1 Introduction

The glossaries package is provided to assist generating glossaries. It has a certain amount of flexibility, allowing the user to customize the format of the glossary and define multiple glossaries. It also supports acronyms and glossary styles that include symbols (in addition to a name and description) for glossary entries. There is provision for loading a database of glossary terms. Only those terms used¹ in the document will be added to the glossary.

This package replaces the `glossary` package which is now obsolete. Please see the file `glossary2glossaries.pdf` for assistance in upgrading.

The glossaries package comes with a `Perl` script called `makeglossaries`. This provides a convenient interface to `makeindex` or `xindy`. It is strongly recommended that you use this script, but *it is not essential*. If you are reluctant to install `Perl`, or for any other reason you don't want to use `makeglossaries`, you can call `makeindex` or `xindy` explicitly. See [subsection 1.3](#) for further details.

One of the strengths of this package is its flexibility, however the drawback of this is the necessity of having a large manual that can cover all the various settings. The documentation is therefore structured as follows:

- [section 2](#) is for people who want a few quick pointers of how to get started creating a basic glossary, without having to read through lengthy descriptions.
- [section 3](#) gives an overview of the main user commands and their syntax.
- [section 4](#) describes the associated `mfirstuc` package.

¹that is, if the term has been referenced using any of the commands described in [subsection 3.4](#), [subsection 3.5](#) or via `\glssee` (or the `see` key)

- [section 5](#) contains the documented source code for those who want to know more about how the package works.
- [section 6](#) contains the documented code for the `mfirstuc` package.

The remainder of this introductory section covers the following:

- [subsection 1.1](#) lists the sample documents provided with this package.
- [subsection 1.2](#) provides information for users who wish to write in a language other than English.
- [subsection 1.3](#) describes how to use a post-processor to create the sorted glossaries for your document.
- [subsection 1.4](#) provides some assistance in the event that you encounter a problem.

1.1 Sample Documents

The `glossaries` package is provided with some sample documents that illustrate the various functions. These should be located in the `samples` subdirectory (folder) of the `glossaries` documentation directory. This location varies according to your operating system and \TeX distribution. You can use `texdoc` to locate the main `glossaries` documentation. For example, in a terminal or command prompt, type:

```
texdoc -l glossaries
```

This should display the full pathname of the file `glossaries.pdf`. View the contents of that directory and see if it contains the `samples` subdirectory.

If you can't find the sample files, they are available in the `doc/latex/glossaries/samples/` subdirectory of the `glossaries.tds.zip` archive which can be downloaded from CTAN.

The sample documents are as follows:

minimalgls.tex This document is a minimal working example. You can test your installation using this file. To create the complete document you will need to do the following steps:

1. Run `minimalgls.tex` through \LaTeX by either typing

```
latex minimalgls
```

in a terminal or by using the relevant button or menu item in your text editor or front-end. This will create the required associated files but you will not see the glossary. If you use \PDF\LaTeX you will also get warnings about non-existent references. These warnings may be ignored on the first run.

If you get a `Missing \begin{document}` error, then it's most likely that your version of `xkeyval` is out of date. Check the log file for a warning of that nature. If this is the case, you will need to update the `xkeyval` package.

2. Run `makeglossaries` on the document. This can be done on a terminal by either typing

```
makeglossaries minimalgls
```

or by typing

```
perl makeglossaries minimalgls
```

If your system doesn't recognise the command `perl` then it's likely you don't have Perl installed. In which case you will need to use `makeindex` directly. You can do this in a terminal by typing (all on one line):

```
makeindex -s minimalgls.ist -t minimalgls.glg -o minimalgls.gls  
minimalgls.glo
```

(See [subsubsection 1.3.3](#) for further details on using `makeindex` explicitly.)

Note that if you need to specify the full path and the path contains spaces, you will need to delimit the file names with the double-quote character.

3. Run `minimalgls.tex` through L^AT_EX again (as step 1)

You should now have a complete document. The number following each entry in the glossary is the location number. By default, this is the page number where the entry was referenced.

sample4col.tex This document illustrates a four column glossary where the entries have a symbol in addition to the name and description. To create the complete document, you need to do:

```
latex sample4col  
makeglossaries sample4col  
latex sample4col
```

As before, if you don't have Perl installed, you will need to use `makeindex` directly instead of using `makeglossaries`. The vertical gap between entries is the gap created at the start of each group. This can be suppressed by redefining `\glsgroupskip` after the glossary style has been set:

```
\renewcommand*{\glsgroupskip}{} 
```

sampleAcr.tex This document has some sample acronyms. It also adds the glossary to the table of contents, so an extra run through L^AT_EX is required to ensure the document is up to date:

```
latex sampleAcr  
makeglossaries sampleAcr  
latex sampleAcr  
latex sampleAcr
```

sampleAcrDesc.tex This is similar to the previous example, except that the acronyms have an associated description. As with the previous example, the glossary is added to the table of contents, so an extra run through L^AT_EX is required:

```
latex sampleAcrDesc  
makeglossaries sampleAcrDesc  
latex sampleAcrDesc  
latex sampleAcrDesc
```

sampleDesc.tex This is similar to the previous example, except that it defines the acronyms using `\newglossaryentry` instead of `\newacronym`. As with the previous example, the glossary is added to the table of contents, so an extra run through \LaTeX is required:

```
latex sampleDesc
makeglossaries sampleDesc
latex sampleDesc
latex sampleDesc
```

sampleDB.tex This document illustrates how to load external files containing the glossary definitions. It also illustrates how to define a new glossary type. This document has the number list suppressed and uses `\glsaddall` to add all the entries to the glossaries without referencing each one explicitly. To create the document do:

```
latex sampleDB
makeglossaries sampleDB
latex sampleDB
```

The glossary definitions are stored in the accompanying files `database1.tex` and `database2.tex`. Note that if you don't have Perl installed, you will need to use `makeindex` twice instead of a single call to `makeglossaries`:

1. Create the main glossary:

```
makeindex -s sampleDB.ist -t sampleDB.glg -o sampleDB.gls sampleDB.glo
```

2. Create the secondary glossary:

```
makeindex -s sampleDB.ist -t sampleDB.nlg -o sampleDB.not sampleDB.ntn
```

sampleEq.tex This document illustrates how to change the location to something other than the page number. In this case, the `equation` counter is used since all glossary entries appear inside an `equation` environment. To create the document do:

```
latex sampleEq
makeglossaries sampleEq
latex sampleEq
```

sampleEqPg.tex This is similar to the previous example, but the number lists are a mixture of page numbers and equation numbers. This example adds the glossary to the table of contents, so an extra \LaTeX run is required:

```
latex sampleEqPg
makeglossaries sampleEqPg
latex sampleEqPg
latex sampleEqPg
```

sampleSec.tex This document also illustrates how to change the location to something other than the page number. In this case, the `section` counter is used. This example adds the glossary to the table of contents, so an extra \LaTeX run is required:

```

latex sampleSec
makeglossaries sampleSec
latex sampleSec
latex sampleSec

```

sampleNtn.tex This document illustrates how to create an additional glossary type. This example adds the glossary to the table of contents, so an extra L^AT_EX run is required:

```

latex sampleNtn
makeglossaries sampleNtn
latex sampleNtn
latex sampleNtn

```

Note that if you don't have Perl installed, you will need to use `makeindex` twice instead of a single call to `makeglossaries`:

1. Create the main glossary:

```
makeindex -s sampleNtn.ist -t sampleNtn.glg -o sampleNtn.gls sampleNtn.glo
```

2. Create the secondary glossary:

```
makeindex -s sampleNtn.ist -t sampleNtn.nlg -o sampleNtn.not sampleNtn.ntn
```

sample.tex This document illustrates some of the basics, including how to create child entries that use the same name as the parent entry. This example adds the glossary to the table of contents, so an extra L^AT_EX run is required:

```

latex sample
makeglossaries sample
latex sample
latex sample

```

You can see the difference between word and letter ordering if you substitute `order=word` with `order=letter`. (Note that this will only have an effect if you use `makeglossaries`. If you use `makeindex` explicitly, you will need to use the `-l` switch to indicate letter ordering.)

sampletree.tex This document illustrates a hierarchical glossary structure where child entries have different names to their corresponding parent entry. To create the document do:

```

latex sampletree
makeglossaries sampletree
latex sampletree

```

samplexdy.tex This document illustrates how to use the `glossaries` package with `xindy` instead of `makeindex`. The document uses UTF8 encoding (with the `inputenc` package). The encoding is picked up by `makeglossaries`. By default, this document will create a `xindy` style file called `samplexdy.xdy`, but if you uncomment the lines

```

\setStyleFile{samplexdy-mc}
\noist
\GlsSetXdyLanguage{}

```

it will set the style file to `samplexdy-mc.xdy` instead. This provides an additional letter group for entries starting with “Mc” or “Mac”. If you use `makeglossaries`, you don’t need to supply any additional information. If you don’t use `makeglossaries`, you will need to specify the required information. Note that if you set the style file to `samplexdy-mc.xdy` you must also specify `\noist`, otherwise the `glossaries` package will overwrite `samplexdy-mc.xdy` and you will lose the “Mc” letter group.

To create the document do:

```
latex samplexdy
makeglossaries samplexdy
latex samplexdy
```

If you don’t have Perl installed, you will have to call `xindy` explicitly instead of using `makeglossaries`. If you are using the default style file `samplexdy.xdy`, then do (no line breaks):

```
xindy -L english -C utf8 -I xindy -M samplexdy -t samplexdy.glg
-o samplexdy.gls samplexdy.glo
```

otherwise, if you are using `samplexdy-mc.xdy`, then do (no line breaks):

```
xindy -I xindy -M samplexdy-mc -t samplexdy.glg -o samplexdy.gls
samplexdy.glo
```

sampleutf8.tex This is another example that uses `xindy`. Unlike `makeindex`, `xindy` can cope with accented or non-Latin characters. This document uses UTF8 encoding. To create the document do:

```
latex sampleutf8
makeglossaries sampleutf8
latex sampleutf8
```

If you don’t have Perl installed, you will have to call `xindy` explicitly instead of using `makeglossaries` (no line breaks):

```
xindy -L english -C utf8 -I xindy -M sampleutf8 -t sampleutf8.glg
-o sampleutf8.gls sampleutf8.glo
```

If you remove the `xindy` option from `sampleutf8.tex` and do:

```
latex sampleutf8
makeglossaries sampleutf8
latex sampleutf8
```

you will see that the entries that start with a non-Latin character now appear in the symbols group, and the word “manœuvre” is now after “manor” instead of before it. If you are unable to use `makeglossaries`, the call to `makeindex` is as follows (no line breaks):

```
makeindex -s sampleutf8.ist -t sampleutf8.glg -o sampleutf8.gls
sampleutf8.glo
```

sampleaccsupp.tex This document uses the experimental `glossaries-accsupp` package. The symbol is set to the replacement text. Note that some PDF viewers don't use the accessibility support. Information about the `glossaries-accsupp` package can be found in [subsection 3.14](#).

1.2 Multi-Lingual Support

As from version 1.17, the `glossaries` package can now be used with `xindy` as well as `makeindex`. If you are writing in a language that uses accented characters or non-Latin characters it is recommended that you use `xindy` as `makeindex` is hard-coded for Latin languages. This means that you are not restricted to the A, ..., Z letter groups. If you want to use `xindy`, remember to use the `xindy` package option. For example:

```
\documentclass[frenchb]{article}
\usepackage[utf8]{inputenc}
\usepackage[T1]{fontenc}
\usepackage{babel}
\usepackage[xindy]{glossaries}
```

If you use an accented or non-Latin character at the start of an entry name, you must place it in a group, or it will cause a problem for commands that convert the first letter to uppercase (e.g. `\Gls`) due to expansion issues. For example:

```
\newglossaryentry{elite}{name={{\acute{e}}lite},
description={select group or class}}
```

If you use the `inputenc` package, `makeglossaries` will pick up the encoding from the auxiliary file. If you use `xindy` explicitly instead of via `makeglossaries`, you may need to specify the encoding using the `-C` option. Read the `xindy` manual for further details.

1.2.1 Changing the Fixed Names

As from version 1.08, the `glossaries` package now has limited multi-lingual support, thanks to all the people who have sent me the relevant translations either via email or via `comp.text.tex`. However you must load `babel` *before* `glossaries` to enable this. Note that if `babel` is loaded and the `translator` package is detected on T_EX's path, then the `translator` package will be loaded automatically, however, it may not pick up on the required languages, so if the predefined text is not translated, you may need to explicitly load the `translator` package with the required languages. For example:

```
\usepackage[spanish]{babel}
\usepackage[spanish]{translator}
\usepackage{glossaries}
```

Alternatively, specify the language as a class option rather than a package option. For example:

```
\documentclass[spanish]{report}
```

```
\usepackage{babel}
\usepackage{glossaries}
```

If you want to use `ngerman` or `german` instead of `babel`, you will need to include the `translator` package to provide the translations. For example:

```
\documentclass[ngerman]{article}
\usepackage{ngerman}
\usepackage{translator}
\usepackage{glossaries}
```

The following languages are currently supported by the `glossaries` package:

Language	As from version
Brazilian Portuguese	1.17
Danish	1.08
Dutch	1.08
English	1.08
French	1.08
German	1.08
Irish	1.08
Italian	1.08
Hungarian	1.08
Polish	1.13
Spanish	1.08

The language dependent commands and `translator` keys used by the `glossaries` package are listed in [table 1](#).

Due to the varied nature of glossaries, it's likely that the predefined translations may not be appropriate. If you are using the `babel` package and do not have the `translator` package installed, you need to be familiar with the advice given in <http://www.tex.ac.uk/cgi-bin/texfaq2html?label=latexwords>.

If you have the `translator` package installed, then it becomes much easier to change the default translations. For example, if you are writing in Irish and you want `\symbolname` to produce “Siombail” instead of “Comhartha”, then you can put the following in your document preamble:

```
\deftranslation[to=Irish]{Symbol (glossaries)}{Siombail}
```

Note that `xindy` provides much better multi-lingual support than `makeindex`, so it's recommended that you use `xindy` if you have glossary entries that contain accented characters or non-Roman letters. See [subsection 3.8.2](#) for further details.

1.3 Generating the Associated Glossary Files

In order to generate a sorted glossary with compact location lists, it is necessary to use an external indexing application as an intermediate step. It is this application that creates the file containing the code that typesets the glossary. If this step is omitted, the glossaries will not appear in your document. The two indexing applications that are most commonly used with \LaTeX are `makeindex` and `xindy`. As from version 1.17, the `glossaries` package can be used with either of these applications. Previous versions were designed to be used with `makeindex` only. Note

Table 1: Customised Text

Command Name	Translator Key Word	Purpose
<code>\glossaryname</code>	Glossary	Title of the main glossary.
<code>\acronymname</code>	Acronyms	Title of the list of acronyms (when used with package option <code>acronym</code>).
<code>\entryname</code>	Notation (glossaries)	Header for first column in the glossary (for 2, 3 or 4 column glossaries that support headers).
<code>\descriptionname</code>	Description (glossaries)	Header for second column in the glossary (for 2, 3 or 4 column glossaries that support headers).
<code>\symbolname</code>	Symbol (glossaries)	Header for symbol column in the glossary for glossary styles that support this option.
<code>\pagelistname</code>	Page List (glossaries)	Header for page list column in the glossary for glossaries that support this option.
<code>\glssymbolsgroupname</code>	Symbols (glossaries)	Header for symbols section of the glossary for glossary styles that support this option.
<code>\glsnumbersgroupname</code>	Numbers (glossaries)	Header for numbers section of the glossary for glossary styles that support this option.

that `xindy` has much better multi-lingual support than `makeindex`, so `xindy` is recommended if you're not writing in English. Commands that only have an effect when `xindy` is used are described in [subsection 3.8.2](#).

The `glossaries` package comes with the Perl script `makeglossaries` which will run `makeindex` or `xindy` on all the glossary files using a customized style file (which is created by `\makeglossaries`). See [subsection 1.3.1](#) for further details. Perl is stable, cross-platform, open source software that is used by a number of T_EX-related applications. Further information is available at <http://www.perl.org/about.html>. However, whilst it is strongly recommended that you use the `makeglossaries` script, it is possible to use the `glossaries` package without having Perl installed. In which case, if you have used the `xindy` package option, you will need to use `xindy` (see [subsection 1.3.2](#)), otherwise you will need to use `makeindex` (see [subsection 1.3.3](#)). Note that some commands and package options have no effect if you don't use `makeglossaries`. These are listed in [table 2](#).

Note that if any of your entries use an entry that is not referenced outside the glossary, you will need to do an additional `makeglossaries`, `makeindex` or `xindy` run, as appropriate. For example, suppose you have defined the following entries:

```
\newglossaryentry{citrusfruit}{name={citrus fruit},
description={fruit of any citrus tree. (See also
\gls{orange})}}
```

```
\newglossaryentry{orange}{name={orange},
description={an orange coloured fruit.}}
```

and suppose you have `\gls{citrusfruit}` in your document but don't reference the `orange` entry, then the `orange` entry won't appear in your glossary until you first create the glossary and then do another run of `makeglossaries`, `makeindex` or `xindy`. For example, if the document is called `myDoc.tex`, then you must do:

```
latex myDoc
makeglossaries myDoc
latex myDoc
makeglossaries myDoc
latex myDoc
```

Likewise, an additional `makeglossaries` and L^AT_EX run may be required if the document pages shift with re-runs. For example, if the page numbering is not reset after the table of contents, the insertion of the table of contents on the second L^AT_EX run may push glossary entries across page boundaries, which means that the number lists in the glossary may need updating.

The examples in this document assume that you are accessing `makeglossaries`, `xindy` or `makeindex` via a terminal. Windows users can use the MSDOS Prompt which is usually accessed via the Start→All Programs menu or Start→All Programs→Accessories menu. Alternatively, your text editor may have the facility to create a function that will call the required application. See your editor's user manual for further details.

If any problems occur, remember to check the transcript files (e.g. `.glg` or `.alg`) for messages.

Table 2: Commands and package options that have no effect when using xindy or makeindex explicitly

Command or Package Option	makeindex	xindy
order=letter	use -l	use -M ord/letorder
order=word	default	default
xindy={language=⟨lang⟩,codename=⟨code⟩}	N/A	use -L ⟨lang⟩ -C ⟨code⟩
\GlsSetXdyLanguage{⟨lang⟩}	N/A	use -L ⟨lang⟩
\GlsSetXdyCodePage{⟨code⟩}	N/A	use -C ⟨code⟩

1.3.1 Using the makeglossaries Perl Script

The `makeglossaries` script picks up the relevant information from the auxiliary (`.aux`) file and will either call `xindy` or `makeindex`, depending on whether the indexing style file ends with `.xdy` or `.ist`. Therefore, you only need to pass the document's name without the extension to `makeglossaries`. For example, if your document is called `myDoc.tex`, type the following in your terminal:

```
latex myDoc
makeglossaries myDoc
latex myDoc
```

You may need to explicitly load `makeglossaries` into Perl:

```
perl makeglossaries myDoc
```

There is a batch file called `makeglossaries.bat` which does this for Windows users, but you must have Perl installed to be able to use it.

1.3.2 Using xindy explicitly

If you want to use `xindy` to process the glossary files, you must make sure you have used the `xindy` package option:

```
\usepackage[xindy]{glossaries}
```

This is required regardless of whether you use `xindy` explicitly or whether it's called implicitly via `makeglossaries`. This causes the glossary entries to be written in raw `xindy` format, so you need to use `-I xindy not -I tex`.

To run `xindy` type the following in your terminal (all on one line):

```
xindy -L ⟨language⟩ -C ⟨encoding⟩ -I xindy -M ⟨style⟩ -t ⟨base⟩.glg
-o ⟨base⟩.gls ⟨base⟩.glo
```

where `⟨language⟩` is the required language name, `⟨encoding⟩` is the encoding, `⟨base⟩` is the name of the document without the `.tex` extension and `⟨style⟩` is the name of the `xindy` style file without the `.xdy` extension. The default name for this style file is `⟨base⟩.xdy` but can be changed via `\setStyleFile{⟨style⟩}`. You may need to specify the full path name depending on the current working directory. If any of the file names contain spaces, you must delimit them using double-quotes.

For example, if your document is called `myDoc.tex` and you are using UTF8 encoding in English, then type the following in your terminal:

```
xindy -L english -C utf8 -I xindy -M myDoc -t myDoc.glg -o myDoc.gls myDoc.glo
```

Note that this just creates the main glossary. You need to do the same for each of the other glossaries (including the list of acronyms if you have used the `acronym` package option), substituting `.glg`, `.gls` and `.glo` with the relevant extensions. For example, if you have used the `acronym` package option, then you would need to do:

```
xindy -L english -C utf8 -I xindy -M myDoc -t myDoc.alg -o myDoc.acr myDoc.acn
```

For additional glossaries, the extensions are those supplied when you created the glossary with `\newglossary`.

Note that if you use `makeglossaries` instead, you can replace all those calls to `xindy` with just one call to `makeglossaries`:

```
makeglossaries myDoc
```

Note also that some commands and package options have no effect if you use `xindy` explicitly instead of using `makeglossaries`. These are listed in [table 2](#).

1.3.3 Using `makeindex` explicitly

If you want to use `makeindex` explicitly, you must make sure that you haven't used the `xindy` package option or the glossary entries will be written in the wrong format. To run `makeindex`, type the following in your terminal:

```
makeindex -s <style>.ist -t <base>.glg -o <base>.gls <base>.glo
```

where `<base>` is the name of your document without the `.tex` extension and `<style>.ist` is the name of the `makeindex` style file. By default, this is `<base>.ist`, but may be changed via `\setStyleFile{<style>}`. Note that there are other options, such as `-l` (letter ordering). See the `makeindex` manual for further details.

For example, if your document is called `myDoc.tex`, then type the following at the terminal:

```
makeindex -s myDoc.ist -t myDoc.glg -o myDoc.gls myDoc.glo
```

Note that this only creates the main glossary. If you have additional glossaries (for example, if you have used the `acronym` package option) then you must call `makeindex` for each glossary, substituting `.glg`, `.gls` and `.glo` with the relevant extensions. For example, if you have used the `acronym` package option, then you need to type the following in your terminal:

```
makeindex -s myDoc.ist -t myDoc.alg -o myDoc.acr myDoc.acn
```

For additional glossaries, the extensions are those supplied when you created the glossary with `\newglossary`.

Note that if you use `makeglossaries` instead, you can replace all those calls to `makeindex` with just one call to `makeglossaries`:

```
makeglossaries myDoc
```

Note also that some commands and package options have no effect if you use `makeindex` explicitly instead of using `makeglossaries`. These are listed in [table 2](#).

1.4 Troubleshooting

The `glossaries` package comes with a minimal file called `minimalgls.tex` which can be used for testing. This should be located in the `samples` subdirectory (folder) of the `glossaries` documentation directory. The location varies according to your operating system and \TeX installation. For example, on my Linux partition it can be found in `/usr/local/texlive/2008/texmf-dist/doc/latex/glossaries/`. Further information on debugging \LaTeX code is available at <http://theoval.cmp.uea.ac.uk/~nlct/latex/minexample/>.

Below is a list of the most frequently asked questions. For other queries, consult the `glossaries` FAQ at <http://theoval.cmp.uea.ac.uk/~nlct/latex/packages/faq/glossariesfaq.html>.

1. **Q.** I get the error message:

```
Missing \begin{document}
```

A. Check you are using an up to date version of the `xkeyval` package.

2. **Q.** I've used the `smallcaps` option, but the acronyms are displayed in normal sized upper case letters.

A. The `smallcaps` package option uses `\textsc` to typeset the acronyms. This command converts lower case letters to small capitals, while upper case letters remain their usual size. Therefore you need to specify the acronym in lower case letters.

3. **Q.** How do I change the font that the acronyms are displayed in?

A. The easiest way to do this is to specify the `smaller` package option and redefine `\acronymfont` to use the required typesetting command. For example, suppose you would like the acronyms displayed in a sans-serif font, then you can do:

```
\usepackage[smaller]{glossaries}
\renewcommand*\acronymfont[1]{\textsf{#1}}
```

4. **Q.** How do I change the font that the acronyms are displayed in on first use?

A. The easiest way to do this is to specify the `smaller` package option and redefine `\firstacronymfont` to use the required command. Note that if you don't want the acronym on subsequent use to use `\textsmaller`, you will also need to redefine `\acronymfont`, as above. For example to make the acronym emphasized on first use, but use the surrounding font for subsequent use, you can do:

```
\usepackage[smaller]{glossaries}
\renewcommand*\firstacronymfont[1]{\emph{#1}}
\renewcommand*\acronymfont[1]{#1}
```

5. **Q.** I don't have Perl installed, do I have to use `makeglossaries`?

A. Although it is strongly recommended that you use `makeglossaries`, you don't have to use it. For further details, read [subsubsection 1.3.2](#) or [subsubsection 1.3.3](#), depending on whether you want to use `xindy` or `makeindex`.

6. **Q.** I'm used to using the `glossary` package: are there any instructions on migrating from the `glossary` package to the `glossaries` package?

A. Read the file `glossary2glossaries.pdf` which should be available from the same location as this document.

7. **Q.** I'm using `babel` but the fixed names haven't been translated.

A. The `glossaries` package currently only supports the following languages: Brazilian Portuguese, Danish, Dutch, English, French, German, Irish, Italian, Hungarian, Polish and Spanish. If you want to add another language, send me the translations, and I'll add them to the next version.

If you are using one of the above languages, but the text hasn't been translated, try adding the `translator` package with the required languages explicitly (before you load the `glossaries` package). For example:

```
\usepackage[ngerman]{babel}
\usepackage[ngerman]{translator}
\usepackage{glossaries}
```

Alternatively, you can add the language as a global option to the class file. Check the `translator` package documentation for further details.

8. **Q.** My acronyms contain strange characters when I use commands like `\acrlong`.

A. Switch off the sanitization:

```
\usepackage[sanitize=none]{glossaries}
```

and protect fragile commands.

9. **Q.** My glossaries haven't appeared.

A. Remember to do the following:

- Add `\makeglossaries` to the document preamble.
- Use either `\printglossary` for each glossary that has been defined or `\printglossaries`.
- Use the commands listed in [subsection 3.4](#), [subsection 3.5](#) or [subsection 3.6](#) for each entry that you want to appear in the glossary.
- Run `LATEX` on your document, then run `makeglossaries`, then run `LATEX` on your document again. If you want the glossaries to appear in the table of contents, you will need an extra `LATEX` run. If any of your entries cross-reference an entry that's not referenced in the main body of the document, you will need to run `makeglossaries` after the second `LATEX` run, followed by another `LATEX` run.

Check the log files (`.log`, `.glg` etc) for any warnings.

10. **Q.** It is possible to change the rules used to sort the glossary entries?

11. **A.** If it's for an individual entry, then you can use the entry's `sort` key to sort it according to a different term. If it's for the entire alphabet, then you will need to use `xindy` (instead of `makeindex`) and use an appropriate `xindy` language module. Writing `xindy` modules or styles is beyond the scope of this manual. Further information about `xindy` can be found at the [Xindy Web Site](http://xindy.sourceforge.net/).² There is also a link to the `xindy` mailing list from that site.

2 A Quick Guide For The Impatient

This section is for people who want a few quick pointers of how to get started. However it is recommended that you read [section 3](#) for additional commands and advice not listed here. There are also some sample files to help you get started, listed in [subsection 1.1](#).

1. Load glossaries *after* hyperref:

```
\usepackage{hyperref}
\usepackage{glossaries}
```

Similarly for the html package:

```
\usepackage{html}
\usepackage{glossaries}
```

2. Always use `\makeglossaries` if you want the glossary entries to be written to the glossary file:

```
\usepackage{glossaries}
\makeglossaries
```

If you don't use `\makeglossaries`, your glossaries will not appear in the document!

3. Use `\printglossaries` to make your glossaries appear in the document at that point. For example:

```
\maketitle
\printglossaries
\section{Introduction}
```

Note that only the glossary entries that have been used in the document text will appear in the glossary.

4. When you have created your document, run \LaTeX on it, then the Perl script `makeglossaries`, then run \LaTeX on it again:

```
latex myfile
makeglossaries myfile
latex myfile
```

²<http://xindy.sourceforge.net/>

(You need to run \LaTeX again if you have used the `toc` package option. You may also need an extra `makeglossaries` run and another \LaTeX run if an entry is only referenced in the glossary, or if including the glossary has caused the number lists to change.)

If you use Windows, there is a batch file called `makeglossaries.bat` which you can use, but you will still need Perl installed. Alternatively, you can call `makeindex` directly. See [subsection 1.3](#) for further details.

5. If you want to use `xindy` instead of `makeindex`, you must specify it in the package option:

```
\usepackage[xindy]{glossaries}
```

See [subsection 1.3](#) for further details.

6. New glossaries can be defined using:

```
\newglossary[⟨log-ext⟩]{⟨label⟩}{⟨in-ext⟩}{⟨out-ext⟩}{⟨title⟩}
```

where $\langle label \rangle$ is an identifying label, $\langle in-ext \rangle$ is the extension of the file to be created by `makeindex` or `xindy` (called by `makeglossaries`), $\langle out-ext \rangle$ is the extension of the file to be read by `makeindex` or `xindy` and $\langle title \rangle$ is the title for this new glossary. The first optional argument $\langle log-ext \rangle$ specifies the extension of the `makeindex` or `xindy` transcript file. Example:

```
\newglossary[nlg]{notation}{not}{ntn}{Notation}
```

This glossary's label is `notation` and its title will be `Notation`. If you use `makeglossaries`, the `makeindex` or `xindy` transcript will be written to a file with the extension `.nlg`. If $\langle log-ext \rangle$ is omitted, the extension `.glg` will be used.

7. Any new glossaries must be defined before `\makeglossaries`:

```
\usepackage{glossaries}
\newglossary{notation}{not}{ntn}{Notation}
\makeglossaries
```

8. If you use the `acronym` package option, the `glossaries` package will automatically create a new glossary type labelled `acronym`:

```
\usepackage[acronym]{glossaries}
```

9. If your pages have a hyphen compositor (i.e. your page numbers appear in the form 2-1), use `\glsSetCompositor` *before* `\makeglossaries`:

```
\documentclass{article}
\usepackage{glossaries}
\glsSetCompositor{-}
\makeglossaries
```

10. To add the glossaries to the table of contents use the `toc` package option:

```
\usepackage[toc]{glossaries}
```

This will require an extra L^AT_EX run. Note that if the table of contents affects the subsequent page numbering (i.e. the page numbers are not reset after the table of contents) then you may need to rerun `makeglossaries` and L^AT_EX.

11. Define a new entry with:

```
\newglossaryentry{<label>}{<key-val list>}
```

The *<key-val list>* must at least contain a name key and a description key. For example:

```
\newglossaryentry{perl}{name=Perl,
description=A scripting language}
```

In this example, I have given the entry the label `perl`. Whenever I want to use this entry, that is the label I need to use to identify it.

12. To define a sub-entry, use the parent key. For example:

```
\newglossaryentry{fruit}{name={fruit}, % parent entry
description={tree product that contains seeds}}
```

```
\newglossaryentry{apple}{name={apple}, % sub-entry
description={firm, round fruit},
parent=fruit}
```

13. To change the sorting order, use the sort key. For example:

```
\newglossaryentry{tex}{name={\TeX},
description={A typesetting language},
sort=tex}
```

This will put the entry in the “T” group (entries starting with the letter “t” or “T”) rather than the “symbols” group (entries starting with a symbol). Similarly, the following example puts the entry in the “U” group instead of the “symbol” group.

```
\newglossaryentry{universal}{name={\ensuremath{\mathcal{U}}},
description=The universal set,
sort=U}
```

Note that if you use `xindy` instead of `makeindex`, characters such as a backslash are ignored, so if you have used the `xindy` package option, you can just do:

```
\newglossaryentry{tex}{name={\TeX},
description={A typesetting language},
}
```

14. Sub-entries may have the same name as the parent entry:

```
\newglossaryentry{glossary}{name=glossary, % parent entry
description={\nopostdesc},
```

```
plural={glossaries}}
```

```
\newglossaryentry{glossarylist}{% first child entry
description={1) list of technical words},
sort={1},
parent={glossary}}
```

```
\newglossaryentry{glossarycol}{% second child entry
description={2) collection of glosses},
sort={2},
parent={glossary}}
```

Note that in this instance the `name` key is not required for the child entries, but the `sort` key is needed to sort the sub-entries. The parent entry has no description, so the description terminator is suppressed using `\nopostdesc`.

15. If the entry name starts with an accented letter or non-Latin character, you will need to group the first letter (otherwise it will cause a problem for commands like `\Gls` and `\Glspl`):

```
\newglossaryentry{elite}{name={{\'}lite},
sort=elite,
description={select group or class}}
```

Likewise with commands such as `\ae` and `\oe`:

```
\newglossaryentry{oesophagus}{%
name={{\oe}sophagus},
sort=oesophagus,
description={canal from mouth to stomach}}
```

16. If you use `xindy`, you can specify the accented or non-Latin character directly (in combination with the `inputenc` and `fontenc` packages) but you still need to group the first letter (otherwise it will cause a problem for commands like `\Gls` and `\Glspl` due to expansion issues):

```
\newglossaryentry{elite}{name={{\`e}lite},
description={select group or class}}
```

Note that in this case the `sort` key is not required as `xindy` knows how to sort the letter `é`.

17. If you have multiple glossaries, use the `type` key to specify in which glossary the entry belongs. For example:

```
\newglossary{languages}{lan}{lng}{Index of Languages}

\makeglossaries

\newglossaryentry{perl}{name=Perl,
description=A scripting language,
type=languages}
```

If `type` is omitted, the default glossary is used.

18. Remember to group values that have a comma or equal sign. For example:

```
\newglossaryentry{pagelist}{name=page list,  
description={A list of individual pages or page ranges  
(e.g.\ 1,2,4,7--9)}}
```

19. You can cross-reference an entry using the `see` key when you define it. For example, suppose you have defined an entry whose label is `taylorstheorem`, then you can cross-reference it:

```
\newglossaryentry{maclaurinseries}{name={Maclaurin series},  
description={Series expansion},  
see={taylorstheorem}}
```

Alternatively, you can use `\glssee` after you have defined the entry:

```
\glssee{maclaurinseries}{taylorstheorem}
```

(The final argument may be a comma-separated list of labels.) The “see” tag may be overridden for a given entry:

```
\glssee[see also]{maclaurinseries}{taylorstheorem}
```

or it can be changed for all entries by redefining `\seename`.

20. Plural forms are assumed to be the singular form with an “s” appended, unless otherwise specified. To specify an irregular plural, use the `plural` key. For example:

```
\newglossaryentry{matrix}{name=matrix,  
description=rectangular array of quantities,  
plural=matrices}
```

21. The way the term appears in the main text can be different from the way the term appears in the glossary:

```
\newglossaryentry{matrix}{name=Matrix,  
description=rectangular array of quantities,  
text=matrix,  
plural=matrices}
```

In this example, the entry name appears as “Matrix” in the glossary, and either “matrix” or “matrices” in the text.

22. The way the term appears on first use can be different to the way it appears subsequently:

```
\newglossaryentry{singmtx}{name=Singular Matrix,  
description=A matrix with a zero determinant,  
first=singular matrix (SM),  
text=SM,  
firstplural=singular matrices (SMs)}
```

In this example, the entry name appears as “Singular Matrix” in the glossary, and in the text it appears as “singular matrix (SM)” or “singular matrices (SMs)” the first time the entry is used, and subsequently appears as “SM” or “SMs”.

23. The quick and easy way to define an acronym is to use:

```
\newacronym[⟨key-val list⟩]{⟨label⟩}{⟨abbrev⟩}{⟨long⟩}
```

For example:

```
\newacronym{svm}{SVM}{support vector machine}
```

This is equivalent to:

```
\newglossaryentry{svm}{type=\acronymtype,
name={SVM},
description={support vector machine},
text={SVM},
first={support vector machine (SVM)},
plural={SVMs},
firstplural={support vector machines (SVMs)}}
```

(The value of `\acronymtype` varies depending on whether the `acronym` package option is used or not. The optional argument `⟨key-val list⟩` can be used to override any of the `\newglossaryentry` keys; for example, if the acronym has an irregular plural.)

24. The font used to display the entry name in the glossary is governed by `\glsnamefont`. This can be redefined as required. For example, to make the entry names appear in a medium sans-serif font do:

```
\renewcommand{\glsnamefont}[1]{\textsf{\mdseries #1}}
```

Note that the list-like glossary styles place the entry name in the optional argument to `\item`, so they will appear in bold, unless you redefine `\glsnamefont` to counteract the bold font. Similarly, the tree-like styles display the entry name in bold.

25. In the document use `\gls{⟨label⟩}` to use a predefined term (this will also enter the term into the associated glossary output file). For example:

A `\gls{singmtx}` is a matrix with a zero determinant.

26. Other variations:

- `\Gls{⟨label⟩}` : like `\gls`, but with first letter in upper case
- `\GLS{⟨label⟩}` : like `\gls`, but all upper case.
- `\glspl{⟨label⟩}` : use plural
- `\Glspl{⟨label⟩}` : use plural with first letter in upper case
- `\GLSpl{⟨label⟩}` : use plural but all upper case
- `\glslink{⟨label⟩}{⟨link text⟩}` : use `⟨link text⟩` to link to the given entry in the glossary.

For example, the following will produce the plural form with the first letter in uppercase:

```
\Glspl{singmtx} are matrices with a zero determinant.
```

27. Additional text can be appended to the link using the end optional argument. For example, to form the possessive:

```
The \gls{singmtx}['s] dimensions \ldots
```

28. The format of the associated entry number can be changed using the `format` key in the optional argument. Note that the value of the `format` key should be the name of a command *without* the initial backslash. For example:

```
The primary definition of \glspl[format=textbf]{singmtx}.
```

In this example the relevant glossary entry will have the page number in bold (since it uses `\textbf`) but it will no longer have a hyperlink (if hyperlinks are enabled).

29. The `glossaries` package provides commands to change the font whilst ensuring that the number remains a hyperlink. These are of the form `\hyper{xx}` and are equivalent to the standard font changing commands of the form `\text{xx}`, as well as `\hyperemph` (which uses `\emph`). For example:

```
The primary definition of \glspl[format=hyperbf]{singmtx}.
```

30. Don't use declarations in `format` (e.g. `format=bfseries`) as this can cause unpredictable results, since there is no guarantee that the effect will be localised to the required text.

31. Entries can be added to the glossary without producing any text using `\glsadd{label}` or `\glsaddall`. These commands also take an optional argument where you can specify the format. For example

```
\glsadd[format=hyperbf]{singmtx}
```

will add a line to the glossary file for the specified term, but will not produce any text where the command occurs.

32. A number range can be entered using `format=(` and `format=)` to mark the beginning and ending of the range. For example:

```
\glsadd[format={}]{singmtx}
This is a very long section all about \glspl{singmtx}.
```

```
% lots of text omitted
```

```
\glsadd[format=)]{singmtx}
```

This is equivalent to `makeindex`'s `| (` and `|)` formats or `xindy`'s `:open-range` and `:close-range` tags.

33. You can combine the range markers with a formatting command (again without the preceding backslash). For example:

```
This is the start of a very long section all
about \glspl[format=(hyperbf)]{singmtx}.
```

```
% lots of text omitted
```

```
This is the end a very long section all about
\glspl[format=)hyperbf]{singmtx}.
```

34. Only those terms that have actually been used in the document will be placed in the glossary. If you have defined a term that doesn't appear in the document, then it means you haven't used it in the text (either via `\glslink` or `\gls` and related commands or via `\glsadd` or `\glsaddall` or via `\glssee`).

35. You don't need to escape `makeindex`'s special characters:

```
\newglossaryentry{quote}{name={"},
description={Double quote character}}
```

```
\newglossaryentry{exclam}{name={!},
description={Exclamation mark}}
```

```
\newacronym{rna}{RNA}{ribonukleins\ "aure}
```

36. Associated symbols can also be specified, but whether the symbol appears in the glossary depends on the glossary style. For example:

```
\newglossaryentry{metre}{name={metre},
description={A metric measurement of length},
symbol={m}}
```

See [subsection 3.12](#) for a list of predefined glossary styles.

37. Glossary styles can be set using the style package option. For example:

```
\usepackage[style=long3col]{glossaries}
```

or using `\glossarystyle{<style>}`. For example:

```
\glossarystyle{altlist}
```

The predefined glossary styles provided by the `glossaries` bundle are listed in [subsection 3.12](#).

38. The list of numbers associated with each glossary entry can be suppressed using the package option `nonumberlist`:

```
\usepackage[nonumberlist]{glossaries}
```

39. By default, the glossary will appear in an unnumbered chapter if chapters are defined, otherwise in an unnumbered section. This can be changed using the `section` package option. For example, to make the glossaries appear in an unnumbered section, even if chapters are defined, do:

```
\usepackage[section]{glossaries}
```

Other sectional units can also be specified as `section=<value>`. For example, to make the glossaries appear in unnumbered subsections:

```
\usepackage[section=subsection]{glossaries}
```

40. If you are using the `hyperref` package and the glossaries are in chapters, you may need to redefine `\glsclearpage` to do `\clearpage` instead of `\cleardoublepage` to prevent an unwanted blank page appearing before the glossary:

```
\renewcommand*\glsclearpage{\clearpage}
```

3 Overview of User Commands

3.1 Package Options

The `glossaries` package options are as follows:

toc Add the glossaries to the table of contents. Note that an extra \LaTeX run is required with this option.

numberline When used with `toc`, this will add `\numberline{}` in the final argument of `\addcontentsline`. This will align the table of contents entry with the numbered section titles. Note that this option has no effect if the `toc` option is omitted. If `toc` is used without `numberline`, the title will be aligned with the section numbers rather than the section titles.

acronym This creates a new glossary with the label `acronym`. This is equivalent to:

```
\newglossary[alg]{acronym}{acr}{acn}{\acronymname}
```

If the `acronym` package option is used, `\acronymtype` is set to `acronym` otherwise it is set to `main`.³ Entries that are defined using `\newacronym` are placed in the glossary whose label is given by `\acronymtype`, unless another glossary is explicitly specified.

section This is a `<key>=<value>` option. Its value should be the name of a sectional unit (e.g. chapter). This will make the glossaries appear in the named sectional unit, otherwise each glossary will appear in a chapter, if chapters exist, otherwise in a section. Unnumbered sectional units will be used by default. Example:

```
\usepackage[section=subsection]{glossaries}
```

³Actually it sets `\acronymtype` to `\glsdefaulttype` if the `acronym` package option is not used, but `\glsdefaulttype` usually has the value `main`.

You can omit the value if you want to use sections, i.e.

```
\usepackage[section]{glossaries}
```

is equivalent to

```
\usepackage[section=section]{glossaries}
```

You can change this value later in the document using

```
\setglossarysection \setglossarysection{<name>}
```

where *<name>* is the sectional unit.

Note that if you are using the `hyperref` package and the glossaries are put in chapters, you may need to redefine `\glsclearpage` to do `\clearpage` instead of `\cleardoublepage` to prevent an unwanted blank page appearing before the glossary:

```
\renewcommand*{\glsclearpage}{\clearpage}
```

numberedsection The glossaries are placed in unnumbered sectional units by default, but this can be changed using `numberedsection`. This option can take three possible values: `false` (no number, i.e. use starred form), `nolabel` (numbered, i.e. unstarred form, but not labelled) and `autolabel` (numbered with automatic labelling). If `numberedsection=autolabel` is used, each glossary is given a label that matches the glossary type, so the main (default) glossary is labelled `main`, the list of acronyms is labelled `acronym`⁴ and additional glossaries are labelled using the value specified in the first mandatory argument to `\newglossary`. For example, if you load `glossaries` using:

```
\usepackage[section,numberedsection=autolabel]{glossaries}
```

then each glossary will appear in a numbered section, and can be referenced using something like:

The main glossary is in section~\ref{main} and the list of acronyms is in section~\ref{acronym}.

If you can't decide whether to have the acronyms in the main glossary or a separate list of acronyms, you can use `\acronymtype` which is set to `main` if the `acronym` option is not used and is set to `acronym` if the `acronym` option is used. For example:

The list of acronyms is in section~\ref{\acronymtype}.

```
\glsautoprefix
```

As from version 1.14, you can add a prefix to the label by redefining `\glsautoprefix`. For example:

```
\renewcommand*{\glsautoprefix}{glo:}
```

⁴if the `acronym` option is used, otherwise the list of acronyms is the main glossary

will add `glo:` to the automatically generated label, so you can then, for example, refer to the list of acronyms as follows:

The list of acronyms is in section~\ref{glo:\acronymtype}.

Or, if you are undecided on a prefix:

The list of acronyms is in section~\ref{\glsautoprefix\acronymtype}.

style This is a $\langle key \rangle = \langle value \rangle$ option. Its value should be the name of the glossary style to use. Predefined glossary styles are listed in [subsection 3.12](#).

nolong This prevents the `glossaries` package from automatically loading `glossary-long` (which means that the `longtable` package also won't be loaded). This reduces overhead by not defining unwanted styles and commands. Not that if you use this option, you won't be able to use any of the glossary styles defined in the `glossary-long` package.

nosuper This prevents the `glossaries` package from automatically loading `glossary-super` (which means that the `supertabular` package also won't be loaded). This reduces overhead by not defining unwanted styles and commands. Not that if you use this option, you won't be able to use any of the glossary styles defined in the `glossary-super` package.

nolist This prevents the `glossaries` package from automatically loading `glossary-list`. This reduces overhead by not defining unwanted styles. Not that if you use this option, you won't be able to use any of the glossary styles defined in the `glossary-list` package. Note that since the default style is `list`, you will also need to use the `style` option to set the style to something else.

notree This prevents the `glossaries` package from automatically loading `glossary-tree`. This reduces overhead by not defining unwanted styles. Not that if you use this option, you won't be able to use any of the glossary styles defined in the `glossary-tree` package.

nostyles This prevents all the predefined styles from being loaded. This option is provided in the event that the user has custom styles that are not dependent on the styles provided by the `glossaries` package. Note that if you use this option, you can't use the `style` package option. Instead you must either use `\glossarystyle{\style}` or the `style` key in the optional argument to `\printglossary`.

nonumberlist This option will suppress the associated number lists in the glossaries (see also [subsection 3.3](#)).

counter This is a $\langle key \rangle = \langle value \rangle$ option. The value should be the name of the default counter to use in the number lists.

sanitize This is a $\langle key \rangle = \langle value \rangle$ option whose value is also a $\langle key \rangle = \langle value \rangle$ list. By default, the `glossaries` package sanitizes the values of the `name`, `description` and `symbol` keys used when defining a new glossary entry. This may lead to unexpected results if you try to display these values within the document text. This sanitization can be switched off using the `sanitize` package option.

(See [subsection 5.2](#) and [subsection 5.7](#) for further details.) For example, to switch off the sanitization for the description and name keys, but not for the symbol key, do:

```
\usepackage[sanitize={name=false,description=false,%  
symbol=true}]{glossaries}
```

Note: this sanitization only applies to the `name`, `description` and `symbol` keys. It doesn't apply to any of the other keys (except the `sort` key which is always sanitized) so fragile commands contained in the value of the other keys must always be protected using `\protect`. Since the value of the `text` key is obtained from the `name` key, you will still need to protect fragile commands in the `name` key if you don't use the `text` key.

description This option changes the definition of `\newacronym` to allow a description. See [subsection 3.10](#) for further details.

footnote This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.10](#) for further details.

smallcaps This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.10](#) for further details.

smaller This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.10](#) for further details.

dua This option changes the definition of `\newacronym` so that acronyms are always expanded. See [subsection 3.10](#) for further details.

shortcuts This option provides shortcut commands for acronyms. See [subsection 3.10](#) for further details.

makeindex (Default) The glossary information and indexing style file will be written in `makeindex` format. If you use `makeglossaries`, it will automatically detect that it needs to call `makeindex`. If you don't use `makeglossaries`, you need to remember to use `makeindex` not `xindy`. The indexing style file will be given a `.ist` extension.

xindy The glossary information and indexing style file will be written in `xindy` format. If you use `makeglossaries`, it will automatically detect that it needs to call `xindy`. If you don't use `makeglossaries`, you need to remember to use `xindy` not `makeindex`. The indexing style file will be given a `.xdy` extension.

The `xindy` package option may additionally have a value that is a $\langle key \rangle = \langle value \rangle$ comma-separated list to override the language and codepage. For example:

```
\usepackage[xindy={language=english,codepage=utf8}]{glossaries}
```

You can also specify whether you want a number group in the glossary. This defaults to `true`, but can be suppressed. For example:

```
\usepackage[xindy={glsnumbers=false}]{glossaries}
```

See [subsection 3.8.2](#) for further details on using `xindy` with the `glossaries` package.

order This may take two values: `word` or `letter`. The default is word ordering. Note that this option has no effect if you don't use `makeglossaries`.

3.2 Defining Glossary Entries

All glossary entries must be defined before they are used, so it is better to define them in the preamble to ensure this.⁵ However only those entries that occur in the document (using any of the commands described in [subsection 3.4](#), [subsection 3.5](#) or [subsection 3.6](#)) will appear in the glossary. Each time an entry is used in this way, a line is added to an associated glossary file (`.glo`), which then needs to be converted into a corresponding `.gls` file which contains the typeset glossary which is input by `\printglossary` or `\printglossaries`. The Perl script `makeglossaries` can be used to call `makeindex` or `xindy`, using a customised indexing style file, for each of the glossaries that are defined in the document. Note that there should be no need for you to explicitly edit or input any of these external files. See [subsection 1.3](#) for further details.

`\makeglossaries` The command `\makeglossaries` must be placed in the preamble in order to create the customised `makeindex` (`.ist`) or `xindy` (`.xdy`) style file and to ensure that glossary entries are written to the appropriate output files. If you omit `\makeglossaries` none of the glossaries will be created.

Note that some of the commands provided by the `glossaries` package must be placed before `\makeglossaries` as they are required when creating the customised style file. If you attempt to use those commands after `\makeglossaries` you will generate an error.

`\noist` You can suppress the creation of the customised `xindy` or `makeindex` style file using `\noist`. Note that this command must be used before `\makeglossaries`.

The default name for the customised style file is given by `\jobname.ist` (for `makeindex`) or `\jobname.xdy` (for `xindy`). This name may be changed using:

`\setStyleFile` `\setStyleFile{<name>}`

where `<name>` is the name of the style file without the extension. Note that this command must be used before `\makeglossaries`.

Each glossary entry is assigned a number list that lists all the locations in the document where that entry was used. By default, the location refers to the page number but this may be overridden using the `counter` package option. The default form of the location number assumes a full stop compositor (e.g. 1.2), but if your location numbers use a different compositor (e.g. 1-2) you need to set this using

`\glsSetCompositor` `\glsSetCompositor{<symbol>}`

For example:

`\glsSetCompositor{-}`

⁵The only preamble restriction on `\newglossaryentry` and `\newacronym` was removed in version 1.13, but the restriction remains for `\loadglsentries`.

Note that this command must be used before `\makeglossaries`.

If you use `xindy`, you can have a different compositor for page numbers starting with an uppercase alphabetical character using:

`\glsSetAlphaCompositor` `\glsSetAlphaCompositor{<symbol>}`

Note that this command has no effect if you haven't used the `xindy` package option. For example, if you want number lists containing a mixture of A-1 and 2.3 style formats, then do:

```
\glsSetCompositor{.}
\glsSetAlphaCompositor{-}
```

See [subsection 3.3](#) for further information about number lists.

`\newglossaryentry` New glossary entries are defined using the command:

`\newglossaryentry{<label>}{<key-val list>}`

The first argument, `<label>`, must be a unique label with which to identify this entry. The second argument, `<key-val list>`, is a `<key>=<value>` list that supplies the relevant information about this entry. There are two required fields: **name** and **description**, except for sub-entries where the **name** field may be omitted. Available fields are listed below:

name The name of the entry (as it will appear in the glossary). If this key is omitted and the **parent** key is supplied, this value will be the same as the parent's name.

description A brief description of this term (to appear in the glossary). Within this value, you can use `\nopostdesc` to suppress the description terminator for this entry. For example, if this entry is a parent entry that doesn't require a description, you can do `description={\nopostdesc}`. If you want a paragraph break in the description use `\glspar`. However, note that not all glossary styles support multi-line descriptions. If you are using one of the tabular-like glossary styles that permit multi-line descriptions, use `\newline` not `\\` if you want to force a line break.

`\nopostdesc`

`\glspar`

parent The label of the parent entry. Note that the parent entry must be defined before its sub-entries. See [subsection 3.2.2](#) for further details.

descriptionplural The plural form of the description (as passed to `\glsdisplay` and `\glsdisplayfirst` by `\glspl`, `\Glspl` and `\GLSpl`). If omitted, the value is set to the same as the **description** key.

text How this entry will appear in the document text when using `\gls` (or one of its uppercase variants). If this field is omitted, the value of the **name** key is used.

first How the entry will appear in the document text the first time it is used with `\gls` (or one of its uppercase variants). If this field is omitted, the value of the **text** key is used.

plural How the entry will appear in the document text when using `\glspl` (or one of its uppercase variants). If this field is omitted, the value is obtained

by appending `\glspluralsuffix` to the value of the `text` field. The default value of `\glspluralsuffix` is the letter “s”.

firstplural How the entry will appear in the document text the first time it is used with `\glspl` (or one of its uppercase variants). If this field is omitted, the value is obtained from the `plural` key, if the `first` key is omitted, or by appending `\glspluralsuffix` to the value of the `first` field, if the `first` field is present.

Note: prior to version 1.13, the default value of `firstplural` was always taken by appending “s” to the `first` key, which meant that you had to specify both `plural` and `firstplural`, even if you hadn’t used the `first` key.

symbol This field is provided to allow the user to specify an associated symbol. If omitted, the value is set to `\relax`. Note that not all glossary styles display the symbol.

symbolplural This is the plural form of the symbol (as passed to `\glsdisplay` and `\glsdisplayfirst` by `\glspl`, `\Glspl` and `\GLSp1`). If omitted, the value is set to the same as the `symbol` key.

sort This value indicates how `makeindex` or `xindy` should sort this entry. If omitted, the value is given by the `name` field.

type This specifies the label of the glossary in which this entry belongs. If omitted, the default glossary is assumed. The list of acronyms type is given by `\acronymtype` which will either be `main` or `acronym`, depending on whether the `acronym` package option was used.

nonumberlist Suppress the number list for this entry.

see Cross-reference another entry. Using the `see` key will automatically add this entry to the glossary, but will not automatically add the cross-referenced entry. The referenced entry should be supplied as the value to this key. If you want to override the “see” tag, you can supply the new tag in square brackets before the label. For example `see=[see also]{anotherlabel}`. For further details, see [subsection 3.6](#).

Note that if the name starts with an accented letter or non-Latin character, you must group the accented letter, otherwise it will cause a problem for commands like `\Gls` and `\Glspl`. For example:

```
\newglossaryentry{elite}{name={\’e}lite},
description={select group or class}}
```

Note that the same applies if you are using the `inputenc` package:

```
\newglossaryentry{elite}{name={\’{e}lite},
description={select group or class}}
```

Note that in both of the above examples, you will also need to supply the `sort` key if you are using `makeindex` whereas `xindy` is usually able to sort accented letters correctly.

3.2.1 Plurals

You may have noticed from above that you can specify the plural form when you define a term. If you omit this, the plural will be obtained by appending `\glspluralsuffix` to the singular form. This command defaults to the letter “s”. For example:

```
\newglossaryentry{cow}{name=cow,description={a fully grown  
female of any bovine animal}}
```

defines a new entry whose singular form is “cow” and plural form is “cows”. However, if you are writing in archaic English, you may want to use “kine” as the plural form, in which case you would have to do:

```
\newglossaryentry{cow}{name=cow,plural=kine,  
description={a fully grown female of any bovine animal}}
```

If you are writing in a language that supports multiple plurals (for a given term) then use the `plural` key for one of them (typically the one you are most likely to use) and for the others you will need to explicitly write the plural form using `\glslink` or `\glsdisp` rather than using `\glspl`. Returning to the cow example above, suppose you will mostly be using “cows” as the plural, but occasionally you want to use “kine” as the plural, then define the term as

```
\newglossaryentry{cow}{name=cow,description={a fully grown  
female of any bovine animal (plural cows, archaic plural kine)}}
```

and use `\glspl{cow}` to produce “cows” and use `\glslink{cow}{kine}` to produce “kine”.

If you are using a language that usually forms plurals by appending a different letter, or sequence of letters, you can redefine `\glspluralsuffix` as required. However, this must be done *before* the entries are defined. For languages that don’t form plurals by simply appending a suffix, all the plural forms must be specified using the `plural` key (and the `firstplural` key where necessary).

3.2.2 Sub-Entries

As from version 1.17, it is possible to specify sub-entries. These may be used to order the glossary into categories, in which case the sub-entry will have a different name to its parent entry, or it may be used to distinguish different definitions for the same word, in which case the sub-entries will have the same name as the parent entry. Note that not all glossary styles support hierarchical entries and may display all the entries in a flat format. Of the styles that support sub-entries, some display the sub-entry’s name whilst others don’t. Therefore you need to ensure that you use a suitable style. See [subsection 3.12](#) for a list of predefined styles.

Note that the parent entry will automatically be added to the glossary if any of its child entries are used in the document. If the parent entry is not referenced in the document, it will not have a number list.

Hierarchical Categories To arrange a glossary with hierarchical categories, you need to first define the category and then define the sub-entries using the relevant category entry as the value of the `parent` key. For example, suppose I

want a glossary of mathematical symbols that are divided into Greek letters and Roman letters. Then I can define the categories as follows:

```
\newglossaryentry{greekletter}{name={Greek letters},
description={\nopostdesc}}

\newglossaryentry{romanletter}{name={Roman letters},
description={\nopostdesc}}
```

Note that in this example, the category entries don't need a description so I have set the descriptions to `\nopostdesc`. This gives a blank description and suppresses the description terminator.

I can now define my sub-entries as follows:

```
\newglossaryentry{pi}{name={pi},
description={ratio of the circumference of a circle to the diameter},
parent=greekletter}

\newglossaryentry{C}{name=C,
description={Euler's constant},
parent=romanletter}
```

Homographs Sub-entries that have the same name as the parent entry, don't need to have the name key. For example, the word "glossary" can mean a list of technical words or a collection of glosses. In both cases the plural is "glossaries". So first define the parent entry:

```
\newglossaryentry{glossary}{name=glossary,
description={\nopostdesc},
plural={glossaries}}
```

Again, the parent entry has no description, so the description terminator needs to be suppressed using `\nopostdesc`.

Now define the two different meanings of the word:

```
\newglossaryentry{glossarylist}{
description={1) list of technical words},
sort={1},
parent={glossary}}

\newglossaryentry{glossarycol}{
description={2) collection of glosses},
sort={2},
parent={glossary}}
```

Note that if I reference the parent entry, the location will be added to the parent's number list, whereas if I reference any of the child entries, the location will be added to the child entry's number list. Note also that since the sub-entries have the same name, the `sort` key is required.

In the above example, the plural form for both of the child entries is the same as the parent entry, so the `plural` key was not required for the child entries. However, if the sub-entries have different plurals, they will need to be specified. For example:

```
\newglossaryentry{bravo}{name={bravo},
description={\nopostdesc}}
```

```

\newglossaryentry{bravocry}{description={1} cry of approval
(pl.\ bravos)},
sort={1},
plural={bravos},
parent=bravo}

\newglossaryentry{bravoruffian}{description={2} hired ruffian or
killer (pl.\ bravo)},
sort={2},
plural={bravo},
parent=bravo}

```

3.2.3 Loading Entries From a File

`\loadglsentries` You can store all your glossary entry definitions in another file and use:

```
\loadglsentries[<type>]{<filename>}
```

where *<filename>* is the name of the file containing all the `\newglossaryentry` commands. The optional argument *<type>* is the name of the glossary to which those entries should belong, for those entries where the `type` key has been omitted (or, more specifically, for those entries whose type has been specified by `\glsdefaulttype`, which is what `\newglossaryentry` uses by default). For example, suppose I have a file called `myentries.tex` which contains:

```

\newglossaryentry{perl}{type=main,
name={Perl},
description={A scripting language}}

\newglossaryentry{tex}{name={\TeX},
description={A typesetting language},sort={TeX}}

\newglossaryentry{html}{type=\glsdefaulttype,
name={html},
description={A mark up language}}

```

and suppose in my document preamble I use the command:

```
\loadglsentries[languages]{myentries}
```

then this will add the entries `tex` and `html` to the glossary whose type is given by `languages`, but the entry `perl` will be added to the main glossary, since it explicitly sets the type to `main`.

Note: if you use `\newacronym` (see [subsection 3.10](#)) the type is set as `type=\acronymtype` unless you explicitly override it. For example, if my file `myacronyms.tex` contains:

```
\newacronym{aca}{aca}{a contrived acronym}
```

then (supposing I have defined a new glossary type called `altacronym`)

```
\loadglsentries[altacronym]{myacronyms}
```

will add `aca` to the glossary type `acronym`, if the package option `acronym` has been specified, or will add `aca` to the glossary type `altacronym`, if the package option `acronym` is not specified.⁶ In this instance, it is better to change `myacronyms.tex` to:

```
\newacronym[type=\glsdefaulttype]{aca}{aca}{a contrived acronym}
```

and now

```
\loadglsentries[altacronym]{myacronyms}
```

will add `aca` to the glossary type `altacronym`, regardless of whether or not the package option `acronym` is used.

Note that only those entries that have been used in the text will appear in the relevant glossaries. Note also that `\loadglsentries` may only be used in the preamble.

3.3 Number lists

Each entry in the glossary has an associated *number list*. By default, these numbers refer to the pages on which that entry has been used (using any of the commands described in [subsection 3.4](#) and [subsection 3.5](#)). The number list can be suppressed using the `nonumberlist` package option, or an alternative counter can be set as the default using the `counter` package option. The number list is also referred to as the location list.

Both `makeindex` and `xindy` concatenate a sequence of 3 or more consecutive pages into a range. With `xindy` you can vary the minimum sequence length using `\GlsSetXdyMinRangeLength{<n>}` where `<n>` is either an integer or the keyword `none` which indicates that there should be no range formation.

Note that `\GlsSetXdyMinRangeLength` must be used before `\makeglossaries` and has no effect if `\noist` is used.

With both `makeindex` and `xindy`, you can replace the separator and the closing number in the range using:

```
\glsSetSuffixF \glsSetSuffixF{<suffix>}
\glsSetSuffixFF \glsSetSuffixFF{<suffix>}
```

where the former command specifies the suffix to use for a 2 page list and the latter specifies the suffix to use for longer lists. For example:

```
\glsSetSuffixF{f.}
\glsSetSuffixFF{ff.}
```

Note that if you use `xindy`, you will also need to set the minimum range length to 1 if you want to change these suffixes:

```
\GlsSetXdyMinRangeLength{1}
```

⁶This is because `\acronymtype` is set to `\glsdefaulttype` if the `acronym` package option is not used.

Note that if you use the `hyperref` package, you will need to use `\nohyperpage` in the suffix to ensure that the hyperlinks work correctly. For example:

```
\glsSetSuffixF{\nohyperpage{f.}}
\glsSetSuffixFF{\nohyperpage{ff.}}
```

Note that `\glsSetSuffixF` and `\glsSetSuffixFF` must be used before `\makeglossaries` and have no effect if `\noist` is used.

3.4 Links to Glossary Entries

Once you have defined a glossary entry using `\newglossaryentry`, you can refer to that entry in the document using one of the commands listed in this section. The text which appears at that point in the document when using one of these commands is referred to as the *link text* (even if there are no hyperlinks). The commands in this section also add a line to an external file that is used by `makeindex` or `xindy` to generate the relevant entry in the glossary. This information includes an associated location that is added to the number list for that entry. By default, the location refers to the page number. For further information on number lists, see [subsection 3.3](#).

It is strongly recommended that you don't use the commands defined in this section in the arguments of sectioning or caption commands.

The above warning is particularly important if you are using the glossaries package in conjunction with the `hyperref` package. Instead, use one of the commands listed in [subsection 3.7](#) (such as `\glsentrytext`) or provide an alternative via the optional argument to the sectioning/caption command. Examples:

```
\section{An overview of \glsentrytext{perl}}
\section[An overview of Perl]{An overview of \gls{perl}}
```

`\glstextformat` The way the link text is displayed depends on `\glstextformat{⟨text⟩}`. For example, to make all link text appear in a sans-serif font, do:

```
\renewcommand*{\glstextformat}[1]{\textsf{#1}}
```

Each entry has an associated conditional referred to as the first use flag. This determines whether `\gls`, `\glsp1` (and their uppercase variants) should use the value of the `first` or `text` keys. Note that an entry can be used without affecting the first use flag (for example, when used with `\glslink`). See [subsection 3.11](#) for commands that unset or reset this conditional.

`\glslink` The command:

```
\glslink[⟨options⟩]{⟨label⟩}{⟨text⟩}
```

will place `\glstextformat{⟨text⟩}` in the document at that point and add a line into the associated glossary file for the glossary entry given by `⟨label⟩`. If hyperlinks are supported, `⟨text⟩` will be a hyperlink to the relevant line in the glossary. The optional argument `⟨options⟩` must be a `⟨key⟩=⟨value⟩` list which can take any of the following keys:

format This specifies how to format the associated location number for this entry in the glossary. This value is equivalent to the `makeindex` `encap` value, and (as with `\index`) the value needs to be the name of a command *without* the initial backslash. As with `\index`, the characters (and) can also be used to specify the beginning and ending of a number range. Again as with `\index`, the command should be the name of a command which takes an argument (which will be the associated location). Be careful not to use a declaration (such as `bfseries`) instead of a text block command (such as `textbf`) as the effect is not guaranteed to be localised. If you want to apply more than one style to a given entry (e.g. **bold** and *italic*) you will need to create a command that applies both formats, e.g.

```
\newcommand*{\textbfem}[1]{\textbf{\emph{#1}}}
```

and use that command.

In this document, the standard formats refer to the standard text block commands such as `\textbf` or `\emph` or any of the commands listed in [table 3](#).

If you use `xindy` instead of `makeindex`, you must specify any non-standard formats that you want to use with the `format` key using `\GlsAddXdyAttribute{<name>}`. So if you use `xindy` with the above example, you would need to add:

```
\GlsAddXdyAttribute{textbfem}
```

Note that unlike `\index`, you can't have anything following the command name, such as an asterisk or arguments. If you want to cross-reference another entry, either use the `see` key when you define the entry or use `\glssee` (described in [subsection 3.6](#)).

If you are using hyperlinks and you want to change the font of the hyperlinked location, don't use `\hyperpage` (provided by the `hyperref` package) as the locations may not refer to a page number. Instead, the `glossaries` package provides number formats listed in [table 3](#).

Table 3: Predefined Hyperlinked Location Formats

<code>hyperrm</code>	serif hyperlink
<code>hypersf</code>	sans-serif hyperlink
<code>hypertt</code>	monospaced hyperlink
<code>hyperbf</code>	bold hyperlink
<code>hypermd</code>	medium weight hyperlink
<code>hyperit</code>	italic hyperlink
<code>hypersl</code>	slanted hyperlink
<code>hyperup</code>	upright hyperlink
<code>hypersc</code>	small caps hyperlink
<code>hyperemph</code>	emphasized hyperlink

Note that if the `\hyperlink` command hasn't been defined, the `hyper<xx>` formats are equivalent to the analogous `text<xx>` font commands (and `hyperemph` is equivalent to `emph`). If you want to make a new format, you will need to define a command which takes one argument and use that; for example, if you want the location number to be in a bold sans-serif font, you can define a command called, say, `\hyperbsf`:

```
\newcommand{\hyperbsf}[1]{\textbf{\hypersf{#1}}}
```

and then use `hyperbsf` as the value for the `format` key. (See also [subsection 5.15](#).) Remember that if you use `xindy`, you will need to add this to the list of location attributes:

```
\GlsAddXdyAttribute{hyperbsf}
```

counter This specifies which counter to use for this location. This overrides the default counter used by this entry. (See also [subsection 3.3](#).)

hyper This is a boolean key which can be used to enable/disable the hyperlink to the relevant entry in the glossary. (Note that setting `hyper=true` will have no effect if `\hyperlink` has not been defined.) The default value is `hyper=true`.

`\glslink*` There is also a starred version:

```
\glslink*[\<options>]{\<label>}{\<text>}
```

which is equivalent to `\glslink`, except it sets `hyper=false`.

`\gls` The command:

```
\gls[\<options>]{\<label>}{\<insert>}
```

is the same as `\glslink`, except that the link text is determined from the values of the `text` and `first` keys supplied when the entry was defined using `\newglossaryentry`. If the entry has been marked as having been used, the value of the `text` key will be used, otherwise the value of the `first` key will be used. On completion, `\gls` will mark the entry's first use flag as used.

There are two uppercase variants:

```
\Gls \Gls[\<options>]{\<label>}{\<insert>}
```

and

```
\GLS \GLS[\<options>]{\<label>}{\<insert>}
```

which make the first letter of the link text or all the link text uppercase, respectively.

The final optional argument `\<insert>`, allows you to insert some additional text into the link text. By default, this will append `\<insert>` at the end of the link text, but this can be changed (see [subsection 3.4.1](#)).

The first optional argument `\<options>` is the same as the optional argument to `\glslink`. As with `\glslink`, these commands also have a starred version that disable the hyperlink.

There are also analogous plural forms:

`\glspl` `\glspl[<options>]{<label>}[<insert>]`

`\Glspl` `\Glspl[<options>]{<label>}[<insert>]`

`\GLSpl` `\GLSpl[<options>]{<label>}[<insert>]`

These determine the link text from the `plural` and `firstplural` keys supplied when the entry was first defined. As before, these commands also have a starred version that disable the hyperlink.

Note that `\glslink` doesn't use or affect the first use flag, nor does it use `\glsdisplay` or `\glsdisplayfirst` (see [subsection 3.4.1](#)). Instead, you can use:

`glsdisp` `\glsdisp[<options>]{<label>}{<link text>}`

This behaves in the same way as `\gls`, except that it uses *<link text>* instead of the value of the `first` or `text` key. (Note that this command always sets *<insert>* to nothing.)

`\glstext` The command:

`\glstext[<options>]{<label>}[<insert>]`

is similar to `\gls` except that it always uses the value of the `text` key and does not affect the first use flag. Unlike `\gls`, the inserted text *<insert>* is always appended to the link text since `\glstext` doesn't use `\glsdisplay` or `\glsdisplayfirst`. (The same is true for all the following commands described in this section.)

There are also analogous commands:

`\Glstext` `\Glstext[<options>]{<text>}[<insert>]`

`\GLStext` `\GLStext[<options>]{<text>}[<insert>]`

As before, these commands also have a starred version that disable the hyperlink.

`\glsfirst` The command:

`\glsfirst[<options>]{<label>}[<insert>]`

is similar to `\glstext` except that it always uses the value of the `first` key. Again, *<insert>* is always appended to the end of the link text and does not affect the first use flag.

There are also analogous commands:

`\Glsfirst` `\Glsfirst[<options>]{<text>}[<insert>]`

`\GLSfirst` `\GLSfirst[<options>]{<text>}[<insert>]`

As before, these commands also have a starred version that disable the hyperlink.

`\glsplural` The command:

`\glsplural[<options>]{<label>}[<insert>]`

is similar to `\glstext` except that it always uses the value of the `plural` key. Again, `\insert` is always appended to the end of the link text and does not mark the entry as having been used.

There are also analogous commands:

`\Glsplural` `\Glsplural[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

`\GLSplural` `\GLSplural[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

As before, these commands also have a starred version that disable the hyperlink.

`\glsfirstplural` The command:

`\glsfirstplural[⟨options⟩]{⟨label⟩}[⟨insert⟩]`

is similar to `\glstext` except that it always uses the value of the `firstplural` key. Again, `\insert` is always appended to the end of the link text and does not mark the entry as having been used.

There are also analogous commands:

`\Glsfirstplural` `\Glsfirstplural[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

`\GLSfirstplural` `\GLSfirstplural[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

As before, these commands also have a starred version that disable the hyperlink.

`\glsname` The command:

`\glsname[⟨options⟩]{⟨label⟩}[⟨insert⟩]`

is similar to `\glstext` except that it always uses the value of the `name` key. Again, `\insert` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `name` key contains commands, you will have to disable the `sanitization` of the `name` key and protect fragile commands.

There are also analogous commands:

`\Glsname` `\Glsname[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

`\GLSname` `\GLSname[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

As before, these commands also have a starred version that disable the hyperlink.

`\glssymbol` The command:

`\glssymbol[⟨options⟩]{⟨label⟩}[⟨insert⟩]`

is similar to `\glstext` except that it always uses the value of the `symbol` key. Again, `\insert` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `symbol` key contains commands, you will have to disable the `sanitization` of the `symbol` key and protect fragile commands.

There are also analogous commands:

`\Glssymbol` `\Glssymbol[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

`\GLSsymbol` `\GLSsymbol[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

As before, these commands also have a starred version that disable the hyperlink.

`\glsdesc` The command:

`\glsdesc[⟨options⟩]{⟨label⟩}[⟨insert⟩]`

is similar to `\gls` except that it always uses the value of the `description` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `description` key contains commands, you will have to disable the `sanitization` of the `description` key and protect fragile commands.

There are also analogous commands:

`\Glsdesc` `\Glsdesc[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

`\GLSdesc` `\GLSdesc[⟨options⟩]{⟨text⟩}[⟨insert⟩]`

As before, these commands also have a starred version that disable the hyperlink.

3.4.1 Changing the format of the link text

`\glsdisplayfirst` The format of the link text for `\gls`, `\glspl` and their uppercase variants is governed by two commands: `\glsdisplayfirst`, which is used the first time a glossary entry is used in the text and `\glsdisplay`, which is used subsequently. Both commands take four arguments: the first is either the singular or plural form given by the `text`, `plural`, `first` or `firstplural` keys (set when the term was defined) depending on context; the second argument is the term’s description (as supplied by the `description` or `descriptionplural` keys); the third argument is the symbol associated with the term (as supplied by the `symbol` or `symbolplural` keys) and the fourth argument is the additional text supplied in the final optional argument to `\gls` or `\glspl` (or their uppercase variants). The default definitions of `\glsdisplay` and `\glsdisplayfirst` simply print the first argument immediately followed by the fourth argument. The remaining arguments are ignored.

`\glslabel` If required, you can access the label for the given entry via `\glslabel`, so it is possible to use this label in the definition of `\glsdisplay` or `\glsdisplayfirst` to supply additional information using any of the commands described in [subsection 3.7](#), if required.

Note that `\glsdisplay` and `\glsdisplayfirst` are not used by `\glslink`. If you want to supply your own link text, you need to use `\glsdisp` instead.

For example, suppose you want a glossary of measurements and units, you can use the `symbol` key to store the unit:

```
\newglossaryentry{distance}{name=distance,
description={The length between two points},
symbol={km}}
```

and now suppose you want `\gls{distance}` to produce “distance (km)” on first use, then you can redefine `\glsdisplayfirst` as follows:

```
\renewcommand{\glsdisplayfirst}[4]{#1#4 (#3)}
```

Note that the additional text is placed after #1, so `\gls{distance}[’s]` will produce “distance’s (km)” rather than “distance (km)’s” which looks a bit odd (even though it may be in the context of “the distance (km) is measured between the two points” — but in this instance it would be better not to use a contraction).

Note also that all of the link text will be formatted according to `\glstextformat` (described earlier). So if you do, say:

```
\renewcommand{\glstextformat}[1]{\textbf{#1}}
\renewcommand{\glsdisplayfirst}[4]{#1#4 (#3)}
```

then `\gls{distance}` will produce “**distance (km)**”.

If you have multiple glossaries, changing `\glsdisplayfirst` and `\glsdisplay` will change the way entries for all of the glossaries appear when using the commands `\gls`, `\glspl` and their uppercase variants. If you only want the change to affect entries for a given glossary, then you need to use

```
\defglsdisplay \defglsdisplay[⟨type⟩]{⟨definition⟩}
```

and

```
\defglsdisplayfirst \defglsdisplayfirst[⟨type⟩]{⟨definition⟩}
```

instead of redefining `\glsdisplay` and `\glsdisplayfirst`.

Both `\defglsdisplay` and `\defglsdisplayfirst` take two arguments: the first (which is optional) is the glossary’s label⁷ and the second is how the term should be displayed when it is invoked using commands `\gls`, `\glspl` and their uppercase variants. This is similar to the way `\glsdisplayfirst` was redefined above.

For example, suppose you have created a new glossary called `notation` and you want to change the way the entry is displayed on first use so that it includes the symbol, you can do:

```
\defglsdisplayfirst[notation]{#1#4 (denoted #3)}
```

Now suppose you have defined an entry as follows:

```
\newglossaryentry{set}{type=notation,
name=set,
description={A collection of objects},
symbol={$$$}
}
```

The first time you reference this entry using `\gls` it will be displayed as: “set (denoted S)” (similarly for `\glspl` and the uppercase variants).

Remember that if you use the `symbol` key, you need to use a glossary style that displays the symbol, as many of the styles ignore it. In addition, if you want either the description or symbol to appear in the link text, you will have to disable the **sanitization** of these keys and protect fragile commands.

⁷`main` for the main (default) glossary, `acronymtype` for the list of acronyms, or the name supplied in the first mandatory argument to `\newglossary` for additional glossaries.

3.4.2 Enabling and disabling hyperlinks to glossary entries

If you load the `hyperref` or `html` packages prior to loading the `glossaries` package, commands such as `\glslink` and `\gls`, described above, will automatically have hyperlinks to the relevant glossary entry, unless the `hyper` option has been set to `false`. You can disable or enable links using:

`\glsdisablehyper` `\glsdisablehyper`

and

`\glsenablehyper` `\glsenablehyper`

respectively. The effect can be localised by placing the commands within a group. Note that you should only use `\glsenablehyper` if the commands `\hyperlink` and `\hypertarget` have been defined (for example, by the `hyperref` package).

3.5 Adding an Entry to the Glossary Without Generating Text

`\glsadd` It is possible to add a line in the glossary file without generating any text at that point in the document using:

`\glsadd[⟨options⟩]{⟨label⟩}`

This is similar to `\glslink`, only it doesn't produce any text (so therefore, there is no `hyper` key available in `⟨options⟩` but all the other options that can be used with `\glslink` can be passed to `\glsadd`). For example, to add a page range to the glossary number list for the entry whose label is given by `set`:

```
\glsadd[format=]{set}
Lots of text about sets spanning many pages.
\glsadd[format=]{set}
```

`\glsaddall` To add all entries that have been defined, use:

`\glsaddall[⟨options⟩]`

The optional argument is the same as for `\glsadd`, except there is also a key `types` which can be used to specify which glossaries to use. This should be a comma separated list. For example, if you only want to add all the entries belonging to the list of acronyms (specified by the glossary type `\acronymtype`) and a list of notation (specified by the glossary type `notation`) then you can do:

`\glsaddall[types={\acronymtype,notation}]`

3.6 Cross-Referencing Entries

There are several ways of cross-referencing entries in the glossary:

1. You can use commands such as `\gls` in the entries description. For example:

```
\newglossaryentry{apple}{name=apple,
description={firm, round fruit. See also \gls{pear}}}
```

Note that with this method, if you don't use the cross-referenced term in the glossary, you will need two runs of `makeglossaries`:

```
latex filename
makeglossaries filename
latex filename
makeglossaries filename
latex filename
```

2. As described in [subsection 3.2](#), you can use the `see` key when you define the entry. For example:

```
\newglossaryentry{MaclaurinSeries}{name={Maclaurin series},
description={Series expansion},
see={TaylorsTheorem}}
```

Note that in this case, the entry with the `see` key will automatically be added to the glossary, but the cross-referenced entry won't. You therefore need to ensure that you use the cross-referenced term with the commands described in [subsection 3.4](#) or [subsection 3.5](#).

You can optionally override the “see” tag using square brackets at the start of the `see` value. For example:

```
\newglossaryentry{MaclaurinSeries}{name={Maclaurin series},
description={Series expansion},
see=[see also]{TaylorsTheorem}}
```

3. After you have defined the entry, use

```
\glssee <tag>[<label>]{<xr label list>}
```

where `<xr label list>` is a comma-separated list of entry labels to be cross-referenced, `<label>` is the label of the entry doing the cross-referencing and `<tag>` is the “see” tag. For example:

```
\glssee[see also]{series}{FourierSeries,TaylorsTheorem}
```

Note that this automatically adds the entry given by `<label>` to the glossary but doesn't add the cross-referenced entries (specified by `<xr label list>`) to the glossary.

In both cases 2 and 3 above, the cross-referenced information appears in the number list, whereas in case 1, the cross-referenced information appears in the description. In cases 2 and 3, the default text for the “see” tag is given by `\seename`.

3.7 Using Glossary Terms Without Links

The commands described in this section display entry details without adding any information to the glossary. They don't use `\glstextformat`, they don't have any optional arguments, they don't affect the first use flag and, apart from `\glshyperlink`, they don't produce hyperlinks.

`\glsentryname` `\glsentryname{⟨label⟩}`
`\Glsentryname` `\Glsentryname{⟨label⟩}`

These commands display the name of the glossary entry given by `⟨label⟩`, as specified by the `name` key. `\Glsentryname` makes the first letter uppercase.

`\glsentrytext` `\glsentrytext{⟨label⟩}`
`\Glsentrytext` `\Glsentrytext{⟨label⟩}`

These commands display the subsequent use text for the glossary entry given by `⟨label⟩`, as specified by the `text` key. `\Glsentrytext` makes the first letter uppercase.

`\glsentryplural` `\glsentryplural{⟨label⟩}`
`\Glsentryplural` `\Glsentryplural{⟨label⟩}`

These commands display the subsequent use plural text for the glossary entry given by `⟨label⟩`, as specified by the `plural` key. `\Glsentryplural` makes the first letter uppercase.

`\glsentryfirst` `\glsentryfirst{⟨label⟩}`
`\Glsentryfirst` `\Glsentryfirst{⟨label⟩}`

These commands display the first use text for the glossary entry given by `⟨label⟩`, as specified by the `first` key. `\Glsentryfirst` makes the first letter uppercase.

`\glsentryfirstplural` `\glsentryfirstplural{⟨label⟩}`
`\Glsentryfirstplural` `\Glsentryfirstplural{⟨label⟩}`

These commands display the plural form of the first use text for the glossary entry given by `⟨label⟩`, as specified by the `firstplural` key. `\Glsentryfirstplural` makes the first letter uppercase.

`\glsentrydesc` `\glsentrydesc{⟨label⟩}`
`\Glsentrydesc` `\Glsentrydesc{⟨label⟩}`

These commands display the description for the glossary entry given by `⟨label⟩`. `\Glsentrydesc` makes the first letter uppercase.

`\glsentrydescplural` `\glsentrydescplural{⟨label⟩}`
`\Glsentrydescplural` `\Glsentrydescplural{⟨label⟩}`

These commands display the plural description for the glossary entry given by `⟨label⟩`. `\Glsentrydescplural` makes the first letter uppercase.

`\glsentrysymbol` `\glsentrysymbol{⟨label⟩}`
`\Glsentrysymbol` `\Glsentrysymbol{⟨label⟩}`

These commands display the symbol for the glossary entry given by `⟨label⟩`. `\Glsentrysymbol` makes the first letter uppercase.

`\glsentrysymbolplural` `\glsentrysymbolplural{⟨label⟩}`

`\Glsentrysymbolplural` `\Glsentrysymbolplural{<label>}`

These commands display the plural symbol for the glossary entry given by *<label>*. `\Glsentrysymbolplural` makes the first letter uppercase.

`\glshyperlink` `\glshyperlink[<link text>]{<label>}`

This command provides a hyperlink to the glossary entry given by *<label>* **but does not add any information to the glossary file**. The link text is given by `\glentryname{<label>}` by default, but can be overridden using the optional argument.

If you use `\glshyperlink`, you need to ensure that the relevant entry has been added to the glossary using any of the commands described in [subsection 3.4](#) or [subsection 3.5](#) otherwise you will end up with a broken link.

For further information see [subsubsection 5.10.2](#).

3.8 Displaying a glossary

`\printglossaries` The command `\printglossaries` will display all the glossaries in the order in which they were defined. Note that no glossaries will appear until you have either used the Perl script `makeglossaries` or have directly used `makeindex` or `xindy` (as described in [subsection 1.3](#)). If the glossary still does not appear after you re- \LaTeX your document, check the `makeindex/xindy` log files to see if there is a problem. Remember that you also need to use the command `\makeglossaries` in the preamble to enable the glossaries.

`\printglossary` An individual glossary can be displayed using:

`\printglossary[<options>]`

where *<options>* is a *<key>=<value>* list of options. The following keys are available:

type The value of this key specifies which glossary to print. If omitted, the default glossary is assumed. For example, to print the list of acronyms:

`\printglossary[type=\acronymtype]`

title This is the glossary's title (overriding the title specified when the glossary was defined).

toctitle This is the title to use for the table of contents (if the `toc` package option has been used). If omitted, the glossary title is used.

style This specifies which glossary style to use for this glossary, overriding the effect of the `style` package option or `\glossarystyle`.

numberedsection This specifies whether to use a numbered section for this glossary, overriding the effect of the `numberedsection` package option. This key has the same syntax as the `numberedsection` package option, described in [subsection 3.1](#).

nonumberlist Unlike the package option of the same name, this key is a boolean key. If true (`nonumberlist=true`) the numberlist is suppressed for this glossary. If false (`nonumberlist=false`) the numberlist is displayed for this glossary. If no value is supplied, true is assumed.

`\glossarypreamble` Information can be added to the start of the glossary (after the title and before the main body of the glossary) by redefining `\glossarypreamble`. For example:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate
primary definitions.}
```

This needs to be done before the glossary is displayed using `\printglossaries` or `\printglossary`. Note that if you want a different preamble for each glossary, you will need to use a separate `\printglossary` for each glossary and change the definition of `\glossarypreamble` between each glossary. For example:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate
primary definitions.}
\printglossary
\renewcommand{\glossarypreamble}{}
\printglossary[type=acronym]
```

Alternatively, you can do something like:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate
primary definitions.}
\gdef\glossarypreamble{}
\printglossaries
```

which will print the preamble text for the first glossary and change the preamble to do nothing for subsequent glossaries. (Note that `\gdef` is required as the glossary is placed within a group.)

`\glossarypostamble` There is an analogous command called `\glossarypostamble` which is placed at the end of each glossary.

3.8.1 Changing the way the entry name appears in the glossary

`\glsnamefont` Within each glossary, each entry name is formatted according to `\glsnamefont` which takes one argument: the entry name. This command is always used regardless of the glossary style. By default, `\glsnamefont` simply displays its argument in whatever the surrounding font happens to be. This means that in the list-like glossary styles (defined in the `glossary-list` style file) the name will appear in bold, since the name is placed in the optional argument of `\item`, whereas in the tabular styles (defined in the `glossary-long` and `glossary-super` style files) the name will appear in the normal font. The hierarchical glossary styles (defined in the `glossary-tree` style file) also set the name in bold.

For example, suppose you want all the entry names to appear in medium weight small caps, then you can do:

```
\renewcommand{\glsnamefont}[1]{\textsc{\mdseries #1}}
```

3.8.2 Xindy

If you want to use xindy to sort the glossary, you must use the package option xindy:

```
\usepackage[xindy]{glossaries}
```

This ensures that the glossary information is written in `xindy` syntax.

Section 1.3 covers how to use the external indexing application. This section covers the commands provided by the `glossaries` package that allow you to adjust the `xindy` style file (`.xdy`) and parameters.

To assist writing information to the `xindy` style file, the `glossaries` package provides the following commands:

```
\glsopenbrace \glsopenbrace
\glsclosebrace \glsclosebrace
```

which produce an open and closing brace. (This is needed because `\{` and `\}` don't expand to a simple brace character when written to a file.)

In addition, if you are using a package that makes the double quote character active (e.g. `ngerman`) you can use:

```
\glsquote \glsquote{<text>}
```

which will produce `"<text>"`. Alternatively, you can use `\string` to write the double-quote character. This document assumes that the double quote character has not been made active, so the examples just use `"` for clarity.

If you want greater control over the `xindy` style file than is available through the `LATEX` commands provided by the `glossaries` package, you will need to edit the `xindy` style file. In which case, you must use `\noist` to prevent the style file from being overwritten by the `glossaries` package. For additional information about `xindy`, read the `xindy` documentation.

Language and Encodings When you use `xindy`, you need to specify the language and encoding used (unless you have written your own custom `xindy` style file that defines the relevant alphabet and sort rules). If you use `makeglossaries`, this information is obtained from the document's auxiliary (`.aux`) file. The `glossaries` package attempts to find the root language, but in the event that it gets it wrong or if `xindy` doesn't support that language, then you can specify the language using:

```
\GlsSetXdyLanguage \GlsSetXdyLanguage[<glossary type>]{<language>}
```

where `<language>` is the name of the language. The optional argument can be used if you have multiple glossaries in different languages. If `<glossary type>` is omitted, it will be applied to all glossaries, otherwise the language setting will only be applied to the glossary given by `<glossary type>`.

If the `inputenc` package is used, the encoding will be obtained from the value of `\inputencodingname`. Alternatively, you can specify the encoding using:

```
\GlsSetXdyCodePage \GlsSetXdyCodePage{<code>}
```

where `<code>` is the name of the encoding. For example:

```
\GlsSetXdyCodePage{utf8}
```

Note that you can also specify the language and encoding using the package option `xindy={language=<lang>,codepage=<code>}`. For example:

```
\usepackage[xindy={language=english,codepage=utf8}]{glossaries}
```

If you write your own custom `xindy` style file that includes the language settings, you need to set the language to nothing:

```
\GlsSetXdyLanguage{}
```

(and remember to use `\noist` to prevent the style file from being overwritten).

The commands `\GlsSetXdyLanguage` and `\GlsSetXdyCodePage` have no effect if you don't use `makeglossaries`. If you call `xindy` without `makeglossaries` you need to remember to set the language and encoding using the `-L` and `-C` switches.

Locations and Number lists The most likely attributes used in the format key (`textrm`, `hyperrm` etc) are automatically added to the `xindy` style file, but if you want to use another attribute, you need to add it using:

```
\GlsAddXdyAttribute \GlsAddXdyAttribute{<name>}
```

where `<name>` is the name of the attribute, as used in the format key. For example, suppose I want a bold, italic, hyperlinked location. I first need to define a command that will do this:

```
\newcommand*{\hyperbfit}[1]{\textit{\hyperbf{#1}}}
```

but with `xindy`, I also need to add this as an allowed attribute:

```
\GlsAddXdyAttribute{hyperbfit}
```

Note that `\GlsAddXdyAttribute` has no effect if `\noist` is used or if `\makeglossaries` is omitted.
`\GlsAddXdyAttribute` must be used before `\makeglossaries`.

If the location numbers don't get expanded to a simple Arabic or Roman number or a letter from a, ..., z or A, ..., Z, then you need to add a location style in the appropriate format.

For example, suppose you want the page numbers written as words rather than digits and you use the `fmtcount` package to do this. You can redefine `\thepage` as follows:

```
\renewcommand*{\thepage}{\Numberstring{page}}
```

This gets expanded to `\protect \Numberstringnum {<n>}` where `<n>` is the Arabic page number. This means that you need to define a new location that has that form:

```
\GlsAddXdyLocation{Numberstring}{:sep "\string\protect\space
\string\Numberstringnum\space\glsoopenbrace"
"arabic-numbers" :sep "\glsclosebrace"}
```

Note that it's necessary to use `\space` to indicate that spaces also appear in the format, since, unlike \TeX , `xindy` doesn't ignore spaces after control sequences.

Note that `\GlsAddXdyLocation` has no effect if `\noist` is used or if `\makeglossaries` is omitted.
`\GlsAddXdyLocation` must be used before `\makeglossaries`.

In the number list, the locations are sorted according to type. The default ordering is: `roman-page-numbers` (e.g. i), `arabic-page-numbers` (e.g. 1), `arabic-section-numbers` (e.g. 1.1 if the compositor is a full stop or 1-1 if the compositor is a hyphen⁸), `alpha-page-numbers` (e.g. a), `Roman-page-numbers` (e.g. I), `Alpha-page-numbers` (e.g. A), `Appendix-page-numbers` (e.g. A.1 if the Alpha compositor is a full stop or A-1 if the Alpha compositor is a hyphen⁹), user defined location names (as specified by `\GlsAddXdyLocation` in the order in which they were defined), `see` (cross-referenced entries). This ordering can be changed using:

```
\GlsSetXdyLocationClassOrder \GlsSetXdyLocationClassOrder{\location names}
```

where each location name is delimited by double quote marks and separated by white space. For example:

```
\GlsSetXdyLocationClassOrder{
  "arabic-page-numbers"
  "arabic-section-numbers"
  "roman-page-numbers"
  "Roman-page-numbers"
  "alpha-page-numbers"
  "Alpha-page-numbers"
  "Appendix-page-numbers"
  "see"
}
```

Note that `\GlsSetXdyLocationClassOrder` has no effect if `\noist` is used or if `\makeglossaries` is omitted.
`\GlsSetXdyLocationClassOrder` must be used before `\makeglossaries`.

If a number list consists of a sequence of consecutive numbers, the range will be concatenated. The number of consecutive locations that causes a range formation defaults to 2, but can be changed using:

```
\GlsSetXdyMinRangeLength \GlsSetXdyMinRangeLength{\<n>}
```

For example:

```
\GlsSetXdyMinRangeLength{3}
```

The argument may also be the keyword `none`, to indicate that there should be no range formations. See the `xindy` manual for further details on range formations.

⁸see `\setCompositor` described in [subsection 3.2](#)

⁹see `\setAlphaCompositor` described in [subsection 3.2](#)

Note that `\GlsSetXdyMinRangeLength` has no effect if `\noist` is used or if `\makeglossaries` is omitted.
`\GlsSetXdyMinRangeLength` must be used before `\makeglossaries`.

See [subsection 3.3](#) for further details.

Glossary Groups The glossary is divided into groups according to the first letter of the sort key. The `glossaries` package also adds a number group by default, unless you suppress it in the `xindy` package option. For example:

```
\usepackage[xindy={glsnumbers=false}]{glossaries}
```

Any entry that doesn't go in one of the letter groups or the number group is placed in the default group.

If you have a number group, the default behaviour is to locate it before the “A” letter group. If you are not using a Roman alphabet, you can change this using

```
\GlsSetXdyFirstLetterAfterDigits{<letter>}
```

Note that `\GlsSetXdyFirstLetterAfterDigits` has no effect if `\noist` is used or if `\makeglossaries` is omitted.
`\GlsSetXdyFirstLetterAfterDigits` must be used before `\makeglossaries`.

3.9 Defining New Glossaries

`\newglossary` A new glossary can be defined using:

```
\newglossary[<log-ext>]{<name>}{<in-ext>}{<out-ext>}{<title>}[<counter>]
```

where `<name>` is the label to assign to this glossary. The arguments `<in-ext>` and `<out-ext>` specify the extensions to give to the input and output files for that glossary, `<title>` is the default title for this new glossary and the final optional argument `<counter>` specifies which counter to use for the associated number lists (see also [subsection 3.3](#)). The first optional argument specifies the extension for the `makeindex` or `xindy` transcript file (this information is only used by `makeglossaries` which picks up the information from the auxiliary file).

Note that the main (default) glossary is automatically created as:

```
\newglossary{main}{gls}{glo}{\glossaryname}
```

so it can be identified by the label `main`. Using the `acronym` package option is equivalent to:

```
\newglossary[alg]{acronym}{acr}{acn}{\acronymname}
```

so it can be identified by the label `acronym`. If you are not sure whether the `acronym` option has been used, you can identify the list of acronyms by the command `\acronymtype` which is set to `acronym`, if the `acronym` option has been used, otherwise it is set to `main`.

`\acronymtype`

All glossaries must be defined before `\makeglossaries` to ensure that the relevant output files are opened.

3.10 Acronyms

`\newacronym` You may have noticed in [subsection 3.2](#) that when you specify a new entry, you can specify alternate text to use when the term is first used in the document. This provides a useful means to define acronyms. For convenience, the `glossaries` package defines the command:

```
\newacronym[⟨key-val list⟩]{⟨label⟩}{⟨abbrv⟩}{⟨long⟩}
```

By default, this is equivalent to:

```
\newglossaryentry{⟨label⟩}{type=\acronymtype,
name={⟨abbrv⟩},
description={⟨long⟩},
text={⟨abbrv⟩},
first={⟨long⟩ (⟨abbrv⟩)},
plural={⟨abbrv⟩\glspluralsuffix},
firstplural={⟨long⟩\glspluralsuffix\space (⟨abbrv⟩\glspluralsuffix)},
⟨key-val list⟩}
```

As mentioned in the previous section, the command `\acronymtype` is the name of the glossary in which the acronyms should appear. If the `acronym` package option has been used, this will be `acronym`, otherwise it will be `main`. The acronyms can then be used in exactly the same way as any other glossary entry.

Note: since `\newacronym` sets `type=\acronymtype`, if you want to load a file containing acronym definitions using `\loadglsentries[⟨type⟩]{⟨filename⟩}`, the optional argument `⟨type⟩` will not have an effect unless you explicitly set the type as `type=\glsdefaulttype` in the optional argument to `\newacronym`. See [subsubsection 3.2.3](#).

For example, the following defines the acronym IDN:

```
\newacronym{idn}{IDN}{identification number}
```

This is equivalent to:

```
\newglossaryentry{idn}{type=\acronymtype,
name={IDN},
description={identification number},
text={IDN},
first={identification number (IDN)},
plural={IDNs},
firstplural={identification numbers (IDNs)}}
```

so `\gls{idn}` will produce “identification number (IDN)” on first use and “IDN” on subsequent uses.

This section describes acronyms that have been defined using `\newacronym`. If you prefer to define all your acronyms using `\newglossaryentry` explicitly, then you should skip this section and ignore the package options: `smallcaps`, `smaller`, `description`, `dua` and `footnote`, as these options change the definition of `\newacronym` for common acronym formats as well as the way that the link text is displayed (see [subsubsection 3.4.1](#)). Likewise you should ignore the package option `shortcuts`

and the new commands described in this section, such as `\acrshort`, as they vary according to the definition of `\newacronym`.

If you use any of the package options `smallcaps`, `smaller`, `description` or `footnote`, the acronyms will be displayed in the document using:

```
\acronymfont \acronymfont{\text}
```

and

```
\firstacronymfont \firstacronymfont{\text}
```

where `\firstacronymfont` is applied on first use and `\acronymfont` is applied on subsequent use. Note that if you don't use any of the above package options, changing the definition of `\acronymfont` or `\firstacronymfont` will have no effect. In this case, the recommended route is to use either the `smaller` or the `smallcaps` package option and redefine `\acronymfont` and `\firstacronymfont` as required. (The `smallcaps` option sets the default plural suffix in an upright font to cancel the effect of `\textsc`, whereas `smaller` sets the suffix in the surrounding font.) For example, if you want acronyms in a normal font on first use and emphasized on subsequent use, do:

```
\usepackage[smaller]{glossaries}
\renewcommand*\firstacronymfont[1]{#1}
\renewcommand*\acronymfont[1]{\emph{#1}}
```

(Note that it is for this reason that the `relsize` package is not automatically loaded when selecting the `smaller` package option.)

Table 4 lists the package options that govern the acronym styles and how the `\newglossaryentry` keys are used to store `\langle long \rangle` (the long form) and `\langle abbrev \rangle` (the short form). Note that the `smallcaps` option redefines `\acronymfont` so that it sets its argument using `\textsc` (so you should use lower case characters in `\langle abbrev \rangle`) and the `smaller` option redefines `\acronymfont` to use `\textsmaller`,¹⁰ otherwise `\acronymfont` simply displays its argument in the surrounding font.

Table 4: Package options governing `\newacronym` and how the information is stored in the keys for `\newglossaryentry`

Package Option	first key	text key	description key	symbol key
description,footnote	<code>\langle abbrev \rangle</code>	<code>\langle abbrev \rangle</code>	user supplied	<code>\langle long \rangle</code>
description,dua	<code>\langle long \rangle</code>	<code>\langle long \rangle</code>	user supplied	<code>\langle abbrev \rangle</code>
description	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>	user supplied	<code>\langle abbrev \rangle</code>
footnote	<code>\langle abbrev \rangle</code>	<code>\langle abbrev \rangle</code>	<code>\langle long \rangle</code>	
smallcaps	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>
smaller	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>
dua	<code>\langle long \rangle</code>	<code>\langle long \rangle</code>	<code>\langle long \rangle</code>	<code>\langle abbrev \rangle</code>
None of the above	<code>\langle long \rangle</code> (<code>\langle abbrev \rangle</code>)	<code>\langle abbrev \rangle</code>	<code>\langle long \rangle</code>	

¹⁰you will need to load a package, such as `relsize`, that defines `\textsmaller` if you use this option.

In case you can't remember which key stores the long or short forms (or their plurals) the `glossaries` package provides the commands:

<code>\glsshortkey</code>	• <code>\glsshortkey</code> The key used to store the short form.
<code>\glsshortpluralkey</code>	• <code>\glsshortpluralkey</code> The key used to store the plural version of the short form.
<code>\glslongkey</code>	• <code>\glslongkey</code> The key used to store the long form.
<code>\glslongpluralkey</code>	• <code>\glslongpluralkey</code> The key used to store the plural version of the long form.

These can be used in the optional argument of `\newacronym` to override the defaults. For example:

```
\newacronym[\glslongpluralkey={diagonal matrices}]{dm}{DM}{diagonal matrix}
```

If the first use uses the plural form, `\glspl{dm}` will display: diagonal matrices (DMs).

Each of the package options `smallcaps`, `smaller`, `footnote`, `dua` and `description` use `\defglstdisplay` and `\defglstdisplayfirst` (described in [subsubsection 3.4.1](#)) to change the way the link text is displayed. This means that these package options only work for the glossary type given by `\acronymtype`. If you have multiple lists of acronyms, you will need to make the appropriate changes for each additional glossary type.

description,footnote

When these two package options are used together, the first use displays the entry as:

```
\firstacronymfont{<abbrv>}<insert>\footnote{<long>}
```

while subsequent use displays the entry as:

```
\acronymfont{<abbrv>}<insert>
```

where `<insert>` indicates the text supplied in the final optional argument to `\gls`, `\glspl` or their uppercase variants.

In this case, the long form is stored in the `symbol` key. This means that the long form will not be displayed in the list of acronyms unless you use a glossary style that displays the entry's symbol (for example, the `index` style). Entries will be sorted according to the short form.

Note also that when these two package options are used (in the given order), the `glossaries` package additionally implements the `sanitize` option using `sanitize={description=false,symbol=false}`, so remember to protect fragile commands when defining acronyms.

dua

The `dua` package option always displays the expanded form and so may not be used with `footnote`, `smaller` or `smallcaps`. Both first use and subsequent

use displays the entry in the form:

`<long><insert>`

If the `description` package option is also used, the `name` key is set to the long form, otherwise the `name` key is set to the short form and the `description` key is set to the long form. In both cases the `symbol` is set to the short form. Therefore, if you use the `description` package option and you want the short form to appear in the list of acronyms, you will need to use a glossary style that displays the entry's symbol (for example, the `index` style). Entries will be sorted according to the long form if the `description` option is used, otherwise they will be sorted according to the short form (unless overridden by the `sort` key in the optional argument of `\newacronym`).

description

This package option displays the entry on first use as:

`<long><insert> (\firstacronymfont{<abbrv>})`

while subsequent use displays the entry as:

`\acronymfont{<abbrv>}<insert>`

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

Note that with this option, you need to specify the description using the `description` key in the optional argument of `\newacronym`. When this option is used without the `footnote` or `dua` options, the name field is specified as `\acrnameformat{<short>}{<long>}`. This defaults to `\acronymfont{<short>}`, which means that the long form will not appear in the list of acronyms by default. To change this, you need to redefine `\acrnameformat` as appropriate. For example, to display the long form followed by the short form in parentheses do:

`\acrnameformat`

`\renewcommand*{\acrnameformat}[2]{#2 (\acronymfont{#1})}`

Note that even if you redefine `\acrnameformat`, the entries will be sorted according to the short form, unless you override this using the `sort` key in the optional argument to `\newacronym`.

footnote

This package option displays the entry on first use as:

`\firstacronymfont{<abbrv>}<insert>\footnote{<long>}`

while subsequent use displays the entry as:

`\acronymfont{<abbrv>}<insert>`

Acronyms will be sorted according to the short form.

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={description=false}`, so remember to protect fragile commands when defining acronyms.

Note that on first use, it is the long form in the footnote that links to the relevant glossary entry (where hyperlinks are enabled), whereas on subsequent use, the acronym links to the relevant glossary entry. It is possible to change this to make the acronym on first use have the hyperlink instead of the footnote, but since the footnote marker will also be a hyperlink, you will have two hyperlinks in immediate succession. This can be ambiguous where the hyperlinks are coloured rather than boxed. The code required to change the first use to make the acronym a hyperlink is as follows:

```
\def\glsdisplayfirst[\acronymtype]{%
\noexpand\protect\noexpand
\glslink[\@gls@link@opts]{\@gls@link@label}{\firstacronymfont{#1}#4}%
\noexpand\protect\noexpand\footnote{#2}}%
```

Note that this involves using internal commands (i.e. commands whose name contains an `@` character), so if this code is placed in a `.tex` file it needs to be placed within a `\makeatletter ... \makeatother` pair. (See <http://www.tex.ac.uk/cgi-bin/texfaq2html?label=atsigns> for further details.)

smallcaps

If neither the `footnote` nor `description` options have been set, this option displays the entry on first use as:

```
<long><insert> (\firstacronymfont{<abbrv>})
```

while subsequent use displays the entry as:

```
\acronymfont{<abbrv>}<insert>
```

where `\acronymfont` is set to `\textsc{#1}`.

Note that since the acronym is displayed using `\textsc`, the short form, `<abbrv>`, should be specified in lower case. (Recall that `\textsc{abc}` produces ABC whereas `\textsc{ABC}` produces ABC.)

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

smaller

If neither the `footnote` nor `description` options have been set, this option displays the entry on first use as:

```
<long><insert> (\firstacronymfont{<abbrv>})
```

while subsequent use displays the entry as:

`\acronymfont{⟨abbrv⟩}⟨insert⟩`

where `\acronymfont` is set to `\textsmaller{#1}`.¹¹ The entries will be sorted according to the short form.

Remember to load a package that defines `\textsmaller` (such as `reysize`) if you want to use this option, unless you want to redefine `\acronymfont` to use some other formatting command.

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

None of the above

If none of the package options `smallcaps`, `smaller`, `footnote`, `dua` or `description` are used, then on first use the entry is displayed as:

`⟨long⟩ (⟨abbrv⟩)⟨insert⟩`

while subsequent use displays the entry as:

`⟨abbrv⟩⟨insert⟩`

Entries will be sorted according to the short form. Note that if none of the acronym-related package options are used, the `sanitize` option will not be affected.

Recall from [subsection 3.4](#) that you can access the values of individual keys using commands like `\glstext`, so it is possible to use these commands to print just the long form or just the abbreviation without affecting the flag that determines whether the entry has been used. However the keys that store the long and short form vary depending on the acronym style, so the `glossaries` package provides commands that are set according to the package options. These are as follows:

```
\acrshort \acrshort[⟨options⟩]{⟨label⟩}[⟨insert⟩]
\Acrshort \ACRshort[⟨options⟩]{⟨label⟩}[⟨insert⟩]
\ACRshort \ACRshort[⟨options⟩]{⟨label⟩}[⟨insert⟩]
```

Print the abbreviated version with (if required) a hyperlink to the relevant entry in the glossary. This is usually equivalent to `\glstext` (or its uppercase variants) but may additionally put the link text within the argument to `\acronymfont`.

```
\acrlong \acrlong[⟨options⟩]{⟨label⟩}[⟨insert⟩]
\Acrlong \ACRlong[⟨options⟩]{⟨label⟩}[⟨insert⟩]
\ACRlong \ACRlong[⟨options⟩]{⟨label⟩}[⟨insert⟩]
```

Print the long version with (if required) a hyperlink to the relevant entry in the

¹¹not that this was change from using `\smaller` to `\textsmaller` as declarations cause a problem for `\makefirstuc`.

glossary. This is may be equivalent to `\glsdesc`, `\glssymbol` or `\glsfirst` (or their uppercase variants), depending on package options.

```
\acrfull \acrfull[\<options>]{\<label>}{\<insert>}
\Acrfull \ACRfull[\<options>]{\<label>}{\<insert>}
\ACRfull \ACRfull[\<options>]{\<label>}{\<insert>}
```

Print the long version followed by the abbreviation in brackets with (if required) a hyperlink to the relevant entry in the glossary.

Note that if any of the above commands produce unexpected output and you haven't used any of the acronym-related package options, you will need to switch off the sanitization. For example:

```
\usepackage[sanitize=none]{glossaries}
```

However, if you do this, you must remember to protect fragile commands when defining acronyms or glossary entries.

Note that if you change the definition of `\newacronym`, you may additionally need to change the above commands as well as changing the way the text is displayed using `\defglsdisplay` and `\defglsdisplayfirst`.

The package option `shortcuts` provides the synonyms listed in [table 5](#). If any of those commands generate an “undefined control sequence” error message, check that you have enabled the shortcuts using the `shortcuts` package option. Note that there are no shortcuts for the commands that produce all upper case text.

Table 5: Synonyms provided by the package option `shortcuts`

Shortcut	Command	Equivalent Command
	<code>\acs</code>	<code>\acrshort</code>
	<code>\Acs</code>	<code>\Acrshort</code>
	<code>\acsp</code>	<code>\acrshortpl</code>
	<code>\Acsp</code>	<code>\Acrshortpl</code>
	<code>\acl</code>	<code>\acrlong</code>
	<code>\Acl</code>	<code>\Acrlong</code>
	<code>\aclp</code>	<code>\acrlongpl</code>
	<code>\Aclp</code>	<code>\Acrlongpl</code>
	<code>\acf</code>	<code>\acrfull</code>
	<code>\Acf</code>	<code>\Acrfull</code>
	<code>\acfp</code>	<code>\acrfullpl</code>
	<code>\Acfp</code>	<code>\Acrfullpl</code>
	<code>\ac</code>	<code>\gls</code>
	<code>\Ac</code>	<code>\Gls</code>
	<code>\acp</code>	<code>\glspl</code>
	<code>\Acp</code>	<code>\Glspl</code>

3.10.1 Upgrading From the glossary Package

Users of the obsolete `glossary` package may recall that the syntax used to define new acronyms has changed with the replacement `glossaries` package. In addition, the old `glossary` package created the command `\acr-name` when defining the acronym `<acr-name>`.

In order to facilitate migrating from the old package to the new one, the `glossaries` package¹² provides the command:

```
\oldacronym \oldacronym[<label>]{<abbrv>}{<long>}{<key-val list>}
```

This uses the same syntax as the `glossary` package’s method of defining acronyms. It is equivalent to:

```
\newacronym[<key-val list>]{<label>}{<abbrv>}{<long>}
```

In addition, `\oldacronym` also defines the commands `\<label>`, which is equivalent to `\gls{<label>}`, and `\<label>*`, which is equivalent to `\Gls{<label>}`. If `<label>` is omitted, `<abbrv>` is used. Since commands names must consist only of alphabetical characters, `<label>` must also only consist of alphabetical characters. Note that `\<label>` doesn’t allow you to use the first optional argument of `\gls` or `\Gls` — you will need to explicitly use `\gls` or `\Gls` to change the settings.

Recall that, in general, L^AT_EX ignores spaces following command names consisting of alphabetical characters. This is also true for `\<label>` unless you additionally load the `xspace` package.

The `glossaries` package doesn’t load the `xspace` package since there are both advantages and disadvantages to using `\xspace` in `\<label>`. If you don’t use the `xspace` package you need to explicitly force a space using `_` (backslash space) however you can follow `\<label>` with additional text in square brackets (the final optional argument to `\gls`). If you use the `xspace` package you don’t need to escape the spaces but you can’t use the optional argument to insert text (you will have to explicitly use `\gls`).

To illustrate this, suppose I define the acronym “abc” as follows:

```
\oldacronym{abc}{example acronym}{}%
```

This will create the command `\abc` and its starred version `\abc*`. Table 6 illustrates the effect of `\abc` (on subsequent use) according to whether or not the `xspace` package has been loaded. As can be seen from the final row in the table, the `xspace` package prevents the optional argument from being recognised.

3.11 Unsetting and Resetting Entry Flags

When using `\gls`, `\glspl` and their uppercase variants it is possible that you may want to use the value given by the first key, even though you have already used the glossary entry. Conversely, you may want to use the value given by the `text` key, even though you haven’t used the glossary entry. The former can be achieved by one of the following commands:

¹²as from version 1.18

Table 6: The effect of using `xspace` with `\oldacronym`

Code	With <code>xspace</code>	Without <code>xspace</code>
<code>\abc.</code>	abc.	abc.
<code>\abc xyz</code>	abc xyz	abcxyz
<code>\abc\ xyz</code>	abc xyz	abc xyz
<code>\abc* xyz</code>	Abc xyz	Abc xyz
<code>\abc['s] xyz</code>	abc [‘s] xyz	abc’s xyz

```
\glsreset \glsreset{<label>}
\glslocalreset \glslocalreset{<label>}
```

while the latter can be achieved by one of the following commands:

```
\glsunset \glsunset{<label>}
\glslocalunset \glslocalunset{<label>}
```

You can also reset or unset all entries for a given glossary or list of glossaries using:

```
\glsresetall \glsresetall[<glossary list>]
\glslocalresetall \glslocalresetall[<glossary list>]
\glsunsetall \glsunsetall[<glossary list>]
\glslocalunsetall \glslocalunsetall[<glossary list>]
```

where `<glossary list>` is a comma-separated list of glossary labels. If omitted, all defined glossaries are assumed. For example, to reset all entries in the main glossary and the list of acronyms:

```
\glsresetall[main,acronym]
```

You can determine whether an entry’s first use flag is set using:

```
\ifglsused \ifglsused{<label>}{<true part>}{<false part>}
```

where `<label>` is the label of the required entry. If the entry has been used, `<true part>` will be done, otherwise `<false part>` will be done.

3.12 Glossary Styles

The `glossaries` package comes with some pre-defined glossary styles. Note that the styles are suited to different types of glossaries: some styles ignore the associated symbol; some styles are not designed for hierarchical entries, so they display sub-entries in the same way as they display top level entries; some styles are designed for homographs, so they ignore the name for sub-entries. You should therefore pick a style that suits your type of glossary. See [table 7](#) for a summary of the available styles.

The glossary style can be set using the `style` package option or using the `style` key in the optional argument to `\printglossary` or using the command:

```
\glossarystyle \glossarystyle{<style-name>}
```

Table 7: Glossary Styles. An asterisk in the style name indicates anything that matches that doesn't match any previously listed style (e.g. `long3col*` matches `long3col`, `long3colheader`, `long3colborder` and `long3colheaderborder`). A maximum level of 0 indicates a flat glossary (sub-entries are displayed in the same way as main entries). Where the maximum level is given as — there is no limit, but note that `makeindex` imposes a limit of 2 sub-levels. If the homograph column is checked, then the name is not displayed for sub-entries. If the symbol column is checked, then the symbol will be displayed if it has been defined.

Style	Maximum Level	Homograph	Symbol
<code>listdotted</code>	0		
<code>sublistdotted</code>	1		
<code>list*</code>	1	✓	
<code>altlist*</code>	1	✓	
<code>long3col*</code>	1	✓	
<code>long4col*</code>	1	✓	✓
<code>altlong4col*</code>	1	✓	✓
<code>long*</code>	1	✓	
<code>super3col*</code>	1	✓	
<code>super4col*</code>	1	✓	✓
<code>altsuper4col*</code>	1	✓	✓
<code>super*</code>	1	✓	
<code>index*</code>	2		✓
<code>treenoname*</code>	—	✓	✓
<code>tree*</code>	—		✓
<code>almtree*</code>	—		✓

`\glsdescwidth`
`\glspagelistwidth`

The tabular-like styles that allow multi-line descriptions and page lists use the length `\glsdescwidth` to set the width of the description column and the length `\glspagelistwidth` to set the width of the page list column.¹³ These will need to be changed using `\setlength` if the glossary is too wide. Note that the `long4col` and `super4col` styles (and their header and border variations) don't use these lengths as they are designed for single line entries. Instead you should use the analogous `altnlong4col` and `altsuper4col` styles. If you want to explicitly create a line-break within a multi-line description in a tabular-like style you should use `\newline` instead of `\\`.

Note that if you use the `style` key in the optional argument to `\printglossary`, it will override any previous style settings for the given glossary, so if, for example, you do

```
\renewcommand*\glsgroupskip{}{}
\printglossary[style=long]
```

then the new definition of `\glsgroupskip` will not have an affect for this glossary, as `\glsgroupskip` is redefined by `style=long`. Likewise, `\glossarystyle` will also override any previous style definitions, so, again

```
\renewcommand*\glsgroupskip{}{}
\glossarystyle{long}
```

will reset `\glsgroupskip` back to its default definition for the named glossary style (`long` in this case). If you want to modify the styles, either use `\newglossarystyle` (described in the next section) or make the modifications after `\glossarystyle`, e.g.:

```
\glossarystyle{long}
\renewcommand*\glsgroupskip{}{}

```

`\glspostdescription`

All the styles except for the three- and four-column styles and the `listdotted` style use the command `\glspostdescription` after the description. This simply displays a full stop by default. To eliminate this full stop (or replace it with something else, say a comma) you will need to redefine `\glspostdescription` before the glossary is displayed. Alternatively, you can suppress it for a given entry by placing `\nopostdesc` in the entry's description.

3.12.1 List Styles

The styles described in this section are all defined in the package `glossary-list`. Since they all use the `description` environment, they are governed by the same parameters as that environment. These styles all ignore the entry's symbol. Note that these styles will not be available if you use either the `nolist` or `nostyles` package options.

list The list style uses the `description` environment. The entry name is placed in the optional argument of the `\item` command (so it will appear in bold by default). The description follows, and then the associated number list for that entry. The symbol is ignored. If the entry has child entries, the description and number list follows (but not the name) for each child entry. Groups are separated using `\indexspace`.

¹³these lengths will not be available if you use both the `nolong` and `nosuper` package options or if you use the `nostyles` package option.

listgroup The `listgroup` style is like `list` but the glossary groups have headings.

listhypergroup The `listhypergroup` style is like `listgroup` but has a navigation line at the start of the glossary with links to each group that is present in the glossary. This requires an additional run through \LaTeX to ensure the group information is up to date. In the navigation line, each group is separated by `\glshypernavsep` which defaults to a vertical bar with a space on either side. For example, to simply have a space separating each group, do:

`\glshypernavsep`

```
\renewcommand*{\glshypernavsep}{\space}
```

Note that the hyper-navigation line is now (as from version 1.14) set inside the optional argument to `\item` instead of after it to prevent a spurious space at the start. This can be changed by redefining `\glossaryheader`, but note that this needs to be done *after* the glossary style has been set.

altlist The `altlist` style is like `list` but the description starts on the line following the name. (As with the `list` style, the symbol is ignored.) Each child entry starts a new line, but as with the `list` style, the name associated with each child entry is ignored.

altlistgroup The `altlistgroup` style is like `altlist` but the glossary groups have headings.

altlisthypergroup The `altlisthypergroup` style is like `altlistgroup` but has a set of links to the glossary groups. The navigation line is the same as that for `listhypergroup`, described above.

listdotted This style uses the `description` environment.¹⁴ Each entry starts with `\item[]`, followed by the name followed by a dotted line, followed by the description. Note that this style ignores both the number list and the symbol. The length `\glslistdottedwidth` governs where the description should start. This is a flat style, so child entries are formatted in the same way as the parent entries.

`\glslistdottedwidth`

sublistdotted This is a variation on the `listdotted` style designed for hierarchical glossaries. The main entries have just the name displayed. The sub entries are displayed in the same manner as `listdotted`.

3.12.2 Longtable Styles

The styles described in this section are all defined in the package `glossary-long`. Since they all use the `longtable` environment, they are governed by the same parameters as that environment. Note that these styles will not be available if you use either the `nolong` or `nostyles` package options.

long The `long` style uses the `longtable` environment (defined by the `longtable` package). It has two columns: the first column contains the entry's name and the second column contains the description followed by the number list. The entry's symbol is ignored. Sub groups are separated with a blank row. The width of the first column is governed by the widest entry in that column.

¹⁴This style was supplied by Axel Menzel.

The width of the second column is governed by the length `\glsdescwidth`. Child entries have a similar format to the parent entries except that their name is suppressed.

longborder The `longborder` style is like `long` but has horizontal and vertical lines around it.

longheader The `longheader` style is like `long` but has a header row.

longheaderborder The `longheaderborder` style is like `longheader` but has horizontal and vertical lines around it.

long3col The `long3col` style is like `long` but has three columns. The first column contains the entry's name, the second column contains the description and the third column contains the number list. The entry's symbol is ignored. The width of the first column is governed by the widest entry in that column, the width of the second column is governed by the length `\glsdescwidth`, and the width of the third column is governed by the length `\glspagelistwidth`.

long3colborder The `long3colborder` style is like the `long3col` style but has horizontal and vertical lines around it.

long3colheader The `long3colheader` style is like `long3col` but has a header row.

long3colheaderborder The `long3colheaderborder` style is like `long3colheader` but has horizontal and vertical lines around it.

long4col The `long4col` style is like `long3col` but has an additional column in which the entry's associated symbol appears. This style is used for brief single line descriptions. The column widths are governed by the widest entry in the given column. Use `altlong4col` for multi-line descriptions.

long4colborder The `long4colborder` style is like the `long4col` style but has horizontal and vertical lines around it.

long4colheader The `long4colheader` style is like `long4col` but has a header row.

long4colheaderborder The `long4colheaderborder` style is like `long4colheader` but has horizontal and vertical lines around it.

altlong4col The `altlong4col` style is like `long4col` but allows multi-line descriptions and page lists. The width of the description column is governed by the length `\glsdescwidth` and the width of the page list column is governed by the length `\glspagelistwidth`. The widths of the name and symbol columns are governed by the widest entry in the given column.

altlong4colborder The `altlong4colborder` style is like the `long4colborder` but allows multi-line descriptions and page lists.

altlong4colheader The `altlong4colheader` style is like `long4colheader` but allows multi-line descriptions and page lists.

altlong4colheaderborder The `altlong4colheaderborder` style is like `long4colheaderborder` but allows multi-line descriptions and page lists.

3.12.3 Supertabular Styles

The styles described in this section are all defined in the package `glossary-super`. Since they all use the `supertabular` environment, they are governed by the same parameters as that environment. Note that these styles will not be available if you use either the `nosuper` or `nostyles` package options. In general, the `longtable` environment is better, but there are some circumstances where it is better to use `supertabular`.¹⁵

super The `super` style uses the `supertabular` environment (defined by the `supertabular` package). It has two columns: the first column contains the entry's name and the second column contains the description followed by the number list. The entry's symbol is ignored. Sub groups are separated with a blank row. The width of the first column is governed by the widest entry in that column. The width of the second column is governed by the length `\glsdescwidth`. Child entries have a similar format to the parent entries except that their name is suppressed.

superborder The `superborder` style is like `super` but has horizontal and vertical lines around it.

superheader The `superheader` style is like `super` but has a header row.

superheaderborder The `superheaderborder` style is like `superheader` but has horizontal and vertical lines around it.

super3col The `super3col` style is like `super` but has three columns. The first column contains the entry's name, the second column contains the description and the third column contains the number list. The entry's symbol is ignored. The width of the first column is governed by the widest entry in that column. The width of the second column is governed by the length `\glsdescwidth`. The width of the third column is governed by the length `\glspagelistwidth`.

super3colborder The `super3colborder` style is like the `super3col` style but has horizontal and vertical lines around it.

super3colheader The `super3colheader` style is like `super3col` but has a header row.

super3colheaderborder The `super3colheaderborder` style is like `super3colheader` but has horizontal and vertical lines around it.

super4col The `super4col` style is like `super3col` but has an additional column in which the entry's associated symbol appears. This style is designed for entries with brief single line descriptions. The column widths are governed by the widest entry in the given column. Use `altsuper4col` for multi-line descriptions.

super4colborder The `super4colborder` style is like the `super4col` style but has horizontal and vertical lines around it.

¹⁵e.g. with the `flowfram` package.

super4colheader The `super4colheader` style is like `super4col` but has a header row.

super4colheaderborder The `super4colheaderborder` style is like `super4colheader` but has horizontal and vertical lines around it.

altsuper4col The `altsuper4col` style is like `super4col` but allows multi-line descriptions and page lists. The width of the description column is governed by the length `\glsdescwidth` and the width of the page list column is governed by the length `\glspagelistwidth`. The width of the name and symbol columns is governed by the widest entry in the given column.

altsuper4colborder The `altsuper4colborder` style is like the `super4colborder` style but allows multi-line descriptions and page lists.

altsuper4colheader The `altsuper4colheader` style is like `super4colheader` but allows multi-line descriptions and page lists.

altsuper4colheaderborder The `altsuper4colheaderborder` style is like `super4colheaderborder` but allows multi-line descriptions and page lists.

3.12.4 Tree-Like Styles

The styles described in this section are all defined in the package `glossary-tree`. These styles are designed for hierarchical glossaries but can also be used with glossaries that don't have sub-entries. These styles will display the entry's symbol if it exists. Note that these styles will not be available if you use either the `notree` or `nostyles` package options.

index The `index` style is similar to the way indices are usually formatted in that it has a hierarchical structure up to three levels (the main level plus two sub-levels). The name is typeset in bold, and if the symbol is present it is set in parentheses after the name and before the description. Sub-entries are indented and also include the name, the symbol in brackets (if present) and the description. Groups are separated using `\indexspace`.

indexgroup The `indexgroup` style is similar to the `index` style except that each group has a heading.

indexhypergroup The `indexhypergroup` style is like `indexgroup` but has a set of links to the glossary groups. The navigation line is the same as that for `listhypergroup`, described above.

tree The `tree` style is similar to the `index` style except that it can have arbitrary levels. (Note that `makeindex` is limited to three levels, so you will need to use `xindy` if you want more than three levels.) Each sub-level is indented by `\glstreeindent`. Note that the name, symbol (if present) and description are placed in the same paragraph block. If you want the name to be apart from the description, use the `alttree` style instead. (See below.)

treegroup The `treegroup` style is similar to the `tree` style except that each group has a heading.

treehypergroup The `treehypergroup` style is like `treegroup` but has a set of links to the glossary groups. The navigation line is the same as that for `listhypergroup`, described above.

treenoname The `treenoname` style is like the `tree` style except that the name for each sub-entry is ignored.

treenonamegroup The `treenonamegroup` style is similar to the `treenoname` style except that each group has a heading.

treenonamehypergroup The `treenonamehypergroup` style is like `treenonamegroup` but has a set of links to the glossary groups. The navigation line is the same as that for `listhypergroup`, described above.

alttree The `alttree` style is similar to the `tree` style except that the indentation for each level is determined by the width of the text specified by

`\glsetwidest` `\glsetwidest[\langle level \rangle]{\langle text \rangle}`

The optional argument $\langle level \rangle$ indicates the level, where 0 indicates the top-most level, 1 indicates the first level sub-entries, etc. If `\glsetwidest` hasn't been used for a given sub-level, the level 0 widest text is used instead. If $\langle level \rangle$ is omitted, 0 is assumed.

For each level, the name is placed to the left of the paragraph block containing the symbol (optional) and the description. If the symbol is present, it is placed in parentheses before the description.

alttreegroup The `alttreegroup` is like the `alttree` style except that each group has a heading.

alttreehypergroup The `alttreehypergroup` style is like `alttreegroup` but has a set of links to the glossary groups. The navigation line is the same as that for `listhypergroup`, described above.

3.13 Defining your own glossary style

`\newglossarystyle` If the predefined styles don't fit your requirements, you can define your own style using:

`\newglossarystyle{\langle name \rangle}{\langle definitions \rangle}`

where $\langle name \rangle$ is the name of the new glossary style (to be used in `\glossarystyle`). The second argument $\langle definitions \rangle$, needs to redefine all of the following:

`theglossary` `theglossary`

This environment defines how the main body of the glossary should be typeset. Note that this does not include the section heading, the glossary preamble (defined by `\glossarypreamble`) or the glossary postamble (defined by `\glossarypostamble`). For example, the `list` style uses the `description` environment, so the `theglossary` environment is simply redefined to begin and end the `description` environment.

<code>\glossaryheader</code>	<p><code>\glossaryheader</code></p> <p>This macro indicates what to do at the start of the main body of the glossary. Note that this is not the same as <code>\glossarypreamble</code>, which should not be affected by changes in the glossary style. The list glossary style redefines <code>\glossaryheader</code> to do nothing, whereas the longheader glossary style redefines <code>\glossaryheader</code> to do a header row.</p>
<code>\glsgroupheading</code>	<p><code>\glsgroupheading{<label>}</code></p> <p>This macro indicates what to do at the start of each logical block within the main body of the glossary. If you use <code>makeindex</code> the glossary is sub-divided into a maximum of twenty-eight logical blocks that are determined by the first character of the <code>sort</code> key (or <code>name</code> key if the <code>sort</code> key is omitted). The sub-divisions are in the following order: symbols, numbers, A, . . . , Z. If you use <code>xindy</code>, the sub-divisions depend on the language settings.</p> <p>Note that the argument to <code>\glsgroupheading</code> is a label <i>not</i> the group title. The group title can be obtained via</p>
<code>\glsgrouptitle</code>	<p><code>\glsgrouptitle{<label>}</code></p> <p>This obtains the title as follows: if <code>\<label>groupname</code> exists, this is taken to be the title, otherwise the title is just <code><label></code>.</p> <p>A navigation hypertarget can be created using</p>
<code>\glsnabhypertarget</code>	<p><code>\glsnabhypertarget{<label>}{<text>}</code></p> <p>For further details about <code>\glsnabhypertarget</code>, see subsection 7.1.</p> <p>Most of the predefined glossary styles redefine <code>\glsgroupheading</code> to simply ignore its argument. The <code>listhypergroup</code> style redefines <code>\glsgroupheading</code> as follows:</p> <pre> \renewcommand*{\glsgroupheading}[1]{% \item[\glsnabhypertarget{##1}{\glsgrouptitle{##1}}]} </pre> <p>See also <code>\glsgroupskip</code> below. (Note that command definitions within <code>\newglossarystyle</code> must use <code>##1</code> instead of <code>#1</code> etc.)</p>
<code>\glsgroupskip</code>	<p><code>\glsgroupskip</code></p> <p>This macro determines what to do after one logical group but before the header for the next logical group. The list glossary style simply redefines <code>\glsgroupskip</code> to be <code>\indexspace</code>, whereas the tabular-like styles redefine <code>\glsgroupskip</code> to produce a blank row.</p>
<code>\glossaryentryfield</code>	<p><code>\glossaryentryfield{<label>}{<formatted name>}{<description>}{<symbol>}{<number list>}</code></p> <p>This macro indicates what to do for a given glossary entry. Note that <code><formatted name></code> will always be in the form <code>\glsglsfont{<name>}</code>. This allows the user to set a given font for the entry name, regardless of the glossary style used. Note that <code><label></code> is the label used when the glossary entry was defined via either <code>\newglossaryentry</code> or <code>\newacronym</code>.</p> <p>Each time you use a glossary entry it creates a hyperlink (if hyperlinks are enabled) to the relevant line in the glossary. Your new glossary style must</p>

therefore redefine `\glossaryentryfield` to set the appropriate target. This is done using

`\glstarget` `\glstarget{<label>}{<text>}`

where `<label>` is the entry’s label. Note that you don’t need to worry about whether the `hyperref` package has been loaded, as `\glstarget` won’t create a target if `\hypertarget` hasn’t been defined.

For example, the `list` style defines `\glossaryentryfield` as follows:

```
\renewcommand*{\glossaryentryfield}[5]{%
\item[\glstarget{##1}{##2}] ##3\glspostdescription\space ##5}
```

Note also that `<number list>` will always be of the form

```
\glossaryentrynumbers{\relax
\setentrycounter{<counter name>}\glsnumberformat{<number(s)>}}
```

where `<number(s)>` may contain `\delimN` (to delimit individual numbers) and/or `\delimR` (to indicate a range of numbers). There may be multiple occurrences of `\setentrycounter{<counter name>}\glsnumberformat{<number(s)>}`, but note that the entire number list is enclosed within the argument to `\glossaryentrynumbers`. The user can redefine this to change the way the entire number list is formatted, regardless of the glossary style. However the most common use of `\glossaryentrynumbers` is to provide a means of suppressing the number list altogether. (In fact, the `nonumberlist` option redefines `\glossaryentrynumbers` to ignore its argument.) Therefore, when you define a new glossary style, you don’t need to worry about whether the user has specified the `nonumberlist` package option.

`\glossarysubentryfield` `\glossarysubentryfield{<level>}{<label>}{<formatted name>}{<description>}{<symbol>}{<number list>}`

This is new to version 1.17, and is used to display sub-entries. The first argument, `<level>`, indicates the sub-entry level. This must be an integer from 1 (first sub-level) onwards. The remaining arguments are analogous to those for `\glossaryentryfield` described above.

For further details of these commands, see [subsection 5.15](#).

3.13.1 Example: creating a completely new style

If you want a completely new style, you will need to redefine all of the commands and the environment listed above.

For example, suppose you want each entry to start with a bullet point. This means that the glossary should be placed in the `itemize` environment, so `\theglossary` should start and end that environment. Let’s also suppose that you don’t want anything between the glossary groups (so `\glsgroupheading` and `\glsgroupskip` should do nothing) and suppose you don’t want anything to appear immediately after `\begin{theglossary}` (so `\glossaryheader` should do nothing). In addition, let’s suppose the symbol should appear in brackets after the name, followed by the description and last of all the number list should appear within square

brackets at the end. Then you can create this new glossary style, called, say, `mylist`, as follows:

```
\newglossarystyle{mylist}{%
% put the glossary in the itemize environment:
\renewenvironment{theglossary}{\begin{itemize}}{\end{itemize}}%
% have nothing after \begin{theglossary}:
\renewcommand*{\glossaryheader}{}%
% have nothing between glossary groups:
\renewcommand*{\glsgroupheading}[1]{}%
\renewcommand*{\glsgroupskip}{}%
% set how each entry should appear:
\renewcommand*{\glossaryentryfield}[5]{%
\item % bullet point
\glstarget{##1}{##2}% the entry name
\space (##4)% the symbol in brackets
\space ##3% the description
\space [##5]% the number list in square brackets
}%
% set how sub-entries appear:
\renewcommand*{\glossarysubentryfield}[6]{%
\glossaryentryfield{##2}{##3}{##4}{##5}{##6}}%
}
```

Note that this style creates a flat glossary, where sub-entries are displayed in exactly the same way as the top level entries.

3.13.2 Example: creating a new glossary style based on an existing style

If you want to define a new style that is a slightly modified version of an existing style, you can use `\glossarystyle` within the second argument of `\newglossarystyle` followed by whatever alterations you require. For example, suppose you want a style like the `list` style but you don't want the extra vertical space created by `\indexspace` between groups, then you can create a new glossary style called, say, `mylist` as follows:

```
\newglossarystyle{mylist}{%
\glossarystyle{list}% base this style on the list style
\renewcommand{\glsgroupskip}{}% make nothing happen between groups
}
```

3.14 Accessibility Support

Limited accessibility support is provided by the accompanying `glossaries-accsupp` package, but note that this package is experimental and it requires the `accsupp` package which is also listed as experimental. The `symbol` key is used to specify the replacement text. For example:

```
\newglossaryentry{tex}{name={\TeX},description={Document preparation
language},symbol={\TeX}}
```

When you reference this entry using `\gls`, `\glspl` or their uppercase variants, the `symbol` is used as the replacement text. For example, `\gls{tex}` would be equivalent to

`\BeginAccSupp{ActualText=TeX}\TeX\EndAccSupp{}`

See [section 8](#) for further details. It is recommended that you also read the `accsupp` documentation.

4 Mfirstuc Package

The `glossaries` bundle is supplied with the package `mfirstuc` which provides the command:

`\makefirstuc` `\makefirstuc{⟨stuff⟩}`

which makes the first object of `⟨stuff⟩` uppercase unless `⟨stuff⟩` starts with a control sequence followed by a non-empty group, in which case the first object in the group is converted to uppercase. Examples:

- `\makefirstuc{abc}` produces *Abc*
- `\makefirstuc{\emph{abc}}` produces *Abc* (`\MakeUppercase` has been applied to the letter “a” rather than `\emph`.) Note however that `\makefirstuc{{\em abc}}` produces *ABC* and `{\makefirstuc{\em abc}}` produces *abc*.
- `\makefirstuc{{\’a}bc}` produces *Ábc*
- `\makefirstuc{\ae bc}` produces *Æbc*
- `\makefirstuc{{\ae}bc}` produces *Æbc*
- `\makefirstuc{{\ä}bc}` produces *Äbc*

Note that non-Latin or accented characters appearing at the start of the text must be placed in a group (even if you are using the `inputenc` package) due to expansion issues.

In version 1.02 of `mfirstuc`, a bug fix resulted in a change in output if the first object is a control sequence followed by an empty group. Prior to version 1.02, `\makefirstuc{\ae{}}bc` produced *æBc*. However as from version 1.02, it now produces *Æbc*.

Note also that

`\newcommand{\abc}{abc}`
`\makefirstuc{\abc}`

produces: *ABC*. This is because the first object in the argument of `\makefirstuc` is `\abc`, so it does `\MakeUppercase\abc`. Whereas:

`\newcommand{\abc}{abc}`
`\expandafter\makefirstuc\expandafter{\abc}`

produces: *Abc*. There is a short cut command which will do this:

`\xmakefirstuc` `\xmakefirstuc{⟨stuff⟩}`

This is equivalent to `\expandafter\makefirstuc\expandafter{\langle stuff \rangle}`. So

```
\newcommand{\abc}{abc}
\xmakefirstuc{\abc}
```

produces: Abc.

If you want to use an alternative command to convert to uppercase, for example `\MakeTextUppercase`,¹⁶ you can redefine the internal command `\gls@makefirstuc`. For example:

```
\renewcommand{\@gls@makefirstuc}[1]{\MakeTextUppercase #1}
```

(Remember that command names that contain the @ character must either be placed in packages or be placed between `\makeatletter` and `\makeatother`.)

5 Documented Code

5.1 Package Definition

This package requires L^AT_EX 2_ε.

```
1 \NeedsTeXFormat{LaTeX2e}
2 \ProvidesPackage{glossaries}[2009/03/02 v1.19 (NLCT)]
```

Required packages:

```
3 \RequirePackage{ifthen}
4 \RequirePackage{xkeyval}[2006/11/18]
5 \RequirePackage{mfirstuc}
6 \RequirePackage{xfor}
```

If babel package is loaded, check to see if translator is installed.

```
7 \@ifpackageloaded{babel}{\IfFileExists{translator.sty}{%
8   \RequirePackage{translator}}{}}{}
```

Need to use `\new@ifnextchar` instead of `\@ifnextchar` in commands that have a final optional argument (such as `\gls`) so require `amsgen`. Thanks to Morten Høgholm for suggesting this. (This has replaced using the `xspace` package.)

```
9 \RequirePackage{amsgen}
```

5.2 Package Options

toc The `toc` package option will add the glossaries to the table of contents. This is a boolean key, if the value is omitted it is taken to be true.

```
10 \define@boolkey{glossaries.sty}[gls]{toc}[true]{}%
```

numberline The `numberline` package option adds `\numberline` to `\addcontentsline`. Note that this option only has an effect if used in with `toc=true`.

```
11 \define@boolkey{glossaries.sty}[gls]{numberline}[true]{}%
```

The sectional unit used to start the glossary is stored in `\@@glossarysec`. If chapters are defined, this is initialised to `chapter`, otherwise it is initialised to `section`.

¹⁶defined in the `textcase` package

`\@@glossarysec`

```
12 \ifundefined{chapter}{\newcommand*\@@glossarysec}{section}}{%
13 \newcommand*\@@glossarysec}{chapter}}
```

section The `section` key can be used to set the sectional unit. If no unit is specified, use `section` as the default. The starred form of the named sectional unit will be used. If you want some other way to start the glossary section (e.g. a numbered section) you will have to redefine `\glossarysection`.

```
14 \define@choicekey{glossaries.sty}{section}{part,chapter,section,%
15 subsection,subsubsection,paragraph,subparagraph}[section]{%
16 \renewcommand*\@@glossarysec}{#1}}
```

Determine whether or not to use numbered sections.

`\@@glossarysecstar`

```
17 \newcommand*\@@glossarysecstar}{*}
```

`\@@glossaryseclabel`

```
18 \newcommand*\@@glossaryseclabel}{}
```

`\glsautoprefix` Prefix to add before label if automatically generated:

```
19 \newcommand*\glsautoprefix){}
```

`numberedsection`

```
20 \define@choicekey{glossaries.sty}{numberedsection}[\val\nr]{%
21 false,nolabel,autolabel}[nolabel]{%
22 \ifcase\nr\relax
23   \renewcommand*\@@glossarysecstar}{*}%
24   \renewcommand*\@@glossaryseclabel}{}%
25 \or
26   \renewcommand*\@@glossarysecstar}{}%
27   \renewcommand*\@@glossaryseclabel}{}%
28 \or
29   \renewcommand*\@@glossarysecstar}{}%
30   \renewcommand*\@@glossaryseclabel}{\label{\glsautoprefix\@glo@type}}%
31 \fi}
```

The default glossary style is stored in `\@glossary@default@style`. This is initialised to `list`. (The `list` style is defined in the accompanying `glossary-list` package described in [subsection 5.18](#).)

`\@glossary@default@style`

```
32 \newcommand*\@glossary@default@style}{list}
```

style The default glossary style can be changed using the `style` package option. The value can be the name of any defined glossary style. The glossary style is set at the beginning of the document, so you can still use the `style` key to set a style that is defined in another package. This package comes with some predefined styles that are defined in [subsection 5.18](#).

```
33 \define@key{glossaries.sty}{style}{%
34 \renewcommand*\@glossary@default@style}{#1}}
```

Each entry within a given glossary will have an associated number list. By default, this refers to the page numbers on which that entry has been used, but it can also refer to any counter used in the document (such as the section or equation counters). The default number list format displays the number list “as is”:

`\glossaryentrynumbers`

```
35 \newcommand*{\glossaryentrynumbers}[1]{#1}
```

nonumberlist Note that the entire number list for a given entry will be passed to `\glossaryentrynumbers` so any font changes will also be applied to the delimiters. The `nonumberlist` package option suppresses the number lists (this simply redefines `\glossaryentrynumbers` to ignore its argument).

```
36 \DeclareOptionX{nonumberlist}{%
```

```
37 \renewcommand*{\glossaryentrynumbers}[1]{}}
```

`\@gls@loadlong`

```
38 \newcommand*{\@gls@loadlong}{\RequirePackage{glossary-long}}
```

nolong This option prevents `glossary-long` from being loaded. This means that the glossary styles that use the `longtable` environment will not be available. This option is provided to reduce overhead caused by loading unrequired packages.

```
39 \DeclareOptionX{nolong}{\renewcommand*{\@gls@loadlong}{}}
```

`\@gls@loadsuper` The `glossary-super` package isn’t loaded if `supertabular` isn’t installed.

```
40 \IfFileExists{supertabular.sty}{%
```

```
41 \newcommand*{\@gls@loadsuper}{\RequirePackage{glossary-super}}}{%
```

```
42 \newcommand*{\@gls@loadsuper}{}}
```

nosuper This option prevents `glossary-super` from being loaded. This means that the glossary styles that use the `supertabular` environment will not be available. This option is provided to reduce overhead caused by loading unrequired packages.

```
43 \DeclareOptionX{nosuper}{\renewcommand*{\@gls@loadsuper}{}}
```

`\@gls@loadlist`

```
44 \newcommand*{\@gls@loadlist}{\RequirePackage{glossary-list}}
```

nolist This option prevents `glossary-list` from being loaded (to reduce overheads if required). Naturally, the styles defined in `glossary-list` will not be available if this option is used.

```
45 \DeclareOptionX{nolist}{\renewcommand*{\@gls@loadlist}{}}
```

`\@gls@loadtree`

```
46 \newcommand*{\@gls@loadtree}{\RequirePackage{glossary-tree}}
```

notree This option prevents `glossary-tree` from being loaded (to reduce overheads if required). Naturally, the styles defined in `glossary-tree` will not be available if this option is used.

```
47 \DeclareOptionX{notree}{\renewcommand*{\@gls@loadtree}{}}
```

nostyles Provide an option to suppress all the predefined styles (in the event that the user has custom styles that are not dependent on the predefined styles).

```
48 \DeclareOptionX{nostyles}{%
49   \renewcommand*{\@gls@loadlong}{}%
50   \renewcommand*{\@gls@loadsuper}{}%
51   \renewcommand*{\@gls@loadlist}{}%
52   \renewcommand*{\@gls@loadtree}{}%
53   \let\@glossary@default@style\relax
54 }
```

Keep track of the default glossary. This is initialised to the main glossary, but can be changed if for some reason you want to make a secondary glossary the main glossary. This affects any commands that can optionally take a glossary name as an argument (or as the value of the `type` key in a key-value list). This was mainly done so that `\loadglsentries` can temporarily change `\glsdefaulttype` while it loads a file containing new glossary entries (see [subsection 5.9](#)).

\glsdefaulttype

```
55 \newcommand{\glsdefaulttype}{main}
```

Keep track of which glossary the acronyms are in. This is initialised to `\glsdefaulttype`, but is changed by the acronym package option.

\acronymtype

```
56 \newcommand{\acronymtype}{\glsdefaulttype}
```

acronym The acronym option sets an associated conditional which is used in [subsection 5.16](#) to determine whether or not to define a separate glossary for acronyms.

```
57 \define@boolkey{glossaries.sty}[gls]{acronym}[true]{}%
```

The default counter associated with the numbers in the glossary is stored in `\glscounter`. This is initialised to the page counter. This is used as the default counter when a new glossary is defined, unless a different counter is specified in the optional argument to `\newglossary` (see [subsection 5.6](#)).

\glscounter

```
58 \newcommand{\glscounter}{page}
```

counter The counter option changes the default counter. (This just redefines `\glscounter`.)

```
59 \define@key{glossaries.sty}{counter}{%
60   \renewcommand*{\glscounter}{#1}}
```

The glossary keys whose values are written to another file (i.e. `sort`, `name`, `description` and `symbol`) need to be sanitized, otherwise fragile commands would not be able to be used in `\newglossaryentry`. However, strange results will occur if you then use those fields in the document. As these fields are not normally used in the document, but are by default only used in the glossary, the default is to sanitize them. If however you want to use these values in the document (either by redefining commands like `\glsdisplay` or by using commands like `\glsentrydesc`) you will have to switch off the sanitization using the `sanitize` package option, but you will then have to use `\protect` to protect fragile commands when defining new glossary entries. The `sanitize` option takes a key-value list as its value, which can be used to switch individual values on and off. For example:

```
\usepackage[sanitize={description,name,symbol=false}]{glossaries}
```

will switch off the sanitization for the `symbol` key, but switch it on for the `description` and `name` keys. This would mean that you can use fragile commands in the description and name when defining a new glossary entry, but not for the symbol.

The default values are defined as:

```
\@gls@sanitizedesc
61 \newcommand*{\@gls@sanitizedesc}{\@onelevel@sanitize\@glo@desc}

\@gls@sanitizename
62 \newcommand*{\@gls@sanitizename}{\@onelevel@sanitize\@glo@name}

\@gls@sanitizesymbol
63 \newcommand*{\@gls@sanitizesymbol}{\@onelevel@sanitize\@glo@symbol}
```

(There is no equivalent for the `sort` key, since that is only provided for the benefit of `makeindex` or `xindy`, and so will always be sanitized.)

Before defining the `sanitize` package option, The key-value list for the `sanitize` value needs to be defined. These are all boolean keys. If they are not given a value, assume `true`.

Firstly the description. If set, it will redefine `\@gls@sanitizedesc` to use `\@onelevel@sanitize`, otherwise `\@gls@sanitizedesc` will do nothing.

```
64 \define@boolkey[gls]{sanitize}{description}[true]{%
65 \ifgls@sanitize@description
66 \renewcommand*{\@gls@sanitizedesc}{\@onelevel@sanitize\@glo@desc}%
67 \else
68 \renewcommand*{\@gls@sanitizedesc}{}%
69 \fi
70 }
```

Similarly for the name key:

```
71 \define@boolkey[gls]{sanitize}{name}[true]{%
72 \ifgls@sanitize@name
73 \renewcommand*{\@gls@sanitizename}{\@onelevel@sanitize\@glo@name}%
74 \else
75 \renewcommand*{\@gls@sanitizename}{}%
76 \fi}
```

and for the symbol key:

```
77 \define@boolkey[gls]{sanitize}{symbol}[true]{%
78 \ifgls@sanitize@symbol
79 \renewcommand*{\@gls@sanitizesymbol}{%
80 \@onelevel@sanitize\@glo@symbol}%
81 \else
82 \renewcommand*{\@gls@sanitizesymbol}{}%
83 \fi}
```

sanitize Now define the `sanitize` option. It can either take a key-val list as its value, or it can take the keyword `none`, which is equivalent to `description=false`, `symbol=false`, `name=false`:

```
84 \define@key[glossaries.sty]{sanitize}[description=true,symbol=true,
85 name=true]{%
86 \ifthenelse{\equal{#1}{none}}{}%
87 \renewcommand*{\@gls@sanitizedesc}{}%
```

```

88 \renewcommand*{\@gls@sanitizename}{}%
89 \renewcommand*{\@gls@sanitizesymbol}{}%
90 }{\setkeys[gls]{sanitize}{#1}}%
91 }

translate Define translate option. If false don't set up multi-lingual support.
92 \define@boolkey{glossaries.sty}[gls]{translate}[true]{}

Set the default value:
93 \glstranslatefalse
94 \@ifpackageloaded{translator}{\glstranslatetrue}{}%
95 \@ifpackageloaded{babel}{\glstranslatetrue}{}}

footnote Set the long form of the acronym in footnote on first use.
96 \define@boolkey{glossaries.sty}[glsacr]{footnote}[true]{%
97 \ifthenelse{\boolean{glsacrdescription}}{}}%
98 {\renewcommand*{\@gls@sanitizedesc}{}}%
99 }

description Allow acronyms to have a description (needs to be set using the description key in
the optional argument of \newacronym).
100 \define@boolkey{glossaries.sty}[glsacr]{description}[true]{%
101 \renewcommand*{\@gls@sanitizesymbol}{}}%
102 }

smallcaps Define \newacronym to set the short form in small capitals.
103 \define@boolkey{glossaries.sty}[glsacr]{smallcaps}[true]{%
104 \renewcommand*{\@gls@sanitizesymbol}{}}%
105 }

smaller Define \newacronym to set the short form using \smaller which obviously needs
to be defined by loading the appropriate package.
106 \define@boolkey{glossaries.sty}[glsacr]{smaller}[true]{%
107 \renewcommand*{\@gls@sanitizesymbol}{}}%
108 }

dua Define \newacronym to always use the long forms (i.e. don't use acronyms)
109 \define@boolkey{glossaries.sty}[glsacr]{dua}[true]{%
110 \renewcommand*{\@gls@sanitizesymbol}{}}%
111 }

shortcuts Define acronym shortcuts.
112 \define@boolkey{glossaries.sty}[glsacr]{shortcuts}[true]{}

\glsorder Stores the glossary ordering. This may either be "word" or "letter". This passes
the relevant information to makeglossaries. The default is word ordering.
113 \newcommand*{\glsorder}{word}

\@glsorder The ordering information is written to the auxiliary file for makeglossaries, so
ignore the auxiliary information.
114 \newcommand*{\@glsorder}[1]{}

```

order

```
115 \define@choicekey{glossaries.sty}{order}{word,letter}{%  
116   \def\glsorder{#1}}
```

`\ifglxindy` Provide boolean to determine whether `xindy` or `makeindex` will be used to sort the glossaries.

```
117 \newif\ifglxindy
```

The default is `makeindex`:

```
118 \glxindyfalse
```

Define package option to specify that `makeindex` will be used to sort the glossaries:

```
119 \DeclareOptionX{makeindex}{\glxindyfalse}
```

The `xindy` package option may have a value which in turn can be a key=value list. First define the keys for this sub-list. The boolean `glsnumbers` determines whether to automatically add the `glsnumbers` letter group.

```
120 \define@boolkey[gls]{xindy}{glsnumbers}[true]{}
```

```
121 \gls@xindy@glsnumberstrue
```

`\@xdy@main@language` Define what language to use for each glossary type (if a language is not defined for a particular glossary type the language specified for the main glossary is used.)

```
122 \def\@xdy@main@language{\rootlanguagename}%
```

Define key to set the language

```
123 \define@key[gls]{xindy}{language}{\def\@xdy@main@language{#1}}
```

`\gls@codepage` Define the code page. If `\inputencodingname` is defined use that, otherwise have initialise with no codepage.

```
124 \@ifundefined{inputencodingname}{%
```

```
125   \def\gls@codepage{}}{%
```

```
126   \def\gls@codepage{\inputencodingname}
```

```
127 }
```

Define a key to set the code page.

```
128 \define@key[gls]{xindy}{codepage}{\def\gls@codepage{#1}}
```

Define package option to specify that `xindy` will be used to sort the glossaries:

```
129 \define@key{glossaries.sty}{xindy}[]{%
```

```
130   \glxindytrue
```

```
131   \setkeys[gls]{xindy}{#1}%
```

```
132 }
```

Process package options:

```
133 \ProcessOptionsX
```

If chapters are defined and the user has requested the section counter as a package option, `\@chapter` will be modified so that it adds a `section.<n>.0` target, otherwise entries placed before the first section of a chapter will have undefined links.

The same problem will also occur if a lower sectional unit is used, but this is less likely to happen. If it does, or if you change `\glscounter`

to `section` later, you will have to specify a different counter for the entries that give rise to a `name{<section-level>.<n>.0}` non-existent warning (e.g. `\gls[counter=chapter]{label}`).

```
134 \ifthenelse{\equal{\glscounter}{section}}{%
135 \ifundefined{chapter}}{%
136 \let\@gls@old@chapter\@chapter
137 \def\@chapter[#1]#2{\@gls@old@chapter[#1]{#2}%
138 \ifundefined{hyperdef}}{\hyperdef{section}{\thesection}{}}}{}}
```

`\@gls@onlypremakeg` Some commands only have an effect when used before `\makeglossaries`. So define a list of commands that should be disabled after `\makeglossaries`

```
139 \newcommand*{\@gls@onlypremakeg}{}
```

`\@onlypremakeg` Adds the specified control sequence to the list of commands that must be disabled after `\makeglossaries`.

```
140 \newcommand*{\@onlypremakeg}[1]{%
141 \ifx\@gls@onlypremakeg\@empty
142 \def\@gls@onlypremakeg{#1}%
143 \else
144 \expandafter\toks@expandafter{\@gls@onlypremakeg}%
145 \edef\@gls@onlypremakeg{\the\toks@,\noexpand#1}%
146 \fi}
```

`\@disable@onlypremakeg` Disable all commands listed in `\@gls@onlypremakeg`

```
147 \newcommand*{\@disable@onlypremakeg}{%
148 \@for\@thiscs:=\@gls@onlypremakeg\do{%
149 \expandafter\@disable@premakecs\@thiscs%
150 }}
```

`\@disable@premakecs` Disables the given command.

```
151 \newcommand*{\@disable@premakecs}[1]{%
152 \def#1{\PackageError{glossaries}{\string#1\space may only be
153 used before \string\makeglossaries}{You can't use
154 \string#1\space after \string\makeglossaries}}%
155 }
```

5.3 Default values

This section sets up default values that are used by this package. Some of the names may already be defined (e.g. by `babel`) so `\providecommand` is used.

Main glossary title:

`\glossaryname`

```
156 \providecommand*{\glossaryname}{Glossary}
```

The title for the `acronym` glossary type (which is defined if `acronym` package option is used) is given by `\acronymname`. If the `acronym` package option is not used, `\acronymname` won't be used.

`\acronymname`

```
157 \providecommand*{\acronymname}{Acronyms}
```

`\glsettoctitle` Sets the TOC title for the given glossary.

```
158 \newcommand*{\glsettoctitle}[1]{%
159 \def\glossarytoctitle{\csname @glotype@#1@title\endcsname}}
```

The following commands provide text for the headers used by some of the tabular-like glossary styles. Whether or not they get used in the glossary depends on the glossary style.

`\entryname`

```
160 \providecommand*{\entryname}{Notation}
```

`\descriptionname`

```
161 \providecommand*{\descriptionname}{Description}
```

`\symbolname`

```
162 \providecommand*{\symbolname}{Symbol}
```

`\pagelistname`

```
163 \providecommand*{\pagelistname}{Page List}
```

Labels for `makeindex`'s symbol and number groups:

`\glssymbolsgroupname`

```
164 \providecommand*{\glssymbolsgroupname}{Symbols}
```

`\glsnumbersgroupname`

```
165 \providecommand*{\glsnumbersgroupname}{Numbers}
```

`\glspluralsuffix` The default plural is formed by appending `\glspluralsuffix` to the singular form.

```
166 \newcommand*{\glspluralsuffix}{s}
```

`\seename`

```
167 \providecommand*{\seename}{see}
```

`\andname`

```
168 \providecommand*{\andname}{\&}
```

Add multi-lingual support. Thanks to everyone who contributed to the translations from both `comp.text.tex` and via email.

```
169 \ifglstranslate
```

If `translator` is not install, used standard `babel` captions, otherwise load `translator` dictionary.

```
170 \@ifpackageloaded{translator}{\usedictionary{glossaries-dictionary}%
171 \renewcommand*{\glsettoctitle}[1]{%
172 \ifthenelse{\equal{#1}{main}}{%
173 \translatelet{\glossarytoctitle}{Glossary}}{%
174 \ifthenelse{\equal{#1}{acronym}}{%
175 \translatelet{\glossarytoctitle}{Acronyms}}{%
176 \def\glossarytoctitle{\csname @glotype@#1@title\endcsname}}}%
177 \renewcommand*{\glossaryname}{\translate{Glossary}}%
178 \renewcommand*{\acronymname}{\translate{Acronyms}}%
```

```

179 \renewcommand*{\entryname}{\translate{Notation (glossaries)}}%
180 \renewcommand*{\descriptionname}{%
181   \translate{Description (glossaries)}}%
182 \renewcommand*{\symbolname}{\translate{Symbol (glossaries)}}%
183 \renewcommand*{\pagelistname}{%
184   \translate{Page List (glossaries)}}%
185 \renewcommand*{\glssymbolsgroupname}{%
186   \translate{Symbols (glossaries)}}%
187 \renewcommand*{\glsnumbersgroupname}{%
188   \translate{Numbers (glossaries)}}%
189 }{%
190   \ifpackageloaded{babel}{\RequirePackage{glossaries-babel}}{}
191 \fi

```

`\glspostdescription` The description terminator is given by `\glspostdescription` (except for the 3 and 4 column styles). This is a full stop by default:

```
192 \newcommand*{\glspostdescription}{.}
```

`\nopostdesc` Provide a means to suppress description terminator for a given entry. (Useful for entries with no description.) Has no effect outside the glossaries.

```
193 \newcommand*{\nopostdesc}{}

```

`\@nopostdesc` Suppress next description terminator.

```

194 \newcommand*{\@nopostdesc}{%
195   \let\org@glspostdescription\glspostdescription
196   \def\glspostdescription{%
197     \let\glspostdescription\org@glspostdescription}%
198 }

```

`\glspar` Provide means of having a paragraph break in glossary entries

```
199 \newcommand{\glspar}{\par}

```

`\setStyleFile` Sets the style file. The relevant extension is appended.

```

200 \ifglxindy
201   \newcommand{\setStyleFile}[1]{%
202     \renewcommand{\istfilename}{#1.xdy}}
203 \else
204   \newcommand{\setStyleFile}[1]{%
205     \renewcommand{\istfilename}{#1.ist}}
206 \fi

```

This command only has an effect prior to using `\makeglossaries`.

```
207 \@onlypremakeg\setStyleFile

```

The name of the `makeindex` or `xindy` style file is given by `\istfilename`. This file is created by `\writeist` (which is used by `\makeglossaries`) so redefining this command will only have an effect if it is done *before* `\makeglossaries`. As from v1.17, use `\setStyleFile` instead of directly redefining `\istfilename`.

`\istfilename`

```

208 \ifglxindy
209   \def\istfilename{\jobname.xdy}
210 \else
211   \def\istfilename{\jobname.ist}
212 \fi

```

The `makeglossaries` Perl script picks up this name from the auxiliary file. If the name ends with `.xdy` it calls `xindy` otherwise it calls `makeindex`. Since its not required by L^AT_EX, `\@istfilename` ignores its argument.

`\@istfilename`

```
213 \newcommand*\@istfilename}[1]{}
```

This command is the value of the `page_compositor` `makeindex` key. Again, any redefinition of this command must take place *before* `\writeist` otherwise it will have no effect. As from 1.17, use `\glsSetCompositor` instead of directly redefining `\glscompositor`.

`\glscompositor`

```
214 \newcommand*\glscompositor}{.}
```

`\glsSetCompositor` Sets the compositor.

```
215 \newcommand*\glsSetCompositor}[1]{%
216   \renewcommand*\glscompositor}{#1}}
```

Only use before `\makeglossaries`

```
217 \@onlypremakeg\glsSetCompositor
```

(The page compositor is usually defined as a dash when using `makeindex`, but most of the standard counters used by L^AT_EX use a full stop as the compositor, which is why I have used it as the default.) If `xindy` is used `\glscompositor` only affects the `arabic-page-numbers` location class.

`\@glsAlphacompositor` This is only used by `xindy`. It specifies the compositor to use when location numbers are in the form `\langle letter \rangle \langle compositor \rangle \langle number \rangle`. For example, if `\@glsAlphacompositor` is set to “.” then it allows locations such as A.1 whereas if `\@glsAlphacompositor` is set to “-” then it allows locations such as A-1.

```
218 \newcommand*\@glsAlphacompositor}{\glscompositor}
```

`\glsSetAlphaCompositor` Sets the alpha compositor.

```
219 \ifglsxindy
220   \newcommand*\glsSetAlphaCompositor[1]{%
221     \renewcommand*\@glsAlphacompositor}{#1}}
222 \else
223   \newcommand*\glsSetAlphaCompositor[1]{%
224     \glsnoxindywarning\glsSetAlphaCompositor}
225 \fi
```

Can only be used before `\makeglossaries`

```
226 \@onlypremakeg\glsSetAlphaCompositor
```

`\gls@sufffixF` Suffix to use for a two page list. This overrides the separator and the closing page number if set to something other than an empty macro.

```
227 \newcommand*\gls@sufffixF}{}
```

`\glsSetSuffixF` Sets the suffix to use for a two page list.

```
228 \newcommand*\glsSetSuffixF}[1]{%
229   \renewcommand*\gls@sufffixF}{#1}}
```

Only has an effect when used before `\makeglossaries`

```
230 \@onlypremakeg\glsSetSuffixF
```

`\gls@suffixFF` Suffix to use for a three page list. This overrides the separator and the closing page number if set to something other than an empty macro.

```
231 \newcommand*{\gls@suffixFF}{}

```

`\glsSetSuffixFF` Sets the suffix to use for a three page list.

```
232 \newcommand*{\glsSetSuffixFF}[1]{%
233   \renewcommand*{\gls@suffixFF}{#1}}

```

The command `\glsnumberformat` indicates the default format for the page numbers in the glossary. (Note that this is not the same as `\glossaryentrynumbers`, but applies to individual numbers or groups of numbers within an entry’s associated number list.) If hyperlinks are defined, it will use `\glshypernumber`, otherwise it will simply display its argument “as is”.

`\glsnumberformat`

```
234 \@ifundefined{hyperlink}{%
235 \newcommand*{\glsnumberformat}[1]{#1}}{%
236 \newcommand*{\glsnumberformat}[1]{\glshypernumber{#1}}}

```

Individual numbers in an entry’s associated number list are delimited using `\delimN` (which corresponds to the `delim_n` `makeindex` keyword). The default value is a comma followed by a space.

`\delimN`

```
237 \newcommand{\delimN}{, }

```

A range of numbers within an entry’s associated number list is delimited using `\delimR` (which corresponds to the `delim_r` `makeindex` keyword). The default is an en-dash.

`\delimR`

```
238 \newcommand{\delimR}{--}

```

The glossary preamble is given by `\glossarypreamble`. This will appear after the glossary sectioning command, and before the `theglossary` environment. It is designed to allow the user to add information pertaining to the glossary (e.g. “page numbers in italic indicate the primary definition”) therefore `\glossarypreamble` shouldn’t be affected by the glossary style. (So if you define your own glossary style, don’t have it change `\glossarypreamble`.) The preamble is empty by default. If you have multiple glossaries, and you want a different preamble for each glossary, you will need to use `\printglossary` for each glossary type, instead of `\printglossaries`, and redefine `\glossarypreamble` before each `\printglossary`.

`\glossarypreamble`

```
239 \newcommand*{\glossarypreamble}{}

```

The glossary postamble is given by `\glossarypostamble`. This is provided to allow the user to add something after the end of the `theglossary` environment (again, this shouldn’t be affected by the glossary style). It is, of course, possible to simply add the text after `\printglossary`, but if you only want the postamble to appear after the first glossary, but not after subsequent glossaries, you can do something like:

`\renewcommand{\glossarypostamble}{For a complete list of terms
see \cite{blah}\gdef\glossarypreamble{}}`

`\glossarypostamble`

240 `\newcommand*{\glossarypostamble}{}%`

The sectioning command that starts a glossary is given by `\glossarysection`. (This does not form part of the glossary style, and so should not be changed by a glossary style.) If `\phantomsection` is defined, it uses `\p@glossarysection`, otherwise it uses `\@glossarysection`.

`\glossarysection`

241 `\newcommand*{\glossarysection}[2][\@gls@title]{%`
242 `\def\@gls@title{#2}%`
243 `\@ifundefined{phantomsection}{%`
244 `\@glossarysection{#1}{#2}}{\p@glossarysection{#1}{#2}}%`
245 `\@mkboth{\glossarytoctitle}{\glossarytoctitle}%`
246 `}`

The required sectional unit is given by `\@glossarysec` which was defined by the `section` package option. The starred form of the command is chosen. If you don't want any sectional command, you will need to redefine `\glossarysection`. The sectional unit can be changed, if different sectional units are required.

`\setglossarysection`

247 `\newcommand*{\setglossarysection}[1]{%`
248 `\setkeys{glossaries.sty}{section=#1}}`

The command `\@glossarysection` indicates how to start the glossary section if `\phantomsection` is not defined.

`\@glossarysection`

249 `\newcommand*{\@glossarysection}[2]{%`
250 `\ifx\@glossarysecstar\@empty`
251 `\csname\@glossarysec\endcsname{#2}%`
252 `\else`
253 `\csname\@glossarysec\endcsname*{#2}%`
254 `\@gls@toc{#1}{\@glossarysec}%`
255 `\fi`
256 `\@glossaryseclabel}`

As `\@glossarysection`, but put in `\phantomsection`, and swap where `\@gls@toc` goes. If using chapters do a `\clearpage`. This ensures that the hyper link from the table of contents leads to the line above the heading, rather than the line below it.

`\p@glossarysection`

257 `\newcommand*{\p@glossarysection}[2]{%`
258 `\glsclearpage`
259 `\phantomsection`
260 `\ifx\@glossarysecstar\@empty`
261 `\csname\@glossarysec\endcsname{#2}%`
262 `\else`
263 `\@gls@toc{#1}{\@glossarysec}%`

```

264 \csname\@@glossarysec\endcsname*{#2}%
265 \fi
266 \@@glossaryseclabel}

```

The `\gls@doclearpage` command is used to issue a `\clearpage` (or `\cleardoublepage`) depending on whether the glossary sectional unit is a chapter. If the sectional unit is something else, do nothing.

`\gls@doclearpage`

```

267 \newcommand*{\gls@doclearpage}{%
268 \ifthenelse{\equal{\@@glossarysec}{chapter}}{%
269 \@ifundefined{cleardoublepage}{\clearpage}{\cleardoublepage}}{}%
270 }

```

`\glscclearpage` This just calls `\gls@doclearpage`, but it makes it easier to have a user command so that the user can override it.

```

271 \newcommand*{\glscclearpage}{\gls@doclearpage}

```

The glossary is added to the table of contents if `glstoc` flag set. If it is set, `\@gls@toc` will add a line to the `.toc` file, otherwise it will do nothing. (The first argument to `\@gls@toc` is the title for the table of contents, the second argument is the sectioning type.)

`\@gls@toc`

```

272 \newcommand*{\@gls@toc}[2]{%
273 \ifglstoc
274 \ifglslnumberline
275 \addcontentsline{toc}{#2}{\numberline{}}{#1}%
276 \else
277 \addcontentsline{toc}{#2}{#1}%
278 \fi
279 \fi}

```

5.4 Xindy

This section defines commands that only have an effect if `xindy` is used to sort the glossaries.

`\glsnoxindywarning` Issues a warning if `xindy` hasn't been specified. These warnings can be suppressed by redefining `\glsnoxindywarning` to ignore its argument

```

280 \newcommand*{\glsnoxindywarning}[1]{%
281 \PackageWarning{glossaries}{Not in xindy mode --- ignoring
282 \string#1}}

```

`\@xdyattributes` Define list of attributes (`\string` is used in case the double quote character has been made active)

```

283 \ifglsxindy
284 \edef\@xdyattributes{\string"default\string"}%
285 \fi

```

`\@xdylocref` Define list of markup location references.

```

286 \ifglsxindy
287 \def\@xdylocref{}
288 \fi

```

`\GlsAddXdyAttribute` Adds an attribute.

```

289 \ifglxsindy
290   \newcommand*\GlsAddXdyAttribute[1]{%
291     \edef\xdyattributes{\xdyattributes ^^J \string"#1\string"}%
292     \expandafter\toks@\expandafter{\xdylocref}%
293     \edef\xdylocref{\the\toks@ ^^J%
294     (markup-locref
295     :open \string"\string~\string\setentrycounter
296       {\noexpand\glscounter}%
297       \expandafter\string\csname#1\endcsname
298       \expandafter@gobble\string\{\string" ^^J
299     :close \string"\expandafter@gobble\string\}\string" ^^J
300     :attr \string"#1\string")}}

```

Only has an effect before `\writeist`:

```

301   \@onlypremakeg\GlsAddXdyAttribute
302 \else
303   \newcommand*\GlsAddXdyAttribute[1]{%
304     \glsnxindywarning\GlsAddXdyAttribute}
305 \fi

```

Add known attributes:

```

306 \ifglxsindy
307   \GlsAddXdyAttribute{glslnumberformat}
308   \GlsAddXdyAttribute{textrm}
309   \GlsAddXdyAttribute{textsf}
310   \GlsAddXdyAttribute{texttt}
311   \GlsAddXdyAttribute{textbf}
312   \GlsAddXdyAttribute{textmd}
313   \GlsAddXdyAttribute{textit}
314   \GlsAddXdyAttribute{textup}
315   \GlsAddXdyAttribute{textsl}
316   \GlsAddXdyAttribute{textsc}
317   \GlsAddXdyAttribute{emph}
318   \GlsAddXdyAttribute{glshypernumber}
319   \GlsAddXdyAttribute{hyperrrm}
320   \GlsAddXdyAttribute{hypersf}
321   \GlsAddXdyAttribute{hypertt}
322   \GlsAddXdyAttribute{hyperbf}
323   \GlsAddXdyAttribute{hypermd}
324   \GlsAddXdyAttribute{hyperit}
325   \GlsAddXdyAttribute{hyperup}
326   \GlsAddXdyAttribute{hypersl}
327   \GlsAddXdyAttribute{hypersc}
328   \GlsAddXdyAttribute{hyperemph}
329 \fi

```

`\@xdyuseralphabets` List of additional alphabets

```

330 \def\@xdyuseralphabets{}

```

`\GlsAddXdyAlphabet` `\GlsAddXdyAlphabet{<name>}{<definition>}` adds a new alphabet called *<name>*.
The definition must use xindy syntax.

```

331 \ifglxsindy
332   \newcommand*\GlsAddXdyAlphabet[2]{%

```

```

333 \edef\@xdyuseralphabets{%
334 \@xdyuseralphabets ^^J
335 (define-alphabet "#1" (#2))}%
336 \else
337 \newcommand*\GlsAddXdyAlphabet}[2]{%
338 \glsnoxindywarning\GlsAddXdyAlphabet}
339 \fi

\@xdyuserlocationdefs List of additional location definitions (separated by ^^J)
340 \def\@xdyuserlocationdefs{}

\@xdyuserlocationnames List of additional user location names
341 \def\@xdyuserlocationnames{}

\GlsAddXdyLocation \GlsAddXdyLocation{<name>}{<definition>} Define a new location called <name>.
The definition must use xindy syntax. (Note that this doesn't check to see if the
location is already defined. That is left to xindy to complain about.)
342 \ifglsxindy
343 \newcommand*\GlsAddXdyLocation}[2]{%
344 \edef\@xdyuserlocationdefs{%
345 \@xdyuserlocationdefs ^^J%

485 }%

```

5.5 Loops and conditionals

To iterate through all glossaries (or comma-separated list of glossary names given in optional argument) use:

`\forallglossaries[<glossary list>]{<cmd>}{<code>}`

where *<cmd>* is a control sequence which will be set to the name of the glossary in the current iteration.

`\forallglossaries`

```

486 \newcommand*\forallglossaries[3][\@glo@types]{%
487 \@for#2:=#1\do{\ifthenelse{equal{#2}{}}{#{3}}{}}

```

To iterate through all entries in a given glossary use:

`\forlgsentries[<type>]{<cmd>}{<code>}`

where *<type>* is the glossary label and *<cmd>* is a control sequence which will be set to the entry label in the current iteration.

`\forlgsentries`

```

488 \newcommand*\forlgsentries[3][\glsdefaulttype]{%
489 \edef\@glo@list{\csname glolist@#1\endcsname}%
490 \@for#2:=\@glo@list\do{%
491 \ifthenelse{equal{#2}{}}{#{3}}{}}

```

To iterate through all glossary entries over all glossaries listed in the optional argument (the default is all glossaries) use:

`\foralllgsentries[<glossary list>]{<cmd>}{<code>}`

Within `\foralllgsentries`, the current glossary type is given by `\@this@glo@`.

`\foralllgsentries`

```

492 \newcommand*\foralllgsentries[3][\@glo@types]{%
493 \expandafter\forallglossaries\expandafter[#1]{\@this@glo@}{%
494 \forlgsentries[\@this@glo@]{#2}{#3}}

```

To check to see if a glossary exists use:

`\ifglossaryexists{<type>}{<true-text>}{<false-text>}`

where $\langle type \rangle$ is the glossary's label.

`\ifglossaryexists`

```
495 \newcommand{\ifglossaryexists}[3]{%
496 \@ifundefined{glo@#1@out}{#3}{#2}}
```

To check to see if a glossary entry has been defined use:

`\ifglentryexists{ $\langle label \rangle$ }{ $\langle true text \rangle$ }{ $\langle false text \rangle$ }`

where $\langle label \rangle$ is the entry's label.

`\ifglentryexists`

```
497 \newcommand{\ifglentryexists}[3]{%
498 \@ifundefined{glo@#1@name}{#3}{#2}}
```

To determine if given glossary entry has been used in the document text yet use:

`\ifglused{ $\langle label \rangle$ }{ $\langle true text \rangle$ }{ $\langle false text \rangle$ }`

where $\langle label \rangle$ is the entry's label. If true it will do $\langle true text \rangle$ otherwise it will do $\langle false text \rangle$.

`\ifglused`

```
499 \newcommand*{\ifglused}[3]{\ifthenelse{\boolean{glo@#1@flag}}{#2}{#3}}
```

The following two commands will cause an error if the given condition fails:

`\glstoifexists{ $\langle label \rangle$ }{ $\langle code \rangle$ }`

Generate an error if entry specified by $\langle label \rangle$ doesn't exist, otherwise do $\langle code \rangle$.

`\glstoifexists`

```
500 \newcommand{\glstoifexists}[2]{\ifglentryexists{#1}{#2}{%
501 \PackageError{glossaries}{Glossary entry '#1' has not been
502 defined.}{You need to define a glossary entry before you
503 can use it.}}}
```

`\glstoifnoexists{ $\langle label \rangle$ }{ $\langle code \rangle$ }`

The opposite: only do second argument if the entry doesn't exist. Generate an error message if it exists.

`\glstoifnoexists`

```
504 \newcommand{\glstoifnoexists}[2]{\ifglentryexists{#1}{%
505 \PackageError{glossaries}{Glossary entry '#1' has already
506 been defined.}{}}{#2}}
```

5.6 Defining new glossaries

A comma-separated list of glossary names is stored in `\@glo@types`. When a new glossary type is created, its identifying name is added to this list. This is used by commands that iterate through all glossaries (such as `\makeglossaries` and `\printglossaries`).

`\@glo@types`

```
507 \newcommand*{\@glo@types}{,}
```

A new glossary type is defined using `\newglossary`. Syntax:

```
\newglossary[<log-ext>]{<name>}{<in-ext>}{<out-ext>}{<title>}[<counter>]
```

where *<log-ext>* is the extension of the `makeindex` transcript file, *<in-ext>* is the extension of the glossary input file (read in by `\printglossary` and created by `makeindex`), *<out-ext>* is the extension of the glossary output file which is read in by `makeindex` (lines are written to this file by the `\glossary` command), *<title>* is the title of the glossary that is used in `\glossarysection` and *<counter>* is the default counter to be used by entries belonging to this glossary. The `makeglossaries` Perl script reads in the relevant extensions from the auxiliary file, and passes the appropriate file names and switches to `makeindex`.

`\newglossary`

```
508 \newcommand*{\newglossary}[5][glg]{%
509 \ifglossaryexists{#2}{%
510 \PackageError{glossaries}{Glossary type ‘#2’ already exists}{%
511 You can’t define a new glossary called ‘#2’ because it already
512 exists}%
513 }{%
```

Add this to the list of glossary types:

```
514 \toks@{#2}\edef\@glo@types{\@glo@types\the\toks@,}%
```

Define a comma-separated list of labels for this glossary type, so that all the entries for this glossary can be reset with a single command. When a new entry is created, its label is added to this list.

```
515 \expandafter\gdef\csname glolist@#2\endcsname{,}%
```

Store details of this new glossary type:

```
516 \expandafter\def\csname @glotype@#2in\endcsname{#3}%
517 \expandafter\def\csname @glotype@#2out\endcsname{#4}%
518 \expandafter\def\csname @glotype@#2title\endcsname{#5}%
519 \protected@write\@auxout{}\string\@newglossary{#2}{#1}{#3}{#4}}%
```

How to display this entry in the document text (uses `\glsdisplay` and `\glsdisplayfirst` by default). These can be redefined by the user later if required (see `\defglsdisplay` and `\defglsdisplayfirst`)

```
520 \expandafter\gdef\csname gls@#2display\endcsname{%
521 \glsdisplay}%
522 \expandafter\gdef\csname gls@#2displayfirst\endcsname{%
523 \glsdisplayfirst}%
```

Find out if the final optional argument has been specified, and use it to set the counter associated with this glossary. (Uses `\glscounter` if no optional argument is present.)

```
524 \@ifnextchar[{\@gls@setcounter{#2}}{\@gls@setcounter{#2}[\glscounter]}]}
```

Only define new glossaries in the preamble:

```
525 \@onlypreamble{\newglossary}
```

Only define new glossaries before `\makeglossaries`

```
526 \@onlypremakeg\newglossary
```

`\@newglossary` is used to specify the file extensions for the `makeindex` input, output and transcript files. It is written to the auxiliary file by `\newglossary`. Since it is not used by L^AT_EX, `\@newglossary` simply ignores its arguments.

`\@newglossary`

```
527 \newcommand*{\@newglossary}[4]{}
```

Store counter to be used for given glossary type (the first argument is the glossary label, the second argument is the name of the counter):

`\@gls@setcounter`

```
528 \def\@gls@setcounter#1[#2]{%
```

```
529 \expandafter\def\csname @gls@#1@counter\endcsname{#2}%
```

```
530 }
```

Get counter associated with given glossary (the argument is the glossary label):

`\@gls@getcounter`

```
531 \newcommand*{\@gls@getcounter}[1]{%
```

```
532 \csname @gls@#1@counter\endcsname}
```

Define the main glossary. This will be the first glossary to be displayed when using `\printglossaries`.

```
533 \newglossary{main}{gls}{glo}{\glossaryname}
```

5.7 Defining new entries

New glossary entries are defined using `\newglossaryentry`. This command requires a label and a key-value list that defines the relevant information for that entry. The definition for these keys follows. Note that the `name`, `description` and `symbol` keys will be sanitized later, depending on the value of the package option `sanitize` (this means that if some of the keys haven't been defined, they can be constructed from the `name` and `description` key before they are sanitized).

name The `name` key indicates the name of the term being defined. This is how the term will appear in the glossary. The `name` key is required when defining a new glossary entry.

```
534 \define@key{glossentry}{name}{%
```

```
535 \def\@glo@name{#1}%
```

```
536 }
```

description The `description` key is usually only used in the glossary, but can be made to appear in the text by redefining `\glsdisplay` and `\glsdisplayfirst` (or using `\defglsdisplay` and `\defglsdisplayfirst`), however, you will have to disable the `sanitize` option (using the `sanitize` package option, `sanitize={description=false}`, and protect fragile commands). The `description` key is required when defining a new glossary entry. (Be careful not to make the description too long, because `makeindex` has a limited buffer. `\@glo@desc` is defined to be a short command to discourage lengthy descriptions for this reason. If you do have a very long description, or if you require paragraph breaks, define a separate command that contains the description, and use it as the value to the `description` key.)

```
537 \define@key{glossentry}{description}{%
```

```
538 \def\@glo@desc{#1}%
```

```
539 }
```

descriptionplural

```
540 \define@key{glossentry}{descriptionplural}{%  
541 \def\@glo@descplural{#1}%  
542 }
```

sort The `sort` key needs to be sanitized here (the `sort` key is provided for `makeindex`'s benefit, not for use in the document). The `sort` key is optional when defining a new glossary entry. If omitted, the value is given by *<name>* *<description>*.

```
543 \define@key{glossentry}{sort}{%  
544 \def\@glo@sort{#1}}
```

text The `text` key determines how the term should appear when used in the document (i.e. outside of the glossary). If omitted, the value of the `name` key is used instead.

```
545 \define@key{glossentry}{text}{%  
546 \def\@glo@text{#1}%  
547 }
```

plural The `plural` key determines how the plural form of the term should be displayed in the document. If omitted, the plural is constructed by appending `\glspluralsuffix` to the value of the `text` key.

```
548 \define@key{glossentry}{plural}{%  
549 \def\@glo@plural{#1}%  
550 }
```

first The `first` key determines how the entry should be displayed in the document when it is first used. If omitted, it is taken to be the same as the value of the `text` key.

```
551 \define@key{glossentry}{first}{%  
552 \def\@glo@first{#1}%  
553 }
```

firstplural The `firstplural` key is used to set the plural form for first use, in the event that the plural is required the first time the term is used. If omitted, it is constructed by appending `\glspluralsuffix` to the value of the `first` key.

```
554 \define@key{glossentry}{firstplural}{%  
555 \def\@glo@firstplural{#1}%  
556 }
```

symbol The `symbol` key is ignored by most of the predefined glossary styles, and defaults to `\relax` if omitted. It is provided for glossary styles that require an associated symbol, as well as a name and description. To make this value appear in the glossary, you need to redefine `\glossaryentryfield` so that it uses its fourth parameter. If you want this value to appear in the text when the term is used by commands like `\gls`, you will need to change `\glsdisplay` and `\glsdisplayfirst` (either explicitly for all glossaries or via `\defglsdisplay` and `\defglsdisplayfirst` for individual glossaries).

```
557 \define@key{glossentry}{symbol}{%  
558 \def\@glo@symbol{#1}%  
559 }
```

symbolplural

```
560 \define@key{glossentry}{symbolplural}{%  
561 \def\@glo@symbolplural{#1}%  
562 }
```

type The `type` key specifies to which glossary this entry belongs. If omitted, the default glossary is used.

```

563 \define@key{glossentry}{type}{%
564 \def\@glo@type{#1}}

```

counter The `counter` key specifies the name of the counter associated with this glossary entry:

```

565 \define@key{glossentry}{counter}{%
566 \@ifundefined{c#1}{\PackageError{glossaries}{There is no counter
567 called ‘#1’}{The counter key should have the name of a valid
568 counter as its value}}{%
569 \def\@glo@counter{#1}}

```

see The `see` key specifies a list of cross-references

```

570 \define@key{glossentry}{see}{%
571 \def\@glo@see{#1}}

```

parent The `parent` key specifies the parent entry, if required.

```

572 \define@key{glossentry}{parent}{%
573 \def\@glo@parent{#1}}

```

nonumberlist The `nonumberlist` key suppresses the number list for the given entry.

```

574 \define@key{glossentry}{nonumberlist}[none]{%
575 \def\@glo@prefix{\glsnonextpages}}

```

\@glsnname Define command to generate error if name key is missing.

```

576 \newcommand*{\@glsnname}{%
577 \PackageError{glossaries}{name key required in

746   \fi
747 \fi
748 }

```

5.8 Resetting and unsetting entry flags

Each glossary entry is assigned a conditional of the form `\ifglo@<label>@flag` which determines whether or not the entry has been used (see also `\ifglsused` defined below). These flags can be set and unset using the following macros:

The command `\glsreset{<label>}` can be used to set the entry flag to indicate that it hasn't been used yet. The required argument is the entry label.

`\glsreset`

```

749 \newcommand*{\glsreset}[1]{%
750 \glsdoifexists{#1}{%
751 \expandafter\global\csname glo@#1@flagfalse\endcsname}}

```

As above, but with only a local effect:

`\glslocalreset`

```

752 \newcommand*{\glslocalreset}[1]{%
753 \glsdoifexists{#1}{%
754 \expandafter\let\csname ifglo@#1@flag\endcsname\iffalse}}

```

The command `\glsunset{<label>}` can be used to set the entry flag to indicate that it has been used. The required argument is the entry label.

`\glsunset`

```
755 \newcommand*{\glsunset}[1]{%
756 \glsdoifexists{#1}{%
757 \expandafter\global\csname glo@#1@flagtrue\endcsname}}
```

As above, but with only a local effect:

`\glslocalunset`

```
758 \newcommand*{\glslocalunset}[1]{%
759 \glsdoifexists{#1}{%
760 \expandafter\let\csname ifglo@#1@flag\endcsname\iftrue}}
```

Reset all entries for the named glossaries (supplied in a comma-separated list).

Syntax: `\glsresetall[<glossary-list>]`

`\glsresetall`

```
761 \newcommand*{\glsresetall}[1][\@glo@types]{%
762 \forallglsentries[1]{\@glsentry}{%
763 \glsreset{\@glsentry}}}
```

As above, but with only a local effect:

`\glslocalresetall`

```
764 \newcommand*{\glslocalresetall}[1][\@glo@types]{%
765 \forallglsentries[1]{\@glsentry}{%
766 \glslocalreset{\@glsentry}}}
```

Unset all entries for the named glossaries (supplied in a comma-separated list).

Syntax: `\glsunsetall[<glossary-list>]`

`\glsunsetall`

```
767 \newcommand*{\glsunsetall}[1][\@glo@types]{%
768 \forallglsentries[1]{\@glsentry}{%
769 \glsunset{\@glsentry}}}
```

As above, but with only a local effect:

`\glslocalunsetall`

```
770 \newcommand*{\glslocalunsetall}[1][\@glo@types]{%
771 \forallglsentries[1]{\@glsentry}{%
772 \glslocalunset{\@glsentry}}}
```

5.9 Loading files containing glossary entries

Glossary entries can be defined in an external file. These external files can contain `\newglossaryentry` and `\newacronym` commands.¹⁷

`\loadglsentries[<type>]{<filename>}`

This command will input the file using `\input`. The optional argument specifies to which glossary the entries should be assigned if they haven't used the `type` key. If the optional argument is not specified, the default glossary is used. Only those entries used in the document (via `\glslink`, `\gls`, `\glspl` and uppercase variants or `\glsadd` and `\glsaddall` will appear in the glossary). The mandatory argument is the filename (with or without `.tex` extension).

¹⁷and any other valid L^AT_EX code that can be used in the preamble.

`\loadglsentries`

```
773 \newcommand*{\loadglsentries}[2][\@gls@default]{%
774 \let\@gls@default\glsdefaulttype
775 \def\glsdefaulttype{#1}\input{#2}%
776 \let\glsdefaulttype\@gls@default}

\loadglsentries can only be used in the preamble:
777 \onlypreamble{\loadglsentries}
```

5.10 Using glossary entries in the text

Any term that has been defined using `\newglossaryentry` (or `\newacronym`) can be displayed in the text (i.e. outside of the glossary) using one of the commands defined in this section. Unless you use `\glslink`, the way the term appears in the text is determined by `\glsdisplayfirst` (if it is the first time the term has been used) or `\glsdisplay` (for subsequent use). Any formatting commands (such as `\textbf`) is governed by `\glstextformat`. By default this just displays the link text “as is”.

`\glstextformat`

```
778 \newcommand*{\glstextformat}[1]{#1}
```

The first time an entry is used, the way in which it is displayed is governed by `\glsdisplayfirst`. This takes four parameters: `#1` will be the value of the entry’s first or firstplural key, `#2` will be the value of the entry’s description key, `#3` will be the value of the entry’s symbol key and `#4` is additional text supplied by the final optional argument to commands like `\gls` and `\glspl`. The default is to display the first parameter followed by the additional text.

`\glsdisplayfirst`

```
779 \newcommand*{\glsdisplayfirst}[4]{#1#4}
```

After the first use, the entry is displayed according to the format of `\glsdisplay`. Again, it takes four parameters: `#1` will be the value of the entry’s text or plural key, `#2` will be the value of the entry’s description key, `#3` will be the value of the entry’s symbol key and `#4` is additional text supplied by the final optional argument to commands like `\gls` and `\glspl`.

`\glsdisplay`

```
780 \newcommand*{\glsdisplay}[4]{#1#4}
```

When a new glossary is created it uses `\glsdisplayfirst` and `\glsdisplay` as the default way of displaying its entry in the text. This can be changed for the entries belonging to an individual glossary using `\defglsdisplay` and `\defglsdisplayfirst`.

```
\defglsdisplay[<type>]{<definition>}
```

The glossary type is given by `<type>` (the default glossary if omitted) and `<definition>` should have at most `#1`, `#2`, `#3` and `#4`. These represent the same arguments as those described for `\glsdisplay`.

`\defglsdisplay`

```
781 \newcommand*{\defglsdisplay}[2][\glsdefaulttype]{%
782 \expandafter\def\csname gls@#1@display\endcsname##1##2##3##4{#2}}
```

`\defglsdisplayfirst[<type>]{<definition>}`

The glossary type is given by *<type>* (the default glossary if omitted) and *<definition>* should have at most #1, #2, #3 and #4. These represent the same arguments as those described for `\glsdisplayfirst`.

`\defglsdisplayfirst`

```
783 \newcommand*{\defglsdisplayfirst}[2][\glsdefaulttype]{%
784 \expandafter\def\csname gls@#1@displayfirst\endcsname##1##2##3##4{#2}}
```

5.10.1 Links to glossary entries

The links to glossary entries all have a first optional argument that can be used to change the format and counter of the associated entry number. Except for `\glslink`, the commands like `\gls` have a final optional argument that can be used to insert additional text in the link (this will usually be appended, but can be redefined using `\defglsdisplay` and `\defglsdisplayfirst`). It goes against the L^AT_EX norm to have an optional argument after the mandatory arguments, but it makes more sense to write, say, `\gls{label}[’s]` rather than, say, `\gls[append=’s]{label}`. Since these control sequences are defined to include the final square bracket, spaces will be ignored after them. This is likely to lead to confusion as most users would not expect, say, `\gls{<label>}` to ignore following spaces, so `\new@ifnextchar` from the `amsgen` package is required.

The following keys can be used in the first optional argument. The `counter` key checks that the value is the name of a valid counter.

```
785 \define@key{glslink}{counter}{%
786 \@ifundefined{c@#1}{\PackageError{glossaries}{There is no counter
787 called ‘#1’}{The counter key should have the name of a valid
788 counter as its value}}{%
789 \def\@gls@counter{#1}}
```

The value of the `format` key should be the name of a command (without the initial backslash) that has a single mandatory argument which can be used to format the associated entry number.

```
790 \define@key{glslink}{format}{%
791 \def\@gls@numberformat{#1}}
```

The `hyper` key is a boolean key, it can either have the value `true` or `false`, and indicates whether or not to make a hyperlink to the relevant glossary entry. If `hyper` is `false`, an entry will still be made in the glossary, but the given text won’t be a hyperlink.

```
792 \define@boolkey{glslink}{hyper}[true]{}
```

Syntax:

`\glslink[<options>]{<label>}{<text>}`

Display *<text>* in the document, and add the entry information for *<label>* into

the relevant glossary. The optional argument should be a key value list using the `glslink` keys defined above.

There is also a starred version:

`\glslink*[\<options>]{\<label>}{\<text>}`

which is equivalent to `\glslink[hyper=false,\<options>]{\<label>}{\<text>}`

First determine whether or not we are using the starred version:

`\glslink`

```
793 \newcommand{\glslink}{%
794 \ifstar\@sgls@link\@gls@link}
```

Define the starred version:

`\@sgls@link`

```
795 \newcommand*\@sgls@link[1][\@gls@link[hyper=false,#1]]{
```

Define the un-starred version:

`\@gls@link`

```
796 \newcommand*\@gls@link[3][\@%
797 \glsdoifexists{#2}%
798 {%
799   \def\glslabel{#2}%
800   \def\@glsnumberformat{glsnumberformat}%
801   \edef\@gls@counter{\csname glo@#2@counter\endcsname}%
802   \KV@glslink@hypertrue
803   \setkeys{glslink}{#1}%
804   \edef\theglsentrycounter{\expandafter\noexpand
805     \csname the\@gls@counter\endcsname}%
806   \ifKV@glslink@hyper
807     \@glslink{glo:#2}{\glstextformat{#3}}%
808   \else
809     \glstextformat{#3}\relax
810   \fi
811   \do@wrglossary{#2}%
812 }%
813 }
```

Set the formatting information in the format required by `makeindex`. The first argument is the format specified by the user (via the format key), the second argument is the name of the counter used to indicate the location and the third argument is a control sequence which stores the required format.

`\@set@glo@numformat`

```
814 \def\@set@glo@numformat#1#2#3{%
815 \expandafter\@glo@check@mkidxrangechar#3\@nil
816 \protected@edef#1{\@glo@prefix setentrycounter{#2}%
817 \expandafter\string\csname\@glo@suffix\endcsname}%
818 \@gls@checkmkidxchars#1}
```

Check to see if the given string starts with a (or). If it does set `\@glo@prefix` to the starting character, and `\@glo@suffix` to the rest (or `glsnumberformat` if

there is nothing else), otherwise set \@glo@prefix to nothing and \@glo@suffix to all of it.

```

819 \def\@glo@check@mkidxrangechar#1#2\@nil{%
820 \if#1(\relax
821   \def\@glo@prefix{()}%
822   \if\relax#2\relax
823     \def\@glo@suffix{glsnumberformat}%
824   \else
825     \def\@glo@suffix{#2}%
826   \fi
827 \else
828   \if#1)\relax
829     \def\@glo@prefix{)}%
830     \if\relax#2\relax
831       \def\@glo@suffix{glsnumberformat}%
832     \else
833       \def\@glo@suffix{#2}%
834     \fi
835   \else
836     \def\@glo@prefix{}\def\@glo@suffix{#1#2}%
837   \fi
838 \fi}

```

\@gls@escbsdq Escape backslashes and double quote marks. The argument must be a control sequence.

```

839 \newcommand*\@gls@escbsdq[1]{%
840   \def\@gls@checkedmkidx{}%
841   \let\gls@xdystring=#1\relax
842   \@onelevel@sanitize\gls@xdystring

1119 }

Now go ahead and define \@gls@xdycheckbackslash
1120 \def@gls@xdycheckbackslash

```

`\@glslink` If `\hyperlink` is not defined `\@glslink` ignores its first argument and just does the second argument, otherwise it is equivalent to `\hyperlink`.

```

1121 \ifundefined{hyperlink}{%
1122   \gdef\@glslink#1#2{#2}%
1123 }{%
1124   \gdef\@glslink#1#2{\hyperlink{#1}{#2}}%
1125 }

```

`\@glstarget` If `\hypertarget` is not defined, `\@glstarget` ignores its first argument and just does the second argument, otherwise it is equivalent to `\hypertarget`.

```

1126 \newlength\gls@tmplen
1127 \ifundefined{hypertarget}{%
1128   \gdef\@glstarget#1#2{#2}%
1129 }{%
1130   \gdef\@glstarget#1#2{%
1131     \settoheight{\gls@tmplen}{#2}%
1132     \raisebox{\gls@tmplen}{\hypertarget{#1}{}}#2}%
1133 }

```

Glossary hyperlinks can be disabled using `\glsdisablehyper` (effect can be localised):

`\glsdisablehyper`

```

1134 \newcommand{\glsdisablehyper}{%
1135 \renewcommand*\@glslink[2]{##2}%
1136 \renewcommand*\@glstarget[2]{##2}}

```

Glossary hyperlinks can be enabled using `\glsenablehyper` (effect can be localised):

`\glsenablehyper`

```

1137 \newcommand{\glsenablehyper}{%
1138 \renewcommand*\@glslink[2]{\hyperlink{##1}{##2}}%
1139 \renewcommand*\@glstarget[2]{%
1140   \settoheight{\gls@tmplen}{##2}%
1141   \raisebox{\gls@tmplen}{\hypertarget{##1}{}}##2}}

```

Syntax:

`\gls[⟨options⟩]{⟨label⟩}[⟨insert text⟩]`

Link to glossary entry using singular form. The link text is taken from the value of the text or first keys used when the entry was defined.

The first optional argument is a key-value list, the same as `\glslink`, the mandatory argument is the entry label. After the mandatory argument, there is another optional argument to insert extra text in the link text (the location of the inserted text is governed by `\glsdisplay` and `\glsdisplayfirst`). As with `\glslink` there is a starred version which is the same as the unstarred version but with the `hyper` key set to `false`. (Additional options can also be specified in the first optional argument.)

First determine if we are using the starred form:

`\gls`

```
1142 \newcommand*{\gls}{\@ifstar\@sgls\@gls}
```

Define the starred form:

`\@sgls`

```
1143 \newcommand*{\@sgls}[1] [] {\@gls[hyper=false,#1]}
```

Defined the un-starred form. Need to determine if there is a final optional argument

`\@gls`

```
1144 \newcommand*{\@gls}[2] [] {%
```

```
1145 \new@ifnextchar[{\@gls@{#1}{#2}}{\@gls@{#1}{#2} []}]}
```

`\@gls@` Read in the final optional argument:

```
1146 \def\@gls@#1#2[#3] {%
```

```
1147 \glsdoifexists{#2}{\edef\@gls@type{\glsentrytype{#2}}}%
```

Save options in `\@gls@link@opts` and label in `\@gls@link@label`

```
1148 \def\@gls@link@opts{#1}%
```

```
1149 \def\@gls@link@label{#2}%
```

Determine what the link text should be (this is stored in `\@gls@text`)

```
1150 \ifglsused{#2}{\protected@edef\@gls@text{%
```

```
1151 \csname gls@\@gls@type @display\endcsname
```

```
1152 {\glsentrytext{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}{%
```

```
1153 \protected@edef\@gls@text{%
```

```
1154 \csname gls@\@gls@type @displayfirst\endcsname
```

```
1155 {\glsentryfirst{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}}%
```

Call `\@gls@link`. If footnote package option has been used, suppress hyperlink for first use.

```
1156 \ifglsused{#2}{%
```

```
1157 \@gls@link[#1]{#2}{\@gls@text}%
```

```
1158 }{%
```

```
1159 \ifthenelse{\equal{\@gls@type}{\acronymtype}}{\and
```

```
1160 \boolean{glsacrfootnote}}{%
```

```
1161 \@gls@link[#1,hyper=false]{#2}{\@gls@text}%
```

```
1162 }{%
```

```

1163 \@gls@link[#1]{#2}{\@glo@text}%
1164 }%
1165 }%

```

Indicate that this entry has now been used

```

1166 \glsunset{#2}}%
1167 }

```

`\Gls` behaves like `\gls`, but the first letter of the link text is converted to uppercase (note that if the first letter has an accent, the accented letter will need to be grouped when you define the entry). It is mainly intended for terms that start a sentence:

`\Gls`

```

1168 \newcommand*{\Gls}{\@ifstar\@sGls\@Gls}

```

Define the starred form:

```

1169 \newcommand*{\@sGls}[1] [] {\@Gls[hyper=false,#1]}

```

Defined the un-starred form. Need to determine if there is a final optional argument

```

1170 \newcommand*{\@Gls}[2] [] {%
1171 \new@ifnextchar[{\@Gls@{#1}{#2}}{\@Gls@{#1}{#2} []}]

```

`\@Gls@` Read in the final optional argument:

```

1172 \def\@Gls@#1#2[#3] {%
1173 \glsdoifexists{#2}{\edef\@glo@type{\glsentrytype{#2}}}%
    Save options in \@gls@link@opts and label in \@gls@link@label
1174 \def\@gls@link@opts{#1}%
1175 \def\@gls@link@label{#2}%
    Determine what the link text should be (this is stored in \@glo@text)
1176 \ifglsused{#2}{\protected@edef\@glo@text{%
1177 \csname gls@\@glo@type @display\endcsname
1178 {\glsentrytext{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}}%
1179 \protected@edef\@glo@text{%
1180 \csname gls@\@glo@type @displayfirst\endcsname
1181 {\glsentryfirst{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}}%

```

Call `\@gls@link` If footnote package option has been used, suppress hyperlink for first use.

```

1182 \ifglsused{#2}{%
1183 \@gls@link[#1]{#2}{%
1184 \expandafter\makefirstuc\expandafter{\@glo@text}}%
1185 }{%
1186 \ifthenelse{\equal{\@glo@type}{\acronymtype}}{\and
1187 \boolean{glsacrfootnote}}{%
1188 \@gls@link[#1,hyper=false]{#2}{%
1189 \expandafter\makefirstuc\expandafter{\@glo@text}}%
1190 }{%
1191 \@gls@link[#1]{#2}{%
1192 \expandafter\makefirstuc\expandafter{\@glo@text}}%
1193 }%
1194 }%

```

Indicate that this entry has now been used

```
1195 \glsunset{#2}}%
1196 }
```

\GLS behaves like \gls, but the link text is converted to uppercase:

\GLS

```
1197 \newcommand*{\GLS}{\@ifstar\@sGLS\@GLS}
```

Define the starred form:

```
1198 \newcommand*{\@sGLS}[1] [] {\@GLS[hyper=false,#1]}
```

Defined the un-starred form. Need to determine if there is a final optional argument

```
1199 \newcommand*{\@GLS}[2] [] {%
1200 \new@ifnextchar [{\@GLS@{#1}{#2}}{\@GLS@{#1}{#2} []}]}
```

\@GLS@ Read in the final optional argument:

```
1201 \def\@GLS@#1#2[#3] {%
1202 \glsdoifexists{#2}{\edef\@glo@type{\glsentrytype{#2}}}%
    Save options in \@gls@link@opts and label in \@gls@link@label
1203 \def\@gls@link@opts{#1}%
1204 \def\@gls@link@label{#2}%
    Determine what the link text should be (this is stored in \@glo@text).
1205 \ifglsused{#2}{\protected@edef\@glo@text{%
1206 \csname gls@\@glo@type @display\endcsname
1207 {\glsentrytext{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}}%
1208 \protected@edef\@glo@text{%
1209 \csname gls@\@glo@type @displayfirst\endcsname
1210 {\glsentryfirst{#2}}{\glsentrydesc{#2}}{\glsentrysymbol{#2}}{#3}}}%
    Call \@gls@link If footnote package option has been used, suppress hyperlink for
    first use.
```

```
1211 \ifglsused{#2}{%
1212   \@gls@link[#1]{#2}{\MakeUppercase{\@glo@text}}%
1213 }{%
1214   \ifthenelse{\equal{\@glo@type}{\acronymtype}}{\and
1215     \boolean{glsacrfootnote}}{%
1216     \@gls@link[#1,hyper=false]{#2}{\MakeUppercase{\@glo@text}}%
1217   }{%
1218     \@gls@link[#1]{#2}{\MakeUppercase{\@glo@text}}%
1219   }%
1220 }%
```

Indicate that this entry has now been used

```
1221 \glsunset{#2}}%
1222 }
```

\glspl behaves in the same way as \gls except it uses the plural form.

\glspl

```
1223 \newcommand*{\glspl}{\@ifstar\@sglspl\@glspl}
```

Define the starred form:

```
1224 \newcommand*{\sglsp1}[1] [] {\@glsp1[hyper=false,#1]}
```

Defined the un-starred form. Need to determine if there is a final optional argument

```
1225 \newcommand*{\@glsp1}[2] [] {%
```

```
1226 \new@ifnextchar [{\@glsp1@{#1}{#2}}{\@glsp1@{#1}{#2} []}]}
```

`\@glsp1@` Read in the final optional argument:

```
1227 \def\@glsp1@#1#2[#3] {%
```

```
1228 \glsdoifexists{#2}{\edef\@glo@type{\glstrytype{#2}}}%
```

Save options in `\@gls@link@opts` and label in `\@gls@link@label`

```
1229 \def\@gls@link@opts{#1}%
```

```
1230 \def\@gls@link@label{#2}%
```

Determine what the link text should be (this is stored in `\@glo@text`)

```
1231 \ifglsused{#2}{\protected@edef\@glo@text{%
```

```
1232 \csname gls@\@glo@type @display\endcsname
```

```
1233 {\glstryplural{#2}}{\glstrydescplural{#2}}}%
```

```
1234 \glstrysymbolplural{#2}{#3}}}%
```

```
1235 \protected@edef\@glo@text{%
```

```
1236 \csname gls@\@glo@type @displayfirst\endcsname

```

5.10.2 Displaying entry details without adding information to the glossary

These commands merely display entry information without adding entries in the associated file or having hyperlinks.

Get the entry name (as specified by the `name` key when the entry was defined). The argument is the label associated with the entry. Note that unless you used `name=false` in the `sanitize` package option you may get unexpected results if the `name` key contains any commands.

`\glsentryname`

```

1622 \newcommand*\glsentryname[1]{\csname glo@#1@name\endcsname}

```

`\Glsentryname`

```

1623 \newcommand*\Glsentryname[1]{%
1624 \protected@edef\glo@text{\csname glo@#1@name\endcsname}%
1625 \expandafter\makefirstuc\expandafter{\glo@text}}

```

Get the entry description (as specified by the `description` when the entry was defined). The argument is the label associated with the entry. Note that unless you used `description=false` in the `sanitize` package option you may get unexpected results if the `description` key contained any commands.

`\glentrydesc`

```
1626 \newcommand*{\glentrydesc}[1]{\csname glo@#1@desc\endcsname}
```

`\Glsentrydesc`

```
1627 \newcommand*{\Glsentrydesc}[1]{%
1628 \protected@edef\@glo@text{\csname glo@#1@desc\endcsname}%
1629 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Plural form:

`\glentrydescplural`

```
1630 \newcommand*{\glentrydescplural}[1]{%
1631 \csname glo@#1@descplural\endcsname}
```

`\Glsentrydescplural`

```
1632 \newcommand*{\Glsentrydescplural}[1]{%
1633 \protected@edef\@glo@text{\csname glo@#1@descplural\endcsname}%
1634 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Get the entry text, as specified by the `text` key when the entry was defined. The argument is the label associated with the entry:

`\glentrytext`

```
1635 \newcommand*{\glentrytext}[1]{\csname glo@#1@text\endcsname}
```

`\Glsentrytext`

```
1636 \newcommand*{\Glsentrytext}[1]{%
1637 \protected@edef\@glo@text{\csname glo@#1@text\endcsname}%
1638 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Get the plural form:

`\glentryplural`

```
1639 \newcommand*{\glentryplural}[1]{\csname glo@#1@plural\endcsname}
```

`\Glsentryplural`

```
1640 \newcommand*{\Glsentryplural}[1]{%
1641 \protected@edef\@glo@text{\csname glo@#1@plural\endcsname}%
1642 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Get the symbol associated with this entry. The argument is the label associated with the entry. Note that unless you used `symbol=false` in the `sanitize` package option you may get unexpected results if the `symbol` key contained any commands.

`\glentrysymbol`

```
1643 \newcommand*{\glentrysymbol}[1]{\csname glo@#1@symbol\endcsname}
```

`\Glsentrysymbol`

```
1644 \newcommand*{\Glsentrysymbol}[1]{%
1645 \protected@edef\@glo@text{\csname glo@#1@symbol\endcsname}%
1646 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Plural form:

`\glsentrysymbolplural`

```
1647 \newcommand*{\glsentrysymbolplural}[1]{%
1648 \csname glo@#1@symbolplural\endcsname}
```

`\Glsentrysymbolplural`

```
1649 \newcommand*{\Glsentrysymbolplural}[1]{%
1650 \protected@edef\@glo@text{\csname glo@#1@symbolplural\endcsname}%
1651 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Get the entry text to be used when the entry is first used in the document (as specified by the first key when the entry was defined).

`\glsentryfirst`

```
1652 \newcommand*{\glsentryfirst}[1]{\csname glo@#1@first\endcsname}
```

`\Glsentryfirst`

```
1653 \newcommand*{\Glsentryfirst}[1]{%
1654 \protected@edef\@glo@text{\csname glo@#1@first\endcsname}%
1655 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Get the plural form (as specified by the firstplural key when the entry was defined).

`\glsentryfirstplural`

```
1656 \newcommand*{\glsentryfirstplural}[1]{%
1657 \csname glo@#1@firstpl\endcsname}
```

`\Glsentryfirstplural`

```
1658 \newcommand*{\Glsentryfirstplural}[1]{%
1659 \protected@edef\@glo@text{\csname glo@#1@firstpl\endcsname}%
1660 \expandafter\makefirstuc\expandafter{\@glo@text}}
```

Display the glossary type with which this entry is associated (as specified by the type key used when the entry was defined)

`\glsentrytype`

```
1661 \newcommand*{\glsentrytype}[1]{\csname glo@#1@type\endcsname}
```

Display the sort text used for this entry. Note that the sort key is sanitize, so unexpected results may occur if the sort key contained commands.

`\glsentrysort`

```
1662 \newcommand*{\glsentrysort}[1]{\csname glo@#1@sort\endcsname}
```

`\glshyperlink` Provide a hyperlink to a glossary entry without adding information to the glossary file. The entry needs to be added using a command like `\glslink` or `\glsadd` to ensure that the target is defined. The first (optional) argument specifies the link text. The entry name is used by default. The second argument is the entry label.

```
1663 \newcommand*{\glshyperlink}[2][\glsentryname{\@glo@label}]{%
1664 \def\@glo@label{#2}}%
1665 \@glslink{glo:#2}{#1}}
```

5.11 Adding an entry to the glossary without generating text

The following keys are provided for `\glsadd` and `\glsaddall`:

```
1666 \define@key{glossadd}{counter}{\def\@glo@counter{#1}}
1667 \define@key{glossadd}{format}{\def\@glo@format{#1}}
```

This key is only used by `\glsaddall`:

```
1668 \define@key{glossadd}{types}{\def\@glo@type{#1}}
```

`\glsadd[<options>]{<label>}`

Add a term to the glossary without generating any link text. The optional argument indicates which counter to use, and how to format it (using a key-value list) the second argument is the entry label. Note that *<options>* only has two keys: `counter` and `format` (the `types` key will be ignored).

`\glsadd`

```
1669 \newcommand*{\glsadd}[2][{}]{%
1670 \glsdoifexists{#2}{%
1671 \def\@glsnumberformat{glsnumberformat}}%
1672 \edef\@gls@counter{\csname glo@#2@counter\endcsname}%
1673 \setkeys{glossadd}{#1}%
1674 \edef\theglentrycounter{\expandafter\noexpand
1675 \csname the\@gls@counter\endcsname}%
1676 \@do@wrglossary{#2}%
1677 }}
```

`\glsaddall[<glossary list>]`

Add all terms defined for the listed glossaries (without displaying any text). If `types` key is omitted, apply to all glossary types.

`\glsaddall`

```
1678 \newcommand*{\glsaddall}[1][{}]{%
1679 \edef\@glo@type{\@glo@types}%
1680 \setkeys{glossadd}{#1}%
1681 \forallglsentries[\@glo@type]{\@glo@entry}{%
1682 \glsadd{#1}{\@glo@entry}}%
1683 }
```

5.12 Creating associated files

The `\writeist` command creates the associated customized `.ist` `makeindex` style file. While defining this command, some characters have their catcodes temporarily changed to ensure they get written to the `.ist` file correctly. The `makeindex` actual character (usually `@`) is redefined to be a `?`, to allow internal commands to be written to the glossary file output file.

The special characters are stored in `\@gls@actualchar`, `\@gls@encapchar`, `\@gls@levelchar` and `\@gls@quotechar` to make them easier to use later, but don't change these values, because the characters are encoded in the command definitions that are used to escape the special characters (which means that the user no longer needs to worry about `makeindex` special characters).

The symbols and numbers label for group headings are hardwired into the `.ist` file as `glssymbols` and `glsnumbers`, the group titles can be translated (so that `\glssymbolsgroupname` replaces `glssymbols` and `\glsnumbersgroupname` replaces `glsnumbers`) using the command `\glssetgrouptitle` which is defined in `glossary-hypernav`. This is done to prevent any problem characters in `\glssymbolsgroupname` and `\glsnumbersgroupname` from breaking hyperlinks.

`\glsopenbrace` Define `\glsopenbrace` to make it easier to write an opening brace to a file.

```
1684 \edef\glsopenbrace{\expandafter\@gobble\string{}}
```

`\glsclosebrace` Define `\glsclosebrace` to make it easier to write an opening brace to a file.

```
1685 \edef\glsclosebrace{\expandafter\@gobble\string{}}
```

`\glsquote` Define command that makes it easier to write quote marks to a file in the event that the double quote character has been made active.

```
1686 \edef\glsquote#1{\string"#1\string"}
```

`\@glsfirstletter` Define the first letter to come after the digits 0,...,9. Only required for `xindy`.

```
1687 \ifglsxindy
1688   \newcommand*{\@glsfirstletter}{A}
1689 \fi
```

`\GlsSetXdyFirstLetterAfterDigits` Sets the first letter to come after the digits 0,...,9.

```
1690 \ifglsxindy
1691   \newcommand*{\GlsSetXdyFirstLetterAfterDigits}[1]{%
1692     \renewcommand*{\@glsfirstletter}{#1}}
1693 \else
1694   \newcommand*{\GlsSetXdyFirstLetterAfterDigits}[1]{%
1695     \glsnoxindywarning\GlsSetXdyFirstLetterAfterDigits}
1696 \fi
```

`\@glsminrange` Define the minimum number of successive location references to merge into a range.

```
1697 \newcommand*{\@glsminrange}{2}
```

`\GlsSetXdyMinRangeLength` Set the minimum range length. The value must either be `none` or a positive integer. The glossaries package doesn't check if the argument is valid, that is left to `xindy`.

```
1698 \ifglsxindy
1699   \newcommand*{\GlsSetXdyMinRangeLength}[1]{%
1700     \renewcommand*{\@glsminrange}{#1}}
```

```

1701 \else
1702   \newcommand*{\GlsSetXdyMinRangeLength}[1]{%
1703     \glsnoxindywarning\GlsSetXdyMinRangeLength}
1704 \fi

\writeist

1705 \newwrite\istfile
1706 \ifglxsindy
  Code to use if xindy is required.
1707   \def\writeist{%
    Open the style file

```

The command `\noist` will suppress the creation of the `.ist` file (it simply redefines `\writeist` to do nothing). Obviously you need to use this command before `\writeist` to have any effect. Since the `.ist` file should only be created once, `\noist` is called at the end of `\writeist`.

`\noist`

```
1904 \newcommand{\noist}{\let\writeist\relax}
```

`\@makeglossary` is an internal command that takes an argument indicating the glossary type. This command will create the glossary file required by `makeindex` for the given glossary type, using the extension supplied by the `<out-ext>` parameter used in `\newglossary` (and it will also activate the `\glossary` command, and create the customized `.ist` `makeindex` style file).

Note that you can't use `\@makeglossary` for only some of the defined glossaries. You either need to have a `\makeglossary` for all glossaries or none (otherwise you will end up with a situation where \TeX is trying to write to a non-existent file). The relevant glossary must be defined prior to using `\@makeglossary`.

`\@makeglossary`

```
1905 \newcommand*{\@makeglossary}[1]{%
1906 \ifglossaryexists{#1}{%
1907 \edef\glo@out{\csname @glo@type@#1@out\endcsname}%
1908 \expandafter\newwrite\csname glo@#1@file\endcsname
1909 \edef\@glo@file{\csname glo@#1@file\endcsname}%
1910 \immediate\openout\@glo@file=\jobname.\glo@out
1911 \@gls@renewglossary
1912 \PackageInfo{glossaries}{Writing glossary file \jobname.\glo@out}
1913 \writeist
1914 }{\PackageError{glossaries}{%
1915 Glossary type ‘#1’ not defined}{New glossaries must be defined before
1916 using \string\makeglossary}}}
```

`\warn@nomakeglossaries` Issue warning that `\makeglossaries` hasn't been used.

```
1917 \newcommand*{\warn@nomakeglossaries}{%
1918 \PackageWarningNoLine{glossaries}{\string\makeglossaries\space
1919 hasn't been used,^^Jthe glossaries will not be updated}%
1920 }
```

`\makeglossaries` will use `\@makeglossary` for each glossary type that has been defined. New glossaries need to be defined before using `\makeglossary`, so have `\makeglossaries` redefine `\newglossary` to prevent it being used afterwards.

`\makeglossaries`

```
1921 \newcommand*{\makeglossaries}{%
1922 % Write the name of the style file to the aux file
1923 % (needed by \appname{makeglossaries})
1924 % \begin{macrocode}
1925 \protected@write\@auxout{}{\string\@istfilename{\istfilename}}%
1926 \protected@write\@auxout{}{\string\@glsorder{\glsorder}}}
```

Iterate through each glossary type and activate it.

```
1927 \@for\@glo@type:=\@glo@types\do{%
1928 \ifthenelse{\equal{\@glo@type}{}}{}{%
1929 \@makeglossary{\@glo@type}}%
1930 }
```

New glossaries must be created before `\makeglossaries` so disable `\newglossary`.

```
1931 \renewcommand*{\newglossary}[4][]{%
1932 \PackageError{glossaries}{New glossaries
```

```

1933 must be created before \string\makeglossaries}{You need
1934 to move \string\makeglossaries\space after all your
1935 \string\newglossary\space commands}}%

Any subsequence instances of this command should have no effect
1936 \let\@makeglossary\relax
1937 \let\makeglossary\relax

1941 }

```

The `\makeglossary` command is redefined to be identical to `\makeglossaries`. (This is done to reinforce the message that you must either use `\@makeglossary` for all the glossaries or for none of them.)

`\makeglossary`

```

1942 \let\makeglossary\makeglossaries

If \makeglossaries hasn't been used, issue a warning. Also issue a warning
if neither \printglossaries nor \printglossary have been used.
1943 \AtEndDocument{%
1944   \warn@nomakeglossaries
1945   \warn@noprntglossary
1946 }

```

5.13 Writing information to associated files

The `\glossary` command is redefined so that it takes an optional argument *<type>* to specify the glossary type (use `\glsdefaulttype` glossary by default). This shouldn't be used at user level as `\glslink` sets the correct format. The associated number should be stored in `\theglsentrycounter` before using `\glossary`.

`\glossary`

```

1947 \renewcommand*{\glossary}[1][\glsdefaulttype]{%
1948 \@glossary[#1]}

```

Define internal `\@glossary` to ignore its argument. This gets redefined in `\@makeglossary`. This is defined to just `\index` as memoir changes the definition of `\@index`. (Thanks to Dan Luecking for pointing this out.)

`\@glossary`

```

1949 \def\@glossary[#1]{\index}

```

This is a convenience command to set `\@glossary`. It is used by `\@makeglossary` and then redefined to do nothing, as it only needs to be done once.

`@gls@renewglossary`

```

1950 \newcommand{\@gls@renewglossary}{%
1951 \gdef\@glossary[##1]{\@bsphack\begingroup\@wrglossary{##1}}%
1952 \let\@gls@renewglossary\@empty
1953 }

```

The `\wrglossary` command is redefined to have two arguments. The first argument is the glossary type, the second argument is the glossary entry (the format of which is set in `\glslink`).

```
\wrglossary
1954 \renewcommand*{\wrglossary}[2]{%
1955   \expandafter\protected@write\csname glo@#1@file\endcsname\{#2}%
1956   \endgroup\@esphack

5.15 Displaying the glossary

An individual glossary is displayed in the text using `\printglossary[<key-val list>]`. If the `type` key is omitted, the default glossary is displayed. The optional argument can be used to specify an alternative glossary, and can also be used to set the style, title and entry in the table of contents. Available keys are defined below.

`\warn@noprintglossary` Warn the user if they have forgotten `\printglossaries` or `\printglossary`. (Will be suppressed if there is at least one occurrence of `\printglossary`. There is no check to ensure that there is a `\printglossary` for each defined glossary.)

```

2037 \def\warn@noprintglossary{\PackageWarningNoLine{glossaries}{No
2038 \string\printglossary\space or \string\printglossaries\space
2039 found.^^JThis document will not have a glossary.}}

```

`\printglossary` The TOC title needs to be processed in a different manner to the main title in case the `translator` and `hyperref` packages are both being used.

```
2040 \@ifundefined{printglossary}{\%
```

2074 }
```

The `\printglossaries` command will do `\printglossary` for each glossary type that has been defined. It is better to use `\printglossaries` rather than individual `\printglossary` commands to ensure that you don't forget any new glossaries you may have created. It also makes it easier to chop and change the value of the `acronym` package option. However, if you want to list the glossaries in a different order, or if you want to set the title or table of contents entry, or if you want to use different glossary styles for each glossary, you will need to use `\printglossary` explicitly for each glossary type.

`\printglossaries`

```
2075 \newcommand*\printglossaries}{%
2076 \forallglossaries{\@glo@type}{\printglossary[type=\@glo@type]}}
```

The keys that can be used in the optional argument to `\printglossary` are as follows: The `type` key sets the glossary type.

```
2077 \define@key{printgloss}{type}{\def\@glo@type{#1}}
```

The `title` key sets the title used in the glossary section header. This overrides the title used in `\newglossary`.

```
2078 \define@key{printgloss}{title}{\def\glossarytitle{#1}}
```

The `toctitle` sets the text used for the relevant entry in the table of contents.

```
2079 \define@key{printgloss}{toctitle}{\def\glossarytoctitle{#1}%
```

```
2080 \let\gls@dotoc@title\relax
```

```
2081 }
```

The `style` key sets the glossary style (but only for the given glossary).

```
2082 \define@key{printgloss}{style}{%
```

```
2083 \@ifundefined{glsstyle@#1}{\PackageError{glossaries}{Glossary
```

```
2084 style ‘#1’ undefined}{}}{%

```

`\@glsnonextpages` Suppresses the next number list only. Global assignments required as it may not occur in the same level of grouping as the next numberlist. (For example, if `\glsnonextpages` is place in the entry’s description and 3 column tabular style glossary is used.) `\org@glossaryentrynumbers` needs to be set at the start of each glossary, in the event that `\glossaryentrynumber` is redefined.

```

2104 \newcommand*{\@glsnonextpages}{%
2105   \gdef\glossaryentrynumbers##1{%
2106     \glsresetentrylist}}

```

`\glsresetentrylist` Resets `\glossaryentrynumbers`

```

2107 \newcommand*{\glsresetentrylist}{%
2108   \global\let\glossaryentrynumbers\org@glossaryentrynumbers}

```

`\glsnonextpages` Outside of `\printglossary` this does nothing.

```

2109 \newcommand*{\glsnonextpages}{}

```

`theglossary` If the `theglossary` environment has already been defined, a warning will be issued. This environment should be redefined by glossary styles.

```

2110 \@ifundefined{theglossary}{%
2111   \newenvironment{theglossary}{}{}}{%
2112   \PackageWarning{glossaries}{overriding ‘theglossary’ environment}%
2113   \renewenvironment{theglossary}{}{}}

```

The glossary header is given by `\glossaryheader`. This forms part of the glossary style, and must indicate what should appear immediately after the start of the `theglossary` environment. (For example, if the glossary uses a tabular-like environment, it may be used to set the header row.) Note that if you don’t want a header row, the glossary style must redefine `\glossaryheader` to do nothing.

`\glossaryheader`

```

2114 \newcommand*{\glossaryheader}{}

```

`\glstarget` `\glstarget{<label>}{<name>}`

Provide user interface to `\@glstarget` to make it easier to modify the glossary style in the document.

```

2115 \newcommand*{\glstarget}[2]{\@glstarget{glo:#1}{#2}}

```

`\glossaryentryfield` `\glossaryentryfield{<label>}{<name>}{<description>}{<symbol>}{<page-list>}`

This command governs how each entry row should be formatted in the glossary. Glossary styles need to redefine this command. Most of the predefined styles ignore `<symbol>`.

```

2116 \newcommand*{\glossaryentryfield}[5]{%
2117   \noindent\textbf{\glstarget{#1}{#2}} #4 #3. #5\par}

```

`\glossaryentryfield` `\glossarysubentryfield{<level>}{<label>}{<name>}{<description>}{<symbol>}{<page-list>}`

This command governs how each subentry should be formatted in the glossary.

Glossary styles need to redefine this command. Most of the predefined styles ignore *<symbol>*. The first argument is a number indicating the level. (The level should be greater than or equal to 1.)

```
2118 \newcommand*{\glossarysubentryfield}[6]{%
2119 \glstarget{#2}{\strut}#4. #6\par}
```

Within each glossary, the entries form distinct groups which are determined by the first character of the `sort` key. When using `makeindex`, there will be a maximum of 28 groups: symbols, numbers, and the 26 alphabetical groups A, ..., Z. If you use `xindy` the groups will depend on whatever alphabet is used. This is determined by the language or custom alphabets can be created in the `xindy` style file. The command `\glsgroupskip` specifies what to do between glossary groups. Glossary styles must redefine this command. (Note that `\glsgroupskip` only occurs between groups, not at the start or end of the glossary.)

`\glsgroupskip`

```
2120 \newcommand*{\glsgroupskip}{}%
```

Each of the 28 glossary groups described above is preceded by a group heading. This is formatted by the command `\glsgroupheading` which takes one argument which is the *label* assigned to that group (not the title). The corresponding labels are: `glssymbols`, `glsnumbers`, A, ..., Z. Glossary styles must redefine this command. (In between groups, `\glsgroupheading` comes immediately after `\glsgroupskip`.)

`\glsgroupheading`

```
2121 \newcommand*{\glsgroupheading}[1]{}%
```

It is possible to “trick” `makeindex` into treating entries as though they belong to the same group, even if the terms don’t start with the same letter, by modifying the `sort` key. For example, all entries belonging to one group could be defined so that the `sort` key starts with an `a`, while entries belonging to another group could be defined so that the `sort` key starts with a `b`, and so on. If you want each group to have a heading, you would then need to modify the translation control sequences `\glsetgrouptitle` and `\glsetgrouplabel` so that the label is translated into the required title (and vice-versa).

```
\glsetgrouptitle{<label>}
```

This command produces the title for the glossary group whose label is given by *<label>*. By default, the group labelled `glssymbols` produces `\glssymbolsgroupname`, the group labelled `glsnumbers` produces `\glsnumbersgroupname` and all the other groups simply produce their label. As mentioned above, the group labels are: `glssymbols`, `glsnumbers`, A, ..., Z. If you want to redefine the group titles, you will need to redefine this command.

`\glsetgrouptitle`

```
2122 \newcommand*{\glsetgrouptitle}[1]{}%
2123 \@ifundefined{#1groupname}{#1}{\csname #1groupname\endcsname}
```

```
\glsetgrouplabel{<title>}
```

This command does the reverse to the previous command. The argument is

the group title, and it produces the group label. Note that if you redefine `\glsgetgrouptitle`, you will also need to redefine `\glsgetgrouplabel`.

`\glsgetgrouplabel`

```
2124 \newcommand*\glsgetgrouplabel}[1]{%
2125 \ifthenelse{\equals{#1}{\glssymbolsgroupname}}{\glssymbols}{%
2126 \ifthenelse{\equals{#1}{\glsnumbersgroupname}}{\glsnumbers}{#1}}}
```

The command `\setentrycounter` sets the entry’s associated counter (required by `\glshypernumber` etc.) `\glslink` and `\glsadd` encode the `\glossary` argument so that the relevant counter is set prior to the formatting command.

`\setentrycounter`

```
2127 \newcommand*\setentrycounter}[1]{\def\glsetentrycounter{#1}}
```

The current glossary style can be set using `\glossarystyle{<style>}`.

`\glossarystyle`

```
2128 \newcommand*\glossarystyle}[1]{%
2129 \@ifundefined{@glsstyle@#1}{\PackageError{glossaries}{Glossary
2130 style ‘#1’ undefined}{}}{%
2131 \csname @glsstyle@#1\endcsname}}
```

`\newglossarystyle` New glossary styles can be defined using:

`\newglossarystyle{<name>}{<definition>}`

The `<definition>` argument should redefine `\theglossary`, `\glossaryheader`, `\glsgroupheading`, `\glossaryentryfield` and `\glsgroupskip` (see [subsection 5.18](#) for the definitions of predefined styles). Glossary styles should not redefine `\glossarypreamble` and `\glossarypostamble`, as the user should be able to switch between styles without affecting the pre- and postambles.

```
2132 \newcommand{\newglossarystyle}[2]{%
2133 \@ifundefined{@glsstyle@#1}{%
2134 \expandafter\def\csname @glsstyle@#1\endcsname{#2}}{%
2135 \PackageError{glossaries}{Glossary style ‘#1’ is already defined}{}}
```

Glossary entries are encoded so that the second argument to `\glossaryentryfield` is always specified as `\glsnamefont{<name>}`. This allows the user to change the font used to display the name term without having to redefine `\glossaryentryfield`. The default uses the surrounding font, so in the list type styles (which place the name in the optional argument to `\item`) the name will appear in bold.

`\glsnamefont`

```
2136 \newcommand*\glsnamefont}[1]{#1}
```

Each glossary entry has an associated number list (usually page numbers) that indicate where in the document the entry has been used. The format for these number lists can be changed using the `format` key in commands like `\glslink`. The default format is given by `\glshypernumber`. This takes a single argument which may be a single number, a number range or a number list. The number ranges are delimited with `\delimR`, the number lists are delimited with `\delimN`.

If the document doesn’t have hyperlinks, the numbers can be displayed just as they are, but if the document supports hyperlinks, the numbers should link to the

relevant location. This means extracting the individual numbers from the list or ranges. The `hyperref` package does this with the `\hyperpage` command, but this is encoded for comma and dash delimiters and only for the page counter, but this code needs to be more general. So I have adapted the code used in the `hyperref` package.

`\glshypernumber`

```
2137 \ifundefined{hyperlink}{%
2138 \def\glshypernumber#1{#1}}{%
2139 \def\glshypernumber#1{%
2140 \@glshypernumber#1\nohyperpage{}\@nil}}
```

`\@glshypernumber` This code was provided by Heiko Oberdiek to allow material to be attached to the location.

```
2141 \def\@glshypernumber#1\nohyperpage#2#3\@nil{%
2142 \ifx\#1\%
2143 \else
2144 \@delimR#1\delimR\delimR\%
2145 \fi
2146 \ifx\#2\%
2147 \else
2148 #2%
2149 \fi
2150 \ifx\#3\%
2151 \else
2152 \@glshypernumber#3\@nil
2153 \fi
2154 }
```

`\@delimR` displays a range of numbers for the counter whose name is given by `\@gls@counter` (which must be set prior to using `\glshypernumber`).

`\@delimR`

```
2155 \def\@delimR#1\delimR #2\delimR #3\%{
2156 \ifx\#2\%
2157 \@delimN{#1}%
2158 \else
2159 \@gls@numberlink{#1}\delimR\@gls@numberlink{#2}%
2160 \fi}
```

`\@delimN` displays a list of individual numbers, instead of a range:

`\@delimN`

```
2161 \def\@delimN#1{\@delimN#1\delimN \delimN\}
2162 \def\@delimN#1\delimN #2\delimN#3\%{
2163 \ifx\#3\%
2164 \@gls@numberlink{#1}%
2165 \else
2166 \@gls@numberlink{#1}\delimN\@gls@numberlink{#2}%
2167 \fi
2168 }
```

The following code is modified from `hyperref`'s `\HyInd@pagelink` where the name of the counter being used is given by `\@gls@counter`.

```

2169 \def\@gls@numberlink#1{%
2170 \begingroup
2171 \toks@={}%
2172 \@gls@removespaces#1 \@nil
2173 \endgroup}

2174 \def\@gls@removespaces#1 #2\@nil{%
2175 \toks@=\expandafter{\the\toks@#1}%
2176 \ifx\\#2\\%
2177 \edef\x{\the\toks@}%
2178 \ifx\x\empty
2179 \else
2180 \hyperlink{\glsentrycounter.\the\toks@}{\the\toks@}%
2181 \fi
2182 \else
2183 \@gls@ReturnAfterFi{%
2184 \@gls@removespaces#2\@nil
2185 }%
2186 \fi
2187 }
2188 \long\def\@gls@ReturnAfterFi#1\fi{\fi#1}

```

The following commands will switch to the appropriate font, and create a hyperlink, if hyperlinks are supported. If hyperlinks are not supported, they will just display their argument in the appropriate font.

```

\hyperrm

\hyperemph
2198 \newcommand*\hyperemph[1]{\emph{\glshypernumber{#1}}}

```

5.16 Acronyms

If the acronym package option is used, a new glossary called `acronym` is created

```
2199 \ifglacronym
2200   \newglossary[alg]{acronym}{acr}{acn}{\acronymname}
      and \acronymtype is set to the name of this new glossary.
2201   \renewcommand{\acronymtype}{acronym}
```

In the event that the user redefines `\glsdisplay` and `\glsdisplayfirst`, the relevant commands for the new acronym glossary are set to match the format given by `\newacronym`. If you redefine `\newacronym` you may need to set these to something else.

```
2202   \defglsdisplay[acronym]{#1#4}
2203   \defglsdisplayfirst[acronym]{#1#4}
2204 \fi
```

```
\newacronym[⟨key-val list⟩]{⟨label⟩}{⟨abbrev⟩}{⟨long⟩}
```

This is a quick way of defining acronyms, all it does is call `\newglossaryentry` with the appropriate values. It sets the glossary type to `\acronymtype` which will be `acronym` if the package option `acronym` has been used, otherwise it will be the default glossary. Since `\newacronym` merely calls `\newglossaryentry`, the acronym is treated like any other glossary entry.

If you prefer a different format, you can redefine `\newacronym` as required. The optional argument can be used to override any of the settings.

`\newacronym`

```
2205 \newcommand{\newacronym}[4][{}]{%
2206   \newglossaryentry{#2}{type=\acronymtype,%
2207     name={#3},description={#4},text={#3},%
2208     descriptionplural={#4\acrpluralsuffix},%
2209     first={#4 (#3)},plural={#3\acrpluralsuffix},%
2210     firstplural={\@glo@descplural\space (\@glo@plural)},%
2211     #1}}
```

`\oldacronym` `\oldacronym[⟨label⟩]{⟨abbrev⟩}{⟨long⟩}{⟨key-val list⟩}`

This emulates the way the old `glossary` package defined acronyms. It is equivalent to `\newacronym[⟨key-val list⟩]{⟨label⟩}{⟨abbrev⟩}{⟨long⟩}` and it additionally defines the command `\⟨label⟩` which is equivalent to `\gls{⟨label⟩}` (thus `⟨label⟩` must only contain alphabetical characters). If `⟨label⟩` is omitted, `⟨abbrev⟩` is used. This only emulates the syntax of the old `glossary` package. The way the acronyms appear in the list of acronyms is determined by the definition of `\newacronym` and the glossary style.

Note that `\⟨label⟩` can't have an optional argument if the `xspace` package is loaded. If `xspace` hasn't been loaded then you can do `\⟨label⟩[⟨insert⟩]` but you can't do `\⟨label⟩[⟨key-val list⟩]`. For example if you define the acronym `svm`, then you can do `\svm['s]` but you can't do `\svm[format=textbf]`. If the `xspace` package is loaded, `\svm['s]` will appear as `svm ['s]` which is unlikely to be the desired result. In this case, you will need to use `\gls` explicitly, e.g. `\gls{svm}['s]`. Note that it is up to the user to load `xspace` if desired.

```
2212 \newcommand{\oldacronym}[4][\gls@label]{%
```

```

2213 \def\gls@label{#2}%
2214 \newacronym[#4]{#1}{#2}{#3}%
2215 \@ifundefined{xspace}{%
2216   \expandafter\edef\csname#1\endcsname{%
2217     \noexpand\@ifstar{\noexpand\Gls{#1}}{\noexpand\gls{#1}}}%
2218   }{%
2219     \expandafter\edef\csname#1\endcsname{%
2220       \noexpand\@ifstar{\noexpand\Gls{#1}\noexpand\xspace}{%
2221         \noexpand\gls{#1}\noexpand\xspace}}%
2222     }%
2223 }

```

Set up some convenient short cuts. These need to be changed if `\newacronym` is changed (or if the `description` key is changed).

`\acrpluralsuffix` Plural suffix used by `\newacronym`. This just defaults to `\glspluralsuffix` but is changed to include `\textup` if the `smallcaps` option is used, so that the suffix doesn't appear in small caps as it doesn't look right. For example, ABCS looks as though the "s" is part of the acronym, but ABCs looks as though the "s" is a plural suffix. Since the entire text `abcs` is set in `\textsc`, `\textup` is needed to cancel it out.

```
2224 \newcommand*{\acrpluralsuffix}{\glspluralsuffix}
```

Make a note of the keys that are used to store the long and short forms:

`\glsshortkey`

```
2225 \newcommand*{\glsshortkey}{text}
```

`\glsshortpluralkey`

```
2226 \newcommand*{\glsshortpluralkey}{plural}

5.17 Additional predefined acronym styles

`\acronymfont` This is only used with the additional acronym styles:

```
2283 \newcommand{\acronymfont}[1]{#1}
```

`\firstacronymfont` This is only used with the additional acronym styles:

```
2284 \newcommand{\firstacronymfont}[1]{\acronymfont{#1}}
```

`\acrnameformat` The styles that allow an additional description use `\acrnameformat{<short>}{<long>}` to determine what information is displayed in the name.

```
2285 \newcommand*{\acrnameformat}[2]{\acronymfont{#1}}
```

```
2286 \ifglsacrdescription
```

If a description and footnote are both required, store the long form in the symbol key. Store the short form in text key. Note that since the long form is stored in the symbol key, if you want the long form to appear in the list of acronyms, you need to use a glossary style that displays the symbol key.

```

2287 \ifglsacrfootnote
2288 \renewcommand{\newacronym}[4] [] {%
2289 \newglossaryentry{#2}{type=\acronymtype,%

```

```

5.18 Predefined Glossary Styles

The glossaries bundle comes with some predefined glossary styles. These need to be loaded now for the `style` option to use them.

First, the glossary hyper-navigation commands need to be loaded.

```
2630 \RequirePackage{glossary-hypernav}
```

The styles that use list-like environments. These are not loaded if the `nolist` option is used:

```
2631 \@gls@loadlist
```

The styles that use the `longtable` environment. These are not loaded if the `nolong` package option is used.

```
2632 \@gls@loadlong
```

The styles that use the `supertabular` environment. These are not loaded if the `nosuper` package option is used or if the `supertabular` package isn't installed.

```
2633 \@gls@loadsuper
```

The tree-like styles. These are not loaded if the `notree` package option is used.

```
2634 \@gls@loadtree
```

The default glossary style is set according to the `style` package option, but can be overridden by `\glossarystyle`. The style must be defined at this point.

```
2635 \ifx\@glossary@default@style\relax
2636 \else
2637 \glossarystyle{\@glossary@default@style}
2638 \fi
```

6 Mfirstuc Documented Code

```

2639 \NeedsTeXFormat{LaTeX2e}
2640 \ProvidesPackage{mfirstuc}[2008/12/22 v1.03 (NLCT)]

\makefirstuc Syntax:
\makefirstuc{<text>}
Makes the first letter uppercase, but will skip initial control sequences if they
are followed by a group and make the first thing in the group uppercase,
unless the group is empty. Thus \makefirstuc{abc} will produce: Abc,
\makefirstuc{\ae bc} will produce: Æbc, but \makefirstuc{\emph{abc}} will
produce Abc. This is required by \Gls and \Glspl.

2641 \newif\if@glscs
2642 \def\makefirstuc#1{%
2643 \def\gls@argi{#1}%
2644 \ifx\gls@argi\@empty
2645 \else

2646 \def\@gls@tmp{\ #1}%
2647 \@onelevel@sanitize\@gls@tmp
2648 \expandafter\@gls@checkcs\@gls@tmp\relax\relax
2649 \if@glscs
2650 \@gls@getbody #1{\@nil
2651 \ifx\@gls@rest\@empty
2652 \@gls@makefirstuc{#1}%
2653 \else
2654 \expandafter\@gls@split\@gls@rest\@nil
2655 \ifx\@gls@first\@empty
2656 \@gls@makefirstuc{#1}%
2657 \else
2658 \@gls@body{\expandafter\@gls@makefirstuc\@gls@first}\@gls@rest%
2659 \fi
2660 \fi
2661 \else
2662 \@gls@makefirstuc{#1}%
2663 \fi
2664 \fi
2665 }

```

Put first argument in \@gls@first and second argument in \@gls@rest:

```

2666 \def\@gls@split#1#2\@nil{\def\@gls@first{#1}\def\@gls@rest{#2}}
2667 \def\@gls@checkcs#1 #2#3\relax{%
2668 \def\@gls@argi{#1}\def\@gls@argii{#2}%
2669 \ifx\@gls@argi\@gls@argii
2670 \@glscstrue
2671 \else
2672 \@glscsfalse
2673 \fi
2674 }

```

Make first thing upper case:

```

2675 \def\@gls@makefirstuc#1{\MakeUppercase #1}

Get the first grouped argument and stores in \@gls@body.
2676 \def\@gls@getbody#1#{\def\@gls@body{#1}\@gls@gobbletonil}

```

Scoup up everything to \@nil and store in \@gls@rest:

```
2677 \def\@gls@gobbletonil#1\@nil{\def\@gls@rest{#1}}
```

\xmakefirstuc Expand argument once before applying \makefirstuc (added v1.01).

```
2678 \newcommand*\xmakefirstuc[1]{%
```

```
2679 \expandafter\makefirstuc\expandafter{#1}}
```

7 Glossary Styles

7.1 Glossary hyper-navigation definitions (glossary-hypernav package)

Package Definition:

```
2680 \ProvidesPackage{glossary-hypernav}[2007/07/04 v1.01 (NLCT)]
```

The commands defined in this package are provided to help navigate around the groups within a glossary (see [subsection 5.15.](#)) \printglossary (and \printglossaries) set \@glo@type to the label of the current glossary. This is used to create a unique hypertarget in the event of multiple glossaries.

```
\glsnavhyperlink[⟨type⟩]{⟨label⟩}{⟨text⟩}
```

This command makes ⟨text⟩ a hyperlink to the glossary group whose label is given by ⟨label⟩ for the glossary given by ⟨type⟩.

\glsnavhyperlink

```
2681 \newcommand*\glsnavhyperlink[3][\@glo@type]{%
```

```
2682 \edef\gls@grplabel{#2}\protected@edef\@gls@grptitle{#3}%
```

```
2683 \@glslink{glsn:#1@#2}{#3}}
```

```
\glsnavhypertarget[⟨type⟩]{⟨label⟩}{⟨text⟩}
```

This command makes ⟨text⟩ a hypertarget for the glossary group whose label is given by ⟨label⟩ in the glossary given by ⟨type⟩. If ⟨type⟩ is omitted, \@glo@type is used which is set by \printglossary to the current glossary label.

\glsnavhypertarget

```
2684 \newcommand*\glsnavhypertarget[3][\@glo@type]{%
```

Add this group to the aux file for re-run check.

```
2685 \protected@write\@auxout{}\string\@gls@hypergroup{#1}{#2}}%
```

Add the target.

```
2686 \@gls@target{glsn:#1@#2}{#3}%
```

Check list of know groups to determine if a re-run is required.

```
2687 \expandafter\let
```

```
2688 \expandafter\@gls@list\csname @gls@hypergroup@#1\endcsname
```

Iterate through list and terminate loop if this group is found.

```
2689 \@for\@gls@elem:=\@gls@list\do{%
```

```
2690 \ifthenelse{\equal{\@gls@elem}{#2}}{\@endfortrue}{}}}
```

Check if list terminated prematurely.

```

2691 \if@endfor
2692 \else
    This group was not included in the list, so issue a warning.
2693 \PackageWarningNoLine{glossaries}{Navigation panel
2694     for glossary type '#1'^^Jmissing group '#2'}%
2695 \gdef\gls@hypergroupprerun{%
2696     \PackageWarningNoLine{glossaries}{Navigation panel
2697     has changed. Rerun LaTeX}}%
2698 \fi
2699 }

```

`\gls@hypergroupprerun` Give a warning at the end if re-run required

```

2700 \let\gls@hypergroupprerun\relax
2701 \AtEndDocument{\gls@hypergroupprerun}

```

`\@gls@hypergroup` This adds to (or creates) the command `\@gls@hypergrouplist@<glossary type>` which lists all groups for a given glossary, so that the navigation bar only contains those groups that are present. However it requires at least 2 runs to ensure the information is up-to-date.

```

2702 \newcommand*{\@gls@hypergroup}[2]{%
2703 \ifundefined{\@gls@hypergrouplist@#1}{%
2704     \expandafter\xdef\csname @gls@hypergrouplist@#1\endcsname{#2}%
2705 }{%
2706     \expandafter\let\expandafter\@gls@tmp
2707         \csname @gls@hypergrouplist@#1\endcsname
2708     \expandafter\xdef\csname @gls@hypergrouplist@#1\endcsname{%
2709         \@gls@tmp,#2}%
2710 }%
2711 }

```

The `\glsnavigation` command displays a simple glossary group navigation. The symbol and number elements are defined separately, so that they can be suppressed if need be. Note that this command will produce a link to all 28 groups, but some groups may not be defined if there are groups that do not contain any terms, in which case you will get an undefined hyperlink warning. Now for the whole navigation bit:

`\glsnavigation`

```

2712 \newcommand*{\glsnavigation}{%
2713 \def\@gls@between{%
2714 \@ifundefined{\@gls@hypergrouplist@\@glo@type}{%
2715     \def\@gls@list{%
2716 }{%
2717     \expandafter\let\expandafter\@gls@list
2718         \csname @gls@hypergrouplist@\@glo@type\endcsname
2719 }%
2720 \@for\@gls@tmp:=\@gls@list\do{%
2721     \@gls@between
2722     \glsnavhyperlink{\@gls@tmp}{\glsgetgrouptitle{\@gls@tmp}}%
2723     \let\@gls@between\glshypernavsep%
2724 }%
2725 }

```

`\glshypernavsep` Separator for the hyper navigation bar.

```
2726 \newcommand*{\glshypernavsep}{\space\textbar\space}
```

The `\glssymbolnav` produces a simple navigation set of links for just the symbol and number groups. This used to be used at the start of `\glsnavigation`. This command is no longer needed.

`\glssymbolnav`

```
2727 \newcommand*{\glssymbolnav}{%
2728 \glsnavhyperlink{glssymbols}{\glsgroup{title{glssymbols}}}%
2729 \glshypernavsep
2730 \glsnavhyperlink{glsnumbers}{\glsgroup{title{glsnumbers}}}%
2731 \glshypernavsep
2732 }
```

7.2 List Style (glossary-list.sty)

The `glossary-list` style file defines glossary styles that use the `description` environment. Note that since the entry name is placed in the optional argument to the `\item` command, it will appear in a bold font by default.

```
2733 \ProvidesPackage{glossary-list}[2009/01/14 v1.05 (NLCT)]
```

list The `list` glossary style uses the `description` environment. The group separator `\glsgroupskip` is redefined as `\indexspace` which produces a gap between groups. The glossary heading and the group headings do nothing. Sub-entries immediately follow the main entry without the sub-entry name. This style does not use the entry's symbol. This is used as the default style for the `glossaries` package.

```
2734 \newglossarystyle{list}{%
```

Use `description` environment:

```
2735 \renewenvironment{theglossary}%
2736 {\begin{description}}{\end{description}}%
```

No header at the start of the environment:

```
2737 \renewcommand*{\glossaryheader}{}%
```

No group headings:

```
2738 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries start a new item in the list:

```
2739 \renewcommand*{\glossaryentryfield}[5]{%
2740 \item[\glstarget{##1}{##2}] ##3\glspostdescription\space ##5}%
```

Sub-entries continue on the same line:

```
2741 \renewcommand*{\glossarysubentryfield}[6]{%
2742 \glstarget{##2}{\strut}##4\glspostdescription\space ##6.}%
2743 % \end{macrocode}
2744 % Add vertical space between groups:
2745 % \begin{macrocode}
2746 \renewcommand*{\glsgroupskip}{\indexspace}%
2747 }
```

listgroup The `listgroup` style is like the `list` style, but the glossary groups have headings.

```
2748 \newglossarystyle{listgroup}{%
```

Base it on the list style:

```
2749 \glossarystyle{list}%
```

Each group has a heading:

```
2750 \renewcommand*{\glsgroupheading}[1]{\item[\glsgetgrouptitle{##1}]}
```

listhypergroup The `listhypergroup` style is like the `listgroup` style, but has a set of links to the groups at the start of the glossary.

```
2751 \newglossarystyle{listhypergroup}{%
```

Base it on the list style:

```
2752 \glossarystyle{list}%
```

Add navigation links at the start of the environment:

```
2753 \renewcommand*{\glossaryheader}{%
2754 \item[\glsnavigation]}%
```

Each group has a heading with a hypertext:

```
2755 \renewcommand*{\glsgroupheading}[1]{%
2756 \item[\glsnavhypertarget{##1}{\glsgetgrouptitle{##1}}]}
```

altlist The `altlist` glossary style is like the `list` style, but places the description on a new line. Sub-entries follow in separate paragraphs without the sub-entry name. This style does not use the entry's symbol.

```
2757 \newglossarystyle{altlist}{%
```

Base it on the list style:

```
2758 \glossarystyle{list}%
```

Main (level 0) entries start a new item in the list with a line break after the entry name:

```
2759 \renewcommand*{\glossaryentryfield}[5]{%
2760 \item[\glstarget{##1}{##2}]{\mbox{}\\newline
2761 ##3\glspostdescription\space ##5}%
```

Sub-entries start a new paragraph:

```
2762 \renewcommand*{\glossarysubentryfield}[6]{%
2763 \par\glstarget{##2}{\strut}##4\glspostdescription\space ##6}%
2764 }
```

altlistgroup The `altlistgroup` glossary style is like the `altlist` style, but the glossary groups have headings.

```
2765 \newglossarystyle{altlistgroup}{%
```

Base it on the `altlist` style:

```
2766 \glossarystyle{altlist}%
```

Each group has a heading:

```
2767 \renewcommand*{\glsgroupheading}[1]{\item[\glsgetgrouptitle{##1}]}
```

altlisthypergroup The `altlisthypergroup` glossary style is like the `altlistgroup` style, but has a set of links to the groups at the start of the glossary.

```
2768 \newglossarystyle{altlisthypergroup}{%
```

Base it on the `altlist` style:

```
2769 \glossarystyle{altlist}%
```

Add navigation links at the start of the environment:

```
2770 \renewcommand*{\glossaryheader}{%
2771 \item[\glsnavigation]}%
```

Each group has a heading with a hypertarget:

```
2772 \renewcommand*{\glsgroupheading}[1]{%
2773 \item[\glsnavhypertarget{##1}{\glsgetgrouptitle{##1}}]}
```

listdotted The `listdotted` glossary style was supplied by Axel Menzel. I've modified it slightly so that the distance from the start of the name to the end of the dotted line is specified by `\glslistdottedwidth`. Note that this style ignores the page numbers as well as the symbol. Sub-entries are displayed in the same way as top-level entries.

```
2774 \newglossarystyle{listdotted}{%
```

Base it on the list style:

```
2775 \glossarystyle{list}%
```

Each main (level 0) entry starts a new item:

```
2776 \renewcommand*{\glossaryentryfield}[5]{%
2777 \item[]\makebox[\glslistdottedwidth][l]{\glstarget{##1}{##2}%
2778 \unskip\leaders\hbox to 2.9mm{\hss.}\hfill\strut}##3}%
```

Sub entries have the same format as main entries:

```
2779 \renewcommand*{\glossarysubentryfield}[6]{%
2780 \item[]\makebox[\glslistdottedwidth][l]{\glstarget{##2}{##3}%
2781 \unskip\leaders\hbox to 2.9mm{\hss.}\hfill\strut}##4}%
2782 }
```

`\glslistdottedwidth`

```
2783 \newlength\glslistdottedwidth
2784 \setlength{\glslistdottedwidth}{.5\linewidth}
```

sublistdotted This style is similar to the `glostylelistdotted` style, except that the main entries just have the name displayed.

```
2785 \newglossarystyle{sublistdotted}{%
```

Base it on the `listdotted` style:

```
2786 \glossarystyle{listdotted}%
```

Main (level 0) entries just display the name:

```
2787 \renewcommand*{\glossaryentryfield}[5]{%
2788 \item[\glstarget{##1}{##2}]}%
2789 }
```

7.3 Glossary Styles using `longtable` (the `glossary-long` package)

The glossary styles defined in the `glossary-long` package used the `longtable` environment in the glossary.

```
2790 \ProvidesPackage{glossary-long}[2009/01/14 v1.03 (NLCT)]
```

Requires the `longtable` package:

```
2791 \RequirePackage{longtable}
```

`\glsdescwidth` This is a length that governs the width of the description column. (There's a chance that the user may specify `nolong` and then load `glossary-long` later, in which case `\glsdescwidth` may have already been defined by `glossary-super`. The same goes for `\glspagelistwidth`.)

```
2792 \@ifundefined{glsdescwidth}{%
2793   \newlength{glsdescwidth
2794   \setlength{glsdescwidth}{0.6\linewidth}
2795 }{}
```

`\glspagelistwidth` This is a length that governs the width of the page list column.

```
2796 \@ifundefined{glspagelistwidth}{%
2797   \newlength{glspagelistwidth
2798   \setlength{glspagelistwidth}{0.1\linewidth}
2799 }{}
```

`long` The long glossary style command which uses the `longtable` environment:

```
2800 \newglossarystyle{long}{%
    Use longtable with two columns:
2801   \renewenvironment{theglossary}%
2802     {\begin{longtable}{lp{glsdescwidth}}}%
2803     {\end{longtable}}%
    Do nothing at the start of the environment:
2804   \renewcommand*{\glossaryheader}{}%
    No heading between groups:
2805   \renewcommand*{\glsgroupheading}[1]{}%
    Main (level 0) entries displayed in a row:
2806   \renewcommand*{\glossaryentryfield}[5]{%
2807     \glstarget{##1}{##2} & ##3\glspostdescription\space ##5\\}%
    Sub entries displayed on the following row without the name:
2808   \renewcommand*{\glossarysubentryfield}[6]{%
2809     & \glstarget{##2}{\strut}##4\glspostdescription\space ##6\\}%
    Blank row between groups:
2810   \renewcommand*{\glsgroupskip}{ & \\}%
2811 }
```

`longborder` The `longborder` style is like the above, but with horizontal and vertical lines:

```
2812 \newglossarystyle{longborder}{%
    Base it on the glostylelong style:
2813   \glossarystyle{long}%
    Use longtable with two columns with vertical lines between each column:
2814   \renewenvironment{theglossary}{%
2815     \begin{longtable}{|lp{glsdescwidth}|}{\end{longtable}}%
    Place horizontal lines at the head and foot of the table:
2816   \renewcommand*{\glossaryheader}{\hline\endhead\hline\endfoot}%
2817 }
```

`longheader` The `longheader` style is like the `long` style but with a header:

```
2818 \newglossarystyle{longheader}{%
```

Base it on the `glostylelong` style:

```
2819 \glossarystyle{long}%
```

Set the table's header:

```
2820 \renewcommand*{\glossaryheader}{%
2821   \bfseries \entryname & \bfseries \descriptionname\\endhead}%
2822 }
```

longheaderborder The `longheaderborder` style is like the `long` style but with a header and border:

```
2823 \newglossarystyle{longheaderborder}{%
```

Base it on the `glostylelongborder` style:

```
2824 \glossarystyle{longborder}%
```

Set the table's header and add horizontal line to table's foot:

```
2825 \renewcommand*{\glossaryheader}{%
2826   \hline\bfseries \entryname & \bfseries \descriptionname\\hline
2827   \endhead
2828   \hline\endfoot}%
2829 }
```

long3col The `long3col` style is like `long` but with 3 columns

```
2830 \newglossarystyle{long3col}{%
```

Use a `longtable` with 3 columns:

```
2831 \renewenvironment{theglossary}%
2832   {\begin{longtable}[lp{\glstdescwidth}p{\glspagelistwidth}}}%
2833   {\end{longtable}}%
```

No table header:

```
2834 \renewcommand*{\glossaryheader}{}%
```

No headings between groups:

```
2835 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries on a row (name in first column, description in second column, page list in last column):

```
2836 \renewcommand*{\glossaryentryfield}[5]{%
2837   \glstarget{##1}{##2} & ##3 & ##5\\}%
```

Sub-entries on a separate row (no name, description in second column, page list in third column):

```
2838 \renewcommand*{\glossarysubentryfield}[6]{%
2839   & \glstarget{##2}{\strut}##4 & ##6\\}%
```

Blank row between groups:

```
2840 \renewcommand*{\glsgroupskip}{ & &\\}%
2841 }
```

long3colborder The `long3colborder` style is like the `long3col` style but with a border:

```
2842 \newglossarystyle{long3colborder}{%
```

Base it on the `glostylelong3col` style:

```
2843 \glossarystyle{long3col}%
```

Use a `longtable` with 3 columns with vertical lines around them:

```
2844 \renewenvironment{theglossary}%
2845   {\begin{longtable}[|l|p{\glstdescwidth}|p{\glspagelistwidth}|]}%
2846   {\end{longtable}}%
```

Place horizontal lines at the head and foot of the table:

```
2847 \renewcommand*{\glossaryheader}{\hline\endhead\hline\endfoot}%
2848 }
```

long3colheader The long3colheader style is like long3col but with a header row:

```
2849 \newglossarystyle{long3colheader}{%
    Base it on the glostylelong3col style:
2850 \glossarystyle{long3col}%
    Set the table's header:
2851 \renewcommand*{\glossaryheader}{%
2852     \bfseries\entryname&\bfseries\descriptionname&
2853     \bfseries\pagelistname\\\endhead}%
2854 }
```

long3colheaderborder The long3colheaderborder style is like the above but with a border

```
2855 \newglossarystyle{long3colheaderborder}{%
    Base it on the glostylelong3colborder style:
2856 \glossarystyle{long3colborder}%
    Set the table's header and add horizontal line at table's foot:
2857 \renewcommand*{\glossaryheader}{%
2858     \hline
2859     \bfseries\entryname&\bfseries\descriptionname&
2860     \bfseries\pagelistname\\\hline\endhead
2861     \hline\endfoot}%
2862 }
```

long4col The long4col style has four columns where the third column contains the value of the associated symbol key.

```
2863 \newglossarystyle{long4col}{%
    Use a longtable with 4 columns:
2864 \renewenvironment{theglossary}%
2865     {\begin{longtable}{l111}}%
2866     {\end{longtable}}%
    No table header:
2867 \renewcommand*{\glossaryheader}{}%
    No group headings:
2868 \renewcommand*{\glsgroupheading}[1]{}%
    Main (level 0) entries on a single row (name in first column, description in second
    column, symbol in third column, page list in last column):
2869 \renewcommand*{\glossaryentryfield}[5]{%
2870     \glstarget{##1}{##2} & ##3 & ##4 & ##5\\}%
    Sub entries on a single row with no name (description in second column, symbol
    in third column, page list in last column):
2871 \renewcommand*{\glossarysubentryfield}[6]{%
2872     & \glstarget{##2}{\strut}##4 & ##5 & ##6\\}%
    Blank row between groups:
2873 \renewcommand*{\glsgroupskip}{& & &\\}%
2874 }
```

long4colheader The long4colheader style is like long4col but with a header row.

```
2875 \newglossarystyle{long4colheader}{%
```

Base it on the glostylelong4col style:

```
2876 \glossarystyle{long4col}%
```

Table has a header:

```
2877 \renewcommand*{\glossaryheader}{%
```

```
2878 \bfseries\entryname&\bfseries\descriptionname&
```

```
2879 \bfseries \symbolname&
```

```
2880 \bfseries\pagelistname\\endhead}%
```

```
2881 }
```

long4colborder The long4colborder style is like long4col but with a border.

```
2882 \newglossarystyle{long4colborder}{%
```

Base it on the glostylelong4col style:

```
2883 \glossarystyle{long4col}%
```

Use a longtable with 4 columns surrounded by vertical lines:

```
2884 \renewenvironment{theglossary}%
```

```
2885 {\begin{longtable}{|l|l|l|l|}}%
```

```
2886 {\end{longtable}}%
```

Add horizontal lines to the head and foot of the table:

```
2887 \renewcommand*{\glossaryheader}{\hline\endhead\hline\endfoot}%
```

```
2888 }
```

long4colheaderborder The long4colheaderborder style is like the above but with a border.

```
2889 \newglossarystyle{long4colheaderborder}{%
```

Base it on the glostylelong4col style:

```
2890 \glossarystyle{long4col}%
```

Use a longtable with 4 columns surrounded by vertical lines:

```
2891 \renewenvironment{theglossary}%
```

```
2892 {\begin{longtable}{|l|l|l|l|}}%
```

```
2893 {\end{longtable}}%
```

Add table header and horizontal line at the table's foot:

```
2894 \renewcommand*{\glossaryheader}{%
```

```
2895 \hline\bfseries\entryname&\bfseries\descriptionname&
```

```
2896 \bfseries \symbolname&
```

```
2897 \bfseries\pagelistname\\hline\endhead\hline\endfoot}%
```

```
2898 }
```

altlong4col The altlong4col style is like the long4col style but can have multiline descriptions and page lists.

```
2899 \newglossarystyle{altlong4col}{%
```

Base it on the glostylelong4col style:

```
2900 \glossarystyle{long4col}%
```

Use a longtable with 4 columns where the second and last columns may have multiple lines in each row:

```
2901 \renewenvironment{theglossary}%
```

```
2902 {\begin{longtable}{lp{\glsgdescwidth}lp{\glspagelistwidth}}%
```

```
2903 {\end{longtable}}%
```

```
2904 }
```

`altlong4colheader` The `altlong4colheader` style is like `altlong4col` but with a header row.

```

2905 \newglossarystyle{altlong4colheader}{%
    Base it on the glostylelong4colheader style:
2906   \glossarystyle{long4colheader}%
    Use a longtable with 4 columns where the second and last columns may have
    multiple lines in each row:
2907   \renewenvironment{theglossary}%
2908     {\begin{longtable}{lp{\glsgdescwidth}lp{\glspagelistwidth}}}%
2909     {\end{longtable}}}%
2910 }
```

`altlong4colborder` The `altlong4colborder` style is like `altlong4col` but with a border.

```

2911 \newglossarystyle{altlong4colborder}{%
    Base it on the glostylelong4colborder style:
2912   \glossarystyle{long4colborder}%
    Use a longtable with 4 columns where the second and last columns may have
    multiple lines in each row:
2913   \renewenvironment{theglossary}%
2914     {\begin{longtable}{|lp{\glsgdescwidth}|lp{\glspagelistwidth}|}}%
2915     {\end{longtable}}}%
2916 }
```

`altlong4colheaderborder` The `altlong4colheaderborder` style is like the above but with a header as well as a border.

```

2917 \newglossarystyle{altlong4colheaderborder}{%
    Base it on the glostylelong4colheaderborder style:
2918   \glossarystyle{long4colheaderborder}%
    Use a longtable with 4 columns where the second and last columns may have
    multiple lines in each row:
2919   \renewenvironment{theglossary}%
2920     {\begin{longtable}{|lp{\glsgdescwidth}|lp{\glspagelistwidth}|}}%
2921     {\end{longtable}}}%
2922 }
```

7.4 Glossary Styles using supertabular environment (glossary-super package)

The glossary styles defined in the `glossary-super` package use the `supertabular` environment.

```

2923 \ProvidesPackage{glossary-super}[2009/01/14 v1.03 (NLCT)]
```

Requires the `supertabular` package:

```

2924 \RequirePackage{supertabular}
```

`\glsgdescwidth` This is a length that governs the width of the description column. This may already have been defined if `glossary-long` has been loaded.

```

2925 \@ifundefined{glsgdescwidth}{%
2926   \newlength{glsgdescwidth}
2927   \setlength{glsgdescwidth}{0.6\linewidth}
2928 }{}
```

`\glspagelistwidth` This is a length that governs the width of the page list column. This may already have been defined if `glossary-long` has been loaded.

```
2929 \@ifundefined{glspagelistwidth}{%
2930   \newlength{glspagelistwidth
2931   \setlength{glspagelistwidth}{0.1\linewidth}
2932 }{}
```

super The `super` glossary style uses the `supertabular` environment (it uses lengths defined in the `glossary-long` package.)

```
2933 \newglossarystyle{super}{%
```

Put the glossary in a `supertabular` environment with two columns and no head or tail:

```
2934   \renewenvironment{theglossary}%
2935   {\tablehead{}\tabletail{}}%
2936   \begin{supertabular}{lp{\glstdescwidth}}}%
2937   {\end{supertabular}}%
```

Do nothing at the start of the table:

```
2938   \renewcommand*{\glossaryheader}{}%
```

No group headings:

```
2939   \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries put in a row (name in first column, description and page list in second column):

```
2940   \renewcommand*{\glossaryentryfield}[5]{%
2941     \glstarget{##1}{##2} & ##3\glspostdescription\space ##5\\}%
```

Sub entries put in a row (no name, description and page list in second column):

```
2942   \renewcommand*{\glossarysubentryfield}[6]{%
2943     & \glstarget{##2}{\strut}##4\glspostdescription\space ##6\\}%
```

Blank row between groups:

```
2944   \renewcommand*{\glsgroupskip}{ & \\}%
2945 }
```

superborder The `superborder` style is like the above, but with horizontal and vertical lines:

```
2946 \newglossarystyle{superborder}{%
```

Base it on the `glostylesuper` style:

```
2947   \glossarystyle{super}%
```

Put the glossary in a `supertabular` environment with two columns and a horizontal line in the head and tail:

```
2948   \renewenvironment{theglossary}%
2949   {\tablehead{\hline}\tabletail{\hline}%
2950   \begin{supertabular}{|lp{\glstdescwidth}|}%
2951   {\end{supertabular}}%
2952 }
```

superheader The `superheader` style is like the `super` style, but with a header:

```
2953 \newglossarystyle{superheader}{%
```

Base it on the `glostylesuper` style:

```
2954   \glossarystyle{super}%
```

Put the glossary in a supertabular environment with two columns, a header and no tail:

```

2955 \renewenvironment{theglossary}%
2956   {\tablehead{\bfseries \entryname & \bfseries \descriptionname\\}%
2957    \tabletail{}}%
2958   \begin{supertabular}{lp{\glsdescwidth}}%
2959   {\end{supertabular}}%
2960 }

```

superheaderborder The superheaderborder style is like the super style but with a header and border:

```

2961 \newglossarystyle{superheaderborder}{%

```

Base it on the glostylesuper style:

```

2962   \glossarystyle{super}%

```

Put the glossary in a supertabular environment with two columns, a header and horizontal lines above and below the table:

```

2963   \renewenvironment{theglossary}%
2964   {\tablehead{\hline\bfseries \entryname &
2965    \bfseries \descriptionname\\ \hline}%
2966    \tabletail{\hline}
2967    \begin{supertabular}{|lp{\glsdescwidth}|}%
2968    {\end{supertabular}}%
2969 }

```

super3col The super3col style is like the super style, but with 3 columns:

```

2970 \newglossarystyle{super3col}{%

```

Put the glossary in a supertabular environment with three columns and no head or tail:

```

2971   \renewenvironment{theglossary}%
2972   {\tablehead{} \tabletail{}}%
2973   \begin{supertabular}{lp{\glsdescwidth}p{\glspagelistwidth}}%
2974   {\end{supertabular}}%

```

Do nothing at the start of the table:

```

2975   \renewcommand*{\glossaryheader}{}%

```

No group headings:

```

2976   \renewcommand*{\glsgroupheading}[1]{}%

```

Main (level 0) entries on a row (name in first column, description in second column, page list in last column):

```

2977   \renewcommand*{\glossaryentryfield}[5]{%
2978     \glstarget{##1}{##2} & ##3 & ##5\\}%

```

Sub entries on a row (no name, description in second column, page list in last column):

```

2979   \renewcommand*{\glossarysubentryfield}[6]{%
2980     & \glstarget{##2}{\strut}##4 & ##6\\}%

```

Blank row between groups:

```

2981   \renewcommand*{\glsgroupskip}{ & & \\}%
2982 }

```

super3colborder The super3colborder style is like the super3col style, but with a border:

```

2983 \newglossarystyle{super3colborder}{%

```

Base it on the `glostylesuper3col` style:

```
2984 \glossarystyle{super3col}%
    Put the glossary in a supertabular environment with three columns and a horizontal
    line in the head and tail:
2985 \renewenvironment{theglossary}%
2986   {\tablehead{\hline}\tabletail{\hline}%
2987    \begin{supertabular}{|l|p{\glsgdescwidth}|p{\glspagelistwidth}|}%
2988   {\end{supertabular}}%
2989 }
```

super3colheader The `super3colheader` style is like the `super3col` style but with a header row:

```
2990 \newglossarystyle{super3colheader}{%
    Base it on the glostylesuper3col style:
2991 \glossarystyle{super3col}%
    Put the glossary in a supertabular environment with three columns, a header and
    no tail:
2992 \renewenvironment{theglossary}%
2993   {\tablehead{\bfseries\entryname&\bfseries\descriptionname&
2994    \bfseries\pagelistname\\}\tabletail{}}%
2995   \begin{supertabular}{lp{\glsgdescwidth}p{\glspagelistwidth}}}%
2996   {\end{supertabular}}%
2997 }
```

super3colheaderborder The `super3colheaderborder` style is like the `super3col` style but with a header and border:

```
2998 \newglossarystyle{super3colheaderborder}{%
    Base it on the glostylesuper3colborder style:
2999 \glossarystyle{super3colborder}%
    Put the glossary in a supertabular environment with three columns, a header with
    horizontal lines and a horizontal line in the tail:
3000 \renewenvironment{theglossary}%
3001   {\tablehead{\hline
3002    \bfseries\entryname&\bfseries\descriptionname&
3003    \bfseries\pagelistname\\ \hline}%
3004   \tabletail{\hline}%
3005   \begin{supertabular}{|l|p{\glsgdescwidth}|p{\glspagelistwidth}|}%
3006   {\end{supertabular}}%
3007 }
```

super4col The `super4col` glossary style has four columns, where the third column contains the value of the corresponding symbol key used when that entry was defined.

```
3008 \newglossarystyle{super4col}{%
    Put the glossary in a supertabular environment with four columns and no head or
    tail:
3009 \renewenvironment{theglossary}%
3010   {\tablehead{}\tabletail{}}%
3011   \begin{supertabular}{|llll|}%
3012   {\end{supertabular}}%
```

Do nothing at the start of the table:

```
3013 \renewcommand*{\glossaryheader}{}%
```

No group headings:

```
3014 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries on a row with the name in the first column, description in second column, symbol in third column and page list in last column:

```
3015 \renewcommand*{\glossaryentryfield}[5]{%
3016 \glstarget{##1}{##2} & ##3 & ##4 & ##5\\}%
```

Sub entries on a row with no name, the description in the second column, symbol in third column and page list in last column:

```
3017 \renewcommand*{\glossarysubentryfield}[6]{%
3018 & \glstarget{##2}{\strut}##4 & ##5 & ##6\\}%
```

Blank row between groups:

```
3019 \renewcommand*{\glsgroupskip}{ & & & \\}%
3020 }
```

super4colheader The `super4colheader` style is like the `super4col` but with a header row.

```
3021 \newglossarystyle{super4colheader}{}%
```

Base it on the `glostylesuper4col` style:

```
3022 \glossarystyle{super4col}%
```

Put the glossary in a `supertabular` environment with four columns, a header and no tail:

```
3023 \renewenvironment{theglossary}%
3024 {\tablehead{\bfseries\entryname&\bfseries\descriptionname&
3025 \bfseries\symbolname &
3026 \bfseries\pagelistname\\}%
3027 \tabletail{}}%
3028 \begin{supertabular}{|l|l|l|l|}%
3029 {\end{supertabular}}%
```

```
3030 }
```

super4colborder The `super4colborder` style is like the `super4col` but with a border.

```
3031 \newglossarystyle{super4colborder}{}%
```

Base it on the `glostylesuper4col` style:

```
3032 \glossarystyle{super4col}%
```

Put the glossary in a `supertabular` environment with four columns and a horizontal line in the head and tail:

```
3033 \renewenvironment{theglossary}%
3034 {\tablehead{\hline}\tabletail{\hline}%
3035 \begin{supertabular}{|l|l|l|l|}%
3036 {\end{supertabular}}%
```

```
3037 }
```

super4colheaderborder The `super4colheaderborder` style is like the `super4col` but with a header and border.

```
3038 \newglossarystyle{super4colheaderborder}{}%
```

Base it on the `glostylesuper4col` style:

```
3039 \glossarystyle{super4col}%
```

Put the glossary in a supertabular environment with four columns and a header bordered by horizontal lines and a horizontal line in the tail:

```

3040 \renewenvironment{theglossary}%
3041   {\tablehead{\hline\bfseries\entryname&\bfseries\descriptionname&
3042     \bfseries\symbolname &
3043     \bfseries\pagelistname\\ \hline}\tabletail{\hline}%
3044   \begin{supertabular}{|l|l|l|l|}%
3045   {\end{supertabular}}%
3046 }

```

altsuper4col The altsuper4col glossary style is like super4col but has provision for multiline descriptions.

```

3047 \newglossarystyle{altsuper4col}{%
  Base it on the glostylesuper4col style:
3048   \glossarystyle{super4col}%
  Put the glossary in a supertabular environment with four columns and no head or
  tail:
3049   \renewenvironment{theglossary}%
3050   {\tablehead{}\tabletail{}}%
3051   \begin{supertabular}{lp{\glsgdescwidth}lp{\glspagelistwidth}}}%
3052   {\end{supertabular}}%
3053 }

```

altsuper4colheader The altsuper4colheader style is like the altsuper4col but with a header row.

```

3054 \newglossarystyle{altsuper4colheader}{%
  Base it on the glostylesuper4colheader style:
3055   \glossarystyle{super4colheader}%
  Put the glossary in a supertabular environment with four columns, a header and
  no tail:
3056   \renewenvironment{theglossary}%
3057   {\tablehead{\bfseries\entryname&\bfseries\descriptionname&
3058     \bfseries\symbolname &
3059     \bfseries\pagelistname\\}\tabletail{}}%
3060   \begin{supertabular}{lp{\glsgdescwidth}lp{\glspagelistwidth}}}%
3061   {\end{supertabular}}%
3062 }

```

altsuper4colborder The altsuper4colborder style is like the altsuper4col but with a border.

```

3063 \newglossarystyle{altsuper4colborder}{%
  Base it on the glostylesuper4colborder style:
3064   \glossarystyle{super4colborder}%
  Put the glossary in a supertabular environment with four columns and a horizontal
  line in the head and tail:
3065   \renewenvironment{theglossary}%
3066   {\tablehead{\hline}\tabletail{\hline}%
3067   \begin{supertabular}%
3068     {|l|p{\glsgdescwidth}|l|p{\glspagelistwidth}|}%
3069   {\end{supertabular}}%
3070 }

```

`altsuper4colheaderborder` The `altsuper4colheaderborder` style is like the `altsuper4col` but with a header and border.

```
3071 \newglossarystyle{altsuper4colheaderborder}{%
```

Base it on the `glostylesuper4colheaderborder` style:

```
3072 \glossarystyle{super4colheaderborder}{%
```

Put the glossary in a `supertabular` environment with four columns and a header bordered by horizontal lines and a horizontal line in the tail:

```
3073 \renewenvironment{theglossary}{%
3074   {\tablehead{\hline
3075     \bfseries\entryname &
3076     \bfseries\descriptionname &
3077     \bfseries\symbolname &
3078     \bfseries\pagelistname\\ \hline}%
3079   \tabletail{\hline}%
3080   \begin{supertabular}%

3082   {\end{supertabular}}}%
3083 }
```

7.5 Tree Styles (`glossary-tree.sty`)

The `glossary-tree` style file defines glossary styles that have a tree-like structure. These are designed for hierarchical glossaries.

```
3084 \ProvidesPackage{glossary-tree}[2009/01/14 v1.01 (NLCT)]
```

`index` The `index` glossary style is similar in style to the way indices are usually typeset using `\item`, `\subitem` and `\subsubitem`. The entry name is set in bold. If an entry has a symbol, it is placed in brackets after the name. Then the description is displayed, followed by the number list. This style allows up to three levels.

```
3085 \newglossarystyle{index}{%
```

Set the paragraph indentation and skip and define `\item` to be the same as that used by `theindex`:

```
3086 \renewenvironment{theglossary}{%
3087   {\setlength{\parindent}{0pt}%
3088   \setlength{\parskip}{0pt plus 0.3pt}%
3089   \let\item\@idxitem}%
3090   {}%
```

Do nothing at the start of the environment:

```
3091 \renewcommand*{\glossaryheader}{}%
```

No group headers:

```
3092 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entry starts a new item with the name in bold followed by the symbol in brackets (if it exists), the description and the page list.

```
3093 \renewcommand*{\glossaryentryfield}[5]{%
3094 \item\textbf{\glstarget{##1}{##2}}%
3095 \ifx\relax##4\relax
3096 \else
3097 \space(##4)%
3098 \fi
3099 \space ##3\glspostdescription \space ##5}%

```

Sub entries: level 1 entries use `\subitem`, levels greater than 1 use `\subsubitem`. The level (`##1`) shouldn't be 0, as that's catered by `\glossaryentryfield`, but for completeness, if the level is 0, `\item` is used. The name is put in bold, followed by the symbol in brackets (if it exists), the description and the page list.

```

3100 \renewcommand*{\glossarysubentryfield}[6]{%
3101   \ifcase##1\relax
3102     % level 0
3103     \item
3104   \or
3105     % level 1
3106     \subitem
3107   \else
3108     % all other levels
3109     \subsubitem
3110   \fi
3111   \textbf{\glstarget{##2}{##3}}%
3112   \ifx\relax##5\relax
3113   \else
3114     \space{##5}%
3115   \fi
3116   \space##4\glspostdescription\space ##6}%

```

Vertical gap between groups is the same as that used by indices:

```

3117 \renewcommand*{\glsgroupskip}{\indexspace}}

```

indexgroup The `indexgroup` style is like the `index` style but has headings.

```

3118 \newglossarystyle{indexgroup}{%

```

Base it on the `glostyleindex` style:

```

3119 \glossarystyle{index}%

```

Add a heading for each group. This puts the group's title in bold followed by a vertical gap.

```

3120 \renewcommand*{\glsgroupheading}[1]{%
3121   \item\textbf{\glsgetgrouptitle{##1}}\indexspace}%
3122 }

```

indexhypergroup The `indexhypergroup` style is like the `indexgroup` style but has hyper navigation.

```

3123 \newglossarystyle{indexhypergroup}{%

```

Base it on the `glostyleindex` style:

```

3124 \glossarystyle{index}%

```

Put navigation links to the groups at the start of the glossary:

```

3125 \renewcommand*{\glossaryheader}{%
3126   \item\textbf{\glsnavigation}\indexspace}%

```

Add a heading for each group (with a target). The group's title is in bold followed by a vertical gap.

```

3127 \renewcommand*{\glsgroupheading}[1]{%
3128   \item\textbf{\glsnavhypertarget{##1}{\glsgetgrouptitle{##1}}}%
3129   \indexspace}%
3130 }

```

tree The tree glossary style is similar in style to the index style, but can have arbitrary levels.

```
3131 \newglossarystyle{tree}{%
```

Set the paragraph indentation and skip:

```
3132 \renewenvironment{theglossary}%
3133 {\setlength{\parindent}{0pt}%
3134 \setlength{\parskip}{0pt plus 0.3pt}}%
3135 {}%
```

Do nothing at the start of the theglossary environment:

```
3136 \renewcommand*{\glossaryheader}{}%
```

No group headings:

```
3137 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries: name in bold, followed by symbol in brackets (if it exists), the description and the page list:

```
3138 \renewcommand{\glossaryentryfield}[5]{%
3139 \hangindent0pt\relax
3140 \parindent0pt\relax
3141 \textbf{\glstarget{##1}{##2}}%
3142 \ifx\relax##4\relax
3143 \else
3144 \space{##4}%
3145 \fi
3146 \space ##3\glspostdescription \space ##5\par}%
```

Sub entries: level $\langle n \rangle$ is indented by $\langle n \rangle$ times `\glstreeindent`. The name is in bold, followed by the symbol in brackets (if it exists), the description and the page list.

```
3147 \renewcommand{\glossarysubentryfield}[6]{%
3148 \hangindent##1\glstreeindent\relax
3149 \parindent##1\glstreeindent\relax
3150 \textbf{\glstarget{##2}{##3}}%
3151 \ifx\relax##5\relax
3152 \else
3153 \space{##5}%
3154 \fi
3155 \space##4\glspostdescription\space ##6\par}%
```

Vertical gap between groups is the same as that used by indices:

```
3156 \renewcommand*{\glsgroupskip}{\indexspace}}
```

treegroup Like the tree style but the glossary groups have headings.

```
3157 \newglossarystyle{treegroup}{%
```

Base it on the glostyletree style:

```
3158 \glossarystyle{tree}%
```

Each group has a heading (in bold) followed by a vertical gap):

```
3159 \renewcommand{\glsgroupheading}[1]{\par
3160 \noindent\textbf{\glsgrouptitle{##1}}\par\indexspace}%
3161 }
```

treehypergroup The `treehypergroup` style is like the `treegroup` style, but has a set of links to the groups at the start of the glossary.

```
3162 \newglossarystyle{treehypergroup}{%
```

Base it on the `glostyletree` style:

```
3163 \glossarystyle{tree}%
```

Put navigation links to the groups at the start of the `theglossary` environment:

```
3164 \renewcommand*{\glossaryheader}{%
```

```
3165 \par\noindent\textbf{\glsnavigation}\par\indexspace}%
```

Each group has a heading (in bold with a target) followed by a vertical gap):

```
3166 \renewcommand*{\glsgroupheading}[1]{%
```

```
3167 \par\noindent
```

```
3168 \textbf{\glsnavhypertarget{##1}{\glsgrouptitle{##1}}}\par
```

```
3169 \indexspace}%
```

```
3170 }
```

\glstreeindent Length governing left indent for each level of the tree style.

```
3171 \newlength\glstreeindent
```

```
3172 \setlength{\glstreeindent}{10pt}
```

treenoname The `treenoname` glossary style is like the `tree` style, but doesn't print the name or symbol for sub-levels.

```
3173 \newglossarystyle{treenoname}{%
```

Set the paragraph indentation and skip:

```
3174 \renewenvironment{theglossary}%
```

```
3175 {\setlength{\parindent}{0pt}%
```

```
3176 \setlength{\parskip}{0pt plus 0.3pt}}%
```

```
3177 {}%
```

No header:

```
3178 \renewcommand*{\glossaryheader}{}%
```

No group headings:

```
3179 \renewcommand*{\glsgroupheading}[1]{}%
```

Main (level 0) entries: the name is in bold, followed by the symbol in brackets (if it exists), the description and the page list.

```
3180 \renewcommand{\glossaryentryfield}[5]{%
```

```
3181 \hangindent0pt\relax
```

```
3182 \parindent0pt\relax
```

```
3183 \textbf{\glstarget{##1}{##2}}%
```

```
3184 \ifx\relax##4\relax
```

```
3185 \else
```

```
3186 \space{##4}%
```

```
3187 \fi
```

```
3188 \space ##3\glspostdescription \space ##5\par}%
```

Sub entries: level $\langle n \rangle$ is indented by $\langle n \rangle$ times `\glstreeindent`. The name and symbol are omitted. The description followed by the page list are displayed.

```
3189 \renewcommand{\glossarysubentryfield}[6]{%
```

```
3190 \hangindent##1\glstreeindent\relax
```

```
3191 \parindent##1\glstreeindent\relax
```

```
3192 \glstarget{##2}{\strut}%
```

```
3193 ##4\glspostdescription\space ##6\par}%
```

Vertical gap between groups is the same as that used by indices:

```
3194 \renewcommand*{\glsgroupskip}{\indexspace}%
3195 }
```

treenonamegroup Like the `treenoname` style but the glossary groups have headings.

```
3196 \newglossarystyle{treenonamegroup}{%
    Base it on the glostyletreenoname style:
3197 \glossarystyle{treenoname}%
    Give each group a heading:
3198 \renewcommand{\glsgroupheading}[1]{\par
3199 \noindent\textbf{\glsgrouptitle{##1}}\par\indexspace}%
3200 }
```

treenamehypergroup The `treenamehypergroup` style is like the `treenonamegroup` style, but has a set of links to the groups at the start of the glossary.

```
3201 \newglossarystyle{treenamehypergroup}{%
    Base it on the glostyletreenoname style:
3202 \glossarystyle{treenoname}%
    Put navigation links to the groups at the start of the theglossary environment:
3203 \renewcommand*{\glossaryheader}{%
3204 \par\noindent\textbf{\glsnavigation}\par\indexspace}%
    Each group has a heading (in bold with a target) followed by a vertical gap):
3205 \renewcommand*{\glsgroupheading}[1]{%
3206 \par\noindent
3207 \textbf{\glsnavigationtarget{##1}{\glsgrouptitle{##1}}}\par
3208 \indexspace}%
3209 }
```

\glswidest `\glswidest[level]{text}` sets the widest text for the given level. It is used by the `alttree` glossary styles to determine the indentation of each level.

```
3210 \newcommand*{\glswidest}[2][0]{%
3211 \expandafter\def\csname @glswidestname\romannumeral#1\endcsname{%
3212 #2}%
3213 }
```

\@glswidestname Initialise `\@glswidestname`.

```
3214 \newcommand*{\@glswidestname}{}
```

alttree The `alttree` glossary style is similar in style to the `tree` style, but the indentation is obtained from the width of `\@glswidestname` which is set using `\glswidest`.

```
3215 \newglossarystyle{alttree}{%
    Redefine the theglossary environment.
3216 \renewenvironment{theglossary}%
3217 {\def\@glsprevlevel{-1}%
3218 \mbox{}\par}%
3219 {\par}%
    Set the header and group headers to nothing.
3220 \renewcommand*{\glossaryheader}{}%
3221 \renewcommand*{\glsgroupheading}[1]{}%

```

Redefine the way that the level 0 entries are displayed.

```

3222 \renewcommand{\glossaryentryfield}[5]{%
    If the level hasn't changed, keep the same settings, otherwise change \glstreeindent
    accordingly.
3223 \ifnum\@gls@prevlevel=0\relax
3224 \else
    Find out how big the indentation should be by measuring the widest entry.
3225 \settowidth{\glstreeindent}{\textbf{\@glswidestname\space}}%
    Set the hangindent and paragraph indent.
3226 \hangindent\glstreeindent
3227 \parindent\glstreeindent
3228 \fi
    Put the name to the left of the paragraph block.
3229 \makebox[0pt][r]{\makebox[\glstreeindent][l]{%

3276      \hangindent0pt\relax
3277      \parindent0pt\relax
3278      \textbf{\glsgrouptitle{##1}}\par\indexspace}%
3279      }

```

alttreehypergroup The `alttreehypergroup` style is like the `alttreegroup` style, but has a set of links to the groups at the start of the glossary.

```

3280 \newglossarystyle{alttreehypergroup}{%

```

Base it on the `glostylealmtree` style:

```

3281 \glossarystyle{almtree}%
    Put the navigation links in the header
3282 \renewcommand*{\glossaryheader}{%
3283   \par
3284   \def\@gls@prevlevel{-1}%
3285   \hangindent0pt\relax
3286   \parindent0pt\relax
3287   \textbf{\glsnavigation}\par\indexspace}%
    Put a hypertarget at the start of each group
3288 \renewcommand*{\glsgroupheading}[1]{%
3289   \par
3290   \def\@gls@prevlevel{-1}%
3291   \hangindent0pt\relax
3292   \parindent0pt\relax
3293   \textbf{\glsnavhypertarget{##1}{\glsgetgrouptitle{##1}}}\par
3294   \indexspace}}

```

8 Accessibilty Support (glossaries-accsupp Code)

The `glossaries-accsupp` package is experimental. It is intended to provide a means of using the PDF accessibility support in glossary entries. See the `accsupp` documentation for further details about accessibility support.

```

3295 \NeedsTeXFormat{LaTeX2e}
3296 \ProvidesPackage{glossaries-accsupp}[2009/03/02 v0.1 (NLCT)]

```

Required packages:

```

3297 \RequirePackage{glossaries}
3298 \RequirePackage{accsupp}

```

Store the replacement text in the symbol key when defining new glossary entries. For example:

```
\newglossaryentry{dr}{name=Dr,description={},symbol={Doctor}}
```

The accessibility support is only provided via the commands `\gls`, `\glspl` and their uppercase variants, e.g. `\gls{dr}`.

```
\glsaccsupp \glsaccsupp{<replacement text>}{<text>}
```

This can be redefined to use `E` or `Alt` instead of `ActualText`. (I don't have the software to test the `E` or `Alt` options.)

```

3299 \newcommand*{\glsaccsupp}[2]{%
3300   \BeginAccSupp{ActualText=#1}#2\EndAccSupp{}%
3301 }

```

`\glsdisplay` Redefine `\glsdisplay` to use symbol as replacement text

```

3302 \renewcommand{\glsdisplay}[4]{%
3303   \protected@edef\@glo@symbol{#3}%
3304   \ifx\@glo@symbol\relax
3305     #1%
3306   \else

```

```

3307     \expandafter\glsaccsupp\expandafter{\@glo@symbol}{#1}%
3308   \fi
3309   #4%
3310 }

```

`\glsdisplayfirst` Redefine `\glsdisplayfirst` to use symbol as replacement text on first use.

```

3311 \renewcommand{\glsdisplayfirst}[4]{%
3312   \protected@edef\@glo@symbol{#3}%
3313   \ifx\@glo@symbol\relax
3314     #1%
3315   \else

9 Multi-Lingual Support

Many thanks to everyone who contributed to the translations both via email and on comp.text.tex.

9.1 Babel Captions

Define babel captions if multi-lingual support is required, but the translator package is not loaded.

```

3801 \providetranslation{Symbols (glossaries)}{Symbolen}
3802 \providetranslation{Numbers (glossaries)}{Cijfers}

```

9.5 English Dictionary

This is a dictionary file provided for use with the translator package.

```

3803 \ProvidesDictionary{glossaries-dictionary}{English}

```

Provide English translations:

```

3804 \providetranslation{Glossary}{Glossary}
3805 \providetranslation{Acronyms}{Acronyms}
3806 \providetranslation{Notation (glossaries)}{Notation}
3807 \providetranslation{Description (glossaries)}{Description}
3808 \providetranslation{Symbol (glossaries)}{Symbol}
3809 \providetranslation{Page List (glossaries)}{Page List}
3810 \providetranslation{Symbols (glossaries)}{Symbols}
3811 \providetranslation{Numbers (glossaries)}{Numbers}

```

9.6 French Dictionary

This is a dictionary file provided for use with the translator package.

```

3812 \ProvidesDictionary{glossaries-dictionary}{French}

```

Provide French translations:

```

3813 \providetranslation{Glossary}{Glossaire}
3814 \providetranslation{Acronyms}{Acronymes}
3815 \providetranslation{Notation (glossaries)}{Terme}
3816 \providetranslation{Description (glossaries)}{Description}
3817 \providetranslation{Symbol (glossaries)}{Symbole}
3818 \providetranslation{Page List (glossaries)}{Pages}
3819 \providetranslation{Symbols (glossaries)}{Symboles}
3820 \providetranslation{Numbers (glossaries)}{Nombres}

```

9.7 German Dictionary

This is a dictionary file provided for use with the translator package.

```

3821 \ProvidesDictionary{glossaries-dictionary}{German}

```

Provide German translations (quite a few variations were suggested for German;
I settled on the following):

```
3822 \providetranslation{Glossary}{Glossar}
3823 \providetranslation{Acronyms}{Akronyme}
3824 \providetranslation{Notation (glossaries)}{Bezeichnung}
3825 \providetranslation{Description (glossaries)}{Beschreibung}
3826 \providetranslation{Symbol (glossaries)}{Symbol}
3827 \providetranslation{Page List (glossaries)}{Seiten}
3828 \providetranslation{Symbols (glossaries)}{Symbole}
3829 \providetranslation{Numbers (glossaries)}{Zahlen}
```

9.8 Irish Dictionary

This is a dictionary file provided for use with the translator package.

```
3830 \ProvidesDictionary{glossaries-dictionary}{Irish}
```

Provide Irish translations:

```
3831 \providetranslation{Glossary}{Gluais}
3832 \providetranslation{Acronyms}{Acrainmneacha}
3833 \providetranslation{Notation (glossaries)}{Ciall}
3834 \providetranslation{Description (glossaries)}{Tuairisc}
3835 \providetranslation{Symbol (glossaries)}{Comhartha}
3836 \providetranslation{Page List (glossaries)}{Leathanaigh}
3837 \providetranslation{Symbols (glossaries)}{Comhartha\'}{i}
3838 \providetranslation{Numbers (glossaries)}{Uimhreacha}
```

9.9 Italian Dictionary

This is a dictionary file provided for use with the translator package.

```
3839 \ProvidesDictionary{glossaries-dictionary}{Italian}
```

Provide Italian translations:

```
3840 \providetranslation{Glossary}{Glossario}
3841 \providetranslation{Acronyms}{Acronimi}
3842 \providetranslation{Notation (glossaries)}{Nomenclatura}
3843 \providetranslation{Description (glossaries)}{Descrizione}
3844 \providetranslation{Symbol (glossaries)}{Simbolo}
3845 \providetranslation{Page List (glossaries)}{Elenco delle pagine}
3846 \providetranslation{Symbols (glossaries)}{Simboli}
3847 \providetranslation{Numbers (glossaries)}{Numeri}
```

9.10 Magyar Dictionary

This is a dictionary file provided for use with the translator package.

```
3848 \ProvidesDictionary{glossaries-dictionary}{Magyar}
```

Provide translations:

```
3849 \providetranslation{Glossary}{Sz\'ojegy\'ek}
3850 \providetranslation{Acronyms}{Bet\H uszavak}
3851 \providetranslation{Notation (glossaries)}{Kifejez\'es}
3852 \providetranslation{Description (glossaries)}{Magyar\'azat}
3853 \providetranslation{Symbol (glossaries)}{Jel\'ol\'es}
3854 \providetranslation{Page List (glossaries)}{Oldalsz\'am}
```

```

3855 \providetranslation{Symbols (glossaries)}{Jelek}
3856 \providetranslation{Numbers (glossaries)}{Sz\'amjegyek}

```

9.11 Polish Dictionary

This is a dictionary file provided for use with the translator package.

```

3857 \ProvidesDictionary{glossaries-dictionary}{Polish}

Provide Polish translations:

3858 \providetranslation{Glossary}{S{\'l}ownik termin\'ow}
3859 \providetranslation{Acronyms}{Skr\'ot}
3860 \providetranslation{Notation (glossaries)}{Termin}
3861 \providetranslation{Description (glossaries)}{Opis}
3862 \providetranslation{Symbol (glossaries)}{Symbol}
3863 \providetranslation{Page List (glossaries)}{Strony}
3864 \providetranslation{Symbols (glossaries)}{Symbole}
3865 \providetranslation{Numbers (glossaries)}{Liczby}

```

9.12 Spanish Dictionary

This is a dictionary file provided for use with the translator package.

```

3866 \ProvidesDictionary{glossaries-dictionary}{Spanish}

Provide Spanish translations:

3867 \providetranslation{Glossary}{Glosario}
3868 \providetranslation{Acronyms}{Siglas}
3869 \providetranslation{Notation (glossaries)}{Entrada}
3870 \providetranslation{Description (glossaries)}{Descripci\'on}
3871 \providetranslation{Symbol (glossaries)}{S\'{i}mbolo}
3872 \providetranslation{Page List (glossaries)}{Lista de p\'aginas}
3873 \providetranslation{Symbols (glossaries)}{S\'{i}mbolos}
3874 \providetranslation{Numbers (glossaries)}{N\'umeros}

```
