Intro

The gutils.sty package provides some macros that are analogous to the standard L^AT_EX ones but extend their functionality, such as `\@ifnextcat`, `\addtomacro` or `\begin(*)`. The others are just conveniences I like to use in all my TeX works, such as `\afterfi`, `\pk` or `\cs`.

I wouldn't say they are only for the package writers but I assume some nonzero (L^A)T_EX-awareness of the user.

For details just read the code part.

Installation

Unpack the gutils-tds.zip archive (this is an archive that conforms the TDS standard, see CTAN/tds/tds.pdf) in some texmf directory or just put the gutils.sty somewhere in the texmf/tex/latex branch. Creating a texmf/tex/latex/gm directory may be advisable if you consider using other packages written by me.

Then you should refresh your TeX distribution's files' database most probably.

Contents of the gutils.zip archive

The distribution of the gutils package consists of the following three files and a TDS-compliant archive.

```
gutils.sty
README
gutils.pdf
gutils.tds.zip
```

Compiling of the documentation

The last of the above files (the .pdf, i.e., *this file*) is a documentation compiled from the .sty file by running L^AT_EX on the gutils.sty file twice (xelatex gutils.sty in the directory you wish the documentation to be in, you don't have copy the .sty file there, TeX will find it), then MakeIndex on the gutils.idx file, and then L^AT_EX on gutils.sty once more.

MakeIndex shell command:

```
makeindex -r gutilsDoc
```

The `-r` switch is to forbid MakeIndex to make implicit ranges since the (code line) numbers will be hyperlinks.

Compiling the documentation requires the packages: gmdoc (gmdoc.sty and gmdoc.cls), gmverb.sty, gutils.sty, gmiflink.sty and also some standard packages: hyperref.sty, color.sty, geometry.sty, multicol.sty, lmodern.sty, fontenc.sty that should be installed on your computer by default.

If you had not installed the mwcls classes (available on CTAN and present in TeX Live e.g.), the result of your compilation might differ a bit from the .pdf provided in this .zip archive in formatting: If you had not installed mwcls, the standard article.cls class would be used.

```

156 \ifx\XeTeXversion\relax
157   \let\XeTeXversion\@undefined% If someone earlier used \ifundefined{%
    % XeTeXversion} to test whether the engine is XETEX, then \XeTeXversion
    is defined in the sense of ε-TEX tests. In that case we \let it to something
    really undefined. Well, we might keep sticking to \ifundefined, but it's
    a macro and it eats its arguments, freezing their catcodes, which is not what
    we want in line 2939.
164 \fi
166 \ifdefined\XeTeXversion
167 \XeTeXinputencoding(utf-8)% we use Unicode dashes later in this file.
168 \fi% and if we are not in XETEX, we skip them thanks to XETEX-test.

```

A couple of abbreviations

```

\@xa 174 \let\@xa\expandafter
\@nx 175 \let\@nx\noexpand
\pdef 178 \def\pdef{\protected\def}

```

And this one is defined, I know, but it's not \long with the standard definition and I want to be able to \gobble a \par sometimes.

```

\gobble 185 \long\def\gobble#1{}
\@gobble 187 \let\@gobble\gobble
\gobbletwo 188 \let\gobbletwo\@gobbletwo
\provide 192 \long\pdef\provide#1{%
193   \ifdefined#1%
194     \ifx\relax#1\afterfifi{\def#1}%
195     \else\afterfifi{\gmu@gobdef}%
196     \fi
197   \else\afterfi{\def#1}%
198   \fi}
\gmu@gobdef 201 \long\def\gmu@gobdef#1#2{%
202   \def\gmu@tempa{}% it's a junk macro assignment to absorb possible prefixes.
204   \gobble}
\pprovide 207 \def\pprovide{\protected\provide}

```

Note that both \provide and \pprovide may be prefixed with \global, \outer, \long and \protected because the prefixes stick to \def because all before it is expandable. If the condition(s) is false (#1 is defined) then the prefixes are absorbed by a junk assignment.

Note moreover that unlike L_AT_EX's \provide command, our \(\)(p)provide allow any parameters string just like \def (because they just *expand* to \def).

```

\@nameedef 220 \long\def\@nameedef#1#2{%
221   \@xa\edef\csname#1\endcsname{#2}}

```

\firstofone and the queer \catcodes

Remember that once a macro's argument has been read, its \catcodes are assigned forever and ever. That's what is \firstofone for. It allows you to change the \catcodes locally for a definition *outside* the changed \catcodes' group. Just see the below usage of this macro 'with T_EX's eyes', as my T_EX Guru taught me.

```

232 \long\def\firstofone#1{#1}

```

The next command, \foone, is intended as two-argument for shortening of the \bgroup... \firstofone{\egroup...} hack.

```
\foone  237 \long\def\foone#1{\bgroup#1\egroup\firstofone}
       239 \long\def\egroup\firstofone#1{\egroup#1}
fooatletter 241 \long\def\fooatletter{\foone\makeatletter}
```

Global Boolean switches

The \newgif declaration's effect is used even in the L^AT_EX 2_E source by redefining some particular user defined ifs (UD-ifs henceforth) step by step. The goal is to make the UD-if's assignment global. I needed it at least twice during gmdoc writing so I make it a macro. It's an almost verbatim copy of L^AT_EX's \newif modulo the letter *g* and the \global prefix. (File d: ltdefns.dtx Date: 2004/02/20 Version v1.3g, lines 139–150)

```
\newgif 255 \pdef\newgif#1{%
  256   {\escapechar\m@ne
  257     \global\let#1\iffalse
  258     \@gif#1\iftrue
  259     \@gif#1\iffalse
  260   }}}
```

'Almost' is also in the detail that in this case, which deals with \global assignments, we don't have to bother with storing and restoring the value of \escapechar: we can do all the work inside a group.

```
@gif 266 \def\@gif#1#2{%
  267   \protected\@xa\gdef\csname\@xa\@gobbletwo\string#1%
  268   g% the letter g for '\global'.
  269   \@xa\@gobbletwo\string#2\endcsname
  270   {\global\let#1#2}}
  272 \pdef\newif#1{%
    We not only make \newif \protected but also make it to define
    \protected assignments so that premature expansion doesn't affect \if...
    % \fi nesting.
  279   \count@\escapechar\escapechar\m@ne
  280   \let#1\iffalse
  281   \@if#1\iftrue
  282   \@if#1\iffalse
  283   \escapechar\count@}
@if 285 \def\@if#1#2{%
  286   \protected\@xa\def\csname\@xa\@gobbletwo\string#1%
  287   \@xa\@gobbletwo\string#2\endcsname
  288   {\let#1#2}}
\hidden@iffalse 291 \pdef\hidden@iffalse{\iffalse}
\hidden@iftrue 292 \pdef\hidden@iftrue{\iftrue}
```

After \newgif\iffoo you may type {\foogtrue} and the \iffoo switch becomes globally equal \iftrue. Simili modo \foogfalse. Note the letter *g* added to underline globalness of the assignment.

If for any reason, no matter how queer ;-) may it be, you need *both* global and local switchers of your \if..., declare it both with \newif and \newgif.

Note that it's just a shorthand. \global\if<switch>\true/false does work as expected.

There's a trouble with \refstepcounter: defining \currentlabel is local. So let's \def a \global version of \refstepcounter.

Warning. I use it because of very special reasons in gmdoc and in general it is probably not a good idea to make `\refstepcounter` global since it is contrary to the original L^AT_EX approach.

```
\grefstepcounter
 313 \pdef\grefstepcounter#1{%
 314   {\let\protected@edef=\protected@xdef\refstepcounter{#1}}}
```

Naïve first try `\globaldefs=\tw@` raised an error unknown command `\reserved@e`. The matter was to globalize `\protected@edef` of `\currentlabel`.

Thanks to using the true `\refstepcounter` inside, it observes the change made to `\refstepcounter` by `hyperref`.

2008/08/10 I spent all the night debugging `\penalty 10000` that was added after a hypertarget in vertical mode. I didn't dare to touch `hyperref`'s guts, so I worked it around with ensuring every `\grefstepcounter` to be in `hmode`:

```
\hgrefstepcounter
 328 \pdef\hgrefstepcounter#1{%
 329   \ifhmode\leavevmode\fi\grefstepcounter{#1}}
```

By the way I read some lines from *The T_EXbook* and was reminded that `\unskip` strips any last skip, whether horizontal or vertical. And I use `\unskip` mostly to replace a blank space with some fixed skip. Therefore define

```
\hunskip
 336 \pdef\hunskip{\ifhmode\unskip\fi}
```

Note the two macros defined above are `\protected`. I think it's a good idea to make `\protected` all the macros that contain assignments. There is one more thing with `\ifhmode`: it can be different at the point of `\edef` and at the point of execution.

Another shorthand. It may decrease a number of `\expandafters` e.g.

```
\glet
 346 \def\glet{\global\let}
```

L^AT_EX provides a very useful `\g@addto@macro` macro that adds its second argument to the current definition of its first argument (works iff the first argument is a no argument macro). But I needed it some times in a document, where @ is not a letter. So:

```
\gaddtomacro
 354 \let\gaddtomacro=\g@addto@macro
```

The redefining of the first argument of the above macro(s) is `\global`. What if we want it local? Here we are:

```
\addto@macro
 359 \long\def\addto@macro#1#2{%
 360   \toks@\@xa{\#1#2}%
 361   \edef#1{\the\toks@}%
 362 }% (\toks@ is a scratch register, namely \tokso.)
```

And for use in the very document,

```
\addtomacro
 366 \let\addtomacro=\addto@macro
```

2008/08/09 I need to prepend something not add at the end—so

```
\prependtomacro
 369 \long\def\prependtomacro#1#2{%
 370   \edef#2{\unexpanded{#1}\@xa\unexpanded\@xa{#2}}}
```

Note that `\prependtomacro` can be prefixed.

```
\addtotoks
 374 \long\def\addtotoks#1#2{%
 375   #1=\@xa{\the#1#2}}
```

```
\@emptify
 378 \newcommand*\@emptify[1]{\let#1=\@empty}
 379 \if definable\emptify{\let\emptify\@emptify}
```

Note the two following commands are in fact one-argument.

```
\g@emptify
 383 \newcommand*\g@emptify{\global\@emptify}
```

```

\gemptify 384 \@ifdefinable\gemptify{\let\gemptify\g@emptify}
@relaxen 387 \newcommand@relaxen[1]{\let#1=\relax}
\relaxen 388 \@ifdefinable\relaxen{\let\relaxen@relaxen}

Note the two following commands are in fact one-argument.

\g@relaxen 392 \newcommand*\g@relaxen{\global\@relaxen}
\grelaxen 393 \ifdefinable\grelaxen{\let\grelaxen\g@relaxen}

```

Ampulex Compressa-like modifications of macros

Ampulex Compressa is a wasp that performs brain surgery on its victim cockroach to lead it to its lair and keep alive for its larva. Well, all we do here with the internal L^AT_EX macros resembles Ampulex's actions but here is a tool for a replacement of part of macro's definition.

The \ampulexdef command takes its #2 which has to be a macro and replaces part of its definition (delimited with #3 and #4) with the replacement #5. The redefinition may be prefixed with #1. #2 may have parameters and for such a macro you have to set the parameters string and arguments string with the \ampulexset declaration. If \ampulexdef doesn't find the start and end tokens in the meaning of the macro, it does nothing to it. For an example use see line 1373.

```

\ampulexdef 411 \newcommand\ampulexdef[5][\relax]{%
    % #1 definition prefix,
    % #2 macro to be redefined,
    % #3 start token(s),
    % #4 end token(s)
    % #5 replacement.

\gmu@tempa 420 \def\gmu@tempa{#3}%
\gmu@tempb 421 \def\gmu@tempb{#4}%
\gmu@tempc 422 \def\gmu@tempc{#5}% we wrap the start, end and replacement tokens in macros
                                to avoid unbalanced \ifs.
\edef\gmu@tempd{%
424   \long\def\@nx\gmu@tempd
425     #####1\all@other\gmu@tempa
426     #####2\all@other\gmu@tempb
427     #####3\@nx\gmu@tempd{%
428       \@ifempty{#####3}{\hidden@iffalse}{\hidden@iftrue}}%
429     \gmu@tempd% it defines \gmu@tempc to produce an open \if depending on whether
430       the start and end token(s) are found in the meaning of #2.

431 \edef\gmu@temp{%
432   \@nx\gmu@tempd\all@other#2%
433   \all@other\gmu@tempa
434   \all@other\gmu@tempb\@nx\gmu@tempd
435 }%
436 \gmu@temp% we apply the checker and it produces an open \if.

\edef\gmu@tempd{%
437   \long\def\@nx\gmu@tempd
438     #####1\@xa\unexpanded\@xa{\gmu@tempa}%
439     #####2\@xa\unexpanded\@xa{\gmu@tempb}%
440     #####3\@nx\ampulexdef{%
441       we define a temporary macro with the parameters
442         delimited with the 'start' and 'end' parameters of \ampulexdef.
443       \@nx\unexpanded{#####1}%
444       \@nx\@xa\@nx\unexpanded
445 }
```

```

452      \c@nx\cxa{\c@nx\gmu@tempc}{% we replace the part of the redefined macro's
453      meaning with the replacement text.
454      \c@nx\unexpanded{####3}}}{%
455      \gmu@tempd
456      \edef\gmu@tempe{%
457          \#1\def\c@nx#2\gmu@ampulexpa{%
458              \c@xa\cxa\cxa\gmu@tempd\c@xa#2\gmu@ampulexp
459              \ampulexdef}}}{%
460          \gmu@tempe
461      \fi}
462
\ampulexset 463 \long\def\ampulexset#1#2{%
464     \def\gmu@ampulexpa{#1}% it's the parameter string for definition
465     \def\gmu@ampulexp{#2}% it's the arguments string for the first expansion. For
466     the example of usage see 1373.
467 }
468
470 \ampulexset{}{}
```

For the heavy debugs I was doing while preparing gmdoc, as a last resort I used `\showlists`. But this command alone was usually too little: usually it needed setting `\showboxdepth` and `\showboxbreadth` to some positive values. So,

```

\gmshowlists 480 \def\gmshowlists{\showboxdepth=1000\showboxbreadth=1000%
481     \showlists}
\nameSHOW 483 \newcommand\nameSHOW[1]{\cxa\show\csname#1\endcsname}
\nameSHOWthe 484 \newcommand\nameSHOWthe[1]{\cxa\showthe\csname#1\endcsname}
```

Note that to get proper `\showthe\my@dimen14` in the ‘other’ @’s scope you write `\nameSHOWthe{\my@dimen}14`.

Standard `\string` command returns a string of ‘other’ chars except for the space, for which it returns `\space`. In gmdoc I needed the spaces in macros’ and environments’ names to be always `\space`, so I define

```

\xiistring 495 \def\xiistring#1{%
496     \if\c@nx#1\xiispace
497         \xiispace
498     \else
499         \string#1%
500     \fi}
```

`\@ifnextcat, \@ifnextac`

As you guess, we `\def \@ifnextcat à la \@ifnextchar`, see L^AT_EX 2_E source dated 2003/12/01, file d, lines 253–271. The difference is in the kind of test used: while `\@ifnextchar` does `\ifx`, `\@ifnextcat` does `\ifcat` which means it looks not at the meaning of a token(s) but at their `\catcode`(s). As you (should) remember from *The T_EXbook*, the former test doesn’t expand macros while the latter does. But in `\@ifnextcat` the peeked token is protected against expanding by `\noexpand`. Note that the first parameter is not protected and therefore it shall be expanded if it’s a macro. Because an assignment is involved, you can’t test whether the next token is an active char.

```

\@ifnextcat 517 \long\def\@ifnextcat#1#2#3{%
521     \def\reserved@d{#1}%
522     \def\reserved@a{#2}%
```

```

523  \def\reserved@b{#3}%
524  \futurelet\@let@token\@ifncat}
\@ifncat 527 \def\@ifncat{%
528  \ifx\@let@token\@sptoken
529  \let\reserved@c\@xifncat
530  \else
531  \ifcat\reserved@d\@nx\@let@token
532  \let\reserved@c\reserved@a
533  \else
534  \let\reserved@c\reserved@b
535  \fi
536  \fi
537  \reserved@c}
539 {\def\:{\let\@sptoken=\:\: \% this makes \@sptoken a space token.
540 \def\:{\@xifncat}\@xa\gdef\:{\futurelet\@let@token\@ifncat}}

```

Note the trick to get a macro with no parameter and requiring a space after it. We do it inside a group not to spoil the general meaning of \: (which we extend later).

The next command provides the real \if test for the next token. It should be called \@ifnextchar but that name is assigned for the future \ifx text, as we know. Therefore we call it \@ifnextif.

```

\@ifnextif 553 \long\pdef\@ifnextif#1#2#3{%
554  \def\reserved@d{#1}%
555  \def\reserved@a{#2}%
556  \def\reserved@b{#3}%
557  \futurelet\@let@token\@ifnif}
\@ifnif 563 \def\@ifnif{%
564  \ifx\@let@token\@sptoken
565  \let\reserved@c\@xifnif
566  \else
567  \if\reserved@d\@nx\@let@token
568  \let\reserved@c\reserved@a
569  \else
570  \let\reserved@c\reserved@b
571  \fi
572  \fi
573  \reserved@c}
576 {\def\:{\let\@sptoken=\:\: \% this makes \@sptoken a space token.
577 \def\:{\@xifnif}\@xa\gdef\:{\futurelet\@let@token\@ifnif}}

```

But how to peek at the next token to check whether it's an active char? First, we look with \@ifnextcat whether there stands a group opener. We do that to avoid taking a whole {...} as the argument of the next macro, that doesn't use \futurelet but takes the next token as an argument, tests it and puts back intact.

```

\@ifnextac 589 \long\pdef\@ifnextac#1#2{%
590  \@ifnextcat\bgroup{#2}{\gm@ifnac{#1}{#2}}}
\gm@ifnac 592 \long\def\gm@ifnac#1#2#3{%
593  \ifcat\@nx~\@nx#3\afterfi{#1#3}\else\afterfi{#2#3}\fi}

```

Yes, it won't work for an active char \let to {, but it will work for an active char \let to a char of catcode ≠ 1. (Is there anybody on Earth who'd make an active char working as \bgroup?)

Now, define a test that checks whether the next token is a genuine space, \square_{10} that is. First define a cs let such a space. The assignment needs a little trick (*The T_EXbook* appendix D) since \let's syntax includes one optional space after =.

```

606 \let\gmu@reserveda\*%
607 \def\*{%
608   \let\*\gmu@reserveda
609   \let\gm@letspace=\%
610 \*%
611 \def\@ifnextspace#1#2{%
612   \let\gmu@reserveda\*%
613   \def\*{%
614     \let\gmu@reserveda\*%
615     \def\*{%
616       \let\*\gmu@reserveda
617       \ifx\@let@token\gm@letspace\afterfi{#1}%
618       \else\afterfi{#2}%
619       \fi}%
620     \futurelet\@let@token\*}

```

First use of this macro is for an active – that expands to --- if followed by a space. Another to make dot checking whether is followed by ~ without gobbling the space if it occurs instead.

Now a test if the next token is an active line end. I use it in gmdoc and later in this package for active long dashes.

```

629 \foone\obeylines{%
630   \long\pdef\@ifnextMac#1#2{%
631     \@ifnextchar^{\M{#1}\M{#2}}{}}

```

\afterfi and pals

It happens from time to time that you have some sequence of macros in an \if... and you would like to expand \fi before expanding them (e.g., when the macros should take some tokens next to \fi... as their arguments. If you know how many macros are there, you may type a couple of \expandafters and not to care how terrible it looks. But if you don't know how many tokens will there be, you seem to be in a real trouble. There's the Knuthian trick with \next. And here another, revealed to me by my T_EX Guru.

I think the situations when the Knuthian (the former) trick is not available are rather seldom, but they are imaginable at least: the \next trick involves an assignment so it won't work e.g. in \edef.

```
\afterfi 656 \long\def\afterfi#1#2\fi{\fi#1}
```

And two more of that family:

```
\afterfifi 658 \long\def\afterfifi#1#2\fi#3\fi{\fi\fi#1}
\afteriffifi 659 \long\def\afteriffifi#1#2\if#3\fi#4\fi{\fi#1}
```

Notice the refined elegance of those macros, that cover both 'then' and 'else' cases thanks to #2 that is discarded.

```
\afterififfifi 663 \long\def\afterififfifi#1#2\fi#3\fi#4\fi{\fi#1}
\afteriffifi 664 \long\def\afteriffifi#1#2\fi#3\fi#4\fi{\fi\fi#1}
\afterfifi 665 \long\def\afterfifi#1#2\fi#3\fi#4\fi{\fi\fi\fi#1}
```

Environments redefined

Almost an environment or redefinition of \begin

We'll extend the functionality of \begin: the non-starred instances shall act as usual and we'll add the starred version. The difference of the latter will be that it won't check whether the 'environment' has been defined so any name will be allowed.

This is intended to structure the source with named groups that don't have to be especially defined and probably don't take any particular action except the scoping.

(If the \begin*'s argument is a (defined) environment's name, \begin* will act just like \begin.)

Original L^AT_EX's \begin:

```
\def\begin#1{%
  \@ifundefined{#1}{%
    {\def\reserved@a{\@latex@error{Environment #1
      undefined}\@eha}}%
    {\def\reserved@a{\def\@currenvir{#1}%
      \edef\@currenvline{\on@line}%
      \csname #1\endcsname}}%
  \@ignorefalse
  \begingroup\@endpefalse\reserved@a}
\@begnamedgroup 696 \long\def\@begnamedgroup#1{%
  \@ignorefalse% not to ignore blanks after group
  \begingroup\@endpefalse
  699 \edef\@currenvir{#1}% We could do recatcoding through \string but all the
    name 'other' could affect a thousand packages so we don't do that and we'll
    recatcode in a testing macro, see line 751.
  703 \edef\@currenvline{\on@line}%
  704 \csname#1\endcsname}% if the argument is a command's name (an environment's e.g.), this command will now be executed. (If the corresponding
    control sequence hasn't been known to TEX, this line will act as \relax.)
```

For back compatibility with my earlier works

```
\bnamegroup 712 \let\bnamegroup\@begnamedgroup
```

And for the ending

```
\enamegroup 714 \def\enamegroup#1{\end{#1}}
```

And we make it the starred version of \begin.

```
\begin* 720 \def\begin{\@ifstar{\@begnamedgroup}{%
  \begin 721   \@begnamedgroup@ifcs}}
```

```
\@begnamedgroup@ifcs 724 \def\@begnamedgroup@ifcs#1{%
  725   \ifcsname#1\endcsname\afterfi{\@begnamedgroup{#1}}%
  726   \else\afterfi{\@latex@error{Environment #1 undefined}\@eha}%
  727   \fi}%
```

\@ifenvir and improvement of \end

It's very clever and useful that \end checks whether its argument is \ifx-equivalent \@currenvir. However, in standard L^AT_EX it works not quite as I would expect: Since the idea of environment is to open a group and launch the cs named in the \begin's argument. That last thing is done with \csname... \endcsname so the catcodes of chars are irrelevant (until they are \active, 1, 2 etc.). Thus should be also in the \end's test and therefore we ensure the compared texts are both expanded and made all 'other'.

First a (not expandable) macro that checks whether current environment is as given in #1. Why is this macro `\long`?—you may ask. It's `\long` to allow environments such as `\string\par`.

```

751 \long\def\@ifenvir#1#2#3{%
752   \edef\gmu@reserveda{\@xa\string\csname\@currenvir\endcsname}%
753   \edef\gmu@reservedb{\@xa\string\csname#1\endcsname}%
754   \ifx\gmu@reserveda\gmu@reservedb\afterfi{#2}%
755   \else\afterfi{#3}%
756   \fi}
757
758 \def\@checkend#1{\@ifenvir{#1}{}{\@badend{#1}}}

```

Thanks to it you may write `\begin{macrocode}` with *₁₂ and end it with `\end{macrocode}` with *₁₁ (that was the problem that led me to this solution). The error messages looked really funny:

```

! LaTeX Error: \begin{macrocode} on input line 1844 ended by
              \end{macrocode}.

```

You might also write also `\end{macrocode}\star` where `\star` is defined as 'other' star or letter star.

From `relsize`

As file `relsize.sty`, v3.1 dated July 4, 2003 states, L^AT_EX 2_E version of these macros was written by Donald Arseneau asnd@triumf.ca and Matt Swift swift@bu.edu after the L^AT_EX 2.09 `smaller.sty` style file written by Bernie Cosell cosell@WILMA.BBN.COM.

I take only the basic, non-math mode commands with the assumption that there are the predefined font sizes.

```

\relsize
    You declare the font size with \relsize{<n>} where <n> gives the number of steps ("mag-step" = factor of 1.2) to change the size by. E.g., n = 3 changes from \normalsize to \LARGE size. Negative n selects smaller fonts. \smaller == \relsize{-1}; \larger == \relsize{1}. \smallerr(my addition) == \relsize{-2}; \largerr guess yourself.
\smaller
\larger
    (Since \DeclareRobustCommand doesn't issue an error if its argument has been defined and it only informs about redefining, loading relsize remains allowed.)
\largerr

\relsize
799 \pdef\relsize#1{%
800   \ifmmode\@nomath\relsize\else
801     \begingroup
802       \tempcnta% assign number representing current font size
803       \ifx\currsize\normalsize\else% funny order is to have most
804         ...
805         \ifx\currsize\small\else...% ...likely sizes checked first
806         \ifx\currsize\footnotesize\else
807           \ifx\currsize\large\else
808             \ifx\currsize\Large\else
809               \ifx\currsize\LARGE\else
810                 \ifx\currsize\scriptsize\else
811                   \ifx\currsize\tiny\else
812                     \ifx\currsize\huge\else
813                       \ifx\currsize\Huge\else
814                         4\rs@unknown@warning% unknown state: \normalsize as
                           starting point
                           \fi\fi\fi\fi\fi\fi\fi\fi

```

Change the number by the given increment:

```
816     \advance\@tempcnta#1\relax
watch out for size underflow:
818     \ifnum\@tempcnta<\z@\rs@size@warning{small}{\string\tiny}%
819         \atempcnta\z@\fi
820     \@xa\endgroup
821     \ifcase\@tempcnta% set new size based on altered number
822         \tiny\or\scriptsize\or\footnotesize\or\small\or%
823             \normalsize\or
824         \large\or\Large\or\LARGE\or\huge\or\Huge\else
825             \rs@size@warning{large}{\string\Huge}\Huge
826     \fi\fi% end of \relsize.
\rs@size@warning 826 \providecommand*\rs@size@warning[2]{\PackageWarning{gmutils}%
827   (relsize)}%
827 \Size requested is too #1.\MessageBreak Using #2 instead}
\rs@unknown@warning 829 \providecommand*\rs@unknown@warning{\PackageWarning{gmutils}%
829   (relsize)}{Current font size
830   is unknown! (Why?!?)\MessageBreak Assuming \string\normalsize}}
```

And a handful of shorthands:

```
\larger 834 \DeclareRobustCommand*\larger[1][\@ne]{\relsize{+\#1}}
\smaller 835 \DeclareRobustCommand*\smaller[1][\@ne]{\relsize{-\#1}}
\textlarger 836 \DeclareRobustCommand*\textlarger[2][\@ne]{{\relsize{+\#1}\#2}}
\textsmaller 837 \DeclareRobustCommand*\textsmaller[2][\@ne]{{\relsize{-\#1}\#2}}
\largerr 838 \pdef\largerr{\relsize{+2}}
\smallerr 839 \pdef\smallerr{\relsize{-2}}
```

Some ‘other’ stuff

Here I define a couple of macros expanding to special chars made ‘other’. It’s important the cs are expandable and therefore they can occur e.g. inside \csname... \endcsname unlike e.g. cs’es \chardef.

```
849 \foone{\catcode`\_=_8}%
\subs 850 {\let\subs=_}
852 \foone{\makeother\_}%
\xiunder 853 {\def\xiunder{_}}
855 \ifdefined\XeTeXversion
\xiunder 856 \def\xiunder{\char"005F}%
857 \let\_xiunder
858 \fi
860 \foone{\catcode`\_=1\makeother\{%
861   \catcode`\_=2\makeother\}}%
862 [%]
\xiilbrace 863 \def\xiilbrace[{}]
\xiirbrace 864 \def\xiirbrace[{}]]%
865 ]% of \firstofone
```

Note that L^AT_EX’s \char1b and \charrb are of catcode 11 (‘letter’), cf. The L^AT_EX 2_E Source file k, lines 129–130.

Now, let's define such a smart `_` (underscore) which will be usual `_8` in the math mode and `_12` ('other') outside math.

```

876 \foone{\catcode`\_=\active}
877 {%
\smartunder 878   \newcommand*\smartunder{%
879     \catcode`\_=\active
880     \def_{\ifmmode\subs\else\_fi}}}% We define it as \_ not just as \xiounder
           because some font encodings don't have _ at the \char`\_ position.

886 \foone{\catcode`\!=o
887   @makeother\\}
\xiibackslash 888 {!newcommand!*xiibackslash{}}

\bslash 892 \let\bslash=\xiibackslash

896 \foone{@makeother\%}
\xiipercent 897 {\def\xiipercent{}}

900 \foone{@makeother\&}\%
\xiand 901 {\def\xiand{\&}}

903 \foone{@makeother\_\_}\%
\xiispace 904 {\def\xiispace{\_\_}}

```

We introduce `\visibleSpace` from Will Robertson's `xltextra` if available. It's not sufficient `\ifpackageloaded{xltextra}` since `\xxt@visibleSpace` is defined only unless `no-verb` option is set. 2008/08/06 I recognized the difference between `\xiispace` which has to be plain 'other' char (used in `\xiistring`) and something visible to be printed in any font.

```

913 \AtBeginDocument{%
914   \ifdefined\xxt@visibleSpace
915     \let\visibleSpace\xxt@visibleSpace
916   \else
917     \let\visibleSpace\xiispace
918   \fi}

```

Metasymbols

I fancy also another Knuthian trick for typesetting *(metasymbols)* in *The TeXbook*. So I repeat it here. The inner `\meta` macro is copied verbatim from doc's v2.1b documentation dated 2004/02/09 because it's so beautifully crafted I couldn't resist. I only don't make it `\long`.

"The new implementation fixes this problem by defining `\meta` in a radically different way: we prevent hyphenation by defining a `\language` which has no patterns associated with it and use this to typeset the words within the angle brackets."

```
\meta 939 \pdef\meta#1{%
```

"Since the old implementation of `\meta` could be used in math we better ensure that this is possible with the new one as well. So we use `\ensuremath` around `\langle` and `\rangle`. However this is not enough: if `\meta@font@select` below expands to `\itshape` it will fail if used in math mode. For this reason we hide the whole thing inside an `\nfss@text` box in that case."

```

947   \ensuremath\langle
948   \ifmmode\@xa\@nfss@text\fi
949   {%

```

```
950 \meta@font@select
```

Need to keep track of what we changed just in case the user changes font inside the argument so we store the font explicitly.

```
958 #1\%  
960 }\ensuremath\rangle  
961 }
```

But I define `\meta@font@select` as the brutal and explicit `\it` instead of the original `\itshape` to make it usable e.g. in the gmdoc's `\cs` macro's argument.

```
\meta@font@select 969 \def\meta@font@select{\it}
```

The below `\meta`'s drag¹ is a version of *The T_EXbook*'s one.

```
\langle...> 975 \def\langle#1\rangle{\meta{#1}}
```

Macros for printing macros and filenames

First let's define three auxiliary macros analogous to `\dywiz` from `polski.sty`: a short-hands for `\discretionary` that'll stick to the word not spoiling its hyphenability and that'll won't allow a linebreak just before nor just after themselves. The `\discretionary` T_EX primitive has three arguments: #1 'before break', #2 'after break', #3 'without break', remember?

```
\discre 986 \def\discre#1#2#3{\leavevmode\kernosp%  
987 \discretionary{#1}{#2}{#3}\penalty10000\hskiposp\relax}  
\discret 988 \def\discret#1{\leavevmode\kernosp%  
989 \discretionary{#1}{#1}{#1}\penalty10000\hskiposp\relax}
```

A tiny little macro that acts like `\-` outside the math mode and has its original meaning inside math.

```
\vs 993 \def\:{\ifmmode\afterfi{\mskip\medmuskip}\else\afterfi{\discret{}%  
}\fi}  
995 \newcommand*\vs{\discre{\visiblespace}{}{\visiblespace}}
```

Then we define a macro that makes the spaces visible even if used in an argument (i.e., in a situation where `\catcode`ing has no effect).

```
\printspaces 1001 \def\printspaces#1{{\let~=\vs\let_==\vs\gm@pswords#1\@nil}}  
\gm@pswords 1003 \def\gm@pswords#1#2\@nil{  
1004 \ifx\relax#1\relax\else#1\fi  
1005 \ifx\relax#2\relax\else\vs\penalty\hyphenpenalty\gm@pswords#2%  
 \@nil\fi}% note that in the recursive call of \gm@pswords the argument  
 string is not extended with a guardian space: it has been already  
 by \printspaces.
```

```
\sfname 1010 \pdef\sfname#1{\textsf{\printspaces{#1}}}  
\gmu@discretionaryslash 1012 \def\gmu@discretionaryslash{\discre{/}{\hbox{}{}}}% the  
 second pseudo-argument nonempty to get \hyphenpenalty  
 not \exhyphenpenalty.
```

```
\file 1017 \pdef\file#1{\gmu@printslashes#1/\gmu@printslashes}  
\gmu@printslashes 1019 \def\gmu@printslashes#1/#2\gmu@printslashes{  
1020 \sfname{#1}}
```

¹ Think of the drags that transform a very nice but rather standard 'auntie' ('Tante' in Deutsch) into a most adorable Queen ;-).

```

1021  \ifx\gmu@printslashes#2\gmu@printslashes
1022  \else
1023  \textsf{\gmu@discretionaryslash}%
1024  \afterfi{\gmu@printslashes#2\gmu@printslashes}\fi}

```

it allows the spaces in the filenames (and prints them as \square).

The below macro I use to format the packages' names.

```
\pk 1032 \pdef\pk#1{\textsf{\textup{#1}}}
```

Some (if not all) of the below macros are copied from doc and/or ltxdoc.

A macro for printing control sequences in arguments of a macro. Robust to avoid writing an explicit \backslash into a file. It calls \ttfamily not \texttt to be usable in headings which are boldface sometimes.

```
\cs 1043 \DeclareRobustCommand*{\cs}[2][\bslash]{%
1044   \def\-\{\discretionary{{\rmfamily-}}{}{}\}%
1045   \def\{\{\char`\\def\}\char`\\}\ttfamily_{\#1\#2}}
```

```
\env 1049 \pdef\env#1{\cs[]{\#1}}
```

And for the special sequences like $\wedge\wedge A$:

```
\foone 1052 {\@makeother\wedge}
\hatthat 1053 {\pdef\hatthat#1{\cs[\wedge]{\#1}}}
```

And one for encouraging linebreaks e.g., before long verbatim words.

```
\possfil 1058 \newcommand*\possfil{\hfil\penalty1000\hfilneg}
```

The five macros below are taken from the ltxdoc.dtx.

$\cmd{\foo}$ Prints \foo verbatim. It may be used inside moving arguments.

$\cs{\foo}$ also prints \foo , for those who prefer that syntax. (This second form may even be used when \foo is \outer).

```
\cmd 1068 \def\cmd#1{\cs{\@xa\cmd@to@cs\string#1}}
\cmd@to@cs 1070 \def\cmd@to@cs#1#2{\char\number`#2\relax}
```

\marg{text} prints $\{text\}$, ‘mandatory argument’.

```
\marg 1074 \def\marg#1{\{\ttfamily\char`\\{}\meta{\#1}\ttfamily\char`\\{}\}}
\oarg 1075 \def\oarg{\@ifnextchar[\@oargsq\@arg}
```

\oarg{text} prints $\{text\}$, ‘optional argument’. Also \oarg{text} does that.

```
\oarg 1079 \def\oarg{\@ifnextchar[\@oargsq\@arg}
\@oarg 1081 \def\@oarg#1{\{\ttfamily\char`\\{}\meta{\#1}\ttfamily\char`\\{}\}}
\@oargsq 1082 \def\@oargsq[#1]{\@oarg{\#1}}
```

$\parg{te,xt}$ prints $\langle te,xt\rangle$, ‘picture mode argument’.

```
\parg 1086 \def\parg{\@ifnextchar(\@pargp\@parg}
\@parg 1088 \def\@parg#1{\{\ttfamily\char`\\{}\meta{\#1}\ttfamily\char`\\{}\}}
\@pargp 1089 \def\@pargp(#1){\@parg{\#1}}
```

But we can have all three in one command.

```
\arg 1093 \AtBeginDocument{%
\arg 1094   \let\math@arg\arg
\arg 1095   \def\arg{\ifmmode\math@arg\else\afterfi{%
1096     \@ifnextchar[%
1097       \@oargsq{\@ifnextchar(%%
1098         \@pargp\marg})\fi}%
1099 }}
```

Now you can write

$\arg\{mand._arg\}$ to get $\{\langle mand. arg \rangle\}$,
 $\arg\{opt._arg\}$ for $\{\langle opt. arg \rangle\}$ and
 $\arg\{pict._arg\}$ for $\{\langle pict. arg \rangle\}$.
And $\arg(1+i) = \pi/4$ for $\arg(1 + i) = \pi/4$.

Storing and restoring the meanings of cses

First a Boolean switch of globalness of assignments and its verifier.

```
\ifgmu@SMglobal 1114 \newif\ifgmu@SMglobal
\SMglobal 1116 \pdef\SMglobal{\gmu@SMglobaltrue}
```

The subsequent commands are defined in such a way that you can ‘prefix’ them with \SMglobal to get global (re)storing.

A command to store the current meaning of a cs in another macro to temporarily redefine the cs and be able to set its original meaning back (when grouping is not recommended):

```
\StoreMacro 1127 \pdef\StoreMacro{%
 1128   \bgroup\makeatletter\@ifstar\egStore@MacroSt\egStore@Macro}
```

The unstarred version takes a cs and the starred version a text, which is intended for special control sequences. For storing environments there is a special command in line [1251](#).

```
\egStore@Macro 1133 \long\def\egStore@Macro#1{\egroup\Store@Macro{#1}}
\egStore@MacroSt 1134 \long\def\egStore@MacroSt#1{\egroup\Store@MacroSt{#1}}
\Store@Macro 1136 \long\def\Store@Macro#1{%
 1137   \escapechar92
 1138   \ifgmu@SMglobal\afterfi\global\fi
 1139   \@xa\let\csname\gmu/store\string#1\endcsname#1%
 1140   \global\gmu@SMglobalfalse}
\Store@MacroSt 1143 \long\def\Store@MacroSt#1{%
 1144   \edef\gmu@smtempa{%
 1145     \ifgmu@SMglobal\global\fi
 1146     \@nx\let\@xa\@nx\csname\gmu/store\bslash#1\endcsname% we add
        backslash because to ensure compatibility between \StoreMacro
        and \StoreMacro*, that is. to allow writing
        e.g. \StoreMacro{kitten} and then \RestoreMacro*{kitten} to
        restore the meaning of \kitten.
 1147     \@xa\@nx\csname#1\endcsname}
 1148   \gmu@smtempa
 1149   \global\gmu@SMglobalfalse}% we wish the globality to be just once.
```

We make the \StoreMacro command a three-step to allow usage of the most inner macro also in the next command.

The starred version, $\StoreMacro*$ works with csnames (without the backslash). It’s first used to store the meanings of robust commands, when you may need to store not only \foo , but also $\csname\foo\endcsname$.

The next command iterates over a list of cses and stores each of them. The cs may be separated with commas but they don’t have to.

```
\StoreMacros 1170 \long\pdef\StoreMacros{\bgroup\makeatletter\Store@Macros}
\Store@Macros 1171 \long\def\Store@Macros#1{\egroup
 1172   \gmu@setsetSMglobal}
```

```

1173  \let\gml@StoreCS\Store@Macro
1174  \gml@storemacros#1.}

\gmu@setsetSMglobal
1177 \def\gmu@setsetSMglobal{%
1178   \ifgmu@SMglobal
1179     \let\gmu@setSMglobal\gmu@SMglobaltrue
1180   \else
1181     \let\gmu@setSMglobal\gmu@SMglobalse
1182   \fi}

```

And the inner iterating macro:

```

\gml@storemacros
1185 \long\def\gml@storemacros#1{%
1186   \def\gmu@reserveda{\@nx#1}% My TeX Guru's trick to deal with \fi and such,
1187   i.e., to hide #1 from TeX when it is processing a test's branch without expanding.
1188   \if\gmu@reserveda.% a dot finishes storing.
1189     \global\gmu@SMglobalse
1190   \else
1191     \if\gmu@reserveda,% The list this macro is put before may contain commas
1192       and that's O.K., we just continue the work.
1193     \afterfifi\gml@storemacros
1194   \else% what is else this shall be stored.
1195     \gml@StoreCS{#1}% we use a particular cs to map \let it both to the storing
1196     macro as above and to the restoring one as below.
1197     \afterfifi{\gmu@setSMglobal\gml@storemacros}%
1198   \fi
1199   \fi
1200 }
1201 \fi

```

And for the restoring

```

\RestoreMacro
1207 \pdef\RestoreMacro{%
1208   \bgroup\makeatletter\@ifstar\egRestore@MacroSt\egRestore@Macro}
\egRestore@Macro
1210 \long\def\egRestore@Macro#1{\egroup\Restore@Macro{#1}}
\egRestore@MacroSt
1211 \long\def\egRestore@MacroSt#1{\egroup\Restore@MacroSt{#1}}

\Restore@Macro
1213 \long\def\Restore@Macro#1{%
1214   \escapechar92
1215   \ifgmu@SMglobal\afterfi\global\fi
1216   \@xa\let\@xa#1\csname\gmu/store/string#1\endcsname
1217   \global\gmu@SMglobalse}

\Restore@MacroSt
1219 \long\def\Restore@MacroSt#1{%
1220   \edef\gmu@smtempa{%
1221     \ifgmu@SMglobal\global\fi
1222     \@nx\let\@xa\@nx\csname#1\endcsname
1223     \@xa\@nx\csname/gmu/store/bslash#1\endcsname}% cf. the commentary
1224     in line 1146.
1225   \gmu@smtempa
1226   \global\gmu@SMglobalse}

\RestoreMacros
1229 \long\pdef\RestoreMacros{\bgroup\makeatletter\Restore@Macros}

\Restore@Macros
1231 \long\def\Restore@Macros#1{\egroup
1232   \gmu@setsetSMglobal
1233   \let\gml@StoreCS\Restore@Macro% we direct the core cs towards restoring
1234   and call the same iterating macro as in line 1174.
1235   \gml@storemacros#1.}

```

As you see, the `\RestoreMacros` command uses the same iterating macro inside, it only changes the meaning of the core macro.

And to restore *and* use immediately:

```
\StoredMacro 1242 \def\StoredMacro{\bgroup\makeatletter\Stored@Macro}
\Stored@Macro 1243 \long\def\Stored@Macro#1{\egroup\Restore@Macro#1#1}
```

To be able to call a stored cs without restoring it.

```
\storedcsname 1246 \def\storedcsname#1{%
 1247   \csname\gmu/store\bslash#1\endcsname}
```

2008/08/03 we need to store also an environment.

```
\StoreEnvironment 1251 \pdef\StoreEnvironment#1{%
 1253   \StoreMacro*{#1}\StoreMacro*{end#1}}
```

```
\RestoreEnvironment 1255 \pdef\RestoreEnvironment#1{%
 1257   \RestoreMacro*{#1}\RestoreMacro*{end#1}}
```

It happened (see the definition of `\@docininclude` in `gmdoc.sty`) that I needed to `\relax` a bunch of macros and restore them after some time. Because the macros were rather numerous and I wanted the code more readable, I wanted to `\do` them. After a proper defining of `\do` of course. So here is this proper definition of `\do`, provided as a macro (a declaration).

```
\StoringAndRelaxingDo 1272 \long\def\StoringAndRelaxingDo{%
 1273   \gmu@SMdo@setscope
 1274   \long\def\do##1{%
 1275     \gmu@SMdo@scope
 1276     \o@xa\let\csname\gmu/store\string##1\endcsname##1%
 1277     \gmu@SMdo@scope\let##1\relax}}
```

```
\gmu@SMdo@setscope 1279 \def\gmu@SMdo@setscope{%
 1280   \ifgmu@SMglobal\let\gmu@SMdo@scope\global
 1281   \else\let\gmu@SMdo@scope\relax
 1282   \fi
 1283   \global\gmu@SMglobalfalse}
```

And here is the counter-definition for restore.

```
\RestoringDo 1292 \long\def\RestoringDo{%
 1293   \gmu@SMdo@setscope
 1294   \long\def\do##1{%
 1295     \gmu@SMdo@scope
 1296     \o@xa\let\o@xa##1\csname\gmu/store\string##1\endcsname}}
```

Note that both `\StoringAndRelaxingDo` and `\RestoringDo` are sensitive to the `\SMglobal` ‘prefix’.

And to store a cs as explicitly named cs, i.e. to `\let` one `csname` another (`\n@melet` not `\@namelet` because the latter is defined in Till Tantau’s beamer class another way) (both arguments should be text):

```
\n@melet 1304 \def\n@melet#1#2{%
 1305   \edef\gmu@nl@reserveda{%
 1306     \let\o@xa\o@nx\csname#1\endcsname
 1307     \o@xa\o@nx\csname#2\endcsname}%
 1308   \gmu@nl@reserveda}
```

The `\global` prefix doesn’t work with `\n@melet` so we define the alternative.

```
\gn@melet 1312 \def\gn@melet#1#2{%
```

```

1313 \edef\gmu@nl@reserveda{%
1314   \global\let\@xa\@nx\csname#1\endcsname
1315   \@xa\@nx\csname#2\endcsname}%
1316 \gmu@nl@reserveda}

```

Not only preamble!

Let's remove some commands from the list to erase at begin document! Primarily that list was intended to save memory not to forbid anything. Nowadays, when memory is cheap, the list of only-preamble commands should be rethought IMO.

```

\not@onlypreamble 1333 \newcommand\not@onlypreamble[1]{{%
1334   \def\do##1{\ifx##1\else\@nx\do\@nx##1\fi}%
1335   \xdef\@preamblecmds{\@preamblecmds}}}
1337 \not@onlypreamble\@preamblecmds
1338 \not@onlypreamble\@ifpackageloaded
1339 \not@onlypreamble\@ifclassloaded
1340 \not@onlypreamble\@ifl@aded
1341 \not@onlypreamble\@pkgextension

```

And let's make the message of only preamble command's forbidden use informative a bit:

```

\gm@notprerr 1346 \def\gm@notprerr{\can be used only in preamble (\online)}
1348 \AtBeginDocument{%
1349   \def\do#1{\@nx\do\@nx#1}%
1350   \edef\@preamblecmds{%
1351     \def\@nx\do##1{%
1352       \def##1{\@nx\PackageError{gmutils/LaTeX}{%
1353         {\@nx\string##1\@nx\gm@notprerr}\@nx\@eha}}%
1354     \@preamblecmds}}

```

A subtle error raises: the L^AT_EX standard \@onlypreamble and what \document does with \@preamblecmds makes any two of 'only preamble' cs's \ifx-identical inside document. And my change makes any two cs's \ifx-different. The first it causes a problem with is standard L^AT_EX's \nocite that checks \ifx\@onlypreamble\document. So hoping this is a rare problem, we circumvent in with. 2008/08/29 a bug is reported by Edd Barrett that with natbib an 'extra)' error occurs so we wrap the fix in a conditional.

```

\gmu@nocite@ampulex 1371 \def\gmu@nocite@ampulex{\% we wrap the stuff in a macro to hide an open \if.
1372   And not to make the begin-input hook not too large.
1373   \ampulexset{#####1}{\#\#\#1}\% the first is the parameters string and the
1374   second the argument for one-level expansion of \nocite so it has to consist
1375   of two times less hashes than the first. Both hash strings are doubled to pass
1376   the first \def.
1377   \ampulexdef\nocite\ifx
1378   {\@onlypreamble\document}%
1379   \iftrue}
1380 \AtBeginDocument\gmu@nocite@ampulex

```

Third person pronouns

Is a reader of my documentations 'she' or 'he' and does it make a difference?

Not to favour any gender in the personal pronouns, define commands that'll print alternately masculine and feminine pronoun of third person. By 'any' I mean not only typically masculine and typically feminine but the entire amazingly rich variety of people's genders, *including* those who do not describe themselves as 'man' or 'woman'.

One may say two pronouns is far too little to cover this variety but I could point Ursula's K. LeGuin's *The Left Hand Of Darkness* as another acceptable answer. In that moody and moderate SF novel the androgynous persons are usually referred to as 'mister', 'sir' or 'he': the meaning of reference is extended. Such an extension also my automatic pronouns do suggest. It's *not* political correctness, it's just respect to people's diversity.

```
gm@PronounGender 1409 \newcounter{gm@PronounGender}
\gm@atppron 1411 \newcommand*\gm@atppron[2]{%
 1412   \stepcounter{gm@PronounGender}% remember \stepcounter is global.
 1413   \ifodd\value{gm@PronounGender}\#1\else\#2\fi}

\HiHim 1422 \newcommand*\HiHim{\gm@atppron{Him}{Her}}
\HiHers 1423 \newcommand*\HiHers{\gm@atppron{His}{Hers}}
```

Improvements to mwcls sectioning commands

That is, 'Experi-mente'² mit MW sectioning & \refstepcounter to improve mwcls's cooperation with hyperref. They shouldn't make any harm if another class (non-mwcls) is loaded.

We \refstep sectioning counters even if the sectionings are not numbered, because otherwise

1. pdfTeX cried of multiply defined \labels,
2. e.g. in a table of contents the hyperlink <rozdzia\l\Kwiaty_polskie> linked not to the chapter's heading but to the last-before-it change of \ref.

```
1480 \AtBeginDocument{%
  because we don't know when exactly hyperref is loaded and
  maybe after this package.}
```

```
NoNumSecs 1482 \@ifpackageloaded{hyperref}{\newcounter{NoNumSecs}%
 1483   \setcounter{NoNumSecs}{617}%
  to make \refing to an unnumbered section
  visible (and funny?).
 1485   \def\gm@hyperrefstepcounter{\refstepcounter{NoNumSecs}}%
 1486   \pdef\gm@targetheading{\%}
 1487     \hypertarget{\#1}{\#1}}%
  end of then
 1488   {\def\gm@hyperrefstepcounter{}%
 1489     \def\gm@targetheading{\#1}{\#1}}%
  end of else
 1490 }%
  of \AtBeginDocument
```

Auxiliary macros for the kernel sectioning macro:

```
bersectionsoutofmainmatter 1493 \def\gm@dontnumbersectionsoutofmainmatter{%
 1494   \if@mainmatter\else\HeadingNumberedfalse\fi}
\gm@clearpagesduetoopenright 1495 \def\gm@clearpagesduetoopenright{%
 1496   \if@openright\cleardoublepage\else\clearpage\fi}
```

² A. Berg, *Wozzeck*.

To avoid \defing of \mw@sectionxx if it's undefined, we redefine \def to gobble the definition and restore the original meaning of itself.

Why shouldn't we change the ontological status of \mw@sectionxx (not define if undefined)? Because some macros (in gmdocc e.g.) check it to learn whether they are in an mwcls or not.

But let's make a shorthand for this test since we'll use it three times in this package and maybe also somewhere else.

```

@ifnotmw 1509 \long\def\@ifnotmw#1#2{\@ifundefined{mw@sectionxx}{#1}{#2}}
          1511 \let\gmu@def\def
@ifnotmw 1512 \@ifnotmw{%
@gmu@def 1513   \StoreMacro\gmu@def\def\gmu@def#14#2{\RestoreMacro\gmu@def}}{}}

```

I know it may be of bad taste (to write such a way *here*) but I feel so lonely and am in an alien state of mind after 3 hour sleep last night and, worst of all, listening to sir Edward Elgar's flamboyant Symphonies d'Art Nouveau.

A *decent* person would just wrap the following definition in \@ifundefined's Else. But look, the definition is so long and I feel so lonely etc. So, I define \def (for some people there's nothing sacred) to be a macro with two parameters, first of which is delimited by digit 4 (the last token of \mw@sectionxx's parameter string) and the latter is undelimited which means it'll be the body of the definition. Such defined \def does nothing else but restores its primitive meaning by the way sending its arguments to the Gobbled Tokens' Paradise. Luckily, \RestoreMacro contains \let not \def.

The kernel of MW's sectioning commands:

```

1532 \gmu@def\mw@sectionxx#1#2[#3]#4{%
1533   \edef\mw@HeadingLevel{\csname#1@level\endcsname
1534     \space}% space delimits level number!
1535   \ifHeadingNumbered
1536     \ifnum\mw@HeadingLevel>\c@secnumdepth%
       \HeadingNumberedfalse\fi

```

line below is in ifundefined to make it work in classes other than mwbk

```

1539   \@ifundefined{if@mainmatter}{}{%
1540     \gm@dontnumbersectionsoutofmainmatter}
1540 \fi

An improvement of MW's \SetSectionFormatting

A version of MW's \SetSectionFormatting that lets to leave some settings unchanged by leaving the respective argument empty ({} or []).

Notice: If we adjust this command for new version of mwcls, we should name it \SetSectionFormatting and add issuing errors if the inner macros are undefined.

```
#1 (optional) the flags, e.g. breakbefore, breakafter;
#2 the sectioning name, e.g. chapter, part;
#3 preskip;
#4 heading type;
#5 postsip
```

```
1621 \relaxen\SetSectionFormatting
1622 \newcommand*\SetSectionFormatting[5][\empty] {%
```

\SetSectionFormatting

```

1623 \ifx\empty#1\relax\else% empty (not \empty!) #1 also launches \else.
1624   \def\mw@HeadingRunIn{\o}\def\mw@HeadingBreakBefore{\o}%
1625   \def\mw@HeadingBreakAfter{\o}\def\mw@HeadingWholeWidth{\o}%
1626   \@ifempty{#1}{}{\mw@processflags#1,\relax}% If #1 is omitted, the flags
      are left unchanged. If #1 is given, even as [], the flags are first cleared and
      then processed again.
1629 \fi
1630 \@ifundefined{#2}{\@namedef{#2}{\mw@section{#2}}}{}
1631 \mw@secdef{#2}{@preskip}{#3}{2\oblig.}%
1632 \mw@secdef{#2}{@head}{#4}{3\oblig.}%
1633 \mw@secdef{#2}{@postskip}{#5}{4\oblig.}%
1634 \ifx\empty#1\relax
1635   \mw@secundef{#2@flags}{1 (optional)}%
1636 \else\mw@setflags{#2}%
1637 \fi
\mw@secdef 1639 \def\mw@secdef#1#2#3#4{%
1640   % #1 the heading name,
1641   % #2 the command distinctor,
1642   % #3 the meaning,
1643   % #4 the number of argument to error message.
1644   \@ifempty{#3}
1645     {\mw@secundef{#1#2}{#4}}
1646     {\@namedef{#1#2}{#3}}}
\mw@secundef 1650 \def\mw@secundef#1#2{%
1651   \@ifundefined{#1}{%
1652     \ClassError{mwcls/gm}{%

1656         SetSectionFormatting.}}{}}
```

First argument is a sectioning command (wo. the backslash) and second the stuff to be added at the beginning of the heading declarations.

```
\addtoheading 1660 \def\addtoheading#1#2{%
1661   \n@melet{gmu@reserveda}{#1@head}%
1662   \toks\z@=\@xa{\gmu@reserveda}%
1663   \toks\tw@={#2}%
1664   \edef\gmu@reserveda{\the\toks\tw@\the\toks\z@}%
1665   \n@melet{#1@head}{gmu@reserveda}%
1666 }
1667 }
```

Negative \addvspace

When two sectioning commands appear one after another (we may assume that this occurs only when a lower section appears immediately after higher), we prefer to put the *smaller* vertical space not the larger, that is, the preskip of the lower sectioning not the postskip of the higher.

For that purpose we modify the very inner macros of `MWCLS` to introduce a check whether the previous vertical space equals the postskip of the section one level higher.

```
1679 \@ifnotmw{}% We proceed only in MWCLS.
```

The information that we are just after a heading will be stored in the `\gmu@prevsec` macro: any heading will define it as the section name and `\everypar` (any normal text) will clear it.

```

\@afterheading 1684 \def\@afterheading{%
 1685   \nobreaktrue
 1686   \xdef\gmu@prevsec{\mw@HeadingType}% added now
 1687   \everypar{%
 1688     \grelaxen\gmu@prevsec% added now. All the rest is original LATEX.
 1689     \if@nobreak
 1690     \nobreakfalse
 1691     \clubpenalty\@M
 1692     \if@afterindent\else
 1693     {\setbox\z@\lastbox}%
 1694     \fi
 1695     \else
 1696     \clubpenalty\@clubpenalty
 1697     \everypar{}%
 1698     \fi}}}
```

If we are (with the current heading) just after another heading (one level lower I suppose), then we add the less of the higher header's post-skip and the lower header pre-skip or, if defined, the two-header-skip. (We put the macro defined below just before `\addvspace` in `mwcls` inner macros.)

```

```

My heading setup for mwcls

The setup of heading skips was tested in ‘real’ typesetting, for money that is. The skips are designed for 11/13 pt leading and together with my version of mw11.clo option file for mwcls make the headings (except paragraph and subparagraph) consist of an integer number of lines. The name of the declaration comes from my employer, “Wiedza Powszechna” Editions.

```

1784 \@ifnotmw{}{}% We define this declaration only when in mwcls.

Compatibilising standard and mwcls sectionings

If you use Marcin Woliński's document classes (mwcls), you might have met their little queerness: the sectioning commands take two optional arguments instead of standard one. It's reasonable since one may wish one text to be put into the running head, another to the toc and yet else to the page. But the order of optionalities causes an incompatibility with the standard classes: MW section's first optional argument goes to the running head not to toc and if you've got a source file written with the standard classes in mind and use the first (and only) optional argument, the effect with mwcls would be different if not error.

Therefore I counter-assign the commands and arguments to reverse the order of optional arguments for sectioning commands when mwcls are in use and reverse, to make mwcls-like sectioning optionals usable in the standard classes.

With the following in force, you may both in the standard classes and in mwcls give a sectioning command one or two optional arguments (and mandatory the last, of course). If you give just one optional, it goes to the running head and to toc as in scs (which is unlike in mwcls). If you give two optionals, the first goes to the running head and the other to toc (like in mwcls and unlike in scs).

(In both cases the mandatory last argument goes only to the page.)

What more is unlike in scs, it's that even with them the starred versions of sectioning commands allow optionals (but they still send them to the Gobbled Tokens' Paradise).

(In mwcls, the only difference between starred and non-starred sec commands is (not) numbering the titles, both versions make a contents line and a mark and that's not changed with my redefinitions.)

```

```

`enumerate*` and `itemize*`

We wish the starred version of `enumerate` to be just numbered paragraphs. But `hyperref` redefines `\item` so we should do it a smart way, to set the L^AT_EX's list parameters that is.

(Marcin Woliński in `mwcls` defines those environments slightly different: his item labels are indented, mine are not; his subsequent paragraphs of an item are not indented, mine are.)

2111   \LaTeX}}

```

As you see, if *TeX* doesn’t recognize *\reflectbox* (*graphics* isn’t loaded), the first E will not be reversed. This version of the command is intended for non-*XeTeX* usage. With

$\text{\texttt{Xe}}\text{\texttt{T}\kern-1pt\texttt{E}}\text{\texttt{X}}$, you can load the $\text{\texttt{xltxtra}}$ package (e.g. with the $\text{\texttt{gmutils \texttt{\textbackslash XeTeXthree}}}$ declaration) and then the reversed E you get as the Unicode Latin Letter Reversed E.

Expandable turning stuff all into ‘other’

While typesetting a unicode file contents with $\text{\texttt{inputenc}}$ package I got a trouble with some Unicode sequences that expanded to unexpandable cses: they could’nt be used within $\text{\texttt{\csname . . . \endcsname}}$. My $\text{\texttt{T}\kern-1pt\texttt{E}}\text{\texttt{X}}\text{\texttt{Guru}}$ advised to use $\text{\texttt{\meanig}}$ to make all the name ‘other’. So—here we are.

Don’t use them in $\text{\texttt{\edefs}}$, they would expand not quite.

The next macro is intended to be put in $\text{\texttt{\edefs}}$ with a macro argument. The meaning of the macro will be made all ‘other’ and the words ‘(long) macro:->’ gobbled.

$\text{\texttt{\all@other}}$ 2136 $\text{\texttt{\long\def\all@other#1{\@xa\gm@gobmacro\meaning#1}}}$

The $\text{\texttt{\gm@gobmacro}}$ macro above is applied to gobble the $\text{\texttt{\meaning}}$ ’s beginnig, $\text{\texttt{long_macro:->}}$ all ‘other’ that is. Use of it:

$\text{\texttt{\gm@gobmacro}}$ 2141 $\text{\texttt{\edef\gmu@tempa{}}}$
 2142 $\text{\texttt{\def\@nx\gm@gobmacro##1\@xa\gobble\string\macro:##2->{}}}$
 2143 $\text{\texttt{\gmu@tempa}}$

In the next two macros’ names, ‘unex’ stands both for not expanding the argument(s) and for disastrously partial unexpandability of the macros themselves.

$\text{\texttt{\unex@namedef}}$ 2149 $\text{\texttt{\long\def\unex@namedef#1#2{}}}$
 2150 $\text{\texttt{\edef@other\gmu@reserveda{#1}}}$
 2151 $\text{\texttt{\@xa\long\@xa\def\csname\gmu@reserveda\endcsname{#2}}}$
 $\text{\texttt{\unex@nameuse}}$ 2154 $\text{\texttt{\long\def\unex@nameuse#1{}}}$
 2155 $\text{\texttt{\edef@other\gmu@reserveda{#1}}}$
 2156 $\text{\texttt{\csname\gmu@reserveda\endcsname}}$

Brave New World of $\text{\texttt{Xe}}\text{\texttt{T}\kern-1pt\texttt{E}}\text{\texttt{X}}$

$\text{\texttt{@ifXeTeX}}$ 2161 $\text{\texttt{\newcommand\@ifXeTeX[2]{}}}$
 2162 $\text{\texttt{\ ifdefined\XeTeXversion}}$
 2163 $\text{\texttt{\ unless\ifx\XeTeXversion\relax\afterfifi{#1}\else\afterfifi{#2}\fi}}$

2253 \let\gmu@denominatorkern\gmu@numeratorkern

```

What have we just done? We defined two versions of the `\Xefractions` declaration. The starred version is intended to make use only of the built-in fractions such as $\frac{1}{2}$ or $\frac{7}{8}$. To achieve that, a handful of macros is defined that expand to the Unicodes of built-in fractions and `\dekfracc` command is defined to use them.

The unstarred version makes use of the Fraction font feature and therefore is much simpler.

Note that in the first argument of `\@ifstar` we wrote 8 (eight) `#`s to get the correct definition and in the second argument ‘only’ 4. (The L^AT_EX 2_E Source claims that that is changed in the ‘new implementation’ of `\@ifstar` so maybe it’s subject to change.)

A simpler version of `\dekfracc` is provided in line [2632](#).

```

Varia

A very neat macro provided by doc. I copy it *verbatim*.

```

\gmu@tilde 2332 \def\gmu@tilde{%
2333   \leavevmode\lower.8ex\hbox{$\backslash$\widetilde{\mbox{$\backslash$}}$\backslash$,$}}

```

Originally there was just \backslash instead of $\mbox{\backslash}$ but some commands of ours do redefine \backslash .

```

/* 2337 \pdef*\{\gmu@tilde}
2343 \AtBeginDocument{%
  to bypass redefinition of \~ as a text command with various
  encodings
\texttilde 2345 \pdef\texttilde{%
2348   \@ifnextchar/{\gmu@tilde\kern-0.1667em\relax}\gmu@tilde}}

```

We prepare the proper kerning for “ \sim ”.

The standard \obeyspaces declaration just changes the space’s \catcode to 13 (‘active’). Usually it is fairly enough because no one ‘normal’ redefines the active space. But we are *not* normal and we do *not* do usual things and therefore we want a declaration that not only will \active the space but also will (re)define it as the \backslash primitive. So define \gmobeyspaces that obeys this requirement.

(This definition is repeated in gmverb.)

```

\gmobeyspaces 2360 \foone{\catcode`\backslash\active}%
2361 {\def\gmobeyspaces{\let\backslash\catcode`\backslash\active}}

```

While typesetting poetry, I was surprised that sth. didn’t work. The reason was that original \obeylines does \let not \def , so I give the latter possibility.

```

\defobeylines 2368 \foone{\catcode`^\^^M\active}%
2369 {\def\defobeylines{\catcode`^\^^M=13\def^\^^M{\par}}}

```

Another thing I dislike in L^AT_EX yet is doing special things for \dots skip’s, ‘cause I like the Knuthian simplicity. So I sort of restore Knuthian meanings:

```

\deksmallskip 2378 \def\deksmallskip{\vskip\smallskipamount}
\undeksmallskip 2379 \def\undeksmallskip{\vskip-\smallskipamount}
\dekmedskip 2380 \def\dekmedskip{\vskip\medskipamount}
\dekbigs skip 2381 \def\dekbigs skip{\vskip\bigs skipamount}
\hfillneg 2384 \def\hfillneg{\hspace\opt\plus\ifill\relax}

```

In some $\if(cat?)$ test I needed to look only at the first token of a tokens’ string (first letter of a word usually) and to drop the rest of it. So I define a macro that expands to the first token (or $\langle text \rangle$) of its argument.

```

@\firstofmany 2392 \long\def@\firstofmany#1#2\@nil{#1}

```

A mark for the **TODO**s:

```

\TODO 2396 \newcommand*{\TODO}[1][]{\%}

```

```

2397   \sffamily\bfseries\huge TODO! \if\relax#1\relax\else\space%
      \fi#1}}

```

I like twocolumn tables of contents. First I tried to provide them by writing `\begin{multicols}{2}` and `\end{multicols}` outto the .toc file but it worked wrong in some cases. So I redefine the internal L^AT_EX macro instead.

```

\twocoltoc 2432 \newcommand*\twocoltoc{%
2433   \RequirePackage{multicol}%
2434   \def\@starttoc##1{%
2435     \begin{multicols}{2}\makeatletter\@input{\jobname.\##1}%
2436     \if@filesw\@xa\newwrite\csname tf@##1\endcsname
2437       \immediate\openout\csname tf@##1\endcsname\jobname%
         .##1\relax
2438     \fi
2439   \@nobreakfalse\end{multicols}}}
2441 \onlypreamble\twocoltoc

```

The macro given below is taken from the multicol package (where its name is `\enough@room`). I put it in this package since I needed it in two totally different works.

```

\enoughpage 2446 \newcommand*\enoughpage[1]{%
2447   \par
2448   \dimeno=\pagegoal
2449   \advance\dimeno by-\pagetotal
2450   \ifdim\dimeno<#1\relax\newpage\fi}

```

An equality sign properly spaced:

```

\equals 2459 \pdef\equals{\hunskip${}={}$\ignorespaces}
        And for the LATEX's pseudo-code statements:

```

```

\eequals 2461 \pdef\eequals{\hunskip${}==${}$\ignorespaces}
\cdot 2463 \pdef\cdot{\hunskip${}·${}$\ignorespaces}

```

While typesetting a UTF-8 ls-R result I found a difficulty that follows: UTF-8 encoding is handled by the inputenc package. It's O.K. so far. The UTF-8 sequences are managed using active chars. That's O.K. so far. While writing such sequences to a file, the active chars expand. You feel the blues? When the result of expansion is read again, it sometimes is again an active char, but now it doesn't star a correct UTF-8 sequence.

Because of that I wanted to 'freeze' the active chars so that they would be \written to a file unexpanded. A very brutal operation is done: we look at all 256 chars' catcodes and if we find an active one, we \let it \relax. As the macro does lots and lots of assignments, it shouldn't be used in \edefs.

```

\freeze@actives 2483 \def\freeze@actives{%
2484   \count\z@\z@
2486   \whilenum\count\z@<\@ccclvi\do{%
2487     \ifnum\catcode\count\z@=\active
2488       \uccode`~=\count\z@
2489       \uppercase{\let~\relax}%
2490     \fi
2491   \advance\count\z@\@ne}}

```

A macro that typesets all 256 chars of given font. It makes use of \whilenum.

```

>ShowFont 2497 \newcommand*\ShowFont[1][6]{%
2498   \begin{multicols}{#1}[The current font (the \f@encoding\ encoding):]

```

```

2499 \parindent\z@
2500 \count\z@\m@ne
2501 \@whilenum\count\z@<\@cclv\do{
2502   \advance\count\z@\@ne
2503   \u\the\count\z@:\~\char\count\z@\par}
2504 \end{multicols}}

```

A couple of macros for typesetting liturgical texts such as psalmody of Liturgia Horarum. I wrap them into a declaration since they'll be needed not every time.

```

\liturgiques 2512 \newcommand*\liturgiques[1] [red]{% Requires the color package.
2513   \gmu@RPfor{color}\color%
\czerwo 2514 \newcommand*\czerwo{\small\color{#1}}% environment
\czer 2515 \newcommand{\czer}[1]{\leavevmode{\czerwo##1}}% we leave vmode because if we don't, then verse's \everypar would be executed in a group and thus its effect lost.
\* 2518 \def\*{\czer{$*$}}
\+ 2519 \def\+{\czer{$\dag$}}
\nieczer 2520 \newcommand*\nieczer[1]{\textcolor{black}{##1}}}

```

After the next definition you can write `\gmu@RP[⟨options⟩]{⟨package⟩}{⟨cs⟩}` to get the package #2 loaded with options #1 if the cs#3 is undefined.

```

\gmu@RPfor 2525 \newcommand*\gmu@RPfor[3] []{%
2526   \ifx\relax#1\relax

And a version with no space at the left, to begin a \noindent paragraph or a dialogue in quotation marks:

```
\lpauza 2898 \pdef\lpauza{%
 2899   \pauzacore\hskip.2em\plus.1em\ignorespaces}%
```

We define \ppauza as an en dash surrounded with thin stretchable spaces and sticking to the upper line or bare but discretionary depending on the next token being space₁₀. Of course you'll never get such a space after a literal cs so an explicit \ppauza will always result with a bare discretionary en dash, but if we \let-\ppauza...

Typesetting dates in my memoirs

A date in the YYYY-MM-DD format we'll transform into 'DD mmmm yyyy' format or we'll just typeset next two tokens/{...} if the arguments' string begins with --. The latter option is provided to preserve compatibility with already used macros and to avoid a starred version of \thedate and the same time to be able to turn \datef off in some cases (for SevSevo4.tex).

3274         \gmu@dashtrue
3275     \fi
3276     \ifgmu@dash}

```

A word of explanation to the above pair of macros. `\gmu@testdash` sets `\iftrue` the `\ifgmu@dash` switch if the argument contains an explicit `-`. To learn it, an auxiliary `\gmu@ifdash` macro is used that expands to an open (un\fied) `\ifx` that tests whether the dash put by us is the only one in the argument string. This is done by matching the parameter string that contains a dash: if the investigated sequence contains (another) dash, `#2` of `\gmu@ifdash` becomes the rest of it and the ‘guardian’ dash put by us so then it’s nonempty. Then `#2` is took as the definiens of `\@tempa` so if it was empty, `\@tempa` becomesx equal `\@empty`, otherwise it isx not.

Why don’t we use just `\gmu@ifdash`? Because we want to put this test into another `\if . . .` A macro that doesn’t *mean* `\if . . .` wouldn’t match its `\else` nor its `\fi` while TeX would skip the falsified branch of the external `\if . . .` and that would result in the ‘extra `\else`’ or ‘extra `\fi`’ error.

Therefore we wrap the very test in a macro that according to its result sets an explicit Boolean switch and write this switch right after the testing macro. (Delimiting `\gmu@testdash`’es parameter with this switch is intended to bind the two which are not one because of TeXnical reasons only.)

Warning: this pair of macros may result in ‘extra `\else`/extra `\fi`’ errors however, if `\gmu@testdash` was `\expandafter`.

Dates for memoirs to be able to typeset them also as diaries.

A left-slanted font

Or rather a left Italic *and* left slanted font. In both cases we sample the skewness of the `\itshape` font of the current family, we reverse it and apply to `\itshape` in `\litshape` and `\textlit` and to `\sl` in `\lsl`. Note a slight asymmetry: `\litshape` and `\textlit` take the current family while `\lsl` and `\textlsl` the basic Roman family and basic (serif) Italic font. Therefore we introduce the `\lit` declaration for symmetry, that declaration left-slants `\it`.

I introduced them first while typesetting E. Szarzyński's *Letters* to follow his (elaborate) hand-writing and now I copy them here when need left Italic for his *Albert Camus' The Plague* to avoid using bold font.

Of course it's rather esoteric so I wrap all that in a declaration.

```

\leftslanting 3455 \def\leftslanting{%
 \litshape 3456   \pdef\litshape{%
   3458     \itshape

  3483     \rm}% Note in this declaration we left-slant the basic Roman font not the it-
       shape of the current family.
  3485   \gmu@tempa}%

```

Now we can redefine `\em` and `\emph` to use left Italic for nested emphasis. In Polish typesetting there is bold in nested emphasis as I have heard but we don't like bold since it perturbs homogeneous greyness of a page. So we introduce a three-cycle instead of two: Italic, left Italic, upright.

```
