 $\mathbf{2}$

Summary

The getfiledate package fetches from the system the date of last modification or opening of a resident file. It is based on an idea by Heiko Oberdiek <oberdiek@uni-freiburg.de> that appeared in February 2009 on the discussion/newsgroup website comp.text.tex, namely, using the \pdffilemoddate command of pdfT_EX. My contribution has been to create a user-friendly interface for obtaining and presenting the needed filedate in several formats.

1 User interface

The package may be loaded without options as in

```
\usepackage{getfiledate}
```

or with options as in

2 \usepackage[option=value]{getfiledate}

The options include the filename for which you want to print the date of last modification. The options and their default values are described in section 2. It is advisable to first load the package by \usepackage{getfiledate} and then use the macro \getfiledate to dynamically determine and print the date of last modification of the filename. This macro sets the various options.

Page 2 of 6

2 Package options

The package options are listed in Table 1 below.

Option	Default	Meaning
file	getfiledate.sty	The file for which the date of last mod- ification is required.
prefix	The date of last modi- fication of file	The prefix of filedate.
width	\hsize	The width of the parbox or boxedmini- page containing the filedate.
head	0ex	The vertical separation between the paragraph before the filedate and the filedate itself. When this option is passed to package without value, its default becomes the \baselineskip .
foot	0ex	The vertical skip between the filedate's line and the paragraph after filedate. When this option is passed to package without value, its default becomes the \baselineskip.
marker	\blacktriangle- right	The mark before the filedate, on the same line with the filedate.
markercolor	blue	The color of the marker.
filenamecolor	blue	The color of the filename.
datecolor	blue	The color of filedate.
inlinespace	lem	The horizontal separation between the marker and the filedate.
separator	\textbullet	The marker between the filedate and filetime.
separatorcolor	black	The color of the separator.
framecolor	black	The color of the boxrule for the boxed- minipage.
framesep	3pt	The \fboxsep for the boxedminipage.
framerule	0.4pt	The $\for the boxed minipage.$
align	justified	Alignment of the boxedminipage (possible values are center, left, right and justified).

3 Examples

Example 1

The simplest example is to use the \getfiledate macro in the following way:

3

\getfiledate{file={dir/filename.ext}}

for which the default values of the package options will be used. For the sample file test1.tex, the outcome of this will be:

▶ The date of last modification of file test1.tex was 2009-03-12 • 22:37:26.

You can, however, use package options to customize the format of the result. The following examples illustrate the most important issues in using this package.

Example 2

The example in this section was obtained with the following settings. There are values specified for head and foot.

```
4 \getfiledate{file={test1.tex},head=.1\baselineskip,
5 foot=2\baselineskip,markercolor=magenta,filenamecolor=brown,
6 datecolor=orange,inlinespace=.5em,marker=$\blacktriangleright$,
7 separator
8 }
```

The outcome of this is:

▶ The date of last modification of file test1.tex was 2009-03-12 • 22:37:26.

If you don't need the marker, you can set marker={} as follows

```
9 \getfiledate{file={test1.tex},head=\baselineskip,
10 foot=\baselineskip,width=.6\hsize,filenamecolor=brown,
11 prefix=The date of final changes to file,
12 datecolor=orange,inlinespace=.5em,boxed=false,
13 separator=$\spadesuit$,separatorcolor=green,
14 marker={},align=center
15 }
```

to get:

The date of final changes to file test1.tex was 2009- $03-12 \Leftrightarrow 22:37:26$.

If you simply remove marker from the key-value list, the marker will retain the last value you set for it rather than the default value (which is nil).

The user should note:

• The inclusion of the width (=0.6\hsize) in the above example. The width will maintain this value until it is changed again, as in the following example.

- The change of prefix here. The default value of prefix is The date of last modification of file. The prefix will maintain this value until it is changed in the next call (see the next example).
- The use of the key-value align=center above. The key align can assume values of center, left, right, and justified. Any other value for align will be rejected by the package.

Example 3

The example in this section was obtained with the following settings:

```
16 \colorlet{redgreen}{red!55!green!65}
18 \getfiledate{file={test2.tex},head=0ex,foot=\baselineskip,
19 prefix,width=\hsize,markercolor=magenta,filenamecolor=red,
20 datecolor=violet,inlinespace=.5em,marker=$\triangleright$,
21 separator=$\clubsuit$,separatorcolor=redgreen
22 }
```

The outcome is:

 \triangleright The date of last modification of file test2.tex was 2009-04-08 \clubsuit 21:52:04.

Here we simply passed the prefix without value so that its default value was used.

Example 4

The example in this section was obtained with the following settings:

```
23 \getfiledate{file={test3.tex},head=\baselineskip,
24 foot=2\baselineskip,markercolor=red!65,filenamecolor=blue,
25 datecolor=orange,inlinespace=.5em,marker={$\star$},
26 separator=$\Diamond$,separatorcolor=red
27 }
```

The outcome is:

 \star The date of last modification of file test 3.tex was 2009-03-13 \Diamond 17:19:00.

Example 5

29

The example in this section was obtained with the following settings:

```
28 \getfiledate{file={test4.tex},head=\baselineskip,foot=2ex,
```

```
markercolor=cyan,filenamecolor=blue,datecolor=orange,
```

30 inlinespace=.5em,marker={\$\blacktriangleright\$},

The outcome is:

▶ The date of last modification of file test4.tex was $2009-03-12 \heartsuit 02:35:38$.

Example 6

The example in this section was obtained with the following settings:

```
33 \getfiledate{file={test5.tex},head=1ex,foot=1ex,
34 markercolor=purple,filenamecolor=blue,
35 datecolor=orange,inlinespace=.5em,
36 marker={$\blacktriangleright$},separator={}
37 } % The separator is nil here.
```

The outcome of this is:

▶ The date of last modification of file test5.tex was 2009-03-24 11:35:16.

Example 7

Instead of keeping head and foot, you may instead decide to frame your result, as follows:

```
38 \getfiledate{file={test5.tex},head=.5\baselineskip,

39 foot=.5\baselineskip,width=12.5cm,framesep=5pt,framerule=.4pt,

40 align=center,markercolor=purple,filenamecolor=blue,

41 datecolor=orange,marker={$\blacktriangleright$},

42 separator=$\heartsuit$,boxed

43 } % marker has no effect here.
```

The outcome is:

The date of last modification of file test5.tex was 2009-03-24 \heartsuit 11:35:16.

The boolean option boxed has the default value of true when listed in the key-value list. If you set the key boxed(=true) in one call to the \getfiledate macro, and you don't want the filedate to be boxed subsequently, you have to turn it off (i.e., enter boxed=false) in the next call to \getfiledate. The choice boxed(=true) automatically turns off marker irrespective of whether or not you have submitted a value to this key in \getfiledate macro. In the above example, the reader will notice that the setting marker=\blacktriangleright has no effect on the outcome. For the boxed filedates, you can set the options framesep and framerule (equivalents of LATEX's native \fboxsep and \fboxrule) as follows:

```
44 \getfiledate{file={test5.tex},head=\baselineskip,
45 foot=1ex,marker={$\blacktriangleright$},markercolor=purple,
46 filenamecolor=blue,width=.9\hsize,datecolor=orange,
47 inlinespace=.5em,align=left,boxed,separator=$\blacklozenge$,
48 framesep=5pt,framerule=2pt
49 } % marker has no effect here.
```

The outcome of this is:

The date of last modification of file test5.tex was $2009-03-24 \blacklozenge 11:35:16$.

The default values of framesep and framerule are 3pt and 0.4pt (\square TEX's native values for \fboxsep and \fboxrule). The user should note that the keys framesep and framerule should, of course, be submitted without backslashes (e.g., framesep=5pt and framerule=2pt).

You can change the box color as in

```
50 \getfiledate{file={test5.tex},head=\baselineskip,
51 foot=\baselineskip,markercolor=purple,filenamecolor=blue,
52 datecolor=orange,width=8cm,align=right,boxed,framesep=5pt,
53 framerule=2pt,separator=$\Diamond$,framecolor=green
54 }
```

The outcome of this is:

The date of last modification of file test5.tex was $2009-03-24 \diamond 11:35:16$.

This box color will remain in force until it is changed again. The default value of framecolor is black.
