

The flexisym package

Morten Høgholm
mh.ctan@gmail.com

2008/08/08 v0.97a

User's guide

For now, the user's guide is in breqn.

Implementation

1 flexisym

```
1 <*package>
2 \RequirePackage{expl3}[2009/08/05]
3 \ProvidesExplPackage{flexisym}{2010/09/17}{0.97b}{Make math characters macros}
4
5 \edef\do{%
6   \noexpand\AtEndOfPackage{%
7     \catcode\number'\="\number\catcode'\
8     \relax
9   }%
10 }
11 \do \let\do\relax
12 \catcode'\="=12
13 \let\@sym\@gobble
14 \DeclareOption{robust}{%
15   \def\@sym#1{%
16     \ifx\protect\@typeset@protect \else\protect#1\exp_after:wN\use_none:n\nn\fi
17   }%
18 }
```

The math groups (mg) here relate to `\textfontn`.

```
19 \def\mg@bin{2}% binary operators
20 \def\mg@rel{2}% relations
21 %%\def\mg@nre{B}% negated relations
22 \def\mg@del{3}% delimiters
23 %%\def\mg@arr{B}% arrows
```

```

24 \def\mg@acc{0}% accents
25 \def\mg@cop{3}% cumulative operators (sum, int)
26 \def\mg@latin{1}% (Latin) letters
27 \def\mg@greek{1}% (lowercase) Greek
28 \def\mg@Greek{0}% (capital) Greek
29 %\def\mg@bflatin{4}% bold upright Latin letters ?
30 %\def\mg@Bbb{B}% blackboard bold
31 \def\mg@cal{2}% script/calligraphic
32 %\def\mg@frak{5}% Fraktur letters
33 \def\mg@digit{0}% decimal digits % 1 = oldstyle, 0 = capital

```

This is how we insert mathchars. The command has three arguments: class, fam and slot position and so it is always given as hexadecimal. This way of separating things should make it easier to get this to work with XeTeX et al. which have many more slot positions

```

34 \cs_set_protected:Nn \math_char:Nnn {
35   \tex_mathchar:D \intexpr_eval:w " #1#2#3 \intexpr_eval_end:
36 }

```

Delimiters and radicals are similar except here we have both small and large variant. Radicals have no class.

```

37 \cs_set_protected:Nn \math_delimiter:NnnNn {
38   \tex_delimiter:D \intexpr_eval:w " #1#2#3#4#5 \intexpr_eval_end:
39 }
40 \cs_set_protected:Nn \math_radical:NnnNn {
41   \tex_radical:D \intexpr_eval:w " #1#2#3#4 \intexpr_eval_end:
42 }
43 \cs_set_protected:Nn \math_accent:Nnnn {
44   \tex_mathaccent:D \intexpr_eval:w " #1 #2 #3 \intexpr_eval_end: {#4}
45 }

```

```

46
47 \let\sumlimits\displaylimits
48 \let\intlimits\nolimits
49 \let\namelimits\displaylimits

```

TeX defines eight types of atoms.

0. Ordinary
1. Operators
2. Binary
3. Relation
4. Open
5. Close
6. Punctuation
7. Inner

TeX defines eight math classes.

0. Ordinary
1. Operators
2. Binary
3. Relation
4. Open
5. Close
6. Punctuation
7. Variable family

flexisym/breqn extends this to types of classes.

0. Ordinary: (Ord), Bidirectional delimiters (DeB), Radicals (Rad), Accented items (Acc)
1. Operators: Cumulative Operators sum-like (COs), Cumulative Operators integral-like (COi)
2. Binary: (Bin)
3. Relation: (Rel), Arrow delimiters (DeA)
4. Open: (DeL)
5. Close (DeR)
6. Punctuation: (Pun)
7. Variable family: (Var)

Here's an overview of what we are about to do. Math chars of each type as defined by us need a basic operation for inserting it. We will call that function `\math_bsym_⟨type⟩:Nn`. Next there are compund symbols for each type which we name `\math_bcsym_⟨type⟩:Nn`. Also, there is inline mode and display mode which are different. We will call them for `\math_isym_⟨type⟩:Nn` `\math_icsym_⟨type⟩:Nn` for inline mode and `\math_dsym_⟨type⟩:Nn` and `\math_dcsym_⟨type⟩:Nn`. The code uses the terms `\math_sym_⟨type⟩:Nn` and `\math_csym_⟨type⟩:Nn` for the current meaning of things. First up the basic definitions. #1 is the math group it is from and #2 is the slot position.

```

50 \cs_new:Npn \math_bsym_Ord:Nn {\math_char:NNn 0 }% \m@Ord
51 \cs_new:Npn \math_bsym_Var:Nn {\math_char:NNn 7 }% \m@Var
52 \cs_new:Npn \math_bsym_Bin:Nn {\math_char:NNn 2}% \m@Bin
53 \cs_new:Npn \math_bsym_Rel:Nn {\math_char:NNn 3 }% \m@Bin
54 \cs_new:Npn \math_bsym_Pun:Nn {\math_char:NNn 6 }% \m@Pun
55 \cs_new:Nn \math_bsym_COs:Nn { \math_char:NNn 1#1{#2} \sumlimits}% \m@COs
56 \cs_new:Nn \math_bsym_COi:Nn { \math_char:NNn 1#1{#2} \intlimits}% \m@COi

```

```

57 \cs_new:Nn \math_bsym_DeL:Nn { \math_sd_del_aux:Nnn 4 #1{#2} }%\m@DeL
58 \cs_new:Nn \math_bsym_DeR:Nn { \math_sd_del_aux:Nnn 5 #1{#2} }%\m@DeR
59 \cs_new:Nn \math_bsym_DeB:Nn { \math_sd_del_aux:Nnn 0 #1{#2} }%\m@DeB
60 \cs_new:Nn \math_bsym_DeA:Nn { \math_sd_del_aux:Nnn 3 #1{#2} }%\m@DeA
61 \cs_new:Nn \math_bsym_Rad:Nn { \math_sd_rad_aux:Nn #1{#2} }%\m@Rad
62 \cs_new:Npn \math_bsym_Acc:Nn #1#2#3#4 {\math_accent:Nnn #1#2{#3}{#4}}% name is wrong
63

```

Next is somewhat complicated internally. The way it is done is that delimiters and radicals need information about the smallest version of the symbol. If this smallest delimiter (SD) is defined, then use it. We have these functions to help us return the number. Extract the numbers to use and stick a function in front of it.

Code changed because now we require the smallest delimiter to be defined (it may be the same, no problem in that). So the two arguments present in `\math_bsym_DeL:Nn` are the location of extensible version (where the font will do the rest for us automatically). For each delimiter, a pointer is defined using the extensible characters family and slot as name and value equal to family and position of the smallest version. For \langle in standard L^AT_EX this is `{del}{00}` and `{OT1}{28}` respectively. Hence, `\math_bsym_DeL:Nn \mg@del {00}` must expand to `\math_delimiter:NnnNn 4 \mg@OT1 {28}\mg@del{00}`. So first expand away to get to the smallest version. Then call next function which shuffles the arguments around.

```

64 \cs_set:Npn \math_sd_del_aux:Nnn #1#2#3{
65   \exp_args:Nf \math_sd_del_auxi:nN {\use:c{sd@#2#3}} #1 #2{#3}
66 }
67 \cs_set:Npn \math_sd_del_auxi:nN #1#2{ \math_delimiter:NnnNn #2 #1 }

```

Same for radicals.

```

68 \cs_set:Npn \math_sd_rad_aux:Nn #1#2{
69   \exp_args:Nf \math_sd_rad_auxi:n {\use:c{sd@#1#2}} #1 {#2}
70 }
71 \cs_set:Npn \math_sd_rad_auxi:n #1{ \math_radical:NnnNn #1 }
72
73
74 % \cs_set:Npn \math_sd_aux:nn #1#2 {
75 %   %\exp_args:Nnf \use:nn { #1} { \math_sd_auxi:Nn #2 }
76 %   \exp_args:Nnf \use:nn { #1} { \use:c{sd@\use:nn#2} }
77 % }
78 % \cs_set:Npn \math_sd_auxi:Nn #1#2 {
79 %   \cs_if_free:cTF {sd@#1#2}
80 %   { #1{#2} }
81 %   { \use:c{sd@#1#2} }
82 % }

```

```

Phew, that was it.

Well, almost. We need to set them up for use properly. Should they be added to `\everymath`? Probably, for math within displays. However, this is a lot of extra processing which we could tackle in the display setup.

```

```

Read delimited argument here. We want to find first character of DeA, Bin, etc. and the control sequence checked against is `\m@DeL`, `\m@Pun`, etc. The `lccode` trick makes the `.` into an `@` with catcode 12. This is what results when the code is called with `\string`. Beware of this when we change internal names for math groups! If a Delimiter is found, insert it with class 0 but use the smallest version available. Otherwise just insert math char of class 0. The code here is not pretty and it indicates it should be tackled differently!

```

355 }
356 \cs_set:Nn \math_ord_delim_aux:Nn {
357   \math_sd_aux:nn { \math_char:NNn 0 } {#1{#2}}
358 }

```

Before declaring any math characters active, we have to take care of a small problem with `amsmath v2.x`, if it is loaded before `flexisym`. `\std@minus` and `\std@equal` are defined as

```

\mathchardef\std@minus\mathcode'\- \relax
\mathchardef\std@equal\mathcode'\= \relax

```

in `amsmath.sty` and again `\AtBeginDocument`. The latter is because

In case some alternative math fonts are loaded later. [`amsmath.dtx`]

The problem arises because `flexisym` sets the mathcode of all symbols to 32768 which is illegal for a `\mathchardef`.

We have to remove the assignments from the `\AtBeginDocument` hook as they will cause an error there.

```

359 \@ifpackageloaded{amsmath}{%
360   \begingroup

```

Split the contents of `\@begindocumenthook` by reading what we search for as a delimited argument and ensure these two assignments do not take place. It is questionable if anything reasonable can be done to them. In the case of a package such as `mathpazo` which defines

```
\DeclareMathSymbol{=}{\mathrel}{upright}{"3D}
```

the `\Relbar` will look wrong if we don't use the correct symbol. The way to solve this is define additional `.sym` files which contain the definition of `\relbar` and `\Relbar` needed. We need those additional files anyway for things like `\joinord`.

```

361   \long\def\next#1\mathchardef\std@minus\mathcode'\- \relax
362           \mathchardef\std@equal\mathcode'\= \relax#2\flexi@stop{%
363     \toks@{#1#2}%
364     \xdef\@begindocumenthook{\the\toks@}%
365   }%
366   \expandafter\next\@begindocumenthook\flexi@stop
367   \endgroup
368 }{}

```

There is problem when using `\DeclareMathOperator` as the operators defined call a command `\newmcodes@` which relies on the mathcode of `-` being less than 32768. We delay the definition `\AtBeginDocument` in case `amssymb` hasn't been loaded yet.

```

369 \AtBeginDocument{%
370   \def\newmcodes@{%
371     \mathcode '\ '39\space

```

```

372 \mathcode '\*42\space
373 \mathcode '\."613A\space
374 \ifnum\mathcode'\-=45\space
375 \else
    The extra check. Don't do anything if - is math active.
376 \ifnum\mathcode'\-=32768\space
377 \else
378 \mathchardef \std@minus \mathcode '\-\relax
379 \fi
380 \fi
381 \mathcode '\-45\space
382 \mathcode '\-/47\space
383 \mathcode '\:"603A\space\relax
384 }%
385 }

```

And we then continue with the options.

```

386 \DeclareOption{mathstyleoff}{%
387 \PassOptionsToPackage{noactivechars}{mathstyle}}
388 \DeclareOption{cmbase}{\usesymbols{cmbase}}
389 \DeclareOption{mathpazo}{\usesymbols{mathpazo}}

402 \renewcommand{\|}{\Vert}
403 \RequirePackage{mathstyle}
404 \endinput

```

2 cmbase, mathpazo, mathptmx

For each math font package we define a corresponding symbol file with extension `sym`. The Computer Modern base is called `cmbase` and `mathpazo` and `mathptmx` corresponds to the packages. The definitions are almost identical as they mostly concern the positions in the math font encodings. Look for differences in `\joinord`, `\relbar` and `\Relbar`. If you inspect the source code, you'll see that the support for `mathptmx` didn't require any work but I thought it better to create a `sym` file to maintain a uniform interface.

Open question on ! and ?: maybe they should have type 'Pun' instead of 'DeR'. Need to search for uses in math in

AMS archives. Or, maybe add a special ‘Clo’ type for them:
non-extensible closing delimiter.

Default mathgroup setup.

```

405 <*cmbase | mathpazo | mathptmx>

670 \DeclareFlexSymbol{\oint}{C0i}{cop}{48}
671 \DeclareFlexSymbol{\bigsqcup}{C0s}{cop}{46}

```

Delimiter symbols. DeL stands for ‘delimiter (left)’. DeR stands for ‘delimiter (right)’. DeB stands for ‘delimiter (bidirectional)’. The principal encoding point for an extensible delimiter is the first link in the list of linked sizes as specified in the font metric information. For a math encoding such as OT1/OML/OMS/OMX where not all sizes of a given delimiter reside in a given font, the extra encoding point for the smallest delimiter must be supplied by defining

```
\sd@GXX
```

where G is the mathgroup and XX is the hexadecimal glyph position. `\DeclareFlexDelimiter` does that for us.

```

672 \DeclareFlexDelimiter{\rangle}{DeR}{del}{0B}{OMS}{69}
673 \DeclareFlexDelimiter{\langle}{DeL}{del}{0A}{OMS}{68}
674 \DeclareFlexDelimiter{\rbrace}{DeR}{del}{09}{OMS}{67}
675 \DeclareFlexDelimiter{\lbrace}{DeL}{del}{08}{OMS}{66}
676 \DeclareFlexDelimiter{\rceil}{DeR}{del}{07}{OMS}{65}

705 \DeclareFlexDelimiter{\backslash}{DeB}{del}{0F}{OMS}{6E}

```

3 Some compound symbols

The following symbols are not robust in standard L^AT_EX because they use # or \mathpalette (which is not robust and contains a # in its expansion): \angle, \cong, \notin, \rightleftharpoons.

In this definition of \hbar, the symbol is cobbled together from a math italic h and the cmr overbar accent glyph.

```

706 \DeclareFlexSymbol{\hbarOrd}{Ord}{OT1}{16}
707 \DeclareFlexCompoundSymbol{\hbar}{Ord}{\hbarOrd\mkern-9mu h}

```

For \surd, the interior symbol gets math class 1 (cumulative operator) to make the glyph vertically centered on the math axis, but the desired horizontal spacing is the spacing for a mathord. (Couldn't it just be class mathopen, though?)

```

708 \DeclareFlexSymbol{\surdOrd}{Ord}{OMS}{70}
709 \DeclareFlexCompoundSymbol{\surd}{Ord}{\mathop{\surdOrd}}

```

As shown in this definition of \angle, rule dimens are not allowed to use math-units, unfortunately.

```

710 \DeclareFlexCompoundSymbol{\angle}{Ord}{%
711   \vbox{\ialign{%
712     $\m@th\scriptstyle##$\cr
713     \notRel\mathrel{\mkern14mu}\cr
714     \noalign{\nointerlineskip}%
715     \mkern2.5mu\leaders\hrule \@height.34pt\hfill\mkern2.5mu\cr
716   }}%
717 }

```

The \not function, which is defined in the flexisym package, requires a suitably defined \notRel symbol.

```

718 \DeclareFlexCompoundSymbol{\neq}{Rel}{\not{=}}
.
719 \DeclareFlexCompoundSymbol{\mapsto}{Rel}{\mapstoOrd\rightharpoonup}

```

The `\@vereq` function ends by centering the whole construction on the math axis, unlike `\buildrel` where the base symbol remains at its normal altitude. Furthermore, `\@vereq` leaves the math style of the top symbol as given instead of downsizing to scriptstyle.

```
720 \DeclareFlexCompoundSymbol{\cong}{Rel}{\mathpalette\@vereq\sim}
```

The `\m@th` in the `fontmath.ltx` definition of `\notin` is superfluous unless `\c@ncel` doesn't include it (which was perhaps true in an older version of `plain.tex`).

```
721 \providecommand*\joinord{}
722 \cmbase | mathptmx \renewcommand*\joinord{\mkern-3mu }
723 \mathpazo \renewcommand*\joinord{\mkern-3.45mu }
724 \DeclareFlexCompoundSymbol{\notin}{Rel}{\mathpalette\c@ncel\in}
725 \DeclareFlexCompoundSymbol{\rightleftharpoons}{Rel}{\mathpalette\rlh@{}}
726 \DeclareFlexCompoundSymbol{\doteq}{Rel}{\buildrel\textstyle.\over=}
727 \DeclareFlexCompoundSymbol{\hookrightarrow}{Rel}{\lhookRel\joinord\rightarrow}
728 \DeclareFlexCompoundSymbol{\hookleftarrow}{Rel}{\leftarrow\joinord\rhookRel}
729 \DeclareFlexCompoundSymbol{\bowtie}{Rel}{\triangleright\joinord\triangleleft}
730 \DeclareFlexCompoundSymbol{\models}{Rel}{\vert\joinord=}
731 \DeclareFlexCompoundSymbol{\Longrightarrow}{Rel}{\Relbar\joinord\rightarrow}
732 \DeclareFlexCompoundSymbol{\longrightarrow}{Rel}{\relbar\joinord\rightarrow}
733 \DeclareFlexCompoundSymbol{\Longleftarrow}{Rel}{\Leftarrow\joinord\Relbar}
734 \DeclareFlexCompoundSymbol{\longleftarrow}{Rel}{\leftarrow\joinord\relbar}
735 \DeclareFlexCompoundSymbol{\longmapsto}{Rel}{\mapstochar\longrightarrow}
736 \DeclareFlexCompoundSymbol{\longleftarrowrightarrow}{Rel}{\leftarrow\joinord\rightarrow}
737 \DeclareFlexCompoundSymbol{\Longleftarrowrightarrow}{Rel}{\Leftarrow\joinord\rightarrow}
```

Here is what you get from the old definition of `\iff`.

```
\glue 2.77771 plus 2.77771
\glue(\thickmuskip) 2.77771 plus 2.77771
\OMS/cmsy/m/n/10 (
\hbox(0.0+0.0)x-1.66663
.\kern -1.66663
\OMS/cmsy/m/n/10 )
\penalty 500
\glue 2.77771 plus 2.77771
\glue(\thickmuskip) 2.77771 plus 2.77771
```

Looks like it could be simplified slightly. But it's not so easy as it looks to do it without screwing up the line breaking possibilities.

```
738 \renewcommand*\iff{%
739 \mskip\thickmuskip\Longleftarrow\mskip\thickmuskip
740 }
```

Some dotly symbols.

```
741 \DeclareFlexCompoundSymbol{\cdots}{Inn}{\cdotp\cdotp\cdotp}%
742 \DeclareFlexCompoundSymbol{\vdots}{Ord}{%
743 \vbox{\baselineskip4\p@ \lineskiplimit\z@
744 \kern6\p@\hbox{.}\hbox{.}\hbox{.}}}
745 \DeclareFlexCompoundSymbol{\ddots}{Inn}{%}
```

```

746 \mkern1mu\raise7\p@
747 \vbox{\kern7\p@\hbox{.}}\mkern2mu%
748 \raise4\p@\hbox{.}\mkern2mu\raise\p@\hbox{.}\mkern1mu%
749 }
.
750 \def\relbar{\begingroup \def\smash@{tb}% in case amsmath is loaded
751 \mathpalette\mathsm@sh{\mathchar"200 }\endgroup}
For \Relbar we take an equal sign of class 0 (Ord) from the operator family. For
cmr and mathptmx we know this is family 0.
752 <cmbase | mathptmx>\def\Relbar{\mathchar"3D }
For the mathpazo setup we need to use the equal sign from cmr and so must insert
class 0 and use the symbol from the upright symbols.
753 <mathpazo>\edef\Relbar{\mathchar\string\hexnumber@\symupright3D }
Done.
754 \ExplSyntaxOff
755 </cmbase | mathpazo | mathptmx>
Various synonyms such as \le for \leq and \to for \rightarrow are defined in
flexisym with \def instead of \let, for slower execution speed but smaller chance
of synchronization problems.
