

Checksum3478

The mdframed package¹

auto-split frame environment

Marco Daniel ² Elke Schubert

v1.0b

2011/12/09

The standard methods for framing text (`fbox` or `fcolorbox`) require you to handle page breaks by hand, meaning that you have to split the `fbox` into two. The present package defines the environment `mdframed` which automatically deals with pagebreaks in framed text.

By defining new environments the user may choose between several individual designs.

Linked files: [mdframed-example-default.pdf](#) [mdframed-example-tikz.pdf](#)
[mdframed-example-pstricks.pdf](#) [mdframed-example-texsx.pdf](#)

FYI: I create a repository for `mdframed` on [github](#) where you can [download](#) the current development status.

4.3. Hidden Lines	9	A. More information	13
4.4. Frametitle	10		
4.5. Footnotes	10		

1. Motivation

Many users wish to (further) emphasize lemmata, definitions, proofs, etc. The package `mdframed` allows you to create environments with breakable frames. I think an example is the best way to demonstrate its properties.

Theorem 1.1 (Pythagorean theorem) *In any right triangle, the area of the square whose side is the hypotenuse is equal to the sum of the areas of the squares whose sides are the two legs.*

¹Extending the package `framed.sty`

²With thanks to Heiko Oberdiek, Rolf Niepraschk, Martin Scharrer and Herbert Voss.

Sorry for bad English.

$$a^2 + b^2 = c^2$$

The frame was defined with the following settings.

```
\newmdtheoremenv[outerlinewidth=2,leftmargin=40,%
  rightmargin=40,backgroundcolor=yellow,%
  outerlinecolor=blue,innertopmargin=0pt,%
  splittopskip=\topskip,skipbelow=\baselineskip,%
  skipabove=\baselineskip,ntheorem]{theorem}%
{Theorem}[section]
\begin{theorem}[Pythagorean theorem]
...
\end{theorem}
```

2. Syntax

The package itself loads the packages `kvoptions`, `etoolbox` and `color`. By setting the correct options `mdframed` will load `xcolor`, `tikz` or `pstricks`.

Load the package as usual:

```
% \usepackage[<GLOBAL OPTIONS>]{mdframed}
```

The package defines only one environment with the following syntax:

```
\begin{mdframed}[<LOCAL OPTIONS>]
<CONTENT>
\end{mdframed}
```

To create own environments with `mdframed` see section 3.

Autodetecting floats

I added a detection of `float` or `minipage` environments. If you use `mdframed` in such an environment `mdframed` will use the option `nobreak` automatically.

Twoside-mode

When you are using `mdframed` inside `twoside` mode you can set the option `innermargin` and `outermargin` (see section 4.2.1).

3. Commands

The following commands should countenance your by the handling with `mdframed`

`\newmdenv`

The command has the following syntax:

```
\newmdenv[<MDFRAMED OPTIONS>]{Name of the environment}
```

In this way you can simply use:

```
\newmdenv[linecolor=red,frametitle=Infobox]{infobox}
...
\begin{infobox}[backgroundcolor=yellow]
```

```

foo    foo    foo    foo    foo    foo
\end{infobox}

```

\renewmdenv

By using this command you can redefine environments which are created by `newmdenv`.

\newmdtheoremenv

Since the package is often used to highlight theorem environments, I have created a command³ to simplify this process. The command has the following syntax:

```

\newmdtheoremenv[<mdframed-options>]{<envname>}%
                  [<numberedlike>]{<caption>}[<within>]

```

The last four arguments are equivalent to the command `newtheorem`. Only the first optional argument is able to pass `mdframed`-options. A simple example is:

```

\theoremstyle{<some style>}
\newmdtheoremenv[ linecolor=blue ]{ lemma }%
                  {Lemma}{ section }
...
\begin{ lemma }[Some title ]
foo    foo    foo    foo    foo    foo
\end{ lemma }

```

So far there is no `renewmdtheoremenv`!

\mdfsetup

To set the options you can use the optional argument of `usepackage` or you can use the command `mdfsetup` which is not limited to the preamble. Inside a group the settings work only local.

\mdfdefinestyle

`mdfdefinestyle` allows the user to define different styles and use as an option of `mdframed` via `style`. The option `style` is explained in section 4.2.3.

Here a small example:

```

\mdfdefinestyle{ mystyle }{ leftmargin=0pt ,%
                             linecolor=blue }
....
\begin{ mdframed }[ style=mystyle ]
foo
\end{ mdframed }

```

\mdfapptodefinestyle

This commands allows to expand a defined style.⁴

³Thanks to Martin Scharrer and Enrico Gregorio:

[Own command to create new environment](#)

⁴Thanks to Martin Scharrer and Enrico Gregorio:

<http://tex.stackexchange.com/questions/34684/argument-of-setkeys>

4. Options

The package provides various options to manipulate frames. In the following section all options are listed. Some internal macros which can be manipulated are not shown in this documentation. The listed options are divided in global and local options. The global options can not be used inside `mdfsetup`.

4.1. Global Options

The following options are only global options.

`xcolor` default=`none`

By setting this key, the package `xcolor` will be loaded with the given value(s). Without any value `mdframed` loads the package `color` without any options. If the package `xcolor` is already loaded the given option will be ignored. I recommend to load `xcolor` before `mdframed`.

`framemethod` default=`default`

With this key you can change the way frames are drawn. You can decide whether the frame is drawn with

1. L^AT_EX-commands `hrule`, `vrule`, `rule`,
2. TikZ (the package `TikZ` will be loaded) or
3. PSTricks (the package `pstricks` will be loaded).

The option `framemethod` requires a string. Allowed combinations are listed in the following table.

Table 1: Allowed keys for `framemethod`

Method	Allowed keys
L ^A T _E X-commands	<code>default</code> , <code>tex</code> , <code>latex</code> , <code>none</code> , <code>0</code>
TikZ	<code>tikz</code> , <code>pgf</code> , <code>1</code>
PSTricks	<code>pstricks</code> , <code>ps</code> , <code>postscript</code> , <code>2</code>

FYI It is independently whether the `method` is written with no, one or more capital letter.

Note

The manipulation of the frames depends on the option `framemethod`. For further information see below.

4.2. Global and Local Options

The options listed below can be set globally or locally and they are not limited to the preamble.

4.2.1. Options with lengths

In figure (1) you can see the adjustable lengths which will be described below. All lengths accept two kinds of input. The first one is a length (e.g. `2pt`) and the second one is a number (e.g. `2`) which will be multiplied by `1 defaultunit`. The figure shows three different colored frames. Only `framemethod=tikz` is able to draw such triple lines.

I know that the predefined lengths are not well prepared. Maybe I will change it later.

`defaultunit`

`default=pt`

see the sentence above.

Figure 1: adjustable lengths of mdfamed

`skipabove`

`default=0pt`

Sets an additional skip above the frame.

`skipbelow`

`default=0pt`

Sets an additional skip below the frame.

`margin`

This option is not longer supported. Use `leftmargin` and `rightmargin` instead.

`leftmargin`

`default=0pt`

Sets the length of the left margin of the environment.

`rightmargin`

`default=0pt`

Sets the length of the right margin of the environment.

`innerleftmargin`

`default=10pt`

Sets the length of the inner left margin of the environment.

`innerrightmargin`

`default=10pt`

Sets the length of the inner right margin of the environment.

`innertopmargin`

`default=.4\baselineskip`

Sets the length of the inner top margin of the environment.

`innerbottommargin` default=`.4\baselineskip`

Sets the length of the inner bottom margin of the environment.

The following lengths are not shown in figure (1).

`userdefinedwidth` default=`0pt`

Sets the width of the whole `mdframed` environment. The width represent the width including the line width and the inner margins. The outer margins will be ignored.

`outermargin`

Sets the length of the outer margin. This option is only available in `twoside`-mode.

`innermargin`

Sets the length of the inner margin. This option is only available in `twoside`-mode.

`splittopskip` default=`0pt`

Sets the length of the skip above the split part of the environment.

`splitbottomskip` default=`0pt`

Sets the length of the skip below the split part of the environment.

`linewidth` default=`0.4pt`

Sets the width of the line around the environment.

`roundcorner` default=`0pt`

Sets the size of the radius of the corners of the frames.

This works only with `framemethod=TikZ` or `PSTricks`.

`innerlinewidth` default=`0pt`

Sets the width of the inner line around the environment.

This works only with `framemethod=TikZ`.

`outerlinewidth` default=`0pt`

Sets the width of the outer line around the environment.

This works only with `framemethod=TikZ`.

`middlelinewidth` default=`linewidth`

Sets the width of the middle line around the environment.

This works only with `framemethod=TikZ`.

4.2.2. Colored Options

`linecolor` default=`black`

Sets the color of the line around the environment.

`backgroundcolor` default=`white`

Sets the color of the background of the environment.

`fontcolor` default=black

Sets the color of the contents of the environment.

`innerlinecolor` default=linecolor

Sets the color of the inner line around the environment.

This works only with `framemethod=TikZ`.

`middlelinecolor` default=linecolor

Sets the color of the middle line around the environment.

This works only with `framemethod=TikZ`.

`outerlinecolor` default=linecolor

Sets the color of the outer line around the environment.

This works only with `framemethod=TikZ`.

4.2.3. General options

`ntheorem` default=false

Before setting this boolean key, you have to load the package `ntheorem`.

With this option you set the values `theoremprskipamount` and `theoremposskipamount` to 0 pt.

`nobreak` default=false

Sometimes it is useful to prevent a frame from splitting. The `nobreak` option is used for this purpose. If you activate this option you can enable it by setting `nobreak=false`.

`needspace` default=0pt

Sometimes it is useful to set a minimum height before a frame should be splitted. For such cases you can use `needspace`. The option requires a length which sets the minimum height before a frame will be splitted.

`style`

If you define a special style with `mdfdefinstyle` you can use the key `style` to load the style. `mdframed` has no predefined styles.

`settings` default=none

With version 0.9 of the package `mdframed` this option was added. This option allows the user to commit some macros. An example is shown in the appendix.

`printheight` default=none

This key allows the entries `none`, `info` or `warning`. In relation to the key the vertical space at the beginning of the environment `mdframed` on the current page will be printed in the `log` file.

`align` default=left

Sometimes it is useful to align the environment itself. For this you have the option `align` which can be set to the following strings: `left`, `right` and `center`. The alignments `left` or `right` depend on the given lengths `leftmargin` and `rightmargin`. Later I will present an example to demonstrate my bad English explanation.

`pstrickssetting` default=`none`

With this key you can pass several options to `psset`. For example if you want all lines dashed you will have to set `pstrickssetting={linestyle=dashed}`. It is very important to put the options of `pstrickssetting` in brackets.

This works only with `framemethod=PSTricks`.

`tikzsetting` default=`none`

With this key you can pass several options to `tikzset`. Some examples are listed in the next section. It is very important to put the options of `tikzsetting` in brackets.

This works only with `framemethod=TikZ`.

`apptotikzsetting` default=`none`

With this key you can add several options to `tikzsetting`. This key based on the idea of manipulation of predefined keys of `mdframed`. The package `mdframed` defines via `tikzset` the following keys to draw frames.

- `tikzset{mdfbox/.style}`
- `tikzset{mdfcorners/.style}`
- `tikzset{mdfbackground/.style}`
- `tikzset{mdfinnerline/.style}`
- `tikzset{mdfouterline/.style}`
- `tikzset{mdfmiddleline/.style}`

Before you change one please have a look at the file `md-frame-1.mdf` to see the settings.

This works only with `framemethod=TikZ`.

4.3. Hidden Lines

`topline` default=`true`

Draws a line at the top.

`bottomline` default=`true`

Draws a line at the bottom.

`leftline` default=`true`

Draws a line on the left.

`rightline` default=`true`

Draws a line on the right.

`hidealllines`default=`false`

With this option you can decide whether all lines should be drawn or not.

4.4. Frametitle

`frametitle`default=`none`

The environment gets a title. To set a title use `frametitle={The Title of the frame}` as an option of the environment.

`frametitleformat`default= `bfserieslarge`

Sets the format of the `frametitle`.

4.5. Footnotes

Inside the environment you can use the command `footnote` as usual. `mdframed` uses the syntax of environment `minipage` with the same counter.

Every footnote text will be collected inside a box and will be displayed at the end of the environment `mdframed`.

`footnotedistance`default= `bigskipamount`

The length is the distance between the end of the environment `mdframed` and the displaying of the `footnoterule`.

`footnoteinside`default=`true`

The position of the footnotes can be changed with the option `footnoteinside`. The footnotes will be displayed at the end of the environment but you can decide whether the output is inside `mdframed` or after.

Note The output of the footnotes with the option `footnoteinside=false` are not in a splitted frame. I think it isn't useful because the first line of a new page shouldn't be a footnote.

5. Examples

I outsource the examples in four files to limit the documentation. The files are

mdframed-example-default

Demonstration of examples created with `framemethod=default`.

mdframed-example-tikz

Demonstration of examples created with `framemethod=TikZ`.

mdframed-example-pstricks

Demonstration of examples created with `framemethod=pstricks`.

mdframed-example-texsx

Demonstration of examples like interaction with `listings`

The examples are often not equivalent but normally they can be adapted to another method.

6. Errors, Warnings and Messages

The package `mdframed` provides different errors, warnings and messages in the `log`-file. Some \LaTeX -editors like `TeXMaker` or `TeXStudio` have a special tab for errors and warnings but not for messages. So you should look in the `log-File` itself.

The followings errors and warnings are generated by `mdframed`.

```
The package ... does not exist but
needed by mdframed
```

To avoid this problem you should install the required packages which are listed in section 2.

```
package option style is depreciated
use framemethod instead style
```

With version 0.9d `mdframed` changed the meaning of the option `style`. The option is used to load a defined style by `mdfdefinestyle`. Instead use `framemethod` (see section 4.1).

```
Unknown framemethod .... mdframed
```

The input string for the option `framemethod` is unknown. See section 4.1.

```
You have not loaded ntheorem yet
```

To use the option `ntheorem` you have to load the package `ntheorem`.

```
You have only a width of 3cm
```

The package `mdframed` calculates the width of the contents based on the given options. If the width of the contents smaller than 3 cm you will get this warnings. You should change the settings to get a greater width.

```
You got a bad break
you have to change it manually
by changing the text , the space
or something else
```

Sometimes you have enough vertical space for the rules and the space between the rules and the contents but not for the contents itself. In this situation you will get this warning because the contents of this box is empty. You have the possibility to change the settings or include a `clearpage` in front of the environment `mdframed`. So far I have no idea how to avoid such things.

```
You got a bad break
because the split box is empty
You have to change the page settings
like enlargethispage or something else
You got a bad break
```

See the explanation above.

```
You got a bad break
because the last split box is empty
You have to change the settings
```

The same reason as above but only in the last box.

```
Option ... is already consumed
and has no effect on input line ...
```

If you set a global option inside the document body you will get this warning.

7. Known Problems

In this section I will collect known problems. In case you encounter any further problems, please drop me an email, [marco.daniel at mada-nada.de](mailto:marco.daniel@mada-nada.de).

Do you have any ideas / wishes on further extensions to this package? Please let me know!

1. So far the environment isn't compatible with the package `gmverb`.

8. ToDo

1. see "Known Problems".
2. So far it isn't possible to combine the environment `begin{multicols}` of the package `multicol` with `mdframed` with the whole option list.
3. Create new styles.
4. Improve page breaks.
5. Improve footnotes
6. Improve documentation and examples
7. Create styles for `frametitle`

9. Previous versions

If you have trouble with the new version of `mdframed` you can load `mdframedpre` instead. In this way you load the version v0.6 (see [Revision history](#)). With the new version 0.7a I changed the internal commands (I use `etoolbox`) and the algorithm of the splitting. So I don't know whether I will get new bugs or not. For the last case and the previous version (v0.6) works well you can load `mdframedpre` instead of `mdframed`.

10. Acknowledgements

Thanks for proofreading

Alan Munn and Nahid Shajari

A. More information

In the following section I want to present how to create your own frame.

A.1. How does `mdframed` work?

With the environment `begin{mdframed} ... end{mdframed}` the whole contents will be saved in a `savebox` called `@tempboxa`. After the calculation of the width and the height of the `@tempboxa` (done by `mdframed.sty`) the box will be set sequentially (done by `md-frame-X.mdf`). The following figure demonstrates this.

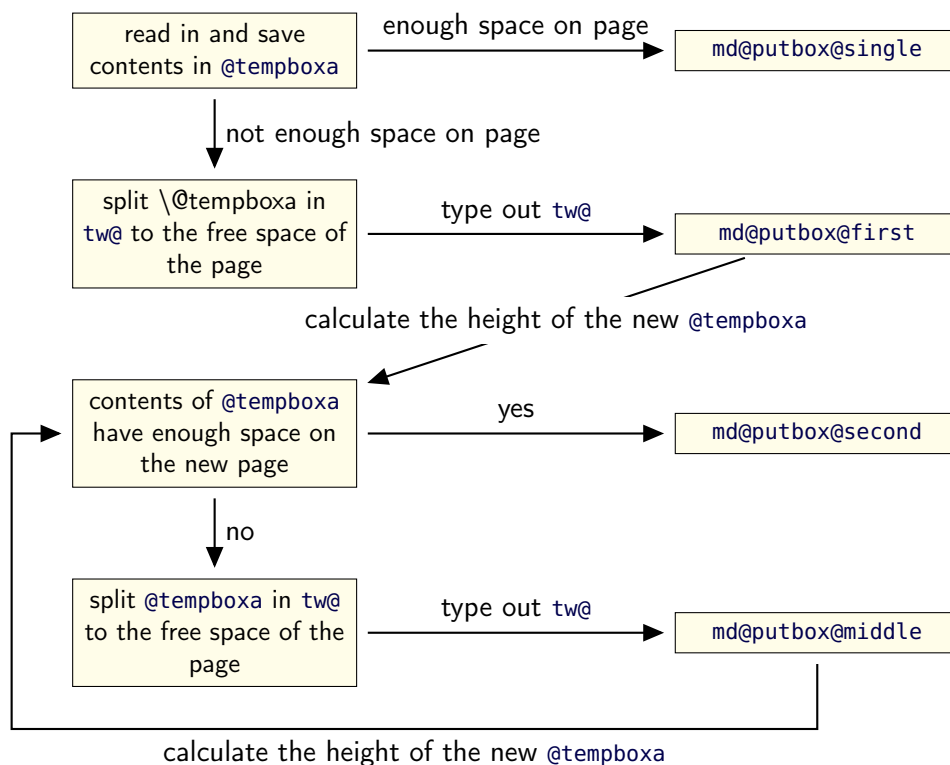

Figure 2: Setting the contents of `mdframed`

The width of the contents is the result of the settings of `leftmargin`, `rightmargin`, `linewidth`, `innerleftmargin` and `innerrightmargin` (see figure (1)).

A.2. The Framecommands

The package `mdframed` knows four kinds of “Framecommand”. These commands tell \LaTeX how to set the contents of `mdframed`.

`md@putbox@single` This command sets the contents of a single unsplit frame.

`md@putbox@first` This command sets the contents of the first frame of a split frame.

`md@putbox@middle` This command sets the contents of the middle frame of a split frame.

`md@putbox@second` This command sets the contents of the last frame of a split frame.

Using the explained commands we give an example. The command `box` uses the contents of the `savebox` and types them out.

First we want to type out the single box without any settings (but with the calculated width).

```
\makeatletter
\def\md@putbox@single{\box\@tempboxa}
\makeatother
```

I am using the command `leftline` to start the “Framcommands” at the left.

```
\makeatletter
\def\md@putbox@single{\leftline{\box\@tempboxa}}
\makeatother
```

Now you have to know how the lengths are named. Every length which can be modified by the options has the following syntax:

```
\mdf@<Name of the Length>@length
```

For example the leftmargin is:

```
\mdf@leftmargin@length
```

To create only a line at the left with the correct `leftmargin` you can set `md@putboxsingle` as follows

```
\makeatletter
\def\md@putbox@single{%
    \leftline{%
        \hspace*{\mdf@leftmargin@length}%
        \rule[-\dp\@tempboxa]{\mdf@linewidth}%
        {\ht\@tempboxa+\dp\@tempboxa}%
        \box\@tempboxa
    }%
}
\makeatother
```

In this way you can do what you want. If you create your own style you can save the file as `md-frame-X.mdf`. `X` must be an integer. In this way you can use the option `framemethod` to load the file by setting `framemethod=X`.

A.3. Revision history

Version 1.0b submitted 9 Dec 2011

- fixes documentation (Thanks to Dietrich Grau) • fixes bug in `newmdtheoremenv` • fixes bug with overfull boxes (Thanks to Dietrich Grau) • defined `newpsstylemdfbackgroundstyle` and `mdflinestyle`

This works only with `framemethod=PStricks`. • created dtx-file (Thanks to Kevin Godby) • added `@parboxrestore` to `md@lrbox`

Version 1.0 submitted 13 Nov 2011

- add option `userdefinedwidth` • add option `align` • add option `apptotikzsetting` • create new command `mdfapptodefinestyle` • changed internal algorithm • removed calc instead using ε -TeX `\dimexpr` • expand documentation • trying to fix problems with `xcolor` • fixed bug with `framemethod=pstricks` • create file `mdframed-example-default` • create file `mdframed-example-tikz` • create file `mdframed-example-pstricks` • create file `mdframed-example-texsx` (texsx stands for tex stackexchange)

Version 0.9g submitted 08 Oct 2011

- fixed documentation • added small footnote compatibility

Version 0.9f submitted 04 Oct 2011

- fixes bugs (thanks to Lars Madsen) • added option `hidealllines` • fixed documentation

Version 0.9e submitted 11 Sep 2011

- working with twoside modus

Version 0.9d submitted 10 Sep 2011

- **changed the meaning of the option `style`!!!** (inspired by Lars Madsen) • added option `framemethod` (inspired by Lars Madsen) • added options `needspace` (inspired by Lars Madsen) • added new command `mdfdefinestyle` (inspired by Lars Madsen) • fixes documentation • renamed `md-frame-3.mdf` to `md-frame-2.mdf`

Version 0.9b submitted 7 Sep 2011

- fixes bugs in `newmdtheoremenv` (Thanks to Enrico Gregorio)

Version 0.9a submitted 5 Sep 2011

- fixes bugs (Thanks to Lars Madson) • expanded documentation (added revision history)

Version 0.9 submitted 4 Sep 2011

- added option `nobreak` • detecting float environments to prevent split calculation • expand documentation (Thanks to Alan Munn)

Version 0.8a

- fixes bugs • fixes documentation

Version 0.8 submitted 22 Aug 2011

- added commands: `newmdenv`, `renewmdenv`, `newmdtheoremenv` • fixes bugs • fixes documentation

Version 0.7a submitted 6 August 2011

- added option `frametitle` • added option `frametitlefont` • allow twocolumn-mode • changed the calculation
- added option `tikzsetting` • added options for hidden lines for all styles • fixes bugs

Version 0.6a submitted 22 Dec 2010

- fixes bugs • added `mdfsetup` • expanded documentation

Version 0.6 submitted 18 Dec 2010

- added `style=3` with `pstricks` • added option `pstrickssetting` • added option `splitbottomskip` • added option `splittopskip` • added options for hidden lines • changed the calculation • fixes bugs

Version 0.4a submitted 14 May 2010

- fixes bug in `fontcolor`

Version 0.4 submitted 13 May 2010

- Elke Schubert creates style file for `tikz` • fixes some bugs – calculation of the page dimen (thanks Dick Nickalls)
- using `tikz` for the frame with different styles

Version 0.3b submitted 1 May 2010

- fixes some bugs – thanks to Dietrich Grau • added new options: `ntheorem`

Version 0.3a submitted 23 Apr 2010

- added new options: `leftmargin` and `rightmargin` • fixes some bugs

Version 0.3 submitted 16 Apr 2010

- first upload to [CTAN](#)

B. Implementation

And finally, here's how it all works...

B.1. The Explanation of mdframed.sty
