible breaking points (i.e. all the points in node@edge path), and break the parent-child edges on these points.

9 Geometry

A α *grow line* is a line through the origin at angle α . The following macro sets up the grow line, which can then be used by other code (the change is local to the \TeX group). More precisely, two normalized vectors are set up: one (x_g, y_g) on the grow line, and one (x_s, y_s) orthogonal to it—to get (x_s, y_s) , rotate (x_g, y_g) 90° counter-clockwise.

```

7639 \newdimen\forest@xg
7640 \newdimen\forest@yg
7641 \newdimen\forest@xs
7642 \newdimen\forest@ys
7643 \def\forest@setupgrowline#1{%
7644 \edef\forest@grow{#1}%
7645 \pgfpointpolar{\forest@grow}{1pt}%
7646 \forest@xg=\pgf@x
7647 \forest@yg=\pgf@y
7648 \forest@xs=-\pgf@y
7649 \forest@ys=\pgf@x
7650 }

```

9.1 Projections

The following macro belongs to the `\pgfpoint...` family: it projects point #1 on the grow line. (The result is returned via `\pgf@x` and `\pgf@y`.) The implementation is based on code from `tikzlibrarycalc`, but optimized for projecting on grow lines, and split to optimize serial usage in `\forest@projectpath`.

```

7651 \def\forest@pgfpointprojectiontogrowline#1{%
7652 \pgf@process{#1}%

```

Calculate the scalar product of (x, y) and (x_g, y_g) : that's the distance of (x, y) to the grow line.

```

7653 \pgfutil@tempdima=\pgf@sys@tonumber{\pgf@x}\forest@xg%
7654 \advance\pgfutil@tempdima by\pgf@sys@tonumber{\pgf@y}\forest@yg%

```

The projection is (x_g, y_g) scaled by the distance.

```

7655 \global\pgf@x=\pgf@sys@tonumber{\pgfutil@tempdima}\forest@xg%
7656 \global\pgf@y=\pgf@sys@tonumber{\pgfutil@tempdima}\forest@yg%
7657 }}

```

The following macro calculates the distance of point #2 to the grow line and stores the result in TeX-dimension #1. The distance is the scalar product of the point vector and the normalized vector orthogonal to the grow line.

```

7658 \def\forest@distancetogrowline#1#2{%
7659   \pgf@process{#2}%
7660   #1=\pgf@sys@tonumber{\pgf@x}\forest@xs\relax
7661   \advance#1 by\pgf@sys@tonumber{\pgf@y}\forest@ys\relax
7662 }

```

Note that the distance to the grow line is positive for points on one of its sides and negative for points on the other side. (It is positive on the side which (x_s, y_s) points to.) We thus say that the grow line partitions the plane into a *positive* and a *negative* side.

The following macro projects all segment edges (“points”) of a simple² path #1 onto the grow line. The result is an array of tuples (x_o, y_o, x_p, y_p) , where x_o and y_o stand for the *original* point, and x_p and y_p stand for its *projection*. The prefix of the array is given by #2. If the array already exists, the new items are appended to it. The array is not sorted: the order of original points in the array is their order in the path. The computation does not destroy the current path. All result-macros have local scope.

The macro is just a wrapper for `\forest@projectpath@process`.

```

```

The following macro processes the data gathered by (possibly more than one invocation of) `\forest@projectpath@trowline` into array with prefix #1. The resulting data is the following.

- Array of projections (prefix #2)
 - its items are tuples (x, y) (the array is sorted by x and y), and

²A path is *simple* if it consists of only move-to and line-to operations.

- an inner array of original points (prefix #2N@, where N is the index of the item in array #2. The items of #2N@ are x, y and d: x and y are the coordinates of the original point; d is its distance to the grow line. The inner array is not sorted.

- A dictionary #2: keys are the coordinates (x,y) of the original points; a value is the index of the original point's projection in array #2.³

```
7693 \def\forest@processprojectioninfo#1#2{%
7694 \edef\forest@ppi@inputprefix{#1}%
```

Loop (counter \c@pgf@counta) through the sorted array of raw data.

```

9.2 Break path

The following macro computes from the given path (#1) a “broken” path (#3) that contains the same points of the plane, but has potentially more segments, so that, for every point from a given set of points on the grow line, a line through this point perpendicular to the grow line intersects the broken path only at its edge segments (i.e. not between them).

The macro works only for *simple* paths, i.e. paths built using only move-to and line-to operations. Furthermore, `\forest@processprojectioninfo` must be called before calling `\forest@breakpath`: we expect information with prefix #2. The macro updates the information compiled by `\forest@processprojectioninfo` with information about points added by path-breaking.

```

7758 \def\forest@breakpath#1#2#3{%
    Store the current path in a macro and empty it, then process the stored path. The processing creates a
    new current path.
7759   \edef\forest@bp@prefix{#2}%
7760   \forest@save@pgfsyssoftpath@tokendefs
7761   \let\pgfsyssoftpath@movetotoken\forest@breakpath@processfirstpoint
7762   \let\pgfsyssoftpath@linetotoken\forest@breakpath@processfirstpoint
7763   \pgfusepath{}% empty the current path. ok?
7764   #1%
7765   \forest@restore@pgfsyssoftpath@tokendefs
7766   \pgfsyssoftpath@getcurrentpath#3%
7767 }

```

The original and the broken path start in the same way. (This code implicitly “repairs” a path that starts illegally, with a line-to operation.)

```
7768 \def\forest@breakpath@processfirstpoint#1#2{%
7769   \forest@breakpath@processmoveto{#1}{#2}%
7770   \let\pgfsyssoftpath@movetotoken\forest@breakpath@processmoveto
7771   \let\pgfsyssoftpath@linetotoken\forest@breakpath@processlineto
7772 }
```

When a move-to operation is encountered, it is simply copied to the broken path, starting a new subpath. Then we remember the last point, its projection’s index (the point dictionary is used here) and the actual projection point.

```
7773 \def\forest@breakpath@processmoveto#1#2{%
7774   \pgfsyssoftpath@moveto{#1}{#2}%
7775   \def\forest@previous@x{#1}%

Patch for speed: no need to call \pgfmathparse here.
7838 \patchcmd{\pgfpointintersectionoflines}{\pgfpoint}{\pgfpoint}{}{}

```

9.3 Get tight edge of path

This is one of the central algorithms of the package. Given a simple path and a grow line, this method computes its (negative and positive) “tight edge”, which we (informally) define as follows.

Imagine an infinitely long light source parallel to the grow line, on the grow line’s negative/positive side.⁴ Furthermore imagine that the path is opaque. Then the negative/positive tight edge of the path is the part of the path that is illuminated.

This macro takes three arguments: #1 is the path; #2 and #3 are macros which will receive the negative and the positive edge, respectively. The edges are returned in the softpath format. Grow line should be set before calling this macro.

Enclose the computation in a \TeX group. This is actually quite crucial: if there was no enclosure, the temporary data (the segment dictionary, to be precise) computed by the prior invocations of the macro could corrupt the computation in the current invocation.

⁴For the definition of negative/positive side, see `forest@distancetogrowline` in §9.1

```

Test whether [the current point]–[the next point] or [the next point]–[the current point] is a segment in the (broken) path. The first segment found is the one with the minimal/maximal distance (depending on the sort order of arrays of points projecting to the same projection) to the grow line.

Note that for this to work in all cases, the original path should have been broken on its self-intersections. However, a careful reader will probably remember that `\forest@breakpath` does *not* break the path at its self-intersections. This is omitted for performance reasons. Given the intended use of the algorithm (calculating edges of subtrees), self-intersecting paths cannot arise anyway, if only the node boundaries are non-self-intersecting. So, a warning: if you develop a new shape and write a macro computing its boundary, make sure that the computed boundary path is non-self-intersecting!

```

10.2 The forest environment

There are three ways to invoke FOREST: the environment and the starless and the starred version of the macro. The latter creates no group.

Most of the code in this section deals with externalization.

```

8469 \NewDocumentEnvironment{forest}{D()}{}{%

Usage: `\forestStandardNode[#1]{#2}{#3}{#4}`. #1 = standard node specification — specify it as any other node content (but without children, of course). #2 = the environment fingerprint: list the values of parameters that influence the standard node’s height and depth; the standard will be adjusted whenever any of these parameters changes. #3 = the calibration procedure: a list of usual forest options which should calculating the values of exported options. #4 = a comma-separated list of exported options: every newly created node receives the initial values of exported options from the standard node. (The standard node definition is local to the \TeX group.)

Define the default standard node. Standard content: `dj` — in Computer Modern font, `d` is the highest and `j` the deepest letter (not character!). Environment fingerprint: the height of the strut and the values of inner and outer seps. Calibration procedure: (i) `1 sep` equals the height of the strut plus the value of `inner ysep`, implementing both font-size and inner sep dependency; (ii) The effect of `l` on the standard node should be the same as the effect of `1 sep`, thus, we derive `l` from `1 sep` by adding to the latter the total height of the standard node (plus the double outer sep, one for the parent and one for the child). (iii) `s sep` is straightforward: a double inner xsep. Exported options: options, calculated in the calibration. (Tricks: to change the default anchor, set it in #1 and export it; to set a non-forest node

option (such as draw or blue) as default, set it in #1 and export the (internal) option node options.)

10.6 Anchors

FOREST anchors are (child/parent)_anchor and growth anchors parent/children_first/last. The following code resolves them into TikZ anchors, based on the value of option (child/parent)_anchor and values of grow and reversed.

We need to access rotate for the anchors below to work in general.

```

8820 \forestset{
8821   declare count={rotate}{0},
8822   autoforward'={rotate}{node options},
8823 }

```

Variants of parent/children_first/last without ' snap border anchors to the closest compass direction.

```

8824 \newif\ifforest@anchor@snapbordertocompass

```

The code is used both in generic anchors (then, the result should be forwarded to TikZ for evaluation into coordinates) and in the UI macro \forestanchortotikzanchor.

```

8825 \newif\ifforest@anchor@forwardtotikz

```

Growth-based anchors set this to true to signal that the result is a border anchor.

```

8826 \newif\ifforest@anchor@isborder

```

The UI macro.

```
