# $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ for Undergraduates* 

Andrew Lounsbury

March 6, 2022

To put a title on a simple homework assignment, you only need lines 31-37 in the code (LaTeX_for_Undergraduates.tex) instead of an entire titlepage, but you don't necessarily have to use this method. You can put the title, your name, and the date on the paper however you'd like.

As you read this, use the keyboard shortcut Ctrl +F to search for specific things in the code so that you can compare the code precisely to what's being printed.

## 1 Setting Up

### 1.1 MiKTeX

Click here to download MiKTeX. Install it to the default directory. When it asks if MiKTeX should install packages on the fly, say yes.

## 1.2 $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ Editors: Visual Studio Code

I recommend Visual Studio Code for Windows users and (maybe) Mac users. ${ }^{1}$ To download the User Installer for VS Code, click here. When it gives the option to add the "Open with Code" action to file and directory context menus, check both boxes.

Open LaTeX_for_Undergraduates.tex in VS Code. With the 蜀 button on the left sidebar, install the following:

LaTeX Workshop
Code Spell Checker
Notepad++ keymap
Initially, there is a wide scrollbar that shows a zoomed-out image of your code. You can toggle this under View -> Show Minimap.

Click the gear in the bottom left, select Settings, and change the following: ${ }^{2}$

| Editor: Word Wrap | on |
| :--- | :--- |
| Auto Find in Selection | multiline |
| LaTeX Workshop > Message > Error: Show | uncheck the box |
| Workbench: Startup Editor | none |

Try building the file with the green button in the top-right.
Windows users may receive an error in the bottom left regarding a file perl.exe from a programming language called Perl. Click here to download Perl. There is a choice between Strawberry Perl and ActiveState Perl. A Stack Exchange page said that ActiveState Perl is better for beginners, so it's probably fine to download that one.

Now, you may need to add the path to your Perl installation to the Path variable. If so, search your computer for the option to edit your Environment Variables in your System Properties. Select Environment Variables... Under System variables, select Path and click Edit....

[^1]

Add the path to your Perl installation with the New button on the right:

| Edit environment variable | $\times$ |
| :---: | :---: |
| C: ${ }^{\text {Program Files\Perl64\bin }}$ | New |
| C:\Users\aloun\AppData\Roaming\ActiveState\bin |  |
| C: \Python38\Scripts\} | Edit |
| C: $\$ Python38\} &  \hline C:\Program Files (x86)ntel\iCLS Client\} & Browse...  \hline C: \Program Files\Intel\iCLS Client\} &  \hline C:\WINDOWS\system32 & Delete  \hline C: $\$ WINDOWS &  \hline C:\WINDOWS\System32\Wbem &  \hline C:\WINDOWS\System32\WindowsPowerShell\v1.0\} & Move Up  \hline C:\Program Files (x86)ntel $\backslash$ Intel( R ) Management Engine Co... | Move Up |
| C:\Program Files \Intel |  |
| ntel(R) Management Engine Compon... | Move Down |
| C:\Program Files (x86)\Intel $\backslash$ Intel(R) Management Engine Co... | Move Down |

Try building the file again to ensure everything works properly. ${ }^{3}$ It will likely take longer than usual because it has to install the necessary packages and

[^2]generate the auxiliary files for the first time and because this is an eighteen-page document. Be sure to press the button in the top right with the magnifying glass to open the pdf and see the result of the compilation.

### 1.3 Creating a Document in VS Code

Create new files and open files under File. Regarding the three buttons $\square \square \mathbb{\square}$ in the top-right corner, the play button on the left builds the file, the middle button with the magnifying glass displays the pdf, and the button on the right splits the editor so that you can open multiple files or open a duplicate view of the same file. ${ }^{4}$ Note, however, that LaTeX Workshop has a setting that builds your code every time you save.

View error messages by clicking the icons in the bottom-left corner.

The font size [12pt] is optional and may be set to sizes other than 12. The article class is for regular documents. ${ }^{5}$ The preamble is everything between \documentclass\{article\} and \begin\{document\}, in other words, your mar- } gins and text dimensions, ${ }^{6}$ which are optional, and your packages.

Regarding the content of the document, writing in $\mathrm{LA}_{\mathrm{E}} \mathrm{X}$ can generally be summarized as (1) typing regular text, (2) typing math with \$ . . . $\$$, (3) displaying math with $\backslash[\ldots \backslash]$, and (4) learning commands and environments as you need them. Any text contained in $\backslash$ begin $\{\langle e n v-n a m e\rangle\} \ldots \backslash e n d\{\langle e n v-n a m e\rangle\}$ is in the $\langle e n v$-name $\rangle$ environment.

[^3]
### 1.4 Keyboard Shortcuts in VS Code

Remember to make ample use of the following shortcuts.

| Source $^{7}$ | Shortcut | Action |
| :---: | :--- | :--- |
| VSC | Ctrl + A | highlight all |
| N++ | Ctrl + D | duplicate |
| LW | Ctrl + E | select current environment |
| VSC | Ctrl + F \& Ctrl + H | search \& replace |
| LW | Ctrl + K | kill compiler process |
| N++ | Ctrl + Q | toggle comments |
| LW | Ctrl + T | toggle between $\backslash[\ldots \backslash]$ and <br> the equation $*$ environment |
| LW | Ctrl + W | wrap in environment |
| VSC | Ctrl + Z \& Ctrl + Y | undo \& redo (even autocompletion) |
| VSC | Double Click | highlight string |
| VSC | Highlight + Delimiter | wrap in $\{\ldots\}$, (... ), [...], \$. . . \$ |
| VSC | Shift + Click | highlight everything between the <br> text cursor and your mouse cursor |
| VSC | Tab \& Shift + Tab | tab/untab multiple lines; <br> next/previous argument in a macro |
| VSC | Tab or Enter | autocomplete suggested text |
| VSC | Shift + Enter | prevent an autocompletion |

These save lots of time. If your editor doesn't have them, you may want to look through your settings and add these shortcuts or change them if they're different from what you want them to be. In VS Code, you can view your keyboard shortcuts in the settings at the bottom-left. ${ }^{8}$

### 1.4.1 Autocompletion

VS Code allows us to autocomplete any string of regular text provided the string has already been typed into the document once. It doesn't give the option to autocomplete "Nullstellensatz" in this document because we haven't typed it yet, but if we type "Nullstellensatz" again, it gives us the option.

For commands, autocompletion doesn't trigger in new, unsaved files nor for commands that haven't already been typed and saved into the document once. Upon typing \msum for the first time, we don't have the option to autocomplete it and successively enter its arguments, but upon adding the three \{...\} to the first instance, saving the document, and typing \msum a second time, we can press Tab and VS Code automatically types $\backslash$ msum $\{\mid\}\}\}$ with the braces ready and the text cursor inside the first set of braces.

[^4]
## 2 Text

Regular text is said to be in paragraph mode．

## 2．1 Formatting Text

Comment things out with \％．${ }^{9}$
Create a new line without indentation using $\backslash \backslash$ ．
Create a new paragraph with indentation either with \par or by leaving an empty line in the code．${ }^{10}$

An empty line with a comment symbol will not create a new line．See code． We can stop the indentation on an empty line like this．${ }^{11}$

It＇s good to use these in such a way that makes your code look similar to what＇s being printed．Using $\backslash \backslash$ along with an empty line will create an empty line in both your code and your document．

This will produce underlined text．
This will produce italicized text．
This will produce boldface text．
This will produce small caps text．
This will produce typewriter（teletype）font．
This will reproduce whatever＇s between the $\$$＇s in teletype font．${ }^{12}$
Changing the 〈font－size〉 option in \documentclass［〈font－size〉］\｛article\} will affect the way the following sizes work．For instance，［12pt］makes \huge and \Huge appear the same．

> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> English is not a finite state language．
> Engish is not a finite state language．

[^5]This is centered.
This is left-justified.
This is right-justified.
You can insert horizontal space
like this, or insert vertical space
like this.

### 2.2 Lists

1. This is enumerate. ${ }^{13}$
label \#2 Though it numbers items automatically, it's good to label the items so that you can tell the difference between all the - 's in your code. Note that you can change the labels with brackets.

2. (a) Once-nested enumerate environment
(b) i. Twice-nested
ii. A. Thrice-nested
B. This is the maximum number of times you can nest them.

- This is itemize.
- Good labeling for itemize might be "dot", "dash", "star", "point," but the utility of this depends on whether you put - on its own line or the same line as your text.

-     - Once-nested itemize environment
-     * Twice-nested
* . Thrice-nested
- This is the maximum number of times you can nest them.

| There is also | the tabular | environment. |
| :--- | :---: | ---: |
| It's like an | array without | math mode. |
| Each column alignment | must be | indicated. |
| $l=$ left-justified |  |  |
|  | $c=$ centered |  |
|  |  | $\mathrm{r}=$ right-justified |

[^6]
## 3 Math

Mathematical text is said to be in math mode.

### 3.1 Formatting Math

Mathmodeisitalicizedbyde fault.
This will produce regular text with whitespace.
This will produce bold text with whitespace.
This will produce italicized text with whitespace.
This will produce Small caps text with whitespace.
This will produce boldfacemathwithoutwhitespace. ${ }^{14}$
This will produce roman(nonitalicized serif font)textwithoutwhitespace.
Theorem (Commands \& Trouble-Shooting). Regarding $L^{A} T_{E} X$ commands, there is plenty of information at your disposal on the internet. You will likely be able to solve most of the problems you encounter and find commands and packages you need by searching for them on the internet.

Proof. Search for a list of commands such as this or this. Search for a package that suites your needs. Search for the error your compiler is giving. Stack Exchange, Overleaf, and Wikibooks are fantastic resources.

Under the $\mathrm{IT}_{\mathrm{E}} \mathrm{X}$ menu on the left sidebar in VS Code, there are two Snippet panels with a myriad of symbols to browse through. Relying on these menus is ill-advised, but being aware of them may still be worthwhile. Here are just a few commands worth noting:

1. $\sin \theta_{1}=\cos \theta_{2}=\max \{0,1\}=\min \{1,2\}=3 \bmod 2=\sqrt[4]{1}= \pm 1$
2. $\exists \ell \in \cap_{i=1}^{n} A_{i}$ such that $f \circ g(\ell)=\operatorname{gcd}(7, \ell)=\operatorname{lcm}(7, \ell)=10=\underbrace{1+\cdots+1}_{10 \text { times }}$
3. (a) $\operatorname{dim} V=\operatorname{rank}(T)+\operatorname{dim} \operatorname{Null}(T)$, where $T \in \mathcal{L}(V, W)$
(b) $|\mathcal{P}(S)|=2^{|S|}$
4. $\mathscr{L}\{f(t-a) \mathscr{U}(t-a)\}=e^{-a s} F(s)$
5. $\left\{x_{n}\right\}_{n=1}^{\infty} \subset \mathbb{R}$ is such that $\inf x_{n} \leq \sup x_{n}$ and $\liminf x_{n} \leq \lim \sup x_{n}$.

Notation 1. $\{\ldots\}$ are required around subscripts and superscripts with more than one character (except for commands such as $\infty$, greek letters, etc.)

Claim. The statement $x_{m}^{n+1}+x_{m+1}^{n} \approx 2^{\pi} \nless 8 \leq 2^{\infty}$ is

1. in inline math mode and
2. has none of the extra white-space from the code.

Proof of (1). Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua.

[^7]Proof of（2）．Note that we temporarily changed the \qedsymbol in the previous proof environment so that it wouldn＇t show up twice．Also，note that we can change the title of any environment with brackets．

Proposition（Display－Math Mode）．The summation

$$
\sum_{i=1}^{n} i^{2}=\frac{n(n+1)(2 n+1)}{6} \in \Theta\left(n^{3}\right)
$$

is in display－math mode．Note that the first letters of commands for capital Greek letters are capitalized and that there are some lowercase Greek letters with variations whose commands begin with var，such as $\varphi$ and $\varepsilon$ ．

Proof．Omitted
Corollary（equation \＆multline）．Let $I \subseteq k\left[x_{1}, \ldots, x_{n}\right]$ be an ideal，where $k$ is an algebraically closed field．Then，

$$
\begin{equation*}
\mathbf{I}(\mathbf{V}(I))=\sqrt{I} \tag{1}
\end{equation*}
$$

and

$$
\begin{align*}
& f_{x}=3 x^{2} y^{4}+6 x y^{5}+3 y^{6}-8 x^{3} y^{2}-18 x^{2} y^{3}-12 x y^{4}-2 y^{5} \\
&+5 x^{4}+12 x^{3} y+9 x^{2} y^{2}+2 x y^{3} \tag{2}
\end{align*}
$$

Equations（1）and（2）are respectively in the equation and multline environ－ ments，which number single lines of display－math．The multline environment is useful for splitting single lines．

Proof．Omitted
Notation 2 （Extensible Block Delimiters）．The commands \left and \right } resize the succeeding character to fit whatever＇s between them．The null delim－ iters \left．and \right．respectively leave the left and right character blank， but there must be both a \left〈something〉 and a \right〈something $\rangle$ ．Note that we can create extensible angle brackets with \left＜and \right＞：

$$
\left\langle\frac{x}{2}, \frac{y}{2}\right\rangle=\left\{\left.h_{1}\left(\frac{x}{2}\right)+h_{2}\left(\frac{y}{2}\right) \right\rvert\, h_{1}, h_{2} \in k\left[x_{1}, \ldots, x_{n}\right]\right\} .
$$

Notation 3 （Punctuation）．When display－math mode ends a phrase，the punc－ tuation must be inside the display．For instance，it is true that

$$
(0,1)=\bigcup_{n=2}^{\infty}\left(0+\frac{1}{n}, 1-\frac{1}{n}\right) \neq \varnothing
$$

but it may be true that $\gamma \in \mathbb{Q}$ or that $\gamma \notin \mathbb{Q}$ ．Hence，we may write $\gamma \stackrel{?}{\in} \mathbb{Q}$ ．

Notation 4 (Readability). Separate long strings of equalities over several lines of code. It's better to write

```
1 5
= 10 + 5
= 3+7+5
= 1+2+3+4+5
```

rather than
$15=10+5=3+7+5=1+2+3+4+5$
Also, $\{$ and $\}$ don't have to appear on the same line. For example,

```
\mbrack{
    \mpar{
            \f{e^x + e^{-x}}{2}
        }
        \mpar{
            \f{e^x - e^{-x}}{2}
        }
}
```

makes it much easier to see where everything is.
Notation 5 (Such That). There are two ways to say "such that" in a set definition. If $I, J \subseteq k\left[x_{1}, \ldots, x_{n}\right]$ are ideals, where $k$ is an algebraically closed field, then

$$
\sqrt{I}=\left\{f \in k\left[x_{1}, \ldots, x_{n}\right]: f^{m} \in I \text { for some } m \in \mathbb{N}\right\}
$$

and

$$
I: J=\left\{f \in k\left[x_{1}, \ldots, x_{n}\right] \mid f g \in I \forall g \in J\right\} .^{15}
$$

Notation 6 (Forcing Display-Math). Various notations get scrunched up in inline math: $\sum_{i=1}^{n}, \prod_{i=1}^{n}, \bigcap_{i=1}^{n}, \bigcup_{i=1}^{n}, \lim _{n \rightarrow \infty}, \sup _{n}\left(b_{n}\right), \int_{a}^{b}, \max _{n}\left\{\delta_{n}\right\}$, etc.

We can often override this by putting \limits after each command. So, we can write $\sum_{i=1}^{n}, \prod_{i=1}^{n}, \bigcap_{i=1}^{n}, \bigcup_{i=1}^{n}, \lim _{n \rightarrow \infty}, \sup _{n}\left(b_{n}\right), \max _{n}\left\{\delta_{n}\right\}$.

Integrals can be put in \displaystyle: $\int_{a}^{b}$, but \limits does provide an alternative way of writing them: $\int_{a}^{b}$.

This is not necessary when these are being displayed, except for \int $\backslash$ limits.

$$
\sum_{i=1}^{n}, \prod_{i=1}^{n}, \bigcap_{i=1}^{n}, \bigcup_{i=1}^{n}, \lim _{n \rightarrow \infty}, \sup _{n}\left(b_{n}\right), \max _{n}\left\{\delta_{n}\right\}, \int_{a}^{b}, \text { and } \int_{a}^{b}
$$

[^8]Notation 7 (Bold Math Symbols). In math mode, mathematical symbols will not be affected by $\backslash$ mathbf $\}$, as in $\sin \pi \notin\{\mathbf{1}, \mathbf{2}, \mathbf{3}\}$. To remedy this, use $\backslash$ boldsymbol $\}$ as in $\sin \pi \notin\{1,2,3\}$.

When nesting block delimiters inside of each other, it is often beneficial to use an abbreviation of \boldsymbol to bold the outer delimiters. For instance, $g^{-1}((c, d))$ is a little better than $g^{-1}((c, d))$.

### 3.2 Displaying Multiple Lines of Math

There are several ways to display multiple lines of math. Some environments have predefined numbering. Add $\mathrm{a} *$ when you begin and end the environment to remove numbering. Note that $\backslash \backslash$ creates a new row.

### 3.2.1 gather

The gather environment is like a multiline center environment that is in math mode by default. Let $V_{1}, \ldots, V_{n} \subseteq k^{n}$ be varieties, where $k$ is an algebraically closed field. Then,

$$
\begin{gather*}
\varnothing \subseteq V_{1} \subseteq \cdots \subseteq V_{n}  \tag{3}\\
\Rightarrow \mathbf{I}(\varnothing) \supseteq \mathbf{I}\left(V_{1}\right) \supseteq \cdots \supseteq \mathbf{I}\left(V_{n}\right)  \tag{4}\\
\text { (toggle individual line numbers with } \backslash \text { notag) } \\
\Rightarrow \mathbf{V}(\mathbf{I}(\varnothing)) \subseteq \mathbf{V}\left(\mathbf{I}\left(V_{1}\right)\right) \subseteq \cdots \subseteq \mathbf{V}\left(\mathbf{I}\left(V_{n}\right)\right)  \tag{5}\\
\Rightarrow \varnothing=\bar{\varnothing} \subseteq \overline{V_{1}} \subseteq \cdots \subseteq \overline{V_{n}} \tag{6}
\end{gather*}
$$

Notation 8 (Dots). The command ··· produces ellipses at the bottom of the line, and \cdots produces ellipses in the middle of the line.

The command \dots is supposed to be able to tell the difference between cases that require lower dots and cases that require center dots. There are a few instances where it doesn't get it right, but I tend to use both \cdots and \dots. See $\S 3.2 .4$ for an example of when \dots doesn't work properly.

Both ··· and \dots work in paragraph and math mode, but \cdots only works in math mode.

### 3.2.2 align \& alignat

The align and alignat environments are in math mode by default. In the align environment, \& indicates an alignment.

$$
\begin{aligned}
f^{\prime}(x)=\int f^{\prime \prime}(x) d x=\iint f^{\prime \prime \prime}(x) d x d x=\iiint f^{(4)}(x) d x d x d x & =\frac{d}{d x} f(x) \\
& =\frac{d^{2}}{d x^{2}} \int f(x) d x \\
& =\frac{\partial}{\partial x} f(x) d x
\end{aligned}
$$

$$
\begin{array}{ll}
A=\left\{x \in S \mid n_{a}(x) \geq 1\right\} & \bar{A}=\left\{x \in S \mid n_{a}(x)=0\right\} \\
B=\left\{x \in S \mid n_{b}(x) \geq 2\right\} & \bar{B}=\left\{x \in S \mid n_{b}(x)<2\right\}
\end{array}
$$

In the alignat environment, the number of alignments must be indicated, and every alignment past the first requires two \&'s.

$$
\begin{aligned}
\left|\overline{A_{1}} \cap \overline{A_{2}}\right|=|S| & -\left|A_{1}\right|-\left|A_{2}\right| \\
& +\left|A_{1} \cap A_{2}\right| \\
= & 10-1-2 \\
& +3 \\
= & 10
\end{aligned}
$$

### 3.2.3 array

Math mode must be specified for arrays.
$1=$ left-justified

$$
\begin{aligned}
& (\forall r>0)(\exists q \neq p)[q \in B(p, r) \cap E] \\
& \Rightarrow p \in E^{\prime}
\end{aligned}
$$

$c=$ centered

$$
\begin{gathered}
(\forall r>0)(\exists q \neq p)[q \in B(p, r) \cap E] \\
\Rightarrow p \in E^{\prime}
\end{gathered}
$$

$r=$ right-justified

$$
\begin{array}{r}
(\forall r>0)(\exists q \neq p)[q \in B(p, r) \cap E] \\
\Rightarrow p \in E^{\prime}
\end{array}
$$

Arrays may also be used to display charts in math mode, and can be nested inside other arrays. For example, the Invisible Hand game $G_{1}$ and the Prisoner's Dilemma $G_{2}$ are two arrays inside of another array.

| $G_{1}$ | $A$ | $B$ |
| :---: | :---: | :---: |
| $A$ | $\mathbf{8 , 8}$ | $\mathbf{6 , 6} 6$ |
| $B$ | $6, \mathbf{6}$ | 2,2 |
| $A$ | $G_{2}$ $A$ $B$ <br> $B$ 3,3 $1, \mathbf{5}$$\quad \mathbf{5 , 1}$ | $\mathbf{2 , 2}$ |

### 3.2.4 Matrices

Math mode must be specified for matrices.

$$
\begin{gathered}
{\left[\begin{array}{ll}
2 & 2 \\
0 & 1
\end{array}\right]} \\
\xrightarrow{r_{1} \mapsto \frac{1}{2} r_{1}}\left[\begin{array}{ll}
1 & 1 \\
0 & 1
\end{array}\right] \xrightarrow{r_{1} \mapsto-r_{2}+r_{1}}\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] \\
\left(\begin{array}{ll}
2 & 2 \\
0 & 1
\end{array}\right) \\
\sim\left(\begin{array}{ll}
1 & 1 \\
0 & 1
\end{array}\right) \sim\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right) \\
\left|\begin{array}{ll}
a & b \\
c & d
\end{array}\right|=a d-b c
\end{gathered}
$$

Use the array environment to separate rows and columns in a matrix.

$$
\left[A \mid I_{2}\right]=\left[\begin{array}{ll|ll}
1 & 2 & 1 & 0 \\
3 & 4 & 0 & 1
\end{array}\right] \quad\left[\begin{array}{l|l}
a & b \\
\hline c & d
\end{array}\right]
$$

Use $\cdots, \vdots$, and $\because$ to apostrophize matrix entries. Note that I made a command that rotates ${ }^{\prime}$. to my liking and that \dots doesn't know that it should be displaying \cdots.

$$
\left[\begin{array}{cccccccc}
\sigma_{1} & 0 & \ldots & & \cdots & 0 & \ldots & 0 \\
0 & \ddots & & & \vdots & & \vdots \\
\vdots & & \sigma_{r} & & & & \ddots & \\
0 & & & 0 & & \vdots & & \vdots \\
0 & 0 & \ldots & & \ddots & 0 & \ldots & 0
\end{array}\right]
$$

The kbordermatrix package displays matrices with row and column labels. Set the delimiters $\backslash k b l d e l i m$ and $\backslash k b r d e l i m$ in the preamble. See line 12.

$$
\begin{gathered}
\\
a \\
b
\end{gathered}\left(\begin{array}{cc}
a & b \\
1 & 0 \\
0 & 1
\end{array}\right)
$$

### 3.2.5 cases

Definition. Let $X$ be an infinite set. Then, $d: X \times X \rightarrow\{0,1\}$ defined by

$$
d(p, q)= \begin{cases}1, & p \neq q \\ 0, & p=q\end{cases}
$$

is formatted with the cases environment, which requires math mode. Either $(p, q) \mapsto 0$ or $(p, q) \mapsto 1 \forall(p, q) \in X \times X$, and $d(p, q)=0 \Longleftrightarrow p=q$.

### 3.3 Escape Sequences and White-space in Math Mode

Use $\backslash$ to insert characters that would otherwise be used in $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$ syntax. Some examples are $, \%, \#, \$,\{$,$\} , and similarly, \lbrack and \rbrack.$

Additionally, there are various ways to insert a space in math mode (but some of these may also be used in paragraph mode.)

| ！！（negative thin） | $\phi(x) \forall x$ | $\nleftarrow$ |
| :--- | :---: | :---: |
| （normal） | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\backslash$, | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\backslash:$ | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\backslash ;$ | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\backslash$（slash space） | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\backslash$ nobreakspace | $\phi(x) \forall x$ | $\rightarrow \leftarrow$ |
| $\sim$（tilde） | $\phi(x) \forall x$ | $\rightarrow \quad \leftarrow$ |
| $\backslash$ quad | $\phi(x) \quad \forall x$ | $\rightarrow \quad \leftarrow$ |
| \qquad | $\phi(x) \quad \forall x$ | $\rightarrow \quad \leftarrow$ |

The command \nobreakspace and tildes are examples of unbreakable space， meaning the adjacent strings won＇t be separated over line breaks．${ }^{16}$ E．g．，

```
string1 string2
```

Rather than printing string1 string2，
it keeps the two strings on the same line．If we remove the space between the last dash and string1，both strings will move to the previous line．This could be useful for keeping inline mathematical statements together；it may sometimes be difficult to read a formula broken up over two lines．

The command \nobreakspace and tildes are unbreakable in math mode and in paragraph mode．Some other options here are only unbreakable in paragraph mode；e．g．，（\，），（\：），and（\；）．

## 4 Macros

The command \newcommand\｛\macroname\}\{〈definition $\rangle\}$ creates a macro in－ struction invoked with \macroname that inserts the $\langle$ definition $\rangle$ wherever $\backslash$ macroname appears．${ }^{17}$ The command \newcommand $*\{\backslash$ macroname $\}[\langle n\rangle]\{\langle\text { definition }\rangle\}^{18}$ is invoked with $\langle n\rangle$ arguments $\left\langle a_{1}\right\rangle, \ldots,\left\langle a_{n}\right\rangle$ as $\backslash$ macroname $\left\{\left\langle a_{1}\right\rangle\right\} \ldots\left\{\left\langle a_{n}\right\rangle\right\}$ ．In the $\langle$ definition $\rangle$ ，\＃i indicates where the i－th argument $\left\langle a_{i}\right\rangle$ will be placed， and \hfill inserts white－space until a space－the space in a matrix entry，for instance－is filled．

[^9]| $\left[\begin{array}{r}1 \\ 2 \\ 333 \\ 44500 \\ 5\end{array}\right]$ | $\left[\begin{array}{c}9 \\ 77 \\ 3008\end{array}\right]$ | $\left[\begin{array}{llll}a & b & c & d\end{array}\right]$ | $(1,2,3,4,5)$ | $\left(a_{1}, \ldots, a_{n}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| $\left[\begin{array}{ll}a & b \\ c & d\end{array}\right]$ | $\left[\begin{array}{lll}1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9\end{array}\right]$ | $\left\|\begin{array}{lll}1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1\end{array}\right\|$ | $\left[u_{1}\left\|u_{2}\right\| u_{3}\right]$ | $\left[\frac{v_{1}^{T}}{v_{2}^{T}}\right]$ |

In general, it's good to reduce the number of keys you have to press as much as possible; however, VS Code's autocompletion already allows us to avoid typing many things. Thus, the benefit of shortening some commands with macros may merely be that it makes our code more concise, but this depends on personal preference. For instance, you may not care whether your code is populated with the few extra letters in \frac as opposed to the one in \f.

### 4.1 Troubleshooting with $\backslash$ end\{document $\}$

One way to locate elusive errors is to put an \end\{document\} right in the middle } of the document. If the error goes away, it was in the portion of the document you cut off. Move the command up or down and repeat until you've found the error. In such a scenario it helps to have a command $\backslash e d$ to do this testing.

## 5 Packages

Packages provide commands for doing various typesetting tasks. For example, the units package allows us to write $a / b$ instead of $\frac{a}{b}$, the xcolor package allows us to highlight things, the cancel package allows us to cancel terms in formulas: $x+\phi-\phi=x$, and the pagecolor package is very useful for removing the glare of the white pages. MiKTeX can install packages so that we don't have to deal with sty (style) files. It should do this automatically. ${ }^{19}$

[^10]
## 5．1 Creating and Manually Installing Packages

Macros should be written in a separate file and added to the beginning of your document．The most prudent way to do this is to create a package by giving it the ．sty file extension and putting these two lines at the beginning：

```
\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{\langlepackage-name\rangle}
```

Create a folder named $\langle$ package－name $\rangle$ containing the file．In MiKTeX Con－ sole，go to Settings－＞Directories．${ }^{20}$ Select the Install directory and open it with the square button．

On marcOS，this directory will be
／Users／＜user＿name＞／Library／Application Support／MiKTeX／texmfs／install
Then，place the $\langle$ package－name〉 folder under tex－＞latex，and under Tasks on the menubar，select Refresh file name database．You should now be able to use commands from 〈package－name〉 in any tex file without having to put the sty file in the same location．

It would be wise to pin the file or folder containing your commands to VS Code＇s icon and the File Explorer icon on your taskbar for easy access．

## 5．2 Images：graphicx

A picture of black writing on a whiteboard with the shadows，contrast，and brightness maximized，the saturation minimized，and possibly some other settings adjusted as needed－such as increasing the brilliance or slightly in－ creasing the exposure－often gives an image whose white background nearly matches the white page and whose black writing nearly matches the black print．

${ }^{20} \mathrm{MiKTeX}$ creates a file miktex－console．lock under C：\Users $\backslash<$ user＿name＞that prevents MiKTeX Console from opening initially．Simply delete this file and this problem shouldn＇t persist．

Use the center environment or  if it's in a figure environment. ${ }^{21,22}$

Figure 1: M33
Set the path to the folder with your images with \graphicspath $\{\{\langle$ path $\rangle\}\}$. The file extensions of the images aren't required.
The graphicx package allows us to easily size images with scale, width, or height. Compare the options of the two images above.

### 5.3 Diagrams: PGF/TikZ

The pgf and tikz packages provide a very complex set of commands to draw shapes, graphs, and intricate diagrams straight into the document. You will probably never need to use them, but as before, your best resource for learning PGF/TikZ is the internet, so look for a some tutorials that might be helpful such as this.

Many packages and $\mathrm{Ti} k \mathrm{Z}$ libraries build off of $\mathrm{Ti} k \mathrm{Z}$ so that we can use it for specific tasks without doing all the work. For examples, there are the forest, chessboard, and tikzducks packages.

Note that in the $\mathrm{E}^{\mathrm{A}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ menu on the left sidebar in VS Code, under the same Snippet panels mentioned in $\S 3.1$, there are TikZ panels that offer the opportunity to play around with various features from PGF/TikZ.

[^11]
### 5.3.1 Chemistry and Physics in $\mathrm{IAT}_{\mathbf{E}} \mathrm{X}$

It may perhaps be worth mentioning that there are ways of typesetting other diagrams from the natural sciences in $\mathrm{LA}_{\mathrm{E}} \mathrm{X}$.
Click here for general info on chemical graphics.
Click here for more info on typesetting chemical formulas.
Click here for more info on typesetting structural formulas.
Click here for info on typesetting molecular orbital diagrams.
Click here for info on typesetting Feynman diagrams.

### 5.4 Algorithms and Code in $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$

The verbatim environment prints your code onto the document exactly how it appears in the editor, but it doesn't include tabs. To remedy this, use either the Verbatim environment in the fancyvrb package or the verbatimtab environment in the moreverb package. Both produce the same result:

```
SumArrayElements(A[1..n])
num <- 0
FOR i <- 1 to n DO
    num <- num + A[i]
end FOR
RETURN num
```

However, there are better options from other packages shown here and here.

### 5.5 Poetry in $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$

The verse package allows us to typeset poetry in $\mathrm{AA}_{\mathrm{E}} \mathrm{X}$.

## уер

stanza 1,
a few words,
some new
lines
stanza 2
a few more, assonance almost
rhymes

[^0]:    * Throughout this paper, there are some commands from the accompanying alounsburymacros package, but I'm going to forgo further reference to alounsburymacros.sty. If you use a command from this tutorial in another document and it says the command is undefined, you probably need to install alounsburymacros and include it in the preamble.

[^1]:    ${ }^{1}$ If you can't or don't want to use VS Code, see here and here.
    ${ }^{2}$ There is a button at the top right that opens a json file with all overridden settings.

[^2]:    ${ }^{3}$ Producing the result of LATEX code is generally referred to as "building the file," but I will occasionally refer to this as "compiling the file." I mean the former by the latter.

[^3]:    ${ }^{4}$ I've noticed that when I close my laptop with a pdf open, that pdf will no longer update when I rebuild. Closing and reopening the pdf seems to consistently fix this.
    ${ }^{5}$ The beamer class allows us to make presentation slides and posters in $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$.
    ${ }^{6}$ An alternative method of setting these values is $\backslash$ setlength $\{\backslash$ lengthname $\}\{\langle$ dimension $\rangle\}$.

[^4]:    ${ }^{7}$ VSC $=$ VS Code; $\mathrm{LW}=\mathrm{LAT} \mathrm{E}_{\mathrm{E}}$ Workshop; $\mathrm{N}++=$ Notepad ++ keymap
    NOTE : These LATEX Workshop shortcuts must be added in the shortcut menu.
    ${ }^{8}$ There is a button at the top right in the shortcuts menu that opens the json file with all overridden shortcuts.

[^5]:    ${ }^{9}$ There is a comment environment in the verbatim package for creating block comments． The benefit of this is that we can minimize environments in VS Code so that we don＇t have to constantly scroll through code we＇re not reading．We could otherwise highlight the multiple lines we want to comment out and press $\mathrm{Ctrl}+\mathrm{Q}$（or an equivalent shortcut）．
    ${ }^{10}$ See lines 26－31 of alounsburymacros．sty for a way to fix indentation of $\backslash$ par and empty lines in enumerate and itemize environments．
    ${ }^{11}$ We wouldn＇t use $\backslash$ par unless we specifically wanted the indentation．
    ${ }^{12}$ Various characters will work in place of the \％．For instance，the \％＇s on line 186 can be replaced with \＄＇s or even the characters 0 through 9，［，or ）．

[^6]:    ${ }^{13}$ The enumitem package provides additional functionality for enumerate.

[^7]:    ${ }^{14}$ See Notation 7 for a possible alternative.

[^8]:    ${ }^{15}$ This is not the $\mid$ character on your keyboard. It's $\backslash$ mid. Also, note the use of $\backslash$ set and the extensible $\backslash$ Mid in Notation 2.

[^9]:    ${ }^{16}$ In particular，a tilde is equivalent to $\backslash$ nobreakspace $\}$ ．The extra $\}$ may cause incon－ sistent spacing when used with certain math symbols，as it did in the above chart．
    ${ }^{17}$ The $\langle$ definition $\rangle$ can either be written on one line for potentially faster compile times or left in a readable format，but compile times won＇t be much faster in the former case since ${ }^{A A} T_{E} X$ Workshop keeps auxiliary files．The first compilation is long，but subsequent compilations are quick because most of the compilation is already done．Hence，saving memory by reducing the number of tokens isn＇t very important since most of those tokens aren＇t recompiled．In the latter case，it＇s good practice to put a $\%$ at the end of most lines to prevent whitespace created by EOL（end of line）characters．BTW： 2 EOL $=$ empty line in code $=\backslash$ par．
    ${ }^{18}$ The＊creates a＂short＂command that invokes error messages if the 〈definition〉 is broken up over paragraphs（ $\backslash$ par or an empty line）．The utility here is that this will also make your compiler tell you the line number if you leave an opening brace unclosed．

[^10]:    ${ }^{19}$ In other words, it should do this "on the fly."
    If not, once you've downloaded a package from CTAN, it should contain some sty files, in which case you should follow the steps laid out it $\S 5.1$.

    If instead of sty files there are ins (installation) files, you must run those ins files to produce the required sty files. The simplest way to do this is to open the ins file in your editor and compile it as you would a tex file.

    When all else fails, the makeshift way to use a package is to copy its sty files directly to the folder containing your tex file.

[^11]:    ${ }^{21}$ For subfigures, consider using the subfigure environment from the subcaption package.
    ${ }^{22}$ The option [h] stands for "here" and indicates that we want the figure to be placed exactly where it is in the code. Sometimes this is not enough, and stronger options are required. Ordered by strength, these are $[\mathrm{h}]<[!\mathrm{h}]<[\mathrm{H}]$, where H comes from the float package.
