Abstract

The goal of this package is the simplest possible provision of map images (OpenStreetMap, Google Maps and Google Street View are supported). In the simplest case, the specification of an address is sufficient. The package loads the map using the `\write18` feature, which you must activate to use this package. The image will be downloaded by an external Lua script. You can use this script also from the command line.

Acknowledgment

I want to thank Norbert Preining, who did most of the recoding of `osmimage` (Bash → Lua). Moreover many thanks to Taco Hoekwater, Reinhard Kotucha and Heiko Oberdiek for their valuable contributions.

1 Options

The following options can be used as package options with global scope, as well as options for the `\getmap` command with local scope!

1.1 mode (`osm|gm|gsv`)

This option sets the mode, that is the source of the images. OpenStreetMap, Google Maps or Google Street View!

1.2 key (`Fmjtd|luur20u22d,75=05-9aylh6`)

In `osm` mode, the download script requires a key in order to use the service of MapQuest. By default, it uses a key, which is registered for `getmap`. But you can register and use your own key with this option. The default key is stored in `getmap.cfg`. You can copy this file to your local \TeX tree and store your own key there¹! This file will be found after running `texhash`!

1.3 scale (`3385` (`osm`), `1` (`gm`))

`osm`: This option allows you to specify a display scale for the map image in the range of 1692 – 221871572. You will not necessarily see a difference between 5000 and 5500. A scale value of 3385 corresponds to a zoom level of 17.

`gm`: For the free version of Google Maps the image size is limited to 640x640. You can set `scale` to a value of 2, to get exactly the same map in doubled size in pixels.

1.4 zoom

This option allows you to specify a zoom level in the range of 1 – 18 (`osm` - this option overwrites a possibly given `scale`) or 0 – 21 (`gm`).

1.5 xsize (`600`)

This option specifies the width of the map in pixels. If you only want to slightly increase or decrease the map extract, you should adjust the size of the map. You still have full control over the size of the map in the document with the options of `\includegraphics`. (max: 3840 (`osm`) or 640 (`gm`))

changed default value to 600 in version 1.2!

¹Mapquest will deliver an url-encoded key, which must be decoded to ASCII, e.g. by [Url decode](#)

1.6 `ysize` (400)

This option specifies the height of the map in pixels. max: 3840 (osm) or 640 (gm)

1.7 `file` (getmap)

This option allows you to specify the name of the image (without extension).

1.8 `imagetype` (png)

This option allows you to specify the type of the image.

osm: png|jpeg|jpg|gif

gm: png|png8|png32|gif|jpg (progressive)|jpg-baseline (flat)

1.9 `type` (map (osm)|roadmap (gm))

This option specifies the type of the map.

osm: map|sat|hyb It seems as if there would be only a few regions of Mother Earth, for which satellite and hybrid images are available.

gm: roadmap|satellite|hybrid|terrain

1.10 `color` (yellow_1) (osm)|blue (gm))

This option specifies the color of the marker. Possible colors:

osm <http://open.mapquestapi.com/staticmap/icons.html>

gm: black, brown, green, purple, yellow, blue, gray, orange, red, white or in hex format 0x3399FF

1.11 `number` (1)

This option specifies the number of the marker.

1.12 `heading` (0)

This option specifies the heading (direction) in degrees in the range of 0 – 360 (gsv mode). (0: north, 90: east, ...)

changed default value to `getmap` in version 1.2!

1.13 pitch (0)

This option specifies the pitch (angle) of the camera view in degrees in the range of -90 – 90 (gsv mode).

1.14 fov (90)

This option specifies the field of horizontal view (kind of zoom) in degrees in the range of 0 – 120 (gsv mode).

1.15 inputencoding

This option specifies the input encoding of your file. The download script requires the strings encoded in utf8. For the safe conversion the input encoding of the file is required. Normally, you don't have to specify an encoding. The package tries to evaluate the encoding given to inputenc or assumes utf8. Usually that should work.

1.16 overwrite (false|true)

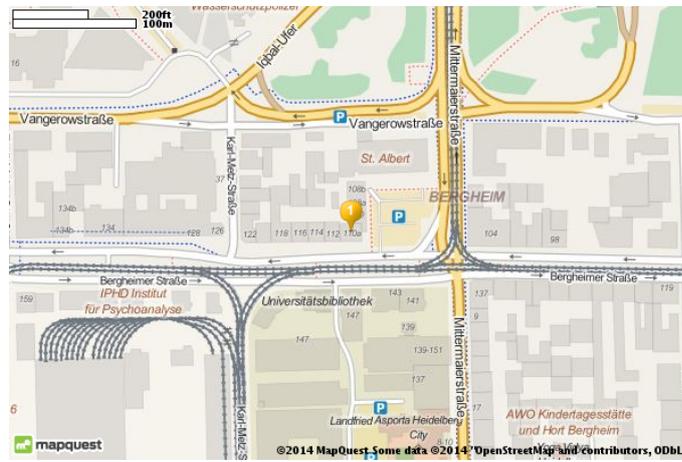

With this option, you can specify whether the image should be downloaded in any case. By default, the option is set to false in order to save bandwidth and compilation time. Nevertheless a check is performed on the existence of the image and the image will be downloaded, if it is not present. In the case of true, the image will be downloaded anyway! BTW, overwrite is equivalent to overwrite=true.

2 Command(s)

2.1 \getmap

`\getmap[options]{address}` With the `\getmap` command you can download a map, if you enable `\write18` (TeXLive: `-shell-escape`, MiKTeX: `--enable-write18`). This is only necessary if you actually download an image. You can use the options described above to specify the properties of the downloaded image. After executing the command, the image is available in the current working directory!

In the simplest case, you only need an address, a POI or geographic coordinates (`latitude, longitude`) to download the map. `{address}` must be fully expanded and must not contain macros! By default, the image is saved under the name `getmap.png`! If you need only one map (e.g. the office of Dante e.V.) in your document, it can be as simple as:

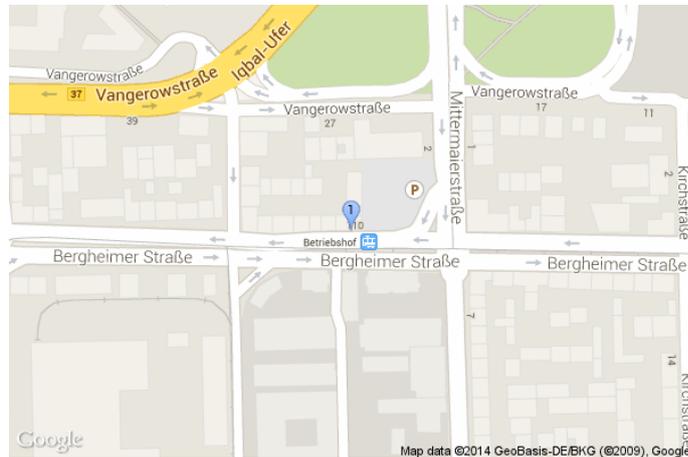

```
1 \getmap{Bergheimer Straße 110A, 69115 Heidelberg, Germany}  
2 \includegraphics[width=9cm]{getmap}
```

3 Examples

The same map as before from Google Maps:

```

1 \getmap[file=dantegm,mode=gm]{Bergheimer Straße 110A,%
2                               69115 Heidelberg, Germany}
3 \includegraphics[width=9cm]{dantegm}

```

The same map as satellite image:

```

1 \getmap[file=dantegmsat,mode=gm,type=satellite]
2       {Bergheimer Straße 110A, 69115 Heidelberg, Germany}
3 \includegraphics[width=9cm]{dantegmsat}

```

L'afrique, mon amour!

```

1 \getmap[file=africa,mode=gm,type=terrain,xsize=500,ysize=500,%
2   scale=2,zoom=3]{0,16}
3 \includegraphics[width=9cm]{africa}

```

L'amour, ...

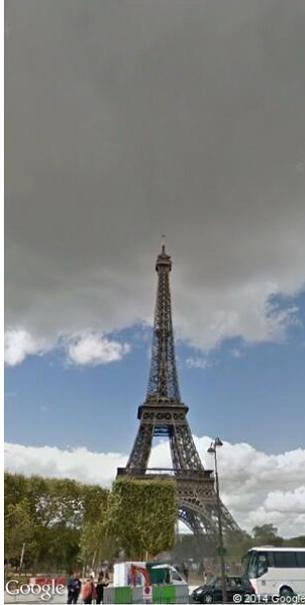

```

1 \getmap[file=paris,mode=gm,type=hybrid,xsize=500,ysize=300,%
2   scale=2,zoom=16]{Tour Eiffel, Paris}
3 \includegraphics[width=9cm]{paris}

```

Street View now:

```
1 \getmap[file=parisgsv,mode=gsv,heading=320,pitch=30,fov=40,%  
2 xsize=300,ysize=600]{Avenue Piere-Loti, Paris}  
3 \includegraphics[width=4cm]{parisgsv}
```

and from the platform:

```
1 \getmap[file=parisgsvp,mode=gsv,heading=30,pitch=-25,fov=60]%  
2 {Tour Eiffel, Paris}  
3 \includegraphics[width=8cm]{parisgsvp}
```

4 Implementation

```
1 ⟨*package⟩
```

First, we provide the L^AT_EX package `getmap`.

```
2 \NeedsTeXFormat{LaTeX2e}%
3 \ProvidesPackage{getmap}[2014/07/19 v1.3 getmap.sty - Josef Kleber (C) 2014]%
```

We need a few packages!

```
4 \RequirePackage{xkeyval}%
5 \RequirePackage{stringenc}%
6 \RequirePackage{ifthen}%
```

We provide a macro `\GM@JK@define@key`, which defines package options with global scope and options for `\getmap` with local scope. It takes four arguments $\{ \langle prefix \rangle \}$, $\{ \langle package \rangle \}$, $\{ \langle option \rangle \}$ and $\{ \langle default \rangle \}$.

```
7 \newcommand*\GM@JK@define@key[4]%
8 {%
9   \expandafter\gdef\csname#1@#3\endcsname{#4}%
10  \define@key{#2.sty}{#3}[#4]%
11  {%
12    \expandafter\gdef\csname#1@#3\endcsname{##1}%
13  }%
14  \define@key{#2}{#3}%
15  {%
16    \expandafter\def\csname#1@#3\endcsname{##1}%
17  }%
18 }%
```

Now, we can use this macro to define our options.

```
19 \GM@JK@define@key{GM@JK}{getmap}{mode}{osm}%
20 \GM@JK@define@key{GM@JK}{getmap}{key}{}%
21 \GM@JK@define@key{GM@JK}{getmap}{xsize}{600}%
22 \GM@JK@define@key{GM@JK}{getmap}{ysize}{400}%
23 \GM@JK@define@key{GM@JK}{getmap}{scale}{3385}%
24 \GM@JK@define@key{GM@JK}{getmap}{zoom}{}%
25 \GM@JK@define@key{GM@JK}{getmap}{type}{map}%
26 \GM@JK@define@key{GM@JK}{getmap}{imagetype}{png}%
27 \GM@JK@define@key{GM@JK}{getmap}{color}{yellow_1}%
28 \GM@JK@define@key{GM@JK}{getmap}{number}{1}%
29 \GM@JK@define@key{GM@JK}{getmap}{heading}{0}%
30 \GM@JK@define@key{GM@JK}{getmap}{fov}{90}%
31 \GM@JK@define@key{GM@JK}{getmap}{pitch}{0}%
32 \GM@JK@define@key{GM@JK}{getmap}{file}{getmap}%
33 \GM@JK@define@key{GM@JK}{getmap}{inputencoding}{}%
34 \GM@JK@define@key{GM@JK}{getmap}{overwrite}{true}%
```

For options without default value, we define reasonable default values! We overwrite the default for `overwrite`, because we don't want `overwrite` to be

true by default, but that `overwrite` is equivalent to `overwrite=true!`

Moreover, we load `getmap.cfg` to set the default key. You can copy this file to your local \TeX tree and replace the key with your own!

We try to use the input encoding specified for `inputenc` or `utf8` instead.

```

35 \gdef\GM@JK@overwrite{false}%
36 \gdef\GM@JK@key{}%
37 %
38 \IfFileExists{getmap.cfg}%
39 {%
40   \input{getmap.cfg}%
41 }%
42 {%
43   \gdef\GM@JK@key{Fmjtd|luur20u22d,75=o5-9aylh6}%
44 }%
45 %
46 \@ifpackageloaded{inputenc}%
47 {%
48   \gdef\GM@JK@inputencoding{\inputencodingname}%
49 }%
50 {%
51   \gdef\GM@JK@inputencoding{utf8}%
52 }%
53 %

```

Later, we will need a switch, if `\write18` is enabled.

```

54 \newif\ifGM@JK@writexviii\GM@JK@writexviiiifalse%
55 %

```

We execute the package options to define and set the option macros.

```

56 \ExecuteOptionsX{mode,xsize,ysize,scale,zoom,type,imagetype,color,number,file,heading,fov,
57 %
58 \ProcessOptionsX\relax%
59 %

```

We need to reset some defaults in `gm` mode.

```

60 %
61 \ifthenelse{\equal{\GM@JK@mode}{gm}}%
62 {%
63   \gdef\GM@JK@scale{1}%
64   \gdef\GM@JK@zoom{17}%
65   \gdef\GM@JK@type{roadmap}%
66   \gdef\GM@JK@color{blue}%
67 }%
68 {}%
69 %

```

We check if `\pdf@shellescape` is available to test if `\write18` is enabled.

If `false`, we assume `\write18` is available and hope for the best.

If true, we set the switch `\GM@JK@writexviii` accordingly!

```
